Index
Preface

This guide explains how to use the programmatic interfaces to Oracle Data Mining and how to use features of Oracle Database to administer Oracle Data Mining. This guide presents the tools and procedures for implementing the concepts that are presented in Oracle Data Mining Concepts.

This preface contains these topics:

• Audience
• Documentation Accessibility
• Related Documentation
• Conventions

Audience

This guide is intended for application developers and database administrators who are familiar with SQL programming and Oracle Database administration and who have a basic understanding of data mining concepts.

Related Documentation

Oracle Data Mining, a component of Oracle Advanced Analytics, is documented on the Data Warehousing and Business Intelligence page of the Oracle Database online documentation library:

http://www.oracle.com/pls/topic/lookup?ctx=db121&id=dwbitab

The following manuals document Oracle Data Mining:

• Oracle Data Mining Concepts
• Oracle Data Mining User’s Guide (this guide)
• Oracle Data Mining API Guide

Note:

The virtual book combines key passages from the two Data Mining manuals with related reference documentation in Oracle Database PL/SQL Packages and Types Reference, Oracle Database SQL Language Reference, and Oracle Database Reference.
Oracle Data Mining Resources on the Oracle Technology Network

The Oracle Data Mining page on the Oracle Technology Network (OTN) provides a wealth of information, including white papers, demonstrations, blogs, discussion forums, and Oracle By Example tutorials:

http://www.oracle.com/pls/topic/lookup?ctx=db121&id=datmin

You can download Oracle Data Miner, the graphical user interface to Oracle Data Mining, from this site:

http://www.oracle.com/pls/topic/lookup?ctx=db121&id=datminGUI

Application Development and Database Administration Documentation

For documentation to assist you in developing database applications and in administering Oracle Database, refer to the following:

- Oracle Database Concepts
- Oracle Database Administrator’s Guide
- Oracle Database Development Guide

Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/
topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

# Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><code>monospace</code></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
Changes in This Release for Oracle Data Mining User’s Guide

Changes in this release for Oracle Data Mining User’s Guide.

Oracle Data Mining User’s Guide is New in This Release

- This guide is new in release 12c. Oracle Data Mining User’s Guide replaces two manuals that were provided in previous releases: Oracle Data Mining Administrator’s Guide and Oracle Data Mining Application Developer’s Guide.

- Information about database administration for Oracle Data Mining is now consolidated in Administrative Tasks for Oracle Data Mining. The remaining chapters of this guide are devoted to application development.

- Information about the Data Mining sample programs is now in The Data Mining Sample Programs.

Changes in Oracle Data Mining 12c Release 1 (12.1)

The following changes are documented in Oracle Data Mining User’s Guide for 12c Release 1 (12.1).

New Features

The following features are new in this release:

- Expanded prediction details
  
  The PREDICTION_DETAILS function now supports all predictive algorithms and returns more details about the predictors. New functions, CLUSTER_DETAILS and FEATURE_DETAILS, are introduced.

  See Prediction Details.

- Dynamic scoring
  
  The Data Mining SQL functions now support an analytic clause for scoring data dynamically without a pre-defined model.

  See Dynamic Scoring.

- Significant enhancements in text mining
  
  This enhancement greatly simplifies the data mining process (model build, deployment and scoring) when unstructured text data is present in the input.
– Manual pre-processing of text data is no longer needed.
– No text index must be created.
– Additional data types are supported: CLOB, BLOB, BFILE.
– Character data can be specified as either categorical values or text.
See Mining Unstructured Text.
• New clustering algorithm: Expectation Maximization
See the following:
  – Table 4-1
  – Example 1-6
  – Example 1-7
  – Example 1-8
  – Example 6-6
  – About the Data Mining Sample Programs
• New feature extraction algorithm: Singular Value Decomposition with Principal Component Analysis
See the following:
  – Table 4-1
  – Example 6-7
  – About the Data Mining Sample Programs
• Generalized Linear Models are enhanced to support feature selection and creation.
See The Data Mining Sample Programs.

Desupported Features
The following features are no longer supported by Oracle. See Oracle Database Upgrade Guide for a complete list of desupported features in this release.
• Oracle Data Mining Java API
• Adaptive Bayes Network (ABN) algorithm

Other Changes
The following are additional new features in this release:
• A new SQL function, CLUSTER_DISTANCE, is introduced. CLUSTER_DISTANCE returns the raw distance between each row and the cluster centroid.
  See Scoring and Deployment.
• New support for native double data types, BINARY_DOUBLE and BINARY_FLOAT, improves the performance of the SQL scoring functions.
See Preparing the Data.

- Decision Tree algorithm now supports nested data.
  See Preparing the Data.
Learn how to solve business problems using the Oracle Data Mining application programming interface (API).

- Highlights of the Data Mining API
- Example: Targeting Likely Candidates for a Sales Promotion
- Example: Analyzing Preferred Customers
- Example: Segmenting Customer Data

### Highlights of the Data Mining API

Learn about the advantages of Data Mining application programming interface (API).

Data mining is a valuable technology in many application domains. It has become increasingly indispensable in the private sector as a tool for optimizing operations and maintaining a competitive edge. Data mining also has critical applications in the public sector and in scientific research. However, the complexities of data mining application development and the complexities inherent in managing and securing large stores of data can limit the adoption of data mining technology.

Oracle Data Mining is uniquely suited to addressing these challenges. The data mining engine is implemented in the Database kernel, and the robust administrative features of Oracle Database are available for managing and securing the data. While supporting a full range of data mining algorithms and procedures, the API also has features that simplify the development of data mining applications.

The Oracle Data Mining API consists of extensions to Oracle SQL, the native language of the Database. The API offers the following advantages:

- Scoring in the context of SQL queries. Scoring can be performed dynamically or by applying data mining models.
- Automatic Data Preparation (ADP) and embedded transformations.
- Model transparency. Algorithm-specific queries return details about the attributes that were used to create the model.
- Scoring transparency. Details about the prediction, clustering, or feature extraction operation can be returned with the score.
- Simple routines for predictive analytics.
- A workflow-based graphical user interface (GUI) within Oracle SQL Developer. You can download SQL Developer free of charge from the following site:

Note:
A set of sample data mining programs ship with Oracle Database. The examples in this manual are taken from these samples.

The Data Mining Sample Programs
 Describes the data mining sample programs that ship with Oracle Database.

Oracle Data Mining Concepts

Example: Targeting Likely Candidates for a Sales Promotion

This example targets customers in Brazil for a special promotion that offers coupons and an affinity card. The query uses data on marital status, education, and income to predict the customers who are most likely to take advantage of the incentives. The query applies a decision tree model called dt_sh_clas_sample to score the customer data.

Example 1-1  Predict Best Candidates for an Affinity Card

```
SELECT cust_id
FROM mining_data_apply_v
WHERE
  PREDICTION(dt_sh_clas_sample
               USING cust_marital_status, education, cust_income_level ) = 1
  AND country_name IN 'Brazil';
```

<table>
<thead>
<tr>
<th>CUST_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>100404</td>
</tr>
<tr>
<td>100607</td>
</tr>
<tr>
<td>101113</td>
</tr>
</tbody>
</table>

The same query, but with a bias to favor false positives over false negatives, is shown here.

```
SELECT cust_id
FROM mining_data_apply_v
WHERE
  PREDICTION(dt_sh_clas_sample COST MODEL
               USING cust_marital_status, education, cust_income_level ) = 1
  AND country_name IN 'Brazil';
```

<table>
<thead>
<tr>
<th>CUST_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>100139</td>
</tr>
<tr>
<td>100163</td>
</tr>
<tr>
<td>100275</td>
</tr>
<tr>
<td>100404</td>
</tr>
<tr>
<td>100607</td>
</tr>
<tr>
<td>101113</td>
</tr>
<tr>
<td>101170</td>
</tr>
<tr>
<td>101463</td>
</tr>
</tbody>
</table>

The COST MODEL keywords cause the cost matrix associated with the model to be used in making the prediction. The cost matrix, stored in a table called
dt_sh_sample_costs, specifies that a false negative is eight times more costly than a false positive. Overlooking a likely candidate for the promotion is far more costly than including an unlikely candidate.

```
SELECT * FROM dt_sh_sample_cost;
```

<table>
<thead>
<tr>
<th>ACTUAL_TARGET_VALUE</th>
<th>PREDICTED_TARGET_VALUE</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>8</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

**Example: Analyzing Preferred Customers**

The examples in this section reveal information about customers who use affinity cards or are likely to use affinity cards. The examples are:

**Example 1-2  Find Demographic Information About Preferred Customers**

This query returns the gender, age, and length of residence of typical affinity card holders. The anomaly detection model, SVMO_SH_Clas_sample, returns 1 for typical cases and 0 for anomalies. The demographics are predicted for typical customers only; outliers are not included in the sample.

```
SELECT cust_gender, round(avg(age)) age, 
       round(avg(yrs_residence)) yrs_residence, 
       count(*) cnt 
FROM mining_data_one_class_v 
WHERE PREDICTION(SVMO_SH_Clas_sample using *) = 1 
GROUP BY cust_gender 
ORDER BY cust_gender;
```

<table>
<thead>
<tr>
<th>CUST_GENDER</th>
<th>AGE</th>
<th>YRS_RESIDENCE</th>
<th>CNT</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>40</td>
<td>4</td>
<td>36</td>
</tr>
<tr>
<td>M</td>
<td>45</td>
<td>5</td>
<td>304</td>
</tr>
</tbody>
</table>

**Example 1-3  Dynamically Identify Customers Who Resemble Preferred Customers**

This query identifies customers who do not currently have an affinity card, but who share many of the characteristics of affinity card holders. The `PREDICTION` and `PREDICTION_PROBABILITY` functions use an `OVER` clause instead of a predefined model to classify the customers. The predictions and probabilities are computed dynamically.

```
SELECT cust_id, pred_prob 
FROM 
  (SELECT cust_id, affinity_card, 
        PREDICTION(FOR TO_CHAR(affinity_card) USING *) OVER () pred_card, 
        PREDICTION_PROBABILITY(FOR TO_CHAR(affinity_card),1 USING *) OVER () pred_prob 
     FROM mining_data_build_v) 
WHERE affinity_card = 0 
  AND pred_card = 1 
ORDER BY pred_prob DESC;
```

<table>
<thead>
<tr>
<th>CUST_ID</th>
<th>PRED_PROB</th>
</tr>
</thead>
<tbody>
<tr>
<td>102434</td>
<td>.96</td>
</tr>
<tr>
<td>102365</td>
<td>.96</td>
</tr>
<tr>
<td>102330</td>
<td>.96</td>
</tr>
</tbody>
</table>
Example 1-4  Predict the Likelihood that a New Customer Becomes a Preferred Customer

This query computes the probability of a first-time customer becoming a preferred customer (an affinity card holder). This query can be executed in real time at the point of sale.

The new customer is a 44-year-old American executive who has a bachelors degree and earns more than $300,000/year. He is married, lives in a household of 3, and has lived in the same residence for the past 6 years. The probability of this customer becoming a typical affinity card holder is only 5.8%.

```
SELECT PREDICTION_PROBABILITY(SVMO_SH_CLas_sample, 1 USING
   44 AS age,
   6 AS yrs_residence,
   'Bach.' AS education,
   'Married' AS cust_marital_status,
   'Exec.' AS occupation,
   'United States of America' AS country_name,
   'M' AS cust_gender,
   'L: 300,000 and above' AS cust_income_level,
   '3' AS household_size
) prob_typical
FROM DUAL;
```

```
PROB_TYPICAL
------------
5.8
```

Example 1-5  Use Predictive Analytics to Find Top Predictors

The DBMS_PREDICTIVE_ANALYTICS PL/SQL package contains routines that perform simple data mining operations without a predefined model. In this example, the EXPLAIN routine computes the top predictors for affinity card ownership. The results show that household size, marital status, and age are the top three predictors.

```
BEGIN
   DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
      data_table_name => 'mining_data_test_v',
      explain_column_name => 'affinity_card',
      result_table_name => 'cust_explain_result');
END;
/
```

```
SELECT * FROM cust_explain_result
WHERE rank < 4;
```
Example: Segmenting Customer Data

The examples in this section use an Expectation Maximization clustering model to segment the customer data based on common characteristics. The examples in this section are:

**Example 1-6  Compute Customer Segments**

This query computes natural groupings of customers and returns the number of customers in each group.

```sql
SELECT CLUSTER_ID(em_sh_clus_sample USING *) AS clus, COUNT(*) AS cnt
FROM mining_data_apply_v
GROUP BY CLUSTER_ID(em_sh_clus_sample USING *)
ORDER BY cnt DESC;
```

<table>
<thead>
<tr>
<th>CLUS</th>
<th>CNT</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>311</td>
</tr>
<tr>
<td>3</td>
<td>294</td>
</tr>
<tr>
<td>7</td>
<td>215</td>
</tr>
<tr>
<td>12</td>
<td>201</td>
</tr>
<tr>
<td>17</td>
<td>123</td>
</tr>
<tr>
<td>16</td>
<td>114</td>
</tr>
<tr>
<td>14</td>
<td>86</td>
</tr>
<tr>
<td>19</td>
<td>64</td>
</tr>
<tr>
<td>15</td>
<td>56</td>
</tr>
<tr>
<td>18</td>
<td>36</td>
</tr>
</tbody>
</table>

**Example 1-7  Find the Customers Who Are Most Likely To Be in the Largest Segment**

The query in Example 1-6 shows that segment 9 has the most members. The following query lists the five customers who are most likely to be in segment 9.

```sql
SELECT cust_id
FROM (SELECT cust_id, RANK() over (ORDER BY prob DESC, cust_id) rnk_clus2
     FROM (SELECT cust_id,
             ROUND(CLUSTER_PROBABILITY(em_sh_clus_sample, 9 USING *),3) prob
             FROM mining_data_apply_v)
     WHERE rnk_clus2 <= 5)
ORDER BY rnk_clus2;
```

<table>
<thead>
<tr>
<th>CUST_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>100002</td>
</tr>
<tr>
<td>100012</td>
</tr>
<tr>
<td>100016</td>
</tr>
<tr>
<td>100019</td>
</tr>
<tr>
<td>100021</td>
</tr>
</tbody>
</table>

**Example 1-8  Find Key Characteristics of the Most Representative Customer in the Largest Cluster**

The query in Example 1-7 lists customer 100002 first in the list of likely customers for segment 9. The following query returns the five characteristics that are most...
significant in determining the assignment of customer 100002 to segments with probability > 20% (only segment 9 for this customer).

```
SELECT S.cluster_id, probability prob,
       CLUSTER_DETAILS(em_sh_clus_sample, S.cluster_id, 5 using T.*) det
FROM
  (SELECT v.*, CLUSTER_SET(em_sh_clus_sample, NULL, 0.2 USING *) pset
   FROM mining_data_apply_v v
   WHERE cust_id = 100002) T,
  TABLE(T.pset) S
ORDER BY 2 desc;
```

<table>
<thead>
<tr>
<th>CLUSTER_ID</th>
<th>PROB</th>
<th>DET</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>1.0000</td>
<td>&lt;Details algorithm=&quot;Expectation Maximization&quot; cluster=&quot;9&quot;&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&lt;Attribute name=&quot;YRS_RESIDENCE&quot; actualValue=&quot;4&quot; weight=&quot;1&quot; rank=&quot;1&quot;/&gt;</td>

</tr>
</tbody>
</table>
```
About the Data Mining API

Overview of the Oracle Data Mining application programming interface (API) components.

- About Mining Models
- Data Mining Data Dictionary Views
- Data Mining PL/SQL Packages
- Data Mining SQL Scoring Functions

About Mining Models

Mining models are database schema objects that perform data mining. As with all schema objects, access to mining models is controlled by database privileges. Models can be exported and imported. They support comments, and they can be tracked in the Database auditing system.

Mining models are created by the CREATE_MODEL procedure in the DBMS_DATA_MINING PL/SQL package. Models are created for a specific mining function, and they use a specific algorithm to perform that function. **Mining function** is a data mining term that refers to a class of mining problems to be solved. Examples of mining functions are: regression, classification, attribute importance, clustering, anomaly detection, and feature extraction. Oracle Data Mining supports one or more algorithms for each mining function.

**Note:**
Most types of mining models can be used to score data. However, it is possible to score data without applying a model. Dynamic scoring and predictive analytics return scoring results without a user-supplied model. They create and apply transient models that are not visible to you.

**See Also:**
- Dynamic Scoring
- DBMS_PREDICTIVE_ANALYTICS
- Creating a Model
- Administrative Tasks for Oracle Data Mining
Data Mining Data Dictionary Views

The data dictionary views for Oracle Data Mining are listed in the following table. A database administrator (DBA) and USER versions of the views are also available.

Table 2-1 Data Dictionary Views for Oracle Data Mining

ALL_MINING_MODEL_SETTINGS

The following example describes ALL_MINING_MODEL_SETTINGS and shows a sample query. Settings influence model behavior. Settings may be specific to an algorithm or to a mining function, or they may be general.

**Example 2-3  ALL_MINING_MODEL_SETTINGS**

describe ALL_MINING_MODEL_SETTINGS

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>NOT NULL</td>
<td>VARCHAR2(128)</td>
</tr>
<tr>

Data Mining PL/SQL Packages

The PL/SQL interface to Oracle Data Mining is implemented in three packages, as shown in the following table.

**Table 2-2  Data Mining PL/SQL Packages**

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_DATA_MINING</td>
<td>Routines for creating and managing mining models</td>
</tr>
<tr>
<td>DBMS_DATA_MINING_TRANSFORM</td>
<td>Routines for transforming the data for mining</td>
</tr>
<tr>
<td>DBMS_PREDICTIVE_ANALYTICS</td>
<td>Routines that perform predictive analytics</td>
</tr>
</tbody>
</table>
The DBMS_DATA_MINING package contains routines for creating mining models, for performing operations on mining models, and for querying mining models. The package includes routines for:

- Creating, dropping, and performing other DDL operations on mining models
- Obtaining detailed information about model attributes, rules, and other information internal to the model (model details)
- Computing test metrics for classification models
- Specifying costs for classification models
- Exporting and importing models

<td>Removes the cost matrix from a classification model</td>
</tr>
<tr>
<td>Alter reverse expression</td>
<td>ALTER_REVERSE_EXPRES SION</td>
<td>Alters the reverse transformation expression associated with a model</td>
</tr>
</tbody>
</table>

The DBMS_DATA_MINING package contains a number of functions that return information about mining models. For example, the query in Example 2-4 returns details about feature 1 of the feature extraction model named NMF_SH_Sample.
Example 2-4 Sample Model Details Query

```sql
SELECT F.feature_id,
       A.attribute_name,
       A.attribute_value,
       A.coefficient
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF('NMF_SH_Sample')) F,
       TABLE(F.attribute_set) A
WHERE feature_id = 1
     AND attribute_name in ('AFFINITY_CARD','AGE','COUNTRY_NAME')
ORDER BY feature_id,attribute_name,attribute_value;
```

DBMS_DATA_MINING_TRANSFORM

The DBMS_DATA_MINING_TRANSFORM package contains routines that perform data transformations such as binning, normalization, and outlier treatment. The package includes routines for:

- Specifying transformations in a format that can be embedded in a mining model.
- Specifying transformations as relational views (external to mining model objects).
- Specifying distinct properties for columns in the build data. For example, you can specify that the column must be interpreted as unstructured text, or that the column must be excluded from Automatic Data Preparation.

- Transforming the Data
- DBMS_DATA_MINING_TRANSFORM in *Oracle Database PL/SQL Packages and Types Reference*

Transformation Methods in DBMS_DATA_MINING_TRANSFORM

**Table 2-4 DBMS_DATA_MINING_TRANSFORM Transformation Methods**

<table>
<thead>
<tr>
<th>Transformation Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XFORM interface</td>
<td>CREATE, INSERT, and XFORM routines specify transformations in external views</td>
</tr>
<tr>
<td>STACK interface</td>
<td>CREATE, INSERT, and XFORM routines specify transformations for embedding in a model</td>
</tr>
<tr>
<td>SET_TRANSFORM</td>
<td>Specifies transformations for embedding in a model</td>
</tr>
</tbody>
</table>
The statements in the following example create an Support Vector Machine (SVM) Classification model called T_SVM_Clas_sample with an embedded transformation that causes the comments attribute to be treated as unstructured text data.

**Example 2-5  Sample Embedded Transformation**

```plsql
DECLARE
    xformlist dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.SET_TRANSFORM(
        xformlist, 'comments', null, 'comments', null, 'TEXT');
    DBMS_DATA_MINING.CREATE_MODEL(
        model_name          => 'T_SVM_Clas_sample',
        mining_function     => dbms_data_mining.classification,
        data_table_name     => 'mining_build_text',
        case_id_column_name => 'cust_id',
        target_column_name  => 'affinity_card',
        settings_table_name => 't_svmc_sample_settings',
        xform_list => xformlist);
END;
/
```

**DBMS_PREDICTIVE_ANALYTICS**

The DBMS_PREDICTIVE_ANALYTICS package contains routines that perform an automated form of data mining known as predictive analytics. With predictive analytics, you do not need to be aware of model building or scoring. All mining activities are handled internally by the procedure. The DBMS_PREDICTIVE_ANALYTICS package includes these routines:

- **EXPLAIN** ranks attributes in order of influence in explaining a target column.
- **PREDICT** predicts the value of a target column based on values in the input data.
- **PROFILE** generates rules that describe the cases from the input data.

The EXPLAIN statement in the following example lists attributes in the view mining_data_build_v in order of their importance in predicting affinity_card.

**Example 2-6  Sample EXPLAIN Statement**

```plsql
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
        data_table_name => 'mining_data_build_v',
        explain_column_name => 'affinity_card',
        result_table_name => 'explain_results');
END;
/
```

**See Also:**

DBMS_PREDICTIVE_ANALYTICS in *Oracle Database PL/SQL Packages and Types Reference*

**Data Mining SQL Scoring Functions**

The Data Mining SQL language functions use Oracle Data Mining to score data. The functions can apply a mining model schema object to the data, or they can dynamically mine the data by executing an analytic clause. SQL functions are
available for all the data mining algorithms that support the scoring operation. Table 2-5 lists the Data Mining SQL functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLUSTER_ID</td>
<td>Returns the ID of the predicted cluster</td>
</tr>
<tr>
<td>CLUSTER_DETAILS</td>
<td>Returns detailed information about the predicted cluster</td>
</tr>
<tr>
<td>CLUSTER_DISTANCE</td>
<td>Returns the distance from the centroid of the predicted cluster</td>
</tr>
<tr>
<td>CLUSTER_PROBABILITY</td>
<td>Returns the probability of a case belonging to a given cluster</td>
</tr>
<tr>
<td>CLUSTER_SET</td>
<td>Returns a list of all possible clusters to which a given case belongs along with the associated probability of inclusion</td>
</tr>
<tr>
<td>FEATURE_ID</td>
<td>Returns the ID of the feature with the highest coefficient value</td>
</tr>
<tr>
<td>FEATURE_DETAILS</td>
<td>Returns detailed information about the predicted feature</td>
</tr>
<tr>
<td>FEATURE_SET</td>
<td>Returns a list of objects containing all possible features along with the associated coefficients</td>
</tr>
<tr>
<td>FEATURE_VALUE</td>
<td>Returns the value of the predicted feature</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>Returns the best prediction for the target</td>
</tr>
<tr>
<td>PREDICTION_BOUNDS</td>
<td>(GLM only) Returns the upper and lower bounds of the interval wherein the predicted values (linear regression) or probabilities (logistic regression) lie.</td>
</tr>
<tr>
<td>PREDICTION_COST</td>
<td>Returns a measure of the cost of incorrect predictions</td>
</tr>
<tr>
<td>PREDICTION_DETAILS</td>
<td>Returns detailed information about the prediction</td>
</tr>
<tr>
<td>PREDICTION_PROBABILITY</td>
<td>Returns the probability of the prediction</td>
</tr>
<tr>
<td>PREDICTION_SET</td>
<td>Returns the results of a classification model, including the predictions and associated probabilities for each case</td>
</tr>
</tbody>
</table>

Example 2-7 shows a query that returns the results of the CLUSTER_ID function. The query applies the model em_sh_clus_sample, which finds groups of customers that share certain characteristics. The query returns the identifiers of the clusters and the number of customers in each cluster.

Example 2-7  CLUSTER_ID Function

```sql
-- List the clusters into which the customers in this data set have been grouped.
SELECT CLUSTER_ID(em_sh_clus_sample USING *) AS clus, COUNT(*) AS cnt
FROM mining_data_apply_v
GROUP BY CLUSTER_ID(em_sh_clus_sample USING *)
ORDER BY cnt DESC;
```

SQL> -- List the clusters into which the customers in this data set have been grouped.
SQL> --
SQL> SELECT CLUSTER_ID(em_sh_clus_sample USING *) AS clus, COUNT(*) AS cnt
2    FROM mining_data_apply_v
3  GROUP BY CLUSTER_ID(em_sh_clus_sample USING *)
4  ORDER BY cnt DESC;

<table>
<thead>
<tr>
<th>CLUS</th>
<th>CNT</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>311</td>
</tr>
<tr>
<td>3</td>

Preparing the Data

Learn how to create a table or view that can be used to build a model.

- Data Requirements
- About Attributes
- Using Nested Data
- Using Market Basket Data
- Handling Missing Values

Data Requirements

Data mining activities require data that is defined within a single table or view. The information for each record must be stored in a separate row. The data records are commonly called cases. Each case can optionally be identified by a unique case ID. The table or view itself can be referred to as a case table.

The CUSTOMERS table in the SH schema is an example of a table that could be used for mining. All the information for each customer is contained in a single row. The case ID is the CUST_ID column. The rows listed in the following example are selected from SH.CUSTOMERS.

---

**Note:**

Oracle Data Mining requires single-record case data for all types of models except association models, which can be built on native transactional data.

**Example 3-1  Sample Case Table**

```
SQL> select cust_id, cust_gender, cust_year_of_birth,
          cust_main_phone_number from sh.customers where cust_id < 11;

CUST_ID CUST_GENDER CUST_YEAR_OF_BIRTH CUST_MAIN_PHONE_NUMBER
------- ----------- ---- ------------- -------------------------
1        M           1946           127-379-8954
2        F           1957           680-327-1419
3        M           1939           115-509-3391
4        M           1934           577-104-2792
5        M           1969           563-667-7731
6        F           1925           682-732-7260
7        F           1986           648-272-6181
8        F           1964           234-693-8728
9        F           1936           697-702-2618
10       F           1947           601-207-4099
```
Column Data Types

The columns of the case table hold the attributes that describe each case. In Example 3-1, the attributes are: CUST_GENDER, CUST_YEAR_OF_BIRTH, and CUST_MAIN_PHONE_NUMBER. The attributes are the predictors in a supervised model or the descriptors in an unsupervised model. The case ID, CUST_ID, can be viewed as a special attribute; it is not a predictor or a descriptor.

Oracle Data Mining supports standard Oracle data types as well as the following collection types:

- DM_NESTED_CATEGORICALS
- DM_NESTED_NUMERICALS
- DM_NESTED_BINARY_DOUBLES
- DM_NESTED_BINARY_FLOATS

Data Sets for Classification and Regression

You need two case tables to build and validate classification and regression models. One set of rows is used for training the model, another set of rows is used for testing the model. It is often convenient to derive the build data and test data from the same data set. For example, you could randomly select 60% of the rows for training the model; the remaining 40% could be used for testing the model.

Models that implement other mining functions, such as attribute importance, clustering, association, or feature extraction, do not use separate test data.

Scoring Requirements

Most data mining models can be applied to separate data in a process known as scoring. Oracle Data Mining supports the scoring operation for classification, regression, anomaly detection, clustering, and feature extraction.

The scoring process matches column names in the scoring data with the names of the columns that were used to build the model. The scoring process does not require all the columns to be present in the scoring data. If the data types do not match, Oracle Data Mining attempts to perform type coercion. For example, if a column called PRODUCT_RATING is VARCHAR2 in the training data but NUMBER in the scoring data, Oracle Data Mining effectively applies a TO_CHAR() function to convert it.
The column in the test or scoring data must undergo the same transformations as the corresponding column in the build data. For example, if the AGE column in the build data was transformed from numbers to the values CHILD, ADULT, and SENIOR, then the AGE column in the scoring data must undergo the same transformation so that the model can properly evaluate it.

**Note:**

Oracle Data Mining can embed user-specified transformation instructions in the model and reapply them whenever the model is applied. When the transformation instructions are embedded in the model, you do not need to specify them for the test or scoring data sets.

Oracle Data Mining also supports Automatic Data Preparation (ADP). When ADP is enabled, the transformations required by the algorithm are performed automatically and embedded in the model along with any user-specified transformations.

**See Also:**

Transforming the Data for more information on automatic and embedded data transformations

---

**About Attributes**

Attributes are the items of data that are used in data mining. In predictive models, attributes are the predictors that affect a given outcome. In descriptive models, attributes are the items of information being analyzed for natural groupings or associations. For example, a table of employee data that contains attributes such as job title, date of hire, salary, age, gender, and so on.

**Data Attributes and Model Attributes**

Data attributes are columns in the data set used to build, test, or score a model. Model attributes are the data representations used internally by the model.

Data attributes and model attributes can be the same. For example, a column called SIZE, with values S, M, and L, are attributes used by an algorithm to build a model. Internally, the model attribute SIZE is most likely be the same as the data attribute from which it was derived.

On the other hand, a nested column SALES_PROD, containing the sales figures for a group of products, does not correspond to a model attribute. The data attribute can be SALES_PROD, but each product with its corresponding sales figure (each row in the nested column) is a model attribute.

Transformations also cause a discrepancy between data attributes and model attributes. For example, a transformation can apply a calculation to two data attributes and store the result in a new attribute. The new attribute is a model attribute that has no corresponding data attribute. Other transformations such as binning, normalization, and outlier treatment, cause the model’s representation of an attribute to be different from the data attribute in the case table.
See Also:

- Using Nested Data
- Transforming the Data for information about transformations

Target Attribute

The target of a supervised model is a special kind of attribute. The target column in the training data contains the historical values used to train the model. The target column in the test data contains the historical values to which the predictions are compared. The act of scoring produces a prediction for the target.

Clustering, feature extraction, association, and anomaly detection models do not use a target.

Nested columns and columns of unstructured data (such as BFILE, CLOB, or BLOB) cannot be used as targets. Target attributes must have a simple data type.

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Target Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>VARCHAR2, CHAR</td>
</tr>
<tr>
<td></td>
<td>NUMBER, FLOAT</td>
</tr>
<tr>
<td></td>
<td>BINARY_DOUBLE, BINARY_FLOAT</td>
</tr>
<tr>
<td>Regression</td>
<td>NUMBER, FLOAT</td>
</tr>
<tr>
<td></td>
<td>BINARY_DOUBLE, BINARY_FLOAT</td>
</tr>
</tbody>
</table>

You can query the `*_MINING_MODEL_ATTRIBUTES` view to find the target for a given model.

See Also:

`ALL_MINING_MODEL_ATTRIBUTES`

Numericals, Categoricals, and Unstructured Text

Model attributes are numerical, categorical, or unstructured (text). Data attributes, which are columns in a case table, have Oracle data types, as described in "Column Data Types".

Numerical attributes can theoretically have an infinite number of values. The values have an implicit order, and the differences between them are also ordered. Oracle Data Mining interprets NUMBER, FLOAT, BINARY_DOUBLE, BINARY_FLOAT, DM_NESTED_NUMERICALS, DM_NESTED_BINARY_DOUBLES, and DM_NESTED_BINARY_FLOATS as numerical.

Categorical attributes have values that identify a finite number of discrete categories or classes. There is no implicit order associated with the values. Some categorical attributes are binary: they have only two possible values, such as yes or no, or male or female. Other categorical attributes are multi-class: they have more than two values, such as small, medium, and large.
Oracle Data Mining interprets `CHAR` and `VARCHAR2` as categorical by default, however these columns may also be identified as columns of unstructured data (text). Oracle Data Mining interprets columns of `DM_NESTED_CATEGORICALS` as categorical. Columns of `CLOB`, `BLOB`, and `BFILE` always contain unstructured data.

The target of a classification model is categorical. (If the target of a classification model is numeric, it is interpreted as categorical.) The target of a regression model is numerical. The target of an attribute importance model is either categorical or numerical.

**See Also:**
- Column Data Types
- Mining Unstructured Text

**Model Signature**

The model signature is the set of data attributes that are used to build a model. Some or all of the attributes in the signature must be present for scoring. The model accounts for any missing columns on a best-effort basis. If columns with the same names but different data types are present, the model attempts to convert the data type. If extra, unused columns are present, they are disregarded.

The model signature does not necessarily include all the columns in the build data. Algorithm-specific criteria can cause the model to ignore certain columns. Other columns can be eliminated by transformations. Only the data attributes actually used to build the model are included in the signature.

The target and case ID columns are not included in the signature.

**Scoping of Model Attribute Name**

The model attribute name consists of two parts: a column name, and a subcolumn name.

`column_name.subcolumn_name`

The `column_name` component is the name of the data attribute. It is present in all model attribute names. Nested attributes and text attributes also have a `subcolumn_name` component as shown in the following example.

**Example 3-2    Model Attributes Derived from a Nested Column**

The nested column `SALESPROD` has three rows.

```
<table>
<thead>
<tr>
<th>ATTRIBUTE_NAME</th>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>(PROD1, 300),</td>
<td></td>
</tr>
<tr>
<td>(PROD2, 245),</td>
<td></td>
</tr>
<tr>
<td>(PROD3, 679)</td>
<td></td>
</tr>
</tbody>
</table>
```

The name of the data attribute is `SALESPROD`. Its associated model attributes are:

- `SALESPROD.PROD1`
- `SALESPROD.PROD2`
- `SALESPROD.PROD3`
Model Details

Model details reveal information about model attributes and their treatment by the algorithm. There is a separate `GET_MODELDETAILS` routine for each algorithm. Oracle recommends that users leverage the model detail views instead.

Transformation and reverse transformation expressions are associated with model attributes. Transformations are applied to the data attributes before the algorithmic processing that creates the model. Reverse transformations are applied to the model attributes after the model has been built, so that the model details are expressed in the form of the original data attributes, or as close to it as possible.

Reverse transformations support model transparency. They provide a view of the data that the algorithm is working with internally but in a format that is meaningful to a user.

Example 3-3 shows the definition of the `GET_MODELDETAILS` function for an Attribute Importance model.

**Example 3-3  Model Details for an Attribute Importance Model**

The syntax of the `GET_MODELDETAILS` function for Attribute Importance models is shown as follows.

```sql
DBMS_DATA_MINING.GET_MODELDETAILS_AI (model_name VARCHAR2)
RETURN DM_RANKED_ATTRIBUTES PIPELINED;
```

The function returns `DM_RANKED_ATTRIBUTES`, a virtual table. The columns are the model details. There is one row for each model attribute in the specified model. The columns are described as follows.

- `attribute_name` VARCHAR2(4000)
- `attribute_subname` VARCHAR2(4000)
- `importance_value` NUMBER
- `rank` NUMBER(38)

Using Nested Data

Oracle Data Mining requires a case table in single-record case format, with each record in a separate row. What if some or all of your data is in multi-record case format, with each record in several rows? What if you want one attribute to represent a series or collection of values, such as a student’s test scores or the products purchased by a customer?

This kind of one-to-many relationship is usually implemented as a join between tables. For example, you can join your customer table to a sales table and thus associate a list of products purchased with each customer.

Oracle Data Mining supports dimensioned data through nested columns. To include dimensioned data in your case table, create a view and cast the joined data to one of the Data Mining nested table types. Each row in the nested column consists of an attribute name/value pair. Oracle Data Mining internally processes each nested row as a separate attribute.

---

**Note:**

O-Cluster is the only algorithm that does not support nested data.
Nested Object Types

Oracle Database supports user-defined data types that make it possible to model real-world entities as objects in the database. **Collection types** are object data types for modeling multi-valued attributes. Nested tables are collection types. Nested tables can be used anywhere that other data types can be used.

Oracle Data Mining supports the following nested object types:

```plaintext
DM_NESTED_BINARY_DOUBLES
DM_NESTED_BINARY_FLOATS
DM_NESTED_NUMERICALS
DM_NESTED_CATEGORICALS
```

Descriptions of the nested types are provided in this example.

**Example 3-4  Oracle Data Mining Nested Data Types**

```plaintext
describe dm_nested_binary_double
Name                        Null?    Type
----------------------------------------- -------- ----------------------------
ATTRIBUTE_NAME                                     VARCHAR2(4000)
VALUE                                               BINARY_DOUBLE

describe dm_nested_binary_doubles
DM_NESTED_BINARY_DOUBLES TABLE OF SYS.DM_NESTED_BINARY_DOUBLE
Name                        Null?    Type
------------------------------------------ -------- ---------------------------
ATTRIBUTE_NAME                                      VARCHAR2(4000)
VALUE                                               BINARY_DOUBLE

describe dm_nested_binary_float

**Example: Transforming Transactional Data for Mining**

**Example 3-5** shows data from a view of a sales table. It includes sales for three of the many products sold in four regions. This data is not suitable for mining at the product level because sales for each case (product), is stored in several rows.

**Example 3-6** shows how this data can be transformed for mining. The case ID column is `PRODUCT`, `SALES_PER_REGION`, a nested column of type `DM_NESTED_NUMERICALS`, is a data attribute. This table is suitable for mining at the product case level, because the information for each case is stored in a single row.

Oracle Data Mining treats each nested row as a separate model attribute, as shown in **Example 3-7**.

**Note:**

The presentation in this example is conceptual only. The data is not actually pivoted before being processed.

**Example 3-5  Product Sales per Region in Multi-Record Case Format**

Using Market Basket Data

Market basket data identifies the items sold in a set of baskets or transactions. Oracle Data Mining provides the association mining function for market basket analysis.

Association models use the Apriori algorithm to generate association rules that describe how items tend to be purchased in groups. For example, an association rule can assert that people who buy peanut butter are 80% likely to also buy jelly.

Market basket data is usually transactional. In transactional data, a case is a transaction and the data for a transaction is stored in multiple rows. Oracle Data Mining association models can be built on transactional data or on single-record case data. The ODMS_ITEM_ID_COLUMN_NAME and ODMS_ITEM_VALUE_COLUMN_NAME settings specify whether the data for association rules is in transactional format.

Note:

Association models are the only type of model that can be built on native transactional data. For all other types of models, Oracle Data Mining requires that the data be presented in single-record case format.
The Apriori algorithm assumes that the data is transactional and that it has many missing values. Apriori interprets all missing values as sparse data, and it has its own native mechanisms for handling sparse data.

See Also:

Oracle Database PL/SQL Packages and Types Reference for information on the ODMS_ITEM_ID_COLUMN_NAME and ODMS_ITEM_VALUE_COLUMN_NAME settings.

Example: Creating a Nested Column for Market Basket Analysis

Association models can be built on native transactional data or on nested data. The following example shows how to define a nested column for market basket analysis.

The following SQL statement transforms this data to a column of type DM_NESTED_NUMERICALS in a view called SALES_TRANS_CUST_NESTED. This view can be used as a case table for mining.

CREATE VIEW sales_trans_cust_nested AS
SELECT trans_id,
CAST(COLLECT(DM_NESTED_NUMERICAL(prod_name, 1)) AS DM_NESTED_NUMERICALS) custprods
FROM sales_trans_cust
GROUP BY trans_id;

This query returns two rows from the transformed data.

SELECT * FROM sales_trans_cust_nested
WHERE trans_id < 101000
AND trans_id > 100997;

TRANS_ID  CUSTPRODS(ATRIBUTE_NAME, VALUE)
-------  ------------------------------------------------
100998    DM_NESTED_NUMERICALS
         (DM_NESTED_NUMERICAL('O/S Documentation Set – English', 1))
100999    DM_NESTED_NUMERICALS
         (DM_NESTED_NUMERICAL('CD-RW, High Speed Pack of 5', 1),
          DM_NESTED_NUMERICAL('External 8X CD-ROM', 1),
          DM_NESTED_NUMERICAL('SIMM-16MB PCMCIAII card', 1))

Example 3-8 Convert to a Nested Column

The view SALES_TRANS_CUST provides a list of transaction IDs to identify each market basket and a list of the products in each basket.

describe sales_trans_cust
Name Null?       Type
------------------------- -------- ----------------
TRANS_ID                  NOT NULL NUMBER
PROD_NAME                  NOT NULL VARCHAR2(50)
QUANTITY                   NOT NULL NUMBER

Handling Missing Values
Handling Missing Values

Oracle Data Mining distinguishes between sparse data and data that contains random missing values. The latter means that some attribute values are unknown. Sparse data, on the other hand, contains values that are assumed to be known, although they are not represented in the data.

A typical example of sparse data is market basket data. Out of hundreds or thousands of available items, only a few are present in an individual case (the basket or transaction). All the item values are known, but they are not all included in the basket. Present values have a quantity, while the items that are not represented are sparse (with a known quantity of zero).

Oracle Data Mining interprets missing data as follows:

- Missing at random: Missing values in columns with a simple data type (not nested) are assumed to be missing at random.
- Sparse: Missing values in nested columns indicate sparsity.

Examples: Missing Values or Sparse Data?

The examples in this section illustrate how Oracle Data Mining identifies data as either sparse or missing at random.

Sparsity in a Sales Table

A sales table contains point-of-sale data for a group of products that are sold in several stores to different customers over a period of time. A particular customer buys only a few of the products. The products that the customer does not buy do not appear as rows in the sales table.

If you were to figure out the amount of money a customer has spent for each product, the unpurchased products have an inferred amount of zero. The value is not random or unknown; it is zero, even though no row appears in the table.

Note that the sales data is dimensioned (by product, stores, customers, and time) and are often represented as nested data for mining.

Since missing values in a nested column always indicate sparsity, you must ensure that this interpretation is appropriate for the data that you want to mine. For example, when trying to mine a multi-record case data set containing movie ratings from users of a large movie database, the missing ratings are unknown (missing at random), but Oracle Data Mining treats the data as sparse and infer a rating of zero for the missing value.

Missing Values in a Table of Customer Data

A table of customer data contains demographic data about customers. The case ID column is the customer ID. The attributes are age, education, profession, gender, house-hold size, and so on. Not all the data is available for each customer. Any missing values are considered to be missing at random. For example, if the age of customer 1 and the profession of customer 2 are not present in the data, that information is simply unknown. It does not indicate sparsity.

Note that the customer data is not dimensioned. There is a one-to-one mapping between the case and each of its attributes. None of the attributes are nested.
### Missing Value Treatment in Oracle Data Mining

Missing value treatment depends on the algorithm and on the nature of the data (categorical or numerical, sparse or missing at random). Missing value treatment is summarized in the following table.

**Note:**
Oracle Data Mining performs the same missing value treatment whether or not Automatic Data Preparation is being used.

<table>
<thead>
<tr>
<th>Missing Data</th>
<th>EM, GLM, NMF, k-Means, SVD, SVM</th>
<th>DT, MDL, NB, OC</th>
<th>Apriori</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>NUMERIC AL missing at random</strong></td>
<td>The algorithm replaces missing numerical values with the mean. For Expectation Maximization (EM), the replacement only occurs in columns that are modeled with Gaussian distributions.</td>
<td>The algorithm handles missing values naturally as missing at random.</td>
<td>The algorithm interprets all missing data as sparse.</td>
</tr>
<tr>
<td><strong>CATEGORICAL missing at random</strong></td>
<td>Genelized Linear Models (GLM), Non-Negative Matrix Factorization (NMF), k-Means, and Support Vector Machine (SVM) replaces missing categorical values with the mode. Singular Value Decomposition (SVD) does not support categorical data. EM does not replace missing categorical values. EM treats NULLs as a distinct value with its own frequency count.</td>
<td>The algorithm handles missing values naturally as missing random.</td>
<td>The algorithm interprets all missing data as sparse.</td>
</tr>
<tr>
<td><strong>NUMERIC AL sparse</strong></td>
<td>The algorithm replaces sparse numerical data with zeros.</td>
<td>O-Cluster does not support nested data and therefore does not support sparse data. Decision Tree (DT), Minimum Description Length (MDL), and Naive Bayes (NB) and replace sparse numerical data with zeros.</td>
<td>The algorithm handles sparse data.</td>
</tr>
</tbody>
</table>
Table 3-2 (Cont.) Missing Value Treatment by Algorithm

<table>
<thead>
<tr>
<th>Missing Data</th>
<th>EM, GLM, NMF, k-Means, SVD, SVM</th>
<th>DT, MDL, NB, OC</th>
<th>Apriori</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATEGORI CAL sparse</td>
<td>All algorithms except SVD replace sparse categorical data with zero vectors. SVD does not support categorical data.</td>
<td>O-Cluster does not support nested data and therefore does not support sparse data. DT, MDL, and NB replace sparse categorical data with the special value DM$SPARSE.</td>
<td>The algorithm handles sparse data.</td>
</tr>
</tbody>
</table>

Changing the Missing Value Treatment

If you want Oracle Data Mining to treat missing data as sparse instead of missing at random or missing at random instead of sparse, transform it before building the model.

If you want missing values to be treated as sparse, but Oracle Data Mining interprets them as missing at random, you can use a SQL function like `NVL` to replace the nulls with a value such as "NA". Oracle Data Mining does not perform missing value treatment when there is a specified value.

If you want missing nested attributes to be treated as missing at random, you can transform the nested rows into physical attributes in separate columns — as long as the case table stays within the 1000 column limitation imposed by the Database. Fill in all of the possible attribute names, and specify them as null. Alternatively, insert rows in the nested column for all the items that are not present and assign a value such as the mean or mode to each one.

*Oracle Database SQL Language Reference* for details about the `NVL` function
Transforming the Data

Understand how to transform data for building a model or for scoring.

- About Transformations
- Preparing the Case Table
- Understanding Automatic Data Preparation
- Embedding Transformations in a Model
- Understanding Reverse Transformations

About Transformations

A transformation is a SQL expression that modifies the data in one or more columns. Data must typically undergo certain transformations before it can be used to build a model. Many data mining algorithms have specific transformation requirements. Before data can be scored, it must be transformed in the same way that the training data was transformed.

Oracle Data Mining supports Automatic Data Preparation (ADP), which automatically implements the transformations required by the algorithm. The transformations are embedded in the model and automatically executed whenever the model is applied.

If additional transformations are required, you can specify them as SQL expressions and supply them as input when you create the model. These transformations are embedded in the model just as they are with ADP.

With automatic and embedded data transformation, most of the work of data preparation is handled for you. You can create a model and score multiple data sets in just a few steps:

1. Identify the columns to include in the case table.
2. Create nested columns if you want to include transactional data.
3. Write SQL expressions for any transformations not handled by ADP.
4. Create the model, supplying the SQL expressions (if specified) and identifying any columns that contain text data.
5. Ensure that some or all of the columns in the scoring data have the same name and type as the columns used to train the model.
Preparing the Case Table

The first step in preparing data for mining is the creation of a case table. If all the data resides in a single table and all the information for each case (record) is included in a single row (single-record case), this process is already taken care of. If the data resides in several tables, creating the data source involves the creation of a view. For the sake of simplicity, the term "case table" is used here to refer to either a table or a view.

Creating Nested Columns

When the data source includes transactional data (multi-record case), the transactions must be aggregated to the case level in nested columns. In transactional data, the information for each case is contained in multiple rows. An example is sales data in a star schema when mining at the product level. Sales is stored in many rows for a single product (the case) since the product is sold in many stores to many customers over a period of time.

Converting Column Data Types

You must convert the data type of a column if its type causes Oracle Data Mining to interpret it incorrectly. For example, zip codes identify different postal zones; they do not imply order. If the zip codes are stored in a numeric column, they are interpreted as a numeric attribute. You must convert the data type so that the column data can be used as a categorical attribute by the model. You can do this using the `TO_CHAR` function to convert the digits 1-9 and the `LPAD` function to retain the leading 0, if there is one.

`LPAD(TO_CHAR(ZIPCODE),5,'0')`

Text Transformation

You can use Oracle Data Mining to mine text. Columns of text in the case table can be mined once they have undergone the proper transformation.

The text column must be in a table, not a view. The transformation process uses several features of Oracle Text; it treats the text in each row of the table as a separate document. Each document is transformed to a set of text tokens known as terms, which have a numeric value and a text label. The text column is transformed to a nested column of `DM_NESTED_NUMERICALS`.
About Business and Domain-Sensitive Transformations

Some transformations are dictated by the definition of the business problem. For example, you want to build a model to predict high-revenue customers. Since your revenue data for current customers is in dollars you need to define what "high-revenue" means. Using some formula that you have developed from past experience, you can recode the revenue attribute into ranges Low, Medium, and High before building the model.

Another common business transformation is the conversion of date information into elapsed time. For example, date of birth can be converted to age.

Domain knowledge can be very important in deciding how to prepare the data. For example, some algorithms produce unreliable results if the data contains values that fall far outside of the normal range. In some cases, these values represent errors or abnormalities. In others, they provide meaningful information.

Understanding Automatic Data Preparation

Most algorithms require some form of data transformation. During the model build process, Oracle Data Mining can automatically perform the transformations required by the algorithm. You can choose to supplement the automatic transformations with additional transformations of your own, or you can choose to manage all the transformations yourself.

In calculating automatic transformations, Oracle Data Mining uses heuristics that address the common requirements of a given algorithm. This process results in reasonable model quality in most cases.

Binning, normalization, and outlier treatment are transformations that are commonly needed by data mining algorithms.

See Also:
- Outlier Treatment

Binning

Binning, also called discretization, is a technique for reducing the cardinality of continuous and discrete data. Binning groups related values together in bins to reduce the number of distinct values.

Binning can improve resource utilization and model build response time dramatically without significant loss in model quality. Binning can improve model quality by strengthening the relationship between attributes.
Supervised binning is a form of intelligent binning in which important characteristics of the data are used to determine the bin boundaries. In supervised binning, the bin boundaries are identified by a single-predictor decision tree that takes into account the joint distribution with the target. Supervised binning can be used for both numerical and categorical attributes.

Normalization

Normalization is the most common technique for reducing the range of numerical data. Most normalization methods map the range of a single variable to another range (often 0,1).

Outlier Treatment

A value is considered an outlier if it deviates significantly from most other values in the column. The presence of outliers can have a skewing effect on the data and can interfere with the effectiveness of transformations such as normalization or binning.

Outlier treatment methods such as trimming or clipping can be implemented to minimize the effect of outliers.

Outliers represent problematic data, for example, a bad reading due to the abnormal condition of an instrument. However, in some cases, especially in the business arena, outliers are perfectly valid. For example, in census data, the earnings for some of the richest individuals can vary significantly from the general population. Do not treat this information as an outlier, since it is an important part of the data. You need domain knowledge to determine outlier handling.

How ADP Transforms the Data

The following table shows how ADP prepares the data for each algorithm.

<table>
<thead>
<tr>

- Part III of Oracle Data Mining Concepts for more information about algorithm-specific data preparation

Embedding Transformations in a Model

You can specify your own transformations and embed them in a model by creating a transformation list and passing it to `DBMS_DATA_MINING.CREATE_MODEL`.

```sql
PROCEDURE create_model(
    model_name           IN VARCHAR2,
    mining_function      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    case_id_column_name  IN VARCHAR2,
    target_column_name   IN VARCHAR2 DEFAULT NULL,
    settings_table_name  IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    settings_schema_name IN VARCHAR2 DEFAULT NULL,
    xform_list           IN TRANSFORM_LIST DEFAULT NULL
);
```

Specifying Transformation Instructions for an Attribute

A transformation list is defined as a table of transformation records. Each record (`transform_rec`) specifies the transformation instructions for an attribute.

```sql
TYPE transform_rec IS RECORD (  
    attribute_name      VARCHAR2(30),  
    attribute_subname   VARCHAR2(4000),  
    expression          EXPRESSION_REC,  
    reverse_expression  EXPRESSION_REC,  
    attribute_spec      VARCHAR2(4000));
```

The fields in a transformation record are described in this table.
### Table 4-2 Fields in a Transformation Record for an Attribute

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name and</td>
<td>These fields identify the attribute, as described in &quot;Scoping of Model Attribute Name&quot;</td>
</tr>
<tr>
<td>attribute_subname</td>
<td></td>
</tr>
<tr>
<td>expression</td>
<td>A SQL expression for transforming the attribute. For example, this expression transforms the age attribute into two categories: child and adult: [0,19) \text{ for } 'child' \text{ and } [19,) \text{ for adult} \text{ CASE WHEN age &lt; 19 THEN 'child' ELSE 'adult' } \text{ Expression and reverse expressions are stored in expression_rec objects. See 'Expression Records' for details.}</td>
</tr>
<tr>
<td>reverse_expression</td>
<td>A SQL expression for reversing the transformation. For example, this expression reverses the transformation of the age attribute: \text{ DECODE(age, 'child', '(-Inf,19)', '[19,Inf]') }</td>
</tr>
<tr>
<td>attribute_spec</td>
<td>Specifies special treatment for the attribute. The attribute_spec field can be null or it can have one or more of these values: \text{ • FORCE_IN — For GLM, forces the inclusion of the attribute in the model build when the ftr_selection_enable setting is enabled. (ftr_selection_enable is disabled by default.) If the model is not using GLM, this value has no effect. FORCE_IN cannot be specified for nested attributes or text. } \text{ • NOPREP — When ADP is on, prevents automatic transformation of the attribute. If ADP is not on, this value has no effect. You can specify NOPREP for a nested attribute, but not for an individual subname (row) in the nested attribute. } \text{ • TEXT — Indicates that the attribute contains unstructured text. ADP has no effect on this setting. TEXT may optionally include subsettings POLICY_NAME, TOKEN_TYPE, and MAX_FEATURES.}</td>
</tr>
</tbody>
</table>

---

**See Also:**

- Scoping of Model Attribute Name
- Expression Records
- Example 4-1
- Example 4-2

---

**Expression Records**

The transformation expressions in a transformation record are expression_rec objects.
TYPE expression_rec IS RECORD (  
lstmt DBMS_SQL.VARCHAR2A,  
lb BINARY_INTEGER DEFAULT 1,  
ub BINARY_INTEGER DEFAULT 0);

TYPE varchar2a IS TABLE OF VARCHAR2(32767)  
INDEX BY BINARY_INTEGER;

The lstmt field stores a VARCHAR2A, which allows transformation expressions to be very long, as they can be broken up across multiple rows of VARCHAR2. Use the DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION procedure to create an expression_rec.

Attribute Specifications

The attribute specification in a transformation record defines characteristics that are specific to this attribute. If not null, the attribute specification can include values FORCE_IN, NOPREP, or TEXT, as described in Table 4-2.

Example 4-1 An Attribute Specification with Multiple Keywords

If more than one attribute specification keyword is applicable, you can provide them in a comma-delimited list. The following expression is the specification for an attribute in a GLM model. Assuming that the ftr_selection_enable setting is enabled, this expression forces the attribute to be included in the model. If ADP is on, automatic transformation of the attribute is not performed.

"FORCE_IN,NOPREP"

Example 4-2 A Text Attribute Specification

For text attributes, you can optionally specify subsettings POLICY_NAME, TOKEN_TYPE, and MAX_FEATURES. The subsettings provide configuration information that is specific to text transformation. In this example, the transformation instructions for the text content are defined in a text policy named my_policy with token type is THEME. The maximum number of extracted features is 3000.

"TEXT(POLICY_NAME:my_policy)(TOKEN_TYPE:THEME)(MAX_FEATURES:3000)"

See Also:
Configuring a Text Attribute

Building a Transformation List

A transformation list is a collection of transformation records. When a new transformation record is added, it is appended to the top of the transformation list. You can use any of the following methods to build a transformation list:

- The SET_TRANFORM procedure in DBMS_DATA_MINING_TRANSFORM
- The STACK interface in DBMS_DATA_MINING_TRANSFORM
- The GET_MODEL_TRANSFORMATIONS and GET_TRANSFORM_LIST functions in DBMS_DATA_MINING
**SET_TRANSFORM**

The SET_TRANSFORM procedure adds a single transformation record to a transformation list.

```sql
DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (
    xform_list IN OUT NOCOPY TRANSFORM_LIST,
    attribute_name VARCHAR2,
    attribute_subname VARCHAR2,
    expression VARCHAR2,
    reverse_expression VARCHAR2,
    attribute_spec VARCHAR2 DEFAULT NULL);
```

SQL expressions that you specify with SET_TRANSFORM must fit within a VARCHAR2. To specify a longer expression, you can use the SET_EXPRESSION procedure, which builds an expression by appending rows to a VARCHAR2 array.

**The STACK Interface**

The STACK interface creates transformation records from a table of transformation instructions and adds them to a transformation list.

The STACK interface specifies that all or some of the attributes of a given type must be transformed in the same way. For example, STACK_BIN_CAT appends binning instructions for categorical attributes to a transformation list. The STACK interface consists of three steps:

1. A CREATE procedure creates a transformation definition table. For example, CREATE_BIN_CAT creates a table to hold categorical binning instructions. The table has columns for storing the name of the attribute, the value of the attribute, and the bin assignment for the value.

2. An INSERT procedure computes the bin boundaries for one or more attributes and populates the definition table. For example, INSERT_BIN_CAT_FREQ performs frequency-based binning on some or all of the categorical attributes in the data source and populates a table created by CREATE_BIN_CAT.

3. A STACK procedure creates transformation records from the information in the definition table and appends the transformation records to a transformation list. For example, STACK_BIN_CAT creates transformation records for the information stored in a categorical binning definition table and appends the transformation records to a transformation list.

**GET_MODEL_TRANSFORMATIONS and GET_TRANSFORM_LIST**

These two functions can be used to create a new transformation list from the transformations embedded in an existing model.

The GET_MODEL_TRANSFORMATIONS function returns a list of embedded transformations.

```sql
DBMS_DATA_MINING.GET_MODEL_TRANSFORMATIONS (
    model_name IN VARCHAR2)
RETURN DM_TRANSFORMS PIPELINED;
```

GET_MODEL_TRANSFORMATIONS returns a table of `dm_transform` objects. Each `dm_transform` has these fields:

- `attribute_name` VARCHAR2(4000)
- `attribute_subname` VARCHAR2(4000)
The components of a transformation list are `transform_rec`, not `dm_transform`. The fields of a `transform_rec` are described in Table 4-2. You can call `GET_MODEL_TRANSFORMATIONS` to convert a list of `dm_transform` objects to `transform_rec` objects and append each `transform_rec` to a transformation list.

```plsql
DBMS_DATA_MINING.GET_TRANSFORM_LIST(
    xform_list OUT NOCOPY TRANSFORM_LIST,
    model_xforms IN  DM_TRANSFORMS);
```

### Transformation Lists and Automatic Data Preparation

If you enable ADP and you specify a transformation list, the transformation list is embedded with the automatic, system-generated transformations. The transformation list is executed before the automatic transformations.

If you enable ADP and do not specify a transformation list, only the automatic transformations are embedded in the model.

If ADP is disabled (the default) and you specify a transformation list, your custom transformations are embedded in the model. No automatic transformations are performed.

If ADP is disabled (the default) and you do not specify a transformation list, no transformations is embedded in the model. You have to transform the training, test, and scoring data sets yourself if necessary. You must take care to apply the same transformations to each data set.

### Oracle Data Mining Transformation Routines

Oracle Data Mining provides routines that implement various transformation techniques in the `DBMS_DATA_MINING_TRANSFORM` package.
Binning Routines

A number of factors go into deciding a binning strategy. Having fewer values typically leads to a more compact model and one that builds faster, but it can also lead to some loss in accuracy.

Model quality can improve significantly with well-chosen bin boundaries. For example, an appropriate way to bin ages is to separate them into groups of interest, such as children 0-13, teenagers 13-19, youth 19-24, working adults 24-35, and so on.

The following table lists the binning techniques provided by Oracle Data Mining:

<table>
<thead>
<tr>
<th>Binning Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Top-N Most Frequent Items</td>
<td>You can use this technique to bin categorical attributes. You specify the number of bins. The value that occurs most frequently is labeled as the first bin, the value that appears with the next frequency is labeled as the second bin, and so on. All remaining values are in an additional bin.</td>
</tr>
<tr>
<td>Supervised Binning</td>
<td>Supervised binning is a form of intelligent binning, where bin boundaries are derived from important characteristics of the data. Supervised binning builds a single-predictor decision tree to find the interesting bin boundaries with respect to a target. It can be used for numerical or categorical attributes.</td>
</tr>
<tr>
<td>Equi-Width Binning</td>
<td>You can use equi-width binning for numerical attributes. The range of values is computed by subtracting the minimum value from the maximum value, then the range of values is divided into equal intervals. You can specify the number of bins or it can be calculated automatically. Equi-width binning must usually be used with outlier treatment.</td>
</tr>
<tr>
<td>Quantile Binning</td>
<td>Quantile binning is a numerical binning technique. Quantiles are computed using the SQL analytic function NTILE. The bin boundaries are based on the minimum values for each quantile. Bins with equal left and right boundaries are collapsed, possibly resulting in fewer bins than requested.</td>
</tr>
</tbody>
</table>

See Also:

Routines for Outlier Treatment

Normalization Routines

Most normalization methods map the range of a single attribute to another range, typically 0 to 1 or -1 to +1.

Normalization is very sensitive to outliers. Without outlier treatment, most values are mapped to a tiny range, resulting in a significant loss of information.
### Table 4-4  Normalization Methods in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>Transformation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Min-Max Normalization</td>
<td>This technique computes the normalization of an attribute using the minimum and maximum values. The shift is the minimum value, and the scale is the difference between the maximum and minimum values.</td>
</tr>
<tr>
<td>Scale Normalization</td>
<td>This normalization technique also uses the minimum and maximum values. For scale normalization, shift = 0, and scale = max(abs(max), abs(min)).</td>
</tr>
<tr>
<td>Z-Score Normalization</td>
<td>This technique computes the normalization of an attribute using the mean and the standard deviation. Shift is the mean, and scale is the standard deviation.</td>
</tr>
</tbody>
</table>

**See Also:**
- Routines for Outlier Treatment

### Routines for Outlier Treatment

**Outliers** are extreme values, typically several standard deviations from the mean. To minimize the effect of outliers, you can Winsorize or trim the data.

**Winsorizing** involves setting the tail values of an attribute to some specified value. For example, for a 90% Winsorization, the bottom 5% of values are set equal to the minimum value in the 5th percentile, while the upper 5% of values are set equal to the maximum value in the 95th percentile.

**Trimming** sets the tail values to NULL. The algorithm treats them as missing values.

Outliers affect the different algorithms in different ways. In general, outliers cause distortion with equi-width binning and min-max normalization.

### Table 4-5  Outlier Treatment Methods in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>Transformation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trimming</td>
<td>This technique trims the outliers in numeric columns by sorting the non-null values, computing the tail values based on some fraction, and replacing the tail values with nulls.</td>
</tr>
<tr>
<td>Windsorizing</td>
<td>This technique trims the outliers in numeric columns by sorting the non-null values, computing the tail values based on some fraction, and replacing the tail values with some specified value.</td>
</tr>
</tbody>
</table>

### Understanding Reverse Transformations

Reverse transformations ensure that information returned by the model is expressed in a format that is similar to or the same as the format of the data that was used to train the model. Internal transformations are reversed in the model details and in the results of scoring.
Some of the attributes used by the model correspond to columns in the build data. However, because of logic specific to the algorithm, nested data, and transformations, some attributes do not correspond to columns.

For example, a nested column in the training data is not interpreted as an attribute by the model. During the model build, Oracle Data Mining explodes nested columns, and each row (an attribute name/value pair) becomes an attribute.

Some algorithms, for example Support Vector Machines (SVM) and Generalized Linear Models (GLM), only operate on numeric attributes. Any non-numeric column in the build data is exploded into binary attributes, one for each distinct value in the column (SVM). GLM does not generate a new attribute for the most frequent value in the original column. These binary attributes are set to one only if the column value for the case is equal to the value associated with the binary attribute.

Algorithms that generate coefficients present challenges in regards to interpretability of results. Examples are SVM and Non-Negative Matrix Factorization (NMF). These algorithms produce coefficients that are used in combination with the transformed attributes. The coefficients are relevant to the data on the transformed scale, not the original data scale.

For all these reasons, the attributes listed in the model details do not resemble the columns of data used to train the model. However, attributes that undergo embedded transformations, whether initiated by Automatic Data Preparation (ADP) or by a user-specified transformation list, appear in the model details in their pre-transformed state, as close as possible to the original column values. Although the attributes are transformed when they are used by the model, they are visible in the model details in a form that can be interpreted by a user.

- The CREATE_MODEL Procedure
- Specifying Model Settings
- Viewing Model Details

Before Creating a Model

As described in "About Mining Models", models are database schema objects that perform data mining. The DBMS_DATA_MINING PL/SQL package is the API for creating, configuring, evaluating, and querying mining models (model details).

Before you create a model, you must decide what you want the model to do. You must identify the training data and determine if transformations are required. You can specify model settings to influence the behavior of the model behavior. The preparation steps are summarized in the following table.

Table 5-1  Preparation for Creating a Mining Model

<table>
<thead>
<tr>
<th>Preparation Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choose the mining function</td>
<td>See &quot;Choosing the Mining Function&quot;</td>
</tr>
<tr>

- About Mining Models
- DBMS_DATA_MINING
The CREATE_MODEL Procedure

The CREATE_MODEL procedure in the DBMS_DATA_MINING package uses the specified data to create a mining model with the specified name and mining function. The model can be created with configuration settings and user-specified transformations.

PROCEDURE CREATE_MODEL(
    model_name            IN VARCHAR2,
    mining_function       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    case_id_column_name   IN VARCHAR2,
    target_column_name    IN VARCHAR2 DEFAULT NULL,
    settings_table_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    settings_schema_name  IN VARCHAR2 DEFAULT NULL,
    xform_list            IN TRANSFORM_LIST DEFAULT NULL);

Choosing the Mining Function

The mining function is a required argument to the CREATE_MODEL procedure. A data mining function specifies a class of problems that can be modeled and solved.

Data mining functions implement either supervised or unsupervised learning. Supervised learning uses a set of independent attributes to predict the value of a dependent attribute or target. Unsupervised learning does not distinguish between dependent and independent attributes. Supervised functions are predictive. Unsupervised functions are descriptive.

Note:

In data mining terminology, a function is a general type of problem to be solved by a given approach to data mining. In SQL language terminology, a function is an operator that returns a value.

In Oracle Data Mining documentation, the term function, or mining function refers to a data mining function; the term SQL function or SQL Data Mining function refers to a SQL function for scoring (applying data mining models).

You can specify any of the values in the following table for the mining_function parameter to CREATE_MODEL.

<table>
<thead>
<tr>
<th>Mining_Function Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASSOCIATION</td>
<td>Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set. (association rules) Association models use the Apriori algorithm.</td>
</tr>
</tbody>
</table>
### Table 5-2  (Cont.) Mining Model Functions

<table>
<thead>
<tr>
<th>Mining Function Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTRIBUTE_IMPORTANCE</td>
<td>Attribute Importance is a predictive mining function. An attribute importance model identifies the relative importance of attributes in predicting a given outcome. Attribute Importance models use the Minimum Description Length algorithm.</td>
</tr>
<tr>
<td>CLASSIFICATION</td>
<td>Classification is a predictive mining function. A classification model uses historical data to predict a categorical target. Classification models can use Naive Bayes, Decision Tree, Logistic Regression, or Support Vector Machines. The default is Naive Bayes. The classification function can also be used for anomaly detection. In this case, the SVM algorithm with a null target is used (One-Class SVM).</td>
</tr>
<tr>
<td>CLUSTERING</td>
<td>Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set. Clustering models can use k-Means, O-Cluster, or Expectation Maximization. The default is k-Means.</td>
</tr>
<tr>
<td>FEATURE_EXTRACTION</td>
<td>Feature Extraction is a descriptive mining function. A feature extraction model creates a set of optimized attributes. Feature extraction models can use Non-Negative Matrix Factorization, Singular Value Decomposition (which can also be used for Principal Component Analysis). The default is Non-Negative Matrix Factorization.</td>
</tr>
<tr>
<td>REGRESSION</td>
<td>Regression is a predictive mining function. A regression model uses historical data to predict a numerical target. Regression models can use Support Vector Machines or Linear Regression. The default is Support Vector Machine.</td>
</tr>
</tbody>
</table>

---

### Choosing the Algorithm

The ALGO_NAME setting specifies the algorithm for a model. If you use the default algorithm for the mining function, or if there is only one algorithm available for the mining function, you do not need to specify the ALGO_NAME setting. Instructions for specifying model settings are in "Specifying Model Settings".

Supplying Transformations
You can optionally specify transformations for the build data in the xform_list parameter to CREATE_MODEL. The transformation instructions are embedded in the model and reapplied whenever the model is applied to new data.

Creating a Transformation List
The following are the ways to create a transformation list:
- The STACK interface in DBMS_DATA_MINING_TRANSFORM.
The STACK interface offers a set of pre-defined transformations that you can apply to an attribute or to a group of attributes. For example, you can specify supervised binning for all categorical attributes.

- The SET_TRANSFORM procedure in `DBMS_DATA_MINING_TRANSFORM`.

The SET_TRANSFORM procedure applies a specified SQL expression to a specified attribute. For example, the following statement appends a transformation instruction for `country_id` to a list of transformations called `my_xforms`. The transformation instruction divides `country_id` by 10 before algorithmic processing begins. The reverse transformation multiplies `country_id` by 10.

```sql
dbms_data_mining_transform.SET_TRANSFORM (my_xforms,
  'country_id', NULL, 'country_id/10', 'country_id*10');
```

The reverse transformation is applied in the model details. If `country_id` is the target of a supervised model, the reverse transformation is also applied to the scored target.

**Transformation List and Automatic Data Preparation**

The transformation list argument to `CREATE_MODEL` interacts with the PREP_AUTO setting, which controls Automatic Data Preparation (ADP):

- When ADP is on and you specify a transformation list, your transformations are applied with the automatic transformations and embedded in the model. The transformations that you specify are executed before the automatic transformations.

- When ADP is off and you specify a transformation list, your transformations are applied and embedded in the model, but no system-generated transformations are performed.

- When ADP is on and you do not specify a transformation list, the system-generated transformations are applied and embedded in the model.

- When ADP is off and you do not specify a transformation list, no transformations are embedded in the model; you must separately prepare the data sets you use for building, testing, and scoring the model.

**See Also:**

- Embedding Transformations in a Model

- "Operational Notes" for `DBMS_DATA_MINING_TRANSFORM` in Oracle Database PL/SQL Packages and Types Reference

---

**Specifying Model Settings**

Numerous configuration settings are available for configuring data mining models at build time. To specify settings, create a settings table with the columns shown in the following table and pass the table to `CREATE_MODEL`.
Example 5-1 creates a settings table for an Support Vector Machine (SVM) Classification model. Since SVM is not the default classifier, the ALGO_NAME setting is used to specify the algorithm. Setting the SVMS_KERNEL_FUNCTION to SVMS_LINEAR causes the model to be built with a linear kernel. If you do not specify the kernel function, the algorithm chooses the kernel based on the number of attributes in the data.

Some settings apply generally to the model, others are specific to an algorithm. Model settings are referenced in Table 5-5 and Table 5-6.

### Table 5-4  Settings Table Required Columns

<table>
<thead>
<tr>
<th>Column Name</th>

</tbody>
</table>

#### Example 5-1 Creating a Settings Table for an SVM Classification Model

```sql
CREATE TABLE svmc_sh_sample_settings ( 
    setting_name VARCHAR2(30), 
    setting_value VARCHAR2(4000));
BEGIN
    INSERT INTO svmc_sh_sample_settings (setting_name, setting_value) VALUES 
    (dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines); 
    INSERT INTO svmc_sh_sample_settings (setting_name, setting_value) VALUES 
    (dbms_data_mining.svms_kernel_function, dbms_data_mining.svms_linear); 
    COMMIT;
END;
/
```

See Also:

Oracle Database PL/SQL Packages and Types Reference for model settings

### Specifying Costs

The CLAS_COST_TABLE_NAME setting specifies the name of a cost matrix table to be used in building a Decision Tree model. A cost matrix biases a classification model to minimize costly misclassifications. The cost matrix table must have the columns shown in the following table:

#### Table 5-7 Cost Matrix Table Required Columns

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>valid target data type</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>valid target data type</td>
</tr>
<tr>
<td>cost</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

Decision Tree is the only algorithm that supports a cost matrix at build time. However, you can create a cost matrix and associate it with any classification model for scoring.

If you want to use costs for scoring, create a table with the columns shown in Table 5-7, and use the DBMS_DATA_MINING.ADD_COST_MATRIX procedure to add the cost matrix table to the model. You can also specify a cost matrix inline when invoking a PREDICTION function.
Specifying Prior Probabilities

The `CLAS_PRIORS_TABLE_NAME` setting specifies the name of a table of prior probabilities to be used in building a Naive Bayes model. Prior probabilities can be used to offset differences in distribution between the build data and the actual population. The priors table must have the columns shown in the following table.

### Table 5-8 Priors Table Required Columns

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>target_value</td>
<td>valid target data type</td>
</tr>
<tr>
<td>prior_probability</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

Specifying Class Weights

The `CLAS_WEIGHTS_TABLE_NAME` setting specifies the name of a table of class weights to be used to bias a logistic regression (Generalized Linear Model Classification) or Support Vector Machine (SVM) Classification model to favor higher weighted classes. The weights table must have the columns shown in the following table.

### Table 5-9 Class Weights Table Required Columns

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>target_value</td>
<td>valid target data type</td>
</tr>
<tr>
<td>class_weight</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>
Model Settings in the Data Dictionary

Information about mining model settings can be obtained from the data dictionary view ALL/USER/DBA_MINING_MODEL_SETTINGS. When used with the ALL prefix, this view returns information about the settings for the models accessible to the current user. When used with the USER prefix, it returns information about the settings for the models in the user's schema. The DBA prefix is only available for DBAs.

The columns of ALL_MINING_MODEL_SETTINGS are described as follows and explained in the following table.

SQL> describe all_mining_model_settings
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
OWNER                                     NOT NULL VARCHAR2(30)
MODEL_NAME                                NOT NULL VARCHAR2(30)
SETTING_NAME                              NOT NULL VARCHAR2(30)
SETTING_VALUE                                      VARCHAR2(4000)
SETTING_TYPE                                       VARCHAR2(7)

Table 5-10  ALL_MINING_MODEL_SETTINGS

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the mining model.</td>
</tr>
<tr>
<td>model_name</td>
<td>Name of the mining model.</td>
</tr>
<tr>
<td>setting_name</td>
<td>Name of the setting.</td>
</tr>
<tr>
<td>setting_value</td>
<td>Value of the setting.</td>
</tr>
<tr>
<td>setting_type</td>
<td>INPUT if the value is specified by a user. DEFAULT if the value is system-generated.</td>
</tr>
</tbody>
</table>

The following query lists the settings for the Support Vector Machine (SVM) Classification model SVMC_SH_CLAS_SAMPLE. The ALGO_NAME, CLAS_WEIGHTS_TABLE_NAME, and SVMS_KERNEL_FUNCTION settings are user-specified. These settings have been specified in a settings table for the model.

Example 5-2  ALL_MINING_MODEL_SETTINGS

SQL> COLUMN setting_value FORMAT A35
SQL> SELECT setting_name, setting_value, setting_type
FROM all_mining_model_settings
WHERE model_name in 'SVMC_SH_CLAS_SAMPLE';

<table>
<thead>
<tr>

<td>DEFAULT</td>
</tr>
<tr>
<td>ALGO_NAME</td>
<td>ALGO_SUPPORT VECTOR MACHINES</td>
<td>INPUT</td>
</tr>
</tbody>
</table>
Viewing Model Details

Model details describe model attributes, rules, statistics, and other information about the model. The DBMS_DATA_MINING package supports a separate GET_MODEL_DETAILS function for each algorithm. Global details are also available for Generalized Linear Models, Expectation Maximization, Singular Value Decomposition, and Association Rules.

Model details reverse the transformations applied to the attributes, thus enabling the information to be easily understood by a user. You can obtain the transformations embedded in the model by invoking the DBMS_DATA_MINING.GET_MODEL_TRANSFORMATIONS function.

The query in Example 5-3 returns the coefficients for several attribute values in a GLM regression model called GLMR_SH_Regr_sample. Additional details available for this algorithm include: standard error, test statistic, p value, standard coefficient, lower coefficient limit, and upper coefficient limit.

The query in Example 5-4 returns global details for the same model.

Example 5-3  Model Details for GLM Regression

```
SELECT attribute_name, attribute_value, coefficient
FROM TABLE(dbms_data_mining.get_model_details_glm('GLMR_SH_Regr_sample'))
WHERE attribute_name IN ('AFFINITY_CARD', 'BULK_PACK_DISKETTES', 'COUNTRY_NAME')
ORDER BY class, attribute_name, attribute_value;
```

<table>
<thead>
<tr>

Scoring and Deployment

Explains the scoring and deployment features of Oracle Data Mining.

- About Scoring and Deployment
- Using the Data Mining SQL Functions
- Prediction Details
- Real-Time Scoring
- Dynamic Scoring
- Cost-Sensitive Decision Making
- DBMS_DATA_MINING.Apply

About Scoring and Deployment

Scoring is the application of models to new data. In Oracle Data Mining, scoring is performed by SQL language functions. Predictive functions perform Classification, Regression, or Anomaly detection. Clustering functions assign rows to clusters. Feature Extraction functions transform the input data to a set of higher order predictors. A scoring procedure is also available in the DBMS_DATA_MINING PL/SQL package.

Deployment refers to the use of models in a target environment. Once the models have been built, the challenges come in deploying them to obtain the best results, and in maintaining them within a production environment. Deployment can be any of the following:

- Scoring data either for batch or real-time results. Scores can include predictions, probabilities, rules, and other statistics.
- Extracting model details to produce reports. For example: clustering rules, decision tree rules, or attribute rankings from an Attribute Importance model.
- Extending the business intelligence infrastructure of a data warehouse by incorporating mining results in applications or operational systems.
- Moving a model from the database where it was built to the database where it used for scoring (export/import)

Oracle Data Mining supports all of these deployment scenarios.
Note:
Oracle Data Mining scoring operations support parallel execution. When parallel execution is enabled, multiple CPU and I/O resources are applied to the execution of a single database operation.

Parallel execution offers significant performance improvements, especially for operations that involve complex queries and large databases typically associated with decision support systems (DSS) and data warehouses.

Using the Data Mining SQL Functions
The data mining SQL functions provide the following benefits:
- Models can be easily deployed within the context of existing SQL applications.
- Scoring operations take advantage of existing query execution functionality. This provides performance benefits.
- Scoring results are pipelined, enabling the rows to be processed without requiring materialization.

The data mining functions produce a score for each row in the selection. The functions can apply a mining model schema object to compute the score, or they can score dynamically without a pre-defined model, as described in "Dynamic Scoring".

Choosing the Predictors
The data mining functions support a USING clause that specifies which attributes to use for scoring. You can specify some or all of the attributes in the selection and you can specify expressions. The following examples all use the PREDICTION function to find the customers who are likely to use an affinity card, but each example uses a different set of predictors.

The query in Example 6-1 uses all the predictors.
The query in Example 6-2 uses only gender, marital status, occupation, and income as predictors.

The query in Example 6-3 uses three attributes and an expression as predictors. The prediction is based on gender, marital status, occupation, and the assumption that all customers are in the highest income bracket.

**Example 6-1 Using All Predictors**

```sql
SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION(dt_sh_clas_sample USING *) = 1
GROUP BY cust_gender
ORDER BY cust_gender;
```

<table>
<thead>
<tr>
<th>C</th>
<th>CNT</th>
<th>AVG_AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>25</td>
<td>38</td>
</tr>
<tr>
<td>M</td>
<td>213</td>
<td>43</td>
</tr>
</tbody>
</table>

**Example 6-2 Using Some Predictors**

```sql
SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION(dt_sh_clas_sample USING cust_gender, cust_marital_status, occupation, cust_income_level) = 1
GROUP BY cust_gender
ORDER BY cust_gender;
```

<table>
<thead>
<tr>
<th>C</th>
<th>CNT</th>
<th>AVG_AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>30</td>
<td>38</td>
</tr>
<tr>
<td>M</td>
<td>186</td>
<td>43</td>
</tr>
</tbody>
</table>

**Example 6-3 Using Some Predictors and an Expression**

```sql
SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION(dt_sh_clas_sample USING cust_gender, cust_marital_status, occupation, 'L: 300,000 and above' AS cust_income_level) = 1
GROUP BY cust_gender
ORDER BY cust_gender;
```

<table>
<thead>
<tr>
<th>C</th>
<th>CNT</th>
<th>AVG_AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>30</td>
<td>38</td>
</tr>
<tr>
<td>M</td>
<td>186</td>
<td>43</td>
</tr>
</tbody>
</table>

**Single-Record Scoring**

The data mining functions can produce a score for a single record, as shown in Example 6-4 and Example 6-5.

**Example 6-4** returns a prediction for customer 102001 by applying the classification model `NB_SH_Clas_sample`. The resulting score is 0, meaning that this customer is unlikely to use an affinity card.

**Example 6-5** returns a prediction for 'Affinity card is great' as the comments attribute by applying the text mining model `T_SVM_Clas_sample`. The resulting score is 1, meaning that this customer is likely to use an affinity card.
Example 6-4  Scoring a Single Customer or a Single Text Expression

```
SELECT PREDICTION (NB_SH_CLAS_Sample USING *)
FROM sh.customers where cust_id = 102001;
```

```
PREDICTION(NB_SH_CLAS_SAMPLEUSING*)
-----------------------------------
0
```

Example 6-5  Scoring a Single Text Expression

```
SELECT
  PREDICTION(T_SVM_CLAS_sample USING ©Affinity card is great© AS comments)
FROM DUAL;
```

```
PREDICTION(T_SVM_CLAS_SAMPLEUSING©AFFINITYCARDISGREAT©ASCOMMENTS)
-----------------------------------------------------------------
1
```

Prediction Details

Prediction details are XML strings that provide information about the score. Details are available for all types of scoring: clustering, feature extraction, classification, regression, and anomaly detection. Details are available whether scoring is dynamic or the result of model apply.

The details functions, CLUSTER_DETAILS, FEATURE_DETAILS, and PREDICTION_DETAILS return the actual value of attributes used for scoring and the relative importance of the attributes in determining the score. By default, the functions return the five most important attributes in descending order of importance.

Cluster Details

For the most likely cluster assignments of customer 100955 (probability of assignment > 20%), the query in the following example produces the five attributes that have the most impact for each of the likely clusters. The clustering functions apply an Expectation Maximization model named em_sh_clus_sample to the data selected from mining_data_apply_v. The "5" specified in CLUSTER_DETAILS is not required, because five attributes are returned by default.

Example 6-6  Cluster Details

```
SELECT S.cluster_id, probability prob,
  CLUSTER_DETAILS(em_sh_clus_sample, S.cluster_id, 5 USING T.*) det
FROM
  (SELECT v.*, CLUSTER_SET(em_sh_clus_sample, NULL, 0.2 USING *) pset
   FROM mining_data_apply_v v
   WHERE cust_id = 100955) T,
  TABLE(T.pset) S
ORDER BY 2 DESC;
```

```
CLUSTER_ID PROB DET
---------- ----- ----------------------------------------------------------------------------
14 .6761 <Details algorithm="Expectation Maximization" cluster="14">
  <Attribute name="AGE" actualValue="51" weight=".676" rank="1"/>
  <Attribute name="HOME_THEATER_PACKAGE" actualValue="1" weight=".557" rank="2"/>
  <Attribute name="FLAT_PANEL_MONITOR" actualValue="0" weight=".412" rank="3"/>
  <Attribute name="Y_BOX_GAMES" actualValue="0" weight=".171" rank="4"/>
  <Attribute name="BOOKKEEPING_APPLICATION" actualValue="1" weight="-.003" rank="5"/>
</Details>
```

6-4  Oracle Data Mining User’s Guide
3 .3227 <Details algorithm="Expectation Maximization" cluster="3">
  <Attribute name="YRS_RESIDENCE" actualValue="3" weight=".323" rank="1"/>
  <Attribute name="BULK_PACK_DISKETTES" actualValue="1" weight=".265" rank="2"/>

  <Attribute name="AFFINITY_CARD" actualValue="0" weight=".125" rank="4"/>
  <Attribute name="OCCUPATION" actualValue="Crafts" weight=".055" rank="5"/>
</Details>

Feature Details

The query in the following example returns the three attributes that have the greatest impact on the top Principal Components Analysis (PCA) projection for customer 101501. The FEATURE_DETAILS function applies a Singular Value Decomposition model named svd_sh_sample to the data selected from svd_sh_sample_build_num.

Example 6-7 Feature Details

```
SELECT FEATURE_DETAILS(svd_sh_sample, 1, 3 USING *) proj1det
FROM svd_sh_sample_build_num
WHERE CUST_ID = 101501;
```

```
PROJ1DET
--------------------------------------------------------------------------------
<Details algorithm="Singular Value Decomposition" feature="1">
  <Attribute name="HOME_THEATER_PACKAGE" actualValue="1" weight=".352" rank="1"/>
  <Attribute name="Y_BOX_GAMES" actualValue="0" weight=".249" rank="2"/>
  <Attribute name="AGE" actualValue="41" weight=".063" rank="3"/>
</Details>
```

Prediction Details

The query in the following example returns the attributes that are most important in predicting the age of customer 100010. The prediction functions apply a Generalized Linear Model Regression model named GLMR_SH_Regr_sample to the data selected from mining_data_apply_v.

Example 6-8 Prediction Details for Regression

```
SELECT cust_id,
    PREDICTION(GLMR_SH_Regr_sample USING *) pr,
    PREDICTION_DETAILS(GLMR_SH_Regr_sample USING *) pd
FROM mining_data_apply_v
WHERE CUST_ID = 100010;
```

```
CUST_ID    PR PD
------- ----- -----------
100010 25.45 <Details algorithm="Generalized Linear Model">
  <Attribute name="FLAT_PANEL_MONITOR" actualValue="1" weight=".025" rank="1"/>
  <Attribute name="OCCUPATION" actualValue="Crafts" weight=".019" rank="2"/>
  <Attribute name="AFFINITY_CARD" actualValue="0" weight=".01" rank="3"/>
  <Attribute name="OS_DOC_SET_KANJI" actualValue="0" weight="0" rank="4"/>
  <Attribute name="BOOKKEEPING_APPLICATION" actualValue="1" weight="-.004" rank="5"/>
</Details>
```

The query in the following example returns the customers who work in Tech Support and are likely to use an affinity card (with more than 85% probability). The prediction functions apply an Support Vector Machine (SVM) Classification model named svmc_sh_clas_sample to the data selected from mining_data_apply_v. The
query includes the prediction details, which show that education is the most important predictor.

**Example 6-9  Prediction Details for Classification**

```sql
SELECT cust_id, PREDICTION_DETAILS(svmc_sh_clas_sample, 1 USING *) PD
FROM mining_data_apply_v
WHERE PREDICTION_PROBABILITY(svmc_sh_clas_sample, 1 USING *) > 0.85
AND occupation = 'TechSup'
ORDER BY cust_id;

```

The query in the following example returns the two customers that differ the most from the rest of the customers. The prediction functions apply an anomaly detection model named `SVMO_SH_Clas_sample` to the data selected from `mining_data_apply_v`. Anomaly Detection uses a one-class SVM classifier.

**Example 6-10  Prediction Details for Anomaly Detection**

```sql
SELECT cust_id, pd FROM
(SELECT cust_id,
    PREDICTION_DETAILS(SVMO_SH_Clas_sample, 0 USING *) pd,
    RANK() OVER (ORDER BY prediction_probability(SVMO_SH_Clas_sample, 0 USING *) DESC, cust_id) rnk
FROM mining_data_one_class_v)
WHERE rnk <= 2
```
ORDER BY rnk;

  <Attribute name="AGE" actualValue="38" weight=".001" rank="5"/>
</Details>

### Real-Time Scoring

Oracle Data Mining SQL functions enable prediction, clustering, and feature extraction analysis to be easily integrated into live production and operational systems. Because mining results are returned within SQL queries, mining can occur in real time.

With real-time scoring, point-of-sales database transactions can be mined. Predictions and rule sets can be generated to help front-line workers make better analytical decisions. Real-time scoring enables fraud detection, identification of potential liabilities, and recognition of better marketing and selling opportunities.

The query in the following example uses a Decision Tree model named `dt_sh_clas_sample` to predict the probability that customer 101488 uses an affinity card. A customer representative can retrieve this information in real time when talking to this customer on the phone. Based on the query result, the representative can offer an extra-value card, since there is a 73% chance that the customer uses a card.

**Example 6-11 Real-Time Query with Prediction Probability**

```
SELECT PREDICTION_PROBABILITY(dt_sh_clas_sample, 1 USING *) cust_card_prob
FROM mining_data_apply_v
WHERE cust_id = 101488;
```

<table>
<thead>
<tr>
<th>CUST_CARD_PROB</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.72764</td>
</tr>
</tbody>
</table>

### Dynamic Scoring

The Data Mining SQL functions operate in two modes: by applying a pre-defined model, or by executing an analytic clause. If you supply an analytic clause instead of a model name, the function builds one or more transient models and uses them to score the data.

The ability to score data dynamically without a pre-defined model extends the application of basic embedded data mining techniques into environments where models are not available. Dynamic scoring, however, has limitations. The transient models created during dynamic scoring are not available for inspection or fine tuning. Applications that require model inspection, the correlation of scoring results with the...
model, special algorithm settings, or multiple scoring queries that use the same model, require a predefined model.

The following example shows a dynamic scoring query. The example identifies the rows in the input data that contain unusual customer age values.

**Example 6-12 Dynamic Prediction**

```sql
SELECT cust_id, age, pred_age, age-pred_age age_diff, pred_det FROM
(SELECT cust_id, age, pred_age, pred_det,
    RANK() OVER (ORDER BY ABS(age-pred_age) DESC) rnk FROM
(SELECT cust_id, age,
    PREDICTION(FOR age USING *) OVER () pred_age,
    PREDICTION_DETAILS(FOR age ABS USING *) OVER () pred_det
FROM mining_data_apply_v))
WHERE rnk <= 5;
```

| CUST_ID | AGE   | PRED_AGE | AGE_DIFF | PRED_DET | Details algorithm="Support Vector Machines"
<table>
<thead>

</tr>
<tr>
<td>100308</td>
<td>81</td>
<td>45.3252491</td>
<td>35.67</td>
<td></td>
</tr>
</tbody>
</table>
Cost-Sensitive Decision Making

Costs are user-specified numbers that bias classification. The algorithm uses positive numbers to penalize more expensive outcomes over less expensive outcomes. Higher numbers indicate higher costs. The algorithm uses negative numbers to favor more beneficial outcomes over less beneficial outcomes. Lower negative numbers indicate higher benefits.

All classification algorithms can use costs for scoring. You can specify the costs in a cost matrix table, or you can specify the costs inline when scoring. If you specify costs inline and the model also has an associated cost matrix, only the inline costs are used. The PREDICTION, PREDICTION_SET, and PREDICTION_COST functions support costs.

Only the Decision Tree algorithm can use costs to bias the model build. If you want to create a Decision Tree model with costs, create a cost matrix table and provide its name in the CLAS_COST_TABLE_NAME setting for the model. If you specify costs when building the model, the cost matrix used to create the model is used when scoring. If you want to use a different cost matrix table for scoring, first remove the existing cost matrix table then add the new one.

A sample cost matrix table is shown in the following table. The cost matrix specifies costs for a binary target. The matrix indicates that the algorithm must treat a misclassified 0 as twice as costly as a misclassified 1.

<table>
<thead>
<tr>
<th>ACTUAL_TARGET_VALUE</th>
<th>PREDICTED_TARGET_VALUE</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>
Example 6-13  Sample Queries With Costs

The table `nbmodel_costs` contains the cost matrix described in Table 6-1.

```
SELECT * from nbmodel_costs;
```

<table>
<thead>
<tr>
<th>ACTUAL_TARGET_VALUE</th>
<th>PREDICTED_TARGET_VALUE</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

The following statement associates the cost matrix with a Naive Bayes model called `nbmodel`.

```
BEGIN
  dbms_data_mining.add_cost_matrix('nbmodel', 'nbmodel_costs');
END;
/
```

The following query takes the cost matrix into account when scoring `mining_data_apply_v`. The output is restricted to those rows where a prediction of 1 is less costly than a prediction of 0.

```
SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION (nbmodel COST MODEL
  USING cust_marital_status, education, household_size) = 1
GROUP BY cust_gender
ORDER BY cust_gender;
```

<table>
<thead>
<tr>
<th>C</th>
<th>CNT</th>
<th>AVG_AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>25</td>
<td>38</td>
</tr>
<tr>
<td>M</td>
<td>208</td>
<td>43</td>
</tr>
</tbody>
</table>

You can specify costs inline when you invoke the scoring function. If you specify costs inline and the model also has an associated cost matrix, only the inline costs are used. The same query is shown below with different costs specified inline. Instead of the “2” shown in the cost matrix table (Table 6-1), “10” is specified in the inline costs.

```
SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION (nbmodel COST (0,1) values ((0, 10),
  (1, 0))
  USING cust_marital_status, education, household_size) = 1
GROUP BY cust_gender
ORDER BY cust_gender;
```

<table>
<thead>
<tr>
<th>C</th>
<th>CNT</th>
<th>AVG_AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>74</td>
<td>39</td>
</tr>
<tr>
<td>M</td>
<td>581</td>
<td>43</td>
</tr>
</tbody>
</table>
The same query based on probability instead of costs is shown below.

```sql
SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION (nbmodel
    USING cust_marital_status, education, household_size) = 1
GROUP BY cust_gender
ORDER BY cust_gender;
```

<table>
<thead>
<tr>
<th>C</th>
<th>CNT</th>
<th>AVG_AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>73</td>
<td>39</td>
</tr>
<tr>
<td>M</td>
<td>577</td>
<td>44</td>
</tr>
</tbody>
</table>

**DBMS_DATA_MINING.Apply**

The `APPLY` procedure in `DBMS_DATA_MINING` is a batch apply operation that writes the results of scoring directly to a table. The columns in the table are mining function-dependent.

Scoring with `APPLY` generates the same results as scoring with the SQL scoring functions. Classification produces a prediction and a probability for each case; clustering produces a cluster ID and a probability for each case, and so on. The difference lies in the way that scoring results are captured and the mechanisms that can be used for retrieving them.

`APPLY` creates an output table with the columns shown in the following table:

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Output Columns</th>
</tr>
</thead>
<tbody>
<tr>
<td>classification</td>
<td>CASE_ID</td>
</tr>
<tr>
<td></td>
<td>PREDICTION</td>
</tr>
<tr>
<td></td>
<td>PROBABILITY</td>
</tr>
<tr>
<td>regression</td>
<td>CASE_ID</td>
</tr>
<tr>
<td></td>
<td>PREDICTION</td>
</tr>
<tr>
<td>anomaly detection</td>
<td>CASE_ID</td>
</tr>
<tr>
<td></td>
<td>PREDICTION</td>
</tr>
<tr>
<td></td>
<td>PROBABILITY</td>
</tr>
<tr>
<td>clustering</td>
<td>CASE_ID</td>
</tr>
<tr>
<td></td>
<td>CLUSTER_ID</td>
</tr>
<tr>
<td></td>
<td>PROBABILITY</td>
</tr>
<tr>
<td>feature extraction</td>
<td>CASE_ID</td>
</tr>
<tr>
<td></td>
<td>FEATURE_ID</td>
</tr>
<tr>
<td></td>
<td>MATCH_QUALITY</td>
</tr>
</tbody>
</table>

Since `APPLY` output is stored separately from the scoring data, it must be joined to the scoring data to support queries that include the scored rows. Thus any model that is used with `APPLY` must have a case ID.

A case ID is not required for models that is applied with SQL scoring functions. Likewise, storage and joins are not required, since scoring results are generated and consumed in real time within a SQL query.
The following example illustrates Anomaly Detection with APPLY. The query of the APPLY output table returns the ten first customers in the table. Each has a a probability for being typical (1) and a probability for being anomalous (0).

**Example 6-14   Anomaly Detection with DBMS_DATA_MINING.APPLY**

EXEC dbms_data_mining.apply
  ('SVMO_SH_Clas_sample', 'svmo_sh_sample_prepared',
   'cust_id', 'one_class_output');

SELECT * from one_class_output where rownum < 11;

<table>
<thead>
<tr>
<th>CUST_ID</th>
<th>PREDICTION</th>
<th>PROBABILITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>101798</td>
<td>1</td>
<td>.567389309</td>
</tr>
<tr>
<td>101798</td>
<td>0</td>
<td>.432610691</td>
</tr>
<tr>
<td>102276</td>
<td>1</td>
<td>.564922469</td>
</tr>
<tr>
<td>102276</td>
<td>0</td>
<td>.435077531</td>
</tr>
<tr>
<td>102404</td>
<td>1</td>
<td>.51213544</td>
</tr>
<tr>
<td>102404</td>
<td>0</td>
<td>.48786456</td>
</tr>
<tr>
<td>101891</td>
<td>1</td>
<td>.563474346</td>
</tr>
<tr>
<td>101891</td>
<td>0</td>
<td>.436525654</td>
</tr>
<tr>
<td>102815</td>
<td>0</td>
<td>.500663683</td>
</tr>
<tr>
<td>102815</td>
<td>1</td>
<td>.499336317</td>
</tr>
</tbody>
</table>

Mining Unstructured Text

Explains how to use Oracle Data Mining to mine unstructured text.

- About Unstructured Text
- About Text Mining and Oracle Text
- Creating a Model that Includes Text Mining
- Creating a Text Policy
- Configuring a Text Attribute

About Unstructured Text

Data mining algorithms act on data that is numerical or categorical. Numerical data is ordered. It is stored in columns that have a numeric data type, such as NUMBER or FLOAT. Categorical data is identified by category or classification. It is stored in columns that have a character data type, such as VARCHAR2 or CHAR.

Unstructured text data is neither numerical nor categorical. Unstructured text includes items such as web pages, document libraries, Power Point presentations, product specifications, emails, comment fields in reports, and call center notes. It has been said that unstructured text accounts for more than three quarters of all enterprise data. Extracting meaningful information from unstructured text can be critical to the success of a business.

About Text Mining and Oracle Text

Text mining is the process of applying data mining techniques to text terms, also called text features or tokens. Text terms are words or groups of words that have been extracted from text documents and assigned numeric weights. Text terms are the fundamental unit of text that can be manipulated and analyzed.

Oracle Text is a Database technology that provides term extraction, word and theme searching, and other utilities for querying text. When columns of text are present in the training data, Oracle Data Mining uses Oracle Text utilities and term weighting strategies to transform the text for mining. Oracle Data Mining passes configuration information supplied by you to Oracle Text and uses the results in the model creation process.

See Also:

Oracle Text Application Developer’s Guide
Creating a Model that Includes Text Mining

Oracle Data Mining supports unstructured text within columns of VARCHAR2, CHAR, CLOB, BLOB, and BFILE, as described in the following table:

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BFILE and BLOB</td>
<td>Oracle Data Mining interprets BLOB and BFILE as text only if you identify the columns as text when you create the model. If you do not identify the columns as text, then CREATE_MODEL returns an error.</td>
</tr>
<tr>
<td>CLOB</td>
<td>Oracle Data Mining interprets CLOB as text.</td>
</tr>
<tr>
<td>CHAR</td>
<td>Oracle Data Mining interprets CHAR as categorical by default. You can identify columns of CHAR as text when you create the model.</td>
</tr>
<tr>
<td>VARCHAR2</td>
<td>Oracle Data Mining interprets VARCHAR2 with data length &gt; 4000 as text. Oracle Data Mining interprets VARCHAR2 with data length &lt;= 4000 as categorical by default. You can identify these columns as text when you create the model.</td>
</tr>
</tbody>
</table>

Note: Text is not supported in nested columns or as a target in supervised data mining.

The settings described in the following table control the term extraction process for text attributes in a model. Instructions for specifying model settings are in Specifying Model Settings.

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Data Type</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ODMS_TEXT_POLICY_NAME</td>
<td>VARCHAR2(4000)</td>
<td>Name of an Oracle Text policy object created with CTX_DDL.CREATE_POLICY</td>
<td>Affects how individual tokens are extracted from unstructured text. See &quot;Creating a Text Policy&quot;.</td>
</tr>
<tr>
<td>ODMS_TEXT_MAX_FEATURES</td>
<td>INTEGER</td>
<td>1 &lt;= value &lt;= 100000</td>
<td>Maximum number of features to use from the document set (across all documents of each text column) passed to CREATE_MODEL. Default is 3000.</td>
</tr>
</tbody>
</table>

A model can include one or more text attributes. A model with text attributes can also include categorical and numerical attributes.

To create a model that includes text attributes:

1. Create an Oracle Text policy object, as described in "Creating a Text Policy".
2. Specify the model configuration settings that are described in "Table 7-2".

3. Specify which columns must be treated as text and, optionally, provide text transformation instructions for individual attributes. See "Configuring a Text Attribute".

4. Pass the model settings and text transformation instructions to DBMS_DATA_MINING.CREATE_MODEL. See "Embedding Transformations in a Model".

---

**Note:**

All algorithms except O-Cluster can support columns of unstructured text.
The use of unstructured text is not recommended for association rules (Apriori).

---

**Creating a Text Policy**

An Oracle Text policy specifies how text content must be interpreted. You can provide a text policy to govern a model, an attribute, or both the model and individual attributes. If a model-specific policy is present and one or more attributes have their own policies, Oracle Data Mining uses the attribute policies for the specified attributes and the model-specific policy for the other attributes.

The CTX_DDL.CREATE_POLICY procedure creates a text policy.

```sql
CTX_DDL.CREATE_POLICY(
    policy_name    IN VARCHAR2,
    filter         IN VARCHAR2 DEFAULT NULL,
    section_group  IN VARCHAR2 DEFAULT NULL,
    lexer          IN VARCHAR2 DEFAULT NULL,
    stoplist       IN VARCHAR2 DEFAULT NULL,
    wordlist       IN VARCHAR2 DEFAULT NULL);
```

The parameters of CTX_DDL.CREATE_POLICY are described in the following table.

**Table 7-3  CTX_DDL.CREATE_POLICY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of the new policy object. Oracle Text policies and text indexes share the same namespace.</td>
</tr>
<tr>
<td>filter</td>
<td>Specifies how the documents must be converted to plain text for indexing. Examples are: CHARSET_FILTER for character sets and NULL_FILTER for plain text, HTML and XML. For filter values, see &quot;Filter Types&quot; in Oracle Text Reference.</td>
</tr>
<tr>
<td>section_group</td>
<td>Identifies sections within the documents. For example, HTML_SECTION_GROUP defines sections in HTML documents. For section_group values, see &quot;Section Group Types&quot; in Oracle Text Reference. Note: You can specify any section group that is supported by CONTEXT indexes.</td>
</tr>
</tbody>
</table>
### Table 7-3 (Cont.) CTX_DDL.CREATE_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lexer</td>
<td>Identifies the language that is being indexed. For example, BASIC_LEXER is the lexer for extracting terms from text in languages that use white space delimited words (such as English and most western European languages). For lexer values, see &quot;Lexer Types&quot; in Oracle Text Reference.</td>
</tr>
<tr>
<td>stoplist</td>
<td>Specifies words and themes to exclude from term extraction. For example, the word &quot;the&quot; is typically in the stoplist for English language documents. The system-supplied stoplist is used by default. See &quot;Stoplists&quot; in Oracle Text Reference.</td>
</tr>
<tr>
<td>wordlist</td>
<td>Specifies how stems and fuzzy queries must be expanded. A stem defines a root form of a word so that different grammatical forms have a single representation. A fuzzy query includes common misspellings in the representation of a word. See BASIC_WORDLIST in Oracle Text Reference.</td>
</tr>
</tbody>
</table>

---

**See Also:**

CTX_DDL.CREATE_POLICY in Oracle Text Reference

---

## Configuring a Text Attribute

As shown in Table 7-1, you can identify columns of CHAR, shorter VARCHAR2 (<=4000), BFILE, and BLOB as text attributes. If CHAR and shorter VARCHAR2 columns are not explicitly identified as unstructured text, then CREATE_MODEL processes them as categorical attributes. If BFILE and BLOB columns are not explicitly identified as unstructured text, then CREATE_MODEL returns an error.

To identify a column as a text attribute, supply the keyword TEXT in an Attribute specification. The attribute specification is a field (attribute_spec) in a transformation record (transform_rec). Transformation records are components of transformation lists (xform_list) that can be passed to CREATE_MODEL.

**Note:**

An attribute specification can also include information that is not related to text. Instructions for constructing an attribute specification are in "Embedding Transformations in a Model" in "Transforming the Data".

You can provide transformation instructions for any text attribute by qualifying the TEXT keyword in the attribute specification with the subsettings described in the following table.
### Table 7-4  Attribute-Specific Text Transformation Instructions

<table>
<thead>
<tr>
<th>Subsetting Name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>POLICY_NAME</td>
<td>Name of an Oracle Text policy object created with CTX_DDL.CREATE_POLICY</td>
<td>(POLICY_NAME:my_policy)</td>
</tr>
<tr>
<td>TOKEN_TYPE</td>
<td>The following values are supported: NORMAL (the default) STEM THEME</td>
<td>(TOKEN_TYPE:THEME)</td>
</tr>
<tr>
<td>MAX_FEATURES</td>
<td>Maximum number of features to use from the attribute.</td>
<td>(MAX_FEATURES:3000)</td>
</tr>
</tbody>
</table>

#### Note:

The TEXT keyword is only required for CLOB and longer VARCHAR2 (>4000) when you specify transformation instructions. The TEXT keyword is *always* required for CHAR, shorter VARCHAR2, BFILE, and BLOB — whether or not you specify transformation instructions.

#### Tip:

You can view attribute specifications in the data dictionary view ALL_MINING_MODEL_ATTRIBUTES, as shown in Oracle Database Reference.

### Token Types in an Attribute Specification

When stems or themes are specified as the token type, the lexer preference for the text policy must support these types of tokens.

The following example adds themes and English stems to BASIC_LEXER.

```sql
BEGIN
    CTX_DDL.CREATE_PREFERENCE('my_lexer', 'BASIC_LEXER');
    CTX_DDL.SET_ATTRIBUTE('my_lexer', 'index_stems', 'ENGLISH');
    CTX_DDL.SET_ATTRIBUTE('my_lexer', 'index_themes', 'YES');
END;
```

#### Example 7-1  A Sample Attribute Specification for Text

This expression specifies that text transformation for the attribute must use the text policy named my_policy. The token type is THEME, and the maximum number of features is 3000.

"TEXT(POLICY_NAME:my_policy) (TOKEN_TYPE:THEME) (MAX_FEATURES:3000)"

Administrative Tasks for Oracle Data Mining

Explains how to perform administrative tasks related to Oracle Data Mining.

- Installing and Configuring a Database for Data Mining
- Upgrading or Downgrading Oracle Data Mining
- Exporting and Importing Mining Models
- Controlling Access to Mining Models and Data
- Auditing and Adding Comments to Mining Models

Installing and Configuring a Database for Data Mining

Learn how to install and configure a database for Data Mining.

- About Installation
- Enabling or Disabling a Database Option
- Database Tuning Considerations for Data Mining

About Installation

Oracle Data Mining is a component of the Oracle Advanced Analytics option to Oracle Database Enterprise Edition. To install Oracle Database, follow the installation instructions for your platform. Choose a Data Warehousing configuration during the installation.

Oracle Data Miner, the graphical user interface to Oracle Data Mining, is an extension to Oracle SQL Developer. Instructions for downloading SQL Developer and installing the Data Miner repository are available on the Oracle Technology Network:

http://www.oracle.com/pls/topic/lookup?ctx=db121&id=datminGUI

To perform data mining activities, you must be able to log on to the Oracle database, and your user ID must have the database privileges described in Example 8-7.

See Also:

- Installing and Upgrading page of the Oracle Database online documentation library for your platform-specific installation instructions:
  http://www.oracle.com/pls/db121/homepage
- Example 8-7
Enabling or Disabling a Database Option

The Oracle Advanced Analytics option is enabled by default during installation of Oracle Database Enterprise Edition. After installation, you can use the command-line utility `chopt` to enable or disable a database option. For instructions, see "Enabling or Disabling Database Options" in the installation guide for your platform. For example:

- Oracle Database Installation Guide for Linux
- Oracle Database Installation Guide for Microsoft Windows

Database Tuning Considerations for Data Mining

DBAs managing production databases that support Oracle Data Mining must follow standard administrative practices as described in Oracle Database Administrator's Guide.

Building data mining models and batch scoring of mining models tend to put a DSS-like workload on the system. Single-row scoring tends to put an OLTP-like workload on the system.

Database memory management can have a major impact on data mining. The correct sizing of Program Global Area (PGA) memory is very important for model building, complex queries, and batch scoring. From a data mining perspective, the System Global Area (SGA) is generally less of a concern. However, the SGA must be sized to accommodate real-time scoring, which loads models into the shared cursor in the SGA. In most cases, you can configure the database to manage memory automatically. To do so, specify the total maximum memory size in the tuning parameter `MEMORY_TARGET`. With automatic memory management, Oracle Database dynamically exchanges memory between the SGA and the instance PGA as needed to meet processing demands.

Most data mining algorithms can take advantage of parallel execution when it is enabled in the database. Parameters in `INIT.ORA` control the behavior of parallel execution.

Upgrading or Downgrading Oracle Data Mining

Understand how to upgrade and downgrade Oracle Data Mining.

- Pre-Upgrade Steps
- Upgrading Oracle Data Mining
• Post Upgrade Steps
• Downgrading Oracle Data Mining

Pre-Upgrade Steps

Before upgrading, you must drop any data mining models that were created in Java and any mining activities that were created in Oracle Data Miner Classic (the earlier version of Oracle Data Miner).

Caution:
In Oracle Database 12c, Oracle Data Mining does not support a Java API, and Oracle Data Miner Classic cannot run against Oracle Database 12c.

Dropping Models Created in Java

If your 10g or 11g database contains models created in Java, use the DBMS_DATA_MINING.DROP_MODEL routine to drop the models before upgrading the database.

Dropping Mining Activities Created in Oracle Data Miner Classic

If your database contains mining activities from Oracle Data Miner Classic, delete the mining activities and drop the repository before upgrading the database. Follow these steps:

1. Use the Data Miner Classic user interface to delete the mining activities.
2. In SQL*Plus or SQL Developer, drop these tables:

   DM4J$ACTIVITIES
   DM4J$RESULTS
   DM4J$TRANSFORMS

   and these views:

   DM4J$MODEL_RESULTS_V
   DM4J$RESULTS_STATE_V

There must be no tables or views with the prefix DM4J$ in any schema in the database after you complete these steps.

Upgrading Oracle Data Mining

After you complete the "Pre-Upgrade Steps", all models and mining metadata are fully integrated with the Oracle Database upgrade process — whether you are upgrading from 11g or from 10g releases.

Upgraded models continue to work as they did in prior releases. Both upgraded models and new models that you create in the upgraded environment can make use of the new mining functionality introduced in the new release.

To upgrade a database, you can use Database Upgrade Assistant (DBUA) or you can perform a manual upgrade using export/import utilities.
Using Database Upgrade Assistant to Upgrade Oracle Data Mining

Oracle Database Upgrade Assistant provides a graphical user interface that guides you interactively through the upgrade process.

On Windows platforms, follow these steps to start the Upgrade Assistant:

1. Go to the Windows Start menu and choose the Oracle home directory.
2. Choose the Configuration and Migration Tools menu.
3. Launch the Upgrade Assistant.

On Linux platforms, run the DBUA utility to upgrade Oracle Database.

Upgrading from Release 10g

In Oracle Data Mining 10g, data mining metadata and PL/SQL packages are stored in the DMSYS schema. In Oracle Data Mining 11g and 12c, DMSYS no longer exists; data mining metadata objects are stored in SYS.

When Oracle Database 10g is upgraded to 12c, all data mining metadata objects and PL/SQL packages are migrated from DMSYS to SYS. The DMSYS schema and its associated objects are removed after a successful migration. When DMSYS is removed, the SYS.DBA_REGISTRY view no longer lists Oracle Data Mining as a component.

After upgrading to Oracle Database 12c, you can no longer switch to the Data Mining Scoring Engine (DMSE). The Scoring Engine does not exist in Oracle Database 11g or 12c.

Upgrading from Release 11g

If you upgrade Oracle Database 11g to Oracle Database 12c, and the database was previously upgraded from Oracle Database 10g, then the DMSYS schema may still be present. If the upgrade process detects DMSYS, it displays a warning message and drops DMSYS during the upgrade.

Using Export/Import to Upgrade Data Mining Models

If required, you can use a less automated approach to upgrading data mining models. You can export the models created in a previous version of Oracle Database and import them into an instance of Oracle Database 12c.

Caution:

Do not import data mining models that were created in Java. They are not supported in Oracle Database 12c.

Export/Import Release 10g Data Mining Models

To export models from an instance of Oracle Database 10g to a dump file, follow the instructions in "Exporting and Importing Mining Models". Before importing the
models from the dump file, run the DMEIDMSYS script to create the DMSYS schema in Oracle Database 12c.

```
SQL>CONNECT / as sysdba;
SQL>@ORACLE_HOME\RDBMS\admin\dmeidmsys.sql
SQL>EXIT;
```

**Note:**

The TEMP tablespace must already exist in the Oracle Database 12g database. The DMEIDMSYS script uses the TEMP and SYSAUX tablespaces to create the DMSYS schema.

To import the dump file into the Oracle Database 12c database:

```
%ORACLE_HOME\bin\impdp system\<password>
dumpfile=\<dumpfile_name>directory=\<directory_name>
logfile=\logfile_name>......
SQL>CONNECT / as sysdba;
SQL>EXECUTE dmp_sysupgrade_models();
SQL>ALTER SYSTEM FLUSH SHARED_POOL;
SQL>ALTER SYSTEM FLUSH BUFFER_CACHE;
SQL>EXIT;
```

The upgrade_models script migrates all data mining metadata objects and PL/SQL packages from DMSYS to SYS and then drops DMSYS before upgrading the models.

**See Also:**

Exporting and Importing Mining Models

**Export/Import Release 11g Data Mining Models**

To export models from an instance of Oracle Database 11g to a dump file, follow the instructions in Exporting and Importing Mining Models.

**Caution:**

Do not import data mining models that were created in Java. They are not supported in Oracle Database 12c.

To import the dump file into the Oracle Database 12c database:

```
%ORACLE_HOME\bin\impdp system\<password>
dumpfile=\<dumpfile_name>directory=\<directory_name>
logfile=\logfile_name>......
SQL>CONNECT / as sysdba;
SQL>EXECUTE dmp_sysupgrade_models();
SQL>ALTER SYSTEM Flush shared_pool;
SQL>ALTER SYSTEM flush buffer_cache;
SQL>EXIT;
```
Post Upgrade Steps

After upgrading the database, check the **DBA_MINING_MODELS** view in the upgraded database. The newly upgraded mining models must be listed in this view.

After you have verified the upgrade and confirmed that there is no need to downgrade, you must set the initialization parameter **COMPATIBLE** to 12.1.

---

**Note:**

The `CREATE MINING MODEL` privilege must be granted to Data Mining user accounts that are used to create mining models.

---

**See Also:**

- Creating a Data Mining User
- Controlling Access to Mining Models and Data

---

Downgrading Oracle Data Mining

Before downgrading the Oracle Database 12c database back to the previous version, ensure that no Singular Value Decomposition models or Expectation Maximization models are present. These algorithms are only available in Oracle Database 12c. Use the **DBMS_DATA_MINING.DROP_MODEL** routine to drop these models before downgrading. If you do not do this, the database downgrade process terminates.

Issue the following SQL statement in **SYS** to verify the downgrade:

```
SQL> SELECT o.name FROM sys.model$ m, sys.obj$ o
WHERE m.obj# = o.obj# AND m.version=2;
```

---

Exporting and Importing Mining Models

You can export data mining models to flat files to back up work in progress or to move models to a different instance of Oracle Database Enterprise Edition (such as from a development database to a test database). All methods for exporting and importing models are based on Oracle Data Pump technology.

The **DBMS_DATA_MINING** package includes the **EXPORT_MODEL** and **IMPORT_MODEL** procedures for exporting and importing individual mining models. **EXPORT_MODEL** and **IMPORT_MODEL** use the export and import facilities of Oracle Data Pump.

- About Oracle Data Pump
- Options for Exporting and Importing Mining Models
- Directory Objects for **EXPORT_MODEL** and **IMPORT_MODEL**
- Using **EXPORT_MODEL** and **IMPORT_MODEL**
- Importing From PMML
About Oracle Data Pump

Oracle Data Pump consists of two command-line clients and two PL/SQL packages. The command-line clients, `expdp` and `impdp`, provide an easy-to-use interface to the Data Pump export and import utilities. You can use `expdp` and `impdp` to export and import entire schemas or databases.

The Data Pump export utility writes the schema objects, including the tables and metadata that constitute mining models, to a dump file set. The Data Pump import utility retrieves the schema objects, including the model tables and metadata, from the dump file set and restores them in the target database.

`expdp` and `impdp` cannot be used to export/import individual mining models.

See Also:

- Oracle Database Utilities for information about Oracle Data Pump and the `expdp` and `impdp` utilities

## Options for Exporting and Importing Mining Models

Options for exporting and importing mining models are described in the following table.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export or import a full database (DBA only)</td>
<td>Use <code>expdp</code> to export a full database and <code>impdp</code> to import a full database. All mining models in the database are included.</td>
</tr>
<tr>
<td>Export or import a schema</td>
<td>Use <code>expdp</code> to export a schema and <code>impdp</code> to import a schema. All mining models in the schema are included.</td>
</tr>
</tbody>
</table>
## Table 8-1  (Cont.) Export and Import Options for Oracle Data Mining

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export or import individual models within a database</td>
<td>Use <code>DBMS_DATA_MINING.EXPORT_MODEL</code> to export individual models and <code>DBMS_DATA_MINING.IMPORT_MODEL</code> to import individual models. These procedures can export and import a single mining model, all mining models, or mining models that match specific criteria. By default, <code>IMPORT_MODEL</code> imports models back into the schema from which they were exported. You can specify the <code>schema_remap</code> parameter to import models into a different schema. You can specify <code>tablespace_remap</code> with <code>schema_remap</code> to import models into a schema that uses a different tablespace. You may need special privileges in the database to import models into a different schema. These privileges are granted by the <code>EXP_FULL_DATABASE</code> and <code>IMP_FULL_DATABASE</code> roles, which are only available to privileged users (such as <code>SYS</code> or a user with the <code>DBA</code> role). You do not need these roles to export or import models within your own schema. To import models, you must have the same database privileges as the user who created the dump file set. Otherwise, a DBA with full system privileges must import the models.</td>
</tr>
<tr>
<td>Export or import individual models to or from a remote database</td>
<td>Use a database link to export individual models to a remote database or import individual models from a remote database. A database link is a schema object in one database that enables access to objects in a different database. The link must be created before you execute <code>EXPORT_MODEL</code> or <code>IMPORT_MODEL</code>. To create a private database link, you must have the <code>CREATE DATABASE LINK</code> system privilege. To create a public database link, you must have the <code>CREATE PUBLIC DATABASE LINK</code> system privilege. Also, you must have the <code>CREATE SESSION</code> system privilege on the remote Oracle Database. Oracle Net must be installed on both the local and remote Oracle Databases.</td>
</tr>
</tbody>
</table>

- `CREATE DATABASE LINK` in *Oracle Database SQL Language Reference*

### Directory Objects for `EXPORT_MODEL` and `IMPORT_MODEL`

`EXPORT_MODEL` and `IMPORT_MODEL` use a directory object to identify the location of the dump file set. A directory object is a logical name in the database for a physical directory on the host computer.

To export data mining models, you must have write access to the directory object and to the file system directory that it represents. To import data mining models, you must have read access to the directory object and to the file system directory. Also, the database itself must have access to file system directory. You must have the `CREATE ANY DIRECTORY` privilege to create directory objects.

The following SQL command creates a directory object named `dmuser_dir`. The file system directory that it represents must already exist and have shared read/write access rights granted by the operating system.

```
CREATE OR REPLACE DIRECTORY dmuser_dir AS '/dm_path/dm_mining';
```
The following SQL command gives user dmuser both read and write access to dmuser_dir.

GRANT READ,WRITE ON DIRECTORY dmuser_dir TO dmuser;

See Also:
CREATE DIRECTORY in Oracle Database SQL Language Reference

Using EXPORT_MODEL and IMPORT_MODEL

The examples in this section illustrate various export and import scenarios with EXPORT_MODEL and IMPORT_MODEL. The examples use the directory object dmdir shown in Example 8-1 and two schemas, dm1 and dm2. Both schemas have data mining privileges. dm1 has two models. dm2 has one model.

```
SELECT owner, model_name, mining_function, algorithm FROM all_mining_models;
```

<table>
<thead>
<tr>
<th>OWNER</th>
<th>MODEL_NAME</th>
<th>MINING_FUNCTION</th>
<th>ALGORITHM</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM1</td>
<td>EM_SH_CLUS_SAMPLE</td>
<td>CLUSTERING</td>
<td>EXPECTATION_Maximization</td>
</tr>
<tr>
<td>DM1</td>
<td>DT_SH_CLAS_SAMPLE</td>
<td>CLASSIFICATION</td>
<td>DECISION_TREE</td>
</tr>
<tr>
<td>DM2</td>
<td>SVD_SH_SAMPLE</td>
<td>FEATURE_EXTRACTION</td>
<td>SINGULAR_VALUE_DECOMP</td>
</tr>
</tbody>
</table>

Example 8-1 Creating the Directory Object

```
-- connect as system user
CREATE OR REPLACE DIRECTORY dmdir AS ©/scratch/dmuser/expimp©;
GRANT READ,WRITE ON DIRECTORY dmdir TO dm1;
GRANT READ,WRITE ON DIRECTORY dmdir TO dm2;
SELECT * FROM all_directories WHERE directory_name IN 'DMDIR';
```

<table>
<thead>
<tr>
<th>OWNER</th>
<th>DIRECTORY_NAME</th>
<th>DIRECTORY_PATH</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS</td>
<td>DMDIR</td>
<td>/scratch/dmuser/expimp</td>
</tr>
</tbody>
</table>

Example 8-2 Exporting All Models From DM1

```
-- connect as dm1
BEGIN
  dbms_data_mining.export_model (filename => 'all_dm1', directory => 'dmdir');
END;
/
```

A log file and a dump file are created in /scratch/dmuser/expimp, the physical directory associated with dmdir. The name of the log file is dm1_exp_11.log. The name of the dump file is all_dm101.dmp.

Example 8-3 Importing the Models Back into DM1

The models that were exported in Example 8-2 still exist in dm1. Since an import does not overwrite models with the same name, you must drop the models before importing them back into the same schema.

```
BEGIN
  dbms_data_mining.drop_model('EM_SH_CLUS_SAMPLE');
  dbms_data_mining.drop_model('DT_SH_CLAS_SAMPLE');
END;
```
Example 8-4  Importing Models Into a Different Schema

In this example, the models that were exported from dm1 in Example 8-2 are imported into dm2. The dm1 schema uses the example tablespace; the dm2 schema uses the sysaux tablespace.

-- CONNECT as sysdba
BEGIN
    dbms_data_mining.import_model(
        filename => 'all_dm101.dmp',
        directory => 'DMDIR',
        schema_remap => 'DM1:DM2',
        tablespace_remap => 'EXAMPLE:SYSAUX');
END;
/
-- CONNECT as dm2
SELECT model_name from user_mining_models;

MODEL_NAME
-------------------------------
DT_SH_CLAS_SAMPLE
EM_SH_CLUS_SAMPLE

Example 8-5  Exporting Specific Models

You can export a single model, a list of models, or a group of models that share certain characteristics.

-- Export the model named dt_sh_clas_sample
EXECUTE dbms_data_mining.export_model (filename => 'one_model',
    directory => 'DMDIR',
    model_filter => 'name in ("DT_SH_CLAS_SAMPLE")');
-- one_model01.dmp and dm1_exp_37.log are created in /scratch/dmuser/expimp

-- Export Decision Tree models
EXECUTE dbms_data_mining.export_model(filename => 'algo_models',
    directory => 'DMDIR',
    model_filter => 'ALGORITHM_NAME IN ("DECISION_TREE")');
-- algo_model01.dmp and dm1_exp_410.log are created in /scratch/dmuser/expimp

-- Export clustering models
EXECUTE dbms_data_mining.export_model(filename => 'func_models',
    directory => 'DMDIR',
    model_filter => 'FUNCTION_NAME = "CLUSTERING"');
-- func_model01.dmp and dm1_exp_513.log are created in /scratch/dmuser/expimp
See Also:

**Importing From PMML**

Predictive Model Markup Language (PMML) is an XML-based standard specified by the Data Mining Group ([http://www.dmg.org](http://www.dmg.org)). Applications that are PMML-compliant can deploy PMML-compliant models that were created by any vendor. Oracle Data Mining supports the core features of PMML 3.1 for regression models.

You can import regression models represented in Predictive Model Markup Language (PMML). The models must be of type `RegressionModel`, either linear regression or binary logistic regression.

See Also:  
*Oracle Database PL/SQL Packages and Types Reference* for more information about PMML import

**Controlling Access to Mining Models and Data**

Understand how to create a Data Mining user and grant necessary privileges.

- Creating a Data Mining User
- System Privileges for Data Mining
- Object Privileges for Mining Models

**Creating a Data Mining User**

A Data Mining user is a database user account that has privileges for performing data mining activities. **Example 8-6** shows how to create a database user. **Example 8-7** shows how to assign data mining privileges to the user.

**Note:**

To create a user for the Data Mining sample programs, you must run two configuration scripts as described in "The Data Mining Sample Programs".

**Example 8-6  Creating a Database User in SQL*Plus**

1. Log in to SQL*Plus with system privileges.
   
   Enter user-name: sys as sysdba  
   Enter password: password

2. To create a user named `dmuser`, type these commands. Specify a password of your choosing.

   ```sql
   CREATE USER dmuser IDENTIFIED BY password
   DEFAULT TABLESPACE USERS
   TEMPORARY TABLESPACE TEMP
   ```
QUOTA UNLIMITED ON USERS;
Commit;

The USERS and TEMP tablespace are included in the pre-configured database that Oracle ships with the database media. USERS is used mostly by demo users; it is appropriate for running the sample programs described in "The Data Mining Sample Programs". TEMP is the temporary tablespace that is shared by most database users.

**Note:**

Tablespaces for Data Mining users must be assigned according to standard DBA practices, depending on system load and system resources.

3. To login as dmuser, type the following.

```sql
CONNECT dmuser
Enter password: password
```

**See Also:**

- The Data Mining Sample Programs
- Oracle Database SQL Language Reference for the complete syntax of the CREATE USER statement

**Granting Privileges for Data Mining**

You must have the CREATE MINING MODEL privilege to create models in your own schema. You can perform any operation on models that you own. This includes applying the model, adding a cost matrix, renaming the model, and dropping the model.

The GRANT statements in the following example assign a set of basic data mining privileges to the dmuser account. Some of these privileges are not required for all mining activities, however it is prudent to grant them all as a group.

Additional system and object privileges are required for enabling or restricting specific mining activities.

**Example 8-7 Privileges Required for Data Mining**

```sql
GRANT CREATE MINING MODEL TO dmuser;
GRANT CREATE SESSION TO dmuser;
GRANT CREATE TABLE TO dmuser;
GRANT CREATE VIEW TO dmuser;
GRANT EXECUTE ON CTXSYS.CTX_DDL TO dmuser;

READ or SELECT privileges are required for data that is not in your schema. For example, the following statement grants SELECT access to the sh.customers table.

GRANT SELECT ON sh.customers TO dmuser;
```
System Privileges for Data Mining

A system privilege confers the right to perform a particular action in the database or to perform an action on a type of schema objects. For example, the privileges to create tablespaces and to delete the rows of any table in a database are system privileges.

You can perform specific operations on mining models in other schemas if you have the appropriate system privileges. For example, CREATE ANY MINING MODEL enables you to create models in other schemas. SELECT ANY MINING MODEL enables you to apply models that reside in other schemas. You can add comments to models if you have the COMMENT ANY MINING MODEL privilege.

To grant a system privilege, you must either have been granted the system privilege with the ADMIN OPTION or have been granted the GRANT ANY PRIVILEGE system privilege.

The system privileges listed in the following table control operations on mining models.

<table>
<thead>
<tr>
<th>System Privilege</th>
<th>Allows you to</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE MINING MODEL</td>
<td>Create mining models in your own schema.</td>
</tr>
<tr>
<td>CREATE ANY MINING MODEL</td>
<td>Create mining models in any schema.</td>
</tr>
<tr>
<td>ALTER ANY MINING MODEL</td>
<td>Change the name or cost matrix of any mining model in any schema.</td>
</tr>
<tr>
<td>DROP ANY MINING MODEL</td>
<td>Drop any mining model in any schema.</td>
</tr>
<tr>
<td>SELECT ANY MINING MODEL</td>
<td>Apply a mining model in any schema, also view model details in any schema.</td>
</tr>
<tr>
<td>COMMENT ANY MINING MODEL</td>
<td>Add a comment to any mining model in any schema.)</td>
</tr>
<tr>
<td>AUDIT_ADMIN role</td>
<td>Generate an audit trail for any mining model in any schema. (See Oracle Database Security Guide for details.)</td>
</tr>
</tbody>
</table>

Example 8-8  Grant System Privileges for Data Mining

The following statements allow dmuser to score data and view model details in any schema as long as SELECT access has been granted to the data. However, dmuser can only create models in the dmuser schema.

GRANT CREATE MINING MODEL TO dmuser;
GRANT SELECT ANY MINING MODEL TO dmuser;

The following statement revokes the privilege of scoring or viewing model details in other schemas. When this statement is executed, dmuser can only perform data mining activities in the dmuser schema.

REVOKE SELECT ANY MINING MODEL FROM dmuser;
Object Privileges for Mining Models

An object privilege confers the right to perform a particular action on a specific schema object. For example, the privilege to delete rows from the SH.PRODUCTS table is an example of an object privilege.

You automatically have all object privileges for schema objects in your own schema. You can grant object privilege on objects in your own schema to other users or roles.

The object privileges listed in the following table control operations on specific mining models.

### Table 8-3 Object Privileges for Mining Models

<table>
<thead>
<tr>
<th>Object Privilege</th>
<th>Allows you to:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER MINING MODEL</td>
<td>Change the name or cost matrix of the specified mining model object.</td>
</tr>
<tr>
<td>SELECT MINING MODEL</td>
<td>Apply the specified mining model object and view its model details.</td>
</tr>
</tbody>
</table>

#### Example 8-9 Grant Object Privileges on Mining Models

The following statements allow dmuser to apply the model testmodel to the sales table, specifying different cost matrixes with each apply. The user dmuser can also rename the model testmodel. The testmodel model and sales table are in the sh schema, not in the dmuser schema.

```
GRANT SELECT ON MINING MODEL sh.testmodel TO dmuser;
GRANT ALTER ON MINING MODEL sh.testmodel TO dmuser;
GRANT SELECT ON sh.sales TO dmuser;
```

The following statement prevents dmuser from renaming or changing the cost matrix of testmodel. However, dmuser can still apply testmodel to the sales table.

```
REVOKE ALTER ON MINING MODEL sh.testmodel FROM dmuser;
```

### Auditing and Adding Comments to Mining Models

Mining model objects support SQL COMMENT and AUDIT statements.

#### Adding a Comment to a Mining Model

Comments can be used to associate descriptive information with a database object. You can associate a comment with a mining model using a SQL COMMENT statement.

```
COMMENT ON MINING MODEL schema_name.model_name IS string;
```
Note:
To add a comment to a model in another schema, you must have the `COMMENT ANY MINING MODEL` system privilege.

To drop a comment, set it to the empty `' ' string.

The following statement adds a comment to the model `DT_SH_CLAS_SAMPLE` in your own schema.

```
COMMENT ON MINING MODEL dt_sh_clas_sample IS
'Decision Tree model predicts promotion response';
```

You can view the comment by querying the catalog view `USER_MINING_MODELS`.

```
SELECT model_name, mining_function, algorithm, comments FROM user_mining_models;
```

<table>
<thead>
<tr>
<th>MODEL_NAME</th>
<th>MINING_FUNCTION</th>
<th>ALGORITHM</th>
<th>COMMENTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>DT_SH_CLAS_SAMPLE</td>
<td>CLASSIFICATION</td>
<td>DECISION_TREE</td>
<td>Decision Tree model predicts promotion response</td>
</tr>
</tbody>
</table>

To drop this comment from the database, issue the following statement:

```
COMMENT ON MINING MODEL dt_sh_clas_sample ' ';
```

See Also:
- Table 8-2
- *Oracle Database SQL Language Reference* for details about SQL `COMMENT` statements

Auditing Mining Models

The Oracle Database auditing system is a powerful, highly configurable tool for tracking operations on schema objects in a production environment. The auditing system can be used to track operations on data mining models.

Note:
To audit mining models, you must have the `AUDIT_ADMIN` role.

Unified auditing is documented in *Oracle Database Security Guide*. However, the full unified auditing system is not enabled by default. Instructions for migrating to unified auditing are provided in *Oracle Database Upgrade Guide*.
See Also:

- "Auditing Oracle Data Mining Events" in *Oracle Database Security Guide* for details about auditing mining models

- "Monitoring Database Activity with Auditing" in *Oracle Database Security Guide* for a comprehensive discussion of unified auditing in Oracle Database

- "About the Unified Auditing Migration Process for Oracle Database" in *Oracle Database Upgrade Guide* for information about migrating to unified auditing
The Data Mining Sample Programs

Describes the data mining sample programs that ship with Oracle Database.

- About the Data Mining Sample Programs
- Installing the Data Mining Sample Programs
- The Data Mining Sample Data

About the Data Mining Sample Programs

You can learn a great deal about the Oracle Data Mining application programming interface (API) from the data mining sample programs. The programs illustrate typical approaches to data preparation, algorithm selection, algorithm tuning, testing, and scoring.

The programs are easy to use. They include extensive inline comments to help you understand the code. They delete all temporary objects on exit; you can run the programs repeatedly without setup or cleanup.

The data mining sample programs are installed with Oracle Database Examples in the demo directory under Oracle Home. The demo directory contains sample programs that illustrate many features of Oracle Database. You can locate the data mining files by doing a directory listing of `dm* .sql`. The following example shows this directory listing on a Linux system.

Note that the directory listing in the following example includes one file, `dmhpdemo.sql`, that is not a data mining program.

**Example A-1 Directory Listing of the Data Mining Sample Programs**

```bash
> cd $ORACLE_HOME/rdbms/demo
> ls dm*.sql
dmaidemo.sql  dmkmdemo.sql  dmsvddemo.sql
dmardemo.sql  dmnbdemo.sql  dmsvodem.sql
dmdtndemo.sql  dmmndemo.sql  dmsvrdem.sql
dmtxvlddemo.sql  dmoctdemo.sql  dmtxtnmf.sql
dmemdemo.sql  dmsh.sql  dmtxtsvm.sql
dmglcdem.sql  dmshgrants.sql
dmglrdem.sql  dmsstardemo.sql
dmhpdemo.sql  dmsvctdemo.sql
```

The data mining sample programs create a set of mining models in the user's schema. After executing the programs, you can list the models with a query like the one in the following example.
### Example A-2  Models Created by the Sample Programs

```sql
SELECT mining_function, algorithm, model_name FROM user_mining_models
ORDER BY mining_function;
```

<table>
<thead>
<tr>
<th>MINING_FUNCTION</th>
<th>ALGORITHM</th>
<th>MODEL_NAME</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

### Installing the Data Mining Sample Programs

The data mining sample programs require:

- Oracle Database Enterprise Edition with the Advanced Analytics option
- Oracle Database sample schemas
- Oracle Database Examples
- A data mining user account
- Execution of `dmshgrants.sql` by a system administrator
- Execution of `dmsh.sql` by the data mining user

Follow these steps to install the data mining sample programs:

1. Install or obtain access to Oracle Database 12c Enterprise Edition with the Advanced Analytics option. To install the Database, see the installation instructions for your platform at [http://www.oracle.com/pls/db121/homepage](http://www.oracle.com/pls/db121/homepage).

2. Ensure that the sample schemas are installed in the database. The sample schemas are installed by default with Oracle Database. See Oracle Database Sample Schemas for details about the sample schemas.

3. Verify that Oracle Database Examples has been installed with the database, or install it locally. Oracle Database Examples loads the Database sample programs into the `rdbms/demo` directory under Oracle home. See Oracle Database Examples Installation Guide for installation instructions.

4. Verify that a data mining user account has been created, or create it yourself if you have administrative privileges. See "Creating a Data Mining User".

5. Ask your system administrator to run `dmshgrants.sql`, or run it yourself if you have administrative privileges. `dmshgrants` grants the privileges that are
required for running the sample programs. These include SELECT access to tables in the SH schema as described in "The Data Mining Sample Data" and the system privileges listed in the following table.

Pass the name of the data mining user to dmshgrants.

```
SQL> CONNECT sys / as sysdba
Enter password: sys_password
Connected.
SQL> @ $ORACLE_HOME/rdbms/demo/dmshgrants dmuser
```

### Table A-1 System Privileges Granted by dmshgrants.sql to the Data Mining User

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Allows the data mining user to</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE SESSION</td>
<td>log in to a database session</td>
</tr>
<tr>
<td>CREATE TABLE</td>
<td>create tables, such as the settings tables for CREATE_MODEL</td>
</tr>
<tr>
<td>CREATE VIEW</td>
<td>create views, such as the views of tables in the SH schema</td>
</tr>
<tr>
<td>CREATE MINING MODEL</td>
<td>create data mining models</td>
</tr>
<tr>
<td>EXECUTE ON</td>
<td>execute procedures in the ctxsys.ctx_ddl PL/SQL package; required for text mining</td>
</tr>
</tbody>
</table>

6. Connect to the database as the data mining user and run dmsh.sql. This script creates views of the sample data in the schema of the data mining user.

```
SQL> CONNECT dmuser
Enter password: dmuser_password
Connected.
SQL> @ $ORACLE_HOME/rdbms/demo/dmsh
```

See Also:
- Creating a Data Mining User
- The Data Mining Sample Data
- Oracle Database Sample Schemas
- Oracle Database Examples Installation Guide
- Creating a Data Mining User

---

### The Data Mining Sample Data

The data used by the sample data mining programs is based on these tables in the SH schema:

- SH.CUSTOMERS
- SH.SALES
- SH.PRODUCTS
- SH.SUPPLEMENTARY_DEMOGRAPHICS
- SH.COUNTRIES

---
The `dmshgrants` script grants `SELECT` access to the tables in `SH`. The `dmsh.sql` script creates views of the `SH` tables in the schema of the data mining user. The views are described in the following table:

### Table A-2  The Data Mining Sample Data

<table>
