Changes in This Release for Oracle Database Net Services Reference ................... xiii

Part I  Control Utilities

1  Listener Control Utility

   Listener Control Utility Overview ......................................................................................................................... 1-1
   SET and SHOW Commands of the Listener Control utility ................................................................................. 1-2
   Distributed Operations ........................................................................................................................................ 1-2
   Oracle Net Listener Security .............................................................................................................................. 1-3
   Listener Control Utility Commands .................................................................................................................. 1-3
       EXIT............................................................................................................................................................. 1-4
       HELP.......................................................................................................................................................... 1-4
       QUIT........................................................................................................................................................... 1-5
       RELOAD.................................................................................................................................................... 1-5
       SAVE_CONFIG........................................................................................................................................... 1-6
       SERVICES.................................................................................................................................................. 1-7
       SET......................................................................................................................................................... 1-8
       SET CURRENT_LISTENER...................................................................................................................... 1-8
       SET DISPLAYMODE................................................................................................................................. 1-9
       SET INBOUND_CONNECT_TIMEOUT ....................................................................................................... 1-9
       SET LOG_DIRECTORY............................................................................................................................... 1-10
       SET LOG_FILE ...................................................................................................................................... 1-11
       SET LOG_STATUS .................................................................................................................................. 1-11
       SET SAVE_CONFIG_ON_STOP................................................................................................................ 1-12
       SET TRC_DIRECTORY .............................................................................................................................. 1-13
       SET TRC_FILE ....................................................................................................................................... 1-13
       SET TRC_LEVEL....................................................................................................................................... 1-13
       SHOW..................................................................................................................................................... 1-14
2 Oracle Connection Manager Control Utility

Oracle Connection Manager Control Utility Overview ............................................................... 2-1
Command Modes and Syntax ....................................................................................................... 2-1
Oracle Connection Manager Control Utility Commands ............................................................ 2-2
ADMINISTER ............................................................................................................................. 2-3
CLOSE CONNECTIONS .............................................................................................................. 2-4
EXIT ........................................................................................................................................ 2-5
HELP ...................................................................................................................................... 2-6
QUIT ..................................................................................................................................... 2-7
RELOAD ................................................................................................................................. 2-7
RESUME GATEWAYS .................................................................................................................. 2-8
SAVE_PASSWORD ....................................................................................................................... 2-8
SET ....................................................................................................................................... 2-9
SET ASO_AUTHENTICATION_FILTER ...................................................................................... 2-9
SET CONNECTION_STATISTICS ............................................................................................. 2-10
SET EVENT .............................................................................................................................. 2-10
SET IDLE_TIMEOUT .................................................................................................................. 2-11
SET INBOUND_CONNECT_TIMEOUT ...................................................................................... 2-12
SET LOG_DIRECTORY .............................................................................................................. 2-12
SET LOG_LEVEL ...................................................................................................................... 2-13
SET OUTBOUND_CONNECT_TIMEOUT .................................................................................... 2-14
SET PASSWORD ...................................................................................................................... 2-14
SET SESSION_TIMEOUT ......................................................................................................... 2-15
SET TRACE_DIRECTORY ......................................................................................................... 2-15
SET TRACE_LEVEL .................................................................................................................. 2-16
SHOW ................................................................................................................................... 2-17
SHOW ALL ............................................................................................................................... 2-17
SHOW CONNECTIONS ........................................................................................................... 2-18
SHOW DEFAULTS ..................................................................................................................... 2-19
SHOW EVENTS ......................................................................................................................... 2-20
SHOW GATEWAYS .................................................................................................................. 2-21
SHOW PARAMETERS .............................................................................................................. 2-21
SHOW RULES .......................................................................................................................... 2-22
SHOW SERVICES .................................................................................................................... 2-23
SHOW STATUS ......................................................................................................................... 2-24
SHOW VERSION ....................................................................................................................... 2-25
SHUTDOWN ............................................................................................................................. 2-25
STARTUP .................................................................................................................................. 2-26
SUSPEND GATEWAY .................................................................................................................. 2-27
Part II  Configuration Parameters

3  Syntax Rules for Configuration Files

Overview of Configuration File Syntax ............................................................................. 3-1
Syntax Rules for Configuration Files .................................................................................. 3-2
Network Character Set for Keywords ................................................................................. 3-2
Character Set for Listener and Net Service Names ............................................................. 3-3

4  Protocol Address Configuration

Protocol Addresses .................................................................................................................. 4-1
ADDRESS ............................................................................................................................... 4-1
ADDRESS_LIST ......................................................................................................................... 4-2
Protocol Parameters ............................................................................................................... 4-2
Recommended Port Numbers ................................................................................................. 4-3
Port Number Limitations ........................................................................................................ 4-3

5  Parameters for the sqlnet.ora File

Overview of Profile Configuration File ................................................................................ 5-1
sqlnet.ora Profile Parameters ............................................................................................... 5-2
BEQUEATH_DETACH .................................................................................................................. 5-4
DEFAULT_SDU_SIZE ................................................................................................................. 5-4
DISABLE_OOB .......................................................................................................................... 5-5
NAMES.DEFAULT_DOMAIN .................................................................................................... 5-5
NAMES.DIRECTORY_PATH ....................................................................................................... 5-6
NAMES.LDAP_AUTHENTICATE_BIND ..................................................................................... 5-6
NAMES.LDAP_CONN_TIMEOUT ............................................................................................... 5-7
NAMES.LDAP_PERSISTENT_SESSION .................................................................................... 5-7
NAMES.NIS.META_MAP .......................................................................................................... 5-7
RECV_BUF_SIZE ...................................................................................................................... 5-8
SDP.PF_INET_SDPI .................................................................................................................. 5-8
SEC_USER_AUDIT_ACTION_BANNER ....................................................................................... 5-8
SEC_USER_UNAUTHORIZED_ACCESS_BANNER ....................................................................... 5-9
SEND_BUF_SIZE ..................................................................................................................... 5-9
SQLNET.ALLOWED_LOGON_VERSION_CLIENT ..................................................................... 5-10
SQLNET.ALLOWED_LOGON_VERSION_SERVER ..................................................................... 5-10
SQLNET.AUTHENTICATION_SERVICES ................................................................................ 5-13
SQLNET.CLIENT_REGISTRATION .......................................................................................... 5-14
SQLNET.COMPRESSION ......................................................................................................... 5-14
SQLNET.COMPRESSION_LEVELS ........................................................................................... 5-15
SQLNET.COMPRESSION_THRESHOLD ...................................................................................... 5-15
SQLNET.CRYPTO_CHECKSUM_CLIENT ................................................................................. 5-15
SQLNET.CRYPTO_CHECKSUM_SERVER ................................................................................. 5-16
SQLNET.CRYPTO_CHECKSUM_TYPESCLIENT .................................................................... 5-16
SQLNET.CRYPTO_CHECKSUM_TYPES_SERVER .................................................................. 5-17
SQLNET.DBFW_PUBLIC_KEY ................................................................................................. 5-17
SQLNET.DOWN_HOSTS_TIMEOUT ........................................................................................... 5-18

DEFAULT_SERVICE_listener_name .............................................................................. 7-9
INBOUND_CONNECT_TIMEOUT_listener_name ............................................................. 7-10
MAX_ALL_CONNECTIONS_listener_name ..................................................................... 7-10
MAX_REG_CONNECTIONS_listener_name ...................................................................... 7-11
REGISTRATION_EXCLUDED_NODES_listener_name ................................................... 7-11
REGISTRATION_INVITED_NODES_listener_name ....................................................... 7-11
REMOTE_REGISTRATION_ADDRESS_listener_name .................................................... 7-12
SAVE_CONFIG_ON_STOP_listener_name ..................................................................... 7-12
SSL_CLIENT_AUTHENTICATION .................................................................................... 7-13
SUBSCRIBE_FOR_NODE_DOWN_EVENT_listener_name ............................................... 7-13
USE_SID_AS_SERVICE_listener_name .......................................................................... 7-13
VALID_NODE_CHECKING_REGISTRATION_listener_name ............................................ 7-14
WALLET_LOCATION .................................................................................................... 7-14
ADR Diagnostic Parameters for Oracle Net Listener ................................................... 7-16
ADR_BASE_listener_name .......................................................................................... 7-17
8 Oracle Connection Manager Parameters (cman.ora)

Overview of Oracle Connection Manager Configuration File........................................... 8-1
Oracle Connection Manager Parameters ................................................................. 8-3
   ADDRESS ........................................................................................................ 8-4
   ASO_AUTHENTICATION_FILTER........................................................................ 8-4
   CONNECTION_STATISTICS ............................................................................. 8-4
   EVENT_GROUP .............................................................................................. 8-5
   IDLE_TIMEOUT ............................................................................................... 8-5
   INBOUND_CONNECT_TIMEOUT ....................................................................... 8-6
   LOG_DIRECTORY ............................................................................................. 8-6
   LOG_LEVEL ..................................................................................................... 8-6
   MAX_ALL_CONNECTIONS ............................................................................... 8-6
   MAX_CMCTL_SESSIONS .................................................................................. 8-7
   MAX_CONNECTIONS ...................................................................................... 8-7
   MAX_GATEWAY_PROCESSSES ......................................................................... 8-7
   MAX_REG_CONNECTIONS ............................................................................... 8-7
   MIN_GATEWAY_PROCESSSES ......................................................................... 8-7
   OUTBOUND_CONNECT_TIMEOUT ..................................................................... 8-8
   PASSWORD_instance_name .............................................................................. 8-8
   REGISTRATION_EXCLUDED_NODES ............................................................. 8-8
   REGISTRATION_INVITED_NODES ................................................................... 8-8
   RULE ............................................................................................................. 8-9
   SESSION_TIMEOUT ....................................................................................... 8-10
   TRACE_FILE .................................................................................................. 8-11
   TRACE_FILELEN .......................................................................................... 8-11
   TRACE_FILENO ............................................................................................ 8-11
   TRACE_LEVEL ................................................................................................ 8-11
   TRACE_TIMESTAMP ....................................................................................... 8-11
   VALID_NODE_CHECKING_REGISTRATION ...................................................... 8-12
ADR Diagnostic Parameters for Oracle Connection Manager .................................................. 8-12
ADR_BASE .......................................................................................................................... 8-13
DIAG_ADR_ENABLED ........................................................................................................ 8-13
LOG_LEVEL ...................................................................................................................... 8-13
TRACE_LEVEL .................................................................................................................. 8-14
TRACE_TIMESTAMP .......................................................................................................... 8-14
Non-ADR Diagnostic Parameters for Oracle Connection Manager .................................. 8-15
LOG_DIRECTORY ............................................................................................................. 8-15
TRACE_DIRECTORY ......................................................................................................... 8-16
TRACE_FILELEN .............................................................................................................. 8-16
TRACE_FILENO .................................................................................................................. 8-16

9 Directory Usage Parameters in the ldap.ora File
Overview of Directory Server Usage File ....................................................................... 9-1
Directory Usage Parameters ............................................................................................. 9-1
DIRECTORY_SERVERS ...................................................................................................... 9-1
DIRECTORY_SERVER_TYPE ............................................................................................... 9-2
DEFAULT_ADMIN_CONTEXT .............................................................................................. 9-2

Part III Appendixes

A Features Not Supported in this Release
Overview of Unsupported Features ................................................................................ A-1
Oracle Net Connection Pooling ....................................................................................... A-1
Oracle Names .................................................................................................................... A-1
Oracle Net Listener Password ......................................................................................... A-1
Unsupported Parameters ................................................................................................. A-1
Unsupported Control Utility Commands ........................................................................ A-2
Unsupported or Deprecated Protocols ............................................................................ A-2

B Upgrade Considerations for Oracle Net Services
Anonymous Access to Oracle Internet Directory ............................................................ B-1
Migrating a Non-default Listener to Oracle Database 12c Release 1 (12.1) .................... B-1

C LDAP Schema for Oracle Net Services

Attributes .......................................................................................................................... C-2

Glossary
Index
Preface

The Oracle Database Net Services Reference contains a complete listing and description of the control utility commands and configuration file parameters available for managing components of Oracle Net Services.

This document describes the features of Oracle Database 12c that apply to the Microsoft Windows and UNIX operating systems.

This preface contains the following topics:

- Audience
- Documentation Accessibility
- Related Documents
- Conventions

Audience

Oracle Database Net Services Reference is intended for network administrators who are responsible for configuring and administering network components.

To use this document, you should be familiar with the networking concepts and configuration tasks described in Oracle Database Net Services Administrator’s Guide.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For additional information, see the following Oracle resources:

- Oracle Database Net Services Administrator’s Guide
- Online Help for Oracle Net Services tools and utilities
- Oracle Database 12c Release 1 (12.1) documentation set
A glossary of Oracle Net Services terms is available in *Oracle Database Net Services Administrator’s Guide*.

Many books in the documentation set use the sample schemas of the seed database, which is installed by default when you install Oracle. Refer to *Oracle Database Sample Schemas* for additional information about how these schemas were created and how you can use them yourself.

To download free release notes, installation documentation, white papers, or other collateral, visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

http://www.oracle.com/technetwork/index.html

If you have a user name and password for OTN, then you can go directly to the documentation section of the OTN Web site at

http://docs.oracle.com

### Conventions

The examples for directories in the book are for Linux. Unless otherwise noted, Microsoft Windows directory paths are the same except that they use a backslash (\) instead of the slash (/).

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><strong>monospace</strong></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
Changes in This Release for Oracle Database
Net Services Reference

This preface describes the new networking features of Oracle Database 12c and provides pointers to additional information. The following topic is included in this chapter:

- Changes in Oracle Net Services 12c Release 1 (12.1)

Changes in Oracle Net Services 12c Release 1 (12.1)

The following are changes in Oracle Database Net Services Reference for Oracle Database 12c Release 1 (12.1):

- New Features
- Deprecated Features
- Desupported Features

New Features

The following are the new features in Oracle Net Services:

- Larger Session Data Unit Sizes
  Oracle Net supports large session data unit (SDU) sizes, with a new upper limit of 2 MB. The larger SDU size can be used to achieve better utilization of available network bandwidth in networks that have high bandwidth delay products and host resources, according to application characteristics.

  See Also: Oracle Database Net Services Administrator’s Guide for information about configuring SDU

- Advance Network Compression
  Advanced Network Compression is another new feature that reduces the amount of data transmitted over the network. New parameters for the sqlnet.ora file enable compression and selection of the preferred compression level. Advanced Network Compression is available as part of Advanced Compression Option.

  See Also: "SQLNET.COMPRESSION" on page 5-14, "SQLNET.COMPRESSION_LEVELS" on page 5-15, and "SQLNET.COMPRESSION_THRESHOLD" on page 5-15

- Terminated Client Detection
Terminated client detection has been enhanced to reduce the amount of time taken to detect terminated connections. The SQLNET.EXPIRE_TIME parameter must be set in the sqlnet.ora file to detect terminated clients. If the system supports TCP keepalive tuning, then Oracle Net Services automatically uses the enhanced detection model, and tunes the TCP keepalive parameters.

- **Intelligent Client Connection**

  This feature reduces the priority of connection attempts to unresponsive nodes in the address string of connect descriptor. No configuration changes are required to use this feature.

- **Incident Generation for Process Failures**

  In case of a process failure, an incident is generated for the following Oracle Net Services components:

  - Oracle Net Listener
  - Listener control utility (LSNRCTL)
  - Connection Manager Administration (CMADMIN)
  - Oracle Connection Manager gateway (CMGW)

  An incident includes the call stack as well as diagnostic information. Incident generation works with Automatic Diagnostic Repository (ADR) to organize the dump information for critical errors into incidents. If ADR is disabled, then incident generation is also disabled.

- **Valid Node Checking for Registration**

  Oracle Net Listener allows screening of service registration requests from database instances. A database instance is allowed to register services if the instance is running on a valid node. Database administrators specify a list of valid nodes and excluded nodes. The list of valid nodes specifies hosts and subnets from which instances can register services with the listener. The list of excluded nodes specifies hosts and subnets from which instances are not allowed to register services with the listener. The database administrator can also disable valid node checking.

  By default, valid node checking for registration (VNCR) is enabled, and registration is allowed from instances running on the local host. Subnets or remote hosts need to be configured in the list of valid nodes. This configuration is performed automatically for Single Client Access Name (SCAN) listeners as part of an Oracle Real Application Clusters installation.

  **See Also:** "REGISTRATION_INVITED_NODES_listener_name" on page 7-11, "REGISTRATION_EXCLUDED_NODES_listener_name" on page 7-11, and "VALID_NODE_CHECKING_REGISTRATION_listener_name" on page 7-14

### Deprecated Features

The following features are being deprecated in Oracle Database. This is based on an effort to streamline configuration and use of Oracle Database.

- **NT LAN Manager (NTLM) protocol for domain authentication**

  NTLM domain authentication has been deprecated from the Oracle Windows adapter. Only Kerberos authentication is used for the NTS adapter.

  NTLM is still used for local user authentication, as well as in the case in which the database service runs as a local user.
Oracle Restart

Oracle Restart is provided as part of Oracle Grid Infrastructure. Oracle Restart monitors and can restart Oracle Database instances, Oracle Net Listeners, and Oracle Automatic Storage Management (Oracle ASM) instances. Oracle Restart is restricted to manage single instance Oracle Databases and Oracle ASM instances only, and is subject to desupport in future releases. Oracle continues to provide Oracle ASM as part of the Oracle Grid Infrastructure installation for Standalone and Cluster deployments. For additional information about the Oracle Restart deprecation announcement and its replacement, see My Oracle Support note 1584742.1.

The following parameter has been deprecated:

- SQLNET.ALLOWED_LOGON_VERSION

See Also:

- "SQLNET.ALLOWED_LOGON_VERSION_CLIENT" on page 5-10
- "SQLNET.ALLOWED_LOGON_VERSION_SERVER" on page 5-10
- Oracle Database Upgrade Guide

Desupported Features

Some features previously described in this book are desupported in Oracle Database 12c Release 1 (12.1). Refer to Oracle Database Upgrade Guide for a complete list of desupported features.

- Oracle Net Connection Pooling

See Also:

- My Oracle Support note 1469466.1
- Oracle Database Upgrade Guide

- Oracle Names

See Also:

- Oracle Database Net Services Administrator’s Guide for additional information about migrating to directory naming
- Oracle Database Upgrade Guide

- Oracle Net Listener Password

See Also:

- "Oracle Net Listener Security” on page 1-3
- Oracle Database Upgrade Guide

- Unsupported Parameters

The following parameters are no longer supported:

- SQLNET.KERBEROS5_CONF_MIT
Part I
Control Utilities

Oracle Net Services provides control utilities to administer listeners, and Oracle Connection Manager. Part 1 lists the commands that are available with each utility, including any applicable prerequisites, passwords, syntax or argument rules, and usage notes or examples to help you use them.

This part contains the following chapters:

- Chapter 1, "Listener Control Utility"
- Chapter 2, "Oracle Connection Manager Control Utility"
This chapter describes the commands and associated syntax of the Listener Control utility.

This chapter contains the following topics:

- Listener Control Utility Overview
- SET and SHOW Commands of the Listener Control utility
- Distributed Operations
- Oracle Net Listener Security
- Listener Control Utility Commands

Listener Control Utility Overview

The Listener Control utility enables you to administer listeners. You can use its commands to perform basic management functions on one or more listeners. Additionally, you can view and change parameter settings.

The basic syntax of Listener Control utility commands is as follows:

```
lsnrctl command listener_name
```

In the preceding command, `listener_name` is the name of the listener to be administered. If no name is specified, then the default name, `LISTENER`, is assumed.

You can also issue Listener Control utility commands at the `LSNRCTL>` program prompt. To obtain the prompt, enter `lsnrctl` with no arguments at the operating system command line. When you run `lsnrctl`, the program is started. You can then enter the necessary commands from the program prompt. The basic syntax of issuing commands from `LSNRCTL>` program prompt is as follows:

```
lsnrctl
LSNRCTL> command listener_name
```
SET and SHOW Commands of the Listener Control utility

For most commands, the Listener Control utility establishes an Oracle Net connection with the listener that is used to transmit the command. To initiate an Oracle Net connection to the listener, the Listener Control utility must obtain the protocol addresses for the named listener or a listener named LISTENER. This is done by resolving the listener name with one of the following mechanisms:

- listener.ora file in the directory specified by the TNS_ADMIN environment variable
- listener.ora file in the ORACLE_HOME/network/admin directory
- Naming method, for example, a tnsnames.ora file

If none of the preceding mechanisms resolve the listener name, then the Listener Control utility uses the default listener name LISTENER, resolves the host name IP address, and uses port 1521.

The Listener Control utility supports the following types of commands:

- Operational commands, such as START, and STOP.
- Modifier commands, such as SET TRC_LEVEL.
- Informational commands, such as STATUS and SHOW LOG_FILE.

SET and SHOW Commands of the Listener Control utility

You can use the SET command to alter parameter values for a specified listener. You set the name of the listener to administer using the SET CURRENT_LISTENER command. Parameter values remain in effect until the listener is shut down. If you want these settings to persist, then use the SAVE_CONFIG command to save changes to the listener.ora.

You can use the SHOW command to display the current value of a configuration setting.

Distributed Operations

The Listener Control utility can perform operations on a local or a remote listener. The following procedure describes how to set up a computer to remotely administer a listener:

1. Ensure that the Listener Control utility (lsnrctl) executable is installed in the ORACLE_HOME/bin directory.
2. Ensure that the name of the listener to administer can be resolved through a listener.ora file or a naming method, as described in "Listener Control Utility Overview" on page 1-1.
All commands except START can be issued when a listener is administered remotely. The Listener Control utility can only start the listener on the same computer from where the utility is running.

When issuing commands, specify the listener name as an argument. For example:

```
LSNRCTL> SERVICES lsnr
```

If the name is omitted, then listener name set with the `SET CURRENT_LISTENER` command is used, or the default name, `LISTENER` is assumed.

**Oracle Net Listener Security**

Local listener administration is secure through local operating system authentication, which restricts listener administration to the user who started the listener or to the super user. By default, remote listener administration is disabled.

Oracle recommends that you perform listener administration in the default mode, and access the system remotely using a remote login. When you administer the listener remotely, use Oracle Enterprise Manager Cloud Control or Secure Shell (SSH) to access the remote host.

**Listener Control Utility Commands**

This section describes the following Listener Control utility commands:

- EXIT
- HELP
- QUIT
- RELOAD
- SAVE_CONFIG
- SERVICES
- SET
- SET CURRENT_LISTENER
- SET DISPLAYMODE
- SET INBOUND_CONNECT_TIMEOUT
- SET LOG_DIRECTORY
- SET LOG_FILE
- SET LOG_STATUS
- SET SAVE_CONFIG_ON_STOP
- SET TRC_DIRECTORY
- SET TRC_FILE
- SET TRC_LEVEL
- SHOW
- SPAWN
- START
- STATUS
Listener Control Utility Commands

- STOP
- TRACE
- VERSION

EXIT

Purpose
To exit from the Listener Control utility, and return to the operating system prompt.

Prerequisites
None

Syntax
From the Listener Control utility:
LSNRCTL> EXIT

Arguments
None

Usage Notes
This command is identical to the QUIT command.

Example
LSNRCTL> EXIT

HELP

Purpose
To provide a list of all the Listener Control utility commands or provide syntax help for a particular Listener Control utility command.

Prerequisites
None

Syntax
From the operating system:
lsnrctl HELP command

From the Listener Control utility:
LSNRCTL> HELP command

Arguments
command: The Listener Control utility command. Commands are shown in the following example output.

When you enter a command as an argument to HELP, the Listener Control utility displays information about how to use the command. When you enter HELP without an argument, the Listener Control utility displays a list of all the commands.
Example

LSNRCTL> HELP
The following operations are available
An asterisk (*) denotes a modifier or extended command:
  exit
  quit
  reload
  services
  set*
  show*
  spawn
  start
  status
  stop
  trace
  version

QUIT

Purpose
To exit from the Listener Control utility and return to the operating system prompt.

Prerequisites
None

Syntax
From the Listener Control utility:
LSNRCTL> QUIT

Arguments
None

Usage Notes
This command is identical to the EXIT command.

Example
LSNRCTL> QUIT

RELOAD

Purpose
To reread the listener.ora file. This command enables you to add or change statically configured services without actually stopping the listener.

In addition, the database services, instances, service handlers, and listening endpoints that were dynamically registered with the listener are unregistered and subsequently registered again.

Prerequisites
None
Syntax

From the operating system:
```
lsnrctl RELOAD listener_name
```

From the Listener Control utility:
```
LSNRCTL> RELOAD listener_name
```

Arguments

`listener_name`: The listener name, if the default name of LISTENER is not used.

Example

```
LSNRCTL> RELOAD
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521)))
The command completed successfully
```

**SAVE_CONFIG**

Purpose

To save the current configuration state of the listener, including trace level, trace file, trace directory, and logging to the `listener.ora` file. Any changes are stored in `listener.ora`, preserving formatting, comments, and case as much as possible. Before modification of the `listener.ora` file, a backup of the file, called `listener.bak`, is created.

Syntax

From the operating system:
```
lsnrctl SAVE_CONFIG listener_name
```

From the Listener Control utility:
```
LSNRCTL> SAVE_CONFIG listener_name
```

Arguments

`listener_name`: The listener name, if the default name of LISTENER is not used.

Usage Notes

This command enables you to save all runtime configuration changes to the `listener.ora` file.

Example

```
LSNRCTL> SAVE_CONFIG listener
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521)))
Saved LISTENER configuration parameters.
Listener Parameter File /oracle/network/admin/listener.ora
Old Parameter File /oracle/network/admin/listener.bak
The command completed successfully
```
SERVICES

Purpose
To obtain detailed information about the database services, instances, and service handlers (dispatchers and dedicated servers) to which the listener forwards client connection requests.

Prerequisites
None

Syntax
From the operating system:

```
lsnrctl SERVICES listener_name
```

From the Listener Control utility:

```
LSNRCTL> SERVICES listener_name
```

Arguments

`listener_name`: The listener name, if the default name of `LISTENER` is not used.

Usage Notes
The `SET DISPLAYMODE` command changes the format and the detail level of the output.

See Also: Oracle Database Net Services Administrator’s Guide for a complete description of `SERVICES` output

Example
This example shows `SERVICES` output in the default display mode. The output shows the following:

- An instance named `sales` belonging to two services, `sales1.us.example.com` and `sales2.us.example.com`, with a total of three service handlers.
- Service `sales1.us.example.com` is handled by one dispatcher only.
- Service `sales2.us.example.com` is handled by one dispatcher and one dedicated server, as specified by in the following output.

```
LSNRCTL> SERVICES
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=net)))
Services Summary...
Service 'sales1.us.example.com' has 1 instance(s).
  Instance 'sales', status READY, has 1 handler(s) for this service...
    Handler(s):
      'D000' established:0 refused:0 current:0 max:10000 state:ready
        DISPATCHER <machine: sales-server, pid: 5696>
          (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=53411))
Service 'sales2.us.example.com' has 1 instance(s).
  Instance 'sales', status READY, has 2 handler(s) for this service...
    Handler(s):
      'DEDICATED' established:0 refused:0 state:ready
        LOCAL SERVER
      'D001' established:0 refused:0 current:0 max:10000 state:ready
        DISPATCHER <machine: sales-server, pid: 5698>
          (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=52618))
```
The command completed successfully

SET

Purpose
To alter the parameter values for the listener. Parameter value changes remain in effect until the listener is shut down. To make the changes permanent, use the SAVE_CONFIG command to save changes to the listener.ora file.

Prerequisites
None

Syntax
From the operating system:
lsnrctl SET parameter

From the Listener Control utility:
LSNRCTL> SET parameter

Arguments
parameter: A SET parameter to modify its configuration setting. Parameters are shown in the example output.

When you enter SET without an argument, the Listener Control utility displays a list of all the parameters.

Usage Notes
If you are using the SET commands to alter the configuration of a listener other than the default LISTENER listener, then use the SET CURRENT_LISTENER command to set the name of the listener to administer.

Example
LSNRCTL> SET
The following operations are available with set.
An asterisk (*) denotes a modifier or extended command.
current_listener
displaymode
inbound_connect_timeout
log_file
log_directory
log_status
rawmode
save_config_on_stop
trc_file
trc_directory
trc_level

SET CURRENT_LISTENER

Purpose
To set the name of the listener to administer. Subsequent commands that would normally require listener_name can be issued without it.
Listener Control Utility Commands

Syntax

From the Listener Control utility:

`LSNRCTL> SET CURRENT_LISTENER listener_name`

Arguments

`listener_name`: The listener name, if the default name of LISTENER is not used.

Usage Notes

When `SET CURRENT_LISTENER` is set, the Listener Control utility commands act on the listener that was set. You do not have to specify the name of the listener.

Example

`LSNRCTL> SET CURRENT_LISTENER lsnr`

Current Listener is lsnr

SET DISPLAYMODE

Purpose

To change the format and level of detail for the SERVICES and STATUS commands.

Syntax

From the Listener Control utility:

`LSNRCTL> SET DISPLAYMODE {compat | normal | verbose | raw}`

Arguments

Specify one of the following modes:

- `compat`: Output that is compatible with earlier releases of the listener.
- `normal`: Output that is formatted and descriptive. Oracle recommends this mode.
- `verbose`: All data received from the listener in a formatted and descriptive output.
- `raw`: All data received from the listener without any formatting. This argument should be used only if recommended by Oracle Support Services.

Example

`LSNRCTL> SET DISPLAYMODE normal`

Service display mode is NORMAL

SET INBOUND_CONNECT_TIMEOUT

Purpose

To specify the time, in seconds, for the client to complete its connect request to the listener after establishing the network connection.

If the listener does not receive the client request in the time specified, then it terminates the connection. In addition, the listener logs the IP address of the client and an ORA-12525:TNS: listener has not received client's request in time allowed error message to the listener.log file.
Listener Control Utility Commands

**See Also:** Oracle Database Net Services Administrator’s Guide for additional information about specifying the time out for client connections

**Syntax**

From the Listener Control utility:

```
LSNRCTL> SET INBOUND_CONNECT_TIMEOUT time
```

**Arguments**

*time*: The time in seconds. Default setting is 60 seconds.

**Example**

```
LSNRCTL> SET INBOUND_CONNECT_TIMEOUT 2
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "inbound_connect_timeout" set to 2
The command completed successfully.
```

**SET LOG_DIRECTORY**

**Purpose**

To set destination directory where the listener log file is written. By default, the log file is written to the ORACLE_HOME/network/log directory.

**Prerequisites**

None

**Syntax**

From the operating system:

```
lsnrctl SET LOG_DIRECTORY directory
```

From the Listener Control utility:

```
LSNRCTL> SET LOG_DIRECTORY directory
```

**Arguments**

*directory*: The directory path of the listener log file.

**Example**

```
LSNRCTL> SET LOG_DIRECTORY /usr/oracle/admin
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "log_directory" set to /usr/oracle/admin
The command completed successfully
```
SET LOG_FILE

**Purpose**
To set the name for the listener log file. By default, the log file name is `listener.log`.

**Prerequisites**
None

**Syntax**
- From the operating system:
  ```
  lsnrctl SET LOG_FILE file_name
  ```
- From the Listener Control utility:
  ```
  LSNRCTL> SET LOG_FILE file_name
  ```

**Arguments**
- `file_name`: The file name of the listener log.

**Example**
```
LSNRCTL> SET LOG_FILE list.log
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter 'log_file' set to list.log
The command completed successfully
```

SET LOG_STATUS

**Purpose**
To turn listener logging on or off.

**Prerequisites**
None

**Syntax**
- From the operating system:
  ```
  lsnrctl SET LOG_STATUS {on | off}
  ```
- From the Listener Control utility:
  ```
  LSNRCTL> SET LOG_STATUS {on | off}
  ```

**Arguments**
- `on`: To turn logging on.
- `off`: To turn logging off.
Example

LSNRCTL> SET LOG_STATUS on
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter 'log_status' set to ON
The command completed successfully

SET SAVE_CONFIG_ON_STOP

Purpose
To specify whether changes made to the parameter values for the listener by the SET commands are to be saved to the listener.ora file at the time the listener is stopped with the STOP command.

When changes are saved, the Listener Control utility tries to preserve formatting, comments, and letter case. Before modification of the listener.ora file, a backup of the file, called listener.bak, is created.

To have all parameters saved immediately, use the SAVE_CONFIG command.

Syntax
From the operating system:
lsnrctl SET SAVE_CONFIG_ON_STOP {on | off}

From the Listener Control utility:
LSNRCTL> SET SAVE_CONFIG_ON_STOP {on | off}

Arguments

on: To save configuration to listener.ora.
off: To not save configuration to listener.ora.

Example

LSNRCTL> SET SAVE_CONFIG_ON_STOP on
LISTENER parameter 'save_config_on_stop' set to ON
The command completed successfully

SET TRC_DIRECTORY

Note: This command works only if Automatic Diagnostic Repository (ADR) is not enabled. The default is for ADR to be enabled, and use the log directory ORACLE_HOME/log/diag/product_type.

Purpose
To set the destination directory where the listener trace files are written. By default, the trace file are written to the ORACLE_HOME/network/trace directory.

Prerequisites
None

Syntax
From the operating system:
lsnrctl SET TRC_DIRECTORY directory

From the Listener Control utility:
LSNRCTL> SET TRC_DIRECTORY directory

**Arguments**

directory: The directory path of the listener trace files.

**Example**
LSNRCTL> SET TRC_DIRECTORY /usr/oracle/admin
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "trc_directory" set to /usr/oracle/admin
The command completed successfully

---

**SET TRC_FILE**

**Note:** This command works only if Automatic Diagnostic Repository (ADR) is not enabled. The default is for ADR to be enabled, and use the log directory ORACLE_HOME/log/diag/product_type.

**Purpose**
To set the name of the listener trace file. By default, the trace file name is listener.trc.

**Prerequisites**
None

**Syntax**
From the operating system:
lsnrctl SET TRC_FILE file_name

From the Listener Control utility:
LSNRCTL> SET TRC_FILE file_name

**Arguments**
file_name: The file name of the listener trace.

**Example**
LSNRCTL> SET TRC_FILE list.trc
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "trc_file" set to list.trc
The command completed successfully

---

**SET TRC_LEVEL**

**Purpose**
To set a specific level of tracing for the listener.
Prerequisites

None

Syntax

From the operating system:

```bash
lsnrctl SET TRC_LEVEL level
```

From the Listener Control utility:

```bash
LSNRCTL> SET TRC_LEVEL level
```

Arguments

`level`: One of the following trace levels:

- `off` for no trace output
- `user` for user trace information
- `admin` for administration trace information
- `support` for Oracle Support Services trace information

Usage Notes

This command has the same functionality as the `TRACE` command.

Example

```bash
LSNRCTL> SET TRC_LEVEL admin
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
LISTENER parameter "trc_level" set to admin
The command completed successfully
```

SHOW

Purpose

To view the current parameter values for the listener.

All the `SET` parameters have equivalent `SHOW` parameters.

Prerequisites

None

Syntax

From the operating system:

```bash
lsnrctl SHOW parameter
```

From the Listener Control utility:

```bash
LSNRCTL> SHOW parameter
```

Arguments

`parameter`: A `SHOW` parameter to view its configuration settings. Parameters are shown in the example output.

When you enter `SHOW` without an argument, the Listener Control utility displays a list of all the parameters.
### Example

```plaintext
LSNRCTL> SHOW
The following properties are available with SHOW:
An asterisk (*) denotes a modifier or extended command:
current_listener
displaymode
inbound_connect_timeout
log_file
log_directory
log_status
rawmode
save_config_on_stop
trc_file
trc_directory
trc_level
```

### SPAWN

**Purpose**

To start a program stored on the computer on which the listener is running, and which is listed with an alias in the `listener.ora` file.

**Prerequisites**

None

**Syntax**

From the operating system:

```plaintext
lsnrctl SPAWN listener_name alias (arguments='arg1,arg2,...')
```

From the Listener Control utility:

```plaintext
LSNRCTL> SPAWN listener_name alias (arguments='arg1,arg2,...')
```

**Arguments**

- `listener_name`: The listener name, if the default name of `LISTENER` is not used.
- `alias`: The alias of the program to be spawned off is specified by a `listener.ora` file entry, similar to the following:

```plaintext
alias = (PROGRAM=(NAME=)(ARGS=)(ENVS=))
```

For example:

```plaintext
nstest = (PROGRAM=(NAME=nstest)(ARGS=test1)(ENVS='ORACLE_HOME=/usr/oracle'))
```

**Example**

The `nstest` program, shown in the preceding section, can then be spawned off using the following command:

```plaintext
lsnrctl SPAWN listener_name nstest
```

### START

**Purpose**

To start the named listener.
Prerequisites

Listener must not be running.

Syntax

From the operating system:

```bash
csrct1 START listener_name
```

From the Listener Control utility:

```
LSNRCTL> START listener_name
```

Arguments

`listener_name`: The listener name, if the default name of `LISTENER` is not used.

Usage Notes

To start a listener configured in the `listener.ora` file with a name other than `LISTENER`, include that name.

For example, if the listener name is `tcp_lsnr`, enter:

```bash
csrct1 START tcp_lsnr
```

From the Listener Control utility:

```
LSNRCTL> START tcp_lsnr
```

Example

```
LSNRCTL> START
```

Starting /private/sales_group/sales/bin/tnslsnr: please wait...

TNSLSNR for Linux: Version 12.1.0.1.0
System parameter file is /oracle/network/admin/listener.ora
Log messages written to /oracle/network/log/listener.log
Listening on: (DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)))

Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521)))

STATUS of the LISTENER
------------------------
Alias                     LISTENER
Version                   TNSLSNR for Linux: Version 12.1.0.1.0
Start Date                12-DEC-2012 18:02:25
Uptime                    0 days 0 hr. 0 min. 0 sec
Trace Level               off
Security                   OFF
SNMP                       OFF
Listener Parameter File   /oracle/network/admin/listener.ora
Listener Log File         /oracle/network/log/listener.log
Listening Endpoints Summary...
  (DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)))
The listener supports no services
The command completed successfully

**See Also:** *Oracle Database Platform Guide for Microsoft Windows* for information about the Oracle Home User

## STATUS

### Purpose

To display basic status information about a listener, including a summary of listener configuration settings, listening protocol addresses, and a summary of services registered with the listener.

**Note:** You can also obtain the status of the listener through the Oracle Enterprise Manager Cloud Control console.

### Prerequisites

None

### Syntax

From the operating system:

```
lsnrctl STATUS listener_name
```

From the Listener Control utility:

```
LSNRCTL> STATUS listener_name
```

### Arguments

`listener_name`: The listener name, if the default name of LISTENER is not used.

### Usage Notes

The `SET DISPLAYMODE` command changes the format and level of the detail of the output.

**See Also:** *Oracle Database Net Services Administrator’s Guide* for a complete description of `STATUS` output

### Example

The following example shows `STATUS` output in the default display mode. The output contains:

- Listener configuration settings
- Listening endpoints summary
- Services summary, which is an abbreviated version of the `SERVICES` command output

```
LSNRCTL> STATUS
Connecting to (DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=net)))
STATUS of the LISTENER
------------------------
Alias                     LISTENER
Version                   TNSLSNR for Linux: Version 12.1.0.1.0 -
Production               -
Start Date                12-DEC-2012 12:02:00
```
Listener Control Utility Commands

Uptime: 0 days 0 hr. 5 min. 29 sec
Trace Level: support
Security: OFF
SNMP: OFF
Listener Parameter File: /oracle/network/admin/listener.ora
Listener Log File: /oracle/network/log/listener.log
Listener Trace File: /oracle/network/trace/listener.trc

Listening Endpoints Summary...
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=net)))
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)))
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcps)(HOST=sales-server)(PORT=2484)))

Services Summary...
Service "sales1.us.example.com" has 1 instance(s).
Instance "sales", status READY, has 1 handler(s) for this service...
Service "sales2.us.example.com" has 1 instance(s).
Instance "sales", status READY, has 2 handler(s) for this service...
The command completed successfully

STOP

Purpose
To stop the named listener.

Prerequisites
The listener must be running.

Syntax
From the operating system:
lsnrctl STOP listener_name

From the Listener Control utility:
LSNRCTL> STOP listener_name

Arguments
listener_name: The listener name, if the default name of LISTENER is not used.

Example
LSNRCTL> STOP
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
The command completed successfully

TRACE

Purpose
To set tracing for the listener.

Syntax
From the operating system:
lsnrctl trace level listener_name
From the Listener Control utility:
LSNRCTL> trace level listener_name

Arguments

level: One of the following trace levels:
- off for no trace output
- user for user trace information
- admin for administration trace information
- support for Oracle Support Services trace information

listener_name: Specify the listener name, if the default name of LISTENER is not used.

Usage Notes

This command has the same functionality as the SET TRC_LEVEL command.

Example

LSNRCTL> TRACE ADMIN lsnr
Connecting to (ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
Opened trace file: /oracle/network/trace/listener.trc
The command completed successfully

VERSION

Purpose

To display the current version of Listener Control utility.

Prerequisites

None

Syntax

From the operating system:
lsnrctl VERSION listener_name

From the Listener Control utility:
LSNRCTL> VERSION listener_name

Arguments

listener_name: The listener name, if the default name of LISTENER is not used.

Example

LSNRCTL> VERSION listener1
Connecting to ADDRESS=(PROTOCOL=TCP)(HOST=sales-server)(PORT=1521))
TNSLSNR for Linux: Version 12.1.0.1.0
TNS for Linux: Version 12.1.0.1.0
Oracle Bequest NT Protocol Adapter for Linux: Version 12.1.0.1.0
Unix Domain Socket IPC NT Protocol Adaptor for Linux: Version 12.1.0.1.0
TCP/IP NT Protocol Adapter for Linux: Version 12.1.0.1.0
The command completed successfully
Oracle Connection Manager Control Utility

This chapter describes the commands and syntax of the Oracle Connection Manager Control utility.

This chapter contains the following topics:

- Oracle Connection Manager Control Utility Overview
- Command Modes and Syntax
- Oracle Connection Manager Control Utility Commands

Oracle Connection Manager Control Utility Overview

The Oracle Connection Manager Control utility enables you to administer Oracle Connection Managers. You can use its commands to perform basic management functions on one or more Oracle Connection Managers. Additionally, you can view and change parameter settings.

Command Modes and Syntax

The basic syntax of the Oracle Connection Manager Control utility is as follows:

```
cmctl command [argument]
```

The Oracle Connection Manager Control utility supports the following types of commands:

- Initialization and termination commands such as STARTUP and SHUTDOWN
- Alter commands such as SET LOG_LEVEL and SET EVENT
- Display commands, such as SHOW STATUS and SHOW RULES
- Gateway commands such as SHOW GATEWAYS and RESUME GATEWAYS

---

**Note:** You can use SET commands to dynamically alter configuration parameters. The changes only remain in effect until Oracle Connection Manager is shut down. You cannot save them to the `cman.ora` file. The one exception is the Oracle Connection Manager password, which you can save using the command `SAVE_PASSWD`.

---

You can use the Oracle Connection Manager Control utility in command mode, or batch mode.

- Using command mode:
- From the Oracle Connection Manager Control utility:
  Enter cmctl at the command line to obtain the program prompt, and then issue the command:
  
  cmctl
  CMCTL> command

- From the operating system:
  Enter the entire command from the operating system command prompt:
  
  cmctl [command] [argument1 . . . argumentN] [-c instance_name]

Each command issued this way can have an Oracle Connection Manager instance name appended as an argument. If an Oracle Connection Manager instance name is not provided, then the default instance name is assumed. The default name is cman_hostname. You may be prompted for a password if one was set in a previous CMCTL session. Issuing commands from an Oracle Connection Manager Control utility session of Oracle Connection Manager requires that a password be entered once, at the beginning of the session, if one has been set.

**Caution:** There is an option to specify the password on the command line. However, doing so exposes the password on the screen, and is a potential security risk. Oracle recommends not using the password option (-p) on the command line.

- Using batch mode:
  You can combine commands in a standard text file, and then run them as a sequence of commands. To run in batch mode, use the following syntax:
  
  cmctl @input_file

**See Also:** *Oracle Database Net Services Administrator’s Guide* for an overview of the Oracle Connection Manager processes

---

**Oracle Connection Manager Control Utility Commands**

This section lists and describes the following commands for the Oracle Connection Manager Control utility:

- ADMINISTER
- CLOSE CONNECTIONS
- EXIT
- HELP
- QUIT
- RELOAD
- RESUME GATEWAYS
- SAVE_PASSWD
- SET
- SET ASO_AUTHENTICATION_FILTER
ADMINISTER

Purpose
To select an Oracle Connection Manager instance.

Prerequisites
None

Syntax
From the Oracle Connection Manager Control utility:

CMCTL> ADMINISTER [-c] instance_name

Arguments
instance_name: The instance name of Oracle Connection Manager that you would like to administer. Instances are defined in the cman.ora file.
Usage Notes

You can issue the ADMINISTER command only within the utility. You cannot issue the command from the operating system.

ADMINISTER enables you to choose which Oracle Connection Manager instance to administer. To start the Oracle Connection Manager instance, you must issue the STARTUP command.

When you omit the instance name from the command, the instance administered defaults to the local instance.

Use the -c option when to administer an instance that is not the local instance.

A password is required only if one was provided at installation time or during a previous session of the Oracle Connection Manager.

Example

CMCTL> ADMINISTER cman_indl040ad
Enter CMAN password: password
Current instance cman_indl040ad is already started
Connections refer to (address=(protocol=TCP)(host=indl040ad)(port=1560)).
The command completed successfully

CLOSE CONNECTIONS

Purpose

To terminate connections, using specific qualifiers to select connections.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

```
cmctl CLOSE CONNECTIONS [in state] [gt time] [from source] [to destination]
[for service] [using gateway_process_id] [connect_identifier_list]
[-c cman_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> CLOSE CONNECTIONS [in state] [gt time] [from source] [to destination]
[for service] [using gateway_process_id] [connect_identifier_list]
```

Arguments

state: One of the following values to specify the connection state:

- idle: Connections that are inactive in the established state.
- connecting: Connections that are in the process of connecting.
- established: Connections that are connected and are transferring data.
- terminating: Connections that are disconnecting.

If no state is specified, then CLOSE CONNECTIONS defaults to all possible states. If the time qualifier is included under these conditions, then the time specified is the amount of time that has elapsed since a client initiated a connection.

time: The time format. Use the following format to specify connections greater than the time indicated:
gt[hh:mm:ss]

source: The source address. Use one of the following formats to specify the source address:
- from IP
- from hostname
- from subnet

destination: The destination address. Use one of the following formats to specify the destination address:
- to IP
- to hostname
- to subnet

service: The service name. Use the service_name parameter to specify the service, such as sales.us.example.com.

gateway_process_id: The gateway process identifier is a number. Use this number to specify connections that are proxied by the gateway process indicated. To determine the gateway process identifier, use the Oracle Connection Manager control utility show gateways command.

connect_identifier_list: The connection identifiers. Use a space between multiple connection identifiers in a list.

Usage Notes

Because the CLOSE CONNECTIONS command terminates connections, it might generate error messages on both client and server sides.

The IDLE state qualifier always requires a time qualifier.

Issuing CLOSE CONNECTIONS without an argument closes all connections.

Examples

The following example shuts down connections in any state. The elapsed time of the connection must be greater than 1 hour and 30 minutes. The connection source is the specified subnet, and the destination is the specified host name.

CMCTL> CLOSE CONNECTIONS gt 1:30:00 from 192.0.2.32/24 to host1

The following example shuts down those connections proxied by gateway process 0 that have been in the idle state more than 30 minutes:

CMCTL> CLOSE idle CONNECTIONS gt 30:00 using 0

The following example shuts down connections that are connected to the service sales.us.example.com:

CMCTL> CLOSE established CONNECTIONS for sales.us.example.com

EXIT

Purpose

To exit from the Oracle Connection Manager Control utility.
**Prerequisites**
None

**Syntax**
From the operating system:
```
cmctl EXIT [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```
CMCTL> EXIT
```

**Usage Notes**
This command is identical to the **QUIT** command.

**Example**
```
CMCTL> EXIT
```

**HELP**

**Purpose**
To provide a list of all commands for the Oracle Connection Manager Control utility or to provide help with the syntax of a particular command.

**Prerequisites**
None

**Syntax**
From the operating system:
```
cmctl HELP [command] [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```
CMCTL> HELP [command]
```

**Arguments**

*command*: Specify a **HELP** command. Commands are shown in the following sample output.

When you enter a command as an argument to **HELP**, the Oracle Connection Manager Control utility displays information about how to use the command. When you enter **HELP** without an argument, the Oracle Connection Manager Control utility displays a list of all the commands.

**Example**
```
CMCTL> HELP
The following operations are available
An asterisk (*) denotes a modifier or extended command:

administer   close*   exit   reload
resume*      save_passwd set*  show*
shutdown     sleep     startup suspend*
show_version  quit
```
QUIT

Purpose
To exit the Oracle Connection Manager Control utility and return to the operating system prompt.

Prerequisites
None

Syntax
From the operating system:
   cmctl QUIT

From the Oracle Connection Manager Control utility:
   CMCTL> QUIT

Usage Notes
This command is identical to the EXIT command.

Example
   CMCTL> QUIT

RELOAD

Purpose
To dynamically reread parameters and rules.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
   cmctl RELOAD [-c instance_name]

From the Oracle Connection Manager Control utility:
   CMCTL> RELOAD

Usage Notes
Configuration information modified using the RELOAD command applies only to new connections. Existing connections are unaffected. The SET RELOAD command restores configurations set in cman.ora, and override the SET command.

RELOAD reregisters gateways with the Oracle Connection Manager listener during which some new connections might be refused until the registration process is complete.

Example
   CMCTL> RELOAD
   The command completed successfully
RESUME GATEWAYS

Purpose
To resume gateway processes that have been suspended.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
```
cmctl RESUME_GATEWAYS [gateway_process_id] [cman_name]
```
From the Oracle Connection Manager Control utility:
```
CMCTL> RESUME_GATEWAYS [gateway_process_id]
```

Arguments
```
gateway_process_id: One or more gateway processes to reopen. Separate multiple gateway processes using a space between the process identifiers.
```

Usage Notes
Issuing `RESUME_GATEWAYS` without an argument reopens all gateway processes that have been closed.

Example
```
CMCTL> RESUME_GATEWAYS 1
The command completed successfully
```

SAVE_PASSWD

Purpose
To save the current password to the `cman.ora` file, the configuration file for Oracle Connection Manager.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
```
cmctl SAVE_PASSWD [-c instance_name]
```
From the Oracle Connection Manager Control utility:
```
CMCTL> SAVE_PASSWD
```

Usage Notes
If you run this command, then the next session of Oracle Connection Manager uses the password. The password is stored in an encrypted format in the `cman.ora` file.

Example
```
CMCTL> SAVE_PASSWD
```
SET

Purpose
To display a list of parameters that can be modified using this command.

Prerequisites
None

Syntax
From the operating system:
```bash
cmctl SET
```
From the Oracle Connection Manager Control utility:
```bash
CMCTL> SET
```

Example
```bash
CMCTL> SET
The following operations are available after set
An asterisk (*) denotes a modifier or extended command:

aso_authentication_filter     outbound_connect_timeout
connection_statistics         password
event                         session_timeout
idle_timeout                  trace_directory
inbound_connect_timeout        trace_level
log_directory
log_level
```

SET ASO_AUTHENTICATION_FILTER

Purpose
To indicate whether the client must use Oracle Database security to authenticate.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
```bash
cmctl SET ASO_AUTHENTICATION_FILTER {on | off}[-c instance_name]
```
From the Oracle Connection Manager Control utility:
```bash
CMCTL> SET ASO_AUTHENTICATION_FILTER {on | off}
```

Arguments
on: To reject connections that are not using Secure Network Service (SNS) to perform client authentication. SNS is part of Oracle Database security.

off: To specify whether no authentication is required for client connections. This is the default.
SET CONNECTION_STATISTICS

Purpose
To specify whether gateway processes collect connection statistics.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
cmctl SET CONNECTION_STATISTICS {yes | no}[-c instance_name]

From the Oracle Connection Manager Control utility:
CMCTL> SET CONNECTION_STATISTICS {yes | no}

Arguments
yes: To have gateway processes collect connection statistics.
no: To not have gateway processes collect connection statistics. This is the default.

Usage Notes
If SET CONNECTION_STATISTICS is set to yes, then you can obtain statistics by issuing the SHOW CONNECTIONS command.

Example
CMCTL> set connection_statistics ON
CMAN_user.us.example.com parameter connection_statistics set to ON
The command completed successfully

SET EVENT

Purpose
To log information for a particular event.

Syntax
From the operating system:
cmctl SET EVENT event_group [-c instance_name]

From the Oracle Connection Manager Control utility:
CMCTL> SET EVENT event_group {on | off}

Arguments
event_group: Specify one of the following event groups:
- init_and_term: Initialization and termination event group.
Oracle Connection Manager Control Utility Commands

- memory_ops: Memory operations event group.
- conn_hdlg: Connection handling event group.
- proc_mgmt: Process management event group.
- reg_and_load: Registration and load update event group.
- wake_up: Events related to Connection Manager Administration (CMADMIN) wakeup queue event group.
- timer: Gateway timeouts event group.
- cmd_proc: Command processing event group.
- relay: Events associated with connection control blocks event group.

Usage Notes

The SET EVENT command accepts only one argument. To log multiple events, you must issue the command for each event separately.

Example

CMCTL> set event memory_ops off
   cman11 event memory_ops set to OFF.
The command completed successfully

SET IDLE_TIMEOUT

Purpose
To specify the amount of time a client can be idle without transmitting data.

Prerequisites
Oracle Connection Manager must be running.

Syntax

From the operating system:

cmctl SET IDLE_TIMEOUT [time] [-c instance_name]

From the Oracle Connection Manager Control utility:

CMCTL> SET IDLE_TIMEOUT [time]

Arguments

time: Specify the idle timeout in seconds. The default is 0 (zero), which disables this feature.

Example

CMCTL> SET IDLE_TIMEOUT 30
   CMAN_user.us.example.com parameter idle_timeout set to 30
   The command completed successfully
**SET INBOUND_CONNECT_TIMEOUT**

**Purpose**
To specify the maximum amount of time the Oracle Connection Manager listener waits for a valid connection request from the client before timing out.

**Prerequisites**
Oracle Connection Manager must be running.

**Syntax**
- From the operating system:
  ```
  cmctl SET INBOUND_CONNECT_TIMEOUT [time] [-c instance_name]
  ```
- From the Oracle Connection Manager Control utility:
  ```
  CMCTL> SET INBOUND_CONNECT_TIMEOUT [time]
  ```

**Arguments**
- **time**: The inbound connect timeout in seconds. The default is 0 (zero), which disables this feature.

**Example**
```
CMCTL> SET INBOUND_CONNECT_TIMEOUT 30
CMAN_user.us.example.com parameter inbound_connect_timeout set to 30
The command completed successfully
```

**SET LOG_DIRECTORY**

**Note:** This command works only if Automatic Diagnostic Repository (ADR) is not enabled. The default is for ADR to be enabled, and use the log directory `ORACLE_HOME/log`.

**Purpose**
To designate where the log files for Oracle Connection Manager are written.

**Prerequisites**
Oracle Connection Manager must be running.

**Syntax**
- From the operating system:
  ```
  cmctl SET LOG_DIRECTORY [directory_path] [-c instance_name]
  ```
- From the Oracle Connection Manager Control utility:
  ```
  CMCTL> SET LOG_DIRECTORY [directory_path]
  ```

**Arguments**
- **directory_path**: The location of the log directory. The default path is as follows:
  - **Linux and UNIX**:
    ```
    ORACLE_HOME/network/log directory
    ```
- **Microsoft Windows:**
  
  ORACLE_HOME\network\log directory

**Usage Notes**

Use the **SHOW PARAMETERS** command to determine the location of the log files.

**Example**

CMCTL>
SET LOG_DIRECTORY /disk1/user_cman_test/oracle/network/admin

CMAN_user.us.example.com parameter log_directory set to /disk1/user_cman_test/oracle/network/admin

The command completed successfully

**SET LOG_LEVEL**

**Purpose**

To set the log level for Oracle Connection Manager.

**Prerequisites**

Oracle Connection Manager must be running.

**Syntax**

From the operating system:

```
cmctl SET LOG_LEVEL [level] [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> SET LOG_LEVEL [level]
```

**Arguments**

`level`: Specify one of the following log levels:

- `off`: No logging.
- `user`: User log information.
- `admin`: Administrative log information.
- `support`: Oracle Support Services log information. This is the default.

**Usage Notes**

Specify `off` to capture the minimum amount of log information. Specify `support` to capture the maximum amount.

**Example**

CMCTL> SET LOG_LEVEL SUPPORT

CMAN_user.us.example.com parameter log_level set to SUPPORT

The command completed successfully
SET OUTBOUND_CONNECT_TIMEOUT

Purpose
To specify the maximum amount of time the Oracle Connection Manager instance waits for a valid connection with the server before timing out.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
    cmctl SET OUTBOUND_CONNECT_TIMEOUT [time] [-c instance_name]

From the Oracle Connection Manager Control utility:
    CMCTL> SET OUTBOUND_CONNECT_TIMEOUT [time]

Arguments
    time: The outbound connect timeout in seconds. The default is 0.

Example
    CMCTL> SET OUTBOUND_CONNECT_TIMEOUT 30
    CMAN_user.us.example.com parameter outbound_connect_timeout set to 30
    The command completed successfully

SET PASSWORD

Purpose
To assign a password to the Oracle Connection Manager instance.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
    cmct1 SET PASSWORD

From the Oracle Connection Manager Control utility:
    CMCTL> SET PASSWORD

Arguments
    None.

Usage Notes
This command may be used either to set a password for the first time or to change an existing one.

This command does not save the password to cman.ora. As a result the password is valid only for the current session. To save the password after you have set it, run the SAVE_PASSWD command.
Example

CMCTL> SET PASSWORD

Enter Old password: old_password
Enter New password: new_password
Reenter New password: new_password

The command completed successfully

SET SESSION_TIMEOUT

Purpose

To specify the maximum amount of time for a session of Oracle Connection Manager.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

```
cmctl SET SESSION_TIMEOUT [time] [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> SET SESSION_TIMEOUT [time]
```

Arguments

`time`: The session timeout in seconds. The default is 0 (zero), which disables this feature.

Example

```
CMCTL> SET SESSION_TIMEOUT 60
CMAN_user.us.example.com parameter session_timeout set to 60
The command completed successfully
```

SET TRACE_DIRECTORY

```
Note: This command works only if Automatic Diagnostic Repository (ADR) is not enabled. The default is for ADR to be enabled.
```

Purpose

To designate where the trace files for an Oracle Connection Manager instance are written.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

```
cmctl SET TRACE_DIRECTORY [directory_path] [-c instance_name]
```

From the Oracle Connection Manager Control utility:
CMCTL> SET TRACEDIRECTORY [directory_path]

Arguments

directory_path: The location of the trace directory. The default path is ORACLE_HOME/network/trace.

Usage Notes

Use the SHOW PARAMETERS command to determine the location of the trace files.

Example

CMCTL> SET TRACEDIRECTORY /disk1/mpurayat_newtest/oracle/network/trace
CMAN1 parameter trace_directory set to /disk1/mpurayat_newtest/oracle/network/trace
The command completed successfully

SET TRACE_LEVEL

Purpose

To set the trace level for an Oracle Connection Manager instance.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

cmctl SET TRACE_LEVEL [level] [-c instance_name]

From the Oracle Connection Manager Control utility:

CMCTL> SET TRACE_LEVEL [level]

Arguments

level: Specify one of the following log levels:

- off: No tracing. This is the default.
- user: User trace information.
- admin: Administrative trace information.
- support: Oracle Support Services trace information.

Usage Notes

Specify off to capture the minimum amount of trace information. Specify support to capture the maximum amount.

Use the SHOW PARAMETERS command to determine the current trace level.

Example

CMCTL> SET TRACE_LEVEL USER
CMAN_user.us.example.com parameter trace_level set to USER
The command completed successfully
SHOW

Purpose
To display a list of parameters that may be used as arguments for this command. Entering one of these parameters with the command displays the parameter value or values.

Prerequisites
None

Syntax
From the operating system:
```
cmctl SHOW [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```
CMCTL> SHOW
```

Example
```
CMCTL> SHOW
The following operations are available after show
An asterisk (*) denotes a modifier or extended command:

<table>
<thead>
<tr>
<th>all</th>
<th>gateways</th>
<th>status</th>
</tr>
</thead>
<tbody>
<tr>
<td>connections</td>
<td>parameters</td>
<td>version</td>
</tr>
<tr>
<td>defaults</td>
<td>rules</td>
<td></td>
</tr>
<tr>
<td>events</td>
<td>services</td>
<td></td>
</tr>
</tbody>
</table>
```

SHOW ALL

Purpose
To combine and display output from the SHOW PARAMETERS and SHOW RULES commands.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
```
cmctl SHOW ALL [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```
CMCTL> SHOW ALL
```

Example
```
CMCTL> SHOW ALL
listener_address          | (address=(protocol=tcp)(host=users.us.example.com)(port=1630))
aso_authentication_filter | OFF
connection_statistics     | OFF
event_group                | OFF
log_directory              | /disk1/user_cman_test/oracle/network/log/
```
SHOW CONNECTIONS

Purpose

To display information about specific connections or all connections.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

```
cmctl SHOW CONNECTIONS [information] [in state] [gt time] [from source]
[to destination] [for service] [using gateway_process_id]
[connect_identifier_list] [-c instance_name]
```

From the Oracle Connection Manager Control utility:

```
CMCTL> SHOW CONNECTIONS [information][in state] [gt time] [from source]
[to destination] [for service] [using gateway_process_id]
[connect_identifier_list]
```

Arguments

- **information**: Specify one of the following values to display information about connections. Information categories include connection identifier, source, destination, service, current state, total idle time, and total elapsed time.
  - **count**: The total number of connections that meet the criteria specified by the other qualifiers. This is the default.
  - **detail**: All information about connections specified by the other qualifiers.
- **state**: Specify one of the following values to specify the connection state:
  - **idle**: Connections that are inactive in the established state.
Oracle Connection Manager Control Utility Commands

- **connecting**: Connections that are in the process of connecting.
- **established**: Connections that are connected and are transferring data.
- **terminating**: Connections that are disconnecting.

If no state is specified, then `SHOW CONNECTIONS` defaults to all possible states. If the time qualifier is included under these conditions, then the time specified is the amount of time that has elapsed since a client initiated a connection.

**time**: Use the following format to specify connections greater than the time indicated:

```
gt[hh:mm:]ss
```

**source**: Specify one of the following formats to specify the source address:

- **from IP**
- **from hostname**
- **from subnet**

**destination**: Specify one of the following formats to specify the destination address:

- **to IP**
- **to hostname**
- **to subnet**

**service**: Use the `service_name` format to request a service:

**gateway_process_id**: Use the following format to specify connections that are proxied by the gateway process indicated:

```
using gateway_process_id
```

**connect_identifier_list**: Separate multiple connection identifiers using a space.

### Usage Notes

Connections are sorted by gateway process identifier and connection identifier, in ascending order.

Issuing `SHOW CONNECTIONS` without an argument displays all connections.

### Examples

The following command displays a detailed description of connections in any state. The elapsed time of the connection must be greater than 1 hour and 30 minutes. The connection source is the specified subnet, and the destination the specified host name.

```
CMCTL> SHOW CONNECTIONS gt 1:30:00 from 192.0.2.32/24 to host1
```

The following command displays the number of connections proxied by Oracle Connection Manager using the gateway process identifier 0 that have been in the idle state more than 30 minutes:

```
CMCTL> SHOW idle CONNECTIONS count gt 30:00 using 0
```

The following command displays a detailed description of connections that are connected to the service `sales.us.example.com`:

```
CMCTL> SHOW established CONNECTIONS detail for sales.us.example.com
```
SHOW DEFAULTS

Purpose
To display default parameter settings.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:

cmctl SHOW DEFAULTS [-c instance_name]

From the Oracle Connection Manager Control utility:

CMCTL> SHOW DEFAULTS

Example

CMCTL> SHOW DEFAULTS
listener_address          | (address=(protocol=tcp)(host=users.us.example.com)(port=1521))
aso_authentication_filter | OFF
connection_statistics     | OFF
event_group               | OFF
log_directory             | /disk1/user_cman_test/oracle/network/log/
log_level                 | SUPPORT
max_connections           | 256
idle_timeout              | 0
inbound_connect_timeout   | 0
session_timeout           | 0
outbound_connect_timeout  | 0
max_gateway_processes     | 16
min_gateway_processes     | 2
max_cmctl_sessions        | 4
password                  | OFF
trace_directory           | /disk1/user_cman_test/oracle/network/trace/
trace_level               | OFF
trace_timestamp           | OFF
trace_filelen             | 0
trace_fileno              | 0

The command completed successfully

SHOW EVENTS

Purpose
To display the events that are in operation.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:

cmctl SHOW EVENTS [-c instance_name]

From the Oracle Connection Manager Control utility:
CMCTL> SHOW EVENTS

Example

CMCTL> SHOW EVENTS
Event Groups:
  memory_ops
The command completed successfully

SHOW GATEWAYS

Purpose

To display the current status of a specific gateway process or processes. Statistics
displayed include number of active connections, number of peak active connections,
total number of connections handled, and number of connections refused.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

cmctl SHOW GATEWAYS [gateway] [-c instance_name]

From the Oracle Connection Manager Control utility:

CMCTL> SHOW GATEWAYS [gateway]

Arguments

gateway: The identifier of the gateway or gateways whose status to display.

Issuing SHOW GATEWAYS without an argument displays the status of all gateway
processes.

Usage Notes

To display multiple gateways, use a space to separate the identifiers when entering the
command.

Example

CMCTL> SHOW GATEWAYS 1
Gateway ID                     1
Gateway state                  READY
Number of active connections   0
Peak active connections        0
Total connections              0
Total connections refused      0
The command completed successfully

SHOW PARAMETERS

Purpose

To display current parameter settings for an instance.

Prerequisites

Oracle Connection Manager must be running.
Syntax

From the operating system:

    cmctl SHOW PARAMETERS [-c instance_name]

From the Oracle Connection Manager Control utility:

    CMCTL> SHOW PARAMETERS

Usage Notes

Several configuration parameters can be dynamically modified using the SET command. Therefore, the information that SHOW PARAMETERS displays might be different from what appears in the cman.ora file.

Example

    CMCTL> SHOW PARAMETERS
    listener_address          | (address=(protocol=tcp)(host=users.us.example.com)(port=1630))
    aso_authentication_filter | ON
    connection_statistics     | ON
    event_group               | {memory_ops}
    log_directory             | /disk1/user_cman_test/oracle/network/log/
    log_level                 | SUPPORT
    max_connections           | 256
    idle_timeout              | 0
    inbound_connect_timeout   | 0
    session_timeout           | 0
    outbound_connect_timeout  | 0
    max_gateway_processes     | 16
    min_gateway_processes     | 2
    max_cmctl_sessions        | 4
    password                  | OFF
    trace_directory           | /disk1/user_cman_test/oracle/network/trace/
    trace_level               | SUPPORT
    trace_timestamp           | OFF
    trace_filelen             | 0
    trace_fileno              | 0

    The command completed successfully

SHOW RULES

Purpose

To display the access control list currently used by the instance.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

    cmctl SHOW RULES [-c instance_name]

From the Oracle Connection Manager Control utility:

    CMCTL> SHOW RULES
Usage Notes

You can update the rules list by issuing the RELOAD command.

Example

CMCTL> SHOW RULES
Number of filtering rules currently in effect: 5
{rule_list=
  {rule=
    {src=usunnae12}
    {dst=usunnae13}
    {srv=*}
    {act=accept}
    {action_list=(mit=120)(mct=1800)(conn_stats=on)(aut=off)}
  }
  {rule=
    {src=usunnae12}
    {dst=usunnae14}
    {srv=service2}
    {act=accept}
  }
  {rule=
    {src=*}
    {dst=usunnae15}
    {srv=*}
    {act=accept}
    {action_list=(mit=120)(mct=3000)(moct=200)(aut=on)}
  }
  {rule=
    {src=*}
    {dst=usunnae16}
    {srv=*}
    {act=reject}
    {action_list=(moct=20)(aut=on)}
  }
  {rule=
    {src=users.us.example.com}
    {dst=users.us.example.com}
    {srv=cmom}
    {act=accept}
    {action_list=(mit=100)(mct=1130)(moct=200)(aut=on)}
  }

SHOW SERVICES

Purpose

To display comprehensive information about the Oracle Connection Manager instance. The information displayed includes number of handlers for gateway and CMADMIN processes, listening ports of handlers, and number of connections, both refused and current.

Prerequisites

Oracle Connection Manager must be running.
Syntax

From the operating system:

    cmctl SHOW SERVICES [-c instance_name]

From the Oracle Connection Manager Control utility:

    CMCTL> SHOW SERVICES

Example

    CMCTL> SHOW SERVICES
    Services Summary...
    Proxy service "cmgw" has 1 instance(s).
    Instance "cman", status READY, has 2 handler(s) for this service...
    Handler(s):
    "cmgw001" established:0 refused:0 current:0 max:256 state:ready
    <machine: user-sun, pid: 29190>
    (ADDRESS=(PROTOCOL=tcp)(HOST=user-sun)(PORT=33175))
    "cmgw000" established:0 refused:0 current:0 max:256 state:ready
    <machine: user-sun, pid: 29188>
    (ADDRESS=(PROTOCOL=tcp)(HOST=user-sun)(PORT=33174))
    Service "cmon" has 1 instance(s).
    Instance "cman", status READY, has 1 handler(s) for this service...
    Handler(s):
    "cmon" established:0 refused:0 current:0 max:4 state:ready
    <machine: user-sun, pid: 29184>
    (ADDRESS=(PROTOCOL=tcp)(HOST=users)(PORT=33168))
    The command completed successfully

SHOW STATUS

Purpose

To display basic information about the instance, including version, start time, and current statistics.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

    cmctl SHOW STATUS

From the Oracle Connection Manager Control utility:

    CMCTL> SHOW STATUS

Example

    CMCTL> SHOW STATUS
    Status of the Instance
    ------------------------
    Instance name             CMAN_user.us.example.com
    Version                   CMAN for Linux: Version 12.1.0.1.0
    Start date                12-DEC-2012 14:50:35
    Uptime                    0 days 1 hr. 25 min. 24 sec
    Num of gateways started   2
    Average Load level        0
SHOW VERSION

Purpose
To display the current version and name of the Oracle Connection Manager Control utility.

Prerequisites
None

Syntax
From the operating system:
```bash
cmctl SHOW VERSION [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```text
CMCTL> SHOW VERSION
```

Examples
```text
CMCTL> SHOW VERSION
CMAN for Linux: Version 12.1.0.1.0
The command completed successfully
```

SHUTDOWN

Purpose
To shut down specific gateway processes or the entire Oracle Connection Manager instance.

Prerequisites
Oracle Connection Manager must be running.

Syntax
From the operating system:
```bash
cmctl SHUTDOWN [gateways gateway] [normal | abort] [-c instance_name]
```

From the Oracle Connection Manager Control utility:
```text
CMCTL> SHUTDOWN [gateways gateway] {normal | abort}
```

Arguments
- `gateways`: To shut down a specific gateway.
- `normal`: To reject new connections and terminate after existing connections close. This is the default.

**Oracle Connection Manager Control Utility Commands**

**abort:** To shut down Oracle Connection Manager immediately, and close all open connections.

To specify more than one gateway, separate gateways using a space.

**Usage Notes**

Issuing **SHUTDOWN** without an argument shuts down all gateways.

**Example**

CMCTL> SHUTDOWN GATEWAYS 0
The command completed successfully

**STARTUP**

**Purpose**

To start Oracle Connection Manager.

**Prerequisites**

Another Oracle Connection Manager instance configured with the same protocol address must not be running.

**Syntax**

From the operating system:

```bash
cmctl STARTUP [-c instance_name]
```

From the Oracle Connection Manager Control utility:

CMCTL> STARTUP

**Usage Notes**

Before issuing this command, you must use the **ADMINISTER** command to select an instance to start.

Issuing this command starts all instance components, which are the listener, CMADMIN, and the gateway processes. The command fails if any one of these components is already running.

The utility may prompt for a password if Oracle Connection Manager was installed with secure installation option.

**Example**

CMCTL> STARTUP
Starting CMAN instance: CMAN_user.us.example.com, please wait...
TNS-04090: *** CMCTL WARNING: No password set in the CMAN instance ***
CMAN for Linux: Version 12.1.0.1.0
Status of the Instance
----------------------
Instance name        CMAN_user.us.example.com
Version               CMAN for Linux: Version 12.1.0.1.0
Start date           12-DEC-2012 19:04:25
Uptime                0 days 0 hr. 0 min. 3 sec
Num of gateways started 2
Average Load level 0
Log Level        SUPPORT
Trace Level        OFF
SUSPEND GATEWAY

Purpose

To specify which gateway processes will no longer accept new client connections.

Prerequisites

Oracle Connection Manager must be running.

Syntax

From the operating system:

`cmctl SUSPEND GATEWAY [gateway_process_id] [-c instance_name]`

From the Oracle Connection Manager Control utility:

`CMCTL> SUSPEND GATEWAY [gateway_process_id]`

Arguments

`gateway_process_id`: The gateway process that will no longer accept new connections. Specify multiple gateway processes by putting a space between entries. Issuing `SUSPEND GATEWAY` without an argument suspends all gateway processes.

Usage Notes

Use the `RESUME GATEWAYS` command to enable gateway processes to accept new connections.

Example

`CMCTL> SUSPEND GATEWAY 1`

The command completed successfully.
Part II describes how to configure listening protocol addresses and Oracle Net Services configuration parameters.

This part contains the following chapters:

- Chapter 3, "Syntax Rules for Configuration Files"
- Chapter 4, "Protocol Address Configuration"
- Chapter 5, "Parameters for the sqlnet.ora File"
- Chapter 6, "Local Naming Parameters in the tnsnames.ora File"
- Chapter 7, "Oracle Net Listener Parameters in the listener.ora File"
- Chapter 8, "Oracle Connection Manager Parameters (cman.ora)"
- Chapter 9, "Directory Usage Parameters in the ldap.ora File"
This chapter describes the syntax rules for Oracle Net Services configuration files. This chapter contains the following topics:

- **Overview of Configuration File Syntax**
- **Syntax Rules for Configuration Files**
- **Network Character Set for Keywords**
- **Character Set for Listener and Net Service Names**

### Overview of Configuration File Syntax

The Oracle Net Services configuration files consist of parameters which include keyword-value pairs. Keyword-value pairs are surrounded by parentheses:

```
parameter=(key=value)
```

Some keywords have other keyword-value pairs as their values:

```
(keyword1=value1)
(keyword2=value2)
```

For example, the address portion of a local naming configuration file (`tnsnames.ora`) might include the following lines:

```
ADDRESS=(PROTOCOL=tcp)
(HOST=sales-server)
(PORT=1521))
```

Set up configuration files so that indentation reflects what keyword is the parent or owner of other keyword-value pairs. If you do not choose to indent your files in this way, then you must still indent a wrapped line by at least one space, or it will be misread as a new parameter. The following syntax is acceptable:

```
ADDRESS=(PROTOCOL=tcp)
(HOST=sales-server) (PORT=1521))
```

The following syntax is not acceptable:

```
ADDRESS=(PROTOCOL=tcp)
(HOST=sales-server) (PORT=1521))
```
Syntax Rules for Configuration Files

The following rules apply to the syntax of configuration files:

- Any keyword in a configuration file that begins a parameter that includes one or more keyword-value pairs must be in the far left column of a line. If it is indented by one or more spaces, then it is interpreted as a continuation of the previous line.
- All characters must belong to the network character set.
- Keywords are not case sensitive. However, values may be case sensitive, depending on the operating system and protocol.
- Spaces around the equal sign (=) are optional in keyword-value pairs.
- There is a hierarchy of keywords such that some keywords are always followed by others. At any level of the hierarchy, keywords can be listed in any order. For example, the following entries are equally valid:

```
ADDRESS=
    (PROTOCOL=TCP)
    (HOST=sales-server)
    (PORT=1521))

ADDRESS=
    (PROTOCOL=tcp)
    (PORT=1521)
    (HOST=sales-server))
```

- Keywords cannot contain spaces.
- Values must not contain spaces unless enclosed within double quotation marks (""") or single quotation marks (‘’).
- If the keyword-value pair consists of a single word or a concatenation of words on either side of the equal sign, then no parentheses are needed.
- The maximum length of a connect descriptor is 4 KB.
- Comments can be included using the number sign (#) at the beginning of a line. Anything following the number sign to the end of the line is considered a comment.

Network Character Set for Keywords

The network character set for keyword values consists of the following characters. Connect descriptors must be made up of single-byte characters.

```
A-Z, a-z
0-9
( ) < > / \,
, . : ; ’ *=- _
$ + * # & ! % ? @
```

Within this character set, the following symbols are reserved:

```
( ) = \ * ’ 
```

Reserved symbols are used as delimiters, not as part of a keyword or a value unless the keyword or value has quotation marks. Either single or double quotation marks can be used to enclose a value containing reserved symbols. To include a quotation marks within a value that is surrounded by quotation marks, use different quotation marks. The backslash (\) is used as an escape character.
The following characters may be used within a connect descriptor, but not in a keyword or value:

- Space
- Tab
- Carriage return
- Newline

Character Set for Listener and Net Service Names

The listener name and net service name are limited to the following character set:

\[[a...z] [A...Z] [0...9] \_\]

The first character must be an alphanumeric character. In general, up to 64 characters is acceptable. A database service name must match the global database name defined by the database administrator, which consists of a database name, and the database domain. Net service names and global database names are not case sensitive.
A network object is identified by a protocol address. When a connection is made, the client and the receiver of the request (listener or Oracle Connection Manager) are configured with identical protocol addresses.

The client uses this address to send the connection request to a particular network object location, and the recipient "listens" for requests on this address, and grants a connection based on its address information matching the client information.

This chapter contains the following topics:

- Protocol Addresses
- Protocol Parameters
- Recommended Port Numbers
- Port Number Limitations

## Protocol Addresses

The protocol address is comprised of ADDRESS and ADDRESS_LIST elements.

### ADDRESS

**Purpose**

To define a protocol address.

**Usage Notes**

Put this parameter under an ADDRESS_LIST or DESCRIPTION parameter. A DESCRIPTION is used in a tnsnames.ora or a listener.ora file.

**Example**

```sql
ADDRESS=
    (PROTOCOL=tcp)
    (HOST=sales-server)
    (PORT=1521))
```

**See Also:**

- "Protocol Parameters" on page 4-2 for each protocol’s required parameters
- Oracle Database Global Data Services Concepts and Administration Guide for information about management of global services
ADDRESS_LIST

Purpose
To define a list of protocol addresses that share common characteristics.

Usage Notes
This parameter is not mandatory when specifying multiple addresses.

Example

```
(ADDRESS_LIST=
 (LOAD_BALANCE=on)
 (ADDRESS=
  (PROTOCOL=tcp)
  (HOST=sales-server)  
  (PORT=1521))
 (ADDRESS=
  (PROTOCOL=tcp)
  (HOST=hr-server)
  (PORT=1521)))
```

Protocol Parameters

The listener and Oracle Connection Manager are identified by protocol addresses. Table 4-1 lists the parameters used by the Oracle protocol support.

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPC</td>
<td>PROTOCOL</td>
<td>Specify ipc as the value.</td>
</tr>
<tr>
<td></td>
<td>KEY</td>
<td>Specify a unique name for the service. Oracle recommends using the service name or the Oracle system identifier (SID) of the service. Example: (PROTOCOL=ipc)(KEY=sales)</td>
</tr>
<tr>
<td>Named Pipes</td>
<td>PROTOCOL</td>
<td>Specify nmp as the value.</td>
</tr>
<tr>
<td></td>
<td>SERVER</td>
<td>Specify the name of the Oracle server.</td>
</tr>
<tr>
<td></td>
<td>PIPE</td>
<td>Specify the pipe name used to connect to the database server. This is the same PIPE keyword specified on server with Named Pipes. This name can be any name. Example: (PROTOCOL=nmp)(SERVER=sales)(PIPE=dbpipe0)</td>
</tr>
<tr>
<td>SDP</td>
<td>PROTOCOL</td>
<td>Specify sdp as the value.</td>
</tr>
<tr>
<td></td>
<td>HOST</td>
<td>Specify the host name or IP address of the computer.</td>
</tr>
<tr>
<td></td>
<td>PORT</td>
<td>Specify the listening port number. Example: (PROTOCOL=sdp)(HOST=sales-server)(PORT=1521)</td>
</tr>
<tr>
<td>TCP/IP</td>
<td>PROTOCOL</td>
<td>Specify tcp as the value.</td>
</tr>
<tr>
<td></td>
<td>HOST</td>
<td>Specify the host name or IP address of the computer.</td>
</tr>
</tbody>
</table>
Port Number Limitations

Oracle allows port numbers from 1 to 65535. However, many operating systems reserve port numbers less than 1024. For example, on certain operating systems, only privileged processes can listen for TCP connections on ports less than 1024.

If you need to configure a listener to listen on a port number less than 1024, then do the following procedure:

1. Use Oracle Net Configuration Assistant or Oracle Net Manager to configure the listener with protocol addresses and other configuration parameters.

   **See Also:** Oracle Database Net Services Administrator’s Guide

2. Log in as the root user on the machine that has the listener.

3. Set file ownership and access permissions for the listener executable (tnslsnr) and the dependent shared libraries so that these files can be modified only by the root user.

---

Table 4-2 Recommended Port Numbers

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1521</td>
<td>Default listening port for client connections to the listener. This port number may change to the officially registered port number of 2483 for TCP/IP and 2484 for TCP/IP with SSL.</td>
</tr>
<tr>
<td>1521</td>
<td>Default and officially registered listening port for client connections to Oracle Connection Manager.</td>
</tr>
<tr>
<td>1830</td>
<td>Default and officially registered listening port for administrative commands to Oracle Connection Manager.</td>
</tr>
</tbody>
</table>

---

Recommended Port Numbers

Table 4–2 lists the recommended port numbers.

TCP/IP with SSL

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| PORT      | Specify the listening port number.  
Example: 
(PROTOCOL=tcp) (HOST=sales-server) (PORT=1521) 
(PROTOCOL=tcp) (HOST=192.0.2.204) (PORT=1521) |
4. Ensure that the permissions of the individual directories found in the path names to these files, starting with the root directory have the same ownership and access permissions.

5. Start the listener as the root user.

6. Enter the following command at the system prompt:
   
   tnslsnr listener_name -user user -group group

   In the preceding command, the following options are used:

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listener_name</td>
<td>Specify the name of the listener. If omitted, then the default name LISTENER is used.</td>
</tr>
<tr>
<td>user</td>
<td>Specify the user whose privileges the listener will use when super user (root) privileges are not needed. After performing the privileged operations, the listener will give up root privileges irreversibly.</td>
</tr>
<tr>
<td>group</td>
<td>Specify the group whose privileges the listener will use when super user (root) group privileges are not needed. After performing the privileged operations, the listener will give up root group privileges irreversibly.</td>
</tr>
</tbody>
</table>

   During this step, the listener switches to the specified user and group. All operations are done with the specified user and group privileges, except the system calls necessary to listen on configured endpoints. The listener reverts to the root user to listen on reserved addresses, such as TCP ports less than 1024.

   After the listener starts listening on all of its endpoints configured in listener.ora, it switches to the specified user and group irreversibly. Therefore, the listener will give up the root privilege that it initially had. The -user and -group command line arguments only accept user and group identifiers specified in numeric form.

   For example, to run a listener with root privileges called mylsnr and have it use privileges of a user identified as 37555 with a group identifier of 16, enter the following at the operating system command prompt:

   tnslsnr mylsnr -user 37555 -group 16

   In the preceding example, 37555 could be the identifier for the oracle user, and 16 could be the identifier for the dba group.

7. After the listener has been started, you can administer it with the Listener Control utility.

   **Important Notes:**
   
   - Oracle recommends that the user which the listener process runs be the oracle user, or a user that the listener process normally runs on the operating system.
   
   - Do not leave the listener process running as the root user because doing so is a security vulnerability.
Parameters for the sqlnet.ora File

This chapter provides a complete listing of the sqlnet.ora file configuration parameters. This chapter includes the following topics:

■ Overview of Profile Configuration File
■ sqlnet.ora Profile Parameters
■ ADR Diagnostic Parameters in sqlnet.ora
■ Non-ADR Diagnostic Parameters in sqlnet.ora

Overview of Profile Configuration File

The sqlnet.ora file is the profile configuration file. It resides on the client machines and the database server. Profiles are stored and implemented using this file. The database server can be configured with access control parameters in the sqlnet.ora file. These parameters specify whether clients are allowed or denied access based on the protocol.

The sqlnet.ora file enables you to do the following:

■ Specify the client domain to append to unqualified names
■ Prioritize naming methods
■ Enable logging and tracing features
■ Route connections through specific processes
■ Configure parameters for external naming
■ Configure Oracle Advanced Security
■ Use protocol-specific parameters to restrict access to the database

By default, the sqlnet.ora file is located in the ORACLE_HOME/network/admin directory. The sqlnet.ora file can also be stored in the directory specified by the TNS_ADMIN environment variable.
sqlnet.ora Profile Parameters

This section lists and describes the following sqlnet.ora file parameters:

- **BEQUEATH_DETACH**
- **DEFAULT_SDU_SIZE**
- **DISABLE_OOB**
- **NAMES.DEFAULT_DOMAIN**
- **NAMES.DIRECTORY_PATH**
- **NAMES.LDAP_AUTHENTICATE_BIND**
- **NAMES.LDAP_CONN_TIMEOUT**
- **NAMES.LDAP_PERSISTENT_SESSION**
- **NAMES.NISMETA_MAP**
- **RECV_BUF_SIZE**
- **SDP.IN_INET_SDP**
- **SEC_USER_AUDIT_ACTION_BANNER**
- **SEC_USER_UNAUTHORIZED_ACCESS_BANNER**
- **SEND_BUF_SIZE**
- **SQLNET.ALLOWED_LOGON_VERSION_CLIENT**
- **SQLNET.ALLOWED_LOGON_VERSION_SERVER**
- **SQLNET.AUTHENTICATION_SERVICES**
- **SQLNET.CLIENT_REGISTRATION**
- **SQLNET.COMPRESSION**
- **SQLNET.COMPRESSION_LEVELS**
- **SQLNET.COMPRESSION_THRESHOLD**
- **SQLNET.CRYPTO_CHECKSUM_CLIENT**
- **SQLNET.CRYPTO_CHECKSUM_SERVER**
- **SQLNET.CRYPTO_CHECKSUM_TYPES_CLIENT**

### Notes:

- The settings in the sqlnet.ora file apply to all pluggable databases (PDBs) in a multitenant container database environment.
- Oracle Net Services supports the IFILE parameter in the sqlnet.ora file, with up to three levels of nesting. The parameter is added manually to the file. The following is an example of the syntax:

  ```
  IFILE=/tmp/listener_em.ora
  IFILE=/tmp/listener_cust1.ora
  IFILE=/tmp/listener_cust2.ora
  ```

  Refer to *Oracle Database Reference* for additional information.
- SQLNET.CRYPTO_CHECKSUM_TYPES_SERVER
- SQLNET.DBFW_PUBLIC_KEY
- SQLNET.DOWN_HOSTS_TIMEOUT
- SQLNET.ENCRYPTION_SERVER
- SQLNET.ENCRYPTION_TYPES_CLIENT
- SQLNET.ENCRYPTION_TYPES_SERVER
- SQLNET.EXPIRE_TIME
- SQLNET.INBOUND_CONNECT_TIMEOUT
- SQLNET.KERBEROS5_CC_NAME
- SQLNET.KERBEROS5_CLOCKSKEW
- SQLNET.KERBEROS5_CONF
- SQLNET.KERBEROS5_CONF_LOCATION
- SQLNET.KERBEROS5_KEYTAB
- SQLNET.KERBEROS5_REALMS
- SQLNET.KERBEROS5_REPLAY_CACHE
- SQLNET.OUTBOUND_CONNECT_TIMEOUT
- SQLNET.RADIUS_ALTERNATE
- SQLNET.RADIUS_ALTERNATE_PORT
- SQLNET.RADIUS_ALTERNATE_RETRIES
- SQLNET.RADIUS_AUTHENTICATION
- SQLNET.RADIUS_AUTHENTICATION_INTERFACE
- SQLNET.RADIUS_AUTHENTICATION_PORT
- SQLNET.RADIUS_AUTHENTICATION_RETRIES
- SQLNET.RADIUS_AUTHENTICATION_TIMEOUT
- SQLNET.RADIUS_CHALLENGE_RESPONSE
- SQLNET.RADIUS_SECRET
- SQLNET.RADIUS_SEND_ACCOUNTING
- SQLNET_RECV_TIMEOUT
- SQLNET_SEND_TIMEOUT
- SQLNET.WALLET_OVERRIDE
- SSL_CERT_REVOCATION
- SSL_CERT_FILE
- SSL_CERT_PATH
- SSL_CIPHER_SUITES
- SSL_EXTENDED_KEY_USAGE
- SSL_SERVER_DN_MATCH
- SSL_VERSION
BEQUEATH_DETACH

Purpose
To turn signal handling on or off for Linux and UNIX systems.

Default
no

Values
- yes to turn signal handling off
- no to leave signal handling on

Example
BEQUEATH_DETACH=yes

DEFAULT_SDU_SIZE

Purpose
To specify the session data unit (SDU) size, in bytes to connections.

Usage Notes
Oracle recommends setting this parameter in both the client-side and server-side sqlnet.ora file to ensure the same SDU size is used throughout a connection. When the configured values of client and database server do not match for a session, the lower of the two values is used.

You can override this parameter for a particular client connection by specifying the SDU parameter in the connect descriptor for a client.

See Also: Oracle Database Net Services Administrator’s Guide for complete SDU usage and configuration information

Default
8192 bytes (8 KB)
Values
512 to 2097152 bytes

Example
DEFAULT_SDU_SIZE=4096

DISABLE_OOB

Purpose
To enable or disable Oracle Net to send or receive out-of-band break messages using urgent data provided by the underlying protocol.

Usage Notes
If turned off, then the parameter enables Oracle Net to send and receive break messages. If turned on, then the parameter disables the ability to send and receive break messages. Once enabled, this feature applies to all protocols used by this client.

Default
off

Example
DISABLE_OOB=on

See Also: Operating system-specific documentation to determine if the protocols you are using support urgent data requests. TCP/IP is an example of a protocol that supports this feature.

NAMES.DEFAULT_DOMAIN

Purpose
To set the domain from which the client most often looks up names resolution requests.

Usage Notes
When this parameter is set, the default domain name is automatically appended to any unqualified net service name or service name.

For example, if the default domain is set to us.example.com, then the connect string CONNECT scott@sales gets searched as sales.us.example.com. If the connect string includes the domain extension, such as CONNECT scott@sales.us.example.com, then the domain is not appended to the string.

Default
None

Example
NAMES.DEFAULT_DOMAIN=example.com
**NAMES.DIRECTORY_PATH**

**Purpose**
To specify the order of the naming methods used for client name resolution lookups.

**Default**
NAMES.DIRECTORY_PATH=(tnsnames, ldap, ezconnect)

**Values**
The following table shows the NAMES.DIRECTORY_PATH values for the naming methods.

<table>
<thead>
<tr>
<th>Naming Method Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tnsnames (local naming method)</td>
<td>Set to resolve a network service name through the tnsnames.ora file on the client.</td>
</tr>
<tr>
<td>ldap (directory naming method)</td>
<td>Set to resolve a database service name, net service name, or network service alias through a directory server.</td>
</tr>
<tr>
<td>ezconnect or hostname (Easy Connect naming method)</td>
<td>Select to enable clients to use a TCP/IP connect identifier, consisting of a host name and optional port and service name.</td>
</tr>
<tr>
<td>nis (external naming method)</td>
<td>Set to resolve service information through an existing Network Information Service (NIS).</td>
</tr>
</tbody>
</table>

**Example**
NAMES.DIRECTORY_PATH=(tnsnames)

**NAMES.LDAP_AUTHENTICATE_BIND**

**Purpose**
To specify whether the LDAP naming adapter should attempt to authenticate using a specified wallet when it connects to the LDAP directory to resolve the name in the connect string.

**Usage Notes**
The parameter value is Boolean.

If the parameter is set to TRUE, then the LDAP connection is authenticated using a wallet whose location must be specified in the WALLET_LOCATION parameter.

If the parameter is set to FALSE, then the LDAP connection is established using an anonymous bind.

**Default**
false

**Example**
NAMES.LDAP_AUTHENTICATE_BIND=true
NAMES.LDAP_CONN_TIMEOUT

Purpose
To specify number of seconds for a non-blocking connect timeout to the LDAP server.

Usage Notes
The parameter value -1 is for infinite timeout.

Default
15 seconds

Values
Values are in seconds. The range is -1 to the number of seconds acceptable for your environment. There is no upper limit.

Example
names.ldap_conn_timeout = -1

NAMES.LDAP_PERSISTENT_SESSION

Purpose
To specify whether the LDAP naming adapter should leave the session with the LDAP server open after name lookup is complete.

Usage Notes
The parameter value is Boolean.

If the parameter is set to TRUE, then the connection to the LDAP server is left open after the name lookup is complete. The connection will effectively stay open for the duration of the process. If the connection is lost, then it is re-established as needed.

If the parameter is set to FALSE, then the LDAP connection is terminated as soon as the name lookup completes. Every subsequent lookup opens the connection, performs the lookup, and closes the connection. This option prevents the LDAP server from having a large number of clients connected to it at any one time.

Default
false

Example
NAMES.LDAP_PERSISTENT_SESSION=true

NAMES.NIS.META_MAP

Purpose
To specify the map file to be used to map Network Information Service (NIS) attributes to an NIS mapname.

Default
sqlnet.maps
Example

NAMES.NIS.META_MAP=sqlnet.maps

RECV_BUF_SIZE

Purpose
To specify the buffer space limit for receive operations of sessions.

Usage Notes
You can override this parameter for a particular client connection by specifying the RECV_BUF_SIZE parameter in the connect descriptor for a client.

This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.

Note: Additional protocols might support this parameter on certain operating systems. Refer to the operating system-specific documentation for additional information about additional protocols that support this parameter.

See Also: Oracle Database Net Services Administrator’s Guide for additional information about configuring this parameter

Default
The default value for this parameter is operating system specific. The default for Linux 2.6 operating system is 87380 bytes.

Example
RECV_BUF_SIZE=11784

SDP.PF_INET_SDP

Purpose
To specify the protocol family or address family constant for the SDP protocol on your system.

Default
27

Values
Any positive integer

Example
SDP.PF_INET_SDP=30

SEC_USER_AUDIT_ACTION_BANNER

Purpose
To specify a text file containing the banner contents that warn the user about possible user action auditing.
Usage Notes
The complete path of the text file must be specified in the sqlnet.ora file on the server. Oracle Call Interface (OCI) applications can make use of OCI features to retrieve this banner and display it to the user.

Default
None

Values
Name of the file for which the database owner has read permissions.

Example
SEC_USER_AUDIT_ACTION_BANNER=/opt/oracle/admin/data/auditwarning.txt

SEC_USER_UNAUTHORIZED_ACCESS_BANNER

Purpose
To specify a text file containing the banner contents that warn the user about unauthorized access to the database.

Usage Notes
The complete path of the text file must be specified in the sqlnet.ora file on the server. OCI applications can make use of OCI features to retrieve this banner and display it to the user.

Default
None

Values
Name of the file for which the database owner has read permissions.

Example
SEC_USER_UNAUTHORIZED_ACCESS_BANNER=/opt/oracle/admin/data/unauthwarning.txt

SEND_BUF_SIZE

Purpose
To specify the buffer space limit for send operations of sessions.

Usage Notes
You can override this parameter for a particular client connection by specifying the SEND_BUF_SIZE parameter in the connect descriptor for a client.

This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.

Note: Additional protocols might support this parameter on certain operating systems. Refer to the operating system-specific documentation for additional information about additional protocols that support this parameter.
See Also: *Oracle Database Net Services Administrator’s Guide* for additional information about configuring this parameter.

**Default**

The default value for this parameter is operating system specific. The default for Linux 2.6 operating system is 16 KB.

**Example**

```
SEND_BUF_SIZE=11784
```

**SQLNET.ALLOWED_LOGON_VERSION_CLIENT**

**Purpose**

To set the minimum authentication protocol allowed for clients, and when a server is acting as a client, such as connecting over a database link, when connecting to Oracle Database instances.

**Usage Notes**

The term `VERSION` in the parameter name refers to the version of the authentication protocol, not the Oracle Database release.

If the version does not meet or exceed the value defined by this parameter, then authentication fails with an `ORA-28040: No matching authentication protocol` error.

See Also: *Oracle Database Security Guide*

**Values**

- 12a for Oracle Database 12c Release 1 (12.1) release 12.1.0.2 or later
- 12 for the critical patch updates CPUOct2012 and later Oracle Database 11g authentication protocols (recommended)
- 11 for Oracle Database 11g authentication protocols (default)
- 10 for Oracle Database 10g authentication protocols
- 8 for Oracle8i authentication protocol

**Default**

11

**Example**

If an Oracle Database 12c database hosts a database link to an Oracle Database 10g database, then the `SQLNET.ALLOWED_LOGON_VERSION_CLIENT` parameter should be set as follows in order for the database link connection to proceed:

```
SQLNET.ALLOWED_LOGON_VERSION_CLIENT=10
```

**SQLNET.ALLOWED_LOGON_VERSION_SERVER**

**Purpose**

To set the minimum authentication protocol allowed when connecting to Oracle Database instances.
Usage Notes

The term VERSION in the parameter name refers to the version of the authentication protocol, not the Oracle Database release.

If the client version does not meet or exceed the value defined by this parameter, then authentication fails with an ORA-28040: No matching authentication protocol error or an ORA-03134: Connections to this server version are no longer supported error.

See Also: Oracle Database Security Guide

A setting of 8 permits most password versions, and allows any combination of the DBA_USERS.PASSWORD_VERSIONS values 10G, 11G, and 12C.

A SQLNET.ALLOWED_LOGON_VERSION_SERVER setting of 12a permits only the 12C password version.

A greater value means the server is less compatible in terms of the protocol that clients must understand in order to authenticate. The server is also more restrictive in terms of the password version that must exist to authenticate any specific account. The ability for a client to authenticate depends on the DBA_USERS.PASSWORD_VERSIONS value on the server for that account.

Note the following implications of setting the value to 12 or 12a:

- The setting SEC_CASESENSITIVE_LOGON=FALSE must not be used because case insensitivity requires the use of the 10G password version. If it is set as FALSE, then user accounts and secure roles become unusable because Exclusive Mode excludes the use of the 10G password version. The SEC_CASESENSITIVE_LOGON initialization parameter enables or disables case sensitivity for passwords.

  Note: The use of the Oracle instance initialization parameter SEC_CASESENSITIVE_LOGON is deprecated in favor of setting the SQLNET.ALLOWED_LOGON_VERSION_SERVER parameter to 12 or 12a to ensure that passwords are treated in a case-sensitive fashion.

- To take advantage of the password protections introduced in Oracle Database 11g, users must change their passwords. The new passwords are case sensitive. When an account password is changed, the earlier 10G case-insensitive password version is automatically removed.

- Releases of OCI clients earlier than Oracle Database 10g and all versions of JDBC thin clients cannot authenticate to the Oracle database using password-based authentication.

- If the client uses Oracle9i Database, then the client will receive an ORA-03134 error message. To allow the connection, set the SQLNET.ALLOWED_LOGON_VERSION_SERVER value to 8. Ensure the DBA_USERS.PASSWORD_VERSIONS value for the account contains the value 10G. It may be necessary to reset the password for that account.

Note the following implication of setting the value to 12a:

- When an account password is changed, the earlier 10G case-insensitive password version and the 11G password version are both automatically removed.

The client must support certain abilities of an authentication protocol before the server will authenticate. If the client does not support a specified authentication ability, then the server rejects the connection with an ORA-28040: No matching authentication protocol error message.
The following is the list of all client abilities. Some clients do not have all abilities. Clients that are more recent have all the capabilities of the older clients, but older clients tend to have less abilities than more recent clients.

- **O7L_MR**: The ability to perform the Oracle Database 10g authentication protocol using the 12C password version.
- **O5L_NP**: The ability to perform the Oracle Database 10g authentication protocol using the 11G password version, and generating a session key encrypted for critical patch update CPUOct2012.
- **O5L**: The ability to perform the Oracle Database 10g authentication protocol using the 10G password version.
- **O4L**: The ability to perform the Oracle9i database authentication protocol using the 10G password version.
- **O3L**: The ability to perform the Oracle8i database authentication protocol using the 10G password version.

A higher ability is more recent and secure than a lower ability. Clients that are more recent have all the capabilities of the older clients.

The following table describes the allowed values, password versions, and descriptions:

<table>
<thead>
<tr>
<th>Value of the ALLOWED_LOGON_VERSION_SERVER Parameter</th>
<th>Generated Password Version</th>
<th>Ability Required of the Client</th>
<th>Meaning for Clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>12a(^1)</td>
<td>12C</td>
<td>07L_MR</td>
<td>Only Oracle Database 12c release 12.1.0.2 or later clients can connect to the server.</td>
</tr>
<tr>
<td>12(^2)</td>
<td>11G, 12C</td>
<td>O5L_NP</td>
<td>Only clients which have applied critical patch update CPUOct2012 or later, or release 11.2.0.3 clients with an equivalent update can connect to the server.</td>
</tr>
<tr>
<td>11</td>
<td>10G, 11G, 12C</td>
<td>O5L</td>
<td>Clients using Oracle Database 10g and later can connect to the server. Clients using releases earlier than Oracle Database release 11.2.0.3 that have not applied critical patch update CPUOct2012 or later patches must use the 10G password version.</td>
</tr>
<tr>
<td>10</td>
<td>10G, 11G, 12C</td>
<td>O5L</td>
<td>Clients using Oracle Database 10g and later can connect to the server. Clients using releases earlier than Oracle Database release 11.2.0.3 that have not applied critical patch update CPUOct2012 or later patches must use the 10G password version.</td>
</tr>
<tr>
<td>9</td>
<td>10G, 11G, 12C</td>
<td>O4L</td>
<td>Oracle9i Database or later clients can connect to the server.</td>
</tr>
<tr>
<td>8</td>
<td>10G, 11G, 12C</td>
<td>O3L</td>
<td>Oracle8i Database and later clients can connect to the server.</td>
</tr>
</tbody>
</table>

\(^1\) This is considered "Exclusive Mode" because it excludes the use of both 10G and 11G password versions.

\(^2\) This is considered "Exclusive Mode" because it excludes the use of the 10G password version.
**Values**

- 12a for Oracle Database 12c release 12.1.0.2 or later authentication protocols (strongest protection)
- 12 for the critical patch updates CPUOct2012 and later Oracle Database 11g authentication protocols (recommended)
- 11 for Oracle Database 11g authentication protocols (default)
- 10 for Oracle Database 10g authentication protocols
- 9 for Oracle9i Database authentication protocol
- 8 for Oracle8i Database authentication protocol

**Default**

11

**Example**

```sql
SQLNET.ALLOWED_LOGON_VERSION_SERVER=11
```

**SQLNET.AUTHENTICATION_SERVICES**

**Purpose**

To enable one or more authentication services. If authentication has been installed, then it is recommended that this parameter be set to either none or to one of the listed authentication methods.

**Usage Notes**

When using the `SQLNET.AUTHENTICATION_SERVICES` value all, the server attempts to authenticate using each of the following methods. The server falls back to the ones lower on the list if the ones higher on the list were unsuccessful.

- Authentication based on a service external to the database, such as a service on the network layer, Kerberos, or RADIUS.
- Authentication based on the operating system user’s membership in an administrative operating system group. Group names are platform-specific. This authentication is applicable to administrative connections only.
- Authentication performed by the database.
- Authentication based on credentials stored in a directory server.

Operating system authentication allows access to the database using any user name and any password when an administrative connection is attempted, such as using the `AS SYSDBA` clause when connecting using SQL*Plus. An example of a connection is as follows.

```
sqlplus ignored_username/ignored_password AS SYSDBA
```

When the operating-system user who issued the preceding command is already a member of the appropriate administrative operating system group, then the connection is successful. This is because the user name and password are ignored by the server due to checking the group membership first.

**See Also:** Oracle Database Security Guide for additional information about authentication methods
sqlnet.ora Profile Parameters

Default

| all |

**Note:** When installing the database with Database Configuration Assistant (DBCA), this parameter may be set to nts in the sqlnet.ora file.

Values

Authentication methods available with Oracle Net Services:

- none for no authentication methods, including Microsoft Windows native operating system authentication. When SQLNET.AUTHENTICATION_SERVICES is set to none, a valid user name and password can be used to access the database.
- all for all authentication methods.
- beq for native operating system authentication for operating systems other than Microsoft Windows
- kerberos5 for Kerberos authentication
- nts for Microsoft Windows native operating system authentication
- radius for Remote Authentication Dial-In User Service (RADIUS) authentication
- tcps for SSL authentication

Example

SQLNET.AUTHENTICATION_SERVICES=(kerberos5)

**See Also:** Oracle Database Security Guide

SQLNET.CLIENT_REGISTRATION

**Purpose**

To set a unique identifier for the client computer.

**Usage Notes**

This identifier is passed to the listener with any connection request, and is included in the audit trail. The identifier can be any alphanumeric string up to 128 characters long.

**Default**

None

**Example**

SQLNET.CLIENT_REGISTRATION=1432

SQLNET.COMPRESSION

**Purpose**

To enable or disable data compression. If both the server and client have this parameter set to ON, then compression is used for the connection.
**Note:** The SQLNET.COMPRESSION parameter applies to all database connections, except for Oracle Data Guard streaming redo and SecureFiles LOBs (Large Objects).

---

**Default**

off

**Values**

- **on** to enable data compression.
- **off** to disable data compression.

**Example**

`SQLNET.COMPRESSION=on`

---

**SQLNET.COMPRESSION_LEVELS**

**Purpose**

To specify the compression level.

**Usage Notes**

The compression levels are used at time of negotiation to verify which levels are used at both ends, and to select one level.

For Database Resident Connection Pooling (DRCP), only the compression level `low` is supported.

**Default**

low

**Values**

- **low** to use low CPU usage and low compression ratio.
- **high** to use high CPU usage and high compression ratio.

**Example**

`SQLNET.COMPRESSION_LEVELS=(high)`

---

**SQLNET.COMPRESSION_THRESHOLD**

**Purpose**

To specify the minimum data size, in bytes, for which compression is needed.

**Usage Notes**

Compression is not be done if the size of the data to be sent is less than this value.

**Default**

1024 bytes
Example

SQLNET.COMPRESSION_THRESHOLD=1024

**SQLNET.CRYPTO_CHECKSUM_CLIENT**

**Purpose**

To specify the checksum behavior for the client.

*See Also:* Oracle Database Security Guide

**Default**

accepted

**Values**

- accepted to enable the security service if required or requested by the other side.
- rejected to disable the security service, even if required by the other side.
- requested to enable the security service if the other side allows it.
- required to enable the security service and disallow the connection if the other side is not enabled for the security service.

**Example**

SQLNET.CRYPTO_CHECKSUM_CLIENT=accepted

**SQLNET.CRYPTO_CHECKSUM_SERVER**

**Purpose**

To specify the checksum behavior for the database server.

**Default**

accepted

**Values**

- accepted to enable the security service if required or requested by the other side.
- rejected to disable the security service, even if required by the other side.
- requested to enable the security service if the other side allows it.
- required to enable the security service and disallow the connection if the other side is not enabled for the security service.

**Example**

SQLNET.CRYPTO_CHECKSUM_SERVER=accepted

*See Also:* Oracle Database Security Guide

**SQLNET.CRYPTO_CHECKSUM_TYPES_CLIENT**

**Purpose**

To specify a list of crypto-checksum algorithms for the client to use.
Default

All available algorithms

Values

- **MD5** for the RSA Data Security MD5 algorithm.
- **SHA1** for the Secure Hash Algorithm.
- **SHA256** for SHA-2 uses 256 bits with the hashing algorithm.
- **SHA384** for SHA-2 uses 384 bits with the hashing algorithm.
- **SHA512** for SHA-2 uses 512 bits with the hashing algorithm.

Example

```
SQLNET.CRYPTO_CHECKSUM_TYPES_CLIENT=(SHA256, MD5)
```

See Also: *Oracle Database Security Guide*

SQLNET.CRYPTO_CHECKSUM_TYPES_SERVER

Purpose

To specify a list of crypto-checksum algorithms for the database server to use.

Default

All available algorithms

Values

- **MD5** for the RSA Data Security's MD5 algorithm
- **SHA1** for the Secure Hash algorithm.
- **SHA256** for SHA-2 uses 256 bits with the hashing algorithm.
- **SHA384** for SHA-2 uses 384 bits with the hashing algorithm.
- **SHA512** for SHA-2 uses 512 bits with the hashing algorithm.

Example

```
SQLNET.CRYPTO_CHECKSUM_TYPES_SERVER=(SHA256, MD5)
```

See Also: *Oracle Database Security Guide*

SQLNET.DBFW_PUBLIC_KEY

Purpose

To provide Oracle Database Firewall public keys to Advanced Security Option (ASO) by specifying the file that stores the Oracle Database Firewall public keys.

Default

None

Values

Full path name of the operating system file that has the public keys.
Example

```
SQLNET.DBFW_PUBLIC_KEY="/path_to_file/dbfw_public_key_file.txt"
```

See Also:
- "SQLNET.ENCRYPTION_TYPES_SERVER" on page 5-20
- Oracle Database Firewall Administration Guide

SQLNET.DOWN_HOSTS_TIMEOUT

Purpose
To specify the amount of time in seconds that information about the down state of server hosts is kept in client process cache.

Usage Notes
Clients discover the down state of server hosts when attempting connections. When a connection attempt fails, the information about the down state of the server host is added to the client process cache. Subsequent connection attempts by the same client process move the down hosts to the end of the address list, thereby reducing the priority of such hosts. When the time specified by the SQLNET.DOWN_HOSTS_TIMEOUT parameter has passed, the host is purged from the process cache, and its priority in the address list is restored.

Default
600 seconds (10 minutes)

Values
Any positive integer

Example
```
SQLNET.DOWN_HOSTS_TIMEOUT=60
```

SQLNET.ENCRYPTION_CLIENT

Purpose
To turn encryption on for the client.

Default
accepted

Values
- accepted to enable the security service if required or requested by the other side.
- rejected to disable the security service, even if required by the other side.
- requested to enable the security service if the other side allows it.
- required to enable the security service and disallow the connection if the other side is not enabled for the security service.

Example
```
SQLNET.ENCRYPTION_CLIENT=accepted
```
See Also: *Oracle Database Security Guide*

**SQLNET.ENCRYPTION_SERVER**

**Purpose**
To turn encryption on for the database server.

**Default**
accepted

**Values**
- accepted to enable the security service if required or requested by the other side.
- rejected to disable the security service, even if required by the other side.
- requested to enable the security service if the other side allows it.
- required to enable the security service and disallow the connection if the other side is not enabled for the security service.

**Example**
```
SQLNET.ENCRYPTION_SERVER=accepted
```

See Also: *Oracle Database Security Guide*

**SQLNET.ENCRYPTION_TYPES_CLIENT**

**Purpose**
To specify a list of encryption algorithms for the client to use.

**Default**
All available algorithms.

**Values**
One or more of the following:
- 3des112 for triple DES with a two-key (112-bit) option
- 3des168 for triple DES with a three-key (168-bit) option
- aes128 for AES (128-bit key size)
- aes192 for AES (192-bit key size)
- aes256 for AES (256-bit key size)
- des for standard DES (56-bit key size)
- des40 for DES (40-bit key size)
- rc4_40 for RSA RC4 (40-bit key size)
- rc4_56 for RSA RC4 (56-bit key size)
- rc4_128 for RSA RC4 (128-bit key size)
- rc4_256 for RSA RC4 (256-bit key size)
Example

```sql
SQLNET.ENCRYPTION_TYPES_CLIENT=(rc4_56)
```

See Also: Oracle Database Security Guide

SQLNET.ENCRYPTION_TYPES_SERVER

Purpose
To specify a list of encryption algorithms for the database server to use.

Default
All available algorithms.

Values
One or more of the following:
- 3des112 for triple DES with a two-key (112-bit) option
- 3des168 for triple DES with a three-key (168-bit) option
- aes128 for AES (128-bit key size)
- aes192 for AES (192-bit key size)
- aes256 for AES (256-bit key size)
- des for standard DES (56-bit key size)
- des40 for DES40 (40-bit key size)
- rc4_40 for RSA RC4 (40-bit key size)
- rc4_56 for RSA RC4 (56-bit key size)
- rc4_128 for RSA RC4 (128-bit key size)
- rc4_256 for RSA RC4 (256-bit key size)

Example

```sql
SQLNET.ENCRYPTION_TYPES_SERVER=(rc4_56, des, ...)
```

See Also: Oracle Database Security Guide

SQLNET.EXPIRE_TIME

Purpose
To specify a time interval, in minutes, to send a check to verify that client/server connections are active.

Usage Notes
Setting a value greater than 0 ensures that connections are not left open indefinitely, due to an abnormal client termination. If the system supports TCP keepalive tuning, then Oracle Net Services automatically uses the enhanced detection model, and tunes the TCP keepalive parameters.

If the probe finds a terminated connection, or a connection that is no longer in use, then it returns an error, causing the server process to exit.
This parameter is primarily intended for the database server, which typically handles multiple connections at any one time.

Limitations on using this terminated connection detection feature are:

- It is not allowed on bequeathed connections.
- Though very small, a probe packet generates additional traffic that may downgrade network performance.
- Depending on which operating system is in use, the server may need to perform additional processing to distinguish the connection probing event from other events that occur. This can also result in degraded network performance.

**Default**

0

**Minimum Value**

0

**Recommended Value**

10

**Example**

SQLNET.EXPIRE_TIME=10

**SQLNET.INBOUND_CONNECT_TIMEOUT**

**Purpose**

To specify the time, in seconds, for a client to connect with the database server and provide the necessary authentication information.

**Usage Notes**

If the client fails to establish a connection and complete authentication in the time specified, then the database server terminates the connection. In addition, the database server logs the IP address of the client and an ORA-12170: TNS:Connect timeout occurred error message to the sqlnet.log file. The client receives either an ORA-12547: TNS:lost contact or an ORA-12637: Packet receive failed error message.

The default value of this parameter is appropriate for typical usage scenarios. However, if you need to explicitly set a different value, then Oracle recommends setting this parameter in combination with the INBOUND_CONNECT_TIMEOUT_listener_name parameter in the listener.ora file. When specifying the values for these parameters, note the following recommendations:

- Set both parameters to an initial low value.
- Set the value of the INBOUND_CONNECT_TIMEOUT_listener_name parameter to a lower value than the SQLNET.INBOUND_CONNECT_TIMEOUT parameter.

For example, you can set INBOUND_CONNECT_TIMEOUT_listener_name to 2 seconds and SQLNET.INBOUND_CONNECT_TIMEOUT parameter to 3 seconds. If clients are unable to complete connections within the specified time due to system or network delays that are normal for the particular environment, then increment the time as needed.
Default

60 seconds

Example

SQLNET.INBOUND_CONNECT_TIMEOUT=3

See Also:

- "Control Parameters" on page 7-7 for additional information about INBOUND_CONNECT_TIMEOUT_listener_name
- Oracle Database Net Services Administrator’s Guide for additional information about configuring these parameters

SQLNET.KERBEROS5_CC_NAME

Purpose

To specify the complete path name to the Kerberos credentials cache file.

Usage Notes

The MSLSA option specifies the file is on Microsoft Windows, and is running Microsoft KDC.

The OS_MEMORY option specifies that an operating system-managed memory credential is used for the credential cache file. This option is supported for all operating systems with such a feature.

Default

/usr/tmp/krbcache on Linux and UNIX operating systems

c:\tmp\krbcache on Microsoft Windows operating systems

Examples

SQLNET.KERBEROS5_CC_NAME=/usr/tmp/krbcache

SQLNET.KERBEROS5_CC_NAME=MSLSA

SQLNET.KERBEROS5_CC_NAME=OS_MEMORY

See Also: Oracle Database Security Guide

SQLNET.KERBEROS5_CLOCKSKEW

Purpose

To specify how many seconds can pass before a Kerberos credential is considered out of date.

Default

300

Example

SQLNET.KERBEROS5_CLOCKSKEW=1200

See Also: Oracle Database Security Guide
SQLNET.KERBEROS5_CONF

Purpose
To specify the complete path name to the Kerberos configuration file, which contains
the realm for the default Key Distribution Center (KDC) and maps realms to KDC
hosts.

Usage Notes
The KDC maintains a list of user principals and is contacted through the kinit
program for the user's initial ticket.

The AUTO_DISCOVER option allows the automatic discovery of KDC and realms. It is the
default configuration for Kerberos clients. If there are multiple realms to be specified,
then Oracle recommends creating configuration files instead of using the AUTO-
DISCOVER option. This option is supported for all operating systems with such a
feature.

Default
/krb5/krb.conf on Linux and UNIX operating systems
c:\krb5\krb.conf on Microsoft Windows operating systems

Values
- Directory path to krb.conf file
- AUTO_DISCOVER

Example
SQLNET.KERBEROS5_CONF=/krb5/krb.conf

See Also: Oracle Database Security Guide

SQLNET.KERBEROS5_CONF_LOCATION

Purpose
To specify the directory for the Kerberos configuration file. The parameter also
specifies the file is created by the system, and not by the client.

Usage Notes
The configuration file uses DNS lookup to obtain the realm for the default KDC, and
maps realms to the KDC hosts. This option is supported for all operating systems with
such a feature.

Default
/krb5 on Linux and UNIX operating systems
c:\krb5 on Microsoft Windows operating systems

Example
SQLNET.KERBEROS5_CONF_LOCATION=/krb5
**SQLNET.KERBEROS5_KEYTAB**

**Purpose**
To specify the complete path name to the Kerberos principal/secret key mapping file, which is used to extract keys and decrypt incoming authentication information.

**Default**
/etc/v5srvtab on Linux and UNIX operating systems

/c:/krb5/v5srvtab on Microsoft Windows operating systems

**Example**

```
SQLNET.KERBEROS5_KEYTAB=/etc/v5srvtab
```

**See Also:** Oracle Database Security Guide

**SQLNET.KERBEROS5_REALMS**

**Purpose**
To specify the complete path name to the Kerberos realm translation file, which provides a mapping from a host name or domain name to a realm.

**Default**

```
/krb5/krb.realms on Linux and UNIX operating systems
```

```
c:/krb5/krb.realms on Microsoft Windows operating systems
```

**Example**

```
SQLNET.KERBEROS5_REALMS=/krb5/krb.realms
```

**See Also:** Oracle Database Security Guide

**SQLNET.KERBEROS5_REPLAY_CACHE**

**Purpose**
To specify replay cache is stored in operating system-managed memory on the server, and that file-based replay cache is not used.

**Usage Notes**
The `OS_MEMORY` option specifies the replay cache is stored in operating system-managed memory on the server, and file-based replay cache is not used.

**Example**

```
SQLNET_KERBEROS5_REPLAY_CACHE=OS_MEMORY
```

**SQLNET.OUTBOUND_CONNECT_TIMEOUT**

**Purpose**
To specify the time, in seconds, for a client to establish an Oracle Net connection to the database instance.
Usage Notes
If an Oracle Net connection is not established in the time specified, then the connect attempt is terminated. The client receives an ORA-12170: TNS:Connect timeout occurred error.

The outbound connect timeout interval is a superset of the TCP connect timeout interval, which specifies a limit on the time taken to establish a TCP connection. Additionally, the outbound connect timeout interval includes the time taken to be connected to an Oracle instance providing the requested service.

Without this parameter, a client connection request to the database server may block for the default TCP connect timeout duration (60 seconds) when the database server host system is unreachable.

The outbound connect timeout interval is only applicable for TCP, TCP with SSL, and IPC transport connections.

This parameter is overridden by the CONNECT_TIMEOUT parameter in the address description.

Default
None

Example
SQLNET.OUTBOUND_CONNECT_TIMEOUT=10

SQLNET.RADIUS_ALTERNATE

Purpose
To specify an alternate RADIUS server to use in case the primary server is unavailable.

Usage Notes
The value can be either the IP address or host name of the server.

Default
None

Example
SQLNET.RADIUS_ALTERNATE=radius2

See Also: Oracle Database Security Guide

SQLNET.RADIUS_ALTERNATE_PORT

Purpose
To specify the listening port of the alternate RADIUS server.

Default
1645

Example
SQLNET.RADIUS_ALTERNATE_PORT=1667
SQLNET.RADIUS_ALTERNATE_RETRIES

**Purpose**
To specify the number of times the database server should resend messages to the alternate RADIUS server.

**Default**
3

**Example**
```
SQLNET.RADIUS_ALTERNATE_RETRIES=4
```

See Also: *Oracle Database Security Guide*

SQLNET.RADIUS_AUTHENTICATION

**Purpose**
To specify the location of the primary RADIUS server, either by its host name or IP address.

**Default**
Local host

**Example**
```
SQLNET.RADIUS_AUTHENTICATION=officeacct
```

See Also: *Oracle Database Security Guide*

SQLNET.RADIUS_AUTHENTICATION_INTERFACE

**Purpose**
To specify the class containing the user interface used to interact with the user.

**Default**
DefaultRadiusInterface

**Example**
```
SQLNET.RADIUS_AUTHENTICATION_INTERFACE=DefaultRadiusInterface
```

See Also: *Oracle Database Security Guide*

SQLNET.RADIUS_AUTHENTICATION_PORT

**Purpose**
To specify the listening port of the primary RADIUS server.

**Default**
1645
Example

```
SQLNET.RADIUS_AUTHENTICATION_PORT=1667
```

**See Also:** Oracle Database Security Guide

### SQLNET.RADIUS_AUTHENTICATION_RETRIES

**Purpose**

To specify the number of times the database server should resend messages to the primary RADIUS server.

**Default**

3

**Example**

```
SQLNET.RADIUS_AUTHENTICATION_RETRIES=4
```

**See Also:** Oracle Database Security Guide

### SQLNET.RADIUS_AUTHENTICATION_TIMEOUT

**Purpose**

To specify the time, in seconds, that the database server should wait for a response from the primary RADIUS server.

**Default**

5

**Example**

```
SQLNET.RADIUS_AUTHENTICATION_TIMEOUT=10
```

**See Also:** Oracle Database Security Guide

### SQLNET.RADIUS_CHALLENGE_RESPONSE

**Purpose**

To turn challenge response on or off.

**Default**

off

**Values**

| on | off |

**Example**

```
SQLNET.RADIUS_CHALLENGE_RESPONSE=on
```

**See Also:** Oracle Database Security Guide
SQLNET.RADIUS_SECRET

Purpose:
To specify the location of the RADIUS secret key.

Default
The ORACLE_HOME/network/security/radius.key file.

Example
SQLNET.RADIUS_SECRET=oracle/bin/admin/radiuskey

See Also: Oracle Database Security Guide

SQLNET.RADIUS_SEND_ACCOUNTING

Purpose
To turn accounting on and off. If enabled, then packets are sent to the active RADIUS server at listening port plus one.

Usage Notes
The default port is 1646.

Default
off

Values
on | off

Example
SQLNET.RADIUS_SEND_ACCOUNTING=on

See Also: Oracle Database Security Guide

SQLNET.RECV_TIMEOUT

Purpose
To specify the time, in seconds, for a database server to wait for client data after establishing a connection. A client must send some data within the time interval.

Usage Notes
Setting this parameter is recommended for environments in which clients shut down on occasion or abnormally. If a client does not send any data in time specified, then the database server logs ORA-12535: TNS:operation timed out and ORA-12609: TNS: Receive timeout occurred messages to the sqlnet.log file. Without this parameter, the database server may continue to wait for data from clients that may be down or are experiencing difficulties.

You can also set this parameter on the client-side to specify the time, in seconds, for a client to wait for response data from the database server after connection establishment. Without this parameter, the client may wait a long period of time for a response from a database server saturated with requests. If you choose to set the value, then set the value to an initial low value and adjust according to system and network
capacity. If necessary, use this parameter with the SQLNET.SEND_TIMEOUT parameter.

**Default**

None

**Example**

SQLNET.RECV_TIMEOUT=3

**See Also:** Oracle Database Net Services Administrator’s Guide for additional information about configuring these parameters

### SQLNET.SEND_TIMEOUT

**Purpose**

To specify the time, in seconds, for a database server to complete a send operation to clients after establishing a connection.

**Usage Notes**

Setting this parameter is recommended for environments in which clients shut down occasionally or abnormally.

If the database server cannot complete a send operation in the time specified, then it logs ORA-12535: TNS:operation timed out and ORA-12608: TNS: Send timeout occurred messages to the sqlnet.log file. Without this parameter, the database server may continue to send responses to clients that are unable to receive data due to a downed computer or a busy state.

You can also set this parameter on the client-side to specify the time, in seconds, for a client to complete send operations to the database server after connection establishment. Without this parameter, the client may continue to send requests to a database server already saturated with requests. If you choose to set the value, then set the value to an initial low value and adjust according to system and network capacity. If necessary, use this parameter with the SQLNET.RECV_TIMEOUT parameter.

**Default**

None

**Example**

SQLNET.SEND_TIMEOUT=3

**See Also:** Oracle Database Net Services Administrator’s Guide for additional information about configuring this parameter

### SQLNET.WALLET_OVERRIDE

**Purpose**

To determine whether the client should override the strong authentication credential with the password credential in the stored wallet to log in to the database.

**Usage Notes**

When wallets are used for authentication, the database credentials for user name and password are securely stored in an Oracle wallet. The auto-login feature of the wallet
is turned on so the database does not need a password to open the wallet. From the
wallet, the database gets the credentials to access the database for the user.

Wallet usage can simplify large-scale deployments that rely on password credentials
for connecting to databases. When this feature is configured, application code, batch
jobs, and scripts do not need embedded user names and passwords. Risk is reduced
because such passwords are no longer exposed in the clear, and password
management policies are more easily enforced without changing application code
whenever user names or passwords change.

Users connect using the connect /@database_name command instead of specifying a
user name and password explicitly. This simplifies the maintenance of the scripts and
secures the password management for the applications.

Middle-tier applications create an Oracle Applications wallet at installation time to
store the application's specific identity. The password may be randomly generated
rather than hardcoded. When an Oracle application accesses the database, it sets
appropriate values for SQLNET.AUTHENTICATION_SERVICES and WALLET_LOCATION. The
new wallet-based password authentication code uses the password credential in the
Oracle Applications wallet to log on to the database.

**Values**

true | false

**Examples**

SQLNET.WALLET_OVERRIDE=true

**See Also:** In order to use wallets, a wallet must be configured on the
client. Refer to Oracle Database Security Guide for additional
information about configuring the clients.

**SSL_CERT_REVOCATION**

**Purpose**

To configure a revocation check for a certificate.

**See Also:** Oracle Database Security Guide

**Default**

none

**Values**

- none to turn off certificate revocation checking. This is the default.
- requested to perform certificate revocation in case a Certificate Revocation List
  (CRL) is available. Reject SSL connection if the certificate is revoked. If no
  appropriate CRL is found to determine the revocation status of the certificate and
  the certificate is not revoked, then accept the SSL connection.
- required to perform certificate revocation when a certificate is available. If a
  certificate is revoked and no appropriate CRL is found, then reject the SSL
  connection. If no appropriate CRL is found to ascertain the revocation status of the
  certificate and the certificate is not revoked, then accept the SSL connection.

**Example**

SSL_CERT_REVOCATION=required
SSL_CERT_FILE

**Purpose**
To specify the name of the file where you can assemble the CRL for client authentication.

**Usage Notes**
This file contains the PEM-encoded CRL files, in order of preference. You can use this file alternatively or in addition to the SSL_CERT_PATH parameter. This parameter is only valid if SSL_CERT_REVOCATION is set to either requested or required.

**Default**
None

**Example**

```
SSL_CERT_FILE=
```

SSL_CERT_PATH

**Purpose**
To specify the destination directory of the CRL of CA.

**Usage Notes**
The files in this directory are hashed symbolic links created by Oracle Wallet Manager. This parameter is only valid if SSL_CERT_REVOCATION is set to either requested or required.

**Default**
None

**Example**

```
SSL_CERT_PATH=
```

SSL_CIPHER_SUITES

**Purpose**
To control which combination of encryption and data integrity is used by the Secure Sockets Layer (SSL). Cipher suites that use Advanced Encryption Standard (AES) only work with Transport Layer Security (TLS 1.0).

**Default**
None

**Values**
- SSL_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
- SSL_ECDHE_ECDSA_WITH_AES_128_CBC_SHA
- SSL_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256
- SSL_ECDHE_ECDSA_WITH_AES_256_CBC_SHA
SSL_CIPHER_SUITES=(ssl_rsa_with_aes_128_cbc_sha256)

Example

Note: SSL_DH_anon_WITH_3DES_EDE_CBC_SHA and SSL_DH_anon_WITH_RC4_128_MD5 do not provide authentication of the communicating parties, and can be vulnerable to man-in-the-middle attacks. Oracle recommends that you do not use these cipher suites to protect sensitive data. However, they are useful if the communicating parties want to remain anonymous or simply do not want the overhead caused by mutual authentication.

SSL_EXTENDED_KEY_USAGE

Purpose

To specify the purpose of the key in the certificate.

Usage Notes

When this parameter is specified, the certificate with the matching extended key is used.

Values

client authentication

Example

SSL_EXTENDED_KEY_USAGE="client authentication"
**SSL_SERVER_DN_MATCH**

**Purpose**
To enforce that the **distinguished name (DN)** for the database server matches its service name.

**Usage Notes**
If you enforce the match verifications, then SSL ensures that the certificate is from the server. If you select to not enforce the match verification, then SSL performs the check but allows the connection, regardless if there is a match. Not enforcing the match allows the server to potentially fake its identify.

In addition to the sqlnet.ora file, configure the tnsnames.ora parameter **SSL_SERVER_CERT_DN** to enable server DN matching.

**Default**
no

**Values**
- yes | on | true to enforce a match. If the DN matches the service name, then the connection succeeds. If the DN does not match the service name, then the connection fails.
- no | off | false to not enforce a match. If the DN does not match the service name, then the connection is successful, but an error is logged to the sqlnet.log file.

**Example**
SSL_SERVER_DN_MATCH=yes

**See Also:** Oracle Database Security Guide

**SSL_VERSION**

**Purpose**
To force the version of the SSL connection.

**Usage Notes**
Clients and database servers must use a compatible version.

**Default**
undetermined

**Values**
undetermined | 2.0 | 3.0

**Example**
SSL_VERSION=2.0

**See Also:** Oracle Database Security Guide
TCP.CONNECT_TIMEOUT

Purpose
To specify the time, in seconds, for a client to establish a TCP connection (PROTOCOL=tcp in the TNS connect address) to the database server.

Usage Notes
If a TCP connection to the database host is not established in the time specified, then the connection attempt is terminated. The client receives an ORA-12170: TNS:Connect timeout occurred error.

The timeout applies to each IP address that resolves to a host name. For example, if a host name resolves to an IPv6 and an IPv4 address, and if the host is not reachable through the network, then the connection request times out twice because there are two IP addresses. In this example, the default timeout setting of 60 would cause a timeout in 120 seconds.

Default
60

Example
TCP.CONNECT_TIMEOUT=10

TCP.EXCLUDED NODES

Purpose
To specify which clients are denied access to the database.

Usage Notes
This parameter is only valid when the TCP.VALIDNODE_CHECKING parameter is set to yes.

This parameter can use wildcards for IPv4 addresses and CIDR notation for IPv4 and IPv6 addresses.

Syntax
TCP.EXCLUDED NODES=(hostname | ip_address, hostname | ip_address, ...)

Example
TCP.EXCLUDED NODES=(finance.us.example.com, mktg.us.example.com, 192.0.2.25, 172.30.*, 2001:DB8:200C:417A/32)

TCP.INVITED NODES

Purpose
To specify which clients are allowed access to the database. This list takes precedence over the TCP.EXCLUDED NODES parameter if both lists are present.

Syntax
TCP.INVITED NODES=(hostname | ip_address, hostname | ip_address, ...)

5-34  Oracle Database Net Services Reference
Usage Notes

- This parameter is only valid when the `TCP.VALIDNODE_CHECKING` parameter is set to `yes`.
- This parameter can use wildcards for IPv4 addresses and CIDR notation for IPv4 and IPv6 addresses.

Example

```
TCP.INVITED_NODES=(sales.us.example.com, hr.us.example.com, 192.0.*, 2001:DB8:200C:433B/32)
```

**TCP.NODELAY**

**Purpose**

To preempt delays in buffer flushing within the TCP/IP protocol stack.

**Default**

`yes`

**Values**

`yes` | `no`

**Example**

```
TCP.NODELAY=yes
```

**TCP.QUEUESIZE**

**Purpose**

To configure the maximum length of the queue for pending connections on a TCP listening socket.

**Default**

System-defined maximum value. The defined maximum value for Linux is 128.

**Values**

Any integer value up to the system-defined maximum.

**Examples**

```
TCP.QUEUESIZE=100
```

**TCP.VALIDNODE_CHECKING**

**Purpose**

To enable and disable valid node checking for incoming connections.

**Usage Notes**

If this parameter is set to `yes`, then incoming connections are allowed only if they originate from a node that conforms to list specified by `TCP.INVITED_NODES` or `TCP.EXCLUDED_NODES` parameters.
The TCP.INVITED_NODES and TCP.EXCLUDED_NODES parameters are valid only when the TCP.VALIDNODE_CHECKING parameter is set to yes.

Default
no

Values
yes | no

Example
TCP.VALIDNODE_CHECKING=yes

**TNSPING.TRACE_DIRECTORY**

*Purpose*
To specify the destination directory for the TNSPING utility trace file, tnsping.trc.

*Default*
The ORACLE_HOME/network/trace directory.

*Example*
TNSPING.TRACE_DIRECTORY=/oracle/traces

**TNSPING.TRACE_LEVEL**

*Purpose*
To turn TNSPING utility tracing on at a specified level or to turn it off.

*Default*
off

*Values*
- off for no trace output
- user for user trace information
- admin for administration trace information
- support for Oracle Support Services trace information

*Example*
TNSPING.TRACE_LEVEL=admin

**USE_CMAN**

*Purpose*
To specify client routing to Oracle Connection Manager.

*Usage Notes*
If set to true, then the parameter routes the client to a protocol address for Oracle Connection Manager.
If set to false, then the client picks one of the address lists at random and fails over to the other address list if the chosen ADDRESS_LIST fails. With USE_CMAN=true, the client always uses the first address list.

If no Oracle Connection Manager addresses are available, then connections are routed through any available listener address.

**Default**
false

**Values**
true | false

**Example**
USE_CMAN=true

**USE_DEDICATED_SERVER**

**Purpose**
To append \( \text{SERVER=dedicated} \) to the CONNECT_DATA section of the connect descriptor used by the client.

**Usage Notes**
It overrides the current value of the SERVER parameter in the tnsnames.ora file.

If set to on, then the parameter USE_DEDICATED_SERVER automatically appends \( \text{SERVER=dedicated} \) to the connect data for a connect descriptor. This way connections from this client use a dedicated server process, even if shared server is configured.

**Default**
off

**Values**
- on to append \( \text{SERVER=dedicated} \)
- off to send requests to existing server processes

**Example**
USE_DEDICATED_SERVER=on

**See Also:** Oracle Database Net Services Administrator’s Guide for complete configuration information

**WALLET_LOCATION**

**Purpose**
To specify the location of wallets. Wallets are certificates, keys, and trustpoints processed by SSL.

**Usage Notes**
The key/value pair for Microsoft certificate store (MCS) omits the METHOD_DATA parameter because MCS does not use wallets. Instead, Oracle PKI (public key
infrastructure) applications obtain certificates, trustpoints and private keys directly from the user’s profile.

If an Oracle wallet is stored in the Microsoft Windows registry and the wallet’s key (KEY) is SALESAPP, then the storage location of the encrypted wallet is HKEY_CURRENT_USER\SOFTWARE\ORACLE\WALLETS\SALESAPP\EWALLET.P12. The storage location of the decrypted wallet is HKEY_CURRENT_USER\SOFTWARE\ORACLE\WALLETS\SALESAPP\CWALLET.SSO.

Syntax

The syntax depends on the wallet, as follows:

- **Oracle wallets on the file system:**
  
  \[
  \text{WALLET\_LOCATION} = \begin{cases} \text{SOURCE} = \text{file} \\
  \text{METHOD\_DATA} = \begin{cases} \text{DIRECTORY} = \text{directory} \\
  \{\text{PKCS11=TRUE/FALSE}\} \end{cases} \end{cases}
  \]

- **Microsoft certificate store:**

  \[
  \text{WALLET\_LOCATION} = \begin{cases} \text{SOURCE} = \text{mcs} \end{cases}
  \]

- **Oracle wallets in the Microsoft Windows registry:**

  \[
  \text{WALLET\_LOCATION} = \begin{cases} \text{SOURCE} = \text{reg} \\
  \text{METHOD\_DATA} = \begin{cases} \text{KEY} = \text{registry\_key} \end{cases} \end{cases}
  \]

- **Entrust wallets:**

  \[
  \text{WALLET\_LOCATION} = \begin{cases} \text{SOURCE} = \text{entr} \\
  \text{METHOD\_DATA} = \begin{cases} \text{PROFILE} = \text{file.epf} \\
  \text{INIFILE} = \text{file.ini} \end{cases} \end{cases}
  \]

Additional Parameters

WALLET_LOCATION supports the following parameters:

- **SOURCE**: The type of storage for wallets, and storage location.
- **METHOD**: The type of storage.
- **METHOD\_DATA**: The storage location.
- **DIRECTORY**: The location of Oracle wallets on file system.
- **KEY**: The wallet type and location in the Microsoft Windows registry.
- **PROFILE**: The Entrust profile file (.epf).
- **INIFILE**: The Entrust initialization file (.ini).

Default

None
ADR Diagnostic Parameters in sqlnet.ora

Since Oracle Database 11g, Oracle Database includes an advanced fault diagnosability infrastructure for preventing, detecting, diagnosing, and resolving problems. The problems are critical errors such as those caused by database code bugs, metadata corruption, and customer data corruption.

When a critical error occurs, it is assigned an incident number, and diagnostic data for the error, such as traces and dumps, is immediately captured and tagged with the incident number. The data is then stored in the Automatic Diagnostic Repository (ADR), a file-based repository outside the database.

This section describes the parameters used when ADR is enabled. Non-ADR parameters listed in the sqlnet.ora file are ignored when ADR is enabled. "Non-ADR Diagnostic Parameters in sqlnet.ora" on page 5-42 describes the parameters used when ADR is disabled. ADR is enabled by default.

The following sqlnet.ora parameters are used when ADR is enabled (when DIAG_ADR_ENABLED is set to on):

- ADR_BASE
- DIAG_ADR_ENABLED
ADR Diagnostic Parameters in sqlnet.ora

- TRACE_LEVEL_CLIENT
- TRACE_LEVEL_SERVER
- TRACE_TIMESTAMP_CLIENT
- TRACE_TIMESTAMP_SERVER

**ADR_BASE**

**Purpose**
To specify the base directory into which tracing and logging incidents are stored when ADR is enabled.

**Default**
The default on the server side is ORACLE_BASE, or ORACLE_HOME/log, if ORACLE_BASE is not defined.

**Values**
Any valid directory path to a directory with write permission.

**Example**
ADR_BASE=/oracle/network/trace

**See Also:** Oracle Call Interface Programmer’s Guide for the default directory on the client side

**DIAG_ADR_ENABLED**

**Purpose**
To specify whether ADR tracing is enabled.

**Usage Notes**
If the DIAG_ADR_ENABLED parameter is set to OFF, then non-ADR file tracing is used.

**Default**
on

**Values**
on | off

**Example**
DIAG_ADR_ENABLED=on

**TRACE_LEVEL_CLIENT**

**Purpose**
To turn client tracing on at a specified level or to turn it off.

**Usage Notes**
This parameter is also applicable when non-ADR tracing is used.
Default

off or 0

Values

- off or 0 for no trace output
- user or 4 for user trace information
- admin or 10 for administration trace information
- support or 16 for Oracle Support Services trace information

Example

TRACE_LEVEL_CLIENT=user

**TRACE_LEVEL_SERVER**

**Purpose**

To turn server tracing on at a specified level or to turn it off.

**Usage Notes**

This parameter is also applicable when non-ADR tracing is used.

**Default**

off or 0

**Values**

- off or 0 for no trace output
- user or 4 for user trace information
- admin or 10 for administration trace information
- support or 16 for Oracle Support Services trace information

**Example**

TRACE_LEVEL_SERVER=admin

**TRACE_TIMESTAMP_CLIENT**

**Purpose**

To add a time stamp in the form of dd-mm-yyyy hh:mm:ss:mil to every trace event in the client trace file, which has a default name of sqlnet.trc.

**Usage Notes**

This parameter is also applicable when non-ADR tracing is used.

**Default**

on

**Values**

on or true | off or false
Example

TRACE_TIMESTAMP_CLIENT=true

TRACE_TIMESTAMP_SERVER

Purpose

To add a time stamp in the form of dd-mmm-yyyy hh:mm:ss:mil to every trace event in the database server trace file, which has a default name of svr_pid.trc.

Usage Notes

This parameter is also applicable when non-ADR tracing is used.

Default

on

Values

on or true | off or false

Example

TRACE_TIMESTAMP_SERVER=true

Non-ADR Diagnostic Parameters in sqlnet.ora

This section lists the sqlnet.ora parameters used when ADR is disabled.

Notes: The default value of DIAG_ADR_ENABLED is on. Therefore, the DIAG_ADR_ENABLED parameter must explicitly be set to off in order for non-ADR tracing to be used.
LOG_DIRECTORY_CLIENT

Purpose
To specify the destination directory for the client log file.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/log

Values
Any valid directory path.

Example
LOG_DIRECTORY_CLIENT=/oracle/network/log

LOG_DIRECTORY_SERVER

Purpose
To specify the destination directory for the database server log file.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/trace

Values
Any valid directory path to a directory with write permission.

Example
LOG_DIRECTORY_SERVER=/oracle/network/trace

LOG_FILE_CLIENT

Purpose
To specify the name of the log file for the client.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/log/sqlnet.log

Values
The default value cannot be changed.
**LOG_FILE_SERVER**

**Purpose**
To specify the name of the log file for the database server.

**Usage Notes**
Use this parameter when ADR is not enabled.

**Default**
sqlnet.log

**Values**
Any valid directory path to a directory with write permission.

**Example**
```
LOG_FILE_SERVER=svr.log
```

**TRACE_DIRECTORY_CLIENT**

**Purpose**
To specify the destination directory for the client trace file.

**Usage Notes**
Use this parameter when ADR is not enabled.

**Default**
The current working directory.

**Values**
Any valid directory path to a directory with write permission.

**Example**
```
TRACE_DIRECTORY_CLIENT=/oracle/traces
```

**TRACE_DIRECTORY_SERVER**

**Purpose**
To specify the destination directory for the database server trace file. Use this parameter when ADR is not enabled.

**Default**
ORACLE_HOME/network/trace

**Values**
Any valid directory path to a directory with write permission.

**Example**
```
TRACE_DIRECTORY_SERVER=/oracle/traces
```
TRACE_FILE_CLIENT

Purpose
To specify the name of the client trace file.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/trace/cli.trc

Values
Any valid file name.

Example
TRACE_FILE_CLIENT=clientsqlnet.trc

TRACE_FILE_SERVER

Purpose
To specify the destination directory for the database server trace output.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/trace/svr_pid.trc

Values
Any valid file name. The process identifier (pid) is appended to the name automatically.

Example
TRACE_FILE_SERVER=svrsqlnet.trc

TRACE_FILELEN_CLIENT

Purpose
To specify the size of the client trace files in kilobytes (KB).

Usage Notes
When the size is met, the trace information is written to the next file. The number of files is specified with the TRACE_FILENO_CLIENT parameter. Use this parameter when ADR is not enabled.

Example
TRACE_FILELEN_CLIENT=100
**TRACE_FILELEN_SERVER**

**Purpose**

To specify the size of the database server trace files in kilobytes (KB).

**Usage Notes**

When the size is met, the trace information is written to the next file. The number of files is specified with the `TRACE_FILENO_Server` parameter. Use this parameter when ADR is not enabled.

**Example**

```sql
TRACE_FILELEN_SERVER=100
```

**TRACE_FILENO_CLIENT**

**Purpose**

To specify the number of trace files for client tracing.

**Usage Notes**

When this parameter is set with the `TRACE_FILELEN_CLIENT` parameter, trace files are used in a cyclical fashion. The first file is filled first, then the second file, and so on. When the last file has been filled, then the first file is re-used, and so on.

The trace file names are distinguished from one another by their sequence number. For example, if the default trace file of `sqlnet.trc` is used, and this parameter is set to 3, then the trace files would be named `sqlnet1.trc`, `sqlnet2.trc`, and `sqlnet3.trc`.

In addition, trace events in the trace files are preceded by the sequence number of the file. Use this parameter when ADR is not enabled.

**Default**

None

**Example**

```sql
TRACE_FILENO_CLIENT=3
```

**TRACE_FILENO_SERVER**

**Purpose**

To specify the number of trace files for database server tracing.

**Usage Notes**

When this parameter is set with the `TRACE_FILELEN_SERVER` parameter, trace files are used in a cyclical fashion. The first file is filled first, then the second file, and so on. When the last file has been filled, then the first file is re-used, and so on.

The trace file names are distinguished from one another by their sequence number. For example, if the default trace file of `svr_pid.trc` is used, and this parameter is set to 3, then the trace files would be named `svr1_pid.trc`, `svr2_pid.trc`, and `svr3_pid.trc`.

In addition, trace events in the trace files are preceded by the sequence number of the file. Use this parameter when ADR is not enabled.
Default
None

Example
TRACE_FILENO_SERVER=3

**TRACE_UNIQUE_CLIENT**

**Purpose**
To specify whether a unique trace file is created for each client trace session.

**Usage Notes**
When the value is set to *on*, a process identifier is appended to the name of each trace file, enabling several files to coexist. For example, trace files named `sqlnetpid.trc` are created if default trace file name `sqlnet.trc` is used. When the value is set to *off*, data from a new client trace session overwrites the existing file. Use this parameter when ADR is not enabled.

**Default**
on

**Values**
on or off

**Example**
TRACE_UNIQUE_CLIENT=on
Local Naming Parameters in the tnsnames.ora File

This chapter provides a complete listing of the tnsnames.ora file configuration parameters. This chapter contains the following topics:

- Overview of Local Naming Parameters
- General Syntax of tnsnames.ora
- Multiple Descriptions in tnsnames.ora
- Multiple Address Lists in tnsnames.ora
- Connect-Time Failover and Client Load Balancing with Oracle Connection Managers
- Connect Descriptor Descriptions
- Protocol Address Section
- Optional Parameters for Address Lists
- Connection Data Section
- Security Section
- Timeout Parameters
- Compression Parameters

Overview of Local Naming Parameters

The tnsnames.ora file is a configuration file that contains network service names mapped to connect descriptors for the local naming method, or net service names mapped to listener protocol addresses.

A net service name is an alias mapped to a database network address contained in a connect descriptor. A connect descriptor contains the location of the listener through a protocol address and the service name of the database to which to connect. Clients and database servers (that are clients of other database servers) use the net service name when making a connection with an application.

By default, the tnsnames.ora file is located in the ORACLE_HOME/network/admin directory. Oracle Net will check the other directories for the configuration file. For example, the order checking the tnsnames.ora file is as follows:

1. The directory specified by the TNS_ADMIN environment variable. If the file is not found in the directory specified, then it is assumed that the file does not exist.
2. If the TNS_ADMIN environment variable is not set, then Oracle Net checks the ORACLE_HOME/network/admin directory.

---

**Note:** On Microsoft Windows, the TNS_ADMIN environment variable is used if it is set in the environment of the process. If the TNS_ADMIN environment variable is not defined in the environment, or the process is a service which does not have an environment, then Microsoft Windows scans the registry for a TNS_ADMIN parameter.

---

**See Also:**
- Oracle Database Global Data Services Concepts and Administration Guide for information about management of global services
- Oracle operating system-specific documentation

### General Syntax of tnsnames.ora

The basic syntax for a tnsnames.ora file is shown in Example 6–1.

**Example 6–1  Basic Format of tnsnames.ora File**

```sql
net_service_name=
 (DESCRIPTION=
  (ADDRESS=(protocol_address_information))
  (CONNECT_DATA=
    (SERVICE_NAME=service_name)))
```

In the preceding example, DESCRIPTION contains the connect descriptor, ADDRESS contains the protocol address, and CONNECT_DATA contains the database service identification information.

### Multiple Descriptions in tnsnames.ora

A tnsnames.ora file can contain net service names with one or more connect descriptors. Each connect descriptor can contain one or more protocol addresses. Example 6–2 shows two connect descriptors with multiple addresses. DESCRIPTION_LIST defines a list of connect descriptors.

**Example 6–2  Net Service Name with Multiple Connect Descriptors in tnsnames.ora**

```sql
net_service_name=
 (DESCRIPTION_LIST=
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521)))
  (CONNECT_DATA=
    (SERVICE_NAME=sales.us.example.com)))
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=hr1-svr)(PORT=1521))
    (ADDRESS=(PROTOCOL=tcp)(HOST=hr2-svr)(PORT=1521)))
  (CONNECT_DATA=
    (SERVICE_NAME=hr.us.example.com)))
```
Multiple Address Lists in tnsnames.ora

The tnsnames.ora file also supports connect descriptors with multiple lists of addresses, each with its own characteristics. In Example 6–3, two address lists are presented. The first address list features client load balancing and no connect-time failover, affecting only those protocol addresses within its ADDRESS_LIST. The second protocol address list features no client load balancing, but does have connect-time failover, affecting only those protocol addresses within its ADDRESS_LIST. The client first tries the first or second protocol address at random, then tries protocol addresses three and four sequentially.

Example 6–3  Multiple Address Lists in tnsnames.ora

```
net_service_name=
 (DESCRIPTION=
  (ADDRESS_LIST=
   (LOAD_BALANCE=on)
   (FAILOVER=off)
   (ADDRESS=(protocol_address_information)))
  (ADDRESS=(protocol_address_information)))
 (ADDRESS_LIST=
   (LOAD_BALANCE=off)
   (FAILOVER=on)
   (ADDRESS=(protocol_address_information)))
 (ADDRESS=(protocol_address_information)))
 (CONNECT_DATA=
  (SERVICE_NAME=service_name)))
```

Note:

- **Oracle Net Manager** supports only the creation of one protocol address list for a connect descriptor.

- Oracle Net Services supports the IFILE parameter in the tnsnames.ora file, with up to three levels of nesting. The parameter is added manually to the file. The following is an example of the syntax:

  IFILE=/tmp/listener_em.ora
  IFILE=/tmp/listener_cust1.ora
  IFILE=/tmp/listener_cust2.ora

  Refer to Oracle Database Reference for additional information.

Connect-Time Failover and Client Load Balancing with Oracle Connection Managers

When a connect descriptor in a tnsnames.ora file contains at least two protocol addresses for **Oracle Connection Manager**, parameters for connect-time failover and load balancing can be included in the file.
Example 6–4 illustrates failover of multiple Oracle Connection Manager protocol addresses.

Example 6–4  Multiple Oracle Connection Manager Addresses in tnsnames.ora

```plaintext
sample1=
(DESCRIPTION=
  (SOURCE_ROUTE=yes)
  (ADDRESS_LIST=
    (ADDRESS=(PROTOCOL=tcp)(HOST=host1)(PORT=1630))   # 1
    (ADDRESS_LIST=
      (FAILOVER=on)
      (LOAD_BALANCE=off)
      (ADDRESS=(PROTOCOL=tcp)(HOST=host2a)(PORT=1630))
      (ADDRESS=(PROTOCOL=tcp)(HOST=host2b)(PORT=1630)))
    (ADDRESS=(PROTOCOL=tcp)(HOST=host3)(PORT=1521)))    # 3
  (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com)))
```

In Example 6–4, the syntax does the following:

1. The client is instructed to connect to the protocol address of the first Oracle Connection Manager, as indicated by:
   ```plaintext
   (ADDRESS=(PROTOCOL=tcp)(HOST=host1)(PORT=1630))
   ```

2. The first Oracle Connection Manager is instructed to connect to the first protocol address of another Oracle Connection Manager. If the first protocol address fails, then it tries the second protocol address. This sequence is specified with the following configuration:
   ```plaintext
   (ADDRESS_LIST=
    (FAILOVER=on)
    (LOAD_BALANCE=off)
    (ADDRESS=(PROTOCOL=tcp)(HOST=host2a)(PORT=1630))
    (ADDRESS=(PROTOCOL=tcp)(HOST=host2b)(PORT=1630)))
   ```

3. Oracle Connection Manager connects to the database service using the following protocol address:
   ```plaintext
   (ADDRESS=(PROTOCOL=tcp)(HOST=host3)(PORT=1521))
   ```

Example 6–5 illustrates client load balancing among two Oracle Connection Managers and two protocol addresses:

Example 6–5  Client Load Balancing in tnsnames.ora

```plaintext
sample2=
(DESCRIPTION=
  (LOAD_BALANCE=on)                                    # 1
  (FAILOVER=on)
  (ADDRESS_LIST=
    (SOURCE_ROUTE=yes)
    (ADDRESS=(PROTOCOL=tcp)(HOST=host1)(PORT=1630))   # 2
    (ADDRESS=(PROTOCOL=tcp)(HOST=host2)(PORT=1521)))
  (ADDRESS_LIST=
    (SOURCE_ROUTE=yes)
    (ADDRESS=(PROTOCOL=tcp)(HOST=host3)(PORT=1630))
    (ADDRESS=(PROTOCOL=tcp)(HOST=host4)(PORT=1521)))
  (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com)))  # 3
```

In Example 6–5, the syntax does the following:
1. The client is instructed to pick an ADDRESS_LIST at random and to fail over to the other if the chosen ADDRESS_LIST fails. This is indicated by the LOAD_BALANCE and FAILOVER parameters being set to on.

2. When an ADDRESS_LIST is chosen, the client first connects to Oracle Connection Manager, using the Oracle Connection Manager protocol address that uses port 1630 indicated for the ADDRESS_LIST.

3. Oracle Connection Manager then connects to the database service, using the protocol address indicated for the ADDRESS_LIST.

Connect Descriptor Descriptions

Each connect descriptor is contained within the DESCRIPTION parameter. Multiple connect descriptors are characterized by the DESCRIPTION_LIST parameter. These parameters are described in this section.

DESCRIPTION

Purpose

To specify a container for a connect descriptor.

Usage Notes

When using more than one DESCRIPTION parameter, put the parameters under the DESCRIPTION_LIST parameter.

Example

```
net_service_name=
  (DESCRIPTION=
    (ADDRESS=...
    (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com)))
```

DESCRIPTION_LIST

Purpose

To define a list of connect descriptors for a particular net service name.

Example

```
net_service_name=
  (DESCRIPTION_LIST=
    (DESCRIPTION=
      (ADDRESS=...
      (CONNECT_DATA=(SERVICE_NAME=sales.example.com)))
    (DESCRIPTION=
      (ADDRESS=...
      (CONNECT_DATA=(SERVICE_NAME=sales2.us.example.com)))))
```

Protocol Address Section

The protocol address section of the tnsnames.ora file specifies the protocol addresses of the listener. If there is only one listener protocol address, then use the ADDRESS parameter. If there is more than one address, then use the ADDRESS_LIST parameter.
Optional Parameters for Address Lists

ADDRESS

Purpose
To define a single listener protocol address.

Usage Notes
Put this parameter under either the ADDRESS_LIST parameter or the DESCRIPTION parameter.

Example
```
net_service_name=
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales-svr)(PORT=1521))
    (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))
```

See Also: Chapter 4, "Protocol Address Configuration" for descriptions of the correct parameters to use for each protocol

ADDRESS_LIST

Purpose
To define a list of protocol addresses.

Usage Notes
If there is only one listener protocol address, then ADDRESS_LIST is not necessary.
Put this parameter under either the DESCRIPTION parameter or the DESCRIPTION_LIST parameter.

Example
```
net_service_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521)))
    (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))
```

Optional Parameters for Address Lists

For multiple addresses, the following parameters are available:

- ENABLE
- FAILOVER
- LOAD_BALANCE
- RECV_BUF_SIZE
- SDU
- SEND_BUF_SIZE
- SOURCE_ROUTE
- TYPE_OF_SERVICE
Optional Parameters for Address Lists

ENABLE

Purpose
To allow the caller to detect a terminated remote server, typically it takes 2 hours or more to notice.

Usage Notes
The keepalive feature on the supported TCP transports can be enabled for a net service client by putting (ENABLE=broken) under the DESCRIPTION parameter in the connect string. On the client side, the default for tcp_keepalive is off. Operating system TCP configurables, which vary by platform, define the actual keepalive timing details.

Values
broken

Example
net_service_name=
 (DESCRIPTION=
  (ENABLE=broken)
  (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
  (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521))
  (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))

Although the preceding example has multiple addresses, the ADDRESS_LIST parameter was not used. This is because the ADDRESS_LIST parameter is not mandatory.

FAILOVER

Purpose
To enable or disable connect-time failover for multiple protocol addresses.

Usage Notes
When you set the parameter to on, yes, or true, Oracle Net fails over at connect time to a different address if the first protocol address fails. When you set the parameter to off, no, or false, Oracle Net tries one protocol address.

Put this parameter under the DESCRIPTION_LIST parameter, the DESCRIPTION parameter, or the ADDRESS_LIST parameter.

---

**Important:** Do not set the GLOBAL_DBNAME parameter in the SID_LIST_listener_name section of the listener.ora. A statically configured global database name disables connect-time failover.

---

Default
on for the DESCRIPTION_LIST, DESCRIPTION, and ADDRESS_LIST parameters

Values
- yes | on | true
- no | off | false
Optional Parameters for Address Lists

Example

```sql
net_service_name=
  (DESCRIPTION=
    (LOAD_BALANCE=on)
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521)))
  (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))
```

**LOAD_BALANCE**

**Purpose**

To enable or disable client load balancing for multiple protocol addresses.

**Usage Notes**

When you set the parameter to `on`, `yes`, or `true`, Oracle Net goes through the list of addresses in a random sequence, balancing the load on the various listener or Oracle Connection Manager protocol addresses. When you set the parameter to `off`, `no`, or `false`, Oracle Net tries the protocol addresses sequentially until one succeeds.

Put this parameter under the `DESCRIPTION_LIST` parameter, the `DESCRIPTION` parameter, or the `ADDRESS_LIST` parameter.

**Default**

`on` for `DESCRIPTION_LIST`

**Values**

- `yes` | `on` | `true`
- `no` | `off` | `false`

**Example**

```sql
net_service_name=
  (DESCRIPTION=
    (LOAD_BALANCE=on)
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521)))
  (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))
```

**RECV_BUF_SIZE**

**Purpose**

To specify, in bytes, the buffer space for receive operations of sessions.

**Usage Notes**

This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.

Put this parameter under the `DESCRIPTION` parameter or at the end of the protocol address.

Setting this parameter in the connect descriptor for a client overrides the `RECV_BUF_SIZE` parameter at the client-side `sqlnet.ora` file.
Optional Parameters for Address Lists

Local Naming Parameters in the tnsnames.ora File

    (SDU=8192)
    (ADDRESS_LIST= |
Optional Parameters for Address Lists

```
ADDRESS=(PROTOCOL=tcp)(HOST=sales1-server)(PORT=1521))
ADDRESS=(PROTOCOL=tcp)(HOST=sales2-server)(PORT=1521))
(CONNECT_DATA=
 (SERVICE_NAME=sales.us.example.com))
```

**See Also:** Oracle Database Net Services Administrator’s Guide for complete SDU usage and configuration information

**SEND_BUF_SIZE**

**Purpose**

To specify, in bytes, the buffer space for send operations of sessions.

**Usage Notes**

This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.

Put this parameter under the `DESCRIPTION` parameter or at the end of the protocol address.

Setting this parameter in the connect descriptor for a client overrides the `SEND_BUF_SIZE` parameter at the client-side `sqlnet.ora` file.

---

**Note:** Additional protocols might support this parameter on certain operating systems. Refer to the operating system-specific documentation for information about additional protocols.

---

**Default**

The default value for this parameter is operating system specific. The default for the Linux 2.6 operating system is 110592 (108 KB) bytes.

**Example**

```
net_service_name=
 (DESCRIPTION=
 (ADDRESS_LIST=
 (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-server)(PORT=1521)
 (SEND_BUF_SIZE=11784))
 (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-server)(PORT=1521)
 (SEND_BUF_SIZE=11784))
 (CONNECT_DATA=
 (SERVICE_NAME=sales.us.example.com)))
net_service_name=
 (DESCRIPTION=
 (SEND_BUF_SIZE=11784)
 (ADDRESS_LIST=
 (ADDRESS=(PROTOCOL=tcp)(HOST=hr1-server)(PORT=1521)
 (ADDRESS=(PROTOCOL=tcp)(HOST=hr2-server)(PORT=1521))
 (CONNECT_DATA=
 (SERVICE_NAME=hr.us.example.com)))
```

**See Also:** Oracle Database Net Services Administrator’s Guide for additional information about configuring this parameter
**SOURCE_ROUTE**

**Purpose**
To enable routing through multiple protocol addresses.

**Usage Notes**
When you set this parameter to on or yes, Oracle Net uses each address in order until the destination is reached.

To use Oracle Connection Manager, an initial connection from the client to Oracle Connection Manager is required, and a second connection from Oracle Connection Manager to the listener is required.

Put this parameter under either the DESCRIPTION_LIST parameter, the DESCRIPTION parameter, or the ADDRESS_LIST parameter.

**Default**
off

**Values**
- yes | on
- no | off

**Example**
```
net_service_name=
  (DESCRIPTION=
    (SOURCE_ROUTE=on)
    (ADDRESS=(PROTOCOL=tcp)(HOST=cman-pc)(PORT=1630))
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
    (CONNECT_DATA=(SERVICE_NAME=sales.us.example.com))
```

**See Also:** Oracle Database Net Services Administrator’s Guide for complete configuration information

**TYPE_OF_SERVICE**

**Purpose**
To specify the type of service to use for an Oracle Rdb database.

**Usage Notes**
This parameter should only be used if the application supports both an Oracle Rdb and Oracle database service, and you want the application to load balance between the two.

Put this parameter under the DESCRIPTION parameter.

**Example**
```
net_service_name=
  (DESCRIPTION_LIST=
    (DESCRIPTION=
      (ADDRESS=...)
      (CONNECT_DATA=
        (SERVICE_NAME=generic)
        (RDB_DATABASE=[.mf]mf_personal.rdb)
```

The connection data section of the tnsnames.ora file specifies the name of the destination service. The following parameters are available:

- **CONNECT_DATA**
- **FAILOVER_MODE**
- **GLOBAL_NAME**
- **HS**
- **INSTANCE_NAME**
- **RDB_DATABASE**
- **SERVER**
- **SERVICE_NAME**

**CONNECT_DATA**

**Purpose**

To define the service to which to connect, such as `SERVICE_NAME`.

**Usage Notes**

Put this parameter under the `DESCRIPTION` parameter.

`CONNECT_DATA` permits the following additional parameters:

- **FAILOVER_MODE**
- **GLOBAL_NAME**
- **HS**
- **INSTANCE_NAME**
- **RDB_DATABASE**
- **SERVER**
- **SERVICE_NAME**

**Example**

```sql
net_service_name=
(DESCRIPTION=
 (ADDRESS_LIST=
  (ADDRESS=(PROTOCOL=tcp)(HOST=sales1-svr)(PORT=1521))
  (ADDRESS=(PROTOCOL=tcp)(HOST=sales2-svr)(PORT=1521)))
 (CONNECT_DATA=
  (SERVICE_NAME=sales.us.example.com)))
```
FAILOVER_MODE

Purpose
To instruct Oracle Net to fail over to a different listener if the first listener fails during run time.

Usage Notes
Depending upon the configuration, the session or any SELECT statements which were in progress are automatically failed over.

This type of failover is called Transparent Application Failover (TAF) and should not be confused with the connect-time failover FAILOVER parameter.

Put this parameter under the CONNECT_DATA parameter.

Additional Parameters
FAILOVER_MODE supports the following parameters:

■ BACKUP: Specifies the failover node by its net service name. A separate net service name must be created for the failover node.

■ TYPE: Specifies the type of failover. Three types of Oracle Net failover functionality are available by default to Oracle Call Interface (OCI) applications:
  ➥ SESSION: Fails over the session. For example, if a user’s connection is lost, then a new session is automatically created for the user on the backup. This type of failover does not attempt to recover selects.
  ➥ SELECT: Allows users with open cursors to continue fetching them after failure. However, this mode involves overhead on the client side in normal select operations.
  ➥ NONE: This is the default, in which no failover functionality is used. This can also be explicitly specified to prevent failover from happening.

■ METHOD: Specifies how fast failover is to occur from the primary node to the backup node:
  ➥ BASIC: Establishes connections at failover time. This option requires almost no work on the backup database server until failover time.
  ➥ PRECONNECT: Pre-establishes connections. This provides faster failover but requires that the backup instance be able to support all connections from every supported instance.

■ TRANSACTION: Allows the database to complete the current database transaction following a recoverable error. This parameter is used with the COMMIT_OUTCOME=TRUE parameter.

■ RETRIES: Specifies the number of times to attempt to connect after a failover. If DELAY is specified, then RETRIES defaults to five retry attempts.

■ DELAY: Specifies the amount of time in seconds to wait between connect attempts. If RETRIES is specified, then DELAY defaults to one second.

Note: If a callback function is registered, then RETRIES and DELAY parameters are ignored.
GLOBAL_NAME

Purpose

To identify the Oracle Rdb database.

Usage Notes

Put this parameter under the CONNECT_DATA parameter.

Example

```plaintext
net_service_name=
  {DESCRIPTION=  
    {ADDRESS_LIST=  
      {ADDRESS=...}  
      {ADDRESS=...}}  
    {CONNECT_DATA=  
      {SERVICE_NAME=generic}  
      {RDB_DATABASE=.mf:mf_personal.rdb}  
      {GLOBAL_NAME=alpha5}}}
```

HS

Purpose

To direct Oracle Net to connect to a non-Oracle system through Heterogeneous Services.

Usage Notes

Put this parameter under the CONNECT_DATA parameter.

Default

None

Values

ok

Example

```plaintext
net_service_name=
  {DESCRIPTION=  
    {ADDRESS_LIST=  
      {ADDRESS=...}  
      {ADDRESS=...}}  
    {CONNECT_DATA=  
      {SID=sales6}  
      {HS=ok}}}
```

See Also:  Oracle Database Net Services Administrator’s Guide for complete configuration information
INSTANCE_NAME

Purpose
To identify the database instance to access.

Usage Notes
Set the value to the value specified by the INSTANCE_NAME parameter in the initialization parameter file.
Put this parameter under the CONNECT_DATA parameter.

Example

```
net_service_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=...)
      (ADDRESS=...))
  )
```

See Also: Oracle Database Net Services Administrator’s Guide for additional information about the use of INSTANCE_NAME

RDB_DATABASE

Purpose
To specify the file name of an Oracle Rdb database.

Usage Notes
Put this parameter under the CONNECT_DATA parameter.

Example

```
net_service_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=...)
    )
  )
```

SERVER

Purpose
To direct the listener to connect the client to a specific type of service handler.

Usage Notes
Put this parameter under the CONNECT_DATA parameter.

Values
- dedicated to specify whether client requests be served by dedicated server.
shared to specify whether client requests be served by a dispatcher or shared server.

pooled to get a connection from the connection pool if database resident connection pooling is enabled on the server.

---

**Notes:**

- Shared server must be configured in the database initialization file in order for the client to connect to the database with a shared server process.
- The **USEDEDICATEDSERVER** parameter in the sqlnet.ora file overrides this parameter.

---

**Example**

```sql
net_service_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=...)
      (ADDRESS=...))
    (CONNECT_DATA=
      (SERVICE_NAME=sales.us.example.com)
      (SERVER=dedicated)))
```

---

**SERVICE_NAME**

**Purpose**

To identify the Oracle Database database service to access.

**Usage Notes**

Set the value to a value specified by the **SERVICE NAMES** parameter in the initialization parameter file.

Put this parameter under the **CONNECT_DATA** parameter.

**Example**

```sql
net_service_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=...)
      (ADDRESS=...))
    (CONNECT_DATA=
      (SERVICE_NAME=sales.us.example.com)))
```

**See Also:** Oracle Database Net Services Administrator’s Guide for additional information about the use of the **SERVICE_NAME** parameter

---

**Security Section**

The security section of the tnsnames.ora file specifies the following security-related parameters for use with Oracle security features:

- **SECURITY**
- **SSL_SERVER_CERT_DN**
SECURITY

Purpose
To enable secure connections. Put this parameter under the DESCRIPTION parameter.

Usage Notes
SECURITY permits the SSL_SERVER_CERT_DN parameter.

Example
```
net_service_name=
{DESCRIPTION=
{ADDRESS_LIST=
 {ADDRESS={PROTOCOL=tcp}(HOST=sales1-svr)(PORT=1521))
 {ADDRESS={PROTOCOL=tcp}(HOST=sales2-svr)(PORT=1521))
{CONNECT_DATA=
 {SERVICE_NAME=sales.us.example.com})
 {SECURITY=
 {SSL_SERVER_CERT_DN="cn=sales,cn=OracleContext,dc=us,dc=acme,dc=com"}}
```

SSL_SERVER_CERT_DN

Purpose
To specify the distinguished name (DN) of the database server.

Usage Notes
The client uses this information to obtain the list of DNs it expects for each of the servers, enforcing the database server DN to match its service name.

Use this parameter with the sqlnet.ora parameter SSL_SERVER_DN_MATCH to enable server DN matching.

Example
```
net_service_name=
{DESCRIPTION=
 {ADDRESS_LIST=
 {ADDRESS=...}
 {ADDRESS=...}}
{CONNECT_DATA=
 {SERVICE_NAME=finance.us.example.com})
 {SECURITY=
 {SSL_SERVER_CERT_DN="cn=finance,cn=OracleContext,dc=us,dc=acme,dc=com"}}
```

See Also: Oracle Database Security Guide

Timeout Parameters

The timeout section of the tnsnames.ora file provides the ability to specify timeout and retry configuration through the TNS connect string. The following parameters can be set at the DESCRIPTION level of a connect string:

- CONNECT_TIMEOUT
- RETRY_COUNT
- RETRY_DELAY
Timeout Parameters

- **TRANSPORT_CONNECT_TIMEOUT**

**CONNECT_TIMEOUT**

**Purpose**

To specify the timeout duration in seconds for a client to establish an Oracle Net connection to an Oracle database.

**Usage Notes**

Put this parameter under the `DESCRIPTION` parameter.

The timeout interval specified by `CONNECT_TIMEOUT` is a superset of the TCP connect timeout interval. It includes the time to be connected to the database instance providing the requested service, not just the duration of the TCP connection.

The timeout interval is applicable for each `ADDRESS` in an `ADDRESS_LIST`, and each IP address to which a host name is mapped.

The `CONNECT_TIMEOUT` parameter is equivalent to the `sqlnet.ora` parameter `SQLNET.OUTBOUND_CONNECT_TIMEOUT`, and overrides it.

**Example**

```
net_service_name=
  (DESCRIPTION= 
    (CONNECT_TIMEOUT=10) (RETRY_COUNT=3) 
    (ADDRESS_LIST= 
      (ADDRESS=(PROTOCOL=tcp) (HOST=sales1-svr) (PORT=1521)) 
      (ADDRESS=(PROTOCOL=tcp) (HOST=sales2-svr) (PORT=1521)) 
    ) 
  ) 
  (CONNECT_DATA= 
    (SERVICE_NAME=sales.us.example.com) 
  )
```

**RETRY_COUNT**

**Purpose**

To specify the number of times an `ADDRESS` list is traversed before the connection attempt is terminated.

**Usage Notes**

Put this parameter under the `DESCRIPTION` parameter.

When a `DESCRIPTION_LIST` is specified, each `DESCRIPTION` is traversed multiple times based on the specified number of retries.

**Example**

```
net_service_name=
  (DESCRIPTION_LIST= 
    (DESCRIPTION= 
      (CONNECT_TIMEOUT=10) (RETRY_COUNT=3) 
      (ADDRESS_LIST= 
        (ADDRESS=(PROTOCOL=tcp) (HOST=sales1a-svr) (PORT=1521)) 
        (ADDRESS=(PROTOCOL=tcp) (HOST=sales1b-svr) (PORT=1521)) 
      ) 
      (CONNECT_DATA= 
        (SERVICE_NAME=sales1.example.com) 
      ) 
    ) 
    (DESCRIPTION= 
      (CONNECT_TIMEOUT=60) (RETRY_COUNT=1) 
      (ADDRESS_LIST= 
```
RETRY_DELAY

Purpose
To specify the delay in seconds between subsequent retries for a connection. This parameter works in conjunction with RETRY_COUNT parameter.

Usage Notes
Put this parameter under the DESCRIPTION parameter.

When a DESCRIPTION_LIST is specified, each DESCRIPTION is traversed multiple times based on the specified number of retries, and the specific delay for the description.

Example
```
net_service_name=
(DESCRIPTION_LIST=
 (DESCRIPTION=
  (CONNECT_TIMEOUT=10) (RETRY_COUNT=3) (RETRY_DELAY=2)
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales1a-svr) (PORT=1521))
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales1b-svr) (PORT=1521))
  (CONNECT_DATA=(SERVICE_NAME=sales1.example.com)))
 (DESCRIPTION=
  (CONNECT_TIMEOUT=60) (RETRY_COUNT=2) (RETRY_DELAY=1)
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales2a-svr) (PORT=1521))
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales2b-svr) (PORT=1521))
  (CONNECT_DATA=(SERVICE_NAME=sales2.us.example.com))))
```

TRANSPORT_CONNECT_TIMEOUT

Purpose
To specify the transportation timeout duration in seconds for a client to establish an Oracle Net connection to an Oracle database.

Usage Notes
This parameter is put under the DESCRIPTION parameter.

The TRANSPORT_CONNECT_TIMEOUT parameter specifies the time, in seconds, for a client to establish a TCP connection to the database server. The default value is 60 seconds.

The timeout interval is applicable for each ADDRESS in an ADDRESS_LIST description, and each IP address that a host name is mapped. The TRANSPORT_CONNECT_TIMEOUT parameter is equivalent to the sqlnet.ora parameter TCP_CONNECT_TIMEOUT, and overrides it.

Example
```
net_service_name =
 (DESCRIPTION=
  (TRANSPORT_CONNECT_TIMEOUT=10)
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales1-svr) (PORT=1521)))
```
Compression Parameters

The compression section of the tnsnames.ora file provides the ability to enable compression and specify compression levels. The following parameters can be set at the DESCRIPTION level of a connect string:

- COMPRESSION
- COMPRESSION_LEVELS

COMPRESSION

Purpose
To enable or disable data compression.

Usage Notes
Put this parameter under the DESCRIPTION parameter.

Setting this parameter in the connect descriptor for a client overrides the SQLNET.COMPRESSION parameter in the client-side sqlnet.ora file.

Default
off

Values
- on to enable data compression.
- off to disable data compression.

Example

net_service_name=
  (DESCRIPTION=
    (COMPRESSION=on)
    (ADDRESS_LIST=
      (ADDRESS= (PROTOCOL=tcp) (HOST=sales1-server) (PORT=1521)))
      (ADDRESS= (PROTOCOL=tcp) (HOST=sales2-server) (PORT=1521)))
      (CONNECT_DATA=
        (SERVICE_NAME=sales.us.example.com)))

COMPRESSION_LEVELS

Purpose
To specify the compression level.

Usage Notes
The compression levels are used at the time of negotiation to verify which levels are used at both ends, and select one level. Put this parameter under the DESCRIPTION parameter.
This parameter is used with the `COMPRESSION` parameter. Setting this parameter in the connect descriptor for a client overrides the `SQLNET.COMPRESSION_LEVELS` parameter in the client-side `sqlnet.ora` file.

**Default**

- `low`

**Values**

- `low` for low CPU usage and a low compression ratio.
- `high` for high CPU usage and a high compression ratio.

**Example**

```plaintext
net_service_name=
  (DESCRIPTION=
   (COMPRESSION=on)
   (COMPRESSION_LEVELS= (LEVEL=low) (LEVEL=high))
   (ADDRESS_LIST=
    (ADDRESS=(PROTOCOL=tcp) (HOST=sales1-server) (PORT=1521))
    (ADDRESS=(PROTOCOL=tcp) (HOST=sales2-server) (PORT=1521)))
   (CONNECT_DATA=
    (SERVICE_NAME=sales.us.example.com)))
```
This chapter provides a complete listing of the `listener.ora` file configuration parameters.

This chapter contains the following topics:

- Overview of Oracle Net Listener Configuration File
- Protocol Address Parameters
- Connection Rate Limiter Parameters
- Control Parameters
- ADR Diagnostic Parameters for Oracle Net Listener
- Non-ADR Diagnostic Parameters for Oracle Net Listener
- Class of Secure Transports Parameters

## Overview of Oracle Net Listener Configuration File

Oracle Net Listener configuration, stored in the `listener.ora` file, consists of the following elements:

- Name of the listener
- Protocol addresses that the listener is accepting connection requests on
- Valid nodes that the listener allows to register with the database
- Database services
- Control parameters

Dynamic **service registration**, eliminates the need for static configuration of supported services. However, static service configuration is required if you plan to use Oracle Enterprise Manager Cloud Control.

By default, the `listener.ora` file is located in the `ORACLE_HOME/network/admin` directory. The `listener.ora` file can also be stored the following locations:

- The directory specified by the `TNS_ADMIN` environment variable or registry value.
- On Linux and UNIX operating systems, it is the global configuration directory. For example, on the Oracle Solaris operating system, the directory is `/var/opt/oracle`.
It is possible to configure multiple listeners, each with a unique name, in one listener.ora file. Multiple listener configurations are possible because each of the top-level configuration parameters has a suffix of the listener name or is the listener name itself.

Example 7–1 shows a listener.ora file for a listener named LISTENER, which is the default name of the listener.

### Example 7–1 listener.ora File

```orchestra
LISTENER=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sale-server)(PORT=1521))
      (ADDRESS=(PROTOCOL=ipc)(KEY=extproc))))
```

### Protocol Address Parameters

The protocol address section of the listener.ora file defines the protocol addresses on which the listener is accepting connection requests. This section describes the most common parameters used in protocol addresses. The ADDRESS_LIST parameter is also supported.

### See Also:
- Chapter 4, "Protocol Address Configuration" for additional information about the ADDRESS_LIST parameter

This section lists and describes the following parameters:

- ADDRESS
- DESCRIPTION
- IP

**Notes:**

- It is often useful to configure multiple listeners in one listener.ora file. However, Oracle recommends running only one listener for each node in most customer environments.
- Oracle Net Services supports the IFILE parameter in the listener.ora file, with up to three levels of nesting. The parameter is added manually to the file. The following is an example of the syntax:

  ```orchestra
  IFILE=/tmp/listener_em.ora
  IFILE=/tmp/listener_cust1.ora
  IFILE=/tmp/listener_cust2.ora
  ```

  Refer to Oracle Database Reference for additional information.
Protocol Address Parameters

- **QUEUESIZE**
- **RECV_BUF_SIZE**
- **SEND_BUF_SIZE**

**ADDRESS**

**Purpose**

To specify a single listener protocol address.

**Usage Notes**

Put this parameter under the DESCRIPTION parameter.

**Example**

```plaintext
listener_name=
  (DESCRIPTION=
   (ADDRESS_LIST=
    (ADDRESS=(PROTOCOL=tcp)(HOST=hr-server)(PORT=1521))
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521))
   )
  )
```

**See Also:** Chapter 4, "Protocol Address Configuration" for descriptions of the correct parameters to use for each type of support protocol

**DESCRIPTION**

**Purpose**

To contain listener protocol addresses.

**Example**

```plaintext
listener_name=
  (DESCRIPTION=
   (ADDRESS_LIST=
    (ADDRESS=(PROTOCOL=tcp)(HOST=hr-server)(PORT=1521))
    (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521))
   )
  )
```

**IP**

**Purpose**

To determine which IP address the listener listens on when a host name is specified.

**Usage Notes**

This parameter is only applicable when the HOST parameter specifies a host name.

**Values**

- **first**
  
  Listen on the first IP address returned by the DNS resolution of the host name. If the user wants the listener to listen on the first IP to which the specified host name resolves, then the address must be qualified with (IP=first).

- **v4_only**

Oracle Net Listener Parameters in the listener.ora File 7-3
Listen only on IPv4 addresses.

- v6_only

Listen only on IPv6 addresses.

Default

This feature is disabled by default.

Example

```
listener_name=
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=rancode1-vip)(PORT=1522)(IP=v6_only))
```

**QUEUESIZE**

Purpose

To specify the number of concurrent connection requests that the listener can accept on a TCP/IP or IPC listening endpoint (protocol address).

Usage Notes

The number of concurrent connection requests is dependent on the platform and listener usage scenarios. If the listener is heavily-loaded, then set the parameter to a higher number.

Put this parameter at the end of the protocol address with its value set to the expected number of concurrent connection requests.

Default

The default number of concurrent connection requests is operating system specific.

Example

```
listener_name=
  (DESCRIPTION=
    (ADDRESS=(PROTOCOL=tcp)(HOST=hr-server)(PORT=1521)(QUEUESIZE=20))
```

See Also: Oracle Database Net Services Administrator’s Guide for additional information about configuring this parameter

**RECV_BUF_SIZE**

Purpose

To specify, in bytes, the buffer space for receive operations of sessions.

Usage Notes

Put this parameter under the DESCRIPTION parameter or at the end of the protocol address with its value set to the expected number of bytes.

This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.
Protocol Address Parameters

The default value for this parameter is operating system specific. The default for the Linux operating system is 110592 bytes (108 KB).

Example

```sql
listener_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)
        (RECV_BUF_SIZE=11784))
      (ADDRESS=(PROTOCOL=ipc)(KEY=extproc)
        (RECV_BUF_SIZE=11784))))
```

See Also: *Oracle Database Net Services Administrator’s Guide* for additional information about configuring this parameter

SEND_BUF_SIZE

Purpose

To specify, in bytes, the buffer space for send operations of sessions.

Usage Notes

Put this parameter under the DESCRIPTION parameter or at the end of the protocol address.

This parameter is supported by the TCP/IP, TCP/IP with SSL, and SDP protocols.

Note: Additional protocols might support this parameter on certain operating systems. Refer to operating system-specific documentation for additional information about additional protocols that support this parameter.

Default

The default value for this parameter is operating system specific. The default for the Linux operating system is 110592 bytes (108 KB).

Example

```sql
listener_name=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521))
      (ADDRESS=(PROTOCOL=ipc)(KEY=extproc)))
```
Connection Rate Limiter Parameters

The connection rate limiter feature in Oracle Net Listener enables a database administrator to limit the number of new connections handled by the listener. When this feature is enabled, Oracle Net Listener imposes a user-specified maximum limit on the number of new connections handled by the listener every second.

Depending on the configuration, the rate can be applied to a collection of endpoints, or to a specific endpoint.

This feature is controlled through the following listener.ora configuration parameters:

- **CONNECTION_RATE_listener name**
- **RATE_LIMIT**

**CONNECTION_RATE_listener name**

**Purpose**

To specify a global rate that is enforced across all listening endpoints that are rate-limited.

**Usage Notes**

When this parameter is specified, it overrides any endpoint-level numeric rate values that might be specified.

**Syntax**

CONNECTION_RATE_listener name=number_of_connections_per_second

**RATE_LIMIT**

**Purpose**

To indicate that a particular listening endpoint is rate limited.

**Usage Notes**

The parameter is specified in the ADDRESS section of the listener endpoint configuration.

**Syntax**

LISTENER=

ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)(RATE_LIMIT=yes)
Control Parameters

When the `RATE_LIMIT` parameter is set to `yes` for an endpoint, that endpoint is included in the enforcement of the global rate configured by the `CONNECTION_RATE_listener_name` parameter. The global rate limit is enforced individually at each endpoint that has `RATE_LIMIT` set to `yes`.

Dynamic endpoints for listeners managed by Oracle Clusterware have the `RATE_LIMIT` parameter set to `yes`.

When the `RATE_LIMIT` parameter is set to a value greater than 0, then the rate limit is enforced at that endpoint level.

Examples

The following examples use the `CONNECTION_RATE_listener_name` and `RATE_LIMIT` parameters.

Example 1

```
CONNECTION_RATE_LISTENER=10

LISTENER=
  (ADDRESS_LIST=
    (ADDRESS=(PROTOCOL=tcp) (HOST=) (PORT=1521) (RATE_LIMIT=yes))
    (ADDRESS=(PROTOCOL=tcp) (HOST=) (PORT=1522) (RATE_LIMIT=yes))
    (ADDRESS=(PROTOCOL=tcp) (HOST=) (PORT=1523))
  )
```

In the preceding example, the global rate of new connections is enforced separately for each endpoint. Connections through port 1521 are limited at 10 every second, and the connections through port 1522 are also separately limited at 10 every second. Connections through port 1523 are not limited.

Example 2

```
LISTENER= (ADDRESS_LIST=
  (ADDRESS=(PROTOCOL=tcp) (HOST=) (PORT=1521) (RATE_LIMIT=5))
  (ADDRESS=(PROTOCOL=tcp) (HOST=) (PORT=1522) (RATE_LIMIT=10))
  (ADDRESS=(PROTOCOL=tcp) (HOST=) (PORT=1523))
)
```

In the preceding example, the connection rates are enforced at the endpoint level. A maximum of 5 connections are processed through port 1521 every second. The limit for connections through port 1522 is 10 every second. Connections through port 1523 are not limited.

---

**Note:** The global `CONNECTION_RATE_listener_name` parameter is not specified in the preceding configuration. If it is specified, then the limits on ports 1521 and 1522 are ignored, and the global value is used instead.

Control Parameters

This section describes the following parameters that control the behavior of the listener:

- `ADMIN_RESTRICTIONS_listener_name`
- `CRS_NOTIFICATION_listener_name`
- `DEDICATED_THROUGH_BROKER_listener_name`
Control Parameters

- DEFAULT_SERVICE_listener_name
- INBOUND_CONNECT_TIMEOUT_listener_name
- MAX_ALL_CONNECTIONS_listener_name
- MAX_REG_CONNECTIONS_listener_name
- REGISTRATION_EXCLUDED_NODES_listener_name
- REGISTRATION_INVITED_NODES_listener_name
- REMOTE_REGISTRATION_ADDRESS_listener_name
- SAVE_CONFIG_ON_STOP_listener_name
- SSL_CLIENT_AUTHENTICATION
- SUBSCRIBE_FOR_NODE_DOWN_EVENT_listener_name
- USE_SID_AS_SERVICE_listener_name
- VALID_NODE_CHECKING_REGISTRATION_listener_name
- WALLET_LOCATION

**ADMIN_RESTRICTIONS_listener_name**

**Purpose**
To restrict runtime administration of the listener.

**Usage Notes**
Setting `ADMIN_RESTRICTIONS_listener_name=on` disables the runtime modification of parameters in `listener.ora`. That is, the listener refuses to accept `SET` commands that alter its parameters. To change any of the parameters in `listener.ora`, including `ADMIN_RESTRICTIONS_listener_name` itself, modify the `listener.ora` file manually and reload its parameters using the `RELOAD` command for the new changes to take effect without explicitly stopping and restarting the listener.

**Default**
off

**Example**
ADMIN_RESTRICTIONS_listener=on

**CRS_NOTIFICATION_listener_name**

**Purpose**
To set notification.

**Usage Notes**
By default, the Oracle Net listener notifies Cluster Ready Services (CRS) when it is started or stopped. These notifications allow CRS to manage the listener in an Oracle Real Application Clusters environment. This behavior can be prevented by setting the `CRS_NOTIFICATION_listener_name` parameter to off.

**Default**
on
Values

on | off

**DEDICATED_THROUGH_BROKER_listener_name**

**Purpose**

To enable the server to spawn a thread or process when a connection to the database is requested through the listener.

**Default**

off

**Values**

on | off

**Example**

DEDICATED_THROUGH_BROKER_listener=on

**DEFAULT_SERVICE_listener_name**

**Purpose**

To enable users to connect to the database without having to specify a service name from the client side.

**Usage Notes**

In Oracle Database 12c, when a client tries to connect to the database the connection request passes through the listener. The listener may be servicing several different databases. If a service name is configured in this parameter, then users may not necessarily need to specify a service name in the connect syntax. If a user specifies a service name, then the listener connects the user to that specific database, otherwise the listener connects to the service name specified by the `DEFAULT_SERVICE_listener_name` parameter. For container databases, the client must explicitly specify the service name.

**See Also:** Oracle Database Net Services Administrator’s Guide for additional information about the Easy Connect naming method

**Default**

There is no default value for the `DEFAULT_SERVICE_listener_name` parameter. If this parameter is not configured and a user does not specify a fully-qualified service name in the connect syntax, then the connection attempt fails. This parameter only accepts one value.

**Example**

DEFAULT_SERVICE_listener=sales.us.example.com
**INBOUND_CONNECT_TIMEOUT_listener_name**

**Purpose**
To specify the time, in seconds, for the client to complete its connect request to the listener after the network connection had been established.

**Usage Notes**
If the listener does not receive the client request in the time specified, then it terminates the connection. In addition, the listener logs the IP address of the client and an ORA-12525:TNS: listener has not received client's request in time allowed error message to the listener.log file.

To protect both the listener and the database server, Oracle recommends setting this parameter in combination with the SQLNET.INBOUND_CONNECT_TIMEOUT parameter in the sqlnet.ora file. When specifying values for these parameters, consider the following recommendations:

- Set both parameters to an initial low value.
- Set the value of the INBOUND_CONNECT_TIMEOUT_listener_name parameter to a lower value than the SQLNET.INBOUND_CONNECT_TIMEOUT parameter.

For example, you can set the INBOUND_CONNECT_TIMEOUT_listener_name parameter to 2 seconds and the INBOUND_CONNECT_TIMEOUT parameter to 3 seconds. If clients are unable to complete connections within the specified time due to system or network delays that are normal for the particular environment, then increment the time as needed.

**Default**
60 seconds

**Example**
```
INBOUND_CONNECT_TIMEOUT_listener=2
```

**MAX_ALL_CONNECTIONS_listener_name**

**Purpose**
To specify the maximum number of concurrent registration and client connection sessions that can be supported by Oracle Net Listener.

**Usage Notes**
This number includes registration connections from databases, and ongoing client connection establishment requests. After a connection is established, the clients do not maintain a connection to the listener. This limit only applies to client connections that are in the initial connection establishment phase from a listener perspective.

**Default**
Operating system-specific

**Example**
```
MAX_ALL_CONNECTIONS_listener=40
```
**MAX_REG_CONNECTIONS_listener_name**

**Purpose**
To specify the maximum number of concurrent registration connection sessions that can be supported by Oracle Net Listener.

**Default**
512

**Example**
MAX_REG_CONNECTIONS_listener=20

**REGISTRATION_EXCLUDED_NODES_listener_name**

**Purpose**
To specify the list of nodes that cannot register with the listener.

**Usage Notes**
The list can include host names or CIDR notation for IPv4 and IPv6 addresses. The wildcard format (*) is supported for IPv4 addresses. The presence of a host name in the list results in the inclusion of all IP addresses mapped to the host name. The host name should be consistent with the public network interface.

If the REGISTRATION_INVITED_NODES_listener_name parameter and the REGISTRATION_EXCLUDED_NODES_listener_name parameter are set, then the REGISTRATION_EXCLUDED_NODES_listener_name parameter is ignored.

**Values**
Valid nodes and subnet IP addresses or names.

**Example**
REGISTRATION_EXCLUDED_NODES_listener = (10.1.26.*, 10.16.40.0/24, \ 
2001:DB8:3eff:fe38, node2)

**REGISTRATION_INVITED_NODES_listener_name**

**Purpose**
To specify the list of node that can register with the listener.

**Usage Notes**
The list can include host names or CIDR notation for IPv4 and IPv6 addresses. The wildcard format (*) is supported for IPv4 addresses. The presence of a host name in the list results in the inclusion of all IP addresses mapped to the host name. The host name should be consistent with the public network interface.

If the REGISTRATION_INVITED_NODES_listener_name parameter and the REGISTRATION_EXCLUDED_NODES_listener_name parameter are set, then the REGISTRATION_EXCLUDED_NODES_listener_name parameter is ignored.
**Values**

Valid nodes and subnet IP addresses or names.

**Example**

```
REGISTRATION_INVITED_NODES_listener = (10.1.35.*, 10.1.34.0/24, \
2001:DB8:fe38:7303, node1)
```

**REMOTE_REGISTRATION_ADDRESS_listener_name**

**Purpose**

To secure registration requests through dedicated secure registration endpoints for SCAN listeners.

**Usage Notes**

The registration endpoint is on a private network within the cluster. All remote registration requests coming in on normal listening endpoints are redirected to the registration endpoint. Any system which is not a part of the cluster cannot connect to the endpoint.

**Default**

This parameter is configured internally in the SCAN listener to restrict registrations to the private network. The value of this parameter should not be modified or specified explicitly. The only supported explicit setting is for turning this feature off by setting the value to `OFF`. The value is `OFF` in non-SCAN listeners.

**Values**

- `off`

**Example**

```
REMOTE_REGISTRATION_ADDRESS_listener=off
```

**SAVE_CONFIG_ON_STOP_listener_name**

**Purpose**

To specify whether runtime configuration changes are saved to the `listener.ora` file.

**Usage Notes**

When you set the parameter to `true`, any parameters that were modified while the listener was running using the Listener Control utility `SET` command are saved to the `listener.ora` file when the `STOP` command is issued. When you set the parameter to `false`, the Listener Control utility does not save the runtime configuration changes to the `listener.ora` file.

**Default**

- `false`

**Values**

- `true`
- `false`
Example

```
SAVE_CONFIG_ON_STOP_listener=true
```

**SSL_CLIENT_AUTHENTICATION**

**Purpose**

To specify whether a client is authenticated using the Secure Sockets Layer (SSL).

**Usage Notes**

The database server authenticates the client. Therefore, this value should be set to `false`. If this parameter is set to `true`, then the listener attempts to authenticate the client, which can result in a failure.

**Default**

`true`

**Values**

`true` | `false`

**Example**

```
SSL_CLIENT_AUTHENTICATION=false
```

*See Also:* Oracle Database Security Guide

**SUBSCRIBE_FOR_NODE_DOWN_EVENT_listener_name**

**Purpose**

To subscribe to Oracle Notification Service (ONS) notifications for downed events.

**Usage Notes**

By default, the listener subscribes to the ONS node down event on startup, if ONS is available. This subscription enables the listener to remove the affected service when it receives node down event notification from ONS. The listener uses asynchronous subscription for the event notification. Alter this behavior by setting `SUBSCRIBE_FOR_NODE_DOWN_EVENT_listener_name=off` in `listener.ora`.

**Default**

`on`

**Values**

`on` | `off`

**USE_SID_AS_SERVICE_listener_name**

**Purpose**

To enable the system identifier (SID) in the connect descriptor to be interpreted as a service name when a user attempts a database connection.
## Control Parameters

### Usage Notes

Database clients with earlier releases of Oracle Database that have hard-coded connect descriptors can use this parameter to connect to a container or pluggable database.

When the database is an Oracle Database 12c container database, the client must specify a service name in order to connect to it. Setting this parameter to `on` instructs the listener to use the SID in the connect descriptor as a service name and connect the client to the specified database.

Do not use the `USE_SID_AS_SERVICE_listener_name` parameter with SCAN listeners. The parameter is used for connecting directly through local listeners.

**Default**

`off`

**Example**

```
USE_SID_AS_SERVICE_listener=on
```

### VALID_NODE_CHECKING_REGISTRATION_listener_name

#### Purpose

To determine whether valid node checking registration is performed, or the subnet is allowed.

#### Usage Notes

When set to `on`, valid node checking registration is performed at the listener for any incoming registration request, and only local IP addresses are allowed.

**Default**

`on`

**Values**

- `off` | 0 to specify valid node checking registration is off, and no checking is performed.
- `on` | 1 | `local` to specify valid node checking registration is on, and all local IP addresses can register. If a list of invited nodes is set, then all IP addresses, host names, or subnets in the list as well as local IP addresses are allowed.
- `subnet` | 2 to specify valid node checking registration is on, and all machines in the local subnets are allowed to register. If a list of invited nodes is set, then all nodes in the local subnets as well as all IP addresses, host names and subnets in the list are allowed.

**Example**

```
VALID_NODE_CHECKING_REGISTRATION_listener=on
```

### WALLET_LOCATION

#### Purpose

To specify the location of wallets.
Usage Notes

Wallets are certificates, keys, and trustpoints processed by SSL that allow for secure connections.

The key/value pair for Microsoft certificate store (MCS) omits the `METHOD_DATA` parameter because MCS does not use wallets. Instead, Oracle PKI (public key infrastructure) applications obtain certificates, trustpoints and private keys directly from the user’s profile.

If an Oracle wallet is stored in the Microsoft Windows registry and the wallet’s key (KEY) is `SALESAPP`, then the storage location of the encrypted wallet is `HKEY_CURRENT_USER\SOFTWARE\ORACLE\WALLETS\SALESAPP\EWALLET.P12`. The storage location of the decrypted wallet is `HKEY_CURRENT_USER\SOFTWARE\ORACLE\WALLETS\SALESAPP\CWALLET.SSO`.

Syntax

Table 7–1 shows the syntax for the `WALLET_LOCATION` parameter based on wallet storage location.

<table>
<thead>
<tr>
<th>Wallet Location</th>
<th>Syntax</th>
</tr>
</thead>
</table>
| Oracle wallets on file system          | `WALLET_LOCATION= (SOURCE= (METHOD=method) (METHOD_DATA=  
                      (DIRECTORY=directory) [ (PKCS11=TRUE/FALSE)]))`       |
| Microsoft certificate store            | `WALLET_LOCATION= (SOURCE= (METHOD=mcs))`                              |
| Oracle wallets in the Microsoft Windows registry | `WALLET_LOCATION= (SOURCE=  
                      (METHOD=reg) (METHOD_DATA= (KEY=registry_key)))` |
| Entrust wallets                        | `WALLET_LOCATION= (SOURCE= (METHOD=entr) (METHOD_DATA=  
                      (PROFILE=file.epf) (INIFILE=file.ini)))` |

Additional Parameters

The following additional parameters are available for `WALLET_LOCATION`:

- **SOURCE**: Type of storage for wallets and storage location.
- **METHOD**: Type of storage.
- **METHOD_DATA**: Storage location.
- **DIRECTORY**: Location of Oracle wallets on file system.
- **KEY**: Wallet type and location in the Microsoft Windows registry.
- **PROFILE**: Entrust profile file (.epf).
- **INIFILE**: Entrust initialization file (.ini).
Default

None

Examples

Oracle wallets on file system:

\[
\text{WALLET\_LOCATION= (SOURCE= (METHOD=file) (METHOD\_DATA= (DIRECTORY=/etc/oracle/wallets/databases)))}
\]

Microsoft certificate store:

\[
\text{WALLET\_LOCATION= (SOURCE= (METHOD=mcs))}
\]

Oracle Wallets in the Microsoft Windows registry:

\[
\text{WALLET\_LOCATION= (SOURCE= (METHOD=REG) (METHOD\_DATA= (KEY=SALESAPP)))}
\]

Entrust Wallets:

\[
\text{WALLET\_LOCATION= (SOURCE= (METHOD=entr) (METHOD\_DATA= (PROFILE=/etc/oracle/wallets/test.epf) (INIFILE=/etc/oracle/wallets/test.ini)))}
\]

ADR Diagnostic Parameters for Oracle Net Listener

Since Oracle Database 11g, Oracle Database includes an advanced fault diagnosability infrastructure for preventing, detecting, diagnosing, and resolving problems. The problems are critical errors such as those caused by database code bugs, metadata corruption, and customer data corruption.

When a critical error occurs, it is assigned an incident number, and diagnostic data for the error, such as traces and dumps, are immediately captured and tagged with the incident number. The data is then stored in the Automatic Diagnostic Repository (ADR), a file-based repository outside the database.

This section includes the parameters used when ADR is enabled. Non-ADR parameters listed in the listener.ora file are ignored when ADR is enabled. "Non-ADR Diagnostic Parameters for Oracle Net Listener" on page 7-19 includes those used when ADR is disabled. ADR is enabled by default.

The following listener.ora parameters are used when ADR is enabled (when DIAG_ADR_ENABLED is set to on):

- **ADR_BASE_listener_name**
ADR Diagnostic Parameters for Oracle Net Listener

- DIAG_ADR_ENABLED_listener_name
- LOGGING_listener_name
- TRACE_LEVEL_listener_name
- TRACE_TIMESTAMP_listener_name

ADR_BASE_listener_name

**Purpose**
To specify the base directory that stores tracing and logging incidents when ADR is enabled.

**Default**
The default is ORACLE_BASE, or ORACLE_HOME/log if ORACLE_BASE is not defined.

**Values**
Any valid directory path to a directory with write permission.

**Example**
ADR_BASE_listener=/oracle/network/trace

DIAG_ADR_ENABLED_listener_name

**Purpose**
To indicate whether ADR tracing is enabled.

**Usage Notes**
When the DIAG_ADR_ENABLED_listener_name parameter is set to on, then ADR file tracing is used. When the DIAG_ADR_ENABLED_listener_name parameter is set to off, then non-ADR file tracing is used.

**Default**
on

**Values**
on | off

**Example**
DIAG_ADR_ENABLED_listener=on

LOGGING_listener_name

**Purpose**
To turn logging on or off.

**Usage Notes**
This parameter is also applicable when non-ADR tracing is used.
Default
  on

Values
  on | off

Example
  LOGGING_listener=on

**TRACE_LEVEL_listener_name**

**Purpose**
To turn listener tracing on, at a specific level, or off.

**Usage Notes**
This parameter is also applicable when non-ADR tracing is used.

Default
  off | 0

Values
  ■ off or 0 for no trace output
  ■ user or 4 for user trace information
  ■ admin or 10 for administration trace information
  ■ support or 16 for Oracle Support Services trace information

Example
  TRACE_LEVEL_listener=admin

**TRACE_TIMESTAMP_listener_name**

**Purpose**
To add a time stamp in the form of dd-mmm-yyyy hh:mi:ss:mil to every trace event in the trace file for the listener.

**Usage Notes**
This parameter is used with the **TRACE_LEVEL_listener_name** parameter. This parameter is also applicable when non-ADR tracing is used.

Default
  on

Values
  ■ on | true
  ■ off | false

Example
  TRACE_TIMESTAMP_listener=true
Non-ADR Diagnostic Parameters for Oracle Net Listener

This section lists the parameters used when ADR is disabled. "ADR Diagnostic Parameters for Oracle Net Listener" on page 7-16 includes the parameters when ADR is enabled.

Notes: The default value of DIAG_ADR_ENABLED_listener_name is on. Therefore, the DIAG_ADR_ENABLED_listener_name parameter must explicitly be set to off to use non-ADR tracing.

- LOG_DIRECTORY_listener_name
- LOG_FILE_listener_name
- TRACE_DIRECTORY_listener_name
- TRACE_FILE_listener_name
- TRACE_FILELEN_listener_name
- TRACE_FILENO_listener_name

LOG_DIRECTORY_listener_name

Purpose
To specify the destination directory of the listener log file.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/log

Example
LOG_DIRECTORY_listener=/oracle/network/admin/log

LOG_FILE_listener_name

Purpose
To specify the name of the log file for the listener.

Usage Notes
Use this parameter when ADR is not enabled.

Default
listener.log

Example
LOG_FILE_listener=list.log
TRACE_DIRECTORY_listener_name

Purpose
To specify the destination directory of the listener trace file.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/trace

Example
TRACE_DIRECTORY_listener=/oracle/network/admin/trace

TRACE_FILE_listener_name

Purpose
To specify the name of the trace file for the listener.

Usage Notes
Use this parameter when ADR is not enabled.

Default
listener.trc

Example
TRACE_FILE_listener=list.trc

TRACE_FILELEN_listener_name

Purpose
To specify the size of the listener trace files in kilobytes (KB).

Usage Notes
When the size is met, the trace information is written to the next file. The number of
files is specified using the TRACE_FILENO_listener_name parameter. Use this
parameter when ADR is not enabled.

Default
Unlimited

Example
TRACE_FILELEN_listener=100

TRACE_FILENO_listener_name

Purpose
To specify the number of trace files for listener tracing.
Usage Notes

When this parameter is set along with the TRACE_FILELEN_listener_name parameter, trace files are used in a cyclical fashion. The first file is filled first, then the second file, and so on. When the last file has been filled, the first file is re-used, and so on.

The trace file names are distinguished from one another by their sequence number. For example, if the default trace file of listener.trc is used, and this parameter is set to 3, then the trace files would be named listener1.trc, listener2.trc and listener3.trc.

In addition, trace events in the trace files are preceded by the sequence number of the file. Use this parameter when ADR is not enabled.

Default

1

Example

TRACE_FILENO_listener=3

Class of Secure Transports Parameters

The class of secure transports (COST) parameters specify a list of transports that are considered secure for administration and registration of a particular listener. The COST parameters identify which transports are considered secure for that installation and whether the administration of a listener requires secure transports. Configuring these parameters is optional.

The following are the COST parameters:

- DYNAMIC_REGISTRATION_listener_name
- SECURE_CONTROL_listener_name
- SECURE_REGISTER_listener_name
- SECURE_PROTOCOL_listener_name

See Also: Oracle Database Net Services Administrator’s Guide for additional information about COST parameters and listener security

DYNAMIC_REGISTRATION_listener_name

Purpose

To enable or disable dynamic registration.

Usage Notes

Static registrations are not affected by this parameter.

Default

The default value is on. Unless this parameter is explicitly set to off, all registration connections are accepted.

Values

- on: The listener accepts dynamic registration.
- off: The listener refuses dynamic registration.
Class of Secure Transports Parameters

**Example**

```
DYNAMIC_REGISTRATION_listener_name=on
```

**SECURE_CONTROL_listener_name**

**Purpose**

To specify the transports on which control commands are to be serviced.

**Usage Notes**

If the `SECURE_CONTROL_listener_name` parameter is configured with a list of transport names, then the control commands are serviced only if the connection is one of the listed transports. Connections arriving by other transport protocols are refused. The following is an example:

```
SECURE_CONTROL_listener1 = (TCPS, IPC)
```

In the preceding example, administration requests are accepted only on TCPS and IPC transports.

If no values are entered for this parameter, then the listener accepts any connection on any endpoint.

**Syntax**

```
SECURE_CONTROL_listener_name =
[()transport1, transport2, ..., transportn]
```

In the preceding syntax, `transport1`, `transport2`, and `transportn` are valid, installed transport protocol names.

**Example**

```
LISTENER1=
 (DESCRIPTION=
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp) (HOST=sales-server) (PORT=1521))
   (ADDRESS=(PROTOCOL=ipc) (HOST=sales-server) (PORT=1522)))
  SECURE_CONTROL_LISTENER1=tcps
```

**SECURE_REGISTER_listener_name**

**Purpose**

To specify the transports on which registration requests are to be accepted.

**Usage Notes**

If the `SECURE_REGISTER_listener_name` parameter is configured with a list of transport names, then only the connections arriving on the specified transports are able to register the service with the listener. Connections arriving by other transport protocols are refused. The following is an example:

```
SECURE_REGISTER_listener1 = (TCPS, IPC)
```

In the preceding example, registration requests are accepted only on TCPS and IPC transports.
If no values are entered for this parameter, then the listener accepts registration requests from any transport.

**Syntax**

```
SECURE_REGISTER_listener_name = [()|transport1[,transport2, ......,transportn]]
```

In the preceding example, `transport1`, `transport2`, and `transportn` are valid, installed transport protocol names.

If this parameter and `SECURE_CONTROL_listener_name` are configured, then they override the `SECURE_PROTOCOL_listener_name` parameter.

**Example**

```
LISTENER1=
{DESCRIPTION=
  {ADDRESS_LIST=
    {ADDRESS= (PROTOCOL=tcp) (HOST=sales-server) (PORT=1521))
    {ADDRESS= (PROTOCOL=ipc) (KEY=extproc))
    {ADDRESS= (PROTOCOL=tcps) (HOST=sales-server) (PORT=1522))}
  }
SECURE_REGISTER_listener1=tcps
```

**SECURE_PROTOCOL_listener_name**

**Purpose**

To specify the transports on which administration and registration requests are accepted.

**Usage Notes**

If this parameter is configured with a list of transport names, then the control commands and service registration can happen only if the connection belongs to the list of transports.

If this parameter is not present and neither `SECURE_CONTROL_listener_name` or `SECURE_REGISTER_listener_name` are configured, then all supported transports accept control and registration requests.

If the `SECURE_CONTROL_listener_name` and `SECURE_REGISTER_listener_name` parameters are configured, then they override the `SECURE_PROTOCOL_listener_name` parameter.

**Syntax**

```
SECURE_PROTOCOL_listener_name = [()|transport1[,transport2, ......,transportn]]
```

In the preceding syntax, `transport1`, `transport2`, and `transportn` are valid, installed transport protocol names.

**Example**

```
LISTENER1=
{DESCRIPTION=
  {ADDRESS_LIST=
    {ADDRESS= (PROTOCOL=tcp) (HOST=sales-server) (PORT=1521))
    {ADDRESS= (PROTOCOL=ipc) (KEY=extproc))
    {ADDRESS= (PROTOCOL=tcps) (HOST=sales-server) (PORT=1522))}}
```
Using COST Parameters in Combination

COST parameters can also be used in combination to further control which transports accept service registration and control commands.

In Example 7–2, control commands are accepted only on the IPC channel and the TCPS transport, and service registrations are accepted only on an IPC channel.

Example 7–2  Combining COST Parameters

```
LISTENER1=
 (DESCRIPTION=
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521))
   (ADDRESS=(PROTOCOL=ipc)(KEY=extproc))
   (ADDRESS=(PROTOCOL=tcps)(HOST=sales-server)(PORT=1522))))
SECURE_CONTROL_listener1=(tcps,ipc)
SECURE_PROTOCOL_listener1=ipc
```

In Example 7–3, control commands are accepted only on the TCPS transport, and service registrations are accepted only on the IPC channel.

Example 7–3  Combining COST Parameters

```
LISTENER1=
 (DESCRIPTION=
  (ADDRESS_LIST=
   (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521))
   (ADDRESS=(PROTOCOL=ipc)(KEY=extproc))
   (ADDRESS=(PROTOCOL=tcps)(HOST=sales-server)(PORT=1522))))
SECURE_CONTROL_listener1=tcps
SECURE_PROTOCOL_listener1=ipc
```
This chapter provides a complete listing of the cman.ora file configuration parameters. This chapter contains the following topics:

- Overview of Oracle Connection Manager Configuration File
- Oracle Connection Manager Parameters
- ADR Diagnostic Parameters for Oracle Connection Manager
- Non-ADR Diagnostic Parameters for Oracle Connection Manager

Overview of Oracle Connection Manager Configuration File

Oracle Connection Manager configuration information is stored in the cman.ora file, and consists of the following elements:

- Protocol address of the Oracle Connection Manager listener
- Access control parameters
- Performance parameters

By default, the cman.ora file is located in the ORACLE_HOME/network/admin directory. The cman.ora file can also be stored in the following locations:

- The directory specified by the TNS_ADMIN environment variable or registry value.
- On Linux and UNIX operating systems, the global configuration directory. For example, on the Oracle Solaris operating system, this directory is /var/opt/oracle.

See Also:

- Oracle Database Global Data Services Concepts and Administration Guide for information about management of global services
- Oracle operating system-specific documentation

Example 8–1 shows an example of a cman.ora file.

Example 8–1  Sample cman.ora File

```
CMAN=
  (CONFIGURATION=
   (ADDRESS=(PROTOCOL=tcp)(HOST=proxysvr)(PORT=1521))
   (RULE_LIST=
```

```
Oracle Connection Manager Parameters (cman.ora)  8-1
```
The `cman.ora` configuration file consists of the following sections:

- **Listening address**: Preceded by `ADDRESS=`, this section contains information pertinent to the listener. The `ADDRESS` parameter is required.
- **Rule list**: Preceded by `RULE_LIST=`, this section contains rule information. The `RULE` parameter is listed in the rule list section of the file. The `RULE` parameter is required.
- **Parameter list**: Preceded by `PARAMETER_LIST=`, this section contains all other parameters including those listed in "ADR Diagnostic Parameters for Oracle Connection Manager" on page 8-12, and "Non-ADR Diagnostic Parameters for Oracle Connection Manager" on page 8-15.

The following parameters are allowed in the parameter list section of the `cman.ora` file. The default values are bold. To override the default setting for a parameter, enter the parameter and a nondefault value.

- `ASO_AUTHENTICATION_FILTER={off | on}`
- `CONNECTION_STATISTICS={no | yes}`
- `EVENT_GROUP={init_and_term | memory_ops | conn_hdlg | proc_mgmt | reg_and_load | wake_up | timer | cmd_proc | relay}`
- `IDLE_TIMEOUT=0 or greater`
- `INBOUND_CONNECT_TIMEOUT=0 or greater. The default value is 60.`
- `LOG_DIRECTORY=log_directory. The default value is ORACLE_HOME/network/log.`
- `LOG_LEVEL={off | user | admin | support}`
- `MAX_CMCTL_SESSIONS= Any positive number. The default value is 4.`
- `MAX_CONNECTIONS= A value between 1 and 1024. The default value is 256.`
- `MAX_GATEWAY_PROCESSES= Any number greater than the minimum number of gateway processes up to 64. The default value is 16.`
- `MIN_GATEWAY_PROCESSES= Any positive number less than or equal to 64. Must be less than or equal to the maximum number of gateway processes. The default value is 2.`
- `OUTBOUND_CONNECT_TIMEOUT=0 or greater`
- `PASSWORD_INSTANCE_NAME= Value is the encrypted instance password, if one has been set. The default value is no value.`
- `SESSION_TIMEOUT=0 or greater`
- `TRACE_DIRECTORY=trace_directory. The default value is ORACLE_HOME/network/trace.`
- `TRACE_FILELEN= Any positive number. The default value is 0 (zero).`
- `TRACE_FILENO= Any positive number. The default value is 0 (zero).`
TRACE_LEVEL={off | user | admin | support}

TRACE_TIMESTAMP={off | on}

**Notes:**
You cannot add the parameter PASSWORD_instance_name directly to the cman.ora file. The parameter is added using the SAVE_PASSWD command.

---

Example 8–2 shows the parameter list section of a cman.ora file.

**Example 8–2 Parameter List Section of a cman.ora File**

```plaintext
(PARAMETER_LIST=
  (ASO_AUTHENTICATION_FILTER=ON)
  (CONNECTION_STATISTICS=NO)
  (EVENT_GROUP=INIT_AND_TERM,MEMORY_OPS,PROCESS_MGMT)
  (IDLE_TIMEOUT=30)
  (INBOUND_CONNECT_TIMEOUT=30)
  (LOG_DIRECTORY=/home/user/network/admin/log)
  (LOG_LEVEL=SUPPORT)
  (MAX_CMCTL_SESSIONS=6)
  (MAX_CONNECTIONS=512)
  (MAX_GATEWAY_PROCESSES=10)
  (MIN_GATEWAY_PROCESSES=4)
  (OUTBOUND_CONNECT_TIMEOUT=30)
  (SESSION_TIMEOUT=60)
  (TRACE_DIRECTORY=/home/user/network/admin/trace)
  (TRACE_FILELEN=100)
  (TRACE_FILENO=2)
  (TRACE_LEVEL=SUPPORT)

```

---

**Oracle Connection Manager Parameters**

This section lists and describes the following cman.ora file parameters:

- ADDRESS
- ASO_AUTHENTICATION_FILTER
- CONNECTION_STATISTICS
- EVENT_GROUP
- IDLE_TIMEOUT
- INBOUND_CONNECT_TIMEOUT
- LOG_DIRECTORY
- LOG_LEVEL
- MAX_ALL_CONNECTIONS
- MAX_CMCTL_SESSIONS
- MAX_CONNECTIONS
- MAX_GATEWAY_PROCESSES
- MIN_GATEWAY_PROCESSES
Oracle Connection Manager Parameters

- MAX_REG_CONNECTIONS
- OUTBOUND_CONNECT_TIMEOUT
- PASSWORD_instance_name
- REGISTRATION_EXCLUDED_NODES
- REGISTRATION_INVITED_NODES
- RULE
- SESSION_TIMEOUT
- TRACE_FILE
- TRACE_FILELEN
- TRACE_FILENO
- TRACE_LEVEL
- TRACE_TIMESTAMP
- VALID_NODE_CHECKING_REGISTRATION

ADDRESS

Purpose
To specify the protocol address of Oracle Connection Manager.

Syntax
(Address=(protocol=protocol)(host=host_name)(port=port_number))

Example
(Address=(protocol=tcp)(host=sales-server)(port=1521))

ASO_AUTHENTICATION_FILTER

Purpose
To specify whether Oracle Database security authentication settings must be used by the client.

Usage Notes
The global setting can be overridden by a rule-level setting in ACTION_LIST.

Values
- **on** to instruct Oracle Connection Manager to reject connection requests that are not using Secure Network Services (SNS). SNS is part of Oracle Database security.
- **off** to instruct Oracle Connection Manager not to check for SNS between the client and server. This is the default.

CONNECTION_STATISTICS

Purpose
To specify whether the SHOW_CONNECTIONS command displays connection statistics.
Usage Notes

The global setting can be overridden by a rule-level setting in ACTION_LIST.

Values

- yes to display statistics.
- no to not display statistics. This is the default.

**EVENT_GROUP**

Purpose

To specify which event groups are logged.

Usage Notes

Multiple events may be designated using a comma-delimited list.

Values

- alert for alert notifications.
- cmd_proc for command processing.
- conn_hdlg for connection handling.
- init_and_term for initialization and termination.
- memory_ops for memory operations.
- proc_mgmt for process management.
- reg_and_load for registration and load update.
- relay for events associated with connection control blocks.
- timer for gateway timeouts.
- wake_up for events related to Connection Manager Administration (CMADMIN) wake-up queue.

---

**Note:** The event group ALERT cannot be turned off.

**IDLE_TIMEOUT**

Purpose

To specify the amount of time that an established connection can remain active without transmitting data.

Usage Notes

The global setting can be overridden by a rule-level setting in ACTION_LIST.

Values

- 0 to disable the timeout. This is the default.
- Any number greater than 0 to enable the timeout. The number equals the timeout period in seconds.
**INBOUND_CONNECT_TIMEOUT**

**Purpose**
To specify how long in seconds the Oracle Connection Manager listener waits for a valid connection from a client or another instance of Oracle Connection Manager.

**Values**
- 60 to disable the timeout. This is the default.
- Any number greater than 0 to enable the timeout. The number equals the timeout period in seconds.

**LOG_DIRECTORY**

**Purpose**
To specify the directory for the Oracle Connection Manager log files.

**LOG_LEVEL**

**Purpose**
To specify the level for log messages.

**Values**
- off for no logging. This is the default.
- user for user-induced errors log information.
- admin for administration log information, such as installation-specific.
- support for Oracle Support Services information.

**MAX_ALL_CONNECTIONS**

**Purpose**
To specify the maximum number of concurrent registration and client connection sessions that can be supported by Oracle Connection Manager.

**Usage Notes**
This number includes registration connections from databases, and ongoing client connection establishment requests. After a connection is established, the clients do not maintain a connection to the listener. This limit only applies to client connections that are in the initial connection establishment phase from a listener perspective.

**Default**
Operating system-specific

**Example**

```
MAX_ALL_CONNECTIONS=40
```
MAX_CMCTL_SESSIONS

Purpose
To specify the maximum number of concurrent local or remote sessions of the Oracle Connection Manager control utility allowable for a given instance.

Usage Notes
One of the sessions must be a local session.

Values
Any number of sessions can be designated.

MAX_CONNECTIONS

Purpose
To specify the maximum number of connection slots that a gateway process can handle.

Values
Any number in the range of 1 to 1024.

MAX_GATEWAY PROCESSES

Purpose
To specify the maximum number of gateway processes that an instance of Oracle Connection Manager supports.

Values
The number designated must be greater than the minimum number of gateway processes. The maximum is 64.

MAX_REG_CONNECTIONS

Purpose
To specify the maximum number of concurrent registration connection sessions that can be supported by Oracle Connection Manager.

Default
512

Example
MAX_REG_CONNECTIONS=20

MIN_GATEWAY PROCESSES

Purpose
To specify the minimum number of gateway processes that an instance of Oracle Connection Manager supports.
Values

Any number of sessions can be designated up to 64.

**OUTBOUND_CONNECT_TIMEOUT**

Purpose

To specify the length of time in seconds that the Oracle Connection Manager instance waits for a valid connection to be established with the database server or with another Oracle Connection Manager instance.

Values

- 60 to disable the timeout. This is the default.
- Any number greater than 0 to enable the timeout. The number equals the timeout period in seconds.

**PASSWORD_<instance_name>**

Purpose

To specify the encrypted instance password, if one has been set.

**REGISTRATION_EXCLUDED_NODES**

Purpose

To specify the list of nodes that cannot register with the listener.

Usage Notes

The list can include host names or CIDR notation for IPv4 and IPv6 addresses. The wildcard format (*) is supported for IPv4 addresses. The presence of a host name in the list results in the inclusion of all IP addresses mapped to the host name. The host name should be consistent with the public network interface.

If the `REGISTRATION_INVITED_NODES` parameter and the `REGISTRATION_EXCLUDED_NODES` parameter are set, then the `REGISTRATION_EXCLUDED_NODES` parameter is ignored.

Values

Valid nodes and subnet IP addresses or names.

Example

```
REGISTRATION_EXCLUDED_NODES = (10.1.26.*, 10.16.40.0/24, \
2001:DB8:3eff:fe38, node2)
```

**REGISTRATION_INVITED_NODES**

Purpose

To specify the list of node that can register with the listener.
Usage Notes

The list can include host names or CIDR notation for IPv4 and IPv6 addresses. The wildcard format (*) is supported for IPv4 addresses. The presence of a host name in the list results in the inclusion of all IP addresses mapped to the host name. The host name should be consistent with the public network interface.

If the `REGISTRATION_INVITED_NODES` parameter and the `REGISTRATION_EXCLUDED_NODES` parameter are set, then the `REGISTRATION_EXCLUDED_NODES` parameter is ignored.

Values

Valid nodes and subnet IP addresses or names.

Example

```
REGISTRATION_INVITED_NODES = (10.1.35.*, 10.1.34.0/24, 
2001:DB8:fe38:7303, node1)
```

RULE

Purpose

To specify an access control rule list to filter incoming connections.

Usage Notes

A rule list specifies which connections are accepted, rejected, or dropped.

If no rules are specified, then all connections are rejected.

The source and destination can be a host name, IP address, or subnet mask.

There must be at least one rule for client connections and one rule for CMCTL connections. Omitting one or the other results in the rejection of all connections for the rule type omitted. The last rule in the example that follows is a CMCTL rule.

Oracle Connection Manager does not support wildcards for partial IP addresses. If you use a wildcard, then use it in place of a full IP address. The IP address of the client may, for example, be (SRC=*).

Oracle Connection Manager supports only the /nn notation for subnet addresses. In the first rule in Example 8-1, /27 represents a subnet mask that comprises 27 left-most bits.

Values

This parameter is listed in the rule list section of the `cman.ora` file preceded by `RULE_LIST=`.

Syntax

```
{RULE_LIST=
 {RULE=
  {SRC=host)
  {DST=host)
  {SRV=service_name)
  {ACT={accept|reject|drop})
  {ACTION_LIST=AUT={on|off}
  {(CONN_STATS={yes|no}) (MCT=time) (MIT=time) (MOCT=time))
  {RULE= ...})
```
**Oracle Connection Manager Parameters**

**Additional Parameters**

The **RULE** parameter filters a connection or group of connections using the following parameters:

- **SRC**: The source host name or IP address of the client.
- **DST**: The destination server host name or IP address of the database server.
- **SRV**: The database **service name** of Oracle Database obtained from the **SERVICE_NAME** parameter in the initialization parameter file.
- **ACT**: The action for the connection request. Use **accept** to accept incoming requests, **reject** to reject incoming requests, or **drop** to reject incoming requests without sending an error message.

**ACTION_LIST**: The rule-level parameter settings for some parameters. These parameters are as follows:

- **AUT**: Oracle Database security authentication on client side.
- **CONN_STATS**: Log input and output statistics.
- **MCT**: Maximum connect time.
- **MIT**: Maximum idle timeout.
- **MOCT**: Maximum outbound connect time.

Rule-level parameters override their global counterparts.

**Example**

```
(RULE_LIST=
 (RULE=
   (SRC=client1-pc)
   (DST=sales-server)
   (SRV=sales.us.example.com)
   (ACT=reject))
 (RULE=
   (SRC=192.0.2.45)
   (DST=192.0.2.200)
   (SRV=db1)
   (ACT=accept))
 (RULE=
   (SRC=sale-rep)
   (DST=sales1-server)
   (SRV=cmon)
   (ACT=accept))
)
```

**SESSION_TIMEOUT**

**Purpose**

To specify the maximum time in seconds allowed for a user session.

**Usage Notes**

The global setting can be overridden by a rule-level setting in **ACTION_LIST**.

**Values**

- 0 to disable the timeout. This is the default.
Any number greater than 0 to enable the timeout. The number equals the timeout period in seconds.

**TRACE_FILE**

**Purpose**
To specify the directory for Oracle Connection Manager trace files.

**TRACE_FILELEN**

**Purpose**
To specify the size of the trace file in KB.

**Usage Notes**
When the size is reached, the trace information is written to the next file. The number of files is specified with the **TRACE_FILENO** parameter.

**TRACE_FILENO**

**Purpose**
To specify the number of trace files.

**Usage Notes**
When this parameter is set along with the **TRACE_FILELEN** parameter, trace files are used in a cyclical fashion. The first file is filled first, then the second file, and so on. When the last file has been filled, the first file is reused, and so on.

**TRACE_LEVEL**

**Purpose**
To specify the level for trace messages.

**Values**
- **off** for no tracing. This is the default.
- **user** for user-induced errors trace information.
- **admin** for administration trace information, such as installation-specific.
- **support** for Oracle Support Services information.

**TRACE_TIMESTAMP**

**Purpose**
To specify the use of a timestamp for the tracing logs.

**Usage Notes**
If the **TRACING** parameter is enabled, then a time stamp in the form of `dd-mmm-yyyy hh:mm:ss:mill` for every trace event in the trace file.
Values

- **off** for no timestamp to be included in the file.
- **on** for timestamp to be included in the file.

**VALID_NODE_CHECKING_REGISTRATION**

**Purpose**

To determine whether valid node checking registration is performed, or the subnet is allowed.

**Usage Notes**

When set to **on**, valid node checking registration is performed at the listener for any incoming registration request, and only local IP addresses are allowed.

**Default**

**off**

**Values**

- **off | 0** to specify valid node checking registration is off, and no checking is performed.
- **on | 1 | local** to specify valid node checking registration is on, and all local IP addresses can register. If a list of invited nodes is set, then all IP addresses, host names, or subnets in the list as well as local IP addresses are allowed.
- **subnet | 2** to specify valid node checking registration is on, and all machines in the local subnets are allowed to register. If a list of invited nodes is set, then all nodes in the local subnets as well as all IP addresses, host names and subnets in the list are allowed.

**Example**

```plaintext
VALID_NODE_CHECKING_REGISTRATION = on
```

**ADR Diagnostic Parameters for Oracle Connection Manager**

Since Oracle Database 11g, Oracle Database includes an advanced fault diagnosability infrastructure for preventing, detecting, diagnosing, and resolving problems. The problems are critical errors such as those caused by database code bugs, metadata corruption, and customer data corruption.

When a critical error occurs, it is assigned an incident number, and diagnostic data for the error, such as traces and dumps, are immediately captured and tagged with the incident number. The data is then stored in the [Automatic Diagnostic Repository (ADR)](https://docs.oracle.com/en/database/oracle/database/11g/11.2.0/guide/index.html), a file-based repository outside the database.

This section describes the parameters used when ADR is enabled. Non-ADR parameters listed in the `cman.ora` file are ignored when ADR is enabled. "Non-ADR Diagnostic Parameters for Oracle Connection Manager" on page 8-15 describes the parameters used when ADR is disabled. ADR is enabled by default.

- **ADR_BASE**
- **DIAG_ADR_ENABLED**
- **LOG_LEVEL**
- TRACE_LEVEL
- TRACE_TIMESTAMP

**ADR_BASE**

**Purpose**
To specify the base directory to store tracing and logging incidents when ADR is enabled.

**Default**
The default is ORACLE_BASE, or ORACLE_HOME/log if ORACLE_BASE is not defined.

**Values**
Any valid directory path to a directory with write permission.

**Example**
ADR_BASE=/oracle/network/trace

**DIAG_ADR_ENABLED**

**Purpose**
To indicate whether ADR tracing is enabled.

**Usage Notes**
When the DIAG_ADR_ENABLED parameter is set to OFF, then non-ADR file tracing is used.

**Values**
on | off

**Example**
DIAG_ADR_ENABLED=on

**LOG_LEVEL**

**Purpose**
To specify the level of logging performed by Oracle Connection Manager.

**Usage Notes**
This parameter is also applicable when non-ADR logging is used.
The following log files are used with Oracle Connection Manager:
- `instance-name_pid.log` for the listener.
- `instance-name_cmadmin_pid.log` for CMADMIN.
- `instance-name_cmgw_pid.log` for the gateway processes.
The log files are located in the ORACLE_HOME/network/log directory.
**Default**

off or 0

**Values**

- off or 0 for no log output.
- user or 4 for user log information.
- admin or 10 for administration log information.
- support or 16 for Oracle Support Services log information.

**Example**

```
LOG_LEVEL=admin
```

**TRACE_LEVEL**

**Purpose**

To specify the trace level for the Oracle Connection Manager instance.

**Usage Notes**

This parameter is also applicable when non-ADR tracing is used.

The following trace files are used with Oracle Connection Manager:

- `instance-name_pid.trc` for the listener.
- `instance-name_cmadmin_pid.trc` for CMADMIN.
- `instance-name_cmgw_pid.trc` for the gateway processes.

The log files are located in the `ORACLE_HOME/network/log` directory.

**Default**

off

**Values**

- off for no trace output.
- user for user trace information.
- admin for administration trace information.
- support for Oracle Support Services trace information.

**Example**

```
TRACE_LEVEL=admin
```

**TRACE_TIMESTAMP**

**Purpose**

To add a time stamp in the form of `dd-mmm-yyyy hh:mm:ss:mil` to every trace event in the trace file for the listener.
Usage Notes

This parameter is used with the TRACE_LEVEL parameter. This parameter is also applicable when non-ADR tracing is used.

Default

on

Values

- on or true
- off or false

Example

TRACE_TIMESTAMP=true

Non-ADR Diagnostic Parameters for Oracle Connection Manager

This section lists the parameters used when ADR is disabled:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Purpose</th>
<th>Usage Notes</th>
<th>Default</th>
<th>Values</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOG_DIRECTORY</td>
<td>To specify the location of Oracle Connection Manager log files.</td>
<td>Use this parameter when ADR is not enabled.</td>
<td>ORACLE_HOME/network/log</td>
<td>Any valid directory path to a directory with write permission.</td>
<td>LOG_DIRECTORY=/oracle/network/log</td>
</tr>
<tr>
<td>TRACE_DIRECTORY</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TRACE_FILELEN</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TRACE_FILENO</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Notes: The default value of DIAG_ADR_ENABLED is on. Therefore, the DIAG_ADR_ENABLED parameter must explicitly be set to off in order for non-ADR tracing to be used.
TRACE_DIRECTORY

Purpose
To specify the location of the Oracle Connection Manager trace files.

Usage Notes
Use this parameter when ADR is not enabled.

Default
ORACLE_HOME/network/trace

Values
Any valid directory path to a directory with write permission.

Example
TRACE_DIRECTORY=/oracle/network/admin/trace

TRACE_FILELEN

Purpose
To specify the size, in KB, of the trace file.

Usage Notes
When the size is met, the trace information is written to the next file. The number of files is specified with the TRACE_FILENO parameter. Any size can be designated. Use this parameter when ADR is not enabled.

Default
Unlimited

Example
TRACE_FILELEN=100

TRACE_FILENO

Purpose
To specify the number of trace files for Oracle Connection Manager tracing.

Usage Notes
When this parameter is set along with the TRACE_FILELEN parameter, trace files are used in a cyclical fashion. The first file is filled first, then the second file, and so on. When the last file has been filled, the first file is reused, and so on. Any number of files can be designated.

The trace file names are distinguished from one another by their sequence number. For example, if this parameter is set to 3, then the gateway trace files would be named instance-name_cmgw1_pid.trc, instance_name_cmgw2_pid.trc and instance_name_cmgw3_pid.trc.

In addition, trace events in the trace files are preceded by the sequence number of the file. Use this parameter when ADR is not enabled.
Default

1

Example

TRACE_FILENO=3
This chapter provides a complete listing of the ldap.ora file configuration parameters. This chapter contains the following topics:

- Overview of Directory Server Usage File
- Directory Usage Parameters

Overview of Directory Server Usage File

The ldap.ora file contains directory usage configuration parameters created by Oracle Internet Directory Configuration Assistant or Oracle Net Configuration Assistant. Do not modify these parameters or their settings.

When created with Oracle Internet Directory Configuration Assistant, ldap.ora is located in the ORACLE_HOME/ldap/admin directory. When created with Oracle Net Configuration Assistant, the ldap.ora file is located in the ORACLE_HOME/network/admin directory. The ldap.ora file can also be stored in the directory specified by the LDAP_ADMIN or TNS_ADMIN environment variable.

Directory Usage Parameters

This section lists and describes the following ldap.ora file configuration parameters:

- DIRECTORY_SERVERS
- DIRECTORY_SERVER_TYPE
- DEFAULT_ADMIN_CONTEXT

DIRECTORY_SERVERS

Purpose

To list the host names and port number of the primary and alternate LDAP directory servers.

Values

host:port[:sslport]

Example

DIRECTORY_SERVERS=(ldap-server:389, raffles:400:636)
DIRECTORY_SERVER_TYPE

Purpose
To specify the type of directory server that is being used.

Values
- oid for Oracle Internet Directory
- ad for Microsoft Active Directory

Example
DIRECTORY_SERVER_TYPE=oid

DEFAULT_ADMIN_CONTEXT

Purpose
To specify the default directory entry that contains an Oracle Context from which connect identifiers can be created, modified, or looked up.

Values
Valid distinguished name (DN)

Example
DEFAULT_ADMIN_CONTEXT=\"o=OracleSoftware,c=US\"
Part III contains the following appendixes:

- Appendix A, "Features Not Supported in this Release"
- Appendix B, "Upgrade Considerations for Oracle Net Services"
- Appendix C, "LDAP Schema for Oracle Net Services"
Features Not Supported in this Release

This appendix describes features no longer supported by Oracle Net Services. This appendix contains the following topics:

- Overview of Unsupported Features
- Unsupported Parameters
- Unsupported Control Utility Commands
- Unsupported or Deprecated Protocols

Overview of Unsupported Features

The following section describe the features and the configuration file that are no longer being supported in Oracle Database. This is based on an effort to streamline configuration and use of Oracle Database.

Oracle Net Connection Pooling

In Oracle Database 12c Release 1 (12.1), Oracle Net connection pooling is no longer supported. It was deprecated in Oracle Database 11g.

See Also: My Oracle Support note 1469466.1

Oracle Names

Oracle Names has not been supported as a naming method since Oracle Database 11g. You must migrate to directory naming.

See Also: Oracle Database Net Services Administrator’s Guide for additional information about migrating to directory naming

Oracle Net Listener Password

In Oracle Database 12c Release 1 (12.1), the Oracle Net Listener password feature is no longer supported. This does not cause a loss of security because authentication is enforced through local operating system authentication.

See Also: "Oracle Net Listener Security" on page 1-3

Unsupported Parameters

Table A–1 describes the networking parameters no longer supported by this release.
Unsupported Control Utility Commands

Table A–2 describes the control utility commands not supported by this release.

<table>
<thead>
<tr>
<th>Control Utility</th>
<th>Commands</th>
<th>Description</th>
<th>Last Supported Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Names Control Utility</td>
<td>All commands</td>
<td>Oracle Names is no longer supported.</td>
<td>9.2</td>
</tr>
</tbody>
</table>

Unsupported or Deprecated Protocols

Table A–3 describes the protocols not supported or deprecated since Oracle Database 12c.

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Description</th>
<th>Last Supported Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>NT LAN Manager (NTLM) protocol for domain authentication</td>
<td>NTLM domain authentication has been deprecated from the Oracle Windows adapter. Only Kerberos authentication is used for the NTS adapter. NTLM is still used for local user authentication, as well as in the case in which the database service runs as a local user.</td>
<td>11.2</td>
</tr>
</tbody>
</table>
This appendix describes coexistence and upgrade issues for Oracle Net Services. This appendix covers the following topics:

- Anonymous Access to Oracle Internet Directory
- Migrating a Non-default Listener to Oracle Database 12c Release 1 (12.1)

Anonymous Access to Oracle Internet Directory

Typical users of directory naming (LDAP) require anonymous access to the Oracle Internet Directory for name lookup. If your Oracle Internet Directory software is upgraded to release 11g or later, then the default setting for Oracle Internet Directory has changed. The default now is to disallow anonymous access to the directory. The directory administrator will need to configure the directory to enable anonymous binds after upgrading the directory to release 11g. In addition, the way anonymous binds are configured in Oracle Internet Directory changed between Oracle Database 10g and Oracle Database 11g.

See Also: Oracle Internet Directory Administrator’s Guide for additional information about anonymous binds

Migrating a Non-default Listener to Oracle Database 12c Release 1 (12.1)

When migrating Oracle Database 11g Release 11.1.0.7 to Oracle Database 12c Release 1 (12.1) in an Oracle Real Application Clusters environment, non-default listeners are not migrated by Oracle Net Services Configuration Assistant. To migrate the non-default listeners, use the following procedure:

1. Use Oracle Database 11g Release 11.1.0.7 Oracle Net Services Configuration Assistant to remove the non-default listeners.
2. Use Oracle Database 12c Release 1 (12.1) Oracle Net Services Configuration Assistant to create the non-default listeners.
This appendix describes the Oracle schema object classes and attributes defined in the directory server for Oracle Net Services objects. It does not describe object classes and attributes reserved for future functionality or used by other Oracle products.

This appendix contains the following topics:

- **Structural Object Classes**
- **Attributes**

## Structural Object Classes

The Oracle schema supports the structural object classes for Oracle Net directory naming lookups. Table C–1 lists the structural object classes for Oracle Connection Manager. The attributes are described in Table C–2 in the following section.

<table>
<thead>
<tr>
<th>Object Class</th>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orclDBServer</td>
<td>orclNetDescName, orclVersion</td>
<td>Defines the attributes for database service entries.</td>
</tr>
<tr>
<td>orclNetAddress</td>
<td>orclNetAddressString,</td>
<td>Specifies a listener protocol address.</td>
</tr>
<tr>
<td></td>
<td>orclNetProtocol, orclVersion</td>
<td></td>
</tr>
<tr>
<td>orclNetAddressAux1</td>
<td>orclNetHostname</td>
<td>Specifies an auxiliary object class to add attributes to an orclNetAddress entry.</td>
</tr>
<tr>
<td>orclNetAddressList</td>
<td>orclNetAddrList, orclNetFailover, orclNetLoadBalance, orclNetSourceRoute, orclVersion</td>
<td>Specifies a list of protocol addresses.</td>
</tr>
</tbody>
</table>
**Table C–2**  LDAP Schema Attributes for Oracle Net Services

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orclCommonContextMap</td>
<td>Allows the mapping of more than one default Oracle Context in the directory server.</td>
</tr>
<tr>
<td>orclNetAddrList</td>
<td>Identifies one or more listener protocol addresses.</td>
</tr>
<tr>
<td>orclNetAddressString</td>
<td>Defines a listener protocol address.</td>
</tr>
<tr>
<td>orclNetConnParamList</td>
<td>Placeholder for connect data parameters.</td>
</tr>
<tr>
<td>orclNetDescList</td>
<td>Identifies one or more connect descriptors.</td>
</tr>
<tr>
<td>orclNetDescName</td>
<td>Identifies a connect descriptor or a list of connect descriptors.</td>
</tr>
<tr>
<td>orclNetFailover</td>
<td>Turns connect-time failover on for a protocol address list.</td>
</tr>
<tr>
<td>orclNetFailoverModeString</td>
<td>Instructs Oracle Net to fail over to a different listener if the first listener fails during runtime. Depending on the configuration, session or any SELECT statements that were in progress are automatically failed over.</td>
</tr>
<tr>
<td>orclNetHostname</td>
<td>Specifies the host name.</td>
</tr>
<tr>
<td>orclNetInstanceName</td>
<td>Specifies the instance name to access.</td>
</tr>
<tr>
<td>orclNetInstanceRole</td>
<td>Specifies a connection to the primary or secondary instance of an Oracle Real Application Clusters (Oracle RAC) configuration.</td>
</tr>
</tbody>
</table>

**Attributes**

Table C–2 lists the attributes used for the object classes. This list is subject to change.

**Table C–1 (Cont.)**  Oracle Net Structural Object Classes

<table>
<thead>
<tr>
<th>Object Class</th>

<td>Identifies the protocol used in the orclAddressString attribute.</td>
<td></td>
</tr>
<tr>
<td>orclNetReceiveBufSize</td>
<td>Specifies the buffer space limit for receive operations of sessions.</td>
<td></td>
</tr>
<tr>
<td>orclNetSdu</td>
<td>Specifies the session data unit (SDU) size.</td>
<td></td>
</tr>
<tr>
<td>orclNetSendBufSize</td>
<td>Specifies the buffer space limit for send operations of sessions.</td>
<td></td>
</tr>
<tr>
<td>orclNetServiceName</td>
<td>Specifies the database service name in the CONNECT_DATA portion.</td>
<td></td>
</tr>
<tr>
<td>orclNetSourceRoute</td>
<td>Instructs Oracle Net to use each address in order until the destination is reached.</td>
<td></td>
</tr>
<tr>
<td>orclSid</td>
<td>Specifies the Oracle system identifier (SID) in the CONNECT_DATA portion of a connection descriptor.</td>
<td></td>
</tr>
<tr>
<td>orclVersion</td>
<td>Specifies the version of software used to create the entry.</td>
<td></td>
</tr>
</tbody>
</table>
Attributes
access control list (ACL)
The group of access directives that you define. The directives grant levels of access to specific data for specific clients or groups of clients.

ACL
See access control list (ACL).

access control
A feature of Oracle Connection Manager that sets rules for denying or allowing certain clients to access designated servers.

address
See protocol address.

ADR
See Automatic Diagnostic Repository (ADR).

alias
An alternative name for a network object in a server. An alias stores the name of the object it is referencing. When a client requests a lookup of an alias, Oracle completes the lookup as if it is the referenced object.

application gateway
A host computer that runs the Oracle Net Firewall Proxy. An application gateway looks and acts like a real server from the client's point of view, and a real client from the server's point of view. An application gateway sits between the Internet and company's internal network and provides middleman services (or proxy services) to users on either side.

ASCII character set
American Standard Code for Information Interchange character set, a convention for representing alphanumeric information using digital data. The collation sequence used by most computers with the exception of IBM and IBM-compatible computers.

attribute
A piece of information that describes an aspect of a directory entry. An entry comprises a set of attributes, each of which belongs to an object class. Moreover, each attribute has both a type, which describes the kind of information in the attribute, and a value which contains the actual data.
**authentication method**

A security method that enables you to have high confidence in the identity of users, clients, and servers in distributed environments. Network authentication methods can also provide the benefit of single sign-on for users. The following authentication methods are supported:

- RADIUS (Remote Authentication Dial-In User Service)
- Kerberos
- **SSL**
- Microsoft Windows NT native authentication

**Automatic Diagnostic Repository (ADR)**

Automatic Diagnostic Repository is a systemwide central repository for tracing and logging files. The repository is a file-based hierarchical data store for depositing diagnostic information.

**cache**

Memory that stores recently-accessed data to so that subsequent requests to access the same data can be processed quickly.

**CIDR**

Classless Inter-Domain Routing. In CIDR notation, an IPv6 subnet is denoted by the subnet prefix and the size in bits of the prefix (in decimal), separated by the slash (/) character. For example, 2001:0db8:0000:0000::/64 denotes a subnet with addresses 2001:0db8:0000:0000:0000:0000:0000:0000 through 2001:0db8:0000:0000:FFFF:FFFF:FFFF:FFFF. The CIDR notation includes support for IPv4 addresses. For example, 192.0.2.1/24 denotes the subnet with addresses 192.0.2.1 through 192.0.2.255.

**Classless Inter-Domain Routing (CIDR)**

See **CIDR**.

**client**

A user, software application, or computer that requests the services, data, or processing from another application or computer. The client is the user process. In a network environment, the client is the local user process and the server may be local or remote.

**client load balancing**

Load balancing, whereby if more than one listener services a single database, a client can randomly choose between the listeners for its connect requests. This randomization enables all listeners to share the burden of servicing incoming connect requests.

**client profile**

The properties of a client, which may include the preferred order of naming methods, client and server logging and tracing, the domain from which to request names, and other client options.

**client/server architecture**

Software architecture based on a separation of processing between two CPUs. One CPU acts as the client in the transaction, requesting and receiving services. The other acts as the server that provides service for the requests.
cman.ora file
An Oracle Connection Manager configuration file that specifies protocol addresses for incoming requests and administrative commands, as well as Oracle Connection Manager parameters and access control rules.

CMADMIN (Connection Manager Administration)
An Oracle Connection Manager process that monitors the health of the listener and Oracle Connection Manager gateway processes, shutting down and starting processes as needed. CMADMIN registers information about gateway processes with the listener and processes commands run with the Oracle Connection Manager Control utility.

CMGW (Connection Manager gateway)
An Oracle Connection Manager process that receives client connections screened and forwarded by the listener located at the Oracle Connection Manager instance. The gateway process forwards the requests to the database server. In addition, it can multiplex or process multiple client connections through a single protocol connection.

connect data
A portion of the connect descriptor that defines the destination database service name or Oracle system identifier (SID). In the following example, SERVICE_NAME defines a database service called sales.us.example.com:

```
(DESCRIPTION=
 (ADDRESS=(PROTOCOL=tcp)(HOST=sales-server)(PORT=1521)
 (CONNECT_DATA=
   (SERVICE_NAME=sales.us.example.com)))
```

connect descriptor
A specially-formatted description of the destination for a network connection. A connect descriptor contains destination service and network route information.

The destination service is indicated by using its service name. The network route provides, at a minimum, the location of the listener through use of a network address.

connect identifier
A connect descriptor or a name that maps to a connect descriptor. A connect identifier can be a network service name, database service name, or network service alias. Users initiate a connect request by passing a user name and password along with a connect identifier in a connect string for the service to which they want to connect:

```
CONNECT username@connect_identifier
```

connect string
Information the user passes to a service to connect, such as user name, and connect identifier:

```
CONNECT username@net_service_name
```

connect-time failover
A client connect request is forwarded to another listener if a listener is not responding. Connect-time failover is enabled by service registration, because the listener knows if an instance is running to attempt a connection.
connection
An interaction between two processes on a network. Connections are originated by an initiator (client) that requests a connection with a destination (server).

connection load balancing
The method for balancing the number of active connections for the same service across the instances and dispatchers. Connection load balancing enables listeners to make routing decisions based on how many connections for each dispatcher and the load on the nodes.

connection request
A notification sent by an initiator and received by a listener that indicates that the initiator wants to start a connection.

data packet
See packet.

database link
A pointer that defines a one-way communication path from an Oracle database server to another database server. Public and private database links are a defined entries in a data dictionary table. Global database links are stored in an LDAP directory and can be accessed by all users on the network. To access public and private links, the user must be connected to the local database that contains the data dictionary entry.

A client connected to local database A can use a public or private link stored in database A to access information in remote database B. However, users connected to database B cannot use the same link to access data in database A. If local users on database B want to access data on database A, then a link must be defined and stored in the data dictionary of database B. Global links may be used between any clients and database on the network.

The following database links are supported:

- A **private database link** in a specific schema of a database. Only the owner of a private database link can use it.
- A **public database link** for a database. All users in the database can use it.
- A **global database link** is a database link stored in the LDAP directory.

dedicated connection
A dedicated server with a database session.

dedicated server
A server process that is dedicated to one client connection. Contrast with **shared server**.

default domain
The domain within which most client requests take place. It could be the domain where the client resides, or it could be a domain from which the client requests network services often. Default domain is also the client configuration parameter that determines what domain should be appended to unqualified network name requests. A name request is unqualified if it does not have a period (.) character within it.
directory information tree (DIT)
A hierarchical tree-like structure in a directory server of the distinguished names (DNs) of the entries. This structure is specific to x500 and LDAP.

directory naming
A naming method that resolves a database service, network service name, or network service alias to a connect descriptor stored in a central directory server. A directory server provides central administration of directory naming objects, reducing the work effort associated with adding or relocating services.

directory server
A directory server that is accessed with the Lightweight Directory Access Protocol (LDAP). Support of LDAP-compliant directory servers provides a centralized method for managing and configuring a distributed Oracle network. The directory server can replace client-side and server-side localized tnsnames.ora files.

dispatcher
A process that enables many clients to connect to the same server without the need for a dedicated server process for each client. A dispatcher handles and directs multiple incoming network session requests to shared server processes.

distinguished name (DN)
Name of entry in a directory server. The DN specifies where the entry resides in the LDAP directory hierarchy, similar to the way a directory path specifies the exact location of a file.

distributed processing
Division of front-end and back-end processing to different computers. Oracle Net Services supports distributed processing by transparently connecting applications to remote databases.

domain
Any tree or subtree within the Domain Name System (DNS) namespace. Domain most commonly refers to a group of computers whose host names share a common suffix, the domain name.

Domain Name System (DNS)
A system for naming computers and network services that is organized into a hierarchy of domains. DNS is used in TCP/IP networks to locate computers through user-friendly names. DNS resolves a friendly name into an IP address, which is understood by computers.

For Oracle Net Services, DNS translates the host name in a TCP/IP address into an IP address.

DNS
See Domain Name System (DNS).

enterprise role
An enterprise role is analogous to a regular database role, except that it spans authorization on multiple databases. An enterprise role is a category of roles that define privileges on a particular database. An enterprise role is created by the database administrator of a particular database. An enterprise role can be granted to or revoked
from one or more enterprise users. The information for granting and revoking these roles is stored in the directory server.

**enterprise user**

A user that has a unique identity across an enterprise. Enterprise users connect to individual databases through a schema. Enterprise users are assigned enterprise roles that determine their access privileges on databases.

**entry**

The building block of a directory server, it contains information about an object of interest to directory users.

**external naming**

A naming method that uses a third-party naming service, such as Network Information Service (NIS).

**external procedure**

Function or procedure written in a third-generation language (3GL) that can be called from PL/SQL code. Only C is supported for external procedures.

**failover**

See connect-time failover.

**firewall support**

See access control.

**FTP**

File Transfer Protocol. A client/server protocol which allows a user on one computer to transfer files to and from another computer over a TCP/IP network.

**global database link**

A database link definition stored in an LDAP directory which can be accessed by all users on the network. This definition is the same as the one used for client connections to the database (name/connect-descriptor).

Global database links cannot include user or password clauses. They only work when the database initiating the link uses the identity of the existing client to establish the link.

**global database name**

The full name of the database which uniquely identifies it from any other database. The global database name is of the form "`database_name.database_domain`," for example, `sales.us.example.com`.

The database name portion, `sales`, is a simple name to call a database. The database domain portion, `us.example.com`, specifies the database domain which the database is located, making the global database name unique. When possible, Oracle recommends that your database domain mirror the network domain.

The global database name is the default service name of the database, as specified by the `SERVICE_NAMES` parameter in the initialization parameter file.
**Heterogeneous Services**
An integrated component that provides the generic technology for accessing non-Oracle systems from the Oracle database server. Heterogeneous Services enables you to:

- Use Oracle SQL to transparently access data stored in non-Oracle systems as if the data resides within an Oracle server.
- Use Oracle procedure calls to transparently access non-Oracle systems, services, or application programming interfaces (APIs), from your Oracle distributed environment.

**hierarchical naming model**
An infrastructure in which names are divided into multiple hierarchically-related domains.

**host naming**
A naming method resolution that enables users in a TCP/IP environment to resolve names through their existing name resolution service. This name resolution service might be Domain Name System (DNS), Network Information Service (NIS), or simply a centrally-maintained set of /etc/hosts files. Host naming enables users to connect to an Oracle database server by simply providing the server computer's host name or host name alias. No client configuration is required to take advantage of this feature. This method is recommended for simple TCP/IP environments.

**HTTP**
Hypertext Transfer Protocol. A protocol that provides the language that enables Web browsers and application Web servers to communicate.

**identity management realm**
A collection of identities, all of which are governed by the same administrative policies. In an enterprise, all employees having access to the intranet may belong to one realm, while all external users who access the public applications of the enterprise may belong to another realm. An identity management realm is represented in the directory by a specific entry with a special object class associated with it.

**instance**
The combination of the **System Global Area (SGA)** and the Oracle background processes. When a database is started on a database server (regardless of the type of computer), Oracle allocates a memory area called the SGA, and starts one or more Oracle processes. The memory and processes of an instance efficiently manage the associated database data and serve the database users. You can connect to any instance to access information within a cluster database.

**instance name**
A name of an Oracle database instance. The instance name is identified by the INSTANCE_NAME parameter in the database initialization parameter file. INSTANCE_NAME corresponds to the **Oracle system identifier (SID)** of the instance. Clients can connect to a specific instance by specifying the INSTANCE_NAME parameter in the connect descriptor.

The instance name is included in the **connect data** part of the **connect descriptor**.
**IP address**

Used to identify a node on a network. Each computer on the network is assigned a unique Internet Protocol (IP) address, which is made up of the network ID, and a unique host ID. This address is typically represented in dotted-decimal notation, with the decimal value of each octet separated by a period, for example **192.0.2.22**.

**IPC**

Interprocess Communication is a protocol used by client applications that resides on the same node as the listener to communicate with the database. IPC can provide a faster local connection than TCP/IP.

**IPv4**

Internet Protocol Version 4. IPv4 is the current standard for the IP protocol. IPv4 uses 32-bit (four-byte) addresses, which are typically represented in dotted-decimal notation. The decimal value of each octet is separated by a period, as in **192.0.2.22**.

**IPv6**

Internet Protocol Version 6. The protocol designed to replace **IPv4**. In IPv6, an IP address is typically represented in eight fields of hexadecimal values separated by colons, as in **2001:0db8:0000:0000:0000:0000:1428:57AB**. In some cases, fields with 0 values can be compressed, as in **2001:DB8::1428:57AB**.

**IP Version 4 (IPv4)**

See **IPv4**.

**IP Version 6 (IPv6)**

See **IPv6**.

**Java Database Connectivity (JDBC) Driver**

A driver that provides Java applications and applets access to an Oracle database.

**JDBC OCI Driver**

A Type II driver for use with client/server Java applications. This driver requires an Oracle client installation.

**JDBC Thin Driver**

A Type IV driver for Oracle JDBC applets and applications. Because it is written entirely in Java, this driver is platform-independent. It does not require any additional Oracle software on the client side. The Thin driver communicates with the server using **Two-Task Common (TTC)**, a protocol developed by Oracle to access the database server.

**keyword-value pair**

The combination of a keyword and a value, used as the standard unit of information in connect descriptors and many configuration files. Keyword-value pairs may be nested; that is, a keyword may have another keyword-value pair as its value.

**latency**

The amount of time it takes to send a request and receive an answer.

**LDAP Data Interchange Format (LDIF)**

See **LDIF**
**ldap.ora file**
A file created by Oracle Internet Directory Configuration Assistant or Oracle Net Configuration Assistant that contains the following directory server access information:
- Type of directory server
- Location of the directory server
- Default Oracle Context that the client or server use to look up or configure connect identifiers for connections to database services

When created with Oracle Internet Directory Configuration Assistant, the `ldap.ora` file is located in the `ORACLE_HOME/ldap/admin` directory. When created with Oracle Net Configuration Assistant, the `ldap.ora` file is located in the `ORACLE_HOME/network/admin` directory.

**LDIF**
LDAP Data Interchange Format (LDIF) is the set of standards for formatting an input file for any of the LDAP command line utilities.

**Lightweight Directory Access Protocol (LDAP)**
A standard, extensible directory access protocol. It is a common language that LDAP clients and servers use to communicate. The framework of design conventions supporting industry-standard directory servers.

**link qualifier**
An extension to the database link name which specifies the connect name used to connect to the database. It provides alternate settings for the database user name and password credentials. For example, a link qualifier of `fieldrep` can be appended to a global database link of `sales.us.example.com`.

```sql
SQL> SELECT * FROM emp@sales.us.example.com@fieldrep
```

**listener**
See Oracle Net Listener.

**Listener Control utility**
A utility included with Oracle Net Services to control listener functions, such as starting, stopping, and getting the status of the listener.

**listener.ora file**
A configuration file for the listener that identifies the following for a listener:
- Unique name
- Protocol addresses that it is accepting connection requests on
- Services it is listening for

The `listener.ora` file typically resides in the `ORACLE_HOME/network/admin` directory.

Oracle does not require identification of the database service because of service registration. However, static service configuration is required if you plan to use Oracle Enterprise Manager Cloud Control.
Listener Registration (LREG)

As a part of service registration, LREG registers instance information with the listener. LREG is an instance background process of each database instance that is configured in the database initialization parameter file.

load balancing

A feature by which client connections are distributed evenly among multiple listeners, dispatchers, instances, and nodes so that no single component is overloaded.

Oracle Net Services support client load balancing and connection load balancing.

local naming

A naming method that locates network addresses by using information configured and stored on each individual client's tnsnames.ora file. Local naming is most appropriate for simple distributed networks with a small number of services that change infrequently.

location transparency

A distributed database characteristic that enables applications to access data tables without knowing where they reside. All data tables appear to be in a single database, and the system determines the actual data location based on the table name. The user can reference data on multiple nodes in a single statement, and the system automatically and transparently routes (parts of) SQL statements to remote nodes for execution if needed. The data can move among nodes with no impact on the user or application.

logging

A feature in which errors, service activity, and statistics are written to a log file. The log file provides additional information for an administrator when the error message on the screen is inadequate to understand the failure. The log file, by way of the error stack, shows the state of the software at various layers.

See also tracing.

loopback test

A connection from the server back to itself. Performing a successful loopback verifies that Oracle Net is functioning on the database server.

map

Files used by the Network Information Service (NIS) ypserv program to handle name requests.

Microsoft Active Directory

An LDAP-compliant directory server included with Microsoft Windows 2000 Server. It stores information about objects on the network, and makes this information available to users and network administrators. Active Directory also provides access to resources on the network using a single logon process.

Microsoft Active Directory can be configured as a directory naming method to store service information that clients can access.

Microsoft Windows NT native authentication

An authentication method that enables a client single login access to a Microsoft Windows NT server and a database running on the server.
Named Pipes protocol
A high-level interface protocol providing interprocess communications between clients and servers using distributed applications. Named Pipes enables client/server conversation over a network using Named Pipes protocol.

naming context
A subtree that resides entirely on one directory server. It is a contiguous subtree, that is, it must begin at an entry that serves as the top of the subtree, and extend downward to either leaf entries or references to subordinate naming contexts. It can range in size from a single entry to the entire directory information tree (DIT).

Oracle Context can be created under a naming context.

naming method
The resolution method used by a client application to resolve a connect identifier to a connect descriptor when attempting to connect to a database service. Oracle Net provides four naming methods:

- Domain Name System (DNS)
- directory naming
- Easy Connect naming
- external naming

network service alias
An alternative name for a directory naming object in a directory server. A directory server stores network service aliases for any defined network service name or database service. A network service alias entry does not have connect descriptor information. Instead, it only references the location of the object for which it is an alias. When a client requests a directory lookup of a network service alias, the directory determines that the entry is a network service alias and completes the lookup as if it was actually the entry it is referencing.

network service name
A simple name for a service that resolves to a connect descriptor. Users initiate a connect request by passing a user name and password along with a network service name in a connect string for the service to which they want to connect:

\texttt{CONNECT username/password@net\_service\_name}

Depending on your needs, network service names can be stored in a variety of places, including:

- Local configuration file, tnsnames.ora, on each client
- Directory server
- External naming service, such as NIS

network
A group of two or more computers linked through hardware and software to allow the sharing of data and peripherals.

network administrator
The person who performs network management tasks such as installing, configuring, and testing network components. The administrator typically maintains the
configuration files, connect descriptors and service names, aliases, and public and global database links.

**network character set**
As defined by Oracle, the set of characters acceptable for use as values in keyword-value pairs (that is, in connect descriptors and configuration files). The set includes alphanumeric uppercase, and lowercase, and some special characters.

**Network Information Service (NIS)**
The client/server protocol for distributing system configuration data such as user and host names between computers on a network. This service was formerly known as “Sun Microsystems Yellow Pages (yp).”

**Network Interface (NI)**
A network layer that provides a generic interface for Oracle clients, servers, or external processes to access Oracle Net functions. The network interface layer handles the break and reset requests for a connection.

**network listener**
See listener.

**network object**
Any service that can be directly addressed on a network, such as a listener.

**network protocol**
See Oracle protocol support.

**Network Program Interface**
An interface for server-to-server interactions that performs all of the functions that the Oracle Call Interface (OCI) does for clients, allowing a coordinating server to construct SQL requests for additional servers.

**Network Session (NS)**
A session layer that is used in typical Oracle Net connections to establish and maintain the connection between a client application and a database server.

**NIS**
See Network Information Service (NIS).

**node**
A computer or terminal that is part of a network

**object class**
In a directory server, a named group of attributes. To assign attributes to an entry, do so by assigning the object classes that hold those attributes to that entry.

All objects associated with the same object class share the attributes of that object class.

**OCI**
See Oracle Call Interface (OCI).

**OPI**
See Oracle Program Interface (OPI).
Open Systems Interconnection (OSI)
Open Systems Interconnection is a network architecture model developed by ISO as a framework for international standards in heterogeneous computer network architecture.

The OSI architecture has seven layers, from lowest to highest:

1. Physical layer
2. Data link layer
3. Network layer
4. Transport layer
5. Session layer
6. Presentation layer
7. Application layer

Oracle Advanced Security
An Oracle product that provides Transparent Data Encryption (TDE) and data redaction.

Oracle Call Interface (OCI)
An application programming interface (API) that enables creation of applications that use the native procedures or function calls of a third-generation language to access an Oracle database server and control all phases of SQL statement execution. OCI supports the data types, calling conventions, syntax, and semantics of a number of third-generation languages including C, C++, COBOL and FORTRAN.

Oracle Connection Manager
A router through which a client connection request may be sent either to its next hop or directly to the database server. Clients who route their connection requests through Oracle Connection Manager can then take advantage of the session multiplexing, access control, or protocol conversion features configured for that Oracle Connection Manager.

Oracle Connection Manager Control utility
A utility included with Oracle Net Services to control various functions, such as starting, stopping, and getting the status of Oracle Connection Manager.

Oracle Context
An entry in an LDAP-compliant Internet directory called cn=OracleContext, under which all Oracle software relevant information is kept, including entries for Oracle Net Services directory naming and checksumming security. There may be one or more than one Oracle Context in a directory. An Oracle Context entry can be associated with a directory naming context.

Oracle Internet Directory automatically creates an Oracle Context at the root of the DIT structure. This root Oracle Context has a DN of dn:cn=OracleContext.

Oracle Enterprise Manager Cloud Control
A separate Oracle product that combines a graphical console, agents, common services, and tools to provide an integrated and comprehensive systems management platform for managing Oracle products.
Oracle Identity Management
An infrastructure enabling deployments to manage centrally and securely all enterprise identities and their access to various applications in the enterprise.

Oracle Internet Directory
A directory server implemented as an application on the Oracle database. It enables retrieval of information about dispersed users and network resources. It combines Lightweight Directory Access Protocol (LDAP) Version 3, the open Internet standard directory server access protocol, with the high performance, scalability, robustness, and availability of the Oracle database.

Oracle Net
Communication software that enables a network session from a client application to an Oracle database server. After a network session is established, Oracle Net acts as a data courier for the client application and the database server. It is responsible for establishing and maintaining the connection between the client application and database server, as well as exchanging messages between them. Oracle Net can perform these jobs because it is located on each computer in the network.

Oracle Net Configuration Assistant
A postinstallation tool that configures basic network components after installation, including:
- Listener names and protocol addresses
- Naming methods the client uses to resolve connect identifiers
- Net service names in a tnsnames.ora file
- Directory server usage

Oracle Net Firewall Proxy
Product offered by some firewall vendors that supplies Oracle Connection Manager functionality.

Oracle Net foundation layer
A networking communication layer that is responsible for establishing and maintaining the connection between the client application and server, as well as exchanging messages between them.

Oracle Net Listener
A process that resides on the server whose responsibility is to listen for incoming client connection requests and manage the traffic to the server.

When a client requests a network session with a database server, a listener receives the actual request. If the client information matches the listener information, then the listener grants a connection to the database server.

Oracle Net Manager
A tool that combines configuration abilities with component control to provide an integrated environment for configuring and managing Oracle Net Services.

You can use Oracle Net Manager to configure the following network components:
- Naming
  Define connect identifiers and map them to connect descriptors to identify the network location and identification of a service. Oracle Net Manager supports
configuration of connect descriptors in a local tnsnames.ora file or directory server.

- **Naming Methods**
  Configure the ways in which connect identifiers are resolved into connect descriptors.

- **Listeners**
  Create and configure listeners to receive client connections.

**Oracle Net Services**
A suite of networking components that provide enterprise-wide connectivity solutions in distributed, heterogeneous computing environments. Oracle Net Services is comprised of Oracle Net, listener, Oracle Connection Manager, Oracle Net Configuration Assistant, and Oracle Net Manager.

**Oracle Program Interface (OPI)**
Oracle Program Interface is the networking layer responsible for responding to each of the possible messages sent by OCI. For example, an OCI request to fetch 25 rows would have an OPI response to return the 25 rows after they have been fetched.

**Oracle protocol support**
A software layer responsible for mapping Transparent Network Substrate (TNS) functionality to industry-standard protocols used in the client/server connection.

**Oracle Real Application Clusters (Oracle RAC)**
An architecture that allows multiple instances to access a shared database of data files. Oracle RAC is also a software component that provides the necessary cluster database scripts, initialization files, and data files needed for Oracle Enterprise Edition and Oracle RAC.

**Oracle Rdb**
A database for Digital’s 64-bit platforms. Because Oracle Rdb has its own listener, the client interacts with Rdb in the same manner as it does with an Oracle database.

**Oracle schema**
A set of rules that determine what can be stored in a directory server. Oracle has its own schema that is applied to many types of Oracle entries, including Oracle Net Services entries. The Oracle schema for Oracle Net Services entries includes the attributes the entries may contain.

**Oracle system identifier (SID)**
A name that identifies a specific instance of an Oracle database. For any database, there is at least one instance referencing the database.

For Oracle databases earlier than release 8.1, a SID is used to identify the database. The SID is included in the connect descriptor of a tnsnames.ora file and in the definition of the listener in the listener.ora file.

**Oracle XML DB**
A high-performance XML storage and retrieval technology provided with Oracle database server. It is based on the W3C XML data model.
ORACLE_HOME
An alternate name for the top directory in the Oracle directory hierarchy on some
directory-based operating systems.

OSI
See Open Systems Interconnection (OSI).

packet
A block of information sent over the network each time a connection or data transfer is
requested. The information contained in packets depends on the type of packet, such
as connect, accept, redirect, data, and so on. Packet information can be useful in
troubleshooting.

PMON process
A process monitor (PMON) database process that performs process recovery when a
user process fails. PMON is responsible for cleaning the cache and freeing resources
that the process was using. PMON also checks on dispatcher and server processes and
restarts them if they have failed.

presentation layer
A networking communication layer that manages the representation of information
that application layer entities either communicate or reference in their communication.
Two-Task Common (TTC) is an example of presentation layer.

private database link
A database link created by one user for exclusive use.
See also database link and public database link.

profile
A collection of parameters that specifies preferences for enabling and configuring
Oracle Net Services features on the client or server. A profile is stored and
implemented through the sqlnet.ora file.

protocol
A set of rules that defines how data is transported across the network.

protocol address
An address that identifies the network address of a network object.
When a connection is made, the client and the receiver of the request, such as the
listener or Oracle Connection Manager, are configured with identical protocol
addresses. The client uses this address to send the connection request to a particular
network object location, and the recipient listens for requests on this address. It is
important to install the same protocols for the client and the connection recipient, as
well as configure the same addresses.

protocol conversion
A feature of Oracle Connection Manager that enables a client and server with different
networking protocols to communicate with each other. This feature replaces
functionality previously provided by the Oracle Multi-Protocol Interchange with
SQL*Net version 2.
**protocol stack**
Designates a particular [presentation layer](#) and [session layer](#) combination.

**proxy server**
A server that substitutes for a real server, forwarding client connection requests to the real server or to other proxy servers. Proxy servers provide access control, data and system security, monitoring, and caching.

**public database link**
A database link created by a DBA on a local database that is accessible to all users on that database.

See also [database link](#) and [private database link](#).

**realm Oracle Context**
An Oracle Context contained in each [identity management realm](#). It stores the following information:
- User naming policy of the identity management realm, that is, how users are named and located
- Mandatory authentication attributes
- Location of groups in the identity management realm
- Privilege assignments for the identity management realm, for example, who has privileges to add more users to the realm
- Application specific data for that realm including authorizations

**RDBMS**
Relational Database Management System.

**RDN**
See [relative distinguished name (RDN)](#).

**relative distinguished name (RDN)**
The local, most granular level entry name. It has no other qualifying entry names that would serve to address the entry uniquely. It is a fully-qualified X.500 name. For example, `cn=sales,dc=us,dc=example,dc=com, cn=sales` is a RDN.

**root Oracle Context**
In the [Oracle Identity Management](#) infrastructure, the root Oracle Context is an entry in Oracle Net Services containing a pointer to the default [identity management realm](#) in the infrastructure. It also contains information about how to locate an identity management realm given the simple name of the realm.

**RPC**
Remote procedure call.

**SDP**
Sockets Direct Protocol.
Secure Sockets Layer (SSL)

An industry-standard protocol designed by Netscape Communications Corporation for securing network connections. SSL provides authentication, encryption, and data integrity using public key infrastructure (PKI).

server parameter file

A binary file containing initialization parameter settings that is maintained on the Oracle Database host. You cannot manually edit this file with a text editor. A server parameter file is initially built from a text initialization parameter file by means of the CREATE SPFILE statement or created directly.

server process

Database processes that handle a client request on behalf of a database.

service

A program that responds to requests from various clients or performs some operation. The database is a service that stores and retrieves data for clients.

service handler

A process that acts a connection point from the listener to the database server. A service handler can be a dispatcher or dedicated server.

service name

A logical representation of a database, which is the way a database is presented to clients. The service name is a string that is the global database name, that is, a name comprised of the database name and domain name, entered during installation or database creation. If you are not sure what the global database name is, then you can obtain it from the value of the SERVICE_NAMES parameter in the initialization parameter file. The service name is included in the connect data part of the connect descriptor.

service registration

A feature by which the Listener Registration (LREG) automatically registers information with a listener. Because this information is registered with the listener, the listener.ora file does not need to be configured with this static information.

Service registration provides the listener with information about:

- Service names for each running instance of the database
- Instance names of the database
- Service handlers (dispatcher or dedicated server) available for each instance
  These enable the listener to direct a client request appropriately.
- Dispatcher, instance, and node load information

This load information enables the listener to determine which dispatcher can best handle a client connection request. If all dispatchers are blocked, then the listener can spawn a dedicated server for the connection.

session data unit (SDU)

A buffer that Oracle Net uses to place data before transmitting it across the network. Oracle Net sends the data in the buffer either when requested or when it is full.
**session layer**
A network layer that provides the services needed by the protocol address entities that enable them to organize and synchronize their dialog and manage their data exchange. This layer establishes, manages, and terminates network sessions between the client and server. An example of a session layer is Network Session (NS).

**session multiplexing**
Combining multiple sessions for transmission over a single network connection to conserve the operating system’s resources.

**shared server**
A database server that is configured to allow many user processes to share very few server processes, so the number of users that can be supported is increased. With shared server configuration, many user processes connect to a dispatcher. The dispatcher directs multiple incoming network session requests to a common queue. An idle shared server process from a shared pool of server processes picks up a request from the queue. This means that a small pool of server processes can serve a large number of clients. Contrast with dedicated server.

**shared server process**
A process type used with shared server configuration.

**SID**
See Oracle system identifier (SID).

**single sign-on**
The ability for a user to log in to different servers using a single password. This permits the user to authenticate to all servers the user is authorized to access.

**sqlnet.ora file**
A configuration file for the client or server that specifies:
- Client domain to append to unqualified service names or net service names
- Order of naming methods the client should use when resolving a name
- Logging and tracing features to use
- Route of connections
- External naming parameters
- Oracle Advanced Security parameters

The sqlnet.ora file typically resides in the ORACLE_HOME/network/admin directory.

**SSL**
See Secure Sockets Layer (SSL).

**System Global Area (SGA)**
A group of shared memory structures that contain data and control information for an Oracle instance.

**TCP/IP**
Transmission Control Protocol/Internet Protocol. The standard communication protocol used for client/server conversation over a network.
**TCP/IP with SSL protocol**

A protocol that enables an Oracle application on a client to communicate with remote Oracle databases through the **TCP/IP** and **Secure Sockets Layer (SSL)**.

**tick**

The amount of time it takes for a message to be sent and processed from the client to the server or from the server to the client.

**TNS**

See [Transparent Network Substrate (TNS)](#).

**tnsnames.ora file**

A configuration file that maps **network service names** to **connect descriptors**. This file is used for the **local naming** method. The tnsnames.ora file typically resides in the ORACLE_HOME/network/admin directory.

**tracing**

A facility that writes detailed information about an operation to an output file. The trace facility produces a detailed sequence of statements that describe the events of an operation as they are run. Administrators use the trace facility for diagnosing an abnormal condition. It is not normally turned on.

See also [logging](#).

**Transparent Application Failover (TAF)**

A runtime failover for high-availability environments, such as Oracle Real Application Clusters and Oracle Fail Safe, that refers to the failover and re-establishment of application-to-service connections. It enables client applications to automatically reconnect to the database if the connection fails, and, optionally, resume a **SELECT** statement that was in progress. This reconnect happens automatically from within the Oracle Call Interface (OCI) library.

**Transparent Network Substrate (TNS)**

A foundation technology, built into the **Oracle Net foundation layer** that works with any standard network transport protocol.

**transport**

A networking layer that maintains end-to-end reliability through data flow control and error recovery methods. The **Oracle Net foundation layer** uses **Oracle protocol support** for the transport layer.

**TTC**

See [Two-Task Common (TTC)](#).

**Two-Task Common (TTC)**

A **presentation layer** type that is used in a typical Oracle Net connection to provide character set and data type conversion between different character sets or formats on the client and server.

**UPI**

User Program Interface.
**virtual circuit**
A piece of shared memory used by the dispatcher for client database connection requests and replies. The dispatcher places a virtual circuit on a common queue when a request arrives. An idle shared server picks up the virtual circuit from the common queue, services the request, and relinquishes the virtual circuit before attempting to retrieve another virtual circuit from the common queue.

**WebDAV protocol**
World Wide Web Distributed Authoring and Versioning. A protocol with a set of extensions to HTTP which allows users to manage files on remote Web servers.
