This procedure creates a stored username/password pair. Credentials are assigned to jobs so that they can authenticate with a local or remote host operating system or a remote Oracle database.

Syntax

```sql
DBMS_SCHEDULER.CREATE_CREDENTIAL ( 
    credential_name IN VARCHAR2, 
    username IN VARCHAR2, 
    password IN VARCHAR2, 
    database_role IN VARCHAR2 DEFAULT NULL, 
    windows_domain IN VARCHAR2 DEFAULT NULL, 
    comments IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>The name to assign to the credential. It can optionally be prefixed with a schema name. It cannot be set to NULL. It is converted to uppercase unless enclosed in double quotation marks.</td>
</tr>
<tr>
<td>username</td>
<td>The user name for logging into the host operating system or remote Oracle database. This cannot be set to NULL and is case-sensitive. It cannot contain double quotes or spaces. Maximum length is 64.</td>
</tr>
<tr>
<td>password</td>
<td>The password for the user name. This cannot be set to NULL and is case-sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views. Maximum length is 128.</td>
</tr>
<tr>
<td>database_role</td>
<td>The value of the database_role attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: SYSDBA and SYSOPER</td>
</tr>
<tr>
<td>windows_domain</td>
<td>For a Windows remote executable target, this is the domain that the specified user belongs to. The domain is converted to uppercase automatically. Maximum length is 64.</td>
</tr>
<tr>
<td>comments</td>
<td>A text string that can be used to describe the credential. Scheduler does not use this parameter. Maximum length is 240.</td>
</tr>
</tbody>
</table>
Usage Notes

Credentials reside in a particular schema and can be created by any user with the CREATE JOB system privilege. To create a credential in a schema other than your own, you must have the CREATE ANY JOB privilege.
This procedure creates a database destination. A database destination represents an Oracle database on which remote database jobs run.

The host that the remote database resides on must have a running Scheduler agent that is registered with the database that this procedure is called from.

Syntax

```sql
DBMS_SCHEDULER.CREATE_DATABASE_DESTINATION (
    destination_name        IN VARCHAR2,
    agent                   IN VARCHAR2,
    tns_name                IN VARCHAR2,
    comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_name</td>
<td>The name to assign to the database destination. It can optionally be prefixed with a schema name. Cannot be NULL. It is converted to uppercase unless enclosed in double quotation marks.</td>
</tr>
<tr>
<td>agent</td>
<td>The external destination name of the Scheduler agent to connect. Equivalent to an agent name. The external destination must already exist. The external destination representing an agent is created automatically on a database instance when the agent registers with that instance. An agent's name is specified in its agent configuration file. If it is not specified, it defaults to the first part (before the first period) of the name of the host it resides on.</td>
</tr>
<tr>
<td>tns_name</td>
<td>An Oracle Net connect identifier that is resolved to the Oracle database instance being connected to. The exact syntax depends on the Oracle Net configuration. The connect identifier can be a complete Oracle Net connect descriptor (network address and database service name) or a net service name, which is an alias for a connect descriptor. The alias must be resolved in the tnsnames.ora file on the local computer. The maximum size for tns_name is 2000 characters. If tns_name is NULL, the agent connects to the default Oracle database on its host. You specify the default database by assigning values to the ORACLE_HOME and ORACLE_SID parameters in the agent configuration file, schagent.conf, located in the agent home directory. See Oracle Database Net Services Administrator’s Guide for more information on connect identifiers.</td>
</tr>
<tr>
<td>comments</td>
<td>A text string that describes the database destination. Scheduler does not use this argument.</td>
</tr>
</tbody>
</table>

Usage Notes

Database destinations reside in a particular schema and can be created by any user with the CREATE JOB system privilege. To create a database destination in a schema other than your own, you must have the CREATE ANY JOB privilege.
CREATE_EVENT_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

Syntax

```sql
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE ( 
  schedule_name           IN VARCHAR2, 
  start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL, 
  event_condition         IN VARCHAR2 DEFAULT NULL, 
  queue_spec              IN VARCHAR2, 
  end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL, 
  comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_name</td>
<td>The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.</td>
</tr>
<tr>
<td>start_date</td>
<td>This attribute specifies the date and time that this schedule becomes valid. Occurrences of the event before this date and time are ignored in the context of this schedule.</td>
</tr>
<tr>
<td>event_condition</td>
<td>This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression, provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code>. For more information on rules, see the <code>DBMS_AQADM.ADD_SUBSCRIBER</code> procedure.</td>
</tr>
<tr>
<td>queue_spec</td>
<td>This argument specifies either a file watcher name or the queue into which events that start this particular job are enqueued (the <code>source queue</code>). If the source queue is a secure queue, the <code>queue_spec</code> argument is a string containing a pair of values of the form <code>queue_name, agent name</code>. For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner’s schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.</td>
</tr>
<tr>
<td>end_date</td>
<td>The date and time after which jobs do not run and windows do not open. An event schedule that has no <code>end_date</code> is valid forever. <code>end_date</code> must be after the <code>start_date</code>. If it is not, then an error is generated when the schedule is created.</td>
</tr>
<tr>
<td>comments</td>
<td>This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else’s schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by
other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.

See Also:  "CREATE_FILE_WATCHER Procedure" on page 140-51
**CREATE_FILE_WATCHER Procedure**

This procedure creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job. After you create a file watcher, you reference it in an event-based job or event schedule.

**Syntax**

```sql
DBMS_SCHEDULER.CREATE_FILE_WATCHER (  
  file_watcher_name            IN VARCHAR2,  
  directory_path               IN VARCHAR2,  
  file_name                    IN VARCHAR2,  
  credential_name              IN VARCHAR2,  
  destination                  IN VARCHAR2 DEFAULT NULL,  
  min_file_size                IN PLS_INTEGER DEFAULT 0,  
  steady_state_duration        IN INTERVAL DAY TO SECOND DEFAULT NULL,  
  comments                     IN VARCHAR2 DEFAULT NULL,  
  enabled                      IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_watcher_name</td>
<td>The name to assign to the file watcher. The name must be unique in the SQL namespace. For example, a file watcher cannot have the same name as a table in a schema. This can optionally be prefixed with a schema name. Cannot be NULL.</td>
</tr>
<tr>
<td>directory_path</td>
<td>Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.</td>
</tr>
<tr>
<td>file_name</td>
<td>Name of the file to look for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.</td>
</tr>
<tr>
<td>credential_name</td>
<td>Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have EXECUTE privileges on the credential. Cannot be NULL.</td>
</tr>
<tr>
<td>destination</td>
<td>Name of an external destination. You create an external destination by registering a remote Scheduler agent with the database. See the view ALL_SCHEDULER_EXTERNAL_DESTS for valid external destination names. If this parameter is NULL, the file watcher is created on the local host.</td>
</tr>
<tr>
<td>min_file_size</td>
<td>Minimum size in bytes that the file must be before the file watcher considers the file found. Default is 0.</td>
</tr>
<tr>
<td>steady_state_duration</td>
<td>Minimum time interval that the file must remain unchanged before the file watcher considers the file found. Cannot exceed one hour. If NULL, an internal value is used. The minimum value is 10 seconds. Oracle recommends similar steady_state_duration values for all file watchers for efficient file watcher job operation. Also, the repeat interval of the file watcher schedule must be equal or greater than the steady_state_duration value.</td>
</tr>
</tbody>
</table>
**Usage Notes**

You must have the `CREATE_JOB` system privilege to create a file watcher in your own schema. You require the `CREATE ANY JOB` system privilege to create a file watcher in a schema different from your own (except the `SYS` schema, which is disallowed).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>Optional comment.</td>
</tr>
<tr>
<td>enabled</td>
<td>If <code>TRUE</code> (the default), the file watcher is enabled.</td>
</tr>
</tbody>
</table>
CREATE_GROUP Procedure

This procedure creates a group. Groups contain members, which you can specify when you create the group or at a later time. There are three types of groups: window groups, database destination groups, and external destination groups.

You can use a group name in other DBMS_SCHEDULER package procedures to specify a list of objects. For example, to specify multiple destinations for a remote database job, you provide a group name for the DESTINATION_NAME parameter of the job.

Syntax

```sql
DBMS_SCHEDULER.CREATE_GROUP (  
group_name           IN VARCHAR2,
  group_type           IN VARCHAR2,
  member               IN VARCHAR2 DEFAULT NULL,
  comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>The name to assign to the group. It can optionally be prefixed with a schema name. It cannot be NULL. It is converted to uppercase unless enclosed in double quotation marks.</td>
</tr>
<tr>
<td>group_type</td>
<td>The type of members in the group. All members must be of the same type. Possible types are:</td>
</tr>
<tr>
<td></td>
<td>- 'DB_DEST'</td>
</tr>
<tr>
<td></td>
<td>Database destination: Members are database destinations, for running remote database jobs.</td>
</tr>
<tr>
<td></td>
<td>- 'EXTERNAL_DEST'</td>
</tr>
<tr>
<td></td>
<td>External destination: Members are external destinations, for running remote external jobs.</td>
</tr>
<tr>
<td></td>
<td>- 'WINDOW'</td>
</tr>
<tr>
<td></td>
<td>Members are Scheduler windows. You must have the MANAGE SCHEDULER privilege to create a group of this type.</td>
</tr>
<tr>
<td>member</td>
<td>Members in database destination and external destination groups have the following format:</td>
</tr>
<tr>
<td></td>
<td>[[schema.]credential][schema.]destination</td>
</tr>
<tr>
<td></td>
<td>where:</td>
</tr>
<tr>
<td></td>
<td>- credential is the name of an existing credential.</td>
</tr>
<tr>
<td></td>
<td>- destination is the name of an existing database destination or external destination.</td>
</tr>
</tbody>
</table>

The credential portion of a destination member is optional. If omitted, the job using this destination member uses its default credential.

Members in window groups are window names. Because all Scheduler windows reside in the SYS schema, you do not specify a schema name for windows.
CREATE GROUP Procedure

Usage Notes

Groups reside in a particular schema and can be created by any user with the CREATE JOB system privilege. To create a group in a schema other than your own, you must have the CREATE ANY JOB privilege. The group name must be unique among all Scheduler objects.

You can grant the SELECT or READ privilege on a group so that other users can reference the group when creating jobs or schedules. To enable other users to modify a group, you can grant the ALTER privilege on the group.

Each group member must be unique within the group. For destination groups, the credential/destination name pairs must be unique within the group. An error is generated if any of the group members do not exist. For destination groups, both the credential and destination portions of a member must exist.

Another group of the same type can be a group member. The Scheduler immediately expands the included group name into its list of members.

Groups are created enabled, but you can disable them.

Example

The following PL/SQL block creates a group named production_dest1, whose members are database destinations for a collection of production databases.

```
BEGIN
  DBMS_SCHEDULER.CREATE_GROUP(
    GROUP_NAME    => 'production_dest1',
    GROUP_TYPE    => 'DB_DEST',
    MEMBER        => 'LOCAL, oracle_cred@prodhost1, prodhost2',
    COMMENTS      => 'All sector1 production machines');
END;
```
CREATE_JOB Procedure

This procedure creates a single job (regular or lightweight). If you create the job as enabled by setting the enabled attribute to TRUE, the Scheduler automatically runs the job according to its schedule. If you create the job disabled, the job does not run until you enable it with the SET_ATTRIBUTE Procedure.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a job in a single call without using an existing program or schedule:

```sql
DBMS_SCHEDULER.CREATE_JOB (
    job_name             IN VARCHAR2,
    job_type             IN VARCHAR2,
    job_action           IN VARCHAR2,
    number_of_arguments  IN PLS_INTEGER DEFAULT 0,
    start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    repeat_interval      IN VARCHAR2 DEFAULT NULL,
    end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    job_class            IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
    enabled              IN BOOLEAN DEFAULT FALSE,
    auto_drop            IN BOOLEAN DEFAULT TRUE,
    comments             IN VARCHAR2 DEFAULT NULL,
    credential_name      IN VARCHAR2 DEFAULT NULL,
    destination_name     IN VARCHAR2 DEFAULT NULL);
```

Creates a job using a named schedule object and a named program object:

```sql
DBMS_SCHEDULER.CREATE_JOB (
    job_name                IN VARCHAR2,
    program_name            IN VARCHAR2,
    schedule_name           IN VARCHAR2,
    job_class               IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
    enabled                 IN BOOLEAN DEFAULT FALSE,
    auto_drop               IN BOOLEAN DEFAULT TRUE,
    comments                IN VARCHAR2 DEFAULT NULL,
    job_style               IN VARCHAR2 DEFAULT 'REGULAR',
    credential_name         IN VARCHAR2 DEFAULT NULL,
    destination_name        IN VARCHAR2 DEFAULT NULL);
```

Creates a job using a named program object and an inlined schedule:

```sql
DBMS_SCHEDULER.CREATE_JOB (
    job_name             IN VARCHAR2,
    program_name         IN VARCHAR2,
    start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    repeat_interval      IN VARCHAR2 DEFAULT NULL,
    end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    job_class            IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
    enabled              IN BOOLEAN DEFAULT FALSE,
    auto_drop            IN BOOLEAN DEFAULT TRUE,
    comments             IN VARCHAR2 DEFAULT NULL,
    job_style            IN VARCHAR2 DEFAULT 'REGULAR',
    credential_name      IN VARCHAR2 DEFAULT NULL,
    destination_name     IN VARCHAR2 DEFAULT NULL);
```

Creates a job using a named schedule object and an inlined program:

```sql
DBMS_SCHEDULER.CREATE_JOB (
    job_name                IN VARCHAR2,
    program_name            IN VARCHAR2,
    start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    repeat_interval      IN VARCHAR2 DEFAULT NULL,
    end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    job_class               IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
    enabled                 IN BOOLEAN DEFAULT FALSE,
    auto_drop               IN BOOLEAN DEFAULT TRUE,
    comments                IN VARCHAR2 DEFAULT NULL,
    job_style               IN VARCHAR2 DEFAULT 'REGULAR',
    credential_name         IN VARCHAR2 DEFAULT NULL,
    destination_name        IN VARCHAR2 DEFAULT NULL);
```
CREATE_JOB Procedure

```
DBMS_SCHEDULER.CREATE_JOB (  
  job_name           IN VARCHAR2,  
  schedule_name      IN VARCHAR2,  
  job_type           IN VARCHAR2,  
  job_action         IN VARCHAR2,  
  number_of_arguments IN PLS_INTEGER       DEFAULT 0,  
  job_class          IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',  
  enabled            IN BOOLEAN           DEFAULT FALSE,  
  auto_drop          IN BOOLEAN           DEFAULT TRUE,  
  comments           IN VARCHAR2          DEFAULT NULL,  
  credential_name    IN VARCHAR2          DEFAULT NULL,  
  destination_name   IN VARCHAR2          DEFAULT NULL);
```

Creates a job using an inlined program and an event:

```
DBMS_SCHEDULER.CREATE_JOB (  
  job_name           IN VARCHAR2,  
  job_type           IN VARCHAR2,  
  job_action         IN VARCHAR2,  
  number_of_arguments IN PLS_INTEGER       DEFAULT 0,  
  start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
  event_condition    IN VARCHAR2          DEFAULT NULL,  
  queue_spec         IN VARCHAR2,  
  end_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
  job_class          IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',  
  enabled            IN BOOLEAN           DEFAULT FALSE,  
  auto_drop          IN BOOLEAN           DEFAULT TRUE,  
  comments           IN VARCHAR2          DEFAULT NULL,  
  credential_name    IN VARCHAR2          DEFAULT NULL,  
  destination_name   IN VARCHAR2          DEFAULT NULL);
```

Creates a job using a named program object and an event:

```
DBMS_SCHEDULER.CREATE_JOB (  
  job_name           IN VARCHAR2,  
  program_name       IN VARCHAR2,  
  start_date         IN TIMESTAMP WITH TIME ZONE,  
  event_condition    IN VARCHAR2,  
  queue_spec         IN VARCHAR2,  
  end_date           IN TIMESTAMP WITH TIME ZONE,  
  job_class          IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',  
  enabled            IN BOOLEAN           DEFAULT FALSE,  
  auto_drop          IN BOOLEAN           DEFAULT TRUE,  
  comments           IN VARCHAR2          DEFAULT NULL,  
  job_style          IN VARCHAR2          DEFAULT 'REGULAR',  
  credential_name    IN VARCHAR2          DEFAULT NULL,  
  destination_name   IN VARCHAR2          DEFAULT NULL);
```
Parameters

Table 140-26  CREATE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| job_name  | The name to assign to the job. The name must be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name.  
If job_name is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the GENERATE_JOB_NAME procedure to generate a name and then use the output in the CREATE_JOB procedure. The GENERATE_JOB_NAME procedure generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "GENERATE_JOB_NAME Function" on page 140-107 for more information. |
| job_type  | This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. See job_action in the next row for related information.  
The supported values are:  
- 'PLSQL_BLOCK'  
  This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0.  
- 'STORED_PROCEDURE'  
  This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported.  
- 'EXECUTABLE'  
  This specifies that the job is going to be run outside the database using an external executable. External jobs are anything that can be executed from the command line of the operating system. Any data arguments are not supported with a job or program type of EXECUTABLE. The job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.  
- 'CHAIN'  
  This specifies that the job is a chain. Arguments are not supported for a chain, so number_of_arguments must be 0.  
- 'EXTERNAL_SCRIPT'  
  This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is cmd.exe and for UNIX based systems the sh shell, unless a different interpreter is specified by prefixing the first line of the script with #!.
Table 140–26  (Cont.) CREATE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'SQL_SCRIPT'</td>
<td>This specifies that the job is a SQL<em>Plus script. The job must point to a credential that contains a valid operating system username and password. The SQL</em>Plus script is run by the SQL<em>Plus executable. The job may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL</em>Plus script. Note that if you choose to use connect credential, you must use <code>set_attribute</code> to specify the <code>Connect_Credential_Name</code> attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege.</td>
</tr>
<tr>
<td>'BACKUP_SCRIPT'</td>
<td>This specifies that the job is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The job points to a credential that contains a valid operating system username and password. The RMAN session runs under this operating system user. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege.</td>
</tr>
</tbody>
</table>
job_action

This attribute specifies the action of the job. If job_action is not specified for an inline program, then an error is generated when creating the job.

The following actions are possible:

- For a PL/SQL block:
  The action is to execute PL/SQL code. These blocks must end with a semicolon. For example, my_proc(); or BEGIN my_proc(); END; or DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END.

  Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution: DECLARE ... BEGIN job_action END; This is done to declare some internal Scheduler variables.

  You can include any Scheduler metadata attribute except event_message in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

  See Table 140–37 on page 140-80 for details on available metadata attributes.

- For a stored procedure:
  The action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, job_action_action=>'"Schema.""Procedure"'.

  PL/SQL procedures with INOUT or OUT arguments are not supported as job_action when the job or program type is STORED_PROCEDURE.

- For an executable:
  The action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign (@) and the job is local, the at-sign is replaced with the SID of the current Oracle instance.

  NOTE: Shell script syntax is not supported, only syntax for the name of and path to an executable is supported.

- For a chain:
  The action is the name of a Scheduler chain object. You must specify the schema of the chain if it resides in a different schema than the job.
For an external script:
The job_action must be either the path to an operating system script or an inline operating system script. If the job_action is a path to a script, then the script must reside on every computer that the job runs on. The job_action may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job.

The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The job must point to a credential that contains a valid operating system username and password.

For a SQL script:
The job_action must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the job_action is a path to a script, then the script must reside on every computer that the job runs on.

The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session.

For a backup script:
The program_action is either the path to a RMAN script or an inline RMAN script. If the program_action is a path to a script, then the script must reside on every computer that the program runs on.

The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.

number_of_arguments
This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.

program_name
The name of the program associated with this job. If the program is of type EXECUTABLE, the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.

start_date
This attribute specifies the first date and time on which this job is scheduled to start. If start_date and repeat_interval are left null, then the job is scheduled to run as soon as the job is enabled.

For repeating jobs that use a calendaring expression to specify the repeat interval, start_date is used as a reference date. The first time the job runs is the first match of the calendaring expression that is on or after the current date and time.

The Scheduler cannot guarantee that a job executes on an exact time because the system may be overloaded and thus resources unavailable.

event_condition
This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with tab.user_data. For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure.
Table 140–26  (Cont.) CREATE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

<tr>
<td></td>
<td>about preferred credentials for local external jobs.</td>
</tr>
<tr>
<td></td>
<td>See also: “CREATE_CREDENTIAL Procedure” on page 39-7</td>
</tr>
</tbody>
</table>
destination_name

The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. Must be NULL for jobs running on the local database or for local external jobs (executables).

This attribute can be a single destination name or the name of a group of type 'EXTERNAL_DEST' or 'DB_DEST'. The single destination or group must already exist.

The following applies to this attribute:

- If it is a database destination, it must have been created by the CREATE_DATABASE_DESTINATION Procedure.
- If it is an external destination, it must have been implicitly created by registering a remote Scheduler agent with the local database.
- If it is a group, each member of the group must exist, and the job must run on all destinations named in the group. See 'CREATE_GROUP Procedure' on page 140-53.

destination_name cannot reference a destination group when:

- The job type is 'CHAIN'
- The job style is 'LIGHTWEIGHT'

If the credential_name argument of CREATE_JOB is NULL, each destination must be preceded by a credential, in the following format:

credential.destination

The credential must already exist. If the credential_name argument is provided, then it serves as the default credential for every destination that is not preceded by a credential.

You can query the views *_SCHEDULER_DB_DESTS and ALL_SCHEDULER_EXTERNAL_DESTS for existing destinations and *_SCHEDULER_GROUP_MEMBERS for existing groups and their members.

***destination job attribute is deprecated in Oracle Database 11gR2 and superseded by destination_name.

enabled

This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured, and the job exists as a database object. However, the Scheduler ignores the job and the job coordinator does not pick it for processing. In order for the job coordinator to process the job, the job must be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.

auto_drop

This flag, if TRUE, causes a job to be automatically dropped after it has completed or has been automatically disabled. A job is considered completed if:

- Its end date (or the end date of the job schedule) has passed.
- It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE.
- It is not a repeating job and has run once.

A job is disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE.

If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure.

By default, jobs are created with auto_drop set to TRUE.
Usage Notes

Jobs are created as disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

The JOB_QUEUE_PROCESSES initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. Beginning with Oracle Database 11g Release 2, JOB_QUEUE_PROCESSES applies to DBMS_SCHEDULER jobs. Setting this parameter to 0 disables DBMS_SCHEDULER jobs.

To create a job in your own schema, you need to have the CREATE JOB privilege. A user with the CREATE ANY JOB privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type EXECUTABLE (or for a job that points to a program of type EXECUTABLE), the job owner must have the CREATE_EXTERNAL_JOB system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires EXECUTE privileges for that class or program.

Not all possible job attributes can be set with CREATE_JOB. Some must be set after the job is created. For example, job arguments must be set with the SET_JOB_ARGUMENT_VALUE Procedure or the SET_JOB_ANYDATA_VALUE Procedure. Other job attributes, such as job_priority and max_runs, are set with the SET_ATTRIBUTE Procedure.

To create multiple jobs efficiently, use the CREATE_JOBS procedure.

---

**Note:** The Scheduler runs event-based jobs for each occurrence of an event that matches the event condition of the job. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.
CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the `SYS` schema.

Syntax

```sql
DBMS_SCHEDULER.CREATE_JOB_CLASS (  
  job_class_name            IN VARCHAR2,  
  resource_consumer_group   IN VARCHAR2 DEFAULT NULL,  
  service                   IN VARCHAR2 DEFAULT NULL,  
  logging_level             IN PLS_INTEGER  
    DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,  
  log_history               IN PLS_INTEGER DEFAULT NULL,  
  comments                  IN VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_class_name</td>
<td>The name to assign to the job class. Job classes can only be created in the <code>SYS</code> schema.</td>
</tr>
<tr>
<td>resource_consumer_group</td>
<td>This attribute specifies the resource consumer group that his class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with determines the resources that are allocated to the job class. If a resource consumer group is dropped, job classes associated with it are then associated with the default resource consumer group. If no resource consumer group is specified, job classes are associated with the default resource consumer group. If the specified resource consumer group does not exist when creating the job class, an error occurs.</td>
</tr>
<tr>
<td>service</td>
<td>This attribute specifies the database service that the jobs in this class have affinity to. In an Oracle RAC environment, this means that the jobs in this class only run on those database instances that are assigned to the specific service. Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See <code>DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING</code> for details. If both the <code>resource_consumer_group</code> and <code>service</code> attributes are specified, and if the service is mapped to a resource consumer group, the <code>resource_consumer_group</code> attribute takes precedence. If no service is specified, the job class belongs to the default service, which means it has no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service. If the specified service does not exist when creating the job class, then an error occurs.</td>
</tr>
</tbody>
</table>
Summary of DBMS_SCHEDULER Subprograms

Usage Notes

For users to create jobs that belong to a job class, the job owner must have EXECUTE privileges on the job class. Therefore, after the job class has been created, EXECUTE privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the EXECUTE privilege to a role.

Creating a job class requires the MANAGE SCHEDULER system privilege.

Table 140–27 (Cont.) CREATE_JOB_CLASS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logging_level</td>
<td>This attribute specifies how much information is logged. The possible options are:</td>
</tr>
</tbody>
</table>
|              | - DBMS_SCHEDULER.LOGGING_OFF  
|              |   No logging is performed for any jobs in this class. |
|              | - DBMS_SCHEDULER.LOGGING_RUNS  
|              |   The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. |
|              | - DBMS_SCHEDULER.LOGGING_FAILED_RUNS  
|              |   The Scheduler logs only jobs that failed in this class. |
|              | - DBMS_SCHEDULER.LOGGING_FULL  
|              |   In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so, an entry is recorded in the log. |
| log_history  | This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately.  
|              | The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL (the default), retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE). |
| comments     | This attribute is for an optional comment about the job class. By default, this attribute is NULL. |
CREATE_JOBS Procedure

This procedure creates multiple jobs (regular and lightweight) and sets the values of their arguments in a single call.

Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (
    jobdef_array      IN SYS.JOB_DEFINITION_ARRAY,
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jobdef_array</td>
<td>The array of job definitions. See “Data Structures” on page 140-16 for a description of the JOB_DEFINITION_ARRAY and JOB_DEFINITION datatypes.</td>
</tr>
<tr>
<td>commit_semantics</td>
<td>The commit semantics. The following types are supported:</td>
</tr>
<tr>
<td></td>
<td>STOP_ON_FIRST_ERROR returns on the first error. Previous successfully created jobs are committed to disk. This is the default.</td>
</tr>
<tr>
<td></td>
<td>TRANSACTIONAL returns on the first error and everything that happened before that error is rolled back.</td>
</tr>
<tr>
<td></td>
<td>ABSORB_ERRORS tries to absorb any errors and attempts to create the rest of the jobs on the list. It commits all successfully created jobs. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure creates many jobs in the context of a single transaction. To realize the desired performance gains, the jobs being created must be grouped in batches of sufficient size. Calling CREATE_JOBS with a small array size may not be much faster than calling CREATE_JOB once for each job.

You cannot use this procedure to create multiple-destination jobs. That is, the destination attribute of the job_definition object cannot reference a destination group.

Examples

See Oracle Database Administrator’s Guide.
CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```sql
DBMS_SCHEDULER.CREATE_PROGRAM (
    program_name             IN VARCHAR2,
    program_type             IN VARCHAR2,
    program_action           IN VARCHAR2,
    number_of_arguments      IN PLS_INTEGER DEFAULT 0,
    enabled                  IN BOOLEAN DEFAULT FALSE,
    comments                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name to assign to the program. The name must be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.</td>
</tr>
</tbody>
</table>
This attribute specifies the type of program you are creating. If it is not specified then you get an error. These are the supported values for program_type:

- **'PLSQL_BLOCK'**
  This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0.

- **'STORED_PROCEDURE'**
  This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with INOUT or OUT arguments are not supported.

- **'EXECUTABLE'**
  This specifies that the job is going to be run outside the database using an external executable. External programs imply anything that can be executed from the operating system command line. AnyData arguments are not supported with job or program type EXECUTABLE.

- **'EXTERNAL_SCRIPT'**
  This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is cmd.exe and for UNIX based systems the sh shell, unless a different interpreter is specified by prefixing the first line of the script with #!.  

- **'SQL_SCRIPT'**
  This specifies that the program is a SQL*Plus script.
  A job using this program must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by SQL*Plus executable. The job using this program may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script.
  Note that if you choose to use connect credential, you must use set_attribute to specify the Connect_Credential_Name attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password.

- **'BACKUP_SCRIPT'**
  This specifies that the program is an RMAN backup script.
  The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing.
The following actions are possible:

- For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semicolon.
  
  For example, `my_proc();` or `BEGIN my_proc(); END;` or `DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;`.
  
  Note that the Scheduler wraps `job_action` in its own block and passes the following to PL/SQL for execution: `DECLARE ... BEGIN job_action END;` This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except `event_message` in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 140–37 on page 140-80 for details on available metadata attributes.
  
  If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: `job_name`, `job_owner`, `job_start`, `window_start`, `window_end`. For more information, see the “DEFINE_METADATA_ARGUMENT Procedure” on page 140-80.

- For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in a schema other than the job.
  
  If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, `program_action=>'"Schema"."Procedure"'.

- For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark (`?`), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at sign (`@`) and the job is local, the at sign is replaced with the SID of the current Oracle instance.

Table 140–29 (Cont.) CREATE_PROGRAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_action</td>
<td>This attribute specifies the action of the program. If <code>program_action</code> is not specified, an error is generated. The following actions are possible:</td>
</tr>
<tr>
<td></td>
<td>- For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semicolon. For example, <code>my_proc();</code> or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;</code> Note that the Scheduler wraps <code>job_action</code> in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except <code>event_message</code> in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 140–37 on page 140-80 for details on available metadata attributes. If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: <code>job_name</code>, <code>job_owner</code>, <code>job_start</code>, <code>window_start</code>, <code>window_end</code>. For more information, see the “DEFINE_METADATA_ARGUMENT Procedure” on page 140-80.</td>
</tr>
<tr>
<td></td>
<td>- For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in a schema other than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, `program_action=&gt;'&quot;Schema&quot;.&quot;Procedure&quot;'.</td>
</tr>
<tr>
<td></td>
<td>- For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark (<code>?</code>), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at sign (<code>@</code>) and the job is local, the at sign is replaced with the SID of the current Oracle instance.</td>
</tr>
</tbody>
</table>
CREATE_PROGRAM Procedure

Usage Notes

To create a program in their own schema, users need the CREATE_JOB privilege. A user with the CREATE ANY JOB privilege can create a program in any schema. A program is created in a disabled state by default (unless the enabled parameter is set to TRUE). It cannot be executed by a job until it is enabled.

To use your programs, other users must have EXECUTE privileges, therefore once a program has been created, you have to grant EXECUTE privileges on it.

See Also: "DEFINE_PROGRAM_ARGUMENT Procedure" on page 140-82
CREATE_SCHEDULE Procedure

This procedure creates a schedule.

Syntax

```sql
DBMS_SCHEDULER.CREATE_SCHEDULE (  
    schedule_name          IN VARCHAR2,  
    start_date             IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,  
    repeat_interval        IN VARCHAR2,  
    end_date               IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,  
    comments               IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schedule_name</code></td>
<td>The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.</td>
</tr>
<tr>
<td><code>start_date</code></td>
<td>This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for <code>start_date</code> is a reference date. In this case, the start of the schedule is not the <code>start_date</code>; it depends on the repeat interval specified. <code>start_date</code> is used to determine the first instance of the schedule. If <code>start_date</code> is specified in the past and no value for <code>repeat_interval</code> is specified, the schedule is invalid. For a repeating job or window, <code>start_date</code> can be derived from the <code>repeat_interval</code> if it is not specified. If <code>start_date</code> is null, then the date that the job or window is enabled is used. <code>start_date</code> and <code>repeat_interval</code> cannot both be null.</td>
</tr>
<tr>
<td><code>repeat_interval</code></td>
<td>This attribute specifies how often the schedule repeats. It is expressed using calendaring syntax. See “Calendaring Syntax” on page 140-6 for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.</td>
</tr>
<tr>
<td><code>end_date</code></td>
<td>The date and time after which jobs will not run and windows will not open. A non-repeating schedule that has no <code>end_date</code> is valid forever. <code>end_date</code> has to be after the <code>start_date</code>. If this is not the case, then an error is generated when the schedule is created.</td>
</tr>
<tr>
<td><code>comments</code></td>
<td>This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure requires the CREATE JOB privilege to create a schedule in your own schema or the CREATE ANY JOB privilege to create a schedule in someone else’s schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.
CREATE_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. You can then use the window to schedule jobs that run under the associated resource plan. Windows are created in the SYS schema.

The procedure is overloaded.

Syntax

Creates a window using a named schedule object:

```sql
DBMS_SCHEDULER.CREATE_WINDOW (  
    window_name             IN VARCHAR2,
    resource_plan           IN VARCHAR2,
    schedule_name           IN VARCHAR2,
    duration                IN INTERVAL DAY TO SECOND,
    window_priority         IN VARCHAR2 DEFAULT 'LOW',
    comments                IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```sql
DBMS_SCHEDULER.CREATE_WINDOW (  
    window_name             IN VARCHAR2,
    resource_plan           IN VARCHAR2,
    start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    repeat_interval         IN VARCHAR2,
    end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    duration                IN INTERVAL DAY TO SECOND,
    window_priority         IN VARCHAR2 DEFAULT 'LOW',
    comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>The name to assign to the window. The name must be unique in the SQL namespace. All windows are in the SYS schema, so the preface 'SYS' is optional.</td>
</tr>
<tr>
<td>resource_plan</td>
<td>This attribute specifies the resource plan that automatically activates when the window opens. When the window closes, the system switches to the appropriate resource plan, which is usually the plan that was in effect before the window opened, but can also be the plan of a different window. Only one resource plan can be associated with a window. It may be NULL or the empty string (&quot;&quot;). When it is NULL, the resource plan in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window. If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.</td>
</tr>
</tbody>
</table>
Creating a window requires the MANAGE_SCHEDULER privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the ALTER SYSTEM SET RESOURCE_MANAGER_PLAN statement or the DBMS_RESOURCE_MANAGER.SWITCH_PLAN package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler windows. For more information, see Oracle Database Administrator’s Guide and “SWITCH_PLAN Procedure” on page 131-43.
DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an AnyData object. A job that references the program can override the default value.

Syntax

```sql
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT ( 
    program_name IN VARCHAR2, 
    argument_position IN PLS_INTEGER, 
    argument_name IN VARCHAR2 DEFAULT NULL, 
    argument_type IN VARCHAR2, 
    default_value IN SYS.ANYDATA, 
    out_argument IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered. A program with this name must exist.</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the argument as it is passed to the executable. Argument numbers go from one to the number_of_arguments specified for the program. This must be unique, so it can replace any argument already defined at this position.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ANYDATA_VALUE Procedure.</td>
</tr>
<tr>
<td>argument_type</td>
<td>The datatype of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.</td>
</tr>
<tr>
<td>default_value</td>
<td>The default value to be assigned to the argument encapsulated within an AnyData object. This is optional.</td>
</tr>
<tr>
<td>out_argument</td>
<td>This parameter is reserved for future use. It must be set to FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

All program arguments from one to the number_of_arguments value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

See Also:

- "DEFINE_PROGRAM_ARGUMENT Procedure" on page 140-82
- "SET_JOB_ANYDATA_VALUE Procedure" on page 140-143
DEFINE_CHAIN_EVENT_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event. Once started in a running chain, this step does not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step replaces the old one.

Syntax

```sql
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (  
  chain_name              IN VARCHAR2,  
  step_name               IN VARCHAR2,  
  event_schedule_name     IN VARCHAR2,  
  timeout                 IN INTERVAL DAY TO SECOND DEFAULT NULL);  

DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (  
  chain_name              IN VARCHAR2,  
  step_name               IN VARCHAR2,  
  event_condition         IN VARCHAR2,  
  queue_spec              IN VARCHAR2,  
  timeout                 IN INTERVAL DAY TO SECOND DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain that the step is in</td>
</tr>
<tr>
<td>step_name</td>
<td>The name of the step</td>
</tr>
<tr>
<td>event_schedule_name</td>
<td>The name of the event schedule that the step waits for</td>
</tr>
<tr>
<td>timeout</td>
<td>This parameter is reserved for future use</td>
</tr>
<tr>
<td>event_condition</td>
<td>See the CREATE_EVENT_SCHEDULE Procedure</td>
</tr>
<tr>
<td>queue_spec</td>
<td>See the CREATE_EVENT_SCHEDULE Procedure</td>
</tr>
</tbody>
</table>

Usage Notes

Defining a chain step requires ALTER privileges on the chain either as the owner of the chain, or as a user with the ALTER object privilege on the chain or the CREATE ANY JOB system privilege.

You can base a chain step on a file watcher as well. To do this, provide the file watcher name directly in the queue_spec parameter, or use a file watcher schedule for the event_schedule_name parameter.

See Also: "DEFINE_CHAIN_STEP Procedure" on page 140-79
DEFINE_CHAIN_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax and indicates the prerequisites for the action to occur. The action is a result of the condition being met.

An actual rule object is created to store the rule in the schema where the chain resides. If a rule name is given, this name is used for the rule object. If an existing rule name in the schema of the chain is given, the existing rule is altered. (A schema different than the schema of the chain cannot be specified). If no rule name is given, one is generated in the form SCHED_RULE$N$.

Syntax

```sql
DBMS_SCHEDULER.DEFINE_CHAIN_RULE (  
  chain_name              IN VARCHAR2,  
  condition               IN VARCHAR2,  
  action                  IN VARCHAR2,  
  rule_name               IN VARCHAR2 DEFAULT NULL,  
  comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to alter</td>
</tr>
<tr>
<td>condition</td>
<td>A boolean expression which must evaluate to TRUE for the action to be performed. Every chain must have a rule that evaluates to TRUE to start the chain. For this purpose, you can use a rule that has 'TRUE' as its condition if you are using Scheduler chain condition syntax, or '1=1' as its condition if you are using SQL syntax.</td>
</tr>
</tbody>
</table>

- **Scheduler Chain Condition Syntax**
  
  See "Scheduler Chain Condition Syntax" on page 140-77 for details

- **SQL WHERE Clause Syntax**

  Conditions expressed with SQL must use the syntax of a SELECT statement WHERE clause.

  You can refer to chain step attributes by using the chain step name as a bind variable.

  The bind variable syntax is :step_name.attribute.(step_name refers to a typed object.) Possible attributes are: completed, state, start_date, end_date, error_code, and duration.

Scheduler Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain.

Chain Condition Syntax

The following are the available constructs for Scheduler chain condition syntax, which are all boolean expressions:

- **TRUE**
- **FALSE**
- `stepname [NOT] SUCCEEDED`
- `stepname [NOT] FAILED`
- `stepname [NOT] STOPPED`
- `stepname [NOT] COMPLETED`
- `stepname ERROR_CODE IN (integer, integer, integer ...)`
- `stepname ERROR_CODE NOT IN (integer, integer, integer ...)`
- `stepname ERROR_CODE = integer`
- `stepname ERROR_CODE != integer`
- `stepname ERROR_CODE <> integer`
- `stepname ERROR_CODE > integer`
- `stepname ERROR_CODE >= integer`
- `stepname ERROR_CODE < integer`
- `stepname ERROR_CODE <= integer`

These boolean operators are available to create more complex conditions:

- `expression AND expression`
- `expression OR expression`
- `NOT (expression)`

`integer` can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the `NOT` operator.
PL/SQL code that runs as part of a step can set the value of `ERROR_CODE` for that step with the `RAISE_APPLICATION_ERROR` statement.

**Usage Notes**

Defining a chain rule requires `ALTER` privileges on the chain (either as the owner, or as a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege). You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator’s Guide* for more information.

**Examples**

The following are examples of using rule conditions and rule actions.

**Rule Conditions Using Scheduler Chain Condition Syntax**

'Step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when any-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'Step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'Step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'Step1 error_code IN (1, 3, 5, 7)'
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7

**Rule Conditions Using SQL Syntax**

':step1.completed = ''TRUE'' AND :step1.end_date > SYSDATE-1/24'
--satisfied when step step1 completed less than an hour ago

':step1.duration > interval ''5'' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to complete

**Rule Actions**

'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has not completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.
**DEFINE_CHAIN_STEP Procedure**

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have `EXECUTE` privileges on the program or chain associated with the step. Only one program or chain can run during a step.

You cannot set all possible step attributes with this procedure. Use the `ALTER_CHAIN` procedure to set additional chain step attributes, such as `credential_name` and `destination_name`.

**Syntax**

```sql
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (  
  chain_name              IN VARCHAR2,  
  step_name               IN VARCHAR2,  
  program_name            IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to alter.</td>
</tr>
<tr>
<td>step_name</td>
<td>The name of the step being defined. If a step already exists with this name, the new step replaces the old one.</td>
</tr>
<tr>
<td>program_name</td>
<td>The name of a program or chain to run during this step. The chain owner must have <code>EXECUTE</code> privileges on this program or chain.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Defining a chain step requires `ALTER` privileges on the chain (either as the owner, or a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

See Also:
- "ALTER_CHAIN Procedure" on page 140-38
- "DEFINE_CHAIN_EVENT_STEP Procedure" on page 140-75
DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

Syntax

```sql
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (
    program_name            IN VARCHAR2,
    metadata_attribute      IN VARCHAR2,
    argument_position       IN PLS_INTEGER,
    argument_name           IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered</td>
</tr>
<tr>
<td>metadata_attribute</td>
<td>The metadata to be passed. Valid metadata attributes are: 'job_name',</td>
</tr>
<tr>
<td></td>
<td>'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end',</td>
</tr>
<tr>
<td></td>
<td>and 'event_message'.</td>
</tr>
<tr>
<td></td>
<td>Table 140–37 describes these attributes in detail.</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the argument as it is passed to the executable. The position</td>
</tr>
<tr>
<td></td>
<td>cannot be greater than the number_of_arguments specified for the program.</td>
</tr>
<tr>
<td></td>
<td>It must be unique, so it replaces any argument already defined at this</td>
</tr>
<tr>
<td></td>
<td>position.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name to assign to the argument. It is optional, but must be unique</td>
</tr>
<tr>
<td></td>
<td>for the program if it is specified. If you assign a name, the name can</td>
</tr>
<tr>
<td></td>
<td>then be used by other package procedures.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Metadata Attribute</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>VARCHAR2</td>
<td>Name of the currently running job</td>
</tr>
<tr>
<td>job_subname</td>
<td>VARCHAR2</td>
<td>Subname of the currently running job. The name + subname form a unique</td>
</tr>
<tr>
<td></td>
<td></td>
<td>identifier for a job that is running a chain step. NULL if the job is not</td>
</tr>
<tr>
<td></td>
<td></td>
<td>part of a chain.</td>
</tr>
<tr>
<td>job_owner</td>
<td>VARCHAR2</td>
<td>Owner of the currently running job</td>
</tr>
<tr>
<td>job_scheduled_start</td>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>When the currently running job was scheduled to start</td>
</tr>
<tr>
<td>job_start</td>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>When the currently running job started</td>
</tr>
</tbody>
</table>
### Usage Notes

Defining a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also define a program argument if you have the `CREATE ANY JOB` privilege.

All metadata attributes except `event_message` can be used in PL/SQL blocks that you enter into the `job_action` or `program_action` attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.
DEFINE_PROGRAM_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

Syntax

Defines a program argument without a default value:

PROCEDURE define_program_argument(
    program_name            IN VARCHAR2,
    argument_position       IN PLS_INTEGER,
    argument_name           IN VARCHAR2 DEFAULT NULL,
    argument_type           IN VARCHAR2,
    out_argument            IN BOOLEAN DEFAULT FALSE);

Defines a program argument with a default value:

PROCEDURE define_program_argument(
    program_name            IN VARCHAR2,
    argument_position       IN PLS_INTEGER,
    argument_name           IN VARCHAR2 DEFAULT NULL,
    argument_type           IN VARCHAR2,
    default_value           IN VARCHAR2,
    out_argument            IN BOOLEAN DEFAULT FALSE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered. A program with this name must exist.</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the argument as it is passed to the executable. Argument numbers go from one to the number_of_arguments specified for the program. This must be unique so it replaces any argument already defined at this position.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name to assign to the argument. It is optional, but must be unique for the program if specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ARGUMENT_VALUE Procedure.</td>
</tr>
<tr>
<td>argument_type</td>
<td>The datatype of the argument being defined. This is not verified or used by the Scheduler. The program user uses argument_type when deciding what value to assign to the argument. Any valid SQL datatype is allowed.</td>
</tr>
<tr>
<td>default_value</td>
<td>The default value to be assigned to the argument if none is specified by the job.</td>
</tr>
<tr>
<td>out_argument</td>
<td>This parameter is reserved for future use. It must be set to FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

All program arguments from 1 to the number_of_arguments value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.
Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

`DEFINE_PROGRAM_ARGUMENT` only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

**See Also:**

- "DEFINE_ANYDATA_ARGUMENT Procedure" on page 140-74
- "SET_JOB_ARGUMENT_VALUE Procedure" on page 140-144
DISABLE Procedure

This procedure disables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is disabled, its enabled attribute is set to FALSE.

Syntax

```
DBMS_SCHEDULER.DISABLE (  
   name              IN VARCHAR2,  
   force             IN BOOLEAN DEFAULT FALSE,  
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object being disabled. Can be a comma-delimited list. If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled. If a group name is specified, then the group is disabled, but the enabled state of the group members is unaffected.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, objects are disabled even if other objects depend on them. See the usage notes for more information.</td>
</tr>
</tbody>
</table>
| commit_semantics   | The commit semantics. The following types are supported:  
   - STOP_ON_FIRST_ERROR: The procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default.  
   - TRANSACTIONAL: The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when force is set to TRUE.  
   - ABSORB_ERRORS: The procedure tries to absorb any errors and disable the rest of the jobs and commits all the disable operations that were successful. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. This type is only supported when disabling a job or a list of jobs. |

Usage Notes

Windows must be preceded by SYS.

Disabling an object that is already disabled does not generate an error.

The purpose of the force option is to point out dependencies. No dependent objects are altered.

To run DISABLE for a window or a group of type WINDOW, you must have the MANAGE SCHEDULER privilege.
You can use `DISABLE` with any schema except the `SYS` schema.

**Jobs**
Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its state in the job queue is changed to disabled.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

For jobs with multiple destinations, you cannot disable a child job at a specific destination. Instead, you can disable the destination.

**Programs**
When a program is disabled, the status is changed to disabled. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call and are allowed to continue

No arguments that pertain to the program are affected when the program is disabled.

**File Watchers**
If `force` is set to `FALSE`, the file watcher must not be referenced by any job, otherwise an error will occur. If you force disabling a file watcher, jobs that depend on it become disabled.

**Windows**
This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error occurs.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is reenabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

**Window Groups**
When a group of type `WINDOW` is disabled, jobs (other than a running job) that have the window group as their schedule will not run when the member windows open. However, a job that has one of the window group members as its schedule still runs.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job, otherwise an error will occur.
If `force` is set to `TRUE`:  
- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

**Job Chains**
When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run. If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur. If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime. Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

**Database Destinations**
When you disable a database destination:
- The destination is skipped when a multiple destination job runs.
- If all destinations are disabled for a job, the Scheduler generates an error when it attempts to run the job.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all jobs that reference the database destination.

**External Destinations**
When you disable an external destination:
- Dependent database destinations remain enabled, but the Scheduler generates an error when it attempts to run a job with a database destination that depends on the external destination.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all external jobs that reference the external destination and for all database jobs with a database destination that depends on the external destination.

**Groups**
If you disable an external destination group or database destination group, the Scheduler generates an error when it attempts to run a job that names the group as its destination.
**DROP_AGENT_DESTINATION Procedure**

This procedure drops one or more external destinations, also known as agent destinations. It should be used only when the preferred method of dropping an external destination, using the `schagent` utility to unregister a Scheduler agent with a database, is unavailable due to failures.

This procedure can be called only by the `SYS` user or a user with the `MANAGE SCHEDULER` privilege.

---

**Note:** External destinations are created on a source database only implicitly by registering an agent with the database. There is no user-callable `CREATE_AGENT_DESTINATION` procedure.

---

**Syntax**

```sql
DBMS_SCHEDULER.DROP_AGENT_DESTINATION (destination_name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_name</td>
<td>A comma-separated list of external destinations to drop. Because user <code>SYS</code> owns all external destinations, do not prefix them with a schema name.</td>
</tr>
<tr>
<td></td>
<td>The procedure stops processing if it encounters an external destination that does not exist. All external destinations processed before the error are dropped.</td>
</tr>
<tr>
<td></td>
<td>Cannot be <code>NULL</code>.</td>
</tr>
</tbody>
</table>

**Usage Notes**

When an external destination is dropped:

- All database destinations that refer to the external destination are disabled and their `agent` attribute is set to `NULL`.
- Members of external destination groups that refer to the destination are removed from the group.
- All job instances in the `*_SCHEDULER_JOB_DESTS` views that refer to the external destination are also dropped.
- Jobs running against the destination are stopped.
DROP_CHAIN Procedure

This procedure drops an existing chain.

Syntax

```sql
DBMS_SCHEDULER.DROP_CHAIN (
    chain_name        IN VARCHAR2,
    force             IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to drop. Can also be a comma-delimited list of chains.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to FALSE, the chain must not be referenced by any job, otherwise an error will occur. If force is set to TRUE, all jobs pointing to the chain are disabled before the chain is dropped. Running jobs that point to this chain are stopped before the chain is dropped.</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a chain requires alter privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user must have the privileges required to do this. See the DBMS_RULEADM.DROP_RULE_SET and DBMS_RULEADM.DROP_EVALUATION_CONTEXT procedures for more information.

If force is FALSE, no jobs may be using this chain. If force is TRUE, any jobs that use this chain are disabled before the chain is dropped (and any of these jobs that are running will be stopped).
DROP_CHAIN_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

Syntax

```sql
DBMS_SCHEDULER.DROP_CHAIN_RULE (
    chain_name              IN VARCHAR2,
    rule_name               IN VARCHAR2,
    force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to alter</td>
</tr>
<tr>
<td>rule_name</td>
<td>The name of the rule to drop</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to TRUE, the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If force is set to FALSE and the chain is running, an error is generated.</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a chain rule requires alter privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so you must have the privileges to drop this rule object. See the DBMS_RULE_ADM.DROP_RULE procedure for more information.
DROP_CHAIN_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

Syntax

```sql
DBMS_SCHEDULER.DROP_CHAIN_STEP (  
  chain_name              IN VARCHAR2,
  step_name               IN VARCHAR2,
  force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to alter</td>
</tr>
<tr>
<td>step_name</td>
<td>The name of the step being dropped. Can be a comma-separated list.</td>
</tr>
<tr>
<td>force</td>
<td>If <code>force</code> is set to <code>TRUE</code>, this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted. If <code>force</code> is set to <code>FALSE</code> and this chain is currently running, an error is thrown.</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a chain step requires `ALTER` privileges on the chain (either as the owner or as a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).
DROP_CREDENTIAL Procedure

Note: This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the DBMS_CREDENTIAL package, specifically the DROP_CREDENTIAL Procedure.

This procedure drops a credential.

Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (  
    credential_name  IN VARCHAR2,  
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>The name of the credential being dropped. This can optionally be prefixed with a schema name. This cannot be set to NULL.</td>
</tr>
<tr>
<td>force</td>
<td>If set to FALSE, the credential must not be referenced by any job, or an error will occur. If set to TRUE, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime.</td>
</tr>
</tbody>
</table>

Usage Notes

Only the owner of a credential or a user with the CREATE ANY JOB system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

See Also: "CREATE_CREDENTIAL Procedure" on page 39-7
DROP_DATABASE_DESTINATION Procedure

This procedure drops one or more database destinations.

Syntax

```sql
DBMS_SCHEDULER.DROP_DATABASE_DESTINATION (destination_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_name</td>
<td>The name of the destination to drop. Can be a comma-separated list of database destinations to drop. Each database destination can optionally be prefixed with a schema name. The procedure stops processing if it encounters a database destination that does not exist. All database destinations processed before the error are dropped. Cannot be NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop the database destination.

When a database destination is dropped:

- All job instances that refer to the destination in the *_SCHEDULER_JOBDESTS views are also dropped.
- Jobs running against the destination are stopped.
- Members of database destination groups that refer to the destination are removed from the group.

See Also: CREATE_DATABASE_DESTINATION Procedure on page 140-48
DROP_FILE_WATCHER Procedure

This procedure drops one or more file watchers.

Syntax

```sql
DBMS_SCHEDULER.DROP_FILE_WATCHER (    file_watcher_name IN VARCHAR2,    force IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_watcher_name</td>
<td>The file watcher to drop. Can be a comma-separated list of file watchers. Each file watcher name can optionally be prefixed with a schema name. Cannot be NULL.</td>
</tr>
<tr>
<td>force</td>
<td>If set to FALSE, the file watcher must not be referenced by any job, or an error occurs. If set to TRUE, the file watcher is dropped whether or not there are jobs referencing it. In this case, jobs that reference the dropped file watcher are disabled.</td>
</tr>
</tbody>
</table>

Usage Notes

Only the owner of a file watcher or a user with the CREATE ANY JOB system privilege may drop the file watcher.

Running jobs that point to the file watcher are not affected by this procedure and are allowed to continue.

See Also: "CREATE_FILE_WATCHER Procedure" on page 140-51
DROP_GROUP Procedure

This procedure drops one or more groups.

Syntax

```
DBMS_SCHEDULER.DROP_GROUP (  
group_name       IN VARCHAR2,  
force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>A group to drop. Can be a comma-separated list of group names. Each group name can optionally be prefixed with a schema name. The procedure stops processing if it encounters a group that does not exist. All groups processed before the error are dropped. Cannot be NULL.</td>
</tr>
<tr>
<td>force</td>
<td>If FALSE, the group must not be referenced by any job, otherwise an error occurs. If TRUE, the group is dropped whether or not there are jobs referencing it. In this case, all jobs referencing the group are disabled and all job instances that reference the group are removed from the *_SCHEDULER_JOB_DESTS views.</td>
</tr>
</tbody>
</table>

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop a group. You must have the MANAGE SCHEDULER privilege to drop a group of type WINDOW.

See Also:  "CREATE_FILE_WATCHER Procedure" on page 140-51
DROP_JOB Procedure

This procedure drops one or more jobs or all jobs in one or more job classes. Dropping a job also drops all argument values set for that job.

Syntax

```sql
DBMS_SCHEDULER.DROP_JOB (  
   job_name               IN VARCHAR2,  
   force                   IN BOOLEAN DEFAULT FALSE,  
   defer                   IN BOOLEAN DEFAULT FALSE,  
   commit_semantics        IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of a job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to TRUE, the Scheduler first attempts to stop the running job instances (by issuing the STOP_JOB call with the force flag set to false), and then drops the jobs.</td>
</tr>
<tr>
<td>defer</td>
<td>If defer is set to TRUE, the Scheduler allows the running jobs to complete and then drops the jobs.</td>
</tr>
</tbody>
</table>
| commit_semantics | The commit semantics. The following types are supported:  
  ■ STOP_ON_FIRST_ERROR returns on the first error and previous successful drop operations are committed to disk. This is the default.  
  ■ TRANSACTIONAL returns on the first error. Everything that happened before that error is rolled back. This type is not supported when force is set to TRUE.  
  ■ ABSORB_ERRORS tries to absorb any errors and drop the rest of the jobs, and commits all the successful drops. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. Only STOP_ON_FIRST_ERROR is permitted when job classes are included in the job_name list. |

Usage Notes

If both force and defer are set to FALSE and a job is running at the time of the call, the attempt to drop that job fails. The entire call to DROP_JOB may then fail, depending on the setting of commit_semantics.

Setting both force and defer to TRUE results in an error.

Dropping a job requires ALTER privileges on the job either as the owner of the job or as a user with the ALTER object privilege on the job or the CREATE ANY JOB system privilege.
DROP_JOB_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

Syntax

```sql
DBMS_SCHEDULER.DROP_JOB_CLASS (  
  job_class_name          IN VARCHAR2,  
  force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_class_name</td>
<td>The name of the job class. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If <code>force</code> is set to <code>FALSE</code>, a class being dropped must not be referenced by any jobs, otherwise an error occurs. If <code>force</code> is set to <code>TRUE</code>, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful is the class dropped. Running jobs that belong to the job class are not affected.</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a job class requires the `MANAGE_SCHEDULER` system privilege.
**DROP_PROGRAM Procedure**

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

**Syntax**

```sql
DBMS_SCHEDULER.DROP_PROGRAM (    program_name            IN VARCHAR2,
    force                   IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be dropped. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If <code>force</code> is set to <code>FALSE</code>, the program must not be referenced by any job, otherwise an error occurs. If <code>force</code> is set to <code>TRUE</code>, all jobs referencing the program are disabled before the program is dropped. Running jobs that point to the program are not affected by the <code>DROP_PROGRAM</code> call and are allowed to continue.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Dropping a program requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program if you have the `CREATE ANY JOB` privilege.
DROP_PROGRAM_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position. The procedure is overloaded.

Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
    program_name            IN VARCHAR2,
    argument_position       IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
    program_name            IN VARCHAR2,
    argument_name           IN VARCHAR2);
```

Parameters

Table 140–51  DROP_PROGRAM_ARGUMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered. A program with this name must exist.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the argument being dropped</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the argument to be dropped</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program argument if you have the CREATE ANY JOB privilege.
**DROP_SCHEDULE Procedure**

This procedure drops a schedule.

**Syntax**

```sql
DBMS_SCHEDULER.DROP_SCHEDULE (    schedule_name    IN VARCHAR2,
    force            IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_name</td>
<td>The name of the schedule. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If <code>force</code> is set to <code>FALSE</code>, the schedule must not be referenced by any job or window, otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code>, any jobs or windows that use this schedule are disabled before the schedule is dropped. Running jobs and open windows that point to the schedule are not affected.</td>
</tr>
</tbody>
</table>

**Usage Notes**

You must be the owner of the schedule being dropped or have `ALTER` privileges for the schedule or the `CREATE ANY JOB` privilege.
DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. The window is removed from any groups that reference it.

Syntax

```sql
DBMS_SCHEDULER.DROP_WINDOW (
    window_name             IN VARCHAR2,
    force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>The name of the window. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to FALSE, the window must not be open or referenced by any job, otherwise an error occurs. If force is set to TRUE, the window is dropped and those jobs that have the window as their schedule are disabled. However, jobs that have a window group, of which the dropped window is a member, as their schedule, are not disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply. Running jobs that have the window as their schedule are allowed to continue, unless the stop_on_window_close flag is set to TRUE for the job. If this is the case, the job is stopped when the window is dropped.</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a window requires the MANAGE SCHEDULER privilege.
ENABLE Procedure

This procedure enables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is enabled, its enabled attribute is set to TRUE. By default, jobs, chains, and programs are created disabled and database destinations, external destinations, file watchers, windows, and groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule. Enabling a disabled job also resets the job RUN_COUNT, FAILURE_COUNT and RETRY_COUNT columns in the *_SCHEDULER_JOBS data dictionary views.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (  
    name   IN VARCHAR2,  
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the Scheduler object being enabled. Can be a comma-delimited list of names.</td>
</tr>
<tr>
<td></td>
<td>If a job class name is specified, then all the jobs in the job class are enabled.</td>
</tr>
<tr>
<td></td>
<td>If a group name is specified, then the group is enabled, but the enabled state of the group members is unaffected.</td>
</tr>
<tr>
<td>commit_semantics</td>
<td>The commit semantics. The following types are supported:</td>
</tr>
<tr>
<td></td>
<td>■ STOP_ON_FIRST_ERROR - The procedure returns on the first error and previous successful enable operations are committed to disk. This is the default.</td>
</tr>
<tr>
<td></td>
<td>■ TRANSACTIONAL - The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs.</td>
</tr>
<tr>
<td></td>
<td>■ ABSORB_ERRORS - The procedure tries to absorb any errors and enable the rest of the jobs. It commits all the enable operations that were successful. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. This type is only supported when enabling a job or a list of jobs.</td>
</tr>
</tbody>
</table>

Usage Notes

Window names must be preceded by SYS.

To run ENABLE for a window or group of type WINDOW, you must have the MANAGE SCHEDULER privilege. For a job of type EXECUTABLE (or for a job that points to a program of type EXECUTABLE), the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.
To enable a file watcher, the file watcher owner must have the `EXECUTE` privilege on the designated credential.

You can use `ENABLE` with any schema except the `SYS` schema.
END_DETACHED_JOB_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the detached attribute set to TRUE. A detached job run does not end until this procedure or the STOP_JOB Procedure is called.

Syntax

```plsql
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (
    job_name          IN VARCHAR2,
    error_number      IN PLS_INTEGER DEFAULT 0,
    additional_info   IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job to end. Must be a detached job that is running.</td>
</tr>
<tr>
<td>error_number</td>
<td>If zero, then the job run is logged as succeeded. If -1013, then the job run is logged as stopped. If non-zero, then the job run is logged as failed with this error number.</td>
</tr>
<tr>
<td>additional_info</td>
<td>This text is stored in the additional_info column of the *_scheduler_job_run_details views for this job run.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure requires that you either own the job or have ALTER privileges on it. You can also end any detached job run if you have the CREATE ANY JOB privilege.

See Also: Oracle Database Administrator’s Guide for information about detached jobs.
EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler calendaring syntax. This procedure evaluates the calendar expression and tells you the next execution date and time of a job or window. This is very useful for testing the correct definition of the calendar string without actually scheduling the job or window.

This procedure can also get multiple steps of the repeat interval by passing the next_run_date returned by one invocation as the return_date_after argument of the next invocation.

See the calendaring syntax described in "Operational Notes" on page 140-6.

Syntax

```sql
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (    calendar_string    IN  VARCHAR2,    start_date         IN  TIMESTAMP WITH TIME ZONE,    return_date_after  IN  TIMESTAMP WITH TIME ZONE,    next_run_date      OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calendar_string</td>
<td>The calendar expression to be evaluated. The string must be in the calendaring syntax described in &quot;Operational Notes&quot; on page 140-6.</td>
</tr>
<tr>
<td>start_date</td>
<td>The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be NULL.</td>
</tr>
<tr>
<td>return_date_after</td>
<td>The return_date_after argument helps the Scheduler determine which one of all possible matches (all valid execution dates) to return from those determined by the start_date and the calendar string. When a NULL value is passed for this argument, the Scheduler automatically fills in systimestamp as its value.</td>
</tr>
<tr>
<td>next_run_date</td>
<td>The first timestamp that matches the calendar string and start date that occur after the value passed in for the return_date_after argument.</td>
</tr>
</tbody>
</table>

Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```sql
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
    start_date        TIMESTAMP;
    return_date_after TIMESTAMP;
    next_run_date     TIMESTAMP;
BEGIN
    start_date := to_timestamp_tz('01-JAN-2003 10:00:00','DD-MON-YYYY HH24:MI:SS');
    return_date_after := start_date;
    FOR i IN 1..5 LOOP
        DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (    calendar_string    => 'RRRRR RRMMDD',    start_date         => start_date,    return_date_after  => return_date_after,    next_run_date      => next_run_date);
    END LOOP;
END;
```
DBMS_SCHEDULER.EVALUATECALENDAR_STRING(
    'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
    start_date, return_date_after, next_run_date);
DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
return_date_after := next_run_date;
END LOOP;
END;
/

next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM

PL/SQL procedure successfully completed.

Usage Notes

No specific Scheduler privileges are required.
EVALUATE_RUNNING_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (RUN_JOB can be used to start the job.)

If any of the steps of the chain are themselves running chains, another EVALUATE_RUNNING_CHAIN is performed on each of the nested running chains.

Syntax

```sql
DBMS_SCHEDULER.EVALUATE_RUNNINGCHAIN (job_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the running job (pointing to a chain) to reevaluate the rules for</td>
</tr>
</tbody>
</table>

Usage Notes

Running EVALUATE_RUNNING_CHAIN on a job requires alter privileges on the job (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

**Note:** The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with an event step in the chain

For most chains, this is sufficient. EVALUATE_RUNNING_CHAIN should be used only under the following circumstances:

- After manual intervention of a running chain with the ALTER_RUNNING_CHAIN procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, EVALUATE_RUNNING_CHAIN may not be needed if you set the evaluation_interval attribute when you created the chain.
**GENERATE_JOB_NAME Function**

This function returns a unique name for a job. The name will be of the form \( \text{prefix}N \) where \( N \) is a number from a sequence. If no prefix is specified, the generated name will, by default, be \text{JOB$_1$}, \text{JOB$_2$}, \text{JOB$_3$}, and so on. If 'SCOTT' is specified as the prefix, the name will be \text{SCOTT1}, \text{SCOTT2}, and so on.

**Syntax**

```sql
DBMS_SCHEDULER.GENERATE_JOB_NAME (prefix        IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>The prefix to use when generating the job name</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the prefix is explicitly set to \text{NULL}, the name is just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the \text{DBMS_SCHEDULER} calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the \text{GENERATE_JOB_NAME} function never returns the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.
GET_AGENT_INFO Function

This function can return job information specific to an agent, such as how many are running and so on, depending on the attribute selected.

Syntax

```sql
DBMS_SCHEDULER.GET_AGENT_INFO (
    agent_name        IN VARCHAR2,
    attribute         IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>The name of an external destination where the agent is running</td>
</tr>
<tr>
<td>attribute</td>
<td>Possible Attributes values</td>
</tr>
<tr>
<td></td>
<td>■ VERSION: Returns the agent version number. Requires the CREATE JOB system privilege.</td>
</tr>
<tr>
<td></td>
<td>■ UPTIME: Returns the time the agent has been up and running. Requires the CREATE JOB system privilege.</td>
</tr>
<tr>
<td></td>
<td>■ NUMBER_OF_RUNNING_JOBS: Returns the number of jobs that the agent is currently running. Requires the CREATE JOB system privilege.</td>
</tr>
<tr>
<td></td>
<td>■ TOTAL_JOBS_RUN: Returns the number of jobs run by the agent since it was started. Requires the CREATE JOB system privilege.</td>
</tr>
<tr>
<td></td>
<td>■ RUNNING_JOBS: Returns a comma-separated list of the names of the jobs running currently. Requires the MANAGE SCHEDULER system privilege.</td>
</tr>
<tr>
<td></td>
<td>■ ALL: Returns all the information the previous options return. It requires the MANAGE SCHEDULER system privilege.</td>
</tr>
</tbody>
</table>

Usage Notes

This function returns the same information as the schagent utility status option. See Oracle Database Administrator’s Guide.
GET_AGENT_VERSION Function

This function returns the version string of a Scheduler agent that is registered with the database and is currently running. GET_AGENT_VERSION throws an error if the agent is not registered with the database or if the agent is not currently running.

Syntax

DBMS_SCHEDULER.GET_AGENT_VERSION (  
    agent_host        IN VARCHAR2) RETURN VARCHAR2;

Parameters

Table 140–60 GET_AGENT_VERSION Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_host</td>
<td>Either the hostname and port on which the agent is running in the form hostname:port or the name of the agent as shown in the destination_name column of the ALL_SCHEDULER_EXTERNAL_DESTS view which lists all Scheduler agents registered with the database.</td>
</tr>
</tbody>
</table>

Usage Notes

This function requires the CREATE EXTERNAL JOB system privilege.
GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to retrieve values of various types.

Syntax

```sql
DBMS_SCHEDULER.GET_ATTRIBUTE (
    name           IN VARCHAR2,
    attribute      IN VARCHAR2,
    value          OUT {VARCHAR2|PLS_INTEGER|BOOLEAN|DATE|TIMESTAMP|
                           TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                           INTERVAL DAY TO SECOND});

DBMS_SCHEDULER.GET_ATTRIBUTE (
    name           IN VARCHAR2,
    attribute      IN VARCHAR2,
    value          OUT VARCHAR2,
    value2         OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object</td>
</tr>
<tr>
<td>attribute</td>
<td>The attribute being retrieved. See the SET_ATTRIBUTE Procedure on page 140-127 for tables of attribute values.</td>
</tr>
<tr>
<td>value</td>
<td>The existing value of the attribute</td>
</tr>
<tr>
<td>value2</td>
<td>The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.</td>
</tr>
</tbody>
</table>

Usage Notes

To run GET_ATTRIBUTE for a job class, you must have the MANAGE_SCHEDULER privilege or have EXECUTE privileges on the class. For a schedule, window, or group, no privileges are necessary. Otherwise, you must be the owner of the object or have ALTER or EXECUTE privileges on that object or have the CREATE ANY JOB privilege.

See the SET_ATTRIBUTE Procedure on page 140-127 for tables of attribute values that you can retrieve for the various Scheduler object types.
GET_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

This procedure differs from the equivalent UTL_FILE procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle database) installed.

Syntax

```
DBMS_SCHEDULER.GET_FILE (
    source_file                  IN VARCHAR2,
    source_host                  IN VARCHAR2,
    credential_name              IN VARCHAR2,
    file_contents                IN OUT NOCOPY {BLOB|CLOB});
```

```
DBMS_SCHEDULER.GET_FILE (
    source_file                  IN VARCHAR2,
    source_host                  IN VARCHAR2,
    credential_name              IN VARCHAR2,
    destination_file_name        IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_permissions      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 140–62  GET_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_file</td>
<td>Fully qualified path name of the file to retrieve from the operating system. The file name is case-sensitive and is not converted to uppercase. If the file name starts with a question mark (‘?’), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host. If the format of this parameter is external_log_id.stdout, then the stdout from the designated external job run is returned. If the format of this parameter is external_log_id.stderr, the error text from the designated external job run is returned. You obtain the value of external_log_id from the ADDITIONAL_INFO column of the *_SCHEDULER_JOB_RUN_DETAILS views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the external_log_id name/value pair, and then append either ”_stdout” or ”_stderr” to its value. The external job must have an associated credential. The credential_name parameter of GET_FILE must name the same credential that is used by the job, and the source_host parameter must be the same as the destination attribute of the job.</td>
</tr>
</tbody>
</table>
### Table 140–62 (Cont.) GET_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>source_host</code></td>
<td>If the file is to be retrieved from a remote host, then this parameter must be a valid an external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views <code>*_SCHEDULER_EXTERNAL_DESTS</code>.) If <code>source_host</code> is NULL or set to ’localhost’, then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the <code>schagent.conf</code> file, which is located in the Scheduler agent home directory on the remote host.</td>
</tr>
<tr>
<td><code>credential_name</code></td>
<td>The name of the credential to use for accessing the file system.</td>
</tr>
<tr>
<td><code>file_contents</code></td>
<td>The variable into which the file contents is read.</td>
</tr>
<tr>
<td><code>destination_file_name</code></td>
<td>The file to which the file contents is written.</td>
</tr>
<tr>
<td><code>destination_directory_object</code></td>
<td>The directory object that specifies the path to the destination file, when <code>destination_file_name</code> is used. The caller must have the necessary privileges on the directory object.</td>
</tr>
<tr>
<td><code>destination_permissions</code></td>
<td>Reserved for future use</td>
</tr>
</tbody>
</table>

### Usage Notes

The caller must have the `CREATE EXTERNAL JOB` system privilege and have `EXECUTE` privileges on the credential.
GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (  
  attribute IN VARCHAR2,  
  value OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>The name of the attribute</td>
</tr>
<tr>
<td>value</td>
<td>The existing value of the attribute</td>
</tr>
</tbody>
</table>

Usage Notes

To run GET_SCHEDULER_ATTRIBUTE, you must have the MANAGE_SCHEDULER privilege.

Table 140–64 lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see Table 140–94 on page 140-149 and the section "Configuring the Scheduler" in Oracle Database Administrator’s Guide.

<table>
<thead>
<tr>
<th>Scheduler Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current_open_window</td>
<td>Name of the currently open window</td>
</tr>
<tr>
<td>default_timezone</td>
<td>Default time zone used by the Scheduler for repeat intervals and windows</td>
</tr>
<tr>
<td>email_sender</td>
<td>The default e-mail address of the sender for job state e-mail notifications</td>
</tr>
<tr>
<td>email_server</td>
<td>The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL.</td>
</tr>
<tr>
<td>event_expiry_time</td>
<td>Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be NULL.</td>
</tr>
<tr>
<td>log_history</td>
<td>Retention period in days for job and window logs. The range of valid values is 0 through 1000000.</td>
</tr>
<tr>
<td>max_job_slave_processes</td>
<td>This Scheduler attribute is not used.</td>
</tr>
</tbody>
</table>
OPEN_WINDOW Procedure

This procedure manually opens a window, unrelated to its schedule. The window opens and the resource plan associated with it takes effect immediately, for the duration specified or for the normal duration of the window, if no duration is given. Only an enabled window can be manually opened.

Syntax

```sql
DBMS_SCHEDULER.OPEN_WINDOW (  
    window_name             IN VARCHAR2,  
    duration                IN INTERVAL DAY TO SECOND,  
    force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>The name of the window</td>
</tr>
<tr>
<td>duration</td>
<td>The duration of the window. It is of type interval day to second. If it is NULL, then the window opens for the regular duration as specified in the window metadata.</td>
</tr>
<tr>
<td>force</td>
<td>If <code>force</code> is set to FALSE, then opening an already open window generates an error. If <code>force</code> is set to TRUE:</td>
</tr>
<tr>
<td></td>
<td>You can open a window that is already open. The window stays open for the duration specified in the call, from the time the OPEN_WINDOW command was issued.</td>
</tr>
<tr>
<td></td>
<td>For example: window1 was created with a duration of four hours. It has how been open for two hours. If, at this point, you reopen window1 using the OPEN_WINDOW call and do not specify a duration, then window1 stays open for four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes.</td>
</tr>
<tr>
<td></td>
<td>The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.</td>
</tr>
</tbody>
</table>

Usage Notes

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated and is determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If there are jobs running when the window opens, the resources allocated to them might change if there is a switch in resource plan.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the `ALTER SYSTEM` statement with the `force` option), the failure to switch resource plans is recorded in the window log.
Opening a window requires the MANAGE SCHEDULER privilege.
**PURGE_LOG Procedure**

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The PURGE_LOG procedure is used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

**Syntax**

```sql
DBMS_SCHEDULER.PURGE_LOG (
  log_history IN PLS_INTEGER DEFAULT 0,
  which_log   IN VARCHAR2   DEFAULT 'JOB_AND_WINDOW_LOG',
  job_name    IN VARCHAR2   DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_history</td>
<td>This specifies how much history (in days) to keep. The valid range is 0 - 1000000. If set to 0, no history is kept.</td>
</tr>
<tr>
<td>which_log</td>
<td>This specifies the log type. Valid values are: job_log, window_log, and job_and_window_log.</td>
</tr>
<tr>
<td>job_name</td>
<td>This specifies which job-specific entries must be purged from the job log. This can be a comma-delimited list of job names and job classes. Whenever job_name has a value other than NULL, the which_log argument implicitly includes the job log.</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure requires the `MANAGE_SCHEDULER` privilege.

**Examples**

The following completely purges all rows from both the job log and the window log:

```sql
DBMS_SCHEDULER.PURGE_LOG();
```

The following purges all rows from the window log that are older than 5 days:

```sql
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following purges all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in `jobclass1` and older than 1 day:

```sql
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```
PUT_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer. It differs from the equivalent UTL_FILE procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

Syntax

```sql
DBMS_SCHEDULER.PUT_FILE (  
    destination_file        IN VARCHAR2,  
    destination_host        IN VARCHAR2,  
    credential_name         IN VARCHAR2,  
    file_contents           IN {BLOB|CLOB},  
    destination_permissions IN VARCHAR2 DEFAULT NULL);  
DBMS_SCHEDULER.PUT_FILE (  
    destination_file        IN VARCHAR2,  
    destination_host        IN VARCHAR2,  
    credential_name         IN VARCHAR2,  
    source_file_name        IN VARCHAR2,  
    source_directory_object IN VARCHAR2,  
    destination_permissions IN VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_file</td>
<td>Fully qualified path name of the file to save to the operating system file system. The file name is case-sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.</td>
</tr>
<tr>
<td>destination_host</td>
<td>If NULL or set to 'localhost', the file is saved to the file system of the local computer. To save to a remote host, this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views <code>*_SCHEDULER_EXTERNAL_DESTS</code>.)</td>
</tr>
<tr>
<td>credential_name</td>
<td>The name of the credential to use for accessing the destination file system.</td>
</tr>
<tr>
<td>file_contents</td>
<td>The variable from which the file contents is read.</td>
</tr>
<tr>
<td>source_file_name</td>
<td>The file from which the file contents is written.</td>
</tr>
<tr>
<td>source_directory_object</td>
<td>The directory object that specifies the path to the source file, when <code>source_file_name</code> is used. The caller must have the necessary privileges on the directory object.</td>
</tr>
<tr>
<td>destination_permissions</td>
<td>Reserved for future use</td>
</tr>
</tbody>
</table>

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.
REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER$EVENT_QUEUE.

Syntax

DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (subscriber_name IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_name</td>
<td>Name of the Oracle Streams Advanced Queuing (AQ) agent to remove the subscription from. If NULL, the user name of the calling user is used.</td>
</tr>
</tbody>
</table>

Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.
REMOVE_GROUP_MEMBER Procedure

This procedure removes one or more members from an existing group.

Syntax

```
DBMS_SCHEDULER.REMOVE_GROUP_MEMBER (  
    group_name              IN VARCHAR2,  
    member                  IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>The name of the group.</td>
</tr>
<tr>
<td>member_name</td>
<td>The name of the member to remove from group. Comma-separated list of members to remove. An error is returned if any of the members is not part of the group. A group of the same type can be named as a member. The Scheduler immediately expands the included group name into its list of members. If the member is a destination, any job instances that run on this destination are removed from the *_SCHEDULER_JOBDESTS views.</td>
</tr>
</tbody>
</table>

Usage Notes

The following users may remove members from a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to remove a member from a group of type WINDOW.

See Also: "CREATE_GROUP Procedure" on page 140-53
REMOVE_JOB_EMAIL_NOTIFICATION Procedure

This procedure removes e-mail notifications for a job. You can remove all e-mail notifications or remove notifications only for specified recipients or specified events.

Syntax

```
DBMS_SCHEDULER.REMOVE_JOB_EMAIL_NOTIFICATION (
    job_name             IN VARCHAR2,
    recipients           IN VARCHAR2 DEFAULT NULL,
    events               IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Name of the job to remove e-mail notifications for. Cannot be NULL.</td>
</tr>
<tr>
<td>recipients</td>
<td>E-mail address to remove e-mail notification for. Comma-separated list of e-mail addresses.</td>
</tr>
<tr>
<td>events</td>
<td>Job state event to remove e-mail notification for. Comma-separated list of job state events.</td>
</tr>
</tbody>
</table>

Usage Notes

When you specify multiple recipients and multiple events, the notification for each specified event is removed for each specified recipient. The procedure ignores any recipients or events that are specified but that were not previously added.

If recipients is NULL, e-mail notifications for the specified events are removed for all existing recipients. If events is NULL, notifications for all events are removed for the specified recipients. If both recipients and events are NULL, all e-mail notifications are removed for the job.

For example, if recipients is 'jsmith@example.com,rjones@example.com' and events is 'JOB_FAILED,JOB_BROKEN', then notifications for both the JOB_FAILED and JOB_BROKEN events are removed for jsmith and rjones. If recipients is NULL, then notifications for both the JOB_FAILED and JOB_BROKEN events are removed for jsmith, rjones, and any other previously defined recipients for these events.

To call this procedure, you must be the job owner or a user with the CREATE ANY JOB system privilege or ALTER object privilege on the job.

See Also: "ADD_JOB_EMAIL_NOTIFICATION Procedure" on page 140-36
RESET_JOB_ARGUMENT_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job. RESET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```sql
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
    job_name                IN VARCHAR2,
    argument_position       IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```sql
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
    job_name                IN VARCHAR2,
    argument_name           IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job being altered</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the program argument being reset</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the program argument being reset</td>
</tr>
</tbody>
</table>

Usage Notes

If the corresponding program argument has no default value, the job is disabled.

Resetting a program argument of a job belonging to another user requires ALTER privileges on that job. Arguments can be specified by position or by name.

RESET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also reset a job argument value if you have the CREATE ANY JOB privilege.

RESET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.
RUN_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given. If no job_name is given, one is generated of the form RUN_CHAIN$chainnameN, where chainname is the first 8 characters of the chain name and N is an integer. If a list of start steps is given, only those steps are started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run). If start_steps is NULL, then the chain starts normally—that is, it performs an initial evaluation to see which steps to start running.

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

Syntax

Runs a chain, with a list of start steps.

DBMS_SCHEDULER.RUN_CHAIN (  
  chain_name  IN VARCHAR2,  
  start_steps IN VARCHAR2,  
  job_name    IN VARCHAR2 DEFAULT NULL);

Runs a chain, with a list of initial step states.

DBMS_SCHEDULER.RUN_CHAIN (  
  chain_name  IN VARCHAR2,  
  step_state_list IN SYS.SCHEDULER$STEP_TYPE_LIST,  
  job_name    IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to run</td>
</tr>
<tr>
<td>job_name</td>
<td>The name of the job to create to run the chain</td>
</tr>
<tr>
<td>start_steps</td>
<td>Comma-separated list of the steps to start when the chain starts running</td>
</tr>
</tbody>
</table>
| step_state_list | List of chain steps with an initial state (SUCCEEDED or FAILED) to set for each.  
|               | Set the attributes of sys.scheduler$step_type as follows:  
|               | step_name The name of the step  
|               | step_type 'SUCCEEDED' or 'FAILED'  
|               | error_number where error_number is a positive or negative integer.  |

Usage Notes

Running a chain requires CREATE JOB if the job is being created in the user’s schema, or CREATE ANY JOB otherwise. In addition, the owner of the job being created needs execute privileges on the chain (as the owner of the chain, or as a user with the EXECUTE privilege on the chain or the EXECUTE ANY PROGRAM system privilege).
Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```
declare
    initial_step_states sys.scheduler$_step_type_list;
begin
    initial_step_states := sys.scheduler$_step_type_list(
        sys.scheduler$_step_type('step1', 'SUCCEEDED'),
        sys.scheduler$_step_type('step2', 'FAILED 27486'),
        sys.scheduler$_step_type('step3', 'SUCCEEDED'),
        sys.scheduler$_step_type('step5', 'SUCCEEDED'));
    dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
```
This procedure runs a job immediately.

If a job is enabled, the Scheduler runs it automatically. It is not necessary to call **RUN_JOB** to run a job according to its schedule. Use **RUN_JOB** to run a job outside of its normal schedule.

### Syntax

```sql
DBMS_SCHEDULER.RUN_JOB (  
  job_name                IN VARCHAR2,  
  use_current_session     IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 140-73 RUN_JOB Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>job_name</code></td>
<td>A job name or a comma-separate list of entries, where each is the name of an existing job, optionally preceded by a schema name and dot separator.</td>
</tr>
<tr>
<td></td>
<td>If you specify a multiple-destination job, the job runs on all destinations. In this case, the <code>use_current_session</code> argument must be <code>FALSE</code>.</td>
</tr>
<tr>
<td><code>use_current_session</code></td>
<td>This specifies whether or not the job run should occur in the same session that the procedure was invoked from.</td>
</tr>
<tr>
<td></td>
<td>The job always runs as the job owner, in the job owner's schema, unless it has credential specified, then the job runs using the user named in the credential.</td>
</tr>
</tbody>
</table>
|              | When `use_current_session` is set to `TRUE`:
|              | - You can test a job and see any possible errors on the command line.  |
|              | - `state`, `run_count`, `last_start_date`, `last_run_duration`, and `failure_count` of `_scheduler_jobs` are not updated.  |
|              | - **RUN_JOB** can be run in parallel with a regularly scheduled job run.  |
|              | When `use_current_session` is set to `FALSE`:
|              | - You need to check the job log to find error information.  |
|              | - All relevant fields in `_scheduler_jobs` are updated.  |
|              | - **RUN_JOB** fails if a regularly scheduled job is running.  |
|              | For jobs that have a specified destination or destination group, or point to chains or programs with the detached attribute set to `TRUE`, `use_current_session` must be `FALSE`.  |

### Usage Notes

Jobs do not have to be enabled. If a job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has **EXECUTE** privileges on the job class.
- If a program or chain is referenced, the program/chain exists.
If a program or chain is referenced, the job owner has privileges to execute the program/chain.

All argument values have been set (or have defaults).

The job owner has the CREATE EXTERNAL JOB privilege if this is an external job.

A TRUE value for use_current_session is not permitted for the following types of jobs:

- Jobs that specify a destination or destination group in the destination_name attribute
- Jobs that point to chains (chain jobs)
- Jobs that make use of detached programs (detached jobs).

When use_current_session is TRUE, the call to RUN_JOB blocks until the job completes. Any errors that occur during the execution of the job are returned as errors to the RUN_JOB procedure.

Using RUN_JOB with use_current_session=TRUE does not update the job state and the job will not appear in *_SCHEDULER_RUNNING_JOBS views.

When use_current_session is FALSE, RUN_JOB returns immediately and the job is picked up by the job coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use RUN_JOB in their sessions simultaneously when use_current_session is set to TRUE.

RUN_JOB requires that you own the job or have ALTER privileges on that job. You can also run a job if you have the CREATE ANY JOB privilege.

Example

The following is an example of using RUN_JOB.

```
BEGIN
  DBMS_SCHEDULER.RUN_JOB(
    JOB_NAME => 'EODJOB, DSS.ETLJOB',
    USE_CURRENT_SESSION => FALSE);
END;
```
SET_AGENT_REGISTRATION_PASS Procedure

This procedure sets the agent registration password for a database. A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (  
  registration_password   IN VARCHAR2,  
  expiration_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
  max_uses                IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>registration_password</td>
<td>This is the password that remote agents must specify in order to successfully register with the database. If this is NULL, then no agents will be able to register with the database.</td>
</tr>
<tr>
<td>expiration_date</td>
<td>If this is set to a non-NULL value, then the registration_password is not valid after this date. After this date, no agents can register with the database. This cannot be set to a date in the past.</td>
</tr>
<tr>
<td>max_uses</td>
<td>This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents can register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations.</td>
</tr>
</tbody>
</table>

Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the MANAGE SCHEDULER system privilege.

By default, max_uses is set to NULL, which means that there is no limit to the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to NULL if no new agents are being registered.
SET_ATTRIBUTE Procedure

This procedure modifies an attribute of a Scheduler object. It is overloaded to accept values of various types. To set an attribute to NULL, use the SET_ATTRIBUTE_NULL procedure. The attributes that can be set depend on the object being altered. All object attributes can be changed, except the object name.

Syntax

```sql
DBMS_SCHEDULER.SET_ATTRIBUTE (    
  name           IN VARCHAR2,    
  attribute      IN VARCHAR2,    
  value          IN {BOOLEAN|DATE|TIMESTAMP|TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|INTERVAL DAY TO SECOND});
```

```sql
DBMS_SCHEDULER.SET_ATTRIBUTE (    
  name           IN VARCHAR2,    
  attribute      IN VARCHAR2,    
  value          IN VARCHAR2,    
  value2         IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>attribute</td>
<td>See Table 140–77 through Table 140–87.</td>
</tr>
<tr>
<td>value</td>
<td>The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure.</td>
</tr>
<tr>
<td>value2</td>
<td>The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.</td>
</tr>
</tbody>
</table>

Table 140–76 is a directory of Scheduler object types and tables of attributes for the object types.

These object types can be viewed with Scheduler Data Dictionary Views, listed in Oracle Database Administrator’s Guide.

Table 140–76  Attribute Tables for Scheduler Object Types

<table>
<thead>
<tr>
<th>Scheduler Object Type</th>

### Usage Notes

If an object is altered and it was in the enabled state, the Scheduler first disables it, then makes the change and reenables it. If any errors are encountered during the enable process, the object is not reenabled and an error is generated.

If an object is altered and it was in the disabled state, it remains disabled after it is altered.

To run `SET_ATTRIBUTE` for a window, a group of type `WINDOW`, or job class, you must have the `MANAGE_SCHEDULER` privilege. Otherwise, you must be the owner of the object being altered or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

#### Job

If there is a running instance of the job when the `SET_ATTRIBUTE` call is made, it is not affected by the call. The change is only affects future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run is scheduled using the new schedule attributes. Schedule attributes of a job include `schedule_name`, `start_date`, `end_date`, and `repeat_interval`.

If any of the program attributes of a job are altered while the job is running, the new program attributes take effect the next time the job runs. Program attributes of a job include `program_name`, `job_action`, `job_type`, and `number_of_arguments`.

If any job argument values are altered while the job is running, the new values take effect the next time the job runs.

Granting the `ALTER` privilege on a job lets a user alter all attributes of that job except its program attributes (`program_name`, `job_type`, `job_action`, `program_action`, and `number_of_arguments`) and does not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column `SYSTEM` set to `TRUE` in job views.

#### Program

If any currently running jobs use the program that was altered, they continue to run with the program definition prior to the alter. The job runs with the new program definition the next time the job executes.

#### Schedule

If a schedule is altered, the change does not affect running jobs and open windows that use this schedule. The change only goes into effect the next time the jobs runs or the window opens.
Summary of DBMS_SCHEDULER Subprograms

**File Watcher**
If a file watcher is altered, any currently running event-based jobs started by the file arrival event are not affected. On the local system, the new file watcher attributes take effect the next time that the file watcher checks for the arrival of the file (every ten minutes by default). On remote systems, there may be an additional delay before the new file watcher attributes take effect.

**Job Class**
With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the `MANAGE_SCHEDULER` privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet.

**Window**
When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan, when a window with a designated resource plan opens, the Resource Manager activates with that plan.

**Job Attribute Values**
Table 140–77 lists attribute values for jobs.

*Note:* See the `CREATE_JOB` procedure and the `CREATE_JOBS` procedure for more complete descriptions of the attributes in this table.

**Table 140–77 Job Attribute Values**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow_runs_in_restricted_mode</td>
<td>If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode. FALSE by default.</td>
</tr>
</tbody>
</table>
| auto_drop                 | This attribute, if TRUE, causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if:  
  - Its end date (or the end date of the schedule) has passed.  
  - It has run `max_runs` number of times. `max_runs` must be set with `SET_ATTRIBUTE`.  
  - It is not a repeating job and has run once.  
  A job is automatically disabled when it has failed `max_failures` times. `max_failures` is also set with `SET_ATTRIBUTE`.  
  If this attribute is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the `DROP_JOB` procedure.  
  By default, jobs are created with `auto_drop` set to TRUE. |
| comments                  | An optional comment.                                                                           |
| connect_credential_name   | This attribute may be set to point to a database credential. For a SQL*Plus or backup script job, the credential connects to the database before running the script. For other job types, it is ignored. The job owner must have execute privileges on the credential, otherwise the job fails.  
  Using a `connect_credential_name` is recommended since it allows the password to be stored securely in a credential in the database rather than in plain view in the job, program action, or script. |
### Table 140–77  (Cont.) Job Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>This attribute specifies the name of the credential object (credential) to use for a remote database job, a remote external job, a local external job, or an event-based job that processes a file arrival event. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See Oracle Database Administrator’s Guide for information about preferred credentials for local external jobs. See also: &quot;CREATE_CREDENTIAL Procedure&quot; on page 39-7</td>
</tr>
<tr>
<td>database_role</td>
<td>This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby. Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a database_role of 'PRIMARY', and the other with a database_role of 'LOGICAL STANDBY'.</td>
</tr>
<tr>
<td>destination</td>
<td>*** Deprecated in Oracle Database 11g Release 2. Use destination_name instead. This attribute specifies a host on which to run a remote external job. It must be set to the host name or IP address of the destination host. It can optionally be followed by a port number, in the following format: hostname:port</td>
</tr>
<tr>
<td>destination_name</td>
<td>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. For jobs running on the local database or for local external jobs (executables), must be NULL. See Table 140–26 on page 140-57 for details about this attribute.</td>
</tr>
<tr>
<td>end_date</td>
<td>Specifies the date and time after which the job expires and is no longer run. After the end_date, if is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED. If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached. The value for end_date must be after the value for start_date. If it is not, an error is generated when the job is enabled.</td>
</tr>
</tbody>
</table>
| event_spec       | This attribute takes two values: the value argument specifies the event condition and the value2 argument specifies the queue specification. For more details, see the descriptions for the event_condition and queue_spec arguments in the "CREATE_JOB Procedure" on page 140-55.
follow_default_timezone
If TRUE and if the job start_date is null, then when the default_timezone
scheduler attribute is changed, the Scheduler recomputes the next run
date and time for this job so that it is in accordance with the new time
zone.

For example, if the job was set to run at 02:00 in the previous time zone, it
will run at 02:00 in the new time zone.

If the job start_date is not null, then the time zone for the run date and
time for the job is always specified by the time zone of the start_date.

If FALSE, the next start date and time for the job is not recomputed when
the default_timezone scheduler attribute is changed. In this case, if the
old time zone is three hours earlier than the new time zone, then a job
scheduled to run at 02:00 in the old time zone runs at 05:00 in the new
time zone.

Summer and winter transitions do not change the default time zone name.

instance_id
Valid only in an Oracle Real Application Clusters environment. Indicates
the instance on which the job is to be run.

instance_stickiness
This attribute should only be used for a database running in an Oracle
Real Application Clusters (Oracle RAC) environment. By default, it is set
to TRUE. If you set instance_stickiness to TRUE, jobs start running on the
instance with the lightest load and the Scheduler thereafter attempts to
run on the instance that it last ran on. If that instance is either down or so
overloaded that it does not start new jobs for a significant period of time,
another instance runs the job. If the interval between runs is large,
instance_stickiness is ignored and the job is handled as if it were a
non-sticky job.

If instance_stickiness is set to FALSE, each instance of the job runs on
the first instance available.

For environments other than Oracle RAC, this attribute is not useful
because there is only one instance.

job_action
The action that the job performs, depending on the job_type attribute. For
example, if job_type is 'STORED_PROCEDURE', job_action contains the
name of the stored procedure.

job_class
The class this job is associated with.

job_priority
This attribute specifies the priority of this job relative to other jobs in the
same class as this job. If multiple jobs within a class are scheduled to be
executed at the same time, the job priority determines the order in which
jobs from that class are picked up for execution by the job coordinator. It
can be a value from 1 through 5, with 1 being the first to be picked up for
job execution.

If no job priority is specified when creating a job, the default priority of 3
is assigned to it.

job_type
The type of this job. Valid values are: 'PLSQL_BLOCK', 'STORED_PROCEDURE',
'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT'.

If this is set, program_name must be NULL.

job_weight
*** Deprecated in Oracle Database 11gR2. Do not change the value of this
attribute from the default, which is 1.
Weight of the job for parallel execution.

Table 140–77  (Cont.) Job Attribute Values

<table>

<tr>
<td>job_weight</td>
<td>*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1. Weight of the job for parallel execution.</td>
</tr>
</tbody>
</table>
logging_level

This attribute specifies how much information is logged. The possible options are:

- DBMS_SCHEDULER.LOGGING_OFF
  (The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur.

- DBMS_SCHEDULER.LOGGING_FAILED_RUNS
  The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence.

- DBMS_SCHEDULER.LOGGING_RUNS
  The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence.

- DBMS_SCHEDULER.LOGGING_FULL
  In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with SET_ATTRIBUTE), stop, and so on.

max_failures

This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its STATE is set to BROKEN in the *_SCHEDULER_JOB views.

max_failures can be an integer between 1 to 1,000,000. By default, it is set to NULL, which indicates that new instances of the job are started regardless of how many previous instances have failed.

max_run_duration

This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is INTERVAL DAY TO SECOND. If this attribute is set to a non-zero and non-NULL value, and job duration exceeds this value, the Scheduler raises an event of type JOB_OVER_MAX_DUR. It is then up to your event handler to decide whether or not to allow the job to continue.

max_runs

This attribute specifies the maximum number of consecutive scheduled runs of the job. Once max_runs is reached, the job is disabled and its state is changed to COMPLETED.

max_runs can be an integer between 1 and 1,000,000. By default, it is set to NULL, which means that it repeats forever or until end_date or max_failures is reached.

number_of_arguments

The number of arguments if the program is inlined. If this is set, program_name should be NULL.
**parallel_instances**

This is a boolean attribute that can be set only for event-based jobs.

If **FALSE** (the default), then if an event is raised and the event-based job that processes that event is already running, the new event is ignored.

If **TRUE**, then an instance of the job is started for every instance of the event, and each job instance is a lightweight job so multiple instances of the same event-based job can run in parallel. Each lightweight job takes its attributes (such as action, maximum run duration, and so on) from the definition of the event-based job (its *parent job*). After the lightweight job completes, it is dropped. There is no explicit limit to the number of lightweight jobs that can run simultaneously to process multiple instances of the event. However, limitations may be imposed by available system resources.

The lightweight jobs are not visible in any of the *_SCHEDULER_JOBS* views. However, they are visible in the *_SCHEDULER_RUNNING_JOBS* views. The name of each lightweight job is the same as that of the parent job, and a subname is automatically generated to distinguish each lightweight job from its parent and from its siblings.

**program_name**

The name of a program object to use with this job. If this is set, *job_action*, *job_type*, and *number_of_arguments* should be **NULL**.

**raise_events**

This attribute tells the Scheduler at what stages of the job execution to raise events. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it.

- **job_started** CONSTANT PLS_INTEGER := 1
- **job_succeeded** CONSTANT PLS_INTEGER := 2
- **job_failed** CONSTANT PLS_INTEGER := 4
- **job_broken** CONSTANT PLS_INTEGER := 8
- **job_completed** CONSTANT PLS_INTEGER := 16
- **job_stopped** CONSTANT PLS_INTEGER := 32
- **job_sch_lim_reached** CONSTANT PLS_INTEGER := 64
- **job_disabled** CONSTANT PLS_INTEGER := 128
- **job_chain_stalled** CONSTANT PLS_INTEGER := 256
- **job_all_events** CONSTANT PLS_INTEGER := 511
- **job_run_completed** CONSTANT PLS_INTEGER := job_succeeded + job_failed + job_stopped

Table 140–78 describes these event types in detail.

**repeat_interval**

Either a PL/SQL function returning the next date and time on which to run, or calendaring syntax expression. If this is set, *schedule_name* should be **NULL**. See “Calendaring Syntax” on page 140-6 for more information.
This attribute specifies whether or not a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to FALSE. Setting this to TRUE means that if a job fails while running, it is restarted from the beginning point of the job.

In the case of a chain job, if this attribute is TRUE, the chain is restarted from the beginning after an application failure. If this attribute is FALSE, or if there has been a database failure, the chain is restarted at the last running step. The restart_on_recovery attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.)

Note that setting this attribute to TRUE might lead to data inconsistencies in some situations, for example, if data is committed within a job.

Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries.

The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler retries the job a maximum of six times. The first time, it waits for one second and multiplies this wait time with a factor of 10 each time thereafter.

Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1.

The Scheduler stops retrying a job when:
- One of the retries succeeds.
- All of its six retries have failed.
- The next retry would occur after the next regularly scheduled run of the job.

The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.

In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m.

If schedule_limit is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log reflects the skipped run.

The name of a schedule, window, or group of type WINDOW to use as the schedule for this job. If this is set, end_date, start_date and repeat_interval should all be NULL.

The original date and time on which this job started or is scheduled to start. If this is set, schedule_name should be NULL.

<table>

<tr>
<td>log_history</td>
<td>This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately.</td>
</tr>
<tr>
<td></td>
<td>The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).</td>
</tr>
<tr>
<td>logging_level</td>
<td>This attribute specifies how much information is logged. The valid values are:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_SCHEDULER.LOGGING_OFF</td>
</tr>
<tr>
<td></td>
<td>No logging is performed for any jobs in this class.</td>
</tr>
<tr>
<td></td>
<td>- DBMS_SCHEDULER.LOGGING_FAILED_RUNS</td>
</tr>
<tr>
<td></td>
<td>The Scheduler logs only jobs in the class that failed, with the reason for failure.</td>
</tr>
<tr>
<td></td>
<td>- DBMS_SCHEDULER.LOGGING_RUNS</td>
</tr>
<tr>
<td></td>
<td>The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default.</td>
</tr>
<tr>
<td></td>
<td>- DBMS_SCHEDULER.LOGGING_FULL</td>
</tr>
<tr>
<td></td>
<td>The Scheduler records all operations performed on all jobs in this class, in addition to recording every run of a job. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so on, an entry is recorded in the log.</td>
</tr>
<tr>
<td>resource_consumer_group</td>
<td>The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See Oracle Database Administrator’s Guide for a description of resource consumer groups and the Database Resource Manager.</td>
</tr>
</tbody>
</table>
### Window Attribute Values

**Table 140–83** lists window attribute values.

**Note:** See the "CREATE_WINDOW Procedure" on page 140-72 for more complete descriptions of the attributes in this table.

#### Table 140–83  Window Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>An optional comment about the window.</td>
</tr>
<tr>
<td>duration</td>
<td>The duration of the window.</td>
</tr>
<tr>
<td>end_date</td>
<td>The date after which the window no longer opens. If this is set, schedule_name must be NULL.</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>An attribute specifying how often the schedule should repeat, using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, schedule_name must be NULL. See &quot;Calendaring Syntax&quot; on page 140-6 for more information.</td>
</tr>
<tr>
<td>resource_plan</td>
<td>The resource plan to be associated with a window. When the window opens, the system switches to this resource plan. When the window closes, the original resource plan is restored. If a resource plan has been made active with the force option, no resource plan switch occurs. Only one resource plan can be associated with a window. It may be NULL or the empty string (&quot;&quot;). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</td>
</tr>
<tr>
<td>schedule_name</td>
<td>The name of a schedule to use with this window. If this is set, start_date, end_date, and repeat_interval must all be NULL.</td>
</tr>
<tr>
<td>start_date</td>
<td>The next date and time on which this window is scheduled to open. If this is set, schedule_name must be NULL.</td>
</tr>
<tr>
<td>window_priority</td>
<td>The priority of the window. Must be either 'LOW' (default) or 'HIGH'.</td>
</tr>
</tbody>
</table>

### Chain Attribute Values

**Table 140–84** lists chain attribute values.

**Note:** See the "CREATE_CHAIN Procedure" on page 140-45 for more complete descriptions of the attributes in this table.

#### Table 140–84  Chain Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>An optional comment describing the purpose of the chain.</td>
</tr>
</tbody>
</table>
Summary of DBMS_SCHEDULER Subprograms

**Table 140–85** Database Destination Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>The name of the external destination (also known as agent destination) that is used to connect to the remote database. You can obtain valid external destination names from the view ALL_SCHEDULER_EXTERNAL_DESTS.</td>
</tr>
<tr>
<td>connect_info</td>
<td>The TNS connect descriptor that identifies the remote database to connect to, or the net service name (alias) in tnsnames.ora that resolves to the connect descriptor. Note: This corresponds to the tns_name argument of CREATE_DATABASE_DESTINATION.</td>
</tr>
<tr>
<td>enabled</td>
<td>If TRUE, the database destination is enabled.</td>
</tr>
<tr>
<td>comments</td>
<td>An optional comment about the database destination.</td>
</tr>
</tbody>
</table>

**External Destination Attribute Values**

**Table 140–86** lists external destination attribute values.

**Note:** External destinations are created only implicitly by registering a remote Scheduler agent with the local database.
**Table 140–86  External Destination Attribute Values**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>(GET_ATTRIBUTE only) The fully qualified host name (including domain) or IP address of the computer on which the Scheduler agent resides.</td>
</tr>
<tr>
<td>port</td>
<td>(GET_ATTRIBUTE only) The TCP port number on which the agent listens.</td>
</tr>
<tr>
<td>ip_address</td>
<td>(GET_ATTRIBUTE only) The IP address of the host on which the agent resides.</td>
</tr>
<tr>
<td>enabled</td>
<td>If TRUE, the external destination is enabled.</td>
</tr>
<tr>
<td>comments</td>
<td>An optional comment about the external destination.</td>
</tr>
</tbody>
</table>

**Group Attribute Values**

*Table 140–87* lists group attribute values.

**Note:** See the "CREATE_GROUP Procedure" on page 140-53 for more complete descriptions of the attributes in this table.

**Table 140–87  Group Attribute Values**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_type</td>
<td>(GET_ATTRIBUTE only) The group type (either WINDOW, DB_DEST, or EXTERNAL_DEST).</td>
</tr>
<tr>
<td>member_name</td>
<td>Comma-separated list of members. Replaces the existing list of members. To add one or more members to the existing list, use ADD_GROUP_MEMBER. Note: this attribute corresponds to the member argument of CREATE_GROUP.</td>
</tr>
<tr>
<td>enabled</td>
<td>If TRUE, the group is enabled.</td>
</tr>
<tr>
<td>comments</td>
<td>An optional comment about the group.</td>
</tr>
<tr>
<td>number_of_members</td>
<td>(GET_ATTRIBUTE only) The number of members in the group.</td>
</tr>
</tbody>
</table>

**Credential Attribute Values**

*Table 140–88* lists credential attribute values.

**Note:** Credential attribute values for the SET_ATTRIBUTE and GET_ATTRIBUTE procedures are deprecated with Oracle Database Release 12c Release 1 (12.1). While these attribute values remain available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the DBMS_CREDENTIAL package, specifically the attribute parameter in the UPDATE_CREDENTIAL Procedure.

**Table 140–88  Credential Attribute Values**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>The user name for logging into the host operating system or remote Oracle database. Maximum length is 64.</td>
</tr>
</tbody>
</table>
### Table 140–88 (Cont.) Credential Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>password</td>
<td>The password for the user name. Maximum length is 128.</td>
</tr>
<tr>
<td>comments</td>
<td>A description of the credential. Maximum length is 240.</td>
</tr>
<tr>
<td>windows_domain</td>
<td>For a Windows remote executable target, this is the domain that the specified user belongs to. Maximum length is 64.</td>
</tr>
<tr>
<td>database_role</td>
<td>The value of the database_role attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: SYSDBA and SYSOPER.</td>
</tr>
</tbody>
</table>
SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of an object to NULL. The attributes that can be set depend on the object being altered. If the object is enabled, it is disabled before being altered and reenabled afterward. If the object cannot be reenabled, an error is generated and the object is left in a disabled state.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
    name  IN VARCHAR2,
    attribute  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object</td>
</tr>
<tr>
<td>attribute</td>
<td>The attribute being changed</td>
</tr>
</tbody>
</table>

Usage Notes

To run SET_ATTRIBUTE_NULL for a window, group of type WINDOW, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.
SET_JOB_ANYDATA_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an AnyData object. It overrides any default value set for the program argument. NULL is a valid assignment for a program argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the DEFINE_ANYDATA_ARGUMENT Procedure

Scheduler does no type checking of the argument at any time.

SET_JOB_ANYDATA_VALUE is overloaded.

Syntax

Sets a program argument by its position.

```sql
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (  
    job_name                IN VARCHAR2,  
    argument_position       IN PLS_INTEGER,  
    argument_value          IN SYS.ANYDATA);  
```

Sets a program argument by its name.

```sql
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (  
    job_name                IN VARCHAR2,  
    argument_name           IN VARCHAR2,  
    argument_value          IN SYS.ANYDATA);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job to be altered</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the program argument being set</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the program argument being set</td>
</tr>
<tr>
<td>argument_value</td>
<td>The new value to be assigned to the program argument, encapsulated in an AnyData object</td>
</tr>
</tbody>
</table>

Usage Notes

SET_JOB_ANYDATA_VALUE requires that you own the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ANYDATA_VALUE does not apply to lightweight jobs because lightweight jobs cannot take AnyData arguments.

See Also:

- "SET_JOB_ARGUMENT_VALUE Procedure" on page 140-144
- "DEFINE_ANYDATA_ARGUMENT Procedure" on page 140-74
SET_JOB_ARGUMENT_VALUE Procedure

This procedure sets the value of an argument for a job.

It overrides any default value set for the corresponding program or stored procedure argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the DEFINE_PROGRAM_ARGUMENT Procedure or the DEFINE_METADATA_ARGUMENT Procedure

Scheduler does no type checking of the argument at any time.

SET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Sets an argument value by position:

```sql
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
    job_name                IN VARCHAR2,
    argument_position       IN PLS_INTEGER,
    argument_value          IN VARCHAR2);
```

Sets an argument value by name:

```sql
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
    job_name                IN VARCHAR2,
    argument_name           IN VARCHAR2,
    argument_value          IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job to be altered</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the program argument being set</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the program argument being set</td>
</tr>
<tr>
<td>argument_value</td>
<td>The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_VALUE procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

SET_JOB_ARGUMENT_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.
See Also:

- "SET_JOB_ANYDATA_VALUE Procedure" on page 140-143
- "DEFINE_PROGRAM_ARGUMENT Procedure" on page 140-82
SET_JOB_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

Syntax

DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (  
jobattr_array IN JOBATTR_ARRAY,  
commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');

Parameters

Table 140–92  SET_JOB_ATTRIBUTES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jobattr_array</td>
<td>The array of job attribute changes.</td>
</tr>
<tr>
<td>commit_semantics</td>
<td>The commit semantics. The following types are supported:</td>
</tr>
<tr>
<td></td>
<td>■ STOP_ON_FIRST_ERROR returns on the first error and commits previous successful attribute changes to disk. This is the default.</td>
</tr>
<tr>
<td></td>
<td>■ TRANSACTIONAL returns on the first error and rolls back everything that happened before that error.</td>
</tr>
<tr>
<td></td>
<td>■ ABSORB_ERRORS tries to absorb any errors and complete the rest of the job attribute changes on the list. It commits all the successful changes. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.</td>
</tr>
</tbody>
</table>

Usage Notes

Calling SET_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and reenables the job. SET_JOB_ATTRIBUTES changes the attribute values in the context of a single transaction.
**SET_RESOURCE_CONSTRAINT Procedure**

This procedure allows users to specify the resources used by jobs.

**Syntax**

```sql
DBMS_SCHEDULER.SET_RESOURCE_CONSTRAINT (
    object_name       IN VARCHAR2,
    resource_name     IN VARCHAR2,
    units             IN NUMBER DEFAULT 1);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of a program or a job, or a comma separated list of these objects.</td>
</tr>
<tr>
<td>resource_name</td>
<td>The name of the resource.</td>
</tr>
<tr>
<td>units</td>
<td>The number of units of this resource that the job or program uses.</td>
</tr>
</tbody>
</table>

**Usages Notes**

If `units` is set to 0, then the program or job does not use this resource anymore and the resulting constraint is deleted. Setting `units` to 0 on a resource with no previous constraint results in an error.

When multiple constraints are defined on the same resource, the object types must match. When one or more existing constraints for a resource are based on jobs and a new constraint is added for the same resource that is based on a program (or vice versa) an error will be raised.
SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately, depending on the attribute affected.

Table 140–94 provides short attribute descriptions for the SET_SCHEDULER_ATTRIBUTE procedure. For complete descriptions, see section "Setting Scheduler Preferences" in Oracle Database Administrator’s Guide.

Syntax

```sql
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (    attribute IN VARCHAR2,    value IN VARCHAR2);
```
Parameters

Table 140–94  SET_SCHEDULER_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>The name of the Scheduler attribute. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ 'default_timezone': Repeating jobs and windows that use the calendaring syntax retrieve the time zone from this attribute when start_date is not specified. See &quot;Calendaring Syntax&quot; on page 140-6 for more information.</td>
</tr>
<tr>
<td></td>
<td>■ 'email_server': The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL.</td>
</tr>
<tr>
<td></td>
<td>■ 'email_sender': The default e-mail address of the sender of job state e-mail notifications.</td>
</tr>
<tr>
<td></td>
<td>■ 'email_serverCredential': The schema and name of an existing credential object that SYS has execute object privileges on. Default is NULL. The username and password stored in this credential are used to authenticate with the e-mail server when sending e-mail notifications.</td>
</tr>
<tr>
<td></td>
<td>■ 'email_server_encryption': This attribute indicates whether or not encryption is enabled for this email server connection, and if so, at what point encryption starts, and with which protocol. Values are:</td>
</tr>
<tr>
<td></td>
<td>-- NONE: the default, indicating no encryption used</td>
</tr>
<tr>
<td></td>
<td>-- SSL_TLS: indicating that either SSL or TLS are used, from the beginning of the connection</td>
</tr>
<tr>
<td></td>
<td>-- STARTTLS: indicating that the connection starts unencrypted, but the command STARTTLS is sent to the e-mail server and starts encryption</td>
</tr>
<tr>
<td></td>
<td>■ 'event_expiry_time': The time, in seconds, before a job state event generated by the Scheduler expires from the Scheduler event queue. If NULL, job state events expire after 24 hours.</td>
</tr>
<tr>
<td></td>
<td>■ 'log_history': The number of days that log entries for both the job log and the window log are retained. Default is 30 and the range of valid values is 0 through 100000.</td>
</tr>
<tr>
<td></td>
<td>■ 'max_job_slave_processes': This Scheduler attribute is not used.</td>
</tr>
<tr>
<td>value</td>
<td>The new value of the attribute</td>
</tr>
</tbody>
</table>

Usage Notes

To run SET_SCHEDULER_ATTRIBUTE, you must have the MANAGE_SCHEDULER privilege.

See Also: Oracle Database Administrator’s Guide for more detailed descriptions of Scheduler attributes
**STOP_JOB Procedure**

This procedure stops currently running jobs or all jobs in a job class. After stopping the job, the state of a one-time job is set to STOPPED, whereas the state of a repeating job is set to SCHEDULED or COMPLETED, depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all running steps of the running chain are stopped.

If a job has multiple destinations, the database attempts to stop the job at all destinations.

For external jobs, STOP_JOB stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

**Syntax**

```sql
DBMS_SCHEDULER.STOP_JOB (
    job_name         IN VARCHAR2,
    force            IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>job_name</code></td>
<td>Name of a job to stop. Can be a comma-separate list of jobs, where each entry can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Job name: the name of an existing job, optionally preceded by a schema name and dot separator.</td>
</tr>
<tr>
<td></td>
<td>- Job destination ID: a number, obtained from the <code>JOB_DEST_ID</code> column of the <code>*_SCHEDULER_JOB_DESTS</code> views, that represents the unique combination of a job, a credential, and a destination.</td>
</tr>
<tr>
<td></td>
<td>- Job class: the name of a job class. Must be preceded by the <code>SYS</code> schema name and a dot separator.</td>
</tr>
<tr>
<td><code>force</code></td>
<td>If <code>force</code> is set to FALSE, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned.</td>
</tr>
<tr>
<td></td>
<td>If <code>force</code> is set to TRUE, the Scheduler immediately terminates the job slave. Oracle recommends that STOP_JOB with force set to TRUE be used only after a STOP_JOB with force set to FALSE has failed.</td>
</tr>
</tbody>
</table>

Use of the `force` option requires the MANAGE_SCHEDULER system privilege.
STOP_JOB without the force option requires that you be the owner of the job or have ALTER privileges on that job. You can also stop a job if you have the CREATE ANY JOB or MANAGE SCHEDULER privilege.

STOP_JOB with the force option requires that you have the MANAGE SCHEDULER privilege.

Example

The following is an example of using STOP_JOB.

BEGIN
   DBMS_SCHEDULER.STOP_JOB('DSS.ETLJOB, 984, 1223, SYS.ETL_JOBCLASS');
END;

Table 140–95 (Cont.) STOP_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>commit_semantics</td>
<td>The commit semantics. The following two types are supported:</td>
</tr>
<tr>
<td></td>
<td>■ STOP_ON_FIRST_ERROR: The procedure returns on the first error and commits previous successful stop operations to disk. This is the default.</td>
</tr>
<tr>
<td></td>
<td>■ ABSORB_ERRORS: The procedure tries to absorb any errors, stops the rest of the jobs, and commits all the successful stop operations. This type is available only if no job classes are specified in the job_name list. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.</td>
</tr>
</tbody>
</table>
The DBMS_SERVER_ALERT package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- **Using DBMS_SERVER_ALERT**
  - Security Model
  - Object Types
  - Relational Operators
  - Supported Metrics
- **Summary of DBMS_SERVER_ALERT Subprograms**
Using DBMS_SERVER_ALERT

This section contains topics which relate to using the DBMS_SERVER_ALERT package. The following topics define constants used in package procedures.

- Security Model
- Object Types
- Relational Operators
- Supported Metrics
Security Model

The user needs DBA or IMP_FULL_DATABASE roles to use the DBMS_SERVER_ALERT package.
Object Types

You qualify the metric by an individual object for the following object types.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT_TYPE_SYSTEM</td>
<td>Metrics collected on the system level for each instance.</td>
</tr>
<tr>
<td>OBJECT_TYPE_FILE</td>
<td>Metrics collected on the file level. These are used for AVG_FILE_READ_TIME and AVG_FILE_WRITE_TIME metrics.</td>
</tr>
<tr>
<td>OBJECT_TYPE_SERVICE</td>
<td>Metrics collected on the service level. Currently ELAPSED_TIME_PER_CALL and CPU_TIME_PER_CALL are collected.</td>
</tr>
<tr>
<td>OBJECT_TYPE_TABLESPACE</td>
<td>Metrics collected on the tablespace level.</td>
</tr>
<tr>
<td>Note: Dictionary managed tablespaces are not supported.</td>
<td></td>
</tr>
<tr>
<td>OBJECT_TYPE_EVENT_CLASS</td>
<td>Metrics collected on wait event class level. Currently supported metrics are AVG_USERS_WAITING and DB_TIME_WAITING.</td>
</tr>
<tr>
<td>OBJECT_TYPE_SESSION</td>
<td>Metrics collected on the session level. Currently only BLOCKED_USERS is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.</td>
</tr>
<tr>
<td>OBJECT_TYPE_WRCLIENT</td>
<td>Refers to a group of metrics (WCR...) used during replay to monitor the replay clients' performance</td>
</tr>
</tbody>
</table>
Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

**Table 141–2  Relational Operators Defined as Constants**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPERATOR_CONTAINS</td>
<td>A metric value matching an entry in a list of threshold values is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_DO_NOT_CHECK</td>
<td>The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric.</td>
</tr>
<tr>
<td>OPERATOR_EQ</td>
<td>A metric value equal to the threshold value is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_GE</td>
<td>A metric value greater than or equal to the threshold value is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_GT</td>
<td>A metric value greater than the threshold value is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_LE</td>
<td>A metric value less than or equal to the threshold value is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_LT</td>
<td>A metric value less than the threshold value is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_NE</td>
<td>A metric value not equal to the threshold value is considered a violation.</td>
</tr>
</tbody>
</table>
Supported Metrics

The following metrics are supported. All internal metric names are supplied as package constants.

<table>
<thead>
<tr>
<th>Metric Name (Internal)</th>
<th>Metric Name (External)</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVG_FILE_READ_TIME</td>
<td>Average File Read Time</td>
<td>Microseconds</td>
</tr>
<tr>
<td>AVG_FILE_WRITE_TIME</td>
<td>Average File Write Time</td>
<td>Microseconds</td>
</tr>
<tr>
<td>AVG_USERS_WAITING</td>
<td>Average Number of Users Waiting on a Class of Wait Events</td>
<td>Count of sessions</td>
</tr>
<tr>
<td>BLOCKED_USERS</td>
<td>Number of Users blocked by some Session</td>
<td>Number of Users</td>
</tr>
<tr>
<td>BRANCH_NODE_SPLITS_SEC</td>
<td>Branch Node Splits (for each second)</td>
<td>Splits for each Second</td>
</tr>
<tr>
<td>BRANCH_NODE_SPLITS_TXN</td>
<td>Branch Node Splits (for each transaction)</td>
<td>Splits for each Transaction</td>
</tr>
<tr>
<td>BUFFER_CACHE_HIT</td>
<td>Buffer Cache Hit (%)</td>
<td>% of cache accesses</td>
</tr>
<tr>
<td>CLUSTER_MSG_WAIT_SCT</td>
<td>Cluster Messaging Wait (by session count)</td>
<td>Count of sessions</td>
</tr>
<tr>
<td>CLUSTER_MSG_WAIT_TIME</td>
<td>Cluster Messaging Wait (by time)</td>
<td>Microseconds</td>
</tr>
<tr>
<td>CONSISTENT_CHANGES_SEC</td>
<td>Consistent Changes (for each second)</td>
<td>Changes for each Second</td>
</tr>
<tr>
<td>CONSISTENT_CHANGES_TXN</td>
<td>Consistent Changes (for each transaction)</td>
<td>Changes for each Transaction</td>
</tr>
<tr>
<td>CONSISTENT_GETS_SEC</td>
<td>Consistent Gets (for each second)</td>
<td>Gets for each Second</td>
</tr>
<tr>
<td>CONSISTENT_GETS_TXN</td>
<td>Consistent Gets (for each transaction)</td>
<td>Gets for each Transaction</td>
</tr>
<tr>
<td>CONTENTION_WAIT_SCT</td>
<td>Internal Contention Wait (by session count)</td>
<td>Count of sessions</td>
</tr>
<tr>
<td>CONTENTION_WAIT_TIME</td>
<td>Internal Contention Wait (by time)</td>
<td>Microseconds</td>
</tr>
<tr>
<td>CPU_TIME_PER_CALL</td>
<td>CPU time for each user call for each service</td>
<td>Microseconds for each call</td>
</tr>
<tr>
<td>CR_BLOCKS_CREATED_SEC</td>
<td>CR Blocks Created (for each second)</td>
<td>Blocks for each Second</td>
</tr>
<tr>
<td>CR_BLOCKS_CREATED_TXN</td>
<td>CR Blocks Created (for each transaction)</td>
<td>Blocks for each Transaction</td>
</tr>
<tr>
<td>CR_RECORDS_APPLIED_SEC</td>
<td>CR Undo Records Applied (for each second)</td>
<td>Records for each Second</td>
</tr>
<tr>
<td>CR_RECORDS_APPLIED_TXN</td>
<td>CR Undo Records Applied (for each transaction)</td>
<td>Records for each Transaction</td>
</tr>
<tr>
<td>CURSOR_CACHE_HIT</td>
<td>Cursor Cache Hit (%)</td>
<td>% of soft parses</td>
</tr>
<tr>
<td>DATABASE_WAIT_TIME</td>
<td>Database Wait Time (%)</td>
<td>% of all database time</td>
</tr>
<tr>
<td>DATABASE_CPU_TIME</td>
<td>Database CPU Time (%)</td>
<td>% of all database time</td>
</tr>
<tr>
<td>DATA_DICT_HIT</td>
<td>Data Dictionary Hit (%)</td>
<td>% of dictionary accesses</td>
</tr>

</tbody>
</table>
**EXPAND_MESSAGE Function**

This function expands alert messages.

**Syntax**

```sql
DBMS_SERVER_ALERT.EXPAND_MESSAGE(
    user_language            IN   VARCHAR2,
    message_id               IN   NUMBER,
    argument_1               IN   VARCHAR2,
    argument_2               IN   VARCHAR2,
    argument_3               IN   VARCHAR2,
    argument_4               IN   VARCHAR2,
    argument_5               IN   VARCHAR2)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_language</td>
<td>The language of the current session.</td>
</tr>
<tr>
<td>message_id</td>
<td>Id of the alert message</td>
</tr>
<tr>
<td>argument_1</td>
<td>The first argument in the alert message.</td>
</tr>
<tr>
<td>argument_2</td>
<td>The second argument in the alert message.</td>
</tr>
<tr>
<td>argument_3</td>
<td>The third argument in the alert message.</td>
</tr>
<tr>
<td>argument_4</td>
<td>The fourth argument in the alert message.</td>
</tr>
<tr>
<td>argument_5</td>
<td>The fifth argument in the alert message.</td>
</tr>
</tbody>
</table>
GET_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

Syntax

```sql
DBMS_SERVER_ALERT.GET_THRESHOLD(
    metrics_id               IN   BINARY_INTEGER,
    warning_operator         OUT  BINARY_INTEGER,
    warning_value            OUT  VARCHAR2,
    critical_operator        OUT  BINARY_INTEGER,
    critical_value           OUT  VARCHAR2,
    observation_period       OUT  BINARY_INTEGER,
    consecutive_occurrences  OUT  BINARY_INTEGER,
    instance_name            IN   VARCHAR2,
    object_type              IN   BINARY_INTEGER,
    object_name              IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metrics_id</td>
<td>The internal name of the metric. See &quot;Supported Metrics&quot; on page 141-6.</td>
</tr>
<tr>
<td>warning_operator</td>
<td>The operator for comparing the actual value with the warning threshold.</td>
</tr>
<tr>
<td>warning_value</td>
<td>The warning threshold value.</td>
</tr>
<tr>
<td>critical_operator</td>
<td>The operator for comparing the actual value with the critical threshold.</td>
</tr>
<tr>
<td>critical_value</td>
<td>The critical threshold value.</td>
</tr>
<tr>
<td>observation_period</td>
<td>The period at which the metric values are computed and verified against the threshold setting.</td>
</tr>
<tr>
<td>consecutive_occurrences</td>
<td>The number of observation periods the metric value should violate the threshold value before the alert is issued.</td>
</tr>
<tr>
<td>instance_name</td>
<td>The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV$INSTANCE View.</td>
</tr>
<tr>
<td>object_type</td>
<td>Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object.</td>
</tr>
</tbody>
</table>

Usage Notes

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid.
SET_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

Syntax

```sql
DBMS_SERVER_ALERT.SET_THRESHOLD(
  metrics_id               IN   BINARY_INTEGER,
  warning_operator         IN   BINARY_INTEGER,
  warning_value            IN   VARCHAR2,
  critical_operator        IN   BINARY_INTEGER,
  critical_value           IN   VARCHAR2,
  observation_period       IN   BINARY_INTEGER,
  consecutive_occurrences  IN   BINARY_INTEGER,
  instance_name            IN   VARCHAR2,
  object_type              IN   BINARY_INTEGER,
  object_name              IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metrics_id</td>
<td>The internal name of the metric. See &quot;Supported Metrics&quot; on page 141-6.</td>
</tr>
<tr>
<td>warning_operator</td>
<td>The operator for the comparing the actual value with the warning threshold (such as OPERATOR_GE). See &quot;Relational Operators&quot; on page 141-5.</td>
</tr>
<tr>
<td>warning_value</td>
<td>The warning threshold value. This is NULL if no warning threshold is set. A list of values may be specified for OPERATOR_CONTAINS.</td>
</tr>
<tr>
<td>critical_operator</td>
<td>The operator for the comparing the actual value with the critical threshold. See &quot;Relational Operators&quot; on page 141-5.</td>
</tr>
<tr>
<td>critical_value</td>
<td>The critical threshold value. This is NULL if not set. A list of values may be specified for OPERATOR_CONTAINS.</td>
</tr>
<tr>
<td>observation_period</td>
<td>The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.</td>
</tr>
<tr>
<td>consecutive_occurrences</td>
<td>The number of observation periods the metric value should violate the threshold value before the alert is issued.</td>
</tr>
<tr>
<td>instance_name</td>
<td>The name of the instance for which the threshold is set. This is NULL for database-wide alerts.</td>
</tr>
<tr>
<td>object_type</td>
<td>See &quot;Object Types&quot; on page 141-4.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object. This is NULL for SYSTEM.</td>
</tr>
</tbody>
</table>

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the `DBA_THRESHOLDS` view. The exception is the lower-case string 'database_wide' which is semantically equivalent to passing NULL for the instance name, the latter being the preferred usage.
The `DBMS_SERVICE` package lets you create, delete, activate, and deactivate services for a single instance.

The chapter contains the following topics:

- **Using DBMS_SERVICE**
  - Overview
  - Security Model
  - Constants
  - Operating Procedures
  - Exceptions

- **Summary of DBMS_SERVICE Subprograms**

  **See Also:** Oracle Real Application Clusters Administration and Deployment Guide for administering services in Oracle Real Application Clusters.
This section contains topics that relate to using the `DBMS_SERVICE` package.

- Overview
- Security Model
- Constants
- Operating Procedures
- Exceptions
Overview

DBMS_SERVICE supports the workload management of high availability, quality of service, job scheduling, and other planned operations in the RDBMS for the purposes of workload measurement, management, prioritization, and XA and distributed transaction management.

Oracle Real Application Clusters (RAC) can manage service names across instances as administered through SRVCTL. The DBMS_SERVICE package allows the creation, deletion, starting, and stopping of services in a single instance. Additionally, it provides the ability to disconnect all sessions that connect to an instance with a service name.

See Also: For more information about Oracle Real Application Clusters, Oracle Real Application Clusters Administration and Deployment Guide.
Security Model

**Privileges**
The client using this package must have the `ALTER SYSTEM` execution privilege and the `V$SESSION` table read privilege.

**Schemas**
This package must be installed under `SYS` schema.

**Roles**
The `EXECUTE` privilege of the package is granted to the `DBA` role only.
The DBMS_SERVICE package uses the constants shown in following tables:

- Constants used in calling arguments are described in Table 142–1, "Constants Used in Calling Arguments"
- Constants used in connection balancing goal arguments are described in Table 142–2, "Constants Used in Connection Balancing Goal Arguments"
- Constants used in TAF failover attribute arguments are described in Table 142–3, "Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF"

**Table 142–1 Constants Used in Calling Arguments**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GOAL_NONE</td>
<td>NUMBER</td>
<td>0</td>
<td>Disables Load Balancing Advisory</td>
</tr>
<tr>
<td>GOAL_SERVICE_TIME</td>
<td>NUMBER</td>
<td>1</td>
<td>Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service</td>
</tr>
<tr>
<td>GOAL_THROUGHPUT</td>
<td>NUMBER</td>
<td>2</td>
<td>Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service</td>
</tr>
</tbody>
</table>

**Table 142–2 Constants Used in Connection Balancing Goal Arguments**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLB_GOAL_SHORT</td>
<td>NUMBER</td>
<td>1</td>
<td>Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either goal_service_time or goal_throughput). When GOAL=NONE (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization.</td>
</tr>
<tr>
<td>CLB_GOAL_LONG</td>
<td>NUMBER</td>
<td>2</td>
<td>Balances the number of connections for each instance using session count for each service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design.</td>
</tr>
</tbody>
</table>

**Table 142–3 Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FAILOVER_METHOD_</td>
<td>VARCHAR2</td>
<td>0</td>
<td>Server side TAF is not enabled for this service</td>
</tr>
<tr>
<td>FAILOVER_METHOD_</td>
<td>VARCHAR2</td>
<td>1</td>
<td>Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time.</td>
</tr>
<tr>
<td>FAILOVER_TYPE_NONE</td>
<td>VARCHAR</td>
<td></td>
<td>Server side TAF type is NONE</td>
</tr>
</tbody>
</table>
If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF continues to re-attempt the connect and authentication as long as the callback returns a value of OCI_FO_RETRY. Any delay must be coded into the callback logic.

Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method defaults to BASIC. Delay and retries are optional and may be specified independently.
Operating Procedures

- You cannot use the following procedures with Oracle Real Applications Clusterware, Oracle Restart and Oracle Global Data Services:
  - CREATE_SERVICE Procedure
  - DELETE_SERVICE Procedure
  - MODIFY_SERVICE Procedure
  - START_SERVICE Procedure
  - STOP_SERVICE Procedure

- With Oracle Database 12c Release 1, you are advised to use the parameter interface in all service-related subprograms.

- If you wish to use DBMS_SERVICE on a pluggable database (PDB) in a single instance, you must connect to that PDB first.
The following table lists the exceptions raised by `DBMS_SERVICE` package.

**Table 142–4 DBMS_SERVICE Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>

<td>START_SERVICE Procedure on page 142-21</td>
<td>Activates service</td>
</tr>
<tr>
<td>STOP_SERVICE Procedure on page 142-22</td>
<td>Stops service</td>
</tr>
</tbody>
</table>
**CREATE_SERVICE Procedure**

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

**Note:** You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

**Syntax**

```sql
DBMS_SERVICE.CREATE_SERVICE(
  service_name       IN VARCHAR2,
  network_name       IN VARCHAR2,
  parameter_array    IN svc_parameter_array);
```

This overload is maintained for backward compatibility:

```sql
DBMS_SERVICE.CREATE_SERVICE(
  service_name       IN VARCHAR2,
  network_name       IN VARCHAR2,
  goal               IN NUMBER DEFAULT NULL,
  dtp                IN BOOLEAN DEFAULT NULL,
  aq_ha_notifications IN BOOLEAN DEFAULT NULL,
  failover_method    IN VARCHAR2 DEFAULT NULL,
  failover_type      IN VARCHAR2 DEFAULT NULL,
  failover_retries   IN NUMBER DEFAULT NULL,
  failover_delay     IN NUMBER DEFAULT NULL,
  clb_goal           IN NUMBER DEFAULT NULL,
  edition            IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service, limited to 64 characters in the Data Dictionary</td>
</tr>
<tr>
<td>network_name</td>
<td>Network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET Service_names character set (see Oracle Database Net Services Reference).</td>
</tr>
</tbody>
</table>
CREATE_SERVICE Procedure

**Table 142-6 (Cont.) CREATE_SERVICE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| parameter_array   | Associative array with name-value pairs of the service attributes. Supported names:  
  ■ goal  
  ■ dtp  
  ■ aq_ha_notifications  
  ■ failover_method  
  ■ failover_type  
  ■ failover_retries  
  ■ failover_delay  
  ■ clb_goal  
  ■ edition  
  ■ commit_outcome  
  ■ retention_timeout  
  ■ replay_initiation_timeout  
  ■ session_state_consistency  
  ■ sql_translation_profile |
| goal              | Workload management goal directive for the service. Valid values:  
  ■ DBMS_SERVICE.GOAL_SERVICE_TIME  
  ■ DBMS_SERVICE.GOAL_THROUGHPUT  
  ■ DBMS_SERVICE.GOAL_NONE |
| dtp               | Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA) |
| aq_ha_notifications| Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity |
| failover_method   | Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting. |
| failover_type     | Failover TYPE for the service for Application Continuity and TAF. |
| failover_retries  | Number of connection retries for Application Continuity and TAF. Using the failover_retries and failover_delay parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity. |
| failover_delay    | Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with RAC when the service is already available. |
Table 142–6  (Cont.) CREATE_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edition</td>
<td>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect. During service creation or modification, no validation is performed on this parameter. At connection time, if the connecting user does not have USE privilege on the edition, or the edition does not exist, this raises the error ORA-38802 (edition does not exist).</td>
</tr>
</tbody>
</table>
| commit_outcome          | Determines whether transaction COMMIT outcome is accessible after the COMMIT has executed. While the database guarantees that COMMIT is durable, this ensures that the outcome of the COMMIT is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:  
  ■ Invoking the GET_LTXID_OUTCOME Procedure of the DBMS_APP_CONT package requires that the commit_outcome attribute be set.  
  ■ commit_outcome has no effect on active Data Guard and read-only databases.  
  ■ commit_outcome is only allowed on the database service and on user-defined database services |
| retention_timeout       | Used in conjunction with commit_outcome, it determines the amount of time (in seconds) that the COMMIT_OUTCOME is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000). |
| replay_initiation_timeout | For Application Continuity, replay_initiation_timeout is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds. |
| session_state_consistency | Describes how nontransactional is changed during a request (values are DYNAMIC or STATIC). This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to DYNAMIC (default). Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode. |
| sql_translation_name    | Name of SQL translation unit                                                                                                               |
| clb_goal                | Method used for Connection Load Balancing (see Table 142–2, "Constants Used in Connection Balancing Goal Arguments")                   |

Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.example.com','ernie.example.com');

DECLARE
  params dbms_service.svc_parameter_array;
BEGIN
  params('FAILOVER_TYPE') := 'TRANSACTION';
```
params('REPLAY_INITIATION_TIMEOUT'):=1800;
params('RETENTION_TIMEOUT')              :=86400;
params('FAILOVER_DELAY')                :=10;
params('FAILOVER_RETRIES')              :=30;
params('commit_outcome')               :='true';
params('aq_ha_notifications')           :='true';
DBMS_SERVICE.MODIFY_SERVICE('GOLD',params);
END;
DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

---

**Note:** You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services.

---

Syntax

```sql
DBMS_SERVICE.DELETE_SERVICE(
    service_name  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service, limited to 64 characters in the Data Dictionary</td>
</tr>
</tbody>
</table>

Examples

```sql
DBMS_SERVICE.DELETE_SERVICE('ernie.example.com');
```
DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

DBMS_SERVICE.DISCONNECT_SESSION(
   service_name   IN VARCHAR2,
   disconnect_option   IN NUMBER DEFAULT POST_TRANSACTION);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service, limited to 64 characters in the Data Dictionary</td>
</tr>
<tr>
<td>disconnect_option</td>
<td>The options, package constants, are expressed as NUMBER:</td>
</tr>
<tr>
<td></td>
<td>- POST_TRANSACTION = 0: session disconnects after the current transaction commits or rolls back</td>
</tr>
<tr>
<td></td>
<td>- IMMEDIATE = 1: session disconnects immediately</td>
</tr>
<tr>
<td></td>
<td>- NOREPLAY = 2: session disconnects immediately and be flagged to not be replayed by application continuity, that is IMMEDIATE and NOREPLAY together</td>
</tr>
</tbody>
</table>

Note: IMMEDIATE or POST_TRANSACTION and NOREPLAY is automatically translated as 1 or 0 or 2 respectively. However, passing a string literal (quoted using either the ' or " characters, such as 'IMMEDIATE' or 'POST_TRANSACTION' or 'NOREPLAY') raises an error.

Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the DBMS_JOB package or put the SQL session in background if the caller does not want to wait for all corresponding sessions to be disconnected.

Examples

This disconnects sessions with service_name 'ernie.example.com'.

DBMS_SERVICE.DISCONNECT_SESSION('ernie.example.com');

If a service is using application continuity, and you do not want the sessions replayed but simply terminated, use the following:

EXECUTE DBMS_SERVICE.DISCONNECT_SESSION('service name', DBMS_SERVICE.NOREPLAY);
**MODIFY_SERVICE Procedure**

This procedure modifies an existing service.

---

**Note:** You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

---

**Syntax**

```sql
DBMS_SERVICE.MODIFY_SERVICE(
    service_name               IN VARCHAR2,
    parameter_array            IN svc_parameter_array);
```

This overload is maintained for backward compatibility:

```sql
DBMS_SERVICE.MODIFY_SERVICE(
    service_name               IN VARCHAR2,
    goal                       IN NUMBER DEFAULT NULL,
    dtp                        IN BOOLEAN DEFAULT NULL,
    aq_ha_notifications        IN BOOLEAN DEFAULT NULL,
    failover_method            IN VARCHAR2 DEFAULT NULL,
    failover_type              IN VARCHAR2 DEFAULT NULL,
    failover_retries           IN NUMBER DEFAULT NULL,
    failover_delay             IN NUMBER DEFAULT NULL,
    clb_goal                   IN NUMBER DEFAULT NULL,
    edition                    IN VARCHAR2 DEFAULT NULL,
    modify_edition             IN BOOLEAN DEFAULT FALSE;
```

<td>clb_goal</td>
<td>Method used for Connection Load Balancing (see Table 142–2, &quot;Constants Used in Connection Balancing Goal Arguments&quot;)</td>
</tr>
</tbody>
</table>
the `srvctl` command rather than `DBMS_SERVICE`. When the service is started by Oracle Clusterware or Oracle Restart, the service is modified in the database to match the resource defined to either Oracle Clusterware or Oracle Restart. Any changes made with `DBMS_SERVICE` are lost unless they are also made with the corresponding `srvctl` command. Starting with 11.2.0.2, service attribute modifications take effect immediately when the service is started or modified by `srvctl`.

- Although users can modify the edition attribute while the service is up and running, it may not be safe to do so. Users must proceed with caution because this causes new connections to be connected at the new edition, while the existing connection is not affected. This can cause mid-tier operations to connect to the wrong edition.
START_SERVICE Procedure

This procedure starts a service. In Oracle RAC, implementing this option acts on the instance specified.

---

**Note:** You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

---

**Syntax**

```
DBMS_SERVICE.START_SERVICE(
    service_name  IN VARCHAR2,
    instance_name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service limited to 64 characters in the Data Dictionary</td>
</tr>
<tr>
<td>instance_name</td>
<td>Name of the instance where the service must be activated (optional). NULL results in starting of the service on the local instance. In single instance, this can only be the current instance or NULL. Specify DBMS_SERVICE.ALL_INSTANCES to start the service on all configured instances.</td>
</tr>
</tbody>
</table>

**Examples**

```
DBMS_SERVICE.START_SERVICE('ernie.example.com');
```
STOP_SERVICE Procedure

This procedure stops a service.

Note: You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```sql
DBMS_SERVICE.STOP_SERVICE(
    service_name   IN VARCHAR2,
    instance_name  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service limited to 64 characters in the Data Dictionary</td>
</tr>
<tr>
<td>instance_name</td>
<td>Name of the instance where the service must be stopped (optional). NULL results in stopping of the service locally. In single instance, this can only be the current instance or NULL. The default in Oracle RAC and exclusive case is NULL. Specify DBMS_SERVICE.ALL_INSTANCES to stop the service on all configured instances.</td>
</tr>
</tbody>
</table>

Examples

```sql
DBMS_SERVICE.STOP_SERVICE('ernie.example.com');
```
This package provides access to SQL `ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- **Using DBMS_SESSION**
  - Security Model
  - Operational Notes
- **Data Structures**
- **Summary of DBMS_SESSION Subprograms**
Using DBMS_SESSION

- Security Model
- Operational Notes
Security Model

This package runs with the privileges of the calling user, rather than the package owner SYS.
Operational Notes

You should not attempt to turn `close_cached_open.Cursors` on or off.
Data Structures

The `DBMS_SESSION` package defines `TABLE` types.

**Table Types**

- `INTEGER_ARRAY` Table Type
- `LNAME_ARRAY` Table Type
INTEGER_ARRAY Table Type

A table type of BINARY_INTEGER.

Syntax

```
TYPE integer_array IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```
LNAME_ARRAY Table Type

A table type of VARCHAR2.

Syntax

TYPE lname_array IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;

CLEAR_ALL_CONTEXT Procedure

Syntax

```sql
DBMS_SESSION.CLEAR_ALL_CONTEXT
  namespace     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>The namespace where the application context information is to be cleared. Required.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.
CLEAR_CONTEXT Procedure

Syntax

```sql
DBMS_SESSION.CLEAR_CONTEXT
namespace VARCHAR2,
client_identifier VARCHAR2,
attribute VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Namespace in which the application context is to be cleared. Required.</td>
</tr>
<tr>
<td></td>
<td>For a session-local context, namespace must be specified. If namespace is</td>
</tr>
<tr>
<td></td>
<td>defined as Session Local Context, then client_identifier is optional since</td>
</tr>
<tr>
<td></td>
<td>it is only associated with a globally accessed context.</td>

<td>username, null) set using SET_CONTEXT.</td>
</tr>
<tr>
<td>client_identifier</td>
<td>Applies to a global context and is optional for other types of contexts;</td>
</tr>
<tr>
<td></td>
<td>64-byte maximum</td>
</tr>
<tr>
<td>attribute</td>
<td>Specific attribute in the namespace to be cleared. Optional. the default</td>
</tr>
<tr>
<td></td>
<td>is NULL. If you specify attribute as NULL, then (namespace, attribute,</td>
</tr>
<tr>
<td></td>
<td>value) for that namespace are cleared from the session. If attribute is</td>
</tr>
<tr>
<td></td>
<td>not specified, then all context information that has the namespace and</td>
</tr>
<tr>
<td></td>
<td>client_identifier arguments is cleared.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.
CLEAR_IDENTIFIED Procedure

This procedure removes the set_client_id in the session.

Syntax

DBMS_SESSION.CLEAR_IDENTIFIED;

Usage Notes

This procedure is executable by public.
CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement:

```
ALTER SESSION CLOSE DATABASE LINK <name>
```

Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (dblink VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dblink</td>
<td>Name of the database link to close</td>
</tr>
</tbody>
</table>
FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire sort_area_size is used and sort_area_size is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the v$sesstat or v$statname fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

Note: This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

Syntax

DBMS_SESSION.FREE_UNUSED_USER_MEMORY;

Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server**: This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server**: This returns unused session memory to the shared_pool. Session memory is allocated from the shared_pool in this configuration.

Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies. They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA.
memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared. After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure **FREE_UNUSED_USER_MEMORY**.

```sql
CREATE PACKAGE foobar
    type number_idx_tbl is table of number indexed by binary_integer;

    store1_table number_idx_tbl;     -- PL/SQL indexed table
    store2_table number_idx_tbl;     -- PL/SQL indexed table
    store3_table number_idx_tbl;     -- PL/SQL indexed table
    ...
END;            -- end of foobar

DECLARE
    ...
    empty_table number_idx_tbl;     -- uninitialized ("empty") version
BEGIN
    FOR i in 1..1000000 loop
        store1_table(i) := i;           -- load data
    END LOOP;
    ...
    store1_table := empty_table;     -- 'truncate' the indexed table
    ...
    dbms_session.free_unused_user_memory;  -- give memory back to system
    store1_table(1) := 100;           -- index tables still declared;
    store2_table(2) := 200;           -- but truncated.
    ...
END;
```
GET_PACKAGE_MEMORY_UTILIZATION Procedure

This procedure describes static package memory usage.

The output collections describe memory usage in each instantiated package. Each package is described by its owner name, package name, used memory amount, and unused allocated memory amount. The amount of unused memory is greater than zero because of memory fragmentation and also because once used free memory chunks initially go to a free list owned by the package memory heap. They are released back to the parent heap only when the FREE_UNUSED_USER_MEMORY Procedure is invoked.

Syntax

```sql
DBMS_SESSION.GET_PACKAGE_MEMORY_UTILIZATION (
    owner_names     OUT NOCOPY LNAME_ARRAY,
    unit_names      OUT NOCOPY LNAME_ARRAY,
    unit_types      OUT NOCOPY INTEGER_ARRAY,
    used_amounts    OUT NOCOPY INTEGER_ARRAY,
    free_amounts    OUT NOCOPY INTEGER_ARRAY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>Owner of package</td>
</tr>
<tr>
<td>unit_name</td>
<td>Name of package</td>
</tr>
<tr>
<td>unit_types</td>
<td>Value of the type# columns of the dictionary table obj$</td>
</tr>
<tr>
<td>used_amounts</td>
<td>Amount of allocated memory specified in bytes</td>
</tr>
<tr>
<td>free_amounts</td>
<td>Amount of available memory specified in bytes</td>
</tr>
</tbody>
</table>
IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (   rolename    VARCHAR2)   RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rolename</td>
<td>Name of the role.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>is_role_enabled</td>
<td>TRUE or FALSE, depending on whether the role is enabled</td>
</tr>
</tbody>
</table>
IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

```sql
DBMS_SESSION.IS_SESSION_ALIVE (uniqueid VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uniqueid</td>
<td>Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>is_session_alive</td>
<td>TRUE or FALSE, depending on whether the session is active</td>
</tr>
</tbody>
</table>
LIST_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

Syntax

```sql
TYPE AppCtxRecTyp IS RECORD {
    namespace VARCHAR2(30),
    attribute VARCHAR2(30),
    value VARCHAR2(256)};

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT {
    list OUT AppCtxTabTyp,
    size OUT NUMBER};
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Buffer to store a list of application context set in the current session</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list of (namespace, attribute, values) set in current session</td>
</tr>
<tr>
<td>size</td>
<td>Returns the number of entries in the buffer returned</td>
</tr>
</tbody>
</table>

Usage Notes

The context information in the list appears as a series of `<namespace> <attribute> <value>`. Because `list` is a table type variable, its size is dynamically adjusted to the size of returned list.
MODIFY_PACKAGE_STATE Procedure

This procedure is used to perform various actions (as specified by the action_flags parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running. The procedure uses the DBMS_SESSION constants listed in Table 143–13.

Syntax

DBMS_SESSION.MODIFY_PACKAGE_STATE(
    action_flags IN PLS_INTEGER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_flags</td>
<td>Bit flags that determine the action taken on PL/SQL program units:</td>
</tr>
<tr>
<td></td>
<td>DBMS_SESSION.FREE_ALL_RESOURCES (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closed cached cursors. On subsequent use, the PL/SQL program units are reinstantiated and package globals are reinitialized. Invoking MODIFY_PACKAGE_STATE with the DBMS_SESSION.FREE_ALL_RESOURCES parameter provides functionality identical to the DBMS_SESSION.RESET_PACKAGE() interface.</td>
</tr>
<tr>
<td></td>
<td>DBMS_SESSION.RE INITIALIZE (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the DBMS_SESSION.REINITIALIZE flag is similar to the DBMS_SESSION.FREE_ALL_RESOURCES flag in that both have the effect of reinitializing all packages. However, DBMS_SESSION.REINITIALIZE should exhibit better performance than the DBMS_SESSION.FREE_ALL_RESOURCES option because:</td>
</tr>
<tr>
<td></td>
<td>• Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused.</td>
</tr>
<tr>
<td></td>
<td>• Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use.</td>
</tr>
<tr>
<td></td>
<td>• The session memory for PL/SQL modules without global state (such as types, stored-procedures) are not freed and recreated.</td>
</tr>
</tbody>
</table>
Usage Notes

See the parameter descriptions in Table 143–14 for the differences between the flags and why `DBMS_SESSION.REINITIALIZE` exhibits better performance than `DBMS_SESSION.FREE_ALL_RESOURCES`.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREE_ALL_RESOURCES</td>
<td>PLS_INTEGER:= 1</td>
</tr>
<tr>
<td>REINITIALIZE</td>
<td>PLS_INTEGER:= 2</td>
</tr>
</tbody>
</table>

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```plsql
package P is
n number;
m number := P2.foo;
d date := SYSDATE;
cursor c is select * from emp;
procedure bar;
end P;
/
package body P is
  v   varchar2(20) := 'hello';
  procedure bar is
    begin
      ...
    end;
  procedure init_pkg is
    begin
      ....
    end;
    begin
      -- initialization block
      init_pkg;
      ...
    end;
end P;
/
```

For the package `P`, reinitialization involves:

- Setting `P.n` to `NULL`
- Invoking function `P2.foo` and setting `P.m` to the value returned from `P2.foo`
- Setting `P.d` to the return value of `SYSDATE` built-in
- Closing cursor `P.c` if it was previously opened
- Setting `P.v` to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.
- When using `FREE_ALL_RESOURCES` or `REINITIALIZE`, make sure that resetting package variable values does not affect the application.
Because `DBMS_SESSION.REINITIALIZE` does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the `FREE_ALL_RESOURCES` flag or the `RESET_PACKAGE` procedure had been used. For instance, after performing `DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE)`, if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages remains until the end of the session (or until `DBMS_SESSION.RESET_PACKAGE` is called).

Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, `DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE)` does not compile on the client because it uses the constant `DBMS_SESSION.REINITIALIZE`. Instead, use `DBMS_SESSION.MODIFY_PACKAGE_STATE(2)` on the client, because the argument is explicitly provided.

**Examples**

This example illustrates the use of `DBMS_SESSION.MODIFY_PACKAGE_STATE`. Consider a package `P` with some global state (a cursor `c` and a number `cnt`). When the package is first initialized, the package variable `cnt` is 0 and the cursor `c` is `CLOSED`. Then, in the session, change the value of `cnt` to 111 and also execute an `OPEN` operation on the cursor. If you call `print_status` to display the state of the package, you see that `cnt` is 111 and that the cursor is `OPEN`. Next, call `DBMS_SESSION.MODIFY_PACKAGE_STATE`. If you print the status of the package `P` again using `print_status`, you see that `cnt` is 0 again and the cursor is `CLOSED`. If the call to `DBMS_SESSION.MODIFY_PACKAGE_STATE` had not been made, then the second `print_status` would have printed 111 and `OPEN`.

```sql
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
  begin
    dbms_output.put_line('P.cnt = ' || cnt);
    if c%ISOPEN then
      dbms_output.put_line('P.c is OPEN');
    else
      dbms_output.put_line('P.c is CLOSED');
    end if;
    end;
  end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
2  P.cnt := 111;
3  open p.c;
4  p.print_status;
5  end;
6  /
P.cnt = 111
P.c is OPEN
```
PL/SQL procedure successfully completed.

SQL> begin
    2   dbms_session.modify_package_state(dbms_session.reinitialize);
    3   end;
    4  /

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
SQL>
SQL> begin
    2   P.print_status;
    3   end;
    4  /
P.cnt = 0
P.c is CLOSED

PL/SQL procedure successfully completed.
SESSION_TRACE_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

Syntax

```
DBMS_SESSION.SESSION_TRACE_DISABLE;
```
SESSION_TRACE_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

Syntax

```sql
DBMS_SESSION.SESSION_TRACE_ENABLE(
    waits IN BOOLEAN DEFAULT TRUE,
    binds IN BOOLEAN DEFAULT FALSE,
    plan_stat IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>waits</td>
<td>Specifies if wait information is to be traced</td>
</tr>
<tr>
<td>binds</td>
<td>Specifies if bind information is to be traced</td>
</tr>
<tr>
<td>plan_stat</td>
<td>Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.</td>
</tr>
</tbody>
</table>
RESET_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

Note: See "SESSION_TRACE_ENABLE Procedure" on page 143-24. The MODIFY_PACKAGE_STATE interface, introduced in Oracle9i, provides an equivalent of the RESET_PACKAGE capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to RESET_PACKAGE frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

RESET_PACKAGE can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. RESET_PACKAGE guarantees that all package variables are reset to their initial values.

Syntax

DBMS_SESSION.RESET_PACKAGE;

Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use RESET_PACKAGE to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values does not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

RESET_PACKAGE does not free the memory, cursors, and package variables immediately when called.

Note: RESET_PACKAGE only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls RESET_PACKAGE. The RESET_PACKAGE effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).

Examples

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

EXECUTE large_plsql_program1;
To free up PL/SQL cached session memory:
EXECUTE DBMS_SESSION.RESET_PACKAGE;

To run another large program:
EXECUTE large_plsql_program2;
**SET_CONTEXT Procedure**

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of its five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

**Syntax**

```sql
DBMS_SESSION.SET_CONTEXT (  
    namespace VARCHAR2,  
    attribute VARCHAR2,  
    value     VARCHAR2,  
    username  VARCHAR2,  
    client_id VARCHAR2 );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Namespace of the application context to be set, limited to 30 bytes</td>
</tr>
<tr>
<td>attribute</td>
<td>Attribute of the application context to be set, limited to 30 bytes</td>
</tr>
<tr>
<td>value</td>
<td>Value of the application context to be set, limited to 4 kilobytes.</td>
</tr>
<tr>
<td>username</td>
<td>Database username attribute of the application context. Default: NULL</td>
</tr>
<tr>
<td>client_id</td>
<td>Application-specific client_id attribute of the application context (64-byte maximum). Default: NULL</td>
</tr>
</tbody>
</table>

**Usage Notes**

- The first three parameters are required for all types of context.
- The `username` parameter must be a valid SQL identifier.
- The `client_id` parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for `set_identifier`.
- If the namespace parameter is a global context namespace, then the `username` parameter is matched against the current database user name in the session, and the `client_id` parameter is matched against the current `client_id` in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package.
- The caller of SETCONTEXT must be in the calling stack of a procedure that has been associated to the context namespace through a `CREATE CONTEXT` statement. The checking of the calling stack does not cross a DBMS boundary.
- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user’s session unless it is reset by the user.
If the value of the parameter in the namespace has been set, `SET_CONTEXT` overwrites this value.

Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

**See Also:** *Oracle Database Security Guide* for more information about

- "Setting the username and client ID"
- "Example: Creating a Global Application Context that Uses a Client Session ID"
**SET_EDITION_DEFERRED Procedure**

This procedure requests a switch to the specified edition. The switch takes effect at the end of the current client call.

**Syntax**

```sql
DBMS_SESSION.SET_EDITION_DEFERRED (edition IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edition</td>
<td>Name of the edition to which to switch. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lower case characters are present in the edition’s actual name and, if double quotation marks are not used, the contents are set in uppercase. The caller must have USE privilege on the named edition.</td>
</tr>
</tbody>
</table>
SET_IDENTIFIER Procedure

This procedure sets the client ID in the session.

Syntax

```sql
DBMS_SESSION.SET_IDENTIFIER (client_id VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>Case-sensitive application-specific identifier of the current database session</td>
</tr>
</tbody>
</table>

Usage Notes

- SET_IDENTIFIER sets the session’s client id to the given value. This value can be used to identify sessions in `v$session` by means of `v$session.client_identifier`. It can also be used to identify sessions by means of `sys_context('USERENV','CLIENT_IDENTIFIER')`.
- This procedure is executable by PUBLIC.
**SET_NLS Procedure**

This procedure sets up your Globalization Support (NLS). It is equivalent to the following SQL statement:

```sql
ALTER SESSION SET <nls_parameter> = <value>
```

**Syntax**

```sql
DBMS_SESSION.SET_NLS (  
    param VARCHAR2,  
    value VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>param</td>
<td>Globalization Support parameter. The parameter name must begin with 'NLS'.</td>
</tr>
<tr>
<td>value</td>
<td>Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, &quot;set_nls (nls_date_format, 'DD-MON-YY')&quot;.</td>
</tr>
</tbody>
</table>
SET_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the `SET ROLE` SQL statement.

Syntax

```
DBMS_SESSION.SET_ROLE (
    role_cmd VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_cmd</td>
<td>Text is appended to &quot;set role&quot; and then run as SQL</td>
</tr>
</tbody>
</table>

Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.
SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the following SQL statement:

```
ALTER SESSION SET SQL_TRACE ...
```

Syntax

```
DBMS_SESSION.SET_SQL_TRACE (sql_trace boolean);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_trace</td>
<td>TRUE turns tracing on, FALSE turns tracing off</td>
</tr>
</tbody>
</table>
SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user’s current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

Syntax

```
DBMS_SESSION.switch_current_consumer_group (  
    new_consumer_group     IN  VARCHAR2,  
    old_consumer_group     OUT VARCHAR2,  
    initial_group_on_error IN  BOOLEAN);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_consumer_group</td>
<td>Name of consumer group to which you want to switch</td>
</tr>
<tr>
<td>old_consumer_group</td>
<td>Name of the consumer group from which you just switched out</td>
</tr>
<tr>
<td>initial_group_on_error</td>
<td>If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error</td>
</tr>
</tbody>
</table>

Return Values

This procedure outputs the old consumer group of the user in the parameter `old_consumer_group`.

Note: You can switch back to the old consumer group later using the value returned in `old_consumer_group`.

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>29368</td>
<td>Non-existent consumer group</td>
</tr>
<tr>
<td>1031</td>
<td>Insufficient privileges</td>
</tr>
<tr>
<td>29396</td>
<td>Cannot switch to <code>OTHER_GROUPS</code> consumer group</td>
</tr>
</tbody>
</table>

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (`old_consumer_group`) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting `initial_group_on_error` to TRUE, `SWITCH_CURRENT_CONSUMER_GROUP` puts the current session into the default group, if it can’t put it into the group designated by
new_consumer_group. The error associated with the attempt to move a session into new_consumer_group is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

CREATE OR REPLACE PROCEDURE high_priority_task is
  old_group varchar2(30);
  prev_group varchar2(30);
  curr_user varchar2(30);
BEGIN
  -- switch invoker to privileged consumer group. If we fail to do so, an
  -- error is thrown, but the consumer group does not change
  -- because 'initial_group_on_error' is set to FALSE
  dbms_session.switch_current_consumer_group('tkrogrp1', old_group, FALSE);
  -- set up exception handler (in the event of an error, we do not want to
  -- return to caller while leaving the session still in the privileged
  -- group)
  BEGIN
    -- perform some operations while under privileged group
    EXCEPTION
      WHEN OTHERS THEN
        -- It is possible that the procedure owner does not have privileges
        -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
        -- that the user is moved out of the privileged group in such a
        -- situation
        dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
        RAISE;
      END;
  -- we've succeeded. Now switch to old_group, or if cannot do so, switch
  -- to caller's initial consumer group
  dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/
UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

```sql
DBMS_SESSION.UNIQUE_SESSION_ID
RETURN VARCHAR2;
```

Pragmas

```sql
pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);
```

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unique_session_id</td>
<td>Returns up to 24 bytes</td>
</tr>
</tbody>
</table>
The `DBMS_SHARED_POOL` package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. `DBMS_SHARED_POOL` enables you to display the sizes of objects in the shared pool, and mark them for keeping or not-keeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- **Using DBMS_SHARED_POOL**
  - Overview
  - Operational Notes
- **Summary of DBMS_SHARED_POOL Subprograms**
Using DBMS_SHARED_POOL

- Overview
- Operational Notes
Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users' response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

DBMS_SHARED_POOL is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, DBMS_SHARED_POOL supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. DBMS_SHARED_POOL is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.
To create `DBMS_SHARED_POOL`, run the `DBMSPOOL.SQL` script. The `PRVTPOOL.PLB` script is automatically executed after `DBMSPOOL.SQL` runs. These scripts are *not* run by as part of standard database creation.
## Summary of DBMS_SHARED_POOL Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ABORTED_REQUEST_THRESHOLD Procedure</strong> on page 144-6</td>
<td>Sets the aborted request threshold for the shared pool</td>
</tr>
<tr>
<td><strong>KEEP Procedure</strong> on page 144-7</td>
<td>Keeps an object in the shared pool</td>
</tr>
<tr>
<td><strong>MARKHOT Procedure</strong> on page 144-9</td>
<td>Marks a library cache object as a hot object</td>
</tr>
<tr>
<td><strong>PURGE Procedure</strong> on page 144-10</td>
<td>Purges the named object or specified heap(s) of the object</td>
</tr>
<tr>
<td><strong>SIZES Procedure</strong> on page 144-12</td>
<td>Shows objects in the shared pool that are larger than the specified size</td>
</tr>
<tr>
<td><strong>UNKEEP Procedure</strong> on page 144-13</td>
<td>Unkeeps the named object</td>
</tr>
<tr>
<td><strong>UNMARKHOT Procedure</strong> on page 144-14</td>
<td>Unmarks a library cache object as a hot object</td>
</tr>
</tbody>
</table>
**ABORTED_REQUEST_THRESHOLD Procedure**

This procedure sets the aborted request threshold for the shared pool.

**Syntax**

```sql
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD {
    threshold_size NUMBER};
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threshold_size</td>
<td>Size, in bytes, of a request which does not try to free unpinned (not &quot;unkeep-ed&quot;) memory within the shared pool. The range of threshold_size is 5000 to ~2 GB inclusive.</td>
</tr>
</tbody>
</table>

**Exceptions**

An exception is raised if the threshold is not in the valid range.

**Usage Notes**

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an 'ALTER SYSTEM FLUSH SHARED_POOL'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than `threshold_size`. This user gets the 'out of memory' error without attempting to search the LRU list.
**KEEP Procedure**

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

**Syntax**

```sql
DBMS_SHARED_POOL.KEEP ( 
  name VARCHAR2, 
  flag CHAR DEFAULT 'P');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the object to keep. The value for this identifier is the concatenation of the address and hash_value columns from the v$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be kept.</td>
</tr>
<tr>
<td>flag</td>
<td>(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to ‘P’ or ‘p’ to fully specify that the input is the name of a package/procedure/function. Set to ‘T’ or ‘t’ to specify that the input is the name of a type. Set to ‘R’ or ‘r’ to specify that the input is the name of a trigger. Set to ‘Q’ or ‘q’ to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except ‘P’ or ‘p’ or ‘Q’ or ‘q’ or ‘R’ or ‘r’ or ‘T’ or ‘t’.</td>
</tr>
</tbody>
</table>

**Exceptions**

An exception is raised if the named object cannot be found.

**Usage Notes**

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, and types which are specified by name
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```sql
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACKAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte
names are allowed). A cursor can be kept by `DBMS_SHARED_POOL.KEEP ('0034CDFF, 20348871', 'C'), 0034CDFF being the ADDRESS and 20348871 the HASH_VALUE. Note that the complete hexadecimal address must be in the first 8 characters.
**MARKHOT Procedure**

This procedure marks a library cache object as a hot object.

**Syntax**

```
DBMS_SHARED_POOL.MARKHOT (
    schema           VARCHAR2,
    objname          VARCHAR2,
    namespace        NUMBER DEFAULT 1,   global          BOOLEAN DEFAULT TRUE);
```

```
DBMS_SHARED_POOL.MARKHOT (
    hash             VARCHAR2,
    namespace        NUMBER DEFAULT 1,
    global           BOOLEAN DEFAULT TRUE);
```

**Parameters**

*Table 144–4  MARKHOT Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>User name or the schema to which the object belongs</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object</td>
</tr>
</tbody>
</table>
| namespace | Number indicating the library cache namespace in which the object is to be searched. Views, such as USER_OBJECTS and DBA_OBJECTS, reflect the namespace as a number column, as do most dictionary tables such as OBJ$.
| global    | If TRUE (default), mark the object hot on all Oracle RAC instances |
| hash      | 16-byte hash value for the object |

**Exceptions**

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input)

**Usage Notes**

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.
PURGE Procedure

This procedure purges the named object or specified heap(s) of the object.

Syntax

DBMS_SHARED_POOL.PURGE (
  name VARCHAR2,
  flag CHAR DEFAULT 'P',
  heaps NUMBER DEFAULT 1);

DBMS_SHARED_POOL.PURGE (
  schema VARCHAR2,
  objname VARCHAR2,
  namespace NUMBER,
  heaps NUMBER);

DBMS_SHARED_POOL.PURGE (
  hash VARCHAR2,
  namespace NUMBER,
  heaps NUMBER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the object to purge. The value for this identifier is the concatenation of the address and hash_value columns from the v$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be purged.</td>
</tr>
<tr>
<td>flag</td>
<td>(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.</td>
</tr>
<tr>
<td>heaps</td>
<td>Heaps to be purged. For example, if heap 0 and heap 6 are to be purged: 1&lt;&lt;0</td>
</tr>
<tr>
<td>schema</td>
<td>User name or the schema to which the object belongs</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object to purge</td>
</tr>
<tr>
<td>namespace</td>
<td>Parameter is a number indicating the library cache namespace in which the object is to be searched</td>
</tr>
</tbody>
</table>
Table 144–5  (Cont.)  PURGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hash</td>
<td>16-byte hash value for the object</td>
</tr>
</tbody>
</table>

Exceptions

ORA-6570: An exception is raised if the named object cannot be found
ORA-6570: An object cannot be purged it marked as permanently kept

Usage Notes

All objects supported by the KEEP Procedure are supported for PURGE.
SIZES Procedure

This procedure shows objects in the shared_pool that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the KEEP or UNKEEP calls.

Syntax

DBMS_SHARED_POOL.SIZES (minsize NUMBER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>minsize</td>
<td>Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.</td>
</tr>
</tbody>
</table>

Usage Notes

Issue the SQLDBA or SQLPLUS ‘SET SERVEROUTPUT ON SIZE XXXX’ command prior to using this procedure so that the results are displayed.
UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

```sql
DBMS_SHARED_POOL.UNKEEP (
   name VARCHAR2,
   flag CHAR DEFAULT 'P');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the object to unkeep. See description of the name object for the KEEP procedure.</td>
</tr>
<tr>
<td>flag</td>
<td>See description of the flag parameter for the KEEP procedure.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-06502: An exception is raised if the named object cannot be found
UNMARKHOT Procedure

This procedure unmarks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.UNMARKHOT (  
   schema       VARCHAR2,  
   objname      VARCHAR2,  
   namespace    NUMBER DEFAULT 1,  
   global       BOOLEAN DEFAULT TRUE);
```

```
DBMS_SHARED_POOL.UNMARKHOT (  
   hash         VARCHAR2,  
   namespace    NUMBER DEFAULT 1,  
   global       BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>User name or the schema to which the object belongs</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object</td>
</tr>
<tr>
<td>namespace</td>
<td>Number indicating the library cache namespace in which the object is to be searched</td>
</tr>
<tr>
<td>global</td>
<td>If TRUE (default), unmark the object hot on all Oracle RAC instances</td>
</tr>
<tr>
<td>hash</td>
<td>16-byte hash value for the object</td>
</tr>
</tbody>
</table>

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input, or non-existent object)

Usage Notes

If a package or type’s specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.
The `DBMS_SPACE` package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- Using `DBMS_SPACE`
  - Security Model
- Data Structures
- Summary of `DBMS_SPACE` Subprograms
Using DBMS_SPACE

- Security Model
Security Model

This package runs with SYS privileges. The execution privilege is granted to PUBLIC. Subprograms in this package run under the caller security. The user must have ANALYZE privilege on the object.
Data Structures

The DBMS_SPACE package defines an OBJECT type, a RECORD type, and a TABLE type.

OBJECT Types

CREATE_TABLE_COST_COLINFO Object Type

RECORD Types

ASA_RECO_ROW Record Type

TABLE Types

ASA_RECO_ROW_TB Table Type
CREATE_TABLE_COST_COLINFO Object Type

This type describes the datatype and size of a column in the table.

Syntax

```
TYPE create_table_cost_colinfo IS OBJECT(
    col_type VARCHAR(200),
    col_size NUMBER)
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col_type</td>
<td>Column type</td>
</tr>
<tr>
<td>col_size</td>
<td>Column size</td>
</tr>
</tbody>
</table>
ASA_RECO_ROW Record Type

This type contains the column type of individual columns returned by the ASA_RECOMMENDATIONS Function.

Syntax

TYPE asa_reco_row IS RECORD {
  tablespace_name VARCHAR2(30),
  segment_owner VARCHAR2(30),
  segment_name VARCHAR2(30),
  segment_type VARCHAR2(18),
  partition_name VARCHAR2(30),
  allocated_space NUMBER,
  used_space NUMBER,
  reclaimable_space NUMBER,
  chain_rowexcess NUMBER,
  recommendations VARCHAR2(1000),
  c1 VARCHAR2(1000),
  c2 VARCHAR2(1000),
  c3 VARCHAR2(1000),
  task_id NUMBER,
  msg_id NUMBER);

Attributes

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace containing the object</td>
</tr>
<tr>
<td>segment_owner</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>segment_name</td>
<td>Name of the object</td>
</tr>
<tr>
<td>segment_type</td>
<td>Type of the segment 'TABLE', 'INDEX' and so on</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition</td>
</tr>
<tr>
<td>allocated_space</td>
<td>Space allocated to the segment</td>
</tr>
<tr>
<td>used_space</td>
<td>Space actually used by the segment</td>
</tr>
<tr>
<td>reclaimable_space</td>
<td>Reclaimable free space in the segment</td>
</tr>
<tr>
<td>chain_rowexcess</td>
<td>Percentage of excess chain row pieces that can be eliminated</td>
</tr>
<tr>
<td>recommendations</td>
<td>Recommendation or finding for this segment</td>
</tr>
<tr>
<td>c1</td>
<td>Command associated with the recommendation</td>
</tr>
<tr>
<td>c2</td>
<td>Command associated with the recommendation</td>
</tr>
<tr>
<td>c3</td>
<td>Command associated with the recommendation</td>
</tr>
<tr>
<td>task_id</td>
<td>Advisor Task that processed this segment</td>
</tr>
<tr>
<td>msg_id</td>
<td>Message ID corresponding to the recommendation</td>
</tr>
</tbody>
</table>
ASA_RECO_ROW_TB Table Type

Syntax

    TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
### Summary of DBMS_SPACE Subprograms

**Table 145–3  DBMS_SPACE Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASA_RECOMMENDATIONS Function on page 145-9</td>
<td>Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user</td>
</tr>
<tr>
<td>CREATE_INDEX_COST Procedure on page 145-10</td>
<td>Determines the cost of creating an index on an existing table</td>
</tr>
<tr>
<td>CREATE_TABLE_COST Procedures on page 145-11</td>
<td>Determines the size of the table given various attributes</td>
</tr>
<tr>
<td>FREE_BLOCKS Procedure on page 145-13</td>
<td>Returns information about free blocks in an object (table, index, or cluster)</td>
</tr>
<tr>
<td>ISDATAFILEDROPPABLE_NAME Procedure on page 145-15</td>
<td>Checks whether a datafile is droppable</td>
</tr>
<tr>
<td>OBJECT_DEPENDENT_SEGMENTS Function on page 145-16</td>
<td>Returns the list of segments that are associated with the object</td>
</tr>
<tr>
<td>OBJECT_GROWTH_TREND Function on page 145-18</td>
<td>A table function where each row describes the space usage of the object at a specific point in time</td>
</tr>
<tr>
<td>SPACE_USAGE Procedures on page 145-20</td>
<td>Returns information about free blocks in an auto segment space managed segment</td>
</tr>
<tr>
<td>UNUSED_SPACE Procedure on page 145-23</td>
<td>Returns information about unused space in an object (table, index, or cluster)</td>
</tr>
</tbody>
</table>
ASA_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

Syntax

```
DBMS_SPACE.ASA_RECOMMENDATIONS (  
  all_runs        IN    VARCHAR2 DEFAULT := TRUE,  
  show_manual     IN    VARCHAR2 DEFAULT := TRUE,  
  show_findings   IN    VARCHAR2 DEFAULT := FALSE)  
RETURN ASA_RECO_ROW_TB PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all_runs</td>
<td>If TRUE, returns recommendations/findings for all runs of auto segment advisor. If FALSE, returns the results of the LATEST run only. LATEST does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.</td>
</tr>
<tr>
<td>show_manual</td>
<td>If TRUE, we show the results of manual invocations only. The auto advisor results are excluded. If FALSE, results of manual invocation of segment advisor are not returned.</td>
</tr>
<tr>
<td>show_findings</td>
<td>Show only the findings instead of the recommendations</td>
</tr>
</tbody>
</table>
CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```sql
DBMS_SPACE.CREATE_INDEX_COST (  
    ddl             IN    VARCHAR2,  
    used_bytes      OUT   NUMBER,  
    alloc_bytes     OUT   NUMBER,  
    plan_table      IN    VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(create_index_cost,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl</td>
<td>The create index DDL statement</td>
</tr>
<tr>
<td>used_bytes</td>
<td>The number of bytes representing the actual index data</td>
</tr>
<tr>
<td>alloc_bytes</td>
<td>Size of the index when created in the tablespace</td>
</tr>
<tr>
<td>plan_table</td>
<td>Which plan table to use, default NULL</td>
</tr>
</tbody>
</table>

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.
CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

Syntax

```sql
DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    avg_row_size       IN NUMBER,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);

DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    colinfos           IN CREATE_TABLE_COST_COLUMNS,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);

CREATE TYPE create_table_cost_colinfo IS OBJECT (
    COL_TYPE   VARCHAR(200),
    COL_SIZE   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The tablespace in which the object will be created. The default is SYSTEM tablespace.</td>
</tr>
<tr>
<td>avg_row_size</td>
<td>The anticipated average row size in the table</td>
</tr>
<tr>
<td>colinfos</td>
<td>The description of the columns</td>
</tr>
<tr>
<td>row_count</td>
<td>The anticipated number of rows in the table</td>
</tr>
<tr>
<td>pct_free</td>
<td>The percentage of free space in each block for future expansion of existing rows due to updates</td>
</tr>
<tr>
<td>used_bytes</td>
<td>The space used by user data</td>
</tr>
<tr>
<td>alloc_bytes</td>
<td>The size of the object taking into account the tablespace extent characteristics</td>
</tr>
</tbody>
</table>
Usage Notes

- The **used_bytes** represent the actual bytes used by the data. This includes the overhead due to the block metadata, pctfree etc.

- The **alloc_bytes** represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```sql
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on
DECLARE
    ub NUMBER;
    ab NUMBER;
    cl sys.create_table_cost_columns;
BEGIN
    cl := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
                                          sys.create_table_cost_colinfo('VARCHAR2',30),
                                          sys.create_table_cost_colinfo('VARCHAR2',30),
                                          sys.create_table_cost_colinfo('DATE',NULL));

    DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',cl,100000,0,ub,ab);
    DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
    DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/
```
FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster). See SPACE_USAGE Procedures for returning free block information in an auto segment space managed segment.

Syntax

```sql
DBMS_SPACE.FREE_BLOCKS (  
    segment_owner    IN  VARCHAR2,  
    segment_name     IN  VARCHAR2,  
    segment_type     IN  VARCHAR2,  
    freelist_group_id IN  NUMBER,  
    free_blks        OUT NUMBER,  
    scan_limit       IN  NUMBER DEFAULT NULL,  
    partition_name   IN  VARCHAR2 DEFAULT NULL);
```

Pragmas

```sql
pragma restrict_references(free_blocks,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_type</td>
<td>Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER):</td>
</tr>
<tr>
<td></td>
<td>• TABLE</td>
</tr>
<tr>
<td></td>
<td>• TABLE PARTITION</td>
</tr>
<tr>
<td></td>
<td>• TABLE SUBPARTITION</td>
</tr>
<tr>
<td></td>
<td>• INDEX</td>
</tr>
<tr>
<td></td>
<td>• INDEX PARTITION</td>
</tr>
<tr>
<td></td>
<td>• INDEX SUBPARTITION</td>
</tr>
<tr>
<td></td>
<td>• CLUSTER</td>
</tr>
<tr>
<td></td>
<td>• LOB</td>
</tr>
<tr>
<td></td>
<td>• LOB PARTITION</td>
</tr>
<tr>
<td></td>
<td>• LOB SUBPARTITION</td>
</tr>
<tr>
<td>freelist_group_id</td>
<td>Freelist group (instance) whose free list size is to be computed</td>
</tr>
<tr>
<td>free_blks</td>
<td>Returns count of free blocks for the specified group</td>
</tr>
<tr>
<td>scan_limit</td>
<td>Maximum number of free list blocks to read (optional). Use a scan limit of X</td>
</tr>
<tr>
<td></td>
<td>Do I have X blocks on the free list?</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition name of the segment to be analyzed</td>
</tr>
<tr>
<td></td>
<td>This is only used for partitioned tables. The name of subpartition should</td>
</tr>
<tr>
<td></td>
<td>be used when partitioning is composite.</td>
</tr>
</tbody>
</table>
Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);

**Note:** An error is raised if scan_limit is not a positive number.
ISDATAFILEDROPPABLE_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

Syntax

DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (  
    filename     IN     VARCHAR2,  
    value        OUT    NUMBER);  

Pragmas

pragma restrict_references(free_blocks,WNDS);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Name of the file</td>
</tr>
<tr>
<td>value</td>
<td>Values: 0 if the file is not droppable, 1 if the file is droppable.</td>
</tr>
</tbody>
</table>

Examples

DECLARE  
    fname    VARCHAR2(100);  
    retval   NUMBER;  
BEGIN  
    SELECT file_name INTO fname FROM dba_data_files WHERE file_name like '%empty%';  
    DBMS_SPACE.ISDATAFILEDROPPABLE_NAME(fname, retval);  
    DBMS_OUTPUT.PUT_LINE(retval);  
END;  
/
OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS(
    objowner    IN     VARCHAR2,
    objname     IN     VARCHAR2,
    partname    IN     VARCHAR2,
    objtype     IN     NUMBER)
RETURN dependent_segments_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objowner</td>
<td>The schema containing the object</td>
</tr>
<tr>
<td>objname</td>
<td>The name of the object</td>
</tr>
<tr>
<td>partname</td>
<td>The name of the partition</td>
</tr>
<tr>
<td>objtype</td>
<td>Type of the object:</td>
</tr>
<tr>
<td></td>
<td>OBJECT_TYPE_TABLE constant positive := 1;</td>
</tr>
<tr>
<td></td>
<td>OBJECT_TYPE_NESTED_TABLE constant positive := 2;</td>
</tr>
<tr>
<td></td>
<td>OBJECT_TYPE_INDEX constant positive := 3;</td>
</tr>
<tr>
<td></td>
<td>OBJECT_TYPE_CLUSTER constant positive := 4;</td>
</tr>
<tr>
<td></td>
<td>OBJECT_TYPE_TABLE_PARTITION constant positive := 7;</td>
</tr>
<tr>
<td></td>
<td>OBJECT_TYPE_INDEX_PARTITION constant positive := 8;</td>
</tr>
<tr>
<td></td>
<td>OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9;</td>
</tr>
<tr>
<td></td>
<td>OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10;</td>
</tr>
<tr>
<td></td>
<td>OBJECT_TYPE_MV constant positive := 13;</td>
</tr>
<tr>
<td></td>
<td>OBJECT_TYPE_MVLOG constant positive := 14;</td>
</tr>
</tbody>
</table>

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD {
    segment_owner    VARCHAR2(100),
    segment_name     VARCHAR2(100),
    segment_type     VARCHAR2(100),
    tablespace_name  VARCHAR2(100),
    partition_name   VARCHAR2(100),
    lob_column_name  VARCHAR2(100));
```
### Table 145–10  OBJECT_DEPENDENT_SEGMENT Type Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>The schema containing the segment</td>
</tr>
<tr>
<td>segment_name</td>
<td>The name of the segment</td>
</tr>
<tr>
<td>segment_type</td>
<td>The type of the segment, such as table, index or LOB</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>The name of the tablespace</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition, if any</td>
</tr>
<tr>
<td>lob_column_name</td>
<td>The name of the LOB column, if any</td>
</tr>
</tbody>
</table>
OBJECT_GROWTH_TREND Function

This is a table function. The output will be in the form of one or more rows where each row describes the space usage of the object at a specific point in time. Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```sql
DBMS_SPACE.OBJECT_GROWTH_TREND (
    object_owner           IN    VARCHAR2,
    object_name            IN    VARCHAR2,
    object_type            IN    VARCHAR2,
    partition_name         IN    VARCHAR2 DEFAULT NULL,
    start_time             IN    TIMESTAMP DEFAULT NULL,
    end_time               IN    TIMESTAMP DEFAULT NULL,
    interval               IN    DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
    skip_interpolated      IN    VARCHAR2 DEFAULT 'FALSE',
    timeout_seconds        IN    NUMBER DEFAULT NULL,
    single_datapoint_flag  IN    VARCHAR2 DEFAULT 'TRUE'
) RETURN object_growth_trend_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_owner</td>
<td>The schema containing the object</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object</td>
</tr>
<tr>
<td>object_type</td>
<td>The type of the object</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition</td>
</tr>
<tr>
<td>start_time</td>
<td>Statistics generated after this time will be used in generating the growth trend</td>
</tr>
<tr>
<td>end_time</td>
<td>Statistics generated until this time will be used in generating the growth trend</td>
</tr>
<tr>
<td>interval</td>
<td>The interval at which to sample</td>
</tr>
<tr>
<td>skip_interpolated</td>
<td>Whether interpolation of missing values should be skipped</td>
</tr>
<tr>
<td>timeout_seconds</td>
<td>The time-out value for the function in seconds</td>
</tr>
<tr>
<td>single_datapoint_flag</td>
<td>Whether in the absence of statistics the segment should be sampled</td>
</tr>
</tbody>
</table>

Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```sql
TYPE object_growth_trend_row IS RECORD(
    timepoint      TIMESTAMP,
    space_usage    NUMBER,
    space_alloc    NUMBER,
    quality        VARCHAR(20));
```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timepoint</td>
<td>The time at which the statistic was recorded</td>
</tr>
<tr>
<td>space_usage</td>
<td>The space used by data</td>
</tr>
<tr>
<td>space_alloc</td>
<td>The size of the segment including overhead and unused space</td>
</tr>
<tr>
<td>quality</td>
<td>The quality of result: &quot;GOOD&quot;, &quot;INTERPOLATED&quot;, &quot;PROJECTION&quot;</td>
</tr>
</tbody>
</table>

```vbnet
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```
SPACE_USAGE Procedures

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBs, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBs.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBs in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBs.

Syntax

\[
\text{DBMS_SPACE.SPACE_USAGE(}
\begin{align*}
\text{segment_owner} & \quad \text{IN VARCHAR2}, \\
\text{segment_name} & \quad \text{IN VARCHAR2}, \\

print fullb;
UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```
DBMS_SPACE.UNUSED_SPACE (
    segment_owner              IN  VARCHAR2,
    segment_name               IN  VARCHAR2,
    segment_type               IN  VARCHAR2,
    total_blocks               OUT NUMBER,
    total_bytes                OUT NUMBER,
    unused_blocks              OUT NUMBER,
    unused_bytes               OUT NUMBER,
    last_used_extent_file_id   OUT NUMBER,
    last_used_extent_block_id  OUT NUMBER,
    last_used_block            OUT NUMBER,
    partition_name             IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>

</tr>
</tbody>
</table>

Examples

The following declares the necessary bind variables and executes.

```sql
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,
                         :total_bytes, :unused_blocks, :unused_bytes, :lastextf,
                         :last_extb, :lastusedblock);
```
The `DBMS_SPACE_ADMIN` package provides functionality for locally managed tablespaces.

**See Also:** *Oracle Database Administrator’s Guide* for an example and description of using `DBMS_SPACE_ADMIN`.

This chapter contains the following topics:

- **Using DBMS_SPACE_ADMIN**
  - Security Model
  - Constants
  - Operational Notes
- **Summary of DBMS_SPACE_ADMIN Subprograms**
Using DBMS_SPACE_ADMIN

This section contains topics which relate to using the DBMS_SPACE_ADMIN package.

- Security Model
- Constants
- Operational Notes
Security Model

This package runs with SYS privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.
## Constants

### Table 146–1  DBMS_SPACE_ADMIN Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEGMENT_VERIFY_EXTENTS</td>
<td>POSITIVE</td>
<td>1</td>
<td>Verifies that the space owned by segment is appropriately reflected in the bitmap as used</td>
</tr>
<tr>
<td>SEGMENT_VERIFY_EXTENTS_GLOBAL</td>
<td>POSITIVE</td>
<td>2</td>
<td>Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it</td>
</tr>
<tr>
<td>SEGMENT_MARK_CORRUPT</td>
<td>POSITIVE</td>
<td>3</td>
<td>Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation)</td>
</tr>
<tr>
<td>SEGMENT_MARK_VALID</td>
<td>POSITIVE</td>
<td>4</td>
<td>Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.</td>
</tr>
<tr>
<td>SEGMENT_DUMP_EXTENT_MAP</td>
<td>POSITIVE</td>
<td>5</td>
<td>Dumps the extent map for a given segment</td>
</tr>
<tr>
<td>TABLESPACE_VERIFY_BITMAP</td>
<td>POSITIVE</td>
<td>6</td>
<td>Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent</td>
</tr>
<tr>
<td>TABLESPACE_EXTENT_MAKE_FREE</td>
<td>POSITIVE</td>
<td>7</td>
<td>Marks the block range (extent) as free in the bitmaps</td>
</tr>
<tr>
<td>TABLESPACE_EXTENT_MAKE_USED</td>
<td>POSITIVE</td>
<td>8</td>
<td>Marks the block range (extent) as used in the bitmaps</td>
</tr>
<tr>
<td>SEGMENT_VERIFY_BASIC</td>
<td>POSITIVE</td>
<td>9</td>
<td>Performs the basic metadata checks</td>
</tr>
<tr>
<td>SEGMENT_VERIFY_DEEP</td>
<td>POSITIVE</td>
<td>10</td>
<td>Performs deep verification</td>
</tr>
<tr>
<td>SEGMENT_VERIFY_SPECIFIC</td>
<td>POSITIVE</td>
<td>11</td>
<td>Performs a specific check for the segment</td>
</tr>
<tr>
<td>HWM_CHECK</td>
<td>POSITIVE</td>
<td>12</td>
<td>Checks high water mark (HWM)</td>
</tr>
<tr>
<td>BMB_CHECK</td>
<td>POSITIVE</td>
<td>13</td>
<td>Checks integrity among L1, L2 and L3 BMBs (Bit Map Blocks)</td>

<td>27</td>
<td>Dumps only bitmap block summaries</td>
</tr>
</tbody>
</table>
Before migrating the **SYSTEM** tablespace, the following conditions must be met. These conditions are enforced by the `TABLESPACE_MIGRATE_TO_LOCAL` procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not **SYSTEM**.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, then an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.
Summary of DBMS_SPACE_ADMIN Subprograms

Table 146–2  DBMS_SPACE_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASSM_SEGMENT_VERIFY Procedure</td>
<td>Verifies segments created in ASSM (Automatic Segment-Space Management) tablespaces</td>
</tr>
<tr>
<td>ASSM_TABLESPACE_VERIFY Procedure</td>
<td>Verifies ASSM tablespaces</td>
</tr>
<tr>
<td>DROP_EMPTY_SEGMENTS Procedure</td>
<td>Drops segments from empty tables or table fragments and dependent objects</td>
</tr>
<tr>
<td>MATERIALIZE_DEFERRED_SEGMENTS Procedure</td>
<td>Materializes segments for tables and table fragments with deferred segment creation and their dependent objects</td>
</tr>
<tr>
<td>SEGMENT_CORRUPT Procedure</td>
<td>Marks the segment corrupt or valid so that appropriate error recovery can be done</td>
</tr>
<tr>
<td>SEGMENT_DROP_CORRUPT Procedure</td>
<td>Drops a segment currently marked corrupt (without reclaiming space)</td>
</tr>
<tr>
<td>SEGMENT_DUMP Procedure</td>
<td>Dumps the segment header and extent maps of a given segment</td>
</tr>
<tr>
<td>SEGMENT_VERIFY Procedure</td>
<td>Verifies the consistency of the extent map of the segment</td>

<td>Fixes the state of the segments in a tablespace in which migration was aborted</td>
</tr>
<tr>
<td>TABLESPACE_MIGRATE_FROM_LOCAL Procedure</td>
<td>Migrates a locally managed tablespace to dictionary-managed tablespace</td>
</tr>
<tr>
<td>TABLESPACE_MIGRATE_TO_LOCAL Procedure</td>
<td>Migrates a tablespace from dictionary-managed format to locally managed format</td>
</tr>
<tr>
<td>TABLESPACE_REBUILD_BITMAPS Procedure</td>
<td>Rebuilds the appropriate bitmaps</td>
</tr>
<tr>
<td>TABLESPACE_REBUILD QUOTAS Procedure</td>
<td>Rebuilds quotas for the given tablespace</td>
</tr>
<tr>
<td>TABLESPACE_RELOCATE_BITMAPS Procedure</td>
<td>Relocates the bitmaps to the destination specified</td>
</tr>
<tr>
<td>TABLESPACE_VERIFY Procedure</td>
<td>Verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized</td>
</tr>
</tbody>
</table>
ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in Automatic Segment Space Management (ASSM) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, and whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (  
  segment_owner   IN VARCHAR2,  
  segment_name    IN VARCHAR2,  
  segment_type    IN VARCHAR2,  
  partition_name  IN VARCHAR2,  
  verify_option   IN POSITIVE  DEFAULT SEGMENT_VERIFY_BASIC,  
  attrib          IN POSITIVE  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema that owns the segment</td>
</tr>
<tr>
<td>segment_name</td>
<td>Name of the segment to be verified</td>
</tr>
<tr>
<td>segment_type</td>
<td>Segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition or subpartition</td>
</tr>
<tr>
<td>verify_option</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>- SEGMENT_VERIFY_BASIC := 9. Performs the basic metadata checks (Default)</td>
</tr>
<tr>
<td></td>
<td>- SEGMENT_VERIFY_DEEP := 10. Performs deep verification</td>
</tr>
<tr>
<td></td>
<td>- SEGMENT_VERIFY_SPECIFIC := 11. Performs a specific check for the segment</td>
</tr>
</tbody>
</table>
### Usage Notes

- Using this procedure requires **SYSDBA** privileges.
- You can determine the relative file # and header block # (**header_relative_file** and **header_block** parameters) by querying **DBA_SEGMENTS**.
- This procedure outputs a dump file named `sid_ora_process_ID.trc` to the location specified in the **USER_DUMP_DEST** initialization parameter.

---

**Table 146-3 (Cont.) ASSM_SEGMENT_VERIFY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attrib</td>
<td>When option <strong>SEGMENT_VERIFY_SPECIFIC</strong> is specified as option, attrib can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>■ <strong>HWM_CHECK</strong> := 12. Checks whether high water mark information is accurate</td>
</tr>
<tr>
<td></td>
<td>■ <strong>BMB_CHECK</strong> := 13. Checks whether space bitmap blocks have correct backpointers to the segment header</td>
</tr>
<tr>
<td></td>
<td>■ <strong>SEG_DICT_CHECK</strong> := 14. Checks whether dictionary information for segment is accurate</td>
</tr>
<tr>
<td></td>
<td>■ <strong>EXTENT_TS_BITMAP_CHECK</strong> := 15. Checks whether extent maps are consistent with file level bitmaps</td>
</tr>
<tr>
<td></td>
<td>■ <strong>DB_BACKPOINTER_CHECK</strong> := 16. Checks whether datablocks have correct backpointers to the space metadata blocks</td>
</tr>
<tr>
<td></td>
<td>■ <strong>EXTENT_SEGMENT_BITMAP_CHECK</strong> := 17. Checks whether extent map in the segment matches the bitmaps in the segment</td>
</tr>
<tr>
<td></td>
<td>■ <strong>BITMAPS_CHECK</strong> := 18. Checks whether space bitmap blocks are accurate</td>
</tr>
</tbody>
</table>
ASSM_TABLESPACE_VERIFY Procedure

This procedures verifies all the segments created in an ASSM tablespace. The verification for each segment performs basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```sql
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (  
tablespace_name   IN VARCHAR2,  
ts_option         IN POSITIVE,  
segment_option    IN POSITIVE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace to verify. The tablespace must be an ASSM tablespace.</td>
</tr>
<tr>
<td>ts_option</td>
<td></td>
</tr>
</tbody>
</table>
| ■ TS_VERIFY_BITMAPS := 19. The bitmaps are verified against the extents. This detects bits that are marked used or free wrongly and detects multiple allocation of extents. The file metadata is validated against file$ and control file.  
| ■ TS_VERIFY_DEEP := 20. This option is used to verify the file bitmaps as well perform checks on all the segments.  
| ■ TS_VERIFY_SEGMENTS := 21. This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally you can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY.  
| segment_option    | When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following:  
| ■ SEGMENT_VERIFY_BASIC := 9  
| ■ SEGMENT_VERIFY_DEEP := 10  
| The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BITMAPS is specified. |

Usage Notes

- Using this procedure requires SYSDBA privileges.
- This procedure outputs a dump file named sid_ora_process_ID.trc to the location specified in the USER_DUMP_DEST initialization parameter.
**DROP_EMPTY_SEGMENTS Procedure**

This procedure drops segments from empty tables or table fragments and dependent objects.

**Syntax**

```
DBMS_SPACE_ADMIN.DROP_EMPTY_SEGMENTS (
    schema_name       IN     VARCHAR2   DEFAULT NULL,
    table_name        IN     VARCHAR2   DEFAULT NULL,
    partition_name    IN     VARCHAR2   DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of table</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of partition</td>
</tr>
</tbody>
</table>

**Usage Notes**

Given a schema name, this procedure scans all tables in the schema. For each table, if the table or any of its fragments are found to be empty, and the table satisfies certain criteria (restrictions being the same as those described in "Restrictions on Deferred Segment Creation"), then the empty table fragment and associated index segments are dropped along with the corresponding LOB data and index segments. A subsequent insert creates segments with the same properties.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned
- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects
MAT mighty DEFERRED SEGMENTS Procedure

This procedure materializes segments for tables and table fragments with deferred segment creation and their dependent objects.

Syntax

```sql
DBMS_SPACE_ADMIN.MATERIALIZE_DEFERRED_SEGMENTS (  
    schema_name       IN   VARCHAR2   DEFAULT NULL,  
    table_name        IN   VARCHAR2   DEFAULT NULL,  
    partition_name    IN   VARCHAR2   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of table</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of partition</td>
</tr>
</tbody>
</table>

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the deferred or delayed segment property is set for the table or any of its fragments, then a new segment is created for those fragments and their dependent objects.

Optionally:
- No `schema_name` is specified, in which case tables belonging to all schemas are scanned
- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects
SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be done. It cannot be used on the SYSTEM tablespace.

Syntax

DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (  
  tablespace_name         IN    VARCHAR2,  
  header_relative_file    IN    POSITIVE,  
  header_block            IN    POSITIVE,  
  corrupt_option          IN    POSITIVE  DEFAULT SEGMENT_MARK_CORRUPT);  

Parameters

Table 146-7  SEGMENT_CORRUPT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
<tr>
<td>corrupt_option</td>
<td>SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID</td>
</tr>
</tbody>
</table>

Usage Notes

You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

The following example marks the segment as corrupt:

EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_MARK_CORRUPT);

Alternately, the next example marks a corrupt segment valid:

EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_MARK_VALID);
SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space). For this to work, the segment must be marked temporary. To mark a corrupt segment as temporary, issue a DROP command on the segment.

Syntax

```sql
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (  
tablespace_name     IN    VARCHAR2,
header_relative_file IN    POSITIVE,
header_block         IN    POSITIVE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
</tbody>
</table>

Usage Notes

- The space for the segment is not released, and it must be fixed by using the TABLESPACE_FIX_BITMAPS Procedure or the TABLESPACE_REBUILD_BITMAPS Procedure.
- The procedure cannot be used on the SYSTEM tablespace.
- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

```sql
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```
SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```sql
DBMS_SPACE_ADMIN.SEGMENT_DUMP (    tablespace_name IN VARCHAR2,    header_relative_file IN POSITIVE,    header_block IN POSITIVE,    dump_option IN POSITIVE DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
<tr>
<td>dump_option</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>SEGMENT_DUMP_EXTENT_MAP</td>
</tr>
<tr>
<td></td>
<td>SEGMENT_DUMP_BITMAP_SUMMARY</td>
</tr>
</tbody>
</table>

Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass SEGMENT_DUMP_BITMAP_SUMMARY as the dump_option parameter.
- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.HEADER_FILE. If HEADER_FILE is greater than 1023 then use DBA_DATA_FILES.RELATIVE_FNO.

Examples

```sql
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```
SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```sql
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
    tablespace_name    IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block       IN    POSITIVE,
    verify_option      IN    POSITIVE  DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
<tr>
<td>verify_option</td>
<td>What kind of check to do: SEGMENT_VERIFY_EXTENTS or SEGMENT_VERIFY_EXTENTS_GLOBAL</td>
</tr>
</tbody>
</table>

Usage Notes

- Anomalies are output as block range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all block ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.

- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps synchronized.

```sql
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_VERIFY_EXTENTS);
```
TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate block range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (  
tablespace_name         IN    VARCHAR2,  
dbarange_relative_file  IN    POSITIVE,  
dbarange_begin_block    IN    POSITIVE,  
dbarange_end_block      IN    POSITIVE,  
fix_option              IN    POSITIVE);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>dbarange_relative_file</td>
<td>Relative file number of block range (extent)</td>
</tr>
<tr>
<td>dbarange_begin_block</td>
<td>Block number of beginning of extent</td>
</tr>
<tr>
<td>dbarange_end_block</td>
<td>Block number (inclusive) of end of extent</td>
</tr>
<tr>
<td>fix_option</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>• TABLESPACE_EXTENT_MAKE_FREE</td>
</tr>
<tr>
<td></td>
<td>• TABLESPACE_EXTENT_MAKE_USED</td>
</tr>
</tbody>
</table>
```

Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as USED in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83, DBMS_SPACE_ADMIN.EXTENT_MAKE_USED);
```

Alternatively, specifying an option of TABLESPACE_EXTENT_MAKE_FREE marks the bits free in bitmaps. The BEGIN and END blocks must be in extent boundary and be extent multiple; otherwise, an error is raised.
TABLESPACE_FIX_SEGMENT_STATES Procedure

This procedure fixes the state of the segments in a tablespace in which migration was aborted. During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, then the segment states are corrected by SMON when event 10906 is set. A database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (
    tablespace_name IN VARCHAR);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace whose segments must be fixed</td>
</tr>
</tbody>
</table>

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1')
```
TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally managed tablespace to a dictionary-managed tablespace.

Syntax

DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (
    tablespace_name IN VARCHAR2);

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
</tbody>
</table>

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```
TABLESPACE_MIGRATE_TO_LOCAL Procedure

This procedure migrates the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

```sql
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (   .tablespace_name     IN     VARCHAR2,
    unit_size           IN     POSITIVE DEFAULT NULL,
    rfno                IN     POSITIVE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace to be migrated</td>
</tr>
<tr>
<td>unit_size</td>
<td>Bitmap unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace specified in number of blocks</td>
</tr>
<tr>
<td>rfno</td>
<td>Relative File Number of the file where the bitmap blocks are placed</td>
</tr>
</tbody>
</table>

Usage Notes

- Before you migrate the `SYSTEM` tablespace, migrate any dictionary-managed tablespaces that you want to use in read/write mode to locally managed. After the `SYSTEM` tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

  See Also: Oracle Database Administrator’s Guide

- The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.

- Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the `MINIMUM EXTENT` for the tablespace (5 if `MINIMUM EXTENT` is not specified). Thus, the calculated value will not be larger than the `MINIMUM EXTENT` for the tablespace. The last free extent in every file is ignored for GCD calculation. If you specify the unit size, then it must be a factor of the `unit_size` calculated by the system; otherwise an error message is returned.

- The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, then an error is issued. The data file specified must be part of the tablespace being migrated. If the dataflow is not specified, then the system chooses a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, then an error is raised.

Examples

To migrate a tablespace 'TS1' in 2KB blocksize with minimum extent size 1MB:

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```
The bitmaps are placed in file with relative file number 2.
TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
    tablespace_name       IN    VARCHAR2,
    bitmap_relative_file  IN    POSITIVE   DEFAULT NULL,
    bitmap_block          IN    POSITIVE   DEFAULT NULL);
```

Parameters

```
Table 146–15   TABLESPACE_REBUILD_BITMAPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>bitmap_relative_file</td>
<td>Relative file number of bitmap block to rebuild</td>
</tr>
<tr>
<td>bitmap_block</td>
<td>Block number of bitmap block to rebuild</td>
</tr>
</tbody>
</table>
```

Usage Notes

Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the USERS tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```
**TABLESPACE_REBUILD_QUOTAS Procedure**

This procedure rebuilds quotas for the given tablespace.

**Syntax**

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (  
    tablespace_name        IN    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
</tbody>
</table>

**Examples**

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```
TABLESPACE_RELOCATE_BITMAPS Procedure

This procedure relocates the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (  
    tablespace_name IN VARCHAR2,  
    filno IN POSITIVE,  
    blkno IN POSITIVE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>filno</td>
<td>Relative File Number of the destination file</td>
</tr>
<tr>
<td>blkno</td>
<td>Block Number of the destination range</td>
</tr>
</tbody>
</table>

Usage Notes

- Migration of a tablespace from dictionary-managed to locally managed format could result in the creation of **SPACE HEADER** segment that contains the bitmap blocks. The **SPACE HEADER** segment is treated as user data. If you explicitly resize a file at or below the space header segment, then an error is issued. Use the **TABLESPACE_RELOCATE_BITMAPS** command to move the control information to a different destination and then resize the file.
- This procedure cannot be used on the **SYSTEM** tablespace.
- The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

---

**Note:** The source and the destination addresses must not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location, then an error is raised.
TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (
    tablespace_name         IN    VARCHAR2,
    verify_option           IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>verify_option</td>
<td>One option is supported: TABLESPACE_VERIFY_BITMAP</td>
</tr>
</tbody>
</table>

Examples

EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
The DBMS_SPD package provides subprograms for managing SQL plan directives (SPD).

This chapter contains the following topics:
- Using DBMS_SPD
  - Overview
  - Security Model
  - Views
- Summary of DBMS_SPD Subprograms
Using DBMS_SPD

- Overview
- Security Model
- Views
Overview

This package provides subprograms for managing SQL plan directives (SPD). SPD are objects generated automatically by Oracle. For example, if Oracle detects that the single table cardinality estimated made by the optimizer is different from the actual number of rows returned when accessing the table, it will automatically create a directive to perform dynamic statistics for the table. When any SQL statement referencing the table is compiled, the optimizer will perform dynamic statistics for the table to get a more accurate estimate.
Security Model

DBMS_SPD is an invoker-rights package. The invoker requires ADMINISTER SQL MANAGEMENT OBJECT privilege for executing most of the subprograms in this package. Also, the subprograms commit the current transaction (if any), perform the operation, and then commit it again.
Views

The DBA view `DBA_SQL_PLAN_DIRECTIVES` shows all the directives created in the system and the view `DBA_SQL_PLAN_DIR_OBJECTS` displays the objects that are included in the directives.
### Summary of DBMS_SPD Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_SQL_PLAN_DIRECTIVE</td>
<td>Changes different attributes of a SQL plan directive</td>
</tr>
<tr>
<td>CREATE_STGTAB_DIRECTIVE</td>
<td>Creates a staging table into which to pack (export) SQL plan directives.</td>
</tr>
<tr>
<td>DROP_SQL_PLAN_DIRECTIVE</td>
<td>Drops a SQL plan directive</td>
</tr>
<tr>
<td>FLUSH_SQL_PLAN_DIRECTIVE</td>
<td>Allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.</td>
</tr>
<tr>
<td>GET_PREFS</td>
<td>Gets the values for preferences for SQL plan directives</td>
</tr>
<tr>
<td>PACK_STGTAB_DIRECTIVE</td>
<td>Packs (exports) SQL plan directives into a staging table.</td>
</tr>
<tr>
<td>SET_PREFS</td>
<td>Allows the setting of different preferences for SQL plan directives</td>
</tr>
<tr>
<td>UNPACK_STGTAB_DIRECTIVE</td>
<td>Unpacks (imports) SQL plan directives from a staging table.</td>
</tr>
</tbody>
</table>
**ALTER_SQL_PLAN_DIRECTIVE Procedure**

This procedure changes different attributes of a SQL plan directive.

**Syntax**

```sql
DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE(
    directive_id IN NUMBER,
    attribute_name IN VARCHAR2,
    attribute_value IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directive_id</td>
<td>SQL plan directive ID</td>
</tr>
<tr>
<td>attribute_name</td>
<td>- ENABLED</td>
</tr>
<tr>
<td></td>
<td>- AUTO_DROP</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>- ENABLED:</td>
</tr>
<tr>
<td></td>
<td>- If YES directive is enabled and may be used</td>
</tr>
<tr>
<td></td>
<td>- If NO  directive is not enabled and will not be used</td>
</tr>
<tr>
<td></td>
<td>- AUTO_DROP:</td>
</tr>
<tr>
<td></td>
<td>- If YES directive will be dropped automatically if not used for SPD_RETENTION_WEEKS. This is the default behavior.</td>
</tr>
<tr>
<td></td>
<td>- If NO  directive will not be dropped automatically</td>
</tr>
</tbody>
</table>

**Exceptions**

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

**Usage Notes**

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

**Examples**

```sql
BEGIN
    DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (12345, 'STATE', 'PERMANENT');
END;
```
CREATE_STGTAB_DIRECTIVE Procedure

This procedure creates a staging table into which to pack (export) SQL plan directives.

Syntax

```sql
DBMS_SPD.CREATE_STGTAB_DIRECTIVE (  
    table_name         IN VARCHAR2,
    table_owner        IN VARCHAR2  := USER,
    tablespace_name    IN VARCHAR2  := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of schema owner of staging table. Default is current schema.</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace. Default NULL means create staging table in the default tablespace:</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-13159 TABLE_ALREADY_EXISTS: The specified table already exists.
- ORA-29304 TABLESPACE_MISSING: The specified tablespace does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
DROP_SQL_PLAN_DIRECTIVE Procedure

This procedure drops a SQL plan directive.

Syntax

DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (
   directive_id        IN     NUMBER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directive_id</td>
<td>SQL plan directive ID</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

BEGIN
   DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (12345);
END;
FLUSH_SQL_PLAN_DIRECTIVE Procedure

This procedure allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements. The information recorded in the SGA is periodically flushed by an Oracle background process. This procedure provides a way to flush the information manually.

Syntax

```
DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
```

Exceptions

ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
END;
```
GET_PREFS Function

This function returns the value for the specified preferences for SQL plan directives.

Syntax

```sql
DBMS_SPD.GET_PREFS (
    pname IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Preference name. The procedure supports the preference SPD_RETENTION_WEEKS.</td>
</tr>
</tbody>
</table>

Return Values

Preference value

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.

Usage Notes

- The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
- SPD_RETENTION_WEEKS - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```sql
SELECT DBMS_SPD.GET_PREFS('SPD_RETENTION_WEEKS') FROM DUAL;
```
PACK_STGTAB_DIRECTIVE Function

This function packs (exports) SQL plan directives into a staging table.

Syntax

```
DBMS_SPD.PACK_STGTAB_DIRECTIVE (  
  table_name  IN VARCHAR2,  
  table_owner IN VARCHAR2 := USER,  
  directive_id IN NUMBER := NULL,  
  obj_list    IN OBJECTTAB := NULL)  
RETURN NUMBER
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of schema owner of staging table. Default is current schema.</td>
</tr>
<tr>
<td>directive_id</td>
<td>SQL plan directive ID. Default NULL means all directives in the system.</td>
</tr>
<tr>
<td>obj_list</td>
<td>Used to filter the directives to be packed based on the objects used in directives. If obj_list is not NULL, a directive is packed only if all the objects in the directive exist in obj_list.</td>
</tr>
</tbody>
</table>

Return Values

Number of SQL plan directives packed.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

-- Pack all directives in the system
SELECT DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Pack directives relevant to objects in SH schema
DECLARE
my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
dir_cnt  NUMBER;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := NULL;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.PACK_STG_TAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Pack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
dir_cnt  NUMBER;
BEGIN
  my_list.extend(2);

  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.PACK_STG_TAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
**SET_PREFS Procedure**

This procedure allows the setting of different preferences for SQL plan directives.

**Syntax**

```sql
DBMS_SPD.SET_PREFS (  
  pname     IN   VARCHAR2,  
  pvalue    IN   VARCHAR2);
```

**Parameters**

*Table 147–7  SET_PREFS Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Preference name. The procedure supports the preference <strong>SPD_RETENTION_WEEKS</strong>.</td>
</tr>
</tbody>
</table>
| pvalue    | Preference value.  
  - **SPD_RETENTION_WEEKS**: SQL plan directives are purged if not used for more than the value set for this preference. Default is 53 (**SPD_RETENTION_WEEKS_DEFAULT**) weeks, which means a directive is purged if it has been left unused for little over a year. It can be set to any value greater than or equal to 0. Also value **NULL** can be passed to set the preference to default. |

**Exceptions**

- ORA-38171 **INSUFFICIENT_PRIVILEGE**: The user does not have proper privilege to perform the operation.
- ORA-28104 **INVALID_INPUT**: The input value is not valid.

**Usage Notes**

- The **ADMINISTER SQL MANAGEMENT OBJECT** privilege is required to execute this procedure.
- **SPD_RETENTION_WEEKS** - SQL plan directives are purged if not used for more than the value set for this preference.

**Examples**

```sql
BEGIN
  DBMS_SPD.SET_PREFS('SPD_RETENTION_WEEKS', '4');
END;
```
UNPACK_STGTAB_DIRECTIVE Function

This procedure unpacks (imports) SQL plan directives from a staging table.

Syntax

```sql
DBMS_SPD.UNPACK_STGTAB_DIRECTIVE (
    table_name    IN VARCHAR2,
    table_owner   IN VARCHAR2 := USER,
    directive_id  IN NUMBER := NULL,
    obj_list      IN OBJECTTAB := NULL)
RETURN NUMBER
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of schema owner of staging table. Default is current schema.</td>
</tr>
<tr>
<td>directive_id</td>
<td>SQL plan directive ID. Default NULL means all directives in the system.</td>
</tr>
<tr>
<td>obj_list</td>
<td>Used to filter the directives to be unpacked based on the objects used in directives. If obj_list is not NULL, a directive is unpacked only if all the objects in the directive exist in obj_list.</td>
</tr>
</tbody>
</table>

Return Values

Number of SQL plan directives unpacked.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT DOES NOT EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```sql
-- Unpack all directives in the staging table
SELECT DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Unpack directives relevant to objects in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  number;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := null;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Unpack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(2);

  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
The DBMS_SPM package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

Using DBMS_SPM

- Overview
- Security Model
- Constants
- Examples
Overview

The DBMS_SPM package allows the user to manage SQL execution plans using SQL plan management. SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.

- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.

- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution plans developed under a standard test configuration for the new SQL statements. If the system production configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.
Security Model

The package is owned by SYS. The EXECUTE package privilege is required to execute its procedures. Any user granted the ADMINISTER SQL MANAGEMENT OBJECT privilege is able to execute the DBMS_SPM package.
### Constants

The `DBMS_SPM` package uses the constants shown in Table 148–1, "DBMS_SPM Constants". These constants are defined as standard input for the `time_limit` parameter of the `EVOLVE_SQL_PLAN_BASELINE` Function.

**Table 148–1  DBMS_SPM Constants**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTO_LIMIT</td>
<td>INTEGER</td>
<td>2147483647</td>
<td>Oracle determines the appropriate time spent by the <code>EVOLVE_SQL_PLAN_BASELINE</code> Function.</td>
</tr>
<tr>
<td>NO_LIMIT</td>
<td>INTEGER</td>
<td>2147483647 -1</td>
<td>There is no limit to the time spent by the <code>EVOLVE_SQL_PLAN_BASELINE</code> Function.</td>
</tr>
</tbody>
</table>
Examples

Detailed examples are located under the following topics:

■ Migrating Stored Outlines to SQL Plan Baselines
■ Migrating Outlines to Utilize SQL Plan Management Features
■ Migrating Outlines to Preserve Stored Outline Behavior
■ Performing Follow-Up Tasks After Stored Outline Migration
Data Structures

The DBMS_SPM package defines a TABLE type.

Table Types

- NAMELIST Table Type
NAMELIST Table Type

This type allows for a list of names as an input parameter.

Syntax

```
TYPE name_list IS TABLE OF VARCHAR2(30);```

Summary of DBMS_SPM Subprograms

This table lists the package subprograms in alphabetical order.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT_SQL_PLAN_BASELINE Procedure on page 148-11</td>
<td>Accepts a plan based on the recommendation of an evolve task</td>
</tr>
<tr>
<td>ALTER_SQL_PLAN_BASELINE Function on page 148-12</td>
<td>Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format</td>
</tr>
<tr>
<td>CANCEL_EVOLVE_TASK Procedure on page 148-14</td>
<td>Cancels a currently executing evolve task</td>
</tr>
<tr>
<td>CONFIGURE Procedure on page 148-15</td>
<td>Sets configuration options for SQL management base, in parameter/value format</td>
</tr>
<tr>
<td>CREATE_EVOLVE_TASK Function on page 148-16</td>
<td>Creates an advisor task and sets its parameters</td>
</tr>
<tr>
<td>CREATE_STGTAB_BASELINE Procedure on page 148-17</td>
<td>Creates a staging table that used for transporting SQL plan baselines from one system to another</td>

<tr>
<td><code>REPORT_EVOLVE_TASK Function</code></td>
<td>Displays the results of an evolved task</td>
</tr>
<tr>
<td><code>SET_EVOLVE_TASK_PARAMETER Procedure</code></td>
<td>Sets a parameter of an evolve task</td>
</tr>
<tr>
<td><code>UNPACK_STGTAB_BASELINE Function</code></td>
<td>Unpacks (imports) SQL plan baselines from a staging table into SQL management base</td>
</tr>
</tbody>
</table>
**ACCEPT_SQL_PLAN_BASELINE Procedure**

The procedure accepts a plan based on the recommendation of an evolve task.

**Syntax**

```sql
DBMS_SPM.ACCEPT_SQL_PLAN_BASELINE  (
   task_name       IN  VARCHAR2,
   object_id       IN  NUMBER    := NULL,
   task_owner      IN  VARCHAR2  := NULL,
   force           IN  BOOLEAN   := FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to implement</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the evolve task. Defaults to the current schema owner.</td>
</tr>
<tr>
<td>force</td>
<td>Accept the plan even if the advisor did not recommend such an action. The default is FALSE requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.</td>
</tr>
</tbody>
</table>
ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

Syntax

```sql
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (sql_handle        IN VARCHAR2 := NULL,
plan_name         IN VARCHAR2 := NULL,
attribute_name    IN VARCHAR2,
attribute_value   IN VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of plan attribute to set (see table below).</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Value of plan attribute to use (see table below).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status.</td>
<td>'YES' or 'NO'</td>
</tr>
<tr>
<td>fixed</td>
<td>'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.</td>
<td>'YES' or 'NO'</td>
</tr>
<tr>
<td>autopurge</td>
<td>'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.</td>
<td>'YES' or 'NO'</td>
</tr>
<tr>
<td>plan_name</td>
<td>Name of the plan</td>
<td>String of up to 30 characters</td>
</tr>
<tr>
<td>description</td>
<td>Plan description.</td>
<td>String of up to 500 bytes</td>
</tr>
</tbody>
</table>

Return Values

The number of plans altered.
Usage Notes

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).
CANCEL_EVOLVE_TASK Procedure

The procedure cancels a currently executing evolve task. All intermediate results are removed from the task.

Syntax

```
DBMS_SPM.CANCEL_EVOLVE_TASK  (
    task_name    IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Table 148–6 CANCEL_EVOLVE_TASK Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>--------------</td>
</tr>
<tr>
<td>task_name</td>
</tr>
</tbody>
</table>
CONFIGURE Procedure

This procedure sets configuration options for SQL management base, in parameter/value format. This function can be called numerous times, each time setting a different configuration option.

Syntax

```sql
DBMS_SPM.CONFIGURE (
    parameter_name    IN VARCHAR2,
    parameter_value   IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter_name</td>
<td>Name of parameter to set (see table below)</td>
</tr>
<tr>
<td>parameter_value</td>
<td>Value of parameter to use (see table below)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Possible Values</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>space_budget_percent</td>
<td>Maximum percent of SYSAUX space that can be used for SQL management base</td>
<td>1,2, ..., 50</td>
<td>10</td>
</tr>
<tr>
<td>plan_retention_weeks</td>
<td>Number of weeks to retain unused plans before they are purged</td>
<td>5,6, ..., 523</td>
<td>53</td>
</tr>
</tbody>
</table>

Usage Notes

- The default space budget for SQL management base is no more than ten percent of the size of SYSAUX tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).
- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.
CREATE_EVOLVE_TASK Function

The function has two overloads, both of which create an advisor task and sets its parameters. This version which takes a SQL handle creates an evolve task in order to evolve one or more plans for a given SQL statement.

Syntax

```
DBMS_SPM.CREATE_EVOLVE_TASK (  
    sql_handle    IN  VARCHAR2  := NULL,  
    plan_name     IN  VARCHAR2  := NULL,  
    time_limit    IN  NUMBER    := DBMS_SPM.AUTO_LIMIT,  
    task_name     IN  VARCHAR2  := NULL,  
    description   IN  VARCHAR2  := NULL)  
RETURN VARCHAR2;

DBMS_SPM.CREATE_EVOLVE_TASK (  
    plan_list     IN  DBMS_SPM.NAME_LIST,  
    time_limit    IN  NUMBER    := DBMS_SPM.AUTO_LIMIT,  
    task_name     IN  VARCHAR2  := NULL,  
    description   IN  VARCHAR2  := NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>Handle of a SQL statement. The default NULL considers all SQL statements with non-accepted plans.</td>
</tr>
<tr>
<td>plan_list</td>
<td>List of plan names. The plans may belong to different SQL statements.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan identifier. The default NULL considers all non-accepted plans of the specified SQL handle or all SQL statements if the SQL handle is NULL.</td>
</tr>
<tr>
<td>time_limit</td>
<td>Time limit in number of minutes. The time limit is global and it is used in the following manner. The time limit for first non-accepted plan is equal to the input value. The time limit for the second non-accepted plan is equal to (input value - time spent in first plan verification) and so on. The default DBMS_SPM.AUTO_LIMIT means let the system choose an appropriate time limit based on the number of plan verifications required to be done. The value DBMS_SPM.NO_LIMIT means no time limit.</td>
</tr>
<tr>
<td>task_name</td>
<td>Evolve task name</td>
</tr>
<tr>
<td>description</td>
<td>Description of the task (maximum 256 characters)</td>
</tr>
</tbody>
</table>

Return Values

SQL evolve task unique name
CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

Syntax

```sql
DBMS_SPM.CREATE_STGTAB_BASELINE (  
  table_name        IN VARCHAR2,
  table_owner       IN VARCHAR2 := NULL,
  tablespace_name   IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table to create for the purpose of packing and unpacking SQL plan baselines</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of owner of the staging table. Default NULL means current schema is the table owner.</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace. Default NULL means create staging table in the default tablespace.</td>
</tr>
</tbody>
</table>

Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system
DROP_EVOLVE_TASK Procedure

The procedure drops an evolved task.

Syntax

```sql
DBMS_SPM.DROP_EVOLVE_TASK  (  
    task_name   IN  VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to drop</td>
</tr>
</tbody>
</table>
DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```sql
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
    sql_handle  IN VARCHAR2 := NULL,
    plan_name   IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If NULL then plan_name must be specified.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name. It identifies a specific plan. Default NULL means to drop all plans associated with the SQL statement identified by sql_handle.</td>
</tr>
</tbody>
</table>

Return Values

The number of plans dropped
EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans. If interrogated by the user (parameter verify = 'YES'), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter commit = 'YES').

The second form of the function employs a plan list format.

Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
   sql_handle   IN VARCHAR2 := NULL,
   plan_name    IN VARCHAR2 := NULL,
   time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
   verify       IN VARCHAR2 := 'YES',
   commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
   plan_list    IN DBMS_SPM.NAME_LIST,
   time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
   verify       IN VARCHAR2 := 'YES',
   commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement identifier. Unless plan_name is specified, NULL means to consider all statements with non-accepted plans in their SQL plan baselines.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan identifier. Default NULL means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if sql_handle is NULL.</td>
</tr>
<tr>
<td>plan_list</td>
<td>A list of plan names. Each plan in the list can belong to same or different SQL statement.</td>
</tr>
<tr>
<td>time_limit</td>
<td>Time limit in number of minutes. This applies only if verify = 'YES'. The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on.</td>
</tr>
</tbody>
</table>

- **DBMS_SPM.AUTO_LIMIT** (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done.
- **DBMS_SPM.NO_LIMIT** means there is no time limit.
- A positive integer value represents a user specified time limit.
Summary of DBMS_SPM Subprograms

Table 148–13  (Cont.) EVOLVE_SQL_PLAN_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verify</td>
<td>Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan.</td>
</tr>
<tr>
<td></td>
<td>■ ‘YES’ (Default) - verifies that a non-accepted plan gives better performance before changing it to an accepted plan</td>
</tr>
<tr>
<td></td>
<td>■ ‘NO’ - directs not to execute plans but only to change non-accepted plans into accepted plans</td>
</tr>
<tr>
<td>commit</td>
<td>Specifies whether to update the ACCEPTED status of non-accepted plans from ‘NO’ to ‘YES’.</td>
</tr>
<tr>
<td></td>
<td>■ ‘YES’ (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when verify = ‘YES’.</td>
</tr>
<tr>
<td></td>
<td>■ ‘NO’ - generate a report without any updates. Note that commit = ‘NO’ together with verify = ‘NO’ represents a no-op.</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if verify = ‘YES’ the result of their performance verification.

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.
EXECUTE_EVOLVE_TASK Function

The function executes a previously created evolve task.

Syntax

```
DBMS_SPM.EXECUTE_EVOLVE_TASK  (  
  task_name        IN  VARCHAR2,
  execution_name   IN  VARCHAR2  := NULL,
  execution_desc   IN  VARCHAR2  := NULL);
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Evolve task name</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by the function.</td>
</tr>
<tr>
<td>execution_desc</td>
<td>Description of the execution (maximum 256 characters)</td>
</tr>
</tbody>
</table>

Return Values

Name of the new execution
IMPLEMENT_EVOLVE_TASK Function

The function implements all the actions recommended by an evolve task.

Syntax

```sql
DBMS_SPM.IMPLEMENT_EVOLVE_TASK  (
    task_name       IN  VARCHAR2,
    task_owner      IN  VARCHAR2  := NULL,
    execution_name  IN  VARCHAR2  := NULL,
    force           IN BOOLEAN    := FALSE)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to report</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the evolve task. Defaults to the current schema owner.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name to qualify and identify an execution. If NULL, the action will be taken for the last task execution.</td>
</tr>
<tr>
<td>force</td>
<td>Accept all plans even if the advisor did not recommend such an action. The default is FALSE requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.</td>
</tr>
</tbody>
</table>

Return Values

The number of plans accepted
INTERRUPT_EVOLVE_TASK Procedure

The procedure interrupts a currently executing evolve task. The task ends its operations as at a normal exit and the user can access the intermediate results. The task can be resumed later.

Syntax

```
DBMS_SPM.INTERRUPT_EVOLVE_TASK  (
    task_name   IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to interrupt</td>
</tr>
</tbody>
</table>
LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using attribute_name and attribute_value pair.

Syntax

```sql
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (sql_id            IN  VARCHAR2,
plan_hash_value   IN  NUMBER   := NULL,
sql_text          IN  CLOB,
fixed             IN  VARCHAR2 := 'NO',
enabled           IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (sql_id            IN  VARCHAR2,
plan_hash_value   IN  NUMBER   := NULL,
sql_handle        IN  VARCHAR2,
fixed             IN  VARCHAR2 := 'NO',
enabled           IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (sql_id            IN  VARCHAR2,
plan_hash_value   IN  NUMBER   := NULL,
fixed             IN  VARCHAR2 := 'NO',
enabled           IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (attribute_name   IN VARCHAR2,
attribute_value  IN VARCHAR2,
fixed            IN VARCHAR2 := 'NO',
enabled          IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID.</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.</td>
</tr>
</tbody>
</table>
LOAD_PLANS_FROM_CURSOR_CACHE Functions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The sql_handle must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.</td>
</tr>
<tr>
<td>fixed</td>
<td>Default ‘NO’ means the loaded plans are used as non-fixed plans. Value ‘YES’ means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>One of possible attribute names:</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Attribute value is used as a search pattern of LIKE predicate if attribute name is ‘SQL_TEXT’. Otherwise, it is used as an equality search value. (For example, for specifying attribute_name =&gt; 'SQL_TEXT', and attribute_value =&gt; '% HR-123 %', means applying SQL_TEXT LIKE '% HR-123 %' as a selection filter. Similarly, specifying attribute_name =&gt; 'MODULE', and attribute_value =&gt; 'HR' means applying 'MODULE = HR' as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is ‘SQL_TEXT’.</td>
</tr>
<tr>
<td>enabled</td>
<td>Default ‘YES’ means the loaded plans are enabled for use by the optimizer</td>
</tr>
</tbody>
</table>

Return Values

Number of plans loaded

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.
LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

Syntax

```sql
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (  
    sqlset_name      IN  VARCHAR2,  
    sqlset_owner     IN  VARCHAR2 := NULL,  
    basic_filter     IN  VARCHAR2 := NULL,  
    fixed            IN  VARCHAR2 := 'NO',  
    enabled          IN  VARCHAR2 := 'YES'  
commit_rows      IN  NUMBER   := 1000)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Name of the STS from where the plans are loaded into SQL plan baselines</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Owner of STS. NULL means current schema is the owner.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any WHERE clause predicate that can specified against the view DBA_SQLSET_STATEMENTS. For example <code>basic_filter =&gt; 'sql_text like '%LOAD_STS%'' or basic_filter =&gt; 'sql_id='b62q7nc33gzwx''</code>.</td>
</tr>
<tr>
<td>fixed</td>
<td>Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.</td>
</tr>
<tr>
<td>enabled</td>
<td>Default 'YES' means the loaded plans are enabled for use by the optimizer.</td>
</tr>
<tr>
<td>commit_rows</td>
<td>Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.</td>
</tr>
</tbody>
</table>

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.
MIGRATE_STORED_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

Syntax

DBMS_SPM.MIGRATE_STORED_OUTLINE (attribute_name IN VARCHAR2, attribute_value IN CLOB, fixed IN VARCHAR2 := 'NO') RETURN CLOB;

DBMS_SPM.MIGRATE_STORED_OUTLINE (outln_list IN DBMS_SPM.NAME_LIST, fixed IN VARCHAR2 := 'NO') RETURN CLOB;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name</td>
<td>Specifies the type of parameter used in attribute_value to identify the migrated stored outlines. It is case insensitive. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• outline_name</td>
</tr>
<tr>
<td></td>
<td>• sql_text</td>
</tr>
<tr>
<td></td>
<td>• category</td>
</tr>
<tr>
<td></td>
<td>• all</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Based on attribute_name, this can be:</td>
</tr>
<tr>
<td></td>
<td>• Name of stored outline to be migrated</td>
</tr>
<tr>
<td></td>
<td>• SQL text of stored outlines to be migrated</td>
</tr>
<tr>
<td></td>
<td>• Category of stored outlines to be migrated</td>
</tr>
<tr>
<td></td>
<td>• NULL if attribute_name is all</td>
</tr>
<tr>
<td>fixed</td>
<td>NO (default) or YES. Specifies the “fixed” status of the plans generated during migration. By default, plans are generated as “non-fixed” plans.</td>
</tr>
<tr>
<td>outln_list</td>
<td>List of outline names to be migrated</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

• Number of stored outlines successfully migrated
Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

Usage Note

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.

- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to `DEFAULT`. The module name of a plan baseline is set to be the same as the stored outline.

- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.

- When user specifies to migrate all, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.
PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```sql
DBMS_SPM.PACK_STGTAB_BASELINE (
  table_name       IN VARCHAR2,
  table_owner      IN VARCHAR2 := NULL,
  sql_handle       IN VARCHAR2 := NULL,
  plan_name        IN VARCHAR2 := NULL,
  sql_text         IN CLOB     := NULL,
  creator          IN VARCHAR2 := NULL,
  origin           IN VARCHAR2 := NULL,
  enabled          IN VARCHAR2 := NULL,
  accepted         IN VARCHAR2 := NULL,
  fixed            IN VARCHAR2 := NULL,
  module           IN VARCHAR2 := NULL,
  action           IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of staging table owner. Default NULL means current schema is the table owner</td>
</tr>
<tr>
<td>sql_handle</td>
<td>SQL handle (case sensitive)</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL text string (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>creator</td>
<td>Creator of SQL plan baseline (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>origin</td>
<td>Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)</td>
</tr>
<tr>
<td>enabled</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>accepted</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>fixed</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>module</td>
<td>Module (case sensitive)</td>
</tr>
<tr>
<td>action</td>
<td>Action (case sensitive)</td>
</tr>
</tbody>
</table>

Return Values

Number of SQL plan baselines packed
RESET_EVOLVE_TASK Procedure

The procedure resets an evolve task to its initial state. All intermediate results will be removed from the task. Call this procedure on a task that is not currently executing.

Syntax

```
DBMS_SPM.RESET_EVOLVE_TASK  (
    task_name    IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to reset</td>
</tr>
</tbody>
</table>
RESUME_EVOLVE_TASK Procedure

The procedure resumes a previously interrupted task.

Syntax

```sql
DBMS_SPM.RESUME_EVOLVE_TASK  (  
   task_name  IN  VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to resume</td>
</tr>
</tbody>
</table>
REPORT_AUTO_EVOLVE_TASK Function

The procedure displays the results of an execution of an automatic evolve task.

Syntax

```
DBMS_SPM.REPORT_AUTO_EVOLVE_TASK  
  (  
    type            IN  VARCHAR2  := TYPE_TEXT,  
    level           IN  VARCHAR2  := LEVEL_TYPICAL,  
    section         IN  VARCHAR2  := SECTION_ALL,  
    object_id       IN  NUMBER    := NULL,  
    execution_name  IN  VARCHAR2  := NULL)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of the report. Possible values are TEXT, HTML, XML</td>
</tr>
<tr>
<td>level</td>
<td>Format of the report. Possible values are BASIC, TYPICAL, ALL.</td>
</tr>
<tr>
<td>section</td>
<td>Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.</td>
</tr>
</tbody>
</table>

Return Values

The report
REPORT_EVOLVE_TASK Function

The procedure displays the results of an evolved task.

Syntax

```sql
DBMS_SPM.REPORT_EVOLVE_TASK  (
    task_name       IN  VARCHAR2,
    type            IN  VARCHAR2  := 'TYPE_TEXT',
    level           IN  VARCHAR2  := 'LEVEL_TYPICAL',
    section         IN  VARCHAR2  := 'SECTION_ALL',
    object_id       IN  NUMBER    := NULL,
    task_owner      IN  VARCHAR2  := NULL,
    execution_name  IN  VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to report</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report. Possible values are TEXT, HTML, XML</td>
</tr>
<tr>
<td>level</td>
<td>Format of the report. Possible values are BASIC, TYPICAL, ALL</td>
</tr>
<tr>
<td>section</td>
<td>Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the evolve task. Defaults to the current schema owner.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.</td>
</tr>
</tbody>
</table>

Return Values

The report
**SET_EVOLVE_TASK_PARAMETER Procedure**

The procedure sets a parameter of an evolve task, either a NUMBER or VARCHAR2.

**Syntax**

```sql
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER  (
    task_name     IN  VARCHAR2,
    parameter     IN  VARCHAR2,
    value         IN  NUMBER);
```

```sql
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER  (
    task_name     IN  VARCHAR2  := NULL,
    parameter     IN  VARCHAR2,
    value         IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Evolve task name</td>
</tr>
<tr>
<td>parameter</td>
<td>Name of the parameter to set</td>
</tr>
<tr>
<td>value</td>
<td>New value of the parameter</td>
</tr>
</tbody>
</table>
UNPACK_STGTAB_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (  
   table_name       IN VARCHAR2,  
   table_owner      IN VARCHAR2 := NULL,  
   sql_handle       IN VARCHAR2 := NULL,  
   plan_name        IN VARCHAR2 := NULL,  
   sql_text         IN CLOB     := NULL,  
   creator          IN VARCHAR2 := NULL,  
   origin           IN VARCHAR2 := NULL,  
   enabled          IN VARCHAR2 := NULL,  
   accepted         IN VARCHAR2 := NULL,  
   fixed            IN VARCHAR2 := NULL,  
   module           IN VARCHAR2 := NULL,  
   action           IN VARCHAR2 := NULL)  
RETURN NUMBER;
```

Parameters

**Table 148–26 UNPACK_STGTAB_BASELINE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of staging table owner. Default NULL means current schema is the table owner</td>
</tr>
<tr>
<td>sql_handle</td>
<td>SQL handle (case sensitive)</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name (case sensitive; % wildcards accepted)</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL text string (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>creator</td>
<td>Creator of SQL plan baseline (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>origin</td>
<td>Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO- CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)</td>
</tr>
<tr>
<td>enabled</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>accepted</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>fixed</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>module</td>
<td>Module (case sensitive)</td>
</tr>
<tr>
<td>action</td>
<td>Action (case sensitive)</td>
</tr>
</tbody>
</table>

Return Values

Number of plans unpacked
The DBMS_SQL package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL. For example, you can enter a DROP TABLE statement from within a stored procedure by using the PARSE Procedures supplied with the DBMS_SQL package.

**See Also:** For more information on native dynamic SQL, see Oracle Database PL/SQL Language Reference.

This chapter contains the following topics:

- **Using DBMS_SQL**
  - Overview
  - Security Model
  - Constants
  - Exceptions

- Examples
Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to DBMS_SQL that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than DBMS_SQL. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)
- There are some tasks that can only be performed using DBMS_SQL. For tasks that require DBMS_SQL, see Oracle Database PL/SQL Language Reference.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

See Also: Oracle Call Interface Programmer’s Guide

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the DBMS_SQL package. These differences include the following:

- The OCI binds by address and the DBMS_SQL package binds by value.
- With DBMS_SQL you must call VARIABLE_VALUE to retrieve the value of an OUT parameter for an anonymous block, and you must call COLUMN_VALUE after fetching rows to retrieve the values of the columns in the rows into your program.
- The current release of the DBMS_SQL package does not provide CANCEL cursor procedures.
- Indicator variables are not required, because NULLs are fully supported as values of a PL/SQL variable.
DBMS_SQL is a SYS-owned package compiled with AUTHID CURRENT_USER. Any DBMS_SQL subprogram called from an anonymous PL/SQL block runs with the privileges of the current user.

See Also: Oracle Database PL/SQL Language Reference for more information about using Invoker Rights or Definer Rights

Preventing Malicious or Accidental Access of Open Cursor Numbers
An error, ORA-29471, is raised when any DBMS_SQL subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and DBMS_SQL becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the IS_OPEN Function denotes a cursor currently open in the session, the return value is TRUE. If the actual value is NULL, then the return value is FALSE. Otherwise, this raises an ORA-29471 error.

Preventing Inappropriate Use of a Cursor
Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single DBMS_SQL subprogram call. The check is:

- The current_user is the same on calling the subprogram as it was on calling the most recent parse.
- The enabled roles on calling the subprogram must be identical to the enabled roles on calling the most recent parse.
- The container is the same on calling the subprogram as it was on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, then an ORA-29470 error is raised.

The mechanism for defining when checks are performed is a new overload for the OPEN_CURSOR subprogram, which takes a formal parameter, security_level, with allowed values NULL, 1 and 2.

- When security_level = 1 (or is NULL), the checks are made only when binding and executing.
- When security_level = 2, the checks are always made.

Upgrade Considerations
This security regime is stricter than those in the previous releases. As a consequence, users of DBMS_SQL may encounter runtime errors on upgrade.
Constants

The constants described in Table 149–1 are used with the language_flag parameter of the PARSE Procedures.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V6</td>
<td>INTEGER</td>
<td>0</td>
<td>Specifies Oracle database version 6 behavior</td>
</tr>
<tr>
<td>NATIVE</td>
<td>INTEGER</td>
<td>1</td>
<td>Specifies normal behavior for the database to which the program is connected</td>
</tr>
<tr>
<td>V7</td>
<td>INTEGER</td>
<td>2</td>
<td>Specifies Oracle database version 7 behavior</td>
</tr>
<tr>
<td>FOREIGN_SYNTAX</td>
<td>INTEGER</td>
<td>4</td>
<td>Passed as the language_flag argument to the PARSE Procedures to specify that the SQL statement to be parsed needs to be translated first by the SQL translation profile set in the database session. An error is raised if a profile is not set.</td>
</tr>
</tbody>
</table>
Exceptions

inconsistent_type EXCEPTION;
pragma exception_init(inconsistent_type, -6562);

This exception is raised by the COLUMN_VALUE Procedure or the VARIABLE_VALUE Procedures when the type of the given OUT parameter (for where to put the requested value) is different from the type of the value.
Operational Notes

- Execution Flow
- Processing Queries
- Processing Updates, Inserts, and Deletes
- Locating Errors

Execution Flow

1. OPEN_CURSOR
2. PARSE
3. BIND_VARIABLE or BIND_ARRAY
4. DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY
5. EXECUTE
6. FETCH_ROWS or EXECUTE_AND_FETCH
7. VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG
8. CLOSE_CURSOR

OPEN_CURSOR

To process a SQL statement, you must have an open cursor. When you call the OPEN_CURSOR Functions, you receive a cursor ID number for the data structure representing a valid cursor maintained by Oracle. These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the DBMS_SQL package.

PARSE

Every SQL statement must be parsed by calling the PARSE Procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

The execution flow of DBMS_SQL is shown in Figure 149–1.
Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied. For each placeholder in the SQL statement, you must call one of the BIND_ARRAY Procedures on page 149-50 or the BIND_VARIABLE Procedures on page 149-53, to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind, variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind variable. The BIND_ARRAY procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each EXECUTE. This is similar to the array interface supported by the OCI.
Note that the datatype of the values bound to placeholders cannot be PL/SQL-only datatypes.

**DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY**

The columns of the row being selected in a `SELECT` statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures (DEFINE_COLUMN Procedures, DEFINE_COLUMN_LONG Procedure, or DEFINE_ARRAY Procedure) to specify the variables that are to receive the `SELECT` values, much the way an `INTO` clause does for a static query.

Use the DEFINE_COLUMN_LONG procedure to define LONG columns, in the same way that DEFINE_COLUMN is used to define non-LONG columns. You must call DEFINE_COLUMN_LONG before using the COLUMN_VALUE_LONG Procedure to fetch from the LONG column.

Use the DEFINE_ARRAY procedure to define a PL/SQL collection into which you want to fetch rows in a single `SELECT` statement. DEFINE_ARRAY provides an interface to fetch multiple rows at one fetch. You must call DEFINE_ARRAY before using the COLUMN_VALUE procedure to fetch the rows.

**EXECUTE**

Call the EXECUTE Function to run your SQL statement.

**FETCH_ROWS or EXECUTE_AND_FETCH**

The FETCH_ROWS Function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve any more rows. Instead of calling EXECUTE Function and then FETCH_ROWS, you may find it more efficient to call EXECUTE_AND_FETCH Function if you are calling EXECUTE for a single execution.

**VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG**

For queries, call the COLUMN_VALUE Procedure to determine the value of a column retrieved by the FETCH_ROWS Function. For anonymous blocks containing calls to PL/SQL procedures or DML statements with returning clause, call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables when statements were run.

To fetch only part of a LONG database column (which can be up to two gigabytes in size), use the DEFINE_COLUMN_LONG Procedure. You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

**CLOSE_CURSOR**

When you no longer need a cursor for a session, close the cursor by calling the CLOSE_CURSOR Procedure. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your Oracle Open Gateway documentation for additional information.

If you neglect to close a cursor, then the memory used by that cursor remains allocated even though it is no longer needed.

**Processing Queries**

If you are using dynamic SQL to process a query, then you must perform the following steps:
1. Specify the variables that are to receive the values returned by the SELECT statement by calling the DEFINE_COLUMN Procedures, the DEFINE_COLUMN_LONG Procedure, or the DEFINE_ARRAY Procedure.

2. Run your SELECT statement by calling the EXECUTE Function.

3. Call the FETCH_ROWS Function (or EXECUTE_AND_FETCH) to retrieve the rows that satisfied your query.

4. Call COLUMN_VALUE Procedure or COLUMN_VALUE_LONG Procedure to determine the value of a column retrieved by the FETCH_ROWS Function for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables of these procedures.

Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an INSERT, UPDATE, or DELETE, then you must perform the following steps:

1. Run your INSERT, UPDATE, or DELETE statement by calling the EXECUTE Function.

2. If statements have the returning clause, then you must call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables.

Locating Errors

The DBMS_SQL package has additional functions for obtaining information about the last referenced cursor in the session. The values returned by these functions are meaningful only immediately after a SQL statement is run. In addition, some error-locating functions are meaningful only after certain DBMS_SQL calls. For example, you call the LAST_ERROR_POSITION Function immediately after calling one of the PARSE Procedures.
Examples

This section provides example procedures that use the DBMS_SQL package.

Example 1
This example does not need dynamic SQL because the text of the statement is known at compile time, but it illustrates the basic concept underlying the package.

The DEMO procedure deletes all of the employees from the EMP table whose salaries are greater than the salary that you specify when you run DEMO.

```sql
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
    cursor_name INTEGER;
    rows_processed INTEGER;
BEGIN
    cursor_name := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
    rows_processed := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
EXCEPTION
    WHEN OTHERS THEN
        DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Example 2
The following sample procedure is passed a SQL statement, which it then parses and runs:

```sql
CREATE OR REPLACE PROCEDURE exec(STRING IN varchar2) AS
    cursor_name INTEGER;
    ret INTEGER;
BEGIN
    cursor_name := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
    ret := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

DDL statements are run by the parse call, which performs the implied commit.

```sql
DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
ret := DBMS_SQL.EXECUTE(cursor_name);
DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```sql
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```sql
exec@hq.com('CREATE TABLE acct(c1 INTEGER)');
```
Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

id of type NUMBER
name of type VARCHAR2(30)
birthdate of type DATE

This procedure does not need the use of dynamic SQL; however, it illustrates the concepts of this package.

CREATE OR REPLACE PROCEDURE copy (source IN VARCHAR2, destination IN VARCHAR2) IS
  id_var NUMBER;
  name_var VARCHAR2(30);
  birthdate_var DATE;
  source_cursor INTEGER;
  destination_cursor INTEGER;
  ignore INTEGER;
BEGIN
  -- Prepare a cursor to select from the source table:
  source_cursor := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(source_cursor,
    'SELECT id, name, birthdate FROM ' || source,
    DBMS_SQL.NATIVE);
  DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
  DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
  DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
  ignore := DBMS_SQL.EXECUTE(source_cursor);
  -- Prepare a cursor to insert into the destination table:
  destination_cursor := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(destination_cursor,
    'INSERT INTO ' || destination ||
    ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
    DBMS_SQL.NATIVE);
  -- Fetch a row from the source table and insert it into the destination table:
  LOOP
    IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
      -- get column values of the row
      DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
      DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
      DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);
      -- Bind the row into the cursor that inserts into the destination table. You
      -- could alter this example to require the use of dynamic SQL by inserting an
      -- if condition before the bind.
      DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
      DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
      DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
        birthdate_var);
      ignore := DBMS_SQL.EXECUTE(destination_cursor);
    ELSE
      -- No more rows to copy:
EXIT;
END IF;
END LOOP;

-- Commit and close all cursors:
COMMIT;
DBMS_SQL.CLOSE_CURSOR(source_cursor);
DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
WHEN OTHERS THEN
IF DBMS_SQL.IS_OPEN(source_cursor) THEN
    DBMS_SQL.CLOSE_CURSOR(source_cursor);
END IF;
IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
    DBMS_SQL.CLOSE_CURSOR(destination_cursor);
END IF;
RAISE;
END;
/

Examples 3, 4, and 5: Bulk DML
This series of examples shows how to use bulk array binds (table items) in the SQL DML statements INSERT, UPDATE and DELETE.

Here is an example of a bulk INSERT statement that demonstrates adding seven new employees to the emp table:

DECLARE
    stmt VARCHAR2(200);
    empno_array      DBMS_SQL.NUMBER_TABLE;
    empname_array    DBMS_SQL.VARCHAR2_TABLE;
    jobs_array       DBMS_SQL.VARCHAR2_TABLE;
    mgr_array        DBMS_SQL.NUMBER_TABLE;
    hiredate_array   DBMS_SQL.VARCHAR2_TABLE;
    sal_array        DBMS_SQL.NUMBER_TABLE;
    comm_array       DBMS_SQL.NUMBER_TABLE;
    deptno_array     DBMS_SQL.NUMBER_TABLE;
    c                NUMBER;
    dummy            NUMBER;
BEGIN
    empno_array(1):= 9001;
    empno_array(2):= 9002;
    empno_array(3):= 9003;
    empno_array(4):= 9004;
    empno_array(5):= 9005;
    empno_array(6):= 9006;
    empno_array(7):= 9007;

    empname_array(1) := 'Dopey';
    empname_array(2) := 'Grumpy';
    empname_array(3) := 'Doc';
    empname_array(4) := 'Happy';
    empname_array(5) := 'Bashful';
    empname_array(6) := 'Sneery';
    empname_array(7) := 'Sleepy';

    jobs_array(1) := 'Miner';
    jobs_array(2) := 'Miner';
    jobs_array(3) := 'Miner';
    jobs_array(4) := 'Miner';
jobs_array(5) := 'Miner';
jobs_array(6) := 'Miner';
jobs_array(7) := 'Miner';

mgr_array(1) := 9003;
mgr_array(2) := 9003;
mgr_array(3) := 9003;
mgr_array(4) := 9003;
mgr_array(5) := 9003;
mgr_array(6) := 9003;
mgr_array(7) := 9003;

hiredate_array(1) := '06-DEC-2006';
hiredate_array(2) := '06-DEC-2006';
hiredate_array(3) := '06-DEC-2006';
hiredate_array(4) := '06-DEC-2006';
hiredate_array(5) := '06-DEC-2006';
hiredate_array(6) := '06-DEC-2006';
hiredate_array(7) := '06-DEC-2006';

sal_array(1):= 1000;
sal_array(2):= 1000;
sal_array(3):= 1000;
sal_array(4):= 1000;
sal_array(5):= 1000;
sal_array(6):= 1000;
sal_array(7):= 1000;

comm_array(1):= 0;
comm_array(2):= 0;
comm_array(3):= 0;
comm_array(4):= 0;
comm_array(5):= 0;
comm_array(6):= 0;
comm_array(7):= 0;

depthno_array(1):= 11;
depthno_array(2):= 11;
depthno_array(3):= 11;
depthno_array(4):= 11;
depthno_array(5):= 11;
depthno_array(6):= 11;
depthno_array(7):= 11;

stmt := 'INSERT INTO emp VALUES(';
stmt := stmt || 'num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,';
stmt := stmt || ':sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
Here is an example of a bulk UPDATE statement that demonstrates updating salaries for four existing employees in the emp table:

```sql
DECLARE
    stmt VARCHAR2(200);
    empno_array    DBMS_SQL.NUMBER_TABLE;
    salary_array   DBMS_SQL.NUMBER_TABLE;
    c              NUMBER;
    dummy          NUMBER;
BEGIN
    empno_array(1):= 7369;
    empno_array(2):= 7876;
    empno_array(3):= 7900;
    empno_array(4):= 7934;
    salary_array(1) := 10000;
    salary_array(2) := 10000;
    salary_array(3) := 10000;
    salary_array(4) := 10000;
    stmt := 'update emp set sal = :salary_array
             WHERE empno = :num_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
    DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
    dummy := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.CLOSE_CURSOR(c);
EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
SHOW ERRORS;
```

In a DELETE statement, for example, you could bind an array in the WHERE clause and have the statement be run for each element in the array:

```sql
DECLARE
    stmt VARCHAR2(200);
    dept_no_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
BEGIN
    dept_no_array(1) := 10; dept_no_array(2) := 20;
    dept_no_array(3) := 30; dept_no_array(4) := 40;
    dept_no_array(5) := 30; dept_no_array(6) := 40;
    stmt := 'delete from emp where deptno = :dept_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, ':dept_array', dept_no_array);
    dummy := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.CLOSE_CURSOR(c);
EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
SHOW ERRORS;
```
DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);

exception when others then
  if DBMS_SQL.IS_OPEN(c) then
    DBMS_SQL.CLOSE_CURSOR(c);
  end if;
  raise;
end;
/

In the preceding example, only elements 1 through 4 are used as specified by the BIND_ARRAY call. Each element of the array potentially deletes a large number of employees from the database.

Examples 6 and 7: Defining an Array
The following examples show how to use the DEFINE_ARRAY procedure:

declare
  c       number;
  d       number;
  n_tab   dbms_sql.number_table;
  indx    number := -10;
begin
  c := DBMS_SQL.OPEN_CURSOR;
  dBMS_SQL.PARSE(c, 'select n from t order by 1', DBMS_SQL.NATIVE);
  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);
  d := DBMS_SQL.EXECUTE(c);
  loop
    d := DBMS_SQL.FETCH_ROWS(c);
    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    exit when d != 10;
  end loop;
  DBMS_SQL.CLOSE_CURSOR(c);
exception when others then
  if DBMS_SQL.IS_OPEN(c) then
    DBMS_SQL.CLOSE_CURSOR(c);
  end if;
  raise;
end;
/

Each time the preceding example calls FETCH_ROWS Function, it fetches 10 rows that are kept in DBMS_SQL buffers. When the COLUMN_VALUE Procedure is called, those rows move into the PL/SQL table specified (in this case n_tab), at positions -10 to -1, as specified in the DEFINE statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at EXECUTE time and is updated every time COLUMN_VALUE is called. If you reexecute at any point, then the current index for each DEFINE is reinitialized to "indx".
In this way the entire result of the query is fetched into the table. When FETCH_ROWS cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the DEFINE_ARRAY procedure:

Consider a table MULTI_TAB defined as:

```sql
CREATE TABLE multi_tab (num NUMBER,
    dat1 DATE,
    var VARCHAR2(24),
    dat2 DATE)
```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```sql
DECLARE
c       NUMBER;
d       NUMBER;
n_tab  DBMS_SQL.NUMBER_TABLE;
d_tab1 DBMS_SQL.DATE_TABLE;
v_tab  DBMS_SQL.VARCHAR2_TABLE;
d_tab2 DBMS_SQL.DATE_TABLE;
indx NUMBER := 10;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);
  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);
  d := DBMS_SQL.EXECUTE(c);
  LOOP
    d := DBMS_SQL.FETCH_ROWS(c);
    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
    DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
    DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);
    EXIT WHEN d != 5;
  END LOOP;
  DBMS_SQL.CLOSE_CURSOR(c);
/
```

The four tables can be used for anything. One usage might be to use BIND_ARRAY to move the rows to another table by using a statement such as 'INSERT into SOME_T values (:a, :b, :c, :d);

/*
EXCEPTION WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(c) THEN
    DBMS_SQL.CLOSE_CURSOR(c);
  END IF;
  RAISE;
*/
Example 8: Describe Columns

This code can be used as a substitute to the SQL*Plus DESCRIBE call by using a SELECT * query on the table that you want to describe.

```plsql
DECLARE
  c           NUMBER;
  d           NUMBER;
  col_cnt     INTEGER;
  f           BOOLEAN;
  rec_tab     DBMS_SQL.DESC_TAB;
  col_num    NUMBER;
PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
BEGIN
  DBMS_OUTPUT.NEW_LINE;
  DBMS_OUTPUT.PUT_LINE('col_type            =    ' || rec.col_type);
  DBMS_OUTPUT.PUT_LINE('col_maxlen          =    ' || rec.col_max_len);
  DBMS_OUTPUT.PUT_LINE('col_name            =    ' || rec.col_name);
  DBMS_OUTPUT.PUT_LINE('col_name_len        =    ' || rec.col_name_len);
  DBMS_OUTPUT.PUT_LINE('col_schema_name     =    ' || rec.col_schema_name);
  DBMS_OUTPUT.PUT_LINE('col_schema_name_len =    ' || rec.col_schema_name_len);
  DBMS_OUTPUT.PUT_LINE('col_precision       =    ' || rec.col_precision);
  DBMS_OUTPUT.PUT('col_scale           =    ' || rec.col_scale);
  IF (rec.col_null_ok) THEN
    DBMS_OUTPUT.PUT_LINE('true');
  ELSE
    DBMS_OUTPUT.PUT_LINE('false');
  END IF;
END;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);
  d := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);
  col_num := rec_tab.first;
  LOOP
    print_rec(rec_tab(col_num));
    col_num := rec_tab.next(col_num);
    EXIT WHEN (col_num IS NULL);
  END LOOP;
END;
/  
```

This code can be used as a substitute to the SQL*Plus DESCRIBE call by using a `SELECT *` query on the table that you want to describe.
Example 9: RETURNING clause

With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions in bind variables.

If a single row is inserted, updated, or deleted, then use `DBMS_SQL.BIND_VARIABLE` to bind these outbinds. To get the values in these bind variables, call `DBMS_SQL.VARIABLE_VALUE`.

Note: This process is similar to `DBMS_SQL.VARIABLE_VALUE`, which must be called after running a PL/SQL block with an outbind inside `DBMS_SQL`.

---

i) Single-row insert

```sql
CREATE OR REPLACE PROCEDURE single_Row_insert
    (c1 NUMBER, c2 NUMBER, r OUT NUMBER) is
    c NUMBER;
    n NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
        'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

ii) Single-row update

```sql
CREATE OR REPLACE PROCEDURE single_Row_update
    (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
    c NUMBER;
    n NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
        'WHERE rownum < 2 ' ||
        'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

iii) Single-row delete

---
CREATE OR REPLACE PROCEDURE single_Row_Delete
  (c1 NUMBER, r OUT NUMBER) is
  c NUMBER;
  n number;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE ROWNUM = :bnd1 ' ||
      'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
 /

iv) Multiple-row insert

CREATE OR REPLACE PROCEDURE multi_Row_insert
  (c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
   r OUT DBMS_SQL.NUMBER_TABLE) is
  c NUMBER;
  n NUMBER;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
    DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
    DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
 /

v) Multiple-row update.

CREATE OR REPLACE PROCEDURE multi_Row_update
  (c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  n NUMBER;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
 /

Note: bnd1 and bnd2 can be arrays too. The value of the expression for all the rows updated will be in bnd3. There is no way to determine which rows were updated for each value of bnd1 and bnd2.
vi) Multiple-row delete

```sql
CREATE OR REPLACE PROCEDURE multi_row_delete
  (c1 DBMS_SQL.NUMBER_TABLE,
   r OUT DBMS_SQL.NUMBER_TABLE) is
  c NUMBER;
  n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1 |
    'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
```

vii) outbind in bulk PL/SQL

```sql
CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/
CREATE OR REPLACE PROCEDURE bulk_plsql
  (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  r NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
  r := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
```

---

**Note:** DBMS_SQL.BIND_ARRAY of number_Table internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

Example 10: Binds and Defines of User-defined Types in DBMS_SQL

```sql
CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/
CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/
INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
/
INSERT INTO depts
  VALUES('Asia', dnames_var('Finance','Payroll','Shipping','Sales'))
/
CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2)
IS
```
some_dnames dnames_var;
c      NUMBER;
r      NUMBER;
sql_stmt VARCHAR2(32767) :=
   'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names INTO :b3';
BEGIN
   c := DBMS_SQL.OPEN_CURSOR;
   DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);
   DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
   DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
   DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);
   r := DBMS_SQL.EXECUTE(c);
   DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);
   DBMS_SQL.CLOSE_CURSOR(c);
   sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';
   c := DBMS_SQL.OPEN_CURSOR;
   DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);
   DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
   DBMS_SQL.BIND_VARIABLE(c, 'b1', region);
   r := DBMS_SQL.EXECUTE_AND_FETCH(c);
   DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);
   DBMS_SQL.CLOSE_CURSOR(c);
   FOR i IN some_dnames.FIRST .. some_dnames.LAST LOOP
      DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
   END LOOP;
END;
/
DECLARE
   new_dnames dnames_var;
BEGIN
   new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting', 'Executive', 'Marketing');
   update_depts(new_dnames, 'Asia');
END;
The DBMS_SQL package defines the following RECORD types and TABLE types.

**RECORD Types**
- DESC_REC Record Type
- DESC_REC2 Record Type
- DESC_REC3 Record Type

**TABLE Types**
- BFILE_TABLE Table Type
- BINARY_DOUBLE_TABLE Table Type
- BINARY_FLOAT_TABLE Table Type
- BLOB_TABLE Table Type
- CLOB_TABLE Table Type
- DATE_TABLE Table Type
- DESC_TAB Table Type
- DESC_TAB2 Table Type
- DESC_TAB3 Table Type
- INTERVAL_DAY_TO_SECOND_TABLE Table Type
- INTERVAL_YEAR_TO_MONTH_TABLE Table Type
- NUMBER_TABLE Table Type
- TIME_TABLE Table Type
- TIME_WITH_TIME_ZONE_TABLE Table Type
- TIMESTAMP_TABLE Table Type
- TIMESTAMP_WITH_LTZ_TABLE Table Type
- TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type
- UROWID_TABLE Table Type
- VARCHAR2_TABLE Table Type
- VARCHAR2A Table Type
- VARCHAR2S Table Type
DESC_REC Record Type

This record type holds the describe information for a single column in a dynamic query. It is the element type of the DESC_TAB table type and the DESCRIBE_COLUMNS Procedure.

Syntax

```sql
TYPE desc_rec IS RECORD (
   col_type            BINARY_INTEGER := 0,
   col_max_len         BINARY_INTEGER := 0,
   col_name            VARCHAR2(32)   := '',
   col_name_len        BINARY_INTEGER := 0,
   col_schema_name     VARCHAR2(32)   := '',
   col_schema_name_len BINARY_INTEGER := 0,
   col_schema_name_len BINARY_INTEGER := 0,
   col_charsetid       BINARY_INTEGER := 0,
   col_charsetform     BINARY_INTEGER := 0,
   col_null_ok         BOOLEAN        := TRUE);

TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col_type</td>
<td>Type of column</td>
</tr>
<tr>
<td>col_max_len</td>
<td>Maximum column length</td>
</tr>
<tr>
<td>col_name</td>
<td>Name of column</td>
</tr>
<tr>
<td>col_name_len</td>
<td>Length of column name</td>
</tr>
<tr>
<td>col_schema_name</td>
<td>Column schema name</td>
</tr>
<tr>
<td>col_schema_name_len</td>
<td>Length of column schema name</td>
</tr>
<tr>
<td>col_precision</td>
<td>Precision of column</td>
</tr>
<tr>
<td>col_scale</td>
<td>Scale of column</td>
</tr>
<tr>
<td>col_charsetid</td>
<td>Column character set id</td>
</tr>
<tr>
<td>col_charsetform</td>
<td>Column character set form</td>
</tr>
<tr>
<td>col_null_ok</td>
<td>NULL column flag; TRUE, if NULL possible</td>
</tr>
</tbody>
</table>
DESC_REC2 Record Type

DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

This record type is identical to DESC_REC except for the col_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC_REC because column name values can be greater than 32 characters. DESC_REC is deprecated as a result.

Syntax

```sql
TYPE desc_rec2 IS RECORD (  
  col_type            binary_integer := 0,  
  col_max_len         binary_integer := 0,  
  col_name            varchar2(32767) := '',  
  col_name_len        binary_integer := 0,  
  col_schema_name     varchar2(32)   := '',  
  col_schema_name_len binary_integer := 0,  
  col_precision       binary_integer := 0,  
  col_scale           binary_integer := 0,  
  col_charsetid       binary_integer := 0,  
  col_charsetform     binary_integer := 0,  
  col_null_ok         boolean        := TRUE);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col_type</td>
<td>Type of column</td>
</tr>
<tr>
<td>col_max_len</td>
<td>Maximum column length</td>
</tr>
<tr>
<td>col_name</td>
<td>Name of column</td>
</tr>
<tr>
<td>col_name_len</td>
<td>Length of column name</td>
</tr>
<tr>
<td>col_schema_name</td>
<td>Column schema name</td>
</tr>
<tr>
<td>col_schema_name_len</td>
<td>Length of column schema name</td>
</tr>
<tr>
<td>col_precision</td>
<td>Precision of column</td>
</tr>
<tr>
<td>col_scale</td>
<td>Scale of column</td>
</tr>
<tr>
<td>col_charsetid</td>
<td>Column character set id</td>
</tr>
<tr>
<td>col_charsetform</td>
<td>Column character set form</td>
</tr>
<tr>
<td>col_null_ok</td>
<td>NULL column flag; TRUE, if NULL possible</td>
</tr>
</tbody>
</table>
DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (type_name) and type name len (type_name_len) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The col_type_name and col_type_name_len fields are only populated when the col_type field's value is 109, the Oracle type number for user-defined types.

Syntax

```sql
TYPE desc_rec3 IS RECORD (
    col_type               binary_integer := 0,
    col_max_len            binary_integer := 0,
    col_name               varchar2(32767) := '',
    col_name_len           binary_integer := 0,
    col_schema_name        varchar2(32) := '',
    col_schema_name_len    binary_integer := 0,
    col_precision          binary_integer := 0,
    col_scale              binary_integer := 0,
    col_charsetid          binary_integer := 0,
    col_charsetform        binary_integer := 0,
    col_null_ok            boolean := TRUE,
    col_type_name          varchar2(32767) := '',
    col_type_name_len      binary_integer := 0);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col_type</td>
<td>Type of column</td>
</tr>
<tr>
<td>col_max_len</td>
<td>Maximum column length</td>
</tr>
<tr>
<td>col_name</td>
<td>Name of column</td>
</tr>
<tr>
<td>col_name_len</td>
<td>Length of column name</td>
</tr>
<tr>
<td>col_schema_name</td>
<td>Column schema name</td>
</tr>
<tr>
<td>col_schema_name_len</td>

</tr>
<tr>
<td>col_null_ok</td>
<td>NULL column flag; TRUE, if NULL possible</td>
</tr>
<tr>
<td>col_type_name</td>
<td>User-define type column type name, this field is valid when col_type is 109</td>
</tr>
<tr>
<td>col_type_name_len</td>
<td>Length of user-define type column type name, this field is valid when col_type is 109</td>
</tr>
</tbody>
</table>
BFILE_TABLE Table Type

This is a table of BFILE.

Syntax

```sql
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```
**BINARY_DOUBLE_TABLE Table Type**

This is a table of BINARY_DOUBLE.

**Syntax**

```
TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
```
**BINAR Y_FLOAT_TABLE Table Type**

This is a table of `BINARY_FLOAT`.

**Syntax**

```
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```
BLOB_TABLE Table Type

This is a table of BLOB.

Syntax

```
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
```
CLOB_TABLE Table Type

This is a table of CLOB.

Syntax

    TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
DATE_TABLE Table Type

This is a table of DATE.

Syntax

type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
DESC_TAB Table Type

This is a table of DESC_REC Record Type.

Syntax

TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
DESC_TAB2 Table Type

This is a table of DESC_REC2 Record Type.

Syntax

```sql
TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;
```
DESC_TAB3 Table Type

This is a table of DESC_REC3 Record Type.

Syntax

```
TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;
```
INTERVAL_DAY_TO_SECOND_TABLE Table Type

This is a table of DSINTERVAL_UNCONCONSTRAINED.

Syntax

```
TYPE interval_day_to_second_Table IS TABLE OF
    DSINTERVAL_UNCONCONSTRAINED INDEX BY binary_integer;
```
**INTERVAL_YEAR_TO_MONTH_TABLE Table Type**

This is a table of YMINTERVAL_UNCONSTRAINED.

**Syntax**

```sql
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED
  INDEX BY BINARY_INTEGER;
```
NUMBER_TABLE Table Type

This is a table of NUMBER.

Syntax

TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TIME_TABLE Table Type

This is a table of TIME_UNCONSTRAINED.

Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```
TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of TIME_TZ_UNCONSTRAINED.

Syntax

```plsql
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```
TIMESTAMP_TABLE Table Type

This is a table of TIMESTAMP_UNCONSTRAINED.

Syntax

TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of TIMESTAMP_LTZ_UNCONSTRAINED

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF
  TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```
TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of TIMESTAMP_TZ_UNCONSTRAINED.

Syntax

```sql
TYPE timestamp_with_time_zone_Table IS TABLE OF
    TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```
UROWID_TABLE Table Type

This is a table of UROWID.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```
VARCHAR2_TABLE Table Type

This is table of VARCHAR2(2000).

Syntax

TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
VARCHAR2A Table Type

This is table of VARCHAR2(32767).

Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```
VARCHAR2S Table Type

This is table of VARCHAR2(256).

**Note:** This type has been superseded by the VARCHAR2A Table Type. Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

Syntax

```sql
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```
### Summary of DBMS_SQL Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td>TO_REFCURSOR Function on page 149-93</td>
<td>Takes an OPENed, PARSED, and EXECUTEed cursor and transforms/migrates it into a PL/SQL manageable REFCURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL</td>
</tr>
<tr>
<td>VARIABLE_VALUE Procedures on page 149-95</td>
<td>Returns value of named variable for given cursor</td>
</tr>
</tbody>
</table>
**BIND_ARRAY Procedures**

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

**Syntax**

```sql
DBMS_SQL.BIND_ARRAY ( 
  c                   IN INTEGER, 
  name                IN VARCHAR2, 
  <table_variable>    IN <datatype>, 
  [,index1              IN INTEGER, 
   index2              IN INTEGER]) );
```

Where the `<table_variable>` and its corresponding `<datatype>` can be any one of the following matching pairs:

- `<clob_tab>` Clob_Table
- `<bflt_tab>` Binary_Float_Table
- `<bdbl_tab>` Binary_Double_Table
- `<blob_tab>` Blob_Table
- `<bfile_tab>` Bfile_Table
- `<date_tab>` Date_Table
- `<num_tab>` Number_Table
- `<urowid_tab>` Urowid_Table
- `<vchr2_tab>` Varchar2_Table
- `<tm_tab>` Time_Table
- `<ttz_tab>` Time_With_Time_Zone_Table
- `<tms_tab>` Timestamp_Table
- `<tstz_tab>` Timestamp_With_Time_Zone_Table
- `<ids_tab>` Interval_Day_To_Second_Table
- `<iym_tab>` Interval_Year_To_Month_Table

Notice that the `BIND_ARRAY` procedure is overloaded to accept different Datatype.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind a value.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the collection in the statement.</td>
</tr>
<tr>
<td>table_variable</td>
<td>Local variable that has been declared as &lt;datatype&gt;.</td>
</tr>
<tr>
<td>index1</td>
<td>Index for the table element that marks the lower bound of the range.</td>
</tr>
<tr>
<td>index2</td>
<td>Index for the table element that marks the upper bound of the range.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The length of the bind variable name must be <=30 bytes.

For binding a range, the table must contain the elements that specify the range — `tab(index1)` and `tab(index2)` — but the range does not have to be dense. `index1` must be less than or equal to `index2`. All elements between `tab(index1)` and `tab(index2)` are used in the bind.
If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

**See Also:** "Examples 3, 4, and 5: Bulk DML" on page 149-13 for examples of how to bind collections.

**Bulk Array Binds**

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The DBMS_SQL package lets you work on collections of data using the PL/SQL table type.

*Table items* are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local DBMS_SQL buffers (the same as for all scalar types) and then the table is manipulated from the local DBMS_SQL buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

**Types for Scalar and LOB Collections**

You can declare a local variable as one of the following table-item types, which are defined as public types in DBMS_SQL.

```sql
TYPE binary_double_table
    IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;

TYPE binary_float_table
    IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;

TYPE bfile_table
    IS TABLE OF BFILE INDEX BY BINARY_INTEGER;

TYPE blob_table
    IS TABLE OF BLOB INDEX BY BINARY_INTEGER;

TYPE clob_table
    IS TABLE OF CLOB INDEX BY BINARY_INTEGER;

TYPE date_table
    IS TABLE OF DATE INDEX BY BINARY_INTEGER;

TYPE interval_day_to_second_Table
    IS TABLE OF dsinterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE interval_year_to_MONTH_Table
    IS TABLE OF yminterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE number_table
    IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;

TYPE time_table
    IS TABLE OF time_unconstrained INDEX BY BINARY_INTEGER;

TYPE time_with_time_zone_table
```

See Also: "Examples 3, 4, and 5: Bulk DML" on page 149-13 for examples of how to bind collections.
TYPE timestamp_table
  IS TABLE OF timestamp_unconstrained
  INDEX BY BINARY_INTEGER;

TYPE timestamp_with_tz_Table
  IS TABLE OF timestamp_tz_unconstrained
  INDEX BY BINARY_INTEGER;

TYPE timestamp_with_time_zone_Table
  IS TABLE OF timestamp_tz_unconstrained
  INDEX BY BINARY_INTEGER;

TYPE urowid_table  IS TABLE OF UROWID       INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
**BIND_VARIABLE Procedures**

This procedures binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

**Syntax**

```sql
DBMS_SQL.BIND_VARIABLE (c IN INTEGER,
name IN VARCHAR2,
value IN <datatype>);
```

Where `<datatype>` can be any one of the following types:

- BINARY_DOUBLE
- BINARY_FLOAT
- BFILE
- BLOB
- CLOB CHARACTER SET ANY_CS
- DATE
- DSINTERVAL_UNCONSTRAINED
- NUMBER
- TIME_UNCONSTRAINED
- TIME_TZ_UNCONSTRAINED
- TIMESTAMP_LTZ_UNCONSTRAINED
- TIMESTAMP_TZ_UNCONSTRAINED
- TIMESTAMP_UNCONSTRAINED
- UROWID
- VARCHAR2 CHARACTER SET ANY_CS
- YMINTERVAL_UNCONSTRAINED
- user-defined object types
- collections (VARRAYs and nested tables)
- REFs
- Opaque types

Notice that `BIND_VARIABLE` is overloaded to accept different Datatype.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets `[]` indicate an optional parameter for the `BIND_VARIABLE` function.

```sql
DBMS_SQL.BIND_VARIABLE (c IN INTEGER,
name IN VARCHAR2,
value IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```sql
DBMS_SQL.BIND_VARIABLE_CHAR (c IN INTEGER,
name IN VARCHAR2,
value IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

```sql
DBMS_SQL.BIND_VARIABLE_RAW (c IN INTEGER,
name IN VARCHAR2,
value IN RAW [,out_value_size IN INTEGER]);
```

```sql
DBMS_SQL.BIND_VARIABLE_ROWID (c IN INTEGER,
name IN VARCHAR2,
value IN UROWID);
```
value IN ROWID);

See Also: Oracle Database SecureFiles and Large Objects Developer’s Guide

Pragmas

pragma restrict_references(bind_variable,WNDS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind a value.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the variable in the statement.</td>
</tr>
<tr>
<td>value</td>
<td>Value that you want to bind to the variable in the cursor. For IN and IN/OUT variables, the value has the same type as the type of the value being passed in for this parameter.</td>
</tr>
<tr>
<td>out_value_size</td>
<td>Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable. If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized.</td>
</tr>
</tbody>
</table>

Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

SELECT emp_name FROM emp WHERE SAL > :X;

For this example, the corresponding bind call would look similar to

BIND_VARIABLE(cursor_name, ':X', 3500);

or

BIND_VARIABLE (cursor_name, 'X', 3500);

The length of the bind variable name must be <=30 bytes.

See Also: "Examples 3, 4, and 5: Bulk DML" on page 149-13 for examples of how to bind collections.
CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

```plsql
DBMS_SQL.CLOSE_CURSOR (  
   c   IN OUT INTEGER);
```

Pragmas

```plsql
pragma restrict_references(close_cursor,RNDS,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>IN</td>
<td>ID number of the cursor that you want to close.</td>
</tr>
<tr>
<td>c</td>
<td>OUT</td>
<td>Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor.</td>
</tr>
</tbody>
</table>
COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.

**Syntax**

```sql
DBMS_SQL.COLUMN_VALUE (  
  c                 IN  INTEGER,  
  position          IN  INTEGER,  
  value             OUT <datatype>  
[,column_error      OUT NUMBER]  
[,actual_length     OUT INTEGER]);
```

Where square brackets [ ] indicate optional parameters and `<datatype>` can be any one of the following types:

- `BINARY_DOUBLE`
- `BINARY_FLOAT`
- `BFILE`
- `BLOB`
- `CLOB CHARACTER SET ANY_CS`
- `DATE`
- `DSINTERVAL_UNCONSTRAINED`
- `NUMBER`
- `TIME_TZ_UNCONSTRAINED`
- `TIME_UNCONSTRAINED`
- `TIMESTAMP_LTZ_UNCONSTRAINED`
- `TIMESTAMP_TZ_UNCONSTRAINED`
- `TIMESTAMP_UNCONSTRAINED`
- `UROWID`
- `VARCHAR2 CHARACTER SET ANY_CS`
- `YMINTERVAL_UNCONSTRAINED`
- user-defined object types
- collections (VARRAYs and nested tables)
- `REFs`
- Opaque types

For variables containing `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```sql
DBMS_SQL.COLUMN_VALUE_CHAR (  
  c               IN  INTEGER,  
  position        IN  INTEGER,  
  value           OUT CHAR CHARACTER SET ANY_CS  
[,column_error    OUT NUMBER]  
[,actual_length   OUT INTEGER]);
```

```sql
DBMS_SQL.COLUMN_VALUE_RAW (  
  c               IN  INTEGER,  
  position        IN  INTEGER,  
  value           OUT RAW  
[,column_error    OUT NUMBER]  
[,actual_length   OUT INTEGER]);
```

```sql
DBMS_SQL.COLUMN_VALUE_ROWID (  
  c               IN  INTEGER,  
  position        IN  INTEGER,  
  value           OUT ROWID  
[,column_error    OUT NUMBER]  
);
The following syntax enables the COLUMN_VALUE procedure to accommodate bulk operations:

```sql
DBMS_SQL.COLUMN_VALUE(
    c             IN INTEGER,
    position      IN INTEGER,
    <param_name>  IN OUT NOCOPY <table_type>);
```

Where the `<param_name>` and its corresponding `<table_type>` can be any one of these matching pairs:

- `bdbl_tab` Binary_Double_Table
- `bflt_tab` Binary_Float_Table
- `bf_tab` Bfile_Table
- `bl_tab` Blob_Table
- `cl_tab` Clob_Table
- `d_tab` Date_Table
- `ids_tab` Interval_Day_To_Second_Table
- `iym_tab` Interval_Year_To_Month_Table
- `n_tab` Number_Table
- `tm_tab` Time_Table
- `ttz_tab` Time_With_Time_Zone_Table
- `tms_tab` Timestamp_Table
- `tstz_tab` Timestamp_With_Time_Zone_Table
- `ur_tab` Urowid_Table
- `c_tab` Varchar2_Table

Pragmas

```sql
pragma restrict_references(column_value,RNDS,WNDS);
```

Parameters

**Table 149–9 COLUMN_VALUE Procedure Parameters (Single Row)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor from which you are fetching the values.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the cursor. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>value</td>
<td>Returns the value at the specified column. Oracle raises exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>DEFINE_COLUMN</code>.</td>
</tr>
<tr>
<td>column_error</td>
<td>Returns any error code for the specified column value.</td>
</tr>
<tr>
<td>actual_length</td>
<td>The actual length, before any truncation, of the value in the specified column.</td>
</tr>
</tbody>
</table>

**Table 149–10 COLUMN_VALUE Procedure Parameters (Bulk)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor from which you are fetching the values.</td>
</tr>
</tbody>
</table>
**Exceptions**

INCONSISTENT_TYPE (ORA-06562) is raised if the type of the given OUT parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure DEFINE_COLUMN.

**See Also:** Oracle Database SecureFiles and Large Objects Developer's Guide
COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

```sql
DBMS_SQL.COLUMN_VALUE_LONG (  
c            IN  INTEGER,  
position     IN  INTEGER,  
length       IN  INTEGER,  
offset       IN  INTEGER,  
value        OUT VARCHAR2,  
value_length OUT INTEGER);
```

Pragma

```sql
pragma restrict_references(column_value_long,RNDS,WNDS);
```

Parameters

**Table 149–11**  COLUMN_VALUE_LONG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor from which to get the value.</td>
</tr>
<tr>
<td>position</td>
<td>Position of the column of which to get the value.</td>
</tr>
<tr>
<td>length</td>
<td>Number of bytes of the long value to fetch.</td>
</tr>
<tr>
<td>offset</td>
<td>Offset into the long field for start of fetch.</td>
</tr>
<tr>
<td>value</td>
<td>Value of the column as a VARCHAR2.</td>
</tr>
<tr>
<td>value_length</td>
<td>Number of bytes actually returned in value.</td>
</tr>
</tbody>
</table>
DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a FETCH_ROWS call). This procedure lets you do batch fetching of rows from a single SELECT statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into DBMS_SQL buffers until you run a COLUMN_VALUE call, at which time the rows are copied into the table that was passed as an argument to the COLUMN_VALUE call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using DBMS_SQL. (These are the same types as you can specify for the BIND_ARRAY procedure.)

```sql
TYPE binary_double_table
  IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;

TYPE binary_float_table
  IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;

TYPE bfile_table
  IS TABLE OF BFILE INDEX BY BINARY_INTEGER;

TYPE blob_table
  IS TABLE OF BLOB INDEX BY BINARY_INTEGER;

TYPE clob_table
  IS TABLE OF CLOB INDEX BY BINARY_INTEGER;

TYPE date_table
  IS TABLE OF DATE INDEX BY BINARY_INTEGER;

TYPE interval_day_to_second_Table
  IS TABLE OF dsinterval_unconstrained
  INDEX BY BINARY_INTEGER;

TYPE interval_year_to_MONTH_Table
  IS TABLE OF yminterval_unconstrained
  INDEX BY BINARY_INTEGER;

TYPE number_table
  IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;

TYPE time_table
  IS TABLE OF time_unconstrained
  INDEX BY BINARY_INTEGER;

TYPE time_with_time_zone_table
  IS TABLE OF time_tz_unconstrained
  INDEX BY BINARY_INTEGER;

TYPE timestamp_table
  IS TABLE OF timestamp_unconstrained
  INDEX BY BINARY_INTEGER;

TYPE timestamp_with_tz_Table
  IS TABLE OF timestamp_tz_unconstrained
  INDEX BY BINARY_INTEGER;

TYPE timestamp_with_time_zone_Table
  IS TABLE OF timestamp_tz_unconstrained
  INDEX BY BINARY_INTEGER;

TYPE urowid_table
  IS TABLE OF UROWID
  INDEX BY BINARY_INTEGER;

TYPE varchar2_table
  IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

Syntax

```sql
DBMS_SQL.DEFINE_ARRAY ( c          IN INTEGER,
                        position    IN INTEGER,
                        <table_variable>    IN <datatype>
                        cnt         IN INTEGER,
                        lower_bnd   IN INTEGER);
```
Where <table_variable> and its corresponding <datatype> can be any one of the following matching pairs, DEFINE_ARRAY being overloaded to accept different datatypes:

- <clob_tab> Clob_Table
- <bflt_tab> Binary_Float_Table
- <bdbl_tab> Binary_Double_Table
- <blob_tab> Blob_Table
- <bfile_tab> Bfile_Table
- <date_tab> Date_Table
- <num_tab> Number_Table
- <urowid_tab> Urowid_Table
- <vchr2_tab> Varchar2_Table
- <tm_tab> Time_Table
- <ttz_tab> Time_With_Time_Zone_Table
- <tms_tab> Timestamp_Table
- <tstz_tab> Timestamp_With_Time_Zone_Table
- <ids_tab> Interval_Day_To_Second_Table
- <iym_tab> Interval_Year_To_Month_Table

**Pragmas**

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent FETCH_ROWS call fetch "count" rows. When the COLUMN_VALUE call is made, these rows are placed in positions lower_bnd, lower_bnd+1, lower_bnd+2, and so on. While there are still rows coming, the user keeps issuing FETCH_ROWS/COLUMN_VALUE calls. The rows keep accumulating in the table specified as an argument in the COLUMN_VALUE call.

**Parameters**

**Table 149–12  DEFINE_ARRAY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind an array.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the array being defined.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
<tr>
<td>table_variable</td>
<td>Local variable that has been declared as &lt;datatype&gt;.</td>
</tr>
<tr>
<td>cnt</td>
<td>Number of rows that must be fetched.</td>
</tr>
<tr>
<td>lower_bnd</td>
<td>Results are copied into the collection, starting at this lower bound index.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The count (cnt) must be an integer greater than zero; otherwise an exception is raised. The lower_bnd can be positive, negative, or zero. A query on which a DEFINE_ARRAY call was issued cannot contain array binds.

**Examples**

```plsql
PROCEDURE BULK_PLSQL(deptid NUMBER)
    TYPE namelist IS TABLE OF employees.last_name%TYPE;
    TYPE sallist IS TABLE OF employees.salary%TYPE;
    names    namelist;
```
sals     sallist;
c        NUMBER;
r        NUMBER;
sql_stmt VARCHAR2(32767) :=
    'SELECT last_name, salary FROM employees WHERE department_id = :b1';
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);
    DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);
    DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
    DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);
    r := DBMS_SQL.EXECUTE(c);
    LOOP
        r := DBMS_SQL.FETCH_ROWS(c);
        DBMS_SQL.COLUMN_VALUE(c, 1, names);
        DBMS_SQL.COLUMN_VALUE(c, 2, sals);
        EXIT WHEN r != 5;
    END LOOP;
    DBMS_SQL.CLOSE_CURSOR(c);
    -- loop through the names and sals collections
    FOR i IN names.FIRST .. names.LAST  LOOP
        DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
    END LOOP;
END;
/

See Also: "Examples 6 and 7: Defining an Array" on page 149-16 for examples of how to define collections.
**DEFINE_COLUMN Procedures**

This procedure defines a column to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the `DEFINE_COLUMN_CHAR Procedure`, `DEFINE_COLUMN_LONG Procedure`, `DEFINE_COLUMN_RAW Procedure` and `DEFINE_COLUMN_ROWID Procedure`.

**Syntax**

```sql
DBMS_SQL.DEFINE_COLUMN (
    c IN INTEGER,
    position IN INTEGER,
    column IN <datatype>);
```

Where `<datatype>` can be any one of the following types:

- `BINARY_DOUBLE`
- `BINARY_FLOAT`
- `BFILE`
- `BLOB`
- `CLOB CHARACTER SET ANY_CS`
- `DATE`
- `DSINTERVAL_UNCONSTRAINED`
- `NUMBER`
- `TIME_UNCONSTRAINED`
- `TIME_TZ_UNCONSTRAINED`
- `TIMESTAMP_LTZ_UNCONSTRAINED`
- `TIMESTAMP_TZ_UNCONSTRAINED`
- `TIMESTAMP_UNCONSTRAINED`
- `UROWID`
- `YMINTERVAL_UNCONSTRAINED`
- user-defined object types
- collections (VARRAYs and nested tables)
- REFs
- Opaque types

Note that `DEFINE_COLUMN` is overloaded to accept different datatypes.

The following syntax is also supported for the `DEFINE_COLUMN` procedure:

```sql
DBMS_SQL.DEFINE_COLUMN (
    c IN INTEGER,
    position IN INTEGER,
    column IN VARCHAR2 CHARACTER SET ANY_CS,
    column_size IN INTEGER);
```

**See Also:** *Oracle Database SecureFiles and Large Objects Developer’s Guide*

**Pragmas**

```sql
pragma restrict_references(define_column,RNDS,WNDS);
```
Parameters

When using character length semantics the maximum number of bytes that can be returned for a column value of type `VARCHAR2` is calculated as: column_size * maximum character byte size for the current character set. For example, specifying the column_size as 10 means that a maximum of 30 (10*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.

Usage Notes

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined. The type of this value determines the type for the column being defined.</td>
</tr>
<tr>
<td>column_size</td>
<td>Maximum expected size of the column value in bytes for columns of type <code>VARCHAR2</code>, and <code>RAW</code>.</td>
</tr>
</tbody>
</table>
**DEFINE_COLUMN_CHAR Procedure**

This procedure defines a column with CHAR data to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_LONG Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

**Syntax**

```sql
DBMS_SQL.DEFINE_COLUMN_CHAR (  
   c              IN INTEGER,  
   position       IN INTEGER,  
   column         IN CHAR CHARACTER SET ANY_CS,  
   column_size    IN INTEGER);
```

**See Also:** Oracle Database SecureFiles and Large Objects Developer’s Guide

**Pragmas**

```sql
pragma restrict_references(define_column,RNDS,WNDS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined. The first column</td>
</tr>
<tr>
<td></td>
<td>in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined. The type of this value determines</td>
</tr>
<tr>
<td></td>
<td>the type for the column being defined.</td>
</tr>
<tr>
<td>column_size</td>
<td>Maximum expected size of the column value in characters for columns of type</td>
</tr>
<tr>
<td></td>
<td>CHAR.</td>
</tr>
</tbody>
</table>

...
DEFINE_COLUMN_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

### Syntax

```sql
DBMS_SQL.DEFINE_COLUMN_LONG (  
c              IN INTEGER,  
position       IN INTEGER);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
</tbody>
</table>
DEFINE_COLUMN_RAW Procedure

This procedure defines a column of type RAW to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_RAW (  
c              IN INTEGER,  
position       IN INTEGER,  
column         IN RAW,  
column_size    IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

*Table 149–16  DEFINE_COLUMN Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined. The type of this value determines the type for the column being defined.</td>
</tr>
<tr>
<td>column_size</td>
<td>Maximum expected size of the column value in bytes for columns of and RAW</td>
</tr>
</tbody>
</table>

See Also: *Oracle Database SecureFiles and Large Objects Developer’s Guide*
DEFINE_COLUMN_ROWID Procedure

This procedure defines a column of type ROWID to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure and DEFINE_COLUMN_RAW Procedure.

Syntax

DBMS_SQL.DEFINE_COLUMN_ROWID (  
c              IN INTEGER,  
position       IN INTEGER,  
column         IN ROWID);  

See Also: Oracle Database SecureFiles and Large Objects Developer’s Guide

Pragmas

pragma restrict_references(define_column,RNDS,WNDS);

Parameters

<table>
<thead>
<tr>
<th>Table 149–17 DEFINE_COLUMN Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>c</td>
</tr>
<tr>
<td>position</td>
</tr>
<tr>
<td>column</td>
</tr>
</tbody>
</table>
DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (  
  c IN INTEGER,  
  col_cnt OUT INTEGER, 
  desc_t OUT DESC_TAB);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the columns being described</td>
</tr>
<tr>
<td>col_cnt</td>
<td>Number of columns in the select list of the query</td>
</tr>
<tr>
<td>desc_t</td>
<td>Describe table to fill in with the description of each of the columns of the query</td>
</tr>
</tbody>
</table>

See Also: "Example 8: Describe Columns" on page 149-18 illustrates how to use DESCRIBE_COLUMNS.
DESCRIBE_COLUMNS2 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS2 (
    c              IN  INTEGER,
    col_cnt        OUT INTEGER,
    desc_t         OUT DESC_TAB2);
```

Pragmas

```
pragma restrict_references(describe_columns2,wnds);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the columns being described.</td>
</tr>
<tr>
<td>col_cnt</td>
<td>Number of columns in the select list of the query.</td>
</tr>
<tr>
<td>desc_t</td>
<td>Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.</td>
</tr>
</tbody>
</table>
**DESCRIBE_COLUMNS3 Procedure**

This procedure describes the specified column. This is an alternative to **DESCRIBE_COLUMNS Procedure**.

**Syntax**

```sql
DBMS_SQL.DESCRIBE_COLUMNS3 (  
c              IN  INTEGER,    
col_cnt        OUT INTEGER,   
desc_t         OUT DESC_TAB3);
```

**Pragmas**

```sql
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the columns being described.</td>
</tr>
<tr>
<td>col_cnt</td>
<td>Number of columns in the select list of the query.</td>
</tr>
<tr>
<td>desc_t</td>
<td>Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The cursor passed in by the cursor ID has to be OPENed and PARSEd, otherwise an "invalid cursor id" error is raised.

**Examples**

```sql
CREATE TYPE PROJECT_T AS OBJECT  
  ( projname          VARCHAR2(20),  
    mgr               VARCHAR2(20))  
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)  
/

DECLARE  
curid      NUMBER;  
desctab    DBMS_SQL.DESC_TAB3;  
colcnt     NUMBER;  
sql_stmt   VARCHAR2(200) := 'select * from projecttab';  
BEGIN  
curid := DBMS_SQL.OPEN_CURSOR;  
DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);  
DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);  
FOR i IN 1 .. colcnt LOOP  
  IF desctab(i).col_type = 109 THEN
```

---

**Table 149–20 DESCRIBE_COLUMNS3 Procedure Parameters**
DESCRIBE_COLUMNS3 Procedure

```
  DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
  DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                        desctab(i).col_type_name);
  END IF;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

Output:

PROJECT is user-defined type: HR.PROJECT_T
```
EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed. The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types of statements, including DDL, the return value is undefined and must be ignored.

Syntax

```
DBMS_SQL.EXECUTE (   
   c  IN INTEGER)  
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor to execute.</td>
</tr>
</tbody>
</table>

Return Values

Returns number of rows processed

Usage Notes

The DBMS_SQL cursor that is returned by the TO_CURSOR_NUMBER Function performs in the same way as a DBMS_SQL cursor that has already been executed. Consequently, calling EXECUTE for this cursor will cause an error.
EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows. This function provides the same functionality as calling EXECUTE and then calling FETCH_ROWS. Calling EXECUTE_AND_FETCH instead, however, may reduce the number of network round-trips when used against a remote database.

The EXECUTE_AND_FETCH function returns the number of rows actually fetched.

Syntax

```sql
DBMS_SQL.EXECUTE_AND_FETCH (    c    IN INTEGER,    exact    IN BOOLEAN DEFAULT FALSE) RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(execute_and_fetch,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to execute and fetch.</td>
</tr>
<tr>
<td>exact</td>
<td>Set to TRUE to raise an exception if the number of rows actually matching the query differs from one. Note: Oracle does not support the exact fetch TRUE option with LONG columns. Even if an exception is raised, the rows are still fetched and available.</td>
</tr>
</tbody>
</table>

Return Values

Returns designated rows
FETCH_ROWS Function

This function fetches a row from a given cursor. You can call FETCH_ROWS repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling COLUMN_VALUE, for each column, after each call to FETCH_ROWS.

The FETCH_ROWS function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

```sql
DBMS_SQL.FETCH_ROWS (c IN INTEGER)
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(fetch_rows,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number.</td>
</tr>
</tbody>
</table>

Return Values

Returns a row from a given cursor
GET_NEXT_RESULT Procedures

This procedure gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client. The statements are returned in same order as they are returned by the RETURN_RESULT Procedures.

Syntax

DBMS_SQL.GET_NEXT_RESULT(
    c            IN          INTEGER,
    rc           OUT         SYS_REFCURSOR);

DBMS_SQL.GET_NEXT_RESULT(
    c            IN          INTEGER,
    rc           OUT         INTEGER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Recursive statement cursor</td>
</tr>
<tr>
<td>rc</td>
<td>Cursor or ref cursor of the statement of the next returned result</td>
</tr>
</tbody>
</table>

Exceptions

ORA-01403 no_data_found: This is raised when there is no further returned statement result.

Usage Notes

- After the cursor of a statement result is retrieved, the caller must close the cursor properly when it is no longer needed.
- The cursors for all unretrieved returned statements will be closed after the cursor of the recursive statement is closed.

Examples

DECLARE
    c  INTEGER;
    rc SYS_REFCURSOR;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR(treat_as_client_for_results => TRUE);
    DBMS_SQL.PARSE(c => c,
                    statement => 'begin proc; end;');
    DBMS_SQL.EXECUTE(c);
    LOOP
        BEGIN
            DBMS_SQL.GET_NEXT_RESULT(c, rc);
            EXCEPTIONS
                WHEN no_data_found THEN
                    EXIT;
        END;
    END;
    LOOP
        FETCH rc INTO ...

... 
END LOOP;
END LOOP;
END;
IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

DBMS_SQL.IS_OPEN (  
c              IN INTEGER)  
RETURN BOOLEAN;

Pragmas

pragma restrict_references(is_open,RNDS,WNDS);

Parameters

Table 149–25  IS_OPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor to check.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE for any cursor number that has been opened but not closed, and FALSE for a NULL cursor number. Note that the CLOSE_CURSOR Procedure Procedure NULLs out the cursor variable passed to it.

Exceptions

ORA-29471 DBMS_SQL access denied: This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent DBMS_SQL call in the same session will raise this error, meaning that DBMS_SQL is non-operational for this session.
LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```sql
DBMS_SQL.LAST_ERROR_POSITION
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(last_error_position,RNDS,WNDS);
```

Return Values

Returns the byte offset in the SQL statement text where the error occurred.

Usage Notes

Call this function after a PARSE call, before any other DBMS_SQL procedures or functions are called.
LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```
DBMS_SQL.LAST_ROW_COUNT
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_row_count,RNDS,WNDS);
```

Return Values

Returns the cumulative count of the number of rows fetched.

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call. If called after an EXECUTE call, then the value returned is zero.
LAST_ROW_ID Function

This function returns the ROWID of the last row processed.

Syntax

```
DBMS_SQL.LAST_ROW_ID
RETURN ROWID;
```

Pragmas

```
pragma restrict_references(last_row_id,RNDS,WNDS);
```

Return Values

Returns the ROWID of the last row processed.

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call.
LAST_SQL_FUNCTION_CODE Function

This function returns the SQL function code for the statement. These codes are listed in the Oracle Call Interface Programmer’s Guide.

Syntax

DBMS_SQL.LAST_SQL_FUNCTION_CODE
RETURN INTEGER;

Pragmas

pragma restrict_references(last_sql_function_code,RNDS,WNDS);

Return Values

Returns the SQL function code for the statement

Usage Notes

You must call this function immediately after the SQL statement is run; otherwise, the return value is undefined.
OPEN_CURSOR Functions

This function opens a new cursor. The security_level parameter allows for application of fine-grained control to the security of the opened cursor.

Syntax

```
DBMS_SQL.OPEN_CURSOR (    
    treat_as_client_for_results    IN     BOOLEAN    DEFAULT FALSE)
RETURN INTEGER;
```

```
DBMS_SQL.OPEN_CURSOR (    
    security_level                 IN     INTEGER, 
    treat_as_client_for_results    IN     BOOLEAN    DEFAULT FALSE)
RETURN INTEGER;
```

Parameters

Table 149–26 OPEN_CURSOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>security_level</td>
<td>Specifies the level of security protection to enforce on the opened cursor. Valid security level values are 0, 1, and 2. When a NULL argument value is provided to this overload, as well as for cursors opened using the overload of open_cursor without the security_level parameter, the default security level value 1 will be enforced on the opened cursor.</td>
</tr>
<tr>
<td></td>
<td>■ Level 0 - allows all DBMS_SQL operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default.</td>
</tr>
<tr>
<td></td>
<td>■ Level 1 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.</td>
</tr>
<tr>
<td></td>
<td>■ Level 2 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.</td>
</tr>
<tr>
<td>treat_as_client_for</td>
<td>Allows the caller of the recursive statement to set itself as the client to receive the statement results returned from the recursive statement to client. The statement results returned may be retrieved by the GET_NEXT_RESULT Procedures.</td>
</tr>
<tr>
<td>results</td>
<td></td>
</tr>
</tbody>
</table>

Pragmas

```
pragma restrict_references(open_cursor,RNDS,WNDS);
```

Return Values

Returns the cursor ID number of the new cursor.
Usage Notes

- When you no longer need this cursor, you must close it explicitly by calling the `CLOSE_CURSOR` Procedure.
- You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.
PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are four versions of the PARSE procedure:

- Taking a VARCHAR2 statement as an argument
- Two versions that take a segmented string, one taking VARCHAR2A, a table of varchar2d(32767), and another, taking VARCHAR2S, a table of varchar2(256), as argument. Both overloads concatenate elements of a PL/SQL table statement and parse the resulting string. You can use these procedures to parse a statement that is longer than the limit for a single VARCHAR2 variable by splitting up the statement.
- Taking a CLOB statement as an argument. You can use the CLOB overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

```sql
DBMS_SQL.PARSE (    c                        IN   INTEGER,    statement             IN   VARCHAR2,    language_flag      IN   INTEGER,    edition             IN   VARCHAR2 DEFAULT NULL,    apply_crossedition_trigger IN   VARCHAR2 DEFAULT NULL,    fire_apply_trigger     IN   BOOLEAN DEFAULT TRUE,    schema              IN   VARCHAR2 DEFAULT NULL,    container           IN   VARCHAR2);

DBMS_SQL.PARSE (    c                        IN   INTEGER,    statement             IN   CLOB,    language_flag      IN   INTEGER,    edition             IN   VARCHAR2 DEFAULT NULL,    apply_crossedition_trigger IN   VARCHAR2 DEFAULT NULL,    fire_apply_trigger     IN   BOOLEAN DEFAULT TRUE,    schema              IN   VARCHAR2 DEFAULT NULL,    container           IN   VARCHAR2);

DBMS_SQL.PARSE (    c                        IN   INTEGER,    statement             IN   VARCHAR2A,    lb                  IN   INTEGER,    ub                  IN   INTEGER,    lfflg                IN   BOOLEAN,    language_flag      IN   INTEGER,    edition             IN   VARCHAR2 DEFAULT NULL,    apply_crossedition_trigger IN   VARCHAR2 DEFAULT NULL,    fire_apply_trigger     IN   BOOLEAN DEFAULT TRUE,    schema              IN   VARCHAR2 DEFAULT NULL,    container           IN   VARCHAR2);

DBMS_SQL.PARSE (    c                        IN   INTEGER,    statement             IN   VARCHAR2s,    lb                  IN   INTEGER,    ub                  IN   INTEGER,    lfflg                IN   BOOLEAN,    language_flag      IN   INTEGER,
```
edition IN VARCHAR2 DEFAULT NULL,
apply_crossedition_trigger IN VARCHAR2 DEFAULT NULL,
fire_apply_trigger IN BOOLEAN DEFAULT TRUE,
schema IN VARCHAR2 DEFAULT NULL,
container IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor in which to parse the statement.</td>
</tr>
<tr>
<td>statement</td>
<td>SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs. Unlike a PL/SQL statement, your SQL statement must not include a final semicolon. For example: DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2); DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);</td>
</tr>
<tr>
<td>lb</td>
<td>Lower bound for elements in the statement</td>
</tr>
<tr>
<td>ub</td>
<td>Upper bound for elements in the statement</td>
</tr>
<tr>
<td>lfflg</td>
<td>If TRUE, then insert a linefeed after each element on concatenation.</td>
</tr>
<tr>
<td>language_flag</td>
<td>Note: This parameter is non-operative with Oracle Database 12c. The parameter is provided for backwards compatibility only.</td>
</tr>
</tbody>
</table>
| edition           | Specifies the edition in which to run the statement under the following conditions:  

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If NULL and container is NULL, the statement will be run in the current edition.</td>
<td>If a valid container is specified, passing NULL indicates the statement is to run in the target container’s default edition.</td>
</tr>
<tr>
<td>If NULL and container is NULL, the statement will be run in the current edition.</td>
<td>Given the user and the edition with which the statement is to be executed, the user must have USE privilege on the edition.</td>
</tr>
</tbody>
</table>

The following general conditions apply. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the edition's actual name, and if double quotation marks are not used the contents will be uppercased.
Using **DBMS_SQL** to dynamically run DDL statements can cause the program to stop responding. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, stops the program from running.

Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

For example, the following code does *not* compile on the client:

```sql
DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant DBMS_SQL.NATIVE
```

The following code works on the client, because the argument is explicitly provided:

```sql
DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client
```
- The `VARCHAR2S` type is currently supported for backward compatibility of legacy code. However, you are advised to use `VARCHAR2A` both for its superior capability and because `VARCHAR2S` will be deprecated in a future release.

- To parse SQL statements larger than 32 KB, the new `CLOB` overload version of the `PARSE` procedure can be used instead of the `VARCHAR2A` overload.

- If the `container` parameter value is the same as the calling container, a container switch will not occur. However, the default roles of the current user will be in effect.

**Exceptions**

If you create a type, procedure, function, or package using `DBMS_SQL` that has compilation warnings, an `ORA-24344` exception is raised, and the PL/SQL unit is still created.
RETURN_RESULT Procedures

This procedure returns the result of an executed statement to the client application. The result can be retrieved later by the client. Alternatively, it can return the statement result to and be retrieved later by the immediate caller that executes a recursive statement in which this statement result will be returned.

The caller can be:
- A PL/SQL stored procedure executing the recursive statement using DBMS_SQL
- A Java stored procedure using JDBC
- A .NET stored procedure using ADO.NET
- An external procedure using the Oracle Call Interface (OCI)

Syntax

```
DBMS_SQL.RETURN_RESULT(
    rc           IN OUT      SYS_REFCURSOR,
    to_client    IN          BOOLEAN           DEFAULT TRUE);
```

Syntax

```
DBMS_SQL.RETURN_RESULT(
    rc           IN OUT      INTEGER,
    to_client    IN          BOOLEAN           DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rc</td>
<td>Statement cursor or ref cursor</td>
</tr>
<tr>
<td>to_client</td>
<td>Returns (or does not return) the statement result to the client. If not, it is returned to the immediate caller.</td>
</tr>
</tbody>
</table>

Usage Notes

- Currently only a SQL query can be returned, and the return of statement results over remote procedure calls is not supported.
- Once the statement is returned, it is no longer accessible except by the client or the immediate caller to which it is returned.
- Statement results cannot be returned when the statement being executed by the client or any intermediate recursive statement is a SQL query and an error is raised.
- A ref cursor being returned can be strongly or weakly-typed.
- A query being returned can be partially fetched.
- Because EXECUTE IMMEDIATE statement provides no interface to retrieve the statement results returned from its recursive statement, the cursors of the statement results returned to the caller of the EXECUTE IMMEDIATE statement will be closed when the statement completes. To retrieve the returned statement results from a recursive statement in PL/SQL, use DBMS_SQL to execute the recursive statement.
Examples

CREATE PROCEDURE proc AS
    rc1 sys_refcursor;
    rc2 sys_refcursor;
BEGIN
    OPEN rc1 FOR SELECT * FROM t1;
    DBMS_SQL.RETURN_RESULT(rc1);
    OPEN rc2 FOR SELECT * FROM t2;
    DBMS_SQL.RETURN_RESULT(rc2);
END;
/

TO_CURSOR_NUMBER Function

This function takes an OPENed strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.

Syntax

```sql
dbms_sql.to_cursor_number(
    rc in out sys_refcursor
) return integer;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rc</td>
<td>REF CURSOR to be transformed into a cursor number</td>
</tr>
</tbody>
</table>

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a REF CURSOR.

Usage Notes

- The REF CURSOR passed in has to be OPENed, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- The DBMS_SQL cursor that is returned by this subprogram performs in the same way as a DBMS_SQL cursor that has already been executed.

Examples

```sql
create or replace procedure do_query(sql_stmt varchar2) is
type curtype is ref cursor;
src_cur         curtype;
curid           number;
desctab         dbms_sql.desc_tab;
colcnt          number;
namevar         varchar2(50);
numvar          number;
datevar         date;
empno           number := 100;
begin
  -- sql_stmt := 'select ....... from employees where employee_id = :b1';
  open src_cur for sql_stmt using empno;
  -- Switch from native dynamic SQL to DBMS_SQL
  curid := dbms_sql.to_cursor_number (src_cur);
  dbms_sql.describe_columns(curid, colcnt, desctab);
  -- Define columns
  for i in 1 .. colcnt loop
    if desctab(i).col_type = 2 then
```

---

**Table 149–29 TO_CURSOR_NUMBER Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rc</td>
<td>REF CURSOR to be transformed into a cursor number</td>
</tr>
</tbody>
</table>
DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
ELSIF desctab(i).col_type = 12 THEN
    DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);

    END IF;
END LOOP;
-- Fetch Rows
WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
    FOR i IN 1 .. colcnt LOOP
        IF (desctab(i).col_type = 1) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
        ELSIF (desctab(i).col_type = 2) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
        ELSIF (desctab(i).col_type = 12) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
        END IF;
    END LOOP;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

TO_CURSOR_NUMBER Function
**TO_REFERENCURSOR Function**

This function takes an OPENed, PARSED, and EXECUTEd cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL. This subprogram is only used with SELECT cursors.

**Syntax**

```sql
DBMS_SQL.TO_REFERENCURSOR(
    cursor_number IN OUT INTEGER
) RETURN SYS_REFERENCURSOR;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cursor_number</td>
<td>Cursor number of the cursor to be transformed into REF CURSOR</td>
</tr>
</tbody>
</table>

**Return Values**

Returns a PL/SQL REF CURSOR transformed from a DBMS_SQL cursor number.

**Usage Notes**

- The cursor passed in by the `cursor_number` has to be OPENed, PARSED, and EXECUTEd; otherwise an error is raised.
- Once the `cursor_number` is transformed into a REF CURSOR, the `cursor_number` is no longer accessible by any DBMS_SQL operations.
- After a cursor_number is transformed into a REF CURSOR, using DBMS_SQL.IS_OPEN to check to see if the `cursor_number` is still open results in an error.
- If the cursor number was last parsed with a valid container parameter, it cannot be converted to a REF CURSOR.

**Examples**

```sql
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
    TYPE CurType IS REF CURSOR;
    src_cur         CurType;
    curid           NUMBER;
    sql_stmt        VARCHAR2(200);
    ret             INTEGER;
    empnos          DBMS_SQL.Number_Table;
    depts           DBMS_SQL.Number_Table;
BEGIN
    -- DBMS_SQL.OPEN_CURSOR
    curid := DBMS_SQL.OPEN_CURSOR;
    sql_stmt := 'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID = :b1';
    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
END;
```

**Table 149–30  TO_REFERENCURSOR Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cursor_number</td>
<td>Cursor number of the cursor to be transformed into REF CURSOR</td>
</tr>
</tbody>
</table>
ret := DBMS_SQL.EXECUTE(curid);

-- Switch from DBMS_SQL to native dynamic SQL
src_cur := DBMS_SQL.TO_REFCURSOR(curid);

-- Fetch with native dynamic SQL
FETCH src_cur BULK COLLECT INTO empnos, depts;

IF empnos.COUNT > 0 THEN
    DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
    DBMS_OUTPUT.PUT_LINE('----- ------');
    -- Loop through the empnos and depts collections
    FOR i IN 1 .. empnos.COUNT LOOP
        DBMS_OUTPUT.PUT_LINE(empnos(i) || '   ' || depts(i));
    END LOOP;
END IF;

-- Close cursor
CLOSE src_cur;
END; /
**VARIABLE_VALUE Procedures**

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause.

**Syntax**

```sql
DBMS_SQL.VARIABLE_VALUE (  
c               IN  INTEGER,  
name            IN  VARCHAR2,  
value           OUT NOCOPY <datatype>);
```

Where `<datatype>` can be any one of the following types:

- BINARY_DOUBLE
- BINARY_FLOAT
- BFILE
- BLOB
- CLOB CHARACTER SET ANY_CS
- DATE
- DSINTERVAL_UNCONSTRAINED
- NUMBER
- TIME_TZ_UNCONSTRAINED
- TIME_UNCONSTRAINED
- TIMESTAMP_LTZ_UNCONSTRAINED
- TIMESTAMP_TZ_UNCONSTRAINED
- TIMESTAMP_UNCONSTRAINED
- UROWID
- VARCHAR2 CHARACTER SET ANY_CS
- YMINTERVAL_UNCONSTRAINED
- user-defined object types
- collections (VARRAYs and nested tables)
- REFs
- Opaque types

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```sql
DBMS_SQL.VARIABLE_VALUE_CHAR (  
c               IN  INTEGER,  
name            IN  VARCHAR2,  
value           OUT CHAR CHARACTER SET ANY_CS);
```

```sql
DBMS_SQL.VARIABLE_VALUE_RAW (  
c               IN  INTEGER,  
name            IN  VARCHAR2,  
value           OUT RAW);
```

```sql
DBMS_SQL.VARIABLE_VALUE_ROWID (  
c               IN  INTEGER,  
name            IN  VARCHAR2,  
value           OUT ROWID);
```

The following syntax enables the VARIABLE_VALUE procedure to accommodate bulk operations:

```sql
DBMS_SQL.VARIABLE_VALUE (  
c               IN  INTEGER,  
name            IN  VARCHAR2,
```

value OUT NOCOPY <table_type>);

For bulk operations, <table_type> can be:

Binary_Double_Table
Binary_Float_Table
Bfile_Table
Blob_Table
Clob_Table
Date_Table
Interval_Day_To_Second_Table
Interval_Year_To_Month_Table
Number_Table
Time_Table
Time_With_Time_Zone_Table
Timestamp_Table
Timestamp_With_Ltz_Table;
Timestamp_With_Time_Zone_Table
Urowid_Table
Varchar2_Table

Pragmas

pragma restrict_references(variable_value,RNDS,WNDS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor from which to get the values.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the variable for which you are retrieving the value.</td>
</tr>
<tr>
<td>value</td>
<td>Single row option: Returns the value of the variable for the specified position. Oracle raises the exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to BIND_VARIABLE.</td>
</tr>
<tr>
<td></td>
<td>Array option: Local variable that has been declared &lt;table_type&gt;. For bulk operations, value is an OUT NOCOPY parameter.</td>
</tr>
</tbody>
</table>
The DBMS_SQL_TRANSLATOR package provides an interface for creating, configuring, and using SQL translation profiles.

Using DBMS_SQL_TRANSLATOR

- Security Model
- Constants
- Operational Notes
- Exceptions
- Examples
Security Model

- DBMSL_SQL_TRANSLATOR is a invoker’s rights package.
- When translating a SQL statement or error, the translator package procedure will be invoked with the same current user and current schema as those in which the SQL statement being parsed. The owner of the translator package must be granted the TRANSLATE SQL user privilege on the current user.
- Additionally, the current user must be granted the EXECUTE privilege on the translator package.
Constants

The `DBMS_SQL_TRANSLATOR` package uses the constants shown in Table 150–1, "DBMS_SQL_TRANSLATOR Constants”

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTR_EDITIONABLE</td>
<td>'EDITIONABLE'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that specifies whether the SQL translation profile becomes an editioned or noneditioned object if editioning is later enabled for the schema object type SQL translation profile in the owner’s schema (see Operational Notes on page 150-5)</td>
</tr>
<tr>
<td>ATTR_FOREIGN_SQL_SYNTAX</td>
<td>'FOREIGN_SQL_SYNTAX'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that indicates if the profile is for translation of foreign SQL syntax (see Operational Notes on page 150-5)</td>
</tr>
<tr>
<td>ATTR_LOG_TRANSLATION_ERROR</td>
<td>'TRANSLATION_ERROR'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that controls if the profile should log translation error in the database alert log (see Operational Notes on page 150-5)</td>
</tr>
<tr>
<td>ATTR_RAISE_TRANSLATION_ERROR</td>
<td>'TRANSLATION_ERROR'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that controls if the profile should raise translation error if a SQL statement or error fails to be translated (see Operational Notes on page 150-5)</td>
</tr>
<tr>
<td>ATTR_TRANSLATE_NEW_SQL</td>
<td>'TRANSLATE_NEW_SQL'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors (see Operational Notes on page 150-5)</td>
</tr>
<tr>
<td>ATTR_TRACE_TRANSLATION</td>
<td>'TRACE_TRANSLATION'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that controls tracing (see Operational Notes on page 150-5)</td>
</tr>
<tr>
<td>ATTR_TRANSLATOR</td>
<td>'TRANSLATOR'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that specifies the translator package (see Operational Notes on page 150-5)</td>
</tr>
<tr>
<td>ATTR_VALUE_TRUE</td>
<td>'TRUE'</td>
<td>VARCHAR2(30)</td>
<td>Value to set a SQL translation profile attribute to true (see Operational Notes on page 150-5)</td>
</tr>
<tr>
<td>ATTR_VALUE_FALSE</td>
<td>'FALSE'</td>
<td>VARCHAR2(30)</td>
<td>Value to set a SQL translation profile attribute to false (see Operational Notes on page 150-5)</td>
</tr>
</tbody>
</table>
Operational Notes

The subprograms that modify a profile have DDL transaction semantics and when invoked will commit any open transaction in the session.

**ATTR_EDITIONABLE Constant**
Editionable is true by default.

**ATTR_FOREIGN_SQL_SYNTAX Constant**
Foreign SQL syntax is true by default.

**ATTR_LOG_TRANSLATION_ERROR Constant**
- If log translation is enabled in a SQL translation profile, an alert log is written to the database alert log if no custom translation is found for a SQL statement or error. This allows the user to catch any error in the custom translation in a profile.
- Log translation error is false by default.

**ATTR_RAISE_TRANSLATION_ERROR Constant**
Raise translation error is false by default.

**ATTR_TRANSLATE_NEW_SQL Constant**
- The name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors. If so, the translator package, if registered, will translate a new SQL statement or error not already translated in custom translations, and also register the new translation as custom translation. If not, any new SQL statement or error encountered will result in a translation error.
- Translate new SQL statements and errors is true by default.

**ATTR_TRACE_TRANSLATION Constant**
- If tracing is enabled in a SQL translation profile, any SQL statement or error translated by the profile in a database session and its translation is written to the database session’s trace file.
- Tracing is disabled by default.

**ATTR_TRANSLATOR Constant**
- The translator package must be a PL/SQL package with the following three procedures. The TRANSLATE_SQL Procedure and the TRANSLATE_ERROR Procedure are called to translate SQL statements and errors. The names of the parameters of the translate procedures must be followed.

```sql
PROCEDURE TRANSLATE_SQL(
    sql_text        IN  CLOB,
    translated_text OUT CLOB);

PROCEDURE TRANSLATE_ERROR(
    error_code          IN  BINARY_INTEGER,
    translated_code     OUT BINARY_INTEGER,
    translated_sqlstate OUT VARCHAR2);
```

Parameters:
- profile_name - profile name
- sql_text - SQL statement to be translated
When NULL is returned in translated_text, translated_code, or translated_sqlstate, it means that no translation is required and the original SQL statement, error code, or SQLSTATE is used instead.

The name of the translator package follows the naming rules for database packages of the form [schema.]package_name. When the schema and package names are used, they are set to uppercase by default unless surrounded by double quotation marks. For example, setting a translator package, translator => 'dbms_tsql_translator' is the same as translator => 'Dbms_Tsql_Translator' and translator => 'DBMS_TSQL_TRANSLATOR', but not the same as translator => '"dbms_tsql_translator"'. The default schema name is the profile owner.

The translator attribute is not set by default.

**ATTR_VALUE_TRUE Constant**
The value to set a SQL translation profile attribute to true.

**ATTR_VALUE_FALSE Constant**
The value to set a SQL translation profile attribute to false.
Exceptions

The following table lists the exceptions raised by the DBMS_SQL_TRANSLATOR package.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>29261</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>1031</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>24252</td>
<td>Profile does not exist</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>1918</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_TRANSLATION_FOUND</td>
<td>24253</td>
<td>No translation of the SQL statement or error code found</td>
</tr>
<tr>
<td>PROFILE_EXISTS</td>
<td>955</td>
<td>Profile already exists</td>
</tr>
</tbody>
</table>
Examples

**Basic SQL Translation**

```sql
BEGIN
    DBMS_SQL_TRANSLATOR.CREATE_PROFILE(
        profile_name => 'tsql_application');
    DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE(
        profile_name => 'tsql_application',
        attribute_name => DBMS_SQL_TRANSLATOR.ATTR_TRANSLATOR,
        attribute_value => 'migration_repo.sybase_tsql_translator');
END;
```
### Summary of DBMS_SQL_TRANSLATOR Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_PROFILE Procedure on page 150-10</td>
<td>Creates a SQL translation profile</td>
</tr>
<tr>
<td>DEREGISTER_SQL_TRANSLATION Procedure on page 150-11</td>
<td>Deregisters the custom translation of a SQL statement in a SQL translation profile</td>
</tr>
<tr>
<td>DEREGISTER_ERROR_TRANSLATION Procedure on page 150-12</td>
<td>Deregisters the translation of an Oracle error code and SQLSTATE in a SQL translation profile</td>
</tr>
<tr>
<td>DROP_PROFILE Procedure on page 150-13</td>
<td>Drops a SQL translation profile and its contents</td>
</tr>
<tr>
<td>ENABLE_ERROR_TRANSLATION Procedure on page 150-14</td>
<td>Enables or disables a custom translation of an Oracle error code in a SQL translation profile</td>
</tr>
<tr>
<td>ENABLE_SQL_TRANSLATION Procedure on page 150-15</td>
<td>Enables or disables a custom translation of a SQL statement in a SQL translation profile</td>
</tr>
<tr>
<td>EXPORT_PROFILE Procedure on page 150-16</td>
<td>Exports the content of a SQL translation profile</td>
</tr>
<tr>
<td>IMPORT_PROFILE Procedure on page 150-18</td>

<tr>
<td>REGISTER_SQL_TRANSLATION Procedure on page 150-21</td>
<td>Registers a custom translation of a SQL statement in a SQL translation profile</td>
</tr>
<tr>
<td>SET_ATTRIBUTE Procedure on page 150-23</td>
<td>Sets an attribute of a SQL translation profile</td>
</tr>
<tr>
<td>SQL_HASH Function on page 150-24</td>
<td>Computes the hash value of a SQL statement in a SQL translation profile</td>
</tr>
<tr>
<td>SQL_ID Function on page 150-25</td>
<td>Computes the SQL identifier of a SQL statement in a SQL translation profile</td>
</tr>
<tr>
<td>TRANSLATE_ERROR Procedure on page 150-26</td>
<td>Translates an Oracle error code and an ANSI SQLSTATE using a SQL translation profile</td>
</tr>
<tr>
<td>TRANSLATE_SQL Procedure on page 150-27</td>
<td>Translates a SQL statement using a SQL translation profile</td>
</tr>
</tbody>
</table>
CREATE_PROFILE Procedure

This procedure creates a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.CREATE_PROFILE (
   profile_name    IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>PROFILE_EXISTS</td>
<td>Profile already exists</td>
</tr>
</tbody>
</table>

Usage Notes

- A SQL translation profile is a database schema object that resides in SQL translation profile namespace. Its name follows the naming rules for database objects of the form `[schema.]name`. When the schema and profile names are used in the `DBMS_SQL_TRANSLATOR` package, they are uppercased unless surrounded by double quotation marks. For example, the translation profile `profile_name => 'tsql_application'` is the same as `profile_name => 'Tsql_Application'` and `profile_name => 'TSQL_APPLICATION'`, but not the same as `profile_name => '"tsql_application"'.

- A SQL translation profile is an editionable object type.

- A SQL translation profile cannot be created as a common object in a multitenant container database (CDB).

- To destroy a SQL translation profile, use the `DROP_PROFILE Procedure`. 

Examples

```sql
BEGIN
   DBMS_SQL_TRANSLATOR.CREATE_PROFILE(profile_name => 'tsql_application');
END;
```
**DEREGISTER_SQL_TRANSLATION Procedure**

This procedure deregisters the custom translation of a SQL statement in a SQL translation profile.

**Syntax**

```sql
DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (  
    profile_name      IN  VARCHAR2,  
    sql_text          IN  CLOB);
```

**Parameters**

*Table 150–6  DEREGISTER_SQL_TRANSLATION Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
</tbody>
</table>

**Exceptions**

*Table 150–7  DEREGISTER_SQL_TRANSLATION Procedure Exceptions*

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>PROFILE_EXISTS</td>
<td>Profile already exists</td>
</tr>
</tbody>
</table>

**Examples**

```sql
BEGIN  
    DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION(  
        profile_name => 'tsql_application',  
        sql_text     => 'select top 5 * from emp');  
END;
```
DEREGISTER_ERROR_TRANSLATION Procedure

This procedure deregisters the translation of an Oracle error code and SQLSTATE in a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION (    profile_name          IN   VARCHAR2,    error_code            IN   PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>error_code</td>
<td>Oracle error code</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Examples

```sql
BEGIN
    DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION(
        profile_name  => 'tsql_application',
        error_code    => 1);
END;
```
DROP_PROFILE Procedure

This procedure drops a SQL translation profile and its contents.

Syntax

```sql
DBMS_SQL_TRANSLATOR.DROP_PROFILE (  
    profile_name IN VARCHAR2);
```

Parameters

**Table 150–10 DROP_PROFILE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
</tbody>
</table>

Exceptions

**Table 150–11 DROP_PROFILE Procedure Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Examples

```sql
BEGIN
    DBMS_SQL_TRANSLATOR.DROP_PROFILE(
        profile_name => 'tsql_application');
END;
```
ENABLE_ERROR_TRANSLATION Procedure

This procedure enables or disables a custom translation of an Oracle error code in a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION (  
    profile_name      IN  VARCHAR2,  
    sql_text          IN  CLOB,  
    enable            IN  BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
<tr>
<td>enable</td>
<td>Enable or disable the translation</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Examples

```sql
BEGIN
    DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION (  
        profile_name => 'tsql_application',  
        sql_text     => 'SELECT TOP 5 * FROM emp',  
        enable       => TRUE);
END;
```
ENABLE_SQL_TRANSLATION Procedure

This procedure enables or disables a custom translation of a SQL statement in a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION (  
    profile_name      IN    VARCHAR2,  
    sql_text          IN    CLOB,  
    enable            IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
<tr>
<td>enable</td>
<td>Enable or disable the translation</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Examples

```sql
BEGIN  
DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION(  
    profile_name => 'tsql_application',  
    sql_text     => 'select top 5 * from emp',  
    enable       => TRUE);  
END;  ```
EXPORT_PROFILE Procedure

This procedure exports the content of a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.EXPORT_PROFILE (  
    profile_name     IN          VARCHAR2,
    content          OUT NOCOPY  CLOB);
```

Parameters

### Table 150–16 EXPORT_PROFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>content</td>
<td>Content of profile</td>
</tr>
</tbody>
</table>

Exceptions

### Table 150–17 EXPORT_PROFILE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

- The content of the SQL translation profile is exported in XML format as follows. Note that the profile name will not be exported.

```xml
<SQLTranslationProfile  
Translator="translator package name"  
ForeignSQLSyntax="TRUE|FALSE"  
TranslateNewSQL="TRUE|FALSE"  
RaiseTranslationError="TRUE|FALSE"  
LogTranslationError="TRUE|FALSE"  
TraceTranslation="TRUE|FALSE"  
Editionable="TRUE|FALSE">
  <SQLTranslations>
    <SQLTranslation Enabled="TRUE|FALSE">  
      <SQLText>original SQL text</SQLText>  
      <TranslatedText>translated SQL text</TranslatedText>  
    </SQLTranslation>
    ...
  </SQLTranslations>
  <ErrorTranslations>
    <ErrorTranslation Enabled="TRUE|FALSE">  
      <ErrorCode>Oracle error code</ErrorCode>  
      <TranslatedCode>translated error code</TranslatedCode>  
      <TranslatedSQLSTATE>translated SQLSTATE</TranslatedSQLSTATE>  
    </ErrorTranslation>
    ...
  </ErrorTranslations>
</SQLTranslationProfile>
```
To import the content to a SQL translation profile, use the IMPORT_PROFILE Procedure.

Examples

DECLARE
    content CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.EXPORT_PROFILE(
        profile_name => 'tsql_application',
        content      => content);
END;
IMPORT PROFILE Procedure

This procedure imports the content of a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.IMPORT_PROFILE (  
    profile_name       IN   VARCHAR2,  
    content            IN   CLOB);  
```

Parameters

### Table 150–18 IMPORT PROFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>content</td>
<td>Content of profile</td>
</tr>
</tbody>
</table>

Exceptions

### Table 150–19 IMPORT PROFILE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

- The content of the SQL translation profile must be in XML format as used by the `EXPORT PROFILE Procedure`. All elements and attributes are optional.
- If the profile does not exist, it is created. If it exists, the content overrides any existing attribute, translator package, SQL or error translation registration.
- To export the content to a SQL translation profile, use the `EXPORT PROFILE Procedure`.

Examples

```sql
DECLARE
    content CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.IMPORT_PROFILE(
        profile_name => 'tsql_application',
        content      => content);
END;
```
REGISTER_ERROR_TRANSLATION Procedure

This procedure registers a custom translation of an Oracle error code and SQLSTATE in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION (  
    profile_name          IN   VARCHAR2,  
    error_code            IN   PLS_INTEGER,  
    translated_code       IN   PLS_INTEGER DEFAULT NULL,  
    translated_sqlstate   IN   VARCHAR2 DEFAULT NULL,  
    enable                IN   BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>error_code</td>
<td>Oracle error code</td>
</tr>
<tr>
<td>translated_code</td>
<td>Translated error code</td>
</tr>
<tr>
<td>translated_sqlstate</td>
<td>Translated SQLSTATE</td>
</tr>
<tr>
<td>enable</td>
<td>Enable or disable the translation</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

- When the Oracle Database translates an Oracle error code using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- The old translation of the error code and SQLSTATE, if present, is replaced with the new translation.
- To deregister a translation, use the DEREGISTER_ERROR_TRANSLATION Procedure.

Examples

```
BEGIN
    DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION(
```

Table 150–20 REGISTER_ERROR_TRANSLATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>error_code</td>
<td>Oracle error code</td>
</tr>
<tr>
<td>translated_code</td>
<td>Translated error code</td>
</tr>
<tr>
<td>translated_sqlstate</td>
<td>Translated SQLSTATE</td>
</tr>
<tr>
<td>enable</td>
<td>Enable or disable the translation</td>
</tr>
</tbody>
</table>

Table 150–21 REGISTER_ERROR_TRANSLATION Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>
profile_name => 'tsql_application',
error_code => 1,
translated_code => 2601);
END;
REGISTER_SQL_TRANSLATION Procedure

This procedure registers a custom translation of a SQL statement in a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION (
    profile_name      IN VARCHAR2,
    sql_text          IN CLOB,
    translated_text   IN CLOB DEFAULT NULL,
    enable            IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
<tr>
<td>translated_text</td>
<td>Translated SQL statement</td>
</tr>
<tr>
<td>enable</td>
<td>Enable or disable the translation</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

- When the Oracle Database translates a statement using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- When `translated_text` is NULL, no translation is required and the original statement is used.
- The old translation of the SQL statement, if present, is replaced with the new translation.
- To deregister a translation, use the `DEREGISTER_SQL_TRANSLATION` Procedure.

Examples

```sql
BEGIN
```
DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text => 'select top 5 * from emp',
    translated_text => 'SELECT * FROM emp WHERE rownum <= :SYS_N_001');
END;
SET_ATTRIBUTE Procedure

This procedure sets an attribute of a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE (
    profile_name      IN  VARCHAR2,
    attribute_name    IN  VARCHAR2,
    attribute_value   IN  VARCHAR2;
)
```

Parameters

Table 150–24 SET_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of attribute</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Value of attribute</td>
</tr>
</tbody>
</table>

Exceptions

Table 150–25 SET_ATTRIBUTE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

See Constants on page 150-4
SQL_HASH Function

This procedure computes the hash value of a SQL statement in the session's SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.SQL_HASH (sql_text IN CLOB)
RETURN NUMBER DETERMINISTIC;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
</tbody>
</table>

Return Values

Returns hash value of the SQL statement in the SQL translation profile

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    sqltext CLOB;
    txltxt CLOB;
    sqlhash NUMBER;
BEGIN
    sqltext  :=  'SELECT TOP 1 * FROM emp';
    sqlhash  :=  DBMS_SQL_TRANSLATOR.SQL_HASH (sqltext);
    SELECT translated_text INTO txltxt
    FROM user_sql_translations
    WHERE sql_hash = sqlhash
    AND DBMS_LOB.COMPARE (sql_text, sqltext) = 0;
END;
```
SQL ID Function

This procedure computes the SQL identifier of a SQL statement in a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.SQL_ID (
    sql_text    IN    CLOB)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
</tbody>
</table>

Return Values

Returns the SQL ID of the SQL statement in the SQL translation profile

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    sqltext CLOB;
    sqlid   VARCHAR2(13);
BEGIN
    sqltext := 'SELECT TOP 1 * FROM emp';
    sqlid := DBMS_SQL_TRANSLATOR.SQL_ID (sqltext);
END;
```
TRANSLATE_ERROR Procedure

This procedure translates an Oracle error code and an ANSI SQLSTATE using the session’s SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR (  
    error_code           IN           PLS_INTEGER,  
    translated_code      OUT          PLS_INTEGER,  
    translated_sqlstate  OUT NOCOPY   VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>error_code</code></td>
<td>Oracle error code</td>
</tr>
<tr>
<td><code>translated_code</code></td>
<td>Translated error code</td>
</tr>
<tr>
<td><code>translated_sqlstate</code></td>
<td>Translated SQLSTATE</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
<tr>
<td>NO_TRANSLATION_FOUND</td>
<td>No translation of the SQL statement or error code is found</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE
    translated_code  BINARY_INTEGER;
    translated_sqlstate VARCHAR2(5);
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR (  
        error_code => 1,  
        translated_code => translated_code,  
        translated_sqlstate => translated_sqlstate);  
END;
```
TRANSLATE_SQL Procedure

This procedure translates a SQL statement using a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.TRANSLATE_SQL (
    sql_text          IN           CLOB,
    translated_text   OUT  NOCOPY  CLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
<tr>
<td>translated_text</td>
<td>Translated SQL statement</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Examples

```sql
ALTER SESSION SET SQL_TRANSLATION_PROFILE = tsql_application;

DECLARE
    translated_text CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_SQL(
        sql_text       => 'select top 5 * from emp',
        translated_text => translated_text);
END;
```
The DBMS_SQL_MONITOR package provides information about Real-time SQL Monitoring and Real-time Database Operation Monitoring.

- Using DBMS_SQL_MONITOR
  - Overview
  - Security Model
  - Constants
- Summary of DBMS_SQL_MONITOR Subprograms
Using DBMS_SQL_MONITOR

- Overview
- Security Model
- Constants
Overview

The DBMS_SQL_MONITOR package provides information about Real-time SQL Monitoring and Real-time Database Operation Monitoring. These features provide automatic monitoring of SQL statements, PL/SQL blocks, or composite database operations that are considered expensive. A simple database operation is a single SQL statement or PL/SQL procedure or function. A composite database operation is activity between two defined points in time in a database session. The monitored data is collected in V$SQL_MONITOR and V$SQL_PLAN_MONITOR.

The following subprograms begin and end monitoring of a composite database operation:

- BEGIN_OPERATION Function
- END_OPERATION Procedure

The following subprograms report on monitoring data collected in V$SQL_MONITOR and V$SQL_PLAN_MONITOR:

- REPORT_SQL_MONITOR Function
- REPORT_SQL_MONITOR_LIST Function
Security Model

This package is available to PUBLIC and executes with invoker's rights privileges. The reporting functions require privileges to select data from the catalog as provided by the role SELECT_CATALOG_ROLE.
Constants

The `DBMS_SQL_MONITOR` package uses the constants shown in Table 151–1, "DBMS_SQL_MONITOR Constants".

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORCE_TRACKING</td>
<td>VARCHAR2(30)</td>
<td>'Y'</td>
<td>Force track the composite database operation when the operation starts</td>
</tr>
<tr>
<td>NO_FORCE_TRACKING</td>
<td>VARCHAR2(30)</td>
<td>'N'</td>
<td>Do not force track the composite database operation when the operation starts. It is only tracked when it has consumed 5 seconds of CPU or I/O time.</td>
</tr>
</tbody>
</table>
Summary of DBMS_SQL_MONITOR Subprograms

Table 151–2  DBMS_SQL_MONITOR Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN_OPERATION Function on page 151-7</td>
<td>Starts a composite database operation in the current session</td>
</tr>
<tr>
<td>END_OPERATION Procedure on page 151-8</td>
<td>Ends the monitoring operation in the current session</td>
</tr>
<tr>
<td>REPORT_SQL_MONITOR Function on page 151-9</td>
<td>Builds a detailed report for a specific database operation that has been monitored by Oracle</td>
</tr>
<tr>
<td>REPORT_SQL_MONITOR_LIST Function on page 151-14</td>
<td>Builds a report for all or a subset of database operations that have been monitored by Oracle</td>
</tr>
</tbody>
</table>
BEGIN_OPERATION Function

This function starts a composite database operation in the current session.

Syntax

```sql
BEGIN_OPERATION (dbop_name IN VARCHAR2,
                     dbop_eid   IN NUMBER   := NULL,
                     forced_tracking IN VARCHAR2 := NO_FORCE_TRACKING,
                     attribute_list  IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbop_name</td>
<td>Name for the composite database operation</td>
</tr>
<tr>
<td>dbop_eid</td>
<td>Unique identifier for the current execution of the composite database operation</td>
</tr>
<tr>
<td>forced_tracking</td>
<td>Values: (see defined Constants):</td>
</tr>
<tr>
<td></td>
<td>• FORCE_TRACKING - forces the composite database operation to be tracked when the operation starts. You can also use the string variable 'Y'.</td>
</tr>
<tr>
<td></td>
<td>• NO_FORCE_TRACKING - the operation will be tracked only when it has consumed at least 5 seconds of CPU or I/O time. You can also use the string variable 'N'.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>List of user-created attributes. It is a comma-separated list of name-value pairs (for example, 'table_name=emp, operation=load')</td>
</tr>
</tbody>
</table>

Return Values

Composite database operation unique execution ID
**END_OPERATION Procedure**

This function ends a composite database operation in the current session. If the specified composite database operation does not exist, this procedure has no effect.

**Syntax**

```sql
DBMS_SQL_MONITOR.END_OPERATION  (  
   dbop_name   IN VARCHAR2,  
   dbop_eid    IN NUMBER)  
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbop_name</td>
<td>Name of a composite database operation</td>
</tr>
<tr>
<td>dbop_eid</td>
<td>Unique identifier for the current execution of the composite database operation</td>
</tr>
</tbody>
</table>
REPORT_SQL_MONITOR Function

This function builds a detailed report with monitoring information for a simple or a composite database operation. For each operation, it gives key information and associated global statistics. Use this function to get detailed monitoring information for a simple or a composite database operation.

The target database operation for this report can be:

- The last database operation monitored by Oracle (default, no parameter)
- The last database operation executed in the specified session and monitored by Oracle. The session is identified by its session ID and optionally its serial number (-1 is current session).
- The last execution of a specific database operation identified by its sql_id
- A specific execution of a database operation identified by the combination sql_id, sql_exec_start, nd sql_exec_id
- The last execution of a specific composite database operation identified by dbop_name
- The specific execution of a composite database operation identified by the combination dbop_name, dbop_exec_id

Syntax

```sql
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR (  
  sql_id                    IN VARCHAR2 DEFAULT NULL,  
  dbop_name                 IN VARCHAR2 DEFAULT NULL,  
  dbop_exec_id              IN NUMBER DEFAULT NULL,  
  session_id                IN NUMBER DEFAULT NULL,  
  session_serial            IN NUMBER DEFAULT NULL,  
  sql_exec_start            IN DATE DEFAULT NULL,  
  sql_exec_id               IN NUMBER DEFAULT NULL,  
  inst_id                   IN NUMBER DEFAULT NULL,  
  start_time_filter         IN DATE DEFAULT NULL,  
  end_time_filter           IN DATE DEFAULT NULL,  
  instance_id_filter        IN NUMBER DEFAULT NULL,  
  parallel_filter           IN VARCHAR2 DEFAULT NULL,  
  plan_line_filter          IN NUMBER DEFAULT NULL,  
  event_detail              IN VARCHAR2 DEFAULT 'YES',  
  bucket_max_count          IN NUMBER DEFAULT 128,  
  bucket_interval           IN NUMBER DEFAULT NULL,  
  base_path                 IN VARCHAR2 DEFAULT NULL,  
  last_refresh_time         IN DATE DEFAULT NULL,  
  report_level              IN VARCHAR2 DEFAULT 'TYPICAL',  
  type                      IN VARCHAR2 DEFAULT 'TEXT',  
  sql_plan_hash_value       IN NUMBER DEFAULT NULL,  
  con_name                  IN VARCHAR2 DEFAULT NULL)  
RETURN CLOB;
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last simple database operation monitored by Oracle.</td>
</tr>
<tr>
<td>dbop_name</td>
<td>DBOP_NAME for which monitoring information of the composite database operation is displayed</td>
</tr>
<tr>
<td>dbop_exec_id</td>
<td>Execution ID for the composite database operation for which monitoring information is displayed</td>
</tr>
<tr>
<td>session_id</td>
<td>Targets only the subset of statements executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.</td>
</tr>
<tr>
<td>sql_exec_start</td>
<td>Time at which execution of the monitored SQL was started. Only applicable when sql_id is specified. Used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.</td>
</tr>
<tr>
<td>sql_exec_id</td>
<td>A numeric ID generated internally by SQL monitor to identify different executions of the same SQL statement. Thus each execution will have the same sql_id but a different sql_exec_id. Only applicable when sql_id is specified and is used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Looks only at queries started on the specified instance. Use -1 to target the current instance. The default, NULL will target all instances.</td>
</tr>
<tr>
<td>start_time_filter</td>
<td>If not NULL, the report shows activity from V$ACTIVE_SESSION_HISTORY started after this date. If NULL, the reported activity starts once the targeted database operation has started.</td>
</tr>
<tr>
<td>end_time_filter</td>
<td>If not NULL, the report shows activity from V$ACTIVE_SESSION_HISTORY started before this date. If NULL, the reported activity ends when the targeted database operation has ended or SYSDATE if the operation is still executing.</td>
</tr>
<tr>
<td>instance_id_filter</td>
<td>Only looks at activity for the specified instance. Use NULL (the default) to target all instances. Only relevant if the query runs in parallel.</td>
</tr>
</tbody>
</table>
| parallel_filter | Parallel filter applies only to parallel execution and allows you to select only a subset of the processes involved in the parallel execution. The string parallel_filter can be:  
  - NULL - target all parallel execution servers as well as the query coordinator  
  - ['qc'] [servers(<svr_grp>[], <svr_set>[], <srv_num>)] where any NULL value is interpreted as ALL |
| plan_line_filter | Selects activity and execution statistics for the specified line number in the plan of a SQL. |
| event_detail    | When set to NO, the activity is aggregated by wait_class only. Use YES (default) to aggregate by wait_class, event_name. |
bucket_max_count  Specifies the maximum number of buckets to create in the report

bucket_interval  Represents the exact time interval, in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.

base_path  URL path for flex HTML resources since flex HTML format requires access to external files (java scripts and the flash .swf file).

last_refresh_time  If not NULL (default), the time when the report was last retrieved (SYSDATE attribute of the report tag). Use this option when you want to display the report of an running query and when that report is refreshed on a regular basis. This optimizes the size of the report since only the new changed information will be returned. In particular, the following will be optimized:

- SQL text will not be returned when this option is specified
- Activity histogram will start at the bucket that intersects that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket
REPORT_SQL_MONITOR Function

---

**Table 151–5 (Cont.) REPORT_SQL_MONITOR Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>report_level</td>
<td>Level of detail for the report. Of the following, only one can be specified:</td>
</tr>
<tr>
<td></td>
<td>■ NONE: Minimum possible</td>
</tr>
<tr>
<td></td>
<td>■ BASIC: This is equivalent to sql_text-plan-xplan-sessions-instance-activity_plan_histogram-metrics where the token &quot;-&quot; implies that report section will not be included in the report.</td>
</tr>
<tr>
<td></td>
<td>■ TYPICAL: Everything but plan_histogram</td>
</tr>
<tr>
<td></td>
<td>■ ALL: Everything</td>
</tr>
<tr>
<td>In addition, individual report sections can also be enabled or disabled by using a +section_name. Several sections are defined:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>■ XPLAN: Shows explain plan. ON by default.</td>
</tr>
<tr>
<td></td>
<td>■ PLAN: Shows plan monitoring statistics. ON by default.</td>
</tr>
<tr>
<td></td>
<td>■ SESSIONS: Show session details. Applies only to parallel queries. ON by default.</td>
</tr>
<tr>
<td></td>
<td>■ INSTANCE: Shows instance details. Applies only to parallel and cross instance queries. ON by default.</td>
</tr>
<tr>
<td></td>
<td>■ PARALLEL: An umbrella parameter for specifying sessions as well as instance details</td>
</tr>
<tr>
<td></td>
<td>■ ACTIVITY: Shows activity summary at global level, plan line level and session</td>
</tr>
<tr>
<td></td>
<td>■ INSTANCE_LEVEL: (If applicable). ON by default.</td>
</tr>
<tr>
<td></td>
<td>■ BINDS: Shows bind information when available. ON by default.</td>
</tr>
<tr>
<td></td>
<td>■ METRICS: Shows metric data (such as CPU and IOs) over time. ON by default</td>
</tr>
<tr>
<td></td>
<td>■ ACTIVITY_HISTOGRAM: Shows a histogram of the overall query activity. ON by default.</td>
</tr>
<tr>
<td></td>
<td>■ PLAN_HISTOGRAM: Shows activity histogram at plan line level. OFF by default.</td>
</tr>
<tr>
<td></td>
<td>■ OTHER: Other information. ON by default.</td>
</tr>
<tr>
<td>In addition, SQL text can be specified at different levels:</td>
<td></td>
</tr>
<tr>
<td>-SQL_TEXT: No SQL text in report</td>
<td></td>
</tr>
<tr>
<td>+SQL_TEXT: Alright with partial SQL text, that is, up to the first 2000 chars as stored in GV$SQL_MONITOR</td>
<td></td>
</tr>
<tr>
<td>SQL_FULLTEXT: No full SQL text, that is, +sql_text</td>
<td></td>
</tr>
<tr>
<td>+SQL_FULLTEXT: Show full SQL text (default)</td>
<td></td>
</tr>
<tr>
<td>type</td>
<td>Report type:</td>
</tr>
<tr>
<td></td>
<td>■ TEXT: text report (default)</td>
</tr>
<tr>
<td></td>
<td>■ HTML: simple HTML report</td>
</tr>
<tr>
<td></td>
<td>■ ACTIVE: database active report. Some information (explain plan, activity_histogram, metrics and plan_histogram) is only shown when this type is selected</td>
</tr>
<tr>
<td></td>
<td>■ XML: raw data for the report</td>
</tr>
<tr>
<td>sql_plan_hash_value</td>
<td>Targets only those with the specified plan hash value. Default is NULL.</td>
</tr>
</tbody>
</table>
Return Values

SQL monitor report, an XML document

Usage Notes

The user invoking this function needs to have privilege to access the following fixed views:

- GV$SQL_MONITOR
- GV$SQL_PLAN_MONITOR
- GV$ACTIVE_SESSION_HISTORY
- GV$SESSION_LONGOPS
- GV$SQL if SQL full text is requested and its length is > 2K
REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of database operations that have been monitored by Oracle. For each database operation, it gives key information and associated global statistics.

Syntax

```sql
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR_LIST (
    sql_id                    IN VARCHAR2 DEFAULT  NULL,
    dbop_name                 IN VARCHAR2 DEFAULT  NULL,
    monitor_type              IN NUMBER   DEFAULT  MONITOR_TYPE_ALL,
    session_id                IN NUMBER   DEFAULT  NULL,
    session_serial            IN NUMBER   DEFAULT  NULL,
    inst_id                   IN NUMBER   DEFAULT  NULL,
    active_since_date         IN DATE     DEFAULT  NULL,
    active_since_sec          IN NUMBER   DEFAULT  NULL,
    last_refresh_time         IN DATE     DEFAULT  NULL,
    report_level              IN VARCHAR2 DEFAULT 'TYPICAL',
    auto_refresh              IN NUMBER   DEFAULT  NULL,
    base_path                 IN VARCHAR2 DEFAULT  NULL,
    type                      IN VARCHAR2 DEFAULT 'TEXT',
    con_name                  IN VARCHAR2 DEFAULT  NULL)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last operation monitored by Oracle.</td>
</tr>
<tr>
<td>dbop_name</td>
<td>DBOP_NAME for which monitoring information of the composite database operation is displayed</td>
</tr>
<tr>
<td>monitor_type</td>
<td>Monitor type:</td>
</tr>
<tr>
<td></td>
<td>■ MONITOR_TYPE_SQL returns only simple database operations</td>
</tr>
<tr>
<td></td>
<td>■ MONITOR_TYPE_DBOP returns composite database operations</td>
</tr>
<tr>
<td></td>
<td>■ MONITOR_TYPE_ALL returns all types</td>
</tr>
<tr>
<td>session_id</td>
<td>Targets only the subset of database operations executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Looks only at monitored database operations originating from the specified instance. Use -1 to target the instance where the report executed. To target all instances, use NULL (default).</td>
</tr>
<tr>
<td>active_since_date</td>
<td>If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified start time.</td>
</tr>
</tbody>
</table>
Table 151–6  (Cont.) REPORT_SQL_MONITOR_LIST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active_since_sec</td>
<td>If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified date and time. In this case, the start time is specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to limit the report to all operations that have been active in the past 1 hour.</td>
</tr>
<tr>
<td>last_refresh_time</td>
<td>If not NULL (default), the time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report will show details about the execution of monitored queries that have been active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, and sql_exec_id). Also, for queries that have their first refresh time after the specified date, only the SQL execution key and statistics are returned.</td>
</tr>
<tr>
<td>report_level</td>
<td>Level of detail for the report. The level can be BASIC (SQL text up to 200 character), TYPICAL (which include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters), or ALL which is the same as TYPICAL.</td>
</tr>
<tr>
<td>auto_refresh</td>
<td>Specifies the duration in seconds after which report data will be automatically refreshed while the monitored SQL or database operation is still executing. This applies to active report types.</td>
</tr>
<tr>
<td>base_path</td>
<td>URL path for flex HTML resources since flex HTML format requires access to external files (java scripts and the flash swf file).</td>
</tr>
<tr>
<td>type</td>
<td>Report type:</td>
</tr>
<tr>
<td></td>
<td>■ TEXT: text report (default)</td>
</tr>
<tr>
<td></td>
<td>■ HTML: simple HTML report</td>
</tr>
<tr>
<td></td>
<td>■ ACTIVE: database active report. Some information (explain plan, activity_histogram, metrics, and plan_histogram) is only shown when this type is selected.</td>
</tr>
<tr>
<td></td>
<td>■ XML: raw data for the report</td>
</tr>
<tr>
<td>con_name</td>
<td>Container name</td>
</tr>
</tbody>
</table>

Return Values

An XML document with the list of the database operations monitored

Usage Notes

- Use the REPORT_SQL_MONITOR Function to get detailed monitoring information for a single database operation.
- The user invoking this function needs to have the privilege to access the fixed views GV$SQL_MONITOR and GV$SQL.
The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

**See Also:** Oracle Database Administrator’s Guide for more information about "Managing Diagnostic Data"

  - Constants
  - Examples
- **Summary of DBMS_SQLDIAG Subprograms**
Using DBMS_SQLDIAG

- Overview
- Constants
- Examples
Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement. This section covers the following topics:

- About the SQL Repair Advisor
- Running the SQL Repair Advisor
- Removing a SQL Patch

About the SQL Repair Advisor

You run the SQL Repair Advisor after a SQL statement fails with a critical error. The advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

Running the SQL Repair Advisor

You run the SQL Repair Advisor by creating and executing a diagnostic task using the CREATE_DIAGNOSIS_TASK and EXECUTE_DIAGNOSIS_TASK respectively. The SQL Repair Advisor first reproduces the critical error and then tries to produce a workaround in the form of SQL patch.

1. Identify the problem SQL statement

Consider the SQL statement that gives a critical error:

```
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (SELECT MAX(ROWID) FROM t t2 WHERE t1.a = t2.a AND t1.b = t2.b AND t1.d=t2.d)
```

You use the SQL Repair advisor to repair this critical error.

2. Create a diagnosis task

Invoke DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK. You can specify an optional task name, an optional time limit for the advisor task, and problem type. In the example below, we specify the SQL text, the task name as 'error_task' and a problem type as 'DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR'.

```
DECLARE
  rep_out         CLOB;
  t_id            VARCHAR2(50);
BEGIN
  t_id := DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK(
    sql_text => 'DELETE FROM t t1 WHERE t1.a = \'a\' AND ROWID <> (SELECT MAX(ROWID) FROM t t2 WHERE t1.a = t2.a AND t1.b = t2.b AND t1.d=t2.d)',
    task_name => 'error_task',
    problem_type => DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR);
END;
```

3. Execute the diagnosis task

To execute the workaround generation and analysis phase of the SQL Repair Advisor, you call DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK with the task ID returned by the CREATE_DIAGNOSIS_TASK. After a short delay, the SQL Repair Advisor returns. As part of its execution, the SQL Repair Advisor keeps a record of its findings which can be accessed through the reporting facilities of SQL Repair Advisor.
4. Report the diagnosis task

The analysis of the diagnosis task is accessed through dbms_sqldiag.report_diagnosis_task. If the SQL Repair Advisor was able to find a workaround, it recommends a SQL Patch. A SQL Patch is similar to a SQL profile but unlike the SQL Profile, it is used to workaround compilation or execution errors.

```
rep_out := DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (t_id, DBMS_SQLDIAG.TYPE_TEXT);
```

```
DBMS_OUTPUT.PUT_LINE ('Report : ' ||  rep_out);
```

```
END;
/
```

5. Applying the patch

If a patch recommendation is present in the report, you can run the ACCEPT_SQL_PATCH command to accept the patch by invoking DBMS_SQLDIAG.ACCEPT_SQL_PATCH. This procedure takes the task_name as an argument.

```
EXECUTE DBMS_SQLDIAG.ACCEPT_SQL_PATCH(task_name => 'error_task', task_owner => 'SYS', replace => TRUE);
```

6. Test the patch

Now that you have accepted the patch, you can rerun the SQL statement. This time, it will not give you the critical error. If you run 'explain plan' for this statement, you will see that a SQL patch was used to generate the plan.

```
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (select max(rowid) FROM t t2 WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d);
```

Removing a SQL Patch

In a situation where you obtained an official patch from Oracle to fix an error, or upgraded to the next patchset or release of Oracle which included the fix for the error, you call DBMS_SQLDIAG.DROP_SQL_PATCH with the patch name to drop the SQL patch. The patch name can be obtained from the explain plan section or by querying the view DBA_SQL_PATCHES.
# Constants

The DBMS_SQLDIAG package uses the constants shown in the following tables:

- **Table 152–1, "DBMS_SQLDIAG Constants - SQLDIAG Advisor Name"** describes the name of SQL repair advisor as seen by the advisor framework
- **Table 152–2, "DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values"** describes SQLDIAG advisor task scope parameter values
- **Table 152–3, "DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants"** describes SQLDIAG advisor time_limit constants
- **Table 152–4, "DBMS_SQLDIAG Constants - Report Type (possible values) Constants"** describes possible formats for a report
- **Table 152–5, "DBMS_SQLDIAG Constants - Report Level (possible values) Constants"** describes possible levels of detail in the report
- **Table 152–6, "DBMS_SQLDIAG Constants - Report Section (possible values) Constants"** describes possible report sections (comma delimited)
- **Table 152–7, "DBMS_SQLDIAG Constants - Problem Type Constants"** describes possible values for the problem_type parameter of the CREATE_DIAGNOSIS_TASK Functions
- **Table 152–8, "DBMS_SQLDIAG Constants - Findings Filter Constants"** describes possible values for the _sql_findings_mode parameter

## Table 152–1  DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

</tbody>
</table>
Patch Pack / Unpack

Patches can be exported out of one system and imported into another by means of a staging table, provided by subprograms in this package. Like with SQL diagnosis sets, the operation of inserting into the staging table is called a "pack", and the operation of creating patches from staging table data is termed the "unpack".

DBAs should perform a pack/unpack as follows:

1. Create a staging table owned by user 'SH' through a call to CREATE_STGTAB_SQLPACK:

   ```sql
   EXEC DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH(
   table_name      =>  'STAGING_TABLE',
   schema_name     =>  'SH');
   ```

2. Call PACK_STGTAB_SQLPATCH one or more times to write SQL patch data into the staging table. In this case, copy data for all SQL patches in the DEFAULT category into a staging table owned by the current schema owner:

   ```sql
   EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
   staging_table_name    =>  'STAGING_TABLE');
   ```

3. In this case, only a single SQL patch **SP_FIND_EMPLOYEE** is copied into a staging table owned by the current schema owner:

   ```sql
   EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
   patch_name           =>  'SP_FIND_EMPLOYEE',
   staging_table_name   =>  'STAGING_TABLE');
   ```

   The staging table can then be moved to another system using either datapump, import/export commands or through a databaselink.

4. Call UNPACK_STGTAB_SQLPATCH to create SQL patches on the new system from the patch data in the staging table. In this case, change the name in the data for the **SP_FIND_EMPLOYEE** patch stored in the staging table to **SP_FIND_EMP_PROD**:

   ```sql
   exec dbms_sqldiag.remap_stgtab_sqlpatch(
   old_patch_name       =>  'SP_FIND_EMPLOYEE',
   new_patch_name       =>  'SP_FIND_EMP_PROD',
   ```
# Summary of DBMS_SQLDIAG Subprograms

ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER := NULL,
  name           IN  VARCHAR2 := NULL,
  description    IN  VARCHAR2 := NULL,
  category       IN  VARCHAR2 := NULL,
  task_owner     IN  VARCHAR2 := NULL,
  replace        IN  BOOLEAN := FALSE,
  force_match    IN  BOOLEAN := FALSE)
RETURN VARCHAR2;
```

Parameters

Table 152–10 ACCEPT_SQL_PATCH Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of the SQL diagnosis task</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object representing the SQL statement</td>
</tr>
<tr>
<td></td>
<td>associated to the diagnosis task</td>
</tr>
<tr>
<td>name</td>
<td>Name of the patch. It cannot contain double quotation marks. The name is</td>
</tr>
<tr>
<td></td>
<td>case sensitive. If not specified, the system will generate a unique name</td>
</tr>
<tr>
<td></td>
<td>for the SQL patch.</td>
</tr>
<tr>
<td>description</td>
<td>User specified string describing the purpose of this SQL patch. Maximum</td>
</tr>
<tr>
<td></td>
<td>size of description is 500.</td>
</tr>
<tr>
<td>category</td>
<td>Category name which must match the value of the SQLDIAGNOSE_CATEGORY</td>
</tr>
<tr>
<td></td>
<td>parameter in a session for the session to use this patch. It defaults to</td>
</tr>
<tr>
<td></td>
<td>the value DEFAULT. This is also the default of the SQLDIAGNOSE_CATEGORY</td>
</tr>
<tr>
<td></td>
<td>parameter. The category must be a valid Oracle identifier. The category</td>
</tr>
<tr>
<td></td>
<td>name specified is always converted to upper case. The combination of the</td>
</tr>
<tr>
<td></td>
<td>normalized SQL text and category name create a unique key for a patch. An</td>
</tr>
<tr>
<td></td>
<td>accept will fail if this combination is duplicated.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the diagnosis task. This is an optional parameter that has to</td>
</tr>
<tr>
<td></td>
<td>be specified to accept a SQL Patch associated to a diagnosis task owned by</td>
</tr>
<tr>
<td></td>
<td>another user. The current user is the default value.</td>
</tr>
</tbody>
</table>
Table 152–10  (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replace</td>
<td>If the patch already exists, it will be replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.</td>
</tr>
<tr>
<td>force_match</td>
<td>If TRUE this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the CURSOR_SHARING parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the CURSOR_SHARING parameter.</td>
</tr>
</tbody>
</table>

Return Values

Name of the SQL patch

Usage Notes

Requires CREATE ANY SQL PROFILE privilege
**ALTER_SQL_PATCH Procedure**

This procedure alters specific attributes of an existing SQL patch object.

**Syntax**

```sql
DBMS_SQLDIAG.ALTER_SQL_PATCH (
    name            IN  VARCHAR2,
    attribute_name  IN  VARCHAR2,
    value           IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of SQL patch to alter.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of SQL patch to alter. Possible values:</td>
</tr>
<tr>
<td></td>
<td>- STATUS -&gt; can be set to ENABLED or DISABLED</td>
</tr>
<tr>
<td></td>
<td>- NAME -&gt; can be reset to a valid name (must be a valid Oracle identifier and must be unique).</td>
</tr>
<tr>
<td></td>
<td>- DESCRIPTION -&gt; can be set to any string of size no more than 500</td>
</tr>
<tr>
<td></td>
<td>- CATEGORY -&gt; can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text)</td>
</tr>
<tr>
<td>value</td>
<td>New value of the attribute. See attribute_name for valid attribute values. This parameter is mandatory.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Requires ALTER ANY SQL PATCH privilege
CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```sql
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (  
    taskname       IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name.

Syntax

Prepares the diagnosis of a single statement given its text:

```sql
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (  
  sql_text          IN   CLOB,  
  bind_list         IN   sql_binds := NULL,  
  user_name         IN   VARCHAR2  := NULL,  
  scope             IN   VARCHAR2  := SCOPE_COMPREHENSIVE,  
  time_limit        IN   NUMBER    := TIME_LIMIT_DEFAULT,  
  task_name         IN   VARCHAR2  := NULL,  
  description       IN   VARCHAR2  := NULL,  
  problem_type      IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)  
RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```sql
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (  
  sql_id             IN   VARCHAR2,  
  plan_hash_value   IN   NUMBER    := NULL,  
  scope             IN   VARCHAR2  := SCOPE_COMPREHENSIVE,  
  time_limit        IN   NUMBER    := TIME_LIMIT_DEFAULT,  
  task_name         IN   VARCHAR2  := NULL,  
  description       IN   VARCHAR2  := NULL,  
  problem_type      IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)  
RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```sql
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (  
  sqlset_name       IN VARCHAR2,  
  basic_filter      IN VARCHAR2 := NULL,  
  object_filter     IN VARCHAR2 := NULL,  
  rank1             IN VARCHAR2 := NULL,  
  rank2             IN VARCHAR2 := NULL,  
  rank3             IN VARCHAR2 := NULL,  
  result_percentage IN NUMBER   := NULL,  
  result_limit      IN NUMBER   := NULL,  
  scope             IN VARCHAR2 := SCOPE_COMPREHENSIVE,  
  time_limit        IN NUMBER    := TIME_LIMIT_DEFAULT,  
  task_name         IN VARCHAR2  := NULL,  
  description       IN VARCHAR2  := NULL,  
  plan_filter       IN VARCHAR2 := 'MAX_ELAPSED_TIME',  
  sqlset_owner      IN VARCHAR2 := NULL,  
  problem_type      IN NUMBER    := PROBLEM_TYPE_PERFORMANCE)  RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>Text of a SQL statement</td>
</tr>
<tr>
<td>bind_list</td>
<td>Set of bind values</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>user_name</td>
<td>Username for who the statement/sqlset will be diagnosed</td>
</tr>
<tr>
<td>scope</td>
<td>Diagnosis scope (limited/comprehensive)</td>
</tr>
<tr>
<td>time_limit</td>
<td>Maximum duration in seconds for the diagnosis session</td>
</tr>
<tr>
<td>task_name</td>
<td>Optional diagnosis task name</td>
</tr>
<tr>
<td>description</td>
<td>Maximum of 256 SQL diagnosis session description</td>
</tr>
<tr>
<td>problem_type</td>
<td>Determines the goal of the task. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ PROBLEM_TYPE_WRONG_RESULTS</td>
</tr>
<tr>
<td></td>
<td>■ PROBLEM_TYPE_COMPILATION_ERROR</td>
</tr>
<tr>
<td></td>
<td>■ PROBLEM_TYPE_EXECUTION_ERROR</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifier of the statement</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Hash value of the SQL execution plan</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>Sqlset name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from the SQL tuning set (STS)</td>
</tr>
<tr>
<td>object_filter</td>
<td>Object filter</td>
</tr>
<tr>
<td>rank(i)</td>
<td>Order-by clause on the selected SQL</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Percentage on the sum of a ranking measure</td>
</tr>
<tr>
<td>result_limit</td>
<td>Top Limit SQL from (filtered/ranked) SQL</td>
</tr>
<tr>
<td>plan_filter</td>
<td>Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ LAST_GENERATED: plan with most recent timestamp</td>
</tr>
<tr>
<td></td>
<td>■ FIRST_GENERATED: opposite to LAST_GENERATED</td>
</tr>
<tr>
<td></td>
<td>■ LAST_LOADED: plan with most recent first_load_time stat info</td>
</tr>
<tr>
<td></td>
<td>■ FIRST_LOADED: opposite to LAST_LOADED</td>
</tr>
<tr>
<td></td>
<td>■ MAX_ELAPSED_TIME: plan with maximum elapsed time</td>
</tr>
<tr>
<td></td>
<td>■ MAX_BUFFER_GETS: plan with maximum buffer gets</td>
</tr>
<tr>
<td></td>
<td>■ MAX_DISK_READS: plan with maximum disk reads</td>
</tr>
<tr>
<td></td>
<td>■ MAX_DIRECT_WRITES: plan with maximum direct writes</td>
</tr>
<tr>
<td></td>
<td>■ MAX_OPTIMIZER_COST: plan with maximum optimum cost</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Owner of the sqlset, or null for current schema owner</td>
</tr>
</tbody>
</table>
CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```sql
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (  
   table_name       IN  VARCHAR2,
   schema_name      IN  VARCHAR2 := NULL,
   tablespace_name  IN  VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>(Mandatory) Name of the table to create (case-sensitive)</td>
</tr>
<tr>
<td>schema_name</td>
<td>Schema to create the table in, or NULL for current schema (case-sensitive)</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive)</td>
</tr>
</tbody>
</table>
DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (  
    taskname   IN   VARCHAR2);  

Parameters

Table 152–15 DROP_DIAGNOSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
**DROP_SQL_PATCH Procedure**

This procedure drops the named SQL patch from the database.

**Syntax**

```sql
DBMS_SQLDIAG.DROP_SQL_PATCH (
    name     IN  VARCHAR2,   ignore   IN  BOOLEAN := FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of patch to be dropped. The name is case sensitive.</td>
</tr>
<tr>
<td>ignore</td>
<td>Ignore errors due to object not existing.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Requires DROP ANY SQL PATCH privilege
EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```sql
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (  
    taskname IN VARCHAR2) ;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (
    sqlTestCase IN CLOB
) RETURN CLOB;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlTestCase</td>
<td>XML document describing the SQL test case</td>
</tr>
</tbody>
</table>
**EXPORT_SQL_TESTCASE Procedures**

This procedure exports a SQL test case to a directory.

**Syntax**

This variant has to be provided with the SQL information.

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory                IN              VARCHAR2,
  sql_text                 IN              CLOB,
  user_name                IN              VARCHAR2  :=  NULL,
  bind_list                IN              sql_binds :=  NULL,
  exportEnvironment        IN              BOOLEAN   :=  TRUE,
  exportMetadata           IN              BOOLEAN   :=  TRUE,
  exportData               IN              BOOLEAN   :=  FALSE,
  exportPkgbody            IN              BOOLEAN   :=  FALSE,
  samplingPercent          IN              NUMBER    :=  100,
  ctrlOptions              IN              VARCHAR2  :=  NULL,
  timeLimit                IN              NUMBER    :=  0,
  testcase_name            IN              VARCHAR2  :=  NULL,
  testcase                 IN OUT NOCOPY   CLOB,
  preserveSchemaMapping    IN              BOOLEAN   :=  FALSE,
  version                  IN              VARCHAR2  :=  'COMPATIBLE');
```

This variant extracts the SQL information from an incident file.

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory                IN              VARCHAR2,
  incident_id              IN              VARCHAR2,
  exportEnvironment        IN              BOOLEAN   :=  TRUE,
  exportMetadata           IN              BOOLEAN   :=  TRUE,
  exportData               IN              BOOLEAN   :=  FALSE,
  exportPkgbody            IN              BOOLEAN   :=  FALSE,
  samplingPercent          IN              NUMBER    :=  100,
  ctrlOptions              IN              VARCHAR2  :=  NULL,
  timeLimit                IN              NUMBER    :=  DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
  testcase_name            IN              VARCHAR2  :=  NULL,
  testcase                 IN OUT NOCOPY   CLOB,
  preserveSchemaMapping    IN              BOOLEAN   :=  FALSE);;
```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use `V$SQL` to get the SQL identifier and the SQL hash value.

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory                IN              VARCHAR2,
  sql_id                   IN              VARCHAR2,
  plan_hash_value          IN              NUMBER    :=  NULL,
  exportEnvironment        IN              BOOLEAN   :=  TRUE,
  exportMetadata           IN              BOOLEAN   :=  TRUE,
  exportData               IN              BOOLEAN   :=  TRUE,
  exportPkgbody            IN              BOOLEAN   :=  FALSE,
  samplingPercent          IN              NUMBER    :=  100,
  ctrlOptions              IN              VARCHAR2  :=  NULL,
  timeLimit                IN              NUMBER    :=  DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
  testcase_name            IN              VARCHAR2  :=  NULL,
  testcase                 IN OUT NOCOPY   CLOB,
  preserveSchemaMapping    IN              BOOLEAN   :=  FALSE);;
```
Parameters

**Table 152–19 EXPORT_SQL_TESTCASE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Directory to store the various generated files</td>
</tr>
<tr>
<td>sql_text</td>
<td>Text of the SQL statement to export</td>
</tr>
<tr>
<td>incident_id</td>
<td>Incident ID containing the offending SQL</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifier of the statement in the cursor cache</td>
</tr>
<tr>
<td>username</td>
<td>Name of the user schema to use to parse the SQL, defaults to SYS</td>
</tr>
<tr>
<td>bind_list</td>
<td>List of bind values associated to the statement</td>

### Table 152–19  (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| ctrlOptions       | Opaque control parameters. For example, to execute three times, set `ctrlOptions` with the following string: `<parameter name="mexec_count">3</parameter>`.
|                   | - capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture.                                             |
|                   |   - BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. |
|                   |   - WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. |
|                   | Note this must be the same value as used in the IMPORT_SQL_TESTCASE Procedures, and that if the user gives incorrect an parameter value, then the TCB runs in default mode and no error is thrown. |
|                   | - replay - EXPLAIN (default), OUTLINE, EXECUTION or OUTLINE EXECUTION. This parameter defines TCB replay functionality.                        |
|                   |   - EXPLAIN: Replay explains the statement without using outlines                                                                         |
|                   |   - OUTLINE: Replay uses outlines mode and explains the statement using outlines                                                            |
|                   |   - EXECUTION: Replay executes the statement without using outlines                                                                        |
|                   |   - OUTLINE EXECUTION: Replay executes the statement using outlines                                                                        |
|                   | Note that if the user gives an incorrect parameter value, then the replay runs in default mode and no error is thrown.                      |
|                   | - name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. |
|                   | - name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported. |
| timeLimit          | How much time should we spend exporting the SQL test case                                                                                  |
| testCaseName       | An optional name for the SQL test case. This is used to prefix all the generated scripts                                                    |
| testcase           | Resulting testcase                                                                                                                         |
| preserveSchemaMapping | TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment.                                   |
Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (.dmp)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata. (xxxxmain.xml)
  - a README.txt file that explain the usage of the TCB
  - the outlines used by the statement (ol.xml)
  - a list of parameters set in the exporting db/env (prmimp.sql)
  - a SQL monitor report, if any (smrpt.html)
  - an AWR report, if any (awrrpt.html)
  - a list of binds used in this statement (bndlst.xml)

- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA role.

- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call EXPORT_SQL_TESTCASE with exportData=>TRUE and the data will be imported by default, unless turned OFF by importData=>FALSE.

- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call EXPORT_SQL_TESTCASE with exportPkgbody=>TRUE. To import a PL/SQL package body, call IMPORT_SQL_TESTCASE Procedures with importPkgbody=>TRUE.

- To export objects statistics history, the database compatibility should be set to 12.0 or higher.
This procedure does not export data and statistics on a Global Temporary Table (GTT).

Examples

The user can specify multiple parameters in the ctrlOptions encapsulated either by using the `<parameters>` parent tag or without the parent tag.

**Using the `<parameters>` Tag**

```xml
<parameters>
  <parameter name="capture"> with_runtime_info
</parameter>
  <parameter name="mexec_count"> 1
</parameter>
</parameters>
```

**Without the `<parameters>` Tag**

```xml
<parameter name="capture"> with_runtime_info
</parameter>
<parameter name="mexec_count"> 1
</parameter>
```
**EXPORT_SQL_TESTCASE_DIR_BY_INC Function**

This function generates a SQL Test Case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

**Syntax**

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
    incident_id        IN   NUMBER,
    directory          IN   VARCHAR2,
    exportEnvironment  IN   VARCHAR2 := 'TRUE',
    exportMetadata     IN   VARCHAR2 := 'TRUE',
    exportData         IN   VARCHAR2 := 'FALSE',
    samplingPercent    IN   VARCHAR2 := '100',
    ctrlOptions        IN   VARCHAR2 := NULL)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Incident ID containing the offending SQL. For more information about Incidents, see Oracle Database Performance Tuning Guide.</td>
</tr>
<tr>
<td>directory</td>
<td>Directory path to the generated files</td>
</tr>
<tr>
<td>exportEnvironment</td>
<td>TRUE if the compilation environment should be exported</td>
</tr>
<tr>
<td>exportMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>exportData</td>
<td>TRUE if the data of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>samplingPercent</td>
<td>If is TRUE, specify the sampling percentage to use to create the dump file</td>
</tr>
</tbody>
</table>
CTRL OPTIONS

Opaque control parameters. For example, to execute three times, set `ctrlOptions` with the following string: `<parameter name="mexec_count">3</parameter>`.

- **capture** - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture.
  - BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.
  - WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.

  Note that if the user gives incorrect an parameter value, then the TCB runs in default mode and no error is thrown.

- **replay** - EXPLAIN (default), OUTLINE, EXECUTION or OUTLINE EXECUTION. This parameter defines TCB replay functionality.
  - EXPLAIN: Replay explains the statement without using outlines
  - OUTLINE: Replay uses outlines mode and explains the statement using outlines
  - EXECUTION: Replay executes the statement without using outlines
  - OUTLINE EXECUTION: Replay executes the statement using outlines

  Note that if the user gives an incorrect parameter value, then the replay runs in default mode and no error is thrown.

- **name=mexec_count** - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution.

- **name=stat_history_since** - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.

---

**Table 152–20 (Cont.) EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `ctrlOptions`     | Opaque control parameters. For example, to execute three times, set `ctrlOptions` with the following string: `<parameter name="mexec_count">3</parameter>`.
|                   | - **capture** - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture.
  - BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.
  - WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.

  Note that if the user gives incorrect an parameter value, then the TCB runs in default mode and no error is thrown.
|                   | - **replay** - EXPLAIN (default), OUTLINE, EXECUTION or OUTLINE EXECUTION. This parameter defines TCB replay functionality.
  - EXPLAIN: Replay explains the statement without using outlines
  - OUTLINE: Replay uses outlines mode and explains the statement using outlines
  - EXECUTION: Replay executes the statement without using outlines
  - OUTLINE EXECUTION: Replay executes the statement using outlines

  Note that if the user gives an incorrect parameter value, then the replay runs in default mode and no error is thrown.

**EXPORT_SQL_TESTCASE_DIR_BY_TXT Function**

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

**Syntax**

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT(
    incident_id        IN   NUMBER,
    directory          IN   VARCHAR2,
    sql_text           IN   CLOB,
    user_name          IN   VARCHAR2 := 'SYS',
    exportEnvironment  IN   VARCHAR2 := 'TRUE',
    exportMetadata     IN   VARCHAR2 := 'TRUE',
    exportData         IN   VARCHAR2 := 'FALSE',
    samplingPercent    IN   VARCHAR2 := '100',
    ctrlOptions        IN   VARCHAR2 := NULL
) RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Incident ID containing the offending SQL</td>
</tr>
<tr>
<td>directory</td>
<td>Directory to store the various generated files</td>
</tr>
<tr>
<td>sql_text</td>
<td>Text of the SQL statement to explain</td>
</tr>
<tr>
<td>username</td>
<td>Name of the user schema to use to parse the SQL, defaults to SYS</td>
</tr>
<tr>
<td>exportEnvironment</td>
<td>TRUE if the compilation environment should be exported</td>
</tr>
<tr>
<td>exportMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>exportData</td>
<td>TRUE if the data of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>samplingPercent</td>
<td>If is TRUE, specify the sampling percentage to use to create the dump file</td>
</tr>
</tbody>
</table>
**Table 152–21 (Cont.) EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| ctrlOptions        | Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: `<parameter name="mexec_count">3</parameter>`.
  - capture - **BASIC** (default) or **WITH_RUNTIME_INFO**. This parameter defines the mode of TCB capture.
    - **BASIC**: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.
    - **WITH_RUNTIME_INFO**: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under **BASIC** mode.
      - Note that if the user gives incorrect an parameter value, then the TCB runs in default mode and no error is thrown.
  - replay - **EXPLAIN** (default), **OUTLINE**, **EXECUTION** or **OUTLINE EXECUTION**. This parameter defines TCB replay functionality:
    - **EXPLAIN**: Replay explains the statement without using outlines
    - **OUTLINE**: Replay uses outlines mode and explains the statement using outlines
    - **EXECUTION**: Replay executes the statement without using outlines
    - **OUTLINE EXECUTION**: Replay executes the statement using outlines
      - Note that if the user gives an incorrect parameter value, then the replay runs in default mode and no error is thrown.
  - name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution.
  - name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.
GET_FIX_CONTROL Function

This function returns the value of fix control for a given bug number.

Syntax

```sql
DBMS_SQLDIAG.GET_FIX_CONTROL (  
    bug_number   IN    NUMBER)  
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bug_number</td>
<td>Bug number</td>
</tr>
</tbody>
</table>
GET_SQL Function

This function loads a sql_setrow from the trace file associated to an the given incident ID.

Syntax

```sql
DBMS_SQLDIAG.GET_SQL (incident_id IN VARCHAR2)
RETURN SQLSET_ROW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Identifier of the incident</td>
</tr>
</tbody>
</table>
IMPORT_SQL_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (  
directory                IN   VARCHAR2,  
sqlTestCase              IN   CLOB,  
importEnvironment        IN   BOOLEAN   :=  TRUE,  
importMetadata           IN   BOOLEAN   :=  TRUE,  
importData               IN   BOOLEAN   :=  TRUE,  
importPkgbody            IN   BOOLEAN   :=  FALSE,  
importDiagnosis          IN   BOOLEAN   :=  TRUE,  
ignoreStorage            IN   BOOLEAN   :=  TRUE,  
ctrlOptions              IN   VARCHAR2  :=  NULL,  
preserveSchemaMapping    IN   BOOLEAN   :=  FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (  
directory                IN   VARCHAR2,  
filename                 IN   VARCHAR2,  
importEnvironment        IN   BOOLEAN   :=  TRUE,  
importMetadata           IN   BOOLEAN   :=  TRUE,  
importData               IN   BOOLEAN   :=  TRUE,  
importPkgbody            IN   BOOLEAN   :=  FALSE,  
importDiagnosis          IN   BOOLEAN   :=  TRUE,  
ignoreStorage            IN   BOOLEAN   :=  TRUE,  
ctrlOptions              IN   VARCHAR2  :=  NULL,  
preserveSchemaMapping    IN   BOOLEAN   :=  FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Directory containing test case files</td>
</tr>
<tr>
<td>filename</td>
<td>Name of a file containing an XML document describing the SQL test case</td>
</tr>
<tr>
<td>importEnvironment</td>
<td>TRUE if the compilation environment should be imported</td>
</tr>
<tr>
<td>importMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be imported</td>
</tr>
<tr>
<td>importData</td>
<td>TRUE if the data of the objects referenced in the SQL should be imported</td>
</tr>
<tr>
<td>importPkgbody</td>
<td>TRUE if the body of the packages referenced in the SQL are imported</td>
</tr>
<tr>
<td>importDiagnosis</td>
<td>TRUE if the diagnostic information associated to the task should be imported</td>
</tr>
<tr>
<td>ignoreStorage</td>
<td>TRUE if the storage attributes should be ignored</td>
</tr>
</tbody>
</table>
Table 152–24 (Cont.) IMPORT_SQL_TESTCASE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters, of which only capture is valid for this subprogram.</td>
</tr>
<tr>
<td></td>
<td>- capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture.</td>
</tr>
<tr>
<td></td>
<td>BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.</td>
</tr>
<tr>
<td></td>
<td>WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</td>
</tr>
<tr>
<td></td>
<td>Note that if the user gives incorrect an parameter value, then the TCB runs in default mode and no error is thrown.</td>
</tr>
<tr>
<td>preserveSchemaMapping</td>
<td>TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment (schema mapping in the target database will be identical to the source database). Note that when an import is run with preserveSchemaMapping set to TRUE, if the objects in the schemas exists then the import will overwrite the existing objects.</td>
</tr>
</tbody>
</table>

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (.dmp)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata. (xxxxxmain.xml)
  - a README.txt file that explain the usage of the TCB
  - the outlines used by the statement (ol.xml)
  - a list of parameters set in the exporting db/env (prmimp.sql)
  - a SQL monitor report, if any (smrpt.html)
  - an AWR report, if any (awrrpt.html)
  - a list of binds used in this statement (bndlst.xml)

- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the SYSDBA privilege.

- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call EXPORT_SQL_TESTCASE Procedures with exportData=>TRUE and the data will be imported by default, unless turned OFF by importData=>FALSE.
- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call `EXPORT_SQL_TESTCASE Procedures` with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call `IMPORT_SQL_TESTCASE Procedures` with `importPkgbody=>TRUE`.

- The capture value used when invoking the `EXPORT_SQL_TESTCASE Procedures` must be used when calling this procedure.
INCIDENTID_2_SQL Procedure

This procedure initializes a sql_setrow from an incident ID.

Syntax

```sql
DBMS_SQLDIAG.INCIDENTID_2_SQL (
    incident_id   IN     VARCHAR2,
    sql_stmt      OUT    SQLSET_ROW,
    problem_type  OUT    NUMBER,
    err_code      OUT    BINARY_INTEGER,
    err_mesg      OUT    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Identifier of the incident</td>
</tr>
<tr>
<td>sql_stmt</td>
<td>Resulting SQL</td>
</tr>
<tr>
<td>problem_type</td>
<td>Tentative type of SQL problem (currently among PROBLEM_TYPE_COMPILATION_ERROR and PROBLEM_TYPE_EXECUTION_ERROR)</td>
</tr>
<tr>
<td>err_code</td>
<td>Error code if any otherwise it is set to NULL</td>
</tr>
<tr>
<td>err_mesg</td>
<td>Error message if any otherwise it is set to NULL</td>
</tr>
</tbody>
</table>
INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

Syntax

```sql
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (taskname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
LOAD_SQLSET_FROM_TCB Function

This function loads a SQLSET from a Test Case Builder file.

Syntax

```
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB (
    directory        IN     VARCHAR2,
    filename         IN     VARCHAR2,
    sqlset_name      IN     VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Name of directory</td>
</tr>
<tr>
<td>filename</td>
<td>Name of file</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>Name of SQLSET</td>
</tr>
</tbody>
</table>
PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.

Syntax

```sql
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
    patch_name            IN  VARCHAR2 := '%',
    patch_category        IN  VARCHAR2 := 'DEFAULT',
    staging_table_name    IN  VARCHAR2,
    staging_schema_owner  IN  VARCHAR2 := NULL);
```

Parameters

- **patch_name**: Name of patch to pack (% wildcards acceptable, case-sensitive)
- **patch_category**: Category to which to pack patches (% wildcards acceptable, case-insensitive)
- **staging_table_name**: (Mandatory) Name of the table to use (case-sensitive)
- **staging_schema_owner**: Schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- Requires: ADMINISTER SQL PLAN MANAGEMENT OBJECT privilege and INSERT privilege on the staging table
- By default, we move all SQL patches in category DEFAULT. See the Examples on page 152-8 for details. Note that the subprogram issues a COMMIT after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.
REPLAY_SQL_TESTCASE Procedure

This procedure automates the reproduction of the SQL Test Case.

Syntax

DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (directory IN VARCHAR2,
filename IN VARCHAR2,
ctrlOptions IN VARCHAR2 := NULL,
format IN VARCHAR2 := 'TEXT');

DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (directory IN VARCHAR2,
sqlTestCase IN CLOB,
ctrlOptions IN VARCHAR2 := NULL,
format IN VARCHAR2 := 'TEXT');

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Directory containing test case files</td>
</tr>
<tr>
<td>filename</td>
<td>Name of a file containing an XML document describing the SQL test case</td>
</tr>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '&lt;parameter name=&quot;mexec_count&quot;&gt;3&lt;/parameter&gt;'.</td>
</tr>
<tr>
<td>name=mexec_count</td>
<td>Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution.</td>
</tr>
<tr>
<td>sqlTestCase</td>
<td>SQL test case</td>
</tr>
<tr>
<td>format</td>
<td>Format of the replay report. Possible formats are: TEXT, XML and HTML...</td>
</tr>
</tbody>
</table>

Examples

TCB Replay Mode: Execute

```
SELECT /* tcbdynpl_1 */ /*+ gather_plan_statistics */ * FROM (SELECT * FROM emp
where emp.sal > 100) emp, dept WHERE emp.deptno = dept.deptno And emp.sal > 1000
```
/* tcbdynpl_1 */

Explain Plan
Plan Hash Value : 2219294842

* 3 - filter("EMP"."SAL">1000)

REPLAY Note:

- Replay used dynamic sampling
- Replay forced Dynamic plan
REPORT_DIAGNOSIS_TASK Function

This function reports on a diagnostic task. It returns a CLOB containing the desired report.

Syntax

```sql
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (  
  taskname           IN   VARCHAR2,  
  type               IN   VARCHAR2  := TYPE_TEXT,  
  level              IN   VARCHAR2  := LEVEL_TYPICAL,  
  section            IN   VARCHAR2  := SECTION_ALL,  
  object_id          IN   NUMBER    := NULL,  
  result_limit       IN   NUMBER    := NULL,  
  owner_name         IN   VARCHAR2  := NULL)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task to report</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report. Possible values are: TEXT, HTML, XML (see Table 152–4, &quot;DBMS_SQLDIAG Constants - Report Type (possible values) Constants&quot;).</td>
</tr>
<tr>
<td>level</td>
<td>Format of the recommendations. Possible values are TYPICAL, BASIC, ALL (Table 152–5, &quot;DBMS_SQLDIAG Constants - Report Level (possible values) Constants&quot;).</td>
</tr>
<tr>
<td>section</td>
<td>Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL (Table 152–6, &quot;DBMS_SQLDIAG Constants - Report Section (possible values) Constants&quot;).</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).</td>
</tr>
<tr>
<td>result_limit</td>
<td>Number of statements in a STS for which the report is generated</td>
</tr>
<tr>
<td>owner_name</td>
<td>Name of the task execution to use. If NULL, the report will be generated for the last task execution.</td>
</tr>
</tbody>
</table>
RESET_DIAGNOSIS_TASK Procedure

This procedure resets a diagnostic task.

Syntax

```sql
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (  
    taskname  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
RESUME_DIAGNOSIS_TASK Procedure

This procedure resumes a diagnostic path.

Syntax

DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (  
taskname IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
SET_DIAGNOSIS_TASK_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2. The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- **MODE**: diag scope (comprehensive, limited)
- **_SQLDIAG_FINDING_MODE**: findings in the report (see “DBMS_SQLDIAG Constants - Findings Filter Constants” on page 152-7 for possible values)

Syntax

```sql
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (
    taskname IN VARCHAR2,
    parameter IN VARCHAR2, value IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Identifier of the task to execute</td>
</tr>
<tr>
<td>parameter</td>
<td>Name of the parameter to set</td>
</tr>
<tr>
<td>value</td>
<td>New value of the specified parameter</td>
</tr>
</tbody>
</table>
UNPACK_STGTAB_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the ACCEPT_SQL_PATCH Function & Procedure).

Syntax

DBMS_SQLDIAG.UNPACK_STGTAB_SQLPATCH (
  patch_name            IN  VARCHAR2 := '%',
  patch_category        IN  VARCHAR2 := '%',
  replace               IN  BOOLEAN,
  staging_table_name    IN  VARCHAR2,
  staging_schema_owner  IN  VARCHAR2 := NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patch_name</td>
<td>Name of patch to unpack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>patch_category</td>
<td>Category from which to unpack patches (% wildcards acceptable, case-insensitive)</td>
</tr>
<tr>
<td>replace</td>
<td>Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>(Mandatory) Name of the table to use (case-sensitive)</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>Schema where the table resides, or NULL for current schema (case-sensitive)</td>
</tr>
</tbody>
</table>

Usage Notes

- Requires: ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT or READ privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.
The DBMS_SQLPA package provides the interface to implement the SQL Performance Analyzer.

The chapter contains the following topics:

- Using DBMS_SQLPA
  - Overview
  - Security Model
- Summary of DBMS_SQLPA Subprograms
Using DBMS_SQLPA

- Overview
- Security Model
Overview

The DBMS_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the CREATE_ANALYSIS_TASK Functions to create an analysis task for a single statement or a group of SQL statements.
2. The EXECUTE_ANALYSIS_TASK Function & Procedure executes a previously created analysis task.
3. The REPORT_ANALYSIS_TASK Function displays the results of an analysis task.
Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (XXX_ANALYSIS_TASK) require privilege ADVISOR.
Summary of DBMS_SQLPA Subprograms

<table>
<thead>
<tr>
<th>Table 153–1</th>
<th>DBMS_SQLPA Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>CANCEL_ANALYSIS_TASK Procedure on page 153-6</td>

<td>Sets the SQL analysis task parameter default value</td>
</tr>
</tbody>
</table>
CANCEL_ANALYSIS_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(
    task_name    IN VARCHAR2);
```

Parameters

Table 153–2  CANCEL_ANALYSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to cancel</td>
</tr>
</tbody>
</table>

Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```
CREATE_ANALYSIS_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements. You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```sql
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text IN CLOB,
    bind_list IN sql_binds := NULL,
    parsing_schema IN VARCHAR2 := NULL,
    task_name IN VARCHAR2 := NULL,
    description IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```sql
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id IN VARCHAR2,
    plan_hash_value IN NUMBER := NULL,
    task_name IN VARCHAR2 := NULL,
    description IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```sql
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap IN NUMBER,
    end_snap IN NUMBER,
    sql_id IN VARCHAR2,
    plan_hash_value IN NUMBER := NULL,
    task_name IN VARCHAR2 := NULL,
    description IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```sql
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sqlset_name IN VARCHAR2,
    basic_filter IN VARCHAR2 := NULL,
    order_by IN VARCHAR2 := NULL,
    top_sql IN VARCHAR2 := NULL,
    task_name IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```
CREATE_ANALYSIS_TASK Functions

```sql
CREATE_ANALYSIS_TASK (
    sql_text IN VARCHAR2 := NULL,
    bind_list IN VARCHAR2 := NULL,
    parsing_schema IN VARCHAR2 := NULL,
    task_name IN VARCHAR2 := NULL,
    description IN VARCHAR2 := NULL,
    sql_id IN VARCHAR2 := NULL,
    plan_hash_value IN VARCHAR2 := NULL,
    begin_snap IN NUMBER := NULL,
    end_snap IN NUMBER := NULL,
    sqlset_name IN VARCHAR2 := NULL,
    basic_filter IN VARCHAR2 := NULL,
    order_by IN VARCHAR2 := NULL,
    top_sql IN VARCHAR2 := NULL,
    sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>Text of a SQL statement</td>
</tr>
<tr>
<td>bind_list</td>
<td>A set of bind values</td>
</tr>
<tr>
<td>parsing_schema</td>
<td>Name of the schema where the statement can be compiled</td>
</tr>
<tr>
<td>task_name</td>
<td>Optional analysis task name</td>
</tr>
<tr>
<td>description</td>
<td>Description of the SQL analysis task to a maximum of 256 characters</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifier of a SQL statement</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Hash value of the SQL execution plan</td>
</tr>
<tr>
<td>begin_snap</td>
<td>Begin snapshot identifier</td>
</tr>
<tr>
<td>end_snap</td>
<td>End snapshot identifier</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>SQL tuning set name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from the SQL tuning set</td>
</tr>
<tr>
<td>order_by</td>
<td>Order-by clause on the selected SQL</td>
</tr>
<tr>
<td>top_sql</td>
<td>Top N SQL after filtering and ranking</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or NULL for the current schema owner</td>
</tr>
</tbody>
</table>

### Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

### Examples

```sql
variable stmt_task VARCHAR2(64);
variable sts_task VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text => 'select quantity_sold from sales s, times t where s.time_id =
        t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap => 1,
    end_snap => 2,
    sql_id => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
```
EXEC : sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -
    sqlset_name   =>   'my_workload', -
    order_by      =>   'BUFFER_GETS', -
    description   =>   'process workload ordered by buffer gets');
DROP_ANALYSIS_TASK Procedure

This procedure drops a SQL analysis task. The task and all its result data are deleted.

Syntax

```sql
DBMS_SQLPA.DROP_ANALYSIS_TASK(
    task_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the analysis task to drop</td>
</tr>
</tbody>
</table>
EXECUTE_ANALYSIS_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

Syntax

```sql
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name         IN VARCHAR2,
    execution_type    IN VARCHAR2               := 'test execute',
    execution_name    IN VARCHAR2               := NULL,
    execution_params  IN dbms_advisor.argList   := NULL,
    execution_desc    IN VARCHAR2               := NULL)
RETURN VARCHAR2;
```

Parameters

Table 153-5 EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the task to execute</td>
</tr>
<tr>
<td>execution_type</td>
<td>Type of the action to perform by the function. If NULL it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- [TEST] EXECUTE - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default.</td>
</tr>
<tr>
<td></td>
<td>- EXPLAIN PLAN - generate explain plan for every statement in the SQL workload. This is similar to the EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task.</td>
</tr>
<tr>
<td></td>
<td>- COMPARE [PERFORMANCE] - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type EXPLAIN_PLAN or TEST_EXECUTE already exist in the task</td>
</tr>
<tr>
<td></td>
<td>- CONVERT SQLSET - used to read the statistics captured in a SQL Tuning Set and model them as a task execution. This can be used when you wish to avoid executing the SQL statements because valid data for the experiment already exists in the SQL Tuning Set.</td>
</tr>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set through the SET_ANALYSIS_DEFAULT_PARAMETER Procedures).</td>
</tr>
</tbody>
</table>
SQL performance analyzer task can be executed multiple times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

**Examples**

1. **Create a task with a purpose of change impact analysis**

   ```plsql
   EXEC :tname := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
       sqlset_name     => 'my_sts');
   ```

2. **Make baseline or the before change execution**

   ```plsql
   EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
       task_name       => :tname,
       execution_type  => 'test execute',
       execution_name  => 'before_change');
   ```

3. **Make change**

   ...

4. **Make the after change version of the workload performance**

   ```plsql
   EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
       task_name       => :tname, -
       execution_type  => 'test execute', -
       execution_name  => 'after_change');
   ```

5. **Compare the two versions of the workload**

   By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

   ```plsql
   EXEC DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
       :tname,'comparison_metric', 'buffer_gets');
   EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
       task_name       => :tname, -
       execution_type  => 'compare performance', -
       execution_name  => 'after_change');
   ```

   Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

   ```plsql
   EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
       task_name       => :tname, -
       execution_type  => 'compare performance', -
       execution_params => dbms_advisor.arglist(
           execution_desc => 'A 256-length string describing the execution'))
   ```
'execution_name1',
'before_change',
'execution_name2',
'after_change',
'comparison_metric',
'buffer_gets');
INTERRUPT_ANALYSIS_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

Syntax

```sql
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(
    task_name           IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the analysis task to interrupt</td>
</tr>
</tbody>
</table>

Examples

```sql
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```
REPORT_ANALYSIS_TASK Function

This procedure displays the results of an analysis task.

Syntax

```sql
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
    task_name       IN   VARCHAR2,
    type            IN   VARCHAR2   := 'TEXT',
    level           IN   VARCHAR2   := 'TYPICAL',
    section         IN   VARCHAR2   := 'SUMMARY',
    object_id       IN   NUMBER     := NULL,
    top_sql         IN   NUMBER     := 100,
    execution_name  IN   VARCHAR2   := NULL,
    task_owner      IN   VARCHAR2   := NULL,
    order_by        IN   VARCHAR2   := NULL)
RETURN CLOB;
```

Parameters

Table 153–7 REPORT_ANALYSIS_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to report</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes).</td>
</tr>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>■ ALL - details of all SQL</td>
</tr>
<tr>
<td></td>
<td>■ BASIC - currently the same as typical</td>
</tr>
<tr>
<td></td>
<td>■ CHANGED - only SQL with changed performance</td>
</tr>
<tr>
<td></td>
<td>■ CHANGED_PLANS - only SQL with plan changes</td>
</tr>
<tr>
<td></td>
<td>■ ERRORS - SQL with errors only</td>
</tr>
<tr>
<td></td>
<td>■ IMPROVED - only improved SQL</td>
</tr>
<tr>
<td></td>
<td>■ REGRESSED - only regressed SQL</td>
</tr>
<tr>
<td></td>
<td>■ TIMEOUT - only SQL which timed-out during execution</td>
</tr>
<tr>
<td></td>
<td>■ TYPICAL (default) - show information about every statement analyzed, including changing and errors</td>
</tr>
<tr>
<td>section</td>
<td>Optionally limit the report to a single section (ALL for all sections):</td>
</tr>
<tr>
<td></td>
<td>■ SUMMARY (default) - workload summary only</td>
</tr>
<tr>
<td></td>
<td>■ ALL - summary and details on SQL</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)</td>
</tr>
<tr>
<td>top_sql</td>
<td>Number of SQL statements in a STS for which the report is generated</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, the report will be generated for the last task execution.</td>
</tr>
</tbody>
</table>
Return Values

A CLOB containing the desired report.

Usage Notes

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

Examples

-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) FROM dual;

-- Show me the summary for thests case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY') FROM dual;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'ALL', 5) FROM dual;
**RESET_ANALYSIS_TASK Procedure**

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution. All intermediate result data will be deleted.

**Syntax**

```sql
DBMS_SQLPA.RESET_ANALYSIS_TASK(
    task_name         IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the analysis task to reset</td>
</tr>
</tbody>
</table>

**Examples**

```sql
-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```
RESUME_ANALYSIS_TASK Procedure

This procedure resumes a previously interrupted or FAILED (with a fatal error) task execution.

Syntax

```sql
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
    task_name IN VARCHAR2,
    basic_filter IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the analysis task to resume</td>
</tr>
<tr>
<td>basic_filter</td>
<td>A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter basic_filter) that was specified when calling the CREATE_ANALYSIS_TASK Functions.</td>
</tr>
</tbody>
</table>

Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```sql
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check -- out its results and then decide. For this example we will just resume.
EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```
SET_ANALYSIS_TASK_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
    task_name IN VARCHAR2,
    parameter IN VARCHAR2,
    value IN VARCHAR2);

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
    task_name IN VARCHAR2,
    parameter IN VARCHAR2,
    value IN NUMBER);

Parameters

Table 153–10 SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the task to execute</td>
</tr>
<tr>
<td>parameter</td>
<td>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</td>
</tr>
<tr>
<td></td>
<td>■ APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</td>
</tr>
<tr>
<td></td>
<td>■ BASIC_FILTER: basic filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>■ CELL_SIMULATION_ENABLED: for more details, see the helper script tcellsim.sql in the ADMIN directory.</td>
</tr>
<tr>
<td></td>
<td>■ COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: buffer_gets, cpu_time + buffer_gets * 10)</td>
</tr>
<tr>
<td></td>
<td>■ DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all TEST EXECUTE and EXPLAIN PLAN operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.</td>
</tr>
<tr>
<td></td>
<td>■ DAYS_TO_EXPIRE: number of days until the task is deleted</td>
</tr>
<tr>
<td></td>
<td>■ DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function &amp; Procedure.</td>
</tr>
</tbody>
</table>
### Table 153–10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| parameter (contd.)            | - DISABLE_MULTI_EXEC: SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to ‘TRUE’ to disable this capability. In this case, each SQL in the SQL tuning set is executed only once.  
- EXECUTION_DAYS_TO_EXPIRE: number of days until the task's executions will be deleted (without deleting the task)  
- EXECUTE_FULLDML: TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML.  
- EXECUTION_NAME1: name of the first task execution to analyze  
- EXECUTION_NAME2: name of the second task execution to analyze  
- LOCAL_TIME_LIMIT: per-statement time out (seconds)  
- METRIC_DELTA_THRESHOLD: threshold of the difference between the SQL performance metric before and after the change. The default value is zero.  
- PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)  
- PLAN_LINES_COMPARISON:  
  - ALWAYS — line by line comparison of plans in all scenarios.  
  - AUTO — Line by Line comparison of plans only if phv2 is not available and phv1 is different  
  - NONE (default) — line by line comparison of plans only if phv is unknown  
- RANK_MEASURE1: first ranking measure for SQL tuning set  
- RANK_MEASURE2: second possible ranking measure for SQL tuning set  
- RANK_MEASURE3: third possible ranking measure for SQL tuning set  
- RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER  
- SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement.  
- SQL_LIMIT: maximum number of SQL statements to process  
- SQL_PERCENTAGE: percentage filter of SQL tuning set statements  
- SQLSET_NAME: name of the SQL tuning set to associate to the specified task or task execution. This parameter is mainly used in comparing two SQL tuning sets using SPA.  
- SQLSET_OWNER: owner of the SQL tuning set specified using task parameter SQLSET_NAME.  
- TIME_LIMIT: global time out (seconds)  |
Table 153–10  (Cont.)  SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter (contd.)</th>
<th>Description</th>

SET_ANALYSIS_DEFAULT_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  VARCHAR2);

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  NUMBER);

The DBMS_SQLTUNE package is the interface for tuning SQL on demand. The related package DBMS_AUTO_SQLTUNE package provides the interface for SQL Tuning Advisor run as an automated task.

The chapter contains the following topics:

- **Using DBMS_SQLTUNE**
  - Overview
  - Security Model

- **Data Structures**

- **Subprogram Groups**
  - SQL Tuning Advisor Subprograms
  - SQL Profile Subprograms
  - SQL Tuning Set Subprograms
  - SQL Performance Reporting Subprograms

- **Summary of DBMS_SQLTUNE Subprograms**
Using DBMS_SQLTUNE

- Overview
- Security Model
Overview

The DBMS_SQLTUNE package provides a number of interrelated areas of functionality:

- SQL Tuning Advisor Subprograms
- SQL Profile Subprograms
- SQL Tuning Set Subprograms

SQL Tuning Advisor

SQL Tuning Advisor is one of a suite of advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, SQL Tuning Advisor automates tuning of problematic SQL statements. It takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advisor provides the advice in the form of SQL actions for tuning the SQL along with their expected performance benefit.

The group of SQL Tuning Advisor Subprograms provide a task-oriented interface that enables you to access the advisor. You can call the following subprograms in the order given to use some of SQL Tuning Advisor's features:

1. CREATE_TUNING_TASK Functions creates a tuning task for tuning one or more SQL statements.
2. The EXECUTE_TUNING_TASK Function and Procedure executes a previously created tuning task.
3. The REPORT_TUNING_TASK Function displays the results of a tuning task.
4. You use the SCRIPT_TUNING_TASK Function to create a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations.

SQL Profile Subprograms

SQL Tuning Advisor may recommend the creation of a SQL profile to improve the performance of a statement. SQL profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of SQL Profile Subprograms provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the ACCEPT_SQL_PROFILE Procedure and Function to accept a SQL profile recommended by SQL Tuning Advisor.
- You can alter the STATUS, NAME, DESCRIPTION, and CATEGORY attributes of an existing SQL profile with the ALTER_SQL_PROFILE Procedure.
- You can drop a SQL profile with the DROP_SQL_PROFILE Procedure.

SQL Tuning Sets

SQL Tuning Advisor input can be a single SQL statement or a set of statements. When tuning multiple statements in one advisor task, you give the input in the form of a SQL tuning set (STS). A SQL tuning set is a database object that stores SQL statements along with their execution context in a system-provided schema. SQL tuning sets
provide an infrastructure for dealing with SQL workloads and simplify tuning of a large number of SQL statements.

SQL tuning sets store SQL statements along with

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans - which are the sequence of operations Oracle performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

SQL tuning sets can be created by filtering or ranking SQL statements from several sources:

- The shared SQL area using the `SELECT_CURSOR_CACHE Function`
- Top SQL statements from the Automatic Workload Repository using the `SELECT_WORKLOAD_REPOSITORY Function`
- Other SQL tuning sets using the `SELECT_SQLSET Function`
- SQL Performance Analyzer task comparison results using the `SELECT_SQLPA_TASK Function`
- SQL Trace files using the `SELECT_SQL_TRACE Function`
- A user-defined workload

The complete group of SQL Tuning Set Subprograms facilitates this functionality. As examples:

- The `CREATE_SQLSET Procedure and Function` creates a SQL tuning set object in the database.
- The `LOAD_SQLSET Procedure` populates the SQL tuning set with a set of selected SQL.
- The `CAPTURE_CURSOR_CACHE_SQLSET Procedure` collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

**Import/Export SQL Tuning Sets and SQL Profiles**

Use `DBMS_SQLTUNE` subprograms to move SQL profiles and SQL tuning sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source database and populate this staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as Oracle Data Pump, or a database link), where it is used to reconstitute the objects in their original form. The following steps are implemented by means of subprograms included in this package:

1. To create the staging table on the source system, call the `CREATE_STGTAB_SQLPROF Procedure` or the `CREATE_STGTAB_SQLSET Procedure`.
2. To populate the staging table with information from the source system, call the `PACK_STGTAB_SQLPROF Procedure` or `PACK_STGTAB_SQLSET Procedure`.
3. Move the staging table to the destination system.
4. To re-create the object on the new system, call the `UNPACK_STGTAB_SQLPROF Procedure` or the `UNPACK_STGTAB_SQLSET Procedure`.

Overview
Automatic Tuning Task Functions
The automated system task SYS_AUTO_SQL_TUNING_TASK is created by the database as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

You can obtain a report on the activity of the Automatic SQL Tuning task through the DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK API. See the DBMS_AUTO_SQLTUNE package for the list of subprograms that you can use to manage the automated SQL tuning task.

See Also: Using DBMS_AUTO_SQLTUNE

Real-Time SQL Monitoring
Real-time SQL Monitoring enables DBAs or performance analysts to monitor the execution of long-running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated in almost real time during statement execution. The V$SQL_MONITOR and V$SQL_PLAN_MONITOR views expose these statistics. In addition, DBMS_SQLTUNE provides the REPORT_SQL_MONITOR and REPORT_SQL_MONITOR_LIST functions to report monitoring information.

Note: DBMS_SQL_MONITOR also contains the REPORT_SQL_MONITOR and REPORT_SQL_MONITOR_LIST functions.
Security Model

This package is available to PUBLIC and performs its own security checking:

- As SQL Tuning Advisor relies on the advisor framework, all tuning task interfaces (*XXX_TUNING_TASK*) require privilege *ADVISOR*.

- SQL tuning set subprograms (*XXX_SQLSET*) require either the *ADMINISTER SQL TUNING SET* or the *ADMINISTER ANY SQL TUNING SET* privilege. Users having the *ADMINISTER SQL TUNING SET* privilege can only create and modify a SQL tuning set they own, while the *ADMINISTER ANY SQL TUNING SET* privilege allows them to operate upon all SQL tuning sets, even those owned by other users. For example, using the `CREATE_SQLSET Procedure and Function` you can create a SQL tuning set to be owned by another user. In this case, the user need not necessarily have the *ADMINISTER SQL TUNING SET* privilege to operate upon her tuning set.

- Previously, three different privileges were needed to invoke subprograms concerned with SQL profiles:
  - `CREATE ANY SQL PROFILE`
  - `ALTER ANY SQL PROFILE`
  - `DROP ANY SQL PROFILE`

  These have now been deprecated in favor of *ADMINISTER SQL MANAGEMENT OBJECT*. 
Data Structures

The DBMS_SQLTUNE package defines the following OBJECT type

Object Types

■ SQLSET_ROW Object Type
SQLSET_ROW Object Type

The SQLSET_ROW object models the content of a SQL tuning set for the user. Logically, a SQL tuning set is a collection of SQLSET_ROWS where each SQLSET_ROW contains a single SQL statement along with its execution context, statistics, binds, and plan. The SELECT_XXX subprograms each model a data source as a collection of SQLSET_ROWS, unique by (sql_id, plan_hash_value). Similarly, the LOAD_SQLSET procedure takes as input a cursor whose row type is SQLSET_ROW, treating each SQLSET_ROW in isolation according to the policies requested by the user.

Several subprograms in the DBMS_SQLTUNE package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the SQLSET_ROW as defined.

Syntax

```
CREATE TYPE sqlset_row AS object {
  sql_id                   VARCHAR(13),
  force_matching_signature NUMBER,
  sql_text                 CLOB,
  object_list              sql_objects,
  bind_data                RAW(2000),
  parsing_schema_name      VARCHAR2(30),
  module                   VARCHAR2(48),
  action                   VARCHAR2(32),
  elapsed_time             NUMBER,
  cpu_time                 NUMBER,
  buffer_gets              NUMBER,
  disk_reads               NUMBER,
  direct_writes            NUMBER,
  rows_processed           NUMBER,
  fetches                  NUMBER,
  executions               NUMBER,
  end_of_fetch_count       NUMBER,
  optimizer_cost           NUMBER,
  optimizer_env            RAW(2000),
  priority                 NUMBER,
  command_type             NUMBER,
  first_load_time          VARCHAR2(19),
  stat_period              NUMBER,
  active_stat_period       NUMBER,
  other                    CLOB,
  plan_hash_value          NUMBER,
  sql_plan                 sql_plan_table_type,
  bind_list                sql_binds
}
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Unique SQL ID</td>

<tr>
<td>forcing_matching_signature</td>
<td>Signature with literals, case, and whitespace removed</td>
</tr>
<tr>
<td>sql_text</td>
<td>Full text for the statement</td>
</tr>
<tr>
<td>object_list</td>
<td>Currently not implemented</td>
</tr>
</tbody>
</table>

Table 154–1  SQLSET_ROW Attributes
### Table 154–1 (Cont.) SQLSET_ROW Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bind_data</td>
<td>Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for bind_list - they are mutually exclusive.</td>
</tr>
<tr>
<td>parsing_schema_name</td>
<td>Schema where the SQL is parsed</td>
</tr>
<tr>
<td>module</td>
<td>Last application module for the SQL</td>
</tr>
<tr>
<td>action</td>
<td>Last application action for the SQL</td>
</tr>
<tr>
<td>elapsed_time</td>
<td>Sum total elapsed time for this SQL statement</td>
</tr>
<tr>
<td>cpu_time</td>
<td>Sum total CPU time for this SQL statement</td>
</tr>
<tr>
<td>buffer_gets</td>
<td>Sum total number of buffer gets</td>
</tr>
<tr>
<td>disk_reads</td>
<td>Sum total number of disk reads</td>
</tr>
<tr>
<td>direct_writes</td>
<td>Sum total number of direct writes</td>
</tr>
<tr>
<td>rows_processed</td>
<td>Sum total number of rows processed by this SQL</td>
</tr>
<tr>
<td>fetches</td>
<td>Sum total number of fetches</td>
</tr>
<tr>
<td>executions</td>
<td>Total executions of this SQL</td>
</tr>
<tr>
<td>end_of_fetch_count</td>
<td>Number of times the statement was fully executed with all of its rows fetched</td>
</tr>
<tr>
<td>optimizer_cost</td>
<td>Optimizer cost for this SQL</td>
</tr>
<tr>
<td>optimizer_env</td>
<td>Optimizer environment for this SQL statement</td>
</tr>
<tr>
<td>priority</td>
<td>User-defined priority (1,2,3)</td>
</tr>
<tr>
<td>command_type</td>
<td>Statement type, such as INSERT or SELECT.</td>
</tr>
<tr>
<td>first_load_time</td>
<td>Load time of parent cursor</td>
</tr>
<tr>
<td>stat_period</td>
<td>Period of time (seconds) when the statistics of this SQL statement were collected</td>
</tr>
<tr>
<td>active_stat_period</td>
<td>Effective period of time (in seconds) during which the SQL statement was active</td>
</tr>
<tr>
<td>other</td>
<td>Other column for user defined attributes</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Plan hash value of the plan</td>
</tr>
<tr>
<td>sql_plan</td>
<td>Explain plan</td>
</tr>
<tr>
<td>bind_list</td>
<td>List of user specified binds for SQL. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data - they are mutually exclusive.</td>
</tr>
</tbody>
</table>
**Subprogram Groups**

DBMS_SQLTUNE subprograms are grouped by function:

- SQL Tuning Advisor Subprograms
- SQL Profile Subprograms
- SQL Tuning Set Subprograms
- SQL Performance Reporting Subprograms
SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

Table 154–2  SQL Tuning Task Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;CANCEL_TUNING_TASK Procedure&quot; on page 154-27</td>
<td>Cancels the currently executing tuning task</td>
</tr>
<tr>
<td>&quot;CREATE_SQL_PLAN_BASELINE Procedure&quot; on page 154-30</td>
<td>Creates a SQL plan baseline for an existing plan</td>
</tr>
<tr>
<td>&quot;CREATE_TUNING_TASK Functions&quot; on page 154-35</td>
<td>Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor</td>
</tr>
<tr>
<td>&quot;DROP_TUNING_TASK Procedure&quot; on page 154-43</td>
<td>Drops a SQL tuning task</td>
</tr>
<tr>
<td>&quot;EXECUTE_TUNING_TASK Function and Procedure&quot; on page 154-44</td>
<td>Executes a previously created tuning task</td>
</tr>
<tr>
<td>&quot;IMPLEMENT_TUNING_TASK Function&quot; on page 154-45</td>
<td>Implements a set of SQL profile recommendations made by SQL Tuning Advisor</td>
</tr>
<tr>
<td>&quot;INTERRUPT_TUNING_TASK Procedure&quot; on page 154-46</td>
<td>Interrupts the currently executing tuning task</td>
</tr>
<tr>
<td>&quot;REPORT_AUTO_TUNING_TASK Function&quot; on page 154-58</td>
<td>Displays a report from the automatic tuning task, reporting on a range of executions</td>
</tr>
<tr>
<td>&quot;REPORT_TUNING_TASK Function&quot; on page 154-70</td>
<td>Displays the results of a tuning task</td>
</tr>
<tr>
<td>&quot;RESET_TUNING_TASK Procedure&quot; on page 154-72</td>
<td>Resets the currently executing tuning task to its initial state</td>
</tr>
<tr>
<td>&quot;RESUME_TUNING_TASK Procedure&quot; on page 154-73</td>
<td>Resumes a previously interrupted task that was created to process a SQL tuning set</td>
</tr>
<tr>
<td>&quot;SCHEDULE_TUNING_TASK Function&quot; on page 154-74</td>
<td>Creates a tuning task and schedules its execution as a scheduler job</td>
</tr>
<tr>
<td>&quot;SCRIPT_TUNING_TASK Function&quot; on page 154-76</td>
<td>Creates a SQL*PLUS script which can then be executed to implement a set of SQL Tuning Advisor recommendations</td>
</tr>
<tr>
<td>&quot;SET_TUNING_TASK_PARAMETER Procedures&quot; on page 154-90</td>
<td>Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER</td>
</tr>
</tbody>
</table>

The Summary of DBMS_SQLTUNE Subprograms contains a complete listing of all subprograms in the package.
SQL Profile Subprograms

This subprogram group provides an interface to manage SQL profiles.

Table 154–3  SQL Profile Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT_ALL_SQL_PROFILES Procedure on page 154-19</td>

ACCEPT_ALL_SQL_PROFILES Procedure

This procedure accepts all SQL profiles recommended by a specific execution of a tuning task, and sets the attributes of the SQL profiles according to the parameter values passed by the user.

**See Also:** SQL Profile Subprograms on page 154-12 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.ACCEPT_ALL_SQL_PROFILES (  
    task_name       IN VARCHAR2,
    category        IN VARCHAR2 := NULL,
    replace         IN BOOLEAN  := FALSE,
    force_match     IN BOOLEAN  := FALSE,
    profile_type    IN VARCHAR2 := REGULAR_PROFILE,
    autotune_period IN NUMBER   := NULL,
    execution_name  IN VARCHAR2 := NULL,
    task_owner      IN VARCHAR2 := NULL,
    description     IN VARCHAR2 := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The (mandatory) name of the SQL tuning task</td>
</tr>
<tr>
<td>category</td>
<td>This is the category name which must match the value of the SQLTUNE_CATEGORY parameter in a session for the session to use this SQL profile. It defaults to the value &quot;DEFAULT&quot;. This is also the default of the SQLTUNE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An ACCEPT_SQL_PROFILE fails if this combination is duplicated.</td>
</tr>
<tr>
<td>replace</td>
<td>If the profile already exists, it is replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.</td>
</tr>
<tr>
<td>force_match</td>
<td>If TRUE this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the cursor_sharing parameter.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the cursor_sharing parameter.</td>
</tr>
</tbody>
</table>

<tr>
<td></td>
<td>■ REGULAR_PROFILE - profile without a change to parallel execution (Default, equivalent to NULL). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan.</td>
</tr>
<tr>
<td></td>
<td>■ PX_PROFILE - regular profile with a change to parallel execution</td>
</tr>
<tr>
<td>autotune_period</td>
<td>The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td>■ null or negative value (default) - all or full. The result includes all task executions.</td>
</tr>
<tr>
<td></td>
<td>■ 0 - result of the current or most recent task execution.</td>
</tr>
<tr>
<td></td>
<td>■ 1 - result for the most recent 24-hour period.</td>
</tr>
<tr>
<td></td>
<td>■ 7 - result for the most recent 7-day period.</td>
</tr>
<tr>
<td></td>
<td>The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If null, then the procedure generates the report for the most recent task execution.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the tuning task. This is an optional parameter that must be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.</td>
</tr>
<tr>
<td>description</td>
<td>A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The CREATE ANY SQL PROFILE privilege is required.
ACCEPT_SQL_PROFILE Procedure and Function

This procedure creates a SQL profile recommended by SQL Tuning Advisor. The SQL text is normalized for matching purposes though it is stored in the data dictionary in de-normalized form for readability. SQL text is provided through a reference to the SQL Tuning task. If the referenced SQL statement doesn’t exist, an error is reported.

See Also: SQL Profile Subprograms on page 154-12 for other subprograms in this group

Syntax

DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
    task_name    IN  VARCHAR2,
    object_id    IN  NUMBER   := NULL,
    name         IN  VARCHAR2 := NULL,
    description  IN  VARCHAR2 := NULL,
    category     IN  VARCHAR2 := NULL,
    task_owner   IN VARCHAR2  := NULL,
    replace      IN BOOLEAN   := FALSE,
    force_match  IN BOOLEAN   := FALSE,
    profile_type IN VARCHAR2  := REGULAR_PROFILE);

Parameters

Table 154–9  ACCEPT_SQL_PROFILE Procedure and Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The (mandatory) name of the SQL tuning task</td>
</tr>
<tr>
<td>object_id</td>
<td>The identifier of the advisor framework object representing the SQL statement associated with the tuning task</td>
</tr>
<tr>
<td>name</td>
<td>The name of the SQL profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system generates a unique name for the SQL profile.</td>
</tr>
<tr>
<td>description</td>
<td>A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.</td>
</tr>
</tbody>
</table>
Table 154–9 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category</td>
<td>This is the category name which must match the value of the SQLTUNE_CATEGORY parameter in a session for the session to use this SQL profile. It defaults to the value &quot;DEFAULT&quot;. This is also the default of the SQLTUNE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An ACCEPT_SQL_PROFILE fails if this combination is duplicated.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.</td>
</tr>
<tr>
<td>replace</td>
<td>If the profile already exists, it is replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.</td>
</tr>
<tr>
<td>force_match</td>
<td>If TRUE this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the cursor_sharing parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the cursor_sharing parameter.</td>
</tr>
<tr>
<td>profile_type</td>
<td>Options:</td>
</tr>
<tr>
<td></td>
<td>■ REGULAR_PROFILE - profile without a change to parallel execution (Default, equivalent to NULL). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan.</td>
</tr>
<tr>
<td></td>
<td>■ PX_PROFILE - regular profile with a change to parallel execution</td>
</tr>
</tbody>
</table>

Return Values

The name of the SQL profile.

Usage Notes

The CREATE ANY SQL PROFILE privilege is required.

Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement form the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```sql
variable stmt_task VARCHAR2(64);
variable sts_task VARCHAR2(64);
-- create a tuning task tune the statement
```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(  
    begin_snap => 1, -
    end_snap   => 2, -
    sql_id     => 'aylm3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);

Note that you do not have to specify the ID (that is, object_id) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, TEST), so that it is not used by default.

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (  
    task_name  =>  :stmt_task, -
    category   =>  'TEST');

You can use command ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same force_matching_signature as the tuned statement.

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name  =>  :stmt_task, -
                                        force_match =>  TRUE);

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to '5'. Please notice that you must pass an object id to the ACCEPT_SQL_PROFILE procedure because there are potentially many SQL profiles for the tuning task. This object id is given along with the report.

EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK (  
    sqlset_name   => 'my_workload',  -
    rank1         => 'ELAPSED_TIME', -
    time_limit    => 3600,           -
    description   => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);

-- create the profile for the sql statement corresponding to object_id = 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name  =>  :sts_task, -
                                       object_id =>  5);
ADD_SQLSET_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (  
    sqlset_name  IN  VARCHAR2,  
    description IN  VARCHAR2 := NULL)  
RETURN NUMBER;

Parameters

Table 154–10 ADD_SQLSET_REFERENCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>description</td>
<td>The description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.</td>
</tr>
</tbody>
</table>

Return Values

The identifier of the added reference.

Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only. The function returns a reference ID that is used to remove it later. You use the REMOVE_SQLSET_REFERENCE Procedure to delete references to a SQL tuning set.

variable rid number;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE ( 
    sqlset_name => 'my_workload', 
    description => 'my sts reference');

You can use the views USER/DBA_SQLSET_REFERENCES to find all references on a given SQL tuning set.
ALTER_SQL_PROFILE Procedure

This procedure alters specific attributes of an existing SQL profile object. The following attributes can be altered (using these attribute names):

- "STATUS" can be set to "ENABLED" or "DISABLED"
- "NAME" can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- "DESCRIPTION" can be set to any string of size no more than 500 characters
- "CATEGORY" can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text

See Also: SQL Profile Subprograms on page 154-12 for other subprograms in this group

Syntax

DBMS_SQLTUNE.ALTER_SQL_PROFILE (  
    name                 IN  VARCHAR2,  
    attribute_name       IN  VARCHAR2,  
    value                IN  VARCHAR2);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The (mandatory) name of the existing SQL profile to alter</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The (mandatory) attribute name to alter (case insensitive) using valid attribute names</td>
</tr>
<tr>
<td>value</td>
<td>The (mandatory) new value of the attribute using valid attribute values</td>
</tr>
</tbody>
</table>

Usage Notes

Requires the ALTER ANY SQL PROFILE privilege.

Examples

-- Disable a profile, so it is not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (  
    name => :pname, -  
    attribute_name => 'STATUS', -  
    value => 'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (  
    name => :pname, -  
    attribute_name => 'STATUS', -  
    value => 'ENABLED');

-- Change the category of the profile so it is used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (  
    name => :pname, -  
    attribute_name => 'CATEGORY', -  
    value => 'TEST');
value => 'TEST');

-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name => :pname, -
        attribute_name => 'CATEGORY', -
        value => 'DEFAULT');
CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

See Also: SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK (  
    task_name    IN VARCHAR2);
```

Parameters

Table 154–12 CANCEL_TUNING_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task to cancel</td>
</tr>
</tbody>
</table>

Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```
CAPTURE_CURSOR_CACHE_SQLSET Procedure

Over a specified time interval this procedure incrementally captures a workload from the shared SQL area into a SQL tuning set. The procedure captures a workload from the shared SQL area into a SQL tuning set, polling the cache multiple times over a time period and updating the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (  
    sqlset_name         IN VARCHAR2,  
    time_limit          IN POSITIVE := 1800,  
    repeat_interval     IN POSITIVE := 300,  
    capture_option      IN VARCHAR2 := 'MERGE',  
    capture_mode        IN NUMBER   := MODE_REPLACE_OLD_STATS,  
    basic_filter        IN VARCHAR2 := NULL,  
    sqlset_owner        IN VARCHAR2 := NULL,  
    recursive_sql       IN VARCHAR2 := HAS_RECURSIVE_SQL);  

Parameters

Table 154–13 CAPTURE_CURSOR_CACHE_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>time_limit</td>
<td>The total amount of time, in seconds, to execute</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>The amount of time, in seconds, to pause between sampling</td>
</tr>
<tr>
<td>capture_option</td>
<td>During capture, either insert new statements, update existing statements, or both. 'INSERT', 'UPDATE', or 'MERGE' just like load_option in load_sqlset</td>
</tr>
<tr>
<td>capture_mode</td>
<td>Capture mode (UPDATE and MERGE capture options). Possible values:</td>
</tr>
<tr>
<td></td>
<td>■ MODE_REPLACE_OLD_STATS - Replace statistics when the number of executions seen is greater than that stored in the SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>■ MODE_ACCUMULATE_STATS - Add new values to current values for SQL we already store. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Filter to apply to shared SQL area on each sampling (see SELECT_XXX subprograms). If basic_filter is not set by the caller, the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set or NULL for current schema owner</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).</td>
</tr>
</tbody>
</table>
Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name     => 'my_workload', -
    time_limit      =>  30, -
    repeat_interval =>  5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name     => 'my_workload', -
    time_limit      =>  30, -
    repeat_interval =>  5, -
    capture_mode    => dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name     => 'my_workload', -
    time_limit      =>  30, -
    repeat_interval =>  5, -
    capture_option  => 'INSERT');
```
CREATE_SQL_PLAN_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by SQL Tuning Advisor.

See Also: SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.CREATE_SQL_PLAN_BASELINE (
  task_name            IN VARCHAR2,
  object_id            IN NUMBER := NULL,
  plan_hash_value      IN NUMBER,
  owner_name           IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task for which to get a script</td>
</tr>
<tr>
<td>object_id</td>
<td>Object ID to which the SQL corresponds</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Plan to create plan baseline</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task. Defaults to the current schema owner.</td>
</tr>
</tbody>
</table>
CREATE_SQLSET Procedure and Function

The procedure creates a SQL tuning set object in the database.
The function causes the system to generate a name for the SQL tuning set.

**See Also:** SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.CREATE_SQLSET (
    sqlset_name  IN  VARCHAR2,
    description  IN  VARCHAR2 := NULL
    sqlset_owner IN  VARCHAR2 := NULL);

DBMS_SQLTUNE.CREATE_SQLSET (
    sqlset_name  IN  VARCHAR2 := NULL,
    description  IN  VARCHAR2 := NULL,
    sqlset_owner IN  VARCHAR2 := NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>description</td>
<td>The description of the SQL tuning set</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or NULL for the current schema owner</td>
</tr>
</tbody>
</table>

**Examples**

```sql
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-
    sqlset_name => 'my_workload', -
    description => 'complete application workload');
```
CREATE_STGTAB_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

See Also: SQL Profile Subprograms on page 154-12 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (  
  table_name            IN VARCHAR2,  
  schema_name           IN VARCHAR2 := NULL,  
  tablespace_name       IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table to create (case-insensitive unless double quoted). Required.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The schema to create the table in, or NULL for current schema (case-insensitive unless double quoted)</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>The tablespace to store the staging table within, or NULL for current user's default tablespace (case-insensitive unless double quoted)</td>
</tr>
</tbody>
</table>

Usage Notes

- Call this procedure once before issuing a call to the PACK_STGTAB_SQLPROF Procedure.
- This procedure can be called multiple times if you would like to have different SQL profiles in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.

Examples

Create a staging table to store profile data that can be moved to another system.

```sql
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name => 'PROFILE_STGTAB');
```
CREATE_STGTAB_SQLSET Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

**See Also:** SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET ( 
  table_name           IN VARCHAR2,
  schema_name          IN VARCHAR2 := NULL,
  tablespace_name      IN VARCHAR2 := NULL,
  db_version           IN NUMBER   := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of the table to create (case-sensitive)</td>
</tr>
<tr>
<td>schema_name</td>
<td>Schema in which to create the table in, or NULL for current schema (case-sensitive)</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Tablespace in which to store the staging table, or NULL for current user's default tablespace (case-sensitive)</td>
</tr>
<tr>
<td>db_version</td>
<td>Database (DB) version determining the format of the staging table. User can also create an older DB version staging table to export STS to an older DB version. One of the following values:</td>
</tr>
</tbody>
</table>

- NULL (default) — current DB version
- STS_STGTAB_10_2_VERSION — 10.2 DB version
- STS_STGTAB_11_1_VERSION — 11.1 DB version
- STS_STGTAB_11_2_VERSION — 11.2 DB version

**Usage Notes**

- Call this procedure once before issuing a call to the PACK_STGTAB_SQLSET Procedure.
- This procedure can be called multiple times if you would like to have different tuning sets in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.
- Users issuing the call must have permission to CREATE TABLE in the schema provided and the relevant tablespace.
- Please note that the staging table contains nested table columns and indexes, so it should not be renamed.

**Examples**

Create a staging table for packing and eventually exporting a SQL tuning sets

```sql
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```
Create a staging table to pack a SQL tuning set in Oracle Database 10g Release 2 (10.2) format
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET{
    table_name => 'STGTAB_SQLSET',
    db_version => DBMS_SQLTUNE.STS_STGTAB_10_2_VERSION}

Create a staging table to pack a SQL tuning set in Oracle Database 11g Release 1 (11.1) format
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET{
    table_name => 'STGTAB_SQLSET',
    db_version => DBMS_SQLTUNE.STS_STGTAB_11_1_VERSION}
CREATE_TUNING_TASK Functions

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the shared SQL area given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.
- Create tuning task for a SQL Performance Analyzer

In all cases, the function mainly creates an advisor task and sets its parameters.

See Also: SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

SQL text format:

```sql
DBMS_SQLTUNE.CREATE_TUNING_TASK (  
  sql_text IN CLOB,  
  bind_list IN sql_binds := NULL,  
  user_name IN VARCHAR2 := NULL,  
  scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,  
  time_limit IN NUMBER := TIME_LIMIT_DEFAULT,  
  task_name IN VARCHAR2 := NULL,  
  description IN VARCHAR2 := NULL,  
  con_name IN VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

SQL ID format:

```sql
DBMS_SQLTUNE.CREATE_TUNING_TASK (  
  sql_id IN VARCHAR2,  
  plan_hash_value IN NUMBER := NULL,  
  scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,  
  time_limit IN NUMBER := TIME_LIMIT_DEFAULT,  
  task_name IN VARCHAR2 := NULL,  
  description IN VARCHAR2 := NULL,  
  con_name IN VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

AWR format:

```sql
DBMS_SQLTUNE.CREATE_TUNING_TASK (  
  begin_snap IN NUMBER,  
  end_snap IN NUMBER,  
  sql_id IN VARCHAR2,  
  plan_hash_value IN NUMBER := NULL,  
  scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,  
  time_limit IN NUMBER := TIME_LIMIT_DEFAULT,  
  task_name IN VARCHAR2 := NULL,  
  description IN VARCHAR2 := NULL,  
  con_name IN VARCHAR2 := NULL)  
RETURN VARCHAR2;
```
CREATE_TUNING_TASK Functions

SQL tuning set format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
    sqlset_name       IN VARCHAR2,
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    rank1             IN VARCHAR2 := NULL,
    rank2             IN VARCHAR2 := NULL,
    rank3             IN VARCHAR2 := NULL,
    result_percentage IN NUMBER  := NULL,
    result_limit      IN NUMBER  := NULL,
    scope             IN VARCHAR2 := 'SCOPE_COMPREHENSIVE',
    time_limit        IN NUMBER  := TIME_LIMIT_DEFAULT,
    task_name         IN VARCHAR2 := NULL,
    description       IN VARCHAR2 := NULL,
    plan_filter       IN VARCHAR2 := 'MAX_ELAPSED_TIME',
    sqlset_owner      IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL Performance Analyzer format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
    spa_task_name     IN VARCHAR2,
    spa_task_owner    IN VARCHAR2 := NULL,
    spa_compare_exec  IN VARCHAR2 := NULL,
    basic_filter      IN VARCHAR2 := NULL,
    time_limit        IN NUMBER  := TIME_LIMIT_DEFAULT,
    task_name         IN VARCHAR2 := NULL,
    description       IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>Text of a SQL statement</td>
</tr>
<tr>
<td>begin_snap</td>
<td>Begin snapshot identifier</td>
</tr>
<tr>
<td>end_snap</td>
<td>End snapshot identifier</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifier of a SQL statement</td>
</tr>
<tr>
<td>bind_list</td>
<td>An ordered list of bind values in ANYDATA type</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Hash value of the SQL execution plan</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>SQL tuning set name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from the SQL tuning set</td>
</tr>
<tr>
<td>object_filter</td>
<td>Object filter</td>
</tr>
<tr>
<td>rank(i)</td>
<td>Order-by clause on the selected SQL</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Percentage on the sum of a ranking measure</td>
</tr>
<tr>
<td>result_limit</td>
<td>Top L(imit) SQL from the (filtered/ranked) SQL</td>
</tr>
<tr>
<td>user_name</td>
<td>User name for whom the statement is to be tuned</td>
</tr>
<tr>
<td>scope</td>
<td>Tuning scope (limited/comprehensive)</td>
</tr>
<tr>
<td>time_limit</td>
<td>The maximum duration in seconds for the tuning session</td>
</tr>
<tr>
<td>task_name</td>
<td>Optional tuning task name</td>
</tr>
</tbody>
</table>
Description of the SQL tuning session to a maximum of 256 characters.

Plan filter. It is applicable when multiple plans (plan_hash_value) are associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are:

- LAST_GENERATED: plan with the most recent timestamp
- FIRST_GENERATED: plan with the earliest timestamp, the opposite to LAST_GENERATED
- LAST_LOADED: plan with the most recent first_load_time statistics information
- FIRST_LOADED: plan with the earliest first_load_time statistics information, the opposite to LAST_LOADED
- MAX_ELAPSED_TIME: plan with the maximum elapsed time
- MAX_BUFFERGETS: plan with the maximum buffer gets
- MAX_DISK_READS: plan with the maximum disk reads
- MAX_DIRECT_WRITES: plan with the maximum direct writes
- MAX_OPTIMIZER_COST: plan with the maximum optimizer cost

Owner of the SQL tuning set, or NULL for the current schema owner

Name of the SQL Performance Analyzer task whose regressions are to be tuned

Owner of specified SQL Performance Analyzer task or NULL for current user

Execution name of Compare Performance trial of SQL Performance Analyzer task. If NULL, we use the most recent execution of the given SQL Performance Analyzer task, of type COMPARE PERFORMANCE.
**Return Values**

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

**Usage Notes**

With regard to the form of this subprogram that takes a SQL tuning set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user’s security privileges and can contain any constructs and subqueries that user can access, but no more.

**Examples**

```sql
VARIABLE stmt_task VARCHAR2(64);
VARIABLE sts_task  VARCHAR2(64);
VARIABLE spa_tune_task VARCHAR2(64);

Create Tuning Task with SQL Text Format
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
   sql_text => 'select quantity_sold from sales s, times t where s.time_id =
   t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

Create Tuning Task with SQL ID Format
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3svtrh24');
```
-- tune in limited scope
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'aylm3ssvtrh24', -
    scope => 'LIMITED');

-- only give 10 minutes for tuning statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'aylm3ssvtrh24', -
    time_limit => 600);

Create Tuning Task with AWR Snapshot Format
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -
    end_snap => 2, sql_id => 'aylm3ssvtrh24');

Create Tuning Task with SQL Tuning Set Format
-- First we need to load an STS, then tune it
-- Tune our statements in order by buffer gets, time limit of one hour
-- the default ranking measure is elapsed time.
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    sqlset_name => 'my_workload', -
    rank1 => 'BUFFER_GETS', -
    time_limit => 3600, -
    description => 'tune my workload ordered by buffer gets');

Create Tuning Task with SPA Task Format
-- Tune the SQLs that were reported as having regressed from the compare
-- performance execution of the SPA task named task_123
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    spa_task_name => 'task_123', -
    spa_task_owner => 'SCOTT', -
    spa_compare_exec => 'exec1');
DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

**See Also:** SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.DELETE_SQLSET(
  sqlset_name   IN  VARCHAR2,
  basic_filter  IN  VARCHAR2 := NULL,
  sqlset_owner  IN  VARCHAR2 := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from the SQL tuning set. This basic filter</td>
</tr>
<tr>
<td></td>
<td>is used as a where clause on the SQL tuning set content to select a</td>
</tr>
<tr>
<td></td>
<td>desired subset of SQL from the Tuning Set.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or NULL for current schema owner</td>
</tr>
</tbody>
</table>

**Examples**

```sql
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload', basic_filter => 'elapsed_time < 1000000');
```
DROP_SQL_PROFILE Procedure

This procedure drops the named SQL profile from the database.

*See Also:* [SQL Profile Subprograms](#) on page 154-12 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.DROP_SQL_PROFILE (
    name          IN  VARCHAR2,
    ignore        IN  BOOLEAN  := FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The (mandatory) name of SQL profile to be dropped. The name is case sensitive.</td>
</tr>
<tr>
<td>ignore</td>
<td>Ignores errors due to object not existing</td>
</tr>
</tbody>
</table>

**Usage Notes**

Requires the "DROP ANY SQL PROFILE" privilege.

**Examples**

```sql
-- Drop the profile: 
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```
DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.DROP_SQLSET (  
    sqlset_name IN VARCHAR2,  
    sqlset_owner IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or NULL for current schema owner</td>
</tr>
</tbody>
</table>

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```
DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

See Also: SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

DBMS_SQLTUNE.DROP_TUNING_TASK (task_name IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the tuning task to drop</td>
</tr>
</tbody>
</table>
EXECUTE_TUNING_TASK Function and Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

See Also: SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (  
  task_name         IN VARCHAR2,  
  execution_name    IN VARCHAR2               := NULL,  
  execution_params  IN dbms_advisor.argList   := NULL,  
  execution_desc    IN VARCHAR2               := NULL)  
RETURN VARCHAR2;
```

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (  
  task_name         IN VARCHAR2,  
  execution_name    IN VARCHAR2               := NULL,  
  execution_params  IN dbms_advisor.argList   := NULL,  
  execution_desc    IN VARCHAR2               := NULL);
```

Parameters

Table 154–23  EXECUTE_TUNING_TASK Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task to execute</td>
</tr>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_TUNING_TASK_PARAMETER Procedures).</td>
</tr>
<tr>
<td>execution_desc</td>
<td>A 256-length string describing the execution</td>
</tr>
</tbody>
</table>

Usage Notes

A tuning task can be executed multiples times without having to reset it.

Examples

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```
IMPLEMENT_TUNING_TASK Function

This function implements a set of SQL profile recommendations made by SQL Tuning Advisor. Call this subprogram is equivalent to calling the SCRIPT_TUNING_TASK Function and then running the script.

See Also: SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK (  
  task_name      IN VARCHAR2,  
  rec_type       IN VARCHAR2 := REC_TYPE_SQL_PROFILES,  
  owner_name     IN VARCHAR2 := NULL,  
  execution_name IN VARCHAR2 := NULL);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task for which to implement recommendations</td>
</tr>
<tr>
<td>rec_type</td>
<td>Filter the types of recommendations to implement. Only 'PROFILES' is supported.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task or NULL for the current user.</td>
</tr>
<tr>
<td>execution_name</td>
<td>name of the task execution to use. If NULL, recommendations from the last task execution are implemented.</td>
</tr>
</tbody>
</table>
INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

See Also: SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

DBMS_SQLTUNE.INTERRUPT_TUNING_TASK (task_name IN VARCHAR2);

Parameters

Table 154–25 INTERRUPT_TUNING_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task to interrupt</td>
</tr>
</tbody>
</table>

Examples

EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.LOAD_SQLSET (
    sqlset_name       IN  VARCHAR2,
    populate_cursor   IN  sqlset_cursor,
    load_option       IN VARCHAR2 := 'INSERT',
    update_option     IN VARCHAR2 := 'REPLACE',
    update_condition  IN VARCHAR2 := NULL,
    update_attributes IN VARCHAR2 := NULL,
    ignore_null       IN BOOLEAN := TRUE,
    commit_rows       IN POSITIVE := NULL,
    sqlset_owner      IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name to populate</td>
</tr>
<tr>
<td>populate_cursor</td>
<td>The cursor reference from which to populate</td>
</tr>
<tr>
<td>load_option</td>
<td>Specifies how the statements are loaded into the SQL tuning set. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- INSERT (default) - add only new statements</td>
</tr>
<tr>
<td></td>
<td>- UPDATE - update existing the SQL statements and ignores any new statements</td>
</tr>
<tr>
<td></td>
<td>- MERGE - this is a combination of the two other options. This option inserts new statements and updates the information of the existing ones.</td>
</tr>
<tr>
<td>update_option</td>
<td>Specifies how the existing statements are updated. This parameter is considered only if load_option is specified with 'UPDATE'/'MERGE' as an option. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- REPLACE (default) - update the statement using the new statistics, bind list, object list, and so on.</td>
</tr>
<tr>
<td></td>
<td>- ACCUMULATE - when possible combine attributes (for example, statistics like elapsed_time, and so on) otherwise just replace the old values (for example, module, action, and so on) by the new provided ones. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.</td>
</tr>
</tbody>
</table>
LOAD_SQLSET Procedure

Table 154–26 (Cont.) LOAD_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| update_condition| Specifies a where clause to execute the update operation. The update is performed only if the specified condition is true. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination:  
■ OLD - to refer to statement attributes from the SQL tuning set (destination)  
■ NEW - to refer to statements attributes from the input statements (source) |
| update_attributes| Specifies the list of a SQL statement attributes to update during a merge or update operation. The possible values are:  
■ NULL (default) - the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution context like module, action, and so on.  
■ BASIC - statistics and binds only  
■ TYPICAL - BASIC + SQL plans (without row source statistics) and without object reference list  
■ ALL - all attributes including the execution context attributes like module, action, and so on.  
■ List of comma separated attribute names to update - EXECUTION_CONTEXT, EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics) |
| ignore_null     | If TRUE do not update an attribute if the new value is NULL. That is, do not override with NULL values unless intentional. |
| commit_rows     | If a value is provided, the load commits after each set of that many statements is inserted. If NULL is provided, the load commits only once, at the end of the operation. Providing a value for this argument allows you to monitor the progress of a SQL tuning set load operation in the DBA_/USER_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded. |
| sqlset_owner    | The owner of the SQL tuning set, or the current schema owner or NULL for current owner |

Exceptions

■ This procedure returns an error when sqlset_name is invalid, or a corresponding SQL tuning set does not exist, or the populate_cursor is incorrect and cannot be executed.

■ Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don’t parse (for example, they refer to attributes not in sqlset_row), or because they violate the user’s privileges.

Usage Notes

Rows in the input populate_cursor must be of type SQLSET ROW.

Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more excluding statements that belong to SYS schema (to simulate an application user workload). You select all
attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```sql
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the shared SQL area
DECLARE
cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(
    DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
        'parsing_schema_name <> 'SYS' AND elapsed_time > 5000000',
        NULL, NULL, NULL, NULL, 1, NULL,
        'ALL')) P;
DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur);
END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your update_option because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the elapsed_time filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```sql
DECLARE
cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(
    DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
        'parsing_schema_name <> 'SYS'',
        NULL, NULL,NULL,NULL,
        1,
        NULL,
        'ALL')) P;
DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur,
    Using DBMS_SQLTUNE
    load_option => 'MERGE',
    update_option => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the load_option argument of the LOAD_SQLSET procedure.

```sql
DECLARE
cur sys_refcursor;
BEGIN
OPEN cur FOR
```
SELECT VALUE(P)
FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
populate_cursor => cur);
END;
/

The next example demonstrates a load with **UPDATE** option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur,
    load_option => 'UPDATE');
END;
/
PACK_STGTAB_SQLPROF Procedure

This procedure copies profile data from the SYS. schema into the staging table.

See Also: SQL Profile Subprograms on page 154-12 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (  
    profile_name          IN VARCHAR2 := '%',  
    profile_category      IN VARCHAR2 := 'DEFAULT',  
    staging_table_name    IN VARCHAR2,  
    staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>The name of the profile to pack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>profile_category</td>
<td>The category to pack profiles from (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table to use (case-insensitive unless double quoted). Required.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedures requires ADMINISTER SQL MANAGEMENT OBJECT privilege and INSERT privilege on the staging table.
- Note that this function issues a COMMIT after packing each SQL profile, so if an error is raised mid-execution, clear the staging table by deleting its rows.

Examples

Put only those profiles in the DEFAULT category into the staging table. This corresponds to all profiles used by default on this system.

```sql
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name => 'PROFILE_STGTAB');
```

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```sql
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -  
    staging_table_name => 'PROFILE_STGTAB');
```
PACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB_SQLSET Procedure.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (  
sqlset_name          IN VARCHAR2,  
sqlset_owner         IN VARCHAR2 := NULL,  
staging_table_name   IN VARCHAR2,  
staging_schema_owner IN VARCHAR2 := NULL,  
db_version           IN NUMBER := NULL);
```

Parameters

Table 154–28 PACK_STGTAB_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The name of the SQL tuning set to pack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The category from which to pack SQL tuning sets (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table to use (case-sensitive)</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-sensitive)</td>
</tr>
<tr>
<td>db_version</td>
<td>Database (DB) version determining the format of the staging table. User can also create an older DB version staging table to export STS to an older DB version. One of the following values:</td>
</tr>
<tr>
<td></td>
<td>- NULL (default) — current DB version</td>
</tr>
<tr>
<td></td>
<td>- STS_STGTAB_10_2_VERSION — 10.2 DB version</td>
</tr>
<tr>
<td></td>
<td>- STS_STGTAB_11_1_VERSION — 11.1 DB version</td>
</tr>
<tr>
<td></td>
<td>- STS_STGTAB_11_2_VERSION — 11.2 DB version</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure can be called several times to move more than one SQL tuning set. Users can then move the populated staging table to another system using any method, such as a database link or Oracle Data Pump. Users can then call the UNPACK_STGTAB_SQLSET Procedure create the SQL tuning set on the other system.
- Note that this function issues a COMMIT after packing each SQL tuning set, so if an error is raised mid-execution, clear the staging table by deleting its rows.

Examples

Put all SQL tuning sets on the system in the staging table

```
-- to create a staging table, see the CREATE_STGTAB_SQLSET Procedure
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name => '%', -
```
Put only those SQL tuning sets owned by the current user in the staging table

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name => '%',
    staging_table_name => 'STGTAB_SQLSET');

Pack a specific SQL tuning set

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name => 'my_workload',
    staging_table_name => 'STGTAB_SQLSET');

Pack a second SQL tuning set

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name => 'workload_subset',
    staging_table_name => 'STGTAB_SQLSET');

Pack the STS my_workload to a staging table STGTAB_SQLSET created for Oracle Database 10g Release 2 (10.2)

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name => 'workload_subset',
    staging_table_name => 'STGTAB_SQLSET',
    db_version => DBMS_SQLTUNE.STS_STGTAB_10_2_VERSION);

Pack the STS my_workload to a staging table STGTAB_SQLSET created for Oracle Database 11g Release 1 (11.1)

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name => 'workload_subset',
    staging_table_name => 'STGTAB_SQLSET',
    db_version => DBMS_SQLTUNE.STS_STGTAB_11_1_VERSION);
REMAP_STGTAB_SQLPROF Procedure

This procedure allows DBAs to change the profile data values kept in the staging table prior to performing an unpack operation. The procedure can be used to change the category of a profile. It can be used to change the name of a profile if one already exists on the system with the same name.

See Also: SQL Profile Subprograms on page 154-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
  old_profile_name      IN VARCHAR2,
  new_profile_name      IN VARCHAR2 := NULL,
  new_profile_category  IN VARCHAR2 := NULL,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_profile_name</td>
<td>The name of the profile to target for a remap operation (case-sensitive)</td>
</tr>
<tr>
<td>new_profile_name</td>
<td>The new name of the profile, or NULL to remain the same (case-sensitive)</td>
</tr>
<tr>
<td>new_profile_category</td>
<td>The new category for the profile, or NULL to remain the same (case-sensitive)</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table on which to perform the remap operation (case-sensitive). Required.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-sensitive)</td>
</tr>
</tbody>
</table>

Usage Notes

Using this procedure requires the UPDATE privilege on the staging table.

Examples

Change the name of a profile before we unpack, to avoid conflicts

```sql
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(old_profile_name  => :pname, -
  new_profile_name => 'IMP' || :pname, -
  staging_table_name   => 'PROFILE_STGTAB');
```

Change the SQL profile in the staging table to be 'TEST' category before we import it. This way users can test the profile on the new system before it is active.

```sql
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(old_profile_name  => :pname, -
  new_profile_category => 'TEST', -
  staging_table_name   => 'PROFILE_STGTAB');
```
REMAP_STGTAB_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system.

See Also: SQL Profile Subprograms on page 154-12 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (  
  old_sqlset_name        IN VARCHAR2,  
  old_sqlset_owner       IN VARCHAR2 := NULL,  
  new_sqlset_name        IN VARCHAR2 := NULL,  
  new_sqlset_owner       IN VARCHAR2 := NULL,  
  staging_table_name     IN VARCHAR2,  
  staging_schema_owner   IN VARCHAR2 := NULL,  
  old_con_dbid           IN NUMBER   := NULL,  
  new_con_dbid           IN NUMBER   := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_sqlset_name</td>
<td>The name of the tuning set to target for a remap operation. Wildcards are not supported.</td>
</tr>
<tr>
<td>old_sqlset_owner</td>
<td>The new name of the tuning set owner to target for a remap operation. NULL for current schema owner</td>
</tr>
<tr>
<td>new_sqlset_name</td>
<td>The new name for the tuning set, or NULL to keep the same tuning set name.</td>
</tr>
<tr>
<td>new_sqlset_owner</td>
<td>The new owner for the tuning set, or NULL to remain the same owner name.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table on which to perform the remap operation (case-sensitive).</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The name of staging table owner, or NULL for current schema owner (case-sensitive).</td>
</tr>
<tr>
<td>old_con_dbid</td>
<td>The old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.</td>
</tr>
<tr>
<td>new_con_dbid</td>
<td>The new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.</td>
</tr>
</tbody>
</table>

Usage Notes

You can call this procedure multiple times to remap more than one tuning set name or owner. Note that this procedure only handles one tuning set per call.
Examples

-- Change the name of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name => 'my_workload', -
  old_sqlset_owner => 'SH', -
  new_sqlset_name  => 'imp_workload', -
  staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name => 'imp_workload', -
  old_sqlset_owner => 'SH', -
  new_sqlset_owner => 'SYS', -
  staging_table_name => 'STGTAB_SQLSET');
REMOVE_SQLSET_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate it is no longer used by the client.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (  
    sqlset_name   IN  VARCHAR2,  
    reference_id  IN  NUMBER);
```

Parameters

Table 154–31 REMOVE_SQLSET_REFERENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>reference_id</td>
<td>The identifier of the reference to remove</td>
</tr>
</tbody>
</table>

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again.

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE(  
    sqlset_name   => 'my_workload',  
    reference_id  => :rid);
```

Use views USER/DBA_SQLSET_REFERENCES to find all references on a given SQL tuning set.
REPORT_AUTO_TUNING_TASK Function

This function displays a report from the automatic tuning task. This function reports on a range of task executions, whereas the REPORT_TUNING_TASK Function reports on a single execution. Note that this function is deprecated with Oracle Database 11g Release 2 (11.2) in favor of DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK.

See Also:
- SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group
- REPORT_AUTO_TUNING_TASK Function on page 30-7

Syntax

DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec     IN VARCHAR2  := NULL,
    end_exec       IN VARCHAR2  := NULL,
    type           IN VARCHAR2  := TYPE_TEXT,
    level          IN VARCHAR2  := LEVEL_TYPICAL,
    section        IN VARCHAR2  := SECTION_ALL,
    object_id      IN NUMBER    := NULL,
    result_limit   IN NUMBER    := NULL)
RETURN CLOB;

Parameters

Table 154–32 REPORT_AUTO_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_exec</td>
<td>Name of execution from which to begin the report. NULL retrieves a report on the most recent run</td>
</tr>
<tr>
<td>end_exec</td>
<td>Name of execution at which to end the report. NULL retrieves a report on the most recent run.</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TYPE_TEXT which produces a text report</td>
</tr>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>■ LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor.</td>
</tr>
<tr>
<td></td>
<td>■ LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented.</td>
</tr>
<tr>
<td></td>
<td>■ LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.</td>
</tr>
<tr>
<td>section</td>
<td>Optionally limit the report to a single section (ALL for all sections):</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_SUMMARY - summary information</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_FINDINGS - tuning findings</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_PLAN - explain plans</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_INFORMATION - general information</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_ERROR - statements with errors</td>
</tr>
<tr>
<td></td>
<td>■ SECTION_ALL - all statements</td>
</tr>
</tbody>
</table>
### Table 154–32 (Cont.) REPORT_AUTO_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_id</td>
<td>Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Maximum number of SQL statements to show in the report</td>
</tr>
</tbody>
</table>

### Return Values

A CLOB containing the desired report.
REPORT_SQL_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the $V$ views and AWR.

**See Also:** [SQL Performance Reporting Subprograms](#) on page 154-15 for other subprograms in this group

### Syntax

```sql
DBMS_SQLTUNE.REPORT_SQL_DETAIL (
  sql_id                   IN  VARCHAR2   DEFAULT NULL,
  sql_plan_hash_value      IN  NUMBER     DEFAULT NULL,
  start_time               IN  DATE       DEFAULT NULL,
  duration                 IN  NUMBER     DEFAULT NULL,
  inst_id                  IN  NUMBER     DEFAULT NULL,
  dbid                     IN  NUMBER     DEFAULT NULL,
  event_detail             IN  VARCHAR2   DEFAULT 'YES',
  bucket_max_count         IN  NUMBER     DEFAULT 128,
  bucket_interval          IN  NUMBER     DEFAULT NULL,
  top_n                    IN  NUMBER     DEFAULT 10,
  report_level             IN  VARCHAR2   DEFAULT 'TYPICAL',
  type                     IN  VARCHAR2   DEFAULT 'ACTIVE')
RETURN CLOB;
```

### Parameters

**Table 154–33 REPORT_SQL_DETAIL Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session.</td>
</tr>
<tr>
<td>sql_plan_hash_value</td>
<td>Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID.</td>
</tr>
<tr>
<td>start_time</td>
<td>If specified, shows SQL activity (from GV$ACTIVE_SESSION_HISTORY) starting at this time. On Oracle RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance.</td>
</tr>
<tr>
<td>dbid</td>
<td>DBID from which to get SQL details. If NULL, uses current DBID.</td>
</tr>
<tr>
<td>event_detail</td>
<td>When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class, event_name).</td>
</tr>
<tr>
<td>bucket_max_count</td>
<td>If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used.</td>
</tr>
</tbody>
</table>
Table 154–33  (Cont.) REPORT_SQL_DETAIL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bucket_interval</td>
<td>If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.</td>
</tr>
<tr>
<td>top_n</td>
<td>Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used.</td>
</tr>
<tr>
<td>report_level</td>
<td>Level of detail for the report, either ‘BASIC’, ‘TYPICAL’ or ‘ALL’. Default assumes ‘TYPICAL’. Their meanings are explained below. In addition, individual report sections can also be enabled or disabled by using a +/- section_name. Several sections are defined:</td>
</tr>
<tr>
<td></td>
<td>- ‘TOP’ - Show top values for the ASH dimensions for a SQL statement; ON by default</td>
</tr>
<tr>
<td></td>
<td>- ‘SPM’ - Show existing plan baselines for a SQL statement; OFF by default</td>
</tr>
<tr>
<td></td>
<td>- ‘MISMATCH’ - Show reasons for creating new child cursors (sharing criteria violations); OFF by default</td>
</tr>
<tr>
<td></td>
<td>- ‘STATS’ - Show SQL execution statistics per plan from GV$SQLAREA_PLAN_HASH; ON by default</td>
</tr>
<tr>
<td></td>
<td>- ‘ACTIVITY’ - Show top activity from ASH for each plan of a SQL statement; ON by default</td>
</tr>
<tr>
<td></td>
<td>- ‘ACTIVITY_ALL’ - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default</td>
</tr>
<tr>
<td></td>
<td>- ‘HISTOGRAM’ - Show activity histogram for each plan of a SQL statement (plan time line histogram); ON by default</td>
</tr>
<tr>
<td></td>
<td>- ‘SESSIONS’ - Show activity for top sessions for each plan of a SQL statement; OFF by default</td>
</tr>
<tr>
<td></td>
<td>- ‘MONITOR’ - Show show one monitored SQL execution per execution plan; ON by default</td>
</tr>
<tr>
<td></td>
<td>- ‘XPLAN’ - Show execution plans; ON by default</td>
</tr>
<tr>
<td></td>
<td>- ‘BINDS’ - Show captured bind data; ON by default</td>
</tr>
</tbody>
</table>

In addition, SQL text can be specified at different levels:
- -SQL_TEXT - No SQL text in report
- +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV$SQL_MONITOR
- -SQL_FULLTEXT - No full SQL text (+SQL_TEXT)
- +SQL_FULLTEXT - Show full SQL text (default value)

The meanings of the three top-level report levels are:
- NONE - minimum possible
- BASIC - SQL_TEXT+STATS+ACTIVITY+HISTOGRAM
- TYPICAL - SQL_FullTEXT+TOP+STATS+ACTIVITY+HISTOGRAM+XPLAN+MONITOR
- ALL - everything

Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string
Report Values

A CLOB containing the desired report.

Usage Notes

- **ACTIVE** reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

- The invoker needs the **SELECT** or **READ** privilege on the following views:
  - V$SESSION
  - DBA_ADVISOR_FINDINGS
  - V$DATABASE
  - GV$ASH_INFO
  - GV$ACTIVE_SESSION_HISTORY
  - GV$SQLAREA_PLAN_HASH
  - GV$SQL
  - DBA_HIST_SNAPSHOT
  - DBA_HIST_WR_CONTROL
  - DBA_HIST_ACTIVE_SESS_HISTORY
  - DBA_HIST_SQLSTAT
  - DBA_HIST_SQL_BIND_METADATA
  - DBA_HIST_SQLTEXT
  - DBA_SQL_PLAN_BASELINES
  - DBA_SQL_PROFILES
  - DBA_ADVISOR_TASKS
  - DBA_SERVICES
  - DBA_USERS
  - DBA_OBJECTS
  - DBA_PROCEDURES

- The invoker needs the **EXECUTE** privilege on the **DBMS_XPLAN** package.
REPORT_SQL_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

**See Also:** Real-Time SQL Monitoring on page 154-5 for other subprograms in this group

### Syntax

```sql
DBMS_SQLTUNE.REPORT_SQL_MONITOR(
    sql_id                    IN VARCHAR2  DEFAULT  NULL,
    dbop_name                 IN VARCHAR2  DEFAULT  NULL,
    dbop_exec_id              IN NUMBER    DEFAULT  NULL,
    session_id                IN NUMBER    DEFAULT  NULL,
    session_serial            IN NUMBER    DEFAULT  NULL,
    sql_exec_start            IN DATE      DEFAULT  NULL,
    sql_exec_id               IN NUMBER    DEFAULT  NULL,
    inst_id                   IN NUMBER    DEFAULT  NULL,
    start_time_filter         IN DATE      DEFAULT  NULL,
    end_time_filter           IN DATE      DEFAULT  NULL,
    instance_id_filter        IN NUMBER    DEFAULT  NULL,
    parallel_filter           IN VARCHAR2  DEFAULT  NULL,
    plan_line_filter          IN NUMBER    DEFAULT  NULL,
    event_detail              IN VARCHAR2  DEFAULT 'YES',
    bucket_max_count          IN NUMBER    DEFAULT 128,
    bucket_interval           IN NUMBER    DEFAULT NULL,
    base_path                 IN VARCHAR2  DEFAULT NULL,
    last_refresh_time         IN DATE      DEFAULT NULL,
    report_level              IN VARCHAR2  DEFAULT 'TYPICAL',
    type                      IN VARCHAR2  DEFAULT 'TEXT',
    sql_plan_hash_value       IN NUMBER    DEFAULT NULL)
RETURN CLOB;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.</td>
</tr>
<tr>
<td>dbop_name</td>
<td>DBOP_NAME for which monitoring information of the composite database operation is displayed.</td>
</tr>
<tr>
<td>dbop_exec_id</td>
<td>Execution ID for the composite database operation for which monitoring information is displayed.</td>
</tr>
<tr>
<td>session_id</td>
<td>If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.</td>
</tr>
</tbody>
</table>
**Table 154–34 (Cont.) REPORT_SQL_MONITOR Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_exec_start</td>
<td>This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.</td>
</tr>
<tr>
<td>sql_exec_id</td>
<td>This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.</td>
</tr>
<tr>
<td>start_time_filter</td>
<td>If not NULL, the report considers only the activity (from GV$ACTIVE_SESSION_HISTORY) recorded after the specified date. If NULL, the reported activity starts when the execution of the targeted SQL statement has started.</td>
</tr>
<tr>
<td>end_time_filter</td>
<td>If not NULL, the report shows only the activity (from GV$ACTIVE_SESSION_HISTORY) collected before the date end_time_filter. If NULL, the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing.</td>
</tr>
<tr>
<td>instance_id_filter</td>
<td>Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (Oracle RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.</td>
</tr>
<tr>
<td>parallel_filter</td>
<td>Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be:</td>
</tr>
<tr>
<td></td>
<td>- NULL to target all processes</td>
</tr>
<tr>
<td></td>
<td>- [qc][servers(&lt;svr_grp&gt;[[,] &lt;svr_set&gt;[[,] &lt;srv_num&gt;])]: 'qc' stands for query coordinator and servers() stipulate which PX servers to consider.</td>
</tr>
</tbody>
</table>

The following examples show how to target a subset of the parallel processes:

- qc: targets only the query coordinator
- servers(1): targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel.
- servers(1,2): targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers)
- servers(1,1): consider only group 1, set 1
- servers(1,2,4): consider only group 1, set 2, server number 4. This reports for a single parallel server process
- qc servers(1,2,4): same as above by also including the query coordinator
### Table 154–34 (Cont.) REPORT_SQL_MONITOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_detail</td>
<td>When value is 'YES' (the default), reported activity from GV$ACTIVE_SESSION_HISTORY is aggregated by (wait_class, event_name). Use 'NO' to only aggregate by wait_class.</td>
</tr>
<tr>
<td>bucket_max_count</td>
<td>If specified, this should be the maximum number of histogram buckets created in the report</td>
</tr>
<tr>
<td>bucket_interval</td>
<td>If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.</td>
</tr>
<tr>
<td>base_path</td>
<td>URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)</td>
</tr>
</tbody>
</table>
| last_refresh_time| If not NULL (default is NULL), the time when the report was last retrieved (see SYSDATE attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized:  
  - SQL text is not returned when this option is specified  
  - activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket |
REPORT_SQL_MONITOR Function

A CLOB containing the desired report.

Return Values

Table 154–34  (Cont.)  REPORT_SQL_MONITOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>report_level</td>
<td>Level of detail for the report, either 'NONE', 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below. In addition, individual report sections can also be enabled or disabled by using a +/- section_name. Several sections are defined:</td>
</tr>
<tr>
<td></td>
<td>'XPLAN' - Show explain plan; ON by default</td>
</tr>
<tr>
<td></td>
<td>'PLAN' - Show plan monitoring statistics; ON by default</td>
</tr>
<tr>
<td></td>
<td>'SESSIONS' - Show session details. Applies only to parallel queries; ON by default</td>
</tr>
<tr>
<td></td>
<td>'INSTANCE' - Show instance details. Applies only to parallel and cross instance; ON by default</td>
</tr>
<tr>
<td></td>
<td>'PARALLEL' - An umbrella parameter for specifying sessions+instance details</td>
</tr>
<tr>
<td></td>
<td>'ACTIVITY' - Show activity summary at global level, plan line level and session or instance level (if applicable); ON by default</td>
</tr>
<tr>
<td></td>
<td>'BINDS' - Show bind information when available; ON by default</td>
</tr>
<tr>
<td></td>
<td>'METRICS' - Show metric data (CPU, I/Os, ...) over time; ON by default</td>
</tr>
<tr>
<td></td>
<td>'ACTIVITY_HISTOGRAM' - Show an histogram of the overall query activity; ON by default</td>
</tr>
<tr>
<td></td>
<td>'PLAN_HISTOGRAM' - Show activity histogram at plan line level; OFF by default</td>
</tr>
<tr>
<td></td>
<td>'OTHER' - Other info; ON by default</td>
</tr>
</tbody>
</table>

In addition, SQL text can be specified at different levels:

- SQL_TEXT - No SQL text in report
- +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV$SQL_MONITOR
- -SQL_FULLTEXT - No full SQL text (+SQL_TEXT)
- +SQL_FULLTEXT - Show full SQL text (default value)

report_level (contd.) The meanings of the three top-level report levels are:

- NONE - minimum possible
- +BASIC = SQL_TEXT-PLAN-XPLAN-SESSIONS-INSTANCE-ACTIVITY_HISTOGRAM-PLAN_HISTOGRAM-METRICS
- TYPICAL - everything but PLAN_HISTOGRAM
- ALL - everything

Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string.

<table>
<thead>
<tr>
<th>type</th>
<th>Report format, 'TEXT' by default. Can be 'TEXT', 'HTML', 'XML' or 'ACTIVE' (see Usage Notes).</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_plan_hash_value</td>
<td>Target only those SQL executions with the specified plan_hash_value. Default is NULL.</td>
</tr>
</tbody>
</table>

Table 154–34  (Cont.)  REPORT_SQL_MONITOR Function Parameters
Usage Notes

- The target SQL statement for this report can be:
  - The last SQL monitored by Oracle (this is the default behavior, so there is no need to specify any parameter). The last SQL executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally its serial number. For example, use `session_id => USERENV('SID')` for the current session or `session_id=>20, session_serial=>103` for session ID 20, serial number 103. The last execution of a specific statement identified by its `sql_id`. A specific execution of a SQL statement identified by its execution key (`sql_id, sql_exec_start` and `sql_exec_id`).

- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).
  - `GV$SQL_MONITOR`
  - `GV$SQL_PLAN_MONITOR`
  - `GV$SQL_PLAN`
  - `GV$ACTIVE_SESSION_HISTORY`
  - `GV$SESSION_LONGOPS`
  - `GV$SQL`

- The `bucket_max_count` and `bucket_interval` parameters control the activity histogram. By default, the maximum number of buckets is set to 128 and the RDBMS derives the `bucket_interval` based on this. The `bucket_interval` (value is in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1s) without exceeding the maximum number of buckets. For example, if the query has executed for 600s, the RDBMS selects a `bucket_interval` of 8s (a power of two) given that 600/8 = 74 which is less than 128 buckets maximum. Smaller than 8s would be 4s which would lead to more buckets than the 128 maximum. If `bucket_interval` is specified, then the RDBMS uses that value instead of deriving it from `bucket_max_count`.

- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

**See Also:** Oracle Database SQL Tuning Guide for more information about SQL real-time monitoring.
REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a sub-set of statements monitored by Oracle. For each statement, the subprogram gives key information and associated global statistics. Use the REPORT_SQL_MONITOR Function to get detail monitoring information for a single SQL statement.

See Also: Real-Time SQL Monitoring on page 154-5 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST(
    sql_id                    IN VARCHAR2  DEFAULT  NULL,
    session_id                IN NUMBER    DEFAULT  NULL,
    session_serial            IN NUMBER    DEFAULT  NULL,
    inst_id                   IN NUMBER    DEFAULT  NULL,
    active_since_date         IN DATE      DEFAULT  NULL,
    active_since_sec          IN NUMBER    DEFAULT  NULL,
    last_refresh_time         IN DATE      DEFAULT  NULL,
    report_level              IN VARCHAR2  DEFAULT  'TYPICAL',
    auto_refresh              IN NUMBER    DEFAULT  NULL,
    base_path                 IN VARCHAR2  DEFAULT  NULL,
    type                      IN VARCHAR2  DEFAULT 'TEXT'
) RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.</td>
</tr>
<tr>
<td>session_id</td>
<td>If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>In addition to the session_id parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.</td>
</tr>
<tr>
<td>active_since_date</td>
<td>If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time.</td>
</tr>
<tr>
<td>active_since_sec</td>
<td>Same as active_since_date but with the date specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour.</td>
</tr>
</tbody>
</table>
Summary of DBMS_SQLTUNE Subprograms

### return values

A report (XML, text, HTML) for the list of SQL statements that have been monitored.

### usage notes

The user tuning this function needs to have privilege to access the following fixed views: GV$SQL_MONITOR and GV$SQL

See Also: Oracle Database SQL Tuning Guide for more information about SQL real-time monitoring.

---

**Table 154–35 (Cont.) REPORT_SQL_MONITOR_LIST Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>last_refresh_time</td>
<td>If not NULL (default), the date and time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report shows detail about the execution of monitored queries that active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, sql_exec_id). For queries with a first refresh time after the specified date, the function returns only the SQL execution key and statistics.</td>
</tr>
</tbody>
</table>
| report_level    | Level of detail for the report. The level is one of the following:  
|                 | - BASIC - SQL text up to 200 characters  
|                 | - TYPICAL - include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters  
|                 | - ALL - currently the same as TYPICAL  
| auto_refresh    | Currently non-operational, reserved for future use.  
| base_path       | URL path for flex HTML resources because flex HTML format is required to access external files (java scripts and the flash SWF file itself).  
| type            | Report format: TEXT (default), HTML, or XML.  

---
REPORT_TUNING_TASK Function

This procedure displays the results of a tuning task.

See Also: SQL Performance Reporting Subprograms on page 154-15 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK(
  task_name       IN   VARCHAR2,
  type            IN   VARCHAR2   := 'TEXT',
  level           IN   VARCHAR2   := 'TYPICAL',
  section         IN   VARCHAR2   := ALL,
  object_id       IN   NUMBER     := NULL,
  result_limit    IN   NUMBER     := NULL,
  owner_name      IN    VARCHAR2  := NULL,
  execution_name  IN  VARCHAR2    := NULL)
RETURN CLOB;
```

Parameters

Table 154–36 REPORT_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task to report.</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TEXT which produces a text report.</td>
</tr>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>- BASIC: simple version of the report. Just show info about the actions taken by the advisor.</td>
</tr>
<tr>
<td></td>
<td>- TYPICAL: show information about every statement analyzed, including requests not implemented.</td>
</tr>
<tr>
<td></td>
<td>- ALL: highly detailed report level, also provides annotations about statements skipped over.</td>
</tr>
<tr>
<td>section</td>
<td>Optionally limit the report to a single section (ALL for all sections):</td>
</tr>
<tr>
<td></td>
<td>- SUMMARY - summary information</td>
</tr>
<tr>
<td></td>
<td>- FINDINGS - tuning findings</td>
</tr>
<tr>
<td></td>
<td>- PLAN - explain plans</td>
</tr>
<tr>
<td></td>
<td>- INFORMATION - general information</td>
</tr>
<tr>
<td></td>
<td>- ERROR - statements with errors</td>
</tr>
<tr>
<td></td>
<td>- ALL - all statements</td>
</tr>
<tr>
<td>object_id</td>
<td>Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Maximum number of SQL statements to show in the report.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task. Defaults to the current schema owner.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, the report is generated for the last task execution.</td>
</tr>
</tbody>
</table>
Return Values

A CLOB containing the desired report.

Examples

-- Display the report for a single statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task)
FROM   DUAL;

-- Display the summary for a SQL tuning set.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM   DUAL;

-- Display the findings for a specific statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'FINDINGS', 5)
FROM   DUAL;
RESET_TUNING_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

See Also: SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.RESET_TUNING_TASK(
    task_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the tuning task to reset</td>
</tr>
</tbody>
</table>

Examples

```sql
-- reset and re-execute a task
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```
RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

**See Also:** SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.RESUME_TUNING_TASK(
    task_name         IN VARCHAR2,
    basic_filter      IN VARCHAR2 := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the tuning task to resume.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>A SQL predicate to filter the SQL from the SQL tuning set.</td>
</tr>
<tr>
<td></td>
<td>Note that this filter is applied in conjunction with the basic filter (i.e., parameter basic_filter) when calling CREATE_TUNING_TASK Functions.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL tuning set) is not supported.

**Examples**

```sql
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check -- out its results and then decide. For this example we will just resume.
EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```
SCHEDULE_TUNING_TASK Function

This function creates a tuning task for a single SQL statement and schedules a DBMS_SCHEDULER job to execute the tuning task. One form of the function finds the information about the statement to be tuned in the shared SQL area, whereas the other finds the information in AWR.

See Also: SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

**Shared SQL Area Format**

```sql
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER                   := NULL,
  start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
  scope           IN VARCHAR2                 := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER                   := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2                 := NULL,
  description     IN VARCHAR2                 := NULL,
  con_name        IN VARCHAR2                 := NULL)
RETURN VARCHAR2;
```

**AWR Format**

```sql
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER                   := NULL,
  start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
  scope           IN VARCHAR2                 := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER                   := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2                 := NULL,
  description     IN VARCHAR2                 := NULL,
  con_name        IN VARCHAR2                 := NULL)
RETURN VARCHAR2;
```

Parameters

**Table 154–39 SCHEDULE_TUNING_TASK Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_snap</td>
<td>The beginning snapshot identifier. The range is exclusive, which means that SQL statements in this snapshot ID are not included.</td>
</tr>
<tr>
<td>end_snap</td>
<td>The end snapshot identifier. The range is inclusive, which means that SQL statements in this snapshot ID are included.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The SQL ID of the statement to be tuned.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>The plan hash value of the statement to be tuned. For example, the tuning job fetches captured binds for this SQL plan.</td>
</tr>
<tr>
<td>start_date</td>
<td>The date on which the schedule becomes valid. If null, then SQL Tuning Advisor immediately executes the task.</td>
</tr>
<tr>
<td>scope</td>
<td>The scope of the tuning job: limited, or comprehensive.</td>
</tr>
</tbody>
</table>
Table 154–39 (Cont.) SCHEDULE_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_limit</td>
<td>The maximum duration in seconds for the SQL tuning session.</td>
</tr>
<tr>
<td>task_name</td>
<td>Optional SQL tuning task name.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the SQL tuning session. The description can contain a maximum of 256 characters.</td>
</tr>
<tr>
<td>con_name</td>
<td>The container from which SQL Tuning Advisor accesses the SQL statement information.</td>
</tr>
</tbody>
</table>

Return Values

A SQL tuning task name that is unique for each user. Multiple users can assign the same name to their advisor tasks.

Usage Notes

- The task is scheduled once only.
- The name of the scheduler job is created as follows: `sqltune_job_taskid_orahash(systimestamp)`.  
- The caller must possess the CREATE JOB privilege for the job.
SCRIPT_TUNING_TASK Function

This function creates a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations.

See Also: SQL Tuning Advisor Subprograms on page 154-11 for other subprograms in this group

Syntax

DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
  task_name         IN VARCHAR2,
  rec_type          IN VARCHAR2  := REC_TYPE_ALL,
  object_id         IN NUMBER    := NULL,
  result_limit      IN NUMBER   := NULL,
  owner_name        IN VARCHAR2  := NULL,
  execution_name    IN VARCHAR2  := NULL)
RETURN CLOB;

Parameters

Table 154–40  SCRIPT_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task for which to apply a script</td>
</tr>
<tr>
<td>rec_type</td>
<td>Filter the script by types of recommendations to include. Any subset of the following separated by commas: or 'ALL': 'PROFILES', 'STATISTICS', 'INDEXES'. For example, a script with profiles and statistics: 'PROFILES,STATISTICS'</td>
</tr>
<tr>
<td>object_id</td>
<td>Optionally filters by a single object ID</td>
</tr>
<tr>
<td>result_limit</td>
<td>Optionally shows commands for only top n SQL (ordered by object_id and ignored if an object_id is also specified)</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task. Defaults to the current schema owner</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, the script is generated for the last task execution.</td>
</tr>
</tbody>
</table>

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- Once the script is returned, it should then be checked by the DBA and executed.
- Wrap with a call to DBMS_ADVISOR.CREATE_FILE to put it into a file.

Examples

SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of just the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;
-- get a script of just stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about just one SQL statement when we have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (  
  basic_filter        IN   VARCHAR2 := NULL,  
  object_filter       IN   VARCHAR2 := NULL,  
  ranking_measure1    IN   VARCHAR2 := NULL,  
  ranking_measure2    IN   VARCHAR2 := NULL,  
  ranking_measure3    IN   VARCHAR2 := NULL,  
  result_percentage   IN   NUMBER   := 1,  
  result_limit        IN   NUMBER   := NULL,  
  attribute_list      IN   VARCHAR2 := NULL,  
  recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)  
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 154–41 SELECT_CURSOR_CACHE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic_filter</td>
<td>The SQL predicate to filter the SQL from the shared SQL area defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>An order-by clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.</td>
</tr>
<tr>
<td>result_limit</td>
<td>The top L(imit) SQL from the (filtered) source ranked by the ranking measure.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>List of SQL statement attributes to return in the result. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default)</td>
</tr>
<tr>
<td></td>
<td>- BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</td>
</tr>
<tr>
<td></td>
<td>- ALL - return all attributes</td>
</tr>
<tr>
<td></td>
<td>- Comma separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN, SQL_PLAN_STATISTICS: similar to SQL_PLAN + row source statistics</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).</td>
</tr>
</tbody>
</table>
Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

Examples

-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = '4rm4183czbs7j'));

-- Notice that some statements can have multiple plans. The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value). This is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = 'ay1m3ssvtrh24'))
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor, along the
-- lines given below

-- Select all statements in the shared SQL area.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;
  -- Process each statement (or pass cursor to load_sqlset).
  CLOSE cur;
END;/

-- Look for statements not parsed by SYS.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <> ''SYS''')) P;
  -- Process each statement (or pass cursor to load_sqlset).
  CLOSE cur;
end;/
-- All statements from a particular module/action.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
        'module = ''MY_APPLICATION'' and action = ''MY_ACTION'') P);
  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
END;/

-- all statements that ran for at least five seconds
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;
  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
END;/

-- select all statements that pass a simple buffer_gets threshold and
-- are coming from an APPS user
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 100 and parsing_schema_name = 'APPS'')) P;
  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
END;/

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of sqlset_row
-- is NULL)
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(dbms_sqltune.select_cursor_cache('elapsed_time > 5000000', NULL, NULL, NULL, NULL, 1, NULL,
'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN')) P;

-- Process each statement (or pass cursor to load_sqlset)
CLOSE cur;
END;/

-- Select the top 100 statements in the shared SQL area ordering by elapsed_time.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
      NULL,
      'ELAPSED_TIME', NULL, NULL,
      1,
      100)) P;

  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
END;/

-- Select the set of statements which cumulatively account for 90% of the
-- buffer gets in the shared SQL area. This means that the buffer gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
      NULL,
      'BUFFER_GETS', NULL, NULL,
      .9)) P;

  -- Process each statement (or pass cursor to load_sqlset).
  CLOSE cur;
END;
/
SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.SELECT_SQL_TRACE (  
directory          IN VARCHAR2,  
file_name           IN VARCHAR2 := NULL,  
mapping_table_name  IN VARCHAR2 := NULL,  
mapping_table_owner IN VARCHAR2 := NULL,  
select_mode         IN POSITIVE := SINGLE_EXECUTION,  
options             IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,  
pattern_start       IN VARCHAR2 := NULL,  
pattern_end         IN VARCHAR2 := NULL,  
result_limit        IN POSITIVE := NULL)  
RETURN sys.sqlset PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>The directory object containing the trace file(s). This field is mandatory.</td>
</tr>
<tr>
<td>file_name</td>
<td>All or part of name of the trace file(s) to process. If NULL then the current or most recent file in the specified location or path is used. ‘%’ wildcards are supported for matching trace file names.</td>
</tr>
<tr>
<td>mapping_table_name</td>
<td>The mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, the mappings in the current database is used.</td>
</tr>
<tr>
<td>mapping_table_owner</td>
<td>The mapping table owner. If it is NULL, the current user is used.</td>
</tr>
<tr>
<td>select_mode</td>
<td>the mode for selecting SQL from the trace. By default, it is SINGLE_EXECUTION.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>▪ SINGLE_EXECUTION - return one execution of a SQL. (default).</td>
</tr>
<tr>
<td></td>
<td>▪ ALL_EXECUTIONS - return all executions.</td>
</tr>
<tr>
<td>options</td>
<td>The options. By default, it is LIMITED_COMMAND_TYPE which can be specified to include SQL statements from all Oracle command types.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>▪ LIMITED_COMMAND_TYPE - returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, UPSERT. It is the default.</td>
</tr>
<tr>
<td></td>
<td>▪ ALL_COMMAND_TYPE - returns the SQL statements with all command types.</td>
</tr>
<tr>
<td>pattern_start</td>
<td>Opening delimiting pattern of the trace file section(s) to consider. CURRENTLY INOPERABLE.</td>
</tr>
<tr>
<td>pattern_end</td>
<td>closing delimiting pattern of the trace file section(s) to process. CURRENTLY INOPERABLE.</td>
</tr>
</tbody>
</table>
Return Values

This function returns a SQLSET_ROW object.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```sql
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4';

-- run SQL statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
FROM dba_objects
WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
'LOB', 'OPERATOR', 'PACKAGE',
'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
'RESOURCE PLAN', 'TRIGGER', 'TYPE',
'TYPE BODY')
UNION ALL
SELECT user_id id, username owner, NULL name
FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(p)
    FROM TABLE(
      DBMS_SQLTUNE.SELECT_SQL_TRACE(
        directory=>'SQL_TRACE_DIR',
        file_name=>'%trc',
        mapping_table_name=>'mapping')) p;
  DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
/```
SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

See Also:

- SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group
- Oracle Database Testing Guide

Syntax

```sql
DBMS_SQLTUNE.SELECT_SQLPA_TASK(
    task_name         IN VARCHAR2,
    task_owner        IN VARCHAR2 := NULL,
    execution_name    IN VARCHAR2 := NULL,
    level_filter      IN VARCHAR2 := 'REGRESSED',
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    attribute_list    IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the SQL Performance Analyzer task</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the SQL Performance Analyzer task. If NULL, then assume the current user.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the SQL Performance Analyzer task execution (type COMPARE PERFORMANCE) from which the provided filters will be applied. If NULL, then assume the most recent COMPARE PERFORMANCE execution.</td>
</tr>
<tr>
<td>level_filter</td>
<td>Filter to specify which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL in addition to the level filters.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
</tbody>
</table>
Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

Table 154–43 (Cont.) SELECT_SQLPA_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_list</td>
<td>List of SQL statement attributes to return in the result. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default)</td>
</tr>
<tr>
<td></td>
<td>- BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</td>
</tr>
<tr>
<td></td>
<td>- ALL - return all attributes</td>
</tr>
<tr>
<td></td>
<td>- Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).</td>
</tr>
</tbody>
</table>
SELECT_SQLSET Function

This function reads SQLSET contents.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.SELECT_SQLSET (
    sqlset_name         IN   VARCHAR2,
    basic_filter        IN   VARCHAR2 := NULL,
    object_filter       IN   VARCHAR2 := NULL,
    ranking_measure1    IN   VARCHAR2 := NULL,
    ranking_measure2    IN   VARCHAR2 := NULL,
    ranking_measure3    IN   VARCHAR2 := NULL,
    result_percentage   IN   NUMBER   := 1,
    result_limit        IN   NUMBER   := NULL,
    attribute_list      IN   VARCHAR2 := NULL,
    plan_filter         IN   VARCHAR2 := NULL,
    sqlset_owner        IN   VARCHAR2 := NULL,
    recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>The SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the SQLSET_ROW</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>An order-by clause on the selected SQL</td>
</tr>
<tr>
<td>result_percentage</td>
<td>A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.</td>
</tr>
<tr>
<td>result_limit</td>
<td>The top L(imit) SQL from the (filtered) source ranked by the ranking measure</td>
</tr>
<tr>
<td>attribute_list</td>
<td>List of SQL statement attributes to return in the result. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- TYPICAL + SQL plan (without row source statistics) and without object reference list (default)</td>
</tr>
<tr>
<td></td>
<td>- BASIC - all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</td>
</tr>
<tr>
<td></td>
<td>- ALL - return all attributes</td>
</tr>
<tr>
<td></td>
<td>- Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).</td>
</tr>
<tr>
<td>plan_filter</td>
<td>The plan filter</td>
</tr>
</tbody>
</table>
Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```sql
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
END;
/
```

---

**Table 154–44  (Cont.) SELECT_SQLSET Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or NULL for the current schema owner</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).</td>
</tr>
</tbody>
</table>
SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository. The overloaded forms let you:

- Collect SQL statements from all snapshots between begin_snap and end_snap.
- Collect SQL statements from a workload repository baseline.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  begin_snap        IN NUMBER,
  end_snap          IN NUMBER,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL,
  attribute_list    IN VARCHAR2 := NULL,
  recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;

DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  baseline_name     IN VARCHAR2,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL,
  attribute_list    IN VARCHAR2 := NULL,
  recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_snap</td>
<td>Begin snapshot (non-inclusive).</td>
</tr>
<tr>
<td>end_snap</td>
<td>End snapshot (inclusive).</td>
</tr>
<tr>
<td>baseline_name</td>
<td>The name of the baseline period.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>The SQL predicate to filter the SQL from the workload repository defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>An order-by clause on the selected SQL.</td>
</tr>
</tbody>
</table>
Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user’s security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```sql
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```
SET_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

<table>
<thead>
<tr>
<th>Function</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER</td>
<td>(task_name IN VARCHAR2, parameter IN VARCHAR2,</td>
</tr>
<tr>
<td></td>
<td>value IN VARCHAR2);</td>
</tr>
<tr>
<td>DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER</td>
<td>(task_name IN VARCHAR2, parameter IN VARCHAR2,</td>
</tr>
<tr>
<td></td>
<td>value IN NUMBER);</td>
</tr>
</tbody>
</table>

Parameters

<table>
<thead>
<tr>
<th>Table 154–46</th>
<th>SET_TUNING_TASK_PARAMETER Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>task_name</td>
<td>Identifier of the task to execute</td>
</tr>
</tbody>
</table>
Usage Notes

When setting automatic tuning task parameters, use the `SET_AUTO_TUNING_TASK_PARAMETER Procedures` in the `DBMS_AUTO_SQLTUNE` package.
This function returns a SQL text's signature. The signature can be used to identify SQL text in dba_sql_profiles.

**See Also:** SQL Profile Subprograms on page 154-12 for other subprograms in this group

### Syntax

```sql
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (  
    sql_text    IN CLOB,  force_match IN BOOLEAN := FALSE)  
RETURN NUMBER;
```

### Parameters

**Table 154–47  SQLTEXT_TO_SIGNATURE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>SQL text whose signature is required. Required.</td>
</tr>
<tr>
<td>force_match</td>
<td>If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed</td>
</tr>
</tbody>
</table>

### Return Values

This function returns the signature of the specified SQL text.
UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

See Also: SQL Profile Subprograms on page 154-12 for other subprograms in this group

Syntax

DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (  
    profile_name          IN VARCHAR2 := '%',  
    profile_category      IN VARCHAR2 := 'DEFAULT',  
    replace               IN BOOLEAN,  
    staging_table_name    IN VARCHAR2,  
    staging_schema_owner  IN VARCHAR2 := NULL);

Parameters

Table 154–48 UNPACK_STGTAB_SQLPROF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>The name of the profile to unpack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>profile_category</td>
<td>The category from which to unpack profiles (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>replace</td>
<td>The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)</td>
</tr>
</tbody>
</table>

Usage Notes

Using this procedure requires the CREATE ANY SQL PROFILE privilege and the SELECT privilege on staging table.

Examples

-- Unpack all profiles stored in a staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace => FALSE, -  
    staging_table_name => 'PROFILE_STGTAB');

-- If there is a failure during the unpack operation, users can find the profile -- we failed on and perform a remap_stgtab_sqlprof operation targeting it. Then -- they can resume the unpack operation by setting replace to TRUE so that -- the profiles that were already created are replaced
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace => TRUE, -  
    staging_table_name => 'PROFILE_STGTAB');
UNPACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (sqlset_name          IN VARCHAR2 := '%',
sqlset_owner         IN VARCHAR2 := NULL,
replace              IN BOOLEAN,
staging_table_name   IN VARCHAR2,
staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The name of the tuning set to unpack (not NULL). Wildcard characters ('%') are supported to unpack multiple tuning sets in a single call. For example, just specify '%' to unpack all tuning sets from the staging table.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The name of tuning set owner, or NULL for current schema owner. Wildcards supported.</td>
</tr>
<tr>
<td>replace</td>
<td>Replaces tuning set if they already exist. If FALSE, raises errors if you try to create a tuning set that already exists</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the staging table, moved after a call to the PACK_STGTAB_SQLSET Procedure (case-sensitive)</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The name of staging table owner, or NULL for current schema owner (case-sensitive)</td>
</tr>
</tbody>
</table>

Usage Notes

- Users can drop the staging table after this procedure completes successfully.
- The unpack procedure commits after successfully loading each SQL tuning set. If it fails with one tuning set, no part of that tuning set will have been unpacked, but those which the subprogram had already apprehended continue to exist.
- When failures occur due to SQL tuning set name or owner conflicts, users should use the REMAP_STGTAB_SQLSET Procedure to patch the staging table, and then call this procedure again to unpack those tuning sets that remain.

Examples

```sql
-- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name => '%', -
sqlset_owner => '%', -
replace => FALSE, -
staging_table_name => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the same name/owner as STS on the system. In this case, users should call
```
-- remap_stgtab_sqlset to patch the staging table and with which to call unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name => '%',
    sqlset_owner  => '%',
    replace       => TRUE,
    staging_table_name => 'STGTAB_SQLSET');
UPDATE_SQLSET Procedures

This procedure updates selected fields for SQL statement in a SQL tuning set.

See Also: SQL Tuning Set Subprograms on page 154-13 for other subprograms in this group

Syntax

DBMS_SQLTUNE.UPDATE_SQLSET (  
sqlset_name      IN  VARCHAR2,  
sql_id           IN  VARCHAR2,  
attribute_name   IN  VARCHAR2,  
attribute_value  IN  VARCHAR2 := NULL);  

DBMS_SQLTUNE.UPDATE_SQLSET (  
sqlset_name      IN  VARCHAR2,  
sql_id           IN  VARCHAR2,  
attribute_name   IN  VARCHAR2,  
attribute_value  IN  NUMBER := NULL);  

Parameters

Table 154–50  UPDATE_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>The SQL tuning set name</td>
</tr>
<tr>
<td>sql_id</td>
<td>The identifier of the statement to update</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The name of the attribute to modify</td>
</tr>
<tr>
<td>attribute_value</td>
<td>The new value of the attribute</td>
</tr>
</tbody>
</table>
With the DBMS_STATS package you can view and modify optimizer statistics gathered for database objects.

Using DBMS_STATS

This section contains topics which relate to using the DBMS_STATS package.

- Overview
- Deprecated Subprograms
- Types
- Constants
- Operational Notes
- Deprecated Subprograms
Overview

The Oracle RDBMS allows you to collect statistics of many different kinds as an aid to improving performance. This package is concerned with optimizer statistics only. Given that Oracle sets automatic statistics collection of this kind on by default, this package is intended for only specialized cases.

The statistics of interest to be viewed or modified can reside in the dictionary or in a table created in the user's schema for this purpose. You can also collect and manage user-defined statistics for tables and domain indexes using this package.

For example, if the `DELETE_COLUMN_STATS` procedure is invoked on a column for which an association is defined, user-defined statistics for that column are deleted in addition to deletion of the standard statistics.

Only statistics stored in the dictionary have an impact on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel.

See Also: Oracle Database SQL Tuning Guide for more information about "Managing Optimizer Statistics".
Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

The following subprogram is deprecated with Oracle Database 12c and later:

- GENERATE_STATS
  This procedure is replaced by the GATHER_INDEX_STAT procedure.

See Also: "GATHER_INDEX_STATS Procedure" on page 155-80
Types

Types for the minimum and maximum values and histogram endpoints include:

```plaintext
TYPE numarray IS VARRAY(2050) OF NUMBER;
TYPE datearray IS VARRAY(2050) OF DATE;
TYPE chararray IS VARRAY(2050) OF VARCHAR2(4000);
TYPE rawarray  IS VARRAY(2050) OF RAW(2000);
TYPE fltarray  IS VARRAY(2050) OF BINARY_FLOAT;
TYPE dblarray  IS VARRAY(2050) OF BINARY_DOUBLE;
```

Types for listing stale tables include:

```plaintext
TYPE ObjectElem IS RECORD (
    ownname VARCHAR2(30),     -- owner
    objtype VARCHAR2(6),      -- 'TABLE' or 'INDEX'
    objname VARCHAR2(30),     -- table/index
    partname VARCHAR2(30),    -- partition
    subpartname VARCHAR2(30)); -- subpartition

type ObjectTab is TABLE of ObjectElem;
```

Type for displaying statistics difference report:

```plaintext
TYPE DiffRepElem IS RECORD {
    report   CLOB,              -- stats difference report
    maxdiffpct number);        -- max stats difference (percentage)

type DiffRepTab is table of DiffRepElem;
```
The **DBMS_STATS** package uses the constants shown in Table 155–1:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_GLOBAL_PREFS</td>
<td>NUMBER</td>
<td>Copies global preferences</td>
</tr>
<tr>
<td>AUTO_CASCADE</td>
<td>BOOLEAN</td>
<td>Lets Oracle decide whether to collect statistics for indexes or not</td>
</tr>
<tr>
<td>AUTO_DEGREE</td>
<td>NUMBER</td>
<td>Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters</td>
</tr>
<tr>
<td>AUTO_INVALIDATE</td>
<td>BOOLEAN</td>
<td>Lets Oracle decide when to invalidate dependent cursors</td>
</tr>
<tr>
<td>AUTO_SAMPLE_SIZE</td>
<td>NUMBER</td>
<td>Indicates that auto-sample size algorithms should be used</td>
</tr>
<tr>
<td>PURGE_ALL</td>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>A flag that can be passed to the <strong>PURGE_STATS Procedure</strong> and unconditionally deletes all the history statistics. The deletion uses TRUNCATE statements on the various dictionary statistics tables holding the history of statistics.</td>
</tr>
<tr>
<td>RECLAIM_SYNOPSIS</td>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>A constant used for reclaiming synopsis table space.</td>
</tr>
</tbody>
</table>
Operational Notes

The DBMS_STATS subprograms perform the following general operations:

- Gathering Optimizer Statistics
- Setting or Getting Statistics
- Deleting Statistics
- Transferring Statistics
- Locking or Unlocking Statistics
- Restoring and Purging Statistics History
- User-Defined Statistics
- Pending Statistics
- Comparing Statistics
- Extended Statistics

Most of the DBMS_STATS procedures include the three parameters statown, stattab, and statid. These parameters allow you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with sets of statistics.

The stattab parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the statown parameter is specified). You can create multiple tables with different stattab identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single stattab by using the statid parameter, which avoids cluttering the user's schema.

For the SET and GET procedures, if stattab is not provided (that is, NULL), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if stattab is not NULL, then the SET or GET operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of DBMS_STATS procedures using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Most of the procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a parameter, force which allows you to override any lock on statistics. Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the ANALYZE command:

GATHER_DATABASE_STATS Procedures
GATHER_DICTIONARY_STATS Procedure
GATHER_FIXED_OBJECTS_STATS Procedure
GATHER_INDEX_STATS Procedure
GATHER_SCHEMA_STATS Procedures
The GATHER_* procedures also collect user-defined statistics for columns and domain indexes.

The statown, stattab, and statid parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

GENERATE_STATS Procedure

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

PREPARE_COLUMN_VALUES Procedures
PREPARE_COLUMN_VALUES_NVARCHAR Procedure
PREPARE_COLUMN_VALUES_ROWID Procedure

SEED_COL_USAGE Procedure
SET_INDEX_STATS Procedures
SET_SYSTEM_STATS Procedure
SET_TABLE_STATS Procedure

GET_COLUMN_STATS Procedures
GET_INDEX_STATS Procedures
GET_SYSTEM_STATS Procedure
GET_TABLE_STATS Procedure

In the special versions of the SET_*_STATS procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or user statistics table:

- User-defined statistics
- Owner of statistics type
- Name of statistics type

The user-defined statistics and the corresponding statistics type are inserted into the USTATS$ dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the GET_*_STATS procedures return user-defined statistics and the statistics type owner and name as OUT arguments corresponding to the schema object specified. If user-defined statistics are not collected, NULL values are returned.

Deleting Statistics

The DELETE_* procedures delete both user-defined statistics and the standard statistics for the given schema object.

DELETE_COLUMN_STATS Procedure
DELETE_DATABASE_STATS Procedure
DELETE_DICTIONARY_STATS Procedure
DELETE_FIXED_OBJECTS_STATS Procedure
DELETE_INDEX_STATS Procedure
DELETE_SCHEMA_STATS Procedure
DELETE_SYSTEM_STATS Procedure
DELETE_TABLE_STATS Procedure

Note that DELETE_TABLE_STATS, DELETE_DICTIONARY_STATS, DELETE_DATABASE_STATS and DELETE_SCHEMA_STATS have a parameter stat_category which specifies which statistics to delete. The parameter accepts multiple values separated by comma. The supported values are 'OBJECT_STATS' (table statistics, column statistics and index statistics) and 'SYNOPSES' (auxiliary statistics created when statistics are incrementally maintained). The default is 'OBJECT_STATS, SYNOPSES'.

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.
CREATE_STAT_TABLE Procedure
DROP_STAT_TABLE Procedure

Use the following procedures to transfer statistics
- from the dictionary to a user statistics table (EXPORT_*)
- from a user statistics table to the dictionary (IMPORT_*)
EXPORT_COLUMN_STATS Procedure
EXPORT_DATABASE_STATS Procedure
EXPORT_DICTIONARY_STATS Procedure
EXPORT_FIXED_OBJECTS_STATS Procedure
EXPORT_INDEX_STATS Procedure
EXPORT_SCHEMA_STATS Procedure
EXPORT_SYSTEM_STATS Procedure
EXPORT_TABLE_STATS Procedure
IMPORT_COLUMN_STATS Procedure
IMPORT_DATABASE_STATS Procedure
IMPORT_DICTIONARY_STATS Procedure
IMPORT_FIXED_OBJECTS_STATS Procedure
IMPORT_INDEX_STATS Procedure
IMPORT_SCHEMA_STATS Procedure
IMPORT_SYSTEM_STATS Procedure
IMPORT_TABLE_STATS Procedure

Note: Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.
LOCK_PARTITION_STATS Procedure
LOCK_SCHEMA_STATS Procedure
LOCK_TABLE_STATS Procedure
UNLOCK_PARTITION_STATS Procedure
UNLOCK_SCHEMA_STATS Procedure
UNLOCK_TABLE_STATS Procedure
The \texttt{LOCK\_\ast} procedures either freeze the current set of the statistics or to keep the statistics untouched. When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

### Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

- \texttt{RESET\_GLOBAL\_PREF\_DEFAULTS} Procedure
- \texttt{RESTORE\_DATABASE\_STATS} Procedure
- \texttt{RESTORE\_DICTIONARY\_STATS} Procedure
- \texttt{RESTORE\_FIXED\_OBJECTS\_STATS} Procedure
- \texttt{RESTORE\_SCHEMA\_STATS} Procedure
- \texttt{RESTORE\_SYSTEM\_STATS} Procedure
- \texttt{RESTORE\_TABLE\_STATS} Procedure

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the \texttt{ALTER\_STATS\_HISTORY\_RETENTION} Procedure.

The other \texttt{DBMS\_STATS} procedures related to restoring statistics are:

- \texttt{PURGE\_STATS} Procedure: This procedure lets you manually purge old versions beyond a time stamp.
- \texttt{GET\_STATS\_HISTORY\_RETENTION} Function: This function gets the current statistics history retention value.
- \texttt{GET\_STATS\_HISTORY\_AVAILABILITY} Function: This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

\texttt{RESTORE\_\ast} operations are not supported for user defined statistics.

### User-Defined Statistics

The \texttt{DBMS\_STATS} package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the \texttt{associate} statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the \texttt{GET\_INDEX\_STATS} Procedures invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

\texttt{SET\_\ast} and \texttt{GET\_\ast} operations for user-defined statistics are also supported using a special version of the \texttt{SET} and \texttt{GET} interfaces for columns and indexes.

\texttt{EXPORT\_\ast}, \texttt{IMPORT\_\ast} and \texttt{RESTORE\_\ast} operations are not supported for user defined statistics.

### Pending Statistics

The package gathers statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the \texttt{PUBLISH} option to \texttt{FALSE} using the \texttt{SET\_\ast\_PREFS} procedures. The default value for
PUBLISH is TRUE. The statistics stored in private area are not used by Cost Based Optimizer unless parameter optimizer_use_pending_statistics is set to TRUE. The default value of this parameter is FALSE and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the EXPORT_PENDING_STATS Procedure) to a test system, then run the query workload and check the performance or plans.
- Set optimizer_use_pending_statistics to TRUE in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

Once the performance or query plans have been verified, the pending statistics can be published (run the PUBLISH_PENDING_STATS Procedure) if the performance is acceptable or delete (run the DELETE_PENDING_STATS Procedure) if not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- DELETE_PENDING_STATS Procedure
- EXPORT_PENDING_STATS Procedure
- PUBLISH_PENDING_STATS Procedure

### Comparing Statistics

The DIFF_TABLE_STATS_* statistics can be used to compare statistics for a table from two different sources. The statistics can be from:

- two different user statistics tables
- a single user statistics table containing two sets of statistics that can be identified using statids
- a user statistics table and dictionary history
- pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold. The threshold can be specified as an argument to the function, with a default of 10%. The statistics corresponding to the first source (stattab1 or timel) will be used as basis for computing the differential percentage.

### Extended Statistics

This package allows you to collect statistics for column groups and expressions. The statistics collected for column groups and expressions are called "extended statistics".

Statistics on column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates c1=1 and c2=1 and if there are statistics on column group (c1, c2), the optimizer will use this statistics for estimating the combined selectivity of the predicates. The expression statistics are used by optimizer for estimating selectivity of predicates on those expressions. The extended statistics are similar to column statistics and the procedures that take columns names will accept extended statistics names in place of column names.
Related subprograms:
- CREATE_EXTENDED_STATS Function
- DROP_EXTENDED_STATS Procedure
- SHOW_EXTENDED_STATS_NAME Function
Deprecated Subprograms

The following subprograms are obsolete with Oracle Database 11g Release 2 (11.2):

- **GET PARAM Function**
  Instead, use **GET_PREFS Function**

- **SET PARAM Procedure**
  Instead, use **SET_GLOBAL_PREFS Procedure**

- **RESET PARAM_DEFAULTS Procedure**
  Instead use **RESET_GLOBAL_PREF_DEFAULTS Procedure**
The `DBMS_STATS` package defines a `RECORD` type.

**RECORD Types**

- `STAT_REC` Record Type
STAT_REC Record Type

This record type is provided for users in case they want to set column statistics manually. Its fields allow specifying column min/max values, as well as a histogram for a column.

Syntax

```
TYPE STATREC IS RECORD {
  epc    NUMBER,
  minval RAW(2000),
  maxval RAW(2000),
  bkvals NUMARRAY,
  novals NUMARRAY,
  chvals CHARARRAY,
  eavals RAWARRAY,
  rpcnts NUMARRAY,
  eavs   NUMBER};
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>epc</td>
<td>Number of buckets in histogram</td>
</tr>
<tr>
<td>minval</td>
<td>Minimum value</td>
</tr>
<tr>
<td>maxval</td>
<td>Maximum value</td>
</tr>
<tr>
<td>bkvals</td>
<td>Array of bucket numbers</td>
</tr>
<tr>
<td>novals</td>
<td>Array of normalized end point values</td>
</tr>
<tr>
<td>chvals</td>
<td>Array of dumped end point values</td>
</tr>
<tr>
<td>eavals</td>
<td>Array of end point actual values</td>
</tr>
<tr>
<td>rpcnts</td>
<td>Array of end point value frequencies</td>
</tr>
<tr>
<td>eavs</td>
<td>A number indicating whether actual end point values are needed in the histogram. If using the PREPARE_COLUMN_VALUES Procedures, this field will be automatically filled.</td>
</tr>
</tbody>
</table>
### Summary of DBMS_STATS Subprograms

</tr>
<tr>
<td>GENERATE_STATS Procedure on page 155-93</td>
<td>Generates object statistics from previously collected statistics of related objects</td>
</tr>
<tr>
<td>GET_COLUMN_STATS Procedures on page 155-94</td>
<td>Gets all column-related information</td>
</tr>
<tr>
<td>GET_INDEX_STATS Procedures on page 155-96</td>
<td>Gets all index-related information</td>
</tr>
<tr>
<td>GET_PARAM Function on page 155-99</td>
<td>Gets the default value of parameters of DBMS_STATS procedures [see Deprecated Subprograms on page 155-13]</td>
</tr>
<tr>
<td>GET_PREFS Function on page 155-100</td>
<td>Gets the default value of the specified preference</td>
</tr>
<tr>
<td>GET_STATS_HISTORY_AVAILABILITY Function on page 155-105</td>
<td>Gets the oldest timestamp where statistics history is available</td>
</tr>
<tr>
<td>GET_STATS_HISTORY_RETENTION Function on page 155-106</td>
<td>Returns the current statistics history retention value</td>
</tr>
<tr>
<td>GET_SYSTEM_STATS Procedure on page 155-107</td>
<td>Gets system statistics from \texttt{stattab}, or from the dictionary if \texttt{stattab} is NULL</td>
</tr>
<tr>
<td>GET_TABLE_STATS Procedure on page 155-109</td>
<td>Gets all table-related information</td>
</tr>
<tr>
<td>IMPORT_COLUMN_STATS Procedure on page 155-111</td>
<td>Retrieves statistics for a particular column from the user statistics table identified by \texttt{stattab} and stores them in the dictionary</td>
</tr>
<tr>
<td>IMPORT_DATABASE_PREFS Procedure on page 155-113</td>
<td>Imports the statistics preferences of all the tables</td>
</tr>
<tr>
<td>IMPORT_DATABASE_STATS Procedure on page 155-114</td>
<td>Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary</td>
</tr>
<tr>
<td>IMPORT_DICTIONARY_STATS Procedure on page 155-116</td>
<td>Retrieves statistics for all dictionary schemas (‘SYS’, ‘SYSTEM’ and RDBMS component schemas) from the user statistics table and stores them in the dictionary</td>
</tr>
<tr>
<td>IMPORTFIXED_OBJECTSSTATS Procedure on page 155-118</td>
<td>Retrieves statistics for fixed tables from the user statistics table identified by \texttt{stattab} and stores them in the dictionary</td>
</tr>
<tr>
<td>IMPORT_INDEX_STATS Procedure on page 155-119</td>
<td>Retrieves statistics for a particular index from the user statistics table identified by \texttt{stattab} and stores them in the dictionary</td>
</tr>
</tbody>
</table>
### DBMS_STATS Package Subprograms

<table>
<thead>

<td>Imports the statistics preferences of all the tables owned by the specified owner name</td>
</tr>
<tr>
<td>IMPORT_SCHEMA_STATS Procedure on page 155-122</td>
<td>Retrieves statistics for all objects in the schema identified by ownername from the user statistics table and stores them in the dictionary</td>
</tr>
<tr>
<td>IMPORT_SYSTEM_STATS Procedure on page 155-124</td>
<td>Retrieves system statistics from the user statistics table and stores them in the dictionary</td>
</tr>
<tr>
<td>IMPORT_TABLE_PREFS Procedure on page 155-125</td>
<td>Sets the statistics preferences of the specified table in the specified schema</td>
</tr>
<tr>
<td>IMPORT_TABLE_STATS Procedure on page 155-126</td>
<td>Retrieves statistics for a particular table from the user statistics table identified by stattab and stores them in the dictionary</td>
</tr>
<tr>
<td>LOCK_PARTITION_STATS Procedure on page 155-128</td>
<td>Locks statistics for a partition</td>
</tr>
<tr>
<td>LOCK_SCHEMA_STATS Procedure on page 155-129</td>
<td>Locks the statistics of all tables of a schema</td>
</tr>
<tr>
<td>LOCK_TABLE_STATS Procedure on page 155-130</td>
<td>Locks the statistics on the table</td>
</tr>
<tr>
<td>MERGE_COL_USAGE Procedure on page 155-131</td>
<td>Merges column usage information from a source database, by means of a dblink, into the local database</td>
</tr>
<tr>
<td>PREPARE_COLUMN_VALUES Procedures on page 155-132</td>
<td>Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle’s internal representation for future storage using the SEED_COL_USAGE Procedure</td>
</tr>
<tr>
<td>PREPARE_COLUMN_VALUES_NVARCHAR Procedure on page 155-135</td>
<td>Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle’s internal representation for future storage using the SEED_COL_USAGE Procedure</td>
</tr>
<tr>
<td>PREPARE_COLUMN_VALUES_ROWID Procedure on page 155-137</td>
<td>Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle’s internal representation for future storage using the SEED_COL_USAGE Procedure</td>
</tr>
<tr>
<td>PUBLISH_PENDING_STATS Procedure on page 155-139</td>
<td>Publishes the statistics gathered and stored as pending</td>
</tr>
<tr>
<td>PURGE_STATS Procedure on page 155-140</td>
<td>Purges old versions of statistics saved in the dictionary</td>
</tr>
<tr>
<td>REMAP_STAT_TABLE Procedure on page 155-141</td>
<td>Remaps the names of objects in the user statistics table</td>
</tr>
<tr>
<td>REPORT_COL_USAGE Function on page 155-142</td>
<td>Reports the recorded column (group) usage information</td>
</tr>
<tr>
<td>REPORT_GATHER_AUTO_STATS Function on page 155-143</td>
<td>Runs the auto statistics gathering job in reporting mode</td>
</tr>
<tr>
<td>REPORT_GATHER_DATABASE_STATS Functions on page 155-146</td>
<td>Runs the GATHER_DATABASE_STATS Procedures in reporting mode.</td>
</tr>
<tr>
<td>REPORT_GATHER_DICTIONARY_STATS Functions on page 155-152</td>
<td>Runs the GATHER_DICTIONARY_STATS Procedure in reporting mode</td>
</tr>
<tr>
<td>REPORT_GATHER_FIXED_OBJ_STATS Function on page 155-158</td>
<td>Runs the GATHER_FIXEDOBJECTS_STATS Procedure in reporting mode</td>
</tr>
</tbody>
</table>
### Subprogram Description

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REPORT_GATHER_SCHEMA_STATS Functions</td>
<td>Runs the GATHER_SCHEMA_STATS Procedures in reporting mode</td>
</tr>
<tr>
<td>REPORT_GATHER_TABLE_STATS Function</td>
<td>Runs the GATHER_TABLE_STATS Procedure in reporting mode</td>
</tr>
<tr>
<td>REPORT_SINGLE_STATS_OPERATION Function</td>
<td>Generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment</td>
</tr>
<tr>
<td>REPORT_STATS_OPERATIONS Function</td>
<td>Generates a report of all statistics operations that take place between two timestamps which may or may not have been provided</td>
</tr>
<tr>
<td>RESET_GLOBAL_PREF_DEFAULTS Procedure</td>
<td>Resets the default values of all parameters to Oracle recommended values</td>
</tr>
<tr>
<td>RESET_PARAM_DEFAULTS Procedure</td>
<td>Resets global preferences to default values [see Deprecated Subprograms on page 155-13]</td>
</tr>
<tr>
<td>RESTORE_DICTIONARY_STATS Procedure</td>
<td>Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp</td>
</tr>
<tr>
<td>RESTORE_FIXED_OBJECTS_STATS Procedure</td>
<td>Restores statistics of all fixed tables as of a specified timestamp</td>
</tr>
<tr>
<td>RESTORE_SCHEMA_STATS Procedure</td>
<td>Restores statistics of all tables of a schema as of a specified timestamp</td>
</tr>
<tr>
<td>RESTORE_SYSTEM_STATS Procedure</td>
<td>Restores statistics of all tables of a schema as of a specified timestamp</td>
</tr>
<tr>
<td>RESTORE_TABLE_STATS Procedure</td>
<td>Restores statistics of a table as of a specified timestamp (as_of_timestamp), as well as statistics of associated indexes and columns</td>
</tr>
<tr>
<td>SEED_COL_USAGE Procedure</td>
<td>Iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements</td>
</tr>
<tr>
<td>SET_COLUMN_STATS Procedures</td>
<td>Sets column-related information</td>
</tr>
<tr>
<td>SET_DATABASE_PREFS Procedure</td>
<td>Sets the statistics preferences of all the tables</td>
</tr>
<tr>
<td>SET_GLOBAL_PREFS Procedure</td>
<td>Sets the global statistics preferences</td>
</tr>
<tr>
<td>SET_INDEX_STATS Procedures</td>
<td>Sets index-related information</td>
</tr>
<tr>
<td>SET_PARAM Procedure</td>
<td>Sets default values for parameters of DBMS_STATS procedures [see Deprecated Subprograms on page 155-13]</td>
</tr>
<tr>
<td>SET_PROCESSING_RATE Procedure</td>
<td>Sets the value of rate of processing for a given operation</td>
</tr>
<tr>
<td>SET_SCHEMA_PREFS Procedure</td>
<td>Sets the statistics preferences of all the tables owned by the specified owner name</td>
</tr>
<tr>
<td>SET_SYSTEM_STATS Procedure</td>
<td>Sets system statistics</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SET_TABLE_PREFS Procedure on page 155-209</td>
<td>Sets the statistics preferences of the specified table in the specified schema</td>
</tr>
<tr>
<td>SET_TABLE_STATS Procedure on page 155-213</td>
<td>Sets table-related information</td>
</tr>
<tr>
<td>SHOW_EXTENDED_STATS_NAME Function on page 155-215</td>
<td>Returns the name of the virtual column that is created for the user-specified extension</td>
</tr>
<tr>
<td>TRANSFER_STATS Procedure on page 155-216</td>
<td>Transfers statistics for specified table(s) from a remote database specified by dblink to the local database</td>
</tr>
<tr>
<td>UNLOCK_PARTITION_STATS Procedure on page 155-217</td>
<td>Unlocks the statistics for a partition</td>
</tr>
<tr>
<td>UNLOCK_SCHEMA_STATS Procedure on page 155-218</td>
<td>Unlocks the statistics on all the tables in schema</td>
</tr>
<tr>
<td>UNLOCK_TABLE_STATS Procedure on page 155-219</td>
<td>Unlocks the statistics on the table</td>
</tr>
<tr>
<td>UPGRADE_STAT_TABLE Procedure on page 155-220</td>
<td>Upgrades user statistics on an older table</td>
</tr>
</tbody>
</table>
ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value. Statistics history retention is used by both the automatic purge and PURGE_STATS Procedure.

Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
    retention       IN     NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1,365000]. Also you can use the following values for special purposes:</td>
</tr>
<tr>
<td></td>
<td>-1: Statistics history is never purged by automatic purge</td>
</tr>
<tr>
<td></td>
<td>0: Old statistics are never saved. The automatic purge will delete all statistics history</td>
</tr>
<tr>
<td></td>
<td>NULL: Change statistics history retention to default value</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges
CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value. The `minval`, `maxval`, and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

**Syntax**

```sql
DBMS_STATS.CONVERT_RAW_VALUE (    rawval     RAW,    resval OUT BINARY_FLOAT);
```

```sql
DBMS_STATS.CONVERT_RAW_VALUE (    rawval     RAW,    resval OUT BINARY_DOUBLE);
```

```sql
DBMS_STATS.CONVERT_RAW_VALUE (    rawval     RAW,    resval OUT DATE);
```

```sql
DBMS_STATS.CONVERT_RAW_VALUE (    rawval     RAW,    resval OUT NUMBER);
```

```sql
DBMS_STATS.CONVERT_RAW_VALUE (    rawval     RAW,    resval OUT VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rawval</td>
<td>Raw representation of a column minimum, maximum, histogram end point actual value</td>
</tr>
<tr>
<td>resval</td>
<td>Converted, type-specific value</td>
</tr>
</tbody>
</table>

**Usage Notes**

No special privilege or role is needed to invoke this procedure.
CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a minimum value, maximum value, or histogram end point actual value. The minval, maxval and eavals fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

```sql
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
  rawval     RAW,
  resval OUT NVARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rawval</td>
<td>The raw representation of a column minimum or maximum datatype-specific output parameters</td>
</tr>
<tr>
<td>resval</td>
<td>The converted, type-specific value</td>
</tr>
</tbody>
</table>

Usage Notes

No special privilege or role is needed to invoke this procedure.
CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a column minimum value, maximum value, or histogram end point actual value. The minval, maxval and eavals fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
    rawval    RAW,
    resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rawval</td>
<td>The raw representation of a column minimum or maximum datatype-specific output parameters</td>
</tr>
<tr>
<td>resval</td>
<td>The converted, type-specific value</td>
</tr>
</tbody>
</table>

Usage Notes

No special privilege or role is needed to invoke this procedure.
COPY_TABLE_STATS Procedure

This procedure copies the statistics of the source [sub] partition to the destination [sub] partition. It also copies statistics of all dependent object such as columns and local indexes. If the statistics for source are not available then nothing is copied. It can optionally scale the statistics (such as the number of blks, or number of rows) based on the given scale_factor.

Syntax

```sql
DBMS_STATS.COPY_TABLE_STATS (  
  ownname          VARCHAR2,  
  tabname          VARCHAR2,  
  srcpartname      VARCHAR2,  
  dstpartname      VARCHAR2,  
  scale_factor     VARCHAR2 DEFAULT 1,  
  flags            NUMBER DEFAULT NULL,  
  force            BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of the table of source and destination [sub] partitions</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name of source and destination [sub] partitions</td>
</tr>
<tr>
<td>srcpartname</td>
<td>Source [sub] partition</td>
</tr>
<tr>
<td>dstpartname</td>
<td>Destination [sub] partition</td>
</tr>
<tr>
<td>scale_factor</td>
<td>Scale factor to scale nblks, nrows etc. in dstpartname</td>
</tr>
<tr>
<td>flags</td>
<td>For internal Oracle use (should be left as NULL)</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE copy statistics even if the destination [sub] partition is locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Invalid [sub]partition name
ORA-20001: Bad input value

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

This procedure updates the minimum and maximum values of destination partition for the first partitioning column as follows:

- If the partitioning type is HASH the minimum and maximum values of the destination partition are same as that of the source partition.
- If the partitioning type is LIST then
  - If the destination partition is a NOT DEFAULT partition then
* The minimum value of the destination partition is set to the minimum value of the value list that describes the destination partition.

* The maximum value of the destination partition is set to the maximum value of the value list that describes the destination partition.

- Alternatively, if the destination partition is a `DEFAULT` partition, then

* The minimum value of the destination partition is set to the minimum value of the source partition.

* The maximum value of the destination partition is set to the maximum value of the source partition.

- If the partitioning type is `RANGE` then

  - The minimum value of the destination partition is set to the high bound of previous partition unless the destination partition is the first partition. For the first partition, the minimum value is set to the high bound of the destination partition.

  - The maximum value of the destination partition is set to the high bound of the destination partition unless the high bound of the destination partition is `MAXVALUE`, in which case the maximum value of the destination partition is set to the high bound of the previous partition.

  - If the source partition column’s minimum value is equal to its maximum value, and both are equal to the source partition’s lower bound, and it has a single distinct value, then the destination partition column’s minimum and maximum values are both set to the destination partition’s lower bound. This is done for all partitioning columns.

  If the above condition does not apply, second and subsequent partitioning columns are updated as follows. The destination partition column’s maximum value is set to the greater of the destination partition upper bound and the source partition column’s maximum value, with one exception. If the destination partition is \( D \) and its preceding partition is \( D-1 \) and the key column to be adjusted is \( C_n \), the maximum value for \( C_n \) is set to the upper bound of \( D \) (ignoring the maximum value of the source partition column) provided that the upper bounds of the previous key column \( C_{n-1} \) are the same in partitions \( D \) and \( D-1 \).

- If the minimum and maximum values are different for a column after modifications, and if the number of distinct values is less than 1, the number of distinct values is updated as 2.

- This procedure does not copy statistics of the underlying subpartitions if the source/destination is a partition of a composite partitioned table.
CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user specified column group or an expression in a table. Statistics for this extension will be gathered when user or auto statistics gathering job gathers statistics for the table. We call statistics for such an extension, "extended statistics". This function returns the name of this newly created entry for the extension.

This second form creates statistics extension based on the column group usage recorded by the SEED_COL_USAGE Procedure. This function returns a report of extensions created.

Syntax

```sql
DBMS_STATS.CREATE_EXTENDED_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    extension  VARCHAR2)
RETURN VARCHAR2;

DBMS_STATS.CREATE_EXTENDED_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    extension  VARCHAR2)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>extension</td>
<td>Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be &quot;(c1, c2)&quot; and an example expression can be &quot;(c1 + c2)&quot;.</td>
</tr>
</tbody>
</table>

Return Values

This function returns the name of this newly created entry for the extension.

Exceptions

- ORA-20000: Insufficient privileges / creating extension is not supported
- ORA-20001: Error when processing extension
- ORA-20007: Extension already exists
- ORA-20008: Reached the upper limit on number of extensions

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
There are nine restrictions on the extension:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by SYS.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables or external tables.
- The total number of extensions in a table cannot be greater than a maximum of \((20, 10\% \text{ of number of non-virtual columns in the table})\).
- The number of columns in a column group must be in the range \([2, 32]\).
- A column can not appear more than once in a column group.
- A column group can not contain expressions.
- An expression must contain at least one column.
- An expression can not contain a subquery.
- The `COMPATIBLE` parameter needs to be 11.0.0.0.0 or greater
CREATE_STAT_TABLE Procedure

This procedure creates a table with name stattab in ownname’s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (    ownname             VARCHAR2,
                                 stattab             VARCHAR2,
                                 tblspace            VARCHAR2 DEFAULT NULL,
                                 global_temporary    BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>Name of the table to create. This value should be passed as the stattab parameter to other procedures when the user does not want to modify the dictionary statistics directly.</td>
</tr>
<tr>
<td>tblspace</td>
<td>Tablespace in which to create the statistics tables. If none is specified, then they are created in the user’s default tablespace.</td>
</tr>
<tr>
<td>global_temporary</td>
<td>Whether or not the table should be created as a global temporary table</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Table already exists or insufficient privileges
- ORA-20001: Tablespace does not exist

Usage Notes

To invoke this procedure you need whichever privileges are required for creating a table in the specified schema.
DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```sql
DBMS_STATS.DELETE_COLUMN_STATS (
    ownname        VARCHAR2,
    tabname        VARCHAR2,
    colname        VARCHAR2,
    partname       VARCHAR2 DEFAULT NULL,
    stattab        VARCHAR2 DEFAULT NULL,
    statid         VARCHAR2 DEFAULT NULL,
    cascade_parts  BOOLEAN  DEFAULT TRUE,
    statown        VARCHAR2 DEFAULT NULL,
    no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),
    force          BOOLEAN  DEFAULT FALSE,
    col_stat_type  VARCHAR2 DEFAULT 'ALL');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>cascade_parts</td>
<td>If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes column statistics even if locked</td>
</tr>
</tbody>
</table>
DELETE_COLUMN_STATS Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col_stat_type</td>
<td>Type of column statistics to be deleted. This argument takes the following values:</td>
</tr>
<tr>
<td></td>
<td>- HISTOGRAM - delete column histogram only</td>
</tr>
<tr>
<td></td>
<td>- ALL - delete base column statistics and histogram</td>
</tr>
</tbody>
</table>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
DELETE_DATABASE_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```sql
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

**Table 155–12 DELETE_DATABASE_PREFS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</td>
</tr>
<tr>
<td></td>
<td>CASCADE</td>
</tr>
<tr>
<td></td>
<td>DEGREE</td>
</tr>
<tr>
<td></td>
<td>ESTIMATE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>METHOD_OPT</td>
</tr>
<tr>
<td></td>
<td>NO_INVALIDATE</td>
</tr>
<tr>
<td></td>
<td>GRANULARITY</td>
</tr>
<tr>
<td></td>
<td>PUBLISH</td>
</tr>
<tr>
<td></td>
<td>INCREMENTAL</td>
</tr>
<tr>
<td></td>
<td>INCREMENTAL_STALENESS</td>
</tr>
<tr>
<td></td>
<td>INCREMENTAL_LEVEL</td>
</tr>
<tr>
<td></td>
<td>STALE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>GLOBAL_TEMP_TABLE_STATS</td>
</tr>
<tr>
<td></td>
<td>TABLE_CACHED_BLOCKS</td>
</tr>
<tr>
<td></td>
<td>OPTIONS</td>
</tr>
<tr>
<td>add_sys</td>
<td>The value determines whether or not index statistics are collected as part of gathering table statistics</td>
</tr>
<tr>
<td></td>
<td>The value determines degree of parallelism used for gathering statistics</td>
</tr>
<tr>
<td></td>
<td>The value determines the percentage of rows to estimate.</td>
</tr>
<tr>
<td></td>
<td>The value controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only ‘FOR ALL’ syntax is allowed.</td>
</tr>
<tr>
<td></td>
<td>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.</td>
</tr>
<tr>
<td></td>
<td>The value determines granularity of statistics to collect (only pertinent if the table is partitioned)</td>
</tr>
</tbody>
</table>
Table 155–12  (Cont.) DELETE_DATABASE_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUBLISH</td>
<td>This value determines whether or not newly gathered statistics will be published once the gather job has completed.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.</td>
</tr>
<tr>
<td>INCREMENTAL_LEVEL</td>
<td>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.</td>
</tr>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>This value controls how we decide a partition or subpartition as stale.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.</td>
</tr>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS</td>
<td>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.</td>
</tr>
<tr>
<td>TABLE_CACHED_BLOCKS</td>
<td>The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.</td>
</tr>
<tr>
<td>OPTIONS</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS Procedure.</td>
</tr>
<tr>
<td>add_sys</td>
<td>Determines whether SYS tables will be included.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges
ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT', TRUE);
```

See Also: Oracle Database SQL Tuning Guide for more complex examples of how to use this subprogram.
DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```sql
DBMS_STATS.DELETE_DATABASE_STATS (  
stattab VARCHAR2 DEFAULT NULL,  
statid VARCHAR2 DEFAULT NULL,  
statown VARCHAR2 DEFAULT NULL,  
no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE')),  
force BOOLEAN  DEFAULT FALSE,  
stat_category VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked</td>
</tr>
<tr>
<td>stat_category</td>
<td>Statistics to delete. It accepts multiple values separated by comma:</td>
</tr>
</tbody>
</table>

- OBJECT_STATS - table statistics, column statistics and index statistics
- SYNOPSES - information to support incremental statistics

The default is ‘OBJECT_STATS, SYNOPSES’

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

DBMS_STATS.DELETE_DICTIONARY_STATS {
    stattab VARCHAR2 DEFAULT NULL,
    statid VARCHAR2 DEFAULT NULL,
    statown VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type {
        get_param('NO_INVALIDATE')},
    stattype VARCHAR2 DEFAULT 'ALL',
    force BOOLEAN DEFAULT FALSE,
    stat_category VARCHAR2 DEFAULT DEFAULT_DEL_STAT CATEGORY);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure</td>
</tr>
<tr>
<td>stattype</td>
<td>Statistics type</td>
</tr>
<tr>
<td>force</td>
<td>When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked</td>
</tr>
<tr>
<td>stat_category</td>
<td>Statistics to delete. It accepts multiple values separated by comma:</td>
</tr>
<tr>
<td></td>
<td>* OBJECT_STATS - table statistics, column statistics and index statistics</td>
</tr>
<tr>
<td></td>
<td>* SYNOPTSES - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>The default is 'OBJECT_STATS, SYNOPTSES'</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20002: Bad user statistics table, may need to upgrade it
DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```sql
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (    stattab          VARCHAR2 DEFAULT NULL,    statid           VARCHAR2 DEFAULT NULL,    statown          VARCHAR2 DEFAULT NULL,    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (    get_param('NO_INVALIDATE')),    force            BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>The user statistics table identifier describing from where to delete the current statistics. If stattab is NULL, the statistics will be deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab. This only applies if stattab is not NULL.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure</td>
</tr>
<tr>
<td>force</td>
<td>Ignores the statistics lock on objects and deletes the statistics if set to TRUE</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20002: Bad user statistics table, may need to upgrade it
DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (  
    ownname          VARCHAR2,  
    indname          VARCHAR2,  
    partname         VARCHAR2 DEFAULT NULL,  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    cascade_parts    BOOLEAN  DEFAULT TRUE,  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (  
       get_param('NO_INVALIDATE')),  
    stattype         VARCHAR2 DEFAULT 'ALL',  
    force            BOOLEAN  DEFAULT FALSE);  
    stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>cascade_parts</td>
<td>If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>stattype</td>
<td>Statistics type</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes index statistics even if locked</td>
</tr>
</tbody>
</table>
DELETE_INDEX_STATS Procedure

**Table 155–16  (Cont.) DELETE_INDEX_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stat_category</td>
<td>Statistics to delete. It accepts multiple values separated by comma:</td>
</tr>
<tr>
<td></td>
<td>- OBJECT_STATS - table statistics, column statistics and index statistics</td>
</tr>
<tr>
<td></td>
<td>- SYNOPSES - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>The default is 'OBJECT_STATS, SYNOPSES'</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

**Usage Notes**

To invoke this procedure you must be owner of the table, or you need the **ANALYZE ANY** privilege. For objects owned by **SYS**, you need to be either the owner of the table, or you need the **ANALYZE ANY DICTIONARY** privilege or the **SYSDBA** privilege.
DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```sql
DBMS_STATS.DELETE_PENDING_STATS (    ownname    IN  VARCHAR2  DEFAULT USER,    tabname    IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter `tabname` is NULL delete applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```sql
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```
DELETE_PROCESSING_RATE Procedure

This procedure deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources.

Syntax

```sql
DBMS_STATS.DELETE_PROCESSING_RATE (
    stat_source     IN    VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stat_source</td>
<td>Source of processing rates:</td>
</tr>
<tr>
<td></td>
<td>- 'MANUAL': values set by the user manually using the SET_PROCESSING_RATE Procedure</td>
</tr>
<tr>
<td></td>
<td>- 'CALIBRATION': values collected by the calibration GATHER_PROCESSING_RATE Procedure run explicitly by the user</td>
</tr>
<tr>
<td></td>
<td>- 'FEEDBACK': values obtained by time feedback</td>
</tr>
</tbody>
</table>

Usage Notes

You require the OPTIMIZER_PROCESSING_RATE role to run this procedure since AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or illegal input value
DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (ownname IN VARCHAR2,
                      pname     IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
</tbody>
</table>
| pname     | Preference name. The existing value for following preferences can be deleted and default preference values will be used:  
- CASCADE  
- DEGREE  
- ESTIMATE_PERCENT  
- METHOD_OPT  
- NO_INVALIDATE  
- GRANULARITY  
- PUBLISH  
- INCREMENTAL  
- INCREMENTAL_STALENESS  
- INCREMENTAL_LEVEL  
- STALE_PERCENT  
- GLOBAL_TEMP_TABLE_STATS  
- TABLE_CACHED_BLOCKS  
- OPTIONS  
- CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics  
- DEGREE - The value determines degree of parallelism used for gathering statistics  
- ESTIMATE_PERCENT - The value determines the percentage of rows to estimate.  
- METHOD_OPT - The value controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.  
- NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.  
- GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned)
DELETE_SCHEMA_PREFS Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUBLISH</td>
<td>This value determines whether or not newly gathered statistics will be published once the gather job has completed.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.</td>
</tr>
<tr>
<td>INCREMENTAL_LEVEL</td>
<td>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.</td>
</tr>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>This value controls how we decide a partition or subpartition as stale.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.</td>
</tr>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS</td>
<td>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.</td>
</tr>
<tr>
<td>TABLE_CACHED_BLOCKS</td>
<td>The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.</td>
</tr>
<tr>
<td>OPTIONS</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS Procedure.</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

**Usage Notes**

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

**Examples**

```sql
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```
DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```sql
DBMS_STATS.DELETE_SCHEMA_STATS (    ownname          VARCHAR2,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (    get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes statistics of tables in a schema even if locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to noworkload statistics (collected using 'NOWORKLOAD' option) if stattab is not specified. If stattab is specified, the subprogram deletes all system statistics with the associated statid from the stattab.

Syntax

```sql
DBMS_STATS.DELETE_SYSTEM_STATS (
    stattab       VARCHAR2 DEFAULT NULL,
    statid        VARCHAR2 DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table where the statistics will be saved</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics saved in the stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.
DELETE_TABLE_PREFS Procedure

This procedure is used to delete the statistics preferences of the specified table in the specified schema.

Syntax

```sql
DBMS_STATS.DELETE_TABLE_PREFS (  
    ownname IN VARCHAR2,  
    tabname IN VARCHAR2,  
    pname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>pname</td>
<td>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</td>
</tr>
<tr>
<td></td>
<td>AUTOSTATS_TARGET</td>
</tr>
<tr>
<td></td>
<td>CASCADE</td>
</tr>
<tr>
<td></td>
<td>CONCURRENT</td>
</tr>
<tr>
<td></td>
<td>DEGREE</td>
</tr>
<tr>
<td></td>
<td>ESTIMATE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>METHOD_OPT</td>
</tr>
<tr>
<td></td>
<td>NO_IN_INVALIDATE</td>
</tr>
<tr>
<td></td>
<td>GRANULARITY</td>
</tr>
<tr>
<td></td>
<td>PUBLISH</td>
</tr>
<tr>
<td></td>
<td>INCREMENTAL</td>
</tr>
<tr>
<td></td>
<td>INCREMENTAL_STALENESS</td>
</tr>
<tr>
<td></td>
<td>INCREMENTAL_LEVEL</td>
</tr>
<tr>
<td></td>
<td>STALE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>GLOBAL_TEMP_TABLE_STATS</td>
</tr>
<tr>
<td></td>
<td>TABLE_CACHED_BLOCKS</td>
</tr>
<tr>
<td></td>
<td>OPTIONS</td>
</tr>
</tbody>
</table>

| AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection. |
| CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics |
| CONCURRENT - This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time. |
| DEGREE - The value determines degree of parallelism used for gathering statistics |
| ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. |
**Table 155–22 (Cont.) DELETE_TABLE_PREFS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>METHOD_OPT</td>
<td>The value controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.</td>
</tr>
<tr>
<td>NO_INVALIDATE</td>
<td>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.</td>
</tr>
<tr>
<td>GRANULARITY</td>
<td>The value determines granularity of statistics to collect (only pertinent if the table is partitioned)</td>
</tr>
<tr>
<td>PUBLISH</td>
<td>This value determines whether or not newly gathered statistics will be published once the gather job has completed.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.</td>
</tr>
<tr>
<td>INCREMENTAL_LEVEL</td>
<td>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.</td>
</tr>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>This value controls how we decide a partition or subpartition as stale.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.</td>
</tr>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS</td>
<td>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.</td>
</tr>
<tr>
<td>TABLE_CACHED_BLOCKS</td>
<td>The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.</td>
</tr>
<tr>
<td>OPTIONS</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS Procedure.</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

**Usage Notes**

- To run this procedure, you need to connect as owner of the table, be granted \_\_ANALYZE privilege on the table, or \_\_ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

**Examples**

```sql
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```
DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```sql
DBMS_STATS.DELETE_TABLE_STATS (
  ownname VARCHAR2,
  tabname VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab VARCHAR2 DEFAULT NULL,
  statid VARCHAR2 DEFAULT NULL,
  cascade_parts BOOLEAN  DEFAULT TRUE,
  cascade_columns BOOLEAN  DEFAULT TRUE,
  cascade_indexes BOOLEAN  DEFAULT TRUE,
  statown VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type (
    get_param('NO_INVALIDATE')),
  force BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table [sub]partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>cascade_parts</td>
<td>If the table is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this table for all underlying partitions as well</td>
</tr>
<tr>
<td>cascade_columns</td>
<td>Indicates that DELETE_COLUMN_STATS should be called for all underlying columns (passing the cascade_parts parameter)</td>
</tr>
<tr>
<td>cascade_indexes</td>
<td>Indicates that DELETE_INDEX_STATS should be called for all underlying indexes (passing the cascade_parts parameter)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes table statistics even if locked</td>
</tr>
</tbody>
</table>
Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20002: Bad user statistics table, may need to upgrade it
ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
DIFF_TABLE_STATS_IN_HISTORY Function

This function can be used to compare statistics for a table from two timestamps in past and compare the statistics as of that timestamps.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
    ownname     IN  VARCHAR2,
    tabname     IN  VARCHAR2,
    time1       IN  TIMESTAMP WITH TIME ZONE,
    time2       IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    pctthreshold IN  NUMBER  DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the table. Specify NULL for current schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table for which statistics are to be compared</td>
</tr>
<tr>
<td>time1</td>
<td>First timestamp 1</td>
</tr>
<tr>
<td>time2</td>
<td>Second timestamp 2</td>
</tr>
<tr>
<td>pctthreshold</td>
<td>The function reports difference in statistics only if it exceeds this limit. The default value is 10.</td>
</tr>
</tbody>
</table>

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.
DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics and statistics as of a timestamp or statistics from dictionary.

Syntax

```sql
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
    ownname IN VARCHAR2,
    tabname IN VARCHAR2,
    timestamp IN TIMESTAMP WITH TIME ZONE,
    pctthreshold IN NUMBER DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the table. Specify NULL for current schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table for which statistics are to be compared</td>
</tr>
<tr>
<td>timestamp</td>
<td>Time stamp to get statistics from the history</td>
</tr>
<tr>
<td>pctthreshold</td>
<td>The function reports difference in statistics only if it exceeds this limit. The default value is 10.</td>
</tr>
</tbody>
</table>

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.
DIFF_TABLE_STATS_IN_STATTAB Function

This function can be used to compare statistics for a table from two different sources. The statistics can be drawn from

- two different user statistics tables
- a single user statistics table containing 2 sets of statistics that can be identified using statids
- a user statistics table and dictionary

The function also compares the statistics of the dependent objects (indexes, columns, partitions) as well. It displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function. The statistics corresponding to the first source (stattab1 or time1) will be used as basis for computing the difference percentage.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(
  ownname    IN  VARCHAR2,
  tabname    IN  VARCHAR2,
  stattab1   IN  VARCHAR2,
  stattab2   IN  VARCHAR2 DEFAULT NULL,
  pctthreshold IN  NUMBER  DEFAULT 10,
  statid1    IN  VARCHAR2 DEFAULT NULL,
  statid2    IN  VARCHAR2 DEFAULT NULL,
  stattab1own IN  VARCHAR2 DEFAULT NULL,
  stattab2own IN  VARCHAR2 DEFAULT NULL)
RETURN DiffRepTab pipelined;
```

Parameters

Table 155–26 DIFF_TABLE_STATS_IN_STATTAB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the table. Specify NULL for current schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table for which statistics are to be compared</td>
</tr>
<tr>
<td>stattab1</td>
<td>User statistics table 1</td>
</tr>
<tr>
<td>stattab2</td>
<td>User statistics table 2. If NULL, statistics in stattab1 is compared with current statistics in dictionary. This is the default. Specify same table as stattab1 to compare two sets within the statistics table (see statid below).</td>
</tr>
<tr>
<td>pctthreshold</td>
<td>The function reports difference in statistics only if it exceeds this limit. The default value is 10.</td>
</tr>
<tr>
<td>statid1</td>
<td>(optional) Identifies statistics set within stattab1.</td>
</tr>
<tr>
<td>statid2</td>
<td>(optional) Identifies statistics set within stattab2</td>
</tr>
<tr>
<td>stattab1own</td>
<td>Schema containing stattab1 (if other than ownname)</td>
</tr>
<tr>
<td>stattab2own</td>
<td>Schema containing stattab2 (if other than ownname)</td>
</tr>
</tbody>
</table>
Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension. This cancels the effects of the CREATE_EXTENDED_STATS Function.

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (    
  ownname   VARCHAR2,    
  tabname   VARCHAR2,    
  extension VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>extension</td>
<td>Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be &quot;(c1, c2)&quot; and an example expression can be &quot;(c1 + c2)&quot;.</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Insufficient privileges or extension does not exist
- ORA-20001: Error when processing extension

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- If no extended statistics set is created for the extension, this function throws an error.
DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

```sql
DBMS_STATS.DROP_STAT_TABLE (  
    ownname VARCHAR2,  
    stattab VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Table does not exist or insufficient privileges.

Usage Notes

To invoke this procedure you need the privileges for dropping the specified table.
EXPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column and stores them in the user statistics table identified by stattab.

Syntax

```sql
DBMS_STATS.EXPORT_COLUMN_STATS (  
  ownname VARCHAR2,  
  tabname VARCHAR2,  
  colname VARCHAR2,  
  partname VARCHAR2 DEFAULT NULL,  
  stattab VARCHAR2,  
  statid VARCHAR2 DEFAULT NULL,  
  statown VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- Oracle does not support export or import of statistics across databases of different character sets.
EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing TRUE for the add_sys parameter.

Syntax

```sql
DBMS_STATS.EXPORT_DATABASE_PREFS (
    stattab IN VARCHAR2,
    statid IN VARCHAR2 DEFAULT NULL,
    statown IN VARCHAR2 DEFAULT NULL,
    add_sys IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Statistics table name to where statistics should be exported</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
<tr>
<td>add_sys</td>
<td>Value TRUE will include the Oracle-owned tables</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```sql
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```
**EXPORT_DATABASE_STATS Procedure**

This procedure retrieves statistics for all objects in the database and stores them in the user statistics tables identified by `statown.stattab`.

**Syntax**

```
DBMS_STATS.EXPORT_DATABASE_STATS (  
    stattab         VARCHAR2,  
    statid          VARCHAR2 DEFAULT NULL,  
    statown         VARCHAR2 DEFAULT NULL,  
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>- OBJECT_STATS - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>- SYNOPTSES - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>If 'OBJECT_STATS, SYNOPTSES' is specified, table statistics, column statistics, index statistics and synopses are deleted.</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

**Usage Notes**

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- Oracle does not support export or import of statistics across databases of different character sets.
EXPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas (‘SYS’, ‘SYSTEM’ and RDBMS component schemas) and stores them in the user statistics table identified by stattab.

Syntax

```sql
DBMS_STATS.EXPORT_DICTIONARY_STATS (
  stattab         VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>- <strong>OBJECT_STATS</strong> - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>- <strong>SYNOPSES</strong> - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>If ‘OBJECT_STATS, SYNOPSES’ is specified, table statistics, column statistics, index statistics and synopses are deleted.</td>
</tr>
</tbody>
</table>

Usage Notes

- You must have the **SYSDBA** or **ANALYZE ANY DICTIONARY** and **ANALYZE ANY system** privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20002: Bad user statistics table, may need to upgrade it
EXPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (  
    stattab VARCHAR2,  
    statid VARCHAR2 DEFAULT NULL,  
    statown VARCHAR2 DEFAULT NULL);
```

Parameters

```
Table 155–33  EXPORT_FIXED_OBJECTS_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>stattab</code></td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code></td>
</tr>
<tr>
<td><code>statown</code></td>
<td>Schema containing <code>stattab</code> (if different from current schema)</td>
</tr>
</tbody>
</table>
```

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

- To invoke this subprogram you need to be connected as `SYS` or have the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege
- Oracle does not support export or import of statistics across databases of different character sets.
EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by stattab.

Syntax

DBMS_STATS.EXPORT_INDEX_STATS (  
  ownname  VARCHAR2,
  indname  VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab VARCHAR2,
  statid   VARCHAR2 DEFAULT NULL,
  statown  VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- Oracle does not support export or import of statistics across databases of different character sets.
EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

Syntax

```sql
DBMS_STATS.EXPORT_PENDING_STATS (  
ownname IN VARCHAR2 DEFAULT USER,  
tabname IN VARCHAR2,  
stattab IN VARCHAR2,  
statid IN VARCHAR2 DEFAULT NULL,  
statown IN VARCHAR2 DEFAULT USER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name to where to export the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- If the parameter tabname is NULL then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```sql
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```
EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name to where to export the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```
**EXPORT_SCHEMA_STATS Procedure**

This procedure retrieves statistics for all objects in the schema identified by `ownname` and stores them in the user statistics tables identified by `stattab`.

**Syntax**

```sql
DBMS_STATS.EXPORT_SCHEMA_STATS (
  ownname         VARCHAR2,
  stattab         VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ownname</code></td>
<td>Name of the schema</td>
</tr>
<tr>
<td><code>stattab</code></td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code></td>
</tr>
<tr>
<td><code>statown</code></td>
<td>Schema containing <code>stattab</code> (if different than <code>ownname</code>)</td>
</tr>
<tr>
<td><code>stat_category</code></td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>- <code>OBJECT_STATS</code> - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>- <code>SYNOPSES</code> - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>If ‘<code>OBJECT_STATS, SYNOPSES’</code> is specified, table statistics, column statistics, index statistics and synopses are deleted.</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

**Usage Notes**

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- Oracle does not support export or import of statistics across databases of different character sets.
EXPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

**Syntax**

```sql
DBMS_STATS.EXPORT_SYSTEM_STATS (  
  stattab       VARCHAR2,
  statid        VARCHAR2 DEFAULT NULL,
  statown       VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table that describes where the statistics will be stored</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics stored from the <code>stattab</code></td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code> (if different from current schema)</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to export system statistics

**Usage Notes**

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

Oracle does not support export or import of statistics across databases of different character sets.
**EXPORT_TABLE_PREFS Procedure**

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

**Syntax**

```sql
DBMS_STATS.EXPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name where to export the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

**Usage Notes**

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

**Examples**

```sql
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```
EXPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table and stores them in the user statistics table. Cascade results in all index statistics associated with the specified table being exported as well.

Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (
    ownname         VARCHAR2,
    tabname         VARCHAR2,
    partname        VARCHAR2 DEFAULT NULL,
    stattab         VARCHAR2,
    statid          VARCHAR2 DEFAULT NULL,
    cascade         BOOLEAN  DEFAULT TRUE,
    statown         VARCHAR2 DEFAULT NULL,
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>cascade</td>
<td>If true, then column and index statistics for this table are also exported.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>- OBJECT_STATS - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>- SYNOPSES - information to support incremental statistics</td>
</tr>
</tbody>
</table>

If 'OBJECT_STATS, SYNOPSES' is specified, table statistics, column statistics, index statistics and synopses are deleted.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
Oracle does not support export or import of statistics across databases of different character sets.
FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure flushes in-memory monitoring information for all tables in the dictionary. Corresponding entries in the *_TAB_MODIFICATIONS, *_TAB_STATISTICS and *_IND_STATISTICS views are updated immediately, without waiting for the Oracle database to flush them periodically. This procedure is useful when you need up-to-date information in those views. Because the GATHER_*_STATS procedures internally flush monitoring information, it is not necessary to run this procedure before gathering the statistics.

Syntax

DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

The ANALYZE_ANY system privilege is required to run this procedure.
GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```
DBMS_STATS.GATHER_DATABASE_STATS (
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type
        (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
    granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    options          VARCHAR2 DEFAULT 'GATHER',
    objlist          OUT      ObjectTab,
    statown          VARCHAR2 DEFAULT NULL,
    gather_sys       BOOLEAN  DEFAULT TRUE,
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),
    obj_filter_list ObjectTab DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>
Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed:

- FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]

size_clause is defined as:

size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}

- integer : Number of histogram buckets. Must be in the range [1,2048].
- REPEAT : Collects histograms only on the columns that already have histograms.
- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.
- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.

The default is FOR ALL COLUMNS SIZE AUTO. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.
Summary of DBMS_STATS Subprograms

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| granularity | Granularity of statistics to collect (only pertinent if the table is partitioned).

  - 'ALL' - Gathers all (subpartition, partition, and global) statistics
  - 'AUTO' - Determines the granularity based on the partitioning type. This is the default value.
  - 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
  - 'GLOBAL' - Gathers global statistics
  - 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
  - 'PARTITION' - Gathers partition-level statistics
  - 'SUBPARTITION' - Gathers subpartition-level statistics

| cascade | Gather statistics on the indexes as well. Using this option is equivalent to running the `GATHER_INDEX_STATS Procedure` on each of the indexes in the database in addition to gathering table and column statistics. Use the constant `DBMS_STATS.AUTO.Cascade` to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the `SET_DATABASE_PREFS Procedure`, `SET_GLOBAL_PREFS Procedure`, `SET_SCHEMA_PREFS Procedure` and `SET_TABLE_PREFS Procedure`.

| stattab | User statistics table identifier describing where to save the current statistics.

The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.

| statid | Identifier (optional) to associate with these statistics within `statstab`.

<td>Gathers statistics on the objects owned by the ‘SYS’ user</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>obj_filter_list</td>
<td>A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges

ORA-200001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components.

Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
    comp_id          VARCHAR2 DEFAULT NULL,
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
    granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    options          VARCHAR2 DEFAULT 'GATHER AUTO',
    objlist    OUT   ObjectTab,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate     BOOLEAN  DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),
    obj_filter_list   ObjectTab DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comp_id</td>
<td>Component id of the schema to analyze (NULL will result in analyzing schemas of all RDBMS components). Please refer to comp_id column of DBA_REGISTRY view. The procedure always gather statistics on 'SYS' and 'SYSTEM' schemas regardless of this argument.</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Default to estimate_percent (get_param('ESTIMATE_PERCENT'))</td>
</tr>
</tbody>
</table>
**Table 155–42 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute). The valid range is ([0.000001, 100]). Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.</td>
</tr>
</tbody>
</table>
| method_opt        | Accepts:  
  - FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]  
  - size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}  
    - integer : Number of histogram buckets. Must be in the range \([1, 2048]\).  
    - REPEAT : Collects histograms only on the columns that already have histograms.  
    - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.  
    - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.  
  The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. |
| degree            | Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution. |
granularity

Granularity of statistics to collect (only pertinent if the table is partitioned).

'ALL' - Gathers all (subpartition, partition, and global) statistics

'AUTO' - Determines the granularity based on the partitioning type. This is the default value.

'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.

'GLOBAL' - Gathers global statistics

'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.

'PARTITION' - Gathers partition-level statistics

'SUBPARTITION' - gathers subpartition-level statistics

cascade

Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO.Cascade to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

stattab

User statistics table identifier describing where to save the current statistics

statid

The (optional) identifier to associate with these statistics within stattab

options

Further specification of objects for which to gather statistics:

- 'GATHER' - Gathers statistics on all objects in the schema
- 'GATHER AUTO' - (Default) Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, stattab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed.
- 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale.
- 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics.
- 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO'
- 'LIST STALE' - Returns list of stale objects as determined by looking at the *_tab_modifications views
- 'LIST EMPTY' - Returns list of objects which currently have no statistics
You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges
ORA-20001: Bad input value
ORA-20002: Bad user statistics table, may need to upgrade it
GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
    stattab        VARCHAR2 DEFAULT NULL,
    statid         VARCHAR2 DEFAULT NULL,
    statown        VARCHAR2 DEFAULT NULL,
    no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to save the current statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier to associate with these statistics within stattab (optional)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Bad input value
- ORA-20002: Bad user statistics table, may need to upgrade it
GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible. Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The granularity and no_invalidate arguments are not relevant to these types of indexes.

Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (  
  ownname          VARCHAR2,  
  indname          VARCHAR2,  
  partname         VARCHAR2 DEFAULT NULL,  
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type  
                  (GET_PARAM('ESTIMATE_PERCENT')),  
  stattab          VARCHAR2 DEFAULT NULL,  
  statid           VARCHAR2 DEFAULT NULL,  
  statown          VARCHAR2 DEFAULT NULL,  
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),  
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),  
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type  
                  (GET_PARAM('NO_INVALIDATE')),  
  force            BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of index to analyze</td>
</tr>
<tr>
<td>indname</td>
<td>Name of index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of partition</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100). Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to save the current statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>
Summary of DBMS_STATS Subprograms

Exceptions

ORA-20000: Index does not exist or insufficient privileges
ORA-20001: Bad input value

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
GATHER_PROCESSING_RATE Procedure

This procedure starts the job of gathering the processing rates which end after an interval defined in minutes.

Syntax

```sql
DBMS_STATS.GATHER_PROCESSING_RATE (  
gathering_mode IN VARCHAR2 DEFAULT 'START',  
interval IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gathering_mode</td>
<td>Mode: 'START' or 'END'. The mode is based on the Active Session History (ASH) data when invoked with 'START' option. It stops gathering when invoked with 'END' option. When invoked with 'START', 'interval' option can be specified optionally. If interval is not specified, its default value is set to 60 minutes.</td>
</tr>
<tr>
<td>interval</td>
<td>Time interval (number of minutes) for which the processing must be gathered.</td>
</tr>
</tbody>
</table>

Usage Notes

- You require the OPTIMIZER_PROCESSING_RATE role to run this procedure.
- AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or illegal input value
GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (  
    ownname          VARCHAR2,  
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type  
        (get_param('ESTIMATE_PERCENT')),  
    block_sample     BOOLEAN  DEFAULT FALSE,  
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),

    cascade          BOOLEAN  DEFAULT get_param('CASCADE'),  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    options          VARCHAR2 DEFAULT 'GATHER',  
    objlist          OUT      ObjectTab,  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN  DEFAULT get_param('NO_INVALIDATE'),  
    force            BOOLEAN DEFAULT FALSE,  
    obj_filter_list  ObjectTab DEFAULT NULL);  
```

```
DBMS_STATS.GATHER_SCHEMA_STATS (  
    ownname          VARCHAR2,  
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type  
        (get_param('ESTIMATE_PERCENT')),  
    block_sample     BOOLEAN  DEFAULT FALSE,  
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),  
    granularity      VARCHAR2 DEFAULT get_param('GRANULARITY'),  
    cascade          BOOLEAN  DEFAULT get_param('CASCADE'),  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    options          VARCHAR2 DEFAULT 'GATHER',  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN  DEFAULT get_param('NO_INVALIDATE'),  
    force            BOOLEAN DEFAULT FALSE,  
    obj_filter_list  ObjectTab DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema to analyze (NULL means current schema)</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>
Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Accepts:
- FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]

size_clause is defined as:
size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}

- integer: Number of histogram buckets. Must be in the range [1,2048].
- REPEAT: Collects histograms only on the columns that already have histograms.
- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.
- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.

The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

</tr>
<tr>
<td></td>
<td>GATHER: (Default) Gathers statistics on all objects in the schema.</td>
</tr>
<tr>
<td></td>
<td>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects.</td>
</tr>
<tr>
<td></td>
<td>GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale.</td>
</tr>
<tr>
<td></td>
<td>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics.</td>
</tr>
<tr>
<td></td>
<td>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO.</td>
</tr>
<tr>
<td></td>
<td>LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views.</td>
</tr>
<tr>
<td></td>
<td>LIST EMPTY: Returns list of objects which currently have no statistics.</td>
</tr>
<tr>
<td>objlist</td>
<td>List of objects found to be stale or empty</td>
</tr>
</tbody>
</table>
Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

When you use a specific value for the sampling percentage, DBMS_STATS honors it except for when:

- The result is less than 2500 rows (too small a sample) and
- The specified percentage is more than the certain percentage.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges
ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that any table with a "t" prefix in the SAMPLE schema and any table in the SYS schema, if stale, will have statistics gathered upon it.

```
DECLARE
    filter_lst   DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
    filter_lst.extend(2);
    filter_lst(1).ownname := 'SH';
    filter_lst(1).objname := 'SALES';
    filter_lst(2).ownname := 'SH';
    filter_lst(2).objname := 'COSTS';
    DBMS_STATS.GATHER_SCHEMA_STATS(ownname=>'SH',obj_filter_list=>filter_lst);
END;
```
**GATHER_SYSTEM_STATS Procedure**

This procedure gathers system statistics.

**Syntax**

```sql
DBMS_STATS.GATHER_SYSTEM_STATS (  
gathering_mode   VARCHAR2  DEFAULT 'NOWORKLOAD',  
interval         INTEGER  DEFAULT NULL,  
stattab          VARCHAR2  DEFAULT NULL,  
statid           VARCHAR2  DEFAULT NULL,  
statown          VARCHAR2  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| gathering_mode | Mode values are:  
  NOWORKLOAD: Will capture characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period Oracle will estimate the average read seek time and transfer speed for the I/O system. This mode is suitable for all workloads. Oracle recommends to run GATHER_SYSTEM_STATS ('NOWORKLOAD') after creation of the database and tablespaces. To fine tune system statistics for the workload use 'START' and 'STOP' or 'INTERVAL' options. If you gather both 'NOWORKLOAD' and workload specific (statistics collected using 'INTERVAL' or 'START' and 'STOP'), the workload statistics will be used by optimizer. Collected components: cpuspeednw, ioseektim, iotfrspeed.  
  INTERVAL: Captures system activity during a specified interval. This works in combination with the interval parameter. You should provide an interval value in minutes, after which system statistics are created or updated in the dictionary or stattab. You can use GATHER_SYSTEM_STATS (gathering_mode=>'STOP') to stop gathering earlier than scheduled. Collected components: maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc.  
  START | STOP: Captures system activity during specified start and stop times and refreshes the dictionary or stattab with statistics for the elapsed period. Interval value is ignored. Collected components: maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc.  
  EXADATA: In this mode the gathered system statistics take into account the unique capabilities provided by using EXADATA such as large IO size and high IO throughput. The multi-block read count and IO throughput statistics are set along with the CPU speed. |
| interval | Time, in minutes, to gather statistics. This parameter applies only when gathering_mode='INTERVAL' |
| stattab | Identifier of the user statistics table where the statistics will be saved |
| statid | Optional identifier associated with the statistics saved in the stattab |
| statown | Schema containing stattab (if different from current schema) |
GATHER_SYSTEM_STATS Procedure

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid input value
ORA-20002: Bad user statistics table; may need to be upgraded
ORA-20003: Unable to gather system statistics
ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

Examples

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
    DBMS_STATS.GATHER_SYSTEM_STATS (
        interval => 720,
        stattab  => 'mystats',
        statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
    DBMS_STATS.GATHER_SYSTEM_STATS (
        interval => 720,
        stattab  => 'mystats',
        statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE   jobno   number;
BEGIN
    DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS (''mystats'',''OLTP'');'
                        sysdate, 'sysdate + 1');
    COMMIT;
END;
```

```
BEGIN
    DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS (''mystats'',''OLAP'');'
                        sysdate + 0.5, 'sysdate + 1');
    COMMIT;
END;
```
GATHER_TABLE_STATS Procedure

This procedure gathers table and column (and index) statistics. It attempts to parallelize as much of the work as possible, but there are some restrictions as described in the individual parameters.

Syntax

```
DBMS_STATS.GATHER_TABLE_STATS ( 
    ownname          VARCHAR2, 
    tabname          VARCHAR2, 
    partname         VARCHAR2 DEFAULT NULL, 
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type 
                        (get_param('ESTIMATE_PERCENT')), 
    block_sample     BOOLEAN  DEFAULT FALSE, 
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'), 
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')), 
    granularity      VARCHAR2 DEFAULT get_param('GRANULARITY'), 
    cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')), 
    stattab          VARCHAR2 DEFAULT NULL, 
    statid           VARCHAR2 DEFAULT NULL, 
    statown          VARCHAR2 DEFAULT NULL, 
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type ( 
                        get_param('NO_INVALIDATE')), 
    stattype         VARCHAR2 DEFAULT 'DATA', 
    force            BOOLEAN  DEFAULT FALSE, 
    context          DBMS_STATS.CCONTEXT DEFAULT NULL, -- non operative 
    options          VARCHAR2 DEFAULT 'GATHER'); 
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of table to analyze</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of partition</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.</td>
</tr>
</tbody>
</table>
**Table 155–48 (Cont.) GATHER_TABLE_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| method_opt | METHOD_OPT - When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed. Other than that, method_opt accepts either of the following options, or both in combination:  
  - FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]  
  - FOR COLUMNS [column_clause] [size_clause]  
  
  size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}  
  
  column_clause is defined as column_clause := column_name | extension name | extension  
  
  - integer : Number of histogram buckets. Must be in the range [1,2048].  
  - REPEAT : Collects histograms only on the columns that already have histograms  
  - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.  
  - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.  
  - column_name : Name of a column  
  - extension : can be either a column group in the format of (column_name, Column_name [, ...]) or an expression  
  
  The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. |
| degree | Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution. |
### Summary of DBMS_STATS Subprograms

**granularity**
Granularity of statistics to collect (only pertinent if the table is partitioned).

- **'ALL'** - Gathers all (subpartition, partition, and global) statistics
- **'APPROX_GLOBAL AND PARTITION'** - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).
- **'AUTO'** - Determines the granularity based on the partitioning type. This is the default value.
- **'DEFAULT'** - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
- **'GLOBAL'** - Gathers global statistics
- **'GLOBAL AND PARTITION'** - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- **'PARTITION'** - Gathers partition-level statistics
- **'SUBPARTITION'** - Gathers subpartition-level statistics.

**cascade**
Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table’s indexes. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

**stattab**
User statistics table identifier describing where to save the current statistics

**statid**
Identifier (optional) to associate with these statistics within stattab

**statown**
Schema containing stattab (if different than ownname)

**no_invalidate**
Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

**stattype**
Statistics type. The only value allowed is DATA.

**force**
Gather statistics of table even if it is locked

**context**
[Non-operative]

---

<td>[Non-operative]</td>
</tr>
</tbody>
</table>
Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Index statistics collection can be parallelized except for cluster, domain and join indexes.

Exceptions

ORA-20000: Table does not exist or insufficient privileges
ORA-20001: Bad input value

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```sql
DBMS_STATS.GATHER_TABLE_STATS(  
  'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```sql
DBMS_STATS.GATHER_TABLE_STATS(  
  'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```
GENERATE_STATS Procedure

Note: This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, use the GATHER_INDEX_STATS procedure. See “GATHER_INDEX_STATS Procedure” on page 155-80.

This procedure generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

Syntax

```
DBMS_STATS.GENERATE_STATS (    
  ownname    VARCHAR2,
  objname    VARCHAR2,
  organized  NUMBER DEFAULT 7,
  force      BOOLEAN default FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of object</td>
</tr>
<tr>
<td>objname</td>
<td>Name of object</td>
</tr>
</tbody>
</table>
| organized | Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk.
  
  This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one. |
| force     | If TRUE, generates statistics for the target object even if it is locked |

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

Exceptions

ORA-20000: Unsupported object type of object does not exist

ORA-20001: Invalid option or invalid statistics
GET_COLUMN_STATS Procedures

These procedures get all column-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```sql
DBMS_STATS.GET_COLUMN_STATS ( 
    ownname     VARCHAR2, 
    tabname     VARCHAR2, 
    colname     VARCHAR2, 
    partname    VARCHAR2 DEFAULT NULL, 
    stattab     VARCHAR2 DEFAULT NULL, 
    statid      VARCHAR2 DEFAULT NULL, 
    distcnt OUT NUMBER, 
    density OUT NUMBER, 
    nullcnt OUT NUMBER, 
    srec    OUT StatRec, 
    avgclen OUT NUMBER, 
    statown     VARCHAR2 DEFAULT NULL);
```

Use the following for user-defined statistics:

```sql
DBMS_STATS.GET_COLUMN_STATS ( 
    ownname          VARCHAR2, 
    tabname          VARCHAR2, 
    colname          VARCHAR2, 
    partname         VARCHAR2 DEFAULT NULL, 
    stattab          VARCHAR2 DEFAULT NULL, 
    statid           VARCHAR2 DEFAULT NULL, 
    ext_stats   OUT  RAW, 
    stattypown  OUT  VARCHAR2 DEFAULT NULL, 
    stattypname OUT  VARCHAR2 DEFAULT NULL, 
    statown          VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>ext_stats</td>
<td>The user-defined statistics</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type</td>
</tr>
</tbody>
</table>
### Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

### Usage Notes

Before invoking this procedure, ensure that the table exists.

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
GET_INDEX_STATS Procedures

These procedures get all index-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_INDEX_STATS (
    ownname     VARCHAR2,
    indname     VARCHAR2,
    partname    VARCHAR2 DEFAULT NULL,
    stattab     VARCHAR2 DEFAULT NULL,
    statid      VARCHAR2 DEFAULT NULL,
    numrows     OUT NUMBER,
    numlblks    OUT NUMBER,
    numdist     OUT NUMBER,
    avglblk     OUT NUMBER,
    avgdblk     OUT NUMBER,
    clstfct     OUT NUMBER,
    indlevel    OUT NUMBER,
    statown     VARCHAR2 DEFAULT NULL,
    cachedblk   OUT NUMBER,
    cachehit    OUT NUMBER);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
    ownname     VARCHAR2,
    indname     VARCHAR2,
    partname    VARCHAR2 DEFAULT NULL,
    stattab     VARCHAR2 DEFAULT NULL,
    statid      VARCHAR2 DEFAULT NULL,
    ext_stats   OUT RAW,
    stattypown  OUT VARCHAR2 DEFAULT NULL,
    stattypname OUT VARCHAR2 DEFAULT NULL,
    statown     VARCHAR2 DEFAULT NULL,
    cachedblk   OUT NUMBER,
    cachehit    OUT NUMBER);
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition for which to get the statistics. If the index is partitioned and if partname is NULL, then the statistics are retrieved for the global index level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>ext_stats</td>
<td>User-defined statistics</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type</td>
</tr>
<tr>
<td>stattypname</td>
<td>Name of the statistics type</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the index (partition)</td>
</tr>
<tr>
<td>numlblks</td>
<td>Number of leaf blocks in the index (partition)</td>
</tr>
<tr>
<td>numdist</td>
<td>Number of distinct keys in the index (partition)</td>
</tr>
<tr>
<td>avglblk</td>
<td>Average integral number of leaf blocks in which each distinct key appears for this index (partition)</td>
</tr>
<tr>
<td>avgdblk</td>
<td>Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)</td>
</tr>
<tr>
<td>clstfct</td>
<td>Clustering factor for the index (partition)</td>
</tr>
<tr>
<td>indlevel</td>
<td>Height of the index (partition)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>guessq</td>
<td>Guess quality for the index (partition)</td>
</tr>
<tr>
<td>cachedblk</td>
<td>The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)</td>
</tr>
<tr>
<td>cachehit</td>
<td>The average cache hit ratio for the segment (index/table/index partition/table partition)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

- Before invoking this procedure, ensure that the table exists.

  To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachehit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other “minor” workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
- When not enough data has been analyzed, such as when an object has been recently create
- When the system does not have one major workload resulting in averages not corresponding to real values.
**GET_PARAM Function**

**Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the GET_PREFS Function. See also Deprecated Subprograms on page 155-13.

This function returns the default value of parameters of DBMS_STATS procedures.

**Syntax**

```sql
DBMS_STATS.GET_PARAM (    pname     IN   VARCHAR2)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Parameter name</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20001: Invalid input values
GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```sql
DBMS_STATS.GET_PREFS (  
    pname     IN   VARCHAR2,  
    ownname   IN   VARCHAR2 DEFAULT NULL,  
    tabname   IN   VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</td>
</tr>
<tr>
<td></td>
<td>- AUTOSTATS_TARGET</td>
</tr>
<tr>
<td></td>
<td>- CASCADE</td>
</tr>
<tr>
<td></td>
<td>- CONCURRENT</td>
</tr>
<tr>
<td></td>
<td>- DEGREE</td>
</tr>
<tr>
<td></td>
<td>- ESTIMATE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>- METHOD_OPT</td>
</tr>
<tr>
<td></td>
<td>- NO_INVALIDATE</td>
</tr>
<tr>
<td></td>
<td>- GRANULARITY</td>
</tr>
<tr>
<td></td>
<td>- PUBLISH</td>
</tr>
<tr>
<td></td>
<td>- INCREMENTAL</td>
</tr>
<tr>
<td></td>
<td>- INCREMENTAL_STALENESS</td>
</tr>
<tr>

<td>- STALE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>- GLOBAL_TEMP_TABLE_STATS</td>
</tr>
<tr>
<td></td>
<td>- TABLE_CACHED_BLOCKS</td>
</tr>
<tr>
<td></td>
<td>- OPTIONS</td>
</tr>
</tbody>
</table>

AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection. It takes the following values:

- ‘ALL’ - Statistics collected for all objects in system
- ‘ORACLE’ - Statistics collected for all Oracle owned objects
- ‘AUTO’ - Oracle decides on which objects to collect statistics

CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics
DBMS_STATS 155-101

Summary of DBMS_STATS Subprograms

CONCURRENT - This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time:

- 'MANUAL' - Concurrency will be turned on only for manual statistics gathering.
- 'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering.
- 'ALL': Concurrency will be turned on for both manual and automatic statistics gathering.
- 'OFF': Concurrency will be turned off for both manual and automatic statistics gathering.

See Usage Notes below.

DEGREE - The value determines degree of parallelism used for gathering statistics.

ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

method_opt

When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed:

- FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]

size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}

- integer: Number of histogram buckets. Must be in the range [1,2048].
- REPEAT: Collects histograms only on the columns that already have histograms.
- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.
- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.

The default is FOR ALL COLUMNS SIZE AUTO. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.

Table 155–53 (Cont.) GET_PREFS Function Parameters

<table>

</tr>
</tbody>
</table>

method_opt

When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed:

- FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]

size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}

- integer: Number of histogram buckets. Must be in the range [1,2048].
- REPEAT: Collects histograms only on the columns that already have histograms.
- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.
- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.

The default is FOR ALL COLUMNS SIZE AUTO. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
The value determines granularity of statistics to collect (only pertinent if the table is partitioned)

'ALL' - gathers all (subpartition, partition, and global) statistics

'AUTO' - determines the granularity based on the partitioning type. This is the default value.

'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.

'GLOBAL' - gathers global statistics

'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.

'PARTITION' - gathers partition-level statistics

'SUBPARTITION' - gathers subpartition-level statistics

PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.

INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:

- the INCREMENTAL value for the partitioned table is set to TRUE;
- the PUBLISH value for the partitioned table is set to TRUE;
- the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.

If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
**Table 155–53 (Cont.) GET_PREFS Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL_LEVEL -</td>
<td>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:</td>
</tr>
<tr>
<td></td>
<td>■ TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures.</td>
</tr>
<tr>
<td></td>
<td>■ PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.</td>
</tr>
<tr>
<td>INCREMENTAL_STALENESS -</td>
<td>This value controls how we decide a partition or subpartition as stale. It takes an enumeration of values which may be multiple, such as 'USE_STALE_PERCENT', 'USE_LOCKED_STATS'.</td>
</tr>
<tr>
<td></td>
<td>■ USE_STALE_PERCENT - a partition/subpartition is not considered as stale if DML changes are less than the STALE_PERCENT preference value</td>
</tr>
<tr>
<td></td>
<td>■ USE_LOCKED_STATS - locked partitions/subpartitions statistics are not considered as stale, regardless of DML changes</td>
</tr>
<tr>
<td></td>
<td>■ NULL - this is the default value, meaning a partition or subpartition is considered as stale as long as it has any DML changes. When the default value is used, statistics gathered in incremental mode are guaranteed to be the same as the statistics gathered in non incremental mode. When a non default value is used, the statistics gathered in incremental mode might be less accurate than those gathered in non-incremental mode</td>
</tr>
<tr>
<td>STALE_PERCENT -</td>
<td>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10, meaning a table having more than 10% of changes is considered as stale.</td>
</tr>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS -</td>
<td>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values:</td>
</tr>
<tr>
<td></td>
<td>■ SHARED - All sessions see the same set of statistics</td>
</tr>
<tr>
<td></td>
<td>■ SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.</td>
</tr>
<tr>
<td>TABLE_CACHED_BLOCKS -</td>
<td>The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.</td>
</tr>
</tbody>
</table>
GET_PREFS Function

Exceptions

- ORA-20000: Unable to gather statistics concurrently: Resource Manager is not enabled.
- ORA-20001: Invalid input values

Usage Notes

- No special privilege or role is needed to invoke this procedure, however note the following with regard to CONCURRENT preference.
- The CONCURRENT preference determines whether the statistics of tables or (sub)partitions of tables to be gathered concurrently when user issues GATHER_*_STATS procedures. DBMS_STATS has the ability to collect statistics for a single object (table, (sub)partition) in parallel based on the value of degree parameter. However the parallelism is limited to one object. The CONCURRENT preference extends the scope of parallelization to multiple database objects by enabling users to concurrently gather statistics for multiple tables in a schema or database and multiple (sub)partitions within a table. Note that this is primarily intended for multi CPU systems and it may not be suitable for small databases on single CPU machines.

To gather statistics concurrently,

- The user must have DBA role or have the following privileges in addition to privileges that are required for gathering statistics: CREATE JOB, MANAGE SCHEDULER, MANAGE ANY QUEUE.
- Resource Manager should be enabled.
- The setting for the job_queue_processes parameter must be at least 4.

- If the ownname and tabname are provided and a preference has been entered for the table, the function returns the preference as specified for the table. In all other cases it returns the global preference if it has been specified, otherwise the default value is returned.

Table 155–53 (Cont.) GET_PREFS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| options   | Further specification of which objects to gather statistics:  
- GATHER - gathers statistics on all objects in the schema  
- GATHER AUTO - gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics. |
| ownname   | Owner name |
| tabname   | Table name |

Options

- GATHER - gathers statistics on all objects in the schema
- GATHER AUTO - gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics.
GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

Syntax

```sql
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY
RETURN TIMESTAMP WITH TIMEZONE;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.
GET_STATS_HISTORY_RETENTION Function

This function returns the current statistics history retention value.

Syntax

```sql
DBMS_STATS.GET_STATS_HISTORY_RETENTION
RETURN NUMBER;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.
**GET_SYSTEM_STATS Procedure**

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

**Syntax**

```sql
DBMS_STATS.GET_SYSTEM_STATS ( 
  status OUT VARCHAR2, 
  dstart OUT DATE, 
  dstop OUT DATE, 
  pname IN VARCHAR2, 
  pvalue OUT NUMBER, 
  stattab IN VARCHAR2 DEFAULT NULL, 
  statid IN VARCHAR2 DEFAULT NULL, 
  statown IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>Output is one of the following:</td>
</tr>
<tr>
<td></td>
<td>- COMPLETED:</td>
</tr>
<tr>
<td></td>
<td>- AUTOGATHERING:</td>
</tr>
<tr>
<td></td>
<td>- MANUALGATHERING:</td>
</tr>
<tr>
<td></td>
<td>- BADSTATS:</td>
</tr>
<tr>
<td>dstart</td>
<td>Date when statistics gathering started.</td>
</tr>
<tr>
<td></td>
<td>If <code>status = MANUALGATHERING</code>, the start date is returned.</td>
</tr>
<tr>
<td>dstop</td>
<td>Date when statistics gathering stopped.</td>
</tr>
<tr>
<td></td>
<td>- If <code>status = COMPLETE</code>, the finish date is returned.</td>
</tr>
<tr>
<td></td>
<td>- If <code>status = AUTOGATHERING</code>, the future finish date is returned.</td>
</tr>
<tr>
<td></td>
<td>- If <code>status = BADSTATS</code>, the must-finished-by date is returned.</td>
</tr>
</tbody>
</table>
Table 155–54 (Cont.) GET_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>

<td>Optional identifier associated with the statistics saved in the stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20002: Bad user statistics table; may need to be upgraded
ORA-20003: Unable to gather system statistics
ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.
GET_TABLE_STATS Procedure

This procedure gets all table-related information.

Syntax

```sql
DBMS_STATS.GET_TABLE_STATS ( 
  ownname         VARCHAR2, 
  tabname         VARCHAR2, 
  partname        VARCHAR2 DEFAULT NULL, 
  stattab         VARCHAR2 DEFAULT NULL, 
  statid          VARCHAR2 DEFAULT NULL, 
  numrows     OUT NUMBER, 
  numblks     OUT NUMBER, 
  avgrlen     OUT NUMBER, 
  statown         VARCHAR2 DEFAULT NULL, 
  cachedblk   OUT NUMBER, 
  cachehit    OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the table (partition)</td>
</tr>
<tr>
<td>numblks</td>
<td>Number of blocks the table (partition) occupies</td>
</tr>
<tr>
<td>avgrlen</td>
<td>Average row length for the table (partition)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>cachedblk</td>
<td>The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)</td>
</tr>
<tr>
<td>cachehit</td>
<td>The average cache hit ratio for the segment (index/table/index partition/table partition)</td>
</tr>
</tbody>
</table>

Usage Notes

- Before invoking this procedure, ensure that the table exists.
- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the
I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations:
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

- Oracle does not support export or import of statistics across databases of different character sets.

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object
IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_COLUMN_STATS (    ownname VARCHAR2,    tabname VARCHAR2,    colname VARCHAR2,    partname VARCHAR2 DEFAULT NULL,    stattab VARCHAR2,    statid VARCHAR2 DEFAULT NULL,    statown VARCHAR2 DEFAULT NULL,    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),    force BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if <code>partname</code> is NULL, then global and partition column statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier to associate with these statistics within <code>stattab</code> (optional)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code> (if different than <code>ownname</code>)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to <code>TRUE</code>. The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code>. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <code>SET_DATABASE_PREFS Procedure</code>, <code>SET_GLOBAL_PREFS Procedure</code>, <code>SET_SCHEMA_PREFS Procedure</code> and <code>SET_TABLE_PREFS Procedure</code>.</td>
</tr>
<tr>
<td>force</td>
<td>If set to <code>TRUE</code>, imports statistics even if statistics are locked</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY privilege` or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table
ORA-20005: Object statistics are locked

Usage Notes
Oracle does not support export or import of statistics across databases of different character sets.
**IMPORT_DATABASE_PREFS Procedure**

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

**Syntax**

```sql
DBMS_STATS.IMPORT_DATABASE_PREFS (STATTAB IN VARCHAR2,
    STATID IN VARCHAR2 DEFAULT NULL,
    STATOWN IN VARCHAR2 DEFAULT NULL,
    ADD_SYS IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>STATTAB</code></td>
<td>Statistics table name where to import the statistics</td>
</tr>
<tr>
<td><code>STATID</code></td>
<td>Optional identifier to associate with these statistics within <code>STATTAB</code></td>
</tr>
<tr>
<td><code>STATOWN</code></td>
<td>Schema containing <code>STATTAB</code> (if different than <code>OWNNAME</code>)</td>
</tr>
<tr>
<td><code>ADD_SYS</code></td>
<td>Value <code>TRUE</code> will include the Oracle-owned tables</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Insufficient privileges.

**Usage Notes**

- To run this procedure, you need to have the SYSDBA role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

**Examples**

```sql
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', STATOWN=>'SH');
```
IMPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database from the user statistics table(s) and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_DATABASE_STATS (
    stattab         VARCHAR2,
    statid          VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
            get_param('NO_INVALIDATE')),
    force           BOOLEAN DEFAULT FALSE,
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics locked at the object (table) level:</td>
</tr>
<tr>
<td></td>
<td>- TRUE - Ignores the statistics lock and imports the statistics</td>
</tr>
<tr>
<td></td>
<td>- FALSE - The statistics will be imported only if they are not locked</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>- OBJECT_STATS - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>- SYNOPSES - information to support incremental statistics</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
Oracle does not support export or import of statistics across databases of different character sets.
IMPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

DBMS_STATS.IMPORT_DICTIONARY_STATS (  
stattab VARCHAR2,  
statid VARCHAR2 DEFAULT NULL,  
statown VARCHAR2 DEFAULT NULL,  
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
    get_param('NO_INVALIDATE')),  
force BOOLEAN DEFAULT FALSE,  
stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);  

Parameters

### Table 155–59 IMPORT_DICTIONARY_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>
| force        | Overrides statistics lock at the object (table) level:  
- TRUE - Ignores the statistics lock and imports the statistics.  
- FALSE - The statistics will be imported only if there is no lock. |
| stat_category| Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:  
- OBJECT_STATS - table statistics, column statistics and index statistics (Default)  
- SYNONYSES - information to support incremental statistics |

Usage Notes

- You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

- Oracle does not support export or import of statistics across databases of different character sets.
Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table
ORA-20002: Bad user statistics table, may need to upgrade it
IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables from the user statistics table(s) and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
    stattab       VARCHAR2,
    statid        VARCHAR2 DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE')),
    force         BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics lock:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Usage Notes

- You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent values in the user statistics table
- ORA-20002: Bad user statistics table, may need to upgrade it
**IMPORT_INDEX_STATS Procedure**

This procedure retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary.

**Syntax**

```sql
DBMS_STATS.IMPORT_INDEX_STATS (    ownname       VARCHAR2,    indname       VARCHAR2,    partname      VARCHAR2 DEFAULT NULL,    stattab       VARCHAR2,    statid        VARCHAR2 DEFAULT NULL,    statown       VARCHAR2 DEFAULT NULL,    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (        get_param('NO_INVALIDATE')),    force         BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Imports statistics even if index statistics are locked</td>
</tr>
</tbody>
</table>

**Exceptions**

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent values in the user statistics table
- ORA-20005: Object statistics are locked
Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.
IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

DBMS_STATS.IMPORT_SCHEMA_PREFS (ownname IN VARCHAR2,
                          stattab IN VARCHAR2,
                          statid IN VARCHAR2 DEFAULT NULL,
                          statown IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name from where to import the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
IMPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by `ownname` from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (  
  ownname VARCHAR2, 
  stattab VARCHAR2, 
  statid VARCHAR2 DEFAULT NULL, 
  statown VARCHAR2 DEFAULT NULL, 
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type( 
    get_param('NO_INVALIDATE')), 
  force BOOLEAN DEFAULT FALSE, 
  stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics locked at the object (table) level:</td>
</tr>
<tr>
<td></td>
<td>TRUE - Ignores the statistics lock and imports the statistics.</td>
</tr>
<tr>
<td></td>
<td>FALSE - Statistics will be imported only if there is no lock.</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>OBJECT_STATS - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>SYNOPSIS - information to support incremental statistics</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table
Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.
IMPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by `stattab`, and stores the statistics in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_SYSTEM_STATS (
  stattab       VARCHAR2,
  statid        VARCHAR2 DEFAULT NULL,
  statown       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>stattab</code></td>
<td>Identifier of the user statistics table where the statistics will be retrieved</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Optional identifier associated with the statistics retrieved from the <code>stattab</code></td>
</tr>
<tr>
<td><code>statown</code></td>
<td>Schema containing <code>stattab</code> (if different from current schema)</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent values in the user statistics table
- ORA-20002: Bad user statistics table; may need to be upgraded
- ORA-20003: Unable to import system statistics

Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

Oracle does not support export or import of statistics across databases of different character sets.
IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (  
    ownname    IN  VARCHAR2,  
    tabname    IN  VARCHAR2,  
    stattab    IN  VARCHAR2,  
    statid     IN  VARCHAR2 DEFAULT NULL,  
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name from where to import the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```
IMPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table from the user statistics table identified by stattab and stores them in the dictionary. Cascade results in all index statistics associated with the specified table being imported as well.

Syntax

```sql
DBMS_STATS.IMPORT_TABLE_STATS (
  ownname         VARCHAR2,
  tabname         VARCHAR2,
  partname        VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  cascade         BOOLEAN  DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
    get_param('NO_INVALIDATE')),
  force           BOOLEAN DEFAULT FALSE,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>cascade</td>
<td>If true, column and index statistics for this table are also imported</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure</td>
</tr>
<tr>
<td>force</td>
<td>Imports statistics even if table statistics are locked</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>OBJECT_STATS - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>SYNOPSES - information to support incremental statistics</td>
</tr>
</tbody>
</table>
Summary of DBMS_STATS Subprograms

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.
LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

```sql
DBMS_STATS.LOCK_PARTITION_STATS (  
    ownname VARCHAR2,  
    tabname VARCHAR2,  
    partname VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema to lock</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>[Sub]Partition name</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

\[
\text{DBMS_STATS.LOCK_SCHEMA_STATS (}
\text{ \ \ \ \ ownname} \ \ \ \ \text{VARCHAR2);}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema to lock</td>
</tr>
</tbody>
</table>

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the `UNLOCK_SCHEMA_STATS Procedure` nor the `UNLOCK_TABLE_STATS Procedure` is designed to unlock statistics of corresponding partitions. When you invoke the `LOCK_TABLE_STATS Procedure`, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the `LOCK_PARTITION_STATS Procedure`. 
LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
</tbody>
</table>

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the `UNLOCK_SCHEMA_STATS Procedure` nor the `UNLOCK_TABLE_STATS Procedure` is designed to unlock statistics of corresponding partitions. When you invoke the `LOCK_TABLE_STATS Procedure`, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the `LOCK_PARTITION_STATS Procedure`. 
MERGE_COL_USAGE Procedure

This procedure merges column usage information from a source database by means of a dblink into the local database. If column usage information already exists for a given table or column MERGE_COL_USAGE will combine both the local and the remote information.

Syntax

```sql
DBMS_STATS.MERGE_COL_USAGE (
    dblink    IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dblink</td>
<td>Name of dblink</td>
</tr>
</tbody>
</table>

Usage Notes

User must be SYS to execute this procedure. In addition the user specified during the creation of the dblink is expected to have privileges to select from tables in the SYS schema.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Parameter dblink cannot be NULL
- ORA-20002: Unable to create a TEMP table
These procedures convert user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

**Syntax**

```sql
DBMS_STATS.PREPARE_COLUMN_VALUES (    srec     IN OUT StatRec,    charvals        CHARARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (    srec      IN OUT StatRec,    datevals         DATEARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (    srec     IN OUT StatRec,    dblvals         DBLARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (    srec     IN OUT StatRec,    fltvals         FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (    srec     IN OUT StatRec,    numvals         NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (    srec     IN OUT StatRec,    rawvals         RAWARRAY);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srec.epc</td>
<td>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</td>
</tr>
<tr>
<td>srec.bkvals</td>
<td>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</td>
</tr>
</tbody>
</table>
Datatype-specific input parameters (use one) are shown in Table 155–72.

Table 155–72  Datatype-Specific Input Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charvals</td>
<td>The array of values when the column type is character-based. Up to the first 64 bytes of each string should be provided. Arrays must have between 2 and 2050 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.</td>
</tr>
<tr>
<td>datevals</td>
<td>Array of values when the column type is date-based</td>
</tr>
<tr>
<td>dblvals</td>
<td>Array of values when the column type is double-based</td>
</tr>
<tr>
<td>fltvals</td>
<td>Array of values when the column type is float-based</td>
</tr>
<tr>
<td>numvals</td>
<td>Array of values when the column type is numeric-based</td>
</tr>
<tr>
<td>rawvals</td>
<td>Array of values when the column type is RAW. Up to the first 64 bytes of each value should be provided.</td>
</tr>
<tr>
<td>nvmin, nvmax</td>
<td>Minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.</td>
</tr>
<tr>
<td>rwmin, rwmax</td>
<td>Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.</td>
</tr>
</tbody>
</table>

Output Parameters

Table 155–73  PREPARE_COLUMN_VALUES Procedure Output Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srec.minval</td>
<td>Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS</td>
</tr>
<tr>
<td>srec.maxval</td>
<td>Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS</td>
</tr>
<tr>
<td>srec.bkvals</td>
<td>Array suitable for use in a call to SET_COLUMN_STATS</td>
</tr>
</tbody>
</table>
### Exceptions

ORA-20001: Invalid or inconsistent input values

### Usage Notes

No special privilege or role is needed to invoke this procedure.
**PREPARE_COLUMN_VALUES_NVARCHAR Procedure**

This procedure converts user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures.

**Syntax**

```sql
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR (    srec     IN OUT StatRec,    nvmin           NVARCHAR2,    nvmax           NVARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| srec.epc  | Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).

The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.

| srec.bkvals | If you want a frequency or hybrid histogram, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called. |

| srec.rpcnts | If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output parameter and it must be set to NULL when this procedure is called. |

As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.

Note:
- Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above.
- Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.

Datatype-specific input parameters (use one) are shown in Table 155–72.
Table 155–75  PREPARE_COLUMN_VALUES_NVARCHAR Datatype-Specific Input Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvmin, nvmax</td>
<td>The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.</td>
</tr>
</tbody>
</table>

Output Parameters

Table 155–76  PREPARE_COLUMN_VALUES_NVARCHAR Procedure Output Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srec.minval</td>
<td>Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.</td>

</tr>
<tr>
<td>srec.rpcnts</td>
<td>Array suitable for use in a call to SET_COLUMN_STATS.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.
**PREPARE_COLUMN_VALUES_ROWID Procedure**

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

**Syntax**

```sql
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (  
srec  IN OUT StatRec,  
rwmin        ROWID,  
rwmax        ROWID);
```

**Pragmas**

```sql
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| srec      | Values (IN):  
| epc       |

---

**DBMS_STATS 155-137**
Datatype-specific input parameters (use one) are shown in Table 155–72.

Table 155–78  Datatype-Specific Input Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rwmin, rwmax</td>
<td>Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.</td>
</tr>
</tbody>
</table>

Usage Notes

No special privilege or role is needed to invoke this procedure.
PUBLISH_PENDING_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

Syntax

```sql
DBMS_STATS.PUBLISH_PENDING_STATS (  
  ownname    IN  VARCHAR2 DEFAULT USER,  
  tabname    IN  VARCHAR2,  
  no_invalidate   BOOLEAN DEFAULT  
    to_no_invalidate_type('NO_INVALIDATE'),  
  force      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Do not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, will override the lock</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter tabname is NULL then publish applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```sql
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```
PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary. To run this procedure, you must have the SYSDBA or both ANALYZE ANY_DICTIONARY and ANALYZE ANY system privilege.

Syntax

```
DBMS_STATS.PURGE_STATS(
    before_timestamp TIMESTAMP WITH TIME ZONE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>before_timestamp</td>
<td>Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.
REMAP_STAT_TABLE Procedure

This procedure remaps the names of objects in the user statistics table. It allows you to import the statistics to objects with same definition but with different names.

Syntax

```
DBMS_STATS.REMAP_STAT_TABLE (  
    ownname    IN    VARCHAR2,  
    stattab    IN    VARCHAR2,  
    src_own    IN    VARCHAR2,  
    src_tab    IN    VARCHAR2,  
    tgt_own    IN    VARCHAR2,  
    tgt_tab    IN    VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the statistics table. NULL means the current schema.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier</td>
</tr>
<tr>
<td>src_own</td>
<td>Owner of the table to be renamed. This argument cannot be NULL.</td>
</tr>
<tr>
<td>src_tab</td>
<td>Name of the table to be renamed. If NULL, all tables are owned by src_own.</td>
</tr>
<tr>
<td>tgt_own</td>
<td>New name of the owner of the table. The owner name is also updated for the dependent objects such as columns and indexes. Note that an index of src_tab not owned by src_own is not renamed. This argument cannot be NULL.</td>
</tr>
<tr>
<td>tgt_tab</td>
<td>New name of the table. This argument is valid only if src_tab is not NULL.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges
ORA-20001: Invalid input

Examples

The following statement remaps all objects of sh to shsave in user statistics table sh.ustat:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', NULL, 'shsave', NULL);
```

The following statement can be used to import statistics into objects of shsave once the preceding remap procedure is completed:

```
DBMS_STATS.IMPORT_SCHEMA_STATS ('shsave', 'ustat', statown => 'sh');
```

The following statement remaps sh.customers to shsave.customers_sav:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', 'customers','shsave', 'customers_sav');
```
REPORT_COL_USAGE Function

This function reports the recorded column (group) usage information.

Syntax

```
DBMS_STATS.REPORT_COL_USAGE (
    ownname    IN    VARCHAR2,
    tabname    IN    VARCHAR2)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name. If NULL it reports column usage information for tables in all schemas in the database.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name. If NULL it reports column usage information for all tables of ownname.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
**REPORT_GATHER_AUTO_STATS Function**

This function runs the auto statistics gathering job in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when auto statistics gathering is invoked are reported.

**Syntax**

```sql
DBMS_STATS.REPORT_GATHER_AUTO_STATS (
    detail_level VARCHAR2 DEFAULT 'TYPICAL',
    format VARCHAR2 DEFAULT 'TEXT')
RETURN CLOB;
```
Parameters

<table>
<thead>
<tr>
<th>Table 155–83 REPORT_GATHER_AUTO_STATS Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>detail_level</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (**CONCURRENT** preference is turned on).

<tbody>
<tr>
<td>format</td>
<td>Report format:</td>
</tr>
<tr>
<td></td>
<td>- XML</td>
</tr>
<tr>
<td></td>
<td>- HTML</td>
</tr>
<tr>
<td></td>
<td>- TEXT (Default)</td>
</tr>
</tbody>
</table>

### Usage Notes

Only user SYS can run the `REPORT_GATHER_AUTO_STATS` function.
REPORT_GATHER_DATABASE_STATS Functions

This function runs the GATHER_DATABASE_STATS Procedures in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when GATHER_DATABASE_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER_DATABASE_STATS with two extra parameters.

Syntax

```sql
DBMS_STATS.REPORT_GATHER_DATABASE_STATS (
    estimate_percent IN NUMBER DEFAULT to_estimate_percent_type (GET_PARAM('ESTIMATE_PERCENT')),
    block_sample IN BOOLEAN DEFAULT FALSE,
    method_opt IN VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
    degree IN NUMBER DEFAULT TO_DEGREE_TYPE(GET_PARAM('DEGREE')),
    granularity IN VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    cascade IN BOOLEAN DEFAULT to_cascade_type (GET_PARAM('CASCADE')),
    stattab IN VARCHAR2 DEFAULT NULL,
    statid IN VARCHAR2 DEFAULT NULL,
    options IN VARCHAR2 DEFAULT 'GATHER',
    objlist OUT ObjectTab,
    statown IN VARCHAR2 DEFAULT NULL,
    gather_sys IN BOOLEAN DEFAULT TRUE,
    no_invalidate IN BOOLEAN DEFAULT TO_NO_INVALIDATE_TYPE(GET_PARAM('NO_INVALIDATE')),
    obj_filter_list IN ObjectTab DEFAULT NULL,
    detail_level IN VARCHAR2 DEFAULT 'TYPICAL',
    format IN VARCHAR2 DEFAULT 'TEXT'
) RETURN CLOB;
```

```sql
DBMS_STATS.REPORT_GATHER_DATABASE_STATS (
    estimate_percent IN NUMBER DEFAULT to_estimate_percent_type (GET_PARAM('ESTIMATE_PERCENT')),
    block_sample IN BOOLEAN DEFAULT FALSE,
    method_opt IN VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
    degree IN NUMBER DEFAULT TO_DEGREE_TYPE(GET_PARAM('DEGREE')),
    granularity IN VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    cascade IN BOOLEAN DEFAULT to_cascade_type (GET_PARAM('CASCADE')),
    stattab IN VARCHAR2 DEFAULT NULL,
    statid IN VARCHAR2 DEFAULT NULL,
    options IN VARCHAR2 DEFAULT 'GATHER',
    statown IN VARCHAR2 DEFAULT NULL,
    gather_sys IN BOOLEAN DEFAULT TRUE,
    no_invalidate IN BOOLEAN DEFAULT TO_NO_INVALIDATE_TYPE(GET_PARAM('NO_INVALIDATE')),
    obj_filter_list IN ObjectTab DEFAULT NULL,
    detail_level IN VARCHAR2 DEFAULT 'TYPICAL',
    format IN VARCHAR2 DEFAULT 'TEXT'
) RETURN CLOB;
```
Parameters

Table 155–84 REPORT_GATHER_DATABASE_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Accepts: FOR ALL [INDEXED</td>
</tr>
<tr>
<td>degree</td>
<td>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</td>
</tr>
</tbody>
</table>
Granularity of statistics to collect (only pertinent if the table is partitioned).

- `'ALL'` - Gathers all (subpartition, partition, and global) statistics
- `'AUTO'` - Determines the granularity based on the partitioning type. This is the default value.
- `'DEFAULT'` - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the `'GLOBAL AND PARTITION'` for this functionality. Note that the default value is now `'AUTO'`.
- `'GLOBAL'` - Gathers global statistics
- `'GLOBAL AND PARTITION'` - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- `'PARTITION'` - Gathers partition-level statistics
- `'SUBPARTITION'` - Gathers subpartition-level statistics

Gather statistics on the indexes as well. Using this option is equivalent to running the `GATHER_INDEX_STATS` Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant `DBMS_STATS.AUTO.Cascade` to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the `SET_DATABASE_PREFS` Procedure, `SET_GLOBAL_PREFS` Procedure, `SET_SCHEMA_PREFS` Procedure and `SET_TABLE_PREFS` Procedure.

User statistics table identifier describing where to save the current statistics.

The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.

Identifier (optional) to associate with these statistics within `stattab`. 

### Table 155–84  (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>granularity</td>
<td>Granularity of statistics to collect (only pertinent if the table is partitioned).</td>
</tr>
<tr>
<td>cascade</td>
<td>Gather statistics on the indexes as well. Using this option is equivalent to running the <code>GATHER_INDEX_STATS</code> Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO.Cascade</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <code>SET_DATABASE_PREFS</code> Procedure, <code>SET_GLOBAL_PREFS</code> Procedure, <code>SET_SCHEMA_PREFS</code> Procedure and <code>SET_TABLE_PREFS</code> Procedure.</td>
</tr>
<tr>

Table 155–84 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters
REPORT_GATHER_DICTIONARY_STATS Functions

This function runs the GATHER_DICTIONARY_STATS Procedure in reporting mode. That is, statistics are not actually collected, but all objects affected when GATHER_DICTIONARY_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER_DICTIONARY_STATS with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (
  comp_id               IN    VARCHAR2   DEFAULT NULL,
  estimate_percent      IN    NUMBER     DEFAULT TO_ESTIMATE_PERCENT_TYPE
                (GET_PARAM('ESTIMATE_PERCENT')),
  block_sample          IN    BOOLEAN    DEFAULT FALSE,
  method_opt            IN    VARCHAR2   DEFAULT GET_PARAM('METHOD_OPT'),
  degree                IN    NUMBER     DEFAULT TO_DEGREE_TYPE
                (GET_PARAM('DEGREE')),
  granularity           IN    VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
  cascade               IN    BOOLEAN    DEFAULT GET_PARAM('CASCADE'),
  stattab               IN    VARCHAR2   DEFAULT NULL,
  statid                IN    VARCHAR2   DEFAULT NULL,
  options               IN    VARCHAR2   DEFAULT 'GATHER AUTO',
  objlist               OUT   ObjectTab,
  statown               IN    VARCHAR2   DEFAULT NULL,
  no_invalidate         IN    BOOLEAN    DEFAULT GET_PARAM('NO_INVALIDATE'),
  obj_filter_list       IN    ObjectTab  DEFAULT NULL,
  detail_level          IN    VARCHAR2   DEFAULT 'TYPICAL',
  format                IN    VARCHAR2   DEFAULT 'TEXT')
RETURN CLOB;
```

```
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (
  comp_id               IN    VARCHAR2   DEFAULT NULL,
  estimate_percent      IN    NUMBER     DEFAULT TO_ESTIMATE_PERCENT_TYPE
                (GET_PARAM('ESTIMATE_PERCENT')),

  detail_level          IN    VARCHAR2   DEFAULT 'TYPICAL',
  format                IN    VARCHAR2   DEFAULT 'TEXT')
RETURN CLOB;
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comp_id</td>
<td>Component id of the schema to analyze (NULL will result in analyzing schemas of all RDBMS components). Please refer to comp_id column of DBA_REGISTRY view. The procedure always gather statistics on 'SYS' and 'SYSTEM' schemas regardless of this argument.</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Accepts:</td>
</tr>
<tr>
<td></td>
<td>■ FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>size_clause is defined as size_clause := SIZE (integer</td>
</tr>
<tr>
<td></td>
<td>- integer: Number of histogram buckets. Must be in the range [1, 2048].</td>
</tr>
<tr>
<td></td>
<td>- REPEAT: Collects histograms only on the columns that already have histograms.</td>
</tr>
<tr>
<td></td>
<td>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td></td>
<td>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</td>
</tr>
<tr>
<td></td>
<td>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>degree</td>
<td>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</td>
</tr>
</tbody>
</table>
### REPORT_GATHER_DICTIONARY_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>granularity</td>
<td>Granularity of statistics to collect (only pertinent if the table is partitioned).&lt;br&gt; 'ALL' - Gathers all (subpartition, partition, and global) statistics&lt;br&gt; 'AUTO' - Determines the granularity based on the partitioning type. This is the default value.&lt;br&gt; 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.&lt;br&gt; 'GLOBAL' - Gathers global statistics&lt;br&gt; 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.&lt;br&gt; 'PARTITION' - Gathers partition-level statistics&lt;br&gt; 'SUBPARTITION' - gathers subpartition-level statistics</td>
</tr>
<tr>
<td>cascade</td>
<td>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to save the current statistics</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>options</td>
<td>Further specification of objects for which to gather statistics:&lt;br&gt; - 'GATHER' - Gathers statistics on all objects in the schema&lt;br&gt; - 'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, stattab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed.&lt;br&gt; - 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale.&lt;br&gt; - 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics.&lt;br&gt; - 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO'&lt;br&gt; - 'LIST STALE' - Returns list of stale objects as determined by looking at the *_tab_modifications views&lt;br&gt; - 'LIST EMPTY' - Returns list of objects which currently have no statistics</td>
</tr>
</tbody>
</table>
### Table 155–85 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objlist</td>
<td>The list of objects found to be stale or empty</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>obj_filter_list</td>
<td>A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true.</td>

Return Values

A CLOB object that contains the report

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges
ORA-20001: Bad input value
ORA-20002: Bad user statistics table, may need to upgrade it
REPORT_GATHER_FIXED_OBJ_STATS Function

This function runs the \texttt{GATHER\_FIXED\_OBJECTS\_STATS} Procedure in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when \texttt{GATHER\_FIXED\_OBJ\_STATS} is invoked are reported. The input set of parameters are exactly the same as in \texttt{GATHER\_FIXED\_OBJ\_STATS} with two extra parameters.

Syntax

\begin{verbatim}
DBMS_STATS.REPORT_GATHER_FIXED_OBJ_STATS (  
  stattab          IN  VARCHAR2 DEFAULT NULL,  
  statid           IN  VARCHAR2 DEFAULT NULL,  
  statown          IN  VARCHAR2 DEFAULT NULL,  
  no_invalidate    IN  BOOLEAN  DEFAULT TO_NO_INVALIDATE_TYPE (  
                        GET_PARAM('NO_INVALIDATE')),  
  detail_level     IN  VARCHAR2   DEFAULT 'TYPICAL',  
  format           IN  VARCHAR2   DEFAULT 'TEXT')  
RETURN CLOB;
\end{verbatim}

detail_level

Detail level for the content of the report

- **BASIC**: The report includes
  - operation ID
  - operation name
  - operation target object
  - start time
  - end time
  - completion status (such as: succeeded, failed)

- **TYPICAL**: In addition to the information provided at level **BASIC**, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation-related details:
  - total number of target objects
  - total number of successfully completed objects
  - total number of failed objects
  - total number of timed-out objects (applies to only auto statistics gathering)
  
  With regard to target objects:
  - owner and name of each target object
  - target object type (such as: table, index)
  - start time
  - end time
  - completion status

- **ALL**: In addition to the information provided at level **TYPICAL**, the report includes further information on each target object. Specifically, with regard to operation-related details:
  - job name
  - session ID
  - parameter values
  - error message if the operation failed

  With regard to target objects:
  - job name
  - batching details
  - estimated cost
  - rank in the target list
  - columns for which histograms were collected
  - list of collected extended statistics (if any)
  - additional error details if the task has failed.

Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (**CONCURRENT** preference is turned on).

</tr>
<tr>
<td>degree</td>
<td>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</td>
</tr>
</tbody>
</table>
Granularity of statistics to collect (only pertinent if the table is partitioned).

- **ALL** - Gathers all (subpartition, partition, and global) statistics
- **AUTO** - Determines the granularity based on the partitioning type. This is the default value.
- **DEFAULT** - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
- **GLOBAL** - Gathers global statistics
- **GLOBAL AND PARTITION** - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- **PARTITION** - Gathers partition-level statistics
- **SUBPARTITION** - Gathers subpartition-level statistics.

Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

User statistics table identifier describing where to save the current statistics

Identifier (optional) to associate with these statistics within stattrab

Further specification of which objects to gather statistics for:

- **GATHER**: Gathers statistics on all objects in the schema.
- **GATHER AUTO**: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, stattrab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects.
- **GATHER STALE**: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale.
- **GATHER EMPTY**: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics.
- **LIST AUTO**: Returns a list of objects to be processed with GATHER AUTO.
- **LIST STALE**: Returns list of stale objects as determined by looking at the *_tab_modifications views.
- **LIST EMPTY**: Returns list of objects which currently have no statistics.

List of objects found to be stale or empty

<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail_level</td>
<td>Detail level for the content of the report</td>
</tr>
</tbody>
</table>

- **BASIC**: The report includes
  - operation ID
  - operation name
  - operation target object
  - start time
  - end time
  - completion status (such as: succeeded, failed)

- **TYPICAL**: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details:
  - total number of target objects
  - total number of successfully completed objects
  - total number of failed objects
  - total number of timed-out objects (applies to only auto statistics gathering)

  With regard to target objects:
  - owner and name of each target object
  - target object type (such as: table, index)
  - start time
  - end time
  - completion status

- **ALL**: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details:
  - job name
  - session ID
  - parameter values
  - error message if the operation failed

  With regard to target objects:
  - job name
  - batching details
  - estimated cost
  - rank in the target list
  - columns for which histograms were collected
  - list of collected extended statistics (if any)
  - additional error details if the task has failed.

Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).
Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

When you use a specific value for the sampling percentage, `DBMS_STATS` honors it except for when:

- The result is less than 2500 rows (too small a sample) and
- The specified percentage is more than the certain percentage.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges
ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the `SAMPLE` schema and any table in the `SYS` schema, if stale, will have statistics gathered upon it.

```sql
DECLARE
  filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
  filter_lst.extend(2);
  filter_lst[1].ownname := 'SAMPLE';
  filter_lst[1].objname := 'T%';
  filter_lst[2].ownname := 'SYS';
  DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                 options => 'GATHER STALE');
END;
```

</table>
REPORT_GATHER_TABLE_STATS Function

This procedure runs the GATHER_TABLE_STATS Procedure in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when GATHER_TABLE_STATS is invoked are reported.

Syntax

```sql
DBMS_STATS.REPORT_GATHER_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                      (get_param('ESTIMATE_PERCENT'))),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE'))),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE'))),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type
                      (get_param('NO_INVALIDATE'))),
   stattype         VARCHAR2 DEFAULT 'DATA',
   force            BOOLEAN  DEFAULT FALSE)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of table to analyze</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of partition</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.</td>
</tr>
</tbody>
</table>
Table 155–88 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| method_opt | Accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]
■ FOR COLUMNS [column_clause] [size_clause]
size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}

column_clause is defined as column_clause := column_name | extension name | extension
- integer : Number of histogram buckets. Must be in the range [1,2048].
- REPEAT : Collects histograms only on the columns that already have histograms
- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.
- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.
- column_name : Name of a column
- extension : can be either a column group in the format of (column_name, Colume_name [, ...]) or an expression
The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. |
| degree | Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution. |
**granularity**

Granularity of statistics to collect (only pertinent if the table is partitioned).

- `'ALL'` - Gathers all (subpartition, partition, and global) statistics
- `'APPROX_GLOBAL AND PARTITION'` - similar to `'GLOBAL AND PARTITION'` but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if `partname` is `NULL` or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).
- `'AUTO'` - Determines the granularity based on the partitioning type. This is the default value.
- `'DEFAULT'` - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the `'GLOBAL AND PARTITION'` for this functionality. Note that the default value is now `'AUTO'`.
- `'GLOBAL'` - Gathers global statistics
- `'GLOBAL AND PARTITION'` - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- `'PARTITION'` - Gathers partition-level statistics
- `'SUBPARTITION'` - Gathers subpartition-level statistics.

**cascade**

Gathers statistics on the indexes for this table. Using this option is equivalent to running the `GATHER_INDEX_STATS Procedure` on each of the table’s indexes. Use the constant `DBMS_STATS.AUTO_CASCADE` to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the `SET_DATABASE_PREFS Procedure`, `SET_GLOBAL_PREFS Procedure`, `SET_SCHEMA_PREFS Procedure` and `SET_TABLE_PREFS Procedure`.

**stattab**

User statistics table identifier describing where to save the current statistics

**statid**

Identifier (optional) to associate with these statistics within `stattab`

**statown**

Schema containing `stattab` (if different than `ownname`)

**no_invalidate**

Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE` to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the `SET_DATABASE_PREFS Procedure`, `SET_GLOBAL_PREFS Procedure`, `SET_SCHEMA_PREFS Procedure` and `SET_TABLE_PREFS Procedure`.

**stattype**

Statistics type. The only value allowed is `DATA`.

**force**

Gather statistics of table even if it is locked

---

</tbody>
</table>
REPORT_SINGLE_STATS_OPERATION Function

This function generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment.

Syntax

```plsql
DBMS_STATS.REPORT_SINGLE_STATS_OPERATIONS (
  opid              NUMBER,
  detail_level      VARCHAR2  DEFAULT 'TYPICAL',
  format            VARCHAR2  DEFAULT 'TEXT'
  container_id      NUMBER    DEFAULT NULL)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opid</td>
<td>Operation ID</td>
</tr>
</tbody>
</table>
**Summary of DBMS_STATS Subprograms**

**Detail Level**

- **BASIC:** The report includes
  - operation ID
  - operation name
  - operation target object
  - start time
  - end time
  - completion status (such as: succeeded, failed)

- **TYPICAL:** In addition to the information provided at level **BASIC,** the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation-related details:
  - total number of target objects
  - total number of successfully completed objects
  - total number of failed objects
  - total number of timed-out objects (applies to only auto statistics gathering)

  With regard to target objects:
  - owner and name of each target object
  - target object type (such as: table, index)
  - start time
  - end time
  - completion status

- **ALL:** In addition to the information provided at level **TYPICAL,** the report includes further information on each target object. Specifically, with regard to operation-related details:
  - job name
  - session ID
  - parameter values
  - error message if the operation failed

  With regard to target objects:
  - job name
  - batching details
  - estimated cost
  - rank in the target list
  - columns for which histograms were collected
  - list of collected extended statistics (if any)
  - reason for including the object in the target list (applies to only automatic statistics gathering operation tasks)
  - additional error details if the task has failed.

Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (**CONCURRENT** preference is turned on).
### Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

---

**Table 155–89  (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Report format:</td>
</tr>
<tr>
<td></td>
<td>- XML</td>
</tr>
<tr>
<td></td>
<td>- HTML</td>
</tr>
<tr>
<td></td>
<td>- TEXT (Default)</td>
</tr>
<tr>
<td>container_id</td>
<td>ID of the pluggable database (PDB) on which this operation was performed. Note that in a multitenant environment, operation ID does not uniquely identify an operation. That is, different operations from distinct PDBs may have the same operation ID. Hence, in a multitenant environment, if a PDB ID is not provided, then the report may contain multiple operations. In a typical (non-CDB) database environment, operation ID is unique to each operation.</td>
</tr>
</tbody>
</table>
REPORT_STATS_OPERATIONS Function

This function generates a report of all statistics operations that take place between two timestamps which may or may not have been provided. It allows the scope of the report to be narrowed down so that report will include only auto statistics gathering runs. Furthermore, in a multitenant environment, users may optionally provide a set of pluggable database (PDB) IDs so that only statistics operations from the specified pluggable databases will be reported.

Syntax

```sql
DBMS_STATS.REPORT_STATS_OPERATIONS (  
detail_level VARCHAR2 DEFAULT 'TYPICAL',  
format VARCHAR2 DEFAULT 'TEXT',  
latestN NUMBER DEFAULT NULL,  
since TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
until TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
auto_only BOOLEAN DEFAULT FALSE,  
container_ids DBMS_UTILITY.NUMBER_ARRAY DEFAULT DBMS_STATS.NULL_NUMTAB)  
RETURN CLOB;
```

Parameters

</tbody>
</table>

DBMS_STATS 155-175
Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

Examples

Note that the type for container_ids input parameter is DBMS_UTILITY.NUMBER_ARRAY which is an associative PL/SQL array collection. Although associative array type allows for more flexible harvals table-like organization of entries, this function treats container_ids as a regular table collection with the first ID located at index 1 and the last id located at index container_ids.count without any empty array slot left between any two IDs. An example for 3 container ids is provided.

 DECLARE
   conid_tab  DBMS_UTILITY.NUMBER_ARRAY;
   report clob;
 BEGIN
   conid_tab(1) := 124;
   conid_tab(2) := 63;
   conid_tab(3) := 98;
   report := DBMS_STATS.REPORT_STATS_OPERATIONS (container_ids => conid_tab);
 END;
RESET_GLOBAL_PREF_DEFAULTS Procedure

This procedures sets global preference, such as CASCADE, ESTIMATE_PERCENT and GRANULARITY, to default values. This reverses the global preferences set by the SET_ GLOBAL_PREFS Procedure.

Syntax

DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.
RESET_PARAM_DEFAULTS Procedure

**Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the RESET_GLOBAL_PREF_DEFAULTS Procedure.

See also Deprecated Subprograms on page 155-13.

This procedure resets the default values of all parameters to Oracle recommended values.

**Syntax**

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```
RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DATABASE_STATS(
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE,
    no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                        (GET_PARAM('NO_INVALIDATE')));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent values
- ORA-20006: Unable to restore statistics, statistics history not available
RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (as_of_timestamp).

Syntax

```plsql
DBMS_STATS.RESTORE_DICTIONARY_STATS(
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE,
    no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                           (GET_PARAM('NO_INVALIDATE')));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>Timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure</td>
</tr>
<tr>
<td></td>
<td>invalidates the dependent cursors immediately if set to FALSE. Use</td>
</tr>
<tr>
<td></td>
<td>DBMS_STATS.AUTOMATIC_INVALIDATE. to have Oracle decide when to invalidate</td>
</tr>
<tr>
<td></td>
<td>dependent cursors. This is the default. The default can be changed using</td>
</tr>
<tr>
<td></td>
<td>the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_</td>
</tr>
<tr>
<td></td>
<td>PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent values
- ORA-20006: Unable to restore statistics, statistics history not available
RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (as_of_timestamp).

Syntax

DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
  as_of_timestamp        TIMESTAMP WITH TIME ZONE,
  force                  BOOLEAN DEFAULT FALSE,
  no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                         (GET_PARAM('NO_INVALIDATE')));

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values
ORA-20006: Unable to restore statistics, statistics history not available
RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
  ownname                VARCHAR2,
  as_of_timestamp        TIMESTAMP WITH TIME ZONE,
  force                  BOOLEAN DEFAULT FALSE,
  no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                          (GET_PARAM('NO_INVALIDATE')));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of the tables for which the statistics are to be restored</td>
</tr>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent values
- ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
    as_of_timestamp    TIMESTAMP WITH TIME ZONE);
```

Parameters

**Table 155–95  RESTORE_SYSTEM_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values
ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.
RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). The procedure will restore statistics of associated indexes and columns as well. If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
    ownname                   VARCHAR2,
    tabname                   VARCHAR2,
    as_of_timestamp           TIMESTAMP WITH TIME ZONE,
    restore_cluster_index     BOOLEAN DEFAULT FALSE,
    force                     BOOLEAN DEFAULT FALSE,
    no_invalidate             BOOLEAN DEFAULT to_no_invalidate_type
                               (GET_PARAM('NO_INVALIDATE')));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The schema of the table for which the statistics are to be restored</td>
</tr>
<tr>
<td>tabname</td>
<td>The table name</td>
</tr>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>restore_cluster_index</td>
<td>If the table is part of a cluster, restore statistics of the cluster index if set to TRUE</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent values
- ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
SEED_COL_USAGE Procedure

This procedure seeds column usage information from statements in the specified SQL tuning set. It iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements. You can monitor the workload on the system for a given amount of time and seed the column usage information based on the columns that appear in statements executed during the monitoring window.

Syntax

```sql
DBMS_STATS.SEED_COL_USAGE (sqlset_name IN VARCHAR2,
                               owner_name IN VARCHAR2,
                               time_limit IN POSITIVE DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Name of the SQL tuning set</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the SQL tuning set</td>
</tr>
<tr>
<td>time_limit</td>
<td>Time limit (in seconds)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

This procedure also records group of columns. Extensions for the recorded group of columns can be created using the `CREATE_EXTENDED_STATS Function` procedure. If `sqlset_name` and `owner_name` are `NULL`, it records the column (group) usage information for the statements executed in the system in next `time_limit` seconds.

Examples

The following example turns on monitoring for 5 minutes or 300 seconds.

```sql
BEGIN
    DBMS_STATS.SEED_COL_USAGE (null,null,300);
END;
```
This procedure sets column-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is `NULL`, the statistics type associated with the index or column is stored.

### Syntax

```sql
DBMS_STATS.SET_COLUMN_STATS(
  ownname       VARCHAR2,
  tabname       VARCHAR2,
  colname       VARCHAR2,
  partname      VARCHAR2 DEFAULT NULL,
  stattab       VARCHAR2 DEFAULT NULL,
  statid        VARCHAR2 DEFAULT NULL,
  distcnt       NUMBER DEFAULT NULL,
  density       NUMBER DEFAULT NULL,
  nullcnt       NUMBER DEFAULT NULL,
  srec          StatRec DEFAULT NULL,
  avgclen       NUMBER DEFAULT NULL,
  flags         NUMBER DEFAULT NULL,
  statown       VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
    get_param('NO_INVALIDATE')),
  force         BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```sql
DBMS_STATS.SET_COLUMN_STATS(
  ownname       VARCHAR2,
  tabname       VARCHAR2,
  colname       VARCHAR2,
  partname      VARCHAR2 DEFAULT NULL,
  stattab       VARCHAR2 DEFAULT NULL,
  statid        VARCHAR2 DEFAULT NULL,
  ext_stats     RAW,
  stattypown    VARCHAR2 DEFAULT NULL,
  stattypname   VARCHAR2 DEFAULT NULL,
  statown       VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
    get_param('NO_INVALIDATE')),
  force         BOOLEAN DEFAULT FALSE);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs.</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition in which to store the statistics. If the table is partitioned and partname is <code>NULL</code>, then the statistics are stored at the global table level.</td>
</tr>
</tbody>
</table>
### Table 155–98 (Cont.) SET_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>ext_stats</td>
<td>User-defined statistics</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type</td>
</tr>
<tr>
<td>stattypename</td>
<td>Name of the statistics type</td>
</tr>
<tr>
<td>distcnt</td>
<td>Number of distinct values</td>
</tr>
<tr>
<td>density</td>
<td>Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.</td>
</tr>
<tr>
<td>nullcnt</td>
<td>Number of NULLs</td>
</tr>
<tr>
<td>srec</td>
<td>StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS</td>
</tr>
<tr>
<td>avgclen</td>
<td>Average length for the column (in bytes)</td>
</tr>
<tr>
<td>flags</td>
<td>For internal Oracle use (should be left as NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Sets the values even if statistics of the column are locked</td>
</tr>
</tbody>
</table>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent input values

ORA-20005: Object statistics are locked

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
SET_DATABASE_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```sql
DBMS_STATS.SET_DATABASE_PREFS (  
   pname            IN   VARCHAR2,  
   pvalue           IN   VARCHAR2,  
   add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</td>
</tr>
<tr>
<td></td>
<td>■ CASCADE</td>
</tr>
<tr>
<td></td>
<td>■ DEGREE</td>
</tr>
<tr>
<td></td>
<td>■ ESTIMATE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>■ METHOD_OPT</td>
</tr>
<tr>
<td></td>
<td>■ NO_INVALIDATE</td>
</tr>
<tr>
<td></td>
<td>■ GRANULARITY</td>
</tr>
<tr>
<td></td>
<td>■ PUBLISH</td>
</tr>
<tr>
<td></td>
<td>■ INCREMENTAL</td>
</tr>
<tr>
<td></td>
<td>■ INCREMENTAL_STALENESS</td>
</tr>
<tr>
<td></td>
<td>■ INCREMENTAL_LEVEL</td>
</tr>
<tr>
<td></td>
<td>■ STALE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>■ GLOBAL_TEMP_TABLE_STATS</td>
</tr>
<tr>
<td></td>
<td>■ TABLE_CACHED_BLOCKS</td>
</tr>
<tr>
<td></td>
<td>■ OPTIONS</td>
</tr>
</tbody>
</table>

- CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics
- DEGREE - The value determines degree of parallelism used for gathering statistics
- ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is `[0.000001, 100]`. Use the constant `DBMS_STATS.AUTO_SAMPLE_SIZE` to have Oracle determine the appropriate sample size for good statistics. This is the default.
Summary of DBMS_STATS Subprograms

Table 155–99  (Cont.) SET_DATABASE_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method_opt</td>
<td>When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed:</td>
</tr>
<tr>
<td></td>
<td>- FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>size_clause is defined as size_clause := SIZE (integer</td>
</tr>
<tr>
<td></td>
<td>- integer: Number of histogram buckets. Must be in the range [1,2048].</td>
</tr>
<tr>
<td></td>
<td>- REPEAT: Collects histograms only on the columns that already have histograms.</td>
</tr>
<tr>
<td></td>
<td>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td></td>
<td>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</td>
</tr>
<tr>
<td></td>
<td>The default is FOR ALL COLUMNS SIZE AUTO. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>NO_INVALIDATE</td>
<td>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</td>
</tr>
<tr>
<td>GRANULARITY</td>
<td>The value determines granularity of statistics to collect (only pertinent if the table is partitioned)</td>
</tr>
<tr>
<td>'ALL'</td>
<td>gathers all (subpartition, partition, and global) statistics</td>
</tr>
<tr>
<td>'AUTO'</td>
<td>determines the granularity based on the partitioning type. This is the default value.</td>
</tr>
<tr>
<td>'DEFAULT'</td>
<td>gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</td>
</tr>
<tr>
<td>'GLOBAL'</td>
<td>gathers global statistics</td>
</tr>
<tr>
<td>'GLOBAL AND PARTITION'</td>
<td>gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</td>
</tr>
<tr>
<td>'PARTITION'</td>
<td>gathers partition-level statistics</td>
</tr>
<tr>
<td>'SUBPARTITION'</td>
<td>gathers subpartition-level statistics</td>
</tr>
<tr>
<td>PUBLISH</td>
<td>This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</td>
</tr>
</tbody>
</table>
INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:

- the INCREMENTAL value for the partitioned table is set to TRUE;
- the PUBLISH value for the partitioned table is set to TRUE;
- the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.

If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.

INCREMENTAL_LEVEL - This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:

- TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SHEMA_PREFS procedures.
- PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non-partitioned table, no synopses are gathered.

INCREMENTAL_STALENESS - This value controls how we decide a partition or subpartition as stale. It takes an enumeration of values which may be multiple, such as ‘USE_STALE_PERCENT’, ‘USE_LOCKED_STATS’.

- USE_STALE_PERCENT - a partition/subpartition is not considered as stale if DML changes are less than the STALE_PERCENT preference value
- USE_LOCKED_STATS - locked partitions/subpartitions statistics are not considered as stale, regardless of DML changes
- NULL - this is the default value, meaning a partition or subpartition is considered as stale as long as it has any DML changes. When the default value is used, statistics gathered in incremental mode are guaranteed to be the same as the statistics gathered in non-incremental mode. When a non-default value is used, the statistics gathered in incremental mode might be less accurate than those gathered in non-incremental mode.
Summary of DBMS_STATS Subprograms

DBMS_STATS
155-191

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE','99');

Table 155-99 (Cont.) SET_DATABASE_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STALE_PERCENT</td>
<td>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10, meaning a table having more than 10% of changes is considered as stale.</td>
</tr>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS</td>
<td>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values:</td>
</tr>
<tr>
<td></td>
<td>■ SHARED - All sessions see the same set of statistics</td>
</tr>
<tr>
<td></td>
<td>■ SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.</td>
</tr>
<tr>
<td>TABLE_CACHED_BLOCKS</td>
<td>The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.</td>
</tr>
<tr>
<td>OPTIONS</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS Procedure. The preference takes two values:</td>
</tr>
<tr>
<td></td>
<td>■ GATHER (default) - Gathers statistics for all objects in the table</td>
</tr>
<tr>
<td></td>
<td>■ GATHER AUTO - Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk loads during which statistics have been gathered. Note that this is only applicable to tables that do not have INCREMENTAL turned on. The GATHER_TABLE_STATS Procedure on these tables with GATHER AUTO options will skip regathering the already fresh statistics.</td>
</tr>
<tr>
<td>pvalue</td>
<td>Preference value. If NULL is specified, it will set the Oracle default value.s</td>
</tr>
<tr>
<td>add_sys</td>
<td>Value TRUE will include the Oracle-owned tables.</td>
</tr>
</tbody>
</table>
SET_GLOBAL_PREFS Procedure

This procedure is used to set the global statistics preferences.

Syntax

```sql
DBMS_STATS.SET_GLOBAL_PREFS (  
    pname     IN   VARCHAR2,  
    pvalue    IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Preference name. The default value for the following preferences can be set:</td>
</tr>
<tr>
<td></td>
<td>- AUTOSTATS_TARGET</td>
</tr>
<tr>
<td></td>
<td>- CASCADE</td>
</tr>
<tr>
<td></td>
<td>- CONCURRENT</td>
</tr>
<tr>
<td></td>
<td>- DEGREE</td>
</tr>
<tr>
<td></td>
<td>- ESTIMATE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>- GLOBAL_TEMP_TABLE_STATS</td>
</tr>
<tr>
<td></td>
<td>- GRANULARITY</td>
</tr>
<tr>
<td></td>
<td>- INCREMENTAL</td>
</tr>
<tr>
<td></td>
<td>- INCREMENTAL_LEVEL</td>
</tr>
<tr>
<td></td>
<td>- INCREMENTAL_STALENESS</td>
</tr>
<tr>
<td></td>
<td>- METHOD_OPT</td>
</tr>
<tr>
<td></td>
<td>- NO_INVALIDATE</td>
</tr>
<tr>
<td></td>
<td>- PUBLISH</td>
</tr>
<tr>
<td></td>
<td>- STALE_PERCENT</td>
</tr>
<tr>
<td></td>
<td>- TABLE_CACHED_BLOCKS</td>
</tr>
<tr>
<td></td>
<td>- OPTIONS</td>
</tr>
</tbody>
</table>

AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection. It takes the following values:

- ‘ALL’ - Statistics collected for all objects in system
- ‘ORACLE’ - Statistics collected for all Oracle owned objects
- ‘AUTO’ - Oracle decides on which objects to collect statistics

CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics.
CONCURRENT - This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time:
  ■ 'MANUAL' - Concurrency will be turned on only for manual statistics gathering.
  ■ 'AUTOMATIC' - Concurrency will be turned on only for the automatic statistics gathering.
  ■ 'ALL' - Concurrency will be turned on for both manual and automatic statistics gathering.
  ■ 'OFF' - Concurrency will be turned off for both manual and automatic statistics.

DEGREE - Determines degree of parallelism used for gathering statistics.

ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

GLOBAL_TEMP_TABLE_STATS - This preference takes two values: SHARED or SESSION (default).
  ■ SHARED - All sessions see the same set of statistics
  ■ SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.

GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned).
  ■ 'ALL' - Gathers all (subpartition, partition, and global) statistics
  ■ 'AUTO' - Determines the granularity based on the partitioning type. This is the default value.
  ■ 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
  ■ 'GLOBAL' - Gathers global statistics
  ■ 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
  ■ 'PARTITION' - gathers partition-level statistics
  ■ 'SUBPARTITION' - gathers subpartition-level statistics.

</tbody>
</table>
INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:

- INCREMENTAL value for the partitioned table is set to TRUE
- PUBLISH value for the partitioned table is set to TRUE;
- User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table

If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.

METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:

- FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]
  
  size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}
  
  - integer: Number of histogram buckets. Must be in the range [1,2048].
  - REPEAT: Collects histograms only on the columns that already have histograms
  - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns
  - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns
  - column_name: name of a column
  - extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression

  The default is FOR ALL COLUMNS SIZE AUTO.

NO_INVALIDATE - Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.

PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.

<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STALE_PERCENT</td>
<td>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%. Note that if you set stale_percent to zero the AUTO STATS gathering job will gather statistics for this table every time a row in the table is modified.</td>
</tr>
<tr>
<td>TABLE_CACHED_BLOCKS</td>
<td>The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.</td>
</tr>
</tbody>
</table>
| OPTIONS            | Determines the options parameter used in the GATHER_TABLE_STATS Procedure. The preference takes two values:  
  ■ GATHER (default) - Gathers statistics for all objects in the table  
  ■ GATHER AUTO - Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk loads during which statistics have been gathered. Note that this is only applicable to tables that do not have INCREMENTAL turned on. The GATHER_TABLE_STATS Procedure on these tables with GATHER AUTO options will skip regathering the already fresh statistics. |

| pvalue             | Preference value. If NULL is specified, it will set the Oracle default value(s)                                                              |

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

■ This setting is honored only of there is no preference specified for the table to be analyzed.

■ To run this procedure, you need to have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

■ Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_GLOBAL_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_GLOBAL_PREFS('DEGREE','99');
```
SET_INDEX_STATS Procedures

These procedures set index-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_INDEX_STATS (  
    ownname       VARCHAR2,  
    indname       VARCHAR2,  
    partname      VARCHAR2  DEFAULT NULL,  
    stattab       VARCHAR2  DEFAULT NULL,  
    statid        VARCHAR2  DEFAULT NULL,  
    numrows       NUMBER    DEFAULT NULL,  
    numlblks      NUMBER    DEFAULT NULL,  
    numdist       NUMBER    DEFAULT NULL,  
    avglblk       NUMBER    DEFAULT NULL,  
    avgdblk       NUMBER    DEFAULT NULL,  
    clstfct       NUMBER    DEFAULT NULL,  
    indlevel      NUMBER    DEFAULT NULL,  
    flags         NUMBER    DEFAULT NULL,  
    statown       VARCHAR2  DEFAULT NULL,  
    no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(  
        get_param('NO_INVALIDATE')),  
    guessq        NUMBER    DEFAULT NULL,  
    cachedblk     NUMBER    DEFAULT NULL,  
    cachehit      NUMBER    DEFAULT NULL,  
    force         BOOLEAN   DEFAULT FALSE);  
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_INDEX_STATS (  
    ownname       VARCHAR2,  
    indname       VARCHAR2,  
    partname      VARCHAR2  DEFAULT NULL,  
    stattab       VARCHAR2  DEFAULT NULL,  
    statid        VARCHAR2  DEFAULT NULL,  
    ext_stats     RAW,  
    stattypown    VARCHAR2 DEFAULT NULL,  
    stattypname   VARCHAR2 DEFAULT NULL,  
    statown       VARCHAR2 DEFAULT NULL,  
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
        get_param('NO_INVALIDATE')),  
    cachedblk     NUMBER    DEFAULT NULL,  
    cachehit      NUMBER    DEFAULT NULL,  
    force         BOOLEAN   DEFAULT FALSE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
</tbody>
</table>
To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_\{TABLE/INDEX/SCHEMA/DATABASE\}_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations

- When not enough data has been analyzed, such as when an object has been recently create
- When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid input value
ORA-20005: Object statistics are locked
SET_PARAM Procedure

**Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the SET_GLOBAL_PREFS Procedure. See also Deprecated Subprograms on page 155-13.

This procedure sets default values for parameters of DBMS_STATS procedures. You can use the GET_PARAM Function to get the current default value of a parameter.

**Syntax**

```sql
DBMS_STATS.SET_PARAM (  
    pname      IN    VARCHAR2,  
    pval       IN    VARCHAR2);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| pname     | The parameter name. The default value for following parameters can be set.  
  - CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures. It is used only by gather procedures.  
  - DEGREE  
  - ESTIMATE_PERCENT  
  - METHOD_OPT  
  - NO_INVALIDATE  
  - GRANULARITY  
  - AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)  
| pval      | The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values:  
  - 'ALL' - Statistics are collected for all objects in the system  
  - 'ORACLE' - Statistics are collected for all Oracle owned objects  
  - 'AUTO' - Oracle decides for which objects to collect statistics |

**Usage Notes**

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
Note also the difference between `NULL` and `'NULL'`:

- When `NULL` is unquoted, this sets the parameter to the value Oracle recommends.
- In the case of the quoted `'NULL'`, this sets the value of the parameter to `NULL`.

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

**Examples**

```sql
DBMS_STATS.SET_PARAM('CASCADE', 'DBMS_STATS.AUTO CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT', '5');
DBMS_STATS.SET_PARAM('DEGREE', 'NULL');
```
SET_PROCESSING_RATE Procedure

This procedure sets the value of rate of processing for a given operation.

Syntax

```sql
DBMS_STATS.SET_PROCESSING_RATE (
    opname      IN    VARCHAR2,
    procrate    IN    NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opname</td>
<td>Name of the operation</td>
</tr>
<tr>
<td>procrate</td>
<td>Processing rate. Valid values are as follows: ALL, CPU, CPU_ACCESS, CPU_AGGR, CPU_BYTES_PER_SEC, CPU_FILTER, CPU_GBY, CPU_HASH_JOIN, CPU_JOIN, CPU_NL_JOIN, CPU_RANDOM_ACCESS, CPU_SEQUENTIAL_ACCESS, CPU_SM_JOIN, CPU_SORT, IO, IO_ACCESS, IO_BYTES_PER_SEC, IO_RANDOM_ACCESS, IO_SEQUENTIAL_ACCESS, HASH, AGGR, MEMCMP, MEMCPY</td>
</tr>
</tbody>
</table>

Usage Notes

- You require the OPTIMIZER_PROCESSING_RATE role to run this procedure.
- AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or illegal input value
SET_SCHEMA_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (  
    ownname   IN   VARCHAR2,  
    pname     IN   VARCHAR2,  
    pvalue    IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
</tbody>
</table>
| pname     | Preference name. The default value for the following preferences can be set:  
  - CASCADE  
  - DEGREE  
  - ESTIMATE_PERCENT  
  - GLOBAL_TEMP_TABLE_STATS  
  - GRANULARITY  
  - INCREMENTAL  
  - INCREMENTAL_LEVEL  
  - INCREMENTAL_STALENESS  
  - METHOD_OPT  
  - NO_INVALIDATE  
  - PUBLISH  
  - STALE_PERCENT  
  - TABLE_CACHED_BLOCKS  
  - OPTIONS  
  - CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics  
  - DEGREE - Determines degree of parallelism used for gathering statistics  
  - ESTIMATE_PERCENT - Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. |
GLOBAL_TEMP_TABLE_STATS - This preference takes two values: SHARED or SESSION (default).

- **SHARED** - All sessions see the same set of statistics
- **SESSION** - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.

GRANULARITY - Determines granularity of statistics to collect (only pertinent if the table is partitioned).

- **ALL** - Gathers all (subpartition, partition, and global) statistics
- **AUTO** - Determines the granularity based on the partitioning type. This is the default value.
- **DEFAULT** - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
- **GLOBAL** - Gathers global statistics
- **GLOBAL AND PARTITION** - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- **PARTITION** - gathers partition-level statistics
- **SUBPARTITION** - gathers subpartition-level statistics.

INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:

- INCREMENTAL value for the partitioned table is set to TRUE
- PUBLISH value for the partitioned table is set to TRUE;
- User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table

If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
INCREMENTAL_LEVEL - This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:

- TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can only be used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures.

- PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.

INCREMENTAL_STALENESS - This value controls how we decide a partition or subpartition as stale. It takes an enumeration of values which may be multiple, such as 'USE_STALE_PERCENT', 'USE_LOCKED_STATS'.

- USE_STALE_PERCENT - a partition/subpartition is not considered as stale if DML changes are less than the STALE_PERCENT preference value

- USE_LOCKED_STATS - locked partitions/subpartitions statistics are not considered as stale, regardless of DML changes

- NULL - this is the default value, meaning a partition or subpartition is considered as stale as long as it has any DML changes. When the default value is used, statistics gathered in incremental mode are guaranteed to be the same as the statistics gathered in non incremental mode. When a non default value is used, the statistics gathered in incremental mode might be less accurate than those gathered in non-incremental mode

METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:

- FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]

size_clause is defined as: size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}

- integer: Number of histogram buckets. Must be in the range [1, 2048].
- REPEAT: Collects histograms only on the columns that already have histograms
- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns
- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns
- column_name: name of a column
- extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression

The default is FOR ALL COLUMNS SIZE AUTO.
Summary of DBMS_STATS Subprograms

155-205

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Table 155–104 (Cont.) SET_SCHEMA_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_INVALIDATE</td>
<td>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</td>
</tr>
<tr>
<td>PUBLISH</td>
<td>This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%. Note that if you set stale_percent to zero the AUTO STATS gathering job will gather statistics for this table every time a row in the table is modified.</td>
</tr>
<tr>
<td>TABLE_CACHED_BLOCKS</td>
<td>The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.</td>
</tr>
<tr>
<td>OPTIONS</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS Procedure. The preference takes two values:</td>
</tr>
<tr>
<td>GATHER</td>
<td>(default) - Gathers statistics for all objects in the table</td>
</tr>
<tr>
<td>GATHER AUTO</td>
<td>Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk loads during which statistics have been gathered. Note that this is only applicable to tables that do not have INCREMENTAL turned on. The GATHER_TABLE_STATS Procedure on these tables with GATHER AUTO options will skip regathering the already fresh statistics.</td>
</tr>
</tbody>
</table>

pvalue Preference value. If NULL is specified, it will set the Oracle default value.
Examples

DBMS_STATS.SET_SCHEMA_PREFS('SH', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'DEGREE', '99');
**SET_SYSTEM_STATS Procedure**

This procedure sets systems statistics.

**Syntax**

```sql
DBMS_STATS.SET_SYSTEM_STATS (
    pname          VARCHAR2,
    pvalue         NUMBER,
    stattab   IN   VARCHAR2 DEFAULT NULL,
    statid    IN   VARCHAR2 DEFAULT NULL,
    statown   IN   VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pname</code></td>
<td>The parameter name to get, which can have one of the following values:</td>
</tr>
<tr>
<td></td>
<td>- <code>iotfrspeed</code>—I/O transfer speed in bytes for each millisecond</td>
</tr>
<tr>
<td></td>
<td>- <code>ioseektim</code>—Seek time + latency time + operating system overhead time, in milliseconds</td>
</tr>
<tr>
<td></td>
<td>- <code>sreadtim</code>—Average time to read single block (random read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>- <code>mreadtim</code>—Average time to read an mbrc block at once (sequential read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>- <code>cpuspeed</code>—Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</td>
</tr>
<tr>
<td></td>
<td>- <code>cpuspeednw</code>—Average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option.</td>
</tr>
<tr>
<td></td>
<td>- <code>mbrc</code>—Average multiblock read count for sequential read, in blocks</td>
</tr>
<tr>
<td></td>
<td>- <code>maxthr</code>—Maximum I/O system throughput, in bytes/second</td>
</tr>
<tr>
<td></td>
<td>- <code>slavethr</code>—Average slave I/O throughput, in bytes/second</td>
</tr>
<tr>
<td><code>pvalue</code></td>
<td>Parameter value to get</td>
</tr>
<tr>
<td><code>stattab</code></td>
<td>Identifier of the user statistics table where the statistics will be obtained. If <code>stattab</code> is null, the statistics will be obtained from the dictionary.</td>
</tr>
<tr>
<td><code>statid</code></td>
<td>Optional identifier associated with the statistics saved in the <code>stattab</code></td>
</tr>
<tr>
<td><code>statown</code></td>
<td>Schema containing <code>stattab</code> (if different from current schema)</td>
</tr>
</tbody>
</table>

**Exceptions**

- **ORA-20000**: Object does not exist or insufficient privileges
- **ORA-20001**: Invalid input value
- **ORA-20002**: Bad user statistics table; may need to be upgraded
ORA-20003: Unable to set system statistics
ORA-20004: Parameter does not exist

Usage Notes
To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.
SET_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```sql
DBMS_STATS.SET_TABLE_PREFS (  
    ownname    IN  VARCHAR2,  
    tabname    IN  VARCHAR2,  
    pname      IN  VARCHAR2,  
    pvalue     IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
</tbody>
</table>
| pname     | Preference name. The default value for following preferences can be set:  
  - CASCADE  
  - DEGREE  
  - ESTIMATE_PERCENT  
  - GRANULARITY  
  - INCREMENTAL  
  - INCREMENTAL_LEVEL  
  - INCREMENTAL_STALENESS  
  - METHOD_OPT  
  - NO_INVALIDATE  
  - PUBLISH  
  - STALE_PERCENT  
  - TABLE_CACHED_BLOCKS  
  - OPTIONS  
  - CASCADE - Determines whether or not index statistics are collected as part of gathering table statistics.
  - CONCURRENT - This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time:  
    - ‘MANUAL’ - Concurrency will be turned on only for manual statistics gathering.
    - ‘AUTOMATIC’ - Concurrency will be turned on only for the automatic statistics gathering.
    - ‘ALL’ - Concurrency will be turned on for both manual and automatic statistics gathering.
    - ‘OFF’ - Concurrency will be turned off for both manual and automatic statistics.
  - DEGREE - Determines degree of parallelism used for gathering statistics.
### ESTIMATE_PERCENT

Determines the percentage of rows to estimate. The valid range is \([0.000001, 100]\). Use the constant `DBMS_STATS.AUTO_SAMPLE_SIZE` to have Oracle determine the appropriate sample size for good statistics. This is the default.

### GLOBAL_TEMP_TABLE_STATS

This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values:

- **SHARED** - All sessions see the same set of statistics
- **SESSION** - Statistics gathered by the `GATHER_TABLE_STATS` Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.

### GRANULARITY

Determines granularity of statistics to collect (only pertinent if the table is partitioned).

- **'ALL'** - Gathers all (subpartition, partition, and global) statistics
- **'AUTO'** - Determines the granularity based on the partitioning type. This is the default value.
- **'DEFAULT'** - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.
- **'GLOBAL'** - Gathers global statistics
- **'GLOBAL AND PARTITION'** - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
- **'PARTITION'** - Gathers partition-level statistics
- **'SUBPARTITION'** - Gathers subpartition-level statistics.

### INCREMENTAL

Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:

- INCREMENTAL value for the partitioned table is set to `TRUE`;
- Publish value for the partitioned table is set to `TRUE`;
- User specifies `AUTO_SAMPLE_SIZE` for `ESTIMATE_PERCENT` and `AUTO` for `GRANULARITY` when gathering statistics on the table.

If the INCREMENTAL value for the partitioned table was set to `FALSE` (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.

<table>

</tbody>
</table>
INCREMENTAL_LEVEL - This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:

- **TABLE** - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can only be used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures.

- **PARTITION** - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.

INCREMENTAL_STALENESS - This value controls how we decide a partition or subpartition as stale. It takes an enumeration of values which may be multiple, such as 'USE_STALE_PERCENT', 'USE_LOCKED_STATS'.

- **USE_STALE_PERCENT** - a partition/subpartition is not considered as stale if DML changes are less than the STALE_PERCENT preference value

- **USE_LOCKED_STATS** - locked partitions/subpartitions statistics are not considered as stale, regardless of DML changes

- **NULL** - this is the default value, meaning a partition or subpartition is considered as stale as long as it has any DML changes. When the default value is used, statistics gathered in incremental mode are guaranteed to be the same as the statistics gathered in non incremental mode. When a non default value is used, the statistics gathered in incremental mode might be less accurate than those gathered in non-incremental mode

METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:

- **FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]**
  
  *size_clause* is defined as:
  
  `size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}`

  - **integer**: Number of histogram buckets. Must be in the range [1,2048],
  - **REPEAT**: Collects histograms only on the columns that already have histograms
  - **AUTO**: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns
  - **SKEWONLY**: Oracle determines the columns on which to collect histograms based on the data distribution of the columns

  - **column_name**: name of a column
  - **extension**: can be either a column group in the format of (column_name, column_name [, ...]) or an expression

  The default is **FOR ALL COLUMNS SIZE AUTO**.
**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

**Usage Notes**

- To run this procedure, you need to connect as owner of the table or should have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

**Examples**

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO.Cascade');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

---

**Table 155–106 (Cont.) SET_TABLE_PREFS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_INVALIDATE</td>
<td>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to <strong>true</strong>. The procedure invalidates the dependent cursors immediately if set to <strong>false</strong>. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default.</td>
</tr>
<tr>
<td>PUBLISH</td>
<td>Determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10%.</td>
</tr>
</tbody>
</table>
| OPTIONS | Determines the `options` parameter used in the `GATHER_TABLE_STATS` Procedure. The preference takes two values:  
  - **GATHER** (default) - Gathers statistics for all objects in the table  
  - **GATHER AUTO** - Gathers all necessary statistics automatically. Oracle recommends setting `GATHER AUTO` on tables that undergo bulk loads during which statistics have been gathered. Note that this is only applicable to tables that do not have `INCREMENTAL` turned on. The `GATHER_TABLE_STATS` Procedure on these tables with `GATHER AUTO` options will skip regathering the already fresh statistics. |

pvalue  Preference value. If **NULL** is specified, it will set the Oracle default value.
SET_TABLE_STATS Procedure

This procedure sets table-related information.

Syntax

DBMS_STATS.SET_TABLE_STATS (  
  ownname  VARCHAR2,  
  tabname  VARCHAR2,  
  partname  VARCHAR2 DEFAULT NULL,  
  stattab  VARCHAR2 DEFAULT NULL,  
  statid  VARCHAR2 DEFAULT NULL,  
  numrows  NUMBER   DEFAULT NULL,  
  numblks  NUMBER   DEFAULT NULL,  
  avgrlen  NUMBER   DEFAULT NULL,  
  flags  NUMBER   DEFAULT NULL,  
  statown  VARCHAR2 DEFAULT NULL,  
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE')),  
  cachedblk  NUMBER    DEFAULT NULL,  
  cachehit  NUMBER    DEFUALT NULL,  
  force  BOOLEAN   DEFAULT FALSE);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the table (partition)</td>
</tr>
<tr>
<td>numblks</td>
<td>Number of blocks the table (partition) occupies</td>
</tr>
<tr>
<td>avgrlen</td>
<td>Average row length for the table (partition)</td>
</tr>
<tr>
<td>flags</td>
<td>For internal Oracle use (should be left as NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>cachedblk</td>
<td>The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)</td>
</tr>
</tbody>
</table>
Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

- `ORA-20000`: Object does not exist or insufficient privileges
- `ORA-20001`: Invalid input value
- `ORA-20005`: Object statistics are locked
SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    extension  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>extension</td>
<td>Can be either a column group or an expression. Suppose the specified table has two columns c1, c2. An example column group can be &quot;(c1, c2)&quot; and an example expression can be &quot;(c1 + c2)&quot;.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Error when processing extension

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
TRANSFER_STATS Procedure

This procedure transfers statistics for specified table(s) from a remote database specified by dblink to the local database. The statistics at the source database are retained. It likewise transfers statistics-related structures such as synopses and DML monitoring information.

Syntax

```
DBMS_STATS.TRANSFER_STATS (  
    ownname     IN     VARCHAR2,  
    tabname     IN     VARCHAR2,  
    dblink      IN     VARCHAR2,  
    options     IN     NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table. If NULL all schemas in the database. If NULL, the procedure will transfer global preferences as well.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table. If NULL, all tables in ownname.</td>
</tr>
<tr>
<td>dblink</td>
<td>Database link name</td>
</tr>
<tr>
<td>options</td>
<td>By default the procedure does not transfer the global preferences. Specifying ADD_GLOBAL_PREFS copies global preferences.</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    partname   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema to unlock</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>[Sub]Partition name</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the **ANALYZE ANY** privilege. For objects owned by **SYS**, you need to be either the owner of the table, or you need the **ANALYZE ANY DICTIONARY** privilege or the **SYSDBA** privilege.
UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```sql
DBMS_STATS.UNLOCK_SCHEMA_STATS (ownname VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
</tbody>
</table>

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the `UNLOCK_SCHEMA_STATS Procedure` nor the `UNLOCK_TABLE_STATS Procedure` is designed to unlock statistics of corresponding partitions. When you invoke the `LOCK_TABLE_STATS Procedure`, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the `LOCK_PARTITION_STATS Procedure`. 
UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```sql
DBMS_STATS.UNLOCK_TABLE_STATS (
    ownname   VARCHAR2,
    tabname   VARCHAR2);
```

Parameters

Table 155–112  UNLOCK_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
</tbody>
</table>

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.

- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke the LOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.
UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```sql
DBMS_STATS.UPGRADE_STAT_TABLE (  
    ownname   VARCHAR2,  
    stattab   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>Name of the table</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Unable to upgrade table

Usage Notes

To invoke this procedure you need the privileges to drop and create a table.
The DBMS_STAT_FUNCS package provides statistical functions.

This chapter contains the following topic:

- Summary of DBMS_STAT_FUNCS Subprograms
## Summary of DBMS_STAT_FUNCS Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

<td></td>
</tr>
</tbody>
</table>
EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```sql
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT ( 
    ownername    IN    VARCHAR2,
    tablename    IN    VARCHAR2,
    columnname   IN    VARCHAR2,
    test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    lambda       IN    NUMBER,
    mu           IN    NUMBER,
    sig          OUT   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>lambda</td>
<td>The scale parameter.</td>
</tr>
<tr>
<td>mu</td>
<td>The location parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```sql
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (  
  ownername    IN    VARCHAR2,  
  tablename    IN    VARCHAR2,  
  columnname   IN    VARCHAR2,  
  test_type    IN    VARCHAR2 DEFAULT 'SHAPIRO_WILKS',  
  mean         IN    NUMBER,  
  stdev        IN    NUMBER,  
  sig          OUT   NUMBER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.</td>
</tr>
<tr>
<td>mean</td>
<td>The mean of the distribution against which to compare.</td>
</tr>
<tr>
<td>stdev</td>
<td>The standard deviation of the distribution against which to compare.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
    ownername    IN    VARCHAR2,
    tablename    IN    VARCHAR2,
    columnname   IN    VARCHAR2,
    test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    lambda       IN    NUMBER,
    sig          OUT   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>lambda</td>
<td>The lambda parameter is the shape parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
SUMMARY Procedure

This procedure summarizes the numerical column specified in the columnname of tablename. The summary is returned as a Summary Type. Note that most of the output of SUMMARY can be obtained with currently available SQL.

Syntax

```sql
DBMS_STAT_FUNCS.SUMMARY (    ownername IN VARCHAR2,    tablename IN VARCHAR2,    columnname IN VARCHAR2,    sigma_value IN NUMBER DEFAULT 3,    s OUT SummaryType);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table to be summarized.</td>
</tr>
<tr>
<td>sigma_value</td>
<td>The number of sigmas for the set of extreme values, defaults to 3.</td>
</tr>
<tr>
<td>s</td>
<td>The Record containing summary information about given column.</td>
</tr>
</tbody>
</table>

Definition of SummaryType

```sql
TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (    count NUMBER,    min NUMBER,    max NUMBER,    range NUMBER,    mean NUMBER,    cmode num_table,    variance NUMBER,    stddev NUMBER,    quantile_5 NUMBER,    quantile_25 NUMBER,    median NUMBER,    quantile_75 NUMBER,    quantile_95 NUMBER,    plus_x_sigma NUMBER,    minus_x_sigma NUMBER,    extreme_values num_table,    top_5_values n_arr,    bottom_5_values n_arr);
```
UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

```
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (    
ownername    IN    VARCHAR2,    
tablename    IN    VARCHAR2,    
columnname   IN    VARCHAR2,    
var_type     IN    VARCHAR2 DEFAULT 'CONTINUOUS',    
test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',    
paramA       IN    NUMBER,    
paramB       IN    NUMBER,    
sig          OUT   NUMBER);    
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>var_type</td>
<td>The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>paramA</td>
<td>Parameter A estimated from the sample (the location parameter).</td>
</tr>
<tr>
<td>paramB</td>
<td>Parameter B estimated from the sample (the scale parameter).</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```sql
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
    ownername    IN    VARCHAR2,
    tablename    IN    VARCHAR2,
    columnname   IN    VARCHAR2,
    test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    alpha        IN    NUMBER,
    mu           IN    NUMBER,
    beta         IN    NUMBER,
    sig          OUT   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>alpha</td>
<td>The scale parameter.</td>
</tr>
<tr>
<td>mu</td>
<td>The location parameter.</td>
</tr>
<tr>
<td>beta</td>
<td>The slope/shape parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- **Using DBMS_STORAGE_MAP**
  - Overview
  - Operational Notes
- **Summary of DBMS_STORAGE_MAP Subprograms**
Using DBMS_STORAGE_MAP

- Overview
- Operational Notes
Overview

The following terminology and descriptions will help you understand the DBMS_STORAGE_MAP API:

- Mapping libraries
  Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in filemap.ora.

- Mapping files
  A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements
  A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack.

- Mapping file extents
  A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

- Oracle Database Reference for V$MAP views, including V$MAP_FILE, V$MAP_ELEMENT, V$MAP_SUBELEMENT, V$MAP_FILE_EXTENT
Operational Notes

For MAP_ELEMENT, MAP_FILE, and MAP_ALL: Invoking these functions when mapping information already exists will refresh the mapping if configuration IDs are supported. If configuration IDs are not supported, then invoking these functions again will rebuild the mapping.

See Also: Oracle Database Administrator’s Guide for a discussion of the configuration ID, an attribute of the element or file that is changed.
### Table 157–1  DBMS_STORAGE_MAP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

<td>Unlocks the mapping information in the shared memory of the instance.</td>
</tr>
</tbody>
</table>
DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 157–2 DROP_ALL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>
DROP_ELEMENT Function

This function drops the mapping information for the element defined by elemname.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(
    elemname    IN VARCHAR2,
    cascade     IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elemname</td>
<td>The element for which mapping information is dropped.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then DROP_ELEMENT is invoked recursively on all elements of the DAG defined by elemname, if possible.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>
DROP_FILE Function

This function drops the file mapping information defined by `filename`.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(
    filename          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>The file for which file mapping information is dropped.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then the mapping DAGs for the elements where the file resides are also dropped, if possible.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; <code>dictionary_update</code> is an overloaded argument.</td>
</tr>
</tbody>
</table>
**LOCK_MAP Procedure**

This procedure locks the mapping information in the shared memory of the instance. This is useful when you need a consistent snapshot of the V$MAP tables. Without locking the mapping information, V$MAP_ELEMENT and V$MAP_SUBELEMENT, for example, may be inconsistent.

**Syntax**

```sql
DBMS_STORAGE_MAP.LOCK_MAP;
```
MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(
    max_num_fileext   IN NUMBER DEFAULT 100,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_num_fileext</td>
<td>Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>

Usage Notes

You must explicitly call MAP_ALL in a cold startup scenario.
**MAP_ELEMENT Function**

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

**Syntax**

```sql
DBMS_STORAGE_MAP.MAP_ELEMENT(
    elemname          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>elemname</code></td>
<td>The element for which mapping information is built.</td>
</tr>
<tr>
<td><code>cascade</code></td>
<td>If <code>TRUE</code>, all elements within the <code>elemname</code> I/O stack DAG are mapped.</td>
</tr>
<tr>
<td><code>dictionary_update</code></td>
<td>If <code>TRUE</code>, mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code>; <code>dictionary_update</code> is an overloaded argument.</td>
</tr>
</tbody>
</table>
MAP_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```sql
DBMS_STORAGE_MAP.MAP_FILE(
    filename           IN VARCHAR2,
    filetype           IN VARCHAR2,
    cascade            IN BOOLEAN,
    max_num_fileextent IN NUMBER DEFAULT 100,
    dictionary_update  IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>The file for which mapping information is built.</td>
</tr>
<tr>
<td>filetype</td>
<td>Defines the type of the file to be mapped. It can be &quot;DATAFILE&quot;, &quot;SPFILE&quot;, &quot;TEMPFILE&quot;, &quot;CONTROLFILE&quot;, &quot;LOGFILE&quot;, or &quot;ARCHIVEFILE&quot;.</td>
</tr>
<tr>
<td>cascade</td>
<td>Should be TRUE only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an ALTER SYSTEM command or DML operations on extended files), cascade can be set to FALSE because the mapping changes are limited to the file extents only. If TRUE, mapping DAGs are also built for the elements where the file resides.</td>
</tr>
<tr>
<td>max_num_fileextent</td>
<td>Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if cascade is TRUE), is owned by a library that must be explicitly synchronized.
MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```sql
DBMS_STORAGE_MAP.MAP_OBJECT(
    objname  IN  VARCHAR2,
    owner    IN  VARCHAR2,
    objtype  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objname</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>owner</td>
<td>The owner of the object.</td>
</tr>
<tr>
<td>objtype</td>
<td>The type of the object.</td>
</tr>
</tbody>
</table>
RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance. You can invoke RESTORE only after a SAVE operation. You must explicitly call RESTORE in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```
SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

DBMS_STORAGE_MAP.SAVE;
UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```
The DBMS_STREAMS package, one of a set of Oracle Streams packages, provides subprograms to convert ANYDATA objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

This chapter contains the following topics:

- **Using DBMS_STREAMS**
  - Overview
  - Security Model

- **Summary of DBMS_STREAMS Subprograms**
Using DBMS_STREAMS

This section contains topics which relate to using the DBMS_STREAMS package.

- Overview
- Security Model
Overview

This package provides subprograms to convert ANYDATA objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

See Also: Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and Oracle Streams
Security Model

PUBLIC is granted EXECUTE privilege on this package.

See Also: Oracle Database Security Guide for more information about user group PUBLIC

Note: The subprograms in this package do not commit.
COMPATIBLE_12_1 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_12_1` constant.

Syntax

```sql
DBMS_STREAMS.COMPATIBLE_12_1
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 12.1.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:
- `GET_COMPATIBLE Member Function` on page 275-38
- `Oracle Streams Concepts and Administration` for information about creating rules that discard changes that are not supported by Oracle Streams
- `Oracle Database Reference` and `Oracle Database Upgrade Guide` for more information about the `COMPATIBLE` initialization parameter
COMPATIBLE_11_2 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_11_2` constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_11_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.2.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:

- `GET_COMPATIBLE Member Function` on page 275-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter
COMPATIBLE_11_1 Function

This function returns the DBMS_STREAMS.COMPATIBLE_11_1 constant.

Syntax

DBMS_STREAMS.COMPATIBLE_11_1
RETURN INTEGER;

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
COMPATIBLE_10_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_10_2 constant.

Syntax

```sql
DBMS_STREAMS.COMPATIBLE_10_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
COMPATIBLE_10_1 Function

This function returns the DBMS_STREAMS.COMPATIBLE_10_1 constant.

Syntax

DBMS_STREAMS.COMPATIBLE_10_1
RETURN INTEGER;

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
COMPATIBLE_9_2 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant.

Syntax

```sql
DBMS_STREAMS.COMPATIBLE_9_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 9.2.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:

- `GET_COMPATIBLE Member Function` on page 275-38
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter
CONVERT_ANYDATA_TO_LCR_DDL Function

This function converts a ANYDATA object into a SYS.LCR$$_DDL$_RECORD object.

Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_DDL(
    source  IN  ANYDATA)
RETURN SYS.LCR$$_DDL$_RECORD;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>The ANYDATA object to be converted. If this object is not a DDL logical change record (DDL LCR), then the function raises an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of DDL LCRs from a ANYDATA queue to a SYS.LCR$$_DDL$_RECORD typed queue.

See Also: Oracle Database Advanced Queuing User’s Guide
CONVERT_ANYDATA_TO_LCR_ROW Function

This function converts a ANYDATA object into a SYS.LCR$_ROW_RECORD object.

Syntax

DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_ROW(
   source  IN  ANYDATA)
RETURN SYS.LCR$_ROW_RECORD;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>The ANYDATA object to be converted. If this object is not a row logical change record (row LCR), then the function raises an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of row LCRs from a ANYDATA queue to a SYS.LCR$_ROW_RECORD typed queue.

See Also: Oracle Database Advanced Queuing User’s Guide
CONVERT_LCR_TO_XML Function

This function converts a logical change record (LCR) encapsulated in a ANYDATA object into an XML object that conforms to the XML schema for LCRs. The LCR can be a row LCR or a DDL LCR.

See Also: Oracle Streams Concepts and Administration for more information about the XML schema for LCRs

Syntax

DBMS_STREAMS.CONVERT_LCR_TO_XML(
   anylcr IN ANYDATA
)
RETURN SYS.XMLTYPE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>anylcr</td>
<td>The ANYDATA encapsulated LCR to be converted. If this object is not a ANYDATA encapsulated LCR, then the function raises an exception.</td>
</tr>
</tbody>
</table>
CONVERT_XML_TO_LCR Function

This function converts an XML object that conforms to the XML schema for logical change records (LCRs) into an LCR encapsulated in a ANYDATA object. The LCR can be a row or DDL LCR.

**See Also:** *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

**Syntax**

```sql
DBMS_STREAMS.CONVERT_XML_TO_LCR(
    xmldat  IN  SYS.XMLTYPE)
RETURN ANYDATA;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmldat</td>
<td>The XML LCR object to be converted. If this object does not conform to XML schema for LCRs, then the function raises an exception.</td>
</tr>
</tbody>
</table>
GET_INFORMATION Function

This function returns information about various Oracle Streams attributes.

Syntax

```
DBMS_STREAMS.GET_INFORMATION(
    name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The type of information you want to retrieve. Currently, the following names are available:</td>
</tr>
<tr>
<td></td>
<td>■ SENDER: Returns the name of the sender for the current logical change record (LCR) from its AQ message properties. This function is called inside a procedure DML handler, a DDL handler, an error handler, or a message handler. Returns NULL if called outside of an apply handler. The return value is to be interpreted as a VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>■ CONSTRAINT_NAME: Returns the name of the constraint that was violated for an LCR that raised an error. This function is called inside a procedure DML handler or error handler for an apply process. Returns NULL if called outside of a procedure DML handler or error handler. The return value is to be interpreted as a VARCHAR2.</td>
</tr>
</tbody>
</table>
GET_STREAMS_NAME Function

This function gets the Oracle Streams name of the invoker if the invoker is one of the following Oracle Streams types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```sql
DBMS_STREAMS.GET_STREAMS_NAME
RETURN VARCHAR2;
```

Usage Notes

You can use this function in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, if you use one error handler for multiple apply processes, then you can use the GET_STREAMS_NAME function to determine the name of the apply process that raised the error.
GET_STREAMS_TYPE Function

This function gets the Oracle Streams type of the invoker and returns one of the following types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```sql
DBMS_STREAMS.GET_STREAMS_TYPE
RETURN VARCHAR2;
```

Usage Notes

This function can be used in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, you can use the `GET_STREAMS_TYPE` function to instruct a procedure DML handler to operate differently if it is processing messages from the error queue (`ERROR_EXECUTION` type) instead of the apply process's queue (`APPLY` type).
GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

---

**Note:**
- To execute this function, a user must be granted either `EXECUTE_CATALOG_ROLE` or `EXECUTE` privilege on the `DBMS_STREAMS_ADM` package.
- Instead of using the `DBMS_STREAMS.GET_TAG` function, Oracle recommends that you use the `DBMS_STREAMS_ADM.GET_TAG` function. See GET_TAG Function on page 159-86.

---

**See Also:** Oracle Streams Replication Administrator’s Guide for more information about tags

**Syntax**

```sql
DBMS_STREAMS.GET_TAG
RETURN RAW;
```

**Examples**

The following example illustrates how to display the current logical change record (LCR) tag as output:

```sql
SET SERVEROUTPUT ON
DECLARE
    raw_tag RAW(2000);
BEGIN
    raw_tag := DBMS_STREAMS.GET_TAG();
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the `DUAL` view:

```sql
SELECT DBMS_STREAMS.GET_TAG FROM DUAL;
```
MAX_COMPATIBLE Function

This function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

Syntax

```sql
DBMS_STREAMS.MAX_COMPATIBLE
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The MAX_COMPATIBLE function always returns the maximum compatibility for the release of Oracle Database on which it is run. Therefore, when you use this function in rule conditions, the rule conditions do not need to be changed when you upgrade to a later release of Oracle Database.

See Also:

- GET_COMPATIBLE Member Function on page 275-38
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter
SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session has this tag. This procedure affects only the current session.

Note:
- To execute this procedure, a user must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- Instead of using the DBMS_STREAMS.SET_TAG procedure, Oracle recommends that you use the DBMS_STREAMS_ADM.SET_TAG procedure. See SET_TAG Procedure on page 159-170.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

DBMS_STREAMS.SET_TAG(
    tag IN RAW DEFAULT NULL);

Parameters

Table 158–7 SET_TAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.</td>
</tr>
</tbody>
</table>

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

EXEC DBMS_STREAMS.SET_TAG(tag => HEXTORAW('17'));

The following are considerations for the SET_TAG procedure:
- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also: BUILD Procedure on page 34-18
SET_TAG Procedure
The `DBMS_STREAMS_ADM` package, one of a set of Oracle Streams packages, provides subprograms for configuring Oracle Streams environments. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. This package also includes subprograms for configuring and managing XStream outbound servers and inbound servers.

This chapter contains the following topics:

- **Using DBMS_STREAMS_ADM**
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Operational Notes
- **Summary of DBMS_STREAMS_ADM Subprograms**
Using DBMS_STREAMS_ADM

This section contains topics that relate to using the DBMS_STREAMS_ADM package.

- Operational Notes
Overview

The DBMS_STREAMS_ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring an Oracle Streams environment. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. These rules support logical change records (LCRs), which include row LCRs and data definition language (DDL) LCRs. This package also contains subprograms for creating message rules for specific message types. This package also contains subprograms for creating queues, and for managing Oracle Streams metadata, such as data dictionary information.

If you require more sophisticated rules, then refer to Chapter 138, "DBMS_RULE" package.

See Also:

- Oracle Streams Concepts and Administration, Oracle Streams Replication Administrator’s Guide for more information about this package and Oracle Streams
- Chapter 138, "DBMS_RULE"
The following subprograms are deprecated with Oracle Database 10g Release 2 and later:

- **MAINTAIN_SIMPLE_TABLESPACE**
  This procedure is replaced by the **MAINTAIN_SIMPLE_TTS** procedure.

  **See Also:** [MAINTAIN_SIMPLE_TTS Procedure on page 159-111](#)

- **MAINTAIN_TABLESPACES**
  This procedure is replaced by the **MAINTAIN_TTS** procedure.

  **See Also:** [MAINTAIN_TTS Procedure on page 159-126](#)
Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

A user is associated with each Oracle Streams client. The following sections describe these users:

- Oracle Streams Administrator
- Capture User
- Propagation User
- Apply User for an Oracle Streams Apply Process
- Apply User for an XStream Inbound Server
- Messaging Client User

---

**Note:** The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as creating a synchronous capture. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

---

**Oracle Streams Administrator**

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:** *Oracle Streams Replication Administrator’s Guide* for information about configuring an Oracle Streams administrator

**Capture User**

The following procedures can create a capture process:

- `ADD_GLOBAL_RULES` Procedure
- `ADD_SCHEMA_RULES` Procedure
- `ADD_SUBSET_RULES` Procedure
- `ADD_TABLE_RULES` Procedure

The following procedures can create a synchronous capture:

- `ADD_SUBSET_RULES` Procedure
- `ADD_TABLE_RULES` Procedure

If one of these procedures creates a capture process or a synchronous capture, then it configures the current user as the capture user. The capture user is the user in whose security domain a capture process or synchronous capture captures changes that...
satisfy its rule set(s) and runs custom rule-based transformations configured for these rules. This user must have the necessary privileges to capture changes. The procedure grants the capture user `ENQUEUE` privilege on the queue used by the capture process or synchronous capture and configures the user as a secure queue user of the queue.

See Also: `CREATE_CAPTURE Procedure` on page 34-19 and `CREATE_SYNC_CAPTURE Procedure` on page 34-29 for information about the privileges required to capture changes (refer to the `capture_user` parameter)

Propagation User

The following procedures can create a propagation:

- `ADD_GLOBAL_PROPAGATION_RULES Procedure`
- `ADD_MESSAGE_PROPAGATION_RULE Procedure`
- `ADD_SCHEMA_PROPAGATION_RULES Procedure`
- `ADD_SUBSET_PROPAGATION_RULES Procedure`
- `ADD_TABLE_PROPAGATION_RULES Procedure`

When a propagation is created, a propagation job also might be created. If a propagation job is created when one of these procedures is run, then the user who runs the procedure owns the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

Note:

- The source queue owner performs the propagation, but the propagation job is owned by the user who creates it. These two users might or might not be the same.
- For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate messages.

See Also:

- `CREATE_PROPAGATION Procedure` on page 117-8 for more information about the required privileges
- "Propagation Rules for LCRs" on page 159-11 for information about when a propagation job is created

Apply User for an Oracle Streams Apply Process

The following procedures can create an apply process:

- `ADD_GLOBAL_RULES Procedure`
- `ADD_MESSAGE_RULE Procedure`
- `ADD_SCHEMA_RULES Procedure`
- `ADD_SUBSET_RULES Procedure`
- `ADD_TABLE_RULES Procedure`
If one of these procedures creates an apply process, then it configures the current user as the apply user. For an apply process, the apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets.

An apply user applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. The procedure grants the apply user $\text{DEQUEUE}$ privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.

**See Also:** [CREATE_APPLY Procedure](#) on page 23-18 for information about the privileges required to apply changes (refer to the $\text{apply_user}$ parameter)

### Apply User for an XStream Inbound Server

The following procedures can create an XStream inbound server:

- **ADD_GLOBAL_RULES Procedure**
- **ADD_SCHEMA_RULES Procedure**
- **ADD_SUBSET_RULES Procedure**
- **ADD_TABLE_RULES Procedure**

**Note:**

- Oracle recommends using procedures in the [DBMS_XSTREAM_ADM](#) package to create or add rules to an XStream inbound server. See Chapter 204, "DBMS_XSTREAM_ADM".
- These procedures cannot create an outbound server.

If the $\text{streams_name}$ parameter is set to $\text{NULL}$ and no relevant apply process, inbound server, or outbound server exists, then the procedure creates an apply process automatically with a system-generated name.

The apply process remains an apply process if it receives captured logical change records (LCRs) from a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives captured LCRs from a capture process. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

If one of these procedures creates an inbound server, then it configures the current user as the apply user. The apply user is the user in whose security domain an XStream client application attaches to an Oracle database.

An apply user applies changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to apply changes. The procedure grants the apply user $\text{DEQUEUE}$ privilege on the queue used by the inbound server and configures the user as a secure queue user.

Each inbound server must have a unique name. The name cannot be used by an apply process, outbound server, or messaging client in the same database, and the name cannot be used by another inbound server in the same database.

If a relevant apply process, inbound server, or outbound server exists, then the procedure does not create an inbound server. Instead, the procedure uses the relevant
apply process, inbound server, or outbound server. If the `streams_name` parameter specifies an existing apply process, inbound server, or outbound server, then the specified client is used.

When `streams_name` parameter is `NULL` and the `streams_type` parameter is set to `apply`, the relevant apply process, inbound server, or outbound server is identified in one of the following ways:

- If one existing apply process or outbound server has the source database specified in the `source_database` parameter and uses the queue specified in the `queue_name` parameter, then the procedure uses this apply process or outbound server.
- If the `source_database` parameter is set to `NULL` and one existing apply process, inbound server, or outbound server is using the queue specified in the `queue_name` parameter, then the procedure uses this apply process, inbound server, or outbound server.

If the `streams_name` parameter is set to `NULL` and multiple relevant apply processes, inbound servers, or outbound servers exist, then the procedure raises an error.

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.  

---

**Messaging Client User**

The following procedures can create a messaging client:

- `ADD_GLOBAL_RULES Procedure`
- `ADD_MESSAGE_RULE Procedure`
- `ADD_SCHEMA_RULES Procedure`
- `ADD_SUBSET_RULES Procedure`
- `ADD_TABLE_RULES Procedure`

If one of these procedures creates a messaging client, then the user who runs this procedure is granted the privileges to dequeue from the queue using the messaging client. The procedure configures this user as a secure queue user of the queue, and only this user can use the messaging client.
Operational Notes

Several procedures in this package create rules for Oracle Streams clients and XStream clients, and several procedures configure an Oracle Streams environment. The following sections provide information about using these procedures:

- Procedures That Create Rules for Oracle Streams Clients and XStream Clients
- Procedures That Configure an Oracle Streams Environment

Procedures That Create Rules for Oracle Streams Clients and XStream Clients

Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. XStream clients include XStream outbound servers and inbound servers. Some of the procedures in the DBMS_STREAMS_ADM package add rules to the rule sets of Oracle Streams clients and XStream clients. The rules can pertain to changes in the redo log, to data manipulation language (DML) changes made to a table, to logical change records (LCRs), or to user messages.

An LCR represents either a row change that results from a DML operation or a data definition language (DDL) change. An LCR that represents a row change is a row LCR, and an LCR that represents a DDL change is a DDL LCR. LCRs can either represent changes that were captured by a capture process or a synchronous capture, or they can represent changes created by a user or application. A user message is a custom message that is based on a user-defined type and created by users or applications.

A capture process, propagation, apply process, messaging client, outbound server, or inbound server can have both positive and negative rule sets. A synchronous capture can have only a positive rule set.

For all of the procedures except the ones that create subset rules, and for all clients except for synchronous captures, you use the inclusion_rule parameter to specify the type of rule set (either positive or negative) for the created rules. If the client does not have a rule set of the specified type, then a rule set is created automatically, and the rules are added to the rule set. Other rules in an existing rule set for the client are not affected. Additional rules can be added to a rule set using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If an client has both a positive and a negative rule set, then the negative rule set is always evaluated first.

The following sections describe each type of rule in detail:

- Capture Process Rules for Changes in the Redo Log
- Synchronous Capture Rules for DML Changes to Tables
- Propagation Rules for LCRs
- Propagation Rules for User Messages
- Apply Process Rules for LCRs
- Apply Process Rules for User Messages
- Messaging Client Rules for LCRs
- Messaging Client Rules for User Messages
- XStream Outbound Server Rules for LCRs
- XStream Inbound Server Rules for LCRs
Capture Process Rules for Changes in the Redo Log

The following procedures add rules to a rule set of a capture process when you specify `capture` for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all changes made to a source database. See `ADD_GLOBAL_RULES Procedure` on page 159-34.

- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified schema. See `ADD_SCHEMA_RULES Procedure` on page 159-50.

- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for DML changes made to a subset of rows in a specified table. See `ADD_SUBSET_RULES Procedure` on page 159-59.

- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified table. See `ADD_TABLE_RULES Procedure` on page 159-70.

If one of these procedures adds rules to the positive rule set for a capture process, then the capture process captures row changes resulting from DML changes, or DDL changes, or both from a source database and enqueues these changes into the specified queue. If one of these procedures adds rules to the negative rule set for a capture process, then the capture process discards row changes, or DDL changes, or both from a source database.

A capture process can capture changes locally at a source database or remotely at a downstream database. Therefore, for capture process rules, you should execute the procedure either at the source database or at a downstream database.

If the capture process is a local capture process, or if the capture process is a downstream capture process that uses a database link to the source database, then these procedures automatically prepare the appropriate database objects for instantiation:

- `ADD_GLOBAL_RULES` invokes the `PREPARE_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

- `ADD_SCHEMA_RULES` invokes the `PREPARE_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

- `ADD_SUBSET_RULES` and `ADD_TABLE_RULES` invoke the `PREPARE_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

These procedures also enable supplemental logging for the primary key, unique key, foreign key, and bitmap index columns in the tables prepared for instantiation. The primary key columns are unconditionally logged. The unique key, foreign key, and bitmap index columns are conditionally logged.

If the capture process is a downstream capture process that does not use a database link to the source database, then you must prepare the appropriate objects for
instantiation and specify the necessary supplemental logging manually at the source database.

If one of these procedures is executed at a downstream database, then you specify the source database using the source_database parameter, and the specified capture process must exist. The procedure cannot create a capture process if it is run at a downstream database. You can create a capture process at a downstream database using the CREATE_CAPTURE procedure in the DBMS_CAPTURE_ADM package.

See Also: Chapter, "Summary of DBMS_CAPTURE_ADM Subprograms" on page 34-5 for more information about the CREATE_CAPTURE procedure and the procedures that prepare database objects for instantiation

Synchronous Capture Rules for DML Changes to Tables

The following procedures add rules to the rule set of a synchronous capture when you specify sync_capture for the streams_type parameter:

- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for DML changes made to a subset of rows in a specified table. See ADD_SUBSET_RULES Procedure on page 159-59.

- The ADD_TABLE_RULES procedure adds a rule whose rule condition evaluates to TRUE for DML changes made to a specified table. See ADD_TABLE_RULES Procedure on page 159-70.

If one of these procedures adds rules to the positive rule set for a synchronous capture, then the synchronous capture captures row changes resulting from DML changes to the table at the source database and enqueues these changes into the specified queue. A synchronous capture cannot have a negative rule set.

A synchronous capture captures changes locally at the database where it is configured. This database is the source database for changes captured by the synchronous capture. Therefore, for synchronous capture rules, you should execute the procedure at the source database.

These procedures automatically prepare the appropriate tables for instantiation by invoking the PREPARE_SYNC_INSTANTIATION function in the DBMS_CAPTURE_ADM package at the source database.

Note:

- A synchronous capture ignores rules in its rule set that were created by a procedure other than ADD_SUBSET_RULES or ADD_TABLE_RULES.

- When the ADD_TABLE_RULES or the ADD_SUBSET_RULES procedure adds rules to a synchronous capture rule set, the procedure must obtain an exclusive lock on the specified table. If there are outstanding transactions on the specified table, then the procedure waits until it can obtain a lock.

Propagation Rules for LCRs

The following procedures add propagation rules for LCRs to a rule set of a propagation:

- The ADD_GLOBAL_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in a source queue. See ADD_GLOBAL_
The `ADD_SCHEMA_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified schema. See `ADD_SCHEMA_PROPAGATION_RULES Procedure` on page 159-46.

The `ADD_SUBSET_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in a source queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_PROPAGATION_RULES Procedure" on page 159-55.

The `ADD_TABLE_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified table. See "ADD_TABLE_PROPAGATION_RULES Procedure" on page 159-65.

If one of these procedures adds rules to the positive rule set for the propagation, then the rules specify that the propagation propagates LCRs in a source queue to a destination queue. If one of these procedures adds rules to the negative rule set for the propagation, then the rules specify that the propagation discards LCRs in a source queue. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database.

### Propagation Rules for User Messages

The `ADD_MESSAGE_PROPAGATION_RULE` procedure adds a message rule to a rule set of a propagation. If this procedure adds a rule to the positive rule set for the propagation, then the rule specifies that the propagation propagates the user messages of a specific message type that evaluate to `TRUE` for the rule condition from a source queue to a destination queue. If this procedure adds a rule to the negative rule set for the propagation, then the rule specifies that the propagation discards the user messages in a source queue of a specific message type that evaluate to `TRUE` for the rule condition.

This procedure generates a rule name for the rule.

See Also:  "ADD_MESSAGE_PROPAGATION_RULE Procedure" on page 159-39

### Apply Process Rules for LCRs

The following procedures add rules to a rule set of an apply process when you specify `apply` for the `streams_type` parameter and an apply process for the `streams_name` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in the apply process's queue. See "ADD_GLOBAL_RULES Procedure" on page 159-34.

- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the apply process's queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure" on page 159-50.

- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in the apply process's queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure" on page 159-59.

- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the apply process's queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure" on page 159-70.
If one of these procedures adds rules to the positive rule set for the apply process, then the rules specify that the apply process applies LCRs in its queue. If one of these procedures adds rules to the negative rule set for the apply process, then the rules specify that the apply process discards LCRs in its queue. For apply process rules, you should execute these procedures at the destination database.

Changes applied by an apply process created by one of these procedures generate tags in the redo log at the destination database with a value of '00' (double zero). You can use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to alter the tag value after the apply process is created, if necessary.

An apply process can apply captured LCRs from only one source database. If one of these procedures creates an apply process, then specify the source database for the apply process using the `source_database` parameter. If the `source_database` parameter is `NULL`, and one of these procedures creates an apply process, then the source database name of the first LCR received by the apply process is used for the source database.

The rules in the apply process rule sets determine which messages are dequeued by the apply process. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database. If the apply process dequeues an LCR with a source database that is different from the source database for the apply process, then an error is raised. In addition, when adding rules to an existing apply process, the database specified in the `source_database` parameter cannot be different from the source database for the apply process. You can determine the source database for an apply process by querying the `DBA_APPLY_PROGRESS` data dictionary view.

An apply process created by one of these procedures can apply messages only at the local database and can apply only captured messages. To create an apply process that applies messages at a remote database or an apply process that applies user messages, use the `CREATE_APPLY` procedure in the `DBMS_APPLY_ADM` package.

You can also use the `DBMS_APPLY_ADM.CREATE_APPLY` procedure to specify nondefault values for the `apply_captured`, `apply_user`, `apply_database_link`, and `apply_tag` parameters when you run that procedure. You can use one of the procedures in the `DBMS_STREAMS_ADM` package to add rules to a rule set used by the apply process after you create it.

**See Also:**
- "ALTER_APPLY Procedure" on page 23-10
- "CREATE_APPLY Procedure" on page 23-18

**Apply Process Rules for User Messages**

The `ADD_MESSAGE_RULE` procedure adds a message rule to a rule set of an apply process when you specify `apply` for the `streams_type` parameter. For an apply process rule, you should execute this procedure at the destination database.

If this procedure adds a rule to the positive rule set for an apply process, then the apply process dequeues user messages of a specific message type that satisfy the apply process rule and sends these messages to its message handler. If no message handler is specified for the apply process, then use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to set the message handler. If this procedure adds a rule to the negative rule set for an apply process, then the apply process discards user messages of a specific message type that satisfy the apply process rule.
Operational Notes

See Also:
- ADD_MESSAGE_RULE Procedure on page 159-43
- ALTER_APPLY Procedure on page 23-10

Messaging Client Rules for LCRs
The following procedures add rules to a rule set of a messaging client when you specify dequeue for the streams_type parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in the messaging client's queue. See "ADD_GLOBAL RULES Procedure" on page 159-34.

- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the messaging client's queue containing changes made to a specified schema. See "ADD_SCHEMA RULES Procedure" on page 159-50.

- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in the messaging client's queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET RULES Procedure" on page 159-59.

- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the messaging client's queue containing changes made to a specified table. See "ADD TABLE RULES Procedure" on page 159-70.

If one of these procedures adds rules to the positive rule set for a messaging client, then the messaging client can dequeue persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the source_database parameter. If one of these procedures adds rules to the negative rule set for a messaging client, then the messaging client discards persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the source_database parameter. You should execute these procedures at the database where you want to dequeue the messages with the messaging client.

Messaging Client Rules for User Messages
The ADD_MESSAGE_RULE procedure adds a message rule to a rule set of a messaging client when you specify dequeue for the streams_type parameter. You should execute this procedure at the database that will dequeue messages.

If this procedure adds a rule to the positive rule set for a messaging client, then the messaging client dequeues user messages of a specific message type that satisfy the message rule. If this procedure adds a rule to the negative rule set for a messaging client, then the messaging client discards user messages of a specific message type that satisfy the message rule.

See Also: "ADD_MESSAGE_RULE Procedure" on page 159-43

XStream Outbound Server Rules for LCRs
When you specify apply for the streams_type parameter and an XStream outbound server for the streams_name parameter, the following procedures add rules to a rule set of the specified outbound server:

- The ADD_GLOBAL_RULES procedure adds rules whose rule conditions evaluate to TRUE for all LCRs.

- The ADD_SCHEMA_RULES procedure adds rules whose rule conditions evaluate to TRUE for LCRs that contain changes made to a specified schema.
The `ADD_SUBSET_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for row LCRs that contain the results of DML changes made to a subset of rows in a specified table.

The `ADD_TABLE_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for LCRs that contain changes made to a specified table.

These rules are evaluated against LCRs in the outbound server’s queue. If one of the preceding procedures adds rules to the positive rule set for the outbound server, then the rules specify that the outbound server sends LCRs in its queue to the XStream client application. If one of these procedures adds rules to the negative rule set for the outbound server, then the rules specify that the outbound server discards LCRs in its queue. For outbound server rules, execute these procedures at the database to which the XStream client application attaches.

An outbound server can process captured LCRs from only one source database. The source database is the database where the changes originated. If one of these procedures adds rules to the rule set of an outbound server, then specify the source database for the outbound server using the `source_database` parameter.

The rules in the outbound server’s rule sets determine which LCRs are dequeued by the outbound server. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database. If the outbound server dequeues an LCR with a source database that is different from the source database for the outbound server, then an error is raised. In addition, when adding rules to an existing outbound server, the database specified in the `source_database` parameter cannot be different from the source database for the outbound server. You can determine the source database for an outbound server by querying the `DBA_XSTREAM_OUTBOUND` data dictionary view.

---

**Note:** These procedures cannot create an XStream outbound server. You can use one of the procedures in the `DBMS_STREAMS_ADM` package to add rules to a rule set used by the outbound server after you create it.

---

**See Also:** *Oracle Database XStream Guide* for information about creating an outbound server

**XStream Inbound Server Rules for LCRs**

When you specify `apply` for the `streams_type` parameter and an XStream inbound server for the `streams_name` parameter, the following procedures add rules to a rule set of the specified inbound server:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for all LCRs sent to the inbound server.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for LCRs sent to the inbound server that contain changes made to a specified schema.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs sent to the inbound server that contain the results of data definition language (DML) changes made to a subset of rows in a specified table.
- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs sent to the inbound server that contain changes made to a specified table.
If one of the preceding procedures adds rules to the positive rule set for the inbound server, then the rules specify that the inbound server applies LCRs sent to it by the XStream client application. If one of these procedures adds rules to the negative rule set for the inbound server, then the rules specify that the inbound server discards LCRs sent to it by the XStream client application. For inbound server rules, execute these procedures at the database to which the XStream client application attaches. If an inbound server has no rule sets, then it applies all of the LCRs sent to it by the XStream client application.

Changes applied by an inbound server created by one of these procedures generate tags in the redo log at the destination database with a value of ‘00’ (double zero). You can use the ALTER_APPLY procedure in the DBMS_APPLY_ADM package to alter the tag value after the inbound server is created, if necessary.

The rules in the XStream inbound server rule sets determine which LCRs are either applied or discarded after the LCRs are received from the XStream client application. An inbound server can only process LCRs sent from an XStream client application.

When one of these procedures creates rules for an inbound server, the procedure ignores the source_database parameter.

---

**Note:** If the name specified in the streams_name parameter does not exist, then these procedures always create an apply process. The apply process remains an apply process if it receives captured LCRs from a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives LCRs from a capture process. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

---

**See Also:** Oracle Database XStream Guide for information about creating an inbound server

---

**Procedures That Configure an Oracle Streams Environment**

The following procedures in this package configure an environment that is maintained by Oracle Streams:

- **MAINTAIN_CHANGE_TABLE Procedure** configures an Oracle Streams environment that records in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database.

- **MAINTAIN_GLOBAL Procedure** configures an Oracle Streams environment that replicates changes at the database level between two databases.

- **MAINTAIN_SCHEMAS Procedure** configures an Oracle Streams environment that replicates changes to specified schemas between two databases.

- **MAINTAIN_SIMPLE_TTS Procedure** clones a simple tablespace from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespace between these two databases.

- **MAINTAIN_TABLES Procedure** configures an Oracle Streams environment that replicates changes to specified tables between two databases.
MAINTAIN_TTS Procedure clones a set of tablespaces from a source database at a
destination database and configures an Oracle Streams environment that replicates
changes to specified tablespaces between these two databases.

PRE_INSTANTIATION_SETUP Procedure and POST_INSTANTIATION_SETUP
Procedure

The PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures must be
used together to complete the Oracle Streams replication configuration. Typically, the
PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures are used to
perform database maintenance operations with little or no down time. See Oracle
Streams Concepts and Administration for more information.

The following sections contain information about using these procedures:

- Automatic Platform Conversion
- Actions Performed by These Procedures
- Configuration Progress and Recoverability
- Requirements for Running These Procedures
- Common Parameters for the Configuration Procedures

See Also: Oracle Streams Replication Administrator’s Guide for more
information about using these procedures

Automatic Platform Conversion

If the source and destination databases run on different platforms, then these
procedures, or the scripts generated by these procedures, convert transferred datafiles
to the appropriate platform automatically.

Actions Performed by These Procedures

To view all of the actions performed by one of these procedures in detail, use the
procedure to generate a script, and view the script in a text editor.

Configuration Progress and Recoverability

When one of these procedures is run with the perform_actions parameter set to TRUE,
metadata about its configuration actions is recorded in the following data dictionary
views: DBA_RECOVERABLE_SCRIPT, DBA_RECOVERABLE_SCRIPT_PARAMS, DBA_
RECOVERABLE_SCRIPT_BLOCKS, and DBA_RECOVERABLE_SCRIPT_ERRORS. If the procedure
stops because it encounters an error, then you can use the RECOVER_OPERATION
procedure to complete the configuration after you correct the conditions that caused
the error.

Note: When one of these procedures is run with the perform_actions parameter set to FALSE, these views are not populated. Also, the views are not populated when a script generated by one of these procedures is run.

See Also: "RECOVER_OPERATION Procedure" on page 159-147

Requirements for Running These Procedures

Meet the following requirements when you use one of these procedures:
Run the procedure at the capture database. The capture database is the database that will contain the capture process that captures changes made to the source database. If the capture database is the same as the source database, then a local capture process is configured. If the capture database is different from the source database, then a downstream capture process is configured. See Oracle Streams Replication Administrator’s Guide for more information about the capture database.

The user who runs the procedure must be able to use a database link from the source database to the destination database. This database link should have the same name as the global name of the destination database.

If the procedure configures downstream capture, then the corresponding user at the capture database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

If the procedure configures downstream capture, and the capture database is different from the destination database, then the corresponding user at the capture database must be able to use a database link to access the destination database. This database link should have the same name as the global name of the destination database.

Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the destination_database parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.

Grant the user who runs the procedure the DBA role. This user must have the necessary privileges to complete the following actions:

- Create ANYDATA queues, capture processes, propagations, and apply processes.
- Specify supplemental logging
- Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
- Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.

Typically, the DBA role can be revoked from the user, if necessary, after the configuration is complete.

The procedure, or the scripts generated by these procedure, must be run at an Oracle Database 10g Release 2 or later database.

If the perform_actions parameter is set to TRUE in the procedure to configure the Oracle Streams environment directly, then all of the databases configured by the procedure must be Oracle Database 10g Release 2 or later databases.

If the perform_actions parameter is set to FALSE in the procedure, and the environment is configured with a generated script, then the databases configured by the script must be Oracle Database 10g Release 1 or later databases. If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

Each specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes the procedure must have READ and WRITE privilege on each one.

For procedures that include the bi_directional parameter, if the bi_directional parameter is set to TRUE, or if the source database is not the capture database, then
the `source_database` parameter must specify a database that contains the
database objects to be shared. The database specified in the `destination_`
database parameter might or might not contain these database objects. If the
destination database does not contain the shared database objects, then the
procedure instantiates the database objects at the destination database (excluding
the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures).

- For procedures that include the `bi_directional` parameter, if the `bi_directional`
  parameter is set to `TRUE` or if a network instantiation will be performed, then the
  corresponding user at the destination database must be able to use a database link
to access the source database. This database link should have the same name as
  the global name of the source database.

To ensure that the user who runs these procedures has the necessary privileges, you
should configure an Oracle Streams administrator at each database, and each database
link should be should be created in the Oracle Streams administrator’s schema.

**See Also:** *Oracle Streams Replication Administrator’s Guide* for
information about configuring an Oracle Streams administrator

### Common Parameters for the Configuration Procedures

Table 159–1 describes the common parameters for the procedures in this package that
configure an Oracle Streams environment. Some of the procedures do not include all of
the parameters in Table 159–1.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `perform_actions` | If `TRUE`, then the procedure performs the necessary actions to configure the environment directly.  
If `FALSE`, then the procedure does not perform the necessary actions to configure the environment directly.  
Specify `FALSE` when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify `FALSE` and either of the following parameters is `NULL`:
  - `script_name`
  - `script_directory_object`
| `script_name` | If non-NULL and the `perform_actions` parameter is `FALSE`, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the `script_directory_object` parameter, then the procedure appends the statements to the existing file.  
If non-NULL and the `perform_actions` parameter is `TRUE`, then the procedure generates the specified script and performs the actions to configure the environment directly.  
If `NULL` and the `perform_actions` parameter is `TRUE`, then the procedure performs the actions to configure the environment directly and does not generate a script.  
If `NULL` and the `perform_actions` parameter is `FALSE`, then the procedure raises an error. |
Table 159–1 (Cont.) Common Parameters for Configuration Procedures

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed.</td>
</tr>
<tr>
<td></td>
<td>If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
<td></td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of each capture process configured to capture changes. Do not specify an owner. If the bi_directional parameter is set to TRUE, then each capture process created by this procedure has the specified name.</td>
</tr>
<tr>
<td></td>
<td>If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the system generates a name for each capture process it creates.</td>
</tr>
<tr>
<td>Note: The capture process name cannot be altered after the capture process is created.</td>
<td></td>
</tr>
<tr>
<td>capture_queue_table</td>
<td>The name of the queue table for each queue used by a capture process, specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.</td>
</tr>
<tr>
<td>capture_queue_name</td>
<td>The name of each queue used by a capture process, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the system generates a name for each queue used by a capture process.</td>
</tr>
<tr>
<td>capture_queue_user</td>
<td>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</td>
</tr>
</tbody>
</table>
The name of each propagation configured to propagate changes. Do not specify an owner.

If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set.

If NULL, then the system generates a name for each propagation it creates.

**Note:** The propagation name cannot be altered after the propagation is created.

The name of each apply process configured to apply changes. Do not specify an owner.

If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set.

The specified name must not match the name of an existing messaging client at the destination database.

If NULL, then the system generates a name for each apply process it creates. When set to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter.

**Note:** The apply process name cannot be altered after the apply process is created.

The name of the queue table for each queue used by an apply process, specified as `[schema_name.]queue_table_name`. For example, `strmadmin.streams_queue_table`. If the schema is not specified, then the current user is the default.

If NULL, then the system generates a name for the queue table of each queue used by an apply process, and the current user is the owner of each queue table.

The name of each queue used by an apply process, specified as `[schema_name.]queue_name`. For example, `strmadmin.streams_queue`.

If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.

If NULL, then the system generates a name for each queue used by an apply process.

The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.

If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
Specify **TRUE** to configure bi-directional replication between the database specified in `source_database` and the database specified in `destination_database`. Both databases are configured as source and destination databases, a capture and apply process is configured to capture changes to both databases, and propagations are configured to propagate these changes. If **TRUE**, then a database link from the destination database to the source database with the same global name as the source database must exist.

Specify **FALSE** to configure one way replication from the database specified in `source_database` and the database specified in `destination_database`. A capture process is configured at the current database and an apply process is configured at the destination database. A propagation is configured if necessary.

**See Also:** Oracle Streams Replication Administrator’s Guide for information about when propagations are configured.

Note:  All subprograms commit unless specified otherwise.
ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The column_value and column_function parameters are mutually exclusive.

Note:
- ADD_COLUMN transformations cannot add columns of the following data types: BLOB, CLOB, NCLOB, BFILE, LONG, LONG RAW, ROWID, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: Oracle Streams Concepts and Administration for more information about declarative rule-based transformations

Syntax

```sql
DBMS_STREAMS_ADM.ADD_COLUMN(
    rule_name IN VARCHAR2,
    table_name IN VARCHAR2,
    column_name IN VARCHAR2,
    column_value IN ANYDATA,
    value_type IN VARCHAR2 DEFAULT 'NEW',
    step_number IN NUMBER DEFAULT 0,
    operation IN VARCHAR2 DEFAULT 'ADD');

DBMS_STREAMS_ADM.ADD_COLUMN(
    rule_name IN VARCHAR2,
    table_name IN VARCHAR2,
    column_name IN VARCHAR2,
    column_function IN VARCHAR2,
    value_type IN VARCHAR2 DEFAULT 'NEW',
    step_number IN NUMBER DEFAULT 0,
    operation IN VARCHAR2 DEFAULT 'ADD');
```
Parameters

Table 159–3  ADD_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table to which the column is added in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column added to each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>column_value</td>
<td>The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified.</td>
</tr>
<tr>
<td>column_function</td>
<td>Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all add column transformations for the specified rule.</td>
</tr>
</tbody>
</table>

</table>
ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```sql
DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
    streams_name IN VARCHAR2 DEFAULT NULL,
    source_queue_name IN VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    dml_rule_name OUT VARCHAR2,
    ddl_rule_name OUT VARCHAR2,
    inclusion_rule IN BOOLEAN DEFAULT TRUE,
    and_condition IN VARCHAR2 DEFAULT NULL,
    queue_to_queue IN BOOLEAN DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
    streams_name IN VARCHAR2 DEFAULT NULL,
    source_queue_name IN VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    inclusion_rule IN BOOLEAN DEFAULT TRUE,
    and_condition IN VARCHAR2 DEFAULT NULL,
    queue_to_queue IN BOOLEAN DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified propagation does not exist, then the procedure creates it automatically.</td>
</tr>
<tr>
<td></td>
<td>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
</tbody>
</table>
**source_queue_name**
The name of the source queue, specified as `schema_name.queue_name`. The current database must contain the source queue, and the queue must be ANYDATA type.

For example, to specify a source queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter.

If the schema is not specified, then the current user is the default.

**destination_queue_name**
The name of the destination queue, including a database link, specified as `[schema_name.queue_name]@dblink_name`, if the destination queue is in a remote database. The queue must be ANYDATA type.

For example, to specify a destination queue named `streams_queue` in the `strmadmin` schema and use a database link named `dbs2.net`, enter `strmadmin.streams_queue@dbs2.net` for this parameter.

If the schema is not specified, then the current user is the default.

If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.

**include_dml**
If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

**include_ddl**
If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

**include_tagged_lcr**
If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.

If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.

Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

See Also: Oracle Streams Replication Administrator's Guide for more information about tags.
ADD_GLOBAL_PROPAGATION_RULES Procedure

Table 159–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
<tr>
<td>and_condition</td>
<td>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (system_condition) AND (and_condition) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of ‘02’, specify the following condition: :lcr.get_tag() = HEXTORAW('02') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. See Also: Chapter 275, &quot;Logical Change Record TYPEs&quot;</td>
</tr>
</tbody>
</table>
Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

See Also:

- "Operational Notes" on page 159-9 and "Propagation Rules for LCRs" on page 159-11 for more information about the rules created by this procedure
- "Propagation User" on page 159-6

Examples

The following is an example of a global rule condition created for DML changes:

```sql
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```
ADD_GLOBAL_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database. See "Capture Process Rules for Changes in the Redo Log" on page 159-10 for more information about these rules.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying all logical change records (LCRs) in a queue. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 159-12 for more information about these rules.

- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing all persistent LCRs from a queue. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 159-14 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

---

**Caution:** If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

---

**Note:** Currently, messaging clients cannot dequeue buffered messages.

---

Syntax

```sql
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(  
    streams_type        IN   VARCHAR2,  
    streams_name        IN   VARCHAR2  DEFAULT NULL,  
    queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',  
    include_dml         IN   BOOLEAN   DEFAULT TRUE,  
    include_ddl         IN   BOOLEAN   DEFAULT FALSE,  
    include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,  
    source_database     IN   VARCHAR2  DEFAULT NULL,  
    dml_rule_name       OUT  VARCHAR2,  
    ddl_rule_name       OUT  VARCHAR2,  
    inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,  
    and_condition       IN   VARCHAR2  DEFAULT NULL);
```

```sql
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(  
    streams_type        IN   VARCHAR2,  
    streams_name        IN   VARCHAR2  DEFAULT NULL,  
    queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',  
    include_dml         IN   BOOLEAN   DEFAULT TRUE,  
    include_ddl         IN   BOOLEAN   DEFAULT FALSE,  
    include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,  
    source_database     IN   VARCHAR2  DEFAULT NULL,

<tr>
<td>and_condition</td>
<td>DEFAULT NULL, DEFAULT NULL, DEFAULT NULL, DEFAULT NULL, DEFAULT NULL,</td>
</tr>
</tbody>
</table>

Parameters

Streams Name: IN VARCHAR2 DEFAULT NULL,
Queue Name: IN VARCHAR2 DEFAULT 'streams_queue',
Include DML: IN BOOLEAN DEFAULT TRUE,
Include DDL: IN BOOLEAN DEFAULT FALSE,
Include Tagged LCR: IN BOOLEAN DEFAULT FALSE,
Source Database: IN VARCHAR2 DEFAULT NULL,
Inclusion Rule: IN BOOLEAN DEFAULT TRUE,
And Condition: IN VARCHAR2 DEFAULT NULL);
include_dml
- If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

include ddl
- If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

include_tagged_lcr
- If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.

- If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.

Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

source_database
- The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.

For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.

For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
**Summary of DBMS_STREAMS_ADM Subprograms**

**159-37**

**Usage Notes**

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

### ADD_MESSAGE_PROPAGATION_RULE Procedure

This procedure adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `rule_name`, and the other does not.

#### Syntax

```sql
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
    message_type            IN   VARCHAR2,
    rule_condition          IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    rule_name               OUT  VARCHAR2,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
    message_type            IN   VARCHAR2,
    rule_condition          IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_type</td>
<td>The type of the message. The type can be an Oracle built-in type, such as VARCHAR2 or NUMBER, or it can be a user-defined type. If the type is not an Oracle built-in type, then it is specified as <code>[schema_name.]type_name</code>. If the schema is not specified, then the current user is the default. For example, to specify VARCHAR2, enter <code>VARCHAR2(n)</code>, where <code>n</code> is the size specification. To specify a type named <code>usr_msg</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.usr_msg</code> for this parameter. The following data types require a size specification: VARCHAR2, NVARCHAR2, and RAW. <strong>See Also</strong>: Oracle Database SQL Language Reference for more information about data types.</td>
</tr>
<tr>
<td>rule_condition</td>
<td>The rule condition for this message type. The rule variable name specified in the rule condition must be the following: <code>:msg</code> <strong>See Also</strong>: &quot;Examples&quot; on page 159-41</td>
</tr>
</tbody>
</table>
ADD_MESSAGE_PROPAGATION_RULE Procedure

**Table 159–6 (Cont.) ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter <a href="mailto:strmadmin.streams_queue@dbs2.net">strmadmin.streams_queue@dbs2.net</a> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. <strong>Note:</strong> Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
<tr>
<td>rule_name</td>
<td>Contains the rule name</td>
</tr>
</tbody>
</table>

---

159-40 Oracle Database PL/SQL Packages and Types Reference
This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:
- "Operational Notes" on page 159-9 and "Propagation Rules for User Messages" on page 159-12 for more information about the rules created by this procedure
- "Propagation User" on page 159-6

Examples

Suppose the message type is VARCHAR2(128). Given this type, the following rule condition can be specified:

`':msg = 'HQ'`  

This rule condition evaluates to TRUE if a user message of type VARCHAR2(128) has HQ for its value.

Suppose the message type is usr_msg, and that this type has the following attributes: source_dbname, owner, name, and message. Given this type, the following rule condition can be specified:
This rule condition evaluates to TRUE if a user message of type \texttt{usr\_msg} has \texttt{DBS1.NET} for its \texttt{source\_dbname} attribute, \texttt{HR} for its \texttt{owner} attribute, and \texttt{EMPLOYEES} for its \texttt{name} attribute.

\textbf{Note: } The quotation marks in the preceding examples are all single quotation marks.
ADD_MESSAGE_RULE Procedure

This procedure adds a message rule to a rule set of one of the following types of Oracle Streams clients:

- When the streams_type parameter is set to apply, this procedure adds an apply process rule for dequeuing user messages of a specific message type from a queue. See "Apply Process Rules for User Messages" on page 159-13 for more information about such rules.

- When the streams_type parameter is set to dequeue, this procedure adds a messaging client rule for dequeuing user messages of a specific message type from a queue. See "Messaging Client Rules for User Messages" on page 159-14 for more information about such rules.

This procedure also creates the specified Oracle Streams client if it does not exist.

This procedure is overloaded. One version of this procedure contains the OUT parameter rule_name, and the other does not.

---

**Note:** Currently, messaging clients cannot dequeue buffered messages.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
message_type IN VARCHAR2,
rule_condition IN VARCHAR2,
streams_type IN VARCHAR2,
streams_name IN VARCHAR2 DEFAULT NULL,
queue_name IN VARCHAR2 DEFAULT 'streams_queue',
inclusion_rule IN BOOLEAN DEFAULT TRUE,
rule_name OUT VARCHAR2);
```

```sql
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
message_type IN VARCHAR2,
rule_condition IN VARCHAR2,
streams_type IN VARCHAR2,
streams_name IN VARCHAR2 DEFAULT NULL,
queue_name IN VARCHAR2 DEFAULT 'streams_queue',
inclusion_rule IN BOOLEAN DEFAULT TRUE);
```

</tr>
<tr>
<td></td>
<td>client automatically with a system-generated name.</td>
</tr>
<tr>
<td></td>
<td>An apply process and a messaging client cannot have the same name.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue from which messages will be dequeued, specified as [schema_name.]queue_name. The current database must contain the</td>
</tr>
<tr>
<td></td>
<td>queue, and the queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the apply process or messaging client.</td>
</tr>
<tr>
<td></td>
<td>If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the apply process or messaging client.</td>
</tr>
<tr>
<td></td>
<td>In either case, the system creates the rule set if it does not exist.</td>
</tr>
<tr>
<td>rule_name</td>
<td>Contains the rule name</td>
</tr>
</tbody>
</table>
Usage Notes

If an apply process rule is added, then this procedure creates the apply process if it
does not exist. An apply process created by this procedure can apply only user
messages, and dequeued messages are sent to the message handler for the apply
process. If a messaging client rule is added, then this procedure creates a messaging
client if it does not exist.

When you use this procedure to create a rule set for a message rule, the new rule set
does not have an evaluation context. If no evaluation context exists for the specified
message type, then this procedure creates a new evaluation context and associates it
with the new rule. The evaluation context also has a system-generated name. If you
create new rules that use an existing message type, then the new rules use the existing
evaluation context for the message type.

See Also:
- "Operational Notes" on page 159-9
- "Security Model" on page 159-5
- ALTER_APPLY Procedure on page 23-10 for more information
  about setting a message handler for an apply process

Examples

Suppose the message type is VARCHAR2(128). Given this type, the following rule
condition can be specified:

'\:msg = ''HQ'''

This rule condition evaluates to TRUE if a user message of type VARCHAR2(128) has HQ
for its value.

Suppose the message type is usr_msg, and that this type has the following attributes:
source_dbname, owner, name, and message. Given this type, the following rule
condition can be specified:

'\:msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND ' ||
\:msg.name = ''EMPLOYEES'''

This rule condition evaluates to TRUE if a user message of type usr_msg has DBS1.NET
for its source_dbname attribute, HR for its owner attribute, and EMPLOYEES for its name
attribute.

Note: The quotation marks in the preceding examples are all
single quotation marks.
ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
    schema_name IN VARCHAR2,
    streams_name IN VARCHAR2 DEFAULT NULL,
    source_queue_name IN VARCHAR2,
    destination_queue_name IN VARCHAR2,

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically.</td>
</tr>
<tr>
<td></td>
<td>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STREAMS_ADM Subprograms

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as {schema_name}.queue_name. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as {schema_name}.queue_name@dblink_name, if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter <a href="mailto:strmadmin.streams_queue@dbs2.net">strmadmin.streams_queue@dbs2.net</a> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. Note: Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.</td>
</tr>
</tbody>
</table>

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags.
The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

Oracle recommends that you specify a source database for propagation rules.

If include_dml is TRUE, then this parameter contains the DML rule name.

If include_dml is FALSE, then this parameter contains a NULL.

If include_ddl is TRUE, then this parameter contains the DDL rule name.

If include_ddl is FALSE, then this parameter contains a NULL.

If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation.

If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation.

In either case, the system creates the rule set if it does not exist.

If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:

\[(\text{system\_condition}) \text{ AND } (\text{and\_condition})\]

The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of ‘02’, specify the following condition:

\[:lcr.get\_tag() = \text{HEXTORAW}('02')\]

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.

See Also: Chapter 275, "Logical Change Record TYPES"
### Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

**See Also:**
- "Operational Notes" on page 159-9 and "Propagation Rules for LCRs" on page 159-11 for more information about the rules created by this procedure
- "Propagation User" on page 159-6

### Examples

The following is an example of a schema rule condition created for DML changes:

```plaintext
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```
ADD_SCHEMA_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a specified schema. See "Capture Process Rules for Changes in the Redo Log" on page 159-10 for more information about these rules.

- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 159-12 for more information about these rules.

- When the streams_type parameter is set to dequeue, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 159-14 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Caution: If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Streams. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES (  
schema_name IN VARCHAR2,  
streams_type IN VARCHAR2,  
streams_name IN VARCHAR2 DEFAULT NULL,  
queue_name IN VARCHAR2 DEFAULT 'streams_queue',  
include_dml IN BOOLEAN DEFAULT TRUE,  
include_ddl IN BOOLEAN DEFAULT FALSE,  
include_tagged_lcr IN BOOLEAN DEFAULT FALSE,  
source_database IN VARCHAR2 DEFAULT NULL,  
dml_rule_name OUT VARCHAR2,  
ddl_rule_name OUT VARCHAR2,  
inclusion_rule IN BOOLEAN DEFAULT TRUE,  
and_condition IN VARCHAR2 DEFAULT NULL);
```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES (  
    schema_name IN VARCHAR2,  
    streams_type IN VARCHAR2,  
    streams_name IN VARCHAR2 DEFAULT NULL,  
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',  
    include_dml IN BOOLEAN DEFAULT TRUE,  
    include_ddl IN BOOLEAN DEFAULT FALSE,  
    include_tagged_lcr IN BOOLEAN DEFAULT FALSE,  
    source_database IN VARCHAR2 DEFAULT NULL,  
    inclusion_rule IN BOOLEAN DEFAULT TRUE,  
    and_condition IN VARCHAR2 DEFAULT NULL);  

Parameters

Table 159–9  ADD_SCHEMA_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr.</td>
</tr>
<tr>
<td></td>
<td>You can specify a schema that does not yet exist, because Oracle Streams does not validate the existence of the schema.</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of Oracle Streams client:</td>
</tr>
<tr>
<td></td>
<td>■ Specify capture for a capture process.</td>
</tr>
<tr>
<td></td>
<td>■ Specify apply for an apply process.</td>
</tr>
<tr>
<td></td>
<td>■ Specify dequeue for a messaging client.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the capture process, apply process, or messaging client.</td>
</tr>
<tr>
<td></td>
<td>Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</td>
</tr>
<tr>
<td></td>
<td>■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</td>
</tr>
<tr>
<td></td>
<td>■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</td>
</tr>
<tr>
<td></td>
<td>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>Each apply process and messaging client must have a unique name.</td>
</tr>
</tbody>
</table>
queue_name
The name of the local queue, specified as \([\text{schema_name}.\text{queue_name}]\). The current database must contain the queue, and the queue must be ANYDATA type.

For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.

For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.

include_dml
If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

include_ddl
If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

include_tagged_lcr
If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.

If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.

Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags.
source_database

The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.

For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.

For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

dml_rule_name

If include_dml is TRUE, then this parameter contains the DML rule name.

If include_dml is FALSE, then this parameter contains a NULL.

ddl_rule_name

If include_ddl is TRUE, then this parameter contains the DDL rule name.

If include_ddl is FALSE, then this parameter contains a NULL.

inclusion_rule

If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client.

If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client.

In either case, the system creates the rule set if it does not exist.
### ADD_SCHEMA_RULES Procedure

**Usage Notes**

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

*See Also:* Chapter 275, "Logical Change Record TYPEs"

### Examples

The following is an example of a schema rule condition created for DML changes:

```sql
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

---

**Table 159–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| and_condition| If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:  

\((\text{system\_condition}) \text{ AND } (\text{and\_condition})\)  

The variable in the specified condition must be `lcr`. For example, to specify that the schema rules generated by the procedure evaluate to `TRUE` only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:  

`:lcr.get_tag() = \text{HEXTORAW}'02'\)  

The `lcr` in the specified condition is converted to `dml` or `ddl`, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify `TRUE` for the `include_dml` parameter and `FALSE` for the `include_ddl` parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify `FALSE` for the `include_dml` parameter and `TRUE` for the `include_ddl` parameter.  

*See Also:* Chapter 275, "Logical Change Record TYPEs"
ADD_SUBSET_PROPAGATION_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
    table_name               IN   VARCHAR2,
    dml_condition            IN   VARCHAR2,
    streams_name             IN   VARCHAR2  DEFAULT NULL,
    source_queue_name        IN   VARCHAR2,
    destination_queue_name   IN   VARCHAR2,
    include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
    source_database          IN   VARCHAR2  DEFAULT NULL,
    insert_rule_name         OUT  VARCHAR2,
    update_rule_name         OUT  VARCHAR2,
    delete_rule_name         OUT  VARCHAR2,
    queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
    table_name               IN   VARCHAR2,
    dml_condition            IN   VARCHAR2,
    streams_name             IN   VARCHAR2  DEFAULT NULL,
    source_queue_name        IN   VARCHAR2,
    destination_queue_name   IN   VARCHAR2,
    include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
    source_database          IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</td>
</tr>
<tr>
<td>dml_condition</td>
<td>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: 'salary &gt; 4000 and job_id = ''SA_MAN'' '</td>
</tr>
</tbody>
</table>

Note: The quotation marks in the preceding example are all single quotation marks.
### ADD_SUBSET_PROPAGATION_RULES Procedure

The `ADD_SUBSET_PROPAGATION_RULES` procedure is used to add subset propagation rules to Oracle Streams. It requires the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner.</td>
</tr>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. <strong>Note:</strong> Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td>include_tagged_lcr</td>
<td>If <code>TRUE</code>, then an LCR is always considered for propagation, regardless of whether it has a non-<code>NULL</code> tag. This setting is appropriate for a full (for example, standby) copy of a database. If <code>FALSE</code>, then an LCR is considered for propagation only when the LCR contains a <code>NULL</code> tag. A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database. <strong>See Also:</strong> Oracle Streams Replication Administrator’s Guide for more information about tags</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically. Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
</tbody>
</table>

---

**Table 159–10 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters**

- **streams_name**: The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

- **source_queue_name**: The name of the source queue, specified as `[schema_name.]queue_name`. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.

- **destination_queue_name**: The name of the destination queue, including a database link, specified as `[schema_name.]queue_name[dblink_name]`, if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named `streams_queue` in the `strmadmin` schema and use a database link named `dbs2.net`, enter `strmadmin.streams_queue@dbs2.net` for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.

- **include_tagged_lcr**: If `TRUE`, then an LCR is always considered for propagation, regardless of whether it has a non-`NULL` tag. This setting is appropriate for a full (for example, standby) copy of a database. If `FALSE`, then an LCR is considered for propagation only when the LCR contains a `NULL` tag. A setting of `FALSE` is often specified in update-anywhere configurations to avoid sending a change back to its source database. **See Also:** Oracle Streams Replication Administrator’s Guide for more information about tags.

- **source_database**: The global name of the source database. The source database is where the change originated. If `NULL`, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify `DBS1` and the domain is `.NET`, then the procedure specifies `DBS1.NET` automatically. Oracle recommends that you specify a source database for propagation rules.
This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified dml_condition, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified dml_condition, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified dml_condition, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified dml_condition, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.
A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

**Attention:** Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

**See Also:**
- "Operational Notes" on page 159-9 and "Propagation Rules for LCRs" on page 159-11 for more information about the rules created by this procedure
- "Propagation User" on page 159-6

**Examples**

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```sql
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS' AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

```sql
Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

**See Also:**
- "Operational Notes" on page 159-9 and "Propagation Rules for LCRs" on page 159-11 for more information about the rules created by this procedure
- "Propagation User" on page 159-6

**Examples**

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```sql
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS' AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```
ADD_SUBSET_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table. See "Capture Process Rules for Changes in the Redo Log" on page 159-10 for more information about these rules.

- When the `streams_type` parameter is set to `sync_capture`, this procedure adds rules for capturing changes to a subset of rows in a specified table. See "Synchronous Capture Rules for DML Changes to Tables" on page 159-11 for more information about these rules.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 159-12 for more information about these rules.

- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 159-14 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

---

**Note:**

- Currently, messaging clients cannot dequeue buffered messages.
- The invoking user must be granted the DBA role to create a synchronous capture.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
    table_name          IN   VARCHAR2,
    dml_condition       IN   VARCHAR2,
    streams_type        IN   VARCHAR2 DEFAULT 'apply',
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
    include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
    source_database     IN   VARCHAR2 DEFAULT NULL,
    insert_rule_name    OUT  VARCHAR2,
    update_rule_name    OUT  VARCHAR2,
    delete_rule_name    OUT  VARCHAR2);
```

```sql
DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
    table_name          IN   VARCHAR2,
    dml_condition       IN   VARCHAR2,
    streams_type        IN   VARCHAR2 DEFAULT 'apply',
);```
### ADD_SUBSET_RULES Procedure

```sql
streams_name IN VARCHAR2 DEFAULT NULL,
queue_name IN VARCHAR2 DEFAULT 'streams_queue',
include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL);
```

## Parameters

### Table 159-1 ADD_SUBSET_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as <code>schema_name.object_name</code>. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process, synchronous capture, apply process, or messaging client. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</td>
</tr>
<tr>
<td>dml_condition</td>
<td>The subset condition. Specify this condition similar to the way you specify conditions in a <code>WHERE</code> clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the <code>job_id</code> is SA_MAN, enter the following as the condition: <code>salary &gt; 4000 and job_id = 'SA_MAN'</code></td>
</tr>
</tbody>
</table>
| streams_type       | The type of Oracle Streams client:  

- Specify capture for a capture process.  
- Specify sync_capture for a synchronous capture.  
- Specify apply for an apply process.  
- Specify dequeue for a messaging client. |
streams_name
The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner.
If NULL, if streams_type is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error.

If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:

- If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.
- If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.

If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.
If NULL and multiple relevant apply processes exist, then the procedure raises an error.

Each apply process and messaging client must have a unique name.

queue_name
The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type.

For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.

For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.
ADD_SUBSET_RULES Procedure

If TRUE, then the Oracle Streams client performs its action regardless of the tag:

- A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.
- A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag.
- An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag.

If FALSE, then an Oracle Streams client performs its action only when the tag is NULL:

- A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag.
- A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag.
- An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag.

A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

source_database

The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.

For synchronous capture rules, specify the name of the local database.

For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.

For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

insert_rule_name

Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.
Summary of DBMS_STREAMS_ADM Subprograms

Usage Notes

Running this procedure generates three rules for the specified capture process, synchronous capture, apply process, or messaging client: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured, applied, or dequeued. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured, applied, or dequeued without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured, applied, or dequeued.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering. If the Oracle Streams client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

**Attention:** Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>update_rule_name</td>
<td>Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.</td>
</tr>
<tr>
<td>delete_rule_name</td>
<td>Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes</td>
</tr>
</tbody>
</table>
Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```sql
:dml.get_object_owner() = 'HR' AND :dml.get_object_name() = 'REGIONS'
AND :dml.is_null_tag() = 'Y' AND :dml.get_source_database_name() = 'DBS1.NET'
AND :dml.get_command_type() = 'UPDATE'
AND (:dml.get_value('NEW', '"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD', '"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD', '"REGION_ID"').AccessNumber() = 2)
AND (:dml.get_value('NEW', '"REGION_ID"').AccessNumber() = 2)
```

ADD_TABLE_PROPAGATION_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```sql
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
    table_name              IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

```sql
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
    table_name              IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as <code>[schema_name.]table_name</code>. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically.</td>
</tr>
<tr>
<td></td>
<td>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
</tbody>
</table>
source_queue_name  The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type.

For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter.

If the schema is not specified, then the current user is the default.

destination_queue_name  The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type.

For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter.

If the schema is not specified, then the current user is the default.

If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.

Note: Connection qualifiers are not allowed.

include_dml  If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

include_ddl  If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.
include_tagged_lcr

If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.

If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.

Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

source_database

The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

Oracle recommends that you specify a source database for propagation rules.

dml_rule_name

If include_dml is TRUE, then this parameter contains the DML rule name.

If include_dml is FALSE, then this parameter contains a NULL.

ddl_rule_name

If include_ddl is TRUE, then this parameter contains the DDL rule name.

If include_ddl is FALSE, then this parameter contains a NULL.

inclusion_rule

If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation.

If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation.

In either case, the system creates the rule set if it does not exist.
Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The

### Table 159–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>and_condition</code></td>
<td>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</td>
</tr>
<tr>
<td></td>
<td><code>(system_condition) AND (and_condition)</code></td>
</tr>
<tr>
<td></td>
<td>The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of ’02’, specify the following condition:</td>
</tr>
<tr>
<td></td>
<td>:lcr.get_tag() = HEXTORAW('02')</td>
</tr>
<tr>
<td><code>queue_to_queue</code></td>
<td>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</td>
</tr>
<tr>
<td></td>
<td>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</td>
</tr>
<tr>
<td></td>
<td>■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>■ If NULL, then the procedure does not change the queue to queue property of the propagation.</td>
</tr>
</tbody>
</table>

See Also: [Oracle Streams Concepts and Administration](#) for more information about queue-to-queue propagations.
sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

See Also:
- "Operational Notes" on page 159-9 and "Propagation Rules for LCRs" on page 159-11 for more information about the rules created by this procedure
- "Security Model" on page 159-5

Examples

The following is an example of a table rule condition created for filtering DML statements:

{ ( :dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS')
  and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' }
ADD_TABLE_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a specified table. See "Capture Process Rules for Changes in the Redo Log" on page 159-10 for more information about these rules.

- When the streams_type parameter is set to sync_capture, this procedure adds rules for capturing changes to a specified table. See "Synchronous Capture Rules for DML Changes to Tables" on page 159-11 for more information about these rules.

- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 159-12 for more information about these rules.

- When the streams_type parameter is set to dequeue, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 159-14 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

---

**Note:**

- Currently, messaging clients cannot dequeue buffered messages.
- The invoking user must be granted the DBA role to create a synchronous capture.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_TABLE_RULES(
    table_name IN VARCHAR2,
    streams_type IN VARCHAR2,
    streams_name IN VARCHAR2 DEFAULT NULL,
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    dml_rule_name OUT VARCHAR2,
    ddl_rule_name OUT VARCHAR2,
    inclusion_rule IN BOOLEAN DEFAULT TRUE,
    and_condition IN VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_STREAMS_ADM.ADD_TABLE_RULES(
    table_name IN VARCHAR2,
);```
Summary of DBMS_STREAMS_ADM Subprograms

```

## Parameters

### Table 159–13 ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as <code>{schema_name}.{object_name}</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Oracle Streams does not validate the existence of the table.</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of Oracle Streams client:</td>
</tr>
<tr>
<td></td>
<td>- Specify capture for a capture process.</td>
</tr>
<tr>
<td></td>
<td>- Specify sync_capture for a synchronous capture.</td>
</tr>
<tr>
<td></td>
<td>- Specify apply for an apply process.</td>
</tr>
<tr>
<td></td>
<td>- Specify dequeue for a messaging client.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner.</td>
</tr>
</tbody>
</table>

If `NULL`, if `streams_type` is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If `NULL` and multiple Oracle Streams clients of the specified `streams_type` for the queue exist, then the procedure raises an error.

If `NULL`, if `streams_type` is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:

- If one existing apply process has the source database specified in `source_database` and uses the queue specified in `queue_name`, then the procedure uses this apply process.

- If `source_database` is `NULL` and one existing apply process is using the queue specified in `queue_name`, then the procedure uses this apply process.

If `NULL` and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.

If `NULL` and multiple relevant apply processes exist, then the procedure raises an error.

Each apply process and messaging client must have a unique name.
The name of the local queue, specified as `schema_name.queue_name`. The current database must contain the queue, and the queue must be ANYDATA type.

For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.

For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.

<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>

The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.
include_tagged_lcr

If **TRUE**, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to **TRUE** regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the Oracle Streams client, then the Oracle Streams client performs its action regardless of the tag:

- A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.
- A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag.
- An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag.

If the rules are added to a positive rule set, then setting this parameter to **TRUE** is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the Oracle Streams client, then whether a database change is discarded does not depend on the tag.

If **FALSE**, then the procedure adds a condition to each generated rule that causes the rule to evaluate to **TRUE** only if a redo entry, session, or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for an Oracle Streams client, then the Oracle Streams client performs its action only when the tag is NULL:

- A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag.
- A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag.
- An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag.

If the rules are added to a positive rule set, then setting this parameter to **FALSE** might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the Oracle Streams client, then a database change can be discarded only if it has a NULL tag.

A setting of **FALSE** is often specified in update-anywhere configurations to avoid sending a change back to its source database.

Usually, specify **TRUE** for this parameter if the inclusion_rule parameter is set to **FALSE**.

**See Also:** Oracle Streams Replication Administrator’s Guide for more information about tags.
The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.

For synchronous capture rules, specify the name of the local database.

For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.

For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

If include_dml is TRUE, then this parameter contains the DML rule name.

If include_dml is FALSE, then this parameter contains a NULL.

If include_ddl is TRUE, then this parameter contains the DDL rule name.

If include_ddl is FALSE, then this parameter contains a NULL.

If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client.

If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. A synchronous capture cannot have a negative rule set. Specifying FALSE for a synchronous capture raises an error.

In either case, the system creates the rule set if it does not exist.
Summary of DBMS_STREAMS_ADM Subprograms

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering.

- "Security Model" on page 159-5

**Examples**

The following is an example of a table rule condition created for DML changes:

```sql
{(.dml.get_object_owner() = 'HR' and .dml.get_object_name() = 'LOCATIONS')
  and .dml.is_null_tag() = 'Y' and .dml.get_source_database_name() = 'DBS1.NET')
```
CLEANUP_INSTANTIATION_SETUP Procedure

This procedure removes an Oracle Streams replication configuration that was set up by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures in this package. This procedure either remove the configuration directly, or it can generate a script that removes the configuration.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Attention: When the CLEANUP_INSTANTIATION_SETUP procedure is run, the parameter values must match the parameter values specified when the corresponding PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures were run, except for the values of the following parameters: perform_actions, script_name, and script_directory_object.

See Also:
- "PRE_INSTANTIATION_SETUP Procedure" on page 159-141
- "POST_INSTANTIATION_SETUP Procedure" on page 159-136
- "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```sql
DBMS_STREAMS_ADM.CLEANUP_INSTANTIATION_SETUP(
    maintain_mode           IN VARCHAR2,
    tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_database         IN VARCHAR2,
    destination_database    IN VARCHAR2,
    perform_actions         IN BOOLEAN   DEFAULT TRUE,
    script_name             IN VARCHAR2  DEFAULT NULL,
    script_directory_object IN VARCHAR2  DEFAULT NULL,
    capture_name            IN VARCHAR2  DEFAULT NULL,
    capture_queue_table     IN VARCHAR2  DEFAULT NULL,
    capture_queue_name      IN VARCHAR2  DEFAULT NULL,
    capture_queue_user      IN VARCHAR2  DEFAULT NULL,
    propagation_name        IN VARCHAR2  DEFAULT NULL,
    apply_name              IN VARCHAR2  DEFAULT NULL,
    apply_queue_table       IN VARCHAR2  DEFAULT NULL,
    apply_queue_name        IN VARCHAR2  DEFAULT NULL,
    apply_queue_user        IN VARCHAR2  DEFAULT NULL,
    bi_directional          IN BOOLEAN   DEFAULT FALSE,
    change_global_name      IN BOOLEAN   DEFAULT FALSE);
```
Parameters

Table 159–14  CLEANUP_INSTANTIATION_SETUP Procedure Parameters

<table>
<thead>
<tr>

</tr>
<tr>
<td>change_global_name</td>
<td>If TRUE, then the procedure changes the global name of the database specified in destination_database to match the global name of the current database. If FALSE, then the procedure does not change the global name of the database specified in destination_database.</td>
</tr>
</tbody>
</table>
DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:
- The DELETE_COLUMN procedure supports the same data types supported by Oracle Streams capture processes.
- The DELETE_COLUMN procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the KEEP_COLUMNS procedure in this package.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also:
- Oracle Streams Concepts and Administration for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- "KEEP_COLUMNS Procedure" on page 159-87

Syntax

```sql
DBMS_STREAMS_ADM.DELETE_COLUMN(
  rule_name     IN  VARCHAR2,
  table_name    IN  VARCHAR2,
  column_name   IN  VARCHAR2,
  value_type    IN  VARCHAR2   DEFAULT '*',
  step_number   IN  NUMBER     DEFAULT 0,
  operation     IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>

<td>Remove all delete column transformations with the specified table_name and column_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations with the specified table_name for the specified rule.</td>
</tr>
</tbody>
</table>
## DELETE_COLUMN Procedure

Remove all delete column transformations with the specified `table_name`, `column_name`, and `step_number` for the specified rule.

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified <code>table_name</code>, <code>column_name</code>, and <code>step_number</code> for the specified rule.</td>
</tr>
</tbody>
</table>
GET_MESSAGE_TRACKING Function

Returns the tracking label for the current session.

**See Also:** SET_MESSAGE_TRACKING Procedure on page 159-165

**Syntax**

```sql
DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```
GET_SCN_MAPPING Procedure

This procedure gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment. This information can be used for the following purposes:

- To recover transactions after point-in-time recovery is performed on a source database in a multiple source Oracle Streams environment
- To run flashback queries for the corresponding SCN at a source database and destination database in an Oracle Streams single source replication environment

See Also: Oracle Streams Replication Administrator’s Guide for information about point-in-time recovery and flashback queries in an Oracle Streams replication environment

Syntax

```sql
DBMS_STREAMS_ADM.GET_SCN_MAPPING(
  apply_name            IN  VARCHAR2,
  src_pit_scn           IN  NUMBER,
  dest_instantiation_scn OUT NUMBER,
  dest_start_scn        OUT NUMBER,
  dest_skip_txn_ids     OUT DBMS_UTILITY.NAME_ARRAY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>Name of the apply process which applies logical change records (LCRs) from the source database. The procedure raises an error if the specified apply process does not exist.</td>
</tr>
<tr>
<td>src_pit_scn</td>
<td>The SCN at the source database.</td>
</tr>
<tr>
<td></td>
<td>For point-in-time recovery, specify the point-in-time recovery SCN at the source database.</td>
</tr>
<tr>
<td></td>
<td>If the specified SCN is greater than the source commit SCN of the last applied transaction, then NULL is returned for both dest_start_scn and dest_instantiation_scn. In this case, no values can be returned for these parameters because the corresponding transaction has not been applied at the destination database yet.</td>
</tr>
<tr>
<td>dest_instantiation_scn</td>
<td>The SCN at the destination database that corresponds to the specified src_pit_scn at the source database.</td>
</tr>
<tr>
<td></td>
<td>For point-in-time recovery, use this value for the instantiation SCN at the source database during recovery.</td>
</tr>
<tr>
<td>dest_start_scn</td>
<td>For point in time recovery, the SCN to use for the start_scn parameter for the recovery capture process.</td>
</tr>
</tbody>
</table>
### Table 159–16 (Cont.) GET_SCN_MAPPNG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_skip_txn_ids</td>
<td>Transaction IDs of transactions that were skipped at the dest_instantiation_scn because the apply process was applying nondependent transactions out of order. For point in time recovery, these transaction IDs should be ignored by the recovery apply process. This parameter is relevant only if the commit_serialization for the apply process that applied these transactions was set to DEPENDENT_TRANSACTIONS, and the transactions were applied out of order.</td>
</tr>
</tbody>
</table>
GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

See Also:
- "SET_TAG Procedure" on page 159-170
- Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

```
DBMS_STREAMS_ADM.GET_TAG
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:
```
SET SERVEROUTPUT ON
DECLARE
    raw_tag RAW(2000);
BEGIN
    raw_tag := DBMS_STREAMS_ADM.GET_TAG();
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the DUAL view:
```
SELECT DBMS_STREAMS_ADM.GET_TAG FROM DUAL;
```
**KEEP_COLUMNS Procedure**

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

**Note:**

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Streams capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

**See Also:**

- *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- "DELETE_COLUMN Procedure" on page 159-80

**Syntax**

```sql
DBMS_STREAMS_ADM.KEEP_COLUMNS(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_list   IN  VARCHAR2,
    value_type    IN  VARCHAR2 DEFAULT '*',
    step_number   IN  NUMBER DEFAULT 0,
    operation     IN  VARCHAR2 DEFAULT 'ADD');

DBMS_STREAMS_ADM.KEEP_COLUMNS(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_table  IN  DBMS_UTILITY.LNAME_ARRAY,
    value_type    IN  VARCHAR2 DEFAULT '*',
    step_number   IN  NUMBER DEFAULT 0,
    operation     IN  VARCHAR2 DEFAULT 'ADD');
```
**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>rule_name</strong></td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><strong>table_name</strong></td>
<td>The name of the table for which the columns are kept in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><strong>column_list</strong></td>
<td>The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR. If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><strong>column_table</strong></td>
<td>The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><strong>value_type</strong></td>
<td>Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR.</td>
</tr>
<tr>
<td><strong>step_number</strong></td>
<td>The order of execution of the transformation. See Also: Oracle Streams Concepts and Administration for more information about transformation ordering</td>
</tr>
<tr>
<td><strong>operation</strong></td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. See &quot;Usage Notes&quot; on page 159-88 for more information about this parameter.</td>
</tr>
</tbody>
</table>

**Usage Notes**

When 'REMOVE' is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_list, column_table, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the **KEEP_COLUMNS** procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_list/column_table</th>
<th>step_number</th>
<th>Result</th>
</tr>

MAINTAIN_CHANGE_TABLE Procedure

This procedure configures an Oracle Streams environment that uses change handlers to record in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

A change handler is a special type of statement DML handler that tracks table changes and was created by either this MAINTAIN_CHANGE_TABLE procedure or the DBMS_APPLY_ADM.SET_CHANGE_HANDLER procedure. Information about change handlers is stored in the ALL_APPLY_CHANGE_HANDLERS and DBA_APPLY_CHANGE_HANDLERS views.

The change table can reside in the same database as the source table or in a different database.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

**Note:** The environment configured by this procedure does not record or replicate data definition language (DDL) changes made to the source table.

**See Also:** "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE(
  change_table_name        IN VARCHAR2,
  source_table_name        IN VARCHAR2,
  column_type_list         IN VARCHAR2,
  extra_column_list        IN VARCHAR2  DEFAULT 'command_type, value_type',
  capture_values           IN VARCHAR2,
  options_string           IN VARCHAR2  DEFAULT NULL,
  script_name              IN VARCHAR2  DEFAULT NULL,
  script_directory_object  IN VARCHAR2  DEFAULT NULL,
  perform_actions          IN BOOLEAN   DEFAULT TRUE,
  capture_name             IN VARCHAR2  DEFAULT NULL,
  propagation_name         IN VARCHAR2  DEFAULT NULL,
  apply_name               IN VARCHAR2  DEFAULT NULL,
  source_database          IN VARCHAR2  DEFAULT NULL,
  destination_database     IN VARCHAR2  DEFAULT NULL,
  keep_change_columns_only IN BOOLEAN   DEFAULT TRUE,
  execute_lcr              IN BOOLEAN   DEFAULT FALSE);
```
Parameters

Table 159–18  MAINTAIN_CHANGE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| change_table_name | The table that records changes to the source table. This table is maintained by Oracle Streams after configuration.  
Specify the table as [schema_name.]table_name. For example, hr.jobs_change_table. If the schema is not specified, then the current user is the default.  
If NULL, then the procedure raises an error.  
If the specified table exists at the database specified in the destination_database parameter, then the procedure raises an error. |
| source_table_name | The table at the source database for which changes are recorded.  
Specify the table as [schema_name.]table_name. For example, hr.jobs. If the schema is not specified, then the current user is the default.  
If NULL, then the procedure raises an error. |
| column_type_list | A list of the columns in the source table for which changes are recorded. Specify a comma-delimited list of each column and its datatype.  
For example, specify the following for the hr.jobs table:  
job_id VARCHAR2(10), job_title VARCHAR2(35), min_salary NUMBER(6), max_salary NUMBER(6)  
The procedure automatically places columns with names that match the source database columns into an unconditional supplemental log group.  
If NULL, then the procedure raises an error. |
MAINTAIN_CHANGE_TABLE Procedure

The following metadata attributes can be included:

- value_type
- source_database_name
- command_type
- object_owner
- object_name
- tag
- transaction_id
- scn
- commit_scn
- compatible
- instance_number
- message_number
- row_text
- row_id
- serial#
- session#
- source_time
- thread#
- tx_name
- username

All of these metadata attributes, except for value_type and message_number, are row LCR attributes that can be stored in row LCRs. For information about LCR attributes, see Oracle Streams Concepts and Administration.

The value_type$ column in the change table contains either OLD or NEW, depending on whether the column value is the original column value or the new column value, respectively.

The message_number$ column in the change table contains the identification number of each row LCR within a transaction. The message number increases incrementally for each row LCR within a transaction and shows the order of the row LCRs within a transaction.

The procedure automatically configures the source database to place information about extra attributes, such as serial#, into the redo log so that the information can be captured and recorded.

MAINTAIN_CHANGE_TABLE Procedure

Table 159–18  (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of each capture process configured to capture changes. Do not specify an owner. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If NULL, then the system generates a name for each capture process it creates. <strong>Note:</strong> The capture process name cannot be altered after the capture process is created.</td>
</tr>
<tr>
<td>propagation_name</td>
<td>The name of the propagation configured to propagate changes from the source database to the destination database. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set. If NULL, then the system generates a name for the propagation. If non-NULL and the source_database and destination_database are set to the same value, then this procedure raises an error. When the capture process and apply process are in the same database, they can use the same queue, and a propagation is not needed. <strong>Note:</strong> The propagation name cannot be altered after the propagation is created.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of each apply process configured to apply changes. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for the apply process. When set to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter. <strong>Note:</strong> The apply process name cannot be altered after the apply process is created.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.</td>
</tr>
</tbody>
</table>
The following are usage notes for this procedure:

**Types of Oracle Streams Environments Configured by the Procedure**

This procedure can configure the following types of Oracle Streams environments:

- **Local capture and apply on one database**: Specify the same global name for the `source_database` and `destination_database` parameter.
- **Local capture and remote apply**: Specify the global name of the local database for the `source_database` parameter and a remote database for the `destination_database` parameter.
- **Downstream capture and local apply**: Specify a remote database for the `source_database` parameter and the local database for the `destination_database` parameter.
- **Downstream capture and remote apply**: Specify a remote database for the `source_database` parameter and a remote database for the `destination_database` parameter.
Optional One-Way Replication With This Procedure

To configure one-way replication of the table, in addition to recording changes to the table, set the `execute_lcr` parameter to `TRUE`. The apply process executes each row LCR and applies the change in the row LCR to the replica table at the destination database. In this case, ensure that the source table is instantiated at the destination database before running the procedure. Specifically, the source table must be prepared for instantiation, the instantiation SCN must be set for the replica table at the destination database, and, usually, the source table replica table should be consistent.

See Also: Oracle Streams Replication Administrator’s Guide

Statement DML Handlers, the Change Table, and Row LCR Execution

This procedure configures one or more statement DML handlers that perform the following actions:

- Record changes in the change table using the information in row LCRs.
- Execute row LCRs if the `execute_lcr` parameter is set to `TRUE`.

The procedure ensures that the row LCRs contain the required attributes to record the changes specified in the `capture_type_list`, `extra_column_list`, and `capture_values` parameters. The procedure adds the statement DML handlers to the apply process specified in the `apply_name` parameter.

See Also: Chapter 162, "DBMS_STREAMS_HANDLER_ADM"
MAINTAIN_GLOBAL Procedure

This procedure configures an Oracle Streams environment that replicates changes at the database level between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:
- This procedure automatically excludes database objects that are not supported by Oracle Streams from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- If the bi_directional parameter is set to TRUE, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the destination database while the MAINTAIN_GLOBAL procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.
- A capture process never captures changes in the SYS, SYSTEM, or CTXSYS schemas. This procedure does not configure replication for these schemas.

See Also: “Procedures That Configure an Oracle Streams Environment” on page 159-16 for more information about this procedure

Syntax

```sql

MAINTAIN_GLOBAL Procedure

Table 159–19 (Cont.) MAINTAIN_GLOBAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instantiation</td>
<td>Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:</td>
</tr>
<tr>
<td></td>
<td>DBMS_STREAMS_ADM.INSTANTIATION_FULL performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package.</td>
</tr>
<tr>
<td></td>
<td>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</td>
</tr>
<tr>
<td></td>
<td>DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If you use the RMAN DUPLICATE or CONVERT DATABASE command for database instantiation, then the destination database cannot be the capture database.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL or DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK, then the database objects being instantiated must exist at the source database.</td>
</tr>
<tr>
<td></td>
<td>If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.</td>
</tr>
</tbody>
</table>
MAINTAIN_SCHEMAS Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified schemas between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One schema_names parameter is type VARCHAR2 and the other schema_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the list of schemas in different ways and are mutually exclusive.

```
Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the schemas from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

- If the bi_directional parameter is set to TRUE, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the MAINTAIN_SCHEMAS procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

See Also:  "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure
```

</tbody>
</table>
Table 159–20  (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_database</td>
<td>The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>dump_file_name</td>
<td>The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the export dump file name is generated by the system. In this case, the export dump file name is expatnn.dmp, where nn is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</td>
</tr>
<tr>
<td>capture_queue_user</td>
<td>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</td>
</tr>
<tr>
<td>log_file</td>
<td>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the log file name is the same name as the export dump file name with an extension of .clg.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STREAMS_ADM Subprograms

Table 159–20  (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instantiation</td>
<td>Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:</td>
</tr>
<tr>
<td></td>
<td>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package.</td>
</tr>
<tr>
<td></td>
<td>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</td>
</tr>
<tr>
<td></td>
<td>DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA or DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK, then the database objects being instantiated must exist at the source database, and the tablespace that contain the schemas must exist at the destination database.</td>
</tr>
<tr>
<td></td>
<td>If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.</td>
</tr>
</tbody>
</table>
MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the MAINTAIN_SIMPLE_TTS procedure.

See Also:
- "Deprecated Subprograms" on page 159-4
- MAINTAIN_SIMPLE_TTS Procedure on page 159-111

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TABLESPACE(
  tablespace_name              IN VARCHAR2,
  source_directory_object      IN VARCHAR2,
  destination_directory_object IN VARCHAR2,
  destination_database         IN VARCHAR2,
  setup_streams                IN BOOLEAN   DEFAULT TRUE,
  script_name                  IN VARCHAR2  DEFAULT NULL,
  script_directory_object      IN VARCHAR2  DEFAULT NULL,
  bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams. The tablespace must exist at the source database, but it must not exist at the destination database. A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have READ privilege on this directory object. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>source_directory_object</td>
<td>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
</tbody>
</table>

<td>The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>setup_streams</td>
<td>If TRUE, then the procedure performs the necessary actions to maintain the tablespace directly. If FALSE, then the procedure does not perform the necessary actions to maintain the tablespace directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</td>
</tr>
<tr>
<td></td>
<td>- script_name</td>
</tr>
<tr>
<td></td>
<td>- script_directory_object</td>
</tr>
<tr>
<td>script_name</td>
<td>If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
</tbody>
</table>
Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate \texttt{ALTER TABLESPACE} statements on the tablespace, nor is it configured to replicate \texttt{ALTER TABLE} statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Documentation for this Procedure

The following documentation applies to the \texttt{MAINTAIN\_SIMPLE\_TABLESPACE} procedure:

- Automatic Platform Conversion on page 159-17
- Oracle Streams Replication Administrator’s Guide

Requirements for Running this Procedure

Meet the following requirements when run the \texttt{MAINTAIN\_SIMPLE\_TABLESPACE} procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the \texttt{destination\_database} parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- Grant the user who runs this procedure the DBA role. This user must have the necessary privileges to complete the following actions:
  - Create \texttt{ANYDATA} queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging

---

### Table 159–21 (Cont.) MAINTAIN\_SIMPLE\_TABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bi_directional</td>
<td>Specify \texttt{TRUE} to configure bi-directional replication between the current database and the database specified in \texttt{destination_database}. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages. Specify \texttt{FALSE} to configure one way replication from the current database to the database specified in \texttt{destination_database}. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STREAMS_ADM Subprograms

- Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
- Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.
- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 164-18 for the list of required privileges.
- The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 164-11 for the list of required privileges.

To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator's schema.

Typically, the DBA role can be revoked from the user, if necessary, after the configuration is complete.

- If the bi_directional parameter is set to TRUE, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- Each specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes this procedure must have READ and WRITE privilege on each one.
- The databases configured by this procedure must be Oracle Database 10g Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The setup_streams parameter is set to TRUE to configure the Oracle Streams replication environment directly.
- The databases configured by this procedure must be Oracle Database 10g Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10g Release 2 or later database.
  - The setup_streams parameter is set to FALSE in this procedure, and the replication environment is configured with a generated script.

If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

- If the procedure is run at an Oracle Database 10g Release 1 database, then the databases configured by the procedure must be Oracle Database 10g Release 1 or later databases.

See Also: Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator
Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure uses the default values for the parameters in the MAINTAIN_TABLESPACES procedure that do not exist in the MAINTAIN_SIMPLE_TABLESPACE procedure. For example, this procedure creates a capture process at the source database named capture, because that is the default value for the capture_name parameter in the MAINTAIN_TABLESPACES procedure.

See Also: MAINTAIN_TABLESPACES Procedure on page 159-119

Configuration Progress and Recoverability

When this procedure is run with the setup_streams parameter set to TRUE, metadata about its configuration actions is recorded in the following data dictionary views: DBA_RECOVERABLE_SCRIPT, DBA_RECOVERABLE_SCRIPT_PARAMS, DBA_RECOVERABLE_SCRIPT_BLOCKS, and DBA_RECOVERABLE_SCRIPT_ERRORS. If the procedure stops because it encounters an error, then you can use the RECOVER_OPERATION procedure to complete the configuration after you correct the conditions that caused the error.

---

**Note:** When this procedure is run with the setup_streams parameter set to FALSE, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

---

See Also: "RECOVER_OPERATION Procedure" on page 159-147
MAINTAIN_SIMPLE_TTS Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:
- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespace from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated MAINTAIN_SIMPLE_TABLESPACE procedure.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TTS(
    tablespace_name              IN VARCHAR2,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database              IN VARCHAR2,
    destination_database         IN VARCHAR2,
    perform_actions              IN BOOLEAN   DEFAULT TRUE,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters that are not in Table 159–22
Table 159–22  MAINTAIN_SIMPLE_TTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams.</td>
</tr>
<tr>
<td></td>
<td>The tablespace must exist at the source database, but it must not exist at the destination database.</td>
</tr>
<tr>
<td></td>
<td>A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have <strong>READ</strong> privilege on this directory object. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>source_directory_object</td>
<td>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes.</td>

<tr>
<td>destination_directory_object</td>
<td>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred.</td>
</tr>
<tr>
<td></td>
<td>If the source database and destination database run on the same computer system, then the source and destination directories must be different.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database.</td>
</tr>
<tr>
<td></td>
<td>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</td>
</tr>
<tr>
<td></td>
<td>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the global name of the local database.</td>
</tr>
</tbody>
</table>
Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Privileges Required by the MAINTAIN_SIMPLE_TTS Procedure

In addition to the required privileges described in "Requirements for Running These Procedures" on page 159-17, the user who runs the MAINTAIN_SIMPLE_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 164-18 for the list of required privileges.
- The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 164-11 for the list of required privileges.

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TTS Procedure

This procedure uses the default values for the parameters in the MAINTAIN_TTS procedure that do not exist in the MAINTAIN_SIMPLE_TTS procedure. For example, this procedure automatically generates the capture process name, because NULL is the default value for the capture_name parameter in the MAINTAIN_TTS procedure, and the procedure generates the capture process name when NULL is specified for capture_name.

See Also: MAINTAIN_TTS Procedure on page 159-126
MAINTAIN_TABLES Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One table_names parameter is type VARCHAR2 and the other table_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the list of tables in different ways and are mutually exclusive.

### Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_TABLES(
    table_names                  IN VARCHAR2,
    source_directory_object      IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database              IN VARCHAR2,
    destination_database         IN VARCHAR2,
    perform_actions              IN BOOLEAN   DEFAULT TRUE,
    script_name                  IN VARCHAR2  DEFAULT NULL,
    script_directory_object      IN VARCHAR2  DEFAULT NULL,
    dump_file_name               IN VARCHAR2  DEFAULT NULL,
    capture_name                 IN VARCHAR2  DEFAULT NULL,
    capture_queue_table          IN VARCHAR2  DEFAULT NULL,
    capture_queue_name           IN VARCHAR2  DEFAULT NULL,
    capture_queue_user           IN VARCHAR2  DEFAULT NULL,
    propagation_name             IN VARCHAR2  DEFAULT NULL,
    apply_name                   IN VARCHAR2  DEFAULT NULL,
    apply_queue_table            IN VARCHAR2  DEFAULT NULL,
    apply_queue_name             IN VARCHAR2  DEFAULT NULL,
    apply_queue_user             IN VARCHAR2  DEFAULT NULL,
    log_file                     IN VARCHAR2  DEFAULT NULL,
    bi_directional               IN BOOLEAN   DEFAULT FALSE,
    include_ddl                  IN BOOLEAN   DEFAULT FALSE,
    instantiation               IN INTEGER   DEFAULT
                                    DBMS_STREAMS_ADM.INSTANTIATION_TABLE);
```

### Note

If the bi_directional parameter is set to TRUE, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the MAINTAIN_TABLES procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

### See Also:

"Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure.
Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters that are not in Table 159-23

Table 159–23 MAINTAIN_TABLES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| table_names       | The tables to be configured for replication and maintained by Oracle Streams after configuration. The tables can be specified in the following ways:  
  - Comma-delimited list of type VARCHAR2  
  - A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. The first table should be in position 1. The last position must be NULL.  

Each table should be specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.  

This procedure raises an error in any of the following cases:  
  - When a specified table does not exist at the source database  
  - When the table_names parameter is set to NULL |

<td>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</td>
</tr>
<tr>
<td></td>
<td>If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the global name of the local database.</td>
</tr>
</tbody>
</table>
**Table 159–23 (Cont.) MAINTAIN_TABLES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_database</td>
<td>The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>dump_file_name</td>
<td>The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE.</td>
</tr>
<tr>
<td></td>
<td>If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the export dump file name is generated by the system. In this case, the export dump file name is expatnn.dmp, where nn is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</td>
</tr>
<tr>
<td>capture_queue_user</td>
<td>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</td>
</tr>
<tr>
<td>log_file</td>
<td>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</td>
</tr>
<tr>
<td></td>
<td>This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE.</td>
</tr>
<tr>
<td></td>
<td>If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the log file name is the same name as the export dump file name with an extension of .clg.</td>
</tr>
</tbody>
</table>
The `instanatiation` parameter specifies whether to perform instantiation and, if instantiation is performed, the type of instantiation:

- `DBMS_STREAMS_ADM.INSTANTIATION_TABLE` performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. If the `instanatiation` parameter is set to this value, then the user who runs this procedure must have `EXECUTE` privilege on the `DBMS_FILE_TRANSFER` package.

- `DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK` performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. If the `instanatiation` parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.

- `DBMS_STREAMS_ADM.INSTANTIATION_NONE` does not perform an instantiation. This setting is valid only if the `perform_actions` parameter is set to `FALSE`, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly.

If this parameter is set to `DBMS_STREAMS_ADM.INSTANTIATION_TABLE` or `DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK`, then the tables being instantiated must exist at the source database, and the tablespaces that contain the tables must exist at the destination database.

If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.

Also, if an instantiated table does not exist at the destination database, then this procedure sets the instantiation SCN for the table. However, if an instantiated table exist at the destination database before instantiation, then this procedure does not set the instantiation SCN for the table. In this case, you must set the instantiation SCN for the table manually after the procedure completes.
MAINTAIN_TABLESPACES Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the MAINTAIN_TTS procedure.

- "Deprecated Subprograms" on page 159-4
- MAINTAIN_TTS Procedure on page 159-126

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_TABLESPACES(
    tablespace_names IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_directory_object IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_database IN VARCHAR2,
    setup_streams IN BOOLEAN DEFAULT TRUE,
    script_name IN VARCHAR2 DEFAULT NULL,
    script_directory_object IN VARCHAR2 DEFAULT NULL,
    dump_file_name IN VARCHAR2 DEFAULT NULL,
    source_queue_table IN VARCHAR2 DEFAULT 'streams_queue_table',
    source_queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    source_queue_user IN VARCHAR2 DEFAULT NULL,
    destination_queue_table IN VARCHAR2 DEFAULT 'streams_queue_table',
    destination_queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    destination_queue_user IN VARCHAR2 DEFAULT NULL,
    capture_name IN VARCHAR2 DEFAULT 'capture',
    propagation_name IN VARCHAR2 DEFAULT NULL,
    apply_name IN VARCHAR2 DEFAULT NULL,
    log_file IN VARCHAR2 DEFAULT NULL,
    bi_directional IN BOOLEAN DEFAULT FALSE,
    include_ddl IN BOOLEAN DEFAULT FALSE)
```
## Parameters

Table 159–24  MAINTAIN_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_names</td>
<td>The local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If NULL, then the procedure raises an error. <strong>See Also:</strong> TABLESPACE_SET Table Type on page 164-9</td>
</tr>
<tr>
<td>source_directory_object</td>
<td>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error. <strong>Note:</strong> The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
<tr>
<td>destination_directory_object</td>
<td>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred. If the source database and destination database run on the same computer system, then the source and destination directories must be different. If NULL, then the procedure raises an error. <strong>Note:</strong> The specified directory object cannot point to an Oracle ASM disk group.</td>
</tr>
<tr>
<td>destination_database</td>
<td>The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
### Summary of DBMS_STREAMS_ADM Subprograms

**setup_streams**

If `TRUE`, then the procedure performs the necessary actions to maintain the tablespaces directly. If `FALSE`, then the procedure does not perform the necessary actions to maintain the tablespaces directly. Specify `FALSE` when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify `FALSE` and either of the following parameters is `NULL`:

- `script_name`
- `script_directory_object`

**script_name**

If non-`NULL` and the `setup_streams` parameter is `FALSE`, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace set. If a file with the specified script name exists in the specified directory for the `script_directory_object` parameter, then the procedure appends the statements to the existing file.

If non-`NULL` and the `setup_streams` parameter is `TRUE`, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly.

If `NULL` and the `setup_streams` parameter is `TRUE`, then this procedure does not generate a script and performs the actions to maintain the specified tablespace set directly.

If `NULL` and the `setup_streams` parameter is `FALSE`, then the procedure raises an error.

**script_directory_object**

The directory object for the directory on the local computer system into which the generated script is placed.

If the `script_name` parameter is `NULL`, then the procedure ignores this parameter and does not generate a script.

If `NULL` and the `script_name` parameter is non-`NULL`, then the procedure raises an error.

**dump_file_name**

The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the `source_directory_object` or `destination_directory_object` parameter, then the procedure raises an error.

If `NULL`, then the export dump file name is generated by the system. In this case, the export dump file name is `expatnn.dmp`, where `nn` is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.

**source_queue_table**

The name of the queue table for the queue at the source database, specified as `[schema_name.]queue_table_name`. For example, `strmadmin.streams_queue_table`. If the schema is not specified, then the current user is the default.
The name of the queue at the source database that will function as the ANYDATA queue, specified as `[schema_name].queue_name`. For example, strmadmin.streams_queue.

If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.

The name of the user who requires `ENQUEUE` and `DEQUEUE` privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the `GRANT` option.

If `NULL`, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the `DBMS_AQADM` package.

The name of the queue table for the queue at the destination database, specified as `[schema_name].queue_table_name`. For example, strmadmin.streams_queue_table.

If the schema is not specified, then the current user is the default.

The name of the queue at the destination database that will function as the ANYDATA queue, specified as `[schema_name].queue_name`. For example, strmadmin.streams_queue.

If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.

The name of the user who requires `ENQUEUE` and `DEQUEUE` privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the `GRANT` option.

If `NULL`, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the `DBMS_AQADM` package.

The name of each capture process configured to capture changes to the database objects in the tablespace set. Do not specify an owner.

If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database objects in the tablespace set to the positive capture process rule set.

Note: The capture process name cannot be altered after the capture process is created.
propagation_name
The name of each propagation configured to propagate changes to the database objects in the tablespace set. Do not specify an owner.

If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the database objects in the tablespace set to the positive propagation rule set.

If NULL, then the system generates a name for each propagation it creates.

Note: The propagation name cannot be altered after the propagation is created.

apply_name
The name of each apply process configured to apply changes to the database objects in the tablespace set. Do not specify an owner.

If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the database objects in the tablespace set to the positive apply process rule set.

The specified name must not match the name of an existing messaging client at the destination database.

If NULL, then the system generates a name for each apply process it creates.

Note: The apply process name cannot be altered after the apply process is created.

log_file
The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.

If NULL, then the log file name is the same name as the export dump file name with an extension of .clg.

bi_directional
Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages.

Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.

include_ddl
Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes.

Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER_TABLE, will not be replicated.
Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also: Oracle Database Administrator’s Guide for more information about self-contained tablespace sets

Additional Documentation for this Procedure

The following documentation applies to the MAINTAIN_TABLESPACES procedure:

- Automatic Platform Conversion on page 159-17
- Oracle Streams Replication Administrator’s Guide

Requirements for Running this Procedure

Meet the following requirements when run the MAINTAIN_TABLESPACES procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the destination_database parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs this procedure should be granted the DBA role. This user must have the necessary privileges to complete the following actions:
  - Create ANYDATA queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
  - Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.
  - Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
  - The necessary privileges to run the CLONE_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_TABLESPACES Procedure on page 164-20 for the list of required privileges.
  - The necessary privileges to run the ATTACH_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_TABLESPACES Procedure on page 164-13 for the list of required privileges.

To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator’s schema.

- If the bi_directional parameter is set to TRUE, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes this procedure must have `READ` and `WRITE` privilege on each one.

The databases configured by this procedure must be Oracle Database 10g Release 2 or later databases when this procedure is run under the following conditions:

- The procedure is run at an Oracle Database 10g Release 2 or later database.
- The `setup_streams` parameter is set to `TRUE` to configure the Oracle Streams replication environment directly.

The databases configured by this procedure must be Oracle Database 10g Release 1 or later databases when this procedure is run under the following conditions:

- The procedure is run at an Oracle Database 10g Release 2 or later database.
- The `setup_streams` parameter is set to `FALSE` in this procedure, and the replication environment is configured with a generated script.

If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

If the procedure is run at an Oracle Database 10g Release 1 database, then the databases configured by the procedure must be Oracle Database 10g Release 1 or later databases.

**See Also:** *Oracle Streams Replication Administrator’s Guide* for information about configuring an Oracle Streams administrator

**Configuration Progress and Recoverability**

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

**Note:** When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

**See Also:** "RECOVER_OPERATION Procedure" on page 159-147
MAINTAIN_TTS Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

---

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespaces from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated `MAINTAIN_TABLESPACES` procedure.

---

See Also:  "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure

Syntax

```sql
DBMS_STREAMS_ADM.MAINTAIN_TTS(
    tablespace_names IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,

MAINTAIN_TTS Procedure

### Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

**See Also:** *Oracle Database Administrator’s Guide* for more information about self-contained tablespace sets

### Additional Privileges Required by the MAINTAIN_TTS Procedure

In addition to the required privileges described in "Requirements for Running These Procedures" on page 159-17, the user who runs the MAINTAIN_TTS procedure must have the necessary privileges to complete the following actions:
- Run subprograms in the `DBMS_STREAMS_TABLESPACES_ADM` package.
- The necessary privileges to run the `CLONE_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the source database. See `CLONE_TABLESPACES Procedure` on page 164-20 for the list of required privileges.
- The necessary privileges to run the `ATTACH_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the destination database. See `ATTACH_TABLESPACES Procedure` on page 164-13 for the list of required privileges.
MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.

However, you can choose to run the MERGE_STREAMS procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The CAPTURE_MESSAGE_CREATE_TIME in the GV$STREAMS_CAPTURE view of the cloned capture process has caught up to, or nearly caught up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The MERGE_STREAMS procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   - The acknowledged SCN of the cloned propagation.
   - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.
5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

See Also:
- MERGE_STREAMS_JOB Procedure on page 159-133
- SPLIT_STREAMS Procedure on page 159-173

Syntax

```sql
DBMSSTREAMSADM.MERGE_STREAMS(
  cloned_propagation_name  IN  VARCHAR2,
  propagation_name         IN  VARCHAR2  DEFAULT NULL,
  queue_name               IN  VARCHAR2  DEFAULT NULL,
  perform_actions          IN  BOOLEAN   DEFAULT TRUE,
  script_name              IN  VARCHAR2  DEFAULT NULL,
  script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>propagation_name</td>
<td>The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. See &quot;Usage Notes&quot; on page 159-132 for more information. If a non-NULL value is specified, then an error is raised under either of the following conditions:</td>
</tr>
<tr>
<td></td>
<td>■ The queue specified in the queue_name parameter does not exist.</td>
</tr>
<tr>
<td></td>
<td>■ The queue specified in the queue_name parameter exists but is not used by a capture process.</td>
</tr>
</tbody>
</table>
MERGE_STREAMS Procedure

159-132
Oracle Database PL/SQL Packages and Types Reference

Usage Notes

You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.

### Table 159-26 (Cont.) MERGE_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See “Usage Notes” on page 159-132 for more information.</td>
</tr>
<tr>
<td>perform_actions</td>
<td>If TRUE, then the procedure performs the necessary actions to merge the streams directly. If FALSE, then the procedure does not perform the necessary actions to merge the streams directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</td>
</tr>
<tr>
<td>script_name</td>
<td>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
</tbody>
</table>
**MERGE_STREAMS_JOB Procedure**

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

If the auto_merge_threshold parameter was set to a positive number in the SPLIT_STREAMS procedure that split the streams, then a merge job runs the MERGE_STREAMS_JOB procedure automatically according to its schedule. The schedule name is specified for the schedule_name parameter, and the merge job name is specified for the merge_job_name parameter when the MERGE_STREAMS_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT_STREAMS procedure.

If the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams, then you can run the MERGE_STREAMS_JOB procedure manually. In this case, it is not run automatically.

**See Also:**

- MERGE_STREAMS Procedure on page 159-130
- SPLIT_STREAMS Procedure on page 159-173
- Oracle Streams Replication Administrator’s Guide for instructions on using the MERGE_STREAMS_JOB procedure

**Syntax**

```sql
MERGE_STREAMS_JOB (cloned_propagation_name IN VARCHAR2,
    propagation_name IN VARCHAR2 DEFAULT NULL,
    queue_name IN VARCHAR2 DEFAULT NULL,
    merge_threshold IN NUMBER,
    schedule_name IN VARCHAR2 DEFAULT NULL,
    merge_job_name IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
**MERGE_STREAMS_JOB Procedure**

**Usage Notes**

You can use the MERGE_STREAMS_JOB procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save...
resources and improve performance when a single database is running two or more capture processes.

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.
POST_INSTANTIATION_SETUP Procedure

This procedure performs the actions required after instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the PRE_INSTANTIATION_SETUP procedure at the source database.
2. Perform any necessary instantiation actions.
3. Run the POST_INSTANTIATION_SETUP procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such as migrating a database to a different platform. In this case, use the CLEANUP_INSTANTIATION_SETUP procedure to remove the replication environment after the maintenance operation is complete.

**Attention:** When the POST_INSTANTIATION_SETUP procedure is run, the parameter values must match the parameter values specified when the corresponding PRE_INSTANTIATION_SETUP procedure was run, except for the values of the following parameters: perform_actions, script_name, script_directory_object, and start_processes.

**Note:** A capture process never captures changes in the SYS, SYSTEM, or CTXSYS schemas. This procedure does not configure replication for these schemas.

**See Also:**

- "PRE_INSTANTIATION_SETUP Procedure" on page 159-141

- "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure
- Oracle Streams Replication Administrator’s Guide for information about setting up an Oracle Streams replication environment
- Oracle Streams Concepts and Administration for information about completing database maintenance operations

**Syntax**

```sql
DBMS_STREAMS_ADM.POST_INSTANTIATION_SETUP (maintain_mode IN VARCHAR2, tablescape_names IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,)
```
source_database IN VARCHAR2,
destination_database IN VARCHAR2,
perform_actions IN BOOLEAN DEFAULT TRUE,
script_name IN VARCHAR2 DEFAULT NULL,
script_directory_object IN VARCHAR2 DEFAULT NULL,
capture_name IN VARCHAR2 DEFAULT NULL,
capture_queue_table IN VARCHAR2 DEFAULT NULL,
capture_queue_name IN VARCHAR2 DEFAULT NULL,
capture_queue_user IN VARCHAR2 DEFAULT NULL,
propagation_name IN VARCHAR2 DEFAULT NULL,
apply_name IN VARCHAR2 DEFAULT NULL,
apply_queue_table IN VARCHAR2 DEFAULT NULL,
apply_queue_name IN VARCHAR2 DEFAULT NULL,
apply_queue_user IN VARCHAR2 DEFAULT NULL,
bi_directional IN BOOLEAN DEFAULT FALSE,
include_ddl IN BOOLEAN DEFAULT FALSE,
start_processes IN BOOLEAN DEFAULT FALSE,
instantiation_scn IN NUMBER DEFAULT NULL,
exclude_schemas IN VARCHAR2 DEFAULT NULL,
exclude_flags IN BINARY_INTEGER DEFAULT NULL);

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters that are not in Table 159–28

Table 159–28 POST_INSTANTIATION_SETUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maintain_mode</td>
<td>Specify one of the following:</td>
</tr>
<tr>
<td></td>
<td>- GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter</td>
</tr>
<tr>
<td></td>
<td>- TRANSPORTABLE TABLESPACES to maintain a set of tablespace names by configuring replication between the local database and the database specified in the destination_database parameter</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL.</td>
</tr>
</tbody>
</table>

POST_INSTANTIATION_SETUP Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.</td>
</tr>
<tr>
<td>destination_database</td>
<td>The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>start_processes</td>
<td>If TRUE, then the procedure starts each capture process and apply process. Any disabled capture or apply process created by the PRE_INSTANTIATION_SETUP procedure also is started. If FALSE, then the procedure does not start any capture processes or apply processes.</td>
</tr>
<tr>
<td>instantiation scn</td>
<td>Specify the instantiation SCN for the database objects at the destination database if the instantiation SCN was not set during instantiation. The instantiation SCN is not set automatically during RMAN instantiations, but the correct instantiation SCN value should be determined during an RMAN instantiation. See the Oracle Streams Replication Administrator's Guide for more information. Specify NULL if the instantiation SCN was set for the database objects at the destination database during instantiation. The instantiation SCN can be set during export/import instantiations.</td>
</tr>
<tr>
<td>exclude_schemas</td>
<td>A comma-delimited list of schemas toexclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas. Specify an asterisk (*) to exclude all of the schemas in the database. If NULL, then the procedure does not exclude any schemas in the database. This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.</td>
</tr>
<tr>
<td>exclude_flags</td>
<td>Specify what is excluded from the replication configuration in the schemas specified by the exclude_schemas parameter. This parameter works the same way in the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures. See &quot;Usage Notes&quot; on page 159-143 for the PRE_INSTANTIATION_SETUP procedure for more information.</td>
</tr>
</tbody>
</table>
Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the `maintain_mode` parameter is set to `TRANSPORTABLE TABLESPACES`, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also: Oracle Database Administrator’s Guide for more information about self-contained tablespace sets

Destination Database Renamed During RMAN Database Instantiation

If the `maintain_mode` parameter is set to `GLOBAL`, then database instantiation is required before running the `POST_INSTANTIATION_SETUP` procedure. If the RMAN DUPLICATE or RMAN CONVERT DATABASE command is used for database instantiation, then the global name of the destination database can be renamed to the global name of the source database during instantiation. In this case, before you run the `POST_INSTANTIATION_SETUP` procedure, complete the following steps:

1. Rename the global name of the destination database back to the name specified in the `destination_database` parameter.

2. At the destination database, drop and re-create any loopback database links that existed on the source and were cloned on the destination database. For example, suppose the source database `dbs1.net` has a database link that refers to itself. Suppose the destination database is `dbs2.net`. At the destination database, drop and re-create this database link as a loopback database link that refers to itself (`dbs2.net`).

3. At the destination database, drop any database links that were cloned from the source database and are from the source database to the destination database. For example, if the source database is `dbs1.net` and the destination database is `dbs2.net`, then drop any database links on the destination database that are from `dbs1.net` to `dbs2.net`.

4. Create a database link from the destination database to the source database with the same name as the global name of the source database. The database link must be accessible to the Oracle Streams administrator at the destination database. This database link is required because the `POST_INSTANTIATION_SETUP` procedure runs the `SET_GLOBAL_INSTANTIATION_SCN` procedure in the `DBMS_APPLY_ADM` package at the destination database, and the `SET_GLOBAL_INSTANTIATION_SCN` procedure requires the database link. The instantiation SCN is set to the value specified in the `instantiation_scn` parameter of the `POST_INSTANTIATION_SETUP` procedure.

Note: When the RMAN DUPLICATE or CONVERT DATABASE command is used for database instantiation, the destination database cannot be the capture database.

Oracle Streams Components Removed From the Destination Database

If the `maintain_mode` parameter is set to `GLOBAL`, then database instantiation is required before running the `POST_INSTANTIATION_SETUP` procedure. During database
instantiation, Oracle Streams components created by the `PRE_INSTANTIATION_SETUP` procedure, such as Oracle Streams clients and queues, can be copied from the source database to the destination database. The `POST_INSTANTIATION_SETUP` procedure removes the Stream components created by the `PRE_INSTANTIATION_SETUP` procedure from the destination database.

In some cases, rule sets and rules created by the `PRE_INSTANTIATION_SETUP` procedure might not be removed from the destination database. The `POST_INSTANTIATION_SETUP` procedure does not associate these rule sets and rules with any Stream clients in the destination database. Optionally, you can remove these rule sets and rules from the destination database after the `POST_INSTANTIATION_SETUP` procedure, or the script generated by the procedure, completes.

---

**Note:** The `POST_INSTANTIATION_SETUP` procedure only removes Oracle Streams components that were created by the `PRE_INSTANTIATION_SETUP` procedure. It does not remove Oracle Streams components that were created in a different way.
PRE_INSTANTIATION_SETUP Procedure

This procedure performs the actions required before instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the PRE_INSTANTIATION_SETUP procedure at the database that will be the source database in the Stream replication environment.

2. Perform any necessary instantiation actions.

3. Run the POST_INSTANTIATION_SETUP procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.

- Replicates changes to database objects during a database maintenance operation, such as migrating a database to a different platform. In this case, use the CLEANUP_INSTANTIATION_SETUP procedure to remove the replication environment after the maintenance operation is complete.

**Note:**

- A capture process never captures changes in the SYS, SYSTEM, or CTXSYS schemas. This procedure does not configure replication for these schemas.

- When the RMAN DUPLICATE or CONVERT DATABASE command is used for database instantiation, the destination database cannot be the capture database.

**See Also:**

- "CLEANUP_INSTANTIATION_SETUP Procedure" on page 159-76
- "Procedures That Configure an Oracle Streams Environment" on page 159-16 for more information about this procedure
- Oracle Streams Replication Administrator’s Guide for information about setting up an Oracle Streams replication environment
- Oracle Streams Concepts and Administration for information about completing database maintenance operations

**Syntax**

```
DBMS_STREAMS_ADM.PRE_INSTANTIATION_SETUP(
    maintain_mode           IN VARCHAR2,
    tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
    source_database         IN VARCHAR2,
    destination_database    IN VARCHAR2,
)
```
Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 159-19 for descriptions of the procedure parameters that are not in Table 159–29

Table 159–29 PRE_INSTANTIATION_SETUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maintain_mode</td>
<td>Specify one of the following:</td>
</tr>
<tr>
<td></td>
<td>■ GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter</td>
</tr>
<tr>
<td></td>
<td>■ TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the destination_database parameter</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL.</td>
</tr>
</tbody>
</table>

See Also: TABLESPACE_SET Table Type on page 164-9
The following sections contain usage notes for this procedure.

**Usage Notes**

The global name of the source database.

If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.

If the specified global name is different from the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.

If NULL, then the procedure uses the global name of the local database.

The global name of the destination database.

If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.

If NULL, then the procedure raises an error.

The name of the queue table for each queue used by a capture process, specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.

If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.

If TRUE, then the procedure starts each capture process and apply process.

If FALSE, then the procedure does not start any capture processes or apply processes.

A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas.

Specify an asterisk (*) to exclude all of the schemas in the database.

If NULL, then the procedure does not exclude any schemas in the database.

This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.

Specify what to exclude from the replication configuration in the schemas specified by the exclude_schemas parameter. See "Usage Notes" on page 159-143 for more information.
Self-Contained Tablespace Sets

If the `maintain_mode` parameter is set to `TRANSPORTABLE TABLESPACES`, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also: Oracle Database Administrator’s Guide for more information about self-contained tablespace sets

The `exclude_flags` Parameter

Specify one of the following values:

- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL` to exclude changes to the schemas and all of the database objects in the schemas
- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED` to exclude changes to the database objects that are not supported by Oracle Streams in the schemas

If both of these values are specified, then the procedure raises an error.

In addition to `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL` or `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED`, specify one or both of the following values:

- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML` to exclude data manipulation language (DML) changes made to the excluded database objects
- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL` to exclude data definition language (DDL) changes made to the excluded database objects

Use the plus sign (+) to specify more than one of these values. For example, to maintain DML changes to the tables in a schema specified by the `exclude_schemas` parameter but exclude DDL changes to these schemas and the database objects in these schemas, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

To exclude DML and DDL changes made to unsupported database objects in the schemas specified by the `exclude_schemas` parameter, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

Rules for the excluded database objects are added to the negative rule set of each capture process. Therefore, changes to the excluded database objects will not be captured and replicated.

This parameter is valid only if the `maintain_mode` parameter is set to `GLOBAL` and the `exclude_schemas` parameter is set to a non-NULL value. If the `maintain_mode` parameter is set to `GLOBAL` and the `exclude_schemas` parameter is set to a `NULL`, then the procedure ignores this parameter. If the `maintain_mode` parameter is set to `TRANSPORTABLE TABLESPACES`, then this the procedure ignores this parameter and excludes any database objects in the specified tablespace set that are not supported by Oracle Streams from the Oracle Streams configuration automatically.

Also, if schemas are specified in the `exclude_schemas` parameter, but the `exclude_flags` parameter is set to `NULL`, then the procedure does not add any rules to the
negative rule set of any capture process, and the procedure includes the schemas specified in the exclude_schemas parameter in the replication environment.
PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object. You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

Syntax

```sql
DBMS_STREAMS_ADM.PURGE_SOURCE_CATALOG(
    source_database     IN  VARCHAR2,
    source_object_name  IN  VARCHAR2,
    source_object_type  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database containing the object.</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the procedure appends it to</td>
</tr>
<tr>
<td></td>
<td>the database name automatically. For example, if you specify DBS1 and the</td>
</tr>
<tr>
<td></td>
<td>domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>source_object_name</td>
<td>The name of the object specified as <code>schema_name.object_name</code>. For example,</td>
</tr>
<tr>
<td></td>
<td>hr.employees. If the schema is not specified, then the current user is the</td>
</tr>
<tr>
<td></td>
<td>default.</td>
</tr>
<tr>
<td>source_object_type</td>
<td>Type of the object. Currently, TABLE is the only possible object type.</td>
</tr>
</tbody>
</table>

Usage Notes

The global name of the source database containing the object must be specified for the `source_database` parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the `hr.employees` table at the `dbs1.net` source database are being applied to the `hr.employees` table at the `dbs2.net` destination database. Also, suppose `hr.employees` at `dbs2.net` is not a source at all. In this case, specifying `dbs2.net` as the `source_database` for this table results in an error. However, specifying `dbs1.net` as the `source_database` for this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions are true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

**Note:** These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.
**RECOVER_OPERATION Procedure**

This procedure provides options for operations that stopped because they encountered errors. These operations include split and merge operations, Oracle Streams replication configuration operations, and Oracle Streams change table configuration operations. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.

This procedure only can perform these actions for the following operations:

- Split and merge operations using:
  - The `split_threshold` and `merge_threshold` capture process parameters set to non-NULL values to enable automatic split and merge
  - `SPLIT_STREAMS Procedure`
  - `MERGE_STREAMS_JOB Procedure`
- Change table configuration operations performed by the `MAINTAIN_CHANGE_TABLE Procedure`
- Replication configuration operations performed by the following procedures:
  - `MAINTAIN_GLOBAL Procedure`
  - `MAINTAIN_SCHEMAS Procedure`
  - `MAINTAIN_SIMPLE_TABLESPACE Procedure`
  - `MAINTAIN_SIMPLE_TTS Procedure`
  - `MAINTAIN_TABLES Procedure`
  - `MAINTAIN_TABLESPACES Procedure`
  - `MAINTAIN_TTS Procedure`
  - `PRE_INSTANTIATION_SETUP Procedure`
  - `POST_INSTANTIATION_SETUP Procedure`

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

For split and merge operations, the data dictionary views are populated at the database that contains the capture process. For the configuration operations, the data dictionary views are populated at the database where the replication configuration procedure was run.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or...
purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

For split and merge operations, run the `RECOVER_OPERATION` procedure at the database that contains the capture process. For the configuration operations, run the `RECOVER_OPERATION` procedure at the database where the replication configuration procedure was run.

---

**Note:**

- Regarding the configuration operations, the procedure must configure the environment directly (`perform_actions => TRUE`), not by generating a script, for information about the operation to be stored in the recoverable views and for the operation to be managed by the `RECOVER_OPERATION` procedure.

- To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10g Release 2 or later databases.

---

**See Also:** *Oracle Streams Replication Administrator’s Guide*

---

**Syntax**

```sql
DBMS_STREAMS_ADM.RECOVER_OPERATION(
    script_id       IN  RAW,
    operation_mode  IN  VARCHAR2  DEFAULT 'FORWARD');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>script_id</code></td>
<td>The operation id of the operation that is being rolled forward, rolled back, or purged. Query the <code>SCRIPT_ID</code> column of the <code>DBA_RECOVERABLE_SCRIPT</code> data dictionary view to determine the operation id.</td>
</tr>
</tbody>
</table>
| `operation_mode` | If `FORWARD`, then the procedure rolls forward the operation. Specify `FORWARD` to try to complete the operation.  
                      If `ROLLBACK`, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views retain information about the operation for 30 days.  
                      If `PURGE`, then the procedure moves the metadata about the operation from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view without rolling the operation back. The other views retain information about the operation for 30 days. |
REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue. Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the Oracle Streams clients that are using the queue.

Note: The specified queue must be a ANYDATA queue.

Syntax

```sql
DBMS_STREAMS_ADM.REMOVE_QUEUE(
    queue_name               IN  VARCHAR2,
    cascade                  IN  BOOLEAN  DEFAULT FALSE,
    drop_unused_queue_table  IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue to remove, specified as <code>[schema_name.]queue_name</code>. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then the procedure drops any Oracle Streams clients that use the queue. If FALSE, then the procedure raises an error if there are any Oracle Streams clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no Oracle Streams clients are using the queue currently.</td>
</tr>
<tr>
<td>drop_unused_queue_table</td>
<td>If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.</td>
</tr>
</tbody>
</table>
REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, apply process, propagation, or messaging client.

If this procedure results in an empty positive rule set for a messaging client, then the procedure drops the messaging client automatically.

---

**Note:** If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

---

**Syntax**

```sql
DBMS_STREAMS_ADM.REMOVE_RULE(
    rule_name         IN  VARCHAR2,
    streams_type      IN  VARCHAR2,
    streams_name      IN  VARCHAR2,
    drop_unused_rule  IN  BOOLEAN  DEFAULT TRUE,
    inclusion_rule    IN  BOOLEAN  DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule to remove, specified as <code>(schema_name.)rule_name</code>. If <code>NULL</code>, then the procedure removes all rules from the specified capture process, synchronous capture, apply process, propagation, or messaging client rule set. For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code>, enter <code>hr.prop_rule1</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of Oracle Streams client:</td>
</tr>
<tr>
<td></td>
<td>- Specify <code>capture</code> for a capture process.</td>
</tr>
<tr>
<td></td>
<td>- Specify <code>sync_capture</code> for a synchronous capture.</td>
</tr>
<tr>
<td></td>
<td>- Specify <code>propagation</code> for a propagation.</td>
</tr>
<tr>
<td></td>
<td>- Specify <code>apply</code> for an apply process.</td>
</tr>
<tr>
<td></td>
<td>- Specify <code>dequeue</code> for a messaging client.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the Oracle Streams client, which can be a capture process, synchronous capture, propagation, apply process, or messaging client. Do not specify an owner. If the specified Oracle Streams client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified Oracle Streams client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Table 159–33  (Cont.) REMOVE_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| drop_unused_rule| If **TRUE** and the rule is not in any rule set, then the procedure drops the rule from the database.  
                      If **TRUE** and the rule exists in any rule set, then the procedure does not drop the rule from the database.  
                      If **FALSE**, then the procedure does not drop the rule from the database.                                                                |
| inclusion_rule  | If **inclusion_rule** is **TRUE**, then the procedure removes the rule from the positive rule set for the Oracle Streams client.  
                      If **inclusion_rule** is **FALSE**, then the procedure removes the rule from the negative rule set for the Oracle Streams client. |
REMOVE_STREAMS_CONFIGURATION Procedure

This procedure removes the Oracle Streams configuration at the local database.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_STREAMS_CONFIGURATION;
```

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_STREAMS_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_STREAMS_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_STREAMS_ADM` package.
Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the `DBMS_RULE_ADM` package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

**Attention:** Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire Oracle Streams configuration at a database.

**Note:**

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

**See Also:**

- `STOP_CAPTURE Procedure` on page 34-58 in the `DBMS_CAPTURE_ADM` package
- `STOP_APPLY Procedure` on page 23-87 in the `DBMS_APPLY_ADM` package
- `REMOVE_RULE Procedure` on page 159-150 in the `DBMS_STREAMS_ADM` package
RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule. For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:
- The RENAME_COLUMN procedure supports the same data types supported by Oracle Streams capture processes.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application, Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: Oracle Streams Concepts and Administration for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes

Syntax

```sql
DBMS_STREAMS_ADM.RENAME_COLUMN(
    rule_name         IN  VARCHAR2,
    table_name        IN  VARCHAR2,
    from_column_name  IN  VARCHAR2,
    to_column_name    IN  VARCHAR2,
    value_type        IN  VARCHAR2  DEFAULT '*',
    step_number       IN  NUMBER    DEFAULT 0,
    operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table in which the column is renamed in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>

</tbody>
</table>
RENAMESCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

### Note:
Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

### See Also: Oracle Streams Concepts and Administration for more information about declarative rule-based transformations

#### Syntax

```sql
DBMS_STREAMS_ADM.RENAME_SCHEMA(
    rule_name         IN  VARCHAR2,
    from_schema_name  IN  VARCHAR2,
    to_schema_name    IN  VARCHAR2,
    step_number       IN  NUMBER    DEFAULT 0,
    operation         IN  VARCHAR2  DEFAULT 'ADD');
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_schema_name</td>
<td>The name of the schema to be renamed in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>to_schema_name</td>
<td>The new name of the schema in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule.</td>
</tr>
<tr>
<td></td>
<td>Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

#### Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified from_schema_name, to_schema_name, and step_number parameters. Nulls
specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_SCHEMA procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>from_schema_name</th>
<th>to_schema_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>NULL</td>

<td>Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.</td>
</tr>
</tbody>
</table>
RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note: Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: Oracle Streams Concepts and Administration for more information about declarative rule-based transformations

Syntax

```sql
DBMS_STREAMS_ADM.RENAME_TABLE(
    rule_name        IN  VARCHAR2,
    from_table_name  IN  VARCHAR2,
    to_table_name    IN  VARCHAR2,
    step_number      IN  NUMBER    DEFAULT 0,
    operation        IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_table_name</td>
<td>The name of the table to be renamed in each row LCR that satisfies the rule, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>to_table_name</td>
<td>The new name of the table in each row LCR that satisfies the rule, specified as [schema_name.]object_name. For example, humres.staff. The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation. See Also: Oracle Streams Concepts and Administration for more information about transformation ordering</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>
Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified from_table_name, to_table_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_TABLE procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>from_table_name</th>
<th>to_table_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>

<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule.</td>
</tr>
</tbody>
</table>
SET_MESSAGE_NOTIFICATION Procedure

This procedure sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue. A notification is sent when a message is enqueued into the specified queue and the specified messaging client can dequeue the message because the message satisfies its rule sets.

Note:

- Currently, messaging clients cannot dequeue buffered messages.
- The DBMS_AQ package can also configure notifications. The DBMS_AQ package provides some notification features that are not available in DBMS_STREAMS_ADM package, such as buffered message notifications and notification grouping by time.

Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_NOTIFICATION(
  streams_name          IN  VARCHAR2,
  notification_action   IN  VARCHAR2,
  notification_type     IN  VARCHAR2     DEFAULT 'PROCEDURE',
  notification_context  IN  ANYDATA      DEFAULT NULL,
  include_notification  IN  BOOLEAN      DEFAULT TRUE,
  queue_name            IN  VARCHAR2     DEFAULT 'streams_queue');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the Oracle Streams messaging client. Do not specify an owner. For example, if the user strmadmin is the messaging client, then specify strmadmin.</td>
</tr>
</tbody>
</table>
The action to be performed on message notification. Specify one of the following:

- For URL notifications, specify a URL without the prefix http://. For example, to specify the URL http://www.company.com:8080, enter the following: www.company.com:8080

- For email notifications, specify an email address. For example, to specify an email address xyz@company.com, enter the following: xyz@company.com

- For PL/SQL procedure notifications, specify an existing user-defined PL/SQL procedure in the form [schema_name.]procedure_name. If the schema_name is not specified, then the user who invokes the SET_MESSAGE_NOTIFICATION procedure is the default. The procedure must be a PLSQLCALLBACK data structure. For example, to specify a procedure named notify_orders in the oe schema, enter the following: oe.notify_orders

See Also: Examples on page 159-164 for more information about message notification procedures.

The type of notification. Specify one of the following:

- HTTP if you specified a URL for notification_action

- MAIL if you specified an email address for notification_action

- PROCEDURE if you specified a user-defined procedure for notification_action

The type must match the specification for the notification_action parameter.

The context of the notification. The context must be specified using RAW datatype information. For example, to specify the hexadecimal equivalent of 'FF', enter the following:

ANYDATA.ConvertRaw(HEXTORAW('FF'))

The notification context is passed the PL/SQL procedure in procedure notifications and is not relevant for mail or HTTP notifications.

If TRUE, then the procedure adds this notification for the specified streams_name and queue_name. That is, specifying TRUE turns on the notification for the streams_name and queue_name.

If FALSE, then the procedure removes this notification for the specified streams_name and queue_name. That is, specifying FALSE turns off the notification for the streams_name and queue_name. If you specify FALSE, then this procedure ignores any specified values for the notification_action or notification_context parameters.
Usage Notes

You can specify one of the following types of notifications:

- An email address to which message notifications are sent. When a relevant message is enqueued into the queue, an email with the message properties is mailed to the specified email address.

- A PL/SQL procedure to be invoked on a notification. When a relevant message is enqueued into the queue, the specified PL/SQL procedure is invoked with the message properties. This PL/SQL procedure can dequeue the message.

- An HTTP URL to which the notification is posted. When a relevant message is enqueued into the queue, a notification with the message properties is posted to the specified URL specified.

A client does not need to be connected to the database to receive a notification.

If you register for email notifications, then you should use the `DBMS_AQELM` package to set the host name and port name for the SMTP server that will be used by the database to send email notifications. If required, then you should set the send-from email address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you might want to use the `DBMS_AQELM` package to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

Each notification is an `AQXmlNotification`, which includes the following:

- `notification_options`, which includes the following:
  - `destination` - The destination queue from which the message was dequeued
  - `consumer_name` - The name of the messaging client that dequeued the message
  - `message_set` - The set of message properties

See Also:

- The documentation for the `DBMS_AQELM` package for more information on email notifications and HTTP notifications
- *Oracle Database Advanced Queuing User’s Guide* and *Oracle XML DB Developer’s Guide* for more information about message notifications and XML
- *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams
Parameters and Options

If you use a message notification procedure, then this PL/SQL procedure must have the following signature:

```sql
PROCEDURE procedure_name(
    context IN ANYDATA,
    reginfo IN SYS.AQ$_REG_INFO,
    descr IN SYS.AQ$_DESCRIPTOR);
```

Here, `procedure_name` stands for the name of the procedure. The procedure is a `PLSQLCALLBACK` data structure that specifies the user-defined PL/SQL procedure to be invoked on message notification.

The following is a simple example of a notification procedure that dequeues a message of type `oe.user_msg` using the message identifier and consumer name sent by the notification. To complete the example, first create the type:

```sql
CREATE TYPE oe.user_msg AS OBJECT(
    object_name VARCHAR2(30),
    object_owner VARCHAR2(30),
    message VARCHAR2(50));
/
```

Next, create the procedure:

```sql
CREATE OR REPLACE PROCEDURE oe.notification_dequeue(
    context ANYDATA,
    reginfo SYS.AQ$_REG_INFO,
    descr SYS.AQ$_DESCRIPTOR)
AS
    dequeue_options DBMS_AQ.DEQUEUE_OPTIONS_T;
    message_properties DBMS_AQ.MESSAGE_PROPERTIES_T;
    message_handle RAW(16);
    message ANYDATA;
    oe_message oe.user_msg;
    rc PLS_INTEGER;
BEGIN
    -- Get the message identifier and consumer name from the descriptor
    dequeue_options.msgid := descr.msg_id;
    dequeue_options.consumer_name := descr.consumer_name;
    -- Dequeue the message
    DBMS_AQ.DEQUEUE(
        queue_name => descr.queue_name,
        dequeue_options => dequeue_options,
        message_properties => message_properties,
        payload => message,
        msgid => message_handle);
    rc := message.getobject(oe_message);
    COMMIT;
END;
/
```

See Also: Oracle Database PL/SQL Packages and Types Reference for more information about `PLSQLCALLBACK` data structures
**SET_MESSAGE_TRACKING Procedure**

Sets the tracking label for logical change records (LCRs) produced by the current session. This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

---

Note: The tracking label set by this procedure does not track non-LCR messages.

---

See Also: GET_MESSAGE_TRACKING Function on page 159-83

**Syntax**

```sql
DBMS_STREAMS_ADM.SET_MESSAGE_TRACKING(
  tracking_label IN VARCHAR2  DEFAULT 'Streams_tracking',
  actions        IN NUMBER    DEFAULT DBMS_STREAMS_ADM.ACTION_MEMORY);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tracking_label</td>
<td>The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session. The size limit for a label is 4,000 bytes.</td>
</tr>
<tr>
<td>actions</td>
<td>When DBMS_STREAMS_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory, and the V$STREAMS_MESSAGE_TRACKING dynamic performance view is populated with information about the LCRs. Currently, DBMS_STREAMS_ADM.ACTION_MEMORY is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.</td>
</tr>
</tbody>
</table>
SET_RULE_TRANSFORM_FUNCTION Procedure

This procedure sets or removes the transformation function name for a custom rule-based transformation.

Syntax

```
DBMS_STREAMS_ADM.SET_RULE_TRANSFORM_FUNCTION(
  rule_name           IN  VARCHAR2,
  transform_function  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule whose rule-based transformation function you are setting or removing, specified as [schema_name.]rule_name. For example, to specify a rule in the hr schema named prop_rule1, enter hr.prop_rule1. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
| transform_function | Either the name of the transformation function to be used in the rule-based transformation for the rule or NULL. If you specify a transformation function name, then specify an existing function in one of the following forms:  
  - [schema_name.]function_name  
  - [schema_name.]package_name.function_name  
    If the function is in a package, then you must specify the package_name. For example, to specify a function in the transform_pkg package in the hr schema named executive_to_management, enter hr.transform_pkg.executive_to_management. An error is returned if the specified procedure does not exist.  
    If the schema_name is not specified, then the user who invokes the rule-based transformation function is the default.  
    If you specify NULL, then the SET_RULE_TRANSFORM_FUNCTION procedure removes the current custom rule-based transformation from the rule. |

Usage Notes

The following sections contain usage notes for this procedure:

- Transformation Function Signature
- Rule Action Context
- User Who Calls the Transformation Function
- Function Verification

Transformation Function Signature

A custom rule-based transformation function always operates on one message, but it can return one message or many messages. A custom rule-based transformation function that returns one message is a one-to-one transformation function. A one-to-one transformation function must have the following signature:

```
FUNCTION user_function (}
Here, `user_function` stands for the name of the function and `parameter_name` stands for the name of the parameter passed to the function. The parameter passed to the function is an `ANYDATA` encapsulation of a message, and the function must return an `ANYDATA` encapsulation of a message.

A custom rule-based transformation function that can return multiple messages is a one-to-many transformation function. A one-to-many transformation function must have the following signature:

```sql
FUNCTION user_function (    parameter_name IN  ANYDATA)
RETURN STREAMS$_ANYDATA_ARRAY;
```

Here, `user_function` stands for the name of the function and `parameter_name` stands for the name of the parameter passed to the function. The parameter passed to the function is an `ANYDATA` encapsulation of a message, and the function must return an array that contains zero or more `ANYDATA` encapsulations of a message. If the array contains zero `ANYDATA` encapsulations of a message, then the original message is discarded.

The `STREAMS$_ANYDATA_ARRAY` type is an Oracle-supplied type that has the following definition:

```sql
CREATE OR REPLACE TYPE SYS.STREAMS$_ANYDATA_ARRAY
    AS VARRAY(2147483647) of ANYDATA
/
```

The following restrictions apply to custom rule-based transformations that use one-to-many functions:

- Rules that are associated with one-to-many functions are supported for Oracle Streams capture processes only. These rules must not be added to rule sets used by other Oracle Streams clients, including propagations, apply processes, and messaging clients.
- One-to-many functions only can operate on row logical change records (row LCRs). They cannot operate on DDL LCRs.
- Row LCRs returned by a one-to-many function cannot contain piecewise LOB, `LONG`, or `LONG RAW` operations.
- The one-to-many function must return row LCRs in the correct order. The order of row LCRs in the array (starting from index 1) is the order that the row LCRs will be executed in the transaction.

When an apply process dequeues row LCRs that are the result of a transformation by a one-to-many function, the apply process uses the instantiation SCN of the LCR passed to the one-to-many function for all of row LCRs.
Note:

- An error is raised if a one-to-one or one-to-many transformation function returns NULL.
- Only one custom rule-based transformation can be specified for a particular rule. You cannot specify both a one-to-one and a one-to-many transformation function for the same rule.
- For any LCR constructed and returned by a custom rule-based transformation, the source_database_name, transaction_id, and scn parameter values must match the values in the original LCR. Oracle automatically specifies the values in the original LCR for these parameters, even if an attempt is made to construct LCRs with different values.

Rule Action Context
This procedure modifies the specified rule's action context to specify the transformation. A rule's action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. The client of the rules engine can be a user-created application or an internal feature of Oracle, such as Oracle Streams. The Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A custom rule-based transformation in Oracle Streams always consists of the following name-value pair in an action context:

- If the function is a one-to-one transformation function, then the name is STREAMS$_TRANSFORM_FUNCTION. If the function is a one-to-many transformation function, then the name is STREAMS$_ARRAY_TRANS_FUNCTION.
- The value is a ANYDATA instance containing a PL/SQL function name specified as a VARCHAR2. This function performs the transformation.

User Who Calls the Transformation Function
The user that calls the transformation function must have EXECUTE privilege on the function. The following list describes which user calls the transformation function:

- If a transformation is specified for a rule used by a capture process, then the user who calls the transformation function is the capture user for the capture process.
- If a transformation is specified for a rule used by a synchronous capture, then the user who calls the transformation function is the capture user for the synchronous capture.
- If a transformation is specified for a rule used by a propagation, then the user who calls the transformation function is the owner of the source queue for the propagation.
- If a transformation is specified on a rule used by an apply process, then the user who calls the transformation function is the apply user for the apply process.
- If a transformation is specified on a rule used by a messaging client, then the user who calls the transformation function is the user who invokes the messaging client.
Function Verification
This procedure does not verify that the specified transformation function exists. If the function does not exist, then an error is raised when an Oracle Streams client tries to invoke the transformation function.
SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

See Also:
- "GET_TAG Function" on page 159-86
- Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

```sql
DBMS_STREAMS_ADM.SET_TAG(
    tag  IN RAW  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.</td>
</tr>
</tbody>
</table>

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```sql
EXEC DBMS_STREAMS_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also: BUILD Procedure on page 34-18
SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```sql
DBMS_STREAMS_ADM.SET_UP_QUEUE(
    queue_table     IN  VARCHAR2  DEFAULT 'streams_queue_table',
    storage_clause  IN  VARCHAR2  DEFAULT NULL,
    queue_name      IN  VARCHAR2  DEFAULT 'streams_queue',
    queue_user      IN  VARCHAR2  DEFAULT NULL,
    comment         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>The name of the queue table specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner.</td>
</tr>
<tr>
<td></td>
<td>Queue table names can be a maximum of 24 bytes.</td>
</tr>
<tr>
<td>storage_clause</td>
<td>The storage clause for queue table</td>
</tr>
<tr>
<td></td>
<td>The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause.</td>
</tr>
<tr>
<td></td>
<td>If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created.</td>
</tr>
<tr>
<td></td>
<td>See Also: Oracle Database SQL Language Reference for more information about storage clauses</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the queue that will function as the ANYDATA queue, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>Queue names can be a maximum of 24 bytes.</td>
</tr>
</tbody>
</table>
Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the `CREATE_QUEUE_TABLE` procedure in the `DBMS_AQADM` package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer `ANYDATA` queue that is both a secure queue and a transactional queue.

  Also, if the database is Oracle Database 10g release 2 or later, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `commit_time`. If the database is a release before Oracle Database 10g release 2, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `enq_time`.

- If the specified queue table exists, then the queue uses the properties of the existing queue table.

- If the specified queue name does not exist, then this procedure runs the `CREATE_QUEUE` procedure in the `DBMS_AQADM` package to create the queue.

- This procedure starts the queue.

- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants `ENQUEUE` and `DEQUEUE` privileges on the queue to the specified queue user.

  To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. `SET_UP_QUEUE` then runs the `ENABLE_DB_ACCESS` procedure in the `DBMS_AQADM` package, specifying the agent and the user.

---

**Note:**

- To enqueue messages into and dequeue messages from a queue, a queue user must have `EXECUTE` privilege on the `DBMS_STREAMS_MESSAGING` package or the `DBMS_AQ` package. The `SET_UP_QUEUE` procedure does not grant this privilege.

- If the agent that `SET_UP_QUEUE` tries to create exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry `SET_UP_QUEUE`.

---

**See Also:** `Oracle Streams Concepts and Administration` for more information about secure queue users
SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill messages to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.

2. Creates a new propagation that propagates messages from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.

3. Stops the capture process.

4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.

5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.

6. Drops the original propagation.

7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.

8. If the auto_merge_threshold parameter is set to a positive number, then creates an Oracle Scheduler job to run the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the MERGE_STREAMS_JOB procedure runs the MERGE_STREAMS procedure to merge the streams automatically.

After the SPLIT_STREAMS procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the START_CAPTURE procedure in the DBMS_CAPTURE_ADM package.

The DBA_STREAMS_SPLIT_MERGE view contains the name of each cloned component and information about the split and merge operation.
SPLIT_STREAMS Procedure

**Note:** If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

- "MERGE_STREAMS Procedure" on page 159-130
- "MERGE_STREAMS_JOB Procedure" on page 159-133
- *Oracle Streams Replication Administrator’s Guide* for instructions on using the SPLIT_STREAMS procedure

### Syntax

```sql
DBMS_STREAMS_ADM.SPLIT_STREAMS(
    propagation_name         IN      VARCHAR2,
    cloned_propagation_name  IN      VARCHAR2  DEFAULT NULL,
    cloned_queue_name        IN      VARCHAR2  DEFAULT NULL,
    cloned_capture_name      IN      VARCHAR2  DEFAULT NULL,
    perform_actions          IN      BOOLEAN   DEFAULT TRUE,
    script_name              IN      VARCHAR2  DEFAULT NULL,
    script_directory_object  IN      VARCHAR2  DEFAULT NULL,
    auto_merge_threshold     IN      NUMBER    DEFAULT NULL,
    schedule_name            IN OUT  VARCHAR2,
    merge_job_name           IN OUT  VARCHAR2);
```

### Parameters

**Table 159–42 SPLIT_STREAMS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation that cannot send messages to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.</td>
</tr>
<tr>
<td>cloned_queue_name</td>
<td>The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.</td>
</tr>
<tr>
<td>cloned_capture_name</td>
<td>The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.</td>
</tr>
</tbody>
</table>
perform_actions

If TRUE, then the procedure performs the necessary actions to split the stream directly.

If FALSE, then the procedure does not perform the necessary actions to split the stream directly.

Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:

- script_name
- script_directory_object

script_name

If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.

If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.

If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script.

If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.

Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Table 159–42 (Cont.) SPLIT_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>perform_actions</td>
<td>If TRUE, then the procedure performs the necessary actions to split the stream directly. If FALSE, then the procedure does not perform the necessary actions to split the stream directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: script_name, script_directory_object.</td>
</tr>
<tr>
<td>script_name</td>
<td>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error. Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.

If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process.

The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.

The Oracle Scheduler schedule name, specified as [schema_name.]schedule_name. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default.

If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily.

If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name.

If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL.

If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.

If an existing schedule name is specified, an error is raised.

The Oracle Scheduler job name, specified as [schema_name.]merge_job_name. For example, strmadmin.merge_job. If the schema is not specified, then the current user is the default.

If auto_merge_threshold is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily.

If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a job name.

If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL.

If an existing job name is specified, an error is raised.
See Also: Oracle Database Administrator’s Guide for information about Oracle Scheduler
The `DBMS_STREAMS_ADVISOR_ADM` package, one of a set of Oracle Streams packages, provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered. This package is part of the Oracle Streams Performance Advisor.

This chapter contains the following topics:

- **Using DBMS_STREAMS_ADVISOR_ADM**
  - Overview
  - Security Model
  - Constants
  - Views

- **Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms**

  **See Also:** *Oracle Streams Concepts and Administration* for instructions about using this package.
Using DBMS_STREAMS_ADVISOR_ADM

This section contains topics which relate to using the DBMS_STREAMS_ADVISOR_ADM package.

- Overview
- Security Model
- Constants
- Views
Overview

The DBMS_STREAMS_ADVISOR_ADM package enables you to gather and analyze information about an Oracle Streams environment. You can use this information in the following ways:

- To populate data dictionary views with an Oracle Streams topology that contains information about the Oracle Streams components at one or more databases
- To examine the Oracle Streams components at one or more databases in your environment and the ways in which information flows through streams that include these components
- To analyze the performance of the Oracle Streams components in your environment
- To detect performance problems with Oracle Streams components and correct these problems

See Also: Oracle Streams Concepts and Administration for instructions about using this package
Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:** Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator.
Constants

The `DBMS_STREAMS_ADVISOR_ADM` package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_STREAMS_ADVISOR_ADM.CAPTURE_TYPE`.

<table>
<thead>
<tr>

</tbody>
</table>
Views

The `DBMS_STREAMS_ADVISOR_ADM` package uses the following views:

- `DBA_STREAMS_TP_COMPONENT` contains information about each Oracle Streams component at each database.
- `DBA_STREAMS_TP_COMPONENT_LINK` contains information about how messages flow between Oracle Streams components.
- `DBA_STREAMS_TP_COMPONENT_STAT` contains temporary performance statistics about each Oracle Streams component.
- `DBA_STREAMS_TP_DATABASE` contains information about each database that contains Oracle Streams components.
- `DBA_STREAMS_TP_PATH_BOTTLENECK` contains temporary information about Oracle Streams components that might be slowing down the flow of a stream.
- `DBA_STREAMS_TP_PATH_STAT` contains temporary performance statistics about each stream path that exists in the Oracle Streams topology.

The topology information is stored permanently in the following data dictionary views: `DBA_STREAMS_TP_DATABASE`, `DBA_STREAMS_TP_COMPONENT`, and `DBA_STREAMS_TP_COMPONENT_LINK`.

However, the following views contain temporary information: `DBA_STREAMS_TP_COMPONENT_STAT`, `DBA_STREAMS_TP_PATH_BOTTLENECK`, and `DBA_STREAMS_TP_PATH_STAT`. Some of the data in these views is retained only for the user session that runs the `ANALYZE_CURRENT_PERFORMANCE` procedure. When this user session ends, this temporary information is purged.

- *Oracle Database Reference*
- *Oracle Streams Concepts and Administration* for sample queries that use these views
Operational Notes

This section contains the following operational notes for the DBMS_STREAMS_ADVISOR_ADM package:

- Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package
- General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package

The DBMS_STREAMS_ADVISOR_ADM analyzes the following Oracle Streams components at the specified databases:

- Capture processes
- Propagations
- Apply processes
- Queues

The DBMS_STREAMS_ADVISOR_ADM package does not analyze the following Oracle Streams components:

- Synchronous captures
- Messaging clients

General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

To use the DBMS_STREAMS_ADVISOR_ADM package, complete the following general steps:

1. Identify the database that you will use to gather the information.
   An administrative user at this database must meet the following requirements:
   - The user must have access to a database link to each database that contains Oracle Streams components.
   - The user must have been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure.

   In an Oracle Streams environment, the Oracle Streams administrator uses this package.
   If no database in your environment meets these requirements, then choose a database, configure the necessary database links, and grant the necessary privileges to the users before proceeding.

2. Connect as the administrative user to the database you identified in Step 1, and remain connected to the session while you complete the remaining steps.

3. Run the ANALYZE_CURRENT_PERFORMANCE procedure.

4. Optionally, allow messages to flow in the environment for some time.

5. Optionally, rerun the ANALYZE_CURRENT_PERFORMANCE procedure one or more times.

6. Query the data dictionary views listed in “Views” on page 160-6 to analyze the Oracle Streams environment.
7. If you want to update the information in the data dictionary views or if you add new Oracle Streams components to any database in the environment, repeat Steps 2-6.

**Note:** When you exit the user session, the rate, bandwidth, event, and flow control statistics are purged from the data dictionary views.
Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms

Table 160–2  DBMS_STREAMS_ADVISOR_ADM Package Subprograms

</tr>
</tbody>
</table>
ANALYZE_CURRENT_PERFORMANCE Procedure

This procedure gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered.

The performance analyses includes:

- Calculating bottleneck components for each separate stream
- Calculating the throughput of each Oracle Streams component
- Calculating the latency of each Oracle Streams component
- Calculating the top wait event of each Oracle Streams component
- Calculating the message rate of each stream
- Calculating the transaction rate of each stream

The procedure places the gathered information in data dictionary views.

**Note:** The parameters in this procedure must all be either non-NULL or NULL.

See Also:

- *Oracle Streams Concepts and Administration* for instructions on using this procedure
- "Views" on page 160-6

Syntax

```sql
DBMS_STREAMS_ADVISOR_ADM.ANALYZE_CURRENT_PERFORMANCE(
  component_name  IN  VARCHAR2  DEFAULT NULL,
  component_db    IN  VARCHAR2  DEFAULT NULL,
  component_type  IN  NUMBER    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component_name</td>
<td>The name of the Oracle Streams component to analyze. For example, to analyze a capture process named capture01, then specify capture01. If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.</td>
</tr>
<tr>
<td>component_db</td>
<td>The global name of the database that contains the component specified in the component_name parameter. For example, if the db.net database contains the component, then specify db.net. If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.</td>
</tr>
</tbody>
</table>
component_type

The type of the component specified in the component_name parameter. If the component_name parameter is non-NULL, then specify one of the following:

- DBMS_STREAMS_ADVISOR_ADM.CAPTURE_TYPE
- DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_SENDER_TYPE
- DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_RECEIVER_TYPE
- DBMS_STREAMS_ADVISOR_ADM.APPLY_TYPE
- DBMS_STREAMS_ADVISOR_ADM.QUEUE_TYPE

See "Constants" on page 160-5 for information about these constants. If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.
The DBMS_STREAMS_AUTH package, one of a set of Oracle Streams packages, provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

This chapter contains the following topics:

- Using DBMS_STREAMS_AUTH
  - Overview
  - Security Model

- Summary of DBMS_STREAMS_AUTH Subprograms
Using DBMS_STREAMS_AUTH

This section contains topics which relate to using the DBMS_STREAMS_AUTH package.

- Overview
- Security Model
Overview

This package provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

See Also: Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and Oracle Streams administrators.
Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.
### Summary of DBMS_STREAMS_AUTH Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRANT_ADMIN_PRIVILEGE Procedure</strong> on page 161-6</td>
<td>Either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that you can use to grant these privileges.</td>
</tr>
<tr>
<td><strong>GRANT_REMOTE_ADMIN_ACCESS Procedure</strong> on page 161-9</td>
<td>Enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.</td>
</tr>
<tr>
<td><strong>REVOKE_ADMIN_PRIVILEGE Procedure</strong> on page 161-10</td>
<td>Either revokes Oracle Streams administrator privileges from a user directly, or generates a script that you can use to revoke these privileges.</td>
</tr>
<tr>
<td><strong>REVOKE_REMOTE_ADMIN_ACCESS Procedure</strong> on page 161-12</td>
<td>Disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link.</td>
</tr>
</tbody>
</table>

**Note:** All subprograms commit unless specified otherwise.
GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that you can use to grant these privileges.

Syntax

```sql
DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE(
    grantee           IN  VARCHAR2,
    grant_privileges  IN  BOOLEAN   DEFAULT TRUE,
    file_name         IN  VARCHAR2  DEFAULT NULL,
    directory_name    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user to whom privileges are granted</td>
</tr>
<tr>
<td>grant_privileges</td>
<td>If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the <code>DBA_STREAMS_ADMINISTRATOR</code> data dictionary view with YES for both the <code>LOCAL_PRIVILEGES</code> column and the <code>ACCESS_FROM_REMOTE</code> column. If the user has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fail, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the <code>DBA_STREAMS_ADMINISTRATOR</code> data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the <code>file_name</code> or <code>directory_name</code> parameter is NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.</td>
</tr>
<tr>
<td>directory_name</td>
<td>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement <code>CREATE DIRECTORY</code>. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the <code>file_name</code> parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the <code>file_name</code> parameter is non-NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The `RESTRICTED SESSION` system privilege
EXECUTE on the following packages:

- DBMS_APPLY_ADM
- DBMS_AQ
- DBMS_AQADM
- DBMS_AQIN
- DBMS_AQELM
- DBMS_CAPTURE_ADM
- DBMS_FLASHBACK
- DBMS_LOCK
- DBMS_PROPAGATION_ADM
- DBMS_RULE_ADM
- DBMS_STREAMS_ADM
- DBMS_STREAMS_ADVISOR_ADM
- DBMS_STREAMS_HANDLER_ADM
- DBMS_STREAMS_MESSAGING
- DBMS_TRANSFORM

- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules
In addition, the grantee can grant these privileges to other users.

- SELECT_CATALOG_ROLE
- SELECT or READ privilege on data dictionary views related to Oracle Streams
- The ability to allow a remote Oracle Streams administrator to perform administrative actions through a database link by connecting to the grantee. This ability is enabled by running the `GRANT_REMOTE_ADMIN_ACCESS` procedure in this package.

Note:

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure does not grant any roles to the grantee.
- This procedure grants only the privileges necessary to configure and administer an Oracle Streams environment. You can grant more privileges to the grantee if necessary.
See Also:

- GRANT_REMOTE_ADMIN_ACCESS Procedure on page 161-9
- Oracle Streams Replication Administrator’s Guide for more information about configuring an Oracle Streams administrator
**GRANT_REMOTE_ADMIN_ACCESS Procedure**

This procedure enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

**Syntax**

```sql
DBMS_STREAMS_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
    grantee  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user who allows remote access. The procedure adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The Oracle Streams administrator at a downstream capture database administers the source database using this connection. You can also run the procedure at a database running an apply process so that a remote Oracle Streams administrator can set instantiation SCNs at the local database.

**Note:** The GRANT_ADMIN_PRIVILEGE procedure runs this procedure.

**See Also:** GRANT_ADMIN_PRIVILEGE Procedure on page 161-6
REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes Oracle Streams administrator privileges from a user directly, or generates a script that you can use to revoke these privileges.

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_ADMIN_PRIVILEGE(
  grantee            IN  VARCHAR2,
  revoke_privileges  IN  BOOLEAN   DEFAULT TRUE,
  file_name          IN  VARCHAR2  DEFAULT NULL,
  directory_name     IN  VARCHAR2  DEFAULT NULL);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user from whom privileges are revoked</td>
</tr>
<tr>
<td>revoke_privileges</td>
<td>If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fail, then the procedure raises an error. A revoke statement will fail if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges to the specified user directly, and does not remove the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.</td>
</tr>
<tr>
<td>directory_name</td>
<td>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
```

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.
Note: To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

See Also: GRANT_ADMIN_PRIVILEGE Procedure on page 161-6
REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link.

Note: The REVOKE_ADMIN_PRIVILEGE procedure runs this procedure.

See Also: REVOKE_ADMIN_PRIVILEGE Procedure on page 161-10

Syntax

```sql
DBMS_STREAMS_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
    grantee  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user for whom access from a remote Oracle Streams administrator is disabled. If a row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure updates the ACCESS_FROM_REMOTE column for the grantee to NO. If, after this update, both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column are NO for the grantee, then the procedure removes the grantee from the view. If no row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure does not update the view and does not raise an error.</td>
</tr>
</tbody>
</table>
The `DBMS_STREAMS_HANDLER_ADM` package, one of a set of Oracle Streams packages, provides interfaces to manage statement DML handlers.

This chapter contains the following topics:

- **Using DBMS_STREAMS_HANDLER_ADM**
  - Overview
  - Security Model
  - Views
  - Operational Notes

- **Summary of DBMS_STREAMS_HANDLER_ADM Subprograms**
Using DBMS_STREAMS_HANDLER_ADM

This section contains topics that relate to using the `DBMS_STREAMS_HANDLER_ADM` package.

- Overview
- Security Model
- Views
- Operational Notes
Overview

A statement DML handler runs one or more data manipulation language (DML) statements on row logical change records (row LCRs) that are dequeued by an apply process. A single statement DML handler can include multiple statements, and you control the execution order of the statements.

Statement DML handlers are similar to procedure DML handlers for apply processes. Both statement DML handlers and procedure DML handlers provide custom processing of row changes that are encapsulated in row LCRs. Statement DML handlers and procedure DML handlers both run when an apply process dequeues a row LCR. However, statement DML handlers have the following advantages over procedure DML handlers:

- Statement DML handlers typically perform better than procedure DML handlers because statement DML handlers do not require PL/SQL processing.
- The syntax for statement DML handlers is same as DML syntax. Statement DML handlers do not require PL/SQL programming. Procedure DML handlers require PL/SQL programming.
- Statement DML handlers do not require the manipulation of `ANYDATA` values to access the information in row LCRs. Typically, procedure DML handlers must manipulate `ANYDATA` values.
- A statement DML handler can coexist with an error handler for same operation on the same database object. In contrast, you cannot specify both a procedure DML handler and an error handler for the same operation on the same database object.

---

**Note:** You can specify multiple statement DML handlers for the same operation on the database object. In this case, the statement DML handlers can execute in any order, and each statement DML handler receives a copy of the original row LCR that was dequeued by the apply process.

---

**See Also:** *Oracle Streams Concepts and Administration*
Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

See Also: Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator.
Views

The DBMS_STREAMS_HANDLER_ADM package uses the views listed in the Oracle Database Reference.

- DBA_APPLY_DML_HANDLERS
- DBA_STREAMS_STMTS
- DBA_STREAMS_STMT_HANDLERS
Operational Notes

The following sections contain operational notes about the DBMS_STREAMS_HANDLER_ADM package:

- Statement Execution Order
- Supported SQL Statements
- Supported Row LCR Column Attributes
- Supported Row LCR Attributes
- Supported Row LCR Extra Attributes
- Supported Row LCR Method

Statement Execution Order

Each statement in a statement DML handler has a unique execution sequence number. When a statement DML handler is invoked, it executes its statements in order from the statement with the lowest execution sequence number to the statement with the highest execution sequence number.

Supported SQL Statements

You can use statement DML handlers for any valid DML operation on a row logical change record (row LCR). For example, a statement DML handler can audit the DML changes made to a table.

The following SQL statements are supported in statement DML handlers:

- INSERT
- UPDATE
- DELETE
- MERGE

In addition, define variables are not supported in the SQL statements in a statement DML handler.

However, the SQL statements in a statement DML handler can include calls to member subprograms for the row LCR type (LCR$_ROW_RECORD), such as ADD_COLUMN, DELETE_COLUMN, KEEP_COLUMNS, and RENAME_COLUMN.

---

**Note:** A statement DML handler cannot modify the value of a column in a row LCR.

---

**See Also:** "LCR$_ROW_RECORD Type" on page 275-15

Supported Row LCR Column Attributes

Statements in statement DML handlers can contain the row LCR column attributes described in Table 162–1.
Specify these attributes in the following way in a statement:

```
:attribute.column_name
```

For example, to specify the `new_only` attribute for the `salary` column, enter the following in a statement:

```
:new_only.salary
```

### Supported Row LCR Attributes

Statements in statement DML handlers can contain the row LCR attributes described in Table 162–2.

#### Table 162–1  Row LCR Column Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>new</code></td>
<td>Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns the old value.</td>
</tr>
<tr>
<td><code>new_exists</code></td>
<td>Returns <code>TRUE</code> if a new column value exists in a row LCR. Returns <code>FALSE</code> if a new column value does not exist in a row LCR.</td>
</tr>
<tr>
<td><code>new_only</code></td>
<td>Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns <code>NULL</code> and does not return the old column value.</td>
</tr>
<tr>
<td><code>old</code></td>
<td>Returns the old column value in a row LCR.</td>
</tr>
<tr>
<td><code>old_exists</code></td>
<td>Returns <code>TRUE</code> if an old column value exists in a row LCR. Returns <code>FALSE</code> if an old column value does not exist in a row LCR.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>new</code></td>
<td>Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns the old value.</td>
</tr>
<tr>
<td><code>new_exists</code></td>
<td>Returns <code>TRUE</code> if a new column value exists in a row LCR. Returns <code>FALSE</code> if a new column value does not exist in a row LCR.</td>
</tr>
<tr>
<td><code>new_only</code></td>
<td>Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns <code>NULL</code> and does not return the old column value.</td>
</tr>
<tr>
<td><code>old</code></td>
<td>Returns the old column value in a row LCR.</td>
</tr>
<tr>
<td><code>old_exists</code></td>
<td>Returns <code>TRUE</code> if an old column value exists in a row LCR. Returns <code>FALSE</code> if an old column value does not exist in a row LCR.</td>
</tr>
</tbody>
</table>

#### Table 162–2  Row LCR Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>command_type</code></td>
<td>Returns the type of DML statement that produced the change, either <code>INSERT</code>, <code>UPDATE</code>, or <code>DELETE</code>. DBMS_LOB piecewise LOB operations are not supported by statement DML handlers.</td>
</tr>
<tr>
<td><code>commit_scn</code></td>
<td>Returns the commit system change number (SCN) of the transaction to which the LCR belongs.</td>
</tr>
<tr>
<td><code>compatible</code></td>
<td>Returns the minimal database compatibility required to support the LCR.</td>
</tr>
<tr>
<td><code>instance_number</code></td>
<td>Returns the instance number of the database instance that made the change that is encapsulated in the LCR. Typically, the instance number is relevant in an Oracle Real Application Clusters (Oracle RAC) configuration.</td>
</tr>
<tr>
<td><code>object_owner</code></td>
<td>Returns the schema name that contains the table with the changed row.</td>
</tr>
<tr>
<td><code>object_name</code></td>
<td>Returns the name of the table that contains the changed row.</td>
</tr>
<tr>
<td><code>scn</code></td>
<td>Returns the SCN at the time when the change was made.</td>
</tr>
<tr>
<td><code>source_database_name</code></td>
<td>Returns the name of the source database where the row change occurred.</td>
</tr>
<tr>
<td><code>source_time</code></td>
<td>Returns the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.</td>
</tr>
<tr>
<td><code>tag</code></td>
<td>Returns a raw tag that can be used to track the LCR.</td>
</tr>
</tbody>
</table>
Specify these attributes in the following way in a statement:

```
:attribute_name
```

For example, to specify the `source_database_name` attribute for a row LCR, enter the following in a statement:

```
:source_database_name
```

**Supported Row LCR Extra Attributes**

Statements in statement DML handlers can contain the row LCR extra attributes described in Table 162-3.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>Returns the rowid of the row changed in a row LCR.</td>
</tr>
<tr>
<td>serial#</td>
<td>Returns the serial number of the session that performed the change captured in the LCR.</td>
</tr>
<tr>
<td>session#</td>
<td>Returns the identifier of the session that performed the change captured in the LCR.</td>
</tr>
<tr>
<td>thread#</td>
<td>Returns the thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle RAC configuration.</td>
</tr>
<tr>
<td>tx_name</td>
<td>Returns the name of the transaction that includes the LCR.</td>
</tr>
<tr>
<td>username</td>
<td>Returns the name of the current user who performed the change captured in the LCR.</td>
</tr>
</tbody>
</table>

Specify these attributes in the following way in a statement:

```
:extra_attribute.attribute_name
```

For example, to specify the `row_id` extra attribute for a row LCR, enter the following in a statement:

```
:extra_attribute.row_id
```

**Supported Row LCR Method**

A statement in a statement DML handler can include a call to the `EXECUTE` member procedure for row LCRs. The `EXECUTE` member procedure executes the row LCR under the security domain of the current user.

A statement that runs the `EXECUTE` member procedure can be placed anywhere in the execution sequence order of the statement DML handler. It is not necessary to execute a row LCR unless the goal is to apply the changes in the row LCR to a table in addition to performing any other SQL statements in the statement DML handler.

When you call the `EXECUTE` member procedure in a statement, the `conflict_resolution` parameter controls whether any conflict resolution defined for the table...
using the `SET_UPDATE_CONFLICT_HANDLER` procedure in the `DBMS_APPLY_ADM` package is used to resolve conflicts resulting from the execution of the LCR:

```
:lcr.execute TRUE|FALSE
```

A `TRUE` argument indicates that conflict resolution is used. A `FALSE` argument indicates that conflict resolution is not used.

For example, to use conflict resolution, enter the following in a statement:

```
:lcr.execute TRUE
```

An error is raised if this parameter is not specified or is set to `NULL`.

Summary of DBMS_STREAMS_HANDLER_ADM Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_STMT_TO_HANDLER Procedure on page 162-11</td>
<td>Adds a statement to a statement DML handler</td>
</tr>
<tr>
<td>CREATE_STMT_HANDLER Procedure on page 162-12</td>
<td>Creates a statement DML handler</td>
</tr>
<tr>
<td>DROP_STMT_HANDLER Procedure on page 162-13</td>
<td>Drops a statement DML handler</td>
</tr>
<tr>
<td>REMOVE_STMT_FROM_HANDLER Procedure on page 162-14</td>
<td>Removes a statement from a statement DML handler</td>
</tr>
</tbody>
</table>

**Note:** The subprograms in this package do not commit.
ADD_STMT_TO_HANDLER Procedure

This procedure adds a statement to a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.ADD_STMT_TO_HANDLER(
    handler_name       IN VARCHAR2,
    statement          IN CLOB,
    execution_sequence IN NUMBER  DEFAULT NULL);
```

Parameters

```
Table 162–5  ADD_STMT_TO_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td>statement</td>
<td>The text of the SQL statement to add to the statement DML handler. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>execution_sequence</td>
<td>The position of the statement in the statement DML handler at which a SQL statement is to be set to execute. Statements are executed in order from the lowest execution sequence number to the highest execution sequence number. You can specify a positive or negative integer or decimal, or you can specify 0 (zero). If you specify an execution sequence number that is used by an existing statement in the statement DML handler, then the statement in the statement parameter replaces the existing statement. If NULL, then the statement is added to the statement DML handler with an execution sequence number that is larger than the execution sequence number for any statement in the statement DML handler.</td>
</tr>
</tbody>
</table>
```
CREATE_STMT_HANDLER Procedure

This procedure creates a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.CREATE_STMT_HANDLER(
    handler_name IN VARCHAR2,
    comment      IN VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td>comment</td>
<td>A comment for the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then no comment is recorded for the statement DML handler.</td>
</tr>
</tbody>
</table>
**DROP_STMT_HANDLER Procedure**

This procedure drops a statement DML handler.

**Syntax**

```sql
DBMS_STREAMS_HANDLER_ADM.DROP_STMT_HANDLER(
    handler_name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
</tbody>
</table>
REMOVE_STMT_FROM_HANDLER Procedure

This procedure removes a statement from a statement DML handler.

Syntax

```sql
DBMS_STREAMS_HANDLER_ADM.REMOVE_STMT_FROM_HANDLER(
    handler_name       IN VARCHAR2,
    execution_sequence IN NUMBER  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td>execution_sequence</td>
<td>The position of the statement to remove.</td>
</tr>
<tr>
<td></td>
<td>You can specify a positive or negative integer or decimal, or you can</td>
</tr>
<tr>
<td></td>
<td>specify 0 (zero).</td>
</tr>
<tr>
<td></td>
<td>If NULL, the procedure removes the last statement in the statement DML</td>
</tr>
<tr>
<td></td>
<td>handler.</td>
</tr>
<tr>
<td></td>
<td>If the specified execution sequence number does not exist for the</td>
</tr>
<tr>
<td></td>
<td>statement DML handler, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
The `DBMS_STREAMS_MESSAGING` package, one of a set of Oracle Streams packages, provides interfaces to enqueue messages into and dequeue messages from an `ANYDATA` queue.

This chapter contains the following topics:

- **Using DBMS_STREAMS_MESSAGING**
  - Overview
  - Security Model
- **Summary of DBMS_STREAMS_MESSAGING Subprograms**
Using DBMS_STREAMS_MESSAGING

This section contains topics which relate to using the DBMS_CAPTUREADM package.

- Overview
- Security Model
Overview

This package provides interfaces to enqueue messages into and dequeue messages from a ANYDATA queue.

---

**Note:** Currently, messaging clients cannot dequeue buffered messages. In addition, the DBMS_STREAMS_MESSAGING package cannot be used to enqueue messages into or dequeue messages from a buffered queue. However, you can use the DBMS_AQ package to enqueue and dequeue buffered messages.

---

**See Also:** Oracle Database Advanced Queuing User’s Guide for more information about queues, messaging, and the DBMS_AQ package.
Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:** Oracle Streams Replication Administrator’s Guide for information about configuring an Oracle Streams administrator.
Summary of DBMS_STREAMS_MESSAGING Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DEQUEUE Procedure</strong> on page 163-6</td>
<td>Uses the specified Oracle Streams messaging client to dequeue a message from the specified queue</td>
</tr>
<tr>
<td><strong>ENQUEUE Procedure</strong> on page 163-8</td>
<td>The current user enqueues a message into the specified queue</td>
</tr>
</tbody>
</table>

**Note:** The subprograms in this package do not commit.
DEQUEUE Procedure

This procedure uses the specified Oracle Streams messaging client to dequeue a message from the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid OUT` parameter, and the other does not.

Syntax

```sql
DBMS_STREAMS_MESSAGING.DEQUEUE(
    queue_name    IN   VARCHAR2,
    streams_name  IN   VARCHAR2,
    payload       OUT  ANYDATA,
    dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
    navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
    wait          IN   BINARY_INTEGER  DEFAULT FOREVER,
    msgid         OUT  RAW);

DBMS_STREAMS_MESSAGING.DEQUEUE(
    queue_name    IN   VARCHAR2,
    streams_name  IN   VARCHAR2,
    payload       OUT  ANYDATA,
    dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
    navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
    wait          IN   BINARY_INTEGER  DEFAULT FOREVER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queue_name</code></td>
<td>The name of the local queue from which messages will be dequeued, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be a secure queue of <code>ANYDATA</code> type. For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>streams_name</code></td>
<td>The name of the Oracle Streams messaging client. For example, if the user <code>strmadmin</code> is the messaging client, then specify <code>strmadmin</code>. If <code>NULL</code> and a relevant messaging client for the queue exists, then the procedure uses the relevant messaging client. If <code>NULL</code> and multiple relevant messaging clients for the queue exist, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>payload</code></td>
<td>The payload that is dequeued</td>
</tr>
<tr>
<td><code>dequeue_mode</code></td>
<td>Specify one of the following settings: REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a <code>select for update</code> statement. BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a <code>select</code> statement.</td>
</tr>
</tbody>
</table>
Exceptions

Table 163–3 DEQUEUE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENDOFCURTRANS</td>
<td>Dequeue has reached the end of the messages in the current transaction. Specify this exception in the following way:</td>
</tr>
<tr>
<td></td>
<td>SYS.DBMS_STREAMS_MESSAGING.ENDOFCURTRANS</td>
</tr>
<tr>
<td></td>
<td>Every dequeue procedure should include an exception handler that handles this exception.</td>
</tr>
<tr>
<td>NOMOREMSGS</td>
<td>There are no more messages in the queue for the dequeue operation. Specify this exception in the following way:</td>
</tr>
<tr>
<td></td>
<td>SYS.DBMS_STREAMS_MESSAGING.NOMOREMSGS</td>
</tr>
<tr>
<td></td>
<td>A dequeue procedure that specifies NO_WAIT for the wait parameter should include an exception handler that handles this exception.</td>
</tr>
</tbody>
</table>
ENQUEUE Procedure

This procedure enables the current user to enqueue a message into the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid OUT` parameter, and the other does not.

Syntax

```sql
DBMS_STREAMS_MESSAGING.ENQUEUE(
    queue_name  IN   VARCHAR2,
    payload     IN   ANYDATA,
   msgid       OUT  RAW);

DBMS_STREAMS_MESSAGING.ENQUEUE(
    queue_name  IN   VARCHAR2,
    payload     IN   ANYDATA);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `queue_name` | The name of the local queue into which messages will be enqueued, specified as `[schema_name.]queue_name`. The current database must contain the queue, and the queue must be a secure queue of `ANYDATA` type.  
For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default. |
| `payload` | The payload that is enqueued |
| `msgid` | The message identifier of the message that is enqueued |

Usage Notes

To successfully enqueue messages into a queue, the current user must be mapped to a unique Advanced Queuing agent with the same name as the current user. You can run the `DBMS_STREAMS_ADM.SET_UP_QUEUE` procedure and specify a user as the queue user to grant the necessary privileges to the user to perform enqueues. The Advanced Queuing agent is created automatically when you run `SET_UP_QUEUE` and specify a queue user.

See Also: [SET_UP_QUEUE Procedure on page 159-171](#)
The DBMS_STREAMS_TABLESPACE_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for copying tablespaces between databases and moving tablespaces from one database to another. This package uses transportable tablespaces, Data Pump, the DBMS_FILE_TRANSFER package, and the DBMS_FILE_GROUP package.

This chapter contains the following topics:

- Using DBMS_STREAMS_TABLESPACE_ADM
  - Overview
  - Security Model
- Data Structures
- Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

See Also: Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and Oracle Streams
Using DBMSSTREAMS_TABLESPACE_ADM

This section contains topics which relate to using the DBMSSTREAMS_TABLESPACE_ADM package.

- Overview
- Security Model
Overview

Either a simple tablespace or a self-contained tablespace set must be specified in each procedure in this package.

A **self-contained tablespace** has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. A **simple tablespace** is a self-contained tablespace that uses only one datafile.

A simple tablespace must be specified in the following procedures:

- ATTACH_SIMPLE_TABLESPACE Procedure
- CLONE_SIMPLE_TABLESPACE Procedure
- DETACH_SIMPLE_TABLESPACE Procedure
- PULL_SIMPLE_TABLESPACE Procedure

A **self-contained tablespace set** has no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

A self-contained tablespace set must be specified in the following procedures:

- ATTACH_TABLESPACES Procedure
- CLONE_TABLESPACES Procedure
- DETACH_TABLESPACES Procedure
- PULL_TABLESPACES Procedure

To determine whether a set of tablespaces is self-contained, use the TRANSPORT_SET_CHECK procedure in the Oracle supplied package DBMS_TTS.

**See Also:** *Oracle Database Administrator’s Guide* for more information about self-contained tablespaces and tablespace sets
Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.
Data Structures

The DBMS_STREAMS_TABLESPACE_ADM package defines RECORD types and TABLE types.

**RECORD Types**
- FILE Record Type

**TABLE Types**
- DIRECTORY_OBJECT_SET Table Type
- FILE_SET Table Type
- TABLESPACE_SET Table Type
DIRECTORY_OBJECT_SET Table Type

Contains the names of one or more directory objects. Each name must be a directory object created using the SQL statement CREATE DIRECTORY.

Syntax

TYPE DIRECTORY_OBJECT_SET IS TABLE OF VARCHAR2(32)
   INDEX BY BINARY_INTEGER;
FILE Record Type

Contains the directory object associated with a directory and the name of the file in the directory.

Syntax

```
TYPE FILE IS RECORD(
    directory_object VARCHAR2(32),
    file_name        VARCHAR2(4000));
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_object</td>
<td>The name of a directory object. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code>.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file in the corresponding directory associated with the directory object</td>
</tr>
</tbody>
</table>
FILE_SET Table Type

Contains one or more files.

Syntax

```sql
TYPE FILE_SET IS TABLE OF FILE
   INDEX BY BINARY_INTEGER;
```
TABLESPACE_SET Table Type

Contains the names of one or more tablespaces.

Syntax

TYPE TABLESPACE_SET IS TABLE OF VARCHAR2(32)
    INDEX BY BINARY_INTEGER;
## Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

**Note:** All subprograms commit unless specified otherwise.
ATTACH_SIMPLE_TABLESPACE Procedure

This procedure uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

Syntax

DBMS_STREAMS_TABLESPACE_ADM.ATTACH_SIMPLE_TABLESPACE(
    directory_object      IN  VARCHAR2,
    tablespace_file_name  IN  VARCHAR2,
    converted_file_name   IN  VARCHAR2  DEFAULT NULL,
    datafile_platform     IN  VARCHAR2  DEFAULT NULL,
    tablespace_name       OUT VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_object</td>
<td>The directory that contains the Data Pump dump file and the datafile for the tablespace. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.</td>
</tr>
<tr>
<td></td>
<td>The name of the Data Pump export dump file must be the same as the data file name for the tablespace, except with a .dmp extension. If the converted_file_name is non-NULL, specify the dump file produced by the export database, not the file name after conversion.</td>
</tr>
<tr>
<td></td>
<td>The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with an .alg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>tablespace_file_name</td>
<td>The name of the datafile for the tablespace being imported. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>converted_file_name</td>
<td>If the datafile_platform parameter is non-NULL and is different from the platform of the local import database, then specify a file name for the converted datafile. The datafile is converted to the platform of the local import database and copied to the new file name. The existing datafile is not modified nor deleted. If non-NULL and the datafile_platform parameter is NULL, then the procedure ignores this parameter. If non-NULL and the datafile_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter. If NULL and the datafile_platform parameter is non-NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
**ATTACH_SIMPLE_TABLESPACE Procedure**

**Usage Notes**

To run this procedure, a user must meet the following requirements:

- Have **IMP_FULL_DATABASE** role
- Have **READ** and **WRITE** privilege on the directory object that contains the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the **directory_object** parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

**See Also:** Overview on page 164-3

---

**Table 164–3 (Cont.) ATTACH_SIMPLE_TABLESPACE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>datafile_platform</td>
<td>Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the current import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Contains the name of the attached tablespace. The attached tablespace is read-only. Use an ALTER TABLESPACE statement to make the tablespace read/write if necessary.</td>
</tr>
</tbody>
</table>
**ATTACH_TABLESPACES Procedure**

This procedure uses Data Pump to import a self-contained tablespace set previously exported using the `DBMS_STREAMS_TABLESPACE_ADM` package, Data Pump export, or the Recovery Manager (RMAN) `TRANSPORT TABLESPACE` command.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump import to complete the attach operation. In addition, if the platform at the export database is different than the local database platform, then this procedure optionally can create datafiles for the tablespace set that can be used with the local platform.

- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump import is performed. This version of the procedure uses the files in a file group version and can copy the export dump file, export log file, and the datafiles that comprise the tablespace set into the specified directories. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a datafiles platform specification if the platform at the export database is different than the local database platform. Instead, the tablespace set is migrated automatically to the correct platform when it is attached.

**Syntax**

```sql
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
    datapump_job_name          IN OUT VARCHAR2,
    dump_file                  IN     FILE,
    tablespace_files           IN     FILE_SET,
    converted_files            IN     FILE_SET,
    datafiles_platform         IN     VARCHAR2  DEFAULT NULL,
    log_file                   IN     FILE      DEFAULT NULL,
    tablespace_names           OUT    TABLESPACE_SET);

DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
    file_group_name            IN   VARCHAR2,
    version_name               IN   VARCHAR2  DEFAULT NULL,
    datafiles_directory_object IN   VARCHAR2  DEFAULT NULL,
    logfile_directory_object   IN   VARCHAR2  DEFAULT NULL,
    repository_db_link         IN   VARCHAR2  DEFAULT NULL,
    tablespace_names           OUT  TABLESPACE_SET);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
</tbody>
</table>
### Table 164–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dump_file</td>
<td>The file name of the Data Pump dump file to import.</td>
</tr>
<tr>
<td></td>

<td>You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
<tr>
<td>log_file</td>
<td>Specify the log file name for the Data Pump import.</td>
</tr>
<tr>
<td></td>
<td>If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .alg and places it in the Data Pump export dump file directory.</td>
</tr>
<tr>
<td></td>
<td>If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td>file_group_name</td>
<td>The name of the file group, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>version_name</td>
<td>The name of the file group version to attach.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the version with the latest creation time for the file group.</td>
</tr>
</tbody>
</table>
Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

Usage Notes

The following sections contain usage notes for this procedure:

- User Requirements
- Procedures Used to Clone or Detach a Tablespace Set
- When the Attach Database Is Different Than the Clone or Detach Database
- Automatic Storage Management Directories

See Also:

- Overview on page 164-3
- Oracle Streams Concepts and Administration

User Requirements

To run either version of this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role
ATTACH_TABLESPACES Procedure

- Have READ and WRITE privilege on the directory objects that contain the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the dump_file and tablespace_files parameters, or by the datafiles_directory_object parameter.

- Have WRITE privilege on the directory object that will hold the Data Pump import log file, specified by the log_file parameter or logfile_directory_object parameter if it is non-NULL.

If the Data Pump job version of the procedure is run, then the user must have WRITE privilege on the directory objects that will hold the converted datafiles for the tablespaces in the set if platform conversion is necessary. These directory objects are specified by the converted_files parameter if it is non-NULL.

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Procedures Used to Clone or Detach a Tablespace Set

After a tablespace set is cloned or detached using the CLONE_TABLESPACES or DETACH_TABLESPACES procedure, respectively, the tablespace set can be attached to a database using the ATTACH_TABLESPACES procedure. If the Data Pump job version of the CLONE_TABLESPACES or DETACH_TABLESPACES procedure was used, then use the Data Pump job version of the ATTACH_TABLESPACES procedure. If the file group version of the CLONE_TABLESPACES or DETACH_TABLESPACES procedure was used, then use the file group version of the ATTACH_TABLESPACES procedure.

See Also:

- CLONE_TABLESPACES Procedure on page 164-20
- DETACH_TABLESPACES Procedure on page 164-26

When the Attach Database Is Different Than the Clone or Detach Database

You can attach a tablespace set to a different database than the database from which the tablespace set was cloned or detached. The two databases might or might not share a file system. If the two databases do not share a file system, then you must transfer the dump file and datafiles to the remote system using the DBMS_FILE_TRANSFER package, FTP, or some other method. You can attach the tablespace set in one of the following ways depending on the version of the ATTACH_TABLESPACES procedure you use:

- If you use the Data Pump job version of the procedure, then specify the relevant files on the file system. The directory object names can be different in the databases.

- If you use the file group version of the procedure, then you can use the repository_db_link parameter to specify the database where tablespace repository resides. The directory objects for the files must exist and must match in the databases.

See Also:

- CLONE_TABLESPACES Procedure on page 164-20
- DETACH_TABLESPACES Procedure on page 164-26
- Chapter 68, "DBMS_FILE_GROUP" for more information about file groups
Automatic Storage Management Directories

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

See Also: Oracle Database Utilities for information about specifying ASM directories for directory objects
CLONE_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace. The specified tablespace must be online. Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the specified directory
3. Places the datafile for the specified tablespace in the specified directory
4. If this procedure made the tablespace read-only, then makes the tablespace read/write

In addition, this procedure optionally can create a datafile for the tablespace that can be used with a platform that is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_SIMPLE_TABLESPACE(
  tablespace_name      IN  VARCHAR2,
  directory_object     IN  VARCHAR2,
  destination_platform IN  VARCHAR2  DEFAULT NULL,
  tablespace_file_name OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The tablespace to be cloned.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>directory_object</td>
<td>The directory where the Data Pump export dump file, the Data Pump export log file, and the datafile for the tablespace are placed. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.</td>
</tr>
<tr>
<td></td>
<td>The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file exists with the same name as the dump file in the directory, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>The name of the log file is the same as the data file name for the tablespace, except with a .clg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>destination_platform</td>
<td>Specify NULL if the platform is the same for the current export database and the intended import database.</td>
</tr>
<tr>
<td></td>
<td>Specify the platform for the intended import database if the platform is different for the export database and the import database.</td>
</tr>
<tr>
<td></td>
<td>You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
</tbody>
</table>
To run this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `directory_object` parameter.
- If the file group version of the procedure is run, then the user must have the necessary privileges to manage file group.

After cloning a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

**Usage Notes**

To run this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `directory_object` parameter.
- If the file group version of the procedure is run, then the user must have the necessary privileges to manage file group.

After cloning a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

  and `PULL_SIMPLE_TABLESPACE Procedure` on page 164-30
CLONE_TABLESPACES Procedure

This procedure clones a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set and places the dump file in the specified directory
3. Places the datafiles that comprise the specified tablespace set in the specified directory
4. If this procedure made a tablespace read-only, then makes the tablespace read/write

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the specified directories, but the files are not added to a file group version. In addition, this version of the procedure optionally can create datafiles for the tablespace set that can be used with a platform that is different than the local database platform.

- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the appropriate file group version. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a destination platform specification if the destination platform is different. Instead, the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the `ATTACH_TABLESPACES` procedure.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
  datapump_job_name IN OUT VARCHAR2,
  tablespace_names IN TABLESPACE_SET,
  dump_file IN FILE,
  tablespace_directory_objects IN DIRECTORY_OBJECT_SET,
  destination_platform IN VARCHAR2 DEFAULT NULL,
  log_file IN FILE DEFAULT NULL,
  tablespace_files OUT FILE_SET);

DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
  tablespace_names IN TABLESPACE_SET,
  tablespace_directory_object IN VARCHAR2 DEFAULT NULL,
  log_file_directory_object IN VARCHAR2 DEFAULT NULL,
  file_group_name IN VARCHAR2,
  version_name IN VARCHAR2 DEFAULT NULL,
  repository_db_link IN VARCHAR2 DEFAULT NULL);
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>The tablespace set to be cloned. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>dump_file</td>
<td>The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file exists, then the procedure raises an error.</td>
</tr>
<tr>
<td>tablespace_directory_objects</td>
<td>The set of directory objects into which the datafiles for the tablespaces are copied. If multiple directory objects are in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure copies datafiles for the tablespace set to the dump file directory.</td>
</tr>
<tr>
<td>destination_platform</td>
<td>Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</td>
</tr>
<tr>
<td>log_file</td>
<td>Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .clg and places it in the dump file directory. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
</tbody>
</table>
The directory object into which the data files are copied and Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp. If NULL, then the procedure copies the datafiles to and places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group.

If NULL and no default directory object exists for the version or file group, then the procedure raises an error.

The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .clg. If NULL, then the procedure uses the directory object specified in `tablespace_directory_object`.

The name of the file group, specified as `[schema_name.]file_group_name`. For example, if the schema is `hq_dba` and the file group name is `sales`, then specify `hq_dba.sales`. If the schema is not specified, then the current user is the default. If the specified file group does not exist, then the procedure creates it.

The name of the version into which the cloned tablespace set is placed. The specified version name cannot be a positive integer. If the specified version does not exist, then the procedure creates it. If the specified version exists, then the procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version.

If NULL, then the procedure creates a new version, and the version number can be used to manage the version.

If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure.

If this parameter is non-NULL, then the directory object specified in `tablespace_directory_object` must exist on the local database and on the remote database. If `tablespace_directory_object` is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system.

If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.

Contains the datafiles for the cloned tablespace set. These datafiles are placed in the directories specified by the directory objects in the parameter `tablespace_directory_objects`.
Usage Notes

To run either version of this procedure, a user must meet the following requirements:

- Have **EXP_FULL_DATABASE** role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include **DBA_TABLESPACES** and **USER_TABLESPACES**.
- Have **MANAGE_TABLESPACE** or **ALTER TABLESPACE** on a tablespace if the tablespace must be made read-only
- Have **READ** privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the **tablespace_names** parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have **READ** and **WRITE** privilege on the directory object that will contain the Data Pump export dump file, specified by the **dump_file** parameter or the **tablespace_directory_object** parameter
- Have **WRITE** privilege on the directory objects that will contain the copied datafiles for the tablespaces in the set, specified by the **tablespace_directory_objects** parameter if non-NULL or the **tablespace_directory_object** parameter
- Have **WRITE** privilege on the directory object that will contain the Data Pump export log file, specified by the **log_file** parameter if non-NULL or the **log_file_directory_object** parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After cloning a tablespace set using this procedure, you can attach the tablespaces to a different database using the **ATTACH_TABLESPACES** procedure.

See Also:

DETACH_SIMPLE_TABLESPACE Procedure

This procedure detaches a simple tablespace. The specified tablespace must be online. Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the directory that contains the tablespace datafile
3. Drops the tablespace and its contents from the database

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.DETACH_SIMPLE_TABLESPACE(
    tablespace_name       IN  VARCHAR2,
    directory_object      OUT VARCHAR2,
    tablespace_file_name  OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>directory_object</td>
<td>Contains the directory where the Data Pump export dump file and the Data Pump export log file are placed. The procedure uses the directory of the datafile for the tablespace. Therefore, make sure a directory object created using the SQL statement CREATE DIRECTORY exists for this directory. The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the data file name for the tablespace, except with a .dlg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td>tablespace_file_name</td>
<td>Contains the name of the detached tablespace datafile.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ and WRITE privilege on the directory object for the directory that contains the tablespace datafile. The name of this tablespace is specified by the tablespace_name parameter. If a directory object does not exist for this directory,
then create the directory object and grant the necessary privileges before you run this procedure. This directory also will contain the Data Pump export dump file generated by this procedure.

After detaching a tablespace using this procedure, you can add the tablespace to a different database using the ATTACH_SIMPLE_TABLESPACE procedure. If the database is a remote database and you want to use the ATTACH_SIMPLE_TABLESPACE procedure, then you can transfer the dump file and datafile to the remote system using the DBMS_FILE_TRANSFER package, FTP, or some other method. You can use the two OUT parameters in this procedure to accomplish the attach or pull operation.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

**Note:** Do not use the DETACH_SIMPLE_TABLESPACE procedure on a tablespace if the tablespace is using the Oracle-managed files feature. If you do, then the datafile for the tablespace is dropped automatically when the tablespace is dropped.

**See Also:**
- **Overview** on page 164-3
- **ATTACH_SIMPLE_TABLESPACE Procedure** on page 164-11 and **PULL_SIMPLE_TABLESPACE Procedure** on page 164-30
- *Oracle Database Administrator’s Guide* for more information about the Oracle-managed files feature
DETACH_TABLESPACES Procedure

This procedure detaches a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online and any table partitions must not span tablespaces in the tablespace set.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespace set and places the dump file in the specified directory
3. Drops the tablespaces in the specified tablespace set and their contents from the database

This procedure does not move or copy the datafiles that comprise the specified tablespace set.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the detach operation by placing the export dump file and export log file in the specified directories, but the files are not added to a file group version.

- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the detach operation by placing the export dump file and export log file in the appropriate file group version. The datafiles that comprise the tablespace set are not moved or copied, but they are referenced in the version that is detached. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. Also, if the destination platform is different, then the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the ATTACH_TABLESPACES procedure.

Note: Do not use the DETACH_TABLESPACES procedure if any of the tablespaces in the tablespace set are using the Oracle-managed files feature. If you do, then the datafiles for these tablespaces are dropped automatically when the tablespaces are dropped.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
  datapump_job_name         IN OUT VARCHAR2,
  tablespace_names          IN     TABLESPACE_SET,
  dump_file                 IN     FILE,
  log_file                  IN     FILE  DEFAULT NULL,
  tablespace_files          OUT    FILE_SET);

DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
  tablespace_names          IN TABLESPACE_SET,
  export_directory_object   IN VARCHAR2  DEFAULT NULL,
  log_file_directory_object IN VARCHAR2  DEFAULT NULL,
  file_group_name           IN VARCHAR2,
```
version_name IN VARCHAR2 DEFAULT NULL,
repository_db_link IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_pump_job_name</td>
<td>The Data Pump job name. Specify a Data Pump job name to adhere to naming conventions or to track the job more easily. If NULL, then the system generates a Data Pump job name.</td>
</tr>
<tr>
<td>tablespace_names</td>
<td>The tablespace set to be detached. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>dump_file</td>
<td>The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file exists, then the procedure raises an error.</td>
</tr>
<tr>
<td>log_file</td>
<td>Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .dlg and places it in the dump file directory. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td>tablespace_files</td>
<td>Contains the names of the datafiles for the detached tablespace set.</td>
</tr>
<tr>
<td>export_directory_object</td>
<td>The directory object into which the Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp. If NULL, then procedure places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group. If NULL and no default directory object exists for the version or file group, then the procedure raises an error.</td>
</tr>
<tr>
<td>log_file_directory_object</td>
<td>The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .dlg. If NULL, then the procedure places the export log file in the same directory as the export dump file.</td>
</tr>
<tr>
<td>file_group_name</td>
<td>The name of the file group, specified as [schema_name].[file_group_name]. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default. If the specified file group does not exist, then the procedure creates it.</td>
</tr>
</tbody>
</table>
Usage Notes

To run this either version of this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `DROP TABLESPACE` privilege
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the `tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `dump_file` parameter or the `export_directory_object` parameter
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-NULL or by the `log_file_directory_object` parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.
Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After detaching a tablespace set using this procedure, you can attach the tablespaces to a different database using the ATTACH_TABLESPACES procedure.

See Also:

- Overview on page 164-3
- ATTACH_TABLESPACES Procedure on page 164-13

- Oracle Streams Concepts and Administration
- Oracle Database Administrator’s Guide for more information about the Oracle-managed files feature
PULL_SIMPLE_TABLESPACE Procedure

This procedure copies a simple tablespace from a remote database and attaches it to the current database. The specified tablespace at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only at the remote database if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace
3. Uses a database link and the DBMS_FILE_TRANSFER package to transfer the datafile for the tablespace and the log file for the Data Pump export to the current database
4. Places the datafile for the specified tablespace and the log file for the Data Pump export in the specified directory at the local database
5. If this procedure made the tablespace read-only, then makes the tablespace read/write
6. Uses Data Pump to import the metadata for the tablespace in the local database

In addition, this procedure optionally can create a datafile for the tablespace that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_SIMPLE_TABLESPACE(
    tablespace_name          IN VARCHAR2,
    database_link            IN VARCHAR2,
    directory_object         IN VARCHAR2  DEFAULT NULL,
    conversion_extension     IN VARCHAR2  DEFAULT NULL,
    convert_directory_object IN VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The tablespace to be pulled. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>database_link</td>
<td>The name of the database link to the database that contains the tablespace to pull. The database link must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>directory_object</td>
<td>The directory object to which the datafile for the tablespace is copied on the local database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with a .plg extension. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the `EXP_FULL_DATABASE` role
- Have `EXECUTE` privilege on the `DBMS_STREAMS_TABLESPACE_ADM` package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` privilege on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles `IMP_FULL_DATABASE` and `EXECUTE_CATALOG_ROLE`
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-NULL
- Have `WRITE` privilege on the directory object that will hold the datafile for the tablespace, specified by the `directory_object` parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also: Overview on page 164-3
PULL_TABLESPACES Procedure

This procedure copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database. All of the tablespaces in the specified tablespace set at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set at the remote database read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set
3. Uses a database link and the DBMS_FILE_TRANSFER package to transfer the datafiles for the tablespace set and the log file for the Data Pump export to the current database
4. Places the datafiles that comprise the specified tablespace set in the specified directories at the local database
5. Places the log file for the Data Pump export in the specified directory at the local database
6. If this procedure made a tablespace read-only, then makes the tablespace read/write
7. Uses Data Pump to import the metadata for the tablespaces in the tablespace set at the local database

In addition, this procedure optionally can create datafiles for the tablespace set that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```sql
DBMS_STREAMS_TABLESPACE_ADM.PULL_TABLESPACES(
  datapump_job_name            IN OUT VARCHAR2,
  database_link                IN     VARCHAR2,
  tablespace_names             IN     TABLESPACE_SET,
  tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
  log_file                     IN     FILE,
  conversion_extension         IN     VARCHAR2  DEFAULT NULL,
  convert_directory_object     IN     VARCHAR2  DEFAULT NULL);
```

Parameters

**Table 164–10  PULL_TABLESPACES Procedure Parameters**

<table>
<thead>

</tbody>
</table>
### Table 164-10 (Cont.) PULL_TABLESPACES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tablespace_names</code></td>
<td>The tablespace set to be pulled. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>tablespace_directory_objects</code></td>
<td>The set of directory objects to which the datafiles for the tablespaces are copied. If multiple directory objects are in the set, then the procedure copies a datafile to each directory object in the set sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>log_file</code></td>
<td>Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .plg and places it in one of the data file directories. If a file exists with the same name as the log file in the directory, then the procedure overwrites the file.</td>
</tr>
<tr>
<td><code>conversion_extension</code></td>
<td>Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafiles that is different than the extension for the tablespace datafiles at the remote database. In this case, the procedure transfers the datafiles to the import database and converts them to be compatible with the current import database platform automatically. After conversion is complete, the original datafiles are deleted at the import database.</td>
</tr>
<tr>
<td><code>convert_directory_object</code></td>
<td>Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code>.</td>
</tr>
</tbody>
</table>

### Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the `EXP_FULL_DATABASE` role
- Have `EXECUTE` privilege on the `DBMS_STREAMS_TABLESPACE_ADM` package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE_TABLESPACE` or `ALTER TABLESPACE` privilege on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the `tablespace_names` parameter. If a directory object does not exist for one or more of
these directories, then create the directory objects and grant the necessary
privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local
database:

■ Have the roles IMP_FULL_DATABASE and EXECUTE_CATALOG_ROLE
■ Have WRITE privilege on the directory object that will contain the Data Pump
export the log file, specified by the log_file parameter if non-NULL
■ Have WRITE privilege on the directory objects that will hold the datafiles for the
tablespaces in the set, specified by the tablespace_directory_objects parameter

Automatic Storage Management (ASM) directories can be specified for the directory
objects that store datafiles and export dump files, but ASM directories cannot be
specified for directory objects that store log files.

The DBMS_SYNC_REFRESH package provides an interface to perform a synchronous refresh of materialized views.

See Also: Oracle Database Data Warehousing Guide for more information on using DBMS_SYNC_REFRESH

This chapter contains the following topics:

- Using DBMS_SYNC_REFRESH
  - Overview
  - Security Model
- Summary of DBMS_SYNC_REFRESH Subprograms
Using DBMS_SYNC_REFRESH

- Overview
- Security Model
Overview

Synchronous refresh is a refresh method introduced in Oracle Database Release 12c, which enables you to keep a set of tables and the materialized views defined on them to be always in sync.

See Also: Oracle Database Data Warehousing Guide for more information about using synchronous refresh
Security Model

The execute privilege for this package is granted to PUBLIC, so all users can execute the procedures in this package to perform synchronous refresh on objects owned by them. The database administrator can perform synchronous refresh operations on all tables and materialized views in the database.

In general, if a user without the DBA privilege wants to use synchronous refresh on another user’s table, he must complete privileges to read from and write to that table, that is, the user must have the SELECT or READ, INSERT, UPDATE, and DELETE privileges on that table or materialized view. A couple of exceptions are:

- **P URGE_REFRESH_STATS and ALTER_REFRESH_STATS_RETENTION Functions**
  These two functions implement the purge policy and can be used to change the default retention period. These functions can be only be executed by the database administrator.

- **The CAN_SYNCREF_TABLE Function**
  This is an advisory function which examines the eligibility for sync refresh of all the materialized views associated with a specified table. Hence, this function requires the SELECT or READ privilege on all materialized views associated with the specified table.
### Summary of DBMS_SYNC_REFRESH Subprograms

<table>

</tr>
</tbody>
</table>
ABORT_REFRESH Procedure

This procedure undoes all the changes made by PREPARE_REFRESH or EXECUTE_REFRESH for the specified sync refresh groups. It helps you to recover to a state where the tables and materialized views are usable and consistent in case they encounter unexpected errors.

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.ABORT_REFRESH (group_id IN NUMBER);

DBMS_SYNC_REFRESH.ABORT_REFRESH (group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_id</td>
<td>The group ID of a sync refresh group.</td>
</tr>
<tr>
<td>group_id_list</td>
<td>An array of group IDs of the sync refresh groups to be aborted for sync refresh.</td>
</tr>
</tbody>
</table>

Usage Notes

If called after PREPARE_REFRESH, this procedure drops the outside tables created by it and unlocks the tables and materialized views in the sync refresh group.

If called after EXECUTE_REFRESH fails, this procedure restores the state of tables to before EXECUTE_REFRESH by undoing any partition exchanges which successfully finished.

This procedure releases the locks placed on the tables in the sync refresh group which were placed on them by the PREPARE_REFRESH procedure. See "PREPARE_REFRESH Procedure" on page 165-14 for a description of these locks.

ABORT_REFRESH will work only if a PREPARE_REFRESH or EXECUTE_REFRESH statement has failed. It cannot be used after successful runs of those commands, and throws an error in such cases.
**ALTER_REFRESH_STATS_RETENTION Procedure**

This procedure alters the refresh history retention value, specified in days. It is intended for use in conjunction with `PURGE_REFRESH_HISTORY`. It also requires the `SYSDBA` privilege in addition to the privilege to execute it.

**Syntax**

```sql
DBMS_SYNC_REFRESH.ALTER_REFRESH_STATS_RETENTION (
    retention IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>The retention time in days. The refresh history will be retained for at least these many number of days. The valid range is 1 to 365,000. You can use the following values for special purposes:</td>
</tr>
<tr>
<td></td>
<td>-1 - Refresh history is never purged by <code>PREPARE_REFRESH</code>.</td>
</tr>
<tr>
<td></td>
<td>0 - Old refresh history is never saved. <code>PREPARE_REFRESH</code> will delete all refresh history.</td>
</tr>
<tr>
<td></td>
<td>NULL - Change refresh history retention to default value.</td>
</tr>
</tbody>
</table>
CAN_SYNCREF_TABLE Procedure

This procedure advises on whether a table and its dependent materialized views are eligible for sync refresh. It provides an explanation of its analysis. If not eligible, you can examine the reasons and take appropriate action if possible.

This procedure lists all of the table's dependent materialized views and whether they qualify for sync refresh. Note that a materialized view may qualify for sync refresh even though the base table may not.

The eligibility rules for materialized views for synchronous refresh are discussed in detail in Oracle Database Data Warehousing Guide.

You can invoke CAN_SYNCREF_TABLE in two ways. The first is to use a table, while the second is to create a VARRAY.

Syntax

```sql
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (  
    schema_name    IN VARCHAR2,  
    table_name     IN VARCHAR2,  
    statement_id   IN VARCHAR2);
```

```sql
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (  
    schema_name    IN VARCHAR2,  
    table_name     IN VARCHAR2,  
    output_array   IN OUT Sys.CanSyncRefTypeArray);
```

Note that only one of statement_id or output_array need be provided to CAN_SYNCREF_TABLE.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema of the base table.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the base table.</td>
</tr>
<tr>
<td>statement_id</td>
<td>A string (VARCHAR2(30)) to identify the rows pertaining to an invocation of CAN_SYNCREF_TABLE when the output is directed to a table named SYNCREF_TABLE in the user's schema.</td>
</tr>
<tr>
<td>output_array</td>
<td>The output array into which CAN_SYNCREF_TABLE records the information on the eligibility of the base table and its dependent materialized views for synchronous refresh.</td>
</tr>
</tbody>
</table>

Using SYNCREF_TABLE

The output of CAN_SYNCREF_TABLE can be directed to a table named SYNCREF_TABLE. The user is responsible for creating the SYNCREF_TABLE; it can be dropped when it is no longer needed. Its structure is as follows:

```sql
CREATE TABLE SYNCREF_TABLE (  
    statement_id VARCHAR2(30),  
    schema_name  VARCHAR2(30),  
    table_name   VARCHAR2(30),  
    mv_schema_name VARCHAR2(30),  
    mv_name      VARCHAR2(30),
);```
Using a VARRAY

You can save the output of CAN_SYNCREF_TABLE in a PL/SQL VARRAY. The elements of this array are of type CanSyncRefMessage, which is predefined in the SYS schema, as shown in the following:

```
TYPE CanSyncRefMessage IS OBJECT (
   schema_name VARCHAR2(30),
   table_name VARCHAR2(30),
   mv_schema_name VARCHAR2(30),
   mv_name VARCHAR2(30),
   eligible VARCHAR2(1),
   seq_num NUMBER,
   msg_number NUMBER,
   message VARCHAR2(4000));
```

The array type CanSyncRefArrayType, which is a varray of CanSyncRefMessage objects, is predefined in the SYS schema as follows:

```
TYPE CanSyncRefArrayType AS VARRAY(256) OF CanSyncRefMessage;
```

Each CanSyncRefMessage record provides a message concerning the eligibility of the base table or a dependent materialized view for synchronous refresh. The semantics of the fields is the same as that of the corresponding fields in the SYNCREF_TABLE. However, the SYNCREF_TABLE has a statement_id field which is absent in CanSyncRefMessage because no statement_id is supplied (because it is not required) when CAN_SYNCREF_TABLE is called with a VARRAY parameter.
EXECUTE_REFRESH Procedure

This procedure executes sync refresh on the sync refresh groups prepared by \texttt{DBMS\_SYNC\_REFRESH.PREPARE\_REFRESH}. These groups are identified by their group IDs. Note this procedure will only perform the refresh on those materialized views that have been registered for synch refresh; any other materialized views will become stale once this procedure completes.

For more information on how to monitor the status of the two synchronous refresh operations, \texttt{PREPARE\_REFRESH} and \texttt{EXECUTE\_REFRESH} and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in \textit{Oracle Database Data Warehousing Guide}.

This procedure is overloaded.

Syntax

\begin{verbatim}
DBMS\_SYNC\_REFRESH.EXECUTE\_REFRESH  
  (  
    group_id IN NUMBER);  

DBMS\_SYNC\_REFRESH.EXECUTE\_REFRESH  
  (  
    group_id_list IN DBMS\_UTILITY.NUMBER\_ARRAY);  
\end{verbatim}

Parameters

\begin{table}[h]
\centering
\begin{tabular}{|l|p{6in}|}
\hline
\textbf{Parameter} & \textbf{Description} \\
\hline
\texttt{group_id} & The group ID of a sync refresh group. \\
\texttt{group_id_list} & An array of group IDs of the sync refresh groups to be executed for sync refresh. \\
\hline
\end{tabular}
\caption{EXECUTE_REFRESH Procedure Parameters}
\end{table}

Usage Notes

This procedure also releases the locks placed on the tables in the sync refresh group that were placed on them by the \texttt{PREPARE\_REFRESH} procedure. See "\textit{PREPARE\_REFRESH Procedure}" on page 165-14 for a description of these locks and \textit{Oracle Database Reference} for information regarding the status of the refresh operation after \texttt{DBMS\_SYNC\_REFRESH.EXECUTE\_REFRESH}. 
**GET_ALLGROUP_IDS Function**

This function returns the group IDs of all the sync refresh groups in the database.

**Syntax**

```sql
FUNCTION DBMS_SYNC_REFRESH.GET_ALL_GROUP_IDS
    RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get_all_group_ids</td>
<td>Returns the group IDs of all the sync refresh groups in the database.</td>
</tr>
</tbody>
</table>
GET_GROUP_ID Function

This function returns the group ID of a materialized view. The group ID identifies the sync refresh group the table belongs to. A sync refresh group is a group of related tables and their dependent materialized views which must be all refreshed together jointly to ensure consistency and correctness.

Syntax

```sql
DBMS_SYNC_REFRESH.GET_GROUP_ID (object_name_list IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name_list</td>
<td>The name of the materialized view. The name can be schema-qualified.</td>
</tr>
</tbody>
</table>
GET_GROUP_ID_LIST Function

This function returns the group IDs of the tables in a given list of objects (materialized views).

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID_LIST (
    object_name_list   IN VARCHAR2
) RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name_list</td>
<td>A comma-separated list of object names (materialized views).</td>
</tr>
<tr>
<td></td>
<td>Each name can be schema-qualified.</td>
</tr>
</tbody>
</table>
PREPARE_REFRESH Procedure

This procedure prepares for refresh the sync refresh groups identified by the group ID in the input. A sync refresh group consists of a set of related tables and all materialized views dependent on those base tables. Note this procedure will only prepare for refresh those dependent materialized views that have been registered for synchronous refresh.

For more information on how to monitor the status of the two synchronous refresh operations, PREPARE_REFRESH and EXECUTE_REFRESH and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in Oracle Database Data Warehousing Guide.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_REFRESH (  
group_id IN NUMBER)  
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_id</td>
<td>The group ID of the sync refresh group to be prepared for sync refresh.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure plans the three phases of the sync refresh operation and executes the steps associated with the prepare phase itself. These steps include identifying the partitions of the fact tables and materialized views that have been changed, and computing their new values as a result of the changes. The new values of the partitions are stored in tables called outside tables that are exchanged into their corresponding partitions at the time of the EXECUTE_REFRESH.

Before running this procedure, the user must run PREPARE_STAGING_LOG on all tables in the group. This is required even for staging logs that do not have changes in them. The user must also register any partition operations on the tables in the group using the REGISTER_PARTITION_OPERATION.

One of the side effects of this procedure is that the tables being prepared are locked in this sense: the staging logs of the tables will be locked to prevent any DMLs from occurring and the registration of partition operations will be disabled. These locks will be in effect until you issue an EXECUTE_REFRESH statement. Alternatively, you can issue an ABORT_REFRESH operation to release these locks. Another side effect of this procedure is that it purges from the catalog records of earlier sync refresh operations; if they are older than the retention period, they are purged.

The degree of parallelism of the prepare refresh job is inherited from the session parameters which you can control with an ALTER SESSION statement.

The group ID of a table can be found using GET_GROUP_ID(table_name). The group IDs of a list of tables can be found with GET_GROUP_ID_LIST(table_name_list). The group IDs of all the lists of tables can be retrieved with GET_ALL_GROUP_IDS.

By default, synchronous refresh does not maintain global indexes belonging to the tables and materialized views in the sync refresh group. If you wish to do so, you can
set event 31904, level 64 before executing PREPARE_REFRESH. This will cause the partition exchange DDL statements generated by PREPARE_REFRESH to have the UPDATE INDEXES clause appended to them, and when they are executed by EXECUTE_REFRESH, the global indexes will be maintained.
PREPARE_STAGING_LOG Procedure

This procedure collects statistics on the data in the staging log of the base table and validates the data in the log. It can be run in several different modes ranging from the enforced mode in which strict checking of the data is done to trusted mode in which no checking is done. You should run this procedure after loading the staging log and before running PREPARE_REFRESH.

In the enforced mode, which is the default, this procedure will fill in the missing values of the columns of the rows being deleted or updated. An error is thrown if any violations of the staging-log rules are found. You can query the view USER_SR_STLOG_EXCEPTIONS to get details on the exceptions.

The notion of the staging log key is described in Oracle Database Data Warehousing Guide.

In the enforced mode, this procedure processes each delete/update row in the staging log as follows:

- It verifies the existence of the row in the base table using the key.
- For the rows being deleted (DMLTYPE$ is 'D'), it verifies a row with this key exists in the base table; if non-null non-key values are supplied in the staging log, it verifies the values match the corresponding columns in the base table; else an exception is logged in the exceptions table. If the values of any of the non-key columns are missing, it fills in those values from the row in the base table.
- For the rows being updated (DMLTYPE$ is 'UO' or 'UN'), it verifies a row with this key exists in the base table. In the old values row (DMLTYPE$ is 'UO'), it makes the same check and does the same processing as with rows being deleted. In the new values row (DMLTYPE$ is 'UN'), it checks that at least the value of one the columns differs from its old value; else an exception is logged.
- In the new values row (DMLTYPE$ is 'UN'), a null value in a column is interpreted as having the same value as the old value of the column except if the old value is non-null and the new value is null in which case, the new value of the column is interpreted as being null. This requires that the user must provide the old value of columns which are being updated to NULL.

In the default enforced mode, this procedure verifies that each key is specified for at most once for a delete or update operation. This means that the user, when doing the change consolidation, must consolidate delete-insert of the same row into an update operation with rows 'UO' and 'UN'; multiple updates must be consolidated into a single update; and null changes such as an insert-update-delete of the same row must not appear in the staging log.

The checking done in the enforced mode can be time-consuming. If you are confident in the integrity of the data, you can choose a lower level of checking. You can choose to:

- trust all the insert rows (DMLTYPE$ is 'I') by choosing the psl_mode of DBMS_SYNC_REFRESH.INSERT_TRUSTED
- trust all the delete rows (DMLTYPE$ is 'D') by choosing the psl_mode of DBMS_SYNC_REFRESH.DELETE_TRUSTED
- trust all the update rows (DMLTYPE$ is 'UO' or 'UN') by choosing the psl_mode of DBMS_SYNC_REFRESH.UPDATE_TRUSTED
- trust all three types of DMLs by choosing the psl_mode of DBMS_SYNC_REFRESH.TRUSTED.
In addition, you can specify the `psl_mode` as a bitmask of the flags described above. For example, `DBMS_SYNC_REFRESH.INSERT_TRUSTED + DBMS_SYNC_REFRESH.DELETE_TRUSTED` will treat inserts and deletes to be trusted but not updates.

**Syntax**

```sql
DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG (
    schema_name      IN VARCHAR2,
    base_table_name  IN VARCHAR2,
    psl_mode         IN NUMBER DEFAULT
                     DBMS_SYNC_REFRESH.ENFORCED);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schema_name</code></td>
<td>The name of the schema of the base table.</td>
</tr>
<tr>
<td><code>base_table_name</code></td>
<td>The name of the base table.</td>
</tr>
<tr>
<td><code>psl_mode</code></td>
<td>The mode in which staging log preparation should be done. The possible values are:</td>
</tr>
<tr>
<td></td>
<td><code>DBMS_SYNC_REFRESH.ENFORCED</code> (the default)</td>
</tr>
<tr>
<td></td>
<td><code>DBMS_SYNC_REFRESH.INSERT_TRUSTED</code></td>
</tr>
<tr>
<td></td>
<td><code>DBMS_SYNC_REFRESH.DELETE_TRUSTED</code></td>
</tr>
<tr>
<td></td>
<td><code>DBMS_SYNC_REFRESH.UPDATE_TRUSTED</code></td>
</tr>
<tr>
<td></td>
<td><code>DBMS_SYNC_REFRESH.TRUSTED</code></td>
</tr>
</tbody>
</table>
PURGE_REFRESH_STATS Procedure

This procedure purges the refresh history of sync refreshes that took place before the value specified by the BEFORE_TIMESTAMP parameter. This procedure requires the SYSDBA privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.PURGE_REFRESH_STATS (
    before_timestamp IN TIMESTAMP WITH TIME ZONE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>before_timestamp</td>
<td>Records of sync refreshes saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than (current time - refresh - history retention). The refresh history retention value can be changed using ALTER_REFRESH_STATS_RETENTION. The default is 31 days.</td>
</tr>
</tbody>
</table>
REGISTER_MVIEWS

This procedure registers a list of materialized views for synchronous refresh. It checks each materialized view in the list for eligibility and places it in the sync refresh group it belongs to. A sync refresh group is a set of related tables and materialized views defined on top of them. Two tables are considered related if there is a referential constraint between them.

The eligibility rules of materialized views for synchronous refresh are described in detail in Oracle Database Data Warehousing Guide. The principal requirements are that the materialized view must be partitioned and its partition key must be derivable from the partition key of its fact table. The materialized view definition must specify the USING TRUSTED CONSTRAINTS clause because sync refresh trusts the foreign key and primary key relationships to perform various refresh optimizations. The materialized view’s refresh policy must be specified as ON DEMAND.

You have an option to register only some of the materialized views associated with a table, and leave some unregistered. Oracle Corporation does not recommend this, and in such a case, the user has to maintain the unregistered ones using the PCT or complete refresh methods.

A staging table must have been created for each base table of each materialized view in the materialized view list (mv_list), or else an error is thrown.

If any of the materialized views are not eligible for sync refresh, an error is thrown and the registration of all materialized views in the materialized view list fails.

Syntax

```sql
DBMS_SYNC_REFRESH.REGISTER_MVIEWS (  
    mv_list   IN VARCHAR2);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mv_list</td>
<td>A comma-delimited list of materialized views to register. These names are optionally schema-qualified.</td>
</tr>
</tbody>
</table>
REGISTER_PARTITION_OPERATION Procedure

This procedure registers a partition-maintenance operation (PMOP) on a partition of a base table.

Syntax

```sql
DBMS_SYNC_REFRESH.REGISTER_PARTITION_OPERATION (  
  partition_op                IN VARCHAR2,  
  schema_name                 IN VARCHAR2,  
  base_table_name             IN VARCHAR2,  
  partition_name              IN VARCHAR2,  
  outside_partn_table_schema  IN VARCHAR2,  
  outside_partn_table_name    IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition_op</td>
<td>The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema of the base table.</td>
</tr>
<tr>
<td>base_table_name</td>
<td>The name of the base table.</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.</td>
</tr>
<tr>
<td>outside_partn_table_schema</td>
<td>The name of the schema of the outside partition table (required for EXCHANGE only).</td>
</tr>
<tr>
<td>outside_partn_table_name</td>
<td>The name of the outside partition table (required for EXCHANGE only).</td>
</tr>
</tbody>
</table>

Usage Notes

The three kinds of change operations that may be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

If DROP is specified, then the partition will be dropped from the base table at the time of EXECUTE_REFRESH. If TRUNCATE is specified, then the data from the partition will be deleted but the partition itself will not be dropped. These operations provide a more efficient way of specifying the deletes of all the rows in a partition than specifying them individually in the staging log.

If EXCHANGE is specified, then the contents of the outside table is exchanged with contents of the specified partition of EXECUTE_REFRESH. This provides an alternative method to the user of providing the changes to the base tables instead of populating the staging log.
UNREGISTER_MVIEWS

This procedure unregisters a list of materialized views from synchronous refresh. Once a materialized view is unregistered, it can be maintained by the user with any of the traditional refresh methods, such as complete or PCT, refresh.

Syntax

```sql
DBMS_SYNC_REFRESH.UNREGISTER_MVIEWS (  
    mv_list IN VARCHAR20;
)
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mv_list</td>
<td>A comma-delimited list of materialized views to unregister. These names are optionally schema-qualified.</td>
</tr>
</tbody>
</table>
UNREGISTER_PARTITION_OPERATION Procedure

This procedure unregisters a partition-maintenance operation (PMOP) that had been previously registered with REGISTER_PARTITION_OPERATION on a base table. The three kinds of change operations that can be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

Syntax

```sql
DBMS_SYNC_REFRESH.UNREGISTER_PARTITION_OPERATION (
    partition_op     IN VARCHAR2,
    schema_name      IN VARCHAR2,
    base_table_name  IN VARCHAR2,
    partition_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition_op</td>
<td>The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema of the base table.</td>
</tr>
<tr>
<td>base_table_name</td>
<td>The name of the base table.</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.</td>
</tr>
</tbody>
</table>
The **DBMS_TDB** package reports whether a database can be transported between platforms using the RMAN `CONVERT DATABASE` command. The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

**See Also:** *Oracle Database Backup and Recovery User’s Guide* regarding database transport using `CONVERT DATABASE`

This chapter contains the following topics:

- **Using DBMS_TDB**
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- **Summary of DBMS_TDB Subprograms**
Using DBMS_TDB

This section contains topics which relate to using DBMS_TDB.

- Overview
- Constants
- Views
- Operational Notes
Overview

In many cases, Oracle supports transporting databases between platforms which have
the same endian format. However, even when the endian formats are the same, a
database must undergo a conversion process to move from one platform to another.
There are also preconditions required for the process of transporting a database, such
as having the database to be transported open read-only.

The DBMS_TDB package serves two purposes:

■ Confirming that Oracle supports transporting a database from a given source
  platform to a given target platform
■ Determining whether a database to be transported has been properly prepared for
  transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager CONVERT DATABASE
command. For a complete discussion of the requirements for transporting a database,
the process of converting a database for transport across platforms, and examples of
the use of the DBMS_TDB subprograms in the conversion process, see Oracle Database
Backup and Recovery User’s Guide.
Security Model

Use of this package requires the DBA privilege.
Constants

The DBMS_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_TDB.SKIP_NONE.

The DBMS_TDB package uses the constants shown in Table 166–1.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SKIP_NONE</td>
<td>NUMBER</td>
<td>0</td>
<td>Check all files when checking whether a database is ready for transport.</td>
</tr>
<tr>
<td>SKIP_OFFLINE</td>
<td>NUMBER</td>
<td>2</td>
<td>Skip files in offline table spaces when checking whether a database is ready for transport.</td>
</tr>
<tr>
<td>SKIP_READONLY</td>
<td>NUMBER</td>
<td>3</td>
<td>Skip files in read-only table spaces when checking whether a database is ready for transport.</td>
</tr>
</tbody>
</table>
Views

The DBMS_TDB package uses the following view listed in Oracle Database Reference:

- V$DB_TRANSPORTABLE_PLATFORM, which specifies which combinations of source and target platforms support database transport
Operational Notes

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User’s Guide* for details on the different uses of these subprograms are used in the conversion process.

- The subprograms in this package return simple `TRUE` or `FALSE` results to indicate whether database transport is possible. Use the subprograms with `SERVEROUTPUT ON` for informative messages about why transport is not possible.
### Summary of DBMS_TDB Subprograms

<table>

</table>

*Table 166–2  DBMS_TDB Package Subprograms*
CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```sql
DBMS_TDB.CHECK_DB (  
    target_platform_name   IN VARCHAR2,  
    skip_option            IN  NUMBER)  
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (  
    target_platform_name   IN VARCHAR2)  
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>target_platform_name</td>
<td>The name of the destination platform, as it appears in V$DB_TRANSPORTABLE_PLATFORM.</td>
</tr>
<tr>
<td>skip_option</td>
<td>Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 166–1, &quot;DBMS_TDB Constants&quot; on page 166-5.</td>
</tr>
</tbody>
</table>

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns FALSE. If the database is ready for transport, returns TRUE.

Usage Notes

- If SERVEROUTPUT is ON, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see Table 166–4, "Reasons for CHECK_DB Function to Return FALSE" on page 166-9.

<table>
<thead>
<tr>
<th>Cause</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>unrecognized target platform name</td>
<td>Check V$DB_TRANSPORTABLE_PLATFORM for recognized platform names.</td>
</tr>
</tbody>
</table>
Table 166–4 (Cont.) Reasons for CHECK_DB Function to Return FALSE

<table>
<thead>
<tr>
<th>Cause</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target platform has a different endian format.</td>
<td>Conversion is not supported.</td>
</tr>
<tr>
<td>Database is not open read-only.</td>
<td>Open database read-only and retry.</td>
</tr>
<tr>
<td>There are active or in-doubt transactions in the database.</td>
<td>Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.</td>
</tr>
<tr>
<td>Deferred transaction rollback needs to be done.</td>
<td>Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.</td>
</tr>
<tr>
<td>Database compatibility version is below 10.0.0.</td>
<td>Change the COMPATIBLE initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.</td>
</tr>
<tr>
<td>Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.</td>
<td>Change the COMPATIBLE initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.</td>
</tr>
</tbody>
</table>

Examples

This example illustrates the use of CHECK_DB with a database that is open read-write:

```sql
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
       db_ready BOOLEAN;
       BEGIN
           db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
       END;
/
```

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.
CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

\[
\text{DBMS_TDB.CHECK_EXTERNAL}
\begin{align*}
\text{RETURN BOOLEAN;}
\end{align*}
\]

Return Values

If the database has external tables, directories, or BFILEs, return TRUE. Otherwise, return FALSE.

Usage Notes

- If SERVEROUTPUT is ON, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of CHECK_EXTERNAL with a database that has several external tables, directories, and BFILEs:

\[
\begin{align*}
\text{SQL}> & \text{SET SERVEROUTPUT ON} \\
\text{SQL}> & \text{DECLARE} \\
\text{external BOOLEAN;}
\text{BEGIN} \\
\text{external := DBMS_TDB.CHECK_EXTERNAL;} \\
\text{END;} \\
\end{align*}
\]

The following external tables exist in the database:

- SH.SALES_TRANSACTIONS_EXT

The following directories exist in the database:

- SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR

The following BFILEs exist in the database:

- PM.PRINT_MEDIA

PL/SQL procedure successfully completed.
The **DBMS_TRACE** package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- **Using DBMS_TRACE**
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Operational Notes
- **Summary of DBMS_TRACE Subprograms**
Using DBMS_TRACE

- Overview
- Security Model
- Constants
- Restrictions
- Operational Notes
Overview

DBMS_TRACE provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

■ Starting PL/SQL tracing in session (DBMS_TRACE.SET_PLSQL_TRACE).
■ Running an application to be traced.
■ Stopping PL/SQL tracing in session (DBMS_TRACE.CLEAR_PLSQL_TRACE).

Security Model

This package must be created under `SYS`.
Constants

The DBMS_TRACE package uses the constants shown in Table 167–1, "DBMS_TRACE Event Constants":

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRACE_ALL_CALLS</td>
<td>INTEGER</td>
<td>1</td>
<td>Traces calls or returns</td>
</tr>
<tr>
<td>TRACE_ENABLED_CALLS</td>
<td>INTEGER</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>TRACE_ALL_EXCEPTIONS</td>
<td>INTEGER</td>
<td>4</td>
<td>Traces exceptions</td>
</tr>
<tr>
<td>TRACE_ENABLED_EXCEPTIONS</td>
<td>INTEGER</td>
<td>8</td>
<td>Traces exceptions and handlers</td>
</tr>
<tr>
<td>TRACE_LIMIT</td>
<td>INTEGER</td>
<td>16</td>
<td>Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of &quot;TRACE_LIMIT&quot; flag.</td>
</tr>
<tr>
<td>TRACE_ALL_SQL</td>
<td>INTEGER</td>
<td>32</td>
<td>Traces SQL statements</td>
</tr>
<tr>
<td>TRACE_ENABLED_SQL</td>
<td>INTEGER</td>
<td>64</td>
<td>Traces SQL statements at PL/SQL level. This does not invoke SQL Trace</td>
</tr>
<tr>
<td>TRACE_ALL_LINES</td>
<td>INTEGER</td>
<td>128</td>
<td>Traces each line</td>
</tr>
<tr>
<td>TRACE_ENABLED_LINES</td>
<td>INTEGER</td>
<td>256</td>
<td></td>
</tr>
<tr>
<td>TRACE_PAUSE</td>
<td>INTEGER</td>
<td>4096</td>
<td>Pauses tracing</td>
</tr>
<tr>
<td>TRACE_RESUME</td>
<td>INTEGER</td>
<td>8192</td>
<td>Resume tracing</td>
</tr>
<tr>
<td>TRACE_STOP</td>
<td>INTEGER</td>
<td>16384</td>
<td>Stops tracing</td>
</tr>
</tbody>
</table>
| NO_TRACE_ADMINISTRATIVE   | INTEGER   | 32768 | Prevents tracing of 'administrative events such as
  • PL/SQL Trace Tool started
  • Trace flags changed
  • PL/SQL Virtual Machine started
  • PL/SQL Virtual Machine stopped |
| NO_TRACE_HANDLED_EXCEPTIONS | INTEGER   | 65536 | Prevents tracing of handled exceptions                       |

Oracle recommends using the symbolic form for all these constants.
Restrictions

You cannot use PL/SQL tracing in a shared server environment.
Operational Notes

- Controlling Data Volume
- Creating Database Tables to Collect DBMS_TRACE Output
- Collecting Trace Data
- Collected Data
- Trace Control

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by enabling specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

**Note:** You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the `DBMS_TRACE` package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by SYS.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMSPBT.SQL`. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

**Tracing Calls**

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`. 
Level 2: Trace calls to enabled program units only. This corresponds to the constant TRACE_ENABLED_CALLS.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

**Tracing Exceptions**

Two levels of exception tracing are available:

- **Level 1**: Trace all exceptions. This corresponds to TRACE_ALL_EXCEPTIONS.
- **Level 2**: Trace exceptions raised in enabled program units only. This corresponds to TRACE_ENABLED_EXCEPTIONS.

**Tracing SQL**

Two levels of SQL tracing are available:

- **Level 1**: Trace all SQL. This corresponds to the constant TRACE_ALL_SQL.
- **Level 2**: Trace SQL in enabled program units only. This corresponds to the constant TRACE_ENABLED_SQL.

**Tracing Lines**

Two levels of line tracing are available:

- **Level 1**: Trace all lines. This corresponds to the constant TRACE_ALL_LINES.
- **Level 2**: Trace lines in enabled program units only. This corresponds to the constant TRACE_ENABLED_LINES.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

---

**Note:** For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

---

**Collected Data**

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller is enabled, the caller's name will also be output. If the callee is enabled, the callee's name will also be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled. Enabling NO_TRACE_HANDLED_EXCEPTIONS limits data collection to unhandled exceptions.
Using DBMS_TRACE

All calls to DBMS_TRACE.SET_PLSQL_TRACE and DBMS_TRACE.CLEAR_PLSQL_TRACE place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants TRACE_PAUSE and TRACE_RESUME are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant TRACE_LIMIT. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level \( n \) changes the record limit to \( 1024 \times n \).

Enabling NO_TRACE_ADMINISTRATIVE prevents the generation of such administrative event records as PL/SQL Trace Tool started, Trace flags changed, PL/SQL Virtual Machine started, and PL/SQL Virtual Machine stopped.
### Summary of DBMS_TRACE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR_PLSQL_TRACE Procedure on page 167-11</td>
<td>Stops trace data dumping in session</td>
</tr>
<tr>
<td>GET_PLSQL_TRACE_LEVEL Function on page 167-12</td>
<td>Gets the trace level</td>
</tr>
<tr>
<td>PLSQL_TRACE_VERSION Procedure on page 167-13</td>
<td>Gets the version number of the trace package</td>
</tr>
<tr>
<td>SET_PLSQL_TRACE Procedure on page 167-14</td>
<td>Starts tracing in the current session</td>
</tr>
</tbody>
</table>
CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

DBMS_TRACE.CLEAR_PLSQL_TRACE;
GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as the sum of one or more of the constants as listed in Table 167–1, "DBMS_TRACE Event Constants".

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL
RETURN BINARY_INTEGER;
```
PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

DBMS_TRACE.PLSQL_TRACE_VERSION ( major OUT BINARY_INTEGER, minor OUT BINARY_INTEGER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>major</td>
<td>Major version number of DBMS_TRACE.</td>
</tr>
<tr>
<td>minor</td>
<td>Minor version number of DBMS_TRACE.</td>
</tr>
</tbody>
</table>

SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE {
    trace_level INTEGER};
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trace_level</td>
<td>You must supply one or more of the constants as listed in Table 167-1, &quot;DBMS_TRACE Event Constants&quot;. By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants &quot;TRACE_PAUSE&quot;, &quot;TRACE_RESUME&quot; and &quot;TRACE_STOP&quot; should not be used in combination with other constants. Also see &quot;Collecting Trace Data&quot; on page 167-7 for more information.</td>
</tr>
</tbody>
</table>
The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

<td>Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction</td>
</tr>
<tr>
<td>USE_ROLLBACK_SEGMENT Procedure on page 168-22</td>
<td>Equivalent to the SQL statement: SET TRANSACTION USE ROLLBACK SEGMENT &lt;rb_seg_name&gt;</td>
</tr>
</tbody>
</table>
ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE COMMIT
```

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```
ADVISE NOTHING Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE NOTHING
```

Syntax

```
DBMS_TRANSACTION.ADVISE NOTHING;
```
ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE ROLLBACK
```

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```
COMMIT Procedure

This procedure is equivalent to the SQL statement:

COMMIT

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

DBMS_TRANSACTION.COMMIT;
COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT COMMENT <text>
```

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT ( cmnt VARCHAR2 );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmnt</td>
<td>Comment to associate with this commit.</td>
</tr>
</tbody>
</table>
COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT FORCE <text>, <number>''
```

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (
    xid VARCHAR2,
    scn VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Local or global transaction ID.</td>
</tr>
<tr>
<td>scn</td>
<td>System change number.</td>
</tr>
</tbody>
</table>
LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (create_transaction BOOLEAN := FALSE) RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>create_transaction</td>
<td>If true, then start a transaction if one is not currently active.</td>
</tr>
</tbody>
</table>
PURGE_LOST_DB_ENTRY Procedure

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in DBA_2PC_PENDING and associated tables are never removed, and recovery will periodically retry. Procedure PURGE_LOST_DB_ENTRY enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Must be set to the value of the LOCAL_TRAN_ID column in the DBA_2PC_PENDING table.</td>
</tr>
</tbody>
</table>

Usage Notes

**WARNING:** PURGE_LOST_DB_ENTRY should only be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA_2PC_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure PURGE_LOST_DB_ENTRY to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:
### Table 168–6  PURGE_LOST_DB_ENTRY Procedure States

<table>
<thead>
<tr>
<th>State of Column</th>
<th>State of Global Transaction</th>
<th>State of Local Transaction</th>
<th>Normal DBA Action</th>
<th>Alternative DBA Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collecting</td>
<td>Rolled back</td>
<td>Rolled back</td>
<td>None</td>
<td>PURGE_LOST_DB_ENTRY (See Note 1)</td>
</tr>
<tr>
<td>Committed</td>
<td>Committed</td>
<td>Committed</td>
<td>None</td>
<td>PURGE_LOST_DB_ENTRY (See Note 1)</td>
</tr>
<tr>
<td>Prepared</td>
<td>Unknown</td>
<td>Prepared</td>
<td>None</td>
<td>FORCE COMMIT or ROLLBACK</td>
</tr>
<tr>
<td>Forced commit</td>
<td>Unknown</td>
<td>Committed</td>
<td>None</td>
<td>PURGE_LOST_DB_ENTRY (See Note 1)</td>
</tr>
<tr>
<td>Forced rollback</td>
<td>Unknown</td>
<td>Rolled back</td>
<td>None</td>
<td>PURGE_LOST_DB_ENTRY (See Note 1)</td>
</tr>
<tr>
<td>Forced commit (mixed)</td>
<td>Mixed</td>
<td>Committed</td>
<td>(See Note 2)</td>
<td></td>
</tr>
<tr>
<td>Forced rollback (mixed)</td>
<td>Mixed</td>
<td>Rolled back</td>
<td>(See Note 2)</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE 1:** Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

**NOTE 2:** Examine and take any manual action to remove inconsistencies; then use the procedure PURGE_MIXED.
PURGE_MIXED Procedure

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome: Some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle; however, Oracle flags entries in DBA_2PC_PENDING by setting the MIXED column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```sql
DBMS_TRANSACTION.PURGE_MIXED (xid VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Must be set to the value of the LOCAL_TRAN_ID column in the DBA_2PC_PENDING table.</td>
</tr>
</tbody>
</table>
READ_ONLY Procedure

This procedure is equivalent to the SQL statement:

SET TRANSACTION READ ONLY

Syntax

DBMS_TRANSACTION.READ_ONLY;
READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```
ROLLBACK Procedure

This procedure is equivalent to the SQL statement:
ROLLBACK

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

DBMS_TRANSACTION.ROLLBACK;
ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement:

ROLLBACK FORCE <text>

Syntax

DBMS_TRANSACTION.ROLLBACK_FORCE ( 
    xid VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Local or global transaction ID.</td>
</tr>
</tbody>
</table>
ROLLBACK_SAVEPPOINT Procedure

This procedure is equivalent to the SQL statement:

ROLLBACK TO SAVEPOINT <savepoint_name>

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPPOINT (
    savept VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>savept</td>
<td>Savepoint identifier.</td>
</tr>
</tbody>
</table>
SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (
  savept VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>savept</td>
<td>Savepoint identifier.</td>
</tr>
</tbody>
</table>
**STEP_ID Function**

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

**Syntax**

```sql
DBMS_TRANSACTION.STEP_ID
RETURN NUMBER;
```
USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>
```

Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (
   rb_name VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rb_name</td>
<td>Name of rollback segment to use.</td>
</tr>
</tbody>
</table>
The DBMS_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

See Also: Oracle Database Advanced Queuing User’s Guide for more on message format transformations.

This chapter contains the following topic:

- Summary of DBMS_TRANSFORM Subprograms
# Summary of DBMS_TRANSFORM Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_TRANSFORMATION Procedure</td>
<td>Creates a transformation that maps an object of the source type to an object of the destination type</td>

</tr>
<tr>
<td>MODIFY_TRANSFORMATION Procedure</td>
<td>Modifies an existing transformation</td>
</tr>
</tbody>
</table>
CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (  
    schema               VARCHAR2(30),  
    name                 VARCHAR2(30),  
    from_schema          VARCHAR2(30),  
    from_type            VARCHAR2(30),  
    to_schema            VARCHAR2(30),  
    to_type              VARCHAR2(30),  
    transformation       VARCHAR2(4000));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
<tr>
<td>from_schema</td>
<td>Specifies the schema of the source type.</td>
</tr>
<tr>
<td>from_type</td>
<td>Specifies the source type.</td>
</tr>
<tr>
<td>to_schema</td>
<td>Specifies the target type schema.</td>
</tr>
<tr>
<td>to_type</td>
<td>Specifies the target type.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.</td>
</tr>
</tbody>
</table>

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on `DBMS_TRANSFORM`. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PL/SQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form `source.user_data`. 
Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.
DROP_TRANSFORMATION Procedure

This procedure drops the given transformation.

Syntax

```sql
DBMS_TRANSFORM.DROP_TRANSFORMATION (
  schema VARCHAR2(30),
  name        VARCHAR2(30));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
</tbody>
</table>
MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```sql
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (  
schema             VARCHAR2(30),  
name               VARCHAR2(30),  
attribute_number   INTEGER,  
transformation     VARCHAR2(4000));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Specifies the schema of the transformation.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the transformation.</td>
</tr>
<tr>
<td>attribute_number</td>
<td>The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.</td>
</tr>
<tr>
<td>transformation</td>
<td>The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.</td>
</tr>
</tbody>
</table>

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an attribute_number of 0. The new transformation may also be specified for each attribute of the target type.

- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.
The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the DBMS_TSDP_PROTECT package with regard to transparent sensitive data protection (TSDP) policies. DBMS_TSDP_MANAGE is available with the Enterprise Edition only.

  - Overview
  - Security Model
- **Summary of DBMS_TSDP_MANAGE Subprograms**
Using DBMS_TSDP_MANAGE

- Overview
- Security Model
Overview

The DBMS_TSDP_MANAGE package lets you manage sensitive columns and sensitive types in the Oracle database. The identified sensitive columns are classified based on the sensitive types. By using the DBMS_TSDP_PROTECT package to create a policy that protects data for a given class based on a column type rather than the data itself, you can then manage security for these types in a uniform fashion and modify the settings to accommodate changing compliance regulations.

You also can export the policies to other databases, when you perform a full export using Data Pump. You cannot export the policy itself, but an export of the database will include the TSDP policies.
All procedures are executed with invoker's rights. The `DBMS_TSDP_MANAGE` package is owned by `SYS`. The `EXECUTE` privilege on this package should be granted as appropriate. Typically, an application database administrator should be granted the `EXECUTE` privilege for this package, while the `DBMS_TSDP_PROTECT` package would be governed by a security administrator.
## Summary of DBMS_TSDP_MANAGE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_SENSITIVE_COLUMN Procedure</td>
<td>Adds a column to the sensitive column list</td>
</tr>
<tr>
<td>ADD_SENSITIVE_TYPE Procedure</td>
<td>Creates and adds a sensitive column type to the list of sensitive column types in the database</td>
</tr>
<tr>
<td>ALTER_SENSITIVE_COLUMN Procedure</td>
<td>Alters the sensitive type and/or the comment of a column in the sensitive column list.</td>
</tr>
<tr>
<td>DROP_SENSITIVE_COLUMN Procedure</td>
<td>Removes columns from the sensitive column list</td>
</tr>
<tr>
<td>DROP_SENSITIVE_TYPE Procedure</td>
<td>Drops a sensitive column type from the list sensitive column types in the database</td>
</tr>
<tr>
<td>DROP_SENSITIVE_TYPE_SOURCE Procedure</td>
<td>Drops sensitive column types corresponding to a source from the list sensitive column types in the database</td>
</tr>
<tr>
<td>IMPORT_DISCOVERY_RESULT Procedure</td>
<td>Imports sensitive columns from an external source. This can be an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance</td>
</tr>
<tr>
<td>IMPORT_SENSITIVE_TYPES Procedure</td>
<td>Imports a list of sensitive column types from a source</td>
</tr>
<tr>
<td>REMOVE_DISCOVERY_RESULT Procedure</td>
<td>Removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance</td>
</tr>
</tbody>
</table>
ADD_SENSITIVE_COLUMN Procedure

This procedure adds a column to the sensitive column list.

Syntax

DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
    schema_name        IN VARCHAR2,
    table_name         IN VARCHAR2,
    column_name        IN VARCHAR2,
    sensitive_type     IN VARCHAR2,
    user_comment       IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema to which the column belongs</td>
</tr>
<tr>
<td>table_name</td>
<td>Table containing the column</td>
</tr>
<tr>
<td>column_name</td>
<td>Sensitive column name</td>
</tr>
<tr>
<td>sensitive_type</td>
<td>Identifier of the sensitive column type</td>
</tr>
<tr>
<td>user_comment</td>
<td>User comment regarding the sensitive column</td>
</tr>
</tbody>
</table>

Examples

Add a column SAL in SCOTT.EMP:

DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
    schema_name   => 'SCOTT',
    table_name    => 'EMP',
    column_name   => 'SAL',
    sensitive_type => 'SALARY_TYPE',
    user_comment  => 'Salary column');
ALTER_SENSITIVE_COLUMN Procedure

This procedure alters the Sensitive Type and/or the Comment of a Column in the sensitive column list.

Syntax

```sql
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
    schema_name        IN VARCHAR2,
    table_name         IN VARCHAR2,
    column_name        IN VARCHAR2,
    sensitive_type     IN VARCHAR2,
    user_comment       IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema to which the column belongs</td>
</tr>
<tr>
<td>table_name</td>
<td>Table containing the column</td>
</tr>
<tr>
<td>column_name</td>
<td>Sensitive column name</td>
</tr>
<tr>
<td>sensitive_type</td>
<td>Identifier of the sensitive column type</td>
</tr>
<tr>
<td>user_comment</td>
<td>User comment regarding the sensitive column</td>
</tr>
</tbody>
</table>

Examples

Alter the column `SAL` in `SCOTT.EMP` that is listed in the sensitive column list:

```sql
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
    schema_name => 'SCOTT',
    table_name => 'EMP',
    column_name => 'SAL',
    sensitive_type => 'FINANCE_Type',
    user_comment => 'Finance Type. Earlier categorized as Salary Type');
```
ADDSENSITIVE_TYPE Procedure

This procedure creates and adds a sensitive column type to the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
    sensitive_type     IN  VARCHAR2,
    user_comment       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitive_type</td>
<td>Name of the sensitive column type</td>
</tr>
<tr>
<td>user_comment</td>
<td>User comment regarding the sensitive column</td>
</tr>
</tbody>
</table>

Examples

Add a sensitive column type called SALARY_TYPE that is intended to be associated with columns containing salary data:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
    sensitive_type     => 'SALARY_TYPE',
    user_comment       => 'Salary data');
```
**DROP_SENSITIVE_COLUMN Procedure**

This procedure removes columns from the sensitive column list.

**Syntax**

```sql
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
    schema_name        IN VARCHAR2 DEFAULT '%',
    table_name         IN VARCHAR2 DEFAULT '%',
    column_name        IN VARCHAR2 DEFAULT '%');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema to which the column belongs</td>
</tr>
<tr>
<td>table_name</td>
<td>Table containing the column</td>
</tr>
<tr>
<td>column_name</td>
<td>Sensitive column name</td>
</tr>
</tbody>
</table>

**Examples**

Remove column `SAL` in `SCOTT.EMP` from the sensitive column list:

```sql
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
    schema_name       => 'SCOTT',
    table_name        => 'EMP',
    column_name       => 'SAL');
```
DROP SENSITIVE TYPE Procedure

This procedure drops a sensitive column type from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
    sensitive_type IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitive_type</td>
<td>Name of the sensitive column type to be dropped</td>
</tr>
</tbody>
</table>

Examples

To drop `SALARY_TYPE`:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
    sensitive_type => 'SALARY_TYPE');
```
**DROP_SENSITIVE_TYPE_SOURCE Procedure**

This procedure drops sensitive column types corresponding to a source from the list sensitive column types in the database.

**Syntax**

```sql
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (    source           IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Name of the source</td>
</tr>
</tbody>
</table>

**Examples**

To drop all sensitive column types corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, `ADM_DEMO`:

```sql
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (    source => 'ADM_DEMO');
```
IMPORT_DISCOVERY_RESULT Procedure

This procedure can be used to import sensitive columns, along with the associated sensitive types, from an external source. The external source can be an Application Data Model (ADM) instance from Oracle Enterprise Manager Cloud Control.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
    discovery_result         IN  CLOB,
    discovery_source         IN  VARCHAR2,
    force                    IN  FORCE DEFAULT FALSE);
```

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
    discovery_result         IN  XMLTYPE,
    discovery_source         IN  VARCHAR2,
    force                    IN  FORCE DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>discovery_result</td>
<td>List of sensitive columns, along with the optional list of (the definitions of) the sensitive column types in XML format (possibly as a CLOB).</td>
</tr>
<tr>
<td>discovery_source</td>
<td>Source of the import. The discovery_sourcename identifies the list of imported sensitive columns. In case of ADM, this should be the ADM name.</td>
</tr>
<tr>
<td>force</td>
<td>Specifies if the discovery result should be imported or not when the discovery result contains columns sensitive columns that are already identified as sensitive by another source.</td>
</tr>
<tr>
<td></td>
<td>- FALSE (default) - the discovery result will not be imported in case of conflicting columns. None of the columns and the sensitive types are imported.</td>
</tr>
<tr>
<td></td>
<td>- TRUE - the discovery result is imported and the attributes of the conflicting columns is set based on the incoming discovery result</td>
</tr>
</tbody>
</table>

Examples

Import the list of sensitive columns of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
    discovery_results => xml_adm_result,
    discovery_source  => 'ADM_Demo');
```
IMPORT_SENSITIVE_TYPES Procedure

This procedure imports a list of sensitive column types from a source.

Syntax

\[
\text{DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES} \{
\begin{array}{l}
\text{sensitive_types} \quad \text{IN CLOB}, \\
\text{source} \quad \text{IN VARCHAR2};
\end{array}
\}
\]

\[
\text{DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES} \{
\begin{array}{l}
\text{sensitive_types} \quad \text{IN XMLTYPE}, \\
\text{source} \quad \text{IN VARCHAR2};
\end{array}
\}
\]

Parameters

Table 170–9 IMPORT_SENSITIVE_TYPES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitive_types</td>
<td>List of sensitive column types in XML Format (possibly as a CLOB)</td>
</tr>
<tr>
<td>source</td>
<td>Source of the import. The source identifies the list of imported sensitive column types. In case of Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, this should be the ADM name.</td>
</tr>
</tbody>
</table>

Examples

Import the list of sensitive column types of ADM instance, ADM_Demo:

\[
\text{DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES} \{
\begin{array}{l}
\text{sensitive_types} \quad \Rightarrow \text{xml_adm_result}, \\
\text{source} \quad \Rightarrow \text{’ADM_Demo’};
\end{array}
\}
\]
REMOVE_DISCOVERY_RESULT Procedure

This procedure removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

Syntax

```sql
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
    discovery_source     IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>discovery_source</td>
<td>Source of the import. In case of ADM, this should be the ADM name, the results of which is to be removed.</td>
</tr>
</tbody>
</table>

Examples

Remove the sensitive columns corresponding to ADM instance, ADM_Demo:

```sql
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
    discovery_source => 'ADM_Demo');
```
The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package. DBMS_TSDP_PROTECT is available with the Enterprise Edition only.

This chapter contains the following topics:

- Using DBMS_TSDP_PROTECT
  - Overview
  - Security Model
  - Constants
- Data Structures
- Summary of DBMS_TSDP_PROTECT Subprograms
Using DBMS_TSDP_PROTECT

- Overview
- Security Model
- Constants
Overview

Use the DBMS_TSDP_PROTECT package to create transparent sensitive data protection policies, configure protection by associating the policies with sensitive types, and to enable and disable the configured protection. Sensitive types can be added using the DBMS_TSDP_MANAGE package.
Security Model

All procedures are executed with invoker’s rights. Typically, a security administrator should have the EXECUTE privilege for this package.
The DBMS_TSDP_PROTECT package uses the constants shown in Table 171–1, "DBMS_TSDP_PROTECT Constants - Compression Types":

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TSDP_PARAM_MAX</td>
<td>INTEGER</td>
<td>4000</td>
<td>Maximum length of the parameter value that can be specified in FEATURE_OPTIONS</td>
</tr>
</tbody>
</table>
Data Structures

The `DBMS_COMPRESSION` package defines the following `TABLE` type.

Table Types

- `FEATURE_OPTIONS` Table Type
- `POLICY_CONDITION` Table Type
FEATURE_OPTIONS Table Type

The following type is an associative array of VARCHAR2(TSDP_PARAM_MAX) that is indexed by VARCHAR2(M_IDEN).

Syntax

```
TYPE FEATURE_OPTIONS IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY VARCHAR2(M_IDEN);
```
POLICY_CONDITION Table Type

The following type is an associative array of VARCHAR2(TSDP_PARAM_MAX) that is indexed by PLS_INTEGER.

Syntax

```
TYPE POLICY_CONDITION IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY PLS_INTEGER;
```
## Summary of DBMS_TSDP_PROTECT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADD_POLICY Procedure</strong> on page 171-10</td>
<td>Creates a TSDP policy</td>
</tr>
<tr>
<td><strong>ALTER_POLICY Procedure</strong> on page 171-12</td>
<td>Alters a TSDP policy</td>
</tr>
<tr>
<td><strong>ASSOCIATE_POLICY Procedure</strong> on page 171-14</td>
<td>Associates or disassociates a TSDP policy with a sensitive column type</td>
</tr>
<tr>
<td><strong>DISABLE_PROTECTION_COLUMN Procedure</strong> on page 171-15</td>
<td>Disables protection for columns</td>
</tr>
<tr>
<td><strong>DISABLE_PROTECTION_SOURCE Procedure</strong> on page 171-16</td>
<td>Disables protection based on the source of truth for the sensitive columns</td>
</tr>
<tr>
<td><strong>DISABLE_PROTECTION_TYPE Procedure</strong> on page 171-17</td>
<td>Disables protection for a sensitive column type</td>
</tr>
<tr>
<td><strong>DROP_POLICY Procedure</strong> on page 171-18</td>
<td>Removes a TSDP policy</td>
</tr>
<tr>
<td><strong>ENABLE_PROTECTION_COLUMN Procedure</strong> on page 171-20</td>
<td>Enables protection for columns</td>
</tr>
<tr>
<td><strong>ENABLE_PROTECTION_SOURCE Procedure</strong> on page 171-21</td>
<td>Enables protection based on the source of truth for the sensitive columns</td>
</tr>
<tr>
<td><strong>ENABLE_PROTECTION_TYPE Procedure</strong> on page 171-22</td>
<td>Enables protection for a sensitive column type</td>
</tr>
</tbody>
</table>
ADD_POLICY Procedure

This procedure creates a TDSP policy.

Syntax

```sql
DBMS_TSDP_PROTECT.ADD_POLICY (    policy_name              IN VARCHAR2,    security_feature         IN PLS_INTEGER,    policy_enable_options    IN FEATURE_OPTIONS,    policy_apply_condition   IN POLICY_CONDITION DEFAULT TSDP$null_condition);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of the policy being created. The maximum length for this identifier is M_IDEN. This follows the Oracle naming convention.</td>
</tr>
<tr>
<td>security_feature</td>
<td>Oracle security feature with which the policy is associated. Allowed values:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_TSDP_PROTECT.REDACT</td>
</tr>
<tr>
<td>policy_enable_options</td>
<td>Initialized with the property-value pairs corresponding to the security feature.</td>
</tr>
<tr>
<td>policy_apply_condition</td>
<td>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER). Example: example_policy_condition(Property)=property_value. Permissible values for Property:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_TSDP_PROPERTY.DATATYPE</td>
</tr>
<tr>
<td></td>
<td>- DBMS_TSDP_PROPERTY.LENGTH</td>
</tr>
<tr>
<td></td>
<td>- DBMS_TSDP_PROPERTY.PARENT_SCHEMA</td>
</tr>
<tr>
<td></td>
<td>- DBMS_TSDP_PROPERTY.PARENT_TABLE</td>
</tr>
</tbody>
</table>

Usage Notes

To create the TDSP policy, you must include the procedure in an anonymous block that defines the type of security feature that will use the policy and conditions to test when the policy is enabled. For more information, see Oracle Database Security Guide.

Examples

Create a policy PARTIAL_MASK_POLICY:

```sql
DECLARE    redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;    policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN    redact_feature_options ('expression') :=    'SYS_CONTEXT(''USERENV'',''SESSION_USER'') =''APPUSER''';    redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';    redact_feature_options ('function_parameters') := 'STR, VVVVVVVV, VVVVVVVV, *, 1, 6';
```
policy_conditions(DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
DBMS_TSDP_PROTECT.ADD_POLICY
  ("PARTIAL_MASK_POLICY", DBMS_TSDP_PROTECT.REDACT, redact_feature_options,
   policy_conditions);
END;
ALTER_POLICY Procedure

This procedure alters an existing TDSP policy

Syntax

```sql
DBMS_TSDP_PROTECT.ALTER_POLICY (  
  policy_name              IN VARCHAR2,
  policy_enable_options    IN FEATURE_OPTIONS,
  policy_apply_condition   IN POLICY_CONDITION default TSDP$null_condition);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of the policy to alter</td>
</tr>
<tr>
<td>policy_enable_options</td>
<td>Initialized with the parameter-value pairs corresponding to the security feature</td>
</tr>
</tbody>
</table>
| policy_apply_condition     | Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER).

Example: example_policy_condition(Property)=property_value. Permissible values for Property:
- DBMS_TSDP_PROPERTY.DATATYPE
- DBMS_TSDP_PROPERTY.LENGTH
- DBMS_TSDP_PROPERTY.PARENT_SCHEMA
- DBMS_TSDP_PROPERTY.PARENT_TABLE

Usage Notes

- If the policy_apply_condition matches an existing condition for the policy, then the corresponding enable options are updated with policy_enable_options.
- If the policy_apply_condition does not match any existing condition for the policy, the combination of policy_enable_options and policy_apply_condition is added to the policy.

Examples

Add a new combination of policy_apply_condition and policy_enable_options to an existing policy PARTIAL_MASK_POLICY:

```sql
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT POLICY CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
    'SYS_CONTEXT(''USERENV'',''SESSION_USER'')='APPUSER'';
  redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters') := 'STR, VVVVVVVVV,VVVVVVVVV, *, 1, 6';
  policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
  DBMS_TSDP_PROTECT.ALTER_POLICY ('PARTIAL_MASK_POLICY', redact_feature_options, policy_conditions);
```
END;
ASSOCIATE_POLICY Procedure

This procedure associates or disassociates a TSDP policy with a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY (
    policy_name        IN  VARCHAR2,
    sensitive_type     IN  VARCHAR2,
    associate          IN  BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of the TDSP policy</td>
</tr>
<tr>
<td>sensitive_type</td>
<td>Name of the sensitive column type:</td>
</tr>
<tr>
<td>associate</td>
<td>Associate or Disassociate. TRUE implies Associate</td>
</tr>
</tbody>
</table>

Usage Notes

Both the policy and the sensitive column type should exist in the database.

Examples

Associate PARTIAL_MASK_POLICY with SSN_TYPE:

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY ('PARTIAL_MASK_POLICY', 'SSN_TYPE');
```
DISABLE_PROTECTION_COLUMN Procedure

This procedure disables protection for columns.

Syntax

```sql
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN (  
    schema_name            IN  VARCHAR2 DEFAULT '%',  
    table_name             IN  VARCHAR2 DEFAULT '%',  
    column_name            IN  VARCHAR2 DEFAULT '%',  
    policy_name            IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema containing the column</td>
</tr>
<tr>
<td>table_name</td>
<td>Table containing the column</td>
</tr>
<tr>
<td>column_name</td>
<td>Column name</td>
</tr>
<tr>
<td>policy_name</td>
<td>Optional policy name. If given, only this policy is disabled.</td>
</tr>
</tbody>
</table>

Examples

Disable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like `%PAYROLL%`, table name like `EMP%`, and column name like `SAL%`:

```sql
EXEC DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```
DISABLE_PROTECTION_SOURCE Procedure

This procedure disables protection based on the source of truth for the sensitive columns.

Syntax

```sql
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE (
    discovery_sourcename IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>discovery_sourcename</td>
<td>Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.</td>
</tr>
</tbody>
</table>

Examples

Disable protection for all columns corresponding to ADM_Demo:

```sql
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE ('ADM_Demo');
```
DISABLE_PROTECTION_TYPE Procedure

This procedure disables protection for a sensitive column type.

Syntax

DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE (sensitive_type IN VARCHAR2);

Parameters

Table 171–8  DISABLE_PROTECTION_TYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitive_type</td>
<td>Name of the sensitive column type</td>
</tr>
</tbody>
</table>

Examples

Disable protection for all columns identified by SSN_TYPE:

DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE ('SSN_TYPE');
DROP_POLICY Procedure

This procedure removes a TDSP policy or one of its condition-enable_options combinations.

Syntax

```sql
DBMS_TSDP_PROTECT.DROP_POLICY (  
    policy_name              IN VARCHAR2,  
    policy_apply_condition   IN POLICY_CONDITION default TSDP$null_condition);

DBMS_TSDP_PROTECT.DROP_POLICY (  
    policy_name              IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of the policy to drop</td>
</tr>
<tr>
<td>policy_apply_condition</td>
<td>To be initialized with the relevant condition</td>
</tr>
</tbody>
</table>

Usage Notes

- The combination of `policy_condition` and `policy_enable_options` can be dropped from a TDSP policy by giving the `policy_apply_condition` parameter. The default condition-default options combination can also be dropped (if it exists for the policy) by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITION`.
- If the condition-enable_options combination that is being dropped is the last condition-enable_options combination for the policy, the policy itself is dropped.
- A policy can be completely dropped by using the overloaded of the procedure that takes only `policy_name`.
- A policy or one of its conditions can be dropped only if the policy is not associated with any sensitive column type. This also means that a policy that is being dropped is not enabled on any column (object).

Examples

Dropping the condition-enable_options combination based on a specific condition:

```sql
DECLARE  
    policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN  
    policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';  
    DBMS_TSDP_PROTECT.DROP_POLICY ('PARTIAL_MASK_POLICY', policy_conditions);
END;
```

The default condition-enable_options combination can be dropped by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITIONS` for the `policy_apply_condition` parameter:

```sql
DECLARE  
    policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
```

DBMS_TSDP_PROTECT.DROP_POLICY ('redact_partial_cc', policy_conditions);
END;

Dropping a TSDP policy:

BEGIN
  DBMS_TSDP_PROTECT.DROP_POLICY {
    policy_name => 'PARTIAL_MASK_POLICY'};
END;
This procedure enables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN (  
  schema_name  IN  VARCHAR2 DEFAULT '%%',  
  table_name   IN  VARCHAR2 DEFAULT '%%',  
  column_name  IN  VARCHAR2 DEFAULT '%%',  
  policy_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema containing the column</td>
</tr>
<tr>
<td>table_name</td>
<td>Table containing the column</td>
</tr>
<tr>
<td>column_name</td>
<td>Column name</td>
</tr>
<tr>
<td>policy_name</td>
<td>Optional policy name. If given, only this policy is enabled.</td>
</tr>
</tbody>
</table>

Usage Notes

- Only a TSDP Policy that is associated with the sensitive column type of the sensitive column can be enabled using this Procedure.
- LIKE condition is used for schema_name, table_name and column_name. AND semantics is followed.

Examples

Enable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```
ENABLE_PROTECTION_SOURCE Procedure

This procedure enables protection based on the source of truth for the sensitive columns.

Syntax

DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE (discovery_sourcename IN VARCHAR2);

Parameters

Table 171–11 ENABLE_PROTECTION_SOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>discovery_sourcename</td>
<td>Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.</td>
</tr>
</tbody>
</table>

Examples

Enable protection for all columns corresponding to ADM_Demo:

DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE ('ADM_Demo');
ENABLE_PROTECTION_TYPE Procedure

This procedure enables protection for a sensitive column type.

Syntax

DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE (  
sensitive_type IN VARCHAR2);  

Parameters

Table 171–12 ENABLE_PROTECTION_TYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitive_type</td>
<td>Name of the sensitive column type</td>
</tr>
</tbody>
</table>

Examples

Enable protection for all columns identified by SSN_TYPE:

DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE ('SSN_TYPE');
The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view `TRANSPORT_SET_VIOLATIONS`.

**See Also:**
- *Oracle Database Administrator’s Guide*
- *Oracle Database Upgrade Guide*

This chapter contains the following topics:

- **Using DBMS_TTS**
  - Security Model
  - Exceptions
  - Operational Notes
- **Summary of DBMS_TTS Subprograms**
Using DBMS_TTS

- Security Model
- Exceptions
- Operational Notes
Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.
Exceptions

ts_not_found EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently:

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.

- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.
Summary of DBMS_TTS Subprograms

These two procedures are designed to be called by database administrators.

Table 172–1   DBMS_TTS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOWNGRADE Procedure on page 172-7</td>
<td>Downgrades transportable tablespace-related data</td>
</tr>
<tr>
<td>TRANSPORT_SET_CHECK Procedure on page 172-8</td>
<td>Checks if a set of tablespaces (to be transported) is self-contained</td>
</tr>
</tbody>
</table>
DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

Syntax

DBMS_TTS.DOWNGRADE;
TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```sql
DBMS_TTS.TRANSPORT_SET_CHECK (
  ts_list          IN CLOB,
  incl_constraints IN BOOLEAN DEFAULT FALSE,
  full_check       IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ts_list</td>
<td>List of one or more tablespaces, separated by comma.</td>
</tr>
<tr>
<td>incl_constraints</td>
<td>TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The incl_constraints parameter is a default so that TRANSPORT_SET_CHECK will work if it is called with only the ts_list argument.)</td>
</tr>
<tr>
<td>full_check</td>
<td>Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to FALSE. It will only consider OUT pointers as violations.</td>
</tr>
</tbody>
</table>

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```sql
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```
The `DBMS_TYPES` package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- **Using DBMS_TYPES**
  - Constants
  - Exceptions
Using DBMS_TYPES

# Constants

The following table lists the constants in the `DBMS_TYPES` package.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_DATA</td>
<td>Is only relevant if PieceWise is called, for a collection or any dataset. Denotes the end of collection/any dataset when all the elements have been accessed</td>
</tr>
<tr>
<td>SUCCESS</td>
<td>The operation succeeded</td>
</tr>
<tr>
<td>TYPECODE_BDOUBLE</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_BFILE</td>
<td>A BFILE type</td>
</tr>
<tr>
<td>TYPECODE_BFLOAT</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_BLOB</td>
<td>A BLOB type</td>
</tr>
<tr>
<td>TYPECODE_CFILE</td>
<td>A CFILE type</td>
</tr>
<tr>
<td>TYPECODE_CHAR</td>
<td>A CHAR type</td>
</tr>
<tr>
<td>TYPECODE_CLOB</td>
<td>A CLOB type</td>
</tr>
<tr>
<td>TYPECODE_DATE</td>
<td>A DATE type</td>
</tr>
<tr>
<td>TYPECODE_INTERVAL_DS</td>
<td>An INTERVAL_DS type</td>
</tr>
<tr>
<td>TYPECODE_INTERVAL_YM</td>
<td>An INTERVAL_YM type</td>
</tr>
<tr>
<td>TYPECODE_MLSLABEL</td>
<td>An MLSLABEL type</td>
</tr>
<tr>
<td>TYPECODE_NAMEDCOLLECTION</td>
<td>A named collection (VARRAY/nested table) type</td>
</tr>
<tr>
<td>TYPECODE_NCHAR</td>
<td>A NCHAR type</td>
</tr>
<tr>
<td>TYPECODE_NCLOB</td>
<td>A NCLOB type</td>
</tr>
<tr>
<td>TYPECODE_NUMBER</td>
<td>A NUMBER type</td>
</tr>
<tr>
<td>TYPECODE_NVARCHAR2</td>
<td>A NVARCHAR2 type</td>
</tr>
<tr>
<td>TYPECODE_OBJECT</td>
<td>An OBJECT type</td>
</tr>
<tr>
<td>TYPECODE_OPAQUE</td>
<td>An OPAQUE type</td>
</tr>
<tr>
<td>TYPECODE_RAW</td>
<td>A RAW type</td>
</tr>
<tr>
<td>TYPECODE_REF</td>
<td>A REF type</td>
</tr>
<tr>
<td>TYPECODE_TABLE</td>
<td>A nested table collection type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP</td>
<td>A TIMESTAMP type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP_LTZ</td>
<td>A TIMESTAMP_LTZ type</td>
</tr>
<tr>
<td>TYPECODE_TIMESTAMP_TZ</td>
<td>A TIMESTAMP_TZ type</td>
</tr>
<tr>
<td>TYPECODE_UROWID</td>
<td>A UROWID type</td>
</tr>
<tr>
<td>TYPECODE_VARCHAR2</td>
<td>A VARCHAR2 type</td>
</tr>
<tr>
<td>TYPECODE_VARCHAR</td>
<td>A VARCHAR type</td>
</tr>
<tr>
<td>TYPECODE_VARRAY</td>
<td>A VARRAY collection type</td>
</tr>
</tbody>
</table>
Exceptions

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH
The DBMS_UTILITY package provides various utility subprograms.

This chapter contains the following topics:

- **Using DBMS_UTILITY**
  - Security Model
  - Constants
  - Exceptions
- **Data Structures**
  - Record Types
  - Table Types
- **Summary of DBMS_UTILITY Subprograms**
Using DBMS_UTILITY

- Security Model
- Constants
- Exceptions
Security Model

DBMSUTILITY runs with the privileges of the calling user for the NAME_RESOLVE Procedure and the COMPILÉ_SCHEMA Procedure. This is necessary so that the SQL works correctly.

The package does not run as SYS. The privileges are checked using DBMS_DDL.
Constants

The `DBMS_UTILITY` package uses the constants shown in Table 174–1, "DBMS_UTILITY Constants".

**Table 174–1  DBMS_UTILITY Constants**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INV_ERROR_ON_</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>This constant is the only legal value for the <code>p_option_flags</code> parameter of</td>
</tr>
<tr>
<td>RESTRICTIONS</td>
<td></td>
<td></td>
<td>the INVALIDATE subprogram</td>
</tr>
</tbody>
</table>
Exceptions

The following table lists the exceptions raised by `DBMS_UTILITY`.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INV_NOT_EXIST_OR_NO_PRIV</td>
<td>-24237</td>
<td>Raised by the INVALIDATE subprogram when the <code>object_id</code> argument is NULL or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated.</td>
</tr>
<tr>
<td>INV_MALFORMED_SETTINGS</td>
<td>-24238</td>
<td>Raised by the INVALIDATE subprogram if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter.</td>
</tr>
<tr>
<td>INV_RESTRICTED_OBJECT</td>
<td>-24239</td>
<td>Raised by the INVALIDATE subprogram when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened.</td>
</tr>
</tbody>
</table>
Data Structures

The `DBMS_UTILITY` package defines a single `RECORD` type and `TABLE` types.

Record Types
- `INSTANCE_RECORD` Record Type

Table Types
- `DBLINK_ARRAY` TABLE Type
- `INDEX_TABLE_TYPE` Table Type
- `INSTANCE_TABLE` Table Type
- `LNAME_ARRAY` Table Type
- `NAME_ARRAY` Table Type
- `NUMBER_ARRAY` Table Type
- `UNCL_ARRAY` Table Type
INSTANCE_RECORD Record Type

This type describes a list of active instance number-name pairs.

Syntax

```sql
TYPE INSTANCE_RECORD IS RECORD (
    inst_number   NUMBER,
    inst_name     VARCHAR2(60));
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inst_number</td>
<td>Active instance number</td>
</tr>
<tr>
<td>inst_name</td>
<td>Instance name</td>
</tr>
</tbody>
</table>
DBLINK_ARRAY TABLE Type

This type stores a list of database links.

Syntax

```sql
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```
INDEX_TABLE_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

Syntax

``` TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER; ```
INSTANCE_TABLE Table Type

This type describes a table of INSTANCE_RECORD Record Type.

Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

Usage Notes

The starting index of INSTANCE_TABLE Is 1; INSTANCE_TABLE Is Dense.
LNAME_ARRAY Table Type

This type stores lists of LONG NAME including fully qualified attribute names.

Syntax

```
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```
NAME_ARRAY Table Type

This type stores lists of NAME.

Syntax

```sql
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```
NUMBER_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

Syntax

```
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```
UNCL_ARRAY Table Type

This type stores lists of "user"."name"."column@link"

Syntax

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```
Summary of DBMS_UTILITY Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE_INSTANCES Procedure on page 174-17</td>
<td>Returns the active instance</td>

<td>EXEC_DDL_STATEMENT Procedure on page 174-29</td>
<td>Executes the DDL statement in parse_string</td>
</tr>
<tr>
<td>EXPAND_SQL_TEXT Procedure on page 174-30</td>
<td>Recursively replaces any view references in the input SQL query with the corresponding view subquery</td>
</tr>
<tr>
<td>FORMAT_CALL_STACK Function on page 174-31</td>
<td>Formats the current call stack</td>
</tr>
<tr>
<td>FORMAT_ERROR_BACKTRACE Function on page 174-32</td>
<td>Formats the traceback from the point of the current error to the exception handler where the error has been caught</td>
</tr>
<tr>
<td>FORMAT_ERROR_STACK Function on page 174-35</td>
<td>Formats the current error stack</td>
</tr>
<tr>
<td>GET_CPU_TIME Function on page 174-36</td>
<td>Returns the current CPU time in 100th's of a second</td>
</tr>
<tr>
<td>GET_DEPENDENCY Procedure on page 174-37</td>
<td>Shows the dependencies on the object passed in.</td>
</tr>
<tr>
<td>GET_ENDIANNESS Function on page 174-37</td>
<td>Gets the endianness of the database platform</td>
</tr>
<tr>
<td>GET_HASH_VALUE Function on page 174-39</td>
<td>Computes a hash value for the given string</td>
</tr>
</tbody>
</table>
### Summary of DBMS_UTILITY Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_PARAMETER_VALUE Function</td>
<td>Gets the value of specified init.ora parameter</td>
</tr>
<tr>
<td>GET_SQL_HASH Function</td>
<td>Computes a hash value for the given string using MD5 algorithm</td>
</tr>
<tr>
<td>GET_TIME Function</td>
<td>Returns the current time in 100th's of a second</td>
</tr>
<tr>
<td>GET_TZ_TRANSITIONS Procedure</td>
<td>Returns timezone transitions by regionid from the timezone.dat file</td>
</tr>
<tr>
<td>INVALIDATE Procedure</td>
<td>Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings</td>
</tr>
<tr>
<td>IS_BIT_SET Function</td>
<td>Checks the bit setting for the given bit in the given RAW value</td>
</tr>
<tr>
<td>IS_CLUSTER_DATABASE Function</td>
<td>Determines if the database is running in cluster database mode</td>
</tr>
<tr>
<td>MAKE_DATA_BLOCK_ADDRESS Function</td>
<td>Creates a data block address given a file number and a block number</td>
</tr>
<tr>
<td>NAME_RESOLVE Procedure</td>
<td>Resolves the given name</td>
</tr>
<tr>
<td>NAME_TOKENIZE Procedure</td>
<td>Calls the parser to parse the given name</td>
</tr>
<tr>
<td>OLD_CURRENT_SCHEMA Function</td>
<td>Returns the session value from SYS_CONTEXT('USERENV','CURRENT_SCHEMA')</td>
</tr>
<tr>
<td>OLD_CURRENT_USER Function</td>
<td>Returns the session value from SYS_CONTEXT('USERENV','CURRENT_USER')</td>
</tr>
<tr>
<td>PORT_STRING Function</td>
<td>Returns a string that uniquely identifies the version of Oracle and the operating system</td>
</tr>
<tr>
<td>SQLID_TO_SQLHASH Function</td>
<td>Converts a SQL ID into a hash value</td>
</tr>
<tr>
<td>TABLE_TO_COMMA Procedures</td>
<td>Converts a PL/SQL table of names into a comma-delimited list of names</td>
</tr>
<tr>
<td>VALIDATE Procedure</td>
<td>Makes invalid database objects valid</td>
</tr>
<tr>
<td>WAIT_ON_PENDING_DML Function</td>
<td>Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back</td>
</tr>
</tbody>
</table>
ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
    instance_table   OUT INSTANCE_TABLE,
    instance_count   OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_table</td>
<td>Contains a list of the active instance numbers and names. When no instance is up, the list is empty.</td>
</tr>
<tr>
<td>instance_count</td>
<td>Number of active instances</td>
</tr>
</tbody>
</table>
ANALYZE_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

Syntax

```sql
DBMS_UTILITY.ANALYZE_DATABASE (  
    method             IN  VARCHAR2,  
    estimate_rows      IN  NUMBER DEFAULT NULL,  
    estimate_percent   IN  NUMBER DEFAULT NULL,  
    method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>method</code></td>
<td>One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either <code>estimate_rows</code> or <code>estimate_percent</code> must be nonzero.</td>
</tr>
<tr>
<td><code>estimate_rows</code></td>
<td>Number of rows to estimate</td>
</tr>
<tr>
<td><code>estimate_percent</code></td>
<td>Percentage of rows to estimate. If <code>estimate_rows</code> is specified ignore this parameter.</td>
</tr>
<tr>
<td><code>method_opt</code></td>
<td>Method options of the following format:</td>
</tr>
<tr>
<td></td>
<td>[ FOR TABLE ]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL [INDEXED] COLUMNS ] [ SIZE n ]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL INDEXES ]</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges for some object in this database
ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL:

'ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>] [<command_opt>] [<sample_clause>]

Syntax

DBMS_UTILITY.ANALYZE_PART_OBJECT (  
schema       IN VARCHAR2 DEFAULT NULL,  
object_name   IN VARCHAR2 DEFAULT NULL,  
object_type   IN CHAR     DEFAULT 'T',  
command_type  IN CHAR     DEFAULT 'E',  
command_opt   IN VARCHAR2 DEFAULT NULL,  
sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');

Parameters

Table 174–7  ANALYZE_PART_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Schema of the object_name</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of object to be analyzed, must be partitioned</td>
</tr>
<tr>
<td>object_type</td>
<td>Type of object, must be T (table) or I (index)</td>
</tr>
<tr>
<td>command_type</td>
<td>Must be V (validate structure)</td>
</tr>
<tr>
<td>command_opt</td>
<td>Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T.</td>
</tr>
<tr>
<td>sample_clause</td>
<td>Sample clause to use when command_type is 'E'</td>
</tr>
</tbody>
</table>

Usage Notes

For each partition of the object, run in parallel using job queues.
ANALYZE_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

Syntax

```sql
DBMS_UTILITY.ANALYZE_SCHEMA (    schema             IN  VARCHAR2,    method             IN  VARCHAR2,    estimate_rows      IN  NUMBER DEFAULT NULL,    estimate_percent   IN  NUMBER DEFAULT NULL,    method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>method</td>
<td>One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.</td>
</tr>
<tr>
<td>estimate_rows</td>
<td>Number of rows to estimate</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Method options of the following format:</td>
</tr>
<tr>
<td></td>
<td>[ FOR TABLE ]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL [INDEXED] COLUMNS] [SIZE n]</td>
</tr>
<tr>
<td></td>
<td>[ FOR ALL INDEXES ]</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges for some object in this schema
CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as ‘table’), and strips off white spaces for a single identifier so that 'table' becomes TABLE.

Syntax

```sql
DBMS_UTILITY.CANONICALIZE(
    name           IN    VARCHAR2,
    canon_name     OUT   VARCHAR2,
    canon_len      IN    BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String to be canonicalized</td>
</tr>
<tr>
<td>canon_name</td>
<td>Canonicalized string</td>
</tr>
<tr>
<td>canon_len</td>
<td>Length of the string (in bytes) to canonicalize</td>
</tr>
</tbody>
</table>

Return Values

Returns the first `canon_len` bytes in `canon_name`.

Usage Notes

- If `name` is NULL, `canon_name` becomes NULL.
- If `name` is not a dotted name, and if `name` begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If `name` is a dotted name (such as `a."b".c`), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after `a[b]*` will be ignored.
- The procedure does not handle cases like ‘A B.’

Examples

- a becomes `A`
- "a*" becomes `a`
- "a*.b" becomes "a." "B"
- "a*.b,c.f" becomes "a." "B" with ",c.f*" ignored.
COMMA_TO_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (  
list   IN  VARCHAR2,  
tablen OUT BINARY_INTEGER,  
tab    OUT unci_array);
```

```
DBMS_UTILITY.COMMA_TO_TABLE (  
list   IN  VARCHAR2,  
tablen OUT BINARY_INTEGER,  
tab    OUT lname_array);
```

Parameters

**Table 174–10  COMMA_TO_TABLE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| list      | Comma-separated list of list of 'names', where a name should have the following format for the first overloading: a [. b [. c ]]([ @ d ])
|           | and the following format for the second overloading: a [. b]*
|           | where a, b, c, d are simple identifiers (quoted or unquoted). |
| tablen    | Number of tables in the PL/SQL table |
| tab       | PL/SQL table which contains list of names |

Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

Usage Notes

- The list must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.
- The values in tab are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.
COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (  
    schema          IN VARCHAR2,  
    compile_all     IN BOOLEAN DEFAULT TRUE,  
    reuse_settings  IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>compile_all</td>
<td>If TRUE, will compile everything within the schema regardless of whether it is VALID</td>
</tr>
<tr>
<td></td>
<td>If FALSE, will compile only INVALID objects</td>
</tr>
<tr>
<td>reuse_settings</td>
<td>Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000</td>
<td>Insufficient privileges for some object in this schema</td>
</tr>
<tr>
<td>ORA-20001</td>
<td>Cannot recompile SYS objects</td>
</tr>
<tr>
<td>ORA-20002</td>
<td>Maximum iterations exceeded. Some objects may not have been recompiled.</td>
</tr>
</tbody>
</table>

Usage Notes

- Note that this subprogram is a wrapper for the RECOMP_SERIAL Procedure included with the UTL_RECOMP package.
- After calling this procedure, you should select from view ALL_OBJECTS for items with status of INVALID to see if all objects were successfully compiled.
- To see the errors associated with INVALID objects, you may use the Enterprise Manager command:
  
```
SHOW ERRORS <type> <schema>.<name>
```
CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the EXCEPTION clause of the ALTER TYPE statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(
  schema_name IN VARCHAR2,
  table_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table created</td>
</tr>
</tbody>
</table>

Exceptions

An error is returned if the table already exists.
CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns NULL when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE
RETURN NUMBER;
```
DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```sql
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (dba NUMBER) RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dba</td>
<td>Data block address</td>
</tr>
</tbody>
</table>

Pragmas

```sql
pragma restrict_references(data_block_address_block, \NDS, \NDS, \NPS, \NPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.
DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```sql
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (dba NUMBER)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dba</td>
<td>Data block address</td>
</tr>
</tbody>
</table>

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.
DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```sql
DBMS_UTILITY.DB_VERSION (
    version       OUT VARCHAR2,
    compatibility OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>A string which represents the internal software version of the database (for example, 7.1.0.0.0).</td>
</tr>
<tr>
<td></td>
<td>The length of this string is variable and is determined by the database version.</td>
</tr>
<tr>
<td>compatibility</td>
<td>The compatibility setting of the database determined by the &quot;compatible&quot; init.ora parameter.</td>
</tr>
<tr>
<td></td>
<td>If the parameter is not specified in the init.ora file, then NULL is returned.</td>
</tr>
</tbody>
</table>
EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

Syntax

```sql
DBMS_UTILITY.EXEC_DDL_STATEMENT (  
    parse_string IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parse_string</td>
<td>DDL statement to be executed</td>
</tr>
</tbody>
</table>
EXPAND_SQL_TEXT Procedure

This procedure recursively replaces any view references in the input SQL query with the corresponding view subquery.

Syntax

```sql
DBMS_UTILITY.EXPAND_SQL_TEXT (  
    input_sql_text  IN           CLOB,  
    output_sql_text OUT NOCOPY   CLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input_sql_text</td>
<td>Input SQL query text</td>
</tr>
<tr>
<td>output_sql_text</td>
<td>View-expanded query text</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-00942</td>
<td>Current user does not have select privileges on all the views and tables recursively referenced in the input_sql_text.</td>
</tr>
<tr>
<td>ORA-24251</td>
<td>input_sql_text is not a SELECT statement.</td>
</tr>
<tr>
<td>ORA-00900</td>
<td>Input is not valid.</td>
</tr>
<tr>
<td>ORA-29477</td>
<td>Input LOB size exceeds maximum size of 4GB -1.</td>
</tr>
</tbody>
</table>

Usage Notes

The expanded and merged SQL statement text is copied to output_sql_text on successful completion. The resulting query text only contains references to underlying tables and is semantically equivalent with some caveats:

- If there are invoker rights functions called from any of the views, they may be called as a different user in the resulting query text if the view owner is different from the user who will eventually compile/run the expanded SQL text.
- The VPD policy expands differently if there is a function supplied to generate the dynamic WHERE clause. This function would return differently, for example, if the userid caused the expansion to be different.
- If there are references to remote objects, results are undetermined.
FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```sql
DBMS_UTILITY.FORMAT_CALL_STACK
    RETURN VARCHAR2;
```

Pragmas

```sql
pragma restrict_references(format_call_stack, WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.
FORMAT_ERROR_BACKTRACE Function

This function displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope. The output is similar to the output of the SQLERRM function, but not subject to the same size limitation.

Syntax

DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
   RETURN VARCHAR2;

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
   g_start_pos integer := 1;
   g_end_pos  integer;

   FUNCTION Output_One_Line RETURN BOOLEAN IS
      BEGIN
         g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );

         CASE g_end_pos > 0
            WHEN true THEN
               DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
             g_end_pos-g_start_pos ) );
               g_start_pos := g_end_pos+1;
               RETURN TRUE;
            WHEN FALSE THEN
               DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
             (Length(i_buff)-g_start_pos)+1 ) );
               RETURN FALSE;
            END CASE;
      END Output_One_Line;

      BEGIN
         WHILE Output_One_Line() LOOP NULL;
      END LOOP;
      END Log_Errors;
      /

      CREATE OR REPLACE PROCEDURE P0 IS
         e_01476 EXCEPTION; pragma exception_init ( e_01476, -1476 );
      BEGIN
         RAISE e_01476;
      END P0;
      /

or database administrator.
*/
FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.
GET_CPU_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

Syntax

```sql
DBMS_UTILITY.GET_CPU_TIME
RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.
GET_DEPENDENCY Procedure

This procedure shows the dependencies on the object passed in.

Syntax

```sql
DBMS_UTILITY.GET_DEPENDENCY
    type IN VARCHAR2,
    schema IN VARCHAR2,
    name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of the object, for example if the object is a table give the type as 'TABLE'</td>
</tr>
<tr>
<td>schema</td>
<td>Schema name of the object</td>
</tr>
<tr>
<td>name</td>
<td>Name of the object</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure uses the DBMS_OUTPUT package to display results, and so you must declare SET SERVEROUTPUT ON if you wish to view dependencies. Alternatively, any application that checks the DBMS_OUTPUT output buffers can invoke this subprogram and then retrieve the output by means of DBMS_OUTPUT subprograms such as GET_LINES.
GET_ENDIANNESS Function

This function gets the endianness of the database platform.

Syntax

```sql
DBMS_UTILITY.GET_ENDIANNESS
RETURN NUMBER;
```

Return Values

A `NUMBER` value indicating the endianness of the database platform: 1 for big-endian or 2 for little-endian.
GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```sql
DBMS_UTILITY.GET_HASH_VALUE (    name VARCHAR2,    base NUMBER,    hash_size NUMBER) RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String to be hashed.</td>
</tr>
<tr>
<td>base</td>
<td>Base value for the returned hash value at which to start</td>
</tr>
<tr>
<td>hash_size</td>
<td>Desired size of the hash table</td>
</tr>
</tbody>
</table>

Pragmas

```sql
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the hash_size value. Using a power of 2 for the hash_size parameter works best.
GET_PARAMETER_VALUE Function

This function gets the value of specified init.ora parameter.

Syntax

```sql
DBMS_UTILITY.GET_PARAMETER_VALUE ( 
  parnam     IN        VARCHAR2,
  intval     IN OUT    BINARY_INTEGER,
  strval     IN OUT    VARCHAR2,
  listno     IN        BINARY_INTEGER DEFAULT 1) 
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parnam</td>
<td>Parameter name</td>
</tr>
<tr>
<td>intval</td>
<td>Value of an integer parameter or the value length of a string parameter</td>
</tr>
<tr>
<td>strval</td>
<td>Value of a string parameter</td>
</tr>
<tr>
<td>listno</td>
<td>List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.</td>
</tr>
</tbody>
</table>

Return Values

Parameter type:
- 0 if parameter is an INTEGER/BOOLEAN parameter
- 1 if parameter is a string/file parameter

Usage Notes

- To execute this function, you must have the SELECT privilege on the V$PARAMETER dynamic view.
- When using `DBMS_UTILITY.GET_PARAMETER_VALUE`, only the first parameter setting of /dir1 is returned when init.ora is set as follows:
  ```sql
  utl_file_dir = /dir1
  utl_file_dir = /dir2
  ```
  However, the full comma-delimited string is returned if you are using:
  ```sql
  utl_file_dir = /dir1, /dir2
  ```

Examples

```sql
DECLARE
  parnam VARCHAR2(256);
  intval BINARY_INTEGER;
  strval VARCHAR2(256);
  partyp BINARY_INTEGER;
BEGIN
  partyp := dbms_utility.get_parameter_value('max_dump_file_size',
```
intval, strval);
dbms_output.put('parameter value is: ');
IF partyp = 1 THEN
    dbms_output.put_line(strval);
ELSE
    dbms_output.put_line(intval);
END IF;
IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
END IF;
dbms_output.put('parameter type is: ');
IF partyp = 1 THEN
    dbms_output.put_line('string');
ELSE
    dbms_output.put_line('integer');
END IF;
END;
GET_SQL_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

Syntax

```sql
Dbms_utility.get_sql_hash (  
    name          IN   VARCHAR2,
    hash          OUT  RAW,
    pre10ihash    OUT  NUMBER)  
RETURN NUMBER;
```

Pragmas

Pragma Restrict_references(Get_sql_hash, Wnds, Rnds, Wnps, Rnps);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String to be hashed</td>
</tr>
<tr>
<td>hash</td>
<td>Optional field to store all 16 bytes of returned hash value</td>
</tr>
<tr>
<td>pre10ihash</td>
<td>Optional field to store the pre 10i database version hash value</td>
</tr>
</tbody>
</table>

Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. one could use an optional raw parameter to get all 16 bytes and to store the pre 10i hash value of 4 bytes in the pre10i hash optional parameter.
GET_TIME Function

This function determines the current time in 100th’s of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME
    RETURN NUMBER;
```

Return Values

Time is the number of 100th’s of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers, application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.
GET_TZ_TRANSITIONS Procedure

This procedure returns time zone transitions by regionid from the timezone.dat file.

Syntax

```plsql
DBMS_UTILITY.GET_TZ_TRANSITIONS
    regionid      IN     NUMBER,
    transitions   OUT    MAXRAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regionid</td>
<td>Number corresponding to the region</td>
</tr>
<tr>
<td>transitions</td>
<td>Raw bytes from the timezone.dat file</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR</td>
<td>For an invalid regionid</td>
</tr>
</tbody>
</table>
INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```sql
DBMS_UTILITY.INVALIDATE (
    p_object_id              NUMBER,
    p_plsql_object_settings  VARCHAR2 DEFAULT NULL,
    p_option_flags           PLS_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_object_id</td>
<td>ID number of object to be invalidated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS. If the object_id argument is NULL or invalid then the exception inv_not_exist_or_no_priv is raised. The caller of this procedure must have create privileges on the object being invalidated else the inv_not_exist_or_no_priv exception is raised.</td>
</tr>
<tr>
<td>p_plsql_object_settings</td>
<td>Optional parameter that ignored if the object specified by p_object_id is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to REUSE SETTINGS. If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else inv_malformed_settings exception will be raised. The setting values are changed only for the object specified by p_object_id and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and REUSE SETTINGS is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and REUSE SETTINGS was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.</td>
</tr>
<tr>
<td>p_option_flags</td>
<td>Optional parameter defaults to zero (no flags). Option flags supported by invalidate.</td>
</tr>
<tr>
<td></td>
<td>inv_error_on_restrictions (see Constants on page 174-4): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by p_object_id cannot be a table. By default, invalidate quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception inv_restricted_object is raised.</td>
</tr>
</tbody>
</table>
Exceptions

**Table 174–27 INVALIDATE Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INV_NOT_EXIST_OR_NO_PRIV</td>
<td>Raised when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated.</td>
</tr>
<tr>
<td>INV_MALFORMED_SETTINGS</td>
<td>Raised if a compiler setting is specified more than once in the p_plsql_object_settings parameter.</td>
</tr>
<tr>
<td>INV_RESTRICTED_OBJECT</td>
<td>Raised when different combinations of conditions pertaining to the p_object_id parameter are contravened.</td>
</tr>
</tbody>
</table>

Usage Notes

The object type (object_type column from ALL_OBJECTS) of the object specified by p_object_id must be a PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, TYPE, TYPE BODY, LIBRARY, VIEW, OPERATOR, SYNONYM, or JAVA CLASS. If the object is not one of these types and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is the package specification of STANDARD, DBMS_STANDARD, or specification or body of DBMS_UTILITY and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is an object type specification and there exist tables which depend on the type and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

Examples

**Example 1**

DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');

Assume that the object_id 1232 refers to the procedure remove_emp in the HR schema. Then the above call will mark the remove_emp procedure invalid and change its PLSQL_OPTIMIZE_LEVEL compiler setting to 2. The values of other compiler settings will remain unchanged since REUSE_SETTINGS is specified.

Objects that depend on hr.remove_emp will also get marked invalid. Their compiler parameters will not be changed.

**Example 2**

DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');

Assume that the object_id 40775 refers to the type body leaf_category_typ in the OE schema. Then the above call will mark the type body invalid and change its PLSQL_CODE_TYPE compiler setting to NATIVE. The values of other compiler settings will be picked up from the current session environment since REUSE_SETTINGS has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.
Example 3

DBMS_UTILITY.INVALIDATE(40796);

Assume that the object_id 40796 refers to the view oc_orders in the OE schema. Then the above call will mark the oc_orders view invalid.

Objects that depend on oe.oc_orders will also get marked invalid.
IS_BIT_SET Function

This function checks the bit setting for the given bit in the given RAW value.

Syntax

```sql
DBMS_UTILITY.IS_BIT_SET (  
    r IN RAW,  
    n IN NUMBER)  
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW source</td>
</tr>
<tr>
<td>n</td>
<td>Bit in r to check</td>
</tr>
</tbody>
</table>

Return Values

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.
IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```sql
DBMS_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

Return Values

This function returns `TRUE` if this instance was started in cluster database mode; `FALSE` otherwise.
MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number. A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```sql
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (                    
    file  NUMBER,                                            
    block NUMBER)                                            
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File that contains the block</td>
</tr>
<tr>
<td>block</td>
<td>Offset of the block within the file in terms of block increments</td>
</tr>
</tbody>
</table>

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.
NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```sql
DBMS_UTILITY.NAME_RESOLVE (  
   name          IN  VARCHAR2,  
   context       IN  NUMBER,  
   schema        OUT VARCHAR2,  
   part1         OUT VARCHAR2,  
   part2         OUT VARCHAR2,  
   dblink        OUT VARCHAR2,  
   part1_type    OUT NUMBER,  
   object_number OUT NUMBER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>name</strong></td>
<td>Name of the object. This can be of the form [[a.]b.[c][d]], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in. a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).</td>
</tr>
<tr>
<td><strong>context</strong></td>
<td>Must be an integer between 0 and 9.</td>
</tr>
</tbody>
</table>
|            | - 0 - table  
|            | - 1 - PL/SQL (for 2 part names)  
|            | - 2 - sequences  
|            | - 3 - trigger  
|            | - 4 - Java Source  
|            | - 5 - Java resource  
|            | - 6 - Java class  
|            | - 7 - type  
|            | - 8 - Java shared data  
|            | - 9 - index |
| **schema** | Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name. |
| **part1**  | First part of the name. The type of this name is specified part1_type (synonym or package). |
| **part2**  | If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram. |
Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.
NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as

\[ a \ [. \ b \ [. \ c \ ]][@ \text{dblink} \ ] \]

It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

Syntax

```sql
DBMS_UTILITY.NAME_TOKENIZE (    name IN VARCHAR2,    a OUT VARCHAR2,    b OUT VARCHAR2,    c OUT VARCHAR2,    dblink OUT VARCHAR2,    nextpos OUT BINARY_INTEGER);```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Input name, consisting of SQL identifiers (for example, <code>scott.foo@dblink</code>)</td>
</tr>
<tr>
<td>a</td>
<td>Output for the first token of the name</td>
</tr>
<tr>
<td>b</td>
<td>Output for the second token of the name (if applicable)</td>
</tr>
<tr>
<td>c</td>
<td>Output for the third token of the name (if applicable)</td>
</tr>
<tr>
<td>dblink</td>
<td>Output for the <code>dblink</code> of the name</td>
</tr>
<tr>
<td>nextpos</td>
<td>Next position after parsing the input name</td>
</tr>
</tbody>
</table>
OLD_CURRENT_SCHEMA Function

This function returns the session value from `sys_context('userenv','current_schema').`

Syntax

```sql
DBMSUTILITY.OLD_CURRENT_SCHEMA
RETURN VARCHAR2;
```
OLD_CURRENT_USER Function

This function returns the session value from `sys_context('userenv', 'current_user')`.

Syntax

```sql
DBMS_UTILITY.OLD_CURRENT_USER
RETURN VARCHAR2;
```
PORT_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"
The maximum length is port-specific.

Syntax

```
DBMS_UTILITY.PORT_STRING
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```
SQLID_TO_SQLHASH Function

This function converts a SQL ID into a hash value.

Syntax

```sql
DBMS_UTILITY.SQLID_TO_SQLHASH (
    sql_id IN VARCHAR2)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL ID of a SQL statement. Must be VARCHAR2(13).</td>
</tr>
</tbody>
</table>
TABLE_TO_COMMA Procedures

This procedure converts a PL/SQL table of names into a comma-delimited list of names. This takes a PL/SQL table, 1..n, terminated with n+1 null. The second version supports fully-qualified attribute names.

Syntax

```sql
DBMS_UTILITY.TABLE_TO_COMMA (  
    tab    IN  UNCL_ARRAY,  
    tablen OUT BINARY_INTEGER,  
    list   OUT VARCHAR2);  

DBMS_UTILITY.TABLE_TO_COMMA (  
    tab    IN  lname_array,  
    tablen OUT BINARY_INTEGER,  
    list   OUT VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tab</td>
<td>PL/SQL table which contains list of table names</td>
</tr>
<tr>
<td>tablen</td>
<td>Number of tables in the PL/SQL table</td>
</tr>
<tr>
<td>list</td>
<td>Comma separated list of tables</td>
</tr>
</tbody>
</table>

Return Values

A comma-delimited list and the number of elements found in the table.
VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

DBMS_UTILITY.VALIDATE(
    object_id       NUMBER);

DBMS_UTILITY.VALIDATE(
    owner          VARCHAR2,
    objname        VARCHAR2,
    namespace      NUMBER,   edition_name := SYS_CONTEXT ('USERENV', 'CURRENT_EDITION'));

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace of the object. Same as the namespace field in obj$. Equivalent numeric values are as follows:</td>
</tr>
<tr>
<td></td>
<td>■ 1 = TABLE/PROCEDURE/TYPEx</td>
</tr>
<tr>
<td></td>
<td>■ 2 = BODY</td>
</tr>
<tr>
<td></td>
<td>■ 3 = TRIGGER</td>
</tr>
<tr>
<td></td>
<td>■ 4 = INDEX</td>
</tr>
<tr>
<td></td>
<td>■ 5 = CLUSTER</td>
</tr>
<tr>
<td></td>
<td>■ 8 = LOB</td>
</tr>
<tr>
<td></td>
<td>■ 9 = DIRECTORY</td>
</tr>
<tr>
<td></td>
<td>■ 10 = QUEUE</td>
</tr>
<tr>
<td></td>
<td>■ 11 = REPLICATION OBJECT GROUP</td>
</tr>
<tr>
<td></td>
<td>■ 12 = REPLICATION PROPAGATOR</td>
</tr>
<tr>
<td></td>
<td>■ 13 = JAVA SOURCE</td>
</tr>
<tr>
<td></td>
<td>■ 14 = JAVA RESOURCE</td>
</tr>
<tr>
<td></td>
<td>■ 58 = (Data Mining) MODEL</td>
</tr>
<tr>
<td>edition_name</td>
<td>[Note: Currently not operable. Reserved for future use]</td>
</tr>
</tbody>
</table>

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.
The INVALIDATE Procedure invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its object_id. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to INVALIDATE will not actualize the object in the current edition.
WAIT_ON_PENDING_DML Function

This function waits until all transactions (other than the caller’s own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back.

Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (    
  tables     IN       VARCHAR2,
  timeout    IN       BINARY_INTEGER,
  scn        IN OUT   NUMBER)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tables</td>
<td>Comma-separated list of one or more table names. The list must be valid for COMMA_TO_TABLE Procedures, and each item valid to the NAME_RESOLVE Procedure. Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum number of seconds to wait, totalled across all tables/transactions. A NULL or negative value will cause a very long wait.</td>
</tr>
<tr>
<td>scn</td>
<td>SCN prior to which transactions must have begun to be considered relevant to this request. If the value is NULL or not recognized as a meaningful SCN on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output.</td>
</tr>
</tbody>
</table>

Return Values

TRUE if all relevant transactions have committed or been rolled back, FALSE if the timeout occurred prior to all relevant transactions committing or being rolled back.
The DBMS_WARNING package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the PLSQL_WARNINGS initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- Using DBMS_WARNING
  - Security Model
- Summary of DBMS_WARNING Subprograms
Using DBMS_WARNING

- Security Model
Security Model

Note that for all the following interfaces, if value of the scope parameter is SYSTEM, then the user must have ALTER SYSTEM privilege.
## Summary of DBMS_WARNING Subprograms

Table 175–1  DBMS_WARNING Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_WARNING_SETTING_CAT Procedure on page 175-5</td>
<td>Modifies the current session or system warning settings of the warning_category previously supplied</td>
</tr>
<tr>
<td>ADD_WARNING_SETTING_NUM Procedure on page 175-6</td>
<td>Modifies the current session or system warning settings of the warning_number previously supplied</td>
</tr>
<tr>
<td>GET_CATEGORY Function on page 175-7</td>
<td>Returns the category name, given the message number</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_CAT Function on page 175-8</td>
<td>Returns the specific warning category in the session</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_NUM Function on page 175-9</td>
<td>Returns the specific warning number in the session</td>
</tr>
<tr>
<td>GET_WARNING_SETTING_STRING Function on page 175-10</td>
<td>Returns the entire warning string for the current session</td>
</tr>
<tr>
<td>SET_WARNING_SETTING_STRING Procedure on page 175-11</td>
<td>Replaces previous settings with the new value</td>
</tr>
</tbody>
</table>
**ADD_WARNING_SETTING_CAT Procedure**

You can modify the current session's or system's warning settings with the value supplied. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value. The effect of calling this function is same as adding the qualifier (ENABLE/DISABLE/ERROR) on the category specified to the end of the current session or system setting.

**Syntax**

```sql
DBMS_WARNING.ADD_WARNING_SETTING_CAT (  
    warning_category    IN    VARCHAR2,  
    warning_value       IN    VARCHAR2,  
    scope               IN    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>warning_category</code></td>
<td>Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.</td>
</tr>
<tr>
<td><code>warning_value</code></td>
<td>Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.</td>
</tr>
<tr>
<td><code>scope</code></td>
<td>Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
ADD_WARNING_SETTING_NUM Procedure

You can modify the current session or system warning settings with the value supplied. If the value was already set, you will override the existing value. The effect of calling this function is same as adding the qualifier (ENABLE / DISABLE / ERROR) on the category specified to the end of the current session or system setting.

Syntax

```sql
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
    warning_number      IN    NUMBER,
    warning_value       IN    VARCHAR2,
    scope               IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>The warning number. Allowed values are all valid warning numbers.</td>
</tr>
<tr>
<td>warning_value</td>
<td>Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.</td>
</tr>
<tr>
<td>scope</td>
<td>Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

DBMS_WARNING.GET_CATEGORY (  
    warning_number IN  pls_integer)  
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>The warning message number.</td>
</tr>
</tbody>
</table>
GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (    
    warning_category IN VARCHAR2) 
RETURN warning_value;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_category</td>
<td>Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).</td>
</tr>
</tbody>
</table>
**GET_WARNING_SETTING_NUM Function**

This function returns the specific warning number setting for the current session.

**Syntax**

```sql
DBMS_WARNING.GET_WARNING_SETTING_NUM (    
    warning_number IN NUMBER)    
RETURN warning_value;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_number</td>
<td>Warning number. Allowed values are all valid warning numbers.</td>
</tr>
</tbody>
</table>
GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```sql
DBMS_WARNING.GET_WARNING_SETTING_STRING
RETURN VARCHAR2;
```

Usage Notes

Use this function when you do not have SELECT or READ privilege on v$parameter or v$paramater2 fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using SET_WARNING_SETTING_STRING.
**SET_WARNING_SETTING_STRING Procedure**

This procedure replaces previous settings with the new value. The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of ‘=’ when issuing an ALTER SESSION or SYSTEM SET PLSQL_WARNINGS command. This will have same effect as ALTER SESSION OR ALTER SYSTEM command.

**Syntax**

```sql
DBMS_WARNING.SET_WARNING_SETTING_STRING (   warning_value   IN   VARCHAR2,   scope           IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning_value</td>
<td>The new string that will constitute the new value.</td>
</tr>
<tr>
<td>scope</td>
<td>This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM.</td>
</tr>
</tbody>
</table>
The DBMS_WM package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

- Documentation of DBMS_WM
For a complete description of this package, see `DBMS_WM` in *Oracle Database Workspace Manager Developer’s Guide*. 
The DBMS_WORKLOAD_CAPTURE package configures the Workload Capture system and produce the workload capture data. Replay of this capture is implemented by way of the DBMS_WORKLOAD_REPLAY package.

See Also: Oracle Database Testing Guide for more information about Database Replay

This chapter contains the following topics:

- Using DBMS_WORKLOAD_CAPTURE
  - Overview
  - Security Model

- Summary of DBMS_WORKLOAD_CAPTURE Subprograms
Using DBMS_WORKLOAD_CAPTURE

- Overview
- Security Model
Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.
Security Model

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```sql
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute `wrc` on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.
Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table lists the package subprograms in alphabetical order.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_FILTER Procedures</td>
<td>Adds a specified filter</td>
</tr>
<tr>
<td>DELETE_CAPTURE_INFO Procedure</td>
<td>Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID</td>
</tr>
<tr>
<td>DELETE_FILTER Procedure</td>
<td>Deletes a specified filter</td>
</tr>
<tr>
<td>EXPORT_AWR Procedure</td>
<td>Exports the AWR snapshots associated with a given capture ID</td>
</tr>
<tr>
<td>FINISH_CAPTURE Procedure</td>
<td>Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured</td>
</tr>
<tr>
<td>GET_CAPTURE_INFO Function</td>
<td>Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID</td>
</tr>
<tr>
<td>IMPORT_AWR Function</td>
<td>Imports the AWR snapshots associated with a given capture ID</td>
</tr>
<tr>
<td>REPORT Function on page 177-14</td>
<td>Returns a report on the workload capture under consideration using one or more different sources</td>
</tr>
<tr>
<td>START_CAPTURE Procedure</td>
<td>Initiates workload capture on all instances</td>
</tr>
</tbody>
</table>
ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.ADD_FILTER ( 
  fname           IN   VARCHAR2 NOT NULL,
  fattribute      IN   VARCHAR2 NOT NULL,
  fvalue          IN   VARCHAR2 NOT NULL);

DBMS_WORKLOAD_CAPTURE.ADD_FILTER ( 
  fname           IN   VARCHAR2 NOT NULL,
  fattribute      IN   VARCHAR2 NOT NULL,
  fvalue          IN   NUMBER NOT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fname</td>
<td>Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)</td>
</tr>
<tr>
<td>fattribute</td>
<td>Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are:</td>
</tr>
<tr>
<td>fvalue</td>
<td>Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as &quot;attribute = value&quot;, with the filter for a STRING attribute parsed as &quot;attribute like value&quot; (Mandatory).</td>
</tr>
</tbody>
</table>

Usage Notes

- The workload capture filters work in either the DEFAULT INCLUSION or the DEFAULT EXCLUSION mode as determined by the default_action input to the START_CAPTURE Procedure.
- ADD_FILTER adds a new filter that affects the next workload capture, and whether the filters are considered as INCLUSION filters or EXCLUSION filters depends on the value of the default_action input to START_CAPTURE Procedure.
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the START_CAPTURE Procedure is executed.
- All the filters are listed in the DBA_WORKLOAD_FILTERS view.
You can capture the workload for a particular PDB by specifying a filter of PDB type.

Examples

- By default, a capture works in an INCLUSION mode, which records everything except for those requests that satisfy conditions of specified filters. For example, if you want to exclude all requests from SCOTT, you can add the following filter before starting a capture.

  ```sql
  EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user1', 'USER', 'SCOTT');
  ```

- Multiple filters are evaluated according to the logical disjunction operator OR. Therefore, if you want to record workload for both SCOTT and JOHN, you add an additional filter:

  ```sql
  EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user2', 'USER', 'JOHN');
  ```

- In a CDB, you exclude the workload of a particular PDB by the filter:

  ```sql
  EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter pdb workload', 'PDB_NAME', 'CDB1_PDB1');
  ```

- To use DBMS_APPLICATION_INFO to identify workload that is issued to the database:

  ```sql
  DBMS_APPLICATION_INFO.SET_MODULE('ORDER_ENTRY', NULL);
  -- run some SQL here
  DBMS_APPLICATION_INFO.SET_ACTION('ORDER_ENTRY_LOG');
  -- run logging SQL
  ```

- If having captured workload, you want to exclude the logging SQL from the captured, specify a filter for capture:

  ```sql
  DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter logging operations', 'ACTION', 'ORDER_ENTRY_LOG');
  ```

- To filter out the full order entry transaction, define a filter:

  ```sql
  DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter order entry', 'MODULE', 'ORDER_ENTRY');
  ```
DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
  capture_id IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the workload capture that needs to be deleted.</td>
</tr>
<tr>
<td></td>
<td>Corresponds to DBA_WORKLOAD_CAPTURES.ID. (Mandatory)</td>
</tr>
</tbody>
</table>

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.
DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (    filter_name           IN   VARCHAR2(40) NOT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter_name</td>
<td>Filter to be deleted</td>
</tr>
</tbody>
</table>

Usage Notes

The DELETE_FILTER Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the ADD_FILTER Procedures after any capture has been completed. Filters that have been added using ADD_FILTER before a START_CAPTURE and FINISH_CAPTURE cannot be deleted anymore using this subprogram.
**EXPORT_AWR Procedure**

This procedure exports the AWR snapshots associated with a given capture ID.

**Syntax**

```sql
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (capture_id IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the capture whose AWR snapshots are to be exported. (Mandatory)</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_CAPTURES` was not created by calling the `GET_CAPTURE_INFO` function) and the AWR snapshots that correspond to the original capture time period are still available.
**FINISH_CAPTURE Procedure**

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

**Syntax**

```sql
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
  timeout     IN   NUMBER  DEFAULT 30
  reason       IN   VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>timeout</code></td>
<td>Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush it's capture buffers. Default value: 30 seconds</td>
</tr>
<tr>
<td><code>reason</code></td>
<td>Specifies a reason for calling the procedure. The reason appears in the column <code>ERROR_MESSAGE</code> of the view <code>DBA_WORKLOAD_CAPTURES</code>.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- By default, `FINISH_CAPTURE` waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.

- All sessions that either were in the middle of executing a user request or received a new user request, while `FINISH_CAPTURE` was waiting for acknowledgements, flush their buffers and send back their acknowledgement to `FINISH_CAPTURE`.

- If a database session remains idle (waiting for the next user request) throughout the duration of `FINISH_CAPTURE`, the session might have unflushed capture buffers and does not send it's acknowledgement to `FINISH_CAPTURE`.

To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking `FINISH_CAPTURE`. Either close the database session(s) before running `FINISH_CAPTURE` or send new database requests to those sessions during `FINISH_CAPTURE`. 
GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views, and returns the appropriate `DBA_WORKLOAD_CAPTURES.ID`

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
  dir     IN   VARCHAR2)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir</td>
<td>Name of the <code>DIRECTORY</code> object (case sensitive) where all the workload capture files are located (Mandatory)</td>
</tr>
</tbody>
</table>

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in `DBA_WORKLOAD_CAPTURES`, the `GET_CAPTURE_INFO Function` simply returns that row’s `DBA_WORKLOAD_CAPTURES.ID`. If no existing row matches the capture present in the stipulated directory a new row is inserted to `DBA_WORKLOAD_CAPTURES` and that row’s ID is returned.
**IMPORT_AWR Function**

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the **EXPORT_AWR Procedure**.

**Syntax**

```sql
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
   capture_id     IN   NUMBER,
   staging_schema IN   VARCHAR2,
   force_cleanup  IN   BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

**Parameters**

**Table 177–8  IMPORT_AWR Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the capture whose AWR snapshots should be imported. (Mandatory)</td>
</tr>
<tr>
<td>staging_schema</td>
<td>Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory, Case sensitive).</td>
</tr>
</tbody>
</table>
| force_cleanup | Values:  
  ■ TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL:  
    ```sql
    SELECT table_name FROM dba_tables
    WHERE owner = staging_schema
    AND table_name like 'WR_$%';
    ```  
  Use this option only if you are sure that there are no important data in any such tables in the staging_schema.  
  ■ FALSE - (default) no tables dropped from the staging_schema prior to the import operation |

**Return Values**

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

**Usage Notes**

**IMPORT_AWR** fails if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking **IMPORT_AWR**.
REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```sql
DBMS_WORKLOAD_CAPTURE.REPORT ( capture_id IN NUMBER, format IN VARCHAR2) RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_id</td>
<td>ID of the workload capture whose capture report is required. (Mandatory) This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture.</td>
</tr>
<tr>
<td>format</td>
<td>Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML. (Mandatory)</td>
</tr>
</tbody>
</table>

Return Values

The report body in the desired format returned as a CLOB.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_HTML</td>
<td>VARCHAR2</td>
<td>'HTML'</td>
<td>Generates the HTML version of the report</td>
</tr>
<tr>
<td>TYPE_TEXT</td>
<td>VARCHAR2</td>
<td>'TEXT'</td>
<td>Used as input to the format argument to generate the text version of the report</td>
</tr>
</tbody>
</table>
**START_CAPTURE Procedure**

This procedure initiates workload capture on all instances.

**Syntax**

```sql
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
    name              IN  VARCHAR2,
    dir               IN  VARCHAR2,
    duration          IN  NUMBER   DEFAULT NULL,
    default_action    IN  VARCHAR2 DEFAULT 'INCLUDE',
    auto_unrestrict   IN  BOOLEAN  DEFAULT TRUE,
    capture_sts       IN  BOOLEAN  DEFAULT FALSE,
    sts_cap_interval  IN  NUMBER   DEFAULT 300);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the workload capture. Allows the workload capture to be given a label, such as “Thanksgiving weekend” or “Christmas peak workload” for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)</td>
</tr>
<tr>
<td>dir</td>
<td>Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)</td>
</tr>
<tr>
<td>duration</td>
<td>Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.</td>
</tr>
<tr>
<td>default_action</td>
<td>Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters.</td>
</tr>
<tr>
<td></td>
<td>- If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.)</td>
</tr>
<tr>
<td></td>
<td>- If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured.</td>
</tr>
<tr>
<td>auto_unrestrict</td>
<td>Can be either TRUE or FALSE.</td>
</tr>
<tr>
<td></td>
<td>- If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT)</td>
</tr>
<tr>
<td></td>
<td>- If FALSE, no database instance is automatically unrestricted.</td>
</tr>
</tbody>
</table>

**Table 177–11  START_CAPTURE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the workload capture. Allows the workload capture to be given a label, such as “Thanksgiving weekend” or “Christmas peak workload” for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)</td>
</tr>
<tr>
<td>dir</td>
<td>Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)</td>
</tr>
<tr>
<td>duration</td>
<td>Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.</td>
</tr>
<tr>
<td>default_action</td>
<td>Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters.</td>
</tr>
<tr>
<td></td>
<td>- If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.)</td>
</tr>
<tr>
<td></td>
<td>- If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured.</td>
</tr>
<tr>
<td>auto_unrestrict</td>
<td>Can be either TRUE or FALSE.</td>
</tr>
<tr>
<td></td>
<td>- If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT)</td>
</tr>
<tr>

</tbody>
</table>
START_CAPTURE Procedure

Table 177–11  (Cont.) START_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_sts</td>
<td>If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context. Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_ MESSAGE. The default value is FALSE.</td>
</tr>
<tr>
<td>sts_cap_interval</td>
<td>Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.</td>
</tr>
</tbody>
</table>

Usage Notes

- All user requests sent to database after a successful invocation of START_CAPTURE are recorded in the given dir directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the FINISH_CAPTURE Procedure is executed.

- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until FINISH_CAPTURE is executed, whichever occurs first.

- One can use workload filters (as described with regard to the ADD_FILTER Procedures) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.

- Workload that is initiated from Oracle Database background processes (such as SMON, PMON, MMON) and Oracle Database Scheduler Jobs (as detailed in the DBMS_SCHEDULER package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.

- By default, all database instances that were started up in RESTRICTED mode using STARTUP RESTRICT are UNRESTRICTED upon a successful invocation of START_CAPTURE Use FALSE for the auto_unrestrict input parameter, if you do not want this behavior.

- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when START_CAPTURE is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after START_CAPTURE are replayed.
The DBMS_WORKLOAD_REPLAY package provides an interface to replay a workload capture.

Using DBMS_WORKLOAD_REPLAY

- Overview
- Security Model
Overview

The `DBMS_WORKLOAD_REPLAY` package provides an interface to replay a workload capture that was originally created by way of the `DBMS_WORKLOAD_CAPTURE` package. Typically, the `DBMS_WORKLOAD_CAPTURE` package is used in the production system to capture a production workload, and the `DBMS_WORKLOAD_REPLAY` package is subsequently used in a test system to replay the captured production workload for testing purposes.
The following code describes the minimum set of privileges required to

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. The Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running.

The replay client is a multithreaded program (an executable named `wrc` located in the `$ORACLE_HOME/bin` directory) where each thread submits a workload from a captured session. The OS user performing the replay must be able to execute `wrc` on hosts that are used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients’ hosts if required.
## Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table lists the package subprograms in alphabetical order.

**Table 178–1  DBMS_WORKLOAD_REPLAY Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_CAPTURE Function on page 178-7</td>
<td>Adds the given capture to the current schedule</td>
</tr>
<tr>
<td>ADD_FILTER Procedure on page 178-8</td>
<td>Adds a filter to replay only a subset of the captured workload</td>
</tr>
<tr>
<td>ADD_SCHEDULE_ORDERING Function on page 178-9</td>
<td>Adds a schedule order between two captures</td>
</tr>
<tr>
<td>BEGIN_REPLAY_SCHEDULE Procedure on page 178-10</td>
<td>Initiates the creation of a reusable replay schedule</td>
</tr>
<tr>
<td>CALIBRATE Function on page 178-11</td>
<td>Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload</td>
</tr>
<tr>
<td>CANCEL_REPLAY Procedure on page 178-12</td>
<td>Cancels the workload replay in progress</td>
</tr>
<tr>
<td>COMPARE_PERIOD_REPORT Procedure on page 178-13</td>
<td>Generates a report comparing a replay to its capture or to another replay of the same capture</td>
</tr>
<tr>
<td>COMPARE_SQLSET_REPORT Function on page 178-14</td>
<td>Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture</td>
</tr>
<tr>
<td>CREATE_FILTER_SET Procedure on page 178-15</td>
<td>Uses the replay filters added to create a set of filters to use against the replay in replay_dir</td>
</tr>
<tr>
<td>DELETE_FILTER Procedure on page 178-16</td>
<td>Deletes the named filter</td>
</tr>
<tr>
<td>DELETE_REPLAY_INFO Procedure on page 178-17</td>
<td>Deletes the rows in DBA_WORKLOAD_REPLAYS that corresponds to the given workload replay ID</td>
</tr>
<tr>
<td>END_REPLAY_SCHEDULE Procedure on page 178-18</td>
<td>Wraps up the creation of the current schedule</td>
</tr>
<tr>
<td>EXPORT_AWR Procedure on page 178-19</td>
<td>Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID</td>
</tr>
<tr>
<td>GENERATE_CAPTURE_SUBSET Procedure on page 178-20</td>
<td>Creates a new capture from an existing workload capture</td>
</tr>
<tr>
<td>GET_DIVERGING_STATEMENT Function on page 178-21</td>
<td>Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID</td>
</tr>
<tr>
<td>GET_REPLAY_DIRECTORY Function on page 178-22</td>
<td>Returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure.</td>
</tr>
<tr>
<td>GET_REPLAY_INFO Function on page 178-23</td>
<td>Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory</td>
</tr>
<tr>
<td>GET_REPLAY_TIMEOUT Procedure on page 178-24</td>
<td>Retrieves the replay timeout setting</td>
</tr>
<tr>
<td>IMPORT_AWR Function on page 178-25</td>
<td>Imports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID</td>
</tr>
<tr>
<td>INITIALIZE_CONSOLIDATED_REPLAY Procedure on page 178-26</td>
<td>Puts the database state in INIT for a multiple-capture replay</td>
</tr>
</tbody>
</table>
### Table 178–1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INITIALIZER_REPLAY Procedure on page 178-27</td>
<td>Initializes replay, and loads specific data produced during processing into the database</td>
</tr>
<tr>
<td>IS_REPLAY_PAUSED Function on page 178-28</td>
<td>Reports whether the replay is currently paused</td>
</tr>
<tr>
<td>PAUSE_REPLAY Procedure on page 178-29</td>
<td>Pauses the in-progress workload replay</td>
</tr>
<tr>
<td>POPULATE_DIVERGENCE Procedure on page 178-29</td>
<td>Precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls</td>
</tr>
<tr>
<td>PREPARE_REPLAY Procedure on page 178-31</td>
<td>Puts the database in a special &quot;Prepare&quot; mode</td>
</tr>
<tr>
<td>PREPARE_CONSOLIDATED_REPLAY Procedure on page 178-35</td>
<td>Puts the database in a special &quot;Prepare&quot; mode for a multiple-capture replay</td>
</tr>
<tr>
<td>PROCESS_CAPTURE Procedure on page 178-37</td>
<td>Processes the workload capture found in capture_dir in place</td>
</tr>
<tr>
<td>REMAP_CONNECTION Procedure on page 178-38</td>
<td>Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay</td>
</tr>
<tr>
<td>REMOVE_CAPTURE Procedure on page 178-39</td>
<td>Removes the given capture from the current schedule</td>
</tr>
<tr>
<td>REMOVE_SCHEDULE_ORDERING Procedure on page 178-40</td>
<td>Removes an existing schedule order from the current replay schedule</td>
</tr>
<tr>
<td>REPORT Function on page 178-41</td>
<td>Generates a report on the given workload replay</td>
</tr>
<tr>
<td>RESUME_REPLAY Procedure on page 178-42</td>
<td>Resumes a paused workload replay</td>
</tr>
<tr>
<td>REUSE_REPLAY_FILTER_SET Procedure on page 178-43</td>
<td>Reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function</td>
</tr>
<tr>
<td>SET_ADVANCED_PARAMETER Procedure on page 178-44</td>
<td>Sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure</td>
</tr>
<tr>
<td>SET_REPLAY_DIRECTORY Procedure on page 178-45</td>
<td>Sets a directory that contains multiple workload captures as the current replay directory</td>
</tr>
<tr>
<td>SET_REPLAY_TIMEOUT Procedure on page 178-46</td>
<td>Sets the replay timeout setting</td>
</tr>
<tr>
<td>SET_USER_MAPPING Procedure on page 178-47</td>
<td>Sets a new schema or user name to be used during replay instead of the captured user</td>
</tr>
<tr>
<td>START_CONSOLIDATED_REPLAY Procedure on page 178-48</td>
<td>Starts the replay of a multiple-capture capture</td>
</tr>
<tr>
<td>START_REPLAY Procedure on page 178-49</td>
<td>Starts the workload replay</td>
</tr>
<tr>
<td>USE_FILTER_SET Procedure on page 178-50</td>
<td>Uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay</td>
</tr>
</tbody>
</table>
ADD_CAPTURE Function

This function adds the given capture to the current schedule. The directory has to be a valid capture processed in the current database's version. It returns a unique ID that identifies this capture within this schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
    capture_dir_name      IN    VARCHAR2,
    start_delay_seconds   IN    NUMBER  DEFAULT 0,
    stop_replay           IN    BOOLEAN FALSE,
    take_begin_snapshot   IN    BOOLEAN TRUE,
    take_end_snapshot     IN    BOOLEAN TRUE,
    query_only            IN    BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_dir_name</td>
<td>Name of the OS directory containing the capture under the replay top-level directory</td>
</tr>
<tr>
<td>start_delay_seconds</td>
<td>Delay time in seconds before the replay of this capture starts</td>
</tr>
<tr>
<td>stop_replay</td>
<td>Stop the replay after it finishes</td>
</tr>
<tr>
<td>take_begin_snapshot</td>
<td>Take an AWR snapshot when the replay of this capture starts</td>
</tr>
<tr>
<td>take_end_snapshot</td>
<td>Take an AWR snapshot when the replay of this capture finishes</td>
</tr>
<tr>
<td>query_only</td>
<td>Replay only the read-only queries of this workload capture</td>
</tr>
</tbody>
</table>

Usage Notes

The SET_REPLAY_DIRECTORY Procedure must have already been called.
ADD_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.
The procedure adds a new filter that is used in the next replay filter set created using
the CREATE_FILTER_SET Procedure. This filter will be considered an "INCLUSION" or
"EXCLUSION" filter depending on the argument passed to CREATE_FILTER_SET when
creating the filter set.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.ADD_FILTER (f
fname          IN VARCHAR2,
fattribute     IN VARCHAR2,
fvalue         IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.ADD_FILTER (f
fname          IN VARCHAR2,
fattribute     IN VARCHAR2,
fvalue         IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fname</td>
<td>(Mandatory) Name of the filter. Can be used to delete the filter later if it is not required.</td>
</tr>
</tbody>
</table>
| fattribute    | (Mandatory) Specifies the attribute on which the filter is defined as one of the following values of type STRING:
|               |     ■ USER  
|               |     ■ MODULE  
|               |     ■ ACTION  
|               |     ■ PROGRAM  
|               |     ■ SERVICE  
|               |     ■ CONNECTION_STRING  |
| fvalue        | (Mandatory) Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type STRING. Currently all the listed values of fattribute are of type STRING. INSTANCE_NUMBER is a NUMBER attribute. It is currently only supported for capture. |
**ADD_SCHEDULE_ORDERING Function**

This function adds a schedule order between two captures. Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the `ADD_SCHEDULE_ORDERING Function`. The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.ADD_SCHEDULE_ORDERING (
    schedule_capture_id     IN VARCHAR2,
    waitfor_capture_id      IN VARCHAR2)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_capture_id</td>
<td>Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, its replay will not start until the replay of another capture specified by <code>waitfor_capture_id</code> runs to completion.</td>
</tr>
<tr>
<td>waitfor_capture_id</td>
<td>Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, the replay of capture specified by <code>schedule_capture_id</code> will not start until the replay of this capture runs to completion.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns a non-zero error code if the constraint cannot be added

**Usage Notes**

The two captures must have already been added to the replay schedule.
BEGIN_REPLAY_SCHEDULE Procedure

This procedure initiates the creation of a reusable replay schedule.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.BEGIN_REPLAY_SCHEDULE (
    replay_dir_obj     IN     VARCHAR2,
    schedule_name      IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir_obj</td>
<td>Directory object that points to the replay directory that contains all the capture directories involved in the schedule</td>
</tr>
<tr>
<td>schedule_name</td>
<td>Name of the schedule to be replayed</td>
</tr>
</tbody>
</table>

Usage Notes

- Only one schedule can be in creation mode at a time. Calling the subprogram again before `end_replay_schedule` will raise an error.
- Prerequisites:
  - The workload capture was already processed using the `PROCESS_CAPTURE Procedure` in the same database version.
  - The user must have copied the capture directory appropriately.
  - The database is not in replay mode.
  - The `SET_REPLAY_DIRECTORY Procedure` has already been called.
CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
    capture_dir          IN VARCHAR2,
    process_per_cpu      IN BINARY_INTEGER DEFAULT 4,
    threads_per_process  IN BINARY_INTEGER DEFAULT 50)
RETURN CLOB;
```

Parameters

```
Table 178–6 CALIBRATE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_dir</td>
<td>Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data</td>
</tr>
<tr>
<td>process_per_cpu</td>
<td>Maximum number of processes allowed for each CPU (default is 4)</td>
</tr>
<tr>
<td>threads_per_process</td>
<td>Maximum number of threads allowed for each process (default is 50)</td>
</tr>
</tbody>
</table>
```

Return Values

Returns a CLOB formatted as XML that contains:
- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the `PROCESS_CAPTURE Procedure` in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```
CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (error_msg IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_msg</td>
<td>An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE.</td>
</tr>
</tbody>
</table>

Usage Notes

Prerequisite: A call to the INITIALIZE_REPLAY Procedure, or PREPARE_REPLAY Procedure, or START_REPLAY Procedure was already issued.
COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
    replay_id1   IN   NUMBER,
    replay_id2   IN   NUMBER,
    format       IN   VARCHAR2,
    result       OUT  CLOB )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id1</td>
<td>First ID of the workload replay whose report is requested</td>
</tr>
<tr>
<td>replay_id2</td>
<td>Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture.</td>
</tr>
<tr>
<td>format</td>
<td>Specifies the report format. Valid values are <code>DBMS_WORKLOAD_CAPTURE.TYPE_HTML</code> and <code>DBMS_WORKLOAD_CAPTURE.TYPE_XML</code>.</td>
</tr>
<tr>
<td>result</td>
<td>Output of the report (CLOB)</td>
</tr>
</tbody>
</table>
COMPARE_SQLSET_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (  
    replay_id1    IN NUMBER,  
    replay_id2    IN NUMBER,  
    format        IN VARCHAR2,  
    r_level       IN VARCHAR2 DEFAULT 'ALL',  
    r_sections    IN VARCHAR2 DEFAULT 'ALL',  
    result        OUT CLOB )  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id1</td>
<td>First ID of the workload replay after a change</td>
</tr>
<tr>
<td>replay_id2</td>
<td>Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture.</td>
</tr>
<tr>
<td>format</td>
<td>Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT.</td>
</tr>
<tr>
<td>r_level</td>
<td>See level parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package</td>
</tr>
<tr>
<td>r_sections</td>
<td>See section parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package</td>
</tr>
<tr>
<td>result</td>
<td>Output of the report (CLOB)</td>
</tr>
</tbody>
</table>
CREATE_FILTER_SET Procedure

This procedure creates a new filter set for the replays at replay_dir. It includes all the replay filters that have already been added by the ADD_FILTER Procedure. After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in replay_dir by calling the USE_FILTER_SET Procedure.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
    replay_dir       IN  VARCHAR2,
    filter_set       IN  VARCHAR2,
    default_action   IN  VARCHAR2 DEFAULT 'INCLUDE');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir</td>
<td>Object directory of the replay to be filtered</td>
</tr>
<tr>
<td>filter_set</td>
<td>Name of the filter set to create (to use in USE_FILTER_SET Procedure)</td>
</tr>
<tr>
<td>default_action</td>
<td>Can be either INCLUDE or EXCLUDE. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as INCLUSION filters or EXCLUSION filters.)</td>
</tr>
</tbody>
</table>

If it is INCLUDE, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as EXCLUSION filters, and will determine the workload that will not be replayed.

If it is EXCLUDE, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as INCLUSION filters, and will determine the workload that is replayed.

Default: INCLUDE and all the filters specified are assumed to be EXCLUSION filters

Usage Notes

This operation must be invoked when no replay is initialized, prepared, or in progress.
DELETEFILTER Procedure

This procedure deletes the named filter.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(
    fname    IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fname</td>
<td>(Mandatory) Name of the filter that must be deleted</td>
</tr>
</tbody>
</table>
DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in DBA_WORKLOAD_REPLAYS that correspond to the given workload replay ID.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (  
    replay_id    IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>(Mandatory) ID of the workload replay that must be deleted.</td>
</tr>
<tr>
<td></td>
<td>Corresponds to DBA_WORKLOAD_REPLAYS.ID</td>
</tr>
</tbody>
</table>
END_REPLAY_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

Usage Notes

The BEGIN_REPLAY_SCHEDULE Procedure must have already been called.
**EXPORT_AWR Procedure**

This procedure exports the AWR snapshots associated with a stipulated replay ID.

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
    replay_id    IN  NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>(Mandatory) ID of the replay whose AWR snapshots are to be exported</td>
</tr>
</tbody>
</table>

**Usage Notes**

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic `EXPORT_AWR` invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_REPLAYS` was not created by calling the `GET_REPLAY_INFO Function`) and the AWR snapshots that correspond to that replay time period are still available.
GENERATE_CAPTURE_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (  
  input_capture_dir          IN   VARCHAR2,  
  output_capture_dir         IN   VARCHAR2,  
  new_capture_name           IN   VARCHAR2,  
  begin_time                 IN   NUMBER,  
  begin_include_incomplete   IN   BOOLEAN DEFAULT TRUE,  
  end_time                   IN   NUMBER,  
  end_include_incomplete     IN   BOOLEAN DEFAULT FALSE,  
  parallel_level             IN   NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input_capture_dir</td>
<td>(Mandatory) Name of the directory object that points to an existing workload capture</td>
</tr>
<tr>
<td>output_capture_dir</td>
<td>(Mandatory) Name of the directory object that points to the new capture</td>
</tr>
<tr>
<td>new_capture_name</td>
<td>(Mandatory) Name of new capture</td>
</tr>
<tr>
<td>begin_time</td>
<td>Start of the time range - time offset in seconds from the start of a workload capture</td>
</tr>
<tr>
<td>begin_include_incomplete</td>
<td>Column to include incomplete calls caused by begin_time</td>
</tr>
<tr>
<td>end_time</td>
<td>End of the time range - time offset in seconds from the start of a workload capture. If end_time is zero or end_time is less or equal than begin_time, the time range is invalid. The new capture will use the whole duration of the input capture.</td>
</tr>
<tr>
<td>end_include_incomplete</td>
<td>Column to include incomplete calls caused by end_time</td>
</tr>
<tr>
<td>parallel_level</td>
<td>Number of Oracle processes used to process the input captures in a parallel fashion. The NULL default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution.</td>
</tr>
</tbody>
</table>
GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
  replay_id    IN NUMBER,
  stream_id    IN NUMBER,
  call_counter IN NUMBER)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>ID of the replay in which that call diverged</td>
</tr>
<tr>
<td>stream_id</td>
<td>Stream ID of the diverging call</td>
</tr>
<tr>
<td>call_counter</td>
<td>Call counter of the diverging call</td>
</tr>
</tbody>
</table>

Usage Notes

- Returns a CLOB formatted as XML that contains:
  - SQL ID
  - SQL Text
  - Bind information: position, name and value
- This function will silently invoke the POPULATE_DIVERGENCE Procedure to read the information from the capture files. Therefore, if divergence has not been populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.
GET_REPLAY_DIRECTORY Function

This function returns the current replay directory set by the SET_REPLAYDIRECTORY Procedure. It returns NULL if no replay directory has been set.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY
RETURN VARCHAR2;
```
GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (dir IN VARCHAR2)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir</td>
<td>(Mandatory) Name of the workload replay directory object (case sensitive).</td>
</tr>
</tbody>
</table>

Return Values

The procedure returns the CAPTURE_ID, which can be associated with both DBA_WORKLOAD_CAPTURES.ID and DBA_WORKLOAD_REPLAYS.CAPTURE_ID to access the imported information.

Usage Notes

- The procedure first imports a row into DBA_WORKLOAD_CAPTURES which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into DBA_WORKLOAD_REPLAYS.
- The procedure will not insert new rows to DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_REPLAYS if these views already contain rows describing the capture and replay history present in the given directory.
GET_REPLAY_TIMEOUT Procedure

This procedure gets the replay timeout setting.

Syntax

```plsql
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (  
enabled OUT BOOLEAN,  
min_delay OUT NUMBER,  
max_delay OUT NUMBER,  
delay_factor OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>TRUE if the timeout action is enabled, FALSE otherwise.</td>
</tr>
<tr>
<td>min_delay</td>
<td>Lower bound of call delay in minutes. The replay action is activated only</td>
</tr>
<tr>
<td></td>
<td>when the delay is equal to or more than min_delay.</td>
</tr>
<tr>
<td>max_delay</td>
<td>Upper bound of call delay in minutes. The timeout action throws ORA-15569</td>
</tr>
<tr>
<td></td>
<td>when the delay is more than max_delay.</td>
</tr>
<tr>
<td>delay_factor</td>
<td>Factor for the call delay that is between min_delay and max_delay. The</td>
</tr>
<tr>
<td></td>
<td>timeout action throws ORA-15569 when the current replay elapsed time is</td>
</tr>
<tr>
<td></td>
<td>more than the product of capture elapsed time and delay_factor.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure can be called anytime during replay.
IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
    replay_id       IN   NUMBER,
    staging_schema  IN   VARCHAR2)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>(Mandatory) ID of the replay whose AWR snapshots must be imported</td>
</tr>
<tr>
<td>staging_schema</td>
<td>(Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to theSYS_AWR schema. The SYS schema is not a valid input.</td>
</tr>
</tbody>
</table>

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the EXPORT_AWR Procedure.
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRMS$_SNAPSHOT or WRHS$_PARAMETER. Drop any such tables in the staging_schema before invoking IMPORT_AWR.
INITIALIZE_CONsolidated_Replay Procedure

This procedure puts the database state in INIT for a multiple-capture replay. It uses the replay_dir which has already been defined by the SET_REPLAY_DIRECTORY Procedure, pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule schedule_name from the directory, and loads required connection data into the replay system.

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONsolidated_REplay (replay_name IN VARCHAR2,
schedule_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_name</td>
<td>(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.</td>
</tr>
<tr>
<td>schedule_name</td>
<td>Name of the schedule to be replayed. It must have been created through the BEGIN_REPLAY_SCHEDULE Procedure for the replay directory replay_dir.</td>
</tr>
</tbody>
</table>

Usage Notes

Prerequisites:

- Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The SET_REPLAY_DIRECTORY Procedure has been called.
**INITIALIZE_REPLAY Procedure**

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (  
  replay_name     IN  VARCHAR2,  
  replay_dir      IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_name</td>
<td>(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.</td>
</tr>
<tr>
<td>replay_dir</td>
<td>Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data</td>
</tr>
</tbody>
</table>

**Usage Notes**

- **Prerequisites:**
  - Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  - Database state has been logically restored to what it was at the beginning of the original workload capture.

- The subprogram loads data into the replay system that is required before preparing for the replay by calling the PAUSE_REPLAY Procedure.

  For instance, during capture the user may record the connection string each session used to connect to the server. The INITIALIZE_REPLAY Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

  Elaborating on the example described in the PROCESS_CAPTURE Procedure, the user could invoke the following:

  ```sql
  DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
  ```

  This command will load up the connection map and by default will set all replay time connection strings to be equal to NULL. A NULL replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the REMAP_CONNECTION Procedure.
IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED
RETURN BOOLEAN;
```

Return Values

Returns TRUE if the PAUSE_REPLAY Procedure has been called successfully and the RESUME_REPLAY Procedure has not been called yet.

Usage Notes

A call to the START_REPLAY Procedure must have already been issued as a prerequisite.
PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay. All subsequent user calls from the replay clients will be stalled until either a call to the RESUME_REPLAY Procedure is issued or the replay is cancelled.

Syntax

DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;

Usage Notes

- Prerequisite: A call to the START_REPLAY Procedure must have already been issued.
- User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.
POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the `GET_DIVERGING_STATEMENT` Function returns as quickly as possible for the precomputed calls.

**Syntax**

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
  replay_id   IN   NUMBER,
  stream_id   IN   NUMBER DEFAULT NULL,
  call_counter IN   NUMBER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>ID of the replay</td>
</tr>
<tr>
<td>stream_id</td>
<td>Stream ID of the diverging call. If <code>NULL</code> is provided, then divergence information is precomputed for all diverging calls in the given replay.</td>
</tr>
<tr>
<td>call_counter</td>
<td>Call counter of the diverging call. If <code>NULL</code> is provided, then divergence information is precomputed for all diverging calls in the given stream.</td>
</tr>
</tbody>
</table>
PREPARE_REPLAY Procedure

This procedure puts the database state in PREPARE FOR REPLAY mode.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
    synchronization IN BOOLEAN DEFAULT TRUE,
    connect_time_scale IN NUMBER DEFAULT 100,
    think_time_scale IN NUMBER DEFAULT 100,
    think_time_auto_correct IN BOOLEAN DEFAULT TRUE,
    scale_up_multiplier IN NUMBER DEFAULT 1,
    capture_sts IN BOOLEAN DEFAULT FALSE,
    sts_cap_interval IN NUMBER DEFAULT 300);
```

```sql
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
    synchronization IN VARCHAR2 DEFAULT 'OBJECT_ID',
    connect_time_scale IN NUMBER DEFAULT 100,
    think_time_scale IN NUMBER DEFAULT 100,
    think_time_auto_correct IN BOOLEAN DEFAULT TRUE,
    scale_up_multiplier IN NUMBER DEFAULT 1,
    capture_sts IN BOOLEAN DEFAULT FALSE,
    sts_cap_interval IN NUMBER DEFAULT 300);
```

Parameters

**Table 178–22 PREPARE_REPLAY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>synchronization</td>
<td>Turns synchronization <strong>ON</strong> or <strong>OFF</strong> during workload replay.</td>
</tr>
<tr>
<td></td>
<td>- OFF - Workload replay runs asynchronously.</td>
</tr>
<tr>
<td></td>
<td>- SCN - The COMMIT order observed during the original workload capture is preserved during replay. Every action that is replayed is executed only after all of its dependent COMMITs (all COMMITs that were issued before the given action in the original workload capture) have finished execution.</td>
</tr>
<tr>
<td></td>
<td>- OBJECT_ID - This is the default, and uses a more advanced synchronization scheme. Every action that is replayed is executed only after the relevant COMMITs have finished executing. The relevant COMMITs are the ones that were issued before the given action in the original workload capture and that had modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This OBJECT_ID scheme has the same logical property of making sure that any action will see the same data it saw during capture, but will allow more concurrency during replays for the actions that do not touch the same objects/tables.</td>
</tr>
</tbody>
</table>

For legacy reasons, there is a boolean version of this procedure:

- **TRUE** means 'OBJECT_ID'
- **FALSE** means 'OFF'
PREPARE_REPLAY Procedure

Usage Notes

■ Prerequisites:
  – The database has been initialized for replay using the INITIALIZE_REPLAY Procedure.
  – Any capture time connection strings that require remapping have been already done using the REMAP_CONNECTION Procedure.

■ One or more external replay clients (WRC) can be started once the PREPARE_REPLAY procedure has been executed.

■ With regard to scale_up_multiplier:
  – One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.
  – The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. SELECT FOR UPDATE statements are also skipped.
  – Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by think_time_scale, connect_time_scale, and think_time_auto_correct.
time_auto_correct. Also, the queries are made to wait for the appropriate commits.

- No replay data or error divergence records are generated for the scale-up sessions.
- All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

Examples

**Application of the connect_time_scale Parameter**

If the following was observed during the original workload capture:

- 12:00: Capture was started
- 12:10: First session connect (10m after)
- 12:30: Second session connect (30m after)
- 12:42: Third session connect (42m after)

If the connect_time_scale is 50, then the session connects will happen as follows:

- 12:00: Replay was started with 50% connect time scale
- 12:05: First session connect (5m after)
- 12:15: Second session connect (15m after)
- 12:21: Third session connect (21m after)

If the connect_time_scale is 200, then the session connects will happen as follows:

- 12:00: Replay was started with 200% connect time scale
- 12:20: First session connect (20m after)
- 13:00: Second session connect (60m after)
- 13:24: Third session connect (84m after)

**Application of the think_time_scale Parameter**

If the following was observed during the original workload capture:

- 12:00: User SCOTT connects
- 12:10: First user call issued (10m after completion of prevcall)
- 12:14: First user call completes in 4mins
- 12:30: Second user call issued (16m after completion of prevcall)
- 12:40: Second user call completes in 10m
- 12:42: Third user call issued (2m after completion of prevcall)
- 12:50: Third user call completes in 8m

If the think_time_scale is 50 during the workload replay, then the user calls will look something like below:

- 12:00: User SCOTT connects
- 12:05: First user call issued 5 mins (50% of 10m) after the completion of previous call
- 12:10: First user call completes in 5m (takes a minute longer)
- 12:18: Second user call issued 8 mins (50% of 16m) after the completion of prev call
- 12:25: Second user call completes in 7m (takes 3 minutes less)
- 12:26: Third user call issued 1 min (50% of 2m) after the completion of prev call
- 12:35: Third user call completes in 9m (takes a minute longer)

**Application of the think_time_auto_correct Parameter**

If the following was observed during the original workload capture:
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued (2m after completion of prevcall)
12:50 : Third user call completes in 8m

If the think_time_scale is 100 and the think_time_auto_correct is TRUE during the workload replay, then the user calls will look something like below:

12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev call took) after the completion of prev call
12:52 : Third user call completes in 8m
PREPARE_CONSOLIDATED_REPLAY Procedure

Similar to the PREPARE_REPLAY Procedure, this procedure puts the database in a special 'Prepare' mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (    
synchronization           IN BOOLEAN,    
connect_time_scale        IN NUMBER    DEFAULT 100,    
think_time_scale          IN NUMBER    DEFAULT 100,    
think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,    
capture_sts               IN BOOLEAN   DEFAULT FALSE,    
sts_cap_interval          IN NUMBER    DEFAULT 300);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| synchronization            | Turns synchronization ON or OFF during workload replay. When synchronization is ON, the COMMIT order observed during the original workload capture is preserved during replay. Every action that is replayed is executed ONLY AFTER all of its dependent COMMITs (all COMMITs that were issued before the given action in the original workload capture) have finished execution. DEFAULT is TRUE which preserves commit order. When synchronization is OBJECT_ID, a more advanced synchronization scheme is used. Every action that is replayed is executed only after the relevant COMMITs have finished executing. The relevant COMMITs are the ones that were issued before the given action in the original workload capture and that had modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This OBJECT_ID scheme has the same logical property of making sure that any action will see the same data it saw during capture, but will allow more concurrency during replays for the actions that do not touch the same objects/tables. DEFAULT VALUE: SCN, preserve commit order. For legacy reasons, there is a boolean version of this procedure:
  - TRUE means 'SCN'
  - FALSE means 'OFF'
| connect_time_scale         | Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Application of the connect_time_scale Parameter" on page 178-33. |
Usage Notes

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.
**PROCESS_CAPTURE Procedure**

This procedure processes the workload capture found in `capture_dir` in place.

### Syntax

```sql
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
    capture_dir            IN   VARCHAR2,
    parallel_level         IN   NUMBER DEFAULT NULL);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_dir</td>
<td>(Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory.</td>
</tr>
<tr>
<td>parallel_level</td>
<td>Number of Oracle processes used to process the capture in parallel. The <code>NULL</code> default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution.</td>
</tr>
</tbody>
</table>

### Usage Notes

- This subprogram analyzes the workload capture found in the `capture_dir` and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.

- Once this procedure runs successfully, the `capture_dir` can be used as input to the `INITIALIZE_REPLAY Procedure` in order to replay the captured workload present in `capture_dir`.

- Before a workload capture can be replayed in a particular database version, the capture must be processed using `PROCESS_CAPTURE` in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

  For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory `rec_dir`:

  ```sql
  DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
  ```

  Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.
REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    connection_id         IN  NUMBER,
    replay_connection     IN  VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    capture_number        IN  VARCHAR2,
    connection_id         IN  NUMBER,
    replay_connection     IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_number</td>
<td>Pointing to a capture of the current replay schedule</td>
</tr>
<tr>
<td>connection_id</td>
<td>ID of the connection to be remapped. Corresponds to DBA_WORKLOAD_CONNECTION_MAP.CONN_ID.</td>
</tr>
<tr>
<td>replay_connection</td>
<td>New connection string to be used during replay</td>
</tr>
</tbody>
</table>

Usage Notes

- Prior to calling REMAP_CONNECTION all replay connection strings are set to NULL by default. If a replay_connection is NULL, then the replay sessions will connect as determined by the replay client’s runtime environment. For example, if the environment variable TNS_ADMIN is defined and the user does not call the REMAP_CONNECTION Procedure, then the wrc executable will connect to the server specified in the tnsnames.ora file pointed to by TNS_ADMIN.

- A valid replay_connection must specify a connect identifier or a service point. See the Oracle Database Net Services Reference for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.

- An error is returned if no row matches the given connection_id.

- Use the DBA_WORKLOAD_CONNECTION_MAP view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.
REMOVE_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
    schedule_capture_number IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_capture_number</td>
<td>Unique ID that identifies this capture within this schedule</td>
</tr>
</tbody>
</table>
REMOVE_SCHEDULE_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule. Together, schedule_capture_id and waitfor_capture_id form a schedule ordering that previously added by the ADD_SCHEDULE_ORDERING Function (schedule_capture_id, waitfor_capture_id). The order is that replay of capture indicated by schedule_capture_id will not start unless the replay of capture indicated by waitfor_capture_id finishes.

Syntax

DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (  
schedule_capture_id IN NUMBER,  
waitfor_capture_id IN NUMBER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_capture_id</td>
<td>Points to a capture that has been added to the current replay schedule (see procedure description).</td>
</tr>
<tr>
<td>waitfor_capture_id</td>
<td>Points to a capture that has been added to the current replay schedule.</td>
</tr>
</tbody>
</table>

Usage Notes

Prerequisites:

- The BEGIN_REPLAY_SCHEDULE Procedure must have been called.
- The replay schedule order should have already been added using the ADD_SCHEDULE_ORDERING Function.
REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.REPORT (
    replay_id          IN NUMBER,
    format             IN VARCHAR2)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>(Mandatory) Specifies the ID of the workload replay whose report is requested.</td>
</tr>
<tr>
<td>format</td>
<td>(Mandatory) Specifies the report format. Valid values:</td>
</tr>
<tr>
<td></td>
<td>- HTML - Generates the HTML version of the report</td>
</tr>
<tr>
<td></td>
<td>- XML - Generates the XML version of the report</td>
</tr>
<tr>
<td></td>
<td>- TEXT - Generates the text version of the report</td>
</tr>
</tbody>
</table>

Return Values

The report body in the desired format returned as a CLOB
RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the PAUSE_REPLAY Procedure must have already been issued.
REUSE_REPLAY_FILTER_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function. Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the CREATE_FILTER_SET Procedure to create a new filter set.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET(
    replay_dir  IN VARCHAR2,
    filter_set  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir</td>
<td>Capture ID of the existing filter set with which it is associated</td>
</tr>
<tr>
<td>filter_set</td>
<td>Name of the filter set to be reused</td>
</tr>
</tbody>
</table>
SET_ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure. The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname    IN   VARCHAR2,
    pvalue   IN   VARCHAR2);

DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname    IN   VARCHAR2,
    pvalue   IN   NUMBER);

DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname    IN   VARCHAR2,
    pvalue   IN   BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Name of the parameter (case insensitive)</td>
</tr>
<tr>
<td>pvalue</td>
<td>Value of the parameter</td>
</tr>
</tbody>
</table>

Usage Notes

The current parameters and values that can be used are:

'DO_NO_WAIT_COMMITS': (default: FALSE)

This parameter controls whether the COMMITs issued by replay sessions is NOWAIT. The default value for this parameter is FALSE. In this case all the COMMITs are issued with the mode they were captured (wait, no-wait, batch, no-batch). If the parameter is set to TRUE, then all COMMITs are issued in no-wait mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent COMMITs. Setting the parameter to TRUE will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.
**SET_REPLAY_DIRECTORY Procedure**

This procedure sets a directory that contains multiple workload captures as the current replay directory.

**Syntax**

```sql
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (
    replay_dir    IN    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_dir</td>
<td>Name of the OS directory containing the captures for a workload consolidation</td>
</tr>
</tbody>
</table>
SET_REPLAY_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
    enabled       OUT  BOOLEAN DEFAULT TRUE,
    min_delay     OUT  NUMBER DEFAULT 10,
    max_delay     OUT  NUMBER DEFAULT 120,
    delay_factor  OUT  NUMBER DEFAULT 8);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>TRUE to enable the timeout action, and FALSE to disable.</td>
</tr>
<tr>
<td>min_delay</td>
<td>Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than <code>min_delay</code>. Default = 10.</td>
</tr>
<tr>
<td>max_delay</td>
<td>Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than <code>max_delay</code>. Default = 120.</td>
</tr>
<tr>
<td>delay_factor</td>
<td>Factor for the call delay that is between <code>min_delay</code> and <code>max_delay</code>. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and <code>delay_factor</code>. Default = 8.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
  - The timeout action has no effect if it is not enabled.
  - If the call delay in minutes is less than a lower bound specified by parameter `min_delay`, then the timeout action is non-operational.
  - If the delay in minutes is more than an upper bound specified by parameter `max_delay`, the timeout action will abort the user call and throw ORA-15569.
  - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter `delay_factor`. |
SET_USER_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (  
    schedule_cap_id IN NUMBER,  
    capture_user IN VARCHAR2,  
    replay_user IN VARCHAR2);
```

```sql
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (  
    capture_user IN VARCHAR2,  
    replay_user IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_cap_id</td>
<td>ID of the a capture in the schedule</td>
</tr>
<tr>
<td>capture_user</td>
<td>User name during the time of the workload capture</td>
</tr>
<tr>
<td>replay_user</td>
<td>User name to which captured user is remapped during replay.</td>
</tr>
</tbody>
</table>

Usage Notes

- A `schedule_cap_id` of NULL is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.
- If `replay_user` is set to NULL, then the mapping is disabled.
- After multiple calls with the same `capture_user`, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:
  ```sql
  SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP
  ```
- The overloaded version without the `schedule_cap_id` calls the one with the `schedule_cap_id` argument by passing in NULL.
- Mappings are stored in a table made public through the view `DBA_WORKLOAD_USER_MAP`. To remove old mappings execute
  ```sql
  DELETE * FROM DBA_WORKLOAD_USER_MAP
  ```
START_CONSOLIDATED_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;
```

Usage Notes

Prerequisites:

- The call to the `PREPARE_REPLAY Procedure` was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
START_REPLAY Procedure

This procedure starts the workload replay. All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

Syntax

DBMS_WORKLOAD_REPLAY.START_REPLAY;

Usage Notes

- Prerequisites:
  - The call to the PREPARE_REPLAY Procedure was already issued.
  - A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using V$WORKLOAD_REPLAY_CLIENTS.

- Use the WRC’s CALIBRATE mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:
  $ wrc mode=calibrate replaydir=. 
USE_FILTER_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule. The filter set must have been created by calling the CREATE_FILTER_SET Procedure.

Syntax

```sql
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
    capture_number   IN    VARCHAR2,
    filter_set       IN    VARCHAR2);

DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
    filter_set       IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_number</td>
<td>Pointing to a capture of the current replay schedule</td>
</tr>
<tr>
<td>filter_set</td>
<td>Name of the filter set</td>
</tr>
</tbody>
</table>

Usage Notes

The filter set must have been created by calling the CREATE_FILTER_SET Procedure.
The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.

**See Also:** *Oracle Database Performance Tuning Guide* for more information about the "Automatic Workload Repository"

The chapter contains the following topics:

- **Using DBMS_WORKLOAD_REPOSITORY**
  - Examples
- **Data Structures**
  - Object Types
  - Table Types
- **Summary of DBMS_WORKLOAD_REPOSITORY Subprograms**
Using DBMS_WORKLOAD_REPOSITORY

This section contains topics which relate to using the DBMS_WORKLOAD_REPOSITORY package.

- Examples
Examples

This example shows how to generate an AWR text report with the DBMS_WORKLOAD_REPOSITORY package for database identifier 1557521192, instance id 1, snapshot ids 5390 and 5391 and with default options.

```sql
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
    DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
        1557521192, 1, 5390, 5392)
) ;
```

You can call the DBMS_WORKLOAD_REPOSITORY packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (awrrpt.sql in this case) for the packaged function, which prompts the user for required information.
Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table types.

**OBJECT Types**
- `AWR_BASELINE_METRIC_TYPE` Object Type

**TABLE Types**
- `AWR_BASELINE_METRIC_TYPE_TABLE` Table Type
- `AWRRPT_INSTANCE_LIST_TYPE` Table Type
AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE breakpoint_info AS OBJECT {
    baseline_name      VARCHAR2(64),
    dbid               NUMBER NOT NULL,
    instance_number    NUMBER NOT NULL,
    beg_time           DATE NOT NULL,
    end_time           DATE NOT NULL,
    metric_id          NUMBER NOT NULL,
    metric_name        VARCHAR2(64) NOT NULL,
    metric_unit        VARCHAR2(64) NOT NULL,
    num_interval       NUMBER NOT NULL,
    interval_size      NUMBER NOT NULL,
    average            NUMBER NOT NULL,
    minimum            NUMBER NOT NULL,
    maximum            NUMBER NOT NULL);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name</td>
<td>Name of the Baseline</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID for the snapshot</td>
</tr>
<tr>
<td>instance_number</td>
<td>Instance number for the snapshot</td>
</tr>
<tr>
<td>beg_time</td>
<td>Begin time of the interval</td>
</tr>
<tr>
<td>end_time</td>
<td>End time of the interval</td>
</tr>
<tr>
<td>metric_id</td>
<td>Metric ID</td>
</tr>
<tr>
<td>metric_name</td>
<td>Metric name</td>
</tr>
<tr>
<td>metric_unit</td>
<td>Unit of measurement</td>
</tr>
<tr>
<td>num_interval</td>
<td>Number of intervals observed</td>
</tr>
<tr>
<td>interval_size</td>
<td>Interval size (in hundredths of a second)</td>
</tr>
<tr>
<td>average</td>
<td>Average over the period</td>
</tr>
<tr>
<td>minimum</td>
<td>Minimum value observed</td>
</tr>
<tr>
<td>maximum</td>
<td>Maximum value observed</td>
</tr>
</tbody>
</table>
AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRIC Function.

Syntax

CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
Table 179–2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

</tbody>
</table>
ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID. If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a TOP SQL). Capture occurs if the SQL is found in the cursor cache at snapshot time. To uncolor the SQL, invoke the REMOVE_COLORED_SQL Procedure.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL(
    sql_id IN VARCHAR2,
    dbid IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>13-character external SQL ID</td>
</tr>
<tr>
<td>dbid</td>
<td>Optional DBID, defaults to Local DBID</td>
</tr>
</tbody>
</table>
ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML(
  l_dbid          IN NUMBER,
  l_inst_num      IN VARCHAR2((1023),
  l_btime         IN DATE,
  l_etime         IN DATE,
  l_options       IN NUMBER    DEFAULT 0,
  l_slot_width    IN NUMBER    DEFAULT 0,
  l_sid           IN NUMBER    DEFAULT NULL,
  l_sql_id        IN VARCHAR2  DEFAULT NULL,
  l_wait_class    IN VARCHAR2  DEFAULT NULL,
  l_service_hash  IN NUMBER    DEFAULT NULL,
  l_module        IN VARCHAR2  DEFAULT NULL,
  l_action        IN VARCHAR2  DEFAULT NULL,
  l_client_id     IN VARCHAR2  DEFAULT NULL,
  l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
  l_data_src      IN NUMBER    DEFAULT 0,
  l_container     IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>List of instances (such as ‘1, 2, 3’), or NULL to report on all instances in the database</td>
</tr>
<tr>
<td>l_btime</td>
<td>The 'begin time'</td>
</tr>
<tr>
<td>l_etime</td>
<td>The 'end time'</td>
</tr>
<tr>
<td>l_options</td>
<td>Report level (currently not used)</td>
</tr>
<tr>
<td>l_slot_width</td>
<td>Specifies (in seconds) how wide the slots used in the &quot;Top Activity&quot; section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.</td>
</tr>
<tr>
<td>l_sid</td>
<td>Session ID (see Usage Notes)</td>
</tr>
<tr>
<td>l_sql_id</td>
<td>SQL ID (see Usage Notes)</td>
</tr>
<tr>
<td>l_wait_class</td>
<td>Wait class name (see Usage Notes)</td>
</tr>
<tr>
<td>l_service_hash</td>
<td>Service name hash (see Usage Notes)</td>
</tr>
<tr>
<td>l_module</td>
<td>Module name (see Usage Notes)</td>
</tr>
<tr>
<td>l_action</td>
<td>Action name (see Usage Notes)</td>
</tr>
<tr>
<td>l_client_id</td>
<td>Client ID for end-to-end backtracing (see Usage Notes)</td>
</tr>
<tr>
<td>l_plsql_entry</td>
<td>PL/SQL entry point (see Usage Notes)</td>
</tr>
<tr>
<td>l_data_src</td>
<td>Ignored since the report works off of data on disk only</td>
</tr>
</tbody>
</table>
The output will be one column of VARCHAR2(1500).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123' pass that sql_id value to the l_sql_id argument:

  ```sql
  l_sql_id = 'abcdefghij123'
  ```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  ```sql
  l_module = 'PAYROLL', l_action = 'PROCESS'
  ```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

### Table 179–4 ASH_GLOBAL_REPORT_HTML Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_container</td>
<td>Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows:</td>
</tr>
<tr>
<td></td>
<td>- If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</td>
</tr>
<tr>
<td></td>
<td>- If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB.</td>
</tr>
</tbody>
</table>

Note: If while connected to a PDB you request information from another PDB this produces an empty report.

### Table 179–5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

<table>
<thead>
<tr>
<th>Argument Name</th>
<th>Comment</th>
<th>Wildcard Allowed</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_sid</td>
<td>Session ID (for example, V$SESSION.SID)</td>
<td>No</td>
</tr>
<tr>
<td>l_sql_id</td>
<td>SQL ID (for example, V$SQL.SQL_ID)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_wait_class</td>
<td>Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_service_hash</td>
<td>Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)</td>
<td>No</td>
</tr>
<tr>
<td>l_module</td>
<td>Module name (for example, V$SESSION.MODULE)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_action</td>
<td>Action name (for example, V$SESSION.ACTION)</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Table 179–5  (Cont.) ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

<table>
<thead>
<tr>
<th>Argument Name</th>
<th>Comment</th>
<th>Wildcard Allowed</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_client_id</td>
<td>Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)</td>
<td>Yes</td>
</tr>

<td>l_data_src</td>
<td>Wildcards are not allowed for l_data_src as it is of numeric datatype</td>
<td>No</td>
</tr>
</tbody>
</table>
ASH_GLOBAL_REPORT_TEXT Function

This table function Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
  l_dbid          IN VARCHAR2(1023),
  l_inst_num      IN NUMBER,
  l_btime         IN DATE,
  l_etime         IN DATE,
  l_options       IN NUMBER    DEFAULT 0,
  l_slot_width    IN NUMBER    DEFAULT 0,
  l_sid           IN NUMBER    DEFAULT NULL,
  l_sql_id        IN VARCHAR2  DEFAULT NULL,
  l_wait_class    IN VARCHAR2  DEFAULT NULL,
  l_service_hash  IN NUMBER    DEFAULT NULL,
  l_module        IN VARCHAR2  DEFAULT NULL,
  l_action        IN VARCHAR2  DEFAULT NULL,
  l_client_id     IN VARCHAR2  DEFAULT NULL,
  l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
  l_data_src      IN NUMBER    DEFAULT 0,
  l_container     IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>List of instances (such as ‘1, 2, 3’), or NULL to report on all instances in the database</td>
</tr>
<tr>
<td>l_btime</td>
<td>The ‘begin time’</td>
</tr>
<tr>
<td>l_etime</td>
<td>The ‘end time’</td>
</tr>
<tr>
<td>l_options</td>
<td>Report level (currently not used)</td>
</tr>
<tr>
<td>l_slot_width</td>
<td>Specifies (in seconds) how wide the slots used in the “Top Activity” section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.</td>
</tr>
<tr>
<td>l_sid</td>
<td>Session ID (see Usage Notes)</td>
</tr>
<tr>
<td>l_sql_id</td>
<td>SQL ID (see Usage Notes)</td>
</tr>
<tr>
<td>l_wait_class</td>
<td>Wait class name (see Usage Notes)</td>
</tr>
<tr>
<td>l_service_hash</td>
<td>Service name hash (see Usage Notes)</td>
</tr>
<tr>
<td>l_module</td>
<td>Module name (see Usage Notes)</td>
</tr>
<tr>
<td>l_action</td>
<td>Action name (see Usage Notes)</td>
</tr>
<tr>
<td>l_client_id</td>
<td>Client ID for end-to-end backtracing (see Usage Notes)</td>
</tr>
<tr>
<td>l_plsql_entry</td>
<td>PL/SQL entry point (see Usage Notes)</td>
</tr>
<tr>
<td>l_data_src</td>
<td>Ignored since the report works off of data on disk only</td>
</tr>
</tbody>
</table>

179-14   Oracle Database PL/SQL Packages and Types Reference
Return Values

The output will be one column of VARCHAR2(320).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123' pass that SQL_ID value to the l_sql_id argument:

  ```sql
  l_sql_id => 'abcdefghij123'
  ```

### Table 179–7 ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

<table>
<thead>
<tr>
<th>Argument Name</th>
<th>Comment</th>
<th>Wildcard Allowed</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_sid</td>
<td>Session ID (for example, V$SESSION.SID)</td>
<td>No</td>
</tr>
<tr>
<td>l_sql_id</td>
<td>SQL ID (for example, V$SQL.SQL_ID)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_wait_class</td>
<td>Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_service_hash</td>
<td>Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)</td>
<td>No</td>
</tr>
<tr>
<td>l_module</td>
<td>Module name (for example, V$SESSION.MODULE)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_action</td>
<td>Action name (for example, V$SESSION.ACTION)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_client_id</td>
<td>Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_plsql_entry</td>
<td>PL/SQL entry point (for example, &quot;SYS.DBMS_LOB.&quot;)</td>
<td>Yes</td>
</tr>
<tr>
<td>l_data_src</td>
<td>Wildcards are not allowed for l_data_src as it is of numeric datatype</td>
<td>No</td>
</tr>
</tbody>
</table>
Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```sql
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.
ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
    l_dbid          IN NUMBER,
    l_inst_num      IN NUMBER,
    l_btime         IN DATE,
    l_etime         IN DATE,
    l_options       IN NUMBER  DEFAULT 0,
    l_slot_width    IN NUMBER  DEFAULT 0,
    l_sid           IN NUMBER  DEFAULT NULL,
    l_sql_id        IN VARCHAR2 DEFAULT NULL,
    l_wait_class    IN VARCHAR2 DEFAULT NULL,
    l_service_hash  IN NUMBER  DEFAULT NULL,
    l_module        IN VARCHAR2 DEFAULT NULL,
    l_action        IN VARCHAR2 DEFAULT NULL,
    l_client_id     IN VARCHAR2 DEFAULT NULL,
    l_plsql_entry   IN VARCHAR2 DEFAULT NULL,
    l_data_src      IN NUMBER  DEFAULT 0,
    l_container     IN VARCHAR2 DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

</tbody>
</table>
ASH_REPORT_HTML Function

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

■ You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.

■ By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_time found in memory, use

1_data_src => 1

Similarly, to generate a report on samples found only on disk, use

1_data_src => 2

■ The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefgij123' pass that sql_id value to the l_sql_id argument:

l_sql_id => 'abcdefgij123'

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.

- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_etime found in memory, use

  \[ l\_data\_src \Rightarrow 1 \]

Similarly, to generate a report on samples found only on disk, use

  \[ l\_data\_src \Rightarrow 2 \]

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123' pass that SQL_ID value to the l_sql_id argument:

  \[ l\_sql\_id \Rightarrow 'abcdefghij123' \]
