- **Name**: A unique name for the compartment (maximum 100 characters, including letters, numbers, periods, hyphens, and underscores). The name must be unique across all the compartments in your tenancy. Avoid entering confidential information.

- **Description**: A friendly description. You can change this later if you want to.

- **Compartment**: The compartment you are in is displayed. To choose another compartment to create this compartment in, select it from the list.

- **Tags**: If you have permissions to create a resource, then you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags on page 239. If you are not sure whether to apply tags, skip this option (you can apply tags later) or ask your administrator.

4. Click **Create Compartment**.

Next, you might want to write a policy for the compartment. See To create a policy on page 3525.

---

**To update a compartment's name**

You can't update the name of a compartment that is associated with a security zone. For more information, see Security Zones.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Compartments**.

   A list of the compartments in your tenancy is displayed.

2. For the compartment you want to rename, click the Actions menu, and then click **Rename Compartment**.

   **Tip:** You can't change the name of your root compartment.

3. Enter the new **Name**. The name must be unique across all the compartments in your tenancy. The name can have a maximum of 100 characters, including letters, numbers, periods, hyphens, and underscores. Avoid entering confidential information.

4. Click **Rename Compartment**.

---

**To update a compartment's description**

You can't update the description of a compartment that is associated with a security zone. For more information, see Security Zones.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Compartments**.

   A list of the compartments in your tenancy is displayed.

2. For the compartment you want to update, click the Actions menu, and then click **Edit Compartment Description**.

3. Enter the new description. Avoid entering confidential information.

4. Click **Save**.

---

**To view the contents of a compartment**

1. Open the Console.

2. Open the navigation menu and select the type of resource you want to view. For example, to view Compute resources: Open the navigation menu and click **Compute**. Under **Compute**, click **Instances**.

3. Choose the compartment from the list on the left side of the page. The page updates to show only the resources in that compartment.

Remember that most IAM resources reside in the tenancy (this includes users, groups, and compartments). Policies can reside in either the tenancy (root compartment) or other compartments.

---

**To move a compartment**

To move a compartment, you must belong to a group that has manage all-resources permissions on the lowest shared parent compartment of the current compartment and the destination compartment.
1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Compartments**.
   
   A list of the compartments in your tenancy is displayed. If the compartment you want to move is not directly beneath the root compartment, click through the hierarchy of compartments to view the wanted compartment.

2. For the compartment you want to move, click the Actions menu, and then click **Move Compartment**.

3. Select the destination compartment.

4. Confirm that you are aware of the implications of the move.

5. Click **Move Compartment**.

**To move a resource to a different compartment**

1. Open the Console.

2. Open the navigation menu and select the type of resource you want to work with. For example, to view Compute resources: Open the navigation menu and click **Compute**. Under **Compute**, click **Instances**.

3. In the **List Scope** section, select a compartment. Resources in the selected compartment are displayed.

4. Find the resource in the list, click the the Actions menu, and follow the prompts to move the resource to a new compartment. See the resource documentation for specific steps.

The resource is moved immediately. If attached resource dependencies move with the parent resource, the resource dependencies are moved asynchronously, and do not appear in the new compartment until the move is complete.

**To apply tags to a compartment**

For instructions, see **Resource Tags** on page 239.

**To manage tag defaults for a compartment**

See **Managing Tag Defaults** on page 5594.

**To delete a compartment**

You must remove all resources from a compartment before you can delete it.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Compartments**. A list of the compartments in your tenancy is displayed.

2. For the compartment you want to delete, click the Actions menu, and then click **Delete Compartment**.

3. At the prompt, click **OK**.

After you click **OK**, a work request is submitted to delete the compartment. The compartment state changes to Deleting. If the work request fails, the state returns to Active.

**To recover a compartment**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Compartments**. A list of the compartments in your tenancy is displayed.

2. In **State**, select Deleted.

3. For the compartment you want to recover, click the Actions menu, and then click **Recover**.

4. At the prompt, click **OK**.

**Using the API**

For information about using the API and signing requests, see **REST APIs** on page 6275 and **Security Credentials** on page 205. For information about SDKs, see **Software Development Kits and Command Line Interface** on page 6094.

Use these API operations to manage compartments:

- **CreateCompartment**
- **ListCompartments**
- **GetCompartment**: Returns the metadata for the compartment, not its contents.
- **UpdateCompartment**
- **DeleteCompartment**
- **MoveCompartment**
- **GetWorkRequest**: Gets the work requests spawned by the DeleteCompartment operation.
• RecoverCompartment

You can retrieve the contents of a compartment only by resource type. There’s no API call that lists all resources in the compartment. For example, to list all the instances in a compartment, call the Core Services API ListInstances operation and specify the compartment ID as a query parameter.

Managing Regions

This topic describes the basics of managing your region subscriptions. For more information about regions in Oracle Cloud Infrastructure, see Regions and Availability Domains on page 206. For information about Platform Services regions, see Managing Platform Services Regions on page 3240.

Required IAM Policy

If you're in the Administrators group, then you have the required access to manage region subscriptions.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for managing regions or other IAM components, see Details for IAM.

The Home Region

When you sign up for Oracle Cloud Infrastructure, Oracle creates a tenancy for you in one region. This is your home region. Your home region is where your IAM resources are defined. When you subscribe to another region, your IAM resources are available in the new region. However, the master definitions reside in your home region and can only be changed there.

Important:

Your home region contains your account information and identity resources. It is not changeable after your tenancy is provisioned. If you are unsure which region to select as your home region, contact your sales representative before you create your account.

Resources that you can create and update only in the home region are:

• Users
• Groups
• Policies
• Compartments
• Dynamic groups
• Federation resources

When you use the API to update your IAM resources, you must use the endpoint for your home region. IAM automatically propagates the updates to all regions in your tenancy.

When you use the Console to update your IAM resources, the Console sends the requests to the home region for you. You don't need to switch to your home region first. IAM then automatically propagates the updates to all regions in your tenancy.

When you subscribe your tenancy to a new region, all the policies from your home region are enforced in the new region. If you want to limit access for groups of users to specific regions, you can write policies to grant access to specific regions only. For an example policy, see Restrict admin access to a specific region.

Note:

IAM Updates Are Not Immediate Across All Regions

When you create or update an IAM resource, be aware that you need to allow up to several minutes for the changes in your home region to become available in all regions.
**Using the Console to Manage Infrastructure Regions**

*To view the list of infrastructure regions*

Open the Console, open the **Region** menu, and then click **Manage Regions**. A list of the regions offered by Oracle Cloud Infrastructure is displayed. Regions that you have not subscribed to provide a button to create a subscription.

*To subscribe to an infrastructure region*

1. Open the Console, open the **Region** menu, and then click **Manage Regions**. The list of regions available to your tenancy Oracle Cloud Infrastructure is displayed. Your home region is labeled.
2. Locate the region you want to subscribe to and click **Subscribe**.

   Note that it could take several minutes to activate your tenancy in the new region.

   Remember, your IAM resources are global, so when the subscription becomes active, all your existing policies are enforced in the new region.

   To switch to the new region, use the **Region** menu in the Console. See **Switching Regions** on page 67 for more information.

   You cannot unsubscribe from a region.

**Using the API to Work with Infrastructure Regions**

For information about using the API and signing requests, see **REST APIs** on page 6275 and **Security Credentials** on page 205. For information about SDKs, see **Software Development Kits and Command Line Interface** on page 6094.

Use these API operations to manage infrastructure regions:

- **GetTenancy**
- **ListRegions**: Returns a list of regions offered by Oracle Cloud Infrastructure in your selected *realm*.
- **CreateRegionSubscription**
- **ListRegionSubscriptions**

You cannot unsubscribe from a region.

**Region FAQs**

*Can an individual user subscribe to a region?*

A region subscription is at the tenancy level. An administrator can subscribe the tenancy to a region. All IAM polices are enforced in the new region, so *all* users in the tenancy will have the same access and permissions in the new region.

*Can I see my existing resources in the new region?*

When you select a region in the Console, you are shown a view of the resources in your selected region. Most cloud resources (instances, VCNs, buckets, etc.) exist only in a specific region, so you only see them when you select the region where they were created. The exception is IAM resources: compartments, users, groups, and policies are global across all regions. See also **Working Across Regions** on page 67.

*How do my service limits apply to the new region?*

Service limits can be scoped to the tenant level, the region level, or the availability domain level. When you subscribe to a new region, you get access to the region and its availability domains. Service limits apply accordingly. The service limits page lists the scope of each resource limit.

*Can I restrict access to a specific region?*

Yes. You can write policies that grant permissions in a specified region only. For an example policy, see **Restrict admin access to a specific region**.

*Can I change my home region?*

No. Oracle assigns your home region and you can't change it.
Managing Platform Services Regions

This topic describes how to manage Platform Services region subscriptions.

About the Platform Services Regions

You can manage Platform Services regions in the Console.

To use Platform Services that are not natively integrated with Oracle Cloud Infrastructure, you need to subscribe to the Platform Services region as well as the Infrastructure region. For example, to create a Platform Service instance in the Germany Central (Frankfurt) region, you need to subscribe your tenancy to both the Infrastructure region: Germany Central (Frankfurt) and to the Platform Service region: Europe and Middle East.

To know which services require the Platform Service region subscription, in the Console, open the navigation menu and click OCI Classic Services. The list of services that require region subscriptions appears in the menu.

Before you can view these services in the Console or access the Manage Platform Services Regions page, your tenancy must have entitlements to use the Platform Services.

Managing Platform Services Regions

To view and subscribe to Platform Services regions

1. Open the Console, open the Region menu, and then click Manage Regions.
2. On the Manage Regions page, click Platform Services Regions.

   The list of geographical regions is displayed. Regions that you have not subscribed to provide a button to create a subscription. A sample of the Platform Services Regions page is shown in the following screenshot:

3. To subscribe to a region, locate the region in the list and click Subscribe.

   It might take several minutes to activate your tenancy in the new region.

Viewing Tenancy Details

This topic describes options on the tenancy details page in the Console.

Required IAM Policy

If you're in the Administrators group, then you have the required access to manage the tenancy.
Important:

Granting a user or a group the Identity domain administrator role in the Default domain is equivalent to granting them full administrator permissions for the tenancy. This behavior applies to the Default domain only. Granting users or groups the Identity domain administrator role for domains other than the Default domain, grants them full administrator permissions to only that domain.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for your tenancy and other IAM components, see Details for IAM.

Viewing the Tenancy Details Page

To view the tenancy details page:

Open the Profile menu (-profile) and click Tenancy: <your_tenancy_name>.

Details About Your Tenancy

The tenancy details page provides the following information about your tenancy:

**TENANCY OCID**

Every Oracle Cloud Infrastructure resource has an Oracle-assigned unique ID called an Oracle Cloud Identifier (OCID). You need your tenancy's OCID to use the API. You'll also need it when contacting support.

**HOME REGION**

When you sign up for Oracle Cloud Infrastructure, Oracle creates a tenancy for you in one of the available regions. This is your home region. Your home region is where your IAM resources are defined. For more information about the home region, see The Home Region on page 3238.

**NAME**

Your tenancy name. Your tenancy name is typically chosen when you set up your Oracle Cloud account.

**CSI NUMBER**

Your Customer Service Identifier for Oracle Support.

**OBJECT STORAGE DESIGNATED COMPARTMENTS AND NAMESPACE**

The Object Storage service provides API support for both Amazon S3 Compatibility API and Swift API. By default, buckets created using the Amazon S3 Compatibility API or the Swift API are created in the root compartment of the Oracle Cloud Infrastructure tenancy. You can designate a different compartment for the Amazon S3 Compatibility API or Swift API to create buckets in. For more information, see Designating Compartments for the Amazon S3 Compatibility and Swift APIs on page 5008.

For information about your Object Storage namespace, see Understanding Object Storage Namespaces on page 4885.

**TAGS**

Tagging allows you to define keys and values and associate them with resources. You can then use the tags to help you organize and list resources based on your business needs. If you have permissions to manage the tenancy, you also have permissions to apply free-form tags. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags on page 239.

**SERVICE LIMITS**

The limits allotted to your tenancy and usage against these limits. Not all service resources are included in the list shown here on the Console. For more information or to request an increase, see Service Limits on page 243.
Using the API

Many of the options set on this page are managed through the owning service. For example, the Object Storage settings are managed with the Object Storage service API, and setting the Audit log retention period is handled by the Audit service API.

To get information about your tenancy use the following operation:

- GetTenancy

To tag a tenancy, use the following operations:

- GetCompartment
- UpdateCompartment

In the above operations, use the tenancy OCID for the `compartmentID` parameter.

Working with Network Source Restrictions

Network source restrictions let you specify an allowed set of IP ranges from which users can sign in to the Console. Users attempting to sign in from an IP address not on the allowed list will be denied access.

To enforce a network source restriction for your tenancy:

1. Set up a network source that specifies the allowed IP addresses. See Managing Network Sources on page 3536 for information on setting up the network source.
2. Select the network source in the Authentication settings page.

An administrator can set only one network source in the authentication settings, but a single network source can include multiple allowed IP addresses.

A network source restriction is applied for every user in the tenancy. If an administrator is unable to access a network with an allowed IP address to sign in from, then they must do one of the following to gain access to the tenancy:

- Use the authentication SDK to sign in and change the network source restriction setting programmatically.
- Contact Oracle Support. If you do not have an API signing key to enable access through the authentication SDK, then you must contact support to regain access to your tenancy.

<table>
<thead>
<tr>
<th>Caution:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Before you set up a network source restriction, ensure that you have an API key set up to enable access to your tenancy in case an allowed network is not available. If you do not set up an API key and an allowed network is not available, then all users will be locked out of the tenancy until you contact Oracle Support. For information about setting up the API signing key, see Required Keys and OCIDs on page 6045.</td>
</tr>
</tbody>
</table>

When Do Changes to Network Source Restrictions Take Effect

After a network source restriction is defined, users signed in to the Console can continue with their current session, but after they sign out, the network restriction will be applied the next time they try to sign in.

Calling Services from an Instance

This topic describes how you can authorize Compute instances to call services in Oracle Cloud Infrastructure.

Introduction

This procedure describes how you can authorize a Compute instance to make API calls in Oracle Cloud Infrastructure services. After you set up the required resources and policies, an application running on an instance can call Oracle Cloud Infrastructure public services, removing the need to configure user credentials or a configuration file.
**Concepts**

**DYNAMIC GROUP**

Dynamic groups allow you to group Oracle Cloud Infrastructure Compute instances as principal actors, similar to user groups. You can then create policies to permit instances in these groups to make API calls against Oracle Cloud Infrastructure services. Membership in the group is determined by a set of criteria you define, called *matching rules*.

**MATCHING RULE**

When you set up a dynamic group, you also define the rules for membership in the group. Resources that match the rule criteria are members of the dynamic group. Matching rules have a specific syntax you follow. See Writing Matching Rules to Define Dynamic Groups on page 3125.

**INSTANCE PRINCIPALS**

The IAM service feature that enables Compute instances to be authorized actors (or principals) to perform actions on service resources. Each Compute instance has its own identity, and it authenticates using the certificates that are added to it. These certificates are automatically created, assigned to instances and rotated, preventing the need for you to distribute credentials to your hosts and rotate them.

**Security Considerations**

Any user who has access to the Compute instance (who can SSH to the instance), automatically inherits the privileges granted to the instance. Before you grant permissions to an instance using the process described in this topic, ensure that you know who can access it (either because they have the SSH key or you added them as users to the instance), and that they should be authorized with the permissions you are granting to the instance.

All Compute instance principals are granted the `compartment_inspect` permission. You cannot revoke this permission. This permission allows the instance to ListCompartments in the tenancy to retrieve the following information:

- Compartment names
- Compartment descriptions
- Free-form tags applied to compartments
- Automatic tag defaults applied to compartments. These tags, such as CreatedBy and CreatedOn, are in the Oracle-Tag namespace and are automatically added by Oracle.

**Process Overview**

The following steps summarize the process flow for setting up and using Compute instances as principals. The subsequent sections provide more details.

1. Create a dynamic group. In the dynamic group definition, you provide the matching rules to specify which Compute instances you want to allow to make API calls against services.
2. Create a policy granting permissions to the dynamic group to access services in your tenancy (or compartment).
3. A developer in your organization configures the application built using the Oracle Cloud Infrastructure SDK to authenticate using the instance principals provider. The developer deploys the application and the SDK to all the Compute instances that belong to the dynamic group.
4. The deployed SDK makes calls to Oracle Cloud Infrastructure APIs as allowed by the policy (without needing to configure API credentials).
5. For each API call made by an instance, the Audit service logs the event, recording the OCID of the instance as the value of `principalId` in the event log.

**Steps to Enable Instances to Call Services**

Perform these tasks to enable a Compute instance to call services:

- **Create a Dynamic Group and Matching Rules**
- **Write Policies for Dynamic Groups**
- **Configure the SDK, CLI, or Terraform**
Creating a Dynamic Group and Matching Rules

See Managing Dynamic Groups on page 3123.

Writing Policies for Dynamic Groups

After you create a dynamic group, you need to create policies to permit the dynamic groups to access Oracle Cloud Infrastructure services.

Policy for dynamic groups follows the syntax described in How Policies Work. Review that topic to understand basic policy features.

The syntax to permit a dynamic group access to resources in a compartment is:

```
Allow dynamic-group <dynamic_group_name> to <verb> <resource-type> in compartment <compartment_name>
```

The syntax to permit a dynamic group access to a tenancy is:

```
Allow dynamic-group <dynamic_group_name> to <verb> <resource-type> in tenancy
```

Here are a few example policies:

To allow a dynamic group (FrontEnd) to use a load balancer in a specific compartment (ProjectA):

```
Allow dynamic-group FrontEnd to use load-balancers in compartment ProjectA
```

To allow a dynamic group to launch instances in a specific compartment:

```
Allow dynamic-group FrontEnd to manage instance-family in compartment ProjectA
Allow dynamic-group FrontEnd to use volume-family in compartment ProjectA
Allow dynamic-group FrontEnd to use virtual-network-family in compartment ProjectA
```

For more sample policies, see Common Policies.

Configuring the SDK, CLI, or Terraform

For information about SDKs, see Software Development Kits and Command Line Interface on page 6094.

For the SDK for Java:

In your SDK for Java, create an `InstancePrincipalsAuthenticationDetailsProvider` object. For example:

```
public static void main(String[] args) throws Exception {
    InstancePrincipalsAuthenticationDetailsProvider provider =
        InstancePrincipalsAuthenticationDetailsProvider.builder().build();
    IdentityClient identityClient = new IdentityClient(provider);
    ...
```

For the SDK for Python:

In your SDK for Python, create an `oci.auth.signers.InstancePrincipalsSecurityTokenSigner` object. For example:

```
# By default this will hit the auth service in the region returned by http://169.254.169.254/opc/v1/instance/region on the instance.
```
signer = oci.auth.signers.InstancePrincipalsSecurityTokenSigner()
 identity_client = oci.identity.IdentityClient(config={}, signer=signer)
...

To refresh the token without waiting, use the following command:

signer.refresh_security_token()

Enabling Instance Principal Authorization for the CLI

To enable instance principal authorization from the CLI, you can set the authorization option (--auth) for a command. For example:

oci os ns get --auth instance_principal

Alternatively, you can set the following environment variable:

OCI_CLI_AUTH=instance_principal

Note that if both are set, the value set for --auth takes precedence over the environment variable.

For information about using the CLI, see Working with the Command Line Interface.

Enabling Instance Principal Authorization for Terraform

To enable instance principal authorization in Terraform, you can set the auth attribute to "InstancePrincipal" in the provider definition as shown in the following sample:

```
variable "region" {}

provider "oci" {
  auth = "InstancePrincipal"
  region = "${var.region}"
}
```

Note that when you use instance principal authorization you do not need to include the tenancy_ocid, user_ocid, fingerprint, and private_key_path attributes.

FAQs

How do I query the instance metadata service to query the certificate on the instance?

How frequently is the certificate rotated on each instance?

The certificate is rotated multiple times each day.

What happens if I try to use an expired certificate?

You will get a 401-Not Authenticated error.

Can I change the frequency at which the certificate is rotated?

No. You can't change the frequency at which the certificate is rotated. However, you can change the policy on the dynamic group. If you think an instance has been compromised, you can either change the policy on the dynamic group to revoke permissions for all members of the group, or you can remove the instance from the dynamic group. See Can I remove an instance from a dynamic group? on page 3246

What happens if the certificate is rotated in the middle of a long running operation?

The token expiration is independent of the certificate expiration period. And, it also depends on the application you are interacting with. For example, if Object Storage does not have a multipart PUT operation, then it does not matter how long the operation runs.
Are the certificates accessible for all users on an instance?

Yes. Ensure that only users who should be granted the access that you have granted to the dynamic group, have access to the instance.

Are dynamic groups created at the tenancy level?

Yes.

Can I remove an instance from a dynamic group?

Yes. You can remove it by modifying the matching rule to exclude it. See below for an example.

Can I exclude specific instances in a compartment from the dynamic group?

Yes. For example, assume you want to exclude two specific instances in a compartment from the dynamic group. Write a matching rule like this:

\[
\text{All \{instance.compartment.id = '<compartment_ocid>',} \\
\text{instance.id != '<instance1_to_exclude_ocid>', instance.id !=} \\
\text{'<instance2_to_exclude_ocid>'}\]

The above rule includes all instances in the compartment except those with the OCIDs specified.

Managing Access to Resources

You can write policies to control access to all of the services within Oracle Cloud Infrastructure. You can also grant access to tasks and resources in an identity domain by assigning users to administrator roles.

Understanding Administrator Roles

In the following topic, you learn about administrator roles and the privileges associated with each role.

In your organization, you might want administrators to have different levels of access to various tasks and resources. For example, the identity domain administrator has superuser privileges for an identity domain. This administrator may want to delegate some of their responsibilities to other users to carry out the tasks associated with these responsibilities, such as managing system configuration and security settings, applications, users, groups, group memberships, and so on. To do this, the administrator assigns these users to other administrator roles. Users who are assigned to these roles will be able to perform specific tasks that are associated with the roles.

The following table lists the administrator roles and summarizes the privileges for each role.

<table>
<thead>
<tr>
<th>Administrator role</th>
<th>Privileges</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity domain administrator</td>
<td>Has superuser privileges for an identity domain in IAM</td>
</tr>
<tr>
<td></td>
<td>Identity domain administrators can:</td>
</tr>
<tr>
<td></td>
<td>• Manage users, groups, applications, system configuration, and security settings</td>
</tr>
<tr>
<td></td>
<td>• Perform delegated administration by assigning users to different administrative roles</td>
</tr>
<tr>
<td></td>
<td>• Enable and disable Multi-Factor Authentication (MFA), configure MFA settings, and configure authentication factors</td>
</tr>
<tr>
<td></td>
<td>• Create self-registration profiles to manage different sets of users, approval policies, and applications</td>
</tr>
<tr>
<td>Security administrator</td>
<td>Manage IAM system configuration and security settings for an identity domain.</td>
</tr>
<tr>
<td></td>
<td>Security administrators can customize the interface, default settings, notifications, and the password policies, configure Multi-Factor Authentication (MFA), and manage the Microsoft Active Directory (AD) Bridge, Provisioning Bridge, identity providers, and trusted partner certificates.</td>
</tr>
</tbody>
</table>
IAM Administrator role

<table>
<thead>
<tr>
<th>Privileges</th>
<th>Application administrator</th>
<th>User administrator</th>
<th>User manager</th>
<th>Help desk administrator</th>
<th>Audit administrator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manage applications. Application administrators can create, update, activate, deactivate, and delete applications. Application administrators can also grant and revoke access to applications for groups and users.</td>
<td>Manage users, groups, and group memberships for an identity domain.</td>
<td>Manage all users or users of selected groups in an identity domain. User managers can update, activate, deactivate, remove, and unlock user accounts. User managers can also reset passwords, reset authentication factors, and generate bypass codes for user accounts.</td>
<td>Manage all users or users of selected groups in an identity domain. Help desk administrators can view the details of a user and unlock a user account. Help desk administrators can also reset passwords, reset authentication factors, and generate bypass codes for user accounts.</td>
<td>Run reports for an identity domain.</td>
<td></td>
</tr>
</tbody>
</table>

Using the Console

Adding Users to Roles

Use the Console to add users to administrator roles to grant them access to various tasks and resources.

2. Select the identity domain you want to work in and click Security and then Administrators.
3. Expand roles by clicking the arrow next to the name of the role that you want to add a user to, and then click Add users.
4. Click the text box and enter at least three characters to search for a user, or use the left and right arrows at the end of the user list to navigate to a new page of users.
   When you find the user you want to add to the role, select the check box next to the user's display name.
5. When you have selected all the users you want to add to the role, click Add users.

Removing Users from Roles

Use the Console to remove users from administrator roles when you want to remove their access to various tasks and resources.

2. Select the identity domain you want to work in and click Security and then Administrators.
3. Expand roles by clicking the arrow next to the name of the role that you want to remove a user from.
4. In the list of users currently assigned to the role, find the user that you want to remove, and then click the Actions menu (three dots) for the user.
5. Click Remove.
6. To confirm, click Remove user.

Getting Started with Policies

To get started, first decide whether and how to get started with policies and familiarize yourself with common questions about policies.

If you're new to IAM policies, this topic gives guidance on how to proceed.

If You're Doing a Proof-of-Concept

If you're just trying out Oracle Cloud Infrastructure or doing a proof-of-concept project with infrastructure resources, you may not need more than a few administrators with full access to everything. In that case, you can simply create any new users you need and add them to the Administrators group. The users will be able to do anything with any kind of resource. And you can create all your resources directly in the tenancy (the root compartment). You don't
need to create any compartments yet, or any other policies beyond the Tenant Admin Policy, which automatically comes with your tenancy and can't be changed.

**Note:**

Don't forget to add your new users to the Administrators group; it's easy to forget to do that after creating them.

**If You're Past the Proof-of-Concept Phase**

If you're past the proof-of-concept phase and want to restrict access to your resources, first:

- Make sure you're familiar with the basic IAM components, and read through the example scenario: Example Scenario on page 3250
- Think about how to organize your resources into compartments: See "Setting Up Your Tenancy" in the Oracle Cloud Infrastructure Getting Started Guide
- Learn the basics of how policies work: How Policies Work on page 3258
- Check out some typical policies: Common Policies on page 3264
- Read the FAQs below

**Policy FAQs**

*Which of the services within Oracle Cloud Infrastructure can I control access to through policies?*

All of them, including IAM itself. You can find specific details for writing policies for each service in the Policy Reference on page 3298.

*Can users do anything without an administrator writing a policy for them?*

Yes. All users can automatically do these things without an explicit policy:

- Change or reset their own Console password.
- Manage their own API signing keys and other credentials.

*Why should I separate resources by compartment? Couldn't I just put all the resources into one compartment and then use policies to control who has access to what?*

You could put all your resources into a single compartment and use policies to control access, but then you would lose the benefits of measuring usage and billing by compartment, simple policy administration at the compartment level, and clear separation of resources between projects or business units.

*Can I control or deny access to an individual user?*

Yes. However, there are a couple things to know first:

- Enterprise companies typically have multiple users that need similar permissions, so policies are designed to give access to groups of users, not individual users. A user gains access by being in a group.
- Policies are designed to allow access; there's no explicit "deny" when you write a policy.

If you need to grant access to a particular user, you can add a condition to the policy that specifies the user's OCID in a variable. This construction restricts the access granted in the policy to only the user specified in the condition. For example:

```allow any-user to read object-family in compartment ObjectStorage where request.user.id = 'ocid1.user.oc1..<user_OCID>'```

For information about using conditions and variables in policies, see Conditions on page 3285.

If you need to restrict a particular user's access, you can:

- Remove the user from the particular group of interest
- Delete the user entirely from IAM (you have to remove the user from all groups first)

*How do I delete a user?*

First ensure the user isn't in any groups. Only then can you delete the user.
**How do I delete a compartment?**

See [To delete a compartment.](#)

**How can I tell which policies apply to a particular group or user?**

You need to look at the individual statements in all your policies to see which statements apply to which group. There’s not currently an easy way to get this information.

**How can I tell which policies apply to a particular compartment?**

You need to look at the individual statements in all the policies in the tenancy to see if any apply to the particular compartment. You also need to look at any policies in the compartment itself. Policies in any of the sibling compartments cannot refer to the compartment of interest, so you don’t need to check those policies.

**Understanding Policies**

IAM uses policies to restrict access to resources.

Policies exist at the tenancy level and can be applied to identity domains. Learn about IAM policies and when you need them for identity domains. Also gain an understanding of how policies work and see what common policies look like.

**Let volume backup admins manage only backups**

**Type of access:** Ability to do all things with volume backups, but not create and manage volumes themselves.

This makes sense if you want to have a single set of volume backup admins manage all the volume backups in all the compartments. The first statement gives the required access to the volume that is being backed up; the second statement enables creation of the backup (and the ability to delete backups). The third statement enables the creation and management of user defined backup policies; the fourth statement enables assignment and removal of assignment of backup policies.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of **policy inheritance.** To reduce the scope of access to just the volumes and backups in a particular compartment, specify that compartment instead of the tenancy.

<table>
<thead>
<tr>
<th>Allow group VolumeBackupAdmins to use volumes in tenancy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow group VolumeBackupAdmins to manage volume-backups in tenancy</td>
</tr>
<tr>
<td>Allow group VolumeBackupAdmins to manage backup-policies in tenancy</td>
</tr>
<tr>
<td>Allow group VolumeBackupAdmins to manage backup-policy-assignments in tenancy</td>
</tr>
</tbody>
</table>

If the group will be using the Console, the following policy gives a better user experience:

<table>
<thead>
<tr>
<th>Allow group VolumeBackupAdmins to use volumes in tenancy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow group VolumeBackupAdmins to manage volume-backups in tenancy</td>
</tr>
<tr>
<td>Allow group VolumeBackupAdmins to inspect volume-attachments in tenancy</td>
</tr>
<tr>
<td>Allow group VolumeBackupAdmins to inspect instances in tenancy</td>
</tr>
<tr>
<td>Allow group VolumeBackupAdmins to manage backup-policies in tenancy</td>
</tr>
<tr>
<td>Allow group VolumeBackupAdmins to manage backup-policy-assignments in tenancy</td>
</tr>
</tbody>
</table>

The last two statements are not necessary in order to manage volume backups. However, they enable the Console to display all the information about a particular volume and the available backup policies.
IAM

Example Scenario
The goal of this scenario is to show how the different IAM components work together, and basic features of policies.

In this scenario, Acme Company has two teams that will be using Oracle Cloud Infrastructure resources for infrastructure: Project A and Project B. In reality, your company may have many more.

Acme Company plans to use a single virtual cloud network (VCN) for both teams, and wants a network administrator to manage the VCN.

Acme Company also wants the Project A team and Project B team to each have their own set of instances and block storage volumes. The Project A team and Project B teams shouldn't be able to use each other's instances. These two teams also shouldn't be allowed to change anything about the VCN set up by the network administrator. Acme Company wants each team to have administrators for that team's resources. The administrators for the Project A team can decide who can use the Project A cloud resources, and how. Same for the Project B team.

Acme Company Gets Started with Oracle Cloud Infrastructure
Acme Company signs up to use Oracle Cloud Infrastructure and tells Oracle that an employee named Wenpei will be the default administrator. In response, Oracle:

- Creates a tenancy for Acme Company (see the following diagram).
- Creates an IAM user account for Wenpei in the tenancy.
- Creates the Administrators group in the tenancy and places Wenpei in that group.
- Creates a policy in Acme Company's tenancy that gives the Administrators group access to manage all of the resources in the tenancy. Here's that policy:

Allow group Administrators to manage all-resources in tenancy

The default setup for a new tenancy:

<table>
<thead>
<tr>
<th>Policies attached to the tenancy:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Allow group Administrators to manage all-resources in tenancy</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Users</th>
<th>Wenpei</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Groups</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrators</td>
</tr>
<tr>
<td>Wenpei</td>
</tr>
</tbody>
</table>

The Default Administrator Creates Some Groups and Another Administrator
Wenpei next creates several groups and users (see the following diagram). She:

- Creates groups called NetworkAdmins, A-Admins, and B-Admins (these last two are for Project A and Project B within the company)
- Creates a user called Alex and puts him in the Administrators group.
- Leaves the new groups empty.

To learn how to create groups, see Managing Groups on page 3121. To learn how to create users and put them in groups, see Managing Users on page 3112.
The Default Administrator Creates Some Compartments and Policies

Wenpei next creates compartments to group resources together (see the following diagram). She:

- Creates a compartment called **Networks** to control access to the Acme Company's VCN, subnets, Site-to-Site VPN, and other components from Networking.
- Creates a compartment called **Project-A** to organize Project A team's cloud resources and control access to them.
- Creates a compartment called **Project-B** to organize Project B team's cloud resources and control access to them.

To learn how to manage compartments, see [Managing Compartments](https://docs.oracle.com/en/cloud/oracle-cloud-infrastructure/user-guide/compartments.html) on page 3225.

Wenpei then creates a policy to give the administrators for each compartment their required level of access. She attaches the policy to the tenancy, which means that only users with access to manage policies in the tenancy can later update or delete the policy. In this scenario, that is only the Administrators group. The policy includes multiple statements that:

- Give the NetworkAdmins group access to manage networks and instances (for the purposes of easily testing the network) in the Networks compartment
- Give both the A-Admins and B-Admins groups access to use the networks in the Networks compartment (so they can create instances into the network).
- Give the A-Admins group access to manage all resources in the Project-A compartment.
- Give the B-Admins group access to manage all resources in the Project-B compartment.

Here's what that policy looks like (notice it has multiple statements in it):

```
Allow group NetworkAdmins to manage virtual-network-family in compartment Networks
Allow group NetworkAdmins to manage instance-family in compartment Networks
Allow group A-Admins,B-Admins to use virtual-network-family in compartment Networks
Allow group A-Admins to manage all-resources in compartment Project-A
Allow group B-Admins to manage all-resources in compartment Project-B
```

Notice the difference in the verbs (manage, use), as well as the resources (virtual-network-family, instance-family, all-resources). For more information about them, see [Verbs](https://docs.oracle.com/en/cloud/oracle-cloud-infrastructure/user-guide/verbs.html) on page 3296 and [Resource-Types](https://docs.oracle.com/en/cloud/oracle-cloud-infrastructure/user-guide/resourcetypes.html) on page 3297. To learn how to create policies, see [To create a policy](https://docs.oracle.com/en/cloud/oracle-cloud-infrastructure/user-guide/policies.html) on page 3525.
**Important:**

A-Admins and B-Admins can use the virtual-network-family in the compartment Networks. However, they can't create instances in that compartment. They can only create instances in the Project-A or Project-B compartment. Remember, a compartment is a logical grouping, not a physical one, so resources that make up or reside on the same VCN can belong to different compartments.

Acme Company wants to let the administrators of the Project-A and Project-B compartments decide which users can use the resources in those compartments. So Wenpei creates two more groups: A-Users and B-Users. She then adds six more statements that give the compartment admins the required access they need in order to add and remove users from those groups:

- Allow group A-Admins to use users in tenancy where target.group.name='A-Users'
- Allow group A-Admins to use groups in tenancy where target.group.name='A-Users'
- Allow group B-Admins to use users in tenancy where target.group.name='B-Users'
- Allow group B-Admins to use groups in tenancy where target.group.name='B-Users'
- Allow group A-Admins,B-Admins to inspect users in tenancy
- Allow group A-Admins,B-Admins to inspect groups in tenancy

Notice that this policy doesn't let the project admins create new users or manage credentials for the users. It lets them decide which existing users can be in the A-Users and B-Users groups. The last two statements are necessary for A-Admins and B-Admins to list all the users and groups, and confirm which users are in which groups.
An Administrator Creates New Users

At this point, Alex is in the Administrators group and now has access to create new users. So he provisions users named Leslie, Jorge, and Cheri and places them in the NetworkAdmins, A-Admins, and B-Admins groups,
respectively. Alex also creates other users who will eventually be put in the A-Users and B-Users groups by the admins for Project A and Project B.
IAM

The Network Admin Sets Up the Network

Leslie (in the NetworkAdmins group) has access to manage virtual-network-family and instance-family in the Networks compartment. She creates a virtual cloud network (VCN) with a single subnet in that compartment. She also sets up an Internet gateway for the VCN, and updates the VCN's route table to allow traffic via that gateway. To test the VCN's connectivity to the on-premises network, she launches an instance in the subnet in the VCN. As part of the launch request, she must specify which compartment the instance should reside in. She specifies the Networks compartment, which is the only one she has access to. She then confirms connectivity from the on-premises network to the VCN by logging in to the instance via SSH from the on-premises network.

Leslie terminates her test instance and lets Jorge and Cheri know that the VCN is up and running and ready to try out. She lets them know that their compartments are named Project-A and Project-B respectively. For more information about setting up a cloud network, see Networking on page 4178. For information about launching instances into the network, see Compute on page 996.

Compartment Admins Set Up Their Compartments

Jorge and Cheri now need to set up their respective compartments. Each admin needs to do the following:

• Launch instances in their own compartment
• Put users in their "users" group (e.g., A-Users)
• Decide the type of access to give those users, and accordingly attach a policy to their compartment

Jorge and Cheri both launch instances into the subnet in the VCN, into their respective team's compartments. They create and attach block volumes to the instances. Only the compartment admins can launch/terminate instances or attach/detach block volumes in their respective team's compartments.

Important:

Network Topology and Compartment Access Are Different Concepts

It's important to understand the difference between the network topology of the VCN and the access control that the compartments provide. The instances Jorge launched reside in the VCN from a network topology standpoint. But from an access standpoint, they're in the Project-A compartment, not the Networks compartment where the VCN is. Leslie (the Networks admin) can't terminate or reboot Jorge's instances, or launch new ones into the Project-A compartment. But Leslie controls the instances' network, so she controls what traffic will be routed to them. If Jorge had specified the Networks compartment instead of the Project-A compartment when launching his instances, his request would have been denied. The story is similar for Cheri and the Project-B compartment.

But it's also important to note that Wenpei and Alex in the Administrators group do have access to the resources inside the compartments, because they have access to manage all kinds of resources in the tenancy. Compartments inherit any policies attached to their parent compartment (the tenancy), so the Administrators access also applies to all compartments within the tenancy.

Next, Jorge puts several of the users that Alex created into the A-Users group. Cheri does the same for B-Users.

Then Jorge writes a policy that gives users the level of access they need in the Project-A compartment.

| Allow group A-Users to use instance-family in compartment Project-A |
| Allow group A-Users to use volume-family in compartment Project-A |
| Allow group A-Users to inspect virtual-network-family in compartment Networks |

This lets them use existing instances (with attached block volumes) that the compartment admins already launched in the compartment, and stop/start/reboot them. It does not let A-Users create/delete or attach/detach any volumes. To give that ability, the policy would need to include manage volume-family.
Jorge attaches this policy to the Project-A compartment. Anyone with the ability to manage policies in the compartment can now modify or delete this policy. Right now, that is only the A-Admins group (and the Administrators group, which can do anything throughout the tenancy).

Cheri creates and attaches her own policy to the Project-B compartment, similar to Jorge's policy:

- Allow group B-Users to use instance-family in compartment Project-B
- Allow group B-Users to use volume-family in compartment Project-B
- Allow group B-Users to inspect virtual-network-family in compartment Networks

Now the A-Users and B-Users can work with the existing instances and attached volumes in the Project-A and Project-B compartments, respectively. Here's what the layout looks like:
CompanyA Tenancy

Policies attached to the tenancy:

- **Allow group Administrators** to manage all-resources in tenancy
- **Allow group NetworkAdmins** to manage virtual-network-family in compartment Networks
- **Allow group NetworkAdmins** to manage instance-family in compartment Networks
- **Allow group A-Admins,B-Admins** to use virtual-network-family in compartment Networks
- **Allow group A-Admins** to manage all-resources in compartment Project-A
- **Allow group B-Admins** to manage all-resources in compartment Project-B
- **Allow group A-Admins** to use users in tenancy where target.group.name='A-Users'
- **Allow group A-Admins** to use groups in tenancy where target.group.name='A-Users'
- **Allow group B-Admins** to use users in tenancy where target.group.name='B-Users'
- **Allow group B-Admins** to use groups in tenancy where target.group.name='B-Users'
- **Allow group A-Admins,B-Admins** to inspect users in tenancy
- **Allow group A-Admins,B-Admins** to inspect groups in tenancy

### Users

<table>
<thead>
<tr>
<th></th>
<th>Alex</th>
<th>Fred</th>
<th>Jorge</th>
<th>Tarik</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

</tr>
</tbody>
</table>

### Groups

- **Administrators**
  - Wenpei
  - Alex

- **NetworkAdmins**
  - Leslie

- **A-Admins**
  - Jorge

- **B-Admins**
  - Cheri

- **A-Users**
  - Laura
  - Dylan

- **B-Users**
  - Fred
  - Jenna
  - Tarik

### Compartments

- **Networks**
- **Project-A**
  - Policy attached and managed by Jorge
    - **Allow group A-Users** to use instance-family in compartment Project-A
    - **Allow group A-Users** to use volume-family in compartment Project-A
- **Project-B**
  - Policy attached and managed by Cheri
    - **Allow group B-Users** to use instance-family in compartment Project-B
    - **Allow group B-Users** to use volume-family in compartment Project-B
    - **Allow group B-Users** to inspect virtual-network-family in compartment Networks
Policy Attachment

Another basic feature of policies is the concept of attachment. When you create a policy you must attach it to a compartment (or the tenancy, which is the root compartment). Where you attach it controls who can then modify it or delete it. If you attach it to the tenancy (in other words, if the policy is in the root compartment), then anyone with access to manage policies in the tenancy can then change or delete it. Typically that’s the Administrators group or any similar group you create and give broad access to. Anyone with access only to a child compartment cannot modify or delete that policy.

If you instead attach the policy to a child compartment, then anyone with access to manage the policies in that compartment can change or delete it. In practical terms, this means it’s easy to give compartment administrators (i.e., a group with access to manage all-resources in the compartment) access to manage their own compartment’s policies, without giving them broader access to manage policies that reside in the tenancy. For an example that uses this kind of compartment administrator design, see Example Scenario on page 3250. (Recall that because of policy inheritance, users with access to manage policies in the tenancy automatically have the ability to manage policies in compartments inside the tenancy.)

The process of attaching the policy is easy (whether attaching to a compartment or the tenancy): If you’re using the Console, when you add the policy to IAM, simply make sure you’re in the desired compartment when you create the policy. If you’re using the API, you specify the OCID of the desired compartment (either the tenancy or other compartment) as part of the request to create the policy.

When you attach a policy to a compartment, you must be in that compartment and you must indicate directly in the statement which compartment it applies to. If you are not in the compartment, you’ll get an error if you try to attach the policy to a different compartment. Notice that attachment occurs during policy creation, which means a policy can be attached to only one compartment. To learn how to attach a policy to a compartment, see To create a policy.

How Policies Work

To establish a framework of understanding before you write your own policies, get an overview of what policies are, what their components consist of, and their basic features.

This topic describes how policies work, the features that impact their use, and how those features integrate with some other basic Oracle Cloud Infrastructure features and resources.

Overview of Policies

A policy is a document that specifies who can access which Oracle Cloud Infrastructure resources that your company has, and how. A policy simply allows a group to work in certain ways with specific types of resources in a particular compartment. If you’re not familiar with users, groups, or compartments, see Overview of IAM on page 3071.

In general, here’s the process an IAM administrator in your organization needs to follow:

1. Define users, groups, and one or more compartments to hold the cloud resources for your organization.
2. Create one or more policies, each written in the policy language. See Common Policies on page 3264.
3. Place users into the appropriate groups depending on the compartments and resources they need to work with.
4. Provide the users with the one-time passwords that they need in order to access the Console and work with the compartments. For more information, see User Credentials on page 3086.

After the administrator completes these steps, the users can access the Console, change their one-time passwords, and work with specific cloud resources as stated in the policies.

Policy Basics

To govern control of your resources, your company will have at least one policy. Each policy consists of one or more policy statements that follow this basic syntax:

```
Allow group <identity_domain_name>/<group_name> to <verb> <resource-type> in compartment <compartment_name>
```
Note:
If you do not include the `<identity_domain_name>` before the `<group_name>`, then the policy statement is evaluated as though the group belongs to the default identity domain.

Notice that the statements always begin with the word Allow. Policies only allow access; they cannot deny it. Instead there's an implicit deny, which means by default, users can do nothing and have to be granted access through policies. (There's one exception to this rule; see Can users do anything without an administrator writing a policy for them? on page 3248)

An administrator in your organization defines the groups and compartments in your tenancy. Oracle defines the possible verbs and resource-types you can use in policies (see Verb on page 3292 and Resource-Types on page 3261).

In some cases you'll want the policy to apply to the tenancy and not a compartment inside the tenancy. In that case, change the end of the policy statement like so:

```
Allow group <identity_domain_name>/<group_name> to <verb> <resource-type> in tenancy
```

For more details about the syntax, see Policy Syntax on page 3291.

For information about how many policies you can have, see Service Limits on page 243.

A Few Examples

Let's say your administrator creates a group called HelpDesk (in the default identity domain) whose job is to manage users and their credentials. Here is a policy that enables that:

```
Allow group default/HelpDesk to manage users in tenancy
```

Notice that because users reside in the tenancy (the root compartment), the policy simply states the word tenancy, without the word compartment in front of it.

Next, let's say you have a compartment called Project-A, and a group (in the default identity domain) called A-Admins whose job is to manage all of the Oracle Cloud Infrastructure resources in the compartment. Here's an example policy that enables that:

```
Allow group default/A-Admins to manage all-resources in compartment Project-A
```

Be aware that the policy directly above includes the ability to write policies for that compartment, which means A-Admins can control access to the compartment's resources. For more information, see Policy Attachment on page 3263.

If you wanted to limit A-Admins' access to only launching and managing compute instances and block storage volumes (both the volumes and their backups) in the Project-A compartment, but the network itself lives in the Networks compartment, then the policy could instead be:

```
Allow group default/A-Admins to manage instance-family in compartment Project-A
Allow group default/A-Admins to manage volume-family in compartment Project-A
Allow group default/A-Admins to use virtual-network-family in compartment Networks
```

The third statement with the virtual-network-family resource-type enables the instance launch process, because the cloud network is involved. Specifically, the launch process creates a new VNIC and attaches it to the subnet where the instance resides.
For additional examples, see Common Policies on page 3264.

**Details about Specifying Groups and Compartments**

Typically you'll specify a group or compartment by name in the policy. However, you can use the OCID instead. Just make sure to add "id" before the OCID. For example:

```
Allow group
  id
  ocid1.group.oc1..aaaaaaaaqjihfhxumr13isyrjw3n6c4rzwskaawuc7i5xwe6s7qmsbc6a
to manage instance-family in compartment Project-A
```

You can specify multiple groups separated by commas:

```
Allow group default/A-Admins, default/B-Admins to manage instance-family in compartment Projects-A-and-B
```

**Verbs**

Oracle defines the possible verbs you can use in your policies. Here's a summary of the verbs, from least amount of access to the most:

<table>
<thead>
<tr>
<th>Verb</th>
<th>Types of Access Covered</th>
<th>Target User</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>Ability to list resources, without access to any confidential information or user-specified metadata that may be part of that resource. <strong>Important:</strong> The operation to list policies includes the contents of the policies themselves, and the list operations for the Networking resource-types return all the information (e.g., the contents of security lists and route tables).</td>
<td>Third-party auditors</td>
</tr>
<tr>
<td>read</td>
<td>Includes inspect plus the ability to get user-specified metadata and the actual resource itself.</td>
<td>Internal auditors</td>
</tr>
<tr>
<td>use</td>
<td>Includes read plus the ability to work with existing resources (the actions vary by resource type). Includes the ability to update the resource, except for resource-types where the &quot;update&quot; operation has the same effective impact as the &quot;create&quot; operation (e.g., UpdatePolicy, UpdateSecurityList, etc.), in which case the &quot;update&quot; ability is available only with the manage verb. In general, this verb does not include the ability to create or delete that type of resource.</td>
<td>Day-to-day end users of resources</td>
</tr>
<tr>
<td>manage</td>
<td>Includes all permissions for the resource.</td>
<td>Administrators</td>
</tr>
</tbody>
</table>

The verb gives a certain general type of access (e.g., inspect lets you list and get resources). When you then join that type of access with a particular resource-type in a policy (e.g., Allow group XYZ to inspect compartments in the tenancy), then you give that group access to a specific set of permissions and API operations (e.g., ListCompartments, GetCompartment). For more examples, see Details for Verbs + Resource-Type Combinations. The Policy Reference on page 3298 includes a similar table for each service, giving you a list of exactly which API operations are covered for each combination of verb and resource-type.

There are some special exceptions or nuances for certain resource-types.

**Users:** Access to both manage users and manage groups lets you do anything with users and groups, including creating and deleting users and groups, and adding/removing users from groups. To add/remove users from groups without access to creating and deleting users and groups, only both use users and use groups are required. See Common Policies on page 3264.
Policies: The ability to update a policy is available only with manage policies, not use policies, because updating a policy is similar in effect to creating a new policy (you can overwrite the existing policy statements). In addition, inspect policies lets you get the full contents of the policies.

Object Storage objects: inspect objects lets you list all the objects in a bucket and do a HEAD operation for a particular object. In comparison, read objects lets you download the object itself.

Load Balancing resources: Be aware that inspect load-balancers lets you get all information about your load balancers and related components (backend sets, etc.).

Networking resources:

Be aware that the inspect verb not only returns general information about the cloud network's components (for example, the name and OCID of a security list, or of a route table). It also includes the contents of the component (for example, the actual rules in the security list, the routes in the route table, and so on).

Also, the following types of abilities are available only with the manage verb, not the use verb:

- Update (enable/disable) internet-gateways
- Update security-lists
- Update route-tables
- Update dhcp-options
- Attach a dynamic routing gateway (DRG) to a virtual cloud network (VCN)
- Create an IPSec connection between a DRG and customer-premises equipment (CPE)
- Peer VCNs

Important:

Each VCN has various components that directly affect the behavior of the network (route tables, security lists, DHCP options, Internet Gateway, and so on). When you create one of these components, you establish a relationship between that component and the VCN, which means you must be allowed in a policy to both create the component and manage the VCN itself. However, the ability to update that component (to change the route rules, security list rules, and so on) does NOT require permission to manage the VCN itself, even though changing that component can directly affect the behavior of the network. This discrepancy is designed to give you flexibility in granting least privilege to users, and not require you to grant excessive access to the VCN just so the user can manage other components of the network. Be aware that by giving someone the ability to update a particular type of component, you're implicitly trusting them with controlling the network's behavior.

Resource-Types

Oracle also defines the resource-types you can use in your policies. First, there are individual types. Each individual type represents a specific type of resource. For example, the vcns resource-type is specifically for virtual cloud networks (VCNs).

To make policy writing easier, there are family types that include multiple individual resource-types that are often managed together. For example, the virtual-network-family type brings together a variety of types related to the management of VCNs (e.g., vcns, subnets, route-tables, security-lists, etc.). If you need to write a more granular policy that gives access to only an individual resource-type, you can. But you can also easily write a policy to give access to a broader range of resources.

In another example: Block Volume has volumes, volume-attachments, and volume-backups. If you need to give access to only making backups of volumes, you can specify the volume-backups resource-type in your policy. But if you need to give broad access to all of the Block Volume resources, you can specify the family type called volume-family. For a full list of the family resource-types, see Resource-Types.
Important:

If a service introduces new individual resource-types, they will typically be included in the family type for that service. For example, if Networking introduces a new individual resource-type, it will be automatically included in the definition of the virtual-network-family resource type. For more information about future changes to the definitions of resource-types, see Policies and Service Updates on page 3264.

Note that there are other ways to make policies more granular, such as the ability to specify conditions under which the access is granted. For more information, see Advanced Policy Features on page 3285.

Access that Requires Multiple Resource-Types

Some API operations require access to multiple resource-types. For example, LaunchInstance requires the ability to create instances and work with a cloud network. The CreateVolumeBackup operation requires access to both the volume and the volume backup. That means you’ll have separate statements to give access to each resource-type (for an example, see Let volume backup admins manage only backups on page 3249). These individual statements do not have to be in the same policy. And a user can gain the required access from being in different groups. For example, George could be in one group that gives the required level of access to the volumes resource-type, and in another group that gives the required access to the volume-backups resource-type. The sum of the individual statements, regardless of their location in the overall set of policies, gives George access to CreateVolumeBackup.

Policy Inheritance

A basic feature of policies is the concept of inheritance: Compartments inherit any policies from their parent compartment. The simplest example is the Administrators group, which automatically comes with your tenancy (see The Administrators Group, Policy, and Administrator Roles on page 3074). There’s a built-in policy that enables the Administrators group (in the default identity domain) to do anything in the tenancy:

Allow group Administrators to manage all-resources in tenancy

Because of policy inheritance, the Administrators group can also do anything in any of the compartments in the tenancy.

To illustrate further, consider a tenancy with three levels of compartments: CompartmentA, CompartmentB, and CompartmentC, shown here:
Policies that apply to resources in CompartmentA also apply to resources in CompartmentB and CompartmentC. So this policy:

```
Allow group default/NetworkAdmins to manage virtual-network-family in compartment CompartmentA
```

allows the group NetworkAdmins (in the default identity domain) to manage VCNs in CompartmentA, CompartmentB, and CompartmentC.

**Policy Attachment**

Another basic feature of policies is the concept of attachment. When you create a policy you must attach it to a compartment (or the tenancy, which is the root compartment). **Where you attach it controls who can then modify it or delete it.** If you attach it to the tenancy (in other words, if the policy is in the root compartment), then anyone with access to manage policies in the tenancy can then change or delete it. Typically that's the Administrators group or any similar group you create and give broad access to. Anyone with access only to a child compartment cannot modify or delete that policy.

If you instead attach the policy to a child compartment, then anyone with access to manage the policies in that compartment can change or delete it. In practical terms, this means it's easy to give compartment administrators (i.e., a group with access to manage all-resources in the compartment) access to manage their own compartment's policies, without giving them broader access to manage policies that reside in the tenancy. For an example that uses this kind of compartment administrator design, see Example Scenario on page 3250. (Recall that because of policy inheritance, users with access to manage policies in the tenancy automatically have the ability to manage policies in compartments inside the tenancy.)

The process of attaching the policy is easy (whether attaching to a compartment or the tenancy): If you're using the Console, when you add the policy to IAM, simply make sure you're in the desired compartment when you create the policy. If you're using the API, you specify the OCID of the desired compartment (either the tenancy or other compartment) as part of the request to create the policy.

When you attach a policy to a compartment, you must be in that compartment and you must indicate directly in the statement which compartment it applies to. If you are not in the compartment, you'll get an error if you try to attach the policy to a different compartment. Notice that attachment occurs during policy creation, which means a policy can be attached to only one compartment. To learn how to attach a policy to a compartment, see To create a policy.

**Policies and Compartment Hierarchies**

As described in the previous section, a policy statement must specify the compartment for which access is being granted (or the tenancy). Where you create the policy determines who can update the policy. If you attach the policy to the compartment or its parent, you can simply specify the compartment name. If you attach the policy further up the hierarchy, you must specify the path. The format of the path is each compartment name (or OCID) in the path, separated by a colon:

```
<compartment_level_1>:<compartment_level_2>::...<compartment_level_n>
```

For example, assume you have a three-level compartment hierarchy, shown here:
You want to create a policy to allow NetworkAdmins (in the default identity domain) to manage VCNs in CompartmentC. If you want to attach this policy to CompartmentC or to its parent, CompartmentB, write this policy statement:

```
Allow group default/NetworkAdmins to manage virtual-network-family in compartment CompartmentC
```

However, if you want to attach this policy to CompartmentA (so that only administrators of CompartmentA can modify it), write this policy statement that specifies the path:

```
Allow group default/NetworkAdmins to manage virtual-network-family in compartment CompartmentB:CompartmentC
```

To attach this policy to the tenancy, write this policy statement that specifies the path from CompartmentA to CompartmentC:

```
Allow group default/NetworkAdmins to manage virtual-network-family in compartment CompartmentA:CompartmentB:CompartmentC
```

**Policies and Service Updates**

It's possible that the definition of a verb or resource-type could change in the future. For example, let's say that the `virtual-network-family` resource-type changes to include a new kind of resource that's been added to Networking. By default, your policies automatically stay current with any changes in service definition, so any policy you have that gives access to `virtual-network-family` would automatically include access to the newly added resource.

**Important:**

If a service introduces new permissions for an existing resource-type, you must update the policy statement for the existing resource-type to make the new permissions take effect. See this [known issue](#) for more information.

**Writing Policies for Each Service**

The [Policy Reference](#) on page 3298 includes details of the specific resource-types for each service, and which verb + resource-type combination gives access to which API operations.

**Common Policies**

This section includes some common policies you might want to use in your organization.

**Note:**

These policies use example group and compartment names. Make sure to replace them with your own names.

**Let the Help Desk manage users**

**Type of access:** Ability to create, update, and delete users and their credentials. It does not include the ability to put users in groups.

**Where to create the policy:** In the tenancy, because users reside in the tenancy.

```
Allow group HelpDesk to manage users in tenancy
```

**Let auditors inspect your resources**

**Type of access:** Ability to list the resources in all compartments. Be aware that:

- The operation to list IAM policies includes the contents of the policies themselves
• The list operations for Networking resource-types return all the information (for example, the contents of security lists and route tables)
• The operation to list instances requires the read verb instead of inspect, and the contents include the user-provided metadata.
• The operation to view Audit service events requires the read verb instead of inspect.

**Where to create the policy:** In the tenancy. Because of the concept of *policy inheritance*, auditors can then inspect both the tenancy and all compartments beneath it. Or you could choose to give auditors access to only specific compartments if they don't need access to the entire tenancy.

| Allow group Auditors to inspect all-resources in tenancy |
| Allow group Auditors to read instances in tenancy |
| Allow group Auditors to read audit-events in tenancy |

**Let network admins manage a cloud network**

*Type of access:* Ability to manage all components in Networking. This includes cloud networks, subnets, gateways, virtual circuits, security lists, route tables, and so on. If the network admins need to launch instances to test network connectivity, see *Let users launch compute instances* on page 3265.

**Where to create the policy:** In the tenancy. Because of the concept of *policy inheritance*, NetworkAdmins can then manage a cloud network in any compartment. To reduce the scope of access to a particular compartment, specify that compartment instead of the tenancy.

| Allow group NetworkAdmins to manage virtual-network-family in tenancy |

**Let network admins manage load balancers**

*Type of access:* Ability to manage all components in Load Balancing. If the group needs to launch instances, see *Let users launch compute instances* on page 3265.

**Where to create the policy:** In the tenancy. Because of the concept of *policy inheritance*, NetworkAdmins can then manage load balancers in any compartment. To reduce the scope of access to a particular compartment, specify that compartment instead of the tenancy.

| Allow group NetworkAdmins to manage load-balancers in tenancy |

If the group uses the Console to manage load balancers, an additional policy to use the associated networking resources is required:

| Allow group NetworkAdmins to manage load-balancers in tenancy |
| Allow group NetworkAdmins to use virtual-network-family in tenancy |

If a particular group needs to update existing load balancers (for example, modify the backend set) but not create or delete them, use this statement:

| Allow group LBUsers to use load-balancers in tenancy |

**Let users launch compute instances**

*Type of access:* Ability to do everything with instances launched into the cloud network and subnets in compartment XYZ, and attach/detach any existing volumes that already exist in compartment ABC. The first statement also lets the group create and manage instance images in compartment ABC. If the group doesn't need to attach/detach volumes, you can delete the *volume-family* statement.
**Where to create the policy:** The easiest approach is to put this policy in the tenancy. If you want the admins of the individual compartments (ABC and XYZ) to have control over the individual policy statements for their compartments, see Policy Attachment on page 3263.

| Allow group InstanceLaunchers to manage instance-family in compartment ABC |
| Allow group InstanceLaunchers to read app-catalog-listing in tenancy |
| Allow group InstanceLaunchers to use volume-family in compartment ABC |
| Allow group InstanceLaunchers to use virtual-network-family in compartment XYZ |

To allow users to create new cloud networks and subnets, see Let network admins manage a cloud network on page 3265.

**Let users launch compute instances from a specific custom image**

**Type of access:** Ability to launch instances into the cloud network and subnets in compartment XYZ using only the specified custom image. The policy also includes the ability to attach/detach any existing volumes that already exist in compartment ABC. If the group doesn't need to attach/detach volumes, you can delete the `volume-family` statement.

To specify multiple custom images, you can use conditions.

**Where to create the policy:** The easiest approach is to put this policy in the tenancy. If you want the admins of the individual compartments (ABC and XYZ) to have control over the individual policy statements for their compartments, see Policy Attachment on page 3263.

| Allow group ImageUsers to inspect instance-images in compartment ABC |
| Allow group ImageUsers to {INSTANCE_IMAGE_READ} in compartment ABC where target.image.id='<image_OCID>' |
| Allow group ImageUsers to manage instances in compartment ABC |
| Allow group ImageUsers to read app-catalog-listing in tenancy |
| Allow group ImageUsers to use volume-family in compartment ABC |
| Allow group ImageUsers to use virtual-network-family in compartment XYZ |

**Let image admins manage custom images**

**Type of access:** Ability to do everything with custom images and compute instances. Also includes the ability to do everything with Object Storage buckets, objects, and namespaces in compartment Y (for creating images from objects and creating pre-authenticated requests to images); to attach/detach any existing volumes in compartment X; and to launch instances into the cloud network and subnets in compartment Z (for creating new instances to base an image on). If the group doesn't need to attach/detach volumes, you can delete the `volume-family` statement.

**Where to create the policy:** The easiest approach is to put this policy in the tenancy. If you want the admins of the individual compartments (X, Y, and Z) to have control over the individual policy statements for their compartments, see Policy Attachment on page 3263.

| Allow group ImageAdmins to manage instances in compartment X |
| Allow group ImageAdmins to manage instance-images in compartment X |
| Allow group ImageAdmins to read app-catalog-listing in tenancy |
| Allow group ImageAdmins to manage object-family in compartment Y |
| Allow group ImageAdmins to use volume-family in compartment X |
| Allow group ImageAdmins to use virtual-network-family in compartment Z |

**Let users manage Compute instance configurations, instance pools, and cluster networks**

**Type of access:** Ability to do all things with instance configurations, instance pools, and cluster networks in all compartments.
**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the instance configurations, instance pools, and cluster networks in a particular compartment, specify that compartment instead of the tenancy.

| Allow group InstancePoolAdmins to manage compute-management-family in tenancy |

If a group needs to create instance configurations using existing instances as a template, and uses the API, SDKs, or command line interface (CLI) to do this, add the following statements to the policy:

| Allow group InstancePoolAdmins to read instance-family in tenancy |
| Allow group InstancePoolAdmins to inspect volumes in tenancy |

If a particular group needs to start, stop, or reset the instances in existing instance pools, but not create or delete instance pools, use this statement:

| Allow group InstancePoolUsers to use instance-pools in tenancy |

If resources used by the instance pool contain default tags, add the following statement to the policy to give the group permission to the tag namespace Oracle-Tags:

| Allow group InstancePoolUsers to use tag-namespaces in tenancy where target.tag-namespace.name = 'oracle-tags' |

If the instance configuration used by the instance pool launches instances in a capacity reservation, add the following statement to the policy:

| Allow service compute_management to use compute-capacity-reservations in tenancy |

**Let users manage Compute autoscaling configurations**

**Type of access:** Ability to create, update, and delete autoscaling configurations.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the autoscaling configurations in a particular compartment, specify that compartment instead of the tenancy.

| Allow group AutoscalingAdmins to manage auto-scaling-configurations in tenancy |
| Allow group AutoscalingAdmins to manage instance-pools in tenancy |

**Let users list and subscribe to images from the Partner Image catalog**

**Type of access:** Ability to list and create subscriptions to images in the Partner Image catalog. It does not include the ability to create instances using images from the Partner Image catalog (see Let users launch compute instances on page 3265).

**Where to create the policy:** In the tenancy. To reduce the scope of access to just creating subscriptions in a particular compartment, specify that compartment instead of the tenancy in the third statement.

| Allow group CatalogSubscribers to inspect app-catalog-listing in tenancy |
| Allow group CatalogSubscribers to read app-catalog-listing in tenancy |
| Allow group CatalogSubscribers to manage app-catalog-listing in tenancy |

**Let users create Compute instance console connections**

**Type of access:** Ability to create instance console connections.
**Where to create the policy:** In the tenancy.

| Allow group <group_name> to manage instance-console-connection in tenancy |
| Allow group <group_name> to read instance in tenancy |

**Let users manage Compute dedicated virtual machine hosts**

**Type of access:** Ability to create, update, and delete dedicated virtual machine hosts as well as launch instances on dedicated virtual machine hosts.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the dedicated virtual machine hosts and instances in a particular compartment, specify that compartment instead of the tenancy.

| Allow group DedicatedVMHostAdmins to manage dedicated-vm-hosts in tenancy |
| Allow group DedicatedVMHostAdmins to manage instances in tenancy |

**Let users launch Compute instances on dedicated virtual machine hosts**

**Type of access:** Ability to launch instances on dedicated virtual machine hosts.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the dedicated virtual machine hosts and instances in a particular compartment, specify that compartment instead of the tenancy.

| Allow group DedicatedVMHostAdmins to use dedicated-vm-hosts in tenancy |
| Allow group DedicatedVMHostAdmins to manage instances in tenancy |

**Let volume admins manage block volumes, backups, and volume groups**

**Type of access:** Ability to do all things with block storage volumes, volume backups, and volume groups in all compartments with the exception of copying volume backups across regions. This makes sense if you want to have a single set of volume admins manage all the volumes, volume backups, and volume groups in all the compartments. The second statement is required in order to attach/detach the volumes from instances.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the volumes/backups and instances in a particular compartment, specify that compartment instead of the tenancy.

| Allow group VolumeAdmins to manage volume-family in tenancy |
| Allow group VolumeAdmins to use instance-family in tenancy |

If the group needs to also copy volume backups and boot volume backups across regions, add the following statements to the policy:

| Allow group VolumeAdmins to use volume-backups in tenancy where request.permission='VOLUME_BACKUP_COPY' |
| Allow group VolumeAdmins to use boot-volume-backups in tenancy where request.permission='BOOT_VOLUME_BACKUP_COPY' |

**Let volume backup admins manage only backups**

**Type of access:** Ability to do all things with volume backups, but not create and manage volumes themselves. This makes sense if you want to have a single set of volume backup admins manage all the volume backups in all the compartments. The first statement gives the required access to the volume that is being backed up; the second statement enables creation of the backup (and the ability to delete backups). The third statement enables the creation and management of user defined backup policies; the fourth statement enables assignment and removal of assignment of backup policies.

| Allow group VolumeBackupAdmins to manage only backup in tenancy where request.permission='VOLUME_BACKUP_MANAGE' |
| Allow group VolumeBackupAdmins to manage only backup in tenancy where request.permission='VOLUME_BACKUP_MANAGE' |
**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the volumes and backups in a particular compartment, specify that compartment instead of the tenancy.

<table>
<thead>
<tr>
<th>Allow group VolumeBackupAdmins to use volumes in tenancy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow group VolumeBackupAdmins to manage volume-backups in tenancy</td>
</tr>
<tr>
<td>Allow group VolumeBackupAdmins to manage backup-policies in tenancy</td>
</tr>
<tr>
<td>Allow group VolumeBackupAdmins to manage backup-policy-assignments in tenancy</td>
</tr>
</tbody>
</table>

If the group will be using the Console, the following policy gives a better user experience:

<table>
<thead>
<tr>
<th>Allow group VolumeBackupAdmins to use volumes in tenancy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow group VolumeBackupAdmins to manage volume-backups in tenancy</td>
</tr>
<tr>
<td>Allow group VolumeBackupAdmins to manage backup-policies in tenancy</td>
</tr>
<tr>
<td>Allow group VolumeBackupAdmins to manage backup-policy-assignments in tenancy</td>
</tr>
</tbody>
</table>

The last two statements are not necessary in order to manage volume backups. However, they enable the Console to display all the information about a particular volume and the available backup policies.

**Let boot volume backup admins manage only backups**

**Type of access:** Ability to do all things with boot volume backups, but not create and manage boot volumes themselves. This makes sense if you want to have a single set of boot volume backup admins manage all the boot volume backups in all the compartments. The first statement gives the required access to the boot volume that is being backed up; the second statement enables creation of the backup (and the ability to delete backups). The third statement enables the creation and management of user defined backup policies; the fourth statement enables assignment and removal of assignment of backup policies.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the boot volumes and backups in a particular compartment, specify that compartment instead of the tenancy.

<table>
<thead>
<tr>
<th>Allow group BootVolumeBackupAdmins to use volumes in tenancy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow group BootVolumeBackupAdmins to manage boot-volume-backups in tenancy</td>
</tr>
<tr>
<td>Allow group BootVolumeBackupAdmins to manage backup-policies in tenancy</td>
</tr>
<tr>
<td>Allow group BootVolumeBackupAdmins to manage backup-policy-assignments in tenancy</td>
</tr>
</tbody>
</table>

If the group will be using the Console, the following policy gives a better user experience:

<table>
<thead>
<tr>
<th>Allow group BootVolumeBackupAdmins to use volumes in tenancy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow group BootVolumeBackupAdmins to manage boot-volume-backups in tenancy</td>
</tr>
<tr>
<td>Allow group BootVolumeBackupAdmins to inspect instances in tenancy</td>
</tr>
<tr>
<td>Allow group BootVolumeBackupAdmins to manage backup-policies in tenancy</td>
</tr>
</tbody>
</table>
Allow group BootVolumeBackupAdmins to manage backup-policy-assignments in tenancy

The last two statements are not necessary in order to manage volume backups. However, they enable the Console to display all the information about a particular boot volume and the available backup policies.

**Let users create a volume group**

**Type of access:** Ability to create a volume group from a set of volumes.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the volumes and volume groups in a particular compartment, specify that compartment instead of the tenancy.

Allow group VolumeGroupCreators to inspect volumes in tenancy
Allow group VolumeGroupCreators to manage volume-groups in tenancy

**Let users clone a volume group**

**Type of access:** Ability to clone a volume group from an existing volume group.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the volumes and volume groups in a particular compartment, specify that compartment instead of the tenancy.

Allow group VolumeGroupCloners to inspect volumes in tenancy
Allow group VolumeGroupCloners to manage volume-groups in tenancy
Allow group VolumeGroupCloners to manage volumes in tenancy

**Let users create a volume group backup**

**Type of access:** Ability to create a volume group backup.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the volumes/backups and volume groups/volume group backups in a particular compartment, specify that compartment instead of the tenancy.

Allow group VolumeGroupBackupAdmins to inspect volume-groups in tenancy
Allow group VolumeGroupBackupAdmins to manage volumes in tenancy
Allow group VolumeGroupBackupAdmins to manage volume-group-backups in tenancy
Allow group VolumeGroupBackupAdmins to manage volume-backups in tenancy

**Let users restore a volume group backup**

**Type of access:** Ability to create a volume group by restoring a volume group backup.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the volumes/backups and volume groups/volume group backups in a particular compartment, specify that compartment instead of the tenancy.

Allow group VolumeGroupBackupAdmins to inspect volume-group-backups in tenancy
Allow group VolumeGroupBackupAdmins to read volume-backups in tenancy
Allow group VolumeGroupBackupAdmins to manage volume-groups in tenancy
Allow group VolumeGroupBackupAdmins to manage volumes in tenancy

**Let users create, manage, and delete file systems**

**Type of access:** Ability to create, manage, or delete a file system or file system clone. Administrative functions for a file system include the ability to rename or delete it or disconnect from it.
IAM

Where to create the policy: In the tenancy, so that the ability to create, manage, or delete a file system is easily granted to all compartments by way of policy inheritance. To reduce the scope of these administrative functions to file systems in a particular compartment, specify that compartment instead of the tenancy.

Allow group StorageAdmins to manage file-family in tenancy

Let users create file systems

Type of access: Ability to create a file system or file system clone.

Where to create the policy: In the tenancy, so that the ability to create a file system is easily granted to all compartments by way of policy inheritance. To reduce the scope of these administrative functions to file systems in a particular compartment, specify that compartment instead of the tenancy.

Allow group Managers to manage file-systems in tenancy
Allow group Managers to read mount-targets in tenancy

The second statement is required when users create a file system using the Console. It enables the Console to display a list of mount targets that the new file system can be associated with.

Let Object Storage admins manage buckets and objects

Type of access: Ability to do all things with Object Storage buckets and objects in all compartments.

Where to create the policy: In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the buckets and objects in a particular compartment, specify that compartment instead of the tenancy.

Allow group ObjectAdmins to manage buckets in tenancy
Allow group ObjectAdmins to manage objects in tenancy

Let users write objects to Object Storage buckets

Type of access: Ability to write objects to any Object Storage bucket in compartment ABC (imagine a situation where a client needs to regularly write log files to a bucket). This consists of the ability to list the buckets in the compartment, list the objects in a bucket, and create a new object in a bucket. Although the second statement gives broad access with the manage verb, that access is then scoped down to only the OBJECT_INSPECT and OBJECT_CREATE permissions with the condition at the end of the statement.

Where to create the policy: The easiest approach is to put this policy in the tenancy. If you want the admins of compartment ABC to have control over the policy, see Policy Attachment on page 3263.

Allow group ObjectWriters to read buckets in compartment ABC
Allow group ObjectWriters to manage objects in compartment ABC where any {request.permission='OBJECT_CREATE', request.permission='OBJECT_INSPECT'}

Access limited to a specific bucket: To limit access to a specific bucket in a particular compartment, add the condition where target.bucket.name='<bucket_name>'. The following policy allows the user to list all the buckets in a particular compartment, but they can only list the objects in and upload objects to BucketA:

Allow group ObjectWriters to read buckets in compartment ABC
Allow group ObjectWriters to manage objects in compartment ABC where all {target.bucket.name='BucketA', any {request.permission='OBJECT_CREATE', request.permission='OBJECT_INSPECT'}}

For more information about using conditions, see Advanced Policy Features on page 3285.
Let users download objects from Object Storage buckets

**Type of access:** Ability to download objects from any Object Storage bucket in compartment ABC. This consists of the ability to list the buckets in the compartment, list the objects in a bucket, and read existing objects in a bucket.

**Where to create the policy:** The easiest approach is to put this policy in the tenancy. If you want the admins of compartment ABC to have control over the policy, see Policy Attachment on page 3263.

<table>
<thead>
<tr>
<th>Allow group ObjectReaders to read buckets in compartment ABC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow group ObjectReaders to read objects in compartment ABC</td>
</tr>
</tbody>
</table>

**Access limited to a specific bucket:** To limit access to a specific bucket in a particular compartment, add the condition `where target.bucket.name='<bucket_name>'`. The following policy allows the user to list all buckets in a particular compartment, but they can only read the objects in and download from BucketA:

<table>
<thead>
<tr>
<th>Allow group ObjectReaders to read buckets in compartment ABC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow group ObjectReaders to read objects in compartment ABC where target.bucket.name='BucketA'</td>
</tr>
</tbody>
</table>

For more information about using conditions, see Advanced Policy Features on page 3285.

Let database admins manage Oracle Cloud database systems

**Type of access:** Ability to do all things with the following system types and their associated resources in all compartments:

- Exadata Cloud Service instances
- bare metal DB systems
- virtual machine DB systems

This makes sense if you want to have a single set of database admins manage all the bare metal, virtual machine, and Exadata systems in all the compartments.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the database systems in a particular compartment, specify that compartment instead of the tenancy.

| Allow group DatabaseAdmins to manage database-family in tenancy |

Let database admins manage Exadata Cloud@Customer instances

**Type of access:** Ability to do all things with the Exadata Cloud@Customer resources in all compartments. This makes sense if you want to have a single set of database admins manage all the Exadata Cloud@Customer systems in all the compartments.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the Exadata Cloud@Customer systems in a particular compartment, specify that compartment instead of the tenancy.

| Allow group ExaCCAdmins to manage database-family in tenancy |

Let database admins manage Oracle Cloud external database resources

**Type of access:** Ability to do all things with the following OCI external database resources in all compartments:

- OCI external container database resources
- OCI external pluggable database resources
- OCI external non-container database resources
- OCI external database connectors
This makes sense if you want to have a single set of database admins manage all the OCI external database resources in all the compartments.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the OCI external database resources in a particular compartment, specify that compartment instead of the tenancy.

| Allow group OnPremDatabaseAdmins to manage external-database-family in tenancy |

---

**Let database and fleet admins manage Autonomous Databases**

Type of access: Ability to do all things with Autonomous Database instances in all compartments. Applicable if you want to have a single set of database administrators manage all the Autonomous Database databases in all the compartments.

**Where to create the policy:** In the tenancy, so that the access is granted to all compartments by way of policy inheritance. To reduce the scope of access to just the Autonomous Databases in a particular compartment, specify that compartment instead of the tenancy.

**Example 1:** For **Fleet Administrator.** Enables Autonomous Database fleet administrator access to the any workload types, and to dedicated Exadata infrastructure resources (container databases and Autonomous Exadata Infrastructure instances).

| Allow group DatabaseAdmins to manage autonomous-database-family in tenancy |

**If you must restrict access to the Autonomous Exadata Infrastructure and Autonomous Container Database resource types (applicable only to dedicated Exadata infrastructure systems), then you can do so by creating separate policy statements for database administrators that allow access to only Autonomous Databases and their backups. Because a policy statement can only specify one resource type, you must create separate statements for the database and backup resources.**

**Example 2:** For **database administrators.** Enables Autonomous Database database administrators access to databases and backups of the various workload types, but denies access to Autonomous Container Databases and Autonomous Exadata Infrastructure instances.

| Allow group ADB-Admins to manage autonomous-database in tenancy  
| Allow group ADB-Admins to manage autonomous-backup in tenancy |

---

To reduce the scope of access for databases and backups to either the a specific workload type, use a **where clause.**

**Example 3:** For **database administrators.** Limits Autonomous Database access to databases and backups for a specific workload type.

| Allow group ADB-Admins to manage autonomous-databases in tenancy where target.workloadType = 'workload_type'  
| Allow group ADB-Admins to manage autonomous-backups in tenancy where target.workloadType = 'workload_type' |

---

In the preceding code examples, **workload_type** is one of the strings listed in the following table.

**Autonomous Database Workload Type Strings**

<table>
<thead>
<tr>
<th>Database Workload Type</th>
<th>workload_type String for Policies</th>
</tr>
</thead>
<tbody>
<tr>
<td>Autonomous Transaction Processing</td>
<td>OLTP</td>
</tr>
<tr>
<td>Autonomous Data Warehouse</td>
<td>DW</td>
</tr>
</tbody>
</table>
Let security admins manage vaults, keys, and secrets

**Type of access:** Ability to do all things with the Vault service in all compartments. This makes sense if you want to have a single set of security admins manage all the vaults, keys, and secret components (including secrets, secret versions, and secret bundles) in all compartments.

**Where to create the policy:** In the tenancy, so that access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the vaults, keys, and secret components in a particular compartment, specify that compartment instead of the tenancy. To reduce the scope of access to just vaults, keys, or secret components, include only the policy statement that pertains to the respective individual or aggregate resource-type, as appropriate.

| Allow group SecurityAdmins to manage vaults in tenancy |
| Allow group SecurityAdmins to manage keys in tenancy |
| Allow group SecurityAdmins to manage secret-family in tenancy |

Let security admins manage all keys in a specific vault in a compartment

**Type of access:** Ability to do all things with keys in a specific vault in compartment ABC.

**Where to create the policy:** The easiest approach is to put this policy in the tenancy. If you want the admins of the individual compartment (ABC) to have control over the individual policy statements for their compartment, see Policy Attachment on page 3263.

| Allow group SecurityAdmins to manage keys in compartment ABC where target.vault.id='<vault_OCID>' |

Let security admins use a specific key in a compartment

**Type of access:** Ability to list, view, and perform cryptographic operations with a specific key in a compartment.

**Where to create the policy:** The easiest approach is to put this policy in the tenancy. If you want the admins of the individual compartment (ABC) to have control over the individual policy statements for their compartment, see Policy Attachment on page 3263.

| Allow group SecurityAdmins to use keys in compartment ABC where target.key.id='<key_OCID>' |

Let a user group delegate key usage in a compartment

**Type of access:** Ability to associate an Object Storage bucket, Block Volume volume, File Storage file system, Kubernetes cluster, or Streaming stream pool with a specific key authorized for use in a specific compartment. With this policy, a user in the specified group does not have permission to use the key itself. Rather, by association, the key can be used by Object Storage, Block Volume, File Storage, Container Engine for Kubernetes, or Streaming on behalf of the user to:

- Create or update an encrypted bucket, volume, or file system and to encrypt or decrypt data in the bucket, volume, or file system.
- Create Kubernetes clusters with encrypted Kubernetes secrets at rest in the etcd key-value store.
- Create a stream pool to encrypt data in the streams in the stream pool.

This policy requires that you also have a companion policy that lets Object Storage, Block Volume, File Storage, Container Engine for Kubernetes, or Streaming use the key to perform cryptographic operations.
**Where to create the policy:** The easiest approach is to put this policy in the tenancy. If you want the admins of the individual compartment (ABC) to have control over the individual policy statements for their compartment, see [Policy Attachment](#) on page 3263.

```
Allow group ObjectWriters, VolumeWriters, FileWriters, ClusterWriters, StreamWriter to use key-delegate in compartment ABC where target.key.id = '<key_OCID>'
```

**Let Block Volume, Object Storage, File Storage, Container Engine for Kubernetes, and Streaming services encrypt and decrypt volumes, volume backups, buckets, file systems, Kubernetes secrets, and stream pools**

**Type of access:** Ability to list, view, and perform cryptographic operations with all keys in compartment ABC.

Because Object Storage is a regional service, it has regional endpoints. As such, you must specify the regional service name for each region where you’re using Object Storage with Vault encryption. This policy also requires that you have a companion policy that allows a user group to use the delegated key that Object Storage, Block Volume, File Storage, Container Engine for Kubernetes, or Streaming will use.

**Where to create the policy:** The easiest approach is to put this policy in the tenancy. If you want the admins of the individual compartment (ABC) to have control over the individual policy statements for their compartment, see [Policy Attachment](#) on page 3263.

```
Allow service blockstorage, objectstorage-<region_name>, FssOclProd, oke, streaming to use keys in compartment ABC where target.key.id = '<key_OCID>'
```

For Object Storage, replace `<region_name>` with the appropriate region identifier, for example:

- objectstorage-us-phoenix-1
- objectstorage-us-ashburn-1
- objectstorage-eu-frankfurt-1
- objectstorage-uk-london-1
- objectstorage-ap-tokyo-1

To determine the region name value of an Oracle Cloud Infrastructure region, see [Regions and Availability Domains](#) on page 206.

For File Storage, the service name used in the policy is FssOclProd.

For Container Engine for Kubernetes, the service name used in the policy is oke.

For Streaming, the service name used in the policy is streaming.

**Let security admins manage all secrets in a specific vault in a compartment**

**Type of access:** Ability to do all things with secrets in a specific vault in compartment ABC.

**Where to create the policy:** The easiest approach is to put this policy in the tenancy. If you want the admins of the individual compartment (ABC) to have control over the individual policy statements for their compartment, see [Policy Attachment](#) on page 3263.

```
Allow group SecurityAdmins to manage secret-family in compartment ABC where target.vault.id='<vault_OCID>'
```

**Let users read, update, and rotate all secrets**

**Type of access:** Ability to read, update, and rotate all secrets in any vault in the tenancy.

**Where to create the policy:** In the tenancy, so that access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the vaults, keys, and secrets in a particular compartment, specify that compartment instead of the tenancy.

```
Allow group SecretsUsers to use secret-family in tenancy
```
Let group admins manage group membership

**Type of access:** Ability to manage the membership of a group. Does not include the ability to create or delete users, or manage their credentials (see Let the Help Desk manage users on page 3264).

The first two statements let GroupAdmins list all the users and groups in the tenancy, list which users are in a particular group, and list what groups a particular user is in.

The last two statements together let GroupAdmins change a group's membership. The condition at the end of the last two statements lets GroupAdmins manage membership to all groups except the Administrators group (see The Administrators Group, Policy, and Administrator Roles on page 3074). You should protect membership to that group because it has power to do anything throughout the tenancy.

It might seem that the last two statements should also cover the basic listing functionality that the first two statements enable. To better understand how conditions work and why you also need the first two statements, see Variables that Aren't Applicable to a Request Result in a Declined Request on page 3286.

**Where to create the policy:** In the tenancy, because users and groups reside in the tenancy.

| Allow group GroupAdmins to inspect users in tenancy |
| Allow group GroupAdmins to inspect groups in tenancy |
| Allow group GroupAdmins to use users in tenancy where target.group.name != 'Administrators' |
| Allow group GroupAdmins to use groups in tenancy where target.group.name != 'Administrators' |

Let users manage their own passwords and credentials

No policy is required to let users manage their own credentials. All users have the ability to change and reset their own passwords, manage their own API keys, and manage their own auth tokens. For more information, see User Credentials on page 3086.

Let a compartment admin manage the compartment

**Type of access:** Ability to manage all aspects of a particular compartment. For example, a group called A-Admins could manage all aspects of a compartment called Project-A, including writing additional policies that affect the compartment. For more information, see Policy Attachment on page 3263. For an example of this kind of setup and additional policies that are useful, see Example Scenario on page 3250.

**Where to create the policy:** In the tenancy.

| Allow group A-Admins to manage all-resources in compartment Project-A |

Restrict admin access to a specific region

**Type of access:** Ability to manage resources in a specific region. Remember that IAM resources must be managed in the home region. If the specified region is not the home region, then the Admin will not be able to manage IAM resources. For more information about the home region, see Managing Regions.

**Where to create the policy:** In the tenancy.

| Allow group PHX-Admins to manage all-resources in tenancy where request.region='phx' |

The preceding policy allows PHX-Admins to manage all aspects of all resources in US West (Phoenix).

Members of the PHX-Admins group can only manage IAM resources if the tenancy's home region is US West (Phoenix).
**Restrict user access to view only summary announcements**

**Type of access:** Ability to view the summary versions of announcements about the operational status of Oracle Cloud Infrastructure services.

**Where to create the policy:** In the tenancy.

| Allow group AnnouncementListers to inspect announcements in tenancy |

The preceding policy allows AnnouncementListers to view a list of summary announcements.

**Let users view details of announcements**

**Type of access:** Ability to view the details of announcements about the operational status of Oracle Cloud Infrastructure services.

**Where to create the policy:** In the tenancy.

| Allow group AnnouncementReaders to read announcements in tenancy |

The preceding policy allows AnnouncementReaders to view a list of summary announcements and the details of specific announcements.

**Let streaming users manage streams**

**Type of access:** Ability to do all things with the Streaming service in all compartments.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the streams in a particular compartment, specify that compartment instead of the tenancy.

| Allow group StreamAdmins to manage streams in tenancy |

**Let streaming users publish messages to streams**

**Type of access:** Ability to produce messages to streams with the Streaming service in all compartments.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the streams in a particular compartment, specify that compartment instead of the tenancy.

| Allow group StreamUsers to use stream-push in tenancy |

**Let streaming users publish messages to a specific stream**

**Type of access:** Ability to produce messages to a stream with the Streaming service.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the streams in a particular compartment, specify that compartment instead of the tenancy.

| Allow group StreamUsers to use stream-push in tenancy where target.stream.id = '<stream_OCID>' |

**Let streaming users publish messages to a stream in a specific stream pool**

**Type of access:** Ability to produce messages to a stream with the Streaming service.
**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the streams in a particular compartment, specify that compartment instead of the tenancy.

```
Allow group StreamUsers to use stream-push in tenancy where
target.streampool.id = '<stream_OC1D>'
```

**Let streaming users consume messages from streams**

**Type of access:** Ability to consume messages from streams with the Streaming service in all compartments.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the streams in a particular compartment, specify that compartment instead of the tenancy.

```
Allow group StreamUsers to use stream-pull in tenancy
```

**Let users view metric definitions in a compartment**

**Type of access:** Ability to view metric definitions in a specific compartment. For more information about metrics, see Metrics Feature Overview on page 4029.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the metric definitions in a particular compartment, specify that compartment instead of the tenancy.

```
Allow group MetricReaders to inspect metrics in compartment ABC
```

**Let users access monitoring metrics in a compartment**

**Type of access:** Ability to view and retrieve monitoring metrics for supported resources in a specific compartment. For more information about metrics, see Metrics Feature Overview on page 4029.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the metrics in a particular compartment, specify that compartment instead of the tenancy.

```
Allow group MetricReaders to read metrics in compartment ABC
```

**Restrict user access to a specific metric namespace**

**Type of access:** Ability to view and retrieve monitoring metrics for resources under a specific metric namespace. For more information about metrics, see Metrics Feature Overview on page 4029.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the metrics in a particular compartment, specify that compartment instead of the tenancy.

```
Allow group MetricReaders to read metrics in compartment ABC where
target.metrics.namespace='oci_computeagent'
```

The preceding policy allows MetricReaders to view and retrieve metric data points from all monitoring-enabled Compute instances in the ABC compartment.

**Let users publish custom metrics**

**Type of access:** Ability to publish custom metrics under a specific metric namespace to the Monitoring service. For instructions, see Publishing Custom Metrics on page 4091.
**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just metrics in a particular compartment, specify that compartment instead of the tenancy.

```plaintext
Allow group MetricPublishers to use metrics in tenancy where target.metrics.namespace='mycustomnamespace'
```

The preceding policy allows MetricPublishers to publish data points for the custom metric namespace mycustomnamespace in the tenancy.

**Let instances make API calls to access monitoring metrics in the tenancy**

**Type of access:** Ability to call the Monitoring API for access to monitoring metrics. The instances on which API requests originate must be members of the dynamic group indicated in the policy. For more information, see Calling Services from an Instance and Metrics Feature Overview on page 4029.

**Where to create the policy:** In the tenancy.

```plaintext
Allow dynamic-group MetricInstances to read metrics in tenancy
```

The preceding policy allows applications that are running on Compute instances in the dynamic group MetricInstances to send API requests to the Monitoring service in the tenancy.

**Let users view alarms**

**Type of access:** Ability to view alarms for supported resources in tenancy. Does not include the ability to create alarms or to create or delete topics. For more information about alarms, see Alarms Feature Overview on page 4030.

**Where to create the policy:** In the tenancy. Because of the concept of policy inheritance, AlarmUsers can then view alarms in any compartment. To reduce the scope of access to a particular compartment, specify that compartment instead of the tenancy.

```plaintext
Allow group AlarmUsers to read alarms in tenancy
Allow group AlarmUsers to read metrics in tenancy
```

**Let users manage alarms**

**Type of access:** Ability to view and create alarms with existing notification topics for supported resources in the tenancy. Does not include the ability to create or delete topics. For more information about alarms, see Alarms Feature Overview on page 4030.

All statements are required to let AlarmUsers create alarms.

**Where to create the policy:** In the tenancy. Because of the concept of policy inheritance, AlarmUsers can then view and create alarms in any compartment. To reduce the scope of access to a particular compartment, specify that compartment instead of the tenancy.

```plaintext
Allow group AlarmUsers to manage alarms in tenancy
Allow group AlarmUsers to read metrics in tenancy
Allow group AlarmUsers to use ons-topics in tenancy
```

**Let users manage alarms and create topics**

**Type of access:** Ability to view and create alarms (with new or existing topics) for supported resources in tenancy. Also includes the ability to create subscriptions in the tenancy, to publish messages (broadcast notification messages) to all subscriptions in the tenancy, and to move alarms to different compartments in the tenancy. For more information about alarms, see Alarms Feature Overview on page 4030.
Where to create the policy: In the tenancy. Because of the concept of policy inheritance, AlarmUsers can then view and create alarms in any compartment. To reduce the scope of access to a particular compartment, specify that compartment instead of the tenancy.

- Allow group AlarmUsers to manage alarms in tenancy
- Allow group AlarmUsers to read metrics in tenancy
- Allow group AlarmUsers to manage ons-topics in tenancy

Let users access usage reports

Type of access: Ability to view usage reports for your tenancy. For more information about usage reports, see Cost and Usage Reports Overview on page 337.

Where to create the policy: This is a special cross-tenancy policy and must be created in the tenancy. For more information, see Cost and Usage Reports Overview on page 337.

define tenancy usage-report as ocid1.tenancy.oc1..aaaaaaaaned4fkpiskbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhqkggq
endorse group Administrators to read objects in tenancy usage-report

Let users analyze costs

Type of access: Ability to see costs for the tenancy. See Checking Your Expenses and Usage on page 78.

Where to create the policy: In the tenancy so that users in the <Example_Group> can see costs for the entire account.

- Allow group <Example_Group> to read usage-reports in tenancy

Allow a group to manage topics

Type of access: Ability to get, create, update, and delete topics in the tenancy, as well as move topics to different compartments in the tenancy. Also includes the ability to create subscriptions in the tenancy and to publish messages (broadcast notification messages) to all subscriptions in the tenancy.

Where to create the policy: In the tenancy.

- Allow group A-Admins to manage ons-topics in tenancy

Allow a group to manage topic subscriptions

Type of access: Ability to list, create, update, and delete subscriptions for topics in the tenancy. Ability to move subscriptions to different compartments in the tenancy.

Where to create the policy: In the tenancy.

- Allow group A-Admins to manage ons-subscriptions in tenancy

Allow a group to publish messages to topics

Type of access: Ability to broadcast notification messages to all subscriptions in the tenancy, as well as list, create, update, and delete subscriptions in the tenancy.

Where to create the policy: In the tenancy.

- Allow group A-Admins to use ons-topics in tenancy
Let users create, deploy, and manage functions and applications using Cloud Shell

**Type of access:** Ability to create, deploy, and manage Functions applications and functions using Cloud Shell. These policy statements give the group access to Cloud Shell, repositories in Oracle Cloud Infrastructure Registry, logs, metrics, functions, networks, and tracing.

**Where to create the policy:** In the tenancy, so that the access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the resources in a particular compartment, you can specify the compartment instead of the tenancy in the to manage logging-family, to read metrics, to manage functions-family, to use virtual-network-family, and to use apm-domains policy statements. However, the remaining policy statements (to use cloud-shell, to manage repos, and to read objectstorage-namespaces) must always be scoped to the tenancy.

| Allow group functions-developers to use cloud-shell in tenancy |
| Allow group functions-developers to manage repos in tenancy |
| Allow group functions-developers to read objectstorage-namespaces in tenancy |
| Allow group functions-developers to manage logging-family in tenancy |
| Allow group functions-developers to read metrics in tenancy |
| Allow group functions-developers to manage functions-family in tenancy |
| Allow group functions-developers to use virtual-network-family in tenancy |
| Allow group functions-developers to use apm-domains in tenancy |
| Allow service faas to use apm-domains in tenancy |

Let users list Events rules in a compartment

**Type of access:** Ability to list Events rules.

**Where to create the policy:** In the tenancy.

| Allow group RuleReaders to read cloudevents-rules in tenancy |

The preceding policy allows RuleReaders to list rules in the tenancy.

Let admins manage Events rules in a compartment

**Type of access:** Ability to manage Events rules, including creating, deleting and updating rules.

**Where to create the policy:** In the tenancy.

This line gives the user inspect access to resources in compartments to select actions.

| allow group <RuleAdmins> to inspect compartments in tenancy |

This line gives the user access to defined tags to apply filter tags to rules.

| allow group <RuleAdmins> to use tag-namespaces in tenancy |

These lines give the user access to Streaming resources for actions

| allow group <RuleAdmins> to inspect streams in tenancy |
| allow group <RuleAdmins> to use stream-push in tenancy |
| allow group <RuleAdmins> to use stream-pull in tenancy |

These lines give the user access to Functions resources for actions.

| allow group <RuleAdmins> to use virtual-network-family in tenancy |
| allow group <RuleAdmins> to manage function-family in tenancy |

This line give the user access to Notifications topics for actions.

| allow group <RuleAdmins> to use ons-topic in tenancy |
This line gives the user manage access to rules for Events.

```
allow group <RuleAdmins> to manage cloudevents-rules in tenancy
```

**Allow a group to access all of Cloud Guard**

**Type of access:** Read-only access to all of Cloud Guard. In the example policy, the group is "CloudGuard_ReadOnly."

```
allow group CloudGuard_ReadOnly to read cloud-guard-family in tenancy
allow group CloudGuard_ReadOnly to read compartments in tenancy
allow group CloudGuard_ReadOnly to read announcements in tenancy
```

**Allow a group to access Cloud Guard problems**

**Type of access:** Read-only access to Cloud Guard problems. In the example policy, the group is "CloudGuard_ReadOnlyProblems."

```
allow group CloudGuard_ReadOnlyProblems to read cloud-guard-family in tenancy
allow group CloudGuard_ReadOnlyProblems to inspect cloud-guard-detectors in tenancy
allow group CloudGuard_ReadOnlyProblems to inspect cloud-guard-targets in tenancy
allow group CloudGuard_ReadOnlyProblems to inspect cloud-guard-resource-types in tenancy
allow group CloudGuard_ReadOnlyProblems to read announcements in tenancy
allow group CloudGuard_ReadOnlyProblems to read compartments in tenancy
allow group CloudGuard_ReadOnlyProblems to read cloud-guard-config in tenancy
```

**Allow a group to access Cloud Guard detector recipes**

**Type of access:** Read-only access to Cloud Guard detector recipes. In the example policy, the group is "CloudGuard_ReadOnlyDetectors."

```
allow group CloudGuard_ReadOnlyDetectors to read cloud-guard-detector-recipes in tenancy
allow group CloudGuard_ReadOnlyDetectors to read announcements in tenancy
allow group CloudGuard_ReadOnlyDetectors to read compartments in tenancy
allow group CloudGuard_ReadOnlyDetectors to read cloud-guard-config in tenancy
```

**Allow a group to access Cloud Guard in a single compartment**

**Type of access:** Read-only access to Cloud Guard in a single compartment. In the example policy, the group is "CloudGuard_ReadOnly_SingleCompartment" and the compartment name is "cgDemo_RestrictedAccess."

```
allow group CloudGuard_ReadOnly_SingleCompartment to read compartments in tenancy where target.compartment.name = 'cgDemo_RestrictedAccess'
allow group CloudGuard_ReadOnly_SingleCompartment to read cloud-guard-family in compartment cgDemo_RestrictedAccess
allow group CloudGuard_ReadOnly_SingleCompartment to read announcements in compartment cgDemo_RestrictedAccess
allow group CloudGuard_ReadOnly_SingleCompartment to read cloud-guard-config in tenancy
```

**Let security admins manage all bastions and sessions**

**Type of access:** Ability to manage all resources in the Bastion service in all compartments. This makes sense if you want to have a single set of security admins manage all *bastions* and *sessions* in all compartments.
**Where to create the policy:** In the tenancy, so that access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the bastions and bastion sessions in a particular compartment, specify that compartment instead of the tenancy.

| Allow group SecurityAdmins to manage bastion in tenancy |
| Allow group SecurityAdmins to manage bastion-session in tenancy |
| Allow group SecurityAdmins to manage virtual-network-family in tenancy |
| Allow group SecurityAdmins to read instance-family in tenancy |
| Allow group SecurityAdmins to read instance-agent-plugins in tenancy |
| Allow group SecurityAdmins to inspect work-requests in tenancy |

**Let security admins manage bastion sessions**

**Type of access:** Ability to manage all sessions on all bastions and in all compartments, including creating, connecting to, and terminating sessions.

**Where to create the policy:** In the tenancy, so that access is easily granted to all compartments by way of policy inheritance. To reduce the scope of access to just the bastion sessions in a particular compartment, specify that compartment instead of the tenancy.

| Allow group SecurityAdmins to use bastion in tenancy |
| Allow group SecurityAdmins to manage bastion-session in tenancy |
| Allow group SecurityAdmins to manage virtual-network-family in tenancy |
| Allow group SecurityAdmins to read instance-family in tenancy |
| Allow group SecurityAdmins to read instance-agent-plugins in tenancy |
| Allow group SecurityAdmins to inspect work-requests in tenancy |

**Let security admins manage bastion sessions for a specific target host in a compartment**

**Type of access:** Ability to manage sessions on a bastion in a specific compartment, and only for sessions that provide connectivity to a specific Compute instance.

**Where to create the policy:** In the tenancy, so that access is easily granted to all compartments by way of policy inheritance.

| Allow group SecurityAdmins to use bastion in compartment ABC |
| Allow group SecurityAdmins to manage bastion-session in compartment ABC where target.resource.ocid = '<instance_OCID>' and target.bastion-session.username='<session_username>' |
| Allow group SecurityAdmins to manage virtual-network-family in tenancy |
| Allow group SecurityAdmins to read instance-family in tenancy |
| Allow group SecurityAdmins to read instance-agent-plugins in tenancy |
| Allow group SecurityAdmins to inspect work-requests in tenancy |

**Allow a group to manage service connectors**

**Type of access:** Ability to list, create, update, and delete service connectors in the tenancy. Ability to move service connectors to different compartments in the tenancy.

**Where to create the policy:** In the tenancy.

| Allow group A-Admins to manage serviceconnectors in tenancy |

**Allow a group to call Operations Insights ingest operations at tenancy**

**Type of access:** Ability to call ingest operations at the tenancy level only.

**Where to create the policy:** In the tenancy.

| allow group opsi-users to use opsi-database-insights in tenancy |
| where any (request.operation='IngestSqlBucket', request.operation='IngestSqlText'), |
Let users create and delete workspaces without networking (Data Integration)

Ability to create, delete, and modify workspaces within a compartment.

`allow group <group-name> to manage dis-workspaces in <compartment-name>
allow group <group-name> to manage dis-work-requests in <compartment-name>
allow group <group-name> to manage tag-namespaces in <compartment-name>`

Let users create and delete workspaces with networking (Data Integration)

Ability to create, delete, and modify workspaces within a virtual network.

`allow service dataintegration to use virtual-network-family in <compartment-name>
allow group <group-name> to manage dis-workspaces in <compartment-name>
allow group <group-name> to manage dis-work-requests in <compartment-name>
allow group <group-name> to use virtual-network-family in <compartment-name>
allow group <group-name> to manage tag-namespaces in <compartment-name>`

Let users and resource principal access and use Object Storage for a given workspace (Data Integration)

Ability to create and use Object Storage data assets within all workspaces.

`allow any-user to use buckets in <compartment-name> where ALL
{request.principal.type='disworkspace'}
allow any-user to manage objects in <compartment-name> where ALL
{request.principal.type='disworkspace'}
allow group <group-name> to use object-family in <compartment-name>`

To give access to an individual workspace, specify the OCID for the workspace where you want to allow access. For example:

`allow any-user to use buckets in <compartment-name> where ALL
{request.principal.type='disworkspace', request.principal.id='<workspace-ocid>'}
allow any-user to manage objects in <compartment-name> where ALL
{request.principal.type='disworkspace', request.principal.id='<workspace-ocid>'}`

Let users and resource principal access and use autonomous databases as a target for a given workspace (Data Integration)

Ability to create and use autonomous database data assets within all workspaces.

`allow any-user to use buckets in <compartment-name> where ALL
{request.principal.type='disworkspace'}
allow any-user to manage objects in <compartment-name> where ALL
{request.principal.type='disworkspace'}
allow group <group-name> to use object-family in <compartment-name>
allow any-user to manage buckets in <compartment-name> where ALL
{request.principal.type='disworkspace', request.permission='PAR_MANAGE'}

To give access to an individual workspace, specify the OCID for the workspace where you want to allow access. For example:

`allow any-user to use buckets in <compartment-name> where ALL
{request.principal.type='disworkspace', request.principal.id='<workspace-ocid>'}`
allow any-user to manage objects in <compartment-name> where ALL
{request.principal.type='disworkspace', request.principal.id='<workspace-ocid>'}
allow any-user to manage buckets in <compartment-name> where ALL
{request.principal.type='disworkspace', request.principal.id='<workspace-ocid>'}, request.permission='PAR_MANAGE'

Let users search objects within a workspace (Data Integration)
Ability to search the components of Data Integration in a given workspace.
This policy must be applied at the tenancy (root compartment) level.

allow service dataintegration to {TENANCY_INSPECT} in tenancy
allow service dataintegration to {DIS_METADATA_INSPECT} in tenancy

Let users move workspaces to a new compartment (Data Integration)
Ability to move workspaces to a new compartment.

allow service dataintegration to inspect compartments in <compartment-name>
allow group <group-name> to manage dis-workspaces in <compartment-name>

Let users publish tasks to the OCI Data Flow service (Data Integration)
Ability to publish the different tasks within all workspaces to the OCI Data Flow service.

allow any-user to manage dataflow-application in <compartment-name> where
ALL {request.principal.type='disworkspace'}

To give access to an individual workspace, specify the OCID for the workspace where you want to allow access. For example:

allow any-user to manage dataflow-application in <compartment-name> where ALL
{request.principal.type='disworkspace', request.principal.id='<workspace-ocid>'}

Let users access the OCI Vault service for a given workspace (Data Integration)
Ability to use OCI Vault secrets within all workspaces.

allow any-user to read secret-bundles in <compartment-name> where ALL
{request.principal.type='disworkspace'}
allow group <group-name> to read secret-bundles in <compartment-name>

To give access to an individual workspace, specify the OCID for the workspace where you want to allow access. For example:

allow any-user to read secret-bundles in <compartment-name> where ALL
{request.principal.type='disworkspace', request.principal.id='<workspace-ocid>'}

Advanced Policy Features
This section describes policy language features that let you grant more granular access.

Conditions
As part of a policy statement, you can specify one or more conditions that must be met in order for access to be granted. For a simple example, see Let group admins manage group membership on page 3276.
Each condition consists of one or more predefined variables that you specify values for in the policy statement. Later, when someone requests access to the resource in question, if the condition in the policy is met, it evaluates to true and the request is allowed. If the condition is not met, it evaluates to false and the request is not allowed.

There are two types of variables: those that are relevant to the request itself, and those relevant to the resource being acted upon in the request, also known as the target. The name of the variable is prefixed accordingly with either request or target followed by a period. For example, there's a request variable called request.operation to represent the API operation being requested. This variable lets you write a broad policy statement, but add a condition based on the specific API operation. For an example, see Let users write objects to Object Storage buckets on page 3271.

Important:

Condition matching is case insensitive. This is important to remember when writing conditions for resource types that allow case-sensitive naming. For example, the Object Storage service allows you to create both a bucket named "BucketA" and a bucket named "bucketA" in the same compartment. If you write a condition that specifies "BucketA", it will apply also to "bucketA", because the condition matching is case insensitive.

Variables that Aren't Applicable to a Request Result in a Declined Request

If the variable is not applicable to the incoming request, the condition evaluates to false and the request is declined. For example, here are the basic policy statements that together let someone add or remove users from any group except Administrators:

Allow group GroupAdmins to use users in tenancy
where target.group.name != 'Administrators'

Allow group GroupAdmins to use groups in tenancy
where target.group.name != 'Administrators'

Given the above policy, if GroupAdmins tried to call a general API operation for users such as ListUsers or UpdateUser (which lets you change the user’s description), the request would be declined, even though those API operations are covered by use users. This is because the above policy statement for use users also includes the target.group.name variable, but the ListUsers or UpdateUser request doesn't involve specifying a group. There is no target.group.name for those requests, so the request is declined.

If you want to also grant access to general user API operations that don’t involve a particular group, you would need an additional statement that gives the level of access you want to grant, but without the condition. For example, if you want to grant access to ListUsers, you need this additional statement:

Allow group GroupAdmins to inspect users in tenancy

Or if you want to grant access to UpdateUser, you need this additional statement (which also covers ListUsers because the use verb includes the capabilities of the inspect verb):

Allow group GroupAdmins to use users in tenancy

This general concept also applies to groups (e.g., ListGroups and UpdateGroup), and any other resource type with target variables.

For more information about the syntax of conditions, see Conditions on page 3294. For a list of all the variables you can use in policies, see the tables in the Policy Reference on page 3298.

Tag-Based Access Control

Using conditions and a set of tag variables, you can write policy to scope access based on the tags that have been applied to a resource. Access can be controlled based on a tag that exists on the requesting resource (the group or dynamic group in the policy) or on the target of the request (resource or compartment). Tag-based access control provides additional flexibility to your policies by allowing you to define access that spans compartments, groups, and
resources. For details about how to write policies to scope access by tags, see Using Tags to Manage Access on page 5599.

**Permissions**

*Permissions* are the atomic units of authorization that control a user's ability to perform operations on resources. Oracle defines all the permissions in the policy language. When you write a policy giving a group access to a particular verb and resource-type, you're actually giving that group access to one or more predefined permissions. The purposes of verbs is to simplify the process of granting multiple related permissions that cover a broad set of access or a particular operational scenario. The next sections give more details and examples.

**Relation to Verbs**

To understand the relationship between permissions and verbs, let's look at an example. A policy statement that allows a group to *inspect volumes* actually gives the group access to a permission called VOLUME_INSPECT (permissions are always written with all capital letters and underscores). In general, that permission enables the user to get information about block volumes.

As you go from *inspect > read > use > manage*, the level of access generally increases, and the permissions granted are cumulative. The following table shows the permissions included with each verb for the volumes resource-type. Notice that no additional permissions are granted going from inspect to read.

<table>
<thead>
<tr>
<th>Inspect Volumes</th>
<th>Read Volumes</th>
<th>Use Volumes</th>
<th>Manage Volumes</th>
</tr>
</thead>
<tbody>
<tr>
<td>VOLUME_INSPECT</td>
<td>VOLUME_INSPECT</td>
<td>VOLUME_INSPECT</td>
<td>VOLUME_INSPECT</td>
</tr>
<tr>
<td></td>
<td></td>
<td>VOLUME_UPDATE</td>
<td>VOLUME_UPDATE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>VOLUME_WRITE</td>
<td>VOLUME_WRITE</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>VOLUME_CREATE</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>VOLUME_DELETE</td>
</tr>
</tbody>
</table>

The *policy reference* lists the permissions covered by each verb for each given resource-type. For example, for block volumes and other resources covered by the Core Services, see the tables in Details for Verb + Resource-Type Combinations. The left column of each of those tables lists the permissions covered by each verb. The other sections of the policy reference include the same kind of information for the other services.

**Relation to API Operations**

Each API operation requires the caller to have access to one or more permissions. For example, to use either ListVolumes or GetVolume, you must have access to a single permission: VOLUME_INSPECT. To attach a volume to an instance, you must have access to multiple permissions, some of which are related to the volumes resource-type, some to the volume-attachments resource-type, and some related to the instances resource-type:

- VOLUME_WRITE
- VOLUME_ATTACHMENT_CREATE
- INSTANCE_ATTACH_VOLUME

The policy reference lists which permissions are required for each API operation. For example, for the Core Services API operations, see the table in Permissions Required for Each API Operation.

**Understanding a User's Access**

The policy language is designed to let you write simple statements involving only verbs and resource-types, without having to state the desired permissions in the statement. However, there may be situations where a security team member or auditor wants to understand the specific permissions a particular user has. The tables in the *policy reference* show each verb and the associated permissions. You can look at the groups the user is in and the policies applicable to those groups, and from there compile a list of the permissions granted. However, having a list of the permissions isn't the complete picture. Conditions in a policy statement can scope a user's access beyond individual
permissions (see the next section). Also, each policy statement specifies a particular compartment and can have conditions that further scope the access to only certain resources in that compartment.

**Scoping Access with Permissions or API Operations**

In a policy statement, you can use conditions combined with permissions or API operations to reduce the scope of access granted by a particular verb.

For example, let's say you want group XYZ to be able to list, get, create, or update groups (i.e., change their description), but not delete them. To list, get, create, and update groups, you need a policy with manage groups as the verb and resource-type. According to the table in Details for Verbs + Resource-Type Combinations, the permissions covered are:

- GROUP_INSPECT
- GROUP_UPDATE
- GROUP_CREATE
- GROUP_DELETE

To restrict access to only the desired permissions, you could add a condition that explicitly states the permissions you want to allow:

Allow group XYZ to manage groups in tenancy where any {request.permission='GROUP_INSPECT',
request.permission='GROUP_CREATE',
request.permission='GROUP_UPDATE'}

An alternative would be a policy that allows all permissions except GROUP_DELETE:

Allow group XYZ to manage groups in tenancy where request.permission != 'GROUP_DELETE'

However, with this approach, be aware that any new permissions the service might add in the future would automatically be granted to group XYZ. Only GROUP_DELETE would be omitted.

Another alternative would be to write a condition based on the specific API operations. Notice that according to the table in Permissions Required for Each API Operation, both ListGroups and GetGroup require only the GROUP_INSPECT permission. Here's the policy:

Allow group XYZ to manage groups in tenancy where any {request.operation='ListGroups',
request.operation='GetGroup',
request.operation='CreateGroup',
request.operation='UpdateGroup'}

It can be beneficial to use permissions instead of API operations in conditions. In the future, if a new API operation is added that requires one of the permissions listed in the permissions-based policy above, that policy will already control XYZ group's access to that new API operation.

But notice that you can further scope a user's access to a permission by also specifying a condition based on API operation. For example, you could give a user access to GROUP_INSPECT, but then only to ListGroups.

Allow group XYZ to manage groups in tenancy where all {request.permission='GROUP_INSPECT',
request.operation='ListGroups'}

**Scoping Policy by the IP Address of the Requestor**

This feature is currently supported by the Object Storage service only.
You can scope access to only a set of allowed IP addresses. For example, you can write policy to allow only requests from a given public IP range to access a specific Object Storage bucket; or, you can allow only specific subnets of a specific VCN to make requests over a service gateway.

To restrict access to a set of IP addresses, do the following:

1. Create a network source object that specifies the allowed IP addresses. See Managing Network Sources on page 3536 for details.
2. Write a policy that uses the network source object in a condition.

Use the following variable in your policy:

```
request.networkSource.name='<network_source_name>'
```

For example:

```
allow group GroupA to manage object-family in tenancy where
request.networkSource.name='corpnet'
```

### Restricting Access to Resources Based on Time Frame

You can use time-based variables in your policies to restrict the access granted in the policy to only certain time frames. This feature allows you to restrict actions on resources to particular times. For example, you can create a policy that allows access only through a specified date. A policy like this would be useful if your company hires contractors and you want to ensure access is not allowed past the contract end date. Or, you could allow access to resources only during business hours (for example, Monday-Friday 9:00 AM - 5:00 PM). This restriction can lower the risk of a bad actor making changes when they are more likely to go unnoticed.

The variables that you can use to scope access based on time are:

- `request.utc-timestamp`
- `request.utc-timestamp.month-of-year`
- `request.utc-timestamp.day-of-month`
- `request.utc-timestamp.day-of-week`
- `request.utc-timestamp.time-of-day`

Usage for these variables is described in more detail in the following sections.

### Information for Working with Time-Based Variables

You must specify the time the variables using ISO 8601 format: YYYY-MM-DDThh:mm:ssZ. Examples of this format are:

- Date and time with seconds: '2020-04-01T15:00:00Z'
- Data and time with minutes: '2020-04-01T05:00Z'
- Date only: '2020-04-01Z'
- Time only: '05:00:00'

Even though you can specify a time down to seconds, you should allow for a 5 minute time difference between the timestamp on the request and the time the request is evaluated by the IAM service. This time difference can be caused by several factors, therefore be aware of this potential discrepancy when you plan and implement your time-based policies.

The time that you specify is evaluated as Coordinated Universal Time (UTC). This means that you must calculate the correct UTC time for the time zone in which the policy is evaluated. For example, to specify 9:00 AM Pacific Standard Time for the value of a variable, you would enter '17:00:00'. If your locale participates in daylight savings, you'll need to update any policies that refer to a specific hour when the time change goes into effect.

### Details for Each Time-Based Variable

Usage for each variable is described in the following sections:
**request.utc-timestamp**

**Description:** The time the request is received for authorization. You can write a policy that allows access only before or after a specific date-time timestamp. The timestamp must follow the ISO 8601 format: YYYY-MM-DDThh:mm:ssZ and be in Coordinated Universal Time (UTC).

**Supported operators:** before | after

**Allowed values:** Coordinated Universal Time (UTC) timestamp in ISO 8601 format: YYYY-MM-DDThh:mm:ssZ

**Example Values:**
- '2020-04-01T00:00:00Z'
- '2020-04-01T00:00Z'

**Example policy:** Allow group, Contractors, to access the instance-family resources only until a certain date:

```
Allow group Contractors to manage instance-family in tenancy where request.utc-timestamp before '2022-01-01T00:00Z'
```

The access granted by the policy to the group Contractors will expire on January 1, 2022, 12:00 AM, UTC.

---

**request.utc-timestamp.month-of-year**

**Description:** The month of the year that the request is received for authorization. You can write a policy that allows access only during specific months.

**Supported operators:** = | != | in

**Allowed values:** Numeric month (matching ISO 8601)

**Example Values:** '1', '2', '3', ... '12'

**Example policy:** Allow group, SummerInterns, to access the instance-family resources only during June, July, and August:

```
Allow group SummerInterns to manage instance-family in tenancy where ANY {request.utc-timestamp.month-of-year in ('6', '7', '8')}
```

The access granted by the policy to the group SummerInterns is only valid during June, July, and August of a given year.

---

**request.utc-timestamp.day-of-month**

**Description:** The day of the month that the request is received for authorization. You can write a policy that allows access only for specific days of the month. Keep in mind that the span of the day is calculated based on UTC. For example, suppose you are in Miami, FL, USA, and you enter '1' to indicate the first day of the month. For the month of February, the policy will be in effect for 12:00 AM through 11:59 PM UTC on February 1, which in Miami is 7:00 PM on January 31 through 6:59 PM on February 1.

**Supported operators:** = | != | in

**Allowed values:** Numeric day of month

**Example Values:** '1', '2', '3', ... '31'

**Example policy:** Allow group, ComplianceAuditors, to read all-resources only on the first day of the month.

```
Allow group ComplianceAuditors to read all-resources in tenancy where request.utc-timestamp.day-of-month = '1'
```

The access granted by the policy to the group ComplianceAuditors is only valid on the first day of each month (the day is defined by UTC time).
**request.utc-timestamp.day-of-week**

**Description:** The day of the week that the request is received for authorization. You can write a policy that allows access only for specific days of the week. Note that the span of the day is calculated based on UTC. For example, suppose you are in Miami, FL, USA, and you enter 'monday'. The policy will be in effect for 12:00 AM through 11:59 PM UTC on Monday, which in Miami is 7:00 PM (EST) on Sunday through 6:59 PM on Monday.

**Supported operators:** = | != | in

**Allowed values:** Name of day of week in English

**Example Values:** 'Monday', 'Tuesday', 'Wednesday', etc.

**Example policy:** Allow group, WorkWeek, to manage instance-family only during the company work week.

```plaintext
Allow group WorkWeek to manage instance-family where ANY {request.utc-timestamp.day-of-week in ('monday', 'tuesday', 'wednesday', 'thursday', 'friday')}
```

The access granted by the policy to the group WorkWeek is only valid on the days specified (the day is defined by UTC time).

**request.utc-timestamp.time-of-day**

**Description:** The time of day that the request is received for authorization. You can write a policy that allows access only for a specific span of time during the day. Note that the time of the day is calculated based on UTC. If you live in a time zone that implements daylight savings, you will need to update the policy when the time changes.

**Supported operators:** between

**Allowed values:** UTC time interval in ISO 8601 format: hh:mm:ssZ

**Example Values:** '01:00:00Z' AND '2:01:00Z'

**Example policies:** Allow group DayShift to manage instances and related resources between the hours of 9:00 AM and 5:00 PM Pacific Standard Time (PST).

Note that the times are converted to UTC:

```plaintext
Allow group DayShift to manage instance-family where request.utc-timestamp.time-of-day between '17:00:00Z' and '01:00:00Z'
```

I want to allow group NightShift to manage instances and related resources between 5:00 PM and 9:00 AM PST.

```plaintext
Allow group NightShift to manage instance-family where request.utc-timestamp.time-of-day between '01:00:00Z' and '17:00:00Z'
```

In both of these examples, the current time is calculated and tested to see if it falls within the provided range or not (ignoring which day the time falls on).

**Policy Syntax**

Learn the details of policy syntax to write your own well-formed policy statements.

The overall syntax of a policy statement is as follows:

```plaintext
Allow <identity_domain_name>/<subject> to <verb> <resource-type> in <location> where <conditions>
```

**Note:**

If you do not include the `<identity_domain_name>` before the `<subject>`, then the policy statement is evaluated as though the subject belongs to the default identity domain.
Spare spaces or line breaks in the statement have no effect.

For limits on the number of policies and statements, see Service Limits on page 243.

**Subject**

Specify one or more comma-separated groups by name or OCID. Or specify any-user to cover all users in the tenancy.

**Syntax:**

```
group <group_name> | group id <group_ocid> | dynamic-group <dynamic-group_name> | dynamic-group id <dynamic-group_ocid> | any-user
```

**Note:**

If you do not include the `<identity_domain_name>` before the `<subject>`, then the policy statement is evaluated as though the subject belongs to the default identity domain.

**Examples:**

- To specify a single group by name:

```
Allow

group A-Admins

to manage all-resources in compartment Project-A
```

- To specify multiple groups by name (a space after the comma is optional):

```
Allow

group A-Admins, B-Admins

to manage all-resources in compartment Projects-A-and-B
```

- To specify a single group by OCID (the OCID is shortened for brevity):

```
Allow group

id ocid1.group.oc1..aaaaaaaaqjihfhvxmlum...awuc7i5xwe6s7qmnsbc6a

to manage all-resources in compartment Project-A
```

- To specify multiple groups by OCID (the OCIDs are shortened for brevity):

```
Allow group

id ocid1.group.oc1..aaaaaaaaqjihfhvxmlumr1...wuc7i5xwe6s7qmnsbc6a,
id ocid1.group.oc1..aaaaaaaaavhea5mellwzb...66yfxv1462tdgx2oecyq

to manage all-resources in compartment Projects-A-and-B
```

- To specify any user in the tenancy:

```
Allow any-user to inspect users in tenancy
```

**Verb**

Specify a single verb. For a list of verbs, see Verbs on page 3260. Example:

```
Allow group A-Admins to manage all-resources in compartment Project-A
```
**Resource-Type**

Specify a single resource-type, which can be one of the following:

- An individual resource-type (e.g., vcns, subnets, instances, volumes, etc.)
- A family resource-type (e.g., virtual-network-family, instance-family, volume-family, etc.)
- all-resources: Covers all resources in the compartment (or tenancy).

A family resource-type covers a variety of components that are typically used together. This makes it easier to write a policy that gives someone access to work with various aspects of your cloud network.

For a list of the available resource-types, see Resource-Types.

**Syntax:** <resource_type> | all-resources

**Examples:**

- To specify a single resource-type:
  
  Allow group HelpDesk to manage users in tenancy

- To specify multiple resource-types, use separate statements:
  
  Allow group A-Users to manage instance-family in compartment Project-A
  
  Allow group A-Users to manage volume-family in compartment Project-A

- To specify all resources in the compartment (or tenancy):
  
  Allow group A-Admins to manage all-resources in compartment Project-A

**Location**

Specify a single compartment or compartment path by name or OCID. Or simply specify tenancy to cover the entire tenancy. Remember that users, groups, and compartments reside in the tenancy. Policies can reside in (i.e., be attached to) either the tenancy or a child compartment.

**Note:**

Granting Access to Specific Regions or availability domains

To create a policy that gives access to a specific region or availability domain, use the request.region or request.ad variable with a condition. See Conditions on page 3294.

The location is required in the statement. If you want to attach a policy to a compartment, you must be in that compartment when you create the policy. For more information, see Policy Attachment on page 3263.

To specify a compartment that is not a direct child of the compartment you are attaching the policy to, specify the path to the compartment, using the colon (:) as a separator. For more information, see Policies and Compartment Hierarchies on page 3263.

**Syntax:** [ tenancy | compartment <compartment_name> | compartment id <compartment_ocid> ]

**Examples:**

- To specify a compartment by name:
  
  Allow group A-Admins to manage all-resources in compartment Project-A

- To specify a compartment by OCID:
  
  Allow group A-Admins to manage all-resources in compartment Project-A
to manage all-resources in compartment
id ocid1.compartment.oc1..aaaaaaaayzfq...4fmameqh7lcdlihrvur7xq

• To specify multiple compartments, use separate statements:

Allow group InstanceAdmins to manage instance-family in
compartment Project-A

Allow group InstanceAdmins to manage instance-family in
compartment Project-B

• To specify multiple compartments by OCID, use separate statements:

Allow group id
ocd1.group.oc1..aaaaaaaavhea5mell...b4rm66yfxv1462tdgx2oecyq
to manage all-resources in compartment id
ocid1.compartment.oc1..aaaaaaaayzfqe...ameq4h7lcdlihrvur7xq

Allow group id
ocd1.group.oc1..aaaaaaaavhea5mell...b4rm66yfxv1462tdgx2oecyq
to manage all-resources in compartment id
ocid1.compartment.oc1..aaaaaaaaphfjutov5s...vyypl1btctehnqg756a

• To specify a compartment that is not a direct child of the compartment where you are attaching the policy, specify
the path:

Allow group InstanceAdmins to manage instance-family in
compartment Project-A:Project-A2

Conditions
Specify one or more conditions. Use any or all with multiple conditions for a logical OR or AND, respectively.

Syntax for a single condition:  variable =|!= value

Syntax for multiple conditions:  any|all {<condition>,<condition>,...}

Important:
Condition matching is case insensitive. This is important to remember when
writing conditions for resource types that allow case-sensitive naming. For
example, the Object Storage service allows you to create both a bucket
named "BucketA" and a bucket named "bucketA" in the same compartment.
If you write a condition that specifies "BucketA", it will apply also to
"bucketA", because the condition matching is case insensitive.

For a list of variables supported by all the services, see General Variables for All Requests. Also see the details for
each service in the Policy Reference on page 3298. Here are the types of values you can use in conditions:
### Type

<table>
<thead>
<tr>
<th>Type</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>'<a href="mailto:johnsmith@example.com">johnsmith@example.com</a>'</td>
</tr>
<tr>
<td></td>
<td>'ocid1.compartment.oc1..aaaaaaaaaph...ctehnqg756a'</td>
</tr>
<tr>
<td></td>
<td>(single quotation marks are required around the value)</td>
</tr>
<tr>
<td>Pattern</td>
<td>/HR*/ (matches strings that start with &quot;HR&quot;)</td>
</tr>
<tr>
<td></td>
<td>/*HR/ (matches strings that end with &quot;HR&quot;)</td>
</tr>
<tr>
<td></td>
<td>/<em>HR</em>/ (matches strings that contain &quot;HR&quot;)</td>
</tr>
</tbody>
</table>

**Examples:**

**Note:**

In the following examples, the statements that specify the condition do not let GroupAdmins actually list all the users and groups, therefore statements including the `inspect` verb are added for completeness. To understand why this is required, see Variables that Aren't Applicable to a Request Result in a Declined Request on page 3286.

- A single condition.

The following policy enables the GroupAdmins group to create, update, or delete any groups with names that start with "A-Users-":

```
Allow group GroupAdmins to manage groups in tenancy where
  target.group.name = /A-Users-*/
Allow group GroupAdmins to inspect groups in tenancy
```

The following policy enables the GroupAdmins group to manage the membership of any group besides the Administrators group. (Note that you must include separate statements for `inspect` access because the `target.group.name` variable is not used by the ListUsers and ListGroups operations):

```
Allow group GroupAdmins to inspect users in tenancy

Allow group GroupAdmins to use users in tenancy where target.group.name != 'Administrators'

Allow group GroupAdmins to inspect groups in tenancy

Allow group GroupAdmins to use groups in tenancy where target.group.name != 'Administrators'
```

The following policy enables the NetworkAdmins group to manage cloud networks in any compartment except the one specified:

```
Allow group NetworkAdmins to manage virtual-network-family in tenancy where target.compartment.id !=
  'ocid1.compartment.oc1..aaaaaaaaayzfqeibduyox6icmdol6zyar3ugly4fmameq4h71cdlihrvur7xq6mh5nivqa'
```
• Multiple conditions.

The following policy lets GroupAdmins create, update, or delete any groups whose names start with "A-", except for the A-Admins group itself:

```
Allow group GroupAdmins to manage groups in tenancy where all
{target.group.name=/A-*/,target.group.name!='A-Admins'}
```

```
Allow group GroupAdmins to inspect groups in tenancy
```

**Verbs**

Oracle defines the possible verbs you can use in your policies. Here’s a summary of the verbs, from least amount of access to the most:

<table>
<thead>
<tr>
<th>Verb</th>
<th>Types of Access Covered</th>
<th>Target User</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>Ability to list resources, without access to any confidential information or user-specified metadata that may be part of that resource. <strong>Important:</strong> The operation to list policies includes the contents of the policies themselves, and the list operations for the Networking resource-types return all the information (e.g., the contents of security lists and route tables).</td>
<td>Third-party auditors</td>
</tr>
<tr>
<td>read</td>
<td>Includes inspect plus the ability to get user-specified metadata and the actual resource itself.</td>
<td>Internal auditors</td>
</tr>
<tr>
<td>use</td>
<td>Includes read plus the ability to work with existing resources (the actions vary by resource type). Includes the ability to update the resource, except for resource-types where the &quot;update&quot; operation has the same effective impact as the &quot;create&quot; operation (e.g., UpdatePolicy, UpdateSecurityList, etc.), in which case the &quot;update&quot; ability is available only with the manage verb. In general, this verb does not include the ability to create or delete that type of resource.</td>
<td>Day-to-day end users of resources</td>
</tr>
<tr>
<td>manage</td>
<td>Includes all permissions for the resource.</td>
<td>Administrators</td>
</tr>
</tbody>
</table>

The verb gives a certain general type of access (e.g., inspect lets you list and get resources). When you then join that type of access with a particular resource-type in a policy (e.g., Allow group XYZ to inspect compartments in the tenancy), then you give that group access to a specific set of permissions and API operations (e.g., ListCompartments, GetCompartment). For more examples, see Details for Verbs + Resource-Type Combinations. The Policy Reference on page 3298 includes a similar table for each service, giving you a list of exactly which API operations are covered for each combination of verb and resource-type.

There are some special exceptions or nuances for certain resource-types.

**Users:** Access to both manage users and manage groups lets you do anything with users and groups, including creating and deleting users and groups, and adding/removing users from groups. To add/remove users from groups without access to creating and deleting users and groups, only both use users and use groups are required. See Common Policies on page 3264.

**Policies:** The ability to update a policy is available only with manage policies, not use policies, because updating a policy is similar in effect to creating a new policy (you can overwrite the existing policy statements). In addition, inspect policies lets you get the full contents of the policies.

**Object Storage objects:** inspect objects lets you list all the objects in a bucket and do a HEAD operation for a particular object. In comparison, read objects lets you download the object itself.

**Load Balancing resources:** Be aware that inspect load-balancers lets you get all information about your load balancers and related components (backend sets, etc.).
Networking resources:

Be aware that the inspect verb not only returns general information about the cloud network's components (for example, the name and OCID of a security list, or of a route table). It also includes the contents of the component (for example, the actual rules in the security list, the routes in the route table, and so on).

Also, the following types of abilities are available only with the manage verb, not the use verb:

- Update (enable/disable) internet-gateways
- Update security-lists
- Update route-tables
- Update dhcp-options
- Attach a dynamic routing gateway (DRG) to a virtual cloud network (VCN)
- Create an IPSec connection between a DRG and customer-premises equipment (CPE)
- Peer VCNs

Important:

Each VCN has various components that directly affect the behavior of the network (route tables, security lists, DHCP options, Internet Gateway, and so on). When you create one of these components, you establish a relationship between that component and the VCN, which means you must be allowed in a policy to both create the component and manage the VCN itself. However, the ability to update that component (to change the route rules, security list rules, and so on) does NOT require permission to manage the VCN itself, even though changing that component can directly affect the behavior of the network. This discrepancy is designed to give you flexibility in granting least privilege to users, and not require you to grant excessive access to the VCN just so the user can manage other components of the network. Be aware that by giving someone the ability to update a particular type of component, you're implicitly trusting them with controlling the network's behavior.

Resource-Types

Oracle also defines the resource-types you can use in your policies. First, there are individual types. Each individual type represents a specific type of resource. For example, the vcns resource-type is specifically for virtual cloud networks (VCNs).

To make policy writing easier, there are family types that include multiple individual resource-types that are often managed together. For example, the virtual-network-family type brings together a variety of types related to the management of VCNs (e.g., vcns, subnets, route-tables, security-lists, etc.). If you need to write a more granular policy that gives access to only an individual resource-type, you can. But you can also easily write a policy to give access to a broader range of resources.

In another example: Block Volume has volumes, volume-attachments, and volume-backups. If you need to give access to only making backups of volumes, you can specify the volume-backups resource-type in your policy. But if you need to give broad access to all of the Block Volume resources, you can specify the family type called volume-family. For a full list of the family resource-types, see Resource-Types.

Important:

If a service introduces new individual resource-types, they will typically be included in the family type for that service. For example, if Networking introduces a new individual resource-type, it will be automatically included in the definition of the virtual-network-family resource type. For more information about future changes to the definitions of resource-types, see Policies and Service Updates on page 3264.

Note that there are other ways to make policies more granular, such as the ability to specify conditions under which the access is granted. For more information, see Advanced Policy Features on page 3285.
Important:

If a service introduces new permissions for an existing resource-type, you must update the policy statement for the existing resource-type to make the new permissions take effect. See this known issue for more information.

For instructions on how to create and manage policies using the Console or API, see Managing Policies on page 3521.

**Verbs**

The verbs are listed in order of least amount of ability to most. The exact meaning of each verb depends on which resource-type it's paired with. The tables later in this section show the API operations covered by each combination of verb and resource-type.

<table>
<thead>
<tr>
<th>Verb</th>
<th>Types of AccessCovered</th>
<th>Target User</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>Ability to list resources, without access to any confidential information or user-specified metadata that may be part of that resource. <strong>Important:</strong> The operation to list policies includes the contents of the policies themselves, and the list operations for the Networking resource-types return all the information (e.g., the contents of security lists and route tables).</td>
<td>Third-party auditors</td>
</tr>
<tr>
<td>read</td>
<td>Includes inspect plus the ability to get user-specified metadata and the actual resource itself.</td>
<td>Internal auditors</td>
</tr>
<tr>
<td>use</td>
<td>Includes read plus the ability to work with existing resources (the actions vary by resource type). Includes the ability to update the resource, except for resource-types where the &quot;update&quot; operation has the same effective impact as the &quot;create&quot; operation (e.g., UpdatePolicy, UpdateSecurityList, etc.), in which case the &quot;update&quot; ability is available only with the manage verb. In general, this verb does not include the ability to create or delete that type of resource.</td>
<td>Day-to-day end users of resources</td>
</tr>
<tr>
<td>manage</td>
<td>Includes all permissions for the resource.</td>
<td>Administrators</td>
</tr>
</tbody>
</table>
**Resource-Types**

The family resource-types are listed below. For the individual resource-types that make up each family, follow the links.

- **all-resources**: All Oracle Cloud Infrastructure resource-types
- **cluster-family**: See Details for Container Engine for Kubernetes on page 3312
- **compute-management-family**: See Details for the Core Services on page 3316
- **data-catalog-family**: See Data Catalog Policies
- **database-family**: See Details for the Database Service on page 3378
- **dns**: See Details for the DNS Service on page 3412
- **email-family**: See Details for the Email Delivery Service on page 3421
- **file-family**: See Details for the File Storage Service on page 3426
- **instance-agent-command-family**: See Details for the Core Services on page 3316
- **instance-agent-family**: See Details for the Core Services on page 3316
- **instance-family**: See Details for the Core Services on page 3316
- **object-family**: See Details for Object Storage, Archive Storage, and Data Transfer on page 3481
- **optimizer-api-family**: See Policy Details for Cloud Advisor on page 848
- **virtual-network-family**: See Details for the Core Services on page 3316
- **volume-family**: See Details for the Core Services on page 3316

IAM has no family resource-type, only individual ones. See Details for IAM (with Identity Domains) on page 3433 or Details for IAM, depending on whether your tenancy has identity domains or not.

**General Variables for All Requests**

You use variables when adding conditions to a policy. For more information, see Conditions on page 3285. Here are the general variables applicable to all requests.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request.user.id</td>
<td>Entity (OCID)</td>
<td>The OCID of the requesting user.</td>
</tr>
</tbody>
</table>
| request.user.mfaTotpVerified| Boolean              | Whether the user has been verified by multi-factor authentication (MFA). To restrict access to only MFA-verified users, add the condition where request.user.mfaTotpVerified = 'true'
<p>|                             |                      | See Managing Multi-Factor Authentication on page 3690 for information on setting up MFA. |
| request.groups.id           | List of entities (OCIDs) | The OCIDs of the groups the requesting user is in.                          |
| request.permission          | String               | The underlying permission being requested (see Permissions on page 3287).    |
| request.operation           | String               | The API operation name being requested (for example, ListUsers).             |
| request.networkSource.name  | String               | The name of the network source group that specifies allowed IP addresses the request may come from. See Managing Network Sources on page 3536 for information. |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request.utc-timestamp</td>
<td>String</td>
<td>The UTC time that the request is submitted, specified in ISO 8601 format. See Restricting Access to Resources Based on Time Frame on page 3289 for more information.</td>
</tr>
<tr>
<td>request.utc-timestamp.month-of-year</td>
<td>String</td>
<td>The month that the request is submitted in, specified in numeric ISO 8601 format (for example, '1', '2', '3', ... '12'). See Restricting Access to Resources Based on Time Frame on page 3289 for more information.</td>
</tr>
<tr>
<td>request.utc-timestamp.day-of-month</td>
<td>String</td>
<td>The day of the month that the request is submitted in, specified in numeric format '1' - '31'. See Restricting Access to Resources Based on Time Frame on page 3289 for more information.</td>
</tr>
<tr>
<td>request.utc-timestamp.day-of-week</td>
<td>String</td>
<td>The day of the week that the request is submitted in, specified in English (for example, 'Monday', 'Tuesday', 'Wednesday', etc.). See Restricting Access to Resources Based on Time Frame on page 3289 for more information.</td>
</tr>
<tr>
<td>request.utc-timestamp.time-of-day</td>
<td>String</td>
<td>The UTC time interval that request is submitted during, in ISO 8601 format (for example, '01:00:00Z' AND '02:01:00Z'). See Restricting Access to Resources Based on Time Frame on page 3289 for more information.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>

**Details for the Announcements Service**

This topic covers details for writing policies to control access to the Announcements service.

**Resource-Types**
- announcements

**Supported Variables**

Only the general variables are supported (see General Variables for All Requests on page 3300).

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the read verb for the announcements resource-type includes the same permissions and API operations as the inspect verb, plus the ANNOUNCEMENT_READ permission and an additional API operation, GetAnnouncement. However, the use verb and manage verbs cover no extra permissions or API operations compared to read.

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>ANNOUNCEMENT_LIST</td>
<td>ListAnnouncements</td>
<td>none</td>
</tr>
</tbody>
</table>

announcements
Verbs | Permissions | APIs Fully Covered | APIs Partially Covered
---|---|---|---
read | INSPECT + ANNOUNCEMENT_READ | INSPECT + GetAnnouncement | none
use | no extra | no extra | none
manage | no extra | no extra | none

Permissions Required for Each API Operation

The following table lists the API operations in a logical order, grouped by resource type.

For information about permissions, see Permissions.

<table>
<thead>
<tr>
<th>API Operation</th>
<th>Permissions Required to Use the Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ListAnnouncements</td>
<td>ANNOUNCEMENT_LIST</td>
</tr>
<tr>
<td>GetAnnouncement</td>
<td>ANNOUNCEMENT_READ</td>
</tr>
</tbody>
</table>

Details for API Gateway

This topic covers details for writing policies to control access to API Gateway.

Resource-Types

Aggregate Resource-Type

api-gateway-family

Individual Resource-Types

- api-gateways
- api-deployments
- api-definitions
- api-workrequests
- api-certificates
- api-sdks

Comments

A policy that uses <verb> api-gateway-family is equivalent to writing one with a separate <verb> <individual resource-type> statement for each of the individual resource-types.

See the table in Details for Verb + Resource-Type Combinations on page 3304 for details of the API operations covered by each verb, for each individual resource-type included in api-gateway-family.

Supported Variables

API Gateway supports all the general variables (see General Variables for All Requests on page 3300).

Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the read verb for the api-gateways resource-type includes the same permissions and API operations as the inspect verb, plus the API_GATEWAY_READ permission and a number of API operations.
IAM
(e.g., GetGateway, etc.). The use verb covers additional permissions and API operations compared to read. Lastly, manage covers more permissions and operations compared to use.

### api-gateways

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>

</tr>
<tr>
<td>Query</td>
<td>APM_DOMAIN_READ</td>
</tr>
</tbody>
</table>

### Details for the Audit Service

This topic covers details for writing policies to control access to the Audit service.

**Resource-Types**

audit-events

**Supported Variables**

Only the general variables are supported (see General Variables for All Requests on page 3300).

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.
For example, the `use` and `manage` verbs for the `audit-events` resource-type cover no extra permissions or API operations compared to the `read` verb.

### `audit-events`

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>none</td>
<td>none</td>
<td>none</td>
</tr>
<tr>
<td>read</td>
<td><code>AUDIT_EVENT_READ</code></td>
<td><code>ListEvents</code></td>
<td>none</td>
</tr>
<tr>
<td>use</td>
<td>no extra</td>
<td>no extra</td>
<td>none</td>
</tr>
<tr>
<td>manage</td>
<td>no extra</td>
<td>no extra</td>
<td>none</td>
</tr>
</tbody>
</table>

#### Permissions Required for Each API Operation

The following table lists the API operations in a logical order, grouped by resource type.

For information about permissions, see [Permissions](#).

<table>
<thead>
<tr>
<th>API Operation</th>
<th>Permissions Required to Use the Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ListEvents</code></td>
<td><code>AUDIT_EVENT_READ</code></td>
</tr>
</tbody>
</table>

#### Details for Container Engine for Kubernetes

This topic covers details for writing policies to control access to Container Engine for Kubernetes.

#### Resource-Types

**Aggregate Resource-Type**

- `cluster-family`

**Individual Resource-Types**

- `clusters`
- `cluster-node-pools`
- `cluster-work-requests`

#### Comments

A policy that uses `<verb> cluster-family` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual resource-types.

See the table in [Details for Verb + Resource-Type Combinations](#) on page 3313 for details of the API operations covered by each verb, for each individual resource-type included in `cluster-family`.

#### Supported Variables

Container Engine for Kubernetes supports all the general variables (see [General Variables for All Requests](#) on page 3300), plus the ones listed here.

The `clusters` resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>target.cluster.id</code></td>
<td>Entity (OCID)</td>
<td></td>
</tr>
</tbody>
</table>
The `cluster-node-pools` resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>target.nodepool.id</code></td>
<td>Entity (OCID)</td>
<td></td>
</tr>
</tbody>
</table>

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from `inspect` > `read` > `use` > `manage`. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the `read` verb for the `clusters` resource-type includes the same permissions and API operations as the `inspect` verb, plus the `CLUSTER_READ` permission and a number of API operations (e.g., `GetCluster`, etc.). The `use` verb covers still another permission and API operation compared to `read`. Lastly, `manage` covers more permissions and operations compared to `use`.

### clusters

<table>
<thead>
<tr>
<th>Verbs</th>

</tbody>
</table>

**Details for the Core Services**

This topic covers details for writing policies to control access to the Core Services (Networking, Compute, and Block Volume).

**Resource-Types**

Networking

**Aggregate Resource-Type**

virtual-network-family
drgs (covers drg-object, drg-route-table, drg-route-distribution, drg-attachment)

**Individual Resource-Types**

vcns
subnets
route-tables
network-security-groups
security-lists
dhcp-options
private-ips
public-ips
ipv6s
internet-gateways
nat-gateways
service-gateways
local-peering-gateways (which includes local-peering-from, and local-peering-to)
remote-peering-connections (which includes remote-peering-from, and remote-peering-to)
drg-object
drg-attachments
drg-route-tables
drg-route-distributions
cpes
ipsec-connections
cross-connects
cross-connect-groups
virtual-circuits
vnics
vnic-attachments
vlans
byoiprange
publicippool

**Comments**

A policy that uses `<verb> virtual-network-family` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual resource-types.

See the table in *Details for Verb + Resource-Type Combinations* on page 3318 for details of the API operations covered by each verb, for each individual resource-type included in `virtual-network-family`.

**Compute**

**instance-family Aggregate Resource-Type**
The `instance-family` aggregate resource-type covers these individual resource-types:
- app-catalog-listing
- console-histories
- instances
- instance-console-connection
- instance-images
- volume-attachments (includes only the permissions required for attaching volumes to instances)

**compute-management-family Aggregate Resource-Type**
The `compute-management-family` aggregate resource-type covers these individual resource-types:
- instance-configurations
- instance-pools
- cluster-networks

**instance-agent-family Aggregate Resource-Type**
The `instance-agent-family` aggregate resource-type covers this individual resource-type:
- instance-agent-plugins

**instance-agent-command-family Aggregate Resource-Type**
The `instance-agent-command-family` aggregate resource-type covers this individual resource-type:
- instance-agent-commands

**Additional Individual Resource-Types**
- auto-scaling-configurations
- compute-capacity-reservations
- dedicated-vm-hosts
- instance-agent-commands
- work-requests
Comments

A policy that uses `<verb> instance-family` or `<verb> compute-management-family` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual resource-types in the family.

See the table in Details for Verb + Resource-Type Combinations on page 3318 for details of the API operations covered by each verb, for each individual resource-type.

Block Volume

**Aggregate Resource-Type**

`volume-family`

**Individual Resource-Types**

`volumes`
`volume-attachments`
`volume-backups`
`boot-volume-backups`
`backup-policies`
`backup-policy-assignments`
`volume-groups`
`volume-group-backups`

Comments

A policy that uses `<verb> volume-family` is equivalent to writing one with a separate `<verb>` `<individual resource-type>` statement for each of the individual resource-types.

See the table in Details for Verb + Resource-Type Combinations on page 3318 for details of the API operations covered by each verb, for each individual resource-type included in `volume-family`.

**Supported Variables**

The Core Services support all the general variables, plus the ones listed here. For more information about general variables supported by Oracle Cloud Infrastructure services, see General Variables for All Requests on page 3300.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>target.boot-volume.kms-key.id</code></td>
<td>String</td>
<td>Use this variable to control whether compute instances can be launched with boot volumes that were created without a Vault service master encryption key.</td>
</tr>
</tbody>
</table>

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from `inspect` > `read` > `use` > `manage`. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the `read` and `use` verbs for the `vcns` resource-type cover no extra permissions or API operations compared to the `inspect` verb. However, the `manage` verb includes several extra permissions and API operations.

For virtual-network-family Resource Types
The following tables list the permissions and API operations covered by each of the individual resource-types included in `virtual-network-family`.

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>VCN_READ</td>
<td>ListVcns</td>
<td>CreateNatGateway, DeleteNatGateway</td>

### vlans
### Verbs | Permissions | APIs Fully Covered | APIs Partially Covered
--- | --- | --- | ---
inspect | VLAN_READ | ListVlans | none
read | no extra | no extra | none
use | READ + | UpdateVlan | none
manage | USE + | no extra | USE +
 | VLAN_CREATE | ChangeVlanCompartment, CreateVlan, DeleteVlan (both also need manage vcns, manage route-tables, manage security-lists)
 | VLAN_DELETE |  
 | VLAN_ASSOCIATE_NETWORK_SECURITY_GROUP |  
 | VLAN_DISASSOCIATE_NETWORK_SECURITY_GROUP |  
 | VLAN_MOVE |  

For instance-family Resource Types

The instance-family aggregate resource-type includes extra permissions beyond the sum of the permissions for the individual resource-types included in instance-family. For example: It includes a few permissions for vnics and volumes, even though those resource-types aren't generally considered part of the instance-family. Why are there extras included? So you can write fewer policy statements to cover general use cases, like working with an instance that has an attached block volume. You can write one statement for instance-family instead of multiple statements covering instances, vnics, and volumes.

Here's a list of the extra permissions:

#### For inspect instance-family:
- VNIC_READ
- VNIC_ATTACHMENT_READ
- VOLUME_ATTACHMENT_INSPECT

#### For read instance-family:
- VOLUME_ATTACHMENT_READ

#### For use instance-family:
- VNIC_ATTACH
- VNIC_DETACH
- VOLUME_ATTACHMENT_UPDATE

#### For manage instance-family:
- VOLUME_ATTACHMENT_CREATE
- VOLUME_ATTACHMENT_DELETE

The following tables list the permissions and API operations covered by each of the individual resource-types included in instance-family.
<table>
<thead>

Details for the Database Service

See the following topics for details for writing policies to control access to Oracle Cloud Infrastructure Database service resources:

- Policy Details for Autonomous Database on page 3379
- Policy Details for Bare Metal and Virtual Machine DB Systems on page 3398
- Policy Details for Database Software Images on page 3405
Policy Details for Autonomous Database

This topic covers details for writing policies to control access to Autonomous Database resources.

Tip:
For a sample policy, see Let database and fleet admins manage Autonomous Databases.

Resource-Types

An aggregate resource-type covers the list of individual resource-types that directly follow. For example, writing one policy to allow a group to have access to the `autonomous-database-family` is equivalent to writing four separate policies for the group that would grant access to the `autonomous-databases`, `autonomous-backups`, `autonomous-container-databases`, and `autonomous-exadata-infrastructures` resource-types. For more information, see Resource-Types.

Resource-Types for Autonomous Database

**Aggregate Resource-Type**

`autonomous-database-family`

**Individual Resource-Types:**

`autonomous-databases`

`autonomous-backups`

`autonomous-container-databases`

`autonomous-exadata-infrastructures`

Supported Variables

General variables are supported. See General Variables for All Requests on page 3300 for more information.

Additionally, you can use the `target.workloadType` variable, as shown in the following table:

<table>
<thead>
<tr>
<th>target.workloadType value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OLTP</td>
<td>Online Transaction Processing, used for the Autonomous Transaction Processing database.</td>
</tr>
<tr>
<td>DW</td>
<td>Data Warehouse, used for the Autonomous Data Warehouse database</td>
</tr>
<tr>
<td>AJD</td>
<td>Autonomous JSON Database</td>
</tr>
<tr>
<td>APEX</td>
<td>Oracle APEX Application Development</td>
</tr>
</tbody>
</table>

Example policy using the `target.workloadType` variable:

```
Allow group ADB-Admins to manage autonomous-database in tenancy where target.workloadType = 'workload_type'
```

Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from `inspect` > `read` > `use` > `manage`. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.
For example, the `read` verb for the `autonomous-databases` resource-type covers the same permissions and API operations as the `inspect` verb, plus the `AUTONOMOUS_DATABASE_CONTENT_READ` permission. The `read` verb partially covers the `CreateAutonomousDatabaseBackup` operation, which also needs manage permissions for `autonomous-backups`.

For autonomous-database-family Resource Types

```
Note:

The resource family covered by `autonomous-database-family` can be used to grant access to database resources associated with either the Autonomous Transaction Processing workload type or the Autonomous Data Warehouse workload type.
```

### autonomous-databases

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>

<td>RestoreAutonomousDatabase (also needs use autonomous-databases)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>ChangeAutonomousDatabaseCompartment (also needs use autonomous-databases)</td>
<td></td>
</tr>
<tr>
<td>use</td>
<td>no extra</td>
<td></td>
<td>none</td>
</tr>
<tr>
<td></td>
<td>no extra</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>no extra</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### IAM

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>manage</td>
<td>USE + AUTONOMOUS_DB_BACKUP_CREATE, AUTONOMOUS_DB_BACKUP_DELETE</td>
<td>DeleteAutonomousDatabaseBackup (also needs read autonomous-databases)</td>
<td></td>
</tr>
</tbody>
</table>

**autonomous-container-databases**

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>AUTONOMOUS_CONTAINER_DATABASE_INSPECT</td>
<td>ListAutonomousContainerDatabases, GetAutonomousContainerDatabase</td>
<td></td>
</tr>
<tr>
<td>read</td>
<td>no extra</td>
<td></td>
<td>none</td>
</tr>
<tr>
<td>use</td>
<td>AUTONOMOUS_CONTAINER_DATABASE_UPDATE</td>
<td>CreateAutonomousContainerDatabase (also needs manage autonomous-databases)</td>
<td></td>
</tr>
<tr>
<td>manage</td>
<td>USE + no extra</td>
<td>AUTONOMOUS_CONTAINER_DATABASE_CREATE, AUTONOMOUS_CONTAINER_DATABASE_DELETE</td>
<td></td>
</tr>
</tbody>
</table>

**autonomous-exadata-infrastructures**

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>AUTONOMOUS_EXADATA_INFRASTRUCTURE_INSPECT</td>
<td>ListAutonomousExadataInfrastructures, GetAutonomousExadataInfrastructure</td>
<td></td>
</tr>
<tr>
<td>read</td>
<td>INSPECT + no extra</td>
<td></td>
<td>none</td>
</tr>
<tr>
<td>use</td>
<td>READ + AUTONOMOUS_EXADATA_INFRASTRUCTURE_UPDATE</td>
<td>CreateAutonomousExadataInfrastructure (also needs manage autonomous-container-databases)</td>
<td></td>
</tr>
<tr>
<td>manage</td>
<td>USE + no extra</td>
<td>AUTONOMOUS_EXADATA_INFRASTRUCTURE_CREATE, AUTONOMOUS_EXADATA_INFRASTRUCTURE_DELETE</td>
<td></td>
</tr>
</tbody>
</table>

For autonomous-data-warehouse-family Resource Types

**Note:**

The **autonomous-data-warehouse-family** permissions are deprecated. You can use the resource family **autonomous-database-family** to grant access.
to the Autonomous Database resources used by both Autonomous Data
Warehouse databases and Autonomous Transaction Processing databases.

### autonomous-data-warehouses

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>

</tbody>
</table>

**Policy Details for Exadata Cloud Service Instances**

This topic covers details for writing policies to control access to bare metal, virtual machine, and Exadata Cloud Service resources.

**Tip:**
For a sample policy, see Let database admins manage Oracle Cloud database systems.

Resource-Types

An aggregate resource-type covers the list of individual resource-types that directly follow. For example, writing one policy to allow a group to have access to the database-family is equivalent to writing separate policies for the group that would grant access to the cloud-exadata-infrastructures, cloud-vmclusters, db-nodes, db-homes, databases, database-software-image, and backups resource-types. For more information, see Resource-Types.

**Resource-Types for Exadata Cloud Service Instances**

**Aggregate Resource-Type**
database-family

**Individual Resource-Types:**
cloud-exadata-infrastructures
cloud-vmclusters
db-nodes
db-homes
databases
backups

**Supported Variables**

Only the general variables are supported (see General Variables for All Requests on page 3300).

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.
For example, the read and use verbs for the `cloud-exadata-infrastructures` resource-type cover no extra permissions or API operations compared to the inspect verb. However, the manage verb includes two more permissions and partially covers two more API operations.

**For database-family Resource Types**

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>CLOUD_EXADATA_INFRASTRUCTURE_INSPECT</td>
<td>GetCloudExadataInfrastructure</td>
<td></td>
</tr>
<tr>
<td>read</td>
<td>no extra</td>
<td>no extra</td>
<td>none</td>
</tr>
<tr>
<td>use</td>
<td>CLOUD_EXADATA_INFRASTRUCTURE_UPDATE</td>
<td>ChangeCloudExadataInfrastructure</td>
<td></td>
</tr>
<tr>
<td>manage</td>
<td>USE +</td>
<td>UpdateCloudExadataInfrastructure</td>
<td></td>
</tr>
</tbody>
</table>

**cloud-vmclusters**

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>CLOUD_VM_CLUSTER_INSPECT</td>
<td>GetCloudVmCluster, ListCloudVmClusterUpdates,</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>ListCloudVmClusterUpdateHistoryEntries, GetCloudVmClusterUpdate, GetCloudVmClusterUpdateHistoryEntry</td>
<td></td>
</tr>
<tr>
<td>read</td>
<td>no extra</td>
<td>no extra</td>
<td>none</td>
</tr>
<tr>
<td>use</td>
<td>CLOUD_VM_CLUSTER_UPDATE</td>
<td>ChangeCloudVmClusterCompartment</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>(also needs use db-homes, use databases, and inspect db-backups)</td>
<td></td>
</tr>
<tr>
<td>manage</td>
<td>USE +</td>
<td>UpdateCloudVmCluster, CreateCloudVmCluster, DeleteCloudVmCluster</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>(both also need manage db-homes, manage databases, use vnics, and use subnets)</td>
<td></td>
</tr>
</tbody>
</table>

**db-nodes**
**Note:**
For Exadata Cloud Service VM clusters, the database node is sometimes referred to as a virtual machine.

<table>
<thead>
<tr>

### Policy Details for External Database

This topic covers details for writing policies to control access to external database resources.

**Tip:**

For a sample policy, see [Let database admins manage Oracle Cloud external database resources](#).

### Resource-Types

An aggregate resource-type covers the list of individual resource-types that directly follow. For example, writing one policy to allow a group to have access to the `external-database-family` is equivalent to writing four separate policies for the group that would grant access to the `external-container-databases`, `external-pluggable-databases`, `external-non-container-databases`, and `external-database-connectors` resource-types. For more information, see [Resource-Types](#).

### Aggregate Resource-Type

`external-database-family`

### Individual Resource-Types:

- `external-container-databases`
- `external-pluggable-databases`
- `external-non-container-databases`
- `external-database-connectors`

### Supported Variables

Only the general variables are supported (see [General Variables for All Requests](#) on page 3300).

### Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the `use` verb for the `external-container-databases` resource-type covers the same permissions and API operations as the `read` verb, plus the `EXTERNAL_CONTAINER_DATABASE_UPDATE`
permission. The `use` verb partially covers the `ScanPluggableDatabases` operation, which also needs read permissions for `external-pluggable-databases`.

### external-container-databases

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>

</tbody>
</table>

Policy Details for Bare Metal and Virtual Machine DB Systems

This topic covers details for writing policies to control access to bare metal and virtual machine DB system resources.

Tip:
For a sample policy, see Let database admins manage Oracle Cloud database systems.

Resource-Types

An aggregate resource-type covers the list of individual resource-types that directly follow. For example, writing one policy to allow a group to have access to the database-family is equivalent to writing separate policies for the group that would grant access to the db-systems, db-nodes, db-homes, databases, database-software-image, and backups resource-types. For more information, see Resource-Types.

Resource-Types for Bare Metal, Virtual Machine, and Exadata DB Systems

Aggregate Resource-Type

database-family

Individual Resource-Types:

db-systems
db-nodes
db-homes
databases
pluggable databases
backups

Supported Variables

Only the general variables are supported (see General Variables for All Requests on page 3300).
Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the read and use verbs for the db-systems resource-type cover no extra permissions or API operations compared to the inspect verb. However, the manage verb includes two more permissions and partially covers two more API operations.

**For database-family Resource Types**

**Policy Details for Database Software Images**

This topic covers details for writing policies to control access to database software images. These are used by Exadata Cloud Service instances, virtual machine DB systems, and bare metal DB systems.

**Tip:**

For a sample policy, see [Let database admins manage Oracle Cloud database systems](#).

**Resource-Types**

The `database-software-image` resource-type covers the Oracle-published and custom database software images available through the Database Software Image feature. The `database-family` aggregate resource-type
IAM covers the database software image resource-type as well as other resources related to DB systems and Exadata Cloud Service instances. For more information, see Resource-Types, and the policy details for Exadata Cloud Service instances and DB systems.

**Aggregate Resource-Type**

There are no aggregate resource-types for database software images.

**Individual Resource-Types:**

database-software-image (covered under the database-family aggregate resource-type)

Supported Variables

Only the general variables are supported (see General Variables for All Requests on page 3300).

Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>DB_SOFTWARE_IMG_INSPECT</td>
<td>ListDatabaseSoftwareImages</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>GetDatabaseSoftwareImage</td>
<td></td>
</tr>
<tr>

<td>UpdateDatabaseSoftwareImage</td>
<td></td>
</tr>
<tr>
<td></td>
<td>DB_SOFTWARE_IMG_UPDATE</td>
<td>ChangeDatabaseSoftwareImageCompartment</td>
<td></td>
</tr>
<tr>
<td>manage</td>
<td>USE +</td>
<td>CreateDatabaseSoftwareImage</td>
<td></td>
</tr>
<tr>
<td></td>
<td>DB_SOFTWARE_IMG_CREATE</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>DB_SOFTWARE_IMG_DELETE</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Permissions Required for Each API Operation

The following tables list the API operations for database software images in a logical order.

For information about permissions, see Permissions.

**Database Software Image API Operations**

<table>
<thead>
<tr>
<th>API Operation</th>
<th>Permissions Required to Use the Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ListDatabaseSoftwareImages</td>
<td>DB_SOFTWARE_IMG_INSPECT</td>
</tr>
<tr>
<td>GetDatabaseSoftwareImage</td>
<td>DB_SOFTWARE_IMG_INSPECT</td>
</tr>
<tr>
<td>UpdateDatabaseSoftwareImage</td>
<td>DB_SOFTWARE_IMG_INSPECT and DB_SOFTWARE_IMG_UPDATE</td>
</tr>
<tr>
<td>ChangeDatabaseSoftwareImageCompartment</td>
<td>DB_SOFTWARE_IMG_INSPECT and DB_SOFTWARE_IMG_UPDATE</td>
</tr>
<tr>

</thead>
<tbody>
<tr>
<td>DeleteDatabaseSoftwareImage</td>
<td>DB_SOFTWARE_IMG_INSPECT and DB_SOFTWARE_IMG_DELETE</td>
</tr>
</tbody>
</table>

### Details for Database Management

This topic covers details for writing policies to control access to the Database Management service.

#### Resource-Types

**Aggregate Resource-Type**

dbmgmt-family

**Individual Resource-Types**

- dbmgmt-jobs
- dbmgmt-managed-database-groups
- dbmgmt-managed-databases
- dbmgmt-private-endpoints
- dbmgmt-work-requests

#### Comments

A policy that uses `<verb> dbmgmt-family` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual resource-types in the family.

See the table in Details for Verb + Resource-Type Combinations on page 3407 for details of the API operations covered by each verb, for each individual resource-type.

#### Supported Variables

Only the general variables are supported (see General Variables for All Requests on page 3300).

#### Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from `inspect > read > use > manage`. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

**Details for the DNS Service**

This topic covers details for writing policies to control access to the DNS service.

**Aggregate Resource-Type**

dns
**Individual Resource-Types**

dns-zones  
dns-records  
dns-steering-policies  
dns-steering-policy-attachments  
dns-tsig-keys  
dns-views  
dns-resolvers

**Comments**

A policy that uses `<verb> dns` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual resource-types.

See the table in Details for Verb + Resource-Type Combinations on page 3416 for details of the API operations covered by each verb, for each individual resource-type included in `dns`.

**Supported Variables**

The DNS service supports all the general variables (see General Variables for All Requests on page 3300), plus the ones listed here.

The `dns-zones` resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>target.dns-zone.id</code></td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to specific DNS zones by OCID.</td>
</tr>
<tr>
<td><code>target.dns-zone.name</code></td>
<td>String</td>
<td>Use this variable to control access to specific DNS zones by name.</td>
</tr>
</tbody>
</table>
| `target.dns-zone.apex-label` | String         | The most significant DNS label for the target zone. Example:  
If the target zone's name is "service.example.com", the value of this variable would be “service”. |
| `target.dns-zone.parent-domain` | String            | The domain name of the target zone's parent zone.                         |
| `target.dns.scope`        | String             | Valid values are "public" and "private".                                 |

The `dns-records` resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>target.dns-zone.id</code></td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to specific DNS zones by OCID.</td>
</tr>
<tr>
<td><code>target.dns-zone.name</code></td>
<td>String</td>
<td>Use this variable to control access to specific DNS zones by name.</td>
</tr>
<tr>
<td>Variable</td>
<td>Variable Type</td>
<td>Comments</td>
</tr>
<tr>
<td>----------</td>
<td>---------------</td>
<td>----------</td>
</tr>
<tr>
<td><strong>target.dns-record.type</strong></td>
<td>List (String)</td>
<td>Use this variable to control access to specific DNS records by type. Valid values in the list can be any supported DNS resource type. For example, &quot;A&quot;, &quot;AAAA&quot;, &quot;TXT&quot;, and so on. See Supported Resource Records on page 2528.</td>
</tr>
</tbody>
</table>
| **target.dns-domain.name** | List (String) | Use this variable to control access to specific domain names. Applicable to the following API operations:  
- GetDomainRecords  
- PatchDomainRecords  
- UpdateDomainRecords  
- DeleteRRSet  
- GetRRSet  
- PatchRRSet  
- UpdateRRSet |
| **target.dns-zone.source-compartment.id** | Entity (OCID) | Use this variable to control access to the current compartment of the DNS zone by OCID. |
| **target.dns-zone.destination-compartment.id** | Entity (OCID) | Use this variable to control access to the destination compartment of the DNS zone by OCID. |

**Note:**
Use the **target.dns-record.type** and **target.dns-domain.name** variables in your authorization policy to restrict users when modifying records of a specific type in a specific subdomain. A policy like this would allow a specific group of users to modify "A" records in the "example.com" domain: Allow group <GroupName> to use dns in compartment <CompartmentName> where all {target.dns-record.type='A', target.dns-domain.name = 'example.com'} Users will only be authorized to use RRSet API operations with this type of authorization policy.

The **dns-steering-policies** resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>target.dns-steering-policy.id</strong></td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to specific steering policies by OCID.</td>
</tr>
<tr>
<td><strong>target.dns-steering-policy.display-name</strong></td>
<td>String</td>
<td>Use this variable to control access to specific steering policies by name.</td>
</tr>
<tr>
<td><strong>target.dns-steering-policy.source-compartment.id</strong></td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to the current compartment of the steering policy by OCID.</td>
</tr>
<tr>
<td>Variable</td>
<td>Variable Type</td>
<td>Comments</td>
</tr>
<tr>
<td>----------</td>
<td>---------------</td>
<td>----------</td>
</tr>
<tr>
<td>target.dns-steering-policy.destination-compartment.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to the destination compartment of the steering policy by OCID.</td>
</tr>
</tbody>
</table>

The `dns-tsig-keys` resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.dns-tsig-key.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to specific TSIG keys by OCID.</td>
</tr>
<tr>
<td>target.dns-tsig-key.name</td>
<td>String</td>
<td>Use this variable to control access to specific TSIG keys by name.</td>
</tr>
<tr>
<td>target.dns-tsig-key.source-compartment.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to the current compartment of a specific TSIG key by OCID.</td>
</tr>
<tr>
<td>target.dns-tsig-key.destination-compartment.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to the destination compartment of the specific TSIG key by OCID.</td>
</tr>
</tbody>
</table>

The `dns-view` resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.dns-view.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to specific view by OCID.</td>
</tr>
<tr>
<td>target.dns-view.display-name</td>
<td>String</td>
<td>Use this variable to control access to specific view by name.</td>
</tr>
<tr>
<td>target.dns-view.source-compartment.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to the current compartment of a specific view by OCID.</td>
</tr>
<tr>
<td>target.dns-view.destination-compartment.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to the destination compartment of the specific view by OCID.</td>
</tr>
</tbody>
</table>

The `dns-resolver` resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.dns-resolver.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to specific resolver by OCID.</td>
</tr>
<tr>
<td>target.dns-resolver.display-name</td>
<td>String</td>
<td>Use this variable to control access to specific resolver by name.</td>
</tr>
<tr>
<td>target.dns-resolver.source-compartment.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to the current compartment of a specific resolver by OCID.</td>
</tr>
<tr>
<td>target.dns-resolver.destination-compartment.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to the destination compartment of the specific resolver by OCID.</td>
</tr>
</tbody>
</table>

The `dns-resolver-endpoint` resource type can use the following variables:
### Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.dns-resolver-endpoint.name</td>
<td>String</td>
<td>Use this variable to control access to specific resolver endpoints by name.</td>
</tr>
</tbody>
</table>

### Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the manage verb for the dns-records resource-type covers no extra permissions or API operations compared to the use verb.

### dns-zones

<table>
<thead>
<tr>
<th>Verbs</th>

**Details for the Email Delivery Service**

This topic covers details for writing policies to control access to the Email Delivery service.

**Resource-Types**
- email-domains
- email-work-requests
- email-family
- approved-senders
- suppressions

**Supported Variables**

The Email Delivery Service supports all the general variables (see General Variables for All Requests on page 3300), plus the ones listed here.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.approved-sender.email-domain</td>
<td>String</td>
<td>The value matches the domain portion (right-hand-side) of the email address and the name of the associated email-domain object if one exists. Policies should use the U-label form of the domain. Matching is case-insensitive. This is not available for ListSenders.</td>
</tr>
<tr>
<td>target.email-domain.name</td>
<td>String</td>
<td>Scopes permission to domains that match the specified domain name. Policies should use the U-label form of the domain. Matching is case-insensitive. This variable can be used with pattern matching syntax to grant sub-domain access. This is not available for ListEmailDomains.</td>
</tr>
<tr>
<td>target.email-domain.id</td>
<td>Entity (OCID)</td>
<td>Not available for ListEmailDomains or CreateEmailDomain.</td>
</tr>
</tbody>
</table>
### IAM

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>target.email-work-request.id</code></td>
<td>Entity (OCID)</td>
<td>Not available for <code>ListWorkRequests</code>.</td>
</tr>
</tbody>
</table>

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from `inspect` > `read` > `use` > `manage`. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

#### email-domains

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td><code>EMAIL_DOMAIN_INSPECT</code></td>
<td><code>ListEmailDomains</code></td>
<td><code>None</code></td>
</tr>
<tr>
<td>read</td>
<td><code>INSPECT + EMAIL_DOMAIN_READ</code></td>
<td><code>GetEmailDomain</code></td>
<td><code>None</code></td>
</tr>
<tr>
<td>use</td>
<td><code>READ + EMAIL_DOMAIN_UPDATE</code></td>
<td><code>UpdateEmailDomain</code></td>
<td><code>None</code></td>
</tr>
<tr>
<td>manage</td>
<td><code>USE + EMAIL_DOMAIN_CREATE EMAIL_DOMAIN_DELETE EMAIL_DOMAIN_MOVE</code></td>
<td><code>CreateEmailDomain DeleteEmailDomain ChangeEmailDomainCompartmen</code></td>
<td><code>None</code></td>
</tr>
</tbody>
</table>

#### email-work-requests

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>

<td>SUPPRESSION_CREATE</td>
<td>DeleteSuppression</td>
<td></td>
</tr>
</tbody>
</table>

Permissions Required for Each API Operation

The following table lists the API operations in a logical order, grouped by resource type. For information about permissions, see Permissions.

<table>
<thead>
<tr>
<th>API Operation</th>
<th>Permissions Required to Use the Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ListEmailDomains</td>
<td>EMAIL_DOMAIN_INSPECT</td>
</tr>
<tr>
<td>GetEmailDomain</td>
<td>EMAIL_DOMAIN_READ</td>
</tr>
<tr>
<td>CreateEmailDomain</td>
<td>EMAIL_DOMAIN_CREATE</td>
</tr>
<tr>
<td>UpdateEmailDomain</td>
<td>EMAIL_DOMAIN_UPDATE</td>
</tr>
<tr>
<td>DeleteEmailDomain</td>
<td>EMAIL_DOMAIN_DELETE</td>
</tr>
<tr>
<td>ChangeEmailDomainCompartment</td>
<td>EMAIL_DOMAIN_MOVE</td>
</tr>
<tr>
<td>ListSenders</td>
<td>APPROVED_SENDER_INSPECT</td>
</tr>
<tr>
<td>GetSender</td>
<td>APPROVED_SENDER_READ</td>
</tr>
<tr>
<td>CreateSender</td>
<td>APPROVED_SENDER_CREATE</td>
</tr>
<tr>
<td>UpdateSender</td>
<td>APPROVED_SENDER_UPDATE</td>
</tr>
<tr>
<td>DeleteSender</td>
<td>APPROVED_SENDER_DELETE</td>
</tr>
<tr>
<td>MoveSender</td>
<td>APPROVED_SENDER_MOVE</td>

Details for the Events Service

This topic covers details for writing user IAM policies that control access to rules for the Events service.

Resource-Types

cloudevents-rules

Supported Variables

Only the general variables are supported (see General Variables for All Requests on page 3300).

Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the read verb for cloudevents-rules includes the same permissions and API operations as the inspect verb, plus the EVENTRULE_READ permissions and the corresponding API operation GetEventRule. The use verb adds no extra permissions or API operations compared to read. However, manage adds more permissions and operations compared to use.

<table>
<thead>
<tr>
<th>Resource-Type</th>
<th>Verbs</th>

Details for the File Storage Service

This topic covers details for writing policies to control access to the File Storage Service.

Aggregate Resource-Type

- file-family

Individual Resource-Types

- file-systems
- mount-targets
- export-sets

Comments

A policy that uses `<verb> file-family` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual resource-types.

See the table in Details for Verb + Resource-Type Combinations on page 3426 for details of the API operations covered by each verb, for each individual resource-type included in file-family.

Supported Variables

Only the general variables are supported (see General Variables for All Requests on page 3300).

Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the read verb for the file-systems resource-type includes the same permissions and API operations as the inspect verb, plus the FILE_SYSTEM_READ permission and a number of API operations (e.g., GetFileSystem, ListMountTargets, etc.). The use verb covers still another permission and set of API operations compared to read. Lastly, manage covers two more permissions and operations compared to use.

### export-sets

<table>
<thead>
<tr>

### Details for Functions

This topic covers details for writing policies to control access to Oracle Functions.

#### Resource-Types

- **Aggregate Resource-Type**
  - functions-family

- **Individual Resource-Types**
  - fn-app
  - fn-function
  - fn-invocation

#### Comments

A policy that uses `<verb> functions-family` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual resource-types.

See the table in Details for Verb + Resource-Type Combinations on page 3430 for details of the API operations covered by each verb, for each individual resource-type included in functions-family.

#### Supported Variables

Oracle Functions supports all the general variables (see General Variables for All Requests on page 3300).
**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from `inspect` > `read` > `use` > `manage`. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the `read` verb for the `fn-app` resource-type includes the same permissions and API operations as the `inspect` verb, plus the `FN_APP_READ` permission and the `GetApp` API operation. In the case of the `fn-app` resource-type, the `use` verb covers no additional permissions or API operations compared to `read`. Lastly, `manage` covers more permissions and operations compared to `use`.

<table>
<thead>
<tr>

</table>
Details for Verbs + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the read verb for compartments covers no extra permissions or API operations compared to the inspect verb. The use verb includes the same ones as the read verb, plus the COMPARTMENT_UPDATE permission and UpdateCompartment API operation. The manage verb includes the same permissions and API operations as the use verb, plus the COMPARTMENT_CREATE permission and two API operations: CreateCompartment and DeleteCompartment.

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>AUTHENTICATION_POLICY_INSPECT</td>
<td>ListAuthenticationPolicy</td>

</tr>
</tbody>
</table>

compartments

To move a compartment (that is, use the MoveCompartment operation) you must belong to a group that has manage all-resources permissions on the lowest shared parent compartment of the current compartment and the destination compartment.

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>

</tbody>
</table>

credentials
The credentials resource type refers to only the SMTP credentials. Permissions to work with other credentials that can be added to a user (such as auth tokens, API keys, and customer secret keys) are included with users resource permissions.

**Details for the Java Management Service**

This topic covers details for writing policies to control access to the Java Management service.

**Resource-Types**

fleet

**Supported Variables**

Only the general variables are supported (see General Variables for All Requests on page 3300).

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.
### Verbs and Permissions

<table>
<thead>
<tr>

</table>

### Details for Load Balancing

This topic covers details for writing policies to control access to the Load Balancing service.

**Resource-Types**

load-balancers

**Supported Variables**

Only the general variables are supported (see General Variables for All Requests on page 3300).

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the read verb for load-balancers includes the same permissions and API operations as the inspect verb, plus the LOAD_BALANCER_READ permission and a number of API operations (e.g., GetLoadBalancer, ListWorkRequests, etc.). The use verb covers still another permission and set of API operations compared to read. And manage covers two more permissions and operations compared to use.

### load-balancers

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>LOAD_BALANCER_INSPECT</td>
<td>ListLoadBalancers</td>
<td>none</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ListShapes</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>ListPolicies</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>ListProtocols</td>
<td></td>
</tr>
</tbody>
</table>
### Permissions Required for Each API Operation

The following table lists the API operations in a logical order, grouped by resource type.

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>read</td>
<td>INSPECT +</td>
<td>LOAD_BALANCER_READ, GetLoadBalancer, ListWorkRequests, GetWorkRequest, ListBackendSets, GetBackendSet, ListBackends, GetBackend, GetHealthChecker, ListCertificates</td>
<td>none</td>
</tr>
<tr>
<td>use</td>
<td>READ +</td>
<td>LOAD_BALANCER_UPDATE, UpdateLoadBalancer, LOAD_BALANCER_MOVE, ChangeLoadBalancerCompartment, UpdateBackendSet, CreateBackendSet, DeleteBackendSet, UpdateBackend, CreateBackend, DeleteBackend, UpdateHealthChecker, CreateCertificate, DeleteCertificate, UpdateListener, CreateListener, DeleteListener</td>
<td>none</td>
</tr>
<tr>
<td>manage</td>
<td>USE +</td>
<td>LOAD_BALANCER_CREATE, DeleteLoadBalancer</td>
<td>none</td>
</tr>
</tbody>
</table>

### Tip:

If a group uses the Console to manage load balancers, permissions to use the associated networking resources are required. See the load balancing policy examples for further guidance.

For information about permissions, see Permissions.
### API Operation

</table>

### Details for Logging

This topic covers details for writing policies to control access to Logging.

#### Resource-Types

#### Aggregate Resource-Type

- logging-family
Individual Resource-Types

- log-groups
- log-content
- unified-configuration

Comments

A policy that uses `<verb>` `logs` is equivalent to writing one with a separate `<verb>` `<individual resource-type>` statement for each of the individual resource-types.

See the table in Details for Verb + Resource-Type Combinations for a detailed breakout of the API operations covered by each verb, for each individual resource-type included in `logs`.

Supported Variables

Logging supports all the general variables (see General Variables for All Requests on page 3300), plus additional ones listed here:

<table>
<thead>
<tr>
<th>Operations for This Resource-Type...</th>
<th>Can Use These Variables...</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>log-groups</td>
<td>target.loggroup.id</td>
<td>Entity (OCID)</td>
<td></td>
</tr>
<tr>
<td>log-content</td>
<td>target.loggroup.id</td>
<td>Entity (OCID)</td>
<td></td>
</tr>
</tbody>
</table>

Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from `inspect` > `read` > `use` > `manage`. A plus (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the `read` verb for the `log-groups` resource-type includes the same permissions and API operations as the `inspect` verb, plus the LOG_GROUPS_READ permission and the corresponding API operations `GetLog` and `GetLogGroup`.

log-groups

**Permissions Required for Each API Operation**

The following table lists the API operations in a logical order, grouped by resource type. For information about permissions, see Permissions.

<table>
<thead>
<tr>
<th>API Operation</th>
<th>Permissions Required to Use the Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ListSearchLogs</td>
<td>LOG_CONTENT_READ</td>
</tr>
<tr>
<td>ListLogs</td>
<td>LOG_GROUP_INSPECT</td>
</tr>
</tbody>
</table>

Oracle Cloud Infrastructure User Guide 3452
## Details for Logging Analytics

This topic covers details for writing policies to control access to the Logging Analytics service.

### Resource-Types

**Individual Resource-Types**

- `loganalytics-config-work-request`
- `loganalytics-entity`
- `loganalytics-entity-type`
- `loganalytics-field`
- `loganalytics-label`
- `loganalytics-lifecycle`
- `loganalytics-log-group`
- `loganalytics-lookup`
- `loganalytics-object-collection-rule`
- `loganalytics-on-demand-upload`
- `loganalytics-parser`
- `loganalytics-query`
- `loganalytics-queryjob-work-request`
- `loganalytics-scheduled-task`
- `loganalytics-source`
- `loganalytics-storage`
Aggregate Resource-Types

The `loganalytics-features-family` aggregate resource-type covers these individual resource-types (resource kinds that are not modeled as resources; that is, resource kinds that do not belong to a compartment):

`loganalytics-entity-type`
`loganalytics-field`
`loganalytics-label`
`loganalytics-lifecycle`
`loganalytics-lookup`
`loganalytics-ondemand-upload`
`loganalytics-parser`
`loganalytics-query`
`loganalytics-source`
`loganalytics-storage`
`loganalytics-storage-work-request`

The `loganalytics-resources-family` aggregate resource-type covers these individual resource-types (resource kinds that are modeled as resources; that is, resource kinds that belong to a compartment):

`loganalytics-config-work-request`
`loganalytics-entity`
`loganalytics-log-group`
`loganalytics-object-collection-rule`
`loganalytics-queryjob-work-request`
`loganalytics-scheduled-task`
`loganalytics-storage-work-request`

Comments

A policy that uses `<verb> loganalytics-features-family` or `<verb> loganalytics-resources-family` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual resource-types in the family.

See the table in Permissions Required for Each API Operation on page 3464 for details of the API operations covered by each verb, for each individual resource-type.

Supported Variables

Only the general variables are supported (see General Variables for All Requests on page 3300).

Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from `inspect` > `read` > `use` > `manage`. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.
<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>LOG_ANALYTICS_CONFIG_WORK_REQUEST_INSPECT + GetConfigWorkRequest</td>

Details for Management Agent

This topic covers details for writing policies to control access to the Management Agent service.

Resource-Types

management-agents

management-agent-install-keys

Supported Variables

Only the general variables are supported (see General Variables for All Requests on page 3300).

Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

Details for Management Dashboard

This topic covers details for writing policies to control access to Management Dashboard.

Resource-Types

Individual Resource-Types

management-dashboard

management-saved-search

Aggregate Resource-Type

management-dashboard-family

Comments

A policy that uses `<verb>` management-dashboard-family is equivalent to writing one with a separate `<verb>` `<individual resource-type>` statement for each of the individual resource-types. The resource-type management-dashboard allows a user group to work with dashboards while the resource-type management-saved-search allows a user group to work with saved searches (widgets) that are displayed in dashboards.

See the table in Details for Verb + Resource-Type Combinations on page 3472 for details of the API operations covered by each verb, for each individual resource-type included in management-dashboard-family.

Supported Variables

Only the general variables are supported (see General Variables for All Requests on page 3300).

Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

</tr>
</tbody>
</table>
### Example Policies

This section provides example policies for use with Management Dashboard.

#### Dashboard Policies

Here are examples of policy statements that authorize access to dashboards (management-dashboard resource-type):

- To allow a user group to list the dashboards in a compartment, use the `inspect` verb:

  ```
  Allow group dashboard-users to inspect management-dashboard in compartment myCompartment1
  ```

- To allow a user group to list dashboards and obtain details regarding the dashboards in a compartment, use the `read` verb:

  ```
  Allow group dashboard-users to read management-dashboard in compartment myCompartment1
  ```

- To allow a group of administrators to list dashboards, obtain details regarding dashboards, and update the dashboards in a compartment, use the `use` verb:

  ```
  Allow group dashboard-admins to use management-dashboard in compartment myCompartment1
  ```

- To allow a group of administrators to list dashboards, obtain details regarding dashboards, update dashboards, and manage (create, move, and delete) the dashboards in a compartment, use the `manage` verb:

  ```
  Allow group dashboard-admins to manage management-dashboard in compartment myCompartment1
  ```

#### Saved Search Policies

Here are examples of policy statements that authorize access to saved searches (management-saved-search resource-type):

- To allow a user group to list the saved searches in a compartment, use the `inspect` verb:

  ```
  Allow group saved-search-users to inspect management-saved-search in compartment myCompartment1
  ```

- To allow a user group to list saved searches and obtain details regarding the saved searches in a compartment, use the `read` verb:

  ```
  Allow group saved-search-users to read management-saved-search in compartment myCompartment1
  ```

- To allow a group of administrators to list saved searches, obtain details regarding saved searches, update the saved searches in a compartment, use the `use` verb:

  ```
  Allow group saved-search-admins to use management-saved-search in compartment myCompartment1
  ```
• To allow a group of administrators to list saved searches, obtain details regarding saved searches, update saved searches, and manage (create, move, and delete) the saved searches in a compartment, use the `manage` verb:

```
Allow group saved-search-admins to manage management(saved-search in compartment myCompartment1
```

**Aggregate Policies**

Here's an example of a policy that simultaneously authorizes access to both dashboards and saved searches by using the aggregate `management-dashboard-family` resource-type. In this example, the `inspect` verb is used to allow a user group to list both the dashboards and saved searches in a compartment:

```
Allow group dashboard-family-admins to inspect management-dashboard-family in compartment myCompartment1
```

Similarly, the other Oracle Cloud Infrastructure verbs can be used to allow user groups to perform the corresponding tasks for dashboards and saved searches in one policy.

**Details for the Marketplace Service**

This topic covers details for writing policies to control access to the Marketplace service.

**Individual Resource-Type**

`marketplace-listings`

`marketplace-publications`

`marketplace-community-listings`

**Supported Variables**

Marketplace supports all the general variables, plus the ones listed here. Specifically, you can use the variables listed here when writing policies that grant `read`, `use`, and `manage` verbs. You cannot use them with the `inspect` verb. For more information about general variables supported by Oracle Cloud Infrastructure services, see [General Variables for All Requests](#) on page 3300.

<table>
<thead>
<tr>
<th>Resource-Type</th>
<th>Variable</th>
<th>Variable Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>marketplace-listings</code></td>
<td>listing.id</td>
<td>String</td>
<td>Use this variable to control whether to return a specific listing (based on the given listing ID) in response to a request.</td>
</tr>
<tr>
<td><code>marketplace-listings</code></td>
<td>listing.publisher.id</td>
<td>String</td>
<td>Use this variable to control whether to return only listings from a specific publisher (based on the given publisher ID) in response to a request.</td>
</tr>
<tr>
<td><code>marketplace-community-listings</code></td>
<td>listing.id</td>
<td>String</td>
<td>Use this variable to control whether to return a specific publication (based on the given listing ID) in response to a request.</td>
</tr>
<tr>
<td><code>marketplace-publications</code></td>
<td>listing.id</td>
<td>String</td>

</tr>
<tr>
<td>Resource-Type</td>
<td>Variable</td>
<td>Variable Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>marketplace-publications</td>
<td>listing.type</td>
<td>String</td>
<td>Use this variable to control whether to return only listings from a specific publisher category (based on the given listing type) in response to a request. A publication's publisher category informs where the listing appears for use.</td>
</tr>
<tr>
<td>marketplace-publications</td>
<td>listing.destination.compartment.id</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>marketplace-publications</td>
<td>listing.source-compartment.id</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the use verb for the marketplace-listings resource-type includes the same permissions and API operations as the read verb, plus the MARKETPLACE_LISTING_LAUNCH permission and an additional API operation, LaunchListing. However, the manage verb covers no extra permissions or API operations compared to use.

### marketplace-listings

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>

Details for Object Storage, Archive Storage, and Data Transfer

This topic covers details for writing policies to control access to Archive Storage, Object Storage, and Data Transfer.

Tip:

The object lifecycle policies feature requires that you grant permissions to the Object Storage service to archive and delete objects on your behalf. See Using Object Lifecycle Policies for more information.

Resource-Types

Individual Resource-Types

objectstorage-namespaces
buckets
objects

Aggregate Resource-Type

object-family

A policy that uses `<verb> object-family` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual resource-types.
See the table in Details for Verb + Resource-Type Combinations on page 3482 for details of the API operations covered by each verb, for each individual resource-type included in object-family.

**Additional Individual Resource-Type for Data Transfer**

**data-transfer-jobs**

**Supported Variables**

Object Storage supports all the general variables (see General Variables for All Requests on page 3300), plus the ones listed here:

<table>
<thead>
<tr>
<th>Operations for This Resource-Type...</th>
<th>Can Use This Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>buckets and objects</td>
<td>target.bucket.name</td>
<td>String</td>
<td>Use this variable to control access to a specific bucket. For an example policy, see Let users write objects to Object Storage buckets. <strong>Important:</strong> Condition matching is case insensitive. If you have a bucket named &quot;BucketA&quot; and a bucket named &quot;bucketA&quot;, the condition where ( \text{target.bucket.name} = \text{&quot;BucketA&quot;} ) applies to both. To avoid potential issues with resource names in policy, give your resources distinct names.</td>
</tr>
</tbody>
</table>

**Note:**

The `request.ipv4.ipaddress` and the `request.vcn.id` variables are deprecated. Instead of using these variables, create a network source to specify either an IP address range or a specific VCN ID. You can then use the network source in your policy to restrict access to only requests coming from the allowed networks. For more information, see Managing Network Sources.

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

**For object-family Resource Types**

**objectstorage-namespaces**

<td></td>
</tr>
</tbody>
</table>

**Permissions Required for Each API Operation**

The following table lists the API operations in a logical order, grouped by resource type.

For information about permissions, see Permissions.

<table>
<thead>
<tr>
<th>API Operation</th>
<th>Permissions Required to Use the Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetNamespace</td>
<td>API requires no permissions and returns the caller's namespace. Use the API to validate your credentials. OBJECTSTORAGE_NAMESPACE_READ permission is required if you include the optional compartmentId parameter. Use the compartmentId parameter to determine the namespace for a third-party tenancy.</td>
</tr>
<tr>
<td>GetNamespaceMetadata</td>
<td>OBJECTSTORAGE_NAMESPACE_READ</td>
</tr>
<tr>
<td>UpdateNamespaceMetadata</td>
<td>OBJECTSTORAGE_NAMESPACE_UPDATE</td>
</tr>
<tr>
<td>CreateBucket</td>
<td>BUCKET_CREATE</td>
</tr>
<tr>
<td>UpdateBucket</td>
<td>BUCKET_UPDATE</td>
</tr>
<tr>
<td>GetBucket</td>
<td>BUCKET_READ</td>
</tr>
<tr>
<td>HeadBucket</td>
<td>BUCKET_INSPECT</td>
</tr>
<tr>
<td>ListBuckets</td>
<td>BUCKET_INSPECT</td>
</tr>
<tr>
<td>DeleteBucket</td>
<td>BUCKET_DELETE</td>
</tr>
<tr>
<td>ReencryptBucket</td>
<td>BUCKET_UPDATE</td>
</tr>
<tr>
<td>PutObject</td>
<td>The permission required depends on whether or not the object already exists in the bucket: OBJECT_CREATE is required when an object with that name does not already exist in the bucket. OBJECT_OVERWRITE is required when an object with that name already exists in the bucket.</td>
</tr>
<tr>
<td>RenameObject</td>
<td>OBJECT_CREATE and OBJECT_OVERWRITE</td>
</tr>
<tr>

### Details for Operations Insights

This topic covers details for writing policies to control access to the Operations Insights service.

#### Resource-Types

- **Individual Resource-Types**
  - opsi-database-insights
  - opsi-enterprise-manager-bridges
  - opsi-host-insights
  - opsi-work-requests
  - opsi-exadata-insights

- **Aggregate Resource-Types**
  - opsi-family

#### Comments

See the table in Permissions Required for Each API Operation on page 3490 for details of the API operations covered by each verb, for each individual resource-type.

#### Supported Variables

Only the general variables are supported (see General Variables for All Requests on page 3300).

#### Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

<table>

Details for Oracle Cloud VMware Solution

This topic covers details for writing policies to control access to Oracle Cloud VMware Solution resources.

Resource-Types

sddcs

Supported Variables

Only the general variables are supported (see General Variables for All Requests on page 3300).

Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the read verb for sddcs includes the same permissions and API operations as the inspect verb, plus the SDDC_READ permission and a number of API operations (e.g., GetSddc, ListWorkRequests, etc.). The use verb covers two more permissions and set of API operations compared to read. And manage covers five more permissions and operations compared to use.

**Details for Container Registry**

This topic covers details for writing policies to control access to Oracle Cloud Infrastructure Registry (also known as Container Registry).

**Resource-Types**
- repos

**Supported Variables**

Oracle Cloud Infrastructure Registry supports all the general variables (see General Variables for All Requests on page 3300), plus the ones listed here.

The repos resource-type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.repo.name</td>
<td>String</td>
<td>Use this variable to control access to specific repositories. For an example policy, see Policies to Control Repository Access on page 5051.</td>
</tr>
</tbody>
</table>

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the read verb for the repos resource-type includes the same permissions and API operations as the inspect verb, plus the REPOSITORY_READ permission and a number of API operations (e.g., GetContainerRepository, etc.). The use verb covers still another permission and API operation compared to read. Lastly, manage covers more permissions and operations compared to use.
<table>
<thead>
<tr>

**Details for Resource Manager**

This topic covers details for writing policies to control access to the Resource Manager service.

**Aggregate Resource-Type**

*orm-family*

**Individual Resource-Types**

*orm-config-source-providers*

*orm-jobs*

*orm-stacks*

*orm-template*

*orm-work-requests*

**Supported Variables**

Resource Manager supports all the general variables (see [General Variables for All Requests](#) on page 3300), plus the ones listed here.

The *orm-jobs* resource type can use the following variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.job.operation</td>
<td>String</td>
<td>Use this variable to control access for running specified job types. For example, to limit access to PLAN and APPLY jobs, use the following phrase: <code>where any {target.job.operation = 'PLAN', target.job.operation = 'APPLY'}</code></td>
</tr>
<tr>
<td>target.stack.id</td>
<td>String</td>
<td>Use this variable to limit access to specified stacks. For example, use the following phrase: <code>where any {target.stack.id = ocid1.ormstack.uniqueid1, target.stack.id = ocid1.ormstack.uniqueid2}</code></td>
</tr>
</tbody>
</table>
**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

</table>

**Details for Search**

The Search service does not require permissions for its API operations. You do not need to write policies specifically to control access to Search. However, what you can see in search or query results depends on the permissions you have. If a policy exists to give you access to the `inspect` verb for a particular resource type, you have access to the permissions needed to view that resource type and its associated metadata in search results. If a service does not recognize the `inspect` verb or if the resource type's `inspect` verb does not fully cover list operations, permissions to view the service's supported resource types are granted by the `read` verb instead.

For more information about permissions, see the Permissions section of Advanced Policy Features.

**Permissions Required to View Each Resource Type**

The following table lists the resource types grouped by service, which are listed in alphabetical order. The Search API operations that can access the metadata for these resource types with these permissions are `GetResourceType`, `ListResourceTypes`, and `SearchResources`.
# Details for Service Connector Hub

This topic covers details for writing policies to control access to the Service Connector Hub service.

## Individual Resource-Types

The `serviceconnectors` resource type can use the following variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>target.serviceconnector.id</code></td>
<td>OCID</td>
<td>Use this variable to control access for service connectors.</td>
</tr>
</tbody>
</table>

## Supported Variables

Service Connector Hub supports all the general variables (see General Variables for All Requests on page 3300), plus the ones listed here.

## Details for Verb + Resource-Type Combinations

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from `inspect` > `read` > `use` > `manage`. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.
APIs Fully Covered | APIs Partially Covered

### Details for the Streaming Service

This topic covers details for writing policies to control access to the Streaming service.
**Resource-Types**

streams
stream-pull
stream-push
connect-harnesses
stream-pools

**Supported Variables**

The Streaming service supports all the general variables (see General Variables for All Requests on page 3300) plus the following:

The streams resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.stream.id</td>
<td>Entity (OCID)</td>
<td>Request</td>
</tr>
</tbody>
</table>

The connect-harnesses resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.connectharness.id</td>
<td>Entity (OCID)</td>
<td>Request</td>
</tr>
</tbody>
</table>

The stream-pools resource type can use the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.streampool.id</td>
<td>Entity (OCID)</td>
<td>Request</td>
</tr>
</tbody>
</table>

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

**streams**

<table>
<thead>
<tr>
<th>Verbs</th>
<th>Permissions</th>
<th>APIs Fully Covered</th>
<th>APIs Partially Covered</th>
</tr>
</thead>
<tbody>
<tr>
<td>inspect</td>
<td>STREAM_INSPECT</td>
<td>ListStreams</td>
<td>none</td>
</tr>
<tr>
<td>read</td>

Details for the Vault Service

This topic covers details for writing policies to control access to the Vault service.

**Individual Resource-Types**

- vaults
- keys
- key-delegate
- secrets
- secret-versions
- secret-bundles

**Aggregate Resource-Type**

- secret-family

A policy that uses `<verb> secret-family` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual secret resource-types. (Secret resource-types include only secrets, secret-versions, and secret-bundles.)

See the table in **Details for Verb + Resource-Type Combinations** on page 3509 for details of the API operations covered by each verb, for each individual resource-type included in `secret-family`.

**Supported Variables**

Vault supports all the general variables, plus the ones listed here. For more information about general variables supported by Oracle Cloud Infrastructure services, see **General Variables for All Requests** on page 3300.
<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>request.includePlainTextKey</td>
<td>String</td>
<td>Use this variable to control whether to return the plaintext key, in addition to the encrypted key, in response to a request to generate a data encryption key.</td>
</tr>
<tr>
<td>request.kms-key.id</td>
<td>String</td>
<td>Use this variable to control whether block volumes or buckets can be created without a Vault master encryption key.</td>
</tr>
<tr>
<td>target.boot-volume.kms-key.id</td>
<td>String</td>
<td>Use this variable to control whether Compute instances can be launched with boot volumes that were created without a Vault master encryption key.</td>
</tr>

<tr>
<td>target.secret.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to specific secrets, secret versions, and secret bundles by OCID.</td>
</tr>
</tbody>
</table>

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the use verb for the keys resource-type includes the same permissions and API operations as the read verb, plus the KEY_ENCRYPT and KEY_DECRYPT permissions and a number of API operations (Encrypt, Decrypt, and GenerateDataEncryptionKey). The manage verb allows even more permissions and API operations when compared to the use verb.

**Details for the WAF Service**

This topic covers details for writing policies to control access to the WAAS service.

**Aggregate Resource-Type**

waas-family

**Individual Resource-Types**

waas-policy
waas-certificate
waas-work-request
waas-metering
waas-custom-protection-rule
waas-address-list
http-redirects

**Comments**

A policy that uses `<verb> waas` is equivalent to writing one with a separate `<verb> <individual resource-type>` statement for each of the individual resource-types.

See the table in Details for Verb + Resource-Type Combinations on page 3515 for details of the API operations covered by each verb, for each individual resource-type included in `waas`.

**Supported Variables**

The WAF Service supports all the general variables (see General Variables for All Requests on page 3300), plus the ones listed here.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Variable Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>target.waas-policy.id</td>
<td>Entity (OCID)</td>
<td>Use this variable to control access to specific WAAS policies by OCID.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**Details for Verb + Resource-Type Combinations**

The following tables show the permissions and API operations covered by each verb. The level of access is cumulative as you go from inspect > read > use > manage. A plus sign (+) in a table cell indicates incremental access compared to the cell directly above it, whereas "no extra" indicates no incremental access.

For example, the use and manage verbs for the `waas-policy` resource-type cover no extra permissions or API operations compared to the read verb.

**Managing Policies**

This topic describes how to create, edit, and delete policies.

**Required IAM Policy**

If you're in the Administrators group, then you have the required access for managing policies.

If you're new to policies, see Getting Started with Policies on page 3247 and Common Policies on page 3264. If you want to dig deeper into writing policies to control who else can write policies or manage other IAM components, see Let a compartment admin manage the compartment on page 3276, and also Details for IAM (with Identity Domains) on page 3433.

**Tagging Resources**

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the wanted tags. For general information about applying tags, see Resource Tags on page 239.

**Working with Policies**

If you haven't already, make sure to read How Policies Work on page 3258 to understand the basics of how policies work.

When creating a policy, you must specify the compartment where it should be attached, which is either the tenancy (the root compartment) or another compartment. Where it's attached governs who can later modify or delete it. For more information, see Policy Attachment on page 3258. When creating the policy in the Console, you attach the...
policy to a compartment by creating the policy in that compartment. If you're using the API, you specify the identifier of the compartment in the CreatePolicy request.

When creating a policy, you must also provide a non-changeable name for it. The name must be unique across all policies in the compartment where you create it. You must also provide a description, which is a non-unique, changeable description for the policy. Oracle will also assign the policy a unique ID called an Oracle Cloud ID. For more information, see Resource Identifiers on page 224.

**Note:**

If you delete a policy and then create a new policy with the same name, they'll be considered different policies because they'll have different OCIDs.

For information about how to write a policy, see How Policies Work on page 3258 and Policy Syntax on page 3291. When using the Console to write policies, you can use the policy builder to help you construct the syntax of the policies you want to add.

When you create a policy, make changes to an existing policy, or delete a policy, your changes go into effect typically within 10 seconds.

You can view a list of your policies in the Console or with the API. In the Console, the list is automatically filtered to show only the policies attached to the compartment you're viewing. To determine which policies apply to a particular group, you must view the individual statements inside all your policies. There isn't a way to automatically obtain that information in the Console or API.

For information about the number of policies you can have, see IAM Object Limits on page 3084.

**Writing Policy Statements with the Policy Builder**

The policy builder in the Console helps you quickly create common policies without the need to manually type the policy statements. The policy builder automatically suggests the permissions that an administrator can grant to groups of users or resources in their tenancy, as well as target resources like instances, networks, and buckets. Most of the policies suggested in the policy builder can also be found in Common Policies on page 3264, where you can learn more details about the access provided by each policy and the use cases for each. Users who don't need the suggestions offered by the policy builder or who have more complex policy requirements can bypass the builder's basic option and go straight to the advanced editor, where you can directly enter the policy statements in a free-form text box.

**Features of the Policy Builder**

The policy builder provides policy templates that you can complete to create policies for your tenancy. A policy template includes all the statements needed to provide the permissions to perform a task or set of related tasks in a service in OCI. To complete the template, select the group from a menu of existing groups and select the location from the list of compartments in your tenancy.

The policy templates in the policy builder are grouped by use case, such as network management, storage management, and account management, to make them easy to browse and find the permission set you need.

For example, assume you are setting up the network administrators for your tenancy. You need to grant a group of users the permissions required to work with all the resources in the Networking service. To create this policy in the policy builder:

- First, find the policy you want: From the Policy Use Cases menu, select Network Management. If you are not sure which use case a policy belongs to, you can leave this option set to All to browse all the templates.
- From the Common Policy Templates menu, select Let network admins manage a cloud network.

The policy builder displays the policy statements that will be created. In this case, there is only one statement:

```
Allow {group name} to manage virtual-network-family in {location}
```

- Now, all you need to do is select the group and location for the policy: When you select a group, the {group name} in the displayed policy statement also updates with your selection.
• Finally, select the location. You can traverse the compartment hierarchy to find and select the appropriate compartment. To create the policy in the tenancy, choose the root compartment.

**Customizing Policies**

If you find that a template doesn't fit your needs exactly, then you can customize the policies provided by adding statements, removing statements, adding conditions, or other changes to create the policy you need. Click **Customize (Advanced)** to edit the statements in a free-form text box. When entering statements directly in the text box, ensure that you follow the **Policy Syntax** on page 3291 rules.

Examples of customizing the Network Admins policy:

• You need to include another group, GroupB to this policy. To add a group:

  Click **Customize (Advanced)**. In the text box, type the changes to the policy (following the required syntax).

  Allow group **GroupA, GroupB** to manage virtual-network-family in compartment **CompartmentA**
• You need to add a condition to the statement. For example, you want to ensure that only users who have been verified by MFA can manage your networks. You can add that condition to the statement as follows:

```
Allow group GroupA to manage virtual-network-family in compartment CompartmentA where request.user.mfaTotpVerified='true'
```

• You want to add another statement to the policy. For example, you want GroupA to be allowed to use instances. To add another statement, enter it on the next line:

```
Allow group GroupA to manage virtual-network-family in compartment CompartmentA
Allow group GroupA to use instance-family in compartment CompartmentA
```

**Editing Policies with the Policy Builder**

After you have created the policy, you can enter any statement changes you need to make directly in the policy text. The template selector is only available when creating a new policy. The editor lets you delete, add, edit, or change the statement order.
Using the Console
To create a policy

Prerequisite: The group and compartment that you're writing the policy for must already exist.

1. Open the navigation menu and click Identity & Security. Under Identity, click Policies. A list of the policies in the compartment you're viewing is displayed.
2. Click Create Policy.
3. Enter the following:
   - **Name**: A unique name for the policy. The name must be unique across all policies in your tenancy. You cannot change this later. Avoid entering confidential information.
   - **Description**: A friendly description. You can change this later if you want to.
   - **Compartment**: If you want to attach the policy to a compartment other than the one you're viewing, select it from list. Where the policy is attached controls who can later modify or delete it (see Policy Attachment on page 3258).
4. Enter the policy statements using the policy builder. Use the Basic option if you want to choose from common policy templates, which you can also customize. Use the Customize (Advanced) option if you already know how to write the statements you need and you want to simply type them in a text box.

To use the policy builder Basic option:
   a. Select from the Policy Use Cases menu to filter the list of policy templates. If you're not sure which use case to choose, you can browse all the templates in the Common Policies Templates list.
   b. Select the template that best matches your requirements from the Common Policies Templates list.

   The policy builder displays the description of the chosen policy and lists the policy statements that it includes.
   c. Select the Group that this policy applies to.
   d. Select a Location. The location is the compartment that this policy grants access to. The compartment you choose here must be either the compartment you chose to attach the policy to in Step 3, or a compartment within the hierarchy of that compartment.
   e. If you need to modify the policy statements, click Customize (Advanced).

To use the Customize (Advanced) option:
   a. Click Customize (Advanced).
   b. Enter or edit policy statements following the format described in Policy Syntax on page 3291, entering one statement per line.
5. To add tags to this policy, click Show Advanced Options. If you have permissions to create a resource, then you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags on page 239. If you are not sure whether to apply tags, skip this option (you can apply tags later) or ask your administrator.
6. If you want to create another policy, select Create Another Policy.
7. Click Create.

The new policy will go into effect typically within 10 seconds.

To get a list of your policies

Open the navigation menu and click Identity & Security. Under Identity, click Policies. A list of the policies in the compartment you're currently viewing is displayed. If you want to view policies attached to a different compartment, select that compartment from the list on the left. You can't get a single list of all policies; they're always displayed by compartment.

To determine which policies apply to a particular group, you must view the individual statements inside all your policies. There isn't a way to automatically obtain that information in the Console.

To update the description for an existing policy

This is available only through the API. A workaround is to create a new policy with the new description and delete the old policy.
To update the statements in an existing policy

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Policies**. A list of the policies in the compartment you're viewing is displayed. If you don’t see the one you're looking for, verify that you're viewing the correct compartment (select from the list on the left side of the page).
2. Click the policy you want to update. The policy's details and statements are displayed.
3. Click **Edit Policy Statements**. Use the **Basic** policy builder option if you want to interact with the statements using graphical controls. Use the **Advanced** policy builder option to edit the statements in a simple text box.

   To use the **Basic** option:
   - To revise a statement, enter the changes following the format in **Policy Basics** on page 3258 and **Policy Syntax** on page 3291.
   - To add a statement, click **+Another Statement** and enter the statement following the required format.
   - To delete a statement, click the X next to the statement.
   - To rearrange the order of the statements, use the up and down arrows to move statements to the correct order, or grab the handle to drag and drop statements to the preferred position.

   To use the **Advanced** option:
   - Select **Advanced**.
   - Revise the policy statements in the text box following the format in **Policy Basics** on page 3258 and **Policy Syntax** on page 3291.
4. Click **Save Changes** when you are finished editing.

   Your changes will go into effect typically within 10 seconds.

To delete a policy

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Policies**. A list of the policies in the compartment you're viewing is displayed. If you don’t see the one you're looking for, verify that you're viewing the correct compartment (select from the list on the left side of the page).
2. For the policy you want to delete, click **Delete**.
3. Confirm when prompted.

   Your changes will go into effect typically within 10 seconds.

To apply tags to a policy

For instructions, see **Resource Tags** on page 239.

Using the API

For information about using the API and signing requests, see **REST APIs** on page 6275 and **Security Credentials** on page 205. For information about SDKs, see **Software Development Kits and Command Line Interface** on page 6094.

---

**Note:**

Updates Are Not Immediate Across All Regions

Your IAM resources reside in your home region. To enforce policy across all regions, the IAM service replicates your resources in each region. Whenever you create or change a policy, user, or group, the changes take effect first in the home region, and then are propagated out to your other regions. It can take several minutes for changes to take effect in all regions. For example, assume you have a group with permissions to launch instances in the tenancy. If you add UserA to this group, UserA will be able to launch instances in your home region within a minute. However, UserA will not be able to launch instances in other regions until the replication process is complete. This process can take up to several minutes. If UserA tries to launch an instance before replication is complete, they will get a not authorized error.

Use these API operations to manage policies:
Managing User Credentials

This topic describes the basics of working with Oracle Cloud Infrastructure Identity and Access Management (IAM) user credentials. If you're not already familiar with the available credentials, see User Credentials.

Working with Console Passwords and API Keys

Each user automatically has the ability to change or reset their own Identity Domains password, as well as manage their own API keys. An administrator does not need to create a policy to give a user those abilities.

To manage credentials for users other than yourself, you must be in the Administrators group or some other group that has permission to work with the tenancy. Having permission to work with a compartment within the tenancy is not sufficient. For more information, see <<link to further info>>.

OCI IAM administrators (or anyone with permission to the tenancy) can use either the OCI IAM or the API to manage all aspects of both types of credentials, for themselves and all other users. This includes creating an initial one-time password for a new user, resetting a password, uploading API keys, and deleting API keys.

Users who are not administrators can manage their own credentials. In the Identity Domains, users can:

- Change or reset their own password.
- Upload an API key in the OCI IAM for their own use (and also delete their own API keys).

And with the API, users can:

- Reset their own password with CreateOrResetUIPassword.
- Upload an additional API key to the OCI IAM service for their own use with UploadApiKey (and also delete their own API keys with DeleteApiKey). Remember that a user can't use the API to change or delete their own credentials until they themselves upload a key in the Identity Domains, or an administrator uploads a key for that user in the Console or the API.

A user can have a maximum of three API keys at a time.

Working with Auth Tokens

Note:

"Auth tokens" were previously named "Swift passwords". Any Swift passwords you had created are now listed in the Console as auth tokens. You can continue to use the existing passwords.

Auth tokens are Oracle-generated token strings that you can use to authenticate with third-party APIs that do not support Oracle Cloud Infrastructure's signature-based authentication. Each user created in the IAM service automatically has the ability to create, update, and delete their own auth tokens in the Console or the API. An administrator does not need to create a policy to give a user those abilities. Administrators (or anyone with permission to the tenancy) also have the ability to manage auth tokens for other users.

Note that you cannot change your auth token to a string of your own choice. The token is always an Oracle-generated string.

Auth tokens do not expire. Each user can have up to two auth tokens at a time. To get an auth token in the Console, see To create an auth token on page 3532.
Working with Customer Secret Keys

Note:
"Customer Secret keys" were previously named "Amazon S3 Compatibility API keys". Any keys you had created are now listed in the Console as Customer Secret keys. You can continue to use the existing keys.

Object Storage provides an API to enable interoperability with Amazon S3. To use this Amazon S3 Compatibility API, you need to generate the signing key required to authenticate with Amazon S3. This special signing key is an Access Key/Secret Key pair. Oracle provides the Access Key that is associated with your Console user login. You or your administrator generates the Customer Secret key to pair with the Access Key.

Each user created in the IAM service automatically has the ability to create, update, and delete their own Customer Secret keys in the Console or the API. An administrator does not need to create a policy to give a user those abilities. Administrators (or anyone with permission to the tenancy) also have the ability to manage Customer Secret keys for other users.

Any user of the Amazon S3 Compatibility API with Object Storage needs permission to work with the service. If you're not sure if you have permission, contact your administrator. For information about policies, see How Policies Work. For basic policies that enable use of Object Storage, see Common Policies.

Customer Secret keys do not expire. Each user can have up to two Customer Secret keys at a time. To create keys using the Console, see To create a customer secret key on page 3533.

Working With OAuth 2.0 Client Credentials

Note:
OAuth 2.0 Client Credentials are not available in the United Kingdom Government Cloud (OC4).

OAuth 2.0 client credentials are required to interact programmatically with those services that use the OAuth 2.0 authorization protocol. The credentials enable you to obtain a secure token to access those service REST API endpoints. The allowed actions and endpoints granted by the token depend on the scopes (permissions) that you select when you generate the credentials. The services that use the OAuth 2.0 protocol are:

- Oracle Analytics Cloud
- Oracle Integration

An OAuth 2.0 access token is valid for 3600 seconds (1 hour).

To create the credentials, you need to know the service resource and scope. Typically, you can select these from a drop-down list. However, if the information is not available in the list, you can manually enter the resource and scope. The scope defines the allowed permissions for the token, so ensure to set the scope at the minimum required access level.

A user can create the credentials for themselves or an Administrator can create the credentials for another user. The lists of available resources and scopes display only those resources and permission levels that the user has been granted access to.

OAuth 2.0 Client Credential Limits

Each user can have up to 10 OAuth 2.0 client credentials. You can increase this limit by Requesting a Service Limit Increase on page 245.

Each OAuth 2.0 client credential can have up to 10 scopes.

Working with SMTP Credentials

Simple Mail Transfer Protocol (SMTP) credentials are needed in order to send email through the Email Delivery service. Each user is limited to a maximum of two SMTP credentials. If more than two are required, they must be generated on other existing users or additional users must be created.
You cannot change your SMTP username or password to a string of your own choice. The credentials are always Oracle-generated strings.

Each user created in the IAM service automatically has the ability to create and delete their own SMTP credentials in the Console or the API. An administrator does not need to create a policy to give a user those abilities. Administrators (or anyone with permission to the tenancy) also have the ability to manage SMTP credentials for other users.

Although each user can create and delete their own credentials, it is a security best practice to create a new user and generate SMTP credentials on this user rather than generating SMTP credentials on your Console user that already has permissions assigned to it.

SMTP credentials do not expire. Each user can have up to two credentials at a time. To get SMTP credentials in the Console, see To generate SMTP credentials on page 3536.

For information about using the Email Delivery service, see Overview of the Email Delivery Service on page 2580.

**Using the Console**

**To Change your Console Password**

You're prompted to change your initial one-time password *the first time* you sign in to the Console. The following procedure is for changing your password again later.

**Note:**

For Federated Users

If your company uses an identity provider (other than Oracle Identity Cloud Service) to manage user logins and passwords, you can't use the Console to update your password. You do that with your identity provider.

1. Sign in to the Console by using your Oracle Cloud Infrastructure username and password.
2. After you sign in, open the **Profile** menu ( ), click **My Profile**, and then click **Change password**.
3. Click **Current password**, and then enter the current password.
4. Click **New password**, and then enter a new password.
5. Click **Confirm new password**, and then enter the new password again.
6. When you are finished and the password satisfies all password criteria, click **Save**.

**To Reset Another User's Console Password**

If you're an administrator, you can use the following procedure to reset a user's password. The procedure generates and sends a reset password email to the user. The email includes a link to the page where the user must change their password before they can sign in to the Console again.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Users**.
3. Click the user with the password that you want to reset.
4. Click **Reset password**.
5. To confirm, click **Reset password**.

The user will receive an email prompting them to reset their password. If they don't change it within the period specified in the email, the link will expire and you'll need to reset the password for the user again.

**To reset your password if you forgot it**

If you have an email address in your user profile, you can use the **Forgot Password** link on the sign-in page to have a temporary password sent to you. If you don't have an email address in your user profile, you must ask an administrator to reset your password for you.
To Unblock a User

If you're an administrator, you can unblock a user who has tried 10 times in a row to sign in to the Console unsuccessfully. See Unlocking Users on page 3118.

To Add an API Signing Key

You can use the Console to generate the private/public key pair for you. If you already have a key pair, you can choose to upload the public key. When you use the Console to add the key pair, the Console also generates a configuration file preview snippet for you.

The following procedures work for a regular user or an administrator. Administrators can manage API keys for either another user or themselves.

About the Configuration File Snippet

When you use the Console to add the API signing key pair, a configuration file preview snippet is generated with the following information:

- **user** - the OCID of the user for whom the key pair is being added.
- **fingerprint** - the fingerprint of the key that was just added.
- **tenancy** - your tenancy's OCID.
- **region** - the currently selected region in the Console.
- **key_file** - the path to your downloaded private key file. You must update this value to the path on your file system where you saved the private key file.

If your configuration file already has a DEFAULT profile, you'll need to do one of the following:

- Replace the existing profile and its contents.
- Rename the existing profile.
- Rename this profile to a different name after pasting it into the configuration file.

You can copy this snippet into your configuration file, to help you get started. If you don't already have a configuration file, see SDK and CLI Configuration File on page 6051 for details on how to create one.

To generate an API signing key pair

**Prerequisite:** Before you generate a key pair, create the `.oci` directory in your home directory to store the credentials. See SDK and CLI Configuration File on page 6051 for more details.

1. View the user's details:
   - If you're adding an API key for **yourself**:
     - Open the **Profile** menu (👤), and then click **My Profile**.
   - If you're an administrator adding an API key for **another user**:
     - Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Users**. Locate the user in the list, and then click the user's name to view the details.

2. Under **Resources**, click **API keys**.
3. Click **Add API key**.
4. In the dialog, click **Generate API key pair**.
5. Click **Download private key** and save the key to your `.oci` directory. In most cases, you do not need to download the public key.
   - **Note:** If your browser downloads the private key to a different directory, be sure to move it to your `.oci` directory.
6. Click **Add**.

The key is added and the **Configuration file preview** is displayed. The file snippet includes required parameters and values you'll need to create your configuration file. Copy and paste the configuration file snippet from the text
box into your ~/.oci/config file. (If you have not yet created this file, see SDK and CLI Configuration File on page 6051 for details on how to create one.)

After you paste the file contents, you'll need to update the key_file parameter to the location where you saved your private key file.

If your configuration file already has a DEFAULT profile, you'll need to do one of the following:

- Replace the existing profile and its contents.
- Rename the existing profile.
- Rename this profile to a different name after pasting it into the configuration file.

7. Update the permissions on your downloaded private key file so that only you can view it:

   a. Go to the .oci directory where you placed the private key file.
   b. Use the command `chmod go-rwx ~/.oci/<oci_api_keyfile>.pem` to set the permissions on the file.

To upload or paste an API key

**Prerequisite:** You have generated a public RSA key in PEM format (minimum 2048 bits). The PEM format looks something like this:

```
-----BEGIN PUBLIC KEY-----
MIIJANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAoTFqF...
...
-----END PUBLIC KEY-----
```

1. View the user's details:
   - If you're adding an API key for yourself:
     - Open the Profile menu ( ), and then click My Profile.
   - If you're an administrator adding an API key for another user: Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Users. Locate the user in the list, and then click the user's name to view the details.

2. Under Resources, click API keys.

3. Click Add API key.

4. In the dialog, select Choose public key file to upload your file, or Paste a public key, if you prefer to paste it into the Public key text box.

5. After you upload the file or paste the key into the text box, click Add.

The key is added and the Configuration file preview is displayed. The file snippet includes required parameters and values you'll need to create your configuration file. Copy and paste the configuration file snippet from the text box into your ~/.oci/config file. (If you have not yet created this file, see SDK and CLI Configuration File on page 6051 for details on how to create one.)

After you paste the file contents, you'll need to update the key_file parameter to the location where you saved your private key file.

If your configuration file already has a DEFAULT profile, you'll need to do one of the following:

- Replace the existing profile and its contents.
- Rename the existing profile.
- Rename this profile to a different name after pasting it into the configuration file.

**To get the configuration file snippet for an API signing key**

The following procedure works for a regular user or an administrator.
1. View the user's details:
   • If you're getting an API key configuration file snippet for yourself:
     
     Open the Profile menu ( ), and then click My Profile.
     • If you're an administrator getting an API key configuration file snippet for another user: Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Users. Locate the user in the list, and then click the user's name to view the details.

2. Under Resources, click API keys. The list of API key fingerprints is displayed.
3. Click the the Actions menu (three dots) for the fingerprint, and select View configuration file.

   The Configuration file preview is displayed. The file snippet includes required parameters and values you'll need to create your configuration file. Copy and paste the configuration file snippet from the text box into your ~/.oci/config file. (If you have not yet created this file, see SDK and CLI Configuration File on page 6051 for details on how to create one.) After you paste the file contents, you'll need to update the key_file parameter to the location where you saved your private key file.

   If your configuration file already has a DEFAULT profile, you'll need to do one of the following:
   • Replace the existing profile and its contents.
   • Rename the existing profile.
   • Rename this profile to a different name after pasting it into the configuration file.

To delete an API signing key

The following procedure works for a regular user or an administrator. Administrators can delete an API key for either another user or themselves.

1. View the user's details:
   • If you're deleting an API key for yourself:
     
     Open the Profile menu ( ), and then click My Profile.
     • If you're an administrator deleting an API key for another user: Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Users. Locate the user in the list, and then click the user's name to view the details.

2. Under Resources, click API keys. The list of API key fingerprints is displayed.
3. Select the check box for the API key you want to delete, and then click Delete.
4. Confirm when prompted.

The API key is no longer valid for sending API requests.

To create an auth token

1. View the user's details:
   • If you're creating an auth token for yourself:
     
     Open the Profile menu ( ), and then click My Profile.
     • If you're an administrator creating an auth token for another user: Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Users. Locate the user in the list, and then click the user's name to view the details.

2. Under Resources, click Auth tokens.
3. Click Generate token.
4. Enter a description that indicates what this token is for, for example, "Swift password token".
5. Click Generate Token.

   The new token string is displayed.
6. Click Copy to copy the token string immediately, because you can't retrieve it again after closing the dialog box.
7. When you are finished, click Close.
If you're an administrator creating an auth token for another user, you need to securely deliver it to the user by providing it verbally, printing it out, or sending it through a secure email service.

To delete an auth token

The following procedure works for a regular user or an administrator. Administrators can delete an auth token for either another user or themselves.

1. View the user's details:
   - If you're deleting an auth token for yourself:
     Open the Profile menu ( ), and then click My Profile.
   - If you're an administrator deleting an auth token for another user: Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Users. Locate the user in the list, and then click the user's name to view the details.

2. Under Resources, click Auth tokens.
3. Select the check box for the auth token you want to delete, and then click Delete.
4. Confirm when prompted.

The auth token is no longer valid for accessing third-party APIs.

To create a customer secret key

1. View the user's details:
   - If you're creating a customer secret key for yourself:
     Open the Profile menu ( ), and then click My Profile.
   - If you're an administrator creating a customer secret key for another user: Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Users. Locate the user in the list, and then click the user's name to view the details.

2. Under Resources, click Customer secret keys.

A customer secret key consists of an access key/secret key pair. Oracle automatically generates the access key when you or your administrator generates the secret key to create the customer secret key.

3. Click Generate secret key.
4. Click Name to enter a friendly name for the key, and then click Generate secret key.
   The generated secret key is displayed in the Generate secret key dialog box. At the same time, Oracle generates the access key that is paired with the secret key. The newly generated customer secret key is added to the list of Customer secret keys.
5. Click Copy to copy the secret key immediately, because you can't retrieve the secret key again after closing the dialog box, for security reasons.
   If you're an administrator creating a secret key for another user, you need to securely deliver it to the user by providing it verbally, printing it out, or sending it through a secure email service.
6. When you are finished, click Close.
7. To show the access key, locate the secret key in the list of customer secret keys, and then click the access key in the Access key column. To copy the access key, while the access key is displayed, click Copy.

To delete a customer secret key

The following procedure works for a regular user or an administrator. Administrators can delete a customer secret key for either another user or themselves.
1. View the user's details:
   - If you're deleting a customer secret key for yourself:
     Open the Profile menu, and then click My Profile.
     - If you're an administrator deleting a customer secret key for another user: Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Users. Locate the user in the list, and then click the user's name to view the details.

2. Under Resources, click Customer secret keys.
3. Select the check box for the customer secret key you want to delete, and then click Delete.
4. Confirm when prompted.

The customer secret key is no longer available to use with the Amazon S3 Compatibility API.

To create OAuth 2.0 client credentials

---

**Note:**

OAuth 2.0 client credentials are not available in the following realms:

- the commercial realm (OC1)
- the United Kingdom Government Cloud (OC4)

---

1. View the user's details:
   - If you're creating an OAuth 2.0 client credential for yourself:
     Open the Profile menu, and then click My Profile.
     - If you're an administrator creating an OAuth 2.0 client credential for another user: Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Users. Locate the user in the list, and then click the user's name to view the details.

2. Under Resources, click OAuth 2.0 client credentials.
3. Click Generate OAuth 2.0 client credential.
4. Click Name, and then enter a name for this credential.
5. Click Title, and then enter a description for this credential.
6. Add the URI for the OAuth 2.0 services that this credential will provide access to.
   - To Select a resource-scope pair:
     a. Select the Select a resource-scope pair option.
     b. The Resource list displays the resources you have permission to view. Select the resource you want to add credentials for. After you select the resource, the Audience field is automatically populated.
     c. Next, select the Scope for this credential. Always select the minimum required privileges.
   - To Enter fully qualified scope:
     a. Select the Enter fully qualified scope option.
     b. Enter the Audience and Scope for this credential.
7. To add more permissions to this credential, click + Another scope and follow the instructions in the previous step.
8. Click Generate. The new secret string is generated.
   - Click Copy to copy the token string immediately, because you can't retrieve it again after closing the dialog box.

If you're an administrator creating OAuth 2.0 client credentials for another user, you need to securely deliver them to the user by providing them verbally, printing them out, or sending them through a secure email service.

You will need the following information from the credential for the token request:

- The generated secret
- The OCID of the OAuth 2.0 client credential
• The scope and audience (fully-qualified scope)

**To add scopes to an existing OAuth 2.0 client credential**

1. View the user's details:
   - If you're creating an OAuth 2.0 client credential for yourself:
     
     Open the **Profile** menu ( ), and then click **My Profile**.
   - If you're an administrator creating an OAuth 2.0 client credential for another user: Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Users**. Locate the user in the list, and then click the user's name to view the details.

2. Under **Resources**, click **OAuth 2.0 client credentials**.

3. Click the name of the credential that you want to add scopes to.

4. Click **Add scopes**.

5. Add the URI for the OAuth 2.0 services that you want to add access to.

   To **Select a resource-scope pair**:
   
   a. Select the **Select a resource-scope pair** option.
   b. The **Resource** list displays the resources you have permission to view. Select the resource you want to add credentials for. After you select the resource, the **Audience** field is automatically populated.
   c. Next, select the **Scope** for this credential. Always select the minimum required privileges.

   To **Enter fully qualified Scope**:
   
   a. Select the **Enter fully qualified scope** option.
   b. Enter the **Audience** and **Scope** for this credential.

6. To add more permissions to this credential, click **+ Another scope** and follow the instructions in the previous step.

7. Click **Save**.

**To regenerate the OAuth 2.0 client credential secret**

**IMPORTANT**: When you regenerate the secret for a credential, requests made with the previous secret will be denied access to target scopes.

1. View the user's details:
   
   a. If you're creating an OAuth 2.0 client credential for yourself:
      
      Open the **Profile** menu ( ), and then click **My Profile**.
   b. If you're an administrator creating an OAuth 2.0 client credential for another user: Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Users**. Locate the user in the list, and then click the user's name to view the details.

2. On the left side of the page, click **OAuth 2.0 client credentials**.

3. Click the name of the credential that you want to regenerate the secret for.

4. Click **Regenerate secret**.

5. Acknowledge the warning dialog and click **Regenerate secret**.

6. Copy the token string immediately, because you can't retrieve it again after closing the dialog box.

   If you're an administrator creating OAuth 2.0 client credentials for another user, you need to securely deliver them to the user by providing them verbally, printing them out, or sending them through a secure email service.

   Ensure to update existing token requests with the new secret string.
To generate SMTP credentials

1. View the user's details:
   - If you're generating SMTP credentials for yourself:
     Open the Profile menu, and then click My Profile.
   - If you're an administrator generating SMTP credentials for another user: Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Users. Locate the user in the list, and then click the user's name to view the details.

2. Under Resources, click SMTP credentials.
3. Click Generate credentials.
4. Enter a Description of the SMTP credentials in the dialog box.
5. Click Generate credentials. A user name and password are displayed.
   Click Copy to copy the password immediately, because you can't retrieve it again after closing the dialog box, for security reasons.
   If you're an administrator generating SMTP credentials for another user, you need to securely deliver them to the user by providing them verbally, printing them out, or sending them through a secure email service.
6. When you are finished, click Close.

To delete SMTP credentials

The following procedure works for a regular user or an administrator. Administrators can delete SMTP credentials for either another user or themselves.

1. View the user's details:
   - If you're deleting SMTP credentials for yourself:
     Open the Profile menu, and then click My Profile.
   - If you're an administrator deleting SMTP credentials for another user: Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Users. Locate the user in the list, and then click the user's name to view the details.

2. Under Resources, click SMTP credentials.
3. Select the check box for the SMTP credentials you want to delete, and then click Delete.
4. Confirm when prompted.

The SMTP credentials are no longer available to use with the Email Delivery service.

Enabling User Provisioning

Managing Network Sources

This topic describes the basics of working with network sources.

Required IAM Policy

If you're in the Administrators group, then you have the required access for managing network sources. To write policies specifically for network sources, use the network-sources resource type, found with the other IAM components, in Details for IAM.

If you're new to policies, see Getting Started with Policies and Common Policies.

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the wanted tags. For general information about applying tags, see Resource Tags on page 239.
**Introduction to Network Sources**

A network source is a set of defined IP addresses. The IP addresses can be public IP addresses or IP addresses from VCNs within your tenancy. After you create the network source, you can reference it in policy or in your tenancy's authentication settings to control access based on the originating IP address.

Network resources can only be created in the tenancy (or root compartment) and, like other Identity resources, reside in the home region. For information about the number of network sources you can have, see IAM Without Identity Domains Limits on page 264.

You can use network sources to help secure your tenancy in the following ways:

- Specify the network source in IAM policy to restrict access to resources.
  
  When specified in a policy, IAM validates that requests to access a resource originate from an allowed IP address.

  For example, you can restrict access to Object Storage buckets in your tenancy to only users that are signed in to Oracle Cloud Infrastructure through your corporate network. Or, you can allow only resources belonging to specific subnets of a specific VCN to make requests over a service gateway.

- Specify the network source in your tenancy's authentication settings to restrict sign in to the Console.

  You can set up your tenancy's authentication policy to allow sign in to the Console from only those IP addresses specified in your network source. Users attempting to sign in from an IP address not on the allowed list in your network source will be denied access. For information on using a network source restriction in authentication policy, see Managing Authentication Settings.

**Support for Network Sources**

The following services support using network sources in policy to restrict access to their resources:

**Services that support network sources**

- Analytics Cloud
- API Gateway
- Classic Migration Service
- Audit
- Blockchain Platform Cloud
- Block Volume
- Budgets
- Compute
- Container Engine for Kubernetes
- Content Management
- Data Flow
- Data Safe
- Database
- Digital Assistant
- Events
- IAM
- Load Balancing
- Monitoring
- MySQL Database
- Notifications
- Object Storage
- Operations Insights
- OS Management
- Resource Manager
- Service Limits
- Streaming
### IAM

- Tagging
- Unified Billing
- WAF

#### Allowing Access to Resources from Only Specified IP Addresses

To restrict access to requests made from a set of IP addresses, do the following:

1. Create a network source that specifies the allowed IP addresses.
2. Write a policy that uses the network source variable in a condition.

### 1. Create the Network Source

Follow the instructions provided for the Console or the API to create the network source.

A single network source can include IP addresses from a specific VCN, public IP addresses, or both.

To specify the VCN, you need the VCN OCID and the subnet IP ranges that you want to allow.

Examples:

- **Public IP addresses or CIDR blocks:** 192.0.2.143 or 192.0.2.0/24
- **VCN OCID:** `ocid1.vcn.oc1.iad.aaaaaaaaexampleuniqueID`
  - **Subnet IP addresses or CIDR blocks:** 10.0.0.4, 10.0.0.0/16
    - To allow any IP address from a specific VCN, use 0.0.0.0/0.

### 2. Write the Policy

The IAM service includes a variable to use in policy that allows you to scope your policy using a condition. The variable is:

```
request.networkSource.name
```

After you have created your network source, you can scope policies by using this variable in a condition. For example, assume you create a network source named "corpnet". You can restrict users of the group "CorporateUsers" to access your Object Storage resources only when their requests originate from IP addresses you specified in corpnet.

To do this, write a policy like the following:

```
allow group CorporateUsers to manage object-family in tenancy where request.networkSource.name='corpnet'
```

This policy allows users in the CorporateUsers group to manage Object Storage resources only when their requests originate from an allowed IP address specified in the network source "corpnet". Requests made from outside the specified IP ranges are denied. For general information about writing policies, see How Policies Work.

### Using the Console to Manage Network Sources

#### Creating a network source

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Network Sources**. A list of the network sources in your tenancy is displayed.
2. Click **Create Network Source**.
3. Enter the following:
   - **Name**: A unique name for the network source. The name must be unique in your tenancy. You cannot change this later. Avoid entering confidential information.
   - **Description**: A friendly description. You can change this later if you want to.
   - **Allow OCI Services**: This check box is selected by default to allow Oracle Cloud Infrastructure services access, even if the request comes from outside the specified IP addresses. Typically, you want this option enabled, for example, to allow a service to interact with objects in a bucket.
   - **Network Type**: Select one of the following:
     - **Public Network**: Enter a specific IP address or CIDR block range. For example: 192.0.2.143.
       Click **Another IP Address/CIDR Block** to add another allowed address or range.
     - **Virtual Cloud Network**: Enter the following for this option:
       - **VCN OCID**: Enter the OCID from the VCN you want to allow.
         For example: ocid1.vcn.oc1.iad.aaaaaaaaexampleuniqueID
       - **IP Address/CIDR Block**: Enter an IP address from the VCN or a subnet CIDR block. For example: 10.0.0.0/16 or 10.0.0.4.
         If you want to allow all subnets from the specified VCN, enter 0.0.0.0/0.
       Click **Another IP Address/CIDR Block** to add another allowed address or range from the same VCN.

4. To add more IP ranges to this network source, click **Add Network**.

5. **Show Advanced Options**: If you have permissions to create a resource, then you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see **Resource Tags** on page 239. If you are not sure whether to apply tags, skip this option (you can apply tags later) or ask your administrator.

6. Click **Create**.

**Updating a network source**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Network Sources**. A list of the network sources in your tenancy is displayed.
2. Locate the network source in the list and click its name to view its details.
3. Edit the network source:
   - To add more allowed IP addresses to this network source, click **Add Networks**. In the **Add Networks** dialog, click **Add Network** again, and enter the details for each IP address or CIDR block you want to add to this network source. Click **Update**.
   - To remove an allowed source, click the Actions menu and click **Delete**.
   - To change the setting of **Allow OCI Services**, click **Edit**. Update the check box setting and click **Save Changes**.

**Deleting a network source**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Network Sources**. The list of network sources in your tenancy is displayed.
2. Locate the network source in the list and click the Actions menu for the item.
3. Click **Delete**.
4. Confirm when prompted.

**Applying tags to a network source**

For instructions, see **Resource Tags** on page 239.

**Using the API**

For information about using the API and signing requests, see **REST APIs** on page 6275 and **Security Credentials** on page 205. For information about SDKs, see **Software Development Kits and Command Line Interface** on page 6094.

Use these API operations to manage network sources:
Creating the Network Source Object

A sample network source object looks like the following example:

```json
{
    "compartmentId" : "ocid1.tenancy.oc1..aaaaaaaabaexampleuniqueID",
    "description" : "Corporate IP ranges to be used for IP-based authorization",
    "name" : "corpnet",
    "virtualSourceList": [{"vcnId": "ocid1.vcn.oc1.iad.aaaaaaaaexampleuniqueID",
                        "ipRanges": [ "129.213.39.0/24" ]}],
    "publicSourceList": [ "192.0.2.5", "192.0.2.6" ],
    "services": ["all"]
}
```

The elements are:

- **virtualSourceList** - specifies the VCN (OCID) and subnet IP ranges within that VCN that are allowed access. The *virtualSourceList* must contain both the VCN OCID and the subnet IP ranges:
  - **vcnID** - the OCID of the VCN
  - **IpRanges** - comma-separated list of the IP addresses or CIDR blocks of the subnets belonging to the specified VCN that are allowed to access the resource. To allow all ranges in the specified VCN, enter 0.0.0.0/0.
- **publicSourceList** - comma-separated list of the public IP ranges that are allowed access.
- **services** - currently, "all" or "none" are the only supported values. The default is "all". Specifying "all" allows Oracle Cloud Infrastructure services to access the resource.

Example:

```json
{
    "virtualSourceList": [{"vcnId": "ocid1.vcn.oc1.iad.aaaaaaaaexampleuniqueID",
                        "ipRanges": [ "129.213.39.0/24" ]}],
    "publicSourceList": [ "192.0.2.0/25", "192.0.2.200" ],
    "services": ["all"]
}
```

Managing Sign-On Policies

This topic describes how to create and implement sign-on policies for an identity domain.

About Sign-On Policies

A sign-on policy allows identity domain administrators, security administrators, and application administrators to define criteria that determine whether to allow a user to sign in to an identity domain.

An identity domain includes a default sign-on policy that contains a default sign-on rule. By default, this rule allows all users to sign in to the identity domain with a username and password. However, you can build upon this policy by adding other sign-on rules to it. By adding these rules, you can prevent some of your users from signing in to the identity domain. Or, you can allow them to sign in, but prompt them for an additional factor to access resources that are protected by the identity domain, such as the Oracle Cloud Infrastructure Console.

For example, you can create two sign-on rules for the default sign-on policy. The first rule prevents any users from signing in to the identity domain if they’re using an IP address that falls within the range of a network perimeter that you defined. The second rule requires users who belong to a particular group (for example, the UA_Developers
IAM group) to be prompted for a second factor as part of the 2-Step Verification process. All other users will be able to sign in without being prompted for a second factor.

Because you can define multiple sign-on rules for a sign-on policy, the identity domain must know the order in which the rules are to be evaluated. To do this, you can set the priority of the rules. For the example above, you can have the network perimeter sign-on rule evaluated first, and the UA_Developers group rule evaluated next. If a user meets the criteria of the network perimeter sign-on rule (that is, the IP address used to attempt to sign in to the identity domain falls within the IP range that you defined in the network perimeter), the user is prevented from accessing identity domain-protected resources. If the user passes the criteria for this rule, then the rule with the next highest priority is evaluated. For this example, this is the UA_Developers group rule. If the user is a member of the UA_Developers group, they will be prompted for an additional factor to sign in to the identity domain. If the user is not a member of the UA_Developers group, the rule with the next highest priority is evaluated. For this example, this is the default sign-on rule. Because this rule, by default, allows all users to sign in to the identity domain, the user will be able to sign in without being prompted for a second factor.

**Important:**

For the default sign-on rule, never set access for all of your users to be denied. If users don't meet the criteria of any other rules you define that allow them to sign in to the identity domain, they will be prevented from accessing identity domain-protected resources. Also, configure the identity domain to evaluate this sign-on rule last because, by default, it allows all users to sign in to the identity domain.

In addition to the default sign-on policy, you can create sign-on policies and associate them with specific apps. When a user uses one of these apps to attempt to sign in to the identity domain, the identity domain checks to see if the app has any sign-on policies associated with it. If so, then the identity domain evaluates the criteria of the sign-on rules assigned to the policy. If there are no sign-on policies for the app, then the default sign-on policy is evaluated.

**Required Policy or Role**

To manage sign-on policies, you must have one of the following access grants:

- Be a member of the Administrators group
- Be granted the Identity Domain Administrator role or the Security Administrator role
- Be a member of a group granted `manage identity-domains`

To understand more about policies and roles, see [The Administrators Group, Policy, and Administrator Roles](#) on page 3074, [Understanding Administrator Roles](#) on page 3246, and [Understanding Policies](#) on page 3249.

**Using the Console**

**Adding a Sign-On Policy**

This procedure adds a sign-on policy in a deactivated state. After completing this task, you must activate the policy to begin enforcing it in the identity domain.

Criteria that you can define for sign-on policies include:

- The identity providers that will be used to authenticate the user
- The groups of which the user is a member
- Whether the user is an identity domain administrator
- Whether to exclude a user
- The IP address that the user is using to sign in to the identity domain
- Whether the user will be forced to sign in to the identity domain again (for authentication purposes), or will be authenticated the next time they sign in to the identity domain
- Whether the user will be prompted for an additional factor to sign in to the identity domain

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **Sign-on policies**.
3. Click **Create sign-on policy**.
4. Add a **Name** and **Description**, and then click **Add policy**:

After you click **Add policy**, the sign-on policy is saved in a deactivated state. You must activate the policy to use it.

5. In the **Add sign-on rules** screen, click **Add sign-on rule** to add a sign-on rule to this policy.

6. Use the following table to configure the rule, and then click **Add sign-on rule**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule name</td>
<td>Enter the name of the sign-on rule.</td>
</tr>
<tr>
<td>Authenticating identity provider</td>
<td>Enter or select all identity providers that will be used to authenticate the user accounts evaluated by this rule.</td>
</tr>
<tr>
<td>Group membership</td>
<td>Enter or select the groups that the user must be a member of to meet the criteria of this rule. You must enter at least three characters to initiate a search of groups.</td>
</tr>
<tr>
<td>Administrator</td>
<td>If the user must be assigned to administrator roles in the identity domain to meet the criteria of this rule, then select this check box.</td>
</tr>
<tr>
<td>Exclude users</td>
<td>Enter or select the users to exclude from the rule. You must enter at least three characters to initiate a search of users.</td>
</tr>
</tbody>
</table>
| Filter by client IP address   | There are two options associated with this field: **Anywhere** and **Restrict to the following network perimeters**.  

- If you select **Anywhere**, then users can log in to the identity domain using any IP address.
- If you select **Restrict to the following network perimeters**, then the **Network perimeters** text box appears. In this text box, enter or select network perimeters that you defined. For more information, see **Adding a Network Perimeter** on page 3700. Users can log in to the identity domain using only IP addresses that are contained in the defined network perimeters. |
| Allow access or Deny access   | Select whether a user will be allowed to access the Console if the user account meets the criteria of this rule. When you select **Allow access**, the following additional options are presented. |
| Prompt for reauthentication    | Select this check box to force the user to log in to the identity domain again. If not selected, the user will be authenticated the next time they log in to the identity domain. |
**Prompt for an additional factor**

Select this check box to prompt the user for an additional factor to log in to the identity domain.

If you select this check box, then you must specify whether the user is required to enroll in Multi-Factor Authentication and how often this additional factor is to be used to log in.

Select **Any factor** to prompt the user to enroll and verify any factor enabled in the MFA tenant level settings.

Select **Specified factors only** to prompt the user to enroll and verify a subset of factors enabled in the MFA tenant level settings. After you select **Specified factors only**, you can select factors that must be enforced by this rule.

**Frequency**

- Select **Once per session or trusted device**, so that for each session that the user has opened from an authoritative device, they must use both their user names and passwords, and a second factor.
- Select **Every time**, so that each time users log in from a trusted device, they must use their user names and passwords, and a second factor.
- Select **Custom interval**, and then specify how often users must provide a second factor to log in. For example, if you want users to use this additional factor every two weeks, then click **Number**, enter 14 in the text field, and then click the **Interval** drop-down menu to select **Days**. If you configured multifactor authentication (MFA), then this number must be less than or equal to the number of days a device can be trusted according to MFA settings. For more information, see **Managing Multi-Factor Authentication** on page 3690.
### Field | Description
--- | ---
**Enrollment** | This menu contains two options: **Required** and **Optional**.
- Select **Required** to force the user to enroll in Multi-Factor Authentication.
- Select **Optional** to give users the option of skipping enrolling in Multi-Factor Authentication. Users see the inline enrollment setup process after they enter their user name and password, but can click **Skip**. Users can then enable MFA later from the **2-Step Verification** setting in the **Security** settings of My Profile. Users are not prompted to set up a factor the next time that they sign in.

*Note:*
If you set **Enrollment** to **Required**, and later change it to **Optional**, the change only affects new users. Users already enrolled in Multi-Factor Authentication will not see the inline enrollment process and will not be able to click **Skip** when logging in.

7. In the **Add sign-on rules** screen, click **Add sign-on rule** to add another sign-on rule to this policy. Otherwise, click Next.

*Note:*
If you have added multiple sign-on rules to this policy, then you can change the order that they will be evaluated. See **To Change the Priority of a Sign-On Rule for the Policy** on page 3545.

8. In the **Add apps** screen, click **Add app** to add apps to this policy.
9. In the **Add app** window, select the check box for each app that you want to add to the policy. Then, click **Add app**.

*Note:*
You can add an app to only one sign-on policy. If the app isn’t assigned to any sign-on policy explicitly, then the default sign-on policy applies to the app.

10. Click Close.

**Activating a Sign-On Policy**
You must activate a sign-on policy after you create it.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **Sign-on policies**.
3. In the **Sign-on policies** page, select the check box for each sign-on policy that you want to activate.
4. From the **Actions** menu, select **Activate sign-on policy**.
5. To confirm the activation, click **Activate sign-on policy**.

**Updating a Sign-On Policy**
You can modify the following:
• Edit the name or description of the policy
• Add, remove, edit, or change the priority of sign-on rules for the policy
• Add or remove apps from the policy

To modify a sign-on policy:

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **Sign-on policies**.
3. In the **Sign-on policies** page, click the sign-on policy that you want to modify.

To Change the Priority of a Sign-On Rule for the Policy

You can change the priority of a sign-on rule for a sign-on policy to change the order that the identity domain will evaluate it.

1. Click **Edit priority**.
2. Click the up or down arrow next to the rule to move it to the position in the listed order that you want the rule applied.

   For example, if your sign-on rule is currently listed fourth, and you want the identity domain to evaluate it first, click the up arrow next to the rule until it is at the top of the list. Your sign-on rule will appear first in the list, and the other rule will now have a priority of 2.
3. Click **Save changes**.

To Add a Rule to the Policy

1. On the sign-on policy details page, click **Add sign-on rule**.
2. Use the following table to configure the rule:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule name</td>
<td>Enter the name of the sign-on rule.</td>
</tr>
<tr>
<td>Authenticating identity provider</td>
<td>Enter or select all identity providers that will be used to authenticate the user accounts evaluated by this rule.</td>
</tr>
<tr>
<td>Group membership</td>
<td>Enter or select the groups that the user must be a member of to meet the criteria of this rule. You must enter at least three characters to initiate a search of groups.</td>
</tr>
<tr>
<td>Administrator</td>
<td>If the user must be assigned to administrator roles in the identity domain to meet the criteria of this rule, then select this check box.</td>
</tr>
<tr>
<td>Exclude users</td>
<td>Enter or select the users to exclude from the rule. You must enter at least three characters to initiate a search of users.</td>
</tr>
</tbody>
</table>
### Field: Filter by client IP address

There are two options associated with this field:  
**Anywhere** and **Restrict to the following network perimeters**.

- If you select **Anywhere**, then users can log in to the identity domain using any IP address.
- If you select **Restrict to the following network perimeters**, then the [Network perimeters](#) text box appears. In this text box, enter or select network perimeters that you defined. For more information, see [Adding a Network Perimeter](#) on page 3700.

Users can log in to the identity domain using only IP addresses that are contained in the defined network perimeters.

### Field: Allow access or Deny access

Select whether a user will be allowed to access the Console if the user account meets the criteria of this rule. When you select **Allow access**, the following additional options are presented.

### Field: Prompt for reauthentication

Select this check box to force the user to log in to the identity domain again.

If not selected, the user will be authenticated the next time they log in to the identity domain.

### Field: Prompt for an additional factor

Select this check box to prompt the user for an additional factor to log in to the identity domain.

If you select this check box, then you must specify whether the user is required to enroll in Multi-Factor Authentication and how often this additional factor is to be used to log in.

Select **Any factor** to prompt the user to enroll and verify any factor enabled in the MFA tenant level settings.

Select **Specified factors only** to prompt the user to enroll and verify a subset of factors enabled in the MFA tenant level settings. After you select **Specified factors only**, you can select factors that must be enforced by this rule.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Frequency | • Select **Once per session or trusted device**, so that for each session that the user has opened from an authoritative device, they must use both their user names and passwords, and a second factor.  
• Select **Every time**, so that each time users log in from a trusted device, they must use their user names and passwords, and a second factor.  
• Select **Custom interval**, and then specify how often users must provide a second factor to log in. For example, if you want users to use this additional factor every two weeks, then click **Number**, enter 14 in the text field, and then click the **Interval** drop-down menu to select **Days**. If you configured multifactor authentication (MFA), then this number must be less than or equal to the number of days a device can be trusted according to MFA settings. For more information, see [Managing Multi-Factor Authentication](#) on page 3690. |
| Enrollment | This menu contains two options: **Required** and **Optional**.  
• Select **Required** to force the user to enroll in Multi-Factor Authentication.  
• Select **Optional** to give users the option of skipping enrolling in Multi-Factor Authentication. Users see the inline enrollment setup process after they enter their user name and password, but can click **Skip**. Users can then enable MFA later from the **2-Step Verification** setting in the **Security** settings of My Profile. Users are not prompted to set up a factor the next time that they sign in.  

**Note:**  
If you set **Enrollment** to **Required**, and later change it to **Optional**, the change only affects new users. Users already enrolled in Multi-Factor Authentication will not see the inline enrollment process and will not be able to click **Skip** when logging in. |

3. Click **Add** sign-on rule.

**Note:**  
If you have added multiple sign-on rules to this policy, then you can change the order that they will be evaluated. See [To Change the Priority of a Sign-On Rule for the Policy](#) on page 3545.

To Edit a Sign-On Rule

1. On the sign-on policy details page, find the rule you want to edit.
2. Click the Actions menu (three dots) for the sign-on rule and click **Edit sign-on rule**.
3. Make your edits. For more a full description of all the fields, see **To Add a Rule to the Policy** on page 3545.
4. When finished, click **Save changes**.

**To Delete a Sign-On Rule**

1. On the sign-on policy details page, find the rule you want to delete.
2. Select the check box for each sign-on rule that you want to delete from the policy.
3. Click **Remove sign-on rule**.
4. In the confirmation window, click **Remove sign-on rule**.

**To Add Apps to the Policy**

1. On the sign-on policy details page, click **Apps**. The list of applications already added to the policy is displayed.
2. Click **Add app**.
3. In the **Add app** window, select the check box for each app that you want to add to the policy. Then, click **Add app**.

**To Remove Apps from the Policy**

1. On the sign-on policy details page, click **Apps**. The list of applications already added to the policy is displayed.
2. Select the check box for each app that you want to remove from the policy.
3. Click **Remove app**.
4. To confirm the removal, click **Remove app**.

**Deactivating a Sign-On Policy**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **Sign-on policies**.
3. In the **Sign-on policies** page, select the check box for each sign-on policy that you want to deactivate.
4. From the **Actions** menu, select **Deactivate sign-on policy**.
5. To confirm the deactivation, click **Deactivate sign-on policy**.

**Deleting a Sign-On Policy**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **Sign-on policies**.
3. In the **Sign-on policies** page, select the check box for each sign-on policy that you want to delete.
4. From the **Actions** menu, select **Delete sign-on policy**.
5. To confirm, click **Delete sign-on policy**.

**Federating with Identity Providers**

This section describes federating with identity providers.

**Federating with Identity Providers**

This topic describes identity federation concepts. Oracle Cloud Infrastructure supports federation with **Oracle Identity Cloud Service**, and Microsoft Active Directory (via Active Directory Federation Services (AD FS)), Microsoft Azure Active Directory, Okta, and other identity providers that support the Security Assertion Markup Language (SAML) 2.0 protocol.

**Overview**

Enterprise companies commonly use an **identity provider (IdP)** to manage user login/passwords and to authenticate users for access to secure websites, services, and resources.
When someone in your company wants to use Oracle Cloud Infrastructure resources in the Console, they must sign in with a user login and password. Your administrators can federate with a supported IdP so that each employee can use an existing login and password and not have to create a new set to use Oracle Cloud Infrastructure resources.

To federate, an administrator goes through a short process to set up a relationship between the IdP and Oracle Cloud Infrastructure (commonly referred to as a federation trust). After an administrator sets up that relationship, any person in your company who goes to the Oracle Cloud Infrastructure Console is prompted with a "single sign-on" experience provided by the IdP. The user signs in with the login/password that they’ve already set up with the IdP. The IdP authenticates the user, and then that user can access Oracle Cloud Infrastructure.

When working with your IdP, your administrator defines groups and assigns each user to one or more groups according to the type of access the user needs. Oracle Cloud Infrastructure also uses the concept of groups (in conjunction with IAM policies) to define the type of access a user has. As part of setting up the relationship with the IdP, your administrator can map each IdP group to a similarly defined IAM group, so that your company can re-use the IdP group definitions when authorizing user access to Oracle Cloud Infrastructure resources. Here’s a screenshot from the mapping process:

![Edit Identity Provider]

For information about the number of federations and group mappings you can have, see Service Limits on page 243. There's no limit on the number of federated users.

**Note:**

Any users who are in more than 50 IdP groups cannot be authenticated to use the Oracle Cloud Infrastructure Console.

**Automated User Provisioning and Synchronization with SCIM**

Tenancies federated with Oracle Identity Cloud Service or the third-party provider Okta can also leverage SCIM (System for Cross-domain Identity Management) to enable provisioning of federated users in Oracle Cloud Infrastructure. Federated users that have been provisioned in Oracle Cloud Infrastructure through this process can have the additional user credentials such as API keys and auth tokens that are managed in the User Settings page. This enables federated users to use the SDK and CLI, and other features that require the additional user credentials. For more information, see User Provisioning for Federated Users.

**Managing Provisioning Bridges**

The provisioning bridge provides a link between your on-premises apps and IAM. Through synchronization, account data that’s created and updated directly on the apps is pulled into an identity domain and stored for the corresponding identity domain users and groups. As a result, any changes to these records are transferred into an identity domain. So, if a user is deleted in one of your apps, then this change is propagated into the identity domain. Because of this, the state of each record is synchronized between your apps and the identity domain.
Suppose you're using an on-premises app such as Oracle Internet Directory as an authoritative source for your company's users and groups. This app lies within your company's firewall. For a provisioning bridge to communicate with on-premises apps such as Oracle Internet Directory, it must use Identity Connector Framework (ICF) connectors to access the associated apps. As a result, the provisioning bridge can poll the on-premises apps for changes to users and groups in the apps, and synchronize these changes with the identity domain. You can configure a provisioning bridge so that IAM can synchronize users and groups from one or multiple apps.

![Directory Synchronization](image)

**Figure 4: Directory Synchronization**

Both the provisioning bridges and your on-premises apps are in your Microsoft Windows or generic environment. A generic environment consists of any machine that has Java 8 installed on it and supports Bash shell.

Each provisioning bridge uses a client network to access the on-premises apps with which you want to synchronize identity domain users and groups. Because IAM is in a different environment, a bridge is needed to span the networks.

![Provisioning Bridge Security](image)

**Figure 5: Provisioning Bridge Security**
To manage provisioning bridges, you must have one of the following access grants:

- Be a member of the Administrators group
- Be granted the Identity Domain Administrator role or the Security Administrator role
- Be a member of a group granted manage domains

To understand more about policies and roles, see The Administrators Group, Policy, and Administrator Roles on page 3074, Understanding Administrator Roles on page 3246, and Understanding Policies on page 3249.

**Statuses**

A provisioning bridge client has two statuses:

- **Started**: The provisioning bridge started successfully.
- **Stopped**: The provisioning bridge stopped unexpectedly or the identity domain administrator or security administrator stopped it. See Stop a Provisioning Bridge.

A provisioning bridge has two statuses:

- **Active**: The provisioning bridge is installed, started, and activated. It’s available to poll the apps to which the provisioning bridge is assigned for changes to users and groups in the apps, and synchronize these changes with the identity domain. See Activate Provisioning Bridges.
- **Inactive**: The provisioning bridge is installed and configured, but it's deactivated. It’s not available to retrieve users and groups from the apps to which the provisioning bridge is assigned. For performance reasons, this is done. See Deactivate Provisioning Bridges.

**Using the Console**

*Creating a Provisioning Bridge*

Part of creating a provisioning bridge is installing the client for the bridge. On the machine where you’re installing this client, you must have:

- Java 8 installed
- Administrative rights to access the client network that the provisioning bridge uses to communicate with the apps that you want to monitor
- Permissions to run the scripts that are used to install and start the provisioning bridge
- Permissions to create, manage, and run commands in the folders associated with the machine where you install the client for the provisioning bridge
- Permissions to manage log files associated with the provisioning bridge
- The ability to communicate with both the identity domain server and the servers associated with the target apps (for example, the Oracle Internet Directory or Oracle E-Business Suite servers)
- Low network latency with these target servers

2. Select the identity domain you want to work in and click Settings and then Provisioning bridges.
3. If this is the first bridge you’re creating, then click Create Provisioning Bridge.
4. In the Name and Description fields of the Add Provisioning Bridge page, enter a name and descriptive information for the provisioning bridge. Then, click Add.

A new panel appears showing the provisioning bridge. By default, this provisioning bridge is deactivated.

The panel contains two links:

- **Apps**: This displays the apps to which the provisioning bridge will
  - Poll for changes to users and groups in the apps, and synchronize these changes into the identity domain.
  - Use identity domains to manage the lifecycle of users in the apps. This includes creating, modifying, deactivating, activating, and removing users and their profiles across the apps.
- **Connectors**: After you install the client for the provisioning bridge and start the bridge, this displays the connectors that the bridge uses to communicate with the apps.
5. Make a note of the URL, Client ID, and Client Secret.

The identity domain URL contains the name and port number for your domain. The Client ID and Client Secret are used by the Provisioning Bridge to access domain as an administrator.

**Note:**

The Client Secret is encrypted (for security purposes). To see the Secret in clear text, click **Show Secret**. To regenerate the Secret for the bridge, click **Regenerate**.

6. Under the **Settings** menu, click the **Downloads** link (because you want to download the client for the Provisioning Bridge).

7. In the **Downloads** page, click **Download** for Identity Cloud Service Provisioning Bridge. The console downloads the client for the provisioning bridge.

8. Verify that a **Success** message is displayed to show that the download is successful.

9. Start the Windows or generic machine where you want to install the client for the provisioning bridge.

**Important:**

Ensure that you have administrative rights for this machine. Also, this machine communicates with the client network that the provisioning bridge uses to access the apps that you want to monitor.

10. On this machine, create a folder, and then unzip the file that you downloaded in step 7 of this procedure into this folder. This zipped file contains the client that you are to install for the provisioning bridge.

After you unzip the file, the following folders are created:

- **bin**: This folder contains the `crossplatform.jar` file. This file is used by the installer to install, start, and stop the provisioning bridge.
- **bundle_home**: This folder contains the connector JAR files that Oracle ships with the bridge. These files are used by the bridge to communicate with the apps.
- **conf**: This folder contains two properties files:
  - `BridgeRuntimeConfigurations.properties`: This file contains properties associated with the provisioning bridge communicating with identity domain and the target apps. Oracle strongly recommends that you don't modify the contents of this file.
  - `log4j.properties`: This file contains properties associated with logging operations that the provisioning bridge performs.
- **dependencies**: This folder contains the script files that the provisioning bridge uses to communicate with Oracle E-Business Suite for synchronization and provisioning purposes.
- **logs**: This is the default folder is where all log files for the provisioning bridge are stored. You can change this folder and path by modifying the `log4j.properties` file.

You also see three files:

- **startup.bat**: Use this file to start the client for the provisioning bridge on a Windows (.bat) machine.
- **startup.sh**: Use this file to start the client on a generic (.sh) machine.
- **FileInfo.json**: This file contains version information about the zipped file that you downloaded. Oracle strongly recommends that you don't modify the contents of this file.

**Tip:**

While you’re installing the client, IAM generates log files for the provisioning bridge automatically, and stores them in the **logs** folder.
11. If you’re installing the provisioning bridge on a generic machine, then open a Terminal window, navigate to the folder that you created in step 10, and run the `./startup.sh install` command.

   OR

   If you’re installing the provisioning bridge on a Windows machine, then open Windows Explorer, navigate to the folder that you created in step 10, and double-click the `startup.bat` file.

12. At the Enter a password for Oracle Wallet prompt, enter your Oracle Wallet password. The wallet is a file that’s used to store sensitive information such as the domain URL, Client ID, and Client Secret securely.

13. At the Re-enter your password prompt, enter this password again.

   **Note:**

   After you install the provisioning bridge, a `wallet` folder is created, and the Oracle Wallet you created is stored in this folder. This way, when you start the provisioning bridge, instead of providing the identity domain URL, Client ID, and Client Secret, you only have to supply the password you provided for your Oracle Wallet.

   **Important:**

   There’s no mechanism to recover your Oracle Wallet password if you forget it. If this happens, then delete the `wallet` folder and install the provisioning bridge again.

14. At the Enter the OCI IAM URL, Enter the Client ID, and Enter the Client Secret prompts, enter the URL, Client ID, and Client Secret.

   **Tip:**

   These credentials appear on the `[Provisioning_Bridge_Name]` page of the console.

15. For the following prompts, enter the appropriate values:

   - Enter the address for the proxy server
   - Enter the port number of the proxy server
   - Enter the name of the administrator who can connect to the proxy server
   - Enter the password of the administrator who can connect to the proxy server

   a) If your organization has a firewall in place and requires communication to be handled using an HTTP Proxy Server, then enter the full path (or address) of the proxy server, the port number reserved for this server, and the administrator credentials for connecting to the server.

   b) If your organization doesn’t require communication to be handled using an HTTP Proxy Server, then press Enter after each prompt to skip the prompt.

   The bridge attempts to connect to the identity domain server.

   If a connection can be established, then information about the Provisioning Bridge you created appears. This information includes the name, description, version number, URL of the identity domain, and the locations of the `log4j.properties` file and `bundle_home` folder.

   Otherwise, you receive an error message, indicating that you entered an incorrect URL, Client ID, or Client Secret. Modify the incorrect values, and try again. If the problem persists, then delete the Oracle Wallet you created, and repeat steps 11 through 15 of this procedure.

**Removing Provisioning Bridges**
You can remove unused provisioning bridges from the identity domain. You can remove either a single provisioning bridge or multiple bridges.

   **Important:**

   Before you remove any provisioning bridges, ensure that you:
- Deactivate the provisioning bridges. See Deactivate Provisioning Bridges.
- Assign different provisioning bridges to apps. See Change the Provisioning Bridge Assigned to Apps.
- Stop the provisioning bridges. See Stop a Provisioning Bridge.

2. Select the identity domain you want to work in and click Settings and then Provisioning bridges.
3. Select the check box for each provisioning bridge that you want to remove.
4. Click Remove.
5. In the Confirmation window, click OK.

Starting the Provisioning Bridge on a Generic Machine

A generic machine has Java 8 installed on it and supports bash shell. For this type of machine, you can start the Provisioning Bridge in two modes:

- **normal**: The bridge starts in a Terminal window.
- **background**: The bridge starts as a process in the background in a Terminal window.

**Important:**

You can’t start multiple provisioning bridges with the same configuration information. If you want to start another provisioning bridge, then use the Provisioning Bridges page to create a new bridge, and use the newly generated Client ID and Secret for the identity domain to start the bridge.

Starting in Normal Mode

Start the Provisioning Bridge in normal mode.

1. Start the generic machine where you installed the client for the Provisioning Bridge.

   **Important:**

   Ensure that you have administrative rights for this machine. Also, this machine communicates with the client network that the Provisioning Bridge uses to access the apps that you want to monitor.

2. In a Terminal window, navigate to the folder you created that contains the files for the Provisioning Bridge. You created this folder in Create a Provisioning Bridge.

3. At the prompt, enter ./startup.sh normal.

4. At the Enter your password for Oracle Wallet prompt, enter the password for Oracle Wallet that you created in Create a Provisioning Bridge.
   
   The Provisioning Bridge attempts to connect to the identity domain server.

5. Verify that you see the The Provisioning Bridge is started. status message. A connection is established between the Provisioning Bridge and the identity domain server.

   **Important:**

   Ensure that you keep this Terminal window open. If you close it, then you stop the Provisioning Bridge.

7. Select the identity domain you want to work in and click Settings and then Provisioning bridges.

8. Verify that the Provisioning Bridge that you created in Create a Provisioning Bridge has a status of Started.

9. Click this Provisioning Bridge, and then click Connectors.

10. Verify that you see the names and versions of the connectors that are used by the Provisioning Bridge to communicate with the associated apps.

Starting in Background Mode
Start the Provisioning Bridge in **background** mode.

1. Start the generic machine where you installed the client for the Provisioning Bridge.

   **Important:**
   
   Ensure that you have administrative rights for this machine. Also, this machine communicates with the client network that the Provisioning Bridge uses to access the apps that you want to monitor.

2. In a Terminal window, navigate to the folder you created that contains the files for the Provisioning Bridge. You created this folder in **Create a Provisioning Bridge**.

3. At the prompt, enter **./startup.sh background**.

4. At the **Enter your password for Oracle Wallet** prompt, enter the password for Oracle Wallet that you created in **Create a Provisioning Bridge**.

   The Provisioning Bridge attempts to connect to the identity domain server.

5. Verify that you see the **The Provisioning Bridge is started. [Process_ID] is the process ID that's used to start this bridge.** status message. A connection is established between the Provisioning Bridge and the identity domain server.

   **Note:**
   
   If you want to stop the Provisioning Bridge, then use the process ID to stop the process. You can also use this ID to check if the process is running properly, or if there are any errors associated with the process.

6. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.

7. Select the identity domain you want to work in and click **Settings** and then **Provisioning bridges**.

8. Verify that the Provisioning Bridge that you created in **Create a Provisioning Bridge** has a status of **Started**.

9. Click this Provisioning Bridge, and then click the **Connectors** tab.

10. Verify that you see the names and versions of the connectors that are used by the Provisioning Bridge to communicate with the associated apps.

### Starting the Provisioning Bridge on a Windows Machine

In this procedure, you start the Provisioning Bridge on a Windows machine.

1. Start the Windows machine where you installed the client for the provisioning bridge.

   **Important:**
   
   You can’t start multiple provisioning bridges with the same configuration information. If you want to start another provisioning bridge, then use the **Provisioning Bridges** page to create a new bridge, and use the newly generated Client ID and Secret for the identity domain to start the bridge.

2. Open Windows Explorer, and then navigate to the folder you created that contains the files for the provisioning bridge. You created this folder in **Create a Provisioning Bridge**.

3. Double-click the **startup.bat** file.

4. At the **Enter your password for Oracle Wallet** prompt of the Command window, enter the password for Oracle Wallet that you created in **Create a Provisioning Bridge**.

   The provisioning bridge attempts to connect to the identity domain server.
5. Verify that you see the The Provisioning Bridge is started. status message. A connection is established between the provisioning bridge and the identity domain server.

<table>
<thead>
<tr>
<th>Important:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ensure that you keep this Command window open. If you close it, then you stop the Provisioning Bridge.</td>
</tr>
</tbody>
</table>

7. Select the identity domain you want to work in and click Settings and then Provisioning bridges.

8. Verify that the provisioning bridge that you created in Create a Provisioning Bridge has a status of Started.

9. Click this provisioning bridge, and then click the Connectors tab.

10. Verify that you see the names and versions of the connectors that are used by the provisioning bridge to communicate with the associated apps.

**Stopping a Provisioning Bridge**
You can stop a provisioning bridge that’s running on a Windows or generic machine.

If you stop a provisioning bridge, then you must wait three minutes to restart the bridge. Also, before you stop a provisioning bridge, you must deactivate it. See Deactivate Provisioning Bridges.

Use the following table to guide you on how to stop a provisioning bridge.

<table>
<thead>
<tr>
<th>Machine</th>
<th>Mode</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generic</td>
<td>normal</td>
<td>Close the Terminal window or press Ctrl + C.</td>
</tr>
<tr>
<td>Generic</td>
<td>background</td>
<td>At the prompt of the Terminal window, stop the process by entering <code>kill -9 [Process_ID]</code>.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Because you started the provisioning bridge in background mode, even if you close the Terminal window, the bridge continues to run. For this reason, you must stop the process to stop the provisioning bridge.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Tip:</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you don't know the process ID, then run the following command: `ps -ef</td>
</tr>
</tbody>
</table>

| Windows | N/A       | Close the Command window. |

2. Select the identity domain you want to work in and click Settings and then Provisioning bridges.

3. Verify that the provisioning bridge that you stopped has a status of Stopped.

   If you still see a status of Started for the provisioning bridge, then wait three minutes, and click Refresh.

**Activating Provisioning Bridges**
You can activate a single provisioning bridge. For efficiency purposes, you can also activate multiple provisioning bridges simultaneously.

2. Select the identity domain you want to work in and click Settings and then Provisioning bridges.
3. Select the check box for each provisioning bridge that you want to activate.
4. Click Activate.
5. In the **Confirmation** window, click **OK**.

The status of each provisioning bridge you selected changes from **Inactive** to **Active**.

**Deactivating Provisioning Bridges**

You can deactivate either a single provisioning bridge or multiple provisioning bridges simultaneously (for efficiency purposes).

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Settings** and then **Provisioning bridges**.
3. Select the check box for each provisioning bridge that you want to deactivate.
4. Click **Deactivate**.
5. In the **Confirmation** window, click **OK**.

The status of each provisioning bridge you selected changes from **Active** to **Inactive**.

**Viewing Details about a Provisioning Bridge**

By default, in the **Provisioning Bridges** page, you can see the name, description, and statuses for each Provisioning Bridge.

You can also see other information about a provisioning bridge, such as its identity domain URL, version number, Client ID, and Client Secret, any apps assigned to the bridge, and any connectors that are used by the bridge to communicate between the apps and the identity domain.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Settings** and then **Provisioning bridges**.
3. Click the bridge about which you want to view additional information.
4. Click **Details**.
   - In this tab, you see information about the provisioning bridge, including its name, description, identity domain URL, version number, and Client ID. By clicking **Show Secret**, you can see the Client Secret for the provisioning bridge in clear text. By clicking **Regenerate**, you can regenerate the Secret for this bridge.
5. Click **Apps**.
   - In this tab, you can see a list of apps assigned to the provisioning bridge. You can assign more apps to this bridge or change the bridge associated with the apps. See **Assign a Provisioning Bridge to Apps** and **Change the Provisioning Bridge Assigned to Apps**.

   **Note:**

   For load-balancing purposes, Oracle suggests that you don't assign more than 10 apps to a provisioning bridge. To maintain more apps, create another provisioning bridge.

6. Click **Connectors**.
   - In this tab, you can see any connectors that the provisioning bridge uses to communicate with the apps.

**Modifying a Provisioning Bridge**

You can modify a provisioning bridge.

You can change the following items for a provisioning bridge:

- The name, description, and Client Secret of the bridge
- The apps to which the bridge is assigned

   **Note:**

   You can also change the folder where all log files for the provisioning bridge are stored and the log level for these log files. See **Manage Log Files for a Provisioning Bridge**.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Settings** and then **Provisioning bridges**.

3. Click the provisioning bridge that you want to modify.

4. Click **Details**.
   a) To edit the name or descriptive information about the provisioning bridge, enter the modifications in the **Name** or **Description** fields.
   b) To regenerate the Client Secret for this bridge, click **Regenerate**.

   **Note:**
   If you have activated this provisioning bridge, then you can’t regenerate a Client Secret for it because the bridge is using this Secret to access the identity domain as an administrator.

   To regenerate the Client Secret for this provisioning bridge, you must first deactivate the bridge, and then stop it. See **Deactivate Provisioning Bridges** and **Stop a Provisioning Bridge**.

   If you regenerate the Client Secret for a provisioning bridge, then you must delete the **wallet** folder and recreate the Oracle Wallet that you made in **Create a Provisioning Bridge** so that the wallet contains the regenerated Secret.

   c) Click **Save**.
   d) In the **Confirmation** window, click **OK**.

**Assigning a Provisioning Bridge to Apps**

After creating a provisioning bridge, you can assign it to on-premises apps in the App Catalog. Because this bridge serves as a provisioning and synchronizing agent between the identity domain and your apps, the bridge can poll for changes to users or groups in the apps and synchronize those changes into the identity domain.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.

2. Select the identity domain you want to work in and click **Applications**.

3. Click the App Catalog app to which you want to assign a Provisioning Bridge.

4. Click **Deactivate**.

5. In the **Confirmation** window, click **OK**.

   **Note:**
   You must deactivate the app so that you can modify it by assigning a provisioning bridge to it.

6. Click **Provisioning**.

7. Turn on the **Enable Provisioning** switch.

8. From the **Associate with Provisioning Bridge** list, select the provisioning bridge that you want to assign to this app.

   **Note:**
   If the provisioning bridge has an inactive status, then activate it.

9. Click **Save**.

10. Click **Activate**.

11. In the **Confirmation** window, click **OK**.

   **Note:**
   By activating this app, the provisioning bridge that you assigned to it can be used either to poll the app for changes to users and groups in the app, and synchronize these changes into the identity domain, or to provision users to the app.
12. Repeat steps 1 through 11 for each app to which you want to assign the provisioning bridge.

13. Navigate to the identity domain: Open the navigation menu and click Security. Under Identity, click Identity Domains. Click the identity domain you want to configure and click Provisioning Bridges.

14. Click the provisioning bridge that you assigned to apps, and then click the Apps tab.

15. Verify that you see each app to which you assigned the provisioning bridge.

Changing the Provisioning Bridge Assigned to Apps

Only one provisioning bridge can be assigned to an app at any time. If you want to assign another bridge to the app, then you must replace the bridge that's already associated with the app with the designated provisioning bridge.

2. Select the identity domain you want to work in and click Settings and then Provisioning bridges.

3. Click the App Catalog app to which you want to assign another provisioning bridge.

4. Click Deactivate.

5. In the Confirmation window, click OK.

6. Click Provisioning.

7. Turn on the Enable Provisioning switch.

8. From the Associate with Provisioning Bridge list, select a different provisioning bridge than the one that’s assigned to this app.

9. Click Save.

10. Click Activate.

11. In the Confirmation window, click OK.

Note:
You must deactivate the app so that you can modify it by changing the provisioning bridge assigned to it.

6. Click Provisioning.

7. Turn on the Enable Provisioning switch.

8. From the Associate with Provisioning Bridge list, select a different provisioning bridge than the one that’s assigned to this app.

9. Click Save.

10. Click Activate.

11. In the Confirmation window, click OK.

Note:
By activating this app, the other provisioning bridge that you selected for it can be used either to poll the app for changes to users and groups in the app, and synchronize these changes into the identity domain, or to provision users to the app.

12. Repeat steps 1 through 11 for each app to which you want to assign a different provisioning bridge.

13. Open the navigation menu and click Settings, and then click Provisioning Bridges.

14. Click the provisioning bridge that you unassigned from the apps, and then click the Apps tab.

15. Verify that you no longer see these apps in the tab.

Managing Log Files for a Provisioning Bridge

After you install and start a provisioning bridge, you might want to access the log files for troubleshooting purposes. You can locate these files in the logs folder.

The logs folder is contained in the directory that you created when you unzipped the file for the provisioning bridge client when you created the provisioning bridge.

You can change the folder path where all log files for the provisioning bridge are stored and the log level for these log files. To do this, you modify the log4j.properties file.

The log4j.properties file is in the conf folder of the directory that you created when you unzipped the file for the provisioning bridge client, and contains properties associated with logging operations that the provisioning bridge performs.

1. Navigate to the conf folder.

2. Using a text editor, open the log4j.properties file.

3. In the file, locate the following line of code: property.baseLocation = ./logs/
4. Change the value of the `property.baseLocation` parameter to the folder path where you want all log files for the provisioning bridge to be stored.

5. Locate the following line of code: `filter.threshold.level = error`

6. Change the value of the `filter.threshold.level` parameter to one of the following log levels:

<table>
<thead>
<tr>
<th>Log Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Capture all events</td>
</tr>
<tr>
<td>debug</td>
<td>Capture fine-grained informational events that are most useful to debug the provisioning bridge</td>
</tr>
<tr>
<td>error</td>
<td>Capture error events that might still allow the provisioning bridge to continue running</td>
</tr>
<tr>
<td>info</td>
<td>Capture informational events that highlight the progress of the provisioning bridge at a coarse-grained level</td>
</tr>
</tbody>
</table>

7. Save and close the `log4j.properties` file.

**Note:**
You must stop the provisioning bridge and restart it for the changes you made to the `log4j.properties` file to take effect. Also, after you stop the provisioning bridge, you must wait three minutes to restart it.

### Managing Identity Providers
You can set up federated login between an identity domain and external identity provider. This allows users to sign in and access Oracle Cloud Infrastructure resources by using existing logins and passwords managed by the identity provider.

#### Required Policy or Role
To manage identity domain security settings and identity providers, you must have one of the following access grants:

- Be a member of the Administrators group
- Be granted the Identity Domain Administrator role or the Security Administrator role
- Be a member of a group granted `manage identity-domains` permissions

To understand more about policies and roles, see [The Administrators Group, Policy, and Administrator Roles](#) on page 3074, [Understanding Administrator Roles](#) on page 3246, and [Understanding Policies](#) on page 3249.

### About Identity Providers and Service Providers
An identity provider, also known as an authentication authority, provides external authentication for users who want to sign in to an identity domain using their external provider’s credentials. While an identity domain can serve as an identity provider to a third-party service provider, in this context where it relies on an identity provider to authenticate users that access the identity domain, the identity domain is the service provider. More generally, you can also think of Oracle Cloud Infrastructure as the service provider because it provides the services and resources that users want access to.

For example, your organization may want users to log in and gain access to Oracle Cloud Services by using their Microsoft Active Directory Federation Services (AD FS) credentials. In this case, Microsoft AD FS acts as the identity provider (IdP) and the identity domain functions as the service provider (SP). MS AD FS authenticates the user and returns a token containing identity and authentication information to the identity domain (for example, the user name and the email address of the user). This security token is digitally signed by the IdP. The SP verifies the signature on the token and then uses the identity information to establish an authenticated session for the user. This is known as federated single sign-on where a user is challenged for credentials in one domain and is granted access to another domain.
About Digital Certificates

A digital certificate is like an electronic passport that helps a person, computer, or organization to exchange information securely over the internet using public key cryptography. A digital certificate may be referred to as a public key certificate.

Just like a passport, a digital certificate provides identifying information, is forgery resistant, and can be verified because it is issued by an official, trusted agency. The certificate can contain the name of the certificate holder, a serial number, expiration dates, a copy of the certificate holder's public key (used for encrypting messages and verifying digital signatures) and the digital signature of the certificate-issuing authority (CA) so that a recipient can verify that the certificate is real.

In order to verify external identity providers’ signatures, the service provider stores copies of their signing certificates. When the service provider receives a signed message from an identity provider, before the stored certificate is used to verify the signature, the certificate must be verified as valid. Certificate validation includes verifying that the certificate has not expired. After the certificate has been validated, the certificate is used to verify the signature on the message.

In order for this operation to succeed, the public key embedded in the certificate must match the private key that the identity provider used to sign the message.

What Happens When an Identity Provider’s Certificate Expires?

If an identity provider's signing certificate expires, then certificate validation will fail, and the identity domain is unable to complete single sign-on (SSO) operations for that identity provider's users. Therefore, when an identity provider's certificate nears its expiration date, you must make plans to replace it. The typical process is a follows:

1. Obtain the new signing certificate from the identity provider. This may be published by the identity provider for self-service download, or you may need to contact the identity provider administrator.
2. Load the new signing certificate into the identity domain configuration for the identity provider.
3. If the identity provider has also rolled over its signing private/public key pair (rather than only reissuing a new certificate for the existing key pair), then you must update the identity provider configuration to begin using the new keys to sign messages. Again, this may be self-service or require coordination with the identity provider administrator.

Note:
If the identity provider rolls over its signing key pair, then SSO will fail during the period of time between Step 2 and Step 3 above. For this reason, the certificate update is typically coordinated between the identity provider and identity domain administrators.

Using the Console

Adding a SAML Identity Provider

There are two ways that you can add a SAML 2.0 identity provider (IdP) to an identity domain to authenticate users from the IdP so that they can access Oracle Cloud Infrastructure resources and cloud applications:

• You can import metadata for the IdP. IdP metadata, published as an XML document in a standard format, summarizes the basic information about the SAML service associated with the IdP. This XML metadata makes managing the IdP's configuration data easier. See Import Metadata for a SAML Identity Provider.
• You can enter metadata for the IdP. See Enter Metadata Manually for a SAML Identity Provider.

The general process for adding a SAML 2.0 IdP requires you to enter the following information:

• Details: Provide a name, description, and icon for the SAML IdP.
• Configure: Configure SSO for the IdP by either importing metadata for it or entering metadata for it.
• Map: Map a user's attribute value received from the IdP to a corresponding attribute value for the user in the identity domain.

After providing information in the Map, the identity domain adds and deactivates the IdP. You can choose to export metadata for the IdP, test it, or activate it.
• **Export**: Export metadata for the identity domain and import this metadata into the IdP. The IdP requires this information to communicate with the identity domain for authentication purposes.

  **Tip:**
  
  If the IdP doesn't support importing metadata, you can get the information for the identity domain in the Export pane. You can enter this metadata into the IdP manually.

• **Test**: Test the configuration settings for the IdP to confirm that the IdP is working properly. You can use the credentials of the IdP to log in to the identity domain through an external website.

• **Activate**: Activate the IdP.

  **Tip:**
  
  Suppose you want a user to use your organization's credentials to authenticate against the identity domain, meaning that you want the user to sign in with the password that's provided by the SAML IdP (instead of their identity domain password). To do this, turn on the **Federated** switch for the user's account. See [Edit Attribute Values for the User Account](#) to learn how to turn on or off this switch.

The identity domain also lets you add a social IdP. This general process is:

• **Details**: Provide a name, description, and icon for the social IdP.

• **Enter Metadata**: Configure SSO for the IdP by entering metadata for it.

**Import Metadata for a SAML Identity Provider**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.

2. Select the identity domain you want to work in and click **Security** and then **Identity providers**.

3. Click **Add SAML IdP**.

4. Enter details for the IdP:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the IdP.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter explanatory information about the IdP.</td>
</tr>
<tr>
<td>Icon</td>
<td>Browse for and select or drag and drop an icon that represents the IdP. The icon should be 95 x 95 pixels in size and have a transparent background. Supported file formats are .png, .fig, .jpg, .jpeg.</td>
</tr>
</tbody>
</table>

5. Click **Next**. Enter the configuration details:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import identity provider metadata</td>
<td>Select this option to import the metadata for the IdP.</td>
</tr>
</tbody>
</table>
### Field Description

**Identity provider metadata**
Select the XML file that contains the metadata for the IdP that you want to import.

**Note:**
You can only define one IdP in the identity domain with a particular Issuer ID, also known as the Provider ID or Entity ID. The Entity ID attribute is part of the IdP metadata, so you can only create one IdP with a given metadata file. Furthermore, you can update an IdP with new metadata, but you cannot change its Issuer ID.

**Send signing certificate with SAML message**
To include the identity domain's signing certificate with SAML messages sent to the IdP, select this check box. The signing certificate is used to verify the signature of the messages for the IdP. This is typically not needed, but some IdPs require it as part of their signature verification process.

**Signature hashing algorithm**
Select the secure hash algorithm to use to sign messages sent to the IdP.
- **SHA-256** is the default.
- If the IDP doesn't support SHA-256, then select **SHA-1**.

6. Click **Next**. Configure the mapping between IdP and identity domain user attributes:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Identity provider user attribute</strong></td>
<td>Select the user attribute value received from the IdP that can be used to uniquely identify the user. You can specify either the assertion <strong>Name ID</strong>, or, you can specify another <strong>SAML attribute</strong> from the assertion by entering it in the <strong>Assertion attribute</strong> text box.</td>
</tr>
<tr>
<td><strong>Identity domain user attribute</strong></td>
<td>Select the attribute in the identity domain to which you are mapping the attribute received from the IdP. You can specify the username or another attribute (such as the user's display name, primary or recovery email address, or an external ID). You use the external ID when you want to map the attribute received from the IdP to a special ID that's associated with the provider.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Requested NameID format</td>
<td>When SAML authentication requests are sent to the IdP, you can specify a Name ID format in the request. If your IdP does not require this in the request, then select &lt;None Requested&gt;.</td>
</tr>
</tbody>
</table>

7. Click **Create IdP**. Export the identity domain’s SAML metadata:

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
</table>
| Service provider metadata        | To export metadata for the identity domain, click **Download**. Then, import this metadata into the IdP. If the IdP does not support importing a SAML metadata XML document, use the following information to manually configure the IdP.  

    If the federation partner into which you are importing the identity domain metadata performs CRL validation (for example, AD FS performs CRL validation) instead of using the metadata exported from this button, download the metadata from: https://[instancename.idcs.internal.oracle.com:port]/fed/v1/metadata?adfsmode=true

    Turn on the switch under Access Signing Certificate in **Default Settings** to enable clients to access the metadata without logging in to the identity domain. |

| Service provider metadata with self-signed certificates | To export metadata for the identity domain along with self-signed certificates, click **Download**. Then, import this metadata into the IdP. If the IdP does not support importing a SAML metadata XML document, use the following information to manually configure the IdP.  

    If the federation partner into which you are importing the identity domain metadata performs CRL validation (for example, AD FS performs CRL validation) instead of using the metadata exported from this button, download the metadata from: https://[instancename.idcs.internal.oracle.com:port]/fed/v1/metadata?adfsmode=true

    Turn on the switch under Access Signing Certificate in **Default Settings** to enable clients to access the metadata without logging in to the identity domain. |

<table>
<thead>
<tr>
<th>Provider ID</th>
<th>The Uniform Resource Identifier (URI) that uniquely identifies the identity domain. The Provider ID is also known as the Issuer ID or Entity ID.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assertion consumer service URL</td>
<td>The Uniform Resource Locator (URL) of the identity domain service endpoint that receives and processes assertions from the IdP.</td>
</tr>
<tr>
<td>Logout service endpoint URL</td>
<td>The URL of the identity domain service endpoint that receives and processes logout requests from the IdP.</td>
</tr>
</tbody>
</table>
### Task Description

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Logout service return URL</strong></td>
<td>The URL of the identity domain service endpoint that receives and processes logout responses from the IdP.</td>
</tr>
<tr>
<td><strong>Service provider signing certificate</strong></td>
<td>To export the identity domain's signing certificate, click <strong>Download</strong>. Select the file that contains the signing certificate. This certificate is used by the IdP to verify the signature on SAML requests and responses sent by the identity domain to the IdP.</td>
</tr>
<tr>
<td><strong>Service provider encryption certificate</strong></td>
<td>To export the identity domain's encryption certificate, click <strong>Download</strong>. Select the file that contains the encryption certificate. This certificate is used by the IdP to encrypt SAML assertions that it sends to the identity domain. This is only needed if the IdP supports encrypted assertions.</td>
</tr>
</tbody>
</table>

To get the issuing identity domain root certificate, see [Obtain the Root CA Certificate](#).

8. Click **Next**.

9. On the **Test IdP** page, click **Test login** to test the configuration settings for the IdP. (You must be logged in to the identity domain for which you configured the IdP to test the configuration settings.)

10. Click **Next**.

11. On the **Activate IdP** page, click **Activate** to activate the IdP.

12. Click **Finish**.

### Enter Metadata Manually for a SAML Identity Provider

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **Identity providers**.
3. Click **Add SAML IdP**.
4. Enter details for the IdP:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the IdP.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter explanatory information about the IdP.</td>
</tr>
<tr>
<td>Icon</td>
<td>Browse for and select or drag and drop an icon that represents the IdP. The icon should be 95 x 95 pixels in size and have a transparent background. Supported file formats are png, fig, jpg, jpeg.</td>
</tr>
</tbody>
</table>

5. Click **Next**. Enter the configuration details:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Enter identity provider metadata manually</strong></td>
<td>Select this option to configure SSO for the IdP by manually entering metadata for it.</td>
</tr>
<tr>
<td><strong>Identity provider issuer URI</strong></td>
<td>Enter the URI of the issuer that's used to register the signing certificate for the IdP. You can only define one IdP in the identity domain with a particular Issuer URI, also known as the Provider ID or Entity ID.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Signing certificate</td>
<td>Browse and select or drag and drop the signing certificate for the IdP. This is the certificate that the identity domain uses to verify the signatures of SAML messages sent by the IdP.</td>
</tr>
<tr>
<td>Encryption certificate</td>
<td>Browse and select or drag and drop the encryption certificate for the IdP. This certificate is used by the IdP to encrypt SAML assertions that it sends to the identity domain. This is only needed if the IdP supports encrypted assertions.</td>
</tr>
<tr>
<td>SSO service URL</td>
<td>Enter the URL of the SAML SSO service endpoint of the IdP. This is the URL to which the identity domain sends SAML authentication requests.</td>
</tr>
<tr>
<td>SSO service binding</td>
<td>This menu contains two options for web-based SSO associated with the IdP: Redirect and POST.</td>
</tr>
<tr>
<td></td>
<td>• To send an authentication request with the HTTP-REDIRECT binding, select <strong>Redirect</strong>.</td>
</tr>
<tr>
<td></td>
<td>• To send an authentication request with the HTTP-POST binding, select <strong>POST</strong>.</td>
</tr>
<tr>
<td>Enable global logout</td>
<td>To enable SAML global logouts between the identity domain and the IdP, select this check box.</td>
</tr>
<tr>
<td></td>
<td>If you select the check box, then you must provide the logout request and logout response URLs for the IdP, and specify whether you want the identity domain to initiate a logout with a HTTP-Redirect or HTTP-POST binding.</td>
</tr>
<tr>
<td>IdP logout request URL</td>
<td>Enter the URL of the IdP service endpoint that receives and processes logout requests sent by the identity domain.</td>
</tr>
<tr>
<td>IdP logout response URL</td>
<td>Enter the URL of the service endpoint that receives and processes logout responses sent by the identity domain.</td>
</tr>
<tr>
<td>Logout binding</td>
<td>This menu contains two options to initiate a logout: Redirect and POST.</td>
</tr>
<tr>
<td></td>
<td>• To initiate a logout with the HTTP-Redirect binding, select <strong>Redirect</strong>.</td>
</tr>
<tr>
<td></td>
<td>• To initiate a logout using the HTTP-POST binding, select <strong>POST</strong>.</td>
</tr>
<tr>
<td>Send signing certificate with SAML message</td>
<td>To include the identity domain's signing certificate with signed SAML messages sent to your IdP, select this check box.</td>
</tr>
<tr>
<td>Signature hashing algorithm</td>
<td>Select the secure hash algorithm to use to sign messages sent to the IdP.</td>
</tr>
<tr>
<td></td>
<td>• <strong>SHA-256</strong> is the default.</td>
</tr>
<tr>
<td></td>
<td>• If the IdP doesn't support SHA-256, then select <strong>SHA-1</strong>.</td>
</tr>
</tbody>
</table>
6. Click **Next**. Configure the mapping between IdP and identity domain user attributes:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Identity provider user attribute** | Select the user attribute value received from the IdP that can be used to uniquely identify the user.  
You can specify either the assertion **Name ID**. Or, you can specify another **SAML attribute** from the assertion by entering it in the **Assertion attribute** text box. |
| **Identity domain user attribute** | Select the attribute in the identity domain to which you are mapping the attribute received from the IdP.  
You can specify the username or another attribute (such as the user's display name, primary or recovery email address, or an external ID). You use the external ID when you want to map the attribute received from the IdP to a special ID that's associated with the provider. |
| **Requested NameID format**        | When SAML authentication requests are sent to the IdP, you can specify a Name ID format in the request.  
If your IdP does not require this in the request, then select **<None requested>**. |

7. Click **Next**. Export the identity domain's SAML metadata:

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Service provider metadata**       | To export metadata for the identity domain, click **Download**. Then, import this metadata into the IdP.  
If the IdP does not support importing a SAML metadata XML document, use the following information to manually configure the IdP.  
If the federation partner into which you are importing the identity domain metadata performs CRL validation (for example, AD FS performs CRL validation) instead of using the metadata exported from this button, download the metadata from: https://[instancename.idcs.internal.oracle.com:port]/fed/v1/metadata?adfsmode=true  
Turn on the switch under Access Signing Certificate in **Default Settings** to enable clients to access the metadata without logging in to the identity domain. |
<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Service provider metadata with self-signed certificates</strong></td>
<td>To export metadata for the identity domain along with self-signed certificates, click <strong>Download</strong>. Then, import this metadata into the IdP. If the IdP does not support importing a SAML metadata XML document, use the following information to manually configure the IdP. If the federation partner into which you are importing the identity domain metadata performs CRL validation (for example, AD FS performs CRL validation) instead of using the metadata exported from this button, download the metadata from: [instancename.idcs.internal.oracle.com:port]/fed/v1/metadata?adfsmode=true. Turn on the switch under Access Signing Certificate in Default Settings to enable clients to access the metadata without logging in to the identity domain.</td>
</tr>
<tr>
<td><strong>Provider ID</strong></td>
<td>The Uniform Resource Identifier (URI) that uniquely identifies the identity domain. The Provider ID is also known as the Issuer ID or Entity ID.</td>
</tr>
<tr>
<td><strong>Assertion consumer service URL</strong></td>
<td>The Uniform Resource Locator (URL) of the identity domain service endpoint that receives and processes assertions from the IdP.</td>
</tr>
<tr>
<td><strong>Logout service endpoint URL</strong></td>
<td>The URL of the identity domain service endpoint that receives and processes logout requests from the IdP.</td>
</tr>
<tr>
<td><strong>Logout service return URL</strong></td>
<td>The URL of the identity domain service endpoint that receives and processes logout responses from the IdP.</td>
</tr>
<tr>
<td><strong>Service provider signing certificate</strong></td>
<td>To export the identity domain's signing certificate, click <strong>Download</strong>. Select the file that contains the signing certificate. This certificate is used by the IdP to verify the signature on SAML requests and responses sent by the identity domain to the IdP.</td>
</tr>
<tr>
<td><strong>Service provider encryption certificate</strong></td>
<td>To export the identity domain's encryption certificate, click <strong>Download</strong>. Select the file that contains the encryption certificate. This certificate is used by the IdP to encrypt SAML assertions that it sends to the identity domain. This is only needed if the IdP supports encrypted assertions.</td>
</tr>
</tbody>
</table>

To get the issuing identity domain root certificate, see **Obtain the Root CA Certificate**.

8. Click **Next**.

9. Under **Test IdP**, click **Test login** to test the configuration settings for the IdP. (You must be logged in to the identity domain for which you configured the IdP to test the configuration settings.)

10. Click **Next**.

11. On the **Activate IdP** page, click **Activate** to activate the IdP.

12. Click **Finish**.
Adding a Social Identity Provider

You can add a social identity provider so that users can log in to the identity domain with their social credentials. You can also allow users to self-register if they do not already have an account.

You can choose from any of the following predefined social login types:

- Facebook
- Google
- LinkedIn
- Microsoft
- OpenID Connect
- Twitter

**Note:** Microsoft Azure is not supported for social login.

1. Create an application for the social identity provider; for example, go to the Google developer site to create a Google application.

2. Configure the redirectUrl in the application created in Step 2. The redirectUrl must have the format: https://<Identity domain base URL>/oauth2/v1/social/callback.

   Each social identity provider calls these URLs by a different name. See the following list of the social identity providers and the names that they use for the URLs.

   - Facebook: **Valid OAuth redirect URIs**
   - Google and LinkedIn: **Authorized redirect URL**
   - Microsoft: **Redirect URLs**
   - Twitter: **Callback URL**

3. Ensure that you retain the **Client ID** and the **Client Secret** from the application that you created at the social identity provider. You use this ID and Secret when configuring a social identity provider in the identity domain.

To add a social identity provider:

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.

2. Select the identity domain you want to work in and click **Security** and then **Identity providers**.

3. Click **Add Social IdP**.

4. Click **Type**, and then choose a social login type.

5. In the **Name** and **Description** fields, enter a name and description for the social identity provider.

   **Note:**

   The social identity provider name can contain spaces. However, it can't contain special characters.

6. Enter the **Client ID** and the **Client secret** for the social login type.

7. Set the **Enable account linking** option.
   - To allow users to link to their social accounts, select the check box to turn on this option.
   - To prevent users from linking to their social accounts, clear the check box to turn off this option.

   **Note:**

   You can prevent users from linking to their social accounts for security or organizational purposes. For example, if a hacker accesses the user's social account, the hacker can't sign in to the identity domain to access resources and applications.

8. When you are finished, click **Add IdP**.
9. Locate the social identity provider that you created. Click the Actions menu (three dots), and then click Activate IdP to activate the social identity provider.

10. Log in with the social identity provider.

**Note:**

You might encounter this error: “Not Logged In: You are not logged in. Please log in and try again.”

The most likely cause is that the application you created on the social identity provider side has the wrong Client ID or Redirect URL in the configuration. Check the Client ID and the Redirect URL configuration, and try to log in again.

**Activating or Deactivating an Identity Provider**

Deactivating an identity provider prevents users from being able to use the identity provider to access their Oracle Cloud services externally from a different login page than the one associated with their local Oracle Cloud account.

Activating an identity provider reinstates users to use the identity provider.

After you activate an identity provider, you can assign the identity provider to an identity provider policy. An identity provider policy allows you to define criteria to determine whether the identity provider appears for users on the Sign In page, either when they're accessing a specific app or attempting to access resources that are protected by the identity domain.

See Understand Identity Provider Policies for more information about identity provider policies, and Add an Identity Provider Policy to learn more about assigning identity providers to an identity provider policy.

**Activating an Identity Provider**

2. Select the identity domain you want to work in and click Security and then Identity providers.
3. In the Identity providers page, click the Actions menu (three dots) for the identity provider that you want to activate.
4. Click Activate IdP.
5. To confirm the activation, click Activate IdP.

**Deactivating an Identity Provider**

2. Select the identity domain you want to work in and click Security and then Identity providers.
3. In the list of Identity providers, click the Actions menu (three dots) for the identity provider that you want to deactivate.
4. Click Deactivate IdP.
5. To confirm the deactivation, click Deactivate IdP.

**Assigning Identity Providers to the Policy**

You can assign identity providers to an IdP policy. These identity providers will appear in the Sign In page, and a user can use them to access resources that are protected by IAM, such as the My Profile console or the IAM console.

2. Select the identity domain you want to work in and click Security and then IdP policies.
3. Click the name of the IdP policy that you want to assign an IdP to.
5. Click the Actions menu (three dots) for the rule to which you want to assign an identity provider, then click Edit IdP rule.
6. Click the **Assign identity providers** box and select the identity provider that you want to assign to this rule. Repeat this step to assign additional identity providers.

7. When you are finished, click **Save changes**.

**Testing an Identity Provider**

After adding and activating an identity provider, you can test it. You can verify that you can use your federated SSO credentials to log in to the identity domain through an external website.

1. If you assigned the identity provider to an identity provider policy, then go to step 2. Otherwise, assign the identity provider to an identity provider policy. See **Assign Identity Providers to the Policy**.

2. Log out of the identity domain.

3. In the **Sign In** page, verify that you see a link called `<Identity_Provider_Name>`.

   The `<Identity_Provider_Name>` placeholder represents the name you entered for the identity provider that you created.

   If, for example, you created an identity provider called Google, then the link appears as **Google**.

4. Click the `<Identity_Provider_Name>` link.

5. Log in to the external website with your federated SSO credentials.

The identity provider evaluates the user's login credentials, verifies that the user is an authorized user, and returns this information to the identity domain.

---

**Tip:**

If you no longer want to display the link to the identity provider in the **Sign In** page, then remove the identity provider from all identity provider policies and deactivate the identity provider. See **Removing Identity Providers from the Policy** and **Deactivating an Identity Provider**.

---

**Updating an Identity Provider**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.

2. Select the identity domain you want to work in and click **Security** and then **Identity providers**.

3. Click the **Actions** menu (three dots) for the identity provider that you want to update.

4. Select **Edit IdP**.

   A window that displays configuration settings for the IdP opens.

5. Modify the configuration settings for the IdP.

6. After editing the configuration settings for the IdP, click **Save changes**.

**Deleting an Identity Provider**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.

2. Select the identity domain you want to work in and click **Security** and then **Identity providers**.

3. If the identity provider that you want to delete is assigned to an identity provider policy, then remove it from the policy. See **Remove Identity Providers from the Policy**.

4. In the list of **Identity providers**, click the **Actions** menu (three dots) for the identity provider that you want to delete.

5. Click **Delete IdP**.

   **Note:**

   Deleting a **social identity provider** removes the **user profiles** that are linked to that **social identity provider**. Alternatively, consider deactivating the social identity provider (which does not remove the user profiles) so that users can still see the accounts in **My Profile** but can't use them to log in.

6. To confirm the deletion, click **Delete IdP**.
Managing Identity Provider Policies

This topic describes how identity provider policies allow you to define which identity providers are visible in the **Sign In** page.

**Required Policy or Role**

To manage identity provider policies, you must have one of the following access grants:

- Be a member of the Administrators group
- Be granted the Identity Domain Administrator role, the Security Administrator role, or the Application Administrator role
- Be a member of a group granted `manage identity-domains`

To understand more about policies and roles, see [The Administrators Group, Policy, and Administrator Roles](#) on page 3074, [Understanding Administrator Roles](#) on page 3246, and [Understanding Policies](#) on page 3249.

**About Identity Provider Policies**

An identity provider policy allows you to define which identity providers are visible in the **Sign In** page either when a user is accessing a specific app or attempting to access resources that are protected by an identity domain. Identity provider policies can also determine whether users authenticate into an identity domain through identity providers or with a local authentication factor.

The following type of identity providers available in an identity domain:

- **SAML identity provider**: This type of identity provider supports the SAML 2.0 (Security Assertion Markup Language 2.0) standard. You use a SAML identity provider when you want to establish trust between an SAML-compatible identity provider such as Active Directory Federation Services so that users in your organization can access resources protected by the identity domain.

  If you want your users to be redirected to a specific SAML identity provider automatically so that they can access an app, then ensure that the identity provider policy associated with the app has only the SAML identity provider assigned to it. If multiple identity providers are assigned to the identity provider policy, then users will be prompted to select one of the identity providers from the **Sign In** page.

- **Social identity provider**: By linking an identity domain user account to a user's social accounts, the user can access an identity domain using their social credentials, such as Facebook, Google, LinkedIn, Microsoft, and Twitter.

- **Passwordless authentication provider**: Allows users to bypass the standard web-form-based authentication. Passwordless authentication allows access to the protected resource without the need for entering the user name and password every time. However, the first time **Sign In** uses the standard login form.

- **Local identity provider (Local IDP)**: Authentication into an identity domain happens locally by the user providing their credentials (user name and password) in the **Sign In** page.

In addition to the identity providers, you can also use the following local authentication factors. To make these local authentication factors available so that you can assign them to identity provider policies, you must first enable them. See [Configure Authentication Factors](#).

- **Email**: Sends a one-time passcode to the user’s primary email address for use as a verification method to authenticate. The user’s primary email address is defined in the user’s account.

- **Mobile App Notification**: Sends a push notification that contains an approval request to allow or deny a login attempt. Push notifications are an easy and quick way to authenticate. After the user enters their user name and password, a login request is sent to the app on their phone. The user taps **Allow** to authenticate.

- **Mobile App Passcode**: An authenticator app such as the Oracle Mobile Authenticator (OMA) app generates a one-time passcode. This passcode can be generated even when the user's device is offline. After the user enters their user name and password, a prompt appears for the passcode. The user obtains a generated passcode from the app, and then enters the code.

- **Text Message**: After the user enters their user name and password, a passcode is sent as a text message to the user's device. The user enters the code to complete sign in.

- **User Name-Password**: The user authenticates by providing their credentials (user name and password) in the **Sign In** page.
The identity provider policy allows you to configure whether local authentication is displayed in the **Sign In** page for the user.

For example, suppose you've created several social identity providers and SAML identity providers, and you want to configure which of these identity providers will appear in the **Sign In** page when the user attempts to authenticate into the identity domain using a particular app. Without identity provider policies, you couldn't configure this. So, if you had all these SAML and social identity providers activated and set to appear in the **Sign In** page, they would all be displayed.

The identity domain provides you with a default identity provider policy that contains a default identity provider rule. This rule has the **User Name-Password** local authentication factor assigned to it. This way, at the bare minimum, users can authenticate with their user names and passwords. However, you can build upon this default policy by adding other identity provider rules to it. By adding these rules, you can prevent some of your identity providers from being available to users to authenticate into the identity domain. Or, you can allow other identity providers to be available only to those users who access the identity domain from an IP address contained in one of your network perimeters. Both the My Profile console and the Admin console use the identity provider rules that are assigned to the default identity provider policy.

Suppose your company has restrictions as to who can sign in to the identity domain locally (by supplying their user names and passwords) and who must use an external identity provider. Company employees must authenticate by using Active Directory Federation Services (AD FS), contractors and partners must use their own SAML identity providers, and all other users (such as consumers) can use either their user names and passwords or a social identity provider.

To accomplish this goal, you can create two identity provider rules for the default identity provider policy. The first rule is applicable only to company employees. These users must sign in with AD FS which is the employee identity provider. The second rule is applicable only to those users that have user names that end with @partner1.com. They can sign in with the partner 1 SAML identity provider. The third rule is applicable only to those users that have user names that end with @partner2.com. They can sign in with the partner 2 SAML identity provider. The final rule is a catch-all rule for all users (consumers). These users can use either their local passwords or a social identity provider.

Because you can define multiple identity provider rules for an identity provider policy, the identity domain must know the order in which the rules are to be evaluated. To do this, you can set the priority of the rules. For the example above, you can have the company employee rule evaluated first. If a user meets the criteria of this rule (that is, the user is an employee), then the user must authenticate with AD FS. Users who aren't employees don't meet the criteria of this identity provider rule, and so, the rule with the next highest priority is evaluated. For this example, this is the partner 1 rule where the user's user name must end with @partner1.com. These users must authenticate using the partner 1 SAML identity provider. For users who aren't employees or who don't have user names that end with partner1@com, the identity domain evaluates the rule with the next highest priority number: the partner 2 rule where the user's user name must end with @partner2.com. These users must use the partner 2 SAML identity provider to authenticate. All other users meet the criteria of the catch-all rule so they can use either their local passwords or a social identity provider to sign in.

In addition to the default identity provider policy, you can create identity provider policies and associate them with specific apps. Suppose you have multiple apps and you want to assign different identity providers to each app. For example, you may have two apps, and you want users to authenticate from Facebook or LinkedIn. So, you can have one identity provider policy specifically for one app and the Facebook social identity provider, and another identity provider policy exclusively for the second app and the LinkedIn social identity provider.

An identity domain displays a maximum of four identity providers on the **Sign In** page. If you assign more than four identity providers to an identity provider policy, then a **View all** link appears on the page. Click the link and all identity providers associated with the policy appear.

**Using the Console**

**Adding an Identity Provider Policy**

Criteria that you can define for an identity provider policy include:

- The username of the user
- The IP address that the user is using to sign in to the identity domain
- The identity providers that will be available to the user to access the identity domain
1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **IdP policies**.
3. On the **Identity provider (IdP) policies** page, click **Create IdP policy**.
4. On the **Add policy** page, enter the **Name** and then click **Add policy**.
   
   After you click **Add policy** the identity provider policy is added.
5. In the **Add identity provider rules** page, click **Add IdP rule** to define rules for this policy.
6. Enter a **Rule name** for the identity provider rule.
7. Use the **Assign identity providers** menu to select the identity providers to assign to this rule.
8. Use the following table to configure rule **Conditions**:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Expression placement          | There are two options associated with this field: **Starts with expression** and **Ends with expression**.  
   If you select **Starts with expression**, then the rule evaluates the start of the username in the user account.  
   If you select **Ends with expression**, then the rule evaluates the end of the username in the user account. |
| Enter user name expression    | Specify information about users' usernames to evaluate to determine whether they meet the criteria of the rule.  
   For example, if you want the rule to be applicable only to those users that have usernames that end with  
   `@example.com`, then select **Ends with expression** from the drop-down menu, and enter `@example.com` in the **Enter user name expression** text box. |
| Exclude users                 | Optionally, enter or select the users to exclude from the rule.              |
| Exclude groups                | Optionally, enter or select the groups to exclude from the rule.             |
| Filter by client IP address   | There are two options associated with this field: **Anywhere** and **Restrict to the following network perimeters**.  
   If you select **Anywhere**, then the identity providers that you specify in this rule will be available to users that sign in from any IP address.  
   If you select **Restrict to the following network perimeters**, then a text box appears. In this text box, enter or select network perimeters that you defined. For more information, see **Adding a Network Perimeter** on page 3700. The identity providers that you specify in this rule will be available to users that log in using only IP addresses that are contained in the defined network perimeters. |
9. Click **Add IdP rule**.
10. To add another identity provider rule to this policy, repeat the preceding steps.

**Note:** If you have added multiple identity provider rules to this policy, then you can change the order in which they will be evaluated. See Change the Priority of an Identity Provider Rule for the Policy.

When you are finished adding identity provider rules, you can add apps to this policy. For more information, see Adding Apps to the Policy on page 3575.

**Updating an Identity Provider Policy**

You can update the following for an identity provider policy:

- Name of the policy
- Rules, including: adding, changing the priority of, editing, and removing identity provider rules for the policy
- Add identity providers and apps to the policy
- Remove identity providers and apps from the policy

To update an identity provider policy:

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **IdP policies**.
3. On the **Identity provider (IdP) policies** page, click the policy that you want to update.
   You can either add, edit, or delete identity provider rules, or you can add or remove apps assigned to the policy.

**Adding Identity Providers to the Policy**

You can add identity providers to an identity provider policy. These identity providers appear in the **Sign In** page, and a user can use them to access resources that are protected by the identity domain.

1. Click **Identity provider rules**.
2. Click the Actions menu (three dots) for the rule to which you want to assign an identity provider, then click **Edit IdP rule**.
3. Click the **Assign identity providers** box and select the identity provider that you want to assign to this rule.
   Repeat this step to assign additional identity providers.
4. When you are finished, click **Save changes**.

**Removing Identity Providers from the Policy**

You can remove identity providers from an identity provider policy. These identity providers will no longer appear in the **Sign In** page, and a user can’t use them to access resources protected by the identity domain.

1. Click **Identity provider rules**.
2. Click the Actions menu (three dots) for the rule from which you want to remove an identity provider, and then select **Edit IdP rule**.
3. In the **Assign identity providers** box, click the "X" in the label for each identity provider that you want to remove from this rule.
4. When you are finished, click **Save changes**.

**Adding Apps to the Policy**

You can assign apps to an identity provider policy. When a user attempts to authenticate through the apps, the only identity providers that appear in the **Sign In** page are the ones you assigned to the policy. (You can assign only one identity provider policy to an app. If the app isn't assigned to any identity provider policy explicitly, then the default identity provider policy applies to the app.)

1. Click **Apps**.
2. Click Add app.
3. In the Add app window, select the check box for each app that you want to add to the policy. Then, click Add app.

**Removing Apps from the Policy**
You can remove apps from an identity provider policy. A user who uses these apps can no longer authenticate into the identity domain using the identity providers assigned to the policy.

1. Click Apps.
2. Select the check box for each app that you want to remove from the policy.
3. Click Remove app.
4. To confirm the removal, click Remove app.

Adding Identity Provider Rules to the Policy

You can add identity provider rules to an identity provider policy.

By adding identity provider policy rules, you can prevent some of your identity providers from being available to users to authenticate into the identity domain. Or you can allow other identity providers to be available only to those users who access the identity domain from an IP address contained in one of your network perimeters.

1. Click Identity provider rules.
2. Click Add IdP rule.
3. Enter a Rule name for the identity provider rule.
4. Use the Assign identity providers menu to select the identity providers to assign to this rule.
5. Use the following table to configure rule Conditions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expression placement</td>
<td>There are two options associated with this field: Starts with expression and Ends with expression.</td>
</tr>
<tr>
<td></td>
<td>If you select Starts with expression, then the rule evaluates the start of the username in the user account.</td>
</tr>
<tr>
<td></td>
<td>If you select Ends with expression, then the rule evaluates the end of the username in the user account.</td>
</tr>
<tr>
<td>Enter user name expression</td>
<td>Specify information about users' usernames to evaluate to determine whether they meet the criteria of the rule. For example, if you want the rule to be applicable only to those users that have usernames that end with @example.com, then select Ends with expression from the drop-down menu, and enter @example.com in the Enter user name expression text box.</td>
</tr>
<tr>
<td>Exclude users</td>
<td>Optionally, enter or select the users to exclude from the rule.</td>
</tr>
<tr>
<td>Exclude groups</td>
<td>Optionally, enter or select the groups to exclude from the rule.</td>
</tr>
<tr>
<td>Filter by client IP address</td>
<td>There are two options associated with this field: Anywhere and Restrict to the following network perimeters.</td>
</tr>
<tr>
<td></td>
<td>If you select Anywhere, then the identity providers that you specify in this rule will be available to users that sign in from any IP address.</td>
</tr>
<tr>
<td></td>
<td>If you select Restrict to the following network perimeters, then a text box appears. In this text box, enter or select network perimeters that you defined. For</td>
</tr>
</tbody>
</table>
Changing the Priority of an Identity Provider Rule for the Policy
You can change the priority of an identity provider rule for an identity provider policy to change the order that the identity domain evaluates it.

1. Click Identity provider rules.
2. Click Edit priority
3. In the Priority column, click the up or down arrow next to the rule that you want to move. Set the rule at the position in the list that indicates the order in which you want it evaluated relative to the other rules.
   For example, if the identity provider rule has a priority of 4, and you want it to be evaluated first, click the up arrow until it is at the top of the list. This rule is now evaluated first, and the rule previously on top will now have a priority of 2.
4. When you are finished, click Save changes.

Deleting Identity Provider Policies
2. Select the identity domain you want to work in and click Security and then IdP policies.
3. In the Identity provider (IdP) policies page, if the policy that you want to delete has apps assigned to it, then remove the apps from the policy. See Removing Apps from the Policy on page 3575.
4. Select the check box for each identity provider policy that you want to delete.
5. Click Delete IdP policy.
6. To confirm the deletion, click Delete IdP policy.

Editing an Identity Provider Rule for the Policy
You can modify configuration settings for an identity provider rule of an identity provider policy.

2. Select the identity domain you want to work in and click Security and then IdP policies.
3. In the Identity provider (IdP) policies page, click Identity provider rules.
4. Click the Actions menu for the identity provider rule that you want to edit.
5. Select Edit IdP rule. A window that displays configuration settings for the identity provider rule opens.
6. Enter a Rule name for the identity provider rule.
7. Use the Assign identity providers menu to select the identity providers to assign to this rule.
8. Use the following table to configure rule Conditions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expression placement</td>
<td>There are two options associated with this field: Starts with expression and Ends with expression.</td>
</tr>
<tr>
<td></td>
<td>If you select Starts with expression, then the rule evaluates the start of the username in the user account.</td>
</tr>
<tr>
<td></td>
<td>If you select Ends with expression, then the rule evaluates the end of the username in the user account.</td>
</tr>
<tr>
<td>Enter user name expression</td>
<td>Specify information about users’ usernames to evaluate to determine whether they meet the criteria of the rule.</td>
</tr>
</tbody>
</table>

The identity providers that you specify in this rule will be available to users that log in using only IP addresses that are contained in the defined network perimeters.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ends with expression</td>
<td>For example, if you want the rule to be applicable only to those users that have usernames that end with @example.com, then select <strong>Ends with expression</strong> from the drop-down menu, and enter @example.com in the <strong>Enter user name expression</strong> text box.</td>
</tr>
<tr>
<td>Exclude users</td>
<td>Optionally, enter or select the users to exclude from the rule.</td>
</tr>
<tr>
<td>Exclude groups</td>
<td>Optionally, enter or select the groups to exclude from the rule.</td>
</tr>
<tr>
<td>Filter by client IP address</td>
<td>There are two options associated with this field: <strong>Anywhere</strong> and <strong>Restrict to the following network perimeters</strong>.</td>
</tr>
<tr>
<td></td>
<td>If you select <strong>Anywhere</strong>, then the identity providers that you specify in this rule will be available to users that sign in from any IP address.</td>
</tr>
<tr>
<td></td>
<td>If you select <strong>Restrict to the following network perimeters</strong>, then a text box appears. In this text box, enter or select network perimeters that you defined. For more information, see Adding a Network Perimeter on page 3700. The identity providers that you specify in this rule will be available to users that log in using only IP addresses that are contained in the defined network perimeters.</td>
</tr>
</tbody>
</table>

9. When you are finished, click **Save changes**.

**Deleting Identity Provider Rules from the Policy**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **IdP policies**.
3. In the **Identity provider (IdP) policies** page, click **Identity provider rules**.
4. Select the check box for each identity provider rule that you want to remove from the policy.
5. Click **Delete IdP rule**.
6. To confirm the deletion, click **Delete IdP rule**.

**Setting Up a Microsoft Active Directory (AD) Bridge**

The Microsoft Active Directory (AD) Bridge provides a link between your AD enterprise directory structure and IAM.

**Understand the Microsoft Active Directory (AD) Bridge**

The Microsoft Active Directory (AD) Bridge provides a link between your AD enterprise directory structure and IAM. IAM can synchronize with this directory structure so that any new, updated, or deleted user or group records are transferred into IAM. Each minute, the AD Bridge polls AD for any changes to these records and brings these changes into IAM. So, if a user is deleted in AD, then this change will be propagated into IAM. Because of this synchronization, the state of each record is synchronized between AD and Identity Domains.

After users are synchronized from AD to IAM, if you activate or deactivate a user, modify the user's attribute values, or change the group memberships for the user in IAM, then these changes are propagated to AD through the AD Bridge.
Note:
The AD organizational units (OUs) contain the users and groups that are imported into IAM.

You can configure IAM to synchronize with one or multiple AD domains by installing an AD Bridge for each domain.

Note:
You must install the AD Bridge on the machine that’s attached to the Microsoft Active Directory domain for auto discovery. You don’t have to install the bridge on the domain controller.

Figure 6: Inbound Directory Synchronization

Figure 7: Outbound Directory Synchronization

In the diagram above, Clarence Saladna (CSALADNA) is a user who's been synchronized from AD to IAM through the AD Bridge. In IAM, an administrator deactivates Clarence's account because he’s on vacation. Also, because Clarence received a promotion, he has a new job title of Director and belongs to different groups that are associated with his new role, including the Executive and Management groups. The AD Bridge can be used to propagate these changes to AD.

Both the AD Bridges and your AD enterprise directory structure are in your Microsoft Windows environment (for example, Microsoft Windows 2003). Because IAM is an Oracle Cloud service, it's in an Oracle environment.
Certified Components
With the Microsoft Active Directory (AD) Bridge, IAM can connect to your AD enterprise directory structure. The following table lists the certified versions for IAM, AD, your operating system, and the Microsoft .NET software framework (which is required for the AD Bridge to run).

<table>
<thead>
<tr>
<th>IAM</th>
<th>AD</th>
<th>64-Bit</th>
<th>Operating System</th>
<th>.NET Framework</th>
</tr>
</thead>
<tbody>
<tr>
<td>20.1.3</td>
<td>Microsoft Windows Server 2008</td>
<td>Yes</td>
<td>Windows 10 v1607 or later</td>
<td>Version 4.6+</td>
</tr>
<tr>
<td></td>
<td>Microsoft Windows Server 2008 R2</td>
<td></td>
<td>Windows Server 2016 or later</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Microsoft Windows Server 2012</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Microsoft Windows Server 2012 R2</td>
<td></td>

</tbody>
</table>

Statuses
Learn about the various statuses for Microsoft Active Directory (AD) and the AD Bridge.

There are two statuses for the AD domain with which the AD Bridge is communicating:

- Partially Configured: The AD Bridge is installed, but it's not configured to communicate with either the AD domain or IAM.
- Configured: The AD Bridge is installed and configured, and available to synchronize with the AD domain.

There are three statuses for the AD Bridge:
• Active: The AD Bridge is installed and configured, and available to synchronize with AD to retrieve user accounts and groups.
• Inactive: The AD Bridge is installed and configured, but it's not available to synchronize with AD. For performance reasons, this is done.
• Unreachable: The AD Bridge is installed and configured. However, one of the following conditions has occurred:
  • The back-end service used to establish communication between IAM and AD is stopped.
  • The IAM administrator uninstalled the client associated with the AD Bridge, but the bridge couldn't be removed from the Directory Integrations page of the IAM console because the client can't connect to the Identity Domains server. IAM can't use the bridge to communicate with AD. See Remove a Microsoft Active Directory (AD) Bridge.
  • The administrator regenerated the Client Secret for the AD Bridge, and then uninstalled the client for the bridge.

Hardware Requirements
Learn about the minimum hardware requirements for setting up the Microsoft Active Directory (AD) Bridge.

The minimum hardware requirements are, as follows:
• 1 GB of RAM
• 1 GB of disk space
• A quad-core CPU

Why Use the Microsoft Active Directory (AD) Bridge?
Learn about why you should use the Microsoft Active Directory (AD) Bridge.

Most customers have AD as their central directory service. These customers also use AD as their network directory. This directory is where all of their workstations are connected to and from where they manage their users.

In addition to AD, customers use an enterprise LDAP to centralize all of their user identities. So, a customer uses AD to manage their employees, but in the centralized LDAP, the customer manages their partners, consumers, and any other users with which the customer has relationships.

For these reasons, it's imperative that IAM can integrate with both AD and an enterprise LDAP (for example, Oracle Internet Directory).

By using IAM, customers can control when they will migrate their directory-based applications to the cloud. In the interim, they can use one of the following:
• AD Bridge: This bridge provides a link between your AD enterprise directory structure and IAM. IAM can synchronize with this directory structure so that any new, updated, or deleted user or group records are transferred into IAM. Each minute, the bridge polls AD for any changes to these records and brings these changes into IAM. So, if a user is deleted in AD, then this change will be propagated into IAM. As a result, the state of each record is synchronized between AD and IAM. After the user is synchronized from AD to IAM, if you activate or deactivate a user, modify the user's attribute values, or change the group memberships for the user in Identity Domains, then these changes are propagated to AD through the AD Bridge.
• Provisioning Bridge: This bridge provides a link between your enterprise LDAP (such as Oracle Internet Directory) and IAM. Through synchronization, account data that's created and updated directly on the LDAP is pulled into IAM and stored for the corresponding IAM users and groups. As a result, any changes to these records will be transferred into IAM. Because of this, the state of each record is synchronized between the LDAP and IAM. See Managing Provisioning Bridges on page 3549.

About Multiple AD Bridges for High Availability and Load Balancing
Learn how to set up High Availability and Load Sharing so that you don’t have a single point of failure for your AD Bridge architecture.

If you only have one Microsoft Active Directory (AD) Bridge component in one Windows Service connecting to your Active Directory domain, it can be a single point of failure in the architecture.

To avoid this, IAM supports the installation of multiple AD Bridge instances mapping to the same Active Directory domain.
The maximum number of AD Bridges that an administrator can install per domain must not exceed five (5). In addition, the maximum number of domains that an administrator can configure per tenant must not exceed 10. To configure these limits, raise an SR with Oracle Support.

With a AD Bridge High Availability (HA) deployment of at least two AD Bridges per domain, delegated authentication and data synchronization loads can be shared among all the AD Bridges. The allocation of requests to a AD Bridge is completely random, depending on the availability of that particular AD Bridge. One delegated authentication request will be picked up by one AD Bridge. An AD Bridge can pick delegated authentication and full or incremental synchronization as well. Both AD Bridges have the capability to perform data synchronization and delegated authentication simultaneously. However, only one AD Bridge can perform data synchronization of a domain at a time.

**Enable HA for an Existing Deployment**

Learn about the prerequisites and the limitations for AD Bridge High Availability (HA) on an existing deployment before you enable AD Bridge HA.

**Prerequisites**

- Ensure that you have upgraded the existing AD Bridge to version 20.1.3 and greater for every domain that you have configured.
- AD Bridge HA must be enabled for you. Once all AD Bridges in all domains have been upgraded to version 20.1.3 or greater, enter an SR with Oracle Support to enable HA. Once HA is enabled, it is enabled for all configured domains.

**Limitations**

Note the following limitations for AD Bridge HA.

- Only one AD Bridge can be configured in one Windows machine. To configure multiple AD Bridges you have to use multiple Windows machines in the same domain. Note that without AD Bridge HA enabled by Oracle Support, installation of second AD Bridge for the domain will fail.
- Maximum of 5 AD Bridges per domain can be configured by an Administrator for HA and load sharing.
• AD Bridge HA won’t work if any one of the AD Bridges installed for a domain is version 19.3.3 and below. To check the version of an AD bridge, open the AD Bridge user interface and note the version in the bottom right corner of the window, as seen in the screenshot below.

WE NEED A NEW SCREENSHOT FOR THIS...

Troubleshooting

If additional bridges won’t install for a domain, make sure that all prerequisites are met and that none of the constraints apply to you.

Enable HA for a New Deployment

Learn how to enable AD Bridge High Availability (HA) for a new deployment as well as learn about the limitations for HA on a new deployment.

Enable HA

AD Bridge High Availability must be enabled for you. Enter an SR with Oracle Support to enable the feature.

Limitations

Note the following limitations for AD Bridge High Availability.

• AD Bridge HA will not work if any one of the AD Bridges installed for a domain is version 19.3.3 and below.
• Only one AD Bridge can be configured in one Windows machine. To configure multiple AD Bridges you have to use multiple Windows machines in the same domain. Note that without AD Bridge HA enabled by Oracle Support, installation of second AD Bridge for the domain will fail.
• Maximum of 5 AD Bridges per domain can be configured by an Administrator for HA and load sharing.

Troubleshooting

If additional bridges won’t install for a domain, make sure that all prerequisites are met and that none of the constraints applies to you.

Checking a Bridge Data Synchronization Status

Use the following steps to check whether a AD Bridge is running a data synchronization.

1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
2. Check the status. You should see examples like the below.

Figure 9: No AD Bridges are running Active Sync.

Figure 10: One AD Bridges is running Active Sync.

Test Active Directory Connectivity
Learn how to test connectivity or network related issues on a machine where the Active Directory (AD) Bridge client is installed.

There are 2 types of connectivity in AD Bridge:
- Connectivity between AD Bridge and LDAP server of Active Directory
- Connectivity between AD Bridge and IAM

To test the connectivity of AD Bridge follow below steps:
1. Open ADBridgeUI.exe. It's in the ADBridge installation folder. The default path is C:\Program Files\Oracle\IDBridge.
2. Click the Test Connectivity button.

AD Bridge Connectivity Notifications
Learn about notifications that IAM sends to the tenant admin when connectivity between AD Bridge and the IAM server is broken and also when it is restored.

Notifications sent when connectivity of AD Bridge with IAM server is broken
Oracle sends notifications to the tenant admin when connectivity between AD Bridge and the IAM server is broken. Connectivity could be broken because of multiple reasons, for example if the AD Bridge is stopped or if the IAM is stopped on the Windows machine.

The notifications will have the email subject: Connectivity to AD bridge <windows machine name> is unreachable.
Notifications sent when connectivity of AD Bridge with IAM server is restored

Similarly, when connectivity is restored, an email will be sent from Oracle to the tenant administrator. The notifications will have the email subject: *Connectivity to AD bridge &lt;windows machine name&gt; is restored.*
Use REST API to Configure Email Notifications
Using the REST API, Administrators can also configure who should receive email notifications when connectivity is broken and restored.

Using REST API, the Administrator can provide comma separated list of emails IDs to which to send the notifications using PATCH /admin/v1/Settings/Settings.

Example payload:

```
{
   "schemas": [
      "urn:ietf:params:scim:api:messages:2.0:PatchOp"
   ],
   "Operations": [
      {
         "op": "replace",
         "path": "/contactEmails",
         "value": [
            "admin8oracle.com",
            "<emailid>@gmail.com"
         ]
      }
   ]
}
```
Set Permissions for Your Microsoft Active Directory (AD) Account
You use your Microsoft Active Directory (AD) domain administrator account to create an AD Bridge. Before creating this bridge, you must set permissions for your account. You must set these permissions so that you can install the bridge and configure delegated authentication for it.

With delegated authentication, identity domain administrators and security administrators don’t have to synchronize user passwords between AD and IAM. Users can use their AD passwords to sign in to IAM to access resources and applications protected by IAM.

Setting Permissions to Synchronize Users, Groups, and Group Membership
You set permissions for your Active Directory Bridge service account so that you can synchronize users, groups, or OUs between Microsoft Active Directory (AD) and Identity Domains.

1. Use your domain administrator credentials to sign in to the machine that contains your AD server.
2. Open a command window.
3. Set the Generic Read permissions for the users, groups, and organizational units (OU) in the AD domain that you want to import into Identity Domains:

   ```bash
dsacls <AD_Domain_Name> /I:T /g "<AD_Domain_Name><User/Group_Name>:GR"
   ``

   **Note:**

   - `<AD_Domain_Name>` is the name of the domain that you're associating with IAM and `<User/Group_Name>` is the username of your domain administrator account.
   - `/I:T`: This parameter specifies the objects to which you are applying the permissions. T is the default, which means you can propagate inheritable permissions to this object and child objects down to one level only.
   - `/g`: This parameter grants the permissions that you specify to the user or group. For example, `/g {<user> | <group>}:<permissions>`.
   - `<permissions>`: This parameter specifies the type of permissions that you are applying.
     - GR: Generic Read
     - GW: Generic Write
     - LC: List the child objects of the object
     - RP: Read Property

4. Set the List Children and Read properties for the `cn=Deleted Objects` container with inheritance. This container is also in the AD domain that you're associating with IAM.

   ```bash
dsacls "cn=deleted objects,<AD_Domain_Name>" /takeOwnership
dsacls "cn=deleted objects,<AD_Domain_Name>" /I:T /g "<AD_Domain_Name><User/Group_Name>:LCRP"
   ``

   **Note:**

   If you don't have the above permissions, then the AD Bridge won’t be able to synchronize deleted users, groups, or OUs between AD and IAM. This will cause inconsistencies between AD and IAM.

Setting Permissions to Propagate Changes to Microsoft Active Directory
You set permissions for your Active Directory Bridge service account so that you can propagate changes you have done in IAM to Microsoft Active Directory (AD) through the AD Bridge.

1. Use your domain administrator credentials to sign in to the machine that contains your AD server.
2. Open a command window.
3. Set the **Generic Write** permission for the users, groups, and organizational units (OU) in the AD domain, if you want to propagate the changes you have done in IAM to Active Directory.

    dsacls <AD_Domain_Name> /I:T /g "<AD_Domain_Name>\<User/Group_Name>:GW"

### Setting Permissions for Delegated Authentication

You set permissions for your Microsoft Active Directory (AD) domain administrator account so that you can configure delegated authentication for the AD Bridge.

1. Open **Active Directory Users and Computers**.
2. Right-click the user, group, or organizational unit (OU) that you want to delegate, and then click **Delegate Control**.
3. On the **Delegation of Control** wizard, click **Next**, and then click **Add**.
4. On the **Select Users, Computers, or Groups** dialog box, in the text area, enter the user name or group name that needs to be granted permissions to configure delegated authentication.
5. Click **Check Names** to verify that the user or group has been created in AD. If it hasn't been created, then create it.
6. Click **OK**, and then click **Next**.
7. Select the **Delegate the following common tasks** option, and then select **Reset user passwords and force password change at next logon**.
8. Click **Next**, and then click **Finish**.

   The next steps explain how to set specific permissions to lock and unlock user accounts.

9. Right-click on the newly modified user or group, and select **Properties**.
10. Select the **Security** tab, click **Advanced**.
11. On the Advanced Security Settings, click **Add**.
12. On the Permission Entry wizard, click **Select a principal**, and enter the same user name or group name that has been granted reset permission.
13. Click **OK**.
14. In the **Applies to** field, select **Descendant User objects**.
   
   The list of permissions allowed for the user account (Principal) displays.
15. Scroll down and enable **Read lockoutTime**, and **Write lockoutTime**.
16. Click **OK** and continue to click **OK** until the end of the setup.

   The user account now has permissions to change passwords for all the user objects present in the high-level context.

### Creating a Microsoft Active Directory (AD) Bridge

To create a Microsoft Active Directory (AD) Bridge that provides a link between your AD enterprise directory structure and IAM, you must be assigned to either the identity domain administrator role or the security administrator role. You must also have administrative rights to access the AD domain that you want to monitor by using the bridge.

Part of creating the AD Bridge is providing administrative credentials for both AD and IAM. The bridge requires these credentials to communicate with AD and IAM as an administrator.

**Important:**

The AD account used to install the AD Bridge should have the following permissions:

- **Generic Read** for the users and groups in the AD domain that you want to import into IAM
- **Generic Read** for all organizational units (OUs) in the domain
- **Generic Read** for the `cn=Configuration` container in the domain
- The **List Children** and **Read** properties for the `cn=Deleted Objects` container with inheritance
If this account is also used to configure delegated authentication for the AD Bridge, then the account should have the following permissions:

- Change Password
- Reset Password
- Read pwdLastSet
- Write pwdLastSet
- Read lockoutTime
- Write lockoutTime

You can access the Managing Security Settings infographic to see how to create an AD Bridge.

1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
2. If this is the first AD Bridge you’re creating, then click Add a Microsoft Active Directory Bridge. Otherwise, click Add.
3. In the Install Bridge page, make a note of the Identity Domains URL, Client ID, and Client Secret.
   The IAM URL contains the name and port number for your Identity Domains identity domain. The Client ID and Client Secret are used by the AD Bridge to access IAM as an administrator.
   
   Note:
   
   The Client Secret is encrypted (for security purposes). To see the Secret in clear text, click Show Secret. To regenerate the Secret for the AD Bridge, click Regenerate.

4. Click Download.
   IAM downloads the client for the AD Bridge.
   
   Note:
   
   Don’t close the Install Bridge page. You’ll need to reference the IAM URL, Client ID, and Client Secret when creating the AD Bridge.

5. To install the client for the AD Bridge, double-click the ad-id-bridge.exe file. The Welcome to AD Bridge Installer window appears.

6. In the Language Selection area, select the language that you want to use to install the client for the AD Bridge, and then click OK.
   The IAM Microsoft Active Directory Bridge Installer appears.
   
   Tip:
   
   While you’re installing the client for the AD Bridge, IAM generates log files for the bridge automatically, and stores them in the %Temp% directory.

7. If the Open File — Security Warning dialog box appears, then click Run. Otherwise, go to step 8.

8. In the Welcome dialog box, click Next.

9. In the Destination Folder dialog box, choose one of the following install choices:
   - To install the client in the default directory, click Next.
   - To select another directory to install the client:
     a. Click Browse.
     b. In the Browse For Folder dialog box, select the directory where Identity Domains will install the client.
     c. Click OK.
     d. Click Next.
10. In the Specify Proxy Server dialog box:
   a) If your organization has a firewall in place and requires communication to be handled using an HTTP Proxy Server, then select Use Proxy Server. If you select this check box, then provide the full path (or address) of the proxy server and the administrator credentials for connecting to the proxy server.
   b) If your organization doesn’t require communication to be handled using an HTTP Proxy Server, then don’t select Use Proxy Server.
   c) Click Next.

11. In the Specify Oracle Identity Cloud Service Credentials dialog box:
   a) Provide the Cloud Service URL, Client ID, and Client Secret.
      Tip: These credentials appear on the Install Bridge page of the IAM console.
   b) Click Test.
      The AD Bridge attempts to connect to the IAM server.
      If a connection can be established, then a Connection Successful! confirmation message appears.
      Otherwise, you’ll receive an error message, indicating that you entered an incorrect Cloud Service URL, Client ID, or Client Secret. Modify the incorrect values, and click Test again.
   c) Click Next.

12. In the Specify Microsoft Active Directory Credentials dialog box, provide the following connection details to the AD server:
   a) Username: The AD account that the AD Bridge uses to access the AD server.
   b) Password: The password for the AD account.
   c) Use SSL: If you’re connecting to the server via an SSL connection, then leave this check box selected. Otherwise, deselect it.
      Note: Oracle recommends that you keep the Use SSL check box selected because this results in a faster and more-secure connection. After you select or deselect this check box, and install the client for the AD Bridge, you can’t modify this setting.
   d) Click Test.
      The AD Bridge attempts to connect to the AD server.
      If a connection can be established, then a Connection Successful! confirmation message appears.
      Otherwise, you’ll receive an error message, indicating that:
      • You entered an incorrect username or password. Modify the incorrect values, and click Test again.
      • You’re attempting to connect to the AD server via an SSL connection, but the certificate for the server isn’t trusted. Make sure that this certificate is valid, and is present in the trust store of your machine. Then, click Test again.
   e) Click Next.

13. In the Summary dialog box, click Close.

    The AD Bridge that you created for the AD domain appears with a status of Partially Configured. The bridge is created, but not configured. See Configure a Microsoft Active Directory (AD) Bridge for more information about configuring this bridge.

Note: If you don't see the AD Bridge in the Directory Integrations page, then refresh your web browser. Also, you can create only one bridge per AD domain.
Configuring a Microsoft Active Directory (AD) Bridge

After creating a Microsoft Active Directory (AD) Bridge, you configure it by:

- Selecting the AD organizational units (OUs) and groups with which you want IAM to synchronize using the AD Bridge. The OUs contain the users that you want to import into IAM. By synchronizing with AD, the bridge can transfer new, updated, or deleted user or group records into IAM.
- Specifying whether, after a user or group is synchronized from AD to Identity Domains, if you activate or deactivate a user, modify the user's attribute values, or change the group memberships for the user in IAM, these changes will be propagated to AD.
- Scheduling how often you want IAM to use the AD Bridge to import users and groups from AD.
- Defining custom attribute mappings between AD and IAM.
- Specifying whether users can use their IAM or AD passwords, or their federated accounts, to authenticate into IAM to access resources that are protected by IAM, such as the My Profile console, the IAM console, or any apps assigned to the users.

You can access the Managing Security Settings infographic to see how to configure an AD Bridge.

1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
2. Click the AD Bridge that you want to configure.

   **Note:**
   
The bridge has a status of **Partially Configured**.

3. In the Configure the Microsoft Active Directory Domain page, configure the AD domain to poll for changes to users or groups in AD and import those changes into IAM.
   
a) In the Select organizational units (OUs) for users and Select organizational units (OUs) for groups panes:
   
   1. Select the Include Hierarchy check box. If you select a parent OU, then all children OUs will be selected. The OUs contain the users and groups that you want to import into IAM.
      
      OR
      
      Deselect the check box. If you select a parent OU, then children OUs won’t be selected.
   
   2. Select the check box for each OU that contains users or groups with which you want IAM to synchronize using the AD Bridge.

   **Note:**
   
   If you don’t see any OUs for users or groups in the Select organizational units (OUs) for users and Select organizational units (OUs) for groups panes, then refresh your web browser.
   
   To force a full synchronization between AD and IAM, deselect all check boxes for selected user or group OUs, click Save, and then in the Save Configuration Changes? dialog box, click OK. Then, click Import to import the users and groups from AD.

   3. Optional. In the Filter text box, enter a custom filter to search for user or group OUs. For example, entering (sn=Smith) will return all users with the last name of Smith. Or, enter (department=IT) to return the IT group.

   **Tip:**
   
   - To select all users or groups, select the Include Hierarchy check box, and then select the top-most check box in each pane.
   
   - In the Filter text box, you can’t enter more than 4,000 characters.
   
   - The wildcard character * is allowed, except when the AD Attribute is a DN attribute. For more information about AD filters, click here.
   
   - You can use the Filter text box to synchronize users from AD to IAM based on their group memberships rather than their OUs. To do
this, **don't** deselect the check boxes for the OUs. Instead, in the **Filter**
text box, provide the custom group membership filters.

- If there's a mismatch between the number of users or groups you're
  expecting to be transferred into IAM and how many users or
  groups are actually imported, then use Active Directory Users and
  Computers to test the custom filter in AD to verify that the users and
  groups brought into IAM are correct.
- The names of the users that you want to import into IAM must
  contain at least three characters. The names of the groups that you
  want to import into IAM must contain at least five characters.
- The telephone numbers of the users that you want to import must
  meet the requirements of the RFC 3966 specification.

b) In the **Supported Operations** area, choose which operations for IAM users or groups will be propagated to
AD:

- If you activate or deactivate IAM users, and you want these user activation status changes to be reflected in
  AD, then select the **Activate/Deactivate Users** check box. Otherwise, leave this check box deselected.
- If you edit attribute values for IAM users, and you want these modifications to be passed to AD, then select
  the **Update Users Attributes** check box. Otherwise, leave this check box deselected.
- If you change the groups to which IAM users belong, and you want these group membership changes to be
  propagated to AD, then select the **Update Groups** check box. Otherwise, leave this check box deselected.

c) In the **Set import frequency** area, schedule how often, in hours and minutes, you want IAM to use the AD
Bridge to import users and groups from AD.

**Important:**

During an incremental synchronization cycle, if there are more than
100,000 group membership changes in Microsoft Active Directory, then
the synchronization cycle might take more than one hour. Microsoft
Active Directory needs this time to process the change logs.

d) In the **Configure Attribute Mappings** area, click **Edit Attribute Mappings** to define custom attribute
mappings between AD and IAM. See **Define Attribute Mappings for a Microsoft Active Directory (AD)
Bridge**. Otherwise, go to step e.

e) In the **Authentication Settings** area, select **Enable local authentication** if you want users to use their IAM or
their AD passwords to authenticate into IAM to access IAM-protected resources.

If you select this option, then configure delegated authentication for this AD Bridge. By activating delegated
authentication, users transferred into IAM through the bridge will use their AD passwords to sign in to IAM.

By deactivating delegated authentication, users must use their IAM passwords to authenticate into IAM.

Also, if you select **Enable local authentication**, then keep **Don't send Welcome Notifications** deselected to
have IAM notify users by email that they must activate the IAM accounts that are created for them.

Otherwise, if you don't want users to be notified that IAM created accounts for them, then select the **Don't
send Welcome Notifications** check box.

If you want users to use their federated accounts to authenticate into IAM, then select **Enable federated
authentication**.

**Note:**

If you select this option, then configure SSO through the **Identity Providers** page.

**Important:**

By selecting **Enable federated authentication**, any user accounts
that are transferred into IAM through the AD Bridge are classified
as federated accounts. For referential integrity purposes, you can't
deactivate, remove, or change the status of these user accounts to nonfederated.

f) Click Save.

4. In the Confirmation window, click OK.
   The status of the AD Bridge changes from Partially Configured to Configured. The bridge is created and configured.

   **Important:**

   Before you use the AD Bridge to import any AD user accounts into IAM, enable the Password Never Expires option for the accounts in AD. Otherwise, the passwords for the accounts will expire. If this occurs, then you can change the passwords. See Microsoft Active Directory (AD) Bridge Limitations in Known Issues for IAM.

   **Note:**

   If you use the AD Bridge to import a group into IAM, and then delete the group in IAM, you can re-establish a link between the group in AD and the group in IAM. To do so:
   a. In the Select organizational units (OUs) for groups pane, clear the check box for the designated group, and click Save.
   b. Select the check box for the group, and click Save again.
   c. Run the AD Bridge to synchronize the group between Identity Domains and AD immediately.

### Defining Attribute Mappings for a Microsoft Active Directory (AD) Bridge

By default, when you create a Microsoft Active Directory (AD) Bridge, attribute mappings are defined between AD and IAM. Attribute mappings enable the AD Bridge to pass values associated with user accounts between AD and IAM.

You can map attributes in two different ways: inbound and outbound. Inbound mappings allow you to map attributes from AD to IAM. Outbound mappings allow you to map any changes in IAM attributes to AD attributes.

For example, when you run the AD Bridge, the bridge can use the `givenName` - First Name mapping to transfer the first name of the user account from the First name field on the General tab of the Properties window of AD to the First Name field on the Details tab of the Users page of IAM. Similarly, you can perform an outbound mapping so that when you make any change to the first name of the user account in IAM, this change is reflected in AD.

In addition to the predefined attribute mappings, you can define custom attribute mappings between AD and IAM.

1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.

2. Click the AD Bridge for which you want to define custom attribute mappings.

3. Click Configuration.

4. In the Configure Attribute Mappings area, click Edit Attribute Mappings. In the Edit Attribute Mappings window, two tabs appear:
   - **Microsoft Active Directory to Identity cloud:** This tab contains inbound attribute mappings from AD to IAM.
   - **Identity cloud to Microsoft Active Directory:** This tab contains outbound attribute mappings from IAM to AD.

5. If you want to define inbound attribute mappings, then click the Microsoft Active Directory to Identity cloud tab. Otherwise, go to step 9.
   You'll see predefined inbound mappings from AD to IAM. These mappings include:

<table>
<thead>
<tr>
<th>List of predefined attributes</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sAMAccountName</td>
<td>Yes</td>
<td>The user's user name.</td>
</tr>
<tr>
<td>List of predefined attributes</td>
<td>Required</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>givenName</td>
<td>No</td>
<td>The user's first name.</td>
</tr>
<tr>
<td>sn</td>
<td>Yes</td>
<td>The user's last name.</td>
</tr>
<tr>
<td>middleName</td>
<td>No</td>
<td>The user's middle name.</td>
</tr>
<tr>
<td>displayName</td>
<td>No</td>
<td>The user's display name.</td>
</tr>
<tr>
<td>title</td>
<td>No</td>
<td>The user's job title.</td>
</tr>
<tr>
<td>preferredlanguage</td>
<td>No</td>
<td>The user's preferred language (for example, English).</td>

</tbody>
</table>

6. Click **Add Row** because you want to define an inbound attribute mapping from AD to IAM.
7. In the **Directory User Attributes** column, select the name of the AD attribute that contains a value which you want to transfer into IAM. If the attribute id is not available in the drop-down list, you can enter the new attribute name. After you save the changes, this new attribute will appear in the drop-down list.
8. In the IAM **User Attributes** column, enter or select the name of the IAM attribute that will contain the value transferred from AD.
9. If you want to define outbound attribute mappings, then click the **Identity cloud to Microsoft Active Directory** tab. Otherwise, go to step 13.

You'll see predefined outbound mappings from IAM to AD. These mappings include:

<table>
<thead>
<tr>
<th>List of predefined attributes</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>No</td>
<td>The user's user name.</td>
</tr>
<tr>
<td>Display Name</td>
<td>No</td>
<td>The user's display name.</td>
</tr>
<tr>
<td>Work Email</td>
<td>No</td>
<td>The user's work-related email address.</td>
</tr>
<tr>
<td>First name</td>
<td>No</td>
<td>The user's first name.</td>
</tr>
<tr>
<td>Last name</td>
<td>No</td>
<td>The user's last name.</td>
</tr>
<tr>
<td>Middle name</td>
<td>No</td>
<td>The user's middle name.</td>
</tr>
</tbody>
</table>
**List of predefined attributes**  |  **Required**  |  **Description**
---|---|---
Title  | No  | The user's job title.
Locale  | No  | The user's language and region (locale)
Preferred Language  | No  | The user's preferred language (for example, English).
Work Phone number  | No  | The user's work-related telephone number.
Mobile Phone number  | No  | The user's mobile telephone number.
Work Address Formatted  | No  | The user's work-related postal address.
Work Street Address  | No  | The user's street address.
Work Locality  | No  | The user's work location.
Work Address Region  | No  | The state or region of the user's work address.
Work Address Zip Code  | No  | The zip code of the user's work address.
Work Address Country  | No  | The country of the user's work address.
Home Phone number  | No  | The user's home telephone number.

**Step 10.** Click **Add Row** because you want to define an outbound attribute mapping from IAM to AD.

**Step 11.** In the IAM User Attributes column, enter or select the name of the IAM attribute that contains a value which you want to transfer into AD.

**Step 12.** In the Directory User Attributes column, enter or select the name of the AD attribute that will contain the value transferred from IAM.

**Step 13.** Click **Save**.

**Understand Full and Incremental Sync**

You can synchronize users and groups from selected organizational units (OUs) in Microsoft Active Directory (AD) into IAM. You can perform either an incremental sync or a full sync. Learn about syncing new OUs and read some example use cases.

**Syncing New Organizational Units**

Before 20.1.3, OU sync was triggered by the Bridge every minute so that newly added OUs in Active Directory were automatically available in IAM. Starting with the 20.1.3 release, when you add a new organizational unit (OU) in Active Directory, you must perform an incremental or full sync to see the newly created OU in IAM. Oracle recommends that you to run an incremental sync when adding new OUs.

**Use Case: Unlink Users from Microsoft Active Directory (AD)**

When you perform a full sync on users from organizational units (OUs), all users in the selected OUs are synchronized in IAM. The next time you apply a filter to synchronize a specific OU, you perform an incremental sync and the users in that OU are resynchronized in IAM.

The synchronized users who were not part of the filter will be unlinked from Microsoft Active Directory (AD). The unlinked users can no longer authenticate using delegated authentication because their link to AD is removed and their authentication falls back to IAM. Any new updates to these users won't be synced to IAM. You can use IAM to reset the passwords for these users. When you request a password change for the users, IAM sends a Password Reset notification to them so that they can provide their new passwords. See <<reset passwords for user accounts>>.

If you remove the filter and synchronize these users again using full sync, then all of the users who were unlinked earlier will now be linked, and their authentication will fall back to AD.

Consider Human Resource and Marketing OUs with five users each. You are using full sync to sync them from AD to IAM. All of the users are synced in IAM.
If you want the Marketing users alone in IAM, then you can perform an incremental sync along with a filter to resync the Marketing users into IAM. All of the users who are part of the Human Resource OU are unlinked because they're not part of the filter that's used to resync users. The number of unlinked users appears in the UI.

![Image of Microsoft Directory and IAM integration]

**Use Case: Delete Users and Groups from Microsoft Active Directory (AD)**
Microsoft Active Directory (AD) is an authoritative source. Users that are deleted from AD are unlinked and deactivated in IAM. You can then remove these users from IAM.

When groups are deleted from AD, upon a full or incremental sync, these groups are also removed from IAM.

**Use Case: Reattach an Unlinked User in IAM**
Consider you want to create previously unlinked users in Microsoft Active Directory (AD) with the same usernames. When you next perform a full or an incremental sync, these users in AD are reattached to the associated users in IAM.

The reattached user's authentication will be delegated to AD if delegated authentication is activated in IAM. For example, a user is synced from multiple AD domains into IAM. All of these domains are authoritative because AD is an authoritative source. If you delete a user from one of the domains, then the user is unlinked in IAM. If you resync the user to a different AD domain, then this domain now becomes authoritative for the user.

**Running a Microsoft Active Directory (AD) Bridge**
You can run a Microsoft Active Directory (AD) Bridge to synchronize IAM with AD immediately.

As part of configuring an AD Bridge, you specified how often, in hours and minutes, you want IAM to use the bridge to import users and groups from AD. You're synchronizing IAM with your AD enterprise directory structure.

When the interval you specified elapses, IAM synchronizes with the directory structure so that any new, updated, or deleted user or group records are transferred into IAM. Because of this, the state of each record is synchronized between AD and IAM.

For security purposes, you may want to import users and groups from AD immediately. There are two types of imports that you can run:

- **Full import:** The AD Bridge polls AD and retrieves data associated with all user and groups that you selected in the Select organizational units (OUs) for users and Select organizational units (OUs) for groups panes of the Configuration tab for the bridge. This data represents users and groups that were created, modified, or removed in AD. As a best practice, Oracle recommends that you perform a full import the first time you run the AD Bridge.
Incremental import: Similar to a full import, but for this type of import, the AD Bridge polls AD and retrieves only user and group data that changed since you last used the AD Bridge to import users and groups into IAM.

By running the AD Bridge, you can propagate changes for IAM users in AD. After users are imported into IAM through the bridge, if you activate or deactivate a user, modify the user's attribute values, or change the group memberships for the user in IAM, then these changes will be reflected in AD.

You can also use the AD Bridge to view a synchronization log of the communication between IAM and AD.

1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
2. Click the AD Bridge that you want to use to import users and groups from AD.
3. Click Configuration.
4. In the Configuration tab:
   a) In the Select organizational units (OUs) for users and Select organizational units (OUs) for groups panes, select the check box for each OU that contains users or groups that you want to import.
   b) In the Supported Operations area, select check boxes to enable IAM to propagate a user's activation status, attribute values, or group memberships to AD. See Configuring a Microsoft Active Directory (AD) Bridge on page 3591 for more information about the Supported Operations area.
   c) Click Save.
      The AD Bridge propagates any changes to an IAM user's activation status, attribute values, or group memberships to AD.
5. In the Confirmation window, click OK.
6. Click Import.
7. In the Import Type window, choose whether you want to run an incremental import or a full import, and then click OK.
   IAM imports the users and groups from AD.

   **Note:**
   Based on how many users and groups you're importing, the job may take several minutes or even hours.

8. Click the Import tab. The status of the job IAM uses to import users and groups from AD is Running. After all users and groups are imported, the status changes to Success.

   Also, on this tab, you'll see a synchronization log of all traffic that occurs between IAM and AD for the current import job that ran. This includes the start date and time, and completion date and time, for the import job, how many users and groups were imported from AD successfully, and how many users and groups couldn't be imported.

   **Note:**
   If you don't see the status change after a few minutes, then click Refresh.
   Also, if the status of the job is Failed, then an error occurred while the AD Bridge was transferring users and groups from AD to IAM.

**Viewing Details About a Microsoft Active Directory (AD) Bridge**

By default, you can see the domain name and status for each Microsoft Active Directory (AD) Bridge.

You might want to see other information about the AD Bridge, such as its configuration information, attribute mappings, and a synchronization log of the communication between IAM and AD.

1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
2. Click the AD Bridge about which you want to see more information.
   • To view configuration information about the AD Bridge, click the Configuration tab. See Configure a Microsoft Active Directory (AD) Bridge.
   • To view attribute mappings for the AD Bridge, open the Edit Attribute Mappings window. See Define Attribute Mappings for a Microsoft Active Directory (AD) Bridge.
   • To view a synchronization log of all traffic between IAM and AD the last time the AD Bridge ran, click the Import tab. See Running a Microsoft Active Directory (AD) Bridge on page 3596.

Activate and Deactivate Microsoft Active Directory (AD) Bridges
You can use IAM to activate and deactivate Microsoft Active Directory (AD) Bridges:
• Deactivate: Disable the link between your AD enterprise directory structure and IAM.
• Activate: Enable the link between IAM and AD.

Using the Console
Activating a Microsoft Active Directory (AD) Bridge
You can use IAM to activate a single Microsoft Active Directory (AD) Bridge.
1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
2. Click the Action menu to the right of the domain that contains the AD Bridge that you want to activate.
3. Select Activate.
4. In the Confirmation window, click OK.
   By activating the domain, you're activating the AD Bridge associated with the domain. The status of the bridge changes from Inactive to Active.

Deactivating a Microsoft Active Directory (AD) Bridge
You can use IAM to deactivate a single Microsoft Active Directory (AD) Bridge.
1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
2. Click the Action menu to the right of the domain that contains the AD Bridge that you want to deactivate.
3. Select Deactivate.
4. In the Confirmation window, click OK.
   By deactivating the domain, you're deactivating the AD Bridge associated with the domain. The status of the bridge changes from Active to Inactive.

Activating All Microsoft Active Directory (AD) Bridges
For efficiency purposes, you can use IAM to activate all Microsoft Active Directory (AD) Bridges simultaneously.
1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
2. Click Activate All.
3. In the Confirmation window, click OK.
   By activating all domains, you're activating the AD Bridge associated with each domain. The status of each bridge changes from Inactive to Active.

Deactivating All Microsoft Active Directory (AD) Bridges
For security purposes, you can use IAM to deactivate all Microsoft Active Directory (AD) Bridges simultaneously.
1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
2. Click Deactivate All.
3. In the Confirmation window, click OK.
   By deactivating all domains, you're deactivating the AD Bridge associated with each domain. The status of each bridge changes from Active to Inactive.

Modify a Microsoft Active Directory (AD) Bridge
You can change the following items for a Microsoft Active Directory (AD) Bridge:
• The AD users and groups that you want IAM to import using the AD Bridge.
• Whether, after a user or group is synchronized from AD to IAM, if you activate or deactivate a user, modify the user's attribute values, or change the group memberships for the user in IAM, these changes will be propagated to AD.
• How often you want IAM to use the AD Bridge to import users and groups from AD.
• The predefined and custom attribute mappings defined between AD and IAM.
• Whether users can use their AD or their IAM passwords, or their federated accounts, to sign in to IAM to access resources protected by IAM, such as the My Profile console, IAM console, and apps assigned to the users.

Note:
You can upgrade the client for the AD Bridge. By doing this, you can install the latest client without removing the existing client that's installed.

To upgrade the client, download it and follow the instructions in Create a Microsoft Active Directory (AD) Bridge. When you see the Specify Oracle Identity Cloud Service Credentials or the Specify Microsoft Active Directory Credentials dialog boxes, the client will use the credentials you provided in the previous installation. For this reason, the values are greyed out so they can't be edited.

Using the Console

Modifying a Microsoft Active Directory (AD) Bridge

You can use the Directory Integrations page to modify a Microsoft Active Directory (AD) Bridge.

1. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
2. Click the AD Bridge that you want to modify.
3. To edit configuration information about the AD Bridge, go to step 4. Otherwise, go to step 5.
4. Click Configuration.
   a) In the Select organizational units (OUs) for users and Select organizational units (OUs) for groups panes, select or deselect check boxes to enable or prevent IAM from importing users and groups using the AD Bridge.
      See Configure a Microsoft Active Directory (AD) Bridge for more information about the Select organizational units (OUs) for users and Select organizational units (OUs) for groups panes.
   b) In the Supported Operations area, select or deselect check boxes to enable or prevent IAM from propagating changes for a user's activation status, attribute values, or group memberships to AD.
      See Configure a Microsoft Active Directory (AD) Bridge for more information about the Supported Operations area.
   c) In the Set import frequency area, change how often you want IAM to use the AD Bridge to import users and groups from AD.
   d) In the Configure Attribute Mappings area, click Edit Attribute Mappings. The Edit Attribute Mappings window opens and two tabs appear:
      • Microsoft Active Directory to Identity cloud: In this tab, you can modify inbound attribute mappings from AD to IAM.
      • Identity cloud to Microsoft Active Directory: Use this tab to modify outbound attribute mappings from IAM to AD.

1. Click the Microsoft Active Directory to Identity cloud or Identity cloud to Microsoft Active Directory tab.
2. In the Directory User Attributes and IAM User Attributes columns, change the AD or IAM attribute used for the predefined or custom attribute mapping.
3. To remove an attribute mapping, click the X button to the right of the mapping.

Note:
Inbound attribute mappings with asterisks in the Microsoft Active Directory to Identity cloud tab are required by the AD Bridge to
pass values associated with AD user accounts into IAM so that the accounts can be created in IAM. You can't delete these mappings.

4. Click **Save** to close the Edit Attribute Mappings window.

See Define Attribute Mappings for a Microsoft Active Directory (AD) Bridge for more information about the Directory User Attributes and IAM User Attributes columns of the Microsoft Active Directory to Identity cloud and Identity cloud to Microsoft Active Directory tabs of the Edit Attribute Mappings window.

e) In the Authentication Settings area, select the Enable local authentication option if you want users to use their IAM or their AD passwords to sign in to IAM to access IAM-protected resources.

If you select this option, then configure delegated authentication for the AD Bridge. See Configure a Microsoft Active Directory (AD) Bridge.

If you select **Enable local authentication**, then select or deselect **Don't send Welcome Notifications** to enable or prevent IAM from notifying users by email that they must activate the IAM accounts that are created for them.

Otherwise, select **Enable federated authentication** to have users use their federated accounts to sign in to IAM.

f) Click **Save**.

g) In the Confirmation window, click **OK**.

See Configure a Microsoft Active Directory (AD) Bridge for more information about the areas of the Configuration tab.

Removing a Microsoft Active Directory (AD) Bridge
You can use IAM to remove a Microsoft Active Directory (AD) Bridge.

1. In the IAM console, expand the **Navigation Drawer**, click **Settings**, and then click **Directory Integrations**.

2. Click the Action menu to the right of the domain that contains the AD Bridge that you want to remove.

3. Select **Remove**.

4. In the Confirmation window, click **OK**.

By removing the domain, you’re removing the AD Bridge associated with the domain. To ensure that your bridge is deleted cleanly and completely, you must delete the client associated with the bridge.

5. Double-click the **ad-id-bridge.exe** file.

The IAM Microsoft Active Directory Bridge Installer appears.

6. In the Welcome dialog box, click **Next**.

7. In the **Removal Completed** dialog box, click **Close**.

---

**Important:**

If you can't remove the client for the AD Bridge or the bridge still appears in the **Directory Integrations** page, then complete the following steps:

1. Run the following CURL command to obtain the Client ID that you used to install the client for the AD Bridge:

   ```bash
   curl -X GET \\n   <Identity_Cloud_Service_URL>/admin/v1/IdentityAgents \\
   -H 'Authorization: Bearer <access_token>
   
   <Identity_Cloud_Service_URL> is a placeholder for the IAM URL that you used to install the client for the bridge, and
   ```
IAM

<access_token> is a placeholder for the access token that contains the authorization credentials that are required to obtain the Client ID.

See the IAM: First REST API Call tutorial to learn how to get this access token.

A list of AD Bridge clients that are installed for your identity domain appears.

2. From this list, find the Client ID of the AD Bridge that you want to remove.

3. Run the following CURL command to remove the client for the AD Bridge:

   curl -X DELETE \
   <Identity_Cloud_Service_URL>/admin/v1/\n   IdentityAgents/<Client_ID> \
   -H 'Authorization: Bearer <access_token>

<Client_ID> represents the ID of the client for the AD Bridge that you want to remove.

A 204 (No Content) response appears, signifying that you removed the client for the bridge.

Understand Best Practices for the Microsoft Active Directory (AD) Bridge

This section contains best practices so that the Microsoft Active Directory (AD) Bridge runs optimally.

Creating and Managing Log Files for the Microsoft Active Directory (AD) Bridge

After you install and configure the Microsoft Active Directory (AD) Bridge, you may want to access the log files for troubleshooting purposes. You can locate these files in the %ProgramData%\Oracle\IDBridge\logs directory.

To modify the log level of the log files for the AD Bridge:

1. Navigate to the %ProgramFiles%\Oracle\IDBridge directory.
2. Using a text editor, open the log4net.config file.
3. In the file, locate the following line of code: <level value="info" />
4. Change the value of the level value parameter to one of the following log levels:

<table>
<thead>
<tr>
<th>Log Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Capture all events.</td>
</tr>
<tr>
<td>debug</td>
<td>Capture fine-grained informational events that are most useful to debug the AD Bridge.</td>
</tr>
<tr>
<td>error</td>
<td>Capture error events that might still allow the AD Bridge to continue running.</td>
</tr>
<tr>
<td>fatal</td>
<td>Capture severe error events that will result in the AD Bridge no longer running.</td>
</tr>
<tr>
<td>info</td>
<td>Capture informational events that highlight the progress of the AD Bridge at a coarse-grained level.</td>
</tr>
<tr>
<td>off</td>
<td>Turn off logging.</td>
</tr>
<tr>
<td>trace</td>
<td>Capture finer-grained informational events than the debug log level.</td>
</tr>
<tr>
<td>warn</td>
<td>Capture potentially harmful situations to the AD Bridge.</td>
</tr>
</tbody>
</table>

5. Save and close the log4net.config file.
Maintain the Microsoft Active Directory (AD) Bridge
Maintaining the Microsoft Active Directory (AD) Bridge includes transferring the bridge to another machine and restarting the bridge.

Transferring the Microsoft Active Directory (AD) Bridge
After you have setup a Microsoft Active Directory (AD) Bridge, you can transfer that bridge to another machine.

Note:
If you can't remove the client for the AD Bridge or the bridge still appears in the Directory Integrations page, then follow the procedure in Removing a Microsoft Active Directory (AD) Bridge on page 3600.

1. From the original machine, access the Control Panel, and uninstall the client for the AD Bridge.
2. On the other machine, install the client. See Create a Microsoft Active Directory (AD) Bridge.
3. In the IAM console, expand the Navigation Drawer, click Settings, and then click Directory Integrations.
4. Verify that the AD Bridge appears in the other machine with an Active status. This bridge can now be used to synchronize with your AD enterprise directory structure.

Restarting the Microsoft Active Directory (AD) Bridge
If the Microsoft Active Directory (AD) Bridge stops unexpectedly, then you can restart it.

1. Click Start.
2. In the text box, enter Services, and then press Enter.
   The Services window appears. This window contains a utility that's used to manage daemon processes within the Windows OS. These processes include the back-end service that’s used to establish communication between IAM and AD.
3. Click Services (Local), click the Standard tab, scroll down the list of services, right-click Oracle Identity Cloud Service Microsoft Active Directory Bridge Service, and then click Start.
4. Verify that Running appears as the status for the service.

Managing User Capabilities for Federated Users
This topic describes managing user capabilities for federated users when your tenancy is federated and configured for user provisioning with a supported identity provider.

About User Capabilities
To access Oracle Cloud Infrastructure, a user must have the required credentials. Users who need to use the Console, must have a password. Users who need access through the API need API keys. Some service features require additional credentials, such as auth tokens, SMTP credentials, and Amazon S3 Compatibility API keys. For a user to get these credentials, the user must be granted the capability to have the credential type.

User capabilities are managed by an Administrator in the user's details. Each user can see their capabilities, but only an Administrator can enable or disable them. The user capabilities available to federated users are:

- API keys
- auth tokens
- SMTP credentials
- customer secret keys
- OAuth 2.0 client credentials

By default, these capabilities are enabled when you provision new users, allowing users to create these credentials for themselves. For information about these user credentials, see User Credentials on page 3086.
Important:

The capability "Console password" is not available for federated users. Federated users authenticate to the Console through their IdP, where their sign-in passwords are managed.

Required IAM Policy

If you're in the Administrators group, then you have the required access for managing user capabilities. A user can't enable or disable user capabilities for themselves (except for Administrators). However, a user can manage their own credentials that have been enabled for them.

Viewing Provisioned Federated Users in the Console

After the prerequisites are satisfied, you can view users that you create in your IdP that belong to groups mapped to Oracle Cloud Infrastructure groups. Whenever you add a user to a group mapped to an Oracle Cloud Infrastructure group, the user automatically displays in the Console.

To list users in the Console:

Open the navigation menu and click Identity & Security. Under Identity, click Users.

Notice that you can filter the list by user type to include only users that belong to a specified identity provider. Local Users are users created in Oracle Cloud Infrastructure's IAM service. The filter list includes all identity providers you have set up.

Using the Console

To edit user capabilities

If you're an Administrator, you can edit user capabilities.

1. Open the navigation menu and click Identity & Security. Under Identity, click Users. A list of the users in your tenancy is displayed.
2. Click the user to see its details.
3. Click Edit User Capabilities.
4. Select or clear the check box to add or remove a capability.
5. Click Save.

Changing a user's description

1. Open the navigation menu and click Identity & Security. Under Identity, click Users. A list of the users in your tenancy is displayed.
2. Click the user you want to update. The user's details are displayed. The description is displayed under the user's login.
3. Click the pencil next to the description.
4. Edit the description and save it. This description is maintained in Oracle Cloud Infrastructure and is not synched back to your identity provider.

Applying tags to a user

For instructions, see Resource Tags on page 239.

Deleting a user

1. Open the navigation menu and click Identity & Security. Under Identity, click Users. A list of the users in your tenancy is displayed.
2. Find the user you want to delete and click the Actions menu.
3. Click Delete.

Important: Deleting a user here does not delete the user in your IdP. If you later want the federated user to have a provisioned user in Oracle Cloud Infrastructure, you must remove the user from all OCI-mapped groups in Oracle Identity Cloud Service and re-add the user.
For information about managing user credentials in the Console, see User Credentials on page 3086.

**Using the API**

For information about using the API and signing requests, see REST APIs on page 6275 and Security Credentials on page 205. For information about SDKs, see Software Development Kits and Command Line Interface on page 6094.

Use these API operations to manage user capabilities:

- ListUsers
- GetUser
- UpdateUser: You can update the user capabilities and the user's description.
- UpdateUserCapabilities
- DeleteUser: This operation deletes the provisioned user in Oracle Cloud Infrastructure, but not the user in the identity provider.

For information about the API operations for managing user credentials, see User Credentials on page 3086.

The following operations are not supported for federated users:

- ListUserGroupMemberships
- AddUserToGroup
- GetUserGroupMembership
- RemoveUserFromGroup

**Managing Application Integrations**

Manage application integration.

**Setting Up RADIUS Proxy**

Remote Authentication Dial In User Service (RADIUS) is a network protocol that defines rules and conventions for communication between network devices. RADIUS Proxy authenticates and authorizes users or devices and also tracks the usage of those services.

**Required Policy or Role**

To set up and validate RADIUS Proxy, you must have one of the following access grants:

- Be a member of the Administrators group
- Be granted the Identity Domain Administrator role or the Security Administrator role
- Be a member of a group granted manage domains

To understand more about policies and roles, see The Administrators Group, Policy, and Administrator Roles on page 3074, Understanding Administrator Roles on page 3246, and Understanding Policies on page 3249.

**RADIUS Proxy Log Files and Configuration Information**

Note the following RADIUS Proxy file locations for log and configuration information. This information can be useful for troubleshooting.

<table>
<thead>
<tr>
<th>Installer Logs</th>
<th>&lt;radius_proxy_installer_location&gt;/oracle_radius_proxy/_Oracle/Identity/Cloud/Service/RADIUS/Proxy_installation/Logs/</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent Logs</td>
<td>&lt;radius_proxy_installer_location&gt;/oracle_radius_proxy/radius_agent/logs/agent.log</td>
</tr>
<tr>
<td>Proxy logs</td>
<td>&lt;radius_proxy_installer_location&gt;/oracle_radius_proxy/radius_proxy/log/radius_proxy.log</td>
</tr>
<tr>
<td>Proxy Configuration</td>
<td>&lt;radius_proxy_installer_location&gt;/radius_proxy/conf/radius_proxy.conf</td>
</tr>
</tbody>
</table>
**RADIUS Proxy Trouble Shooting**

Learn about common problems that you might encounter when using RADIUS Proxy and learn how to solve them.

/sbin/service idcs_radiusd is stopped

Use the following steps when you see that the status of /sbin/service idcs_radiusd is stopped.

1. Check that the radius agent is running by using the following Python command:
   ```bash
   <radius_proxy_installer_location>/oracle_radius_proxy/radius_agent/scripts/src/radius_agent.py status
   ```

2. If the status is running, check the agent logs at:
   ```bash
   <radius_proxy_installer_location>/oracle_radius_proxy/radius_agent/logs/agent.log
   ```

   If you see the following exception in the RADIUS Proxy logs (<radius_proxy_installer_location>/oracle_radius_proxy/radius_proxy/log/radius_proxy.log) file:
   ```
   Exception in thread "main" java.net.BindException: Cannot assign requested address at sun.nio.ch.Net.bind0(Native Method)
   ```

   The solution is to ensure that the host entry is correct in RADIUS Proxy listener.

**RADIUS Proxy Known Issues**

Learn about RADIUS Proxy known issues you might encounter.

**Changes in the RADIUS Proxy Configuration**

If any RADIUS Proxy configuration is changed in IAM, restart RADIUS Agent and RADIUS Proxy by completing the following steps so that the new configuration is reflected.

1. `<radius_proxy_installer_location>/oracle_radius_proxy/radius_agent/scripts/src/radius_agent.py restart`

2. Verify if the configuration is updated in: `<radius_proxy_installer_location>/radius_proxy/conf/radius_proxy.conf` or `<radius_proxy_installer_location>/radius_proxy/conf/radius_clients.conf`

3. `/sbin/service idcs_radiusd restart`

**Change an IP Address from CIDR Format**

You can't add an IP address in CIDR format using the IAM user interface. If the IP address of the Oracle Database is in CIDR format, use the following request from the Postman collection. Go to RADIUS Proxy, RADIUS App, Modify, and then Update RADIUS App (IP Address in CIDR format).

```
PATCH: {{HOST}}/admin/v1/Apps/{{appid}}
{
   "schemas": [
      "urn:ietf:params:scim:api:messages:2.0:PatchOp"
   ],
   "Operations": [{
      "op": "replace",
      "value": "10.34.0.0/16"
   }]
}
```
The Postman collection is contained in a single Postman collection file and organized into folders within the collection. Folders are organized based on use cases, use scenarios, and so on, and include variations of API use. Download the collection and environment files from GitHub and import them into Postman.

**Using the Console**

*Setting up RADIUS Proxy*

Install, setup, and test RADIUS Proxy.

**Before You Begin:**

- Install the latest Postman client.
- Download the RADIUS Proxy Postman collection.
- Review these checkpoints. As you're setting up RADIUS Proxy, use the following checkpoints to verify that your configuration is correct at each step of the process.

1. Check that the RADIUS Proxy and the RADIUS Proxy Client App are activated in the identity domain.
2. Check the IP address of Database and port number of RADIUS Proxy are correctly configured in the RADIUS App.
3. Check that the RADIUS Agent is up and running.
4. Check that the proxy server is up and running.
5. Check that the database is up.

1. Download the latest RADIUS Proxy Installer from the Downloads page in the identity domain console.
   a) Open the navigation menu and click **Identity & Security.** Under **Identity**, click **Domains.** Select the identity domain you want to work in and click **Settings** and then **Downloads.**
   b) Choose **Oracle Identity Cloud Service RADIUS Proxy for Linux**, and then click **Download.**

2. Create the RADIUS App from the RADIUS App Template. Note: For REST go to RADIUS Proxy, RADIUS App, Search, and then Search all apps (with search criteria).
   a) In the identity domain console, click **Applications, Add**, and then **App Catalog.**
   b) Search for the **Oracle Database Radius App Template** and click **Add.**
   c) Complete the App details similar to the following example.

   - **Name:** dbserver
   - **Description:** App representing the Oracle database server as a RADIUS client
   - **IP Address of Oracle Database server:** 10.242.230.122 (This IP address is where the database is installed.)
   - **Port of RADIUS Proxy:** 1812 (The port number on which RADIUS Proxy listens for requests from this Oracle database. The same port number must be configured in the RADIUS settings of Oracle Database.)
   - **Secret key:** testing123 (The secret key used to secure communication between RADIUS Proxy and the Oracle Database server. The same key must be configured in the RADIUS settings of Oracle Database.)
   d) Click **Add, Activate**, and then click the **Users** tab.

### Note:

Assign the users who are allowed to sign in to Oracle Database, to this Radius App by clicking Assign Users. Instead of assigning individual users, a Group which contains those users, can also be assigned. Click the Groups tab, and then Assign Groups.

Note: Create the group name in the identity domain according to the following format defined in Step 3C: Configure the RADIUS Server in Configuring RADIUS Authentication:

```{ora_databaseSID_rolename}[_[A]|_[D]]```

For every role in Oracle database to be identified by IAM, create a corresponding group using the format above. Assign a user to this group in IAM so that the respective database user is associated with the respective database role.
3. Create a RADIUS Proxy in IAM.
   a) Register a Client Application. See Register a Client Application.
   b) Open Postman and import the `RADIUS Proxy.postman_collection.json` collection to make the REST requests in this section.
   c) Import the `RADIUS Proxy Example Environment with Variables.postman_environment.json` environment file which contains the environment variables used in the collection.
   d) Set the following environment variables.

   For HOST, use the IAM address, for example, https://example.identity.acmecorp.com.

   For CLIENT_ID and CLIENT_SECRET, use the values that you copied above.

   **Note:** Other environment variables are automatically set when REST requests are made. Ensure that following REST requests are made in the same order.

   e) Obtain an access token. To make API calls to IAM, you must authenticate your client against IAM, and then obtain an OAuth access token. The access token provides a session between a client (in this case, Postman) and IAM. By default, the access token has a timeout interval of 60 minutes, and then you must request a new access token to perform additional REST API calls. To obtain an OAuth access token, make the request in the Postman collection under RADIUS Proxy, OAuth Token, and then Obtain access_token (client credentials).

   f) Create the RADIUS Proxy by using a POST Operation. Go to RADIUS Proxy, Create, and then Create a RADIUS Proxy.

   **End point:** admin/v1/RadiusProxies/ {{RPid}}

   ```json
   {
     "displayName": "Acme RADIUS Proxy",
     "description": "This is a RADIUS Proxy used for authentication of database users",
     "type": "proxy",
     "timeout": 20,
     "noOfWorkerThreads": 10,
     "schemas": 
   }
   ```

   g) Use this Patch Operation to activate the RADIUS Proxy. Go to RADIUS Proxy, Lifecycle, and then Activate a RADIUS Proxy.

   **End point:** /admin/v1/RadiusProxies/{{RPid}}

   ```json
   {
     "Operations": [
       {
         "op": "replace",
         "path": "active",
         "value": true
       },
       "schemas": [
         "urn:ietf:params:scim:api:messages:2.0:PatchOp"
       ]
     }
   }
   ```

   h) Create the RADIUS Proxy Listener using a POST Operation. Go to RADIUS Proxy, RADIUS Proxy Listeners, Create, and then Create a RADIUS Proxy Listener.

   **End point:** {{HOST}}/admin/v1/RadiusProxyListeners

   ```json
   {
     "description": "Brief description for this RADIUS Proxy Listener."
   }
   ```
i) Get the dbserver App ID. Perform a GET call on admin/v1/Apps?filter=displayName eq "dbserver". Fetch the App ID from the response of this GET call. Go to RADIUS Proxy, RADIUS App, Search, and then Search all apps (with search criteria).
You can also get the App ID from the URL of the dbserver.

j) Create a RADIUS Proxy Mapping using a POST Operation. Go to RADIUS Proxy, RADIUS Proxy Mappings, Create, and then Create a RADIUS Proxy Mapping.

End point: {{HOST}}/admin/v1/RadiusProxyMappings/

Note:
For "value" below, the ID is the ID of Radius Proxy which you created above.

```json
{
  "description": "RADIUS Proxy mapping for Database server",
  "radiusProxy": {
    "value": "<RadiusProxyID>"
  },
  "radiusApp": {
    "value": "<ID of RADIUS App obtained above.>"
  },
  "schemas": [
  ]
}
```

k) GET client_id and clientSecret of the RADIUS Proxy. The client_id and clientSecret are required during RADIUS Proxy installation. RADIUS Proxy uses these credentials to authenticate with IAM. Go to RADIUS Proxy, Search, Create, Get client ID, and client secret of the App corresponding to RADIUS Proxy.

End point: {{HOST}}/admin/v1/Apps/{{RPOAuthClientAppId}}?attributes=clientSecret,name

RPOAuthClientAppId is the ID of the App corresponding to RADIUS Proxy. You can find it in the response [response.oauthClient.value] in step 3f, Create a RADIUS Proxy Mapping using a POST Operation.

Response:

```json
{
  "isAliasApp": false,
  "basedOnTemplate": {
    "value": "RadiusProxyAppTemplateId"
  },
  "displayName": "Acme RADIUS Proxy",
  "name": "<client id>",
  "id": "75d525ce49ee469ba4dcac00bdfe6446",
  "clientSecret": "<client secret>"
}
```
4. Run the Installer.
   a) Unzip the downloaded idcs_radius_proxy-xxxx.zip file into a folder.
   b) Name the folder `<radius bin location-xxxx>`. Where `xxxx` is the version number (for example, 20.1.3).
   Three files are extracted: `FileInfo.json`, `idcs_radius_proxy_installer.bin`, and `InstallerValidation.jar`. The `InstallerValidation.jar` file and the `idcs_radius_proxy_installer.bin` file are located in the same directory post extraction. They must remain in the same directory.
   c) Login as root user or run the following command as sudo: `./idcs_radius_proxy_installer.bin`

   **Note:**
   The installer supports only Graphical User Interface mode. It does not support console mode. So, if you see the error: "Graphical installers are not supported by the VM.", then ensure `X server` is configured properly. Then, run this command as non root user: `xhost +si:localuser:root` and run installer again.

5. Install RADIUS Proxy.
   a) Read the Welcome screen, and then click Next.
   b) Read the Information screen, and then click Next.
   c) Select the Destination Folder (default is `/root/oracle_radius_proxy`), where the RADIUS Proxy installer will be installed. Click Next.
   d) On the HTTP Proxy screen, select Use HTTP Proxy if RADIUS Proxy needs to use HTTP proxy to connect to IAM. If not, then leave this check box unchecked. Click Next.
   e) On the IAM screen, enter the Cloud Service URL in the following format: `https://tenant-base-url`. Provide the Client ID and Client Secret of the RADIUS Proxy created in IAM. (This is the RADIUS Proxy you created using the POST Operation above.) Click Next.
   f) On the RADIUS User and Group Information screen, provide the Username and user Group information, for example:
      - Username: `<client>`
      - Group: `<dba>`
      IAM RADIUS Proxy daemon will run under the specified username and group.
   g) Click Next.
   h) On the preinstall screen, verify that all the information is correct. If the information is correct, click Install.
   i) When the installation is complete, click Done.

6. Check that the RADIUS Agent and RADIUS Proxy are running. The RADIUS Agent obtains configuration data from IAM at regular intervals. Then, it updates the configuration files used by RADIUS Proxy.
   a) Use the following RADIUS Agent commands to check whether the agent is running:
      - python `<RADIUS_PROXY_INSTALLER_LOCATION>/oracle_radius_proxy/radius_agent/scripts/src/radius_agent.py status`
      - You can also use stop, start and restart if needed.
   b) Use the following command to run RADIUS Proxy: `/sbin/service idcs_radiusd start`
   c) Run these RADIUS server commands to verify that the RADIUS service is RADIUS running.
      - `/sbin/service idcs_radiusd status`
      - You can also use stop, start, and restart if needed.
7. (Optional) Use the NTRadPing Test Utility to validate that RADIUS proxy is working.
   a) Install the NTRadPing Test Utility in Windows, and then create a User in IAM.
   b) Use the below screenshot as an example. In the below screenshot **client** is the user created in IAM and **testing123** is the secret key given in RADIUS Settings. **Secret key** of **App Details** page.

   ![NTRadPing Test Utility in Windows](image)

   **Figure 13: NTRadPing Test Utility in Windows**

8. Set up and Configure Oracle Database 12c. Follow the instructions at Configuring Authentication and then use the following commands to create a user/role in the database.

9. Set up and Configure Oracle Database 12c. For more information, see Configuring RADIUS Authentication. Follow the instructions in the Configuring RADIUS Authentication section to create a user and role in the database.

   ```sql
   sqlplus /@orclpdb
   Alter system set OS_ROLES=TRUE scope=spfile;
   Alter system set OS_AUTHENT_PREFIX='' scope=spfile;
   create user ckent identified externally;
   create role dblogin identified externally;
   create role dbreadtable identified externally;
   grant create session to dblogin;
   grant select on system.help to dbreadtable;
   ```

10. You can't add an IP address in CIDR format using the IAM user interface. If the IP address of the Oracle Database is in CIDR format, use the following request from the Postman collection. See Change an IP Address from CIDR Format on page 3605.

11. Set up MFA. To set up MFA follow these instructions, see Managing Multi-Factor Authentication on page 3690.

### Understanding App Gateway

App Gateway is a software appliance that enables you to integrate applications hosted either on a compute instance, in a cloud infrastructure, or in an on-premises server with IAM for authentication purposes.

App Gateway acts as a reverse proxy protecting web applications by restricting unauthorized network access to them. App Gateway intercepts any HTTP request to these applications and ensures that the users are authenticated with Identity Domains before forwarding the request to these applications. App Gateway propagates the authenticated user's identity to the applications.

If the user isn't authenticated with IAM, then App Gateway redirects the user to identity domain's Sign In page for credential validation.

Use App Gateway to:
• Integrate enterprise applications hosted either on-premises or in a cloud infrastructure with IAM for authentication purposes.

For example, if you have a web application hosted on-premises or in a cloud infrastructure, you can integrate this application with any other cloud-based applications for single sign-on. Use App Gateway to integrate your web application with IAM, and then ensure that the other cloud-based applications use IAM as their authentication mechanism. All these applications make use of the single sign-on provided by IAM.

• Expose intranet web applications to internet access.

If your web application is hosted and accessed over your intranet and you want to expose access to this application over the internet, use App Gateway to proxy any internet request and to require users to authenticate with IAM before accessing your intranet web application. In this case, you deploy App Gateway in your network DMZ while your application remains in the intranet zone.

• Integrate with applications that lack a native authentication mechanism and don’t support SAML federation, OAuth, or OpenID Connect integration methods.

If your application doesn’t support the standards for authentication that IAM supports (SAML, OAuth, and OpenID Connect), and you can’t use IAM’s SDKs in your application, then you can use App Gateway to integrate your web application with IAM.

• Integrate with applications that support the HTTP Header-based authentication.

For web applications that support HTTP Header-based authentication, the App Gateway integration method requires no change to the web application’s source code. You must configure the application’s authentication policies in IAM to add header variables in the request before App Gateway forwards the request to the application. By doing so, the application can identify the user authenticated with IAM.

**How does App Gateway work?**

The App Gateway is deployed within a customer’s infrastructure, regardless of whether the infrastructure is in the cloud, on-premises, or a hybrid one.

The App Gateway works as a reverse proxy, intercepting all requests from the client to the application. The App Gateway then verifies if a user is already logged in to IAM. If the user has logged in, then App Gateway adds header variables to the request so that the application being protected can access the header variable. The application trusts App Gateway has identified the signed in user in identity domain values and create the user session.

Ensure that the communication between App Gateway and application is secure to avoid changes in the header variable values before the request is sent to the application.

The following steps explain the form-based authentication flow between the web browser, App Gateway, and an enterprise application:
1. In a web browser, a user requests access to an application through a URL exposed by App Gateway.
2. App Gateway intercepts the request, verifies that the user doesn't have a session with IAM, and then redirects the user's browser to the **Sign In** page.

   In step 2, if the user has a session with IAM, it means that the user has already signed in. If so, then an access token is sent to App Gateway, and then the remaining steps are skipped.
3. IAM presents the **Sign In** page or whichever sign-in mechanism has been configured for the domain.
4. The user signs in to IAM.
5. Upon successful authentication, IAM creates a session for the user and issues an access token to App Gateway.
6. App Gateway uses the token to identify the user. It then adds header variables to the request and forwards the request to the application.
7. The application receives the header information, validates the user's identity, and starts the user session.

App Gateway intercepts any subsequent request to the application's protected resources. App Gateway identifies the user, adds header variables to the request, and forwards the request to the application.

To sign out, the user calls an application's logout URL. The App Gateway identifies the logout URL and redirects the user to the identity domain's OAuth log out endpoint (/oauth2/v1/userlogout). After IAM signs the user out, IAM can redirect the user's browser to a URL of the application which can then remove the application's user session.

**Set up high availability**

Use a load balancer to achieve high availability for multiple instances of App Gateway.

If high-availability is a requirement to access your web application, you can have multiple App Gateways, configure each of them to integrate with IAM, and use a load balancer to balance the request among the App Gateway instances.

This architecture diagram shows the components required for high availability.
This architecture requires that you install and configure more than one instance of App Gateway. Each App Gateway instance is configured to link to the same IAM URL, and to use the same Client ID and Client Secret from the App Gateway registration in IAM console.

Use a load balancer to distribute request between the App Gateway instances.

Also, the load balancer must perform health checks by way of HTTP with HTTP keepalives enabled for a duration that exceeds the health check interval. This prevents the load balancer from redirecting browser requests to an offline App Gateway instance.

The health check endpoint of App Gateway is /cloudgate/v1/about.
**Set up App Gateway**
Download the App Gateway binary file, install the App Gateway server, register the App Gateway using the console, configure the App Gateway server, assign an enterprise application, start the App Gateway server, and test the access to the application through App Gateway.

**Using the Console**

**Downloading and extracting the App Gateway binary file**
The App Gateway binary file you download from the IAM console is a compressed (.zip) file. This file contains an Open Virtual Appliance (.ova) file which you use to install the App Gateway server.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Settings** and then **Downloads**.
3. In the **Downloads** page, click **Download** to the right of **App Gateway for Oracle Identity Cloud Service**.
4. Verify that a **Success** status appears to the right of **App Gateway for Oracle Identity Cloud Service**.
5. Extract the content of the zip file you downloaded to a location on your desktop. For Example, c:\temp. The c:\temp\app-gateway-<version>.ova file is created.

**Note:**
The **App Gateway for Oracle Identity Cloud Service** doesn't replace the **App Gate for Oracle Identity Cloud Service**. The **App Gateway for Oracle Identity Cloud Service** software is based on NGINX web server and is used to protect access of enterprise applications. The **App Gate for Oracle Identity Cloud Service** software is an OEM product that has similar but not the same features.

Install App Gateway on Oracle Cloud Infrastructure
To install App Gateway on Oracle Cloud Infrastructure, you need to upload the App Gateway virtual disk image file to a **Bucket** in Oracle Cloud Infrastructure, create a **Custom Image** using the App Gateway virtual disk image file, and then create a **Compute** instance based on this custom image.

Uploading the App Gateway VM disk image file to an object storage bucket in Oracle Cloud Infrastructure
Before creating a compute instance on Oracle Cloud Infrastructure to run App Gateway, you need create a **Virtual Machine Disk Image** (VMDK) file using the App Gateway Open Virtual Appliance (OVA) file, and then upload this VMDK file to Oracle Cloud Infrastructure.

To create the VMDK file, follow the procedure to import the App Gateway's Open Virtual Appliance (OVA) file using Oracle VM Virtual Box software, but don't start the machine or configure port forward rule for it.

1. Open the navigation menu and click **Storage**. Under **Object Storage**, click **Buckets**.
2. Select the compartment where the bucket is to upload the image. Click **Create Bucket**, click **Create Bucket** in the **Create Bucket** dialog, and then click the name of the bucket you created.
   Contact your Oracle Cloud Infrastructure administrator for more information about which compartment to create buckets.
3. On the **Bucket Detail** page, click **Upload Object** in the **Objects** section.
4. Click **select files** to browse and open the App Gateway's VMDK file, and then click **Upload Objects**.
5. After the file uploads, click **Close**.
6. Click the menu on the right for your object entry, and then record the **URL Path (URI)** value.

Creating a custom image in Oracle Cloud Infrastructure based on the App Gateway VM disk image file
To create a compute instance on Oracle Cloud Infrastructure to run App Gateway, you need to create a custom image from the App Gateway's Virtual Machine Disk Image (VMDK) file you uploaded to a bucket on Oracle Cloud Infrastructure.

Ensure your Oracle Cloud Infrastructure account has compartments, a virtual cloud network, and subnets previously set up.

Ensure you have selected a compartment in Oracle Cloud console, before proceeding.
Note:
The components design must align with your Oracle Cloud Infrastructure operational model. Contact your Oracle Cloud Infrastructure administrator for more information.

1. Open the navigation menu and click Compute. Under Compute, click Custom Images.
2. Select the same compartment where you uploaded your VMDK file, and then click Import Image.
3. In the Import Image dialog box, enter or select the following values, and then click Import Image.
   - CREATE IN COMPARTMENT: Select the compartment to import the image. The compartment must be the same where your compute instance is created.
   - NAME: App Gateway Custom Image
   - OPERATING SYSTEM: Select Linux.
   - OBJECT STORAGE URL: Enter the URL path you recorded after you uploaded the VMDK file.
   - IMAGE Tipo: Select VMDK.
   - LAUNCH MODE: Select EMULATED MODE.

Wait until the custom image creation finishes.

Creating a compute instance using App Gateway's custom image
After you uploaded the App Gateway's Virtual Machine Disk Image (VMDK) file to a bucket in Oracle Cloud Infrastructure and created a custom image using this VMDK file, you can create a compute instance to run App Gateway.

1. Open the navigation menu and click Compute. Under Compute, click Instances.
2. Click Create Instance.
3. In the Create Compute Instance page, enter My App Gateway Server in the Name your instance field, and then click Change Image Source.
4. In the Browse All Images dialog, click Custom Images, select the appropriate compartment, select App Gateway Custom Image, and then click Select Image.
5. In the Add SSH Key section, add a public SSH key, by either uploading a public key file or pasting the public key value in the SSH Key field.

See Creating an SSH Key Pair Using PuTTY Key Generator section in Managing Key Pairs on Linux Instances.

6. In the Configure networking section, select a compartment in Virtual cloud network compartment.

   If your compartment doesn't have virtual cloud network configured, then enter App Gateway VNC as Name in the New virtual cloud network section. If your compartment has virtual cloud network configured, then select the values for Virtual cloud network, Subnet compartment, and Subnet in which your compute instance will be created.

   Note:
The components design must align with your Oracle Cloud Infrastructure operational model. Contact your Oracle Cloud Infrastructure administrator for more information.

7. Click Create, and wait until your compute instance is provisioned and running.
8. Record the value of the Public IP Address assigned to this compute instance.

Ensure that you have a Security List configured so that you can connect to the My App Gateway Server compute instance using a SSH client software such as PuTTY. Contact your Oracle Cloud Infrastructure administrator for more information.

Install App Gateway using Oracle VM Virtual Box
To install App Gateway using Oracle VM Virtual Box, import the App Gateway Open Virtual Appliance (OVA) file in an Oracle VM Virtual Box, and then configure the App Gateway virtual machine to receive HTTP request.

Importing the open virtual appliance image file in VM software
To run App Gateway in a virtual machine, import the App Gateway Open Virtual Appliance (OVA) image file in virtual machine software such as Oracle VM Virtual Box.

The following procedure requires access to a Windows server as administrator. This server must have Oracle VM Virtual Box software installed.

1. Log in to the Windows server, and upload the App Gateway OVA file from your desktop to a working folder in the server. For example, c:\temp.
2. Start the Oracle VM Virtual Box Manager software, and then select Import Appliance from the File menu.
3. Locate the OVA file on the Windows server, and then click Next.
4. In the Import Virtual Appliance window, update the Name field with the value App Gateway Server.
5. To define a new MAC address to the App Gateway server network component, select Reinitialize the MAC address of all network cards.
6. Click Import.
7. Verify App Gateway server is listed in the Oracle VM Virtual Box Manager.

After you import App Gateway, a virtual disk image file (VMDK) will be created in the Windows server. To locate this file, select App Gateway Server in Oracle VM Virtual Box Manager, click Settings, click Storage, and then click the name that appears under Controller: SATA in the Storage Devices section. The location of the VMDK file appears in the Location field under Information.

Configuring port forwarding rules
Create a port forwarding rule to allow the requests received by the Windows server hosting the App Gateway virtual machine to be forwarded to the App Gateway server.

1. In the Oracle VM Virtual Box Manager software, select the App Gateway server, and then click Settings.
2. Select Network on the left menu, expand Advanced, and then click Port Forwarding.
3. In the Port Forwarding Rules window, click , configure a rule to forward the requests from the host port to the guest port, and then click OK.

   For example, if your App Gateway is configured to use port 4443, then enter 4443 in both Host Port and Guest Port columns.

   The port number must be the same as the port value that you provided during App Gateway registration.
4. In the Port Forwarding Rules window, click , configure a rule to forward the requests from the host port 22 to the guest port 22, and then click OK.

   This enables you to use a SSH client such as PuTTY to log in to the App Gateway server later.
5. In the Port Forwarding Rules dialog box, click OK.
6. In the App Gateway Settings dialog box, click OK.
7. Select the App Gateway server, and then click Start.

Deploy the Oracle App Gateway Docker Container
App Gateway can be deployed by using OVA or using Docker. Learn how to deploy the Oracle App Gateway Docker container.

Prerequisites
- Download the App Gateway docker image. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Settings and then Downloads.
- Create a wallet file containing the Client ID and Client Secret of the App Gateway that was created in the Admin Console. Name the wallet file cwallet.sso and copy it to the local folder so that the container can uptake the file.
Note: The wallet tool can be downloaded from the IAM console. In the IAM console, expand the Navigation Drawer, click Settings, and then click Downloads.

- Install Docker (Command: $ yum install docker-engine).
- Add the current user to the Docker group (Command: $ sudo usermod -a -G docker $USER).

Extract the Docker Image

If the Docker image is in .tar.gz format, then you must use the following commands to extract the image before you can create the container.

1. Load the .tar.gz file to the local Docker registry. Command: $ docker load -i <.tar.gz file>
2. Verify that you see the image in the local Docker registry. Command: $ docker images

Create the App Gateway Container

Set the App Gateway Environment Variables

To run the App Gateway Docker container, the following environment variables must be set in the appgateway-env file. Important: No validation is performed on these values. If you configure invalid values, App Gateway Docker container creation fails.

- CG_APP_TENANT=<tenant name>
- IDCS_INSTANCE_URL=<idcs instance url>. The URL required to access the IAM instance.
- NGINX_DNS_RESOLVER=<resolver ip>. Configure the nameserver found in the file /etc/resolv.conf. The default value is 127.0.0.1.

Run Docker

Use the following command to run Docker.

```
$ docker run -it -d
--name <container name>
--env-file <path to env file>
--env HOST_MACHINE=`hostname -f`
--volume <local folder>/cwallet.sso:/usr/local/nginx/conf/cwallet.sso
--net=host/<User-defined bridge name> <image name>
```

Example Container with Host Networking with No Port Mapping

The following is an example of Host Networking with no port mapping. This is only for port numbers greater than 1024.

```
$ docker run -it -d
--name appgateway
--env-file appgateway-env
--env HOST_MACHINE=`hostname -f`
```

Note:

If the port number configured for the App Gateway host is less than 1024, then you must use Bridge Networking for the Docker, along with the port mapping. See the Bridge Networking with Port Mapping command example below to run the Docker container.

```
$ docker run -it -d
--name appgateway
--env-file appgateway-env
--env HOST_MACHINE=`hostname -f`
```
Example Bridge Networking with Port Mapping

The following is an example of Bridge Networking with port mapping (ports 80 to 65535).

**Prerequisite:** Before you use the Bridge Network configuration, add/update `iptables` to `true` in the file `/etc/docker/daemon.json`. This allows the Docker daemon to edit the iptables filter rules required for port mapping.

```bash
```

**Note:** Docker internally updates the `iptables/firewalld` with the routes for the port, when the above command is run.

**Post-Requisite Container Step**

If the host is configured as HTTPS, the following extra steps are required to copy the certificates to the container.

1. Configured SSL certificates must be copied to the location that is specified in Additional Properties. Go to Security, App Gateways, <Gateway>, Hosts, Additional Properties and note the location.
2. Run commands like the following. **Note:** The location of the certificate depends on the location you specified in the App Gateways Host.

```bash
$ docker cp deploy/docker/nginx/build/test-config/certs/my-appgateway.cert appgateway:/scratch/docker/cloudgate/certs/my-appgateway.cert
$ docker cp deploy/docker/nginx/build/test-config/certs/my-appgateway.key appgateway:/scratch/docker/cloudgate/certs/my-appgateway.key
```

Upgrade to a New App Gateway Version

To upgrade to a new App Gateway version, delete the existing container and re-create the container with a new version of the image. The wallet files are automatically used by the container, provided the files are not deleted in the local folder, and the same local folder is used for the volume mount.

FAQs

- **How do I know if my container was created successfully?**
  
  Run the command: `$ docker ps -a` and ensure that the STATUS is `Up` in the list corresponding to your container name.

- **If the container STATUS shows exited, how do I check the logs to determine why the container was terminated?**

  Run the command: `$ docker logs <container name>`. This command prints the log messages, which contain the log messages printed by App Gateway.

- **How to do edit the cloudgate.config file inside the container?**

  Run the command: `$ docker exec -it <container name> bash`. Run this command to access the container if the container is running with a Bash shell. Once inside the container, you can edit the files using Nano editor.
**Can we print the access logs in JSON format?**

Yes, you can print the access logs in JSON format. Add the lines below to the file `/usr/local/nginx/conf/nginx.conf`, inside an HTTP block and then restart App Gateway.

```plaintext
log_format jsonf escape=json '{"remote_addr": "$remote_addr", "remote_user": "$remote_user", "time": "\$time_local", "request": "$request", "status": "$status", "body_bytes_sent": $body_bytes_sent, "http_referer": "$http_referer", "user_agent": "$http_user_agent", "x_forwarded_for": "$http_x_forwarded_for"}';
access_log /usr/local/nginx/logs/access.log jsonf;
```

**Note:** You can edit the JSON fields that you're interested in by removing or adding the NGINX variable.

### Registering App Gateway

Before installing the binary file for App Gateway that appears on the **Downloads** page, you must register your App Gateway using Identity Domains console.

To register an App Gateway, you must add hosts and associate each host to an enterprise application your App Gateway will protect:

- In the **Hosts** pane, you define host identifiers. Each host identifier represents a domain name and port number App Gateway uses to proxy an enterprise application.
- In the **Apps** pane, you associate an enterprise application with a host identifier.

To register an App Gateway, you must be assigned to either the **Identity Domain Administrator** role or the **Security Administrator** role.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **App gateways**.
3. Click **Add**.
4. In the **Details** pane, specify the name of your App Gateway, and then click **Next (>)**.
5. In the **Hosts** pane, click **Add**.
6. In the **Add Host** dialog, provide a name in the **Host Identifier** field.
7. Enter the **Host** and **Port** values that the App Gateway server will respond to HTTP requests.
   
   The port number you provide in this step is used by the App Gateway server to respond to HTTP requests.
8. To have your App Gateway listen to HTTP requests in secure mode (HTTPS), select the **SSL Enabled** check box. Otherwise, clear this check box and your App Gateway will listen to non-secure HTTP requests only.
9. If you select the **SSL Enabled** check box, then populate the **Additional Properties** text area with the following values to specify the certificate key pair the App Gateway server will use, protocols, and ciphers for SSL:

   ```plaintext
   ssl_certificate /usr/local/example.com.rsa.crt;
   ssl_certificate_key /usr/local/example.com.rsa.key;
   ssl_protocols TLSv1 TLSv1.1 TLSv1.2;
   ssl_ciphers HIGH:!aNULL:!MD5;
   ```

   The `/usr/local/example.com.rsa.crt` is the full path of a certificate file in the App Gateway server. The `/usr/local/example.com.rsa.key` is the secret key of that certificate file. You must upload both files to the App Gateway server after you install the App Gateway binary file.
10. In the **Add Host** dialog, click **Save**.
11. In the **Hosts** pane, click **Next (>)**.
12. If you have previously registered an enterprise application in Identity Domains, then in the **Apps** pane, click **Add**. See Registering App Gateway on page 3619.
13. Click **Finish**.
14. In the **App Gateway Details** page, note the value of the **Client ID**.

15. Click **Show Secret** and note the value of the **Client Secret**.

    The **Client ID** and **Client Secret** are equivalent to a credential (for example, an ID and password) that your App Gateway server uses to communicate with IAM. You need these values when you configure the App Gateway server.

16. In the **Navigation Drawer**, click **App Gateways**.

17. In the **App Gateways** page, select your App Gateway, click **Activate**, and then click **OK** in the **Confirmation** window to activate your App Gateway.

Configuring the App Gateway Server

Before you start the App Gateway server for the first time, you need to configure the server to connect with IAM.

1. Use an SSH client such as **PuTTY** and the following credentials to log in to the App Gateway server.
   - **Localhost login**: oracle
   - **Password**: cloudgateR0X!

     You are required to change the provisioned password on the first login.

2. Run the `sudo yum updateinfo list security all` command and provide sudo password.

   This command lists the security errata for your App Gateway Oracle Linux server. To update all packages for which security-related errata are available to the latest versions of the packages enter `sudo yum --security update`.

3. Run the `telnet <identity-domain-tenant>.identity.oraclecloud.com` command to confirm that the App Gateway server can reach the IAM instance.

4. Restart the App Gateway server after applying the updates.

5. Navigate to the `/scratch/oracle/cloudgate/ova/bin/setup` folder, and then edit the `cloudgate-env` file present in this folder (`vi cloudgate-env`).

6. Enter values for the following parameters, and then save the file:
   - **IDCS_INSTANCE_URL**: The URL of your Identity Domains instance.
     For example, `https://idcs-123456789.identity.oraclecloud.com`
   - **CG_APP_TENANT**: The tenant name of the Identity Domains instance.
     For example, `idcs-123456789`
   - **CG_APP_NAME**: The client ID value you made note during the App Gateway registration in the IAM console.
   - **CG_APP_SECRET**: The client secret value you made note during the App Gateway registration in the Identity Domains console.
   - **CG_CALLBACK_PREFIX**: If App Gateway is configured in SSL mode (HTTPs), then set the value to `https://%hostid%`. Otherwise, use `http://%hostid%` as the value for this parameter.

7. Confirm that the resolver entry in `/usr/local/nginx/conf/nginx-cg-sub.conf` has the right DNS server IP address.

   Run the `nslookup <your_identity_cloud_service_domain>` command, and verify the Server IP Address is the same one of the resolver entries in the `/usr/local/nginx/conf/nginx-cg-sub.conf` file. If not, then update this file accordingly.

8. In the `/scratch/oracle/cloudgate/ova/bin/setup` folder, run `./setup-cloudgate` command.

   When prompted, enter `y` to proceed with the configuration.

App Gateway service and agent service will start after the configuration finishes.

Assigning an enterprise application to App Gateway

Update the App Gateway registration in the IAM console and assign an enterprise application.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.

2. Select the identity domain you want to work in and click **Security** and then **App gateways**.
3. Click **Add**.

4. In the **Assign an App to gate** window, map App Gateway to an enterprise application using the values below, and then click **Save**.

   - **Application**: Select the enterprise application you want to protect using this App Gateway.

     - **Note**: The enterprise application must be in activated status.

   - **Select a Host**: Select the host identifier to which the App Gateway will proxy the enterprise application.

   - **Resource Prefix**: Enter the URL prefix used by App Gateway to proxy the enterprise application.

     For example, use `/` to represent that every request since root path is forwarded to the enterprise application you select.

   - **Origin Server**: This is the actual base URL where the application is hosted. If the application is not directly accessible, but accessible through a web proxy, then enter the URL of the web proxy. See example diagram below.

   - **Additional Properties**: This field is used to provide more configuration for the application. The values specified into the field are NGINX directives or statements which are part of location block in `nginx.conf`. Examples when you would do this are:

     a. If protected applications need to do further redirects or to access resources after successful authentication with App Gateway, you can use this field to populate the host header with correct value and pass it to the application.

        For example, if a user accesses the application using `https://myappgateway.example.com:4443/home`, the browser passes the host header to App Gateway with the value set to `Host: myappgateway.example.com:4443`. This value is passed by App Gateway to the downstream application, and you can achieve this by setting either of the values below in `more Properties`:

        ```
        proxy_set_header host "myappgateway.example.com:4443";
        ```

        or

        ```
        proxy_set_header host $http_host;
        ```

        `$http_host` is a variable and its value is populated with the host header App Gateway receives from the browser or from any client.

        - **Note**: If the there are load balancers sitting behind App Gateway, then it is the job of the load balancers to forward the actual host header to app...
gateway so that $http_host is populated with the correct value and App Gateway can forward it to the application.

b. If the application is accessible through a web proxy, then enter the values below:

```
proxy_set_header host "myapp.internal.example.com";
```

The "myapp.internal.example.com" domain is the domain name where the application is hosted, also known as origin server.

In this case, App Gateway can't pass the host header received from browser or other client and applications cannot do further redirects via App Gateway.

The following figure provides examples of the mappings that you configure between App Gateway and your enterprise application:

![Image of App Gateway and Enterprise Application mappings](https://myappgateway.example.com:4443/myapp/private/home)

App Gateway
- Host Identifier: My Host Identifier
- Host: myappgateway.example.com
- Port: 4443

Enterprise Application
- Application Name: My Enterprise Application
- Resource x AuthN Policy: /myapp/private/* [Basic Auth Policy]
- /myapp/public /* [Public Policy]

Host: myappgateway.example.com

**Note:**

You can assign multiple enterprise applications to the same App Gateway, and so the same App Gateway server will protect these applications.

Ensure for each application, the value of **Resource Prefix** differs. For example, if you have http://myapp.internal.example.com:3266/myapp1/page.jsp and http://myapp.internal.example.com:6355/myapp2/page.jsp, both accessible through http://myappgateway.example.com:4443/App Gateway URL, then enter /myapp1 as **Resource Prefix** when you register application 1, and /myapp2 as **Resource Prefix** when you register application 2.

After you assign the application to your App Gateway, you might need to restart the App Gateway server for the changes to be effective immediately.

Start and stop App Gateway

To start and stop App Gateway server and App Gateway agent, you can use scripts or the services installed in the server where your App Gateway runs.

Using a script to start and stop App Gateway

You can start and stop the App Gateway server and agent using scripts provided in the server.

Log in to the App Gateway server and then run the following command:
1. To start App Gateway server.
   
   `/scratch/oracle/cloudgate/home/bin/cg-start`

2. To start App Gateway agent.
   
   `/scratch/oracle/cloudgate/home/bin/agent-start`

3. To stop App Gateway server.
   
   `/scratch/oracle/cloudgate/home/bin/cg-stop`

4. To stop App Gateway agent.
   
   `/scratch/oracle/cloudgate/home/bin/agent-stop`

When you start the App Gateway server, App Gateway contacts IAM to retrieve the port number you configured during the App Gateway registration in the IAM console. The App Gateway server starts using this port number.

The App Gateway agent is responsible for synchronizing the App Gateway configuration (hosts and applications) from IAM to the App Gateway server.

To check the running status of the App Gateway server, run the following command: `/scratch/oracle/cloudgate/home/bin/cg-status`

Using the service to start and stop App Gateway

You can start and stop the App Gateway server and agent as services running on the server.

Log in to the App Gateway server and then run the following command:

1. To start App Gateway server.
   
   `service cloudgate-nginx start`

2. To start App Gateway agent.
   
   `service cloudgate-agent start`

3. To stop App Gateway server.
   
   `service cloudgate-nginx stop`

4. To stop App Gateway agent.
   
   `service cloudgate-agent stop`

To check the running status of the App Gateway server, run the following command: `/scratch/oracle/cloudgate/home/bin/cg-status`

Activate and deactivate App Gateway

You can use IAM to activate and deactivate app gateways.

- Deactivating an App Gateway prevents IAM from working with the App Gateway software.
- Activating an App Gateway enable IAM working with the App Gateway software.

**Note:**

A green check mark indicates an activated App Gateway. A red circle with a white line through the circle indicates a deactivated App Gateway.
Activating App Gateway
You can use IAM to activate app gateways.
1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **App gateways**.
3. Click the name of your App Gateway.
4. Click **Activate**.
5. In the **Confirmation** window, click **OK**. The status of each App Gateway changes from deactivated to activated.

Deactivating App Gateway
You can use IAM to deactivate app gateways.
1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **App gateways**.
3. Click the name of your App Gateway.
4. Click **Deactivate**.
5. In the **Confirmation** window, click **OK**. The status of each app gateway changes from activated to deactivated.

Enable session persistence with sticky cookies
Follow these steps to enable persistent sessions using cookies in App Gateway. The sticky cookie is forwarded to the same backend server.

You only need to use sticky support when you have multiple origins, and you do this by creating a NGINX upstream block.

1. Enable the sticky module in App Gateway by editing the file `/usr/local/nginx/conf/nginx.conf`.
   - Below the line `load_module /scratch/oracle/cloudgate/home/lib/idcs_cloudgate ngx.so;`, add
     ```
     load_module /scratch/oracle/cloudgate/home/lib/ngx_http_sticky_module.so;
     ```
   - Below the line `include /usr/local/nginx/conf/agent_conf/*.conf;`, add
     ```
     include /usr/local/nginx/conf/origin_conf/*.conf;
     ```

2. Create a NGINX upstream block using
   ```
   $ vi /usr/local/nginx/conf/origin_conf/myupstream.conf
   ```
   Add below entry to myupstream.conf
   ```
   upstream weblogic {
   sticky;
   server 100.111.190.221:7003;
   server 100.111.190.220:7003;
   }
   ```

3. Change the origin server.
   - Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
   - Select the identity domain you want to work in and click **Security** and then **App gateways**.
   - Click the name of your App Gateway.
Sticky Parameters

```javascript
upstream {
    sticky;
    server 127.0.0.1:9001;
    server 127.0.0.1:9002;
}

sticky [hash=index|md5|sha1] [no_fallback]
    [name=route] [domain=.foo.bar] [path=/] [expires=1h] [secure]
    [httponly];

or

sticky [hmac=md5|sha1 hmac_key=<foobar_key>] [no_fallback]
    [name=route] [domain=.foo.bar] [path=/] [expires=1h] [secure]
    [httponly];

or

sticky [text=raw] [no_fallback]
    [name=route] [domain=.foo.bar] [path=/] [expires=1h] [secure]
    [httponly];
```

Server Selection Algorithm

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hash</td>
<td>The hash mechanism used to encode upstream server. It can't be used with hmac or text.</td>
</tr>
<tr>
<td></td>
<td>- md5</td>
</tr>
<tr>
<td></td>
<td>- index. The information is not hashed and instead an in-memory index is used. This is quicker and the overhead is shorter, but the matching against upstream servers list is inconsistent and if the upstream server has changed index values might not correspond to the same server. Only use index if you are certain you want to use it despite this.</td>
</tr>
<tr>
<td></td>
<td>The default is md5.</td>
</tr>
<tr>
<td>hmac</td>
<td>The HMAC hash mechanism used to encode upstream server. It's like the hash mechanism but it uses hmac_key to secure the hashing. It can't be used with hash or text.</td>
</tr>
<tr>
<td>hmac_key</td>
<td>The cryptographic key to use with hmac. Set a hmac_key if you use hmac.</td>
</tr>
<tr>
<td>no_fallback</td>
<td>Set this flag so that if a request comes with a cookie and the corresponding backend is unavailable, a 502 (Bad Gateway or Proxy Error) is returned. You can set it to the upstream block, or set sticky_no_fallback in a server or location block.</td>
</tr>
</tbody>
</table>

Cookie Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie used to track the persistent upstream server. The default is route.</td>
</tr>
</tbody>
</table>
### Setting | Description
--- | ---
domain | The domain in which the cookie is valid. The default is `none` when the browser handles the domain.
path | The path in which the cookie is valid. The default is `/`.
expires | The validity duration of the cookie. The default is `nothing` which means that it's a session cookie and deleted when the client shuts down.
| Enter a value to have the cookie expire after the specified time. The value is set relative to the client, and it must be for a period greater than one second.
secure | Enable secure cookies (transferred only using https).
httponly | Tells the browser that the cookie can only be accessed by the server.

Testing access to your application using App Gateway

After you configure the App Gateway server to communicate with your IAM instance, and start the server, test access to your enterprise application.

The following diagram provides an example of how App Gateway and IAM interact when the user browser sends an HTTP request to an application resource through App Gateway.

Because App Gateway proxies your web application, use the App Gateway base URL to access the application instead of the application actual URL.

![Diagram of App Gateway and IAM interaction](https://example.com/image.png)

**Figure 15: Workflow of protecting an application using App Gateway**
1. Open a new web browser and access your application using the App Gateway URL.
   In this example, the URL is: https://myappgateway.example.com:4443/myapp/private/home
   The actual application https://myapp.internal.example.com:3266/myapp/private/home isn't accessible by the user browser.

2. App Gateway intercepts the request and communicates with IAM to verify if the URL corresponds to an enterprise application.
   In this example, My Enterprise Application is registered, and the authentication policy for this enterprise application is **Form or Access Token**.

3. App Gateway verifies that the request contains a valid IAM's access token in the Authorization Bearer header or IAM's session cookie, indicating the user has already signed in to IAM.

4. If the user hasn't signed in to IAM, then App Gateway redirects the user browser to the IAM Sign In page.

5. If the user has signed in, then App Gateway adds header variables and a cookie to the request, and then forwards the request to the application.
   The application receives the request, uses the header variables to identify the user and to present the content of the /myapp/private/home page.

**Viewing details about App Gateway**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **App gateways**.
3. Click the name of your App Gateway.
   You can modify the App Gateway configurations.

**Modifying App Gateway**

After viewing details about, activating, or deactivating an App Gateway, you can modify it.

Modifying an App Gateway in IAM includes:

- Changing the name or description of the App Gateway
- Show or regenerate the client secret
- Add or remove hosts
- Add or remove enterprise applications

To modify an App Gateway:

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **App gateways**.
3. Click the name of your App Gateway.
   The App Gateway page opens and displays three options: **Hosts**, and **Apps**.
4. After you modify any App Gateway configuration, click **Save** to save the modification.

**Removing App Gateway**

You can use IAM to remove multiple app gateways simultaneously.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **App gateways**.
3. In the **App Gateways** page, select the check box for each App Gateway that you want to remove.
4. Click **Remove**.
5. In the **Confirmation** window, click **OK**.
**How App Gateway logout works**

Users can log out from the applications protected by App Gateway using two different mechanisms: App Gateway Log out URL or by calling a resource protected by a logout authentication method.

**Use App Gateway logout URL**

App Gateway provides a central logout URL which can be used to log the user out from the single sign-on provided by IAM. Any call to this endpoint triggers the logout process. After the user is logged out, then any subsequent access to a protected application resource will require the user to sign in to IAM again.

This endpoint supports two parameters appended to the URL:

- **postlogouturl**: The URL of a post-logout landing page. This value must be URL-encoded. If the parameter isn't specified, then App Gateway redirects the user browser to the **Logout URL** specified in the Identity Domains console's **Session Settings**.
- **state**: This is an optional parameter to be used by the enterprise application, after the logout process finishes.

**Syntax**

http(s)://${appgateway_host}:${appgateway_port}/cloudgate/logout.html?
postlogouturl=${url_encoded}&state=${state_value}

**Log out Endpoint With Parameters**

If the App Gateway base URL is `https://myappgateway.example.com:4443`, then use the following URL to log the user out from the single sign-on: `https://myappgateway.example.com:4443/cloudgate/logout.html?postlogouturl=http%3A%2F%2Fwww.oracle.com&state=123`

**Use Resource Protected by Logout authentication method**

You can create a resource in your enterprise application and configure an authentication policy for this resource using **Forms+Logout** authentication method. When the user accesses this resource, App Gateway invokes the log out process and logs the user out from the single sign-on provided by Identity Domains.

**Syntax**

http(s)://${appgateway_host}:${appgateway_port}/${logout_resource}

**Resource Protected by Logout authentication method**

If you created `/myapp/logout` resource in your enterprise application, and assigned **Forms+Logout** as **Authentication Method** for this resource in **Authentication Policy** section, then when users access the URL `https://myappgateway.example.com:4443/myapp/logout`, they are logged out from the single sign-on provided by IAM.

**Run App Gateway in SSL mode on port 1024 or lower**

You can configure App Gateway to run in SSL mode on port number 1024 or lower.

**Note:**

To run your App Gateway server in Secure Sockets Layer (SSL) mode, you need to have a valid certificate.

**Using the Console**

Configuring App Gateway in the IAM console

Update your App Gateway configuration to enable the server to listen on port number 443 and in Secure Sockets Layer (SSL) mode.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security** and then **App gateways**.
3. Click the name of the App gateway you want.
4. In **Hosts** click the name of the host you created.
5. in the Edit Hosts window, update the following parameters as in the example below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>443</td>
</tr>
<tr>
<td>SSL Enabled</td>
<td>Selected.</td>
</tr>
</tbody>
</table>

**Additional Properties**

- `ssl_certificate /scratch/myappgateway.example.com.cert;`
- `ssl_certificate_key /scratch/myappgateway.example.com.key;`
- `ssl_protocols TLSv1 TLSv1.1 TLSv1.2;`
- `ssl_ciphers HIGH:!aNULL:!MD5;`

**Note:**

Generate a valid certificate to be used as the SSL certificate. The certificate file (`myappgateway.example.com.cert`) and the certificate key file (`myappgateway.example.com.key`) are referenced as an example.

6. Click Save.

Configuring the App Gateway server

Use the following procedure to enable your App Gateway server to run on port 443 in SSL mode.

**Note:**

Generate a valid certificate to your App Gateway to run on SSL mode, and copy the certificate file and the certificate key file to your desktop.

1. Use an SSH client such as PuTTY to log in to the App Gateway server.
2. Run the following commands to update a privileged user.

```bash
sed -i "s/touch \$source_log/touch \$source_log &\& chown \$NGINX_USER:\$NGINX_USER \$source_log/g" /scratch/oracle/cloudgate/ova/bin/jobs/manage-logs.sh
sudo sed -i "s/oracle / root /g" /etc/cron.d/cloudgate-jobs
sudo sed -i "s/sudo -u oracle//g" /etc/init.d/cloudgate-nginx
sudo sed -i "s/sudo -u oracle//g" /etc/init.d/cloudgate-agent
```

3. Run the following commands to change permission of the folders.

```bash
sudo chmod -R 755 /scratch/
sudo chown root:root /scratch/oracle/cloudgate/home/bin/nginx
cd /usr/local/nginx/sbin/
rm nginx
sudo ln -sf /scratch/oracle/cloudgate/home/bin/nginx
```

4. Copy the certificate file (for example, `myappgateway.example.com.cert`) and the certificate key file (for example, `myappgateway.example.com.key`) from your desktop to the `/scratch/` folder.

5. Add user `oracle` to the `nginx.conf` file by running the following command.

```bash
sudo sed -i "/working_directory.*/a user oracle;" /usr/local/nginx/conf/nginx.conf
```

6. Edit the `/scratch/oracle/cloudgate/ova/bin/setup/cloudgate-env` file. You can use the following command or any other text editor of your choice: `vi /scratch/oracle/cloudgate/ova/bin/setup/cloudgate-env`
7. Replace the value of the `CG_CALLBACK_PREFIX` parameter with the following `https://%hostid%`

8. Save the `/scratch/oracle/cloudgate/ova/bin/setup/cloudgate-env` file.

9. Run the following `sed` commands to enable running the server with `sudo` command:

```bash
sed -i s/verify_running_as_user/#verify_running_as_user/g /scratch/oracle/cloudgate/ova/bin/setup/cloudgate
sudo sed -i "/create_wallet || .*/a chmod -R 755 /scratch/oracle/cloudgate/wallet/" /scratch/oracle/cloudgate/ova/bin/setup/cloudgate
```

10. Confirm the `setup-cloudgate` file is configured with the values of your IAM tenant, and the values of the `Client ID` and `Client Secret` of the App Gateway you registered in the IAM console.

11. Run the following command to reconfigure App Gateway according to the parameters registered in the IAM console (in this case, port number 443 and SSL Enabled).

```bash
sudo -E /scratch/oracle/cloudgate/ova/bin/setup/setup-cloudgate
```

After the `setup-cloudgate` script finishes, the App Gateway server starts automatically. You can access any application protected by your App Gateway using HTTPS, App Gateway domain, and port number 443 (default HTTPs port). For example, `https://myappgateway.example.com/myapp/index`

Starting and stopping App Gateway server using `sudo`

Because you set up your App Gateway server to run on port 443, you need to start and stop App Gateway server and agent using `sudo` command.

1. To stop the App Gateway server and agent use the following command:

```bash
sudo -E /scratch/oracle/cloudgate/home/bin/cg-stop
sudo -E /scratch/oracle/cloudgate/home/bin/agent-stop
```

2. To start the App Gateway server and agent use the following command:

```bash
sudo -E /scratch/oracle/cloudgate/home/bin/cg-start
sudo -E /scratch/oracle/cloudgate/home/bin/agent-start
```

How to enable and access App Gateway logs

App Gateway provides log files to help you monitor App Gateway’s behavior. Learn how to configure and access these log files.

**Configure App Gateway logs**

Enable App Gateway log files and configure logging levels.

To disable logs or change the log levels of the App Gateway server, log in to the server, edit the `/usr/local/nginx/conf/cloudgate.config` file, and then under the `general` section, change the value of the `logLevel` attribute, and then save the file.

The following are default values for App Gateway:

```json
"general":{
  "disableAuthorize":false,
  "logLevel":"warn",
  "logFolder":"",
  "policyMode":"gateway",
  "policyRefreshTime":300,
  "policyStaleTime":3600,
  "policyExpiryTime":604800
}
```

**Note:**

Values for the `logLevel` attribute are: off | crit | security | config | fail | warn | info | trace1 | trace2 | trace3.
By Default, the log files are in the `/usr/local/nginx/logs` folder. If you want to change the default log folder, then update the value of the `logFolder` attribute under the `general` section of the `/usr/local/nginx/conf/cloudgate.config` file.

To change the log level for the agent service of the App Gateway, modify the `/usr/local/nginx/conf/cloudgate.config` file, and set the `logLevel` and `logFolder` attributes under the `agentConfig` section as follows:

For example, to change the log level to `trace3` and the log folder to `/tmp`, update the `/usr/local/nginx/conf/cloudgate.config` file with the following values, and then save the file.

```json
"agentConfig":{
   "pollIntervalSecs":60,
   "daemon":true,
   "logFolder":"/tmp",
   "logLevel":"trace3"
}
```

The log level and log folder changes take effect next time you start App Gateway.

**View App Gateway logs**
Learn about the different log files App Gateway uses.

App Gateway is based on a NGINX Server. The following NGINX native log files are in the `/usr/local/nginx/logs/` directory:

**NGINX Native Log Files**

<table>
<thead>
<tr>
<th>Log File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>access.log</td>
<td>NGINX Native access log contains information about all HTTP requests received by NGINX, and by App Gateway.</td>
</tr>
<tr>
<td>error.log</td>
<td>NGINX Native debug log.</td>
</tr>
<tr>
<td>nginx.pid</td>
<td>Contains the NGINX Server process ID number.</td>
</tr>
</tbody>
</table>

The following App Gateway specific log files are in the `/usr/local/nginx/logs/` directory:

**App Gateway Log Files**

<table>
<thead>
<tr>
<th>Log File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cg-trace-main.log</td>
<td>App Gateway main log file.</td>
</tr>
<tr>
<td>cg-trace-policy.log</td>
<td>Logs information about a policy refresh, when App Gateway contacts IAM.</td>
</tr>
<tr>
<td>cg-trace-session.log</td>
<td>Logs information about the sessions created and handled by App Gateway.</td>
</tr>
<tr>
<td>cg-trace-token.log</td>
<td>Logs information about the access tokens received by App Gateway.</td>
</tr>
<tr>
<td>cg-trace-agent.log</td>
<td>Agent logging file.</td>
</tr>
<tr>
<td>cg-trace-init.log</td>
<td>Contains information about the initialization process.</td>
</tr>
</tbody>
</table>

**Upgrading and Patching App Gateway**
Learn how to upgrade and patch App Gateway.

If you are performing a patch upgrade, the App Gateway patch is installed when you run the upgrade script.
App Gateway versioning uses the following convention: `<release version>-<major version>.<minor version>.<build number>`. For example, App Gateway version `19.3.3-1.0.1`, means release `19.3.3`, major version `1`, minor version `0`, and patch version `1`.

If you have multiple App Gateway instances, then repeat the following procedure for each App Gateway server.

1. Use an SSH client such as PuTTY to log in to the App Gateway server.
2. Run `cd /scratch/oracle/cloudgate`, and verify two information in this folder:
   - In the command prompt, run the following command `cat /scratch/oracle/cloudgate/INSTALLED_VERSION` to verify the version of the App Gateway.
     
     The following example shows that the version of the App Gateway is `19.3.3-1.0.0`:
     
     ```
     $ cd /scratch/oracle/cloudgate
     $ cat INSTALLED_VERSION
     OVA Base Version: 19.3.3-1.0.0
     OVA Patch Version: Cloud Gate Version: 19.3.3-1910012252
     ```
   - Run the following command `ls -la` and verify that the home folder links to the folder named the App Gateway version:
     
     The following example shows that the home folder is linked to the `19.3.3-1.0.0` folder:
     
     ```
     $ cd /scratch/oracle/cloudgate
     $ ls -la
     total 16
     drwx------. 6 oracle oracle 4096 Oct  2 00:23 19.3.3-1.0.0
     lrwxrwxrwx. 1 oracle oracle  38 Oct  2 01:38 home -> /scratch/oracle/cloudgate/19.3.3-1.0.0
     drwx------. 1 oracle oracle  89 Oct  2 01:38 INSTALLED_VERSION
     drwx------. 3 oracle oracle 4096 Oct  2 01:38 ova
     drwxr-x---. 2 oracle oracle 4096 Oct  7 09:45 wallet
     ```
3. Run `cd /scratch/oracle/cloudgate/home/bin`, and then `./cg-upgrade` to start the upgrade process.
   During the upgrade process, App Gateway contacts IAM to verify if a patch for your App Gateway is available. If so, then the process downloads the patch and applies the patch to your App Gateway server.
4. After the upgrade process finishes, Run the commands described in step 2 and verify whether their return refers to the App Gateway patch or the upgraded version.
5. (Optional) Configure App Gateway in SSL mode. If you ran the `cg-upgrade` script, and App Gateway was configured in non-SSL mode, then after running the `cg-upgrade` script, complete the following steps. **Note:** If App Gateway was already configured in SSL mode, then don't complete the following steps.
   a) Get the SSL certificates.
   b) Log in to App Gateway and copy the certificates, for example, to `/scratch/certificates/`.
   c) Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
   d) Navigate to **App Gateway**. **Hosts**, and then open the required host. Navigate to **Additional Properties** and then add the path of the certificates and other information, such as `ssl_protocols` and `ssl_ciphers`.

```
ssl_certificate /scratch/certificates/myappgateway.example.com.cert;
ssl_certificate_key /scratch/certificates/myappgateway.example.com.key;
```
ssl_protocols TLSv1 TLSv1.1 TLSv1.2; ssl_ciphers HIGH:!aNULL:!MD5;

e) Open /usr/local/nginx/conf/cloudgate.config, search for callbackPrefix and change its value from HTTP to HTTPS.

f) Run the following commands so that you can see all changes reflected in App Gateway:

1. cg-stop
2. cg-start
3. agent-stop
4. agent-start

Now the application can be accessed only through the HTTPS protocol and not the HTTP protocol.

During this procedure, App Gateway restarts. Access to your application through this App Gateway server might be affected.

Troubleshoot App Gateway

Learn about common problems that you might encounter when setting up App Gateway and how to solve them.

I made changes in IAM but the App Gateway server doesn't reflect the changes

Changes you make to enterprise applications and App Gateway definitions in Identity Domains might not be reflected immediately on App Gateway because App Gateway caches Identity Domains information, such as resources, authentication policies, and header values of enterprise applications.

Explanation: App Gateway contacts IAM using agents to collect host and port information. When you start App Gateway, its NGINX server is automatically configured with this information. Any changes to IAM are periodically polled by the agents.

By default the policy and headers refresh time are 3,600 seconds (1 hour) each. To change these values, log in to the App Gateway server, and edit the /usr/local/nginx/conf/cloudgate.config file. Change the ttl value for policy and headers in the caching section as per the following example, and then restart both App Gateway server and the agent.

```
"caching" : {
    "minimumTtl" : 300,
    "headers" : { "ttl": 3600 },
    "discovery" : { "ttl": 3600 },
    "policy" : { "ttl": 3600 },
    "tenantKeys" : { "ttl": 86400 }
}
```

You can also change the poll interval of the agents. By default, the agent's refresh time to get new App Gateway configuration from IAM is 60 seconds, which is the minimum amount of time supported. In the /usr/local/nginx/conf/cloudgate.config file, change the pollIntervalSecs value in the agentConfig section as in the example:

```
"agentConfig": {
    "pollIntervalSecs" : 60,
    "daemon" : true,
    "logLevel" : "warn",
    "logFolder" : ""
}
```

If you want the changes in the Enterprise Application configuration to be reflected immediately, stop the App Gateway server and then start the server.

```
/scratch/oracle/cloudgate/home/bin/cg-stop
/scratch/oracle/cloudgate/home/bin/cg-start
```

If you want the changes in the App Gateway configuration to be reflected immediately, stop the agent and then start the agent.

```
/scratch/oracle/cloudgate/home/bin/agent-stop
```
Error log files contain invalid_session message
When App Gateway can't communicate correctly with IAM, you find invalid_session messages in the App Gateway error log files.

The following is an example of a message invalid_session in error.log file:

```
www-authenticate: Bearer error="invalid_session",
error_description="Authentication Failure"
```

This can be because of the way App Gateway processes a client request to a protected resource. App Gateway uses NGINX sub requests to make requests to IAM, and then App Gateway requires Linux NGINX resolver to be configured appropriately to allow these sub requests to function correctly.

1. Verify that the resolver setting in the file /usr/local/nginx/conf/nginx-cg-sub.conf is set to the correct IP.
2. Verify that the tenant name in /usr/local/nginx/conf/cloudgate.config file is configured correctly.

Error log files contain GET 127.0.0.1:53 command responding error number 500
Because App Gateway makes sub requests to an internal servlet, App Gateway requires your virtual machine to listen to port 53.

The App Gateway server must communicate to itself through IP address 127.0.0.1 and port 53.

If you're running App Gateway in a virtual machine software, configure port forward for this port from the host to the guest. See Configuring port forwarding rules on page 3616.

App Gateway Server Can't Communicate With IAM

Use an SSH client such as PuTTY and the following credentials to log in to the App Gateway server:

1. Run the sudo su - command to log in as root, and when prompted provide the oracle password.
2. Install telnet by running the following command:

```
yum install telnet
```

3. Run the following telnet command and try to establish a connection to your IAM instance and your application from the App Gateway server.

```
telnet <idcs-tenant>.identity.oraclecloud.com 443
```

If telnet can't connect to your IAM, then contact your network administrator to apply any other network configuration to enable the App Gateway server to establish connection with your IAM instance.

4. Run the exit command, to log out from root account.

About the PAM

The Pluggable Authentication Module (PAM) allows you to integrate your Linux environment with IAM to perform end user authentication with first and second factor authentication.

Topics:
- [What is the Linux PAM?](#) on page 3635
- [Why use the Linux PAM?](#) on page 3635
- [Certified Components for the Linux PAM](#) on page 3635
- [Using the Console](#) on page 3635
What is the Linux PAM?
The PAM is an authentication module for Linux that performs end user authentication with IAM.

The PAM also allows Linux administrators, or end users, to query information about users and groups stored in IAM using standard Linux commands that utilize NSS such as `id`, `group`, and `getent`.

Why use the Linux PAM?
Use the PAM when you want to authenticate users in Linux using IAM.

An organization might have large numbers of Linux servers, making management of users, for example creating, modifying, or deleting users, a time intensive and costly activity. With the Linux PAM you can manage Linux users centrally in IAM, providing cost and time savings.

Linux administrators can utilize IAM to authenticate end users. End users can log in to a Linux server, for example with SSH, and authenticate with their IAM user credentials. In addition, the multi-factor authentication offerings of IAM can be utilized so end users are prompted to authenticate with a second factor such as a One Time Password code sent using Email, SMS, a Mobile Authenticator application, or authenticate using security questions. As well as authenticating with single or multiple factors, administrators, and end users can use NSS and standard Linux commands to query user and group information.

Certified Components for the Linux PAM
The following table lists the certified versions for IAM and your operating system (which is required for the Linux Pluggable Authentication Module (PAM) to run).

<table>
<thead>
<tr>
<th>IAM</th>
<th>64-Bit</th>
<th>Operating System</th>
</tr>
</thead>
<tbody>
<tr>
<td>19.2.1</td>
<td>Yes</td>
<td>Oracle Enterprise Linux 6.8+</td>
</tr>
</tbody>
</table>

Using the Console

Install and Configure the Linux PAM
Learn how to download, install and configure the Linux Pluggable Authentication Module (PAM).

Downloading the Linux PAM
To download the the Linux Pluggable Authentication Module (PAM), see Downloading SDKs and Applications on page 3214.

Installing the Linux PAM
To install the Linux Pluggable Authentication Module (PAM) on your Linux environment, you install the PAM rpm's along with some dependencies:

1. Extract the downloaded zip file to a directory of your choice. This will extract the `pam_cloud.rpm` and `authn_oracle_cloud.rpm`.

2. Check the curl and json-c Linux dependencies are installed:
   - As the root user, run the following commands:
     - `yum list installed | grep curl.x86_64`
     - `yum list installed | grep json-c.x86_64`
   - If they are not installed, run the following commands:
     - `yum install json-c`
     - `yum install curl`

3. Change to the directory where you extracted the zip file:
   - `cd <folder_where_pam_oracle-cloud.pam_resides>`
4. Install the PAM rpm's as the root user.
   • If using yum:
     • `yum install pam_oracle-cloud.rpm authn-oracle-cloud.rpm`
   • If using rpm:
     • `rpm -Uvh pam_oracle-cloud.rpm authn-oracle-cloud.rpm`

   A successful installation will install the following files:
   • `pam_oracle_cloud.so` in `/lib64/security`
   • `libnss_oracle_cloud.so.2` in `/lib64`
   • `libauthn_api.so` in `/lib64`
   • `libclntsh.so.11.1` in `/lib64`
   • `libnnz11.so` in `/lib64`
   • `opc.conf` in `/etc`
   • `walletMgr` in `/usr/bin`

Configuring a Confidential Application

To register the IAM Linux Pluggable Authentication Module (PAM) as a client application in IAM, you create a confidential application with the POSIX Viewer role.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Applications.
2. Click Add application.
3. In the Add application window, click Confidential Application, and then click Launch workflow.
4. In the Add Confidential Application page, enter a Name for the application. Click Next.
5. On the Add Confidential Application page, click Configure this application as a client now.
6. In the Authorization section, select these two Allowed grant types:
   • Client Credentials
   • JWT Assertion
7. Click Add app roles.
8. In the Add app roles dialog box, select these roles:
   • Me
   • POSIX Viewer
   • Signin
9. Click Add.
10. Click Next.
11. Click Finish.

12. Record the Client ID and Client Secret in the General Information section.
    To integrate with your confidential application, use this ID and secret as part of your connection settings. The Client ID and Client Secret are equivalent to a credential (for example, an ID and password) that your application uses to communicate with IAM.
13. At the top of the page, to the right of the application name, click Activate.
14. In the Activate application dialog box, click Activate application.

Creating a Wallet

Configure a wallet on your Linux environment to store the client_id and client_secret of the confidential application with the POSIX Viewer role. This enables the Linux Pluggable Authentication Module (PAM) to communicate securely with the confidential application.

On the Linux environment, run the following commands as the root user:
• `walletMgr add <wallet_location> client_id <client_id>`
IAM

• walletMgr add <wallet_location> client_secret <client_secret>

For example:

```bash
$ walletMgr add /etc/opc-wallet/ client_id b6d001f65da542c38ceb284ea8a05926
wallet initialized successfully.
key client_id is added successfully in wallet.
```

```bash
$ walletMgr add /etc/opc-wallet/ client_secret fea39433-5115-4050-b486-138cce381f2
wallet initialized successfully.
key client_secret is added successfully in wallet.
```

Configuring the Linux PAM

Configure the Linux Pluggable Authentication Module (PAM) on your Linux environment.

The PAM is configured using either the SSSD or NSCD service on Linux.

Note:
The PAM can't be configured using both SSSD and NSCD simultaneously. Choose one configuration only. Choosing whether to use SSSD or NSCD is dependent on how your Linux environment is currently configured. Contact your Linux Administrator for details.

Configuring the PAM using SSSD

Configure the Linux Pluggable Authentication Module (PAM) on Linux using the SSSD service.

• The SSSD service should be installed. If it is not installed, install via `sudo yum install sssd`.
• The service must be configured to start when the system reboots. You can perform this configuration via `sudo chkconfig sssd on`.
• The property `SELINUX` must be set as `permissive` or `disabled` in file `/etc/selinux/config`. If it is not set, then set `SELINUX=permissive` or `SELINUX=disabled`.
• Restart Linux to incorporate the above changes.

1. Verify the `/etc/sssd/sssd.conf` file exists, has 600 permission, and is owned by the root user. If the file does not exist create it as follows and run `chmod 600 /etc/sssd/sssd.conf`.

```
/etc/sssd/sssd.conf
```

```
[sssd]
config_file_version = 2
services = nss, pam
domains = proxy_proxy

[nss]
fallback_homedir = /home/%u
default_shell = /bin/sh

[pam]
[domain/proxy_proxy]
auth_provider = proxy
id_provider = proxy
proxy_lib_name = oracle_cloud
proxy_pam_target = sssd_proxy_oracle_cloud
enumerate = false
cache_credentials = true
debug_level = 5
```
Optional, you can configure email addresses as the SSO usernames. To do this, add the line in bold (below) to the `/etc/sssd/sssd.conf` file to specify the regular expression.

```
...[pam]
[domain/proxy_proxy]
re_expression = (?P<domain>\[^\]\*?)\?(?P<name>\[^\]+$)
auth_provider = proxy
id_provider = proxy
...
```

2. Verify the `/etc/pam.d/sssd_proxy_oracle_cloud` file exists and is owned by the root user. If the file does not exist then create it as the root user and add the following:

```
/etc/pam.d/sssd_proxy_oracle_cloud
```

```
auth          required      pam_oracle_cloud.so
account       required      pam_oracle_cloud.so
password      required      pam_oracle_cloud.so
session       required      pam_oracle_cloud.so
```

3. Edit the `/etc/pam.d/sshd` and add the `pam_oracle_cloud` module:

```
/etc/pam.d/sshd
```

```
auth sufficient pam_oracle_cloud.so

#Note: the above has to be added before the following line:
auth include password-auth
```

4. Edit the `/etc/sshd/sshd_config` to configure sshd to allow the use of Multi-Factor Authentication:

```
/etc/sshd/sshd_config
```

```
#Search for the ChallengeResponseAuthentication property and set it to yes
ChallengeResponseAuthentication yes
```

5. Edit the `/etc/opc.conf` to allow the plugin to interact with IAM:

```
/etc/opc.conf
```

```
#This is sample format of opc.conf file, please use the correct
#information to configure this file.
#Enter the IAM tenancy base url.
base_url = https://identity-cloud-service-instance-url
#There is no need to change value of scope.
scope = urn:opc:idm:__myscopes__
#Enter the location of the wallet.
wallet_location = /etc/opc-wallet
#Enter the log level, this is optional and the default is 0, which means
#no log. 0 - None, 1 - Error, 2 - Info, 3 - Debug.
log_level = 0
#Enter the log file path, this is optional and defaults to /var/log/opc/
pam_nss.log
log_file_path = /var/log/opc/pam_nss.log
#Enter the value for proxy usage to connect toIAM. Set the value to 1 to
#use a proxy and 0 to not use a proxy.
use_proxy=1
#Enter the information below if use_proxy=1
#Enter the proxy url
proxy_url=http://proxy.example.com
#Enter the proxy port
```
IAM

proxy_port=80
#Enter the username to connect to the proxy url.
proxy_username=username_example
#Enter the password of username to connect proxy url.
proxy_pwd=pwd_example

6. Restart ssd and sshd:
   • authconfig --enablessd --enablesssdauth --enablesmkhomedir --enablepamaccess --update
   • service sshd restart
   • service ssd restart

Configuring the PAM using NSCD
Configure the Linux Pluggable Authentication Module (PAM) on Linux using the NSCD service.

   • The NSCD service should be installed. If it's not installed, install using sudo yum install nscd.
   • The service must be configured to start when the system reboots. You can perform this configuration using sudo chkconfig nscd on.
   • The property SELINUX must be set as permissive or disabled in file /etc/selinux/config. If it's not set, then set SELINUX=permissive or SELINUX=disabled.
   • Restart Linux to incorporate the above changes.

1. Edit the /etc/nsswitch.conf and add oracle_cloud as follows:

   /etc/nsswitch.conf

   passwd: files oracle_cloud
   group: files oracle_cloud

2. Edit the /etc/nscd.conf and enable caching in the nscd service:

   /etc/nscd.conf

   enable-cache passwd yes
   enable-cache group yes

3. Edit the /etc/pam.d/sshd and add the pam_oracle_cloud module:

   /etc/pam.d/sshd

   auth sufficient pam_oracle_cloud.so
   #Note: the above has to be added before the following line:
   auth include password-auth

4. Edit the /etc/ssh/sshd_config to configure sshd to allow the use of Multi-Factor Authentication:

   /etc/ssh/sshd_config

   #Search for the ChallengeResponseAuthentication property and set it to yes
   ChallengeResponseAuthentication yes

5. Edit the /etc/opc.conf to allow the plugin to interact with IAM:

   /etc/opc.conf

   #This is sample format of opc.conf file, please use the correct information to configure this file.
   #Enter the IAM tenancy base url.
   base_url = https://identity-cloud-service-instance-url
   #There is no need to change value of scope.
   scope = urn:opc:idm:__myscopes__
   #Enter the location of the wallet.
   wallet_location = /etc/opc-wallet
IAM

# Enter the log level, this is optional and the default is 0, which means no log. 0 - None, 1 - Error, 2 - Info, 3 - Debug.
log_level = 0
# Enter the log file path, this is optional and defaults to /var/log/opc/pam_nss.log
log_file_path = /var/log/opc/pam_nss.log
# Enter the value for proxy usage to connect to IAM. Set the value to 1 to use a proxy and 0 to not use a proxy.
use_proxy=1
# Enter the information below if use_proxy=1
# Enter the proxy url
proxy_url=http://proxy.example.com
# Enter the proxy port
proxy_port=80
# Enter the username to connect to the proxy url.
proxy_username=username_example
# Enter the password of username to connect proxy url.
proxy_pwd=pwd_example

---

6. Restart sshd and nscd:

- authconfig --enablemkhomedir --enablepamaccess --update
- service sshd restart
- service nscd restart

Configure PAM-enabled Groups and Users

Learn how to create new groups and users with POSIX Viewer role attributes, or add POSIX Viewer role attributes to existing groups and users, to allow end users on Linux to authenticate with IAM using the Linux Pluggable Authentication Module (PAM).

Obtaining an Access Token

Obtain an admin access token to allow you to create groups and users with POSIX attributes, or add POSIX attributes to existing groups and users.

In the Linux environment run the following command:

```
curl -k -X POST -u "client-id:client-secret" -d
   "grant_type=client_credentials&scope=urn:opc:idm:__myscopes__" "https://
identity-cloud-service-instance-url/oauth2/v1/token"
```

where:

- **client-id** is the client ID of a confidential application with administrative privileges
- **client-secret** is the client secret of a confidential application with administrative privileges
- **identity-cloud-service-instance-url** is your IAM Instance URL

Creating a Group with POSIX Attributes

Create a group with POSIX attributes.

1. Create a `group.json` file with the following request body:

```json
{ "schemas":
   [ "urn:ietf:params:scim:schemas:core:2.0:Group",
   "displayName": "posix group",
}```
where:

- **displayName** is set to the name of the group you wish to create
- **gidNumber** must be set to a unique group id (gid) number. Use the `getent group` command on Linux to see the existing group gid's.

2. Run the following curl command to create the group:

```bash
```

where:

- **token-string** is the OAuth access token that you obtained
- **identity-cloud-service-instance-url** is your IAM Instance URL

**Note:**
It is not possible to create a group with POSIX attributes using the IAM Administration Console.

Creating a User with POSIX Attributes and Add to Group

Create a user with POSIX attributes and add the user to the group previously created.

1. Create a `user.json` file with the following request body:

```json
{
  "password": "Securepasswd@1",
  "userName": "userPosix",
  "Name.givenName": "user",
  "Name.familyName": "Posix",
  "userType": "Employee",
  "emails": [
    {
      "value": "user.posix@example.com",
      "type": "work",
      "primary": true
    },
    {
      "value": "posix@example.com",
      "type": "home"
    }
  ],
  "addresses": [
    {
      "type": "work",
      "primary": true,
      "streetAddress": "401 Island Parkway",
      "locality": "Redwood Shores",
      "region": "California",
      "postalCode": "94065",
      "country": "US",
      "formatted": "userPosix"
    }
  ],
    "homeDirectory": "/home/userPosix",
    "loginShell": "/bin/bash",
    "gecos": "userPosix 24855",
```
IAM

```
"uidNumber": 12001,
"gidNumber": 11010
},
"meta": {
"resourceType": "User"
},
"schemas": [
]
```

where:

- **userName** is set to the username of the user you want to create
- **homeDirectory** is set to the location of the user's home directory
- **loginShell** is set to the default shell
- **gecos** is set to general information about the user, for example the user's username and phone number
- **uidNumber** must be set to a unique user id (uid) number in Linux. Use the `getent passwd` command on Linux to see existing users and their uid's
- **gidNumber** must be set to the group id (gid) number created previously

2. Run the following curl command to create the user and add it to the group:

```
user.json
```

```
```

where:

- **token-string** is the OAuth access token that you obtained
- **identity-cloud-service-instance-url** is your IAM Instance URL

**Note:**

It is not possible to create a user with POSIX attributes using the IAM Console.

After the user is created, the user will be sent a notification email to activate their account and set a new password. The user must activate their account before testing authentication in Linux.

Adding POSIX Attributes to Existing Groups

Add POSIX attributes to existing groups.

1. Create a `group_update.json` file with the following request body:

```
group_update.json
```

```
{
    "schemas": [
        "urn:ietf:params:scim:api:messages:2.0:PatchOp"
    ],
    "Operations": [
        {
            "op": "add",
            "value": 11020
        }
    ]
}
```
where:

- `gidNumber` must be set to a **unique** group id (gid) number. Use the `getent group` command on Linux to see the existing group gid's.

2. Run the following curl command to retrieve the group id's:

```bash
```

where:

- `token-string` is the OAuth access token that you obtained
- `identity-cloud-service-instance-url` is your IAM Instance URL

In the response, note the `id` of the group you want to update with POSIX attributes. For example, in the response below, the Marketing group `id` is `8c1f45fee6354e20aa9e57079082d6a2`:

```json
...
{
  "displayName": "Marketing",
  "idcsLastModifiedBy": {
    "type": "User",
    "value": "f142a5ce639643c2be8e8deb0ca5bce",
    "display": "admin example",
    "$ref": "https://identity-cloud-service-instance-url/admin/v1/Users/f142a5chjky3c2be8e8deb0ca5bce"
  },
  "idcsCreatedBy": {
    "type": "User",
    "display": "admin example",
    "value": "f142a5ce639643c2be8e8deb0ca5bce",
    "$ref": "https://identity-cloud-service-instance-url/admin/v1/Users/f142a5chjky3c2be8e8deb0ca5bce"
  },
  "id": "8c1f45fee6354e20aa9e57079082d6a2",
  "meta": {
    "created": "2019-06-10T13:23:59.451Z",
    "lastModified": "2019-06-10T13:23:59.451Z",
    "resourceType": "Group",
    "location": "https://identity-cloud-service-instance-url/admin/v1/Groups/8c1f45fee6354e20aa9e57079082d6a2"
  },
  "schemas": [
    "urn:ietf:params:scim:schemas:core:2.0:Group"
  ]
}
...
```
3. Run the following curl command to update the group:

```bash
```

where:
- `token-string` is the OAuth access token that you obtained
- `identity-cloud-service-instance-url` is your IAM Instance URL
- `id` is the id for the group you want to update with POSIX attributes

**Note:**
It is not possible to update a group with POSIX attributes using the IAM Administration Console.

Adding POSIX Attributes to Existing Users
Add POSIX attributes to existing users.

**Note:**
In order to add POSIX attributes to an existing user, that user must first be part of a group, and that group must have POSIX attributes.

1. Create a `user_update.json` file with the following request body:

```json
{
   "schemas": [
      "urn:ietf:params:scim:api:messages:2.0:PatchOp"
   ],
   "Operations": [
      {
         "op": "add",
         "value": "/home/msmith"
      },
      {
         "op": "add",
         "value": "msmith 25895"
      },
      {
         "op": "add",
         "value": 12002
      },
      {
         "op": "add",
         "value": 11020
      },
      {
         "op": "add",
         "value": "/bin/bash"
      }
   ]
}
```
IAM

where:

• homeDirectory is set to the location of the user’s home directory
• gecos is set to general information about the user, for example the user’s username and phone number
• uidNumber must be set to a unique user id (uid) number in Linux. Use the `getent passwd` command on Linux to see existing users and their uid's
• gidNumber must be set to the group id (gid) number updated previously
• loginShell is set to the default shell

2. Run the following curl command to retrieve the user id's:

   ```
   ```

where:

• token-string is the OAuth access token that you obtained
• identity-cloud-service-instance-url is your IAM Instance URL

In the response, note the id of the user you want to update with POSIX attributes. For example, in the response below, the msmith user id is e5438fcee80374d539b8638c289036ecd:

   ```
   ...
   {
     "idcsCreatedBy": {
       "type": "User",
       "display": "admin example",
       "value": "f142a5ce639643c2befe8deb0ca5bcec",
       "$ref": "https://identity-cloud-service-instance-url/admin/v1/Users/f142a5chjky3c2befe8deb0ca5bcec"
     },
     "id": "e5438fcee80374d539b8638c289036ecd",
     "meta": {
       "created": "2019-06-10T13:24:38.184Z",
       "lastModified": "2019-06-10T13:28:50.096Z",
       "resourceType": "User",
       "location": "https://identity-cloud-service-instance-url/admin/v1/Users/e5438fcee80374d539b8638c289036ecd"
     },
     "active": true,
     "displayName": "Mark Smith",
   ...
   ```
3. Run the following curl command to update the user:

```
```

where:
- `token-string` is the OAuth access token that you obtained
- `identity-cloud-service-instance-url` is your IAM Instance URL
- `id` is the id for the user you want to update with POSIX attributes

**Note:**
It is not possible to update a user with POSIX attributes using the IAM Administration Console.

### Verifying Endpoints

Verify that you can view users and groups and their POSIX attributes.

1. Obtain a POSIX access token by running the following curl command:

```
```

where:
- `client-id` is the client ID for the POSIX confidential application
- `client-secret` is the client secret for the POSIX confidential application
- `identity-cloud-service-instance-url` is your IAM Instance URL

2. Run the following curl command to view users with POSIX attributes:

```
```

where:
- `token-string` is the OAuth POSIX access token that you obtained
- `identity-cloud-service-instance-url` is your IAM Instance URL

An example response is as follows:

```
GET HOST/admin/v1/Users

{
    "schemas": [
        "urn:ietf:params:scim:api:messages:2.0:ListResponse"
    ],
    "totalResults": 3,
    "Resources": [
        {
            "id": "af79f523f0f8416fb4407ed80a3bdbc",
            "userName": "userPosix",
                "homeDirectory": "/home/userPosix",
                "loginShell": "/bin/bash",
                "gidNumber": 12001,
                "gecos": "userPosix 24855",
                "uidNumber": 11010
            }
        }
    ]
}
```
3. Run the following curl command to view groups with POSIX attributes:

```
```

where:

- `token-string` is the OAuth POSIX access token that you obtained
- `identity-cloud-service-instance-url` is your IAM URL

An example response is as follows:

```
GET HOST/admin/v1/Groups

{
   "schemas": [
      "urn:ietf:params:scim:api:messages:2.0:ListResponse"
   ],
   "totalResults": 3,
   "Resources": [
      {
         "displayName": "posix group",
         "id": "afb20ea78e84421aaba7009adf212ecf",
            "gidNumber": 11010
         },
         "members": [
            {
               "value": "af79f523f0f8416fb4407ed80a3bdbc6",
               "type": "User",
               "display": "user Posix",
               "name": "userPosix",
               "$ref": "https://identity-cloud-service-instance-url/admin/v1/Users/af79f523f0f8416fb4407ed80a3bdbc6"
            }
         ]
      },
      {
         "displayName": "Marketing",
         "id": "8c1f45fee6354e20aa9e57079082d6a2",
            "gidNumber": 11020
         }
      }
   ]
}
```
"members": [  
  {  
    "value": "e5438fcede80374d539b8638c289036ecd",
    "type": "User",
    "display": "Mark Smith",
    "name": "msmith",
    "$ref": "https://identity-cloud-service-instance-url/admin/v1/Users/e5438fcede80374d539b8638c289036ecd"
  }

}

**Testing Authentication into Linux Using IAM**

Test authentication on Linux using a user in IAM.

1. SSH into your Linux environment where the Linux Pluggable Authentication Module (PAM) is installed.
2. When prompted enter the password for the IAM user:

   For example:

   # ssh userPosix@host.example.com
   password:

   Last login: Thur Mar 28th 12:14:04 2019 from host.example.com
   [userPosix@host ~]$ 

   You should be logged in successfully.

**Enabling MFA to Authenticate into Linux**

Learn how to set up Multi-Factor Authentication (MFA) so Linux users can authenticate using multiple factors.

1. Enable the MFA factors for your requirements. See [Configuring Multi-Factor Authentication Settings](#) on page 3692 and [Configuring Authentication Factors](#) on page 3692

2. Create a group for MFA, and add the POSIX Users to this group.
   a) Navigate to **Groups > Create group**.
   b) Enter the **Name** of the group.
   c) Search for the POSIX users you want to enable for MFA.
   d) Select the users and click **Create**.

3. Create a Sign-On rule.
   a) Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
   b) Select the identity domain you want to work in and click **Security** and then **Sign-on policies**.
   c) Click the **Default Sign-On Policy**.
   d) Click **Add sign-on rule**.
   e) Enter a **Rule name**, and under **Conditions** in the field **Group membership** type and select the group that you created above. Under **Actions** ensure that **Allow access** and **Prompt for an additional factor** is checked. Change the **Enrollment** to **Optional** and click **Add sign-on rule**.

   **Note:**

   The only sign on policy that the Linux Pluggable Authentication Module (PAM) supports, is the **Default Sign-On Policy**.
4. Move the newly created sign-on rule to the top by clicking the sign-on rule and dragging it to the top of the list. Click Save. This ensures that this rule gets evaluated first so that users belonging to the chosen group are prompted for MFA when they sign in.

5. Sign in to IAM as a user in the MFA Group, for example via https://identity-cloud-service-instance-url/ui/v1/myconsole

6. Enroll the user in MFA and select the factors to enroll in.

   **Note:** Backup factors are not currently supported with the IAM Linux PAM.

7. After the user is enrolled in MFA, test authentication on Linux:
   a) SSH into your Linux environment where the IAM Linux PAM is installed.
   b) When prompted enter the password for the IAM user.
   c) Enter the second factor with which to authenticate.
   
   For example, for a user who has configured SMS as their second factor:

   ```
   # ssh userPosix@host.example.com
   password:
   Complete 2-Step Verification
   An SMS that contains a passcode was sent to +1XXXXXXX455. Enter the passcode or use the following option, and then press Enter:
   r - Resend passcode
   Enter the passcode or an option (r):
   Last login: Thu Mar 28 16:18:52 2019 from localhost
   [userPosix@host ~]$```

**Typical Workflow for Using IAM E-Business Suite Asserter to Authenticate Oracle EBS with IAM**

With the IAM E-Business Suite Asserter component that you download from the IAM console, you integrate your Oracle E-Business Suite with IAM to allow end users to authenticate in Oracle E-Business Suite environments and to Oracle E-Business Suite mobile applications using their IAM credentials.

**Understand IAM E-Business Suite Asserter**

The E-Business Suite Asserter is a lightweight web application that enables single sign-on (SSO) for E-Business Suite using IAM. The asserter enables users to access E-Business Mobile Apps and the E-Business Suite Web interfaces. Users can also access other applications that are secured using IAM.

The IAM E-Business Suite Asserter is a lightweight Java application. It helps to simplify the deployment topology for Oracle E-Business Suite single sign-on (SSO) by replacing Oracle Access Manager and Oracle Internet Directory with IAM.

To enhance security for the sign-in process, you can set up sign-on and identity provider policies, and configure multi-factor authentication. You can also enable adaptive security to provide strong authentication capabilities and risk analysis for your users across applications and Oracle E-Business Suite in IAM.

You can use the asserter when you want to:

- Have your Oracle E-Business Suite integrated with other applications for single sign-on.
- Enhance security to access your Oracle E-Business Suite by enabling IAM security features such as multi-factor authentication, sign-on policies, account recovery, and adaptive security.

The E-Business Suite Asserter provides the following benefits:
Multiple access modes for SSO with Oracle E-Business Suite. You can access Oracle E-Business Suite by using one of the following modes:

- The asserter direct URL (which you can bookmark).
- The IAM My Apps page.
- The asserter direct URL with a redirect parameter.
- Previously bookmarked Oracle E-Business Suite URLs.
- Supports log out from multiple points including Oracle E-Business Suite, E-Business Suite Asserter, and IAM.
- Allows single sign-on between Oracle E-Business Suite and Oracle E-Business Suite mobile application.

**Certified Components for IAM E-Business Suite Asserter**
The following table lists the certified components and their versions for IAM, Oracle E-Business Suite, WebLogic Server, Java JDK, and the IAM E-Business Suite Asserter to use for integration.

<table>
<thead>
<tr>
<th>IAM</th>
<th>Oracle E-Business Suite (EBS)</th>
<th>WebLogic Server</th>
<th>JDK</th>
<th>E-Business Suite Asserter</th>
</tr>
</thead>
<tbody>
<tr>
<td>19.2.1+</td>
<td>The following versions with latest patches applied:</td>
<td>Oracle WebLogic Server 12c (12.1.3 and 12.2)</td>
<td>• Java SE Development Kit 8</td>
<td>19.1.4-1.2.2+</td>
</tr>
<tr>
<td></td>
<td>• Oracle EBS Release 11i (11.5.10)</td>
<td></td>
<td>• Java EE 8</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Oracle EBS Release 12 (12.1.3, 12.2 or greater), with latest patch applied.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Architecture**
The IAM E-Business Suite Asserter is deployed to a separate Oracle WebLogic Server instance. The E-Business Suite Asserter interacts with IAM through IAM REST API and redirects the user's web browser to IAM and to Oracle E-Business Suite.

This architectural diagram shows how the E-Business Suite Asserter, Oracle E-Business Suite, and IAM interact.
The following diagrams show the login and logout flow when using the E-Business Suite Asserter to integrate Oracle E-Business Suite with IAM. These flow diagrams show the login and logout process starting with Oracle E-Business Suite, but the E-Business Suite Asserter approach also supports E-Business Suite Asserter and IAM initiated flow.
1. The user has access to an Oracle E-Business Suite protected resource.
2. Oracle E-Business Suite redirects the user browser to the E-Business Suite Asserter application.
3. The E-Business Suite Asserter uses an IAM SDK to generate the authorization URL and then redirects the browser to IAM.
4. IAM presents its sign in page to the user.
5. The user submits credentials to IAM.
6. IAM issues an authorization code and redirects the user's browser to the E-Business Suite Asserter.
7. The E-Business Suite Asserter uses an IAM SDK to communicate with IAM to exchange the authorization code for an access token.
8. IAM issues an access token and an ID token to the E-Business Suite Asserter.
10. Oracle E-Business Suite presents the user requested protected resource.

The following logout process refers to a user invoking logout from Oracle E-Business Suite. If the logout process is initiated in IAM, then only step 5 and 6 are run.
1. The user selects to log out from Oracle E-Business Suite.
2. Oracle E-Business Suite logs the user out and then redirects the user's browser to the E-Business Suite Asserter application.
3. The E-Business Suite Asserter uses an IAM SDK to obtain the IAM logout URL, and then redirects the user's browser to this URL.
4. The user browser invokes the IAM logout URL.
5. IAM removes the user session and then redirects the user's browser to the E-Business Suite Asserter logout URL, which is defined in the application configuration.
6. The E-Business Suite Asserter logs out the user and redirects the user's browser to the Post Logout Redirect URL, which is defined in the application configuration.

Considerations for Using the E-Business Suite Asserter

To use the E-Business Suite Asserter, you must understand the following considerations for installation and configuration.

- The host names for the EBS Asserter's WebLogic server and Oracle E-Business Suite's application server must have exactly same domain for SSO to work.
- The E-Business Suite Asserter must be accessed over SSL, since IAM can only be accessed over SSL. Failure to do so might cause SSO between IAM and the E-Business Suite Asserter to fail.
- Synchronize the server clock where the E-Business Suite Asserter runs, and the server clock where Oracle E-Business Suite runs.
- You can deploy the asserter in Oracle WebLogic Server 12c by using secure communications such as Secure Sockets Layer (SSL) and Transport Layer Security (TLS).
How to Use the Asserter With Multiple Instances of Oracle E-Business Suite

You can use the same WebLogic Server installation with multiple managed servers or from a different WebLogic Server installation, each with one managed server. In both cases, each IAM E-Business Suite Asserter URL has its own domain name and port number pair.

**Note:**

For each Oracle E-Business Suite (EBS) instance, the associated database name must be unique. For example, if there are three EBS instances - test, dev and prod, the database names could be ebstest, ebsdev, ebsprod respectively.

For each Oracle E-Business Suite (EBS) instance, you configure and deploy one instance of the E-Business Suite Asserter (EBS Asserter) Java application. Usually you deploy each EBS Asserter Java application to a specific WebLogic managed server.

Starting from EBS Asserter version 19.2.1-1.5.0, if you don't want to create multiple managed servers and deploy one EBS Asserter Java application to each of them, you can deploy multiple EBS Asserter Java applications to the same WebLogic managed server.

To accomplish this scenario, you need to perform the following tasks:

- Rename each EBS Asserter Java application's Web Application Resource (WAR) file before you deploy the file to the same WebLogic managed server. In this case, the domain name and port number of all EBS Asserter's URLs are same, but the URL's context changes.
- Extract the contents of each ebs.war file to a folder, find the weblogic.xml file, edit this file, update the value of the `<cookie-path>` tag to match the EBS Asserter's URL, and then rebuild the ebs.war.

  For example, if you want EBS Asserter to respond to URL context `/app/ebs`, then the tag within weblogic.xml with the value `<cookie-path>/app/ebs</cookie-path>`.

For example: If you have two EBS instances named Development 1 and Development 2, you want to integrate these EBS instances with IAM using the EBS Asserter, but you only have one WebLogic managed server for the two EBS Asserter Java applications, you need to run the procedures in this tutorial for each EBS instance. You configure the WebLogic Server only once, and configure and deploy the EBS Asserter Java Application for each EBS instance:

- For EBS instance Development 1:
  
  - Make a copy of the ebs.war file and name the new file ebsdev1.war.
  - Update the weblogic.xml file contained in the ebsdev1.war file, by replacing the cookie-path tag with the following: `<cookie-path>/ebsdev1</cookie-path>`.
  - Update the bridge.properties file contained in the ebsdev1.war file.
  - Deploy the ebsdev1.war file to the WebLogic managed server.

- For EBS instance Development 2:
  
  - Make a copy of the ebs.war file and name the new file ebsdev2.war.
  - Update the weblogic.xml file contained in the ebsdev2.war file, by replacing the cookie-path tag with the following: `<cookie-path>/ebsdev2</cookie-path>`.
  - Update the bridge.properties file contained in the ebsdev2.war file.
  - Deploy the ebsdev2.war file to the WebLogic managed server.

You deploy both ebsdev1.war and ebsdev2.war files in to the same WebLogic managed server. The EBS Asserter's URL for EBS instance Development 1 is similar to the following example: https://ebsasserter.example.com:7002/ebsdev1.

The EBS Asserter's URL for EBS instance Development 2 is similar to the following example: https://ebsasserter.example.com:7002/ebsdev2.
What do You Need to Use the E-Business Suite Asserter

Verify which services, roles, components, and information are required to perform the configurations to integrate your Oracle E-Business Suite environment with IAM using the Identity Cloud Service E-Business Asserter.

Before You Begin

Before you begin using E-Business Suite Asserter, understand how to enable it, and how it works with other components.

• If your Oracle E-Business Suite is integrated with Oracle Access Manager, Oracle Internet Directory, E-Business Suite AccessGate, or uses any other SSO profile, then remove the integration between these components and Oracle E-Business Suite, and then restart the servers before using the IAM E-Business Suite Asserter.

• Know what’s supported. All Oracle E-Business modules which use browser-based login works with E-Business Suite Asserter for SSO. Excel-based login of Web ADI is supported. Mobile Apps for EBS, such as approvals and expenses, are supported. Modules which do not use browser-based login, such as Mobile Web Applications (MWA) and E-Signature, are not supported.

About Required Services and Roles

An IAM administrator must be able to access the IAM console to download E-Business Suite Asserter and configure and activate applications.

You must have access to the following services and products:

• IAM
• Oracle E-Business Suite

You must have the following roles:

<table>
<thead>
<tr>
<th>Role</th>
<th>Required to...</th>
</tr>
</thead>
<tbody>
<tr>
<td>IAM: Security administrator</td>
<td>Access the Downloads page of the IAM console. From this page, you can download the Identity Cloud Service E-Business Suite Asserter.</td>
</tr>
<tr>
<td>IAM: Application administrator</td>
<td>Manage applications in IAM, which includes registering the sample mobile app with IAM.</td>
</tr>
</tbody>
</table>

See Learn how to get Oracle Cloud services for Oracle Solutions.

Downloading the E-Business Suite Asserter from the IAM Console

You can access the Downloads page from the IAM console. From this page, you can download the IAM E-Business Suite Asserter.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Settings** and then **Downloads**.
3. On the **Downloads** page, click the **Identity Cloud Service Asserter for E-Business Suite** download button.

   For instances of Identity Cloud Service EBS Asserter Release 20.1.3, the feature for EBS Asserter has to be enabled.

   • If the EBS Asserter is disabled and you try to use it you see an error message.
   • Check the feature state by going to `tenant base url/admin/v1/FeatureInfos. oracle.idaas.ebs.asserter should be marked as enabled.`

4. Save the .zip file to a temporary folder on your local machine (for example, `c:\temp` for Windows or `/temp` for UNIX).
5. Extract the contents of the .zip file and find the location of the ebs.war and idcs-wallet-<version>.jar files.

   The name of the files might vary accordingly to the version.
6. Copy the ebs.war and idcs-wallet-<version>.jar files to a working folder into the E-Business Suite Asserter's WebLogic Server machine. For example, /opt/ebssdk (create this folder if it doesn't exist).

Provide Environment Information
Record the environment information that you need when you configure the E-Business Suite Asserter configuration file.

- Oracle WebLogic Server host name where the E-Business Suite Asserter is deployed. For example, ebsasserter.example.com
- Oracle WebLogic Server HTTPS address (including port number if not default one) where the E-Business Suite Asserter is deployed. For example, https://ebsasserter.example.com:7002
- Oracle E-Business Suite host name. For example, ebs.example.com
- Oracle E-Business Suite HTTPS address. For example, https://ebs.example.com:8001/
- IAM HTTPS address (including port number if not using the default one). For example, https://idcs-example.identity.oraclecloud.com
- Oracle E-Business Suite Database name. For example, EBSDB
- Oracle E-Business Suite Database host. For example, ebs.example.com
- Oracle E-Business Suite Database port. For example, 1521
- Oracle E-Business Suite APPS user password. For example, apps

Configure E-Business Suite Asserter Integration
Set up Oracle E-Business Suite, register the asserter in IAM, and deploy the asserter.

Create Users and Update the Administrator's Email in Oracle E-Business Suite
Create a user for the E-Business Suite Asserter to communicate with Oracle E-Business Suite, a user in IAM that correspond to the System Administrator in your Oracle E-Business Suite. Then update the email address of the SYSADMIN user in Oracle E-Business Suite.

Creating an Application User on Oracle E-Business Suite
You must create a specific application user that is authorized to connect to the Oracle E-Business Suite database. The Apps Schema Connect role determines the authorization to connect to the Oracle E-Business Suite database. A user that has this role is authorized to connect to the Oracle E-Business Suite database.

1. Log in to the Oracle E-Business Suite as an administrator. For example, sysadmin.
2. In the Oracle E-Business Suite Home page, scroll down the Navigator, expand User Management, and then click Users.
3. In the User Management page, select User Account from the Register menu, and then click Go.
4. In the Create User Account page, enter the following details to create a user, and then click Submit.
   - Username: Provide a username
   - Password: Provide a password
   - Description: E-Business Suite Asserter Service User
   - Password Expire: None

   Provide a temporary password for this user because the user needs to reset the password after first login.
5. After the A new user account has been created. message appears, click Assign Roles, and then click Assign Roles in the Update User page.
6. In the Search and Select: Assign Roles window, search for Code UMX|APPS_SCHEMA_CONNECT.
7. Select Apps Schema Connect Role, and then click Select.
8. In the Update User page, enter the justification as EBS Asserter Service User, and then click Save.

   You can ignore the warning message regarding the Workflow Background Engine.
9. After the user is created, log off Oracle E-Business Suite application, and then log in using the username and password you provided in step 4 to reset the user password.

Creating Oracle E-Business Suite's System Administrator in IAM
Create a user in IAM that corresponds to the System Administrator in your Oracle E-Business Suite.

This user is necessary otherwise the system administrator won't be able to log in to the Oracle E-Business Suite console after Oracle E-Business Suite is configured to use IAM for authentication.

1. Sign in to IAM to access the IAM console.
2. In the IAM console, expand the **Navigation Drawer**, click **Users**, and then click **Add** in the **Users** page.
3. In the **Add User** window, provide the following values, and then click **Finish**:
   - **First Name**: EBS
   - **Last Name**: Sysadmin
   - **Username**: sysadmin
   - **Email**: If the sysadmin user in your Oracle E-Business Suite is configured with an email address, provide this email address. Otherwise, provide an email address and then update Oracle E-Business Suite’s System Administrator email address with this same value.

IAM sends a **Welcome** notification email to the email you provided with the procedures to reset the password of the sysadmin user.

**Updating Oracle E-Business Suite's System Administrator Email Address**

Update the email address of the SYSADMIN user in Oracle E-Business Suite to match the email address you provided to the corresponding user in IAM.

1. Login as administrator (for example, sysadmin) to the Oracle E-Business Suite application.
2. In the **Oracle E-Business Suite Home** page, scroll down to the **Navigator**, expand **User Management**, and then click **Users**.
3. In the **User Maintenance** page, search for the **Username** SYSADMIN, and click the update icon for the SYSADMIN user.
4. If the **Email** field hasn’t been set, update this field value with the same email address you provided during the creation of the system administrator user in IAM, and then click **Apply**.

**Configure the E-Business Suite Asserter in Oracle E-Business Suite**

Register the E-Business Suite Asserter application server with Oracle E-Business Suite.

**Registering the E-Business Suite Asserter with Oracle E-Business Suite**

To establish communication with Oracle E-Business Suite, the E-Business Suite Asserter uses the application server ID in the database connection file. The database connection file is generated while registering the E-Business Suite Asserter application server with Oracle E-Business Suite.

1. Log in to the Oracle E-Business Suite application server machine. Don't use the root user. Use the user that installed and ran the WebLogic Server.
2. Run the commands `echo $JAVA_HOME` and `echo $WL_HOME`, and then make note of the value that is set for each:
   - **JAVA_HOME**: /usr/java/jdk1.7.0_201
   - **WL_HOME**: /u01/oracle/wlserver

   If the values of the commands $JAVA_HOME and $WL_HOME aren’t set, request that the WebLogic administrator set them. The $WL_HOME value is only needed if you use a version of Oracle E-Business Suite greater than 12.2.

   The values for the $JAVA_HOME and $WL_HOME might differ from your environment. Update the fields with the correct values for your environment.
3. Run the following command to create a working folder:

   ```bash
   cd /opt
   mkdir ebssdk
   cd ebssdk
   ```
4. Extract the fnnext.jar file, which is in the WEB-INF/lib folder inside the ebs.war file that you have downloaded from the IAM console.

5. Copy the fnnext.jar file to the working folder you created in the previous step and also to the E-Business Suite Asserter WebLogic $DOMAIN_HOME/lib folder.

   The name of the fnnext.jar file might vary depending on the current version.

6. Locate your Oracle E-Business Suite environment file (in this example, /u01/install/VISION/EBSapps.env) and run the following command:

   ```
   source /u01/install/VISION/EBSapps.env
   ```

   The path to the .env file might vary depending on your environment.

7. Locate the .dbc file that is associated with your Oracle E-Business Suite instance in the following folder: $FND_SECURE/EBSDB.dbc.

   If your database instance name is EBSDB, the file has a name like EBSDB.dbc. Make a note of the full path of the .dbc file (including the file name itself): /u01/install/VISION/fs1/inst/apps/EBSDB_ebs/appl/fnd/12.0.0/secure/EBSDB.dbc.

8. Run the following command to register the E-Business Suite Asserter application server with Oracle E-Business Suite:

   ```
   cd /opt/ebssdk
   java oracle.apps.fnd.security.AdminDesktop apps/apps CREATE
   NODE_NAME=ebsasserter.example.com DBC=/u01/install/VISION/fs1/inst/apps/EBSDB_ebs/appl/fnd/12.0.0/secure/EBSDB.dbc
   ```

   **Note:**

   The value of CREATE NODE_NAME is the asserter hostname. Use the value that is correct for your setup.

9. Run the following command:

   ```
   cat EBSDB_ebsasserter.example.com.dbc
   ```

   The resulting file name might be in all uppercase letters. Make a note of the APPL_SERVER_ID value.

10. Copy the EBSDB_ebsasserter.example.com.dbc file to the EBS Asserter's WebLogic Server machine under the /opt/ebssdk folder. Create the folder if the folder doesn't exist.

**Registering and Activate the E-Business Suite Asserter in IAM**

To establish communication with IAM, the E-Business Suite Asserter uses the client ID and the client secret of an IAM registered application.

1. In the IAM console, expand the Navigation Drawer, and then click Applications.
2. On the Applications page, click Add.
3. In the Add Application dialog box, click Trusted Application.
4. In the Details pane, enter the following information, and then click Next.

   - **Name**: EBS Asserter
   - **Description**: E-Business Suite Asserter Application
   - **Application URL**: https://ebsasserter.example.com:7002/ebs
   - **Display in My Apps**: Select this check box
5. In the **Client** pane, select **Configure this application as a client now**, and then enter or select the following values:
   - **Allowed Grant Types**: Client Credentials and Authorization Code
   - **Redirect URL**: https://ebsasserter.example.com:7002/ebs/response
   - **Logout URL**: https://ebsasserter.example.com:7002/ebs/logout
   - **Post Logout Redirect URL**: https://ebs.example.com:8001/OA_HTML/OA.jsp?OAFunc=OANEWHOMEPAGE

6. In the **Client** pane, scroll down, and click **Add** underneath Grant the client access to IAM Admin APIs.
7. In the **Add App Role** dialog box, select Authenticator Client and Me from the list, and then click **Add**.
8. In the **Client** pane, click **Next**.
9. Click **Next** until you reach the last pane, and then click **Finish**.
10. In the **Application Added** dialog box, make a note of the **Client ID** and **Client Secret** values, and then click **Close**.

   E-Business Suite Asserter needs these values to integrate with IAM.

11. Click **Activate**.
12. In the **Activate Application** dialog box, click **Activate Application**.

---

**Configure and Deploy the E-Business Suite Asserter**

After registering the E-Business Suite Asserter in IAM, you must configure and deploy the E-Business Suite Asserter that will act as an interface between an identity token issued by IAM and a user session created in Oracle E-Business Suite.

### Creating a Wallet for the E-Business Suite Asserter

For security purposes, the E-Business Suite Asserter component uses a wallet to register the client ID, client secret, and IAM URL as parameters.

1. Log in to the E-Business Suite Asserter application server machine, and navigate to the `/opt/ebssdk` folder. Ensure the user has enough privileges to perform the following actions.
2. Access the folder where the `idcs-wallet-<version>.jar` file is located.
3. Run the command `java -jar idcs-wallet-<version>.jar`, and then provide the following values when prompted:
   - **Enter Client ID**: Enter the client ID generated while registering and activating the E-Business Suite Asserter in IAM.
   - **Enter Client Secret**: Enter the client secret for the client ID.
   - **Enter IDCS base URL**: Enter IAM base URL. For example: `https://MYTENANT.identity.oraclecloud.com`.

   The command line creates a wallet file named `cwallet.sso` in the provided path.

   Make note of the path of the `cwallet.sso` file.

### Updating the E-Business Suite Asserter Configuration File

After you register the IAM E-Business Suite Asserter (EBS Asserter), you can configure the asserter configuration file to connect with IAM during authentication.

Starting from IAM E-Business Suite Asserter version 19.1.4-1.4.0 onward, the asserter contains a properties file called `bridge.properties`. This file is located inside the `ebs.war` file. You must update the information in the `bridge.properties` file, and then regenerate the `ebs.war` file, before deploying it to a WebLogic Server.

**Note:**

For E-Business Suite Asserter versions before 19.1.4-1.4.0 release, the war file might not contain the `bridge.properties` file inside. You must create this file in a folder of the E-Business Suite Asserter's WebLogic server, update its content as described in step 3, save the file, and then set an environment variable, as in the following example: `export ebs_property_file="/opt/ebssdk/bridge.properties"`
1. In the server where you downloaded the E-Business Suite Asserter zip file, navigate to the location where you decompressed the ebs.war file.
2. Using a zip utility, decompress the ebs.war file, locate the bridge.properties file, and open the file for editing.
3. Uncomment the following properties by removing the # from the beginning of each line, and update their values as follows:

```
# Properties File
app.url=https://ebsasserter.example.com:7002/ebs
app.serverid=APPL_SERVER_ID_value
ebs.url.homepage=https://ebs.example.com:8001/OA_HTML/OA.jsp?
OAPunc=OANEWHOMEPAGE
ebs.ds.name=visionDS
ebs.user.identifier=username
idcs.iss.url=https://identity.oraclecloud.com
idcs.aud.url=https://idcs-example.identity.oraclecloud.com
#post.logout.url=https://ebs.example.com:8001
wallet.path=[FULL_PATH_OF_THE_WALLET_FILE]
whitelist.urls=https://ebs.example.com:8001/OA_HTML/RF.jsp,
https://ebs.example.com:8001/OA_HTML/OA.jsp,
close.jsp
ebs.renew.session=true
proxy.mode=true
proxy.home.url=https://ebs.example.com:8001/OA_HTML/RF.jsp?
function_id=1031198&resp_id=-1&resp_appl_id=0&security_group_id=0&lang_code=US
#istore.pages=ibeCZzdMinisites.jsp,ibeCAcpSSOLoginR.jsp
#idcs.user.identifier=email/username
```

The following table provides the description for each bridge.properties parameter and optional parameters supported by each EBS Asserter version.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>EBS Asserter Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>app.url</td>
<td>The URL and port number for the E-Business Suite Asserter application.</td>
<td>19.1.4 onward</td>
</tr>
<tr>
<td>app.serverid</td>
<td>Corresponds to the APPL_SERVER_ID value in the .dbc file generated while registering the E-Business Suite Asserter.</td>
<td>19.1.4 onward</td>
</tr>
<tr>
<td>ebs.url.homepage</td>
<td>The URL address for the Oracle E-Business Suite home page.</td>
<td>19.1.4 onward</td>
</tr>
<tr>
<td>ebs.ds.name</td>
<td>The data source name to be created in the Oracle WebLogic Server where the E-Business Suite Asserter is deployed.</td>
<td>19.1.4 onward</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>EBS Asserter Version</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>ebs.user.identifier</td>
<td>Oracle E-Business Suite field used to match the IAM username. Allowed values are username (representing the FND_USERS.USER_NAME column) or email (representing the FND_USERS.EMAIL_ADDRESS column). Ensure that the attribute chosen here has unique values in FND_USERS otherwise the login fails.</td>
<td>19.1.4 onward</td>
</tr>
<tr>
<td>idcs.iss.url</td>
<td>IAM issuer URL. This value can be found in the IAM Discovery Doc endpoint. The default value is <a href="https://identity.oraclecloud.com">https://identity.oraclecloud.com</a>. This value must match the Issuer value set in the IAM OAuth settings. See Configure OAuth Settings.</td>
<td>19.1.4 onward</td>
</tr>
<tr>
<td>post.logout.url</td>
<td>This is an optional parameter. Uncomment this parameter so that E-Business Asserter redirects to this URL after logging the user out from the Single Sign-On. This value must match the value of the Post Logout Redirect URL parameter in IAM App Configuration.</td>
<td>19.1.4 onward</td>
</tr>
<tr>
<td>wallet.path</td>
<td>The full path of the wallet file, including the file name.</td>
<td>19.1.4 onward</td>
</tr>
<tr>
<td>whitelist.urls</td>
<td>Lists the URL E-Business Suite Asserter can accept as the requestUrl parameter value. If the requestUrl value doesn't match one of the whitelist.urls values, then the test scenario for SSO Using the E-Business Suite Asserter Direct URL with a Redirect Parameter fails.</td>
<td>19.1.4 onward</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>EBS Asserter Version</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>ebs.renew.session</td>
<td>This is an optional parameter. Use this parameter to control how the E-Business Suite Asserter manages the Oracle E-Business Suite session when the Oracle E-Business Suite cookie has expired. If you add this parameter to the bridge.properties file, and set the value to true, then the asserter refreshes the Oracle E-Business Suite Forms session after having reach the configured limit (ICX:Session Timeout). If the parameter is set to false, then after reaching the configured limit, the Forms session is invalidated closing all active Forms, however the Oracle E-Business Suite session in the browser will be active, allowing the user to reopen a new Forms session.</td>
<td>19.2.1 onward</td>
</tr>
<tr>
<td>proxy.mode</td>
<td>This is an optional parameter. Add this parameter to the bridge.properties file, and set the value to true to enable Oracle E-Business Suite Proxy User feature. Users trying to log in as a proxy user, are redirected to the URL you provide in the proxy.home.url parameter.</td>
<td>19.3.3-1.7.0 onward</td>
</tr>
<tr>
<td>proxy.home.url</td>
<td>This attribute is mandatory if proxy.mode=true. After the user signs in to IAM, the EBS Asserter redirects the proxy user to this URL. Typically this URL is Oracle E-Business Suite's Switch User page. For example: <a href="https://ebs.example.com:8001/OA_HTML/RF.jsp?function_id=1031198&amp;resp_id=-1&amp;resp_appl_id=0&amp;security_group=0">https://ebs.example.com:8001/OA_HTML/RF.jsp?function_id=1031198&amp;resp_id=-1&amp;resp_appl_id=0&amp;security_group=0</a>.</td>
<td>19.3.3-1.7.0 onward</td>
</tr>
<tr>
<td>istore.pages</td>
<td>Lists the comma-separated value of iStore pages E-Business Suite Asserter accepts. If the requestUrl matches one of the istore.pages values, then user will be redirected to the requested iStore page post login. Add the iStore pages to the existing list of istore.pages.</td>
<td>19.3.3-1912170009 onward</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>EBS Asserter Version</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>idcs.user.identifier</td>
<td>This is an optional parameter. The IAM user attribute used to match with ebs.user.identifier. Allowed values are username (representing the username attribute in IAM), email (representing the email attribute in IAM), custom attribute name (representing the custom attribute of a user in IAM e.g: employee_no). If this value is not provided in bridge.properties, then it is defaulted to the value of ebs.user.identifier. Ensure that there is one-to-one mapping between the idcs.user.identifier attribute in IAM to the ebs.user.attribute attribute in FND_USERS otherwise the login fails.</td>
<td>19.3.3-1912170009 onward</td>
</tr>
</tbody>
</table>

**Note:**

Ensure that the custom attribute used in idcs.user.identifier is added to the user schema in IAM. The custom attribute feature is available in EBS Asserter version 20.1.3 onwards.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>EBS Asserter Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>base.lang</td>
<td>The Oracle Identity Cloud Service EBS Asserter supports the user’s language configuration provided in EBS. If the FND_OVERRIDE_SSO_LANG profile option is enabled for a user in EBS, Asserter creates an EBS session based on the value of the ICX_LANGUAGE profile option of this user. If no language configuration is present for the users in EBS and the browser language needs to be overwritten across all the users of the application, the base.lang property can be set in the bridge.properties file. For example, if base.lang is set to US and the user does not possess any language-specific configuration in EBS, irrespective of the browser (with local languages) from which the user tries to log in into EBS with Asserter, the EBS session is created in American English. <strong>Note:</strong> The base.lang configuration is relevant in case the EBS is enabled with multiple languages. If there’s only one language enabled in EBS, the asserter creates the EBS session with the base installed language even without a base.lang configuration.</td>
<td>Oracle Identity Cloud Service release version</td>
</tr>
</tbody>
</table>

4. Rebuild the ebs.war file and make sure it contains the updated version of the bridge.properties file. The structure of the ebs.war file is as follows:

```
META-INF/
 MANIFEST.MF
WEB-INF/
  classes/
  lib/
  bridge.properties
 web.xml
 weblogic.xml
```

**Configuring Hostname Verification in WebLogic Console**

You can configure the hostname verification in Oracle WebLogic Server Administration Console.

2. Log in to WebLogic console as an administrator.
3. In the left panel, click **Lock & Edit**, expand **Environment**, select **Servers**.
4. Click the name of the target server where you want to deploy the EBS Asserter. In this example, **AdminServer**.
5. Click the **SSL** tab. Scroll down and expand the **Advanced** section.
6. Update the **Hostname Verification** parameter with the value **None**, and then click **Save**.
7. Click **Activate Changes**.
8. Restart the servers.

**Configuring Keystores in WebLogic Console**

If you are using Custom Trust Store in WebLogic for asserter deployment, instead of using **Custom Identity and Custom Trust Store** with WebLogic server, use **Custom Identity and Java Trust Store**. With this configuration, you do not need to import IAM certificate.

1. Start the Oracle WebLogic Server Administration Console by entering http://
   wls_host:wls_port/console in the URL line of a web browser. For example, https://
ebsasserter.example.com:7002/console.
2. Log in to WebLogic console as an administrator.
3. In the left panel, click **Lock & Edit**, expand **Environment**, select **Servers**.
4. Click the name of the target server where you want to configure the keystore.
5. Click **Keystores** under the **Configuration** tab.
6. In the left panel, click **Lock & Edit** to make the changes.
7. Select **Custom Identity and Java Trust Store**.
8. Click **Save** and **Activate Changes**.
9. Restart the WebLogic server.

**Defining the Data Source**

In the Oracle WebLogic Server where E-Business Suite Asserter is deployed, you must configure database connectivity by adding data sources to your WebLogic domain. WebLogic Java Database Connectivity (JDBC) data sources provide database access and database connection management.

1. Enter the following URL in a web browser, replacing **host:port** with the host name and port for the WebLogic Administration Console:

   http://wls_host:wls_port/console

   For example, https://ebsasserter.example.com:7002/console.
2. Log in to WebLogic console as an administrator.
3. In the administration console under **Domain Structure**, expand **Services** and then click **Data Sources**.
4. Under the **Data Sources** table heading, click the **New** list, and select **Generic Data Source**.
5. In the **JDBC Data Source Properties** section, specify the following values, and then click **Next**:
   * **Name**: visionDS
   * **JNDI Name**: visionDS
   * **Database Type**: oracle

   The value of the **Name** parameter must match the **ebs.ds.name** parameter in the E-Business Suite Asserter configuration file.
6. Select a database driver, and then click **Next**.
   * If you are using an XA data source, select *Oracle's Driver (Thin XA) for Instance connections; Versions:any*.
   * If you are using a non-XA data source, select *Oracle's Driver (Thin) for Instance connections; Versions:Any*.
7. In the **Transaction Options** section, perform one of the following, and click **Next**:
   * For a non-XA data source, uncheck the **Supports Global Transactions** check box.
   * For an XA data source, leave the check box checked.
8. In the **Connection Properties** section, specify the following appropriate values and then click **Next**.
   
   - **Database Name**: EBSDB
   - **Host Name**: ebs.example.com
   - **Port**: 1521
   - **Database Username**: Enter the username you created earlier in Creating an Application User on Oracle E-Business Suite on page 3656.
   - **Password**: Enter the password for the username.

9. In the **Driver Class Name** field, enter one of the following:
   
   - `oracle.apps.fnd.ext.jdbc.datasource.AppsDataSource` if you use a non-XA data source.
   - `oracle.apps.fnd.ext.jdbc.datasource.AppsXADatasource` if you are using an XA data source.

   Optionally, you can use the `oracle.jdbc.OracleDriver` driver instead, but you need to provide administrative database credentials during this value. If you don't want to expose administrative database credentials to WebLogic administrators, use one of the two values provided for **Driver Class Name** in this task.

10. In the **Properties** text box, keep the current value for `user`, add a new line, and enter the path to the `dbc` file as shown in this example:

    ```
    user=IDENTITYADMIN
dbcFile=/opt/ebssdk/EBSDB_ebsasserter.example.com.dbc
    ```

    **Note:**
    This field is case sensitive. Ensure the name of the file is correctly written with the correct uppercase and lowercase letters.

11. Review the data source properties values, confirm that the database is running, and click **Test Configuration**.

    Ensure your network doesn't block communication between the E-Business Suite Asserter's WebLogic server machine and the Oracle E-Business Suite database through the port number you provided in the datasource.

12. When you see the **Connection test succeeded** message, then click **Next**.

13. In the **Select Targets** section, select the target server (for example, **EBSAsserter_server**), and click **Finish**.

14. In the **Change Center**, click the **Activate Changes** button.

**Deploying the E-Business Suite Asserter on Oracle WebLogic Server**

You must deploy the E-Business Suite Asserter to the Administration Server instance of Oracle WebLogic Server to perform end-to-end testing of the integration.

1. Copy the E-Business Suite Asserter war file (`ebs.war`) to the working folder in the Oracle WebLogic Server `/opt/ebssdk`.

2. Enter the following URL in a web browser, replacing `host:port` with the host name and port for the Oracle WebLogic Server Administration Console:

   ```
   http://wls_host:wls_port/console
   ```

   For example, `https://ebsasserter.example.com:7002/console`.

3. Log in to the WebLogic console as an administrator.

4. In the **Change Center**, click the **Lock & Edit** button.

5. Under Domain Structure, click **Deployments**.

6. On the right, under **Deployments**, click the **Install** button.

7. Enter the path for the E-Business Suite Asserter war file as `/opt/ebssdk`.

8. Select the `ebs.war` file and click **Next**.

9. Select **Install this deployment as an application**, and then click **Next**.

10. Select the target server (for example, **EBSAsserter_server**) and then click **Next**.
11. Accept the default values and click **Finish**.

12. Click **Activate Changes**.

**Updating Oracle E-Business Suite Profiles**
Configure the URL allowlist property to prevent access to the Oracle E-Business Suite local login and direct all requests to the E-Business Suite Asserter log in instead.

1. Log in to Oracle E-Business Suite console as a user that is assigned the Functional Administrator responsibility (typically **sysadmin**).
2. Use the drawer icon (E-Business Suite version 12.2.8) or navigator icon (E-Business Suite version 12.1/12.2), click **Functional Administrator**.
3. In the **Oracle Applications Administration** page, click the **Core Services** tab, and then click **Profiles**.
4. Enter **APPS_AUTH_AGENT** in the **Code** field and then click **Go**.
5. On the list of profiles, select **Application Authenticate Agent**, and then click **Define Profile Values**.
6. On the **Define Profile Values: Application Authenticate Agent** page, enter the E-Business Suite Asserter URL in the **Site Value** field, and then click **Update**.
7. Click **Profiles** under the **Core Services** tab, enter **APPS_SSO** in the **Code** field, and then click **Go**.
8. On the list of profiles, select **Applications SSO Type**, click **Define Profile Values**, change the **Site Value** field from **SSWA** to **SSWA w/SSO**, and then click **Update**.
9. Click **Profiles** under the **Core Services** tab, enter **ICX_SESSION_COOKIE_DOMAIN** in the **Code** field, and then click **Go**.
10. On the list of profiles, select **Oracle Applications Session Cookie Domain**, click **Define Profile Values**, replace the **Site Value** field from **HOST** to **DOMAIN**, and then click **Update**.

**Validate the Integration**
To successfully test SSO with Oracle E-Business Suite, ensure that you create a user in IAM whose username is identical to an Oracle E-Business Suite user name. Then, assign the E-Business Suite Asserter application to this user. These sample configurations and testing apply to an Oracle E-Business Suite demo distribution (VISION) environment. Check the values of the encoded URLs before applying them to your environment.

**Testing the SSO Using the E-Business Suite Asserter Direct URL**
You can use the E-Business Suite Asserter direct URL to verify the integration and ensure that the SSO works.

1. Open a browser and enter the URL **https://ebsasserter.example.com:7002/ebs** for the E-Business Suite Asserter.
2. The IAM **Sign In** page appears. Use the username and password of the previously created user to sign in.
3. Upon successful authentication, the user is redirected to the Oracle E-Business Suite home page without having to enter Oracle E-Business Suite credentials.
4. If the Oracle E-Business Suite home page appears, verify the logged-in username.
5. Log out from Oracle E-Business Suite. The browser is redirected to the IAM **Sign In** page.

**Testing the SSO Using the E-Business Suite Asserter Icon in IAM**
You can use the E-Business Suite Asserter icon within the **My Apps** page in IAM to verify the integration and ensure that the SSO works.

1. Open a browser and enter the IAM **My Console** URL **https://idcs-example.identity.oraclecloud.com/ui/v1/myconsole**.
2. Sign in using the credentials of the previously created user.
3. In the **My Apps** page, click the E-Business Suite Asserter icon to access the Oracle E-Business Suite Home page.
4. If the Oracle E-Business Suite Home page appears, verify the logged-in user name.
5. Log out from Oracle E-Business Suite. The browser is redirected to the IAM **Sign In** page.
Testing the SSO Using the E-Business Suite Asserter Direct URL with a Redirect Parameter

You can use the URL for the E-Business Suite Asserter with a redirect parameter to verify the integration and ensure that the SSO works.

1. Open a browser and enter the URL for the E-Business Suite Asserter along with the requestUrl parameter. In the following example, the parameter value points to one of the Oracle E-Business Suite pages (for example, Self-Service Reports page - P11D Reports).

   ![URL Example](https://ebsasserter.example.com:7002/ebs?requestUrl=http%3A%2F%2Febs.example.com%3A8000%2FOA_HTML%2FRF.jsp%3Ffunction_id%3D1023615%26resp_id%3D54745%26resp_appl_id%3D800%26security_group_id%3D0%26lang_code%3DUS%26oas%3DZGSSqTllSAVkI4tpzTqoZw..%26params%3DYQiYllX3TGJSmdkebayqm4plh8uddwPMseD54DE-G-c)

   The requestUrl parameter value must match one of the whitelist.urls and must be URL encoded.

2. The IAM Sign In page appears. Use the username and password of the previously created user to sign in.

3. Upon successful authentication, the user is redirected to the page passed as a parameter to the E-Business Suite Asserter URL in the requestUrl parameter.

4. Log out from Oracle E-Business Suite. The browser is redirected to the IAM Sign In page.

Testing the SSO Using a Previously Oracle E-Business Suite Bookmarked URL

You can use the Oracle E-Business Suite URL that you have bookmarked to verify the integration and ensure that the SSO works.

1. Open a browser and enter one of the Oracle E-Business Suite URLs that you have bookmarked (for example, the Self-Service Reports page - P11D Reports):

   ![URL Example](https://ebsasserter.example.com:7002/ebs?requestUrl=http%3A%2F%2Febs.example.com%3A8000%2FOA_HTML%2FRF.jsp%3Ffunction_id%3D1023615%26resp_id%3D54745%26resp_appl_id%3D800%26security_group_id%3D0%26lang_code%3DUS%26oas%3DZGSSqTllSAVkI4tpzTqoZw..%26params%3DYQiYllX3TGJSmdkebayqm4plh8uddwPMseD54DE-G-c)

2. The IAM Sign In page appears. Use the user name and password of the previously created user to sign in.

3. Upon successful authentication, the user is redirected to the Oracle E-Business Suite page passed as a parameter to the E-Business Suite Asserter URL in the requestUrl parameter.

4. Log out from Oracle E-Business Suite. The browser is redirected to the IAM Sign In page.

Validating the Service

You can validate the Asserter configuration, E-Business Suite configuration, and IAM Application setup using the Validation Service.

**Note:**
This validation service is only available for EBS Asserter 20.1.3 onwards.

Access the validation service using the endpoint app.url/validate for example, https://ebsasserter.example.com:7002/ebs/validate.

The validation result of each configuration is one of Success, Failure, Undetermined.

If the result is Failure or Undetermined, the response body suggests the expected configuration. Reconfigure EBS Asserter or the Oracle E-Business Suite or IAM Application as appropriate.

Logging in with Non-US English Language

Identity Cloud Service EBS Asserter supports the language configuration of a user provided in EBS. If the FND_OVERRIDE_SSO_LANG profile option is enabled for a user in EBS, Asserter creates an EBS session based on the value of the ICX_LANGUAGE profile option of this user.

For a given EBS deployment, if there is no such configuration for a user in EBS, the language can be controlled using the langCode parameter or base.lang can be set in the bridge.properties.
You can log in to the EBS Home Page in a different language by specifying the code for the language in the login URL:

https://apps.example.com/OA_HTML/AppsLogin?langCode=language code

Set up E-Business Suite Mobile Applications
You can authenticate Oracle E-Business Suite mobile applications such as Approvals for EBS with IAM, when your Oracle E-Business Suite is using IAM E-Business Suite Asserter.

By doing so, when users open the mobile application and try to access Oracle E-Business Suite information, the asserter uses IAM to authenticate these users through the mobile application.

This set up is valid for the following Oracle E-Business Suite mobile applications:

- Custom mobile applications based on Oracle Mobile Application Framework (Oracle MAF).
- Approvals for EBS from Oracle America, Inc.

Before You Begin
You must ensure you have configured the E-Business Suite mobile application to work with your Oracle E-Business Suite.

- For Oracle E-Business Suite version 12.1.3 and version 12.2, apply or validate if mobile application patches have been applied as described in the Oracle E-Business Suite documentation. If you use Oracle E-Business Suite 12.2.8, you can skip applying the patches as those are already included.
- To run the following configurations, you need to log in to Oracle E-Business Suite with any user (excluding sysadmin) assigned to Mobile Applications Manager role.

Configuring E-Business Suite for Mobile Applications
Configure Oracle E-Business Suite to enable E-Business Suite mobile applications to authenticate with IAM.

1. Access the drawer icon (E-Business Suite version 12.2.8) or navigator icon (E-Business Suite version 12.1/12.2), select Mobile Applications Manager, and then select Applications.
2. Search for Application Name. For example, EBS Approvals.
3. In the results list, click the Configure icon for the application. For example, EBS Approvals.
4. In the Configure Mobile Application page, expand the Connection Settings.
5. Select Sub Category as AppsSSO Login.
6. Expand the Connection Settings category, and then update the parameters as follows:
   - LoginURL: %APPS_AUTH_AGENT%/login/sso
   - LogoutURL: %APPS_AUTH_AGENT%/logout/sso
   - LoginSuccessURL: %APPS_AUTH_AGENT%/login/sso
   - APPS_SESSION_SERVICE: %APPS_AUTH_AGENT%/login/apps
7. Click Apply.

After you save the changes, restart Oracle E-Business Suite.

Testing Authentication for E-Business Suite Mobile Applications
Test the authentication of the Oracle E-Business mobile applications in scenarios in which E-Business Suite uses IAM E-Business Suite Asserter.

If you configured E-Business Suite Mobile Applications to use IAM EBS Asserter, then you perform the following test:

1. Use your mobile device to open the Oracle E-Business mobile application and access a protected feature.
   The mobile device opens IAM Sign In page.
2. Sign in to IAM.
   After successful authentication, the mobile application completes the login process and activates the requested feature.

The mobile application completes the login flow and shows the protected feature only if it detects a successful return that redirects to the URL configured in the Login Success URL parameter.

Collect Diagnostic Data
Configuration and log files help you diagnose issues relating to the IAM and Oracle E-Business Suite integration using the E-Business Suite Asserter.

Collect the following files:
- The E-Business Suite Asserter configuration file (bridge.properties).
- The E-Business Suite Asserter diagnostic logs.
- The domain log file for the WebLogic domain where the E-Business Suite Asserter is deployed.
- The HTTP header trace.
- The output of validating the service. See Validating the Service on page 3668.

Enabling the E-Business Suite Asserter Debug Log
To send logs to a file, add FileHandler to the handlers property in the logger.properties file. This enables file logging globally.

1. Create a logger.properties file with entries as follows:

   ```java
   handlers = java.util.logging.FileHandler, java.util.logging.ConsoleHandler
   java.util.logging.FileHandler.pattern = %h/ebsasserter.log
   java.util.logging.FileHandler.formatter = java.util.logging.SimpleFormatter
   java.util.logging.FileHandler.level=ALL
   java.util.logging.ConsoleHandler.formatter = java.util.logging.SimpleFormatter
   java.util.logging.ConsoleHandler.level=ALL
   com.oracle.ebs.sso.level=ALL
   oracle.apps.fnd.ext.level=ALL
   oracle.security.jps.idcsbinding.level=ALL
   ```

2. Add the option -Djava.util.logging.config.file=<logger.properties file created above> in Oracle WebLogic Server:
   a) Using a browser, access the Oracle WebLogic Server Administration Console.
   b) In the Oracle WebLogic Server Administration Console, click servers under Environment in the Domain Structure.
   c) In the Servers table, click the name of the server instance where the E-Business Suite Asserter is deployed.
   d) From the WebLogic Server menu, select Administration, then select Server Start.
   e) From the Server Start page, you can add the option -Djava.util.logging.config.file=<logger.properties file created above> in the Arguments field.
   f) Click Save.

3. Restart the Oracle WebLogic Server where the E-Business Suite Asserter is deployed.
   The E-Business Suite Asserter debug log file is in <HOME DIR>/ebsasserter.log.

Using Fiddler to Capture HTTP Traffic
You can use Fiddler to view and debug HTTP traffic between a client and a host computer.

1. Download the Fiddler installer.
2. Run the Fiddler installer and follow the wizard to install Fiddler on your client machine.
3. Stop all other programs and services that might access the internet or use HTTP. This helps to obtain a clean and uncluttered trace.
4. Select the Fiddler icon in the workstation’s Start menu to run Fiddler.

Fiddler starts capturing events as soon as it runs. Fiddler logs all network requests instantly and these requests are summarized in the left-hand pane of the tool.

The individual sections of the Fiddler trace are color coded. Each color is meaningful, but failures are shown in red. The result column contains the HTTP code that the section returned. For example, if a section returned an HTTP 404 or Not Found error message, the section would be red. Since we are typically looking for errors or failures, the sections we want to concentrate on are the red sections in the trace. Fiddler creates a file containing the trace with a file extension of .saz.

**Monitor the E-Business Suite Asserter**

You can monitor the E-Business Suite Asserter to determine the status and in turn its availability.

Use the *app.url/about* URL to monitor the availability of the EBS Asserter. For example, `https://ebsasserter.example.com:7002/ebs/about`.

**Collect Diagnostic Data**

Configuration and log files help you diagnose issues relating to the IAM and Oracle E-Business Suite integration using the E-Business Suite Asserter.

Collect the following files:

- The E-Business Suite Asserter configuration file (`bridge.properties`).
- The E-Business Suite Asserter diagnostic logs.
- The domain log file for the WebLogic domain where the E-Business Suite Asserter is deployed.
- The HTTP header trace.
- The output of validating the service. See [Validating the Service](#) on page 3668.

**Troubleshoot Common Issues**

Here are a few errors that you might encounter while integrating Oracle E-Business Suite with IAM using the E-Business Suite Asserter.

**Resolving an Insufficient Privileges Error**

After IAM authentication, instead of getting access to Oracle E-Business Suite, the user gets redirected back to Oracle E-Business Suite with the error message "You have insufficient privileges for the current operation." and prompts the user to sign in again.

Generally, when the Oracle E-Business Suite application throws this error, it means that the cookie is set with an incorrect domain. To confirm this, check the E-Business Suite Asserter debug log (`<HOME_DIR>/ebsasserter.log`). The E-Business Suite Asserter debug log shows that the `sessionCookieDomain` has an incorrect value. The `CookieDomain was set to .oracle.com`.

```plaintext
Aug 22, 2018 2:26:34 PM oracle.apps.fnd.ext.common.EBiz init
FINE: Ebiz init(): sessionCookieDomain =.oracle.com ; protocol=https;
ssoCookieName= ORASSO_AUTH_HINT
```

The `ICX_PARAMETERS.SESSION_COOKIE_DOMAIN` must not be set to a value of any kind. You must update the `SESSION_COOKIE_DOMAIN` setting in `ICX_PARAMETERS`.

1. Update the `SESSION_COOKIE_DOMAIN` value in `ICX_PARAMETERS`:

```sql
SQL> select SESSION_COOKIE_DOMAIN from ICX_PARAMETERS;
SESSION_COOKIE_DOMAIN
-------------------------
.oracle.com
```

2. Set `session_cookie_domain` to `NULL` in the `ICX_PARAMETERS`:

```sql
update ICX_PARAMETERS set SESSION_COOKIE_DOMAIN = NULL;
commit;
```

3. Restart all services.
4. Retest the issue.

**Resolving an Internal Server Error While Logging Out**

When you are logging out from Oracle E-Business Suite, the browser throws an error message "Internal Server Error".

This issue was because of an older version of AppsLogoutRedirect.java in the Oracle E-Business Suite side.

Check the header for AppsLogoutRedirect.java in the Oracle E-Business Suite side:

```
adident Header $JAVA_TOP/oracle/apps/fnd/sso/AppsLogoutRedirect.class
$Header AppsLogoutRedirect.java 120.10.12010000.7 2010/01/19 20:18:52
rsantis ship $
```

Apply the latest Oracle E-Business Suite Release 12 Critical Patch Update Jan 2013 or above to fix this issue. This Critical Patch Update enables AppsLogoutRedirect.java to use the APPS_SSO and APPS_AUTH_AGENT profiles. Check the Knowledge Document (July 2018) (Doc ID 2379675.1) for all the details to apply this patch.

**Fixing a Time Sync Issue**

While you are accessing the E-Business Suite Asserter application URL, the Oracle E-Business Suite application login flow resulted in an internal server error.

The HTTP header trace looks like this:

```
GET https://xxxxxxxxxxxxxxxxxxxx.oracle.com:7002/ebs/response?code=AQIDBAVcZbun_M5qU4-t9LUCYDJa0gWy1DorflKb5ndbWAHEYdo5C-uxdFswP8Ejfn51WT-gTuyj6bLFFYAPHQEqgYy26MTEqRU5DU11Q2ZIIFVE1PT19LRVxNCB7djF9NCAPFFABCDEF= HTTP/1.1
```

Error 500--Internal Server Error

From RFC 2068 Hypertext Transfer Protocol -- HTTP/1.1:

10.5.1 500 Internal Server Error

The server encountered an unexpected condition which prevented it from fulfilling the request.

The E-Business Suite Asserter domain log looks like this:

```
####<Sep 23, 2018 6:53:31,380 PM AST> <Error> <HTTP> <ebshost01.oracle.com> <AdminServer> <<[ACTIVE] ExecuteThread: '6' for queue: 'weblogic.kernel.Default (self-tuning)'> <<WLS Kernel>> <> <0b38f1ae-a3cb-48f6-80d9-00e3f3db263-000000a0> <1537718011380> <<[severity-value: 8] [rif: 0] [partition-id: 0] [partition-name: DOMAIN]> <BES-101020> <<[ServletContext@44159983[app:ebs module:ebs.war path:null spec-version:3.1]] Servelet failed with an Exception
```

The E-Business Suite Asserter log looks like this:

```
FINE: validateToken return with result {"user_result":"America\New_York", "at_hash":"81A3gT4BT0WcWTCLE3IFa5A", "sub":"john.doe@oracle.com", "user_locale":"en", "idp_name":"localIDP", "idp_guid":"localIDP", "a mr": ["USERNAME_PASSWORD"], "iss":"https://identity.oraclecloud.com/", "user_tenantname": "idcs-a61feab148e2485082050d98cdea4232", "client_id": "67179f2609ab46309a75e5c1f582a53", "sid": "18ee87ea-04cf-4469-5a65-48cc763c6a9", "authn_strength": "2", "apaz":"67179f2609ab46309a75e5c1f582a53", "auth_time": "1536180434", "session_exp": "1537715029", "user_lang": "en", "exp": "1536209235", "iat": "1536180437"}, idp_type: "LOCAL", inenant: "idcs-a61feab148e2485082050d98cdea4232", jti: "ed7be32bd4e1-4e72-9868-6df142f07c6b", "user_displayname": "John Doe", "sub_mappingattr": "userName", "tok_type": "IT", "aud": ["https://identity.oraclecloud.com/", "67179f2609ab46309a75e5c1f582a53"],
```

Oracle Cloud Infrastructure User Guide 3672
"user_id":"63bf3d3f96094a66a6b7714218338116"}

The `session_exp` is set to 1537715029. Use `EpochConverter` to convert the current UNIX epoch time to a human readable date and time. Hence, the expiry time in the token is set to Sunday, September 23, 2018 3:03:49 PM GMT. However, the time in the E-Business Suite Asserter domain log is Sep 23, 2018 6:53:31, 380 PM AST. Note that Greenwich Mean Time is 4 hours ahead of Atlantic Standard Time. Hence the time set is Sep 23, 2018 10:53:31 PM GMT. The system where the E-Business Suite Asserter is deployed, is not in time sync with IAM, as a result the token passed by IAM is effectively out of the validity period and hence the error "Token Expired".

Ensure the date and time on the system where the E-Business Suite Asserter is deployed is in time sync with NTP servers and hence the IAM host.

Handling Java Error `ExceptionInInitializerError`

While you are accessing the E-Business Suite Asserter application URL, the Oracle E-Business Suite application throws the `java.lang.ExceptionInInitializerError` error.

The E-Business Suite Asserter debug log shows the following Java error:

```java
-Feb 26, 2019 2:17:16,884 PM PST <Error> <HTTP> <BEA-101020>
servlet failed with an Exception
java.lang.ExceptionInInitializerError
at
com.oracle.ebs.sso.ConnectionProvider.getConnection(ConnectionProvider.java:36)
at
com.oracle.ebs.sso.RequestWrapperFilter.doFilter(RequestWrapperFilter.java:34)
at
weblogic.servlet.internal.FilterChainImpl.doFilter(FilterChainImpl.java:78)
```

This occurs because of incorrect settings in the `bridge.properties` file. Verify the `bridge.properties` file and check that it has the required configuration. Also, check that the path specified in `wallet.path` in the `bridge.properties` file is valid.

Handling Java Error `RuntimeException`

While you are accessing the E-Business Suite Asserter application URL, the Oracle E-Business Suite application throws `java.lang.RuntimeException`.

The E-Business Suite Asserter debug log shows the following Java error:

```java
-Feb 26, 2019 2:01:33,454 PM PST <Error> <HTTP> <BEA-101020>
servlet failed with an Exception
java.lang.RuntimeException: javax.naming.NameNotFoundException: Unable to resolve 'visionDS1'. Resolved ''; remaining name 'visionDS1'
at
com.oracle.ebs.sso.ConnectionProvider.getConnection(ConnectionProvider.java:42)
at
com.oracle.ebs.sso.RequestWrapperFilter.doFilter(RequestWrapperFilter.java:34)
```

Check that the `ebs.ds.name` value set corresponds to the datasource name created in WebLogic.

Fixing a Deep Link Issue

After IAM authentication, instead of getting access to Oracle E-Business Suite, the user gets redirected back to Oracle E-Business Suite and prompts the user to sign in again.

This occurs because the deep link is not working.

Check that the `whitelist.urls` bridge property is configured. If the issue persists, specify the port numbers explicitly in the `whitelist.urls` configuration. For example, `whitelist.urls=http://ebs.oracle.com:80/OA_HTML...`. You can also check the JSESSION ID Cookie Name of the E-Business Suite...
Asserter App in the `weblogic.xml` file. If there is any other web app in the WebLogic with the same cookie name, there is a conflict.

**Resolving Issues During Log Out**
If you find issues during the logout process verify the Post Logout Redirect URL parameter value in IAM and the `post.logout.url` parameter value in the `bridge.properties` file.

The `post.logout.url` in the `bridge.properties` file is an optional parameter and by default you don't need to provide a value. You use this parameter to make the E-Business Suite Asserter application redirect the user browser to the specified URL after E-Business Suite Asserter finishes the logout process.

If enabled, the value of the `post.logout.url` in the `bridge.properties` file must match the value of the Post Logout Redirect URL parameter for E-Business Suite Asserter application in IAM.

1. Open the E-Business Suite Asserter application in IAM and update the Post Logout Redirect URL value.
2. Open the `ebs.war` file, update the `bridge.properties` file, regenerate the war file, and redeploy the file to the WebLogic server. Ensure the value of this parameter matches the Post Logout Redirect URL parameter in IAM.

**Securing IAM**
Manage IAM security features.

**Managing Terms of Use**
This feature lets you present disclaimers and acceptable use policies, also known as *terms of use*, to users in an identity domain. You can configure terms of use for each application and collect consent from users prior to allowing them access to the application.

**Required Policy or Role**
To manage terms of use settings, you must have one of the following access grants:

- Be a member of the Administrators group
- Be granted the Identity Domain Administrator role or the Security Administrator role
- Be a member of a group granted `manage identity-domains`

To understand more about policies and roles, see The Administrators Group, Policy, and Administrator Roles on page 3074, Understanding Administrator Roles on page 3246, and Understanding Policies on page 3249.

**About Terms of Use**
The terms of use feature enables you to set the terms and conditions to access the OCI console or a target application, based on the user's consent. This feature allows the identity domain administrator to set relevant disclaimers for legal or compliance requirements and enforce the terms by refusing the service unless consent is received.

In an identity domain, you can optionally grant or deny access to applications based on the consent provided by the user. When the user logs in for the first time, the disclaimers for legal or compliance requirements are displayed. The user has the option of either consenting or denying consent. If the user does not provide consent by accepting the terms of use, they will not be allowed to access the application.

When you create a terms of use, you add the customized content and language that you want to display and choose the applications that will use the terms. You can also set an expiration date for the consent to require users to provide consent again after a set period of time.

When you add a terms of service to an identity domain, it is always added in the deactivated state.

**Using the Console**

*Adding a terms of use*

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Terms of use**.
4. Click **Create terms of use document**.
5. In the **Add terms of use document** screen, do the following:
   - **Name**: Enter a name for the terms of use to easily identify it.
   - **Description**: Enter the description to help understand the purpose and usage of this terms of use.
   - **Consent acceptance expiration**: Enter the duration for which the terms of use consent will be valid. The value can range between 1 and 365 days. Select **Never expires** if you don't want the consent to the terms of use to expire.

Click **Add terms of use document** to proceed to the statements options.
6. In the **Add terms of use statements** screen, click **Add terms of use statement** and do the following:
   - **Language**: Select the language in which you want to create the statement for your terms of use. (You can create additional terms of use statements in other languages later.)
   - **Statement**: Enter or paste the statement content.

To save changes, click **Add terms of use statement**.
7. Click **Next**.
8. In the **Add apps** screen, click **Add app** and do the following:
   - Search and select the applications that you want to assign to this terms of use.

When you are ready, click **Add app** and the app is listed as an app associated with this terms of use.
9. Click **Close**.

The terms of use is added in the deactivated state. You must activate this terms of use before it is used by the applications in your identity domain.

*Activating a terms of use*
1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Terms of use**.
4. Select the terms of use to activate.
5. From the **Actions** menu, select **Activate terms of use document**.
6. To confirm, click **Activate terms of use document**.

*Updating a terms of use*
You can update some the details of a terms of use, like the name, description, duration, statements, and the applications that are assigned to it.
1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Terms of use**.
4. Click the terms of use you want to modify, and then click **Edit terms of use document** to modify the details.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You cannot modify the name of the default terms of use.</td>
</tr>
</tbody>
</table>

5. When you are finished, click **Save changes**.

*Deactivating a terms of use*
1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Terms of use**.
4. Select the terms of use to deactivate.
5. From the **Actions** menu, select **Deactivate terms of use document**.
6. To confirm, click **Deactivate terms of use document**.
Deleting a terms of use

Remove all application references to a terms of use before you delete the terms of use. Otherwise, the only way you can delete a terms of use is to force the deletion.

Note:

You cannot delete the default terms of use.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Terms of use**.
4. Select the terms of use to delete.
5. From the **Actions** menu, select **Delete terms of use document**.
6. To confirm, click **Delete terms of use document**.

Adding a terms of use statement

The statement in a terms of use document provides the text that users must agree to when they first launch any apps assigned to the terms of use. If you want, you can multiple terms of use statements, for example, if you need them in different languages.

1. In the **Add terms of use statements** screen, do the following:
   - **Language**: Select the language in which you want to create the statement for your terms of use.
   - **Statement**: Enter or paste the statement content.
   
   To save changes, click **Add terms of use statement**.
2. (Optional) If you want to create additional terms of use statements, perhaps in different languages, repeat the previous step.

Remove a terms of use statement

The statement in a terms of use document provides the text that users must agree to when they first launch any apps assigned to the terms of use. If you no longer want to use a particular statement, you can remove it from the terms of use.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Terms of use**.
4. Click the terms of use for which you want to remove the terms of use statement, and then click **Terms of use statements**.
5. Under **Terms of use statements**, select the check box next to the terms of use statements that you want to delete, and then click **Remove terms of use statement**.
6. To confirm, click **Remove terms of use statement**.

Adding apps

You can assign an application to a terms of use document so that the application displays the terms of use to an end user when they first launch the application.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Terms of use**.
4. Click the terms of use to which you want to add an app, and then click **Apps**.
5. Find the app or apps you want to assign to the terms of use, and then select the check box next to the app name.
6. When you are ready, click **Add app**.
Remove apps
You can remove an application that is assigned to a terms of use document if you no longer want those terms of use to display to an end user when they first launch the application.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Terms of use**.
4. Click the terms of use from which you want to remove an app, and then click **Apps**.
5. Under **Apps**, select the check box for the app or apps that you want to remove from the terms of use, and then click **Remove app**.
6. To confirm, click **Remove app**.

Managing Password Policies
Learn how to create and manage group-based password policies for an identity domain.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle must enable this feature for you. To learn about the features that Oracle must enable for you and how to enable them, see Service Request Features for Oracle Identity Cloud Service.</td>
</tr>
</tbody>
</table>

Required Policy or Role
To manage identity domain settings, you must have one of the following access grants:

- Be a member of the Administrators group
- Be granted the Identity Domain Administrator role or the Security Administrator role
- Be a member of a group granted manage domains

To understand more about policies and roles, see The Administrators Group, Policy, and Administrator Roles on page 3074, Understanding Administrator Roles on page 3246, and Understanding Policies on page 3249.

Working with Password Policies
Password policies let you define a set of criteria for user passwords. The criteria are enforced when a user creates their own password for an identity domain.

Password policies are assigned to groups. All users who are members of the group must meet the requirements of the password policy when creating passwords for their accounts. You can create up to 10 password policies per identity domain and assign each policy a priority. When a user is a member of more than one group, the password policy with the highest priority applies when that user creates their password.

If a user is a member of a group that does not have a password policy assigned, the default password policy is enforced.

Deleting Password Policies
When you delete a password policy, the groups, and therefore users of the groups, are no longer associated with it. Password criteria for those users will revert to the highest-priority password policy assigned to them.

When you delete a group, the password policy attached to the group will no longer be assigned to users who had been members of the group. Instead, the highest priority password policy available will apply to users.

Types of Password Policies
There are three types of password policies you can set for an identity domain and their names indicate their relative strength:

- Simple - Use this policy for developer services and demos when you don't want to customize a policy for them.
  You can't modify this type of password policy.
- Standard - Use this policy when you don't want to use the Oracle-recommended password policy for your enterprise applications. You can't modify this type of password policy.

- Custom - Use this policy to tailor the strength of your password policy to meet the business and security requirements for your enterprise applications. It's your responsibility to make the minimal requirements of the custom password policy strong.

The default settings for the simple, standard, and custom password policies are shown in the following table. You can't modify the simple or standard password policy. You can modify the custom password policy.

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Simple</th>
<th>Standard</th>
<th>Custom</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum length (characters)</td>
<td>8</td>
<td>8</td>
<td>8</td>
</tr>
<tr>
<td>Maximum length (characters)</td>
<td>40</td>
<td>40</td>
<td>40</td>
</tr>
<tr>
<td>Expires after (days)</td>
<td>Never</td>
<td>120</td>
<td>120</td>
</tr>
<tr>
<td>User account gets locked after consecutive, unsuccessful attempts</td>
<td>20</td>
<td>5</td>
<td>12</td>
</tr>
<tr>
<td>Enable automatic account unlock</td>
<td>Not available</td>
<td>Yes, after 30 minutes</td>
<td>No, but after 30 minutes, by default, when enabled</td>
</tr>
<tr>
<td>Can use previous passwords</td>
<td>No</td>
<td>No</td>
<td>Yes, but not the last 4</td>
</tr>
<tr>
<td>Alphabetic characters (minimum)</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Numeric characters (minimum)</td>
<td>1</td>
<td>1</td>
<td>1</td>

</tbody>
</table>
### Limit for Password Policies

You can create up to 10 password policies per identity domain.

You cannot assign a group to more than one password policy.

### Using the Console

**Adding a password policy**

You can create up to ten password policies in your identity domain, assign relative priorities to them, and attach them to groups. A group cannot be assigned to more than one password policy.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Settings**.
3. Click **Password policy**.
4. Click **Add**.
5. Enter a **Name** and **Description**.
6. Choose the **Priority**.
   - The priority can be any integer between 1 and 10, where 1 is highest priority and 10 is lowest. If there is already a password policy with the priority you choose, that policy moves to the next priority number. For example, if there is a password policy with a priority of 2 and another with a priority of 3, and you create a new policy with a priority of 2, the existing policy priorities are reset to 3 and 4.
7. Add one or more groups to the password policy. Each group can only have one policy assigned to it. Click **Add** and select the group. When finished adding groups, click **Add**.
   - If a user has only one group assigned to them, then the password policy attached to that group is the password policy enforced for the user.
   - If a user has more than one group assigned to them, then the password policy with the highest priority is the password policy enforced for the user.
8. Select the type of policy that you want to set for this identity domain (**Simple**, **Standard**, or **Custom**).
   - If you select **Simple** or **Standard**, the criteria for the selected policy are displayed. You can't modify the criteria for these policies. If you select **Custom**, see **Modifying the Custom Policy** for details about the criteria you can set.
9. When you are finished, click **Add**.

**Modifying the custom password policy**

You can tailor the strength of the custom password policy to meet the business and security requirements for your enterprise applications.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Settings**.
3. Click **Password policy**.
4. Select the policy you want to modify. On the policy details page, click **Edit password rules**.
5. Click **Custom**.
6. Edit the criteria. The criteria are described in the following table:

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Simple</th>
<th>Standard</th>
<th>Custom</th>
</tr>
</thead>
<tbody>
<tr>
<td>Characters not allowed</td>
<td>Not available</td>
<td>Not available</td>
<td>None</td>
</tr>
<tr>
<td>Can contain dictionary words</td>
<td>Not available</td>
<td>Not available</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Criteria not allowed**

- Not available
- Not available
- None

**Can contain dictionary words**

- Not available
- Not available
- Yes
<table>
<thead>
<tr>
<th>Criterion</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password length (maximum)</td>
<td>How many characters are allowed for the password. A password can’t exceed 500 characters.</td>
</tr>
<tr>
<td>Expires after (days)</td>
<td>How many days until the password expires. Setting this option to 0 means that the password never expires.</td>
</tr>
<tr>
<td>Account lock threshold</td>
<td>The number of consecutive, unsuccessful login attempts into the identity domain after which the user account is locked. If you enter 0 in the Account lock threshold field, then the user's account will never be locked.</td>
</tr>
<tr>
<td>Enable automatic account unlock</td>
<td>Automatically unlocks locked user accounts after the configured amount of time has passed.</td>
</tr>
<tr>
<td>Automatically unlock account after (minutes)</td>
<td>The amount of time (in minutes), after which locked user accounts unlock automatically. You can set a value ranging between 5 minutes and 24 hours.</td>
</tr>
<tr>
<td>Previous passwords remembered</td>
<td>How many unique new passwords a user must use before a previously used password can be reused.</td>
</tr>
<tr>
<td>Alphabetic (minimum)</td>
<td>How many alphabetic characters the password must contain.</td>
</tr>
<tr>
<td>Numeric (minimum)</td>
<td>How many numeric characters the password must contain.</td>
</tr>
<tr>
<td>Special (minimum)</td>
<td>How many special characters the password must contain.</td>
</tr>
<tr>
<td>Lowercase (minimum)</td>
<td>How many lowercase characters the password must contain.</td>
</tr>
<tr>
<td>Uppercase (minimum)</td>
<td>How many uppercase characters the password must contain.</td>
</tr>
<tr>
<td>Unique (minimum)</td>
<td>How many unique characters a password must contain. Increasing the number of unique characters in a password can increase password strength by avoiding repetitive sequences that are easily guessed.</td>
</tr>
<tr>
<td>Repeated (maximum)</td>
<td>How many repeated characters are allowed for the password. This rule limits the use of repeating characters in a password. This value provides extra security by preventing users from specifying passwords that are easy to guess, such as the same character repeated several times.</td>
</tr>
<tr>
<td>Starts with an alphanumeric character</td>
<td>To force the first character of all passwords to be an alphanumeric character, select this check box.</td>
</tr>
<tr>
<td>Required characters</td>
<td>The alphanumeric or special characters that passwords must contain, separated by commas.</td>
</tr>
<tr>
<td>Password must not contain: The user's first name</td>
<td>To prevent the user's first name from being used as all or part of the password, select this check box.</td>
</tr>
<tr>
<td>Password must not contain: The user's last name</td>
<td>To prevent the user's last name from being used as all or part of the password, select this check box.</td>
</tr>
<tr>
<td>Criterion</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Password must not contain: The user's username</strong></td>
<td>To prevent the user's username from being used as all or part of the password, select this check box.</td>
</tr>
<tr>
<td><strong>Characters not allowed</strong></td>
<td>Any alphanumeric or special characters that you enter into this field, separated by commas, are characters that aren't allowed in passwords.</td>
</tr>
<tr>
<td><strong>Whitespaces</strong></td>
<td>To prevent whitespace characters from being used as part of a password, select this check box. A whitespace character is a character that represents horizontal space. For example, for the display name of John Smith, the space between the first name of John and the last name of Smith is a whitespace character.</td>
</tr>
<tr>
<td><strong>Dictionary Words</strong></td>
<td>If you select this check box, then you can screen all passwords against words that can be found in a dictionary.</td>
</tr>
</tbody>
</table>

7. When you are finished, click Add or Save changes.

**Testing a password policy**

After creating a password policy, you can test the criteria for the policy to validate that the password policy has been set.

2. Select the identity domain you want to work in and click Settings.
3. Click Password policy.
4. Click the name of the password policy to test.
5. On the details page, click Test password policy.
6. In the Test password policy dialog, click the box, and then enter a test password.

   After you enter the first character, the gray question mark associated with each criterion turns into either a red X mark or a green check mark. As the password meets each criterion for the policy, the associated red X mark changes to a green check mark. After all criteria are met, all red X marks appear as green check marks.

7. When you are finished, click Close.

**Managing Adaptive Security and Risk Providers**

This section describes adaptive security and risk providers, how to activate adaptive security, how to configure the Default risk provider, how to add a third-party risk provider.

**Required Policy or Role**

To manage identity domain settings, you must have one of the following access grants:

- Be a member of the Administrators group
- Be granted the Identity Domain Administrator role or the Security Administrator role
- Be a member of a group granted manage domains

To understand more about policies and roles, see The Administrators Group, Policy, and Administrator Roles on page 3074, Understanding Administrator Roles on page 3246, and Understanding Policies on page 3249.

**Understand Adaptive Security**

Adaptive Security provides strong authentication capabilities for your users, based on their behavior within, and across multiple heterogeneous on-premises applications and cloud services.

Adaptive Security analyzes a user’s risk profile based on their historical behavior, such as too many unsuccessful sign-on attempts and too many unsuccessful MFA attempts. To evaluate the user’s behavior across other systems with
which IAM isn’t directly involved, Adaptive Security allows you to configure your existing risk providers to obtain
the user’s risk score from third-party risk providers, such as Symantec CloudSOC Cloud Access Security Broker
(CASB). With this context and risk information, Adaptive Security profiles each user, and arrives at its own risk score
and an overall consolidated risk level (High, Medium, Low).

These scores and risk levels can be used with policies to enforce a remediation action, such as allowing or denying the
user from accessing IAM and its protected applications and resources, requiring the user to provide a second factor to
authenticate into IAM.

Administrators can also view how the user’s risk profile trended over time, and drill down to see details associated
with each event.

Understanding Risk Providers
Identity domain administrators and security administrators use identity domain risk providers to configure various
contextual and threat events to be analyzed within an identity domain. An identity domain can also consume user risk
scores from third-party risk providers.

Default Risk Provider
An identity domain includes a default risk provider with a list of supported contextual and threat events, such as
too many unsuccessful login attempts or too many unsuccessful MFA attempts. Administrators can enable events
of interest, and specify weighting or severity for each of these events. The system uses the configured weighting to
compute the user’s risk score.

You can configure the following events for a risk provider:

• Access from an unknown device
• Too many unsuccessful login attempts
• Too many unsuccessful MFA attempts
• Access from suspicious IP addresses
• Access from an unfamiliar location
• Impossible travel between locations

As an example, if a user uses a new (unknown) device to log in, the system won't recognize the device, and will the
trigger the **Access from an unknown login device** event.

Administrator can assign weighting to events that correspond to risk ranges. Consider the weighting for each of the
risks as follows:

• low risk range (0-25)
• medium risk range (26-75)
• high risk range (76-100)

If the administrator wants to consider the user login from an unknown device to be of low risk, then the administrator
sets the weighting for that event to be less than 25. If the administrator wants to consider the same event to be
of medium risk, then the administrator sets the weighting for that event to be from 26 through 75. Any value set
above 75 for that event is considered as high risk. If the user violates more than one event, then the risk score is a
combination of two weightings and corresponds to the appropriate risk level. The user's risk scores are evaluated
continuously and are reduced based on the remediation actions that are taken by the user, such as successful logins
and password resets.

Third-Party Risk Providers
Administrators can add risk providers to obtain a user’s risk score from the Symantec third-party risk engine. This
risk engine provides additional intelligence on the user’s behavior across heterogeneous systems with which IAM
isn’t directly involved.

To provide a consolidated risk profile of the user at any time, IAM takes the highest level of the risk scores of both
the default OCI IAM risk provider and the configured third-party risk providers, and qualifies the user as a high-risk,
medium-risk, or low-risk user. For example, if a user’s risk score from the default risk provider is within the Low
range, but the risk score from a third-party risk provider is within the Medium range, then the user’s consolidated risk level is set to Medium.

Administrators can then use the identity domain risk score, third-party risk score, or consolidated user risk level as conditions that can be used with identity domain sign-on policies to enforce a remediation action, such as allowing or denying the user from accessing an identity domain and its protected applications and resources, requiring the user to provide a second factor to authenticate into an identity domain, and so on.

**Using the Console**

**Activating Adaptive Security**

Start evaluating contextual and threat analysis, and obtain user risk scores from the configured third-party risk providers by turning on adaptive security.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Security** and then **Adaptive security**.

2. In the Adaptive security page, turn on **Adaptive intelligence**.

**Deactivating Adaptive Security**

Stop performing contextual and threat event analytics, and obtaining user risk scores from third-party risk providers by turning off adaptive security.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Security** and then **Adaptive security**.

2. In the Adaptive security page, turn off **Adaptive intelligence**.

**Configuring the Default Risk Provider**

You can modify the default risk provider that’s associated with an identity domain.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Security** and then **Adaptive security**.

2. Click the **Actions** menu in the **Default risk provider** row and then **Edit risk provider**. Change the **Description** or the **Risk range**. See Adding a Third-Party Risk Provider on page 3683 for more information about risk ranges.

3. Select or clear a check box to enable or disable the event. You can’t disable all events for the default risk provider.

   **Note:**

   See Modifying the custom password policy on page 3679 to learn how to set the maximum number of unsuccessful logins for the **Too many unsuccessful login attempts** event.

   See Configuring Multi-FactorAuthentication Settings on page 3692 to learn how to set the maximum number of unsuccessful MFA logins for the **Too many unsuccessful MFA attempts** event.

4. Set a value (weighting) for each event that corresponds to the risk range for this risk provider.

   For example, suppose you set the Low risk range for the risk provider to be from 0 through 10, the Medium risk range to be from 11 through 80, and the High risk range to be from 81 through 100.

   If you set the weighting of the **Access from an unknown device** event to 20, and a low-risk user accesses an identity domain with an unknown device, then the user’s risk range changes to Medium.

5. Click **Save changes**.

6. Confirm your changes.

**Adding a Third-Party Risk Provider**

You can add a risk provider that can be used to obtain a user’s risk score from the Symantec third-party risk engine. This risk score provides additional intelligence on the user’s behavior across heterogeneous systems with which IAM isn’t directly involved. Administrators can then use this third-party risk score with identity domain sign-on policies to enforce a remediation action, such as allowing or denying the user from accessing an identity domain and its protected applications and resources, requiring the user to provide a second factor to authenticate, and so on.
1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Security** and then **Adaptive security**.

2. Click **Create risk provider**. The **Create risk provider** page appears.

3. Use the following table as a guide when adding a third-party risk provider.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Company</td>
<td>Select the vendor of the risk provider solution.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter the name of the risk provider.</td>
</tr>
<tr>
<td>Description</td>
<td>Provide a brief description of the risk provider.</td>
</tr>
<tr>
<td>Risk provider URL</td>
<td>Enter the risk provider URL that IAM can use to obtain the user's risk score.</td>
</tr>
<tr>
<td>Authentication type</td>
<td>This menu contains two methods that IAM uses to authenticate against the risk provider: <strong>BASIC</strong> and <strong>TOKEN</strong>.</td>
</tr>
<tr>
<td></td>
<td>If you select <strong>BASIC</strong>, then the <strong>User name</strong> and <strong>Password</strong> fields appear. Enter the user name and password that IAM uses to authenticate against the risk provider.</td>
</tr>
<tr>
<td></td>
<td>If you select <strong>TOKEN</strong>, then the <strong>Scheme</strong> and <strong>Token</strong> fields appear. Enter the name of the authentication scheme and the authentication token that OCI IAM uses to pass a user's credentials to the risk provider.</td>
</tr>
<tr>
<td>User identifier</td>
<td>Select the unique identifier for user accounts that IAM uses to link the user in the risk provider. This identifier can be either the user name or the primary email address.</td>
</tr>
<tr>
<td>Refresh rate</td>
<td>Specify how often (in minutes or hours) IAM calls the risk provider to check for refreshed scores.</td>
</tr>
</tbody>
</table>

4. To check whether the risk provider information is correct, click **Validate risk provider**. Verify that you see the **The connection to the {risk_provider_name} risk provider has been validated.** message.

   **Note:**
   
   If you receive an error message, then check the values that you entered or selected for the **Risk provider URL** and **Authentication type** fields.

5. In the **Risk range** pane of the **Add risk provider** page, the risk levels configured in the risk provider are shown automatically, if the provider supports an API to get this information. If the API is not available, then the administrator can specify the risk ranges manually, as configured in the risk provider. This is just to provide a reference to the configured risk ranges in the risk provider and has no significance in the risk calculations.

6. Click **Create risk provider**. The risk provider is added and saved with a deactivated status. See **Activating a Risk Provider** on page 3684 for more information about activating this risk provider.

**Activating a Risk Provider**

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Security** and then **Adaptive security**.

2. In the **Risk providers** section, click the **Actions** menu to the right of the risk provider that you want to activate.

3. Select **Activate risk provider**.

4. Confirm the activation.
Deactivating a Risk Provider
If the default risk provider is deactivated, then none of the events configured in this risk provider is used for the user’s risk score analysis. If third-party risk providers are deactivated, risk scores are not retrieved from these risk providers.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Adaptive security.
2. In the Risk providers section, click the Actions menu to the right of the risk provider that you want to deactivate.
3. Select Deactivate risk provider.
4. Confirm the deactivation.

Viewing Details About a Risk Provider
View details such as the name, company, and activation status of each risk provider. You can also see other information, such as the risk levels and authentication information associated with the risk provider.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Adaptive security.
2. Click the Actions menu in the Default risk provider row and then Edit risk provider.
The risk provider opens and displays: Details and Risk range. See Adding a Third-Party Risk Provider on page 3683 for more information about these panes.

Note:
If you clicked the default risk provider, then you’ll see a third section: Events. See Configuring the Default Risk Provider on page 3683 to learn more about this pane.

Modifying a Third-Party Risk Provider
After viewing details about, activating, or deactivating a risk provider that you added, you can modify it.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Adaptive security.
2. In the Risk providers section, click the Actions menu to the right of the risk provider that you want to modify.
3. Make any necessary changes.
4. Click Validate risk provider. Verify that you see the The connection to the {risk_provider_name} risk provider has been validated. message. If you receive an error message, then check the values that you changed for the Risk provider URL and Authentication type fields.
5. Click Save changes.
6. Confirm the changes.

Deleting a Third-Party Risk Provider
If a third-party risk provider is no longer needed to provide its user risk score, then you can remove it.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Adaptive security.
2. In the Adaptive Security page, if the risk provider that you want to remove is activated, then deactivate it. See Deactivating a Risk Provider on page 3685.
3. In the Risk providers section, click the Actions menu to the right of the risk provider that you want to delete.
4. Select Delete risk provider.
5. Confirm the deletion.

Managing Delegated Authentication
With delegated authentication, identity domain administrators and security administrators don’t have to synchronize user passwords between an on-premises Microsoft Active Directory (AD) enterprise directory structure and IAM. Users can use their AD passwords to sign in to their identity domain to access resources and applications protected by IAM.
Suppose you have an AD domain that contains user accounts that you want to import into identity domains. To transfer these accounts, install and configure an AD Bridge for the AD domain. The AD Bridge provides a link between the AD domain and IAM. IAM can synchronize with the AD domain so that any new, updated, or deleted user records are transferred into IAM. Because of this, the state of each record is synchronized between AD and IAM.

After using an AD Bridge to transfer user accounts from the AD domain into an Identity Domain, you want to configure the IAM so that users from the AD domain must use their AD passwords to sign in to OCI. To do this, activate delegated authentication for the AD Bridge. However, first, you might want to verify that the AD credentials from a user in the AD domain can be used to sign in to IAM. This way, if there are any issues, then you can resolve them before activating delegated authentication.

After you activate delegated authentication in IAM, if you change or reset a password in IAM, then the password is stored directly in AD. The AD password policies are applicable for the new password. Password policies configured in OCI IAM aren't applicable for this password. IAM doesn't maintain the password.

**Statuses**
The status of connection between IAM and AD domains. There can be multiple bridges for an AD domain.

There are three statuses for an AD Bridge that IAM uses to communicate with an AD domain to delegate responsibilities for authenticating users of that domain into IAM:

- **Connected**: The AD Bridge is installed and configured, and can communicate with the domain.
- **No Clients Found**: You installed or configured an AD Bridge without installing the client for the AD domain. Click [Click here to download the client](#) to download the client for the AD domain.
- **Incompatible Client Found**: You used an outdated version of the client to install or configure an AD Bridge. Click [Click here to download the client](#) to download the updated client for the AD domain.

**Using the Console**

**Viewing Details About Delegated Authentication**

By default, in the Delegated Authentication page, you can see the name and status of each Microsoft Active Directory (AD) Bridge that IAM uses to communicate with an AD domain. You can also see other information about the bridge, such as whether it's activated or deactivated for delegated authentication.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Delegated Authentication**.
4. Expand the node to the right of the AD Bridge about which you want to view additional information. You'll see an **Activate Delegated Authentication** switch, which indicates whether the AD domain is activated or deactivated for delegated authentication.

**Tip:**
Click the AD Bridge to see detailed configuration information about it, and how many users and groups were transferred by the bridge from AD into IAM.

**Activate Delegated Authentication** might be "grayed out" (that is, you can't turn the switch on or off) for one of the following reasons:

- The status of the AD Bridge is No Clients Found. You can't activate delegated authentication for the AD domain because the AD domain doesn't work until you install a client for the AD domain. Click [Click here to download the client](#) to download the client for the AD domain.
- The status of the AD Bridge is Incompatible Client Found. You can't activate delegated authentication for the AD domain because the AD domain doesn't work until you install the correct version of
the client for the AD domain. Click **Click here to download the client** to download the updated client for the AD domain.

- The AD Bridge isn't configured for delegated authentication. To configure it:
  
  a. Click the AD domain.
  
  b. Click **Configuration**.
  
  c. In the Configure the Microsoft Active Directory Domain page, scroll down until you see the Authentication Settings area.
  
  d. Select **Enable local authentication**.
  
  e. Click **Save**.
  
  f. In the Save Configuration Changes? dialog box, click **OK**.

**Deactivating Delegated Authentication**

You can deactivate delegated authentication for a Microsoft Active Directory (AD) Bridge associated with an AD domain. Users transferred into IAM through this bridge must use their IAM passwords to authenticate into the identity domain. Also, by deactivating delegated authentication, you can verify that the AD credentials from a user in that domain can be used to sign in to IAM before activating delegated authentication for the bridge.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Delegated Authentication**.
4. Expand the node to the right of the AD Bridge for which you want to deactivate delegated authentication.
5. Turn **Off** the **Activate Delegated Authentication** switch.
6. In the **Deactivate Delegated Authentication** window:
   
   a) Select the **Send a Password Reset Notification (recommended)** option if you want users in the AD domain associated with the AD bridge to receive notifications to reset the passwords for their accounts. This is recommended for security purposes.
   
   b) Select the **Create a Password** option if you want to manually reset passwords for the users in the domain associated with the bridge. No notification is sent to users. Selecting **Create a Password** means that the Users in the domain, who were previously able to sign in using Delegated Authentication, cannot sign in to the system. To allow them to sign into the system, reset their passwords using the reset passwords option on the Users tab.

7. Click **OK**.

**Testing Delegated Authentication**

You can verify that a user's Microsoft Active Directory (AD) credentials from a domain associated with an AD Bridge can be used to sign in to IAM. This way, if there are any issues, then you can resolve them before activating delegated authentication for the AD domain.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Delegated Authentication**.
4. Expand the node to the right of the AD Bridge for which you want to test delegated authentication.
5. Click **Test Delegated Authentication**.
6. In the **Test Delegated Authentication** window, enter the AD user name and password that you want to use to sign in to IAM.
7. Click **Test**.

**Activating Delegated Authentication**

After verifying that the Microsoft Active Directory (AD) credentials of a user in the domain associated with an AD Bridge can be used to sign in to IAM, activate delegated authentication for the AD domain. Users transferred into IAM through this AD domain will use their AD passwords to authenticate into IAM.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Delegated Authentication**.
4. Expand the node to the right of the AD Bridge for which you want to activate delegated authentication.
5. Turn **On** the **Activate Delegated Authentication** switch.
6. In the **Confirmation** window, click **Activate delegated authentication**.

**Handle Network Failure in Delegated Authentication**

Most organizations still rely on Microsoft Active Directory (AD) for managing their user accounts, and users rely on Active Directory for authentication and access to various systems. If for some reasons, users are not able to authenticate themselves with Active Directory credentials. This has a huge impact on the daily operations and business of the organizations.

To avoid situations like these, IAM provides you with a network failure handling functionality. This functionality helps users to log in with Active Directory credentials even when IAM is not able to reach the Active Directory (AD) Bridge.

You configure delegated authentication for an AD domain in IAM so that a user can use their Active Directory password to authenticate into IAM.

If the AD Bridge is not reachable, then users are unable to validate their credentials with Active Directory and therefore cannot sign in into IAM. Your Active Directory is not reachable for several reasons. This could be because of network connectivity between AD Bridge and IAM is down.

To avoid this situation, IAM provides the local password caching functionality to perform local authentication in case AD Bridge is not reachable. This functionality helps delegated users to log in into IAM even if AD Bridge is not reachable. For security reasons, this password is stored in hashed form in IAM.

Ensure that the lifetime of this cache password in IAM is limited. You can configure the maximum duration (5 days) you set to cache the password on IAM. For example, if your network connectivity is down and you have set the cache password duration to 2 days, then it enables users to log in to IAM for only 2 days. However, if Active Directory is still not reachable for longer than the specified duration, then you cannot log in to IAM.

To guard against the possibility that someone can use brute force attacks to access your account, you can limit the number of unsuccessful password attempts during password caching in IAM. After several failed attempts, IAM locks your user account. There is a limit of 5 which is configurable.

You cannot perform the following operations while the network connectivity is down:

- A user cannot change their own password
- A user cannot reset their own password by validating the token
- A user cannot change their own email address
- An administrator cannot change a user's password to a known value
- An administrator cannot reset a user's password whose password is authenticated by Active Directory

However, if you recently changed a password in Active Directory, then you can log in to IAM with that password while connectivity is down, provided you have already login to IAM while Active Directory was available.

**Note:**

Sometimes, you might encounter a system error even if you provide a correct password. This is either because the password cache is empty or because the password has expired.

**Activating Local Password Caching**

You must activate the local password caching functionality to enable delegated authentication users to log in into OCI IAM in case Microsoft Active Directory is not reachable.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**.
2. Select the identity domain you want to work in and click **Security**.
3. Click **Delegated Authentication**.
4. Expand the node to the right of the AD Bridge for which you want to activate password cache.
5. Turn On the Activate password cache switch.
6. Set the duration you want to cache this password in Cache password duration (days).
7. Select how many unsuccessful password attempts that you want during password caching in Number of unsuccessful passwords attempts during password caching.
8. Click Save.

Configuring Account Recovery

Account recovery is an automated process designed to help users regain access to their accounts if they have trouble signing in, if they're locked out, or they forget their passwords.

There are three account recovery factors that identity domain administrators and security administrators can configure for users:

- **Security questions:** You can allow a user to select and answer security questions, and provide hints for answers to these questions, to verify their identity. If they have to recover their account, then they must answer these questions correctly to regain access.
- **Email:** By default, a user’s primary email address has been set as the email address that Oracle Identity Cloud Service will use to help the user recover their account. If the user has to regain access, then Oracle Identity Cloud Service will send a notification to this email address. The user follows the instructions in the notification to recover their account.

Instead of their primary email address, you can allow the user to specify an alternate (recovery) email address to regain access to their account.

- **Text message (SMS):** You can allow a user to provide a mobile number that Oracle Identity Cloud Service will use to help them recover access to their account. This way, if they have to regain access, then Oracle Identity Cloud Service will send a passcode in a text message (SMS) to this mobile number. The user enters this passcode to recover their account.

**Important:**

Because you want users to be able to regain access to their accounts, you will usually want to at least one account recovery factor for them.

In addition to setting account recovery factors, identity domain administrators and security administrators can specify:

- **How many consecutive, unsuccessful account recovery attempts a user can make before the user’s account recovery is locked.**
- **How long the user’s account recovery will be locked before they can attempt to recover their account again.**

**Using the console**

*Configuring Account Recovery*

This describes configuring account recovery at administrative level. Users can also configure security settings, such as resetting their password or recovering their account.

1. Open the navigation menu and click **Identity & Security.** Under **Identity**, click **Domains.** Select the identity domain you want to work in and click **Security.** Select the identity domain you want to work in and click **Security** and then **Account recovery settings.**
2. Choose at least one of these factors.

<table>
<thead>
<tr>
<th>Factor</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Questions</td>
<td>If you want users to be able to configure security questions to recover their accounts, then select this check box.</td>
</tr>
<tr>
<td></td>
<td>Otherwise, deselect this check box, and in the Deactivate Security Questions? dialog box, click Deactivate Security Questions.</td>
</tr>
<tr>
<td></td>
<td>If you select this check box, then click Configure to set up security questions that users can manage for their accounts. See &lt;&lt;link to Configure Security Questions&gt;&gt;.</td>
</tr>
<tr>
<td>Email</td>
<td>If you want users to be able to specify an email address to recover their accounts then select this check box.</td>
</tr>
<tr>
<td></td>
<td>Otherwise, deselect this check box, and in the Deactivate Email? dialog box, click Deactivate Email.</td>
</tr>
<tr>
<td></td>
<td>If you select this check box, then click Configure to define the settings for the notification that’s sent to the user. See &lt;&lt;link to email settings&gt;&gt;.</td>
</tr>
<tr>
<td>Text Message (SMS)</td>
<td>If you want users to be able to provide a mobile number to recover their accounts, then select this check box.</td>
</tr>
<tr>
<td></td>
<td>Otherwise, deselect this check box, and in the Deactivate SMS? dialog box, click Deactivate SMS.</td>
</tr>
<tr>
<td></td>
<td>If you select this check box, then click Configure to define the settings for sending a passcode as a text message (SMS) to the user. &lt;&lt;link to text messages&gt;&gt;</td>
</tr>
</tbody>
</table>

3. **Lockout durations** Specify the number of consecutive, unsuccessful account recovery attempts after which the user’s account recovery is locked. Use a number between 1 and 99.

4. Specify (in minutes) how long the user's account recovery will be locked (because they exceeded the setting in the **Maximum consecutive unsuccessful recovery attempts** field) before the user can attempt to recover their account again. Use a number between 5 and 9,999.

### Managing Multi-Factor Authentication

Multi-Factor Authentication (MFA) is a method of authentication that requires the use of more than one factor to verify a user’s identity.

With MFA enabled in an identity domain, when a user signs in to an application, they are prompted for their user name and password, which is the first factor – something that they know. The user is then required to provide a second type of verification. This is called 2-Step Verification. The two factors work together to add an additional layer of security by using either additional information or a second device to verify the user’s identity and complete the login process.

MFA may include any two of the following:

- Something that you **know**, like a password.
- Something that you **have**, like a device.
- Something that you **are**, like your fingerprint.
Users are increasingly connected, accessing their accounts and applications from anywhere. As an administrator, when you add MFA on top of the traditional user name and password, you reduce the likelihood of online identity theft and fraud, which secures your business applications even if an account password is compromised.

**Using Mobile Authenticator Apps with MFA**

Using a mobile authenticator application for MFA provides a second factor of authentication in the form of a time-based one-time passcode (OTP) or push notification, and offers multiple options for implementing app protection and compliance policy.

A mobile authenticator app is a soft token that is installed on a mobile device. A mobile authenticator app uses either OTP or push notifications to prove that the user has possession of the mobile device. Only the mobile authenticator app that is in possession of the user's secret key can generate a valid OTP. During MFA enrollment, when a user scans the Quick Response (QR) code or uses the enrollment URL, the mobile authenticator app is automatically configured with the IAM server. The mobile authenticator app retrieves a secret key, which is required to generate the OTP and to receive push notifications on the mobile authenticator app. That secret key is then shared between the client and the IAM server. If the user is enrolling offline, IAM shares the secret with the Mobile Authenticator through a QR Code. If the user is enrolling online, IAM shares the secret with the Mobile Authenticator through the enrollment notification.

A user can use the mobile authenticator app to generate an OTP both online or offline. However, registering for push notifications and performing device compliance checks (jailbreak detection/PIN protection) can only be done while online.

- **Mobile App Passcode**: Use a mobile authenticator app, such as the Oracle Mobile Authenticator app, to generate an OTP. A new OTP is generated every 30-60 seconds and is valid for 90-180 seconds. After the user enters their user name and password, a prompt appears for the passcode. After generating the passcode using the mobile authenticator app, the user enters that code as the second verification method.

- **Mobile App Notification**: Send a push notification to the OMA app that contains an approval request to allow or deny a login attempt. After the user enters their user name and password, a login request is sent to their phone. The user taps **Allow** to authenticate.

The OMA app is available for Android, iOS, and Windows operating systems.

**Note:**

During MFA enrollment, a user must enter the key manually or use the enrollment URL when using the OMA app on a Surface Pro or Windows Desktop device. The QR code scanner can't be used due to a camera limitation. When a user enters that key manually, the OMA app supports only BASE32 encoding.

When you enable both the **Mobile App Passcode** and **Mobile App Notification** factors and a user is enrolled in Mobile App as a second method of verification, the Mobile App Notification factor is the default that is presented to the user. Users can change which factor they want to use by either selecting a different backup verification method when logging in or by selecting a different method as their default option. IAM users can use the OMA app or any supported third-party authenticator app that they want to generate OTPs. However, users must use the OMA app to receive push notifications.

IAM works with any third-party authenticator app (such as Google Authenticator) that adheres to the TOTP: Time-Based One-Time Password Algorithm specification. There are no special administrator configuration steps for third-party authenticator apps. When a user enrolls in MFA and selects **Mobile App** as the method, the user can either select the **Enter Key Manually** or **Scan offline QR code** options to set up third-party authenticators. We recommend the use of the OMA app as it supports notifications and security features such as app protection policy, compliance policy, and silent key refresh.

**Multi-Factor Authentication (MFA) Authorization Flow**

The authorization flows that support MFA are the Authorization Code Grant Type and SAML2 Assertion.

**Authorization Flows that Don’t Support MFA:**

- Resource Owner Password Credentials Grant Type
IAM

- Client Credentials Grant Type
- Assertion Grant Type
- Implicit Grant Type

Using the Console
Configuring Multi-Factor Authentication Settings
Configure multi-factor authentication settings and compliance policies that define which authentication factors that you want to allow and then configure the MFA factors.

To define MFA settings, you must be assigned to either the identity domain administrator role or the security administrator role.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then MFA.
2. In the Factors section, select each of the factors that you want users to be able to select.
3. (Optional) Click Configure for the MFA factors you have selected to configure them individually.
   See Configuring Authentication Factors on page 3692.
4. Set the Maximum number of enrolled factors that users can configure.
5. Use the Trusted devices section to configure trusted device settings.
   Similar to “remember my computer,” trusted devices don’t require the user to provide secondary authentication each time that they sign in.
6. In the Sign-in Rules section, set the Maximum unsuccessful MFA attempts that you want to allow a user to incorrectly provide MFA verification before being locked out.
7. Click Save changes, and then confirm the change.
8. Ensure that any sign-on policies that are active allow two-step authentication:
   a) Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Sign-on policies.
   b) On the Sign-on policies page, click Default Sign-On Policy.
   d) In the Default Sign-On Rule row, click the Actions menu and select Edit sign-on rule.
   e) In the Edit sign-on rule dialog box, ensure that Actions is set to Allow access and Prompt for an additional factor is selected.
   f) If you changed any settings, click Save changes.
   g) If other sign-on policies have been added, follow steps c-d above for each of those policies to ensure that MFA is enabled under all conditions where you want it to be enabled.

   Note:
The settings for the default sign-in rule enable MFA globally. Settings for other sign-in rules may override the default sign-in rule for users and groups specified by conditions for those rules. See Managing Password Policies on page 3677.

Configuring Authentication Factors
You can configure the following authentication factors for an identity domain.

- Security Questions: Prompt the user to answer security questions to verify their identity. After the user enters their user name and password, they must answer a defined number of security questions as the second verification method.
- Email: Send a one-time passcode in an email to the user. After the user selects Email as the authentication method, IAM sends a one-time passcode to the user’s primary email address for use as a second verification method. The user’s primary email (Email) address is defined in the user’s IAM account.
- Duo Security: Enable Duo Security as an MFA Factor so that users use the Duo App or other Duo factors to authenticate. If Duo Security is enabled, users that have not enrolled are prompted to do so when a Sign-On policy triggers an MFA verification.
• **Fast ID Online (FIDO):** Configure FIDO authentication so that users can use their FIDO authentication device, for example an external authentication device such as a YubiKey, or an internal device such as Windows Hello or Mac Touch ID, to authenticate to an identity domain.

• **Mobile App Passcode:** Use an authenticator app, such as the Oracle Mobile Authenticator (OMA) app to generate an OTP. An OTP can be generated even when the user's device is offline. After the user enters their user name and password, a prompt appears for the passcode. The user obtains a generated passcode from the app, and then enters the code as the second verification method.

IAM also works with any third-party authentication app that adheres to the TOTP: Time-Based One-Time Password Algorithm specification, such as the Google Authenticator.

• **Mobile App Notification:** Send a push notification that contains an approval request to allow or deny a login attempt. Push notifications are an easy and quick way to authenticate. After the user enters their user name and password, a login request is sent to the app on their phone. The user taps Allow to authenticate.

• **Text Message (SMS) or Phone Call:** Send a passcode as a text message (SMS) or as a phone call to the user. This method is useful for users without Internet connectivity. After the user enters their user name and password, IAM sends a passcode to their device for use as a second verification method.

• **Bypass Code:** Use the IAM self-service console to generate bypass codes. The ability to generate a bypass code is available to the user after the user enrolls in 2-Step Verification. Users can generate bypass codes and save for use later. User-generated bypass codes never expire, but can only be used once. Users also have the option to contact an administrator to obtain a bypass code for access.

Configuring Security Questions

Configure security questions settings, select the security questions that a user may use as a second verification method during log in, and add custom security questions.

1. Open the navigation menu and click **Identity & Security.** Under **Identity,** click **Domains.** Select the identity domain you want to work in and click **Security** and then **Two-factor authentication.** Click **Security questions.**

2. In the **Security questions settings** section, set options for answer length and the number of questions a user is asked.

   • **Minimum number of questions:** The minimum number of security questions a user must configure.
   
   • **Minimum answer length (characters):** The minimum number of characters that must be contained in each security question answer.
   
   • **Number of security questions a user is asked:** The default number of security questions that a user must set up is set to three.

   **Note:**
   
   This value can’t be changed using the user interface.
   If you need to change this number, you must use the `/SecurityQuestionSettings` endpoint.

3. In the **Manage security questions** section, select the check boxes for the questions that you want to use. To disable a default security question, clear the check box for that question.

   • Select the **Language** in which you want to view the questions.
   
   • To add a custom security question:
     
     a. Click **Add question.**
     
     b. In the **Add a security question** page, enter the custom security question in the **Default language** field. Optionally, enter the translated question text into the appropriate language row. When you view the custom
security questions in a different language, those questions appear in your default language if you don’t provide translated question text.

c. Click Save.
d. Confirm your changes.

Your custom question is added at the bottom of the user-defined Questions list.

• To edit a custom question:
  a. Locate the custom question in the user-defined Questions list.
  b. Click the menu to the right of the question and select Edit.
  c. Make your changes and click Save.

• To remove a custom question:
  a. Locate the custom question in the user-defined Questions list.
  b. Click the menu to the right of the question and select Remove.
  c. Click Remove in the confirmation dialog box.

Configuring OTP Phone Calls
Configure settings for sending a one-time passcode (OTP) as a phone call to users.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Two-factor authentication. Click Phone number.
2. (Optional) Make any necessary changes to the passcode length and the duration for which the passcode is valid.
3. In the Text message template section, choose the language in which the message will be spoken and then create the message.

Use the default message a guide to create a new one. Click the Message variables link to see the variables that can be used in the template.

4. Click Save changes.
5. Confirm your changes.

Configuring Email Settings
Configure settings for sending a one-time passcode (OTP) to a user's primary email address.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Two-factor authentication. Click Email.
2. In the Configure the mail settings for MFA section, set the passcode length and the passcode validity.
3. In the Configure the email settings for account recovery and activation section, configure activation and password reset validity and whether you want to allow the user to add an alternate email address for account recovery.

4. Click Save changes.
5. Confirm your changes.

To access the email template that's sent to the user's primary email account:

a. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Settings and then Notification settings.

b. Select the Email templates tab.

The template name is 2-Step email one-time passcode verification.

Configuring Duo Security
If you have implemented or want to implement Duo security as a third-party multi-factor authentication (MFA) solution, and IAM manages your primary authentication and identity management, you can connect to and integrate with Duo to secure Oracle IaaS, PaaS, or SaaS applications or to secure applications already secured by IAM.

• Download and install the Duo Mobile app from the Google Play Store or the Apple Store.
1. Enable Duo.
   
   File a Service Request with My Oracle Support.

2. Subscribe to Duo and create a Duo administrator account.
   
   Go to https://duo.com/ to set up your subscription and to set up your Duo administrative account. Refer to the Duo documentation for the latest instructions.

3. Create and activate the Duo-protected Web SDK app.
   
   To create and activate the Duo-protected Web SDK app, refer to the Duo documentation for the latest instructions.

4. Note the credentials and connecting host information.
   
   These values were generated when you created and activated the Duo-protected Web SDK app. You need the values for Integration key, Secret key, and API hostname. Refer to the Duo documentation for the latest instructions.

5. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Two-factor authentication. Click Duo security.

6. Enter the credentials and connecting host information (Integration key, Secret key, and API hostname) that was generated from your Duo Administrative account, and then choose a User identifier.
   
   The User identifier that you choose must map to the user identifier set in the Duo user account. For example, User Name in the identity domain user account must map to Username in the Duo security user account.

7. Click Save changes.

8. Confirm your changes.

   You may have to log out and log in again to see Duo security.

Configuring Fast ID Online (FIDO) Authenticator

    Configure FIDO authentication so that users can authenticate with an external authentication device such as a YubiKey, or an internal device such as Windows Hello or Mac Touch ID.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Two-factor authentication. Click Fast ID Online (FIDO) authenticator.
2. Configure the FIDO Authenticator settings:
   - **Time-out (milliseconds)**: The length of time the user has to take action. If the user doesn't take action within this period, authentication fails. The default is 60,000 milliseconds (6 seconds).
   - **Attestation**
     - None
     - Indirect
     - Direct
   - **Authenticator selection attachment**: Controls the authenticator type a user register with.
     - Platform. Windows Hello and Mac Touch ID.
     - Cross Platform. Choose to use a cross-platform authenticator such as YubiKey.
     - Both (default).
   - **Authenticator selection resident key**: Whether Resident key support should be enabled.
     - Required.
     - Preferred.
     - Discouraged.
     - None (default). The private key is encrypted and stored on the server.
   - **Authenticator selection user verification**: Relying Party's requirements regarding user verification during Registration:
     - Required.
     - Preferred (default).
     - Discouraged.
   - **Public key types**: The cryptographic algorithm used to generate a public key pair during Registration. IAM only certifies ES256 (the default) and RS256.
   - **Exclude credentials**: Used by Relying Parties to limit the creation of multiple credentials for the same account on a single authenticator. Default value is `false`.

3. Click **Save changes**.

4. Confirm your changes.

FIDO authentication is now an additional sign-in factor

Configuring Mobile OTP and Notifications
Configure policy for the time-based one-time passcode (OTP), and protection and compliance policies for the Oracle Mobile Authenticator (OMA) app.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Security** and then **Two-factor authentication**. Click **Mobile app**.

2. In the **Passcode policy** section, make any necessary changes.

The default values are the industry-recommended settings:
   - The value in the **Passcode generation interval (seconds)** box indicates the number of seconds before a new passcode must be generated.
     To avoid clock skew, which is the time difference between the server and the device, the user must ensure that their device clock is synchronized. The maximum allowed time difference between the server and the device is 90 seconds.
   - The value in the **Secret key refresh interval (days)** box indicates the number of days before you want to refresh the shared secret.

Each time that a user enrolls a mobile device, a secret key is pushed and securely stored on the device by using the scanned Quick Response (QR) code or when the user enters the key manually. This key is the input to the OTP algorithm that is used to generate the OTP. The key is refreshed silently, so no user action is required.
3. In the **Notification Policy** section, select **Enable pull notifications** to allow the OMA App to pull pending notification requests from the server.

Pull notifications are updates that are delivered to a mobile device or computer in response to a user who is manually checking for login request notifications. You can only enable this option if you enabled the **Mobile app notification** factor on the Multi-factor authentication (MFA) settings page.

Pull notifications are useful in scenarios where the GCM service (Android) or Firebase Cloud Messaging (FCM), APNS Service (iPhone), or WNS service (Windows) doesn’t work. For example, China blocks the GCM service, so users don’t receive notifications that are pushed to their device. However, if pull notifications are available, the user can manually pull notifications from a server using the OMA app. Also, offering pull notifications is useful in situations where push notifications are not 100% reliable.

4. Configure the **App protection policy** and **Compliance policy** for the OMA app.

Compliance policy checks are performed each time that the OMA app opens.

5. Click **Save changes**.

6. Confirm your changes.

**Configuring Text Message (SMS) Settings**

Configure settings for sending a passcode as a text message (SMS) to the user. This method is useful for users without Internet connectivity.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Security** and then **Two-factor authentication**. Click **Text message (SMS)**.

2. Make any necessary changes to the settings for the one-time passcode that is sent in a text to the user's device.
   - **Passcode length**: The number of characters in the passcode.
   - **Passcode validity duration**: The number of minutes for which the passcode will be valid, after the passcode was sent.

3. Select the language in which you want to view the text message, and then click **View** to preview the text message.

4. Use the message template to create the wording that is sent in the SMS message to the user.

IAM provides a fixed list of message variables for your use. Click **Message variables** to view the available variables and variable definitions.

### Note:

When you use the `$(companyName)` variable, be sure to add your company name to the **Company name** field on the **Branding** page in **Settings**. If you don't, your company details don't appear in email notifications, SMS notifications, or in the Oracle Mobile Authenticator (OMA) app when a user completes MFA enrollment.

5. Click **Save**.

**Managing Trusted Partner Certificates**

Learn about trusted partners and trusted partner certificates.

A **trusted partner** is any application or organization, remote to IAM that communicates with IAM.

IAM uses identity propagation to communicate with a trusted partner. During identity propagation, a front-end Oracle Identity Management product, such as Oracle Access Manager, challenges a user and authenticates the user's credentials.

After the user's identity is validated, a token is generated. This token is used in place of a password to prove that the user is who they claim to be. The asserted identity is then passed into the identity domain. Because the identity has already been established, the identity domain trusts that it is a valid user identity, and can use it, as required.

For example, an identity domain receives a user assertion from Oracle Access Manager. As a result, a user can use Oracle Access Manager to log in to a portal associated with a trusted partner. This portal takes the user to the Home...
IAM

page of an order management system. The Home page displays the orders the user made from the order management system.

The first step in establishing a trusted partner is to determine the partner's role in the trust relationship. A trusted partner can be a source site (one that generates an SSO assertion) or a destination site (one that consumes an SSO assertion).

Currently, trusted partners generate SSO assertions that IAM consumes.

To ensure that the assertions are transmitted to the identity domains securely, the information contained in the assertions is encrypted in X.509 digital certificates. These certificates are known as trusted partner certificates.

Identity domains use trusted partner certificates that have Distinguished Encoding Rules (DER) file extensions.

Using the Console

Importing a Trusted Partner Certificate

2. Select the identity domain you want to work in and click Settings and then Trusted partner certificates.
3. Navigate to the identity domain: Open the navigation menu and click Security. Under Identity, click Identity Domains. Click the identity domain you want to configure and click Partner Settings.
4. In the Trusted Partner Certificates page, click Import.
5. In the Import pane:
   a) In the Alias field, enter an alias for the trusted partner certificate (for example, TPcert1).
      The certificate that you import is an authorization certificate for the trusted partner. It contains a keystore. The keystore is used to authenticate and encrypt the data for the trusted partner for security purposes. A keystore entry is identified by an alias.
   b) To locate and select the DER file that contains the trusted partner certificate to import, choose Drop a file or select one and either drag a file into the page, or browse to the location.
   c) Verify that the path and name of the DER file you selected appear in the Certificate field.
   d) Click Import.

Viewing Details About a Trusted Partner Certificate

By default, you can see the alias, SHA-1 and SHA-256 thumbprints, start date, and end date for each certificate that you import into the identity domain. You can see either the abbreviated version of a certificate (the thumbprint) or the entire certificate.

2. Select the identity domain you want to work in and click Settings and then Trusted partner certificates.
3. In the Trusted Partner Certificates page, verify that you see the following information about the imported trusted partner certificate:

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alias</td>
<td>The alias for the trusted partner certificate.</td>
</tr>
<tr>
<td>SHA-1 Thumbprint</td>
<td>A hash value computed over the complete certificate, which contains all its fields, including the signature. If SHA-1 is used as the algorithm to encrypt the certificate, then the encrypted value appears in this column. Otherwise, the column is empty.</td>
</tr>
<tr>
<td>SHA-256 Thumbprint</td>
<td>If SHA-256 is used as the algorithm to encrypt the certificate, then the encrypted value appears in this column. Otherwise, the column is empty.</td>
</tr>
<tr>
<td>Certificate Start Date</td>
<td>The date and time after which the identity domain can use the certificate to authenticate the trusted partner.</td>
</tr>
<tr>
<td>Task</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>Certificate End Date</td>
<td>The date and time after which the identity domain can no longer use the certificate to authenticate the trusted partner.</td>
</tr>
</tbody>
</table>

4. You can view the entire trusted partner certificate, as opposed to the certificate's thumbprint. To do so, select the certificate and click View. After viewing the certificate, click OK.

Deleting a Trusted Partner Certificate

2. Select the identity domain you want to work in and click Settings and then Trusted partner certificates.
3. In the Trusted Partner Certificates page, click the certificate that you want to remove, and click Delete.
4. In the Confirmation window, click OK.

Managing Network Perimeters

For security purposes, identity domain administrators, security administrators, and application administrators can define network perimeters in an identity domain. A network perimeter contains a list of IP addresses.

After creating a network perimeter, you can prevent users from signing in to IAM if they use one of the IP addresses in the network perimeter. This is known as blocking. A blocklist contains IP addresses or domains that are suspicious. As an example, a user may be trying to sign in to IAM with an IP address that comes from a country where hacking is rampant.

An IP address is a string of numbers that identifies the network of any device connected to the internet. It’s like a return address on an envelope, and is associated with a human-readable domain. Since the IP address tells other devices where data is coming from, it can be a good way to track bad content.

Blocklists can list a single IP address or a (set) range of IPs. IAM can use this information to block users who attempt to sign in from suspicious IP addresses.

You can also configure IAM so that users can log in, using only IP addresses contained in the network perimeter. This is known as allowlisting, where users who attempt to sign in to IAM with these IP addresses will be accepted. Allowlisting is the reverse of blocklisting, the practice of identifying IP addresses that are suspicious, and as a result, will be denied access to IAM.

You can configure IAM so that only users who use a particular IP address or IP address in a specific range will be allowed to sign in to IAM. Or, you can configure IAM to monitor for suspicious IP addresses or IP address ranges, and prevent users who use these IP addresses from signing in to IAM.

With a network perimeter, you can define, in a standard format, an exact IP address, a range of IP addresses, or a set of masked IP addresses. Both Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) protocols are supported.

Detailed information about these three formats appears below.

- **Exact IP address.** You can enter a single IP address or multiple IP addresses. If you enter multiple exact IP addresses, then put a comma between each one.
- **Two IP addresses, separated by a hyphen, which is an IP range.** For example, if you specify the IP range of 10.10.10.1-10.10.10.10, any user who attempts to sign in to IAM with an IP address from 10.10.10.1 through 10.10.10.10 will be using an IP address that falls within the IP range.
- **Masked IP address range.** Each number of an IP address is 8 bits. For example, if you have a masked range of 10.11.12.18/24, then the first three numbers (24 bits) is the mask that must be applied to see if an IP address falls in this range. For this example, valid IP addresses will be those that begin with 10.11.12.

**Note:**

The examples listed above are using IP addresses with the IPv4 protocol. However, you can apply the same formats to IP addresses that use the IPv6 protocol (for example, B138:C14:52:8000:0:0:4D8).
After defining your network perimeters, you can assign them to a sign-on policy, and configure the policy so that if you're trying to sign in to IAM using an IP address that's defined in the network perimeter, you can log in to IAM or you'll be prevented from accessing IAM.

See Add a Sign-On Policy for more information about assigning network perimeters to a sign-on policy.

Adding a Network Perimeter
You can add a network perimeter in an identity domain, and then configure IAM to restrict the IP addresses that users can use to log in to IAM.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Network perimeters.
2. In the Network perimeters page, click Create network perimeter. The Create network perimeter window appears.
3. Use the following table to populate the Add network perimeter window, and then click Create:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the network perimeter.</td>
</tr>
<tr>
<td>IP Addresses</td>
<td>Enter the exact IP address or IP addresses, IP range, or masked IP address range for the network perimeter. See Managing Network Perimeters on page 3699 for more information about these IP address formats.</td>
</tr>
</tbody>
</table>

You added a network perimeter. See Adding a Sign-On Policy on page 3541 for more information about using this network perimeter in sign-on policy rules.

Viewing Details About a Network Perimeter
By default, you can see the name of each network perimeter you defined in an identity domain. You can also see other information about the policy, such as the IP addresses for the network perimeter.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Network perimeters.
2. In the Network perimeters page, click the Actions menu to the right of the network perimeter about which you want to see more information, and then click Edit network perimeter.
   A window opens and displays the name and IP addresses associated with the network perimeter. From this window, you can modify this information. See Modifying a Network Perimeter on page 3700.

Modifying a Network Perimeter
After viewing details about a network perimeter, you can modify it. Modifying a network perimeter in IAM includes changing the name of the network perimeter or the IP addresses associated with the network perimeter.

1. Open the navigation menu and click Identity & Security. Under Identity, click Domains. Select the identity domain you want to work in and click Security and then Network perimeters.
2. In the Network perimeters page, click the Actions menu to the right of the network perimeter about which you want to modify, and then click Edit.
   A window opens and displays the name and IP addresses associated with the network perimeter.
3. In the Name field, enter the new name of the network perimeter.
4. In the IP Addresses text area, modify the IP addresses associated with the network perimeter by adding, editing, or removing IP addresses for the network perimeter. If you enter multiple new IP addresses, then put a comma between each one.
5. Click Save changes.
Removing Network Perimeters
Use the OCI Console to remove multiple network perimeters simultaneously.

1. Open the navigation menu and click **Identity & Security**. Under **Identity**, click **Domains**. Select the identity domain you want to work in and click **Security** and then **Network perimeters**.
2. In the **Network perimeters** page, select the check box for each network perimeter that you want to remove.
3. Click **Delete network perimeter**.
4. Confirm the deletion.

Identity Domains User Guide
Your administrator gives you access to an identity domain. You use an identity domain to configure profile and security settings, manage 2-step verification for your account, and to use the Oracle Mobile Authenticator (OMA) app.

When you sign in to an identity domain, you can:

- **Configure profile and security settings.** Set up or modify your profile, change your password, set your primary email address, set your account recovery options, enroll in 2-Step Verification, link your social login accounts to your user account if you're using social login, access all apps assigned to you, activate your deactivated account, and unlock your account. See **Configuring Profile and Security Settings** on page 3701.

- **Manage 2-Step verification.** Configure security settings for 2-Step Verification for your user account. See **Managing 2-Step Verification** on page 3710.

- **Use the Oracle Mobile Authenticator (OMA) app.** Use this app to increase your security by providing a second verification method to sign in. See **Using the Oracle Mobile Authenticator App** on page 3722.

Configuring Profile and Security Settings
Change your password, manage your profile information, manage applications to which you have been granted access, unlink your social accounts from your accounts, and access your consents.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change your password.</td>
<td>You can change your password whenever you need to or when it expires.</td>
<td><em>Changing Your Password</em> on page 3702</td>
</tr>
<tr>
<td>Manage your profile information.</td>
<td>You can set up your profile, set your primary email address, configure your account recovery factors, set up and manage your 2–Step Verification methods, and edit your profile information.</td>
<td><em>Setting Up or Modify Your Profile</em> on page 3703</td>
</tr>
<tr>
<td>Access and organize your applications.</td>
<td>You can access and organize the applications to which you have been granted access.</td>
<td><em>Accessing My Apps</em> on page 3708</td>
</tr>
<tr>
<td>Access your consents.</td>
<td>You can list and revoke your consents.</td>
<td><em>Accessing Your Consents</em> on page 3708</td>
</tr>
</tbody>
</table>

Using the Console
Changing Your Password

Passwords are valid only for the period specified by the password policy defined by your administrator. When your password expires, you must update your password to access IAM.

1. Click your user avatar, and then select My Profile. In the My Profile console, click Change password.
2. In the Current password field, enter your current password.
3. In the New password field, enter a new password.

Tip:
If you're using your password to sign in, then use the Password Criteria pane to confirm that your new password conforms to the password policy set by your administrator. If your password conforms to the policy, then each criterion displays a green check mark.

If you're using your Microsoft Active Directory password to sign in to an identity domain, then your password policy criteria is defined and maintained by your Microsoft Active Directory administrator. Contact your administrator for more information about this criteria.

4. In the Confirm new password field, reenter your new password.
5. Click Save.
You receive an email verification that your password was updated correctly.

Recovering Your Account
If you have trouble signing in, you're locked out, or you forget your password, then you can reset your password to recover your account.

There are three factors that you can set to regain access to your account. You can specify an alternate (recovery) email address, provide a mobile number, or select and answer security questions to verify your identity.

1. In the identity domain login page, click the Click here link.
2. In the Forgot Your Password? page, enter your username, and then click Next.
3. Select the Recovery email, Mobile number, or Security questions account recovery method.
   a) If you select Recovery email, then a Password reset notification is sent to the recovery email address associated with your account. Follow the instructions in the notification to reset your password.
   b) If you select Mobile number, then a passcode is sent to the mobile number associated with your account. Enter the passcode, and then click Verify to reset your password.
   c) If you select Security questions, then one of the security questions that you set appears. Provide the answer to this security question, and then click Verify to reset your password.

Important:
The factors that are available for you to select are dependent upon the selections you made when you set your account recovery options. For example, if you didn't set your mobile number as an account recovery factor, then you can’t use this factor to recover your account. It doesn't appear in the Forgot Your Password? page.

If Recovery email is the only account recovery method that you set, then you won't be prompted to select a method. Instead, the Password reset notification is sent to the recovery email address associated with your account.

If you haven't set any account recovery options, then the Password reset notification is sent to your primary email address.
Setting Up or Modify Your Profile

If you're signing in to an identity domain for the first time, then set up your profile information. If you already set up your profile, then you can modify this information.

Your profile includes the following types of information:

- Account information: Your username, email address, full name, instant messaging address, and home and mobile phone numbers.
- Work information: Your job title, your work address, phone number, and country, and your time zone and language (locale). The time zone and locale determine the time zone and language that displays for your account in an identity domain.
- Other information: Your user type, employee number, organization name, division, department, and cost center.

1. Click your user avatar, and then select My Profile. In the My Profile console, click Edit my profile and update any information, as necessary.
   For example, you can change the time zone and language that displays for your account.
2. (Optional) If you have a multi-valued attribute for your profile, then a Values link appears to the right of the attribute. To populate this attribute with values:
   a) Click the Values link.
   b) In the popup window that appears, click Add.
   c) In the text box that appears, enter a value for the attribute.
   d) Repeat steps b and c to add other values for the attribute.
   e) Click OK. The counter to the right of the Values link changes to reflect the updated number of values for the attribute.
3. Click Save.

Setting Your Email Options

You can change the primary email address that was set up for you when your account was created.

The primary email address is the email address to which all your notifications are sent. Your administrator has already set your primary email address.

1. Click your user avatar, and then select My Profile. In the My Profile console, click More Actions, and then select Edit email.
2. Click Change.
3. In the Change primary email dialog box, enter your password, and then click Verify.
4. In the New primary email field, enter a new email address.
5. Click Change primary email.

A verification email is sent to your new email address. To verify your email address, follow the instructions in the email. Also, an update email notification is sent to your old email address.

Note:
In addition to your primary email address, you can set an alternate (recovery) email address that you can use to help you recover your account.

Setting Your Account Recovery Options

If you didn’t set your account recovery options the first time you signed in to an identity domain, then you can do so from the Security tab of the My Profile console. This way, if you have trouble signing in, you’re locked out, or you forget your password, then you can regain access to your account.

You can set the following account recovery factors:
• Recovery email: By default, your primary email address has been set as the email address that IAM uses to help you recover your account. If you have to regain access, then IAM sends a notification to this email address. Follow the instructions in the notification to recover your account. Instead of your primary email address, you can specify an alternate (recovery) email address to regain access.

• Mobile number: You can provide a mobile number that IAM uses to help you recover your account. This way, if you have to regain access, then IAM sends a one-time passcode in a text message to this mobile number. You enter this passcode to recover your account.

• Security questions: You can select and answer security questions, and provide hints for answers to these questions, to verify your identity. If you have to recover your account, then you must answer these questions correctly to regain access.

Important:
The account recovery factors that are available for you to set are dependent upon the selections your identity domain administrator or security administrator made when they set up account recovery for your identity domain. For example, if your administrator deactivated mobile number as an account recovery factor, then you can’t use this factor to recover your account. It doesn't appear in the Security tab of the My Profile console. See Configure Account Recovery.

Because you want to be able to regain access to your account, you must set at least one account recovery factor.

Setting a Recovery Email Address as an Account Recovery Factor
By default, your primary email address has been set as the email address that IAM uses to help you recover your account. If you have to regain access, then IAM sends a notification to this email address. Follow the instructions in the notification to recover your account. Instead of your primary email address, you can specify an alternate (recovery) email address to regain access.

1. Click your user avatar, and then select My Profile. In the My Profile console, click Security.
2. In the Recovery email pane, click the Actions menu.
3. Select Edit.
4. In the Change recovery email dialog box, enter your password for security purposes, and then click Verify password.
5. In the New recovery email field, enter a different email address to use to recover your account, and then click Change recovery email.

IAM sends a verification notification to this email address.

Tip:
If you didn’t receive the notification, then in the Recovery options page, click Resend email. OCI IAM resends the notification to the email address you provided in step 5.

6. In your Inbox, open the verification notification, and then click the Email verification link.
7. In the Email verified page, click the Click here to continue link.
8. In the Recovery email pane of the Account recovery options section, verify that you see the recovery email address that you provided in step 5.

Setting Your Mobile Number as an Account Recovery Factor
You can provide a mobile number that IAM uses to help you recover your account. This way, if you have to regain access, then IAM sends a one-time passcode in a text message to this mobile number. You enter this passcode to recover your account.

1. Click your user avatar, and then select My Profile. In the My Profile console, click Security.
2. In the Mobile number pane, click the Actions menu.
3. Select **Configure**.

   **Note:**
   If you don’t see **Configure**, then you have already set your mobile number as an account recovery factor.

4. In the **Mobile number** field of the **Mobile number** dialog box, select a country code for your mobile number, enter the mobile number to use to recover your account, and then click **Text me**. IAM sends a passcode in a text message to this mobile number.

   **Note:**
   Don’t enter any non-numeric characters for your mobile number. For example, if your mobile number is 212-555-1212, then enter 2125551212.

5. After you receive the passcode, enter the passcode in the text field that appears below the **Mobile number** field, and then click **Verify**.

   **Note:**
   If you didn’t receive the passcode, then click **Resend**. IAM resends the passcode to your mobile number.

Setting Security Questions as an Account Recovery Factor

You can select and answer security questions, and provide hints for answers to these questions, to verify your identity. If you have to recover your account, then you must answer these questions correctly to regain access.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **Security**.
2. In the **Security questions** pane, click **Configure**.

   **Note:**
   If you don’t see **Configure** in this pane, then you have already set security questions as an account recovery factor.

3. In the **Security questions** dialog box, select your security questions, provide answers and optional answer hints, and then click **Save**.

   **Tip:**
   After you provide an answer to a security question, click **Reveal**. Your answer appears in clear text, and you can verify that you entered it correctly.

Modify Your Recovery Email Address

You can change the email address that IAM uses to help you recover your account if you have to regain access.

To modify your recovery email address, follow the instructions in **Set a Recovery Email Address as an Account Recovery Factor**.

Modifying Your Mobile Number

You can change the mobile number that IAM uses to help you recover your account if you have to regain access.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **Security**.
2. In the **Mobile number** pane, click the **Actions** menu.

   **Note:**
   If you don’t see the **Actions** menu in this pane, then you have not set your mobile number as an account recovery factor.

3. Select **Edit**.
4. In the **Mobile number** field of the **Mobile number** dialog box, select a different country code for your mobile number or enter the updated mobile number to use to recover your account, and then click **Text me**. IAM sends a passcode in a text message to this mobile number.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Don’t enter any non-numeric characters for your mobile number. For example, if your mobile number is <strong>212-555-1212</strong>, then enter <strong>2125551212</strong>.</td>
</tr>
</tbody>
</table>

5. After you receive the passcode, enter the passcode in the text field that appears below the **Mobile number** field, and then click **Verify**.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you didn’t receive the passcode, then click <strong>Resend</strong>. IAM resends the passcode to your mobile number.</td>
</tr>
</tbody>
</table>

### Modifying Your Security Questions

You can change the security questions, answers, and hints that IAM uses to help you recover your account if you have to regain access.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **Security**.

2. In the **Security questions** pane, click the **Actions** menu.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you don’t see the <strong>Actions</strong> menu in this pane, then you have not set security questions as an account recovery factor.</td>
</tr>
</tbody>
</table>

3. Select **Edit**.

4. In the **Security questions** dialog box, select different security questions, provide other answers and optional answer hints, and then click **Save**.

<table>
<thead>
<tr>
<th>Tip:</th>
</tr>
</thead>
<tbody>
<tr>
<td>After you provide an answer to a security question, click <strong>Reveal</strong>. Your answer appears in clear text, and you can verify that you entered it correctly.</td>
</tr>
</tbody>
</table>

### Removing Your Mobile Number as an Account Recovery Factor

If you no longer want to use your mobile number to recover your account if you have to regain access, then you can remove it as an account recovery factor.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **Security**.

2. In the **Mobile Number** pane, click the **Actions** menu.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you don’t see the <strong>Actions</strong> menu in this pane, then you have not set your mobile number as an account recovery factor.</td>
</tr>
</tbody>
</table>

3. Select **Remove**.

4. Confirm the removal.

### Removing Security Questions as an Account Recovery Factor

If you no longer want to use security questions to recover your account if you have to regain access, then you can remove them as an account recovery factor.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **Security**.
2. In the **Security questions** pane, click the **Actions** menu.

    **Note:**

    If you don’t see the **Actions** menu in this pane, then you have not set your mobile number as an account recovery factor.

3. Select **Remove**.
4. Confirm the removal.

**Managing Group and Application Access**

After you request group and application access from the Catalog page you can view your access and requests from the **My Profile** page.

**Requesting Group and Application Access**

Request access to groups to which you want to be a member and to applications to which you want use. If you do not see the group or application on the Catalog page, the administrator has not allowed the group or application to be requested. To make the group or application accessible, contact your administrator.

1. Click your user avatar, and then select **My Profile**. In the **My Profile** console, click **My groups** to request access to a group or **My applications** to request access to an application.
2. Click **Request access to a new group** or **Request access to a new application**.
3. In the Catalog page, select either **Groups** or **Applications**.
4. Click the plus (+) sign for the group or application to which you want access.
5. In the **Add Access** dialog box, enter the reason for the request, and then click **OK**.

    Two emails are sent to you.

    • The first email verifies your request. To go to the **My requests** tab and verify that your request has been submitted, click the **My requests** link in the email.
    • The second email verifies your access. To go to the **My access** tab and verify that your access has been granted, click the **My access** link in the email.

**Viewing Group and Application Access**

Click your user avatar, and then select **My Profile**. In the **My Profile** console, click **My groups** or **My applications**.

The groups and applications that you have access to are listed.

**Viewing Group and Application Access Requests**

Viewing your requests for group and application access, in the **My Profile** console, click **My requests**. Your group and application access requests are listed.

For each request, the following information is displayed:

• The name of the group or application.
• The justification you entered while requesting for the group or application
• The date and time when you submitted the request
• The status of each request to denote that you have been granted access to the group or application.

**Generating Personal Access Tokens**

An access token is an authorization that's used by a client application to access an API or a resource application within a limited period.

The time-bound access tokens inform the resource application that the client is authorized to access the application and perform specific actions specified by the scope that's granted.

You can download access tokens only if an identity domain administrator assigns administrator roles or resource applications to your user account.

To generate personal access tokens:

1. Click your user avatar, and then select **My Profile**. In the **My Profile** console, click **My access tokens**.
2. You can download an access token in the following ways:
   
   • Select **Invokes Identity Domains APIs** to specify the available administrator roles that are assigned to you. The APIs from the specified administrator roles will be included in the token.
   
   • Select **Invokes other APIs** to select confidential applications that are assigned to your account.
     
     a. Click **Select an application** to add a configured confidential resource application. On the **Select an application** window, the list of assigned confidential applications displays.
     
     b. Click applications to select them, and then click **Add**. The **My access tokens** page lists the added applications.
   
3. In the **Token Expires in mins** field, select or enter how long (in minutes) the access token you're generating can be used before it expires. You can choose to keep the default number or specify between 1 and 527,040.

4. Click **Download token**. The access token is generated and downloaded to your local machine as a **tokens.tok** file.

**Accessing Your Consents**

For some applications, you must agree to the terms of use so that you can access them. Also, application resources might require consent so that client applications can access these resources. You can view and revoke the terms of use and consents of applications you have agreed upon.

The **My consents** page of the **My Profile** console lists two types of applications:

• Applications you have agreed to the terms of use.
• Applications you have consented access to resources.

The **Terms of use consents** section in the **My consents** page of the My Profile console is associated with consents that you agreed to upon accessing applications protected by IAM.

The **Application consents** section of this page refers to OAuth consents that you allowed applications to access, for resource scopes that require consent.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **My consents**. The page shows the list of applications that you have agreed to the terms of use, and the list of applications you have allowed consent.

2. For both the **Terms of use consents** and **Application consents** sections, perform the following:

   • **Open the terms of use consent**: Click one of the application names. The **Terms of use** page opens and displays the statement of the consent that you agreed upon for the application.
   
   • **Revoke**: Select the check box in front of the application name, and then click **Revoke**. Alternatively, you can click the **Actions** menu option of the application, and then click **Revoke**.

     In the **Confirmation** window, click **OK** to confirm you want to revoke the terms of use consent.

**Accessing My Apps**

Use the **My Apps** page to access and organize applications.

Applications that show in the **My Apps** page are applications to which the administrator has granted you access. Access can be granted to you as an individual user or to a group to which you belong. You are directed to the **My Apps** page after you activate your account and each time you log in thereafter.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **More Actions**, and then select **Applications launcher**.

2. Search for applications by entering a string that begins the application name.

3. Set your favorites.

4. Sort applications by **Name** and **Recently granted**.

5. To access an application, click the application tile or the application name to be taken to the home page of the application. Bookmark application homepages so that you can access the applications directly.
Using Form Fill Applications

Store your application credentials using form fill apps so that you have one click access to the websites you use most.

For applications where your administrator enables the Oracle Secure Form Fill plugin, collects your credentials the first time you access the app from the **My Apps** page, and then seamlessly logs you in on future accesses.

**Prerequisite:** You must be using a Google Chrome or Mozilla Firefox browser.

---

### Installing the Oracle Form-Fill Plugin

Learn when and how to install the plugin that's required to use form fill apps.

When your administrator grants you access to an application that requires the Oracle Form Fill Plugin, you see a prompt to install the plugin the next time you open the **My Apps** page.

Follow the steps below to install the plugin after you see the prompt in **My Apps**.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **More Actions**, and then select **Applications launcher**.

2. If you see a message at the top of the page that says, "One or more applications granted to you requires the Secure Form Fill Plugin...", proceed with the steps below to install the form fill plugin.

   If you don't see the message:

3. Click **Install Plugin** at top right.

   You might need to disable pop-up blocking to proceed.

4. Follow browser-specific instructions to complete the plugin installation.

   - In Google Chrome, click the **Add to Chrome** button.
   - In Firefox:
     a. Save the plugin file (**stf.xpi**) locally.
     b. In the file system, right-click the file and open it with Firefox.

5. On the **My Apps** page, refresh the browser window after completing the plugin installation.

6. Click the icon for an app that requires the form fill plugin.

   In the **Enter Credentials** dialog box that opens in front of the **My Apps** page, enter your credentials and click **OK** to proceed to the application's home page.

---

### You can now access form fill applications from the **My Apps** page:

1. The first time you access a form fill application:

   a. Instead of going to the application's login page, an **Enter Credentials** dialog box opens in front of the **My Apps** page.

   b. Enter the login credentials for the application in the **Enter Credentials** dialog box and click **Login**.

      The Oracle Form Fill Plugin captures your credentials and logs you in to the application.

2. When you access the same form fill application from **My Apps** in the future, you are automatically logged in to the application.

---

**Note:**

If instead of the **Enter Credentials** dialog box you see the application's login page – the app doesn't support the form fill plugin.
Updating Credentials for a Form Fill Application

If you change your login credentials with an application that uses the Oracle Form Fill Plugin, you must update your credentials from the My Apps page.

After the first time you access a form fill application from the My Apps page, the Oracle Form Fill Plugin automatically logs you in to that application in the future. But when you change your login credentials within the application, the automatic login using your old credentials fails, and you must manually enter your credentials in the application's login page.

To restore your automatic login through the form fill plugin:

1. Click your user avatar, and then select My Profile. In the My Profile console, click More Actions, and then select Applications launcher.
2. Locate the form fill application for which your credentials have changed.
3. Click the gear icon in the bottom-right corner of the application's tile and select Update Credentials.
4. Enter your current login credentials and click Save.

Managing 2-Step Verification

2-Step Verification is an authentication method that requires you to use more than one way of verifying your identity, providing a second layer of security to your account.

When you sign in to an identity domain, you’re prompted for your user name and password, which is the first factor. You then might be required to provide a second type of verification. Providing a second type of verification is called 2-Step Verification. The two factors work together to add an additional layer of security by using either additional information or a second device to verify your identity and complete the sign-in process.

Learn how to set up one-time passcodes, SMS, security questions, and email as 2-Step Verification.

Managing 2–Step Verification Overview

Set up 2–Step Verification for your account either during 2–Step Verification enrollment or using the 2–Step Verification page from the self-service console. Also, use the 2–Step Verification page to perform tasks such as enabling and disabling 2–Step Verification, setting up authentication methods, trusting a device, and generating bypass codes.

Using the Console

Setting Up 2–Step Verification During Enrollment

2-Step Verification is an authentication method that requires you to use more than one way of verifying your identity, providing a second layer of security to your accounts.

After you enter your user name and password at the login page, you use a second verification method, such as a passcode that is sent as an SMS to your mobile device. Second verification methods prevent anyone but you from logging in, even if they know your password. You can set up 2-Step Verification for your account during 2-Step Verification enrollment or using the My Profile console independent of enrollment. This section covers the steps to set up authentication methods during enrollment, and also the steps required to use those methods to verify your identity during sign-in.

The following 2–Step Verification methods are supported:

- Text Message (SMS)
- Mobile App OTP and Notifications
- Security Questions
- Email

Changing Your Default Verification Method During Enrollment

You can change your default verification method when you log in.

1. Enter your user name and password in an MFA-protected environment.
   The 2-Step Verification page appears, and then you are prompted for your second verification method.
2. Click Show alternative login methods. All 2–Step Verification methods that you are enrolled in appear in the Alternative login methods section.
3. Select a different verification method. You are then prompted to enter the required verification for that method.
4. Enter the required verification.
5. Select the **Make this my default method** check box to set this 2-Step Verification method as your default. The next time that you log in, you are prompted to verify your identity using this method of verification.

Setting up a Mobile Number

Enroll your mobile number as a 2-Step Verification method.

When multi-factor authentication (MFA) is enabled, the first time that you log in, the **Select Your Default 2-Step Verification Method** flow appears after you enter your user name and password.

1. Enter your name and password to log in to an identity domain where 2-step verification has been enabled.

2. On the **Enable 2-Step Verification** introduction page, click **Enable 2-Step Verification**.

   The authentication methods available to you appear on the **Select Your Default 2-Step Verification Method** page.

3. Click **Mobile SMS**.

4. Enter the mobile number where you want to receive the passcode, and then click **Send Passcode**.

   An SMS passcode is sent to your mobile device.

5. Enter the passcode into the **Passcode** box, and then click **Verify Mobile Device**.

   The **Successfully Enrolled** page appears.

   If you do not receive a text, click **Resend**.

6. (Optional) To set up an additional method during enrollment, select another method from the bottom of the page, and then complete the enrollment process for that method. Alternatively, you can set up additional methods later using the **Security** tab in the My Profile console.

7. Click **Done**.

Setting up the Oracle Mobile Authenticator App

Enroll the Oracle Mobile Authenticator (OMA) app as a 2-step verification method.

When multi-factor authentication (MFA) is enabled, the first time that you log in, the **Select Your Default 2-Step Verification Method** flow appears after you enter your user name and password.

1. Enter your name and password to log in to an identity domain where 2-step verification has been enabled.

2. On the **Enable 2-Step Verification** introduction page, click **Enable 2-Step Verification**.

   The authentication methods available to you appear on the **Select Your Default 2-Step Verification Method** page.

3. Click **Mobile App**.

   You are prompted to download the Oracle Mobile Authenticator app from the app store.

4. After you install the OMA app, you need to link it to an account. You can add an account three ways:

   a) **Scan the Quick Response (QR) code**

   b) **Enter the key manually**

   c) **Use the enrollment URL**

   After you add the account using one of these methods, OMA app enrollment is complete.

Setting up a Third-Party Authenticator App

Enroll a third-party authenticator app as a 2-Step Verification method.

When multi-factor authentication (MFA) is enabled, the first time that you log in, the **Select Your Default 2-Step Verification Method** flow appears after you enter your user name and password.

1. Enter your user name and password in an MFA-protected environment.

   The **2-Step Verification** page appears, and then you are prompted for your second verification method.

2. On the **Enable 2-Step Verification** introduction page, click **Enable 2-Step Verification**.

   The authentication methods available to you appear on the **Select Your Default 2-Step Verification Method** page.

3. Click **Mobile app**, and then follow the instructions.

4. Scan the offline version of the Quick Response (QR) code that appears for use with third-party authenticators.

   If you can’t scan the QR code, you are also given the option enter the key manually. You can use either option
with the third-party authenticator app. We recommend using the Oracle Mobile Authenticator as it supports notifications and many important security features.

5. After setup is complete on the Authenticator app, a one-time passcode (OTP) appears for your account in the third-party authenticator app. Enter that OTP on the Enable 2-Step Verification page, and then click Verify. The Successfully Enrolled page appears.

6. Click Done.
   To set up an additional method during enrollment, select another method from the bottom of the page, and then complete the enrollment process for that method. Alternatively, you can set up additional methods later using the Security tab in the My Profile console.

### Setting up Security Questions

Enroll in the security questions 2–Step Verification method.

When multi-factor authentication (MFA) is enabled, the first time that you log in, the Select Your Default 2-Step Verification Method flow appears after you enter your user name and password.

1. Enter your user name and password in an MFA-protected environment.
   The 2-Step Verification page appears, and then you are prompted for your second verification method.

2. On the Enable 2-Step Verification introduction page, click Enable 2-Step Verification.
   The authentication methods available to you appear on the Select Your Default 2-Step Verification Method page.

3. Click Security questions.
   The number of security questions that you are required to answer appear.

4. Select the questions, and then provide your answers.

5. (Optional) Enter answer hints. The answer and the hint can’t be the same.
   The hint appears as a tooltip when you are using security questions as your second authentication method.

6. Click Save.
   The Successfully Enrolled page appears.

7. Click Done.
   To set up an additional method during enrollment, select another method from the bottom of the page, and then complete the enrollment process for that method. Alternatively, you can set up additional methods later using the Security tab in the My Profile console.

### Setting up a Recovery Email or Another Email

Enroll your email as your 2–Step Verification method.

**Note:** Depending on how your administrator has configured your email settings, you might see either Recovery Email, or Email, or both as 2–Step Verification options.

When multi-factor authentication (MFA) is enabled, the first time that you log in, the Select Your Default 2-Step Verification Method flow appears after you enter your user name and password.

1. Enter your name and password to log in to an identity domain where 2-step verification has been enabled.

2. On the Enable 2-Step Verification introduction page, click Enable 2-Step Verification.
   The authentication methods available to you appear on the Select Your Default 2-Step Verification Method page.

3. Click Recovery Email or Email.
   A one-time passcode is sent to your primary email address.

4. Enter the passcode into the Code box, and then click Verify Email Address.

5. (Optional) To set up an additional method during enrollment, select another method from the bottom of the page, and then complete the enrollment process for that method. Alternatively, you can set up additional methods later using the Security tab in the My Profile console.

6. Click Done.
Using 2–Step Verification Authentication Methods

Using a Mobile Number

After you enroll your mobile device as a 2–Step Verification method, use it to provide a second method of verification when you log in.

1. Enter your user name and password in an MFA-protected environment.
   The Mobile Number Verification page appears, with a message saying that a passcode was sent to your mobile number.
2. Get the passcode from your mobile device and enter it into the Passcode box.
   If you didn’t receive the passcode, click Resend Passcode.
3. (Optional) If enabled by the administrator, select the Trust this computer for _ days check box to skip providing a second method of authentication for the number of days indicated when you log in from the same device. An administrator specifies the number of days.
4. Click Verify.
5. (Optional) If you can’t receive a text, for example, you don’t have your phone with you, click Show alternative login methods to use an alternative method to verify your identity.

   Note:
   You must have previously set up more than one verification method, such as using a bypass code that you previously generated and stored in a safe place. If you haven’t set up more than one verification method, you can call the help desk and have a bypass code generated for you.

6. (Optional) You can also select Show alternative login methods to change your default verification method.
   a) Click Show alternative login methods. All 2–Step Verification methods that you are enrolled in appear in the Alternative login methods section.
   b) Select a different verification method. You are then prompted to enter the required verification for that method.
   c) Enter the required verification.
   d) Select the Make this my default method check box to set this 2-Step Verification method as your default.

Using the Oracle Mobile Authenticator

After you enroll the Oracle Mobile Authenticator (OMA) app as a 2–Step Verification method, use it to provide a second method of verification to securely log in to applications.

1. Enter your user name and password in an MFA-protected environment.
   The 2-Step Verification page appears, and then you are prompted for your second verification method.
2. The authentication method that displays depends on the MFA method that your administrator enabled:
   If your administrator enabled both Mobile App OTP and Mobile App Notification, Mobile App Notification is the default method pushed to your phone for authentication.
   a) Mobile App OTP
      To avoid clock skew, which is the time difference between the server and your device, ensure that your device clock is synchronized. The maximum allowed time difference is 90 seconds.
      • You are prompted to enter the passcode that is generated by the OMA app on your mobile device.
      • Tap the OMA app on your device to launch it.
      • Tap the account for which you want to generate a new OTP. An OTP for the account appears, and the countdown begins until a new OTP is automatically generated.
      • Enter or paste that passcode into the Passcode box on the 2-Step Verification page, and then click Verify.
   b) Mobile App Notification
      • You are prompted to open and respond to the notification that was sent to the OMA app on your mobile device.
      • Open the notification in the OMA app, and then tap Allow.

3. (Optional) If enabled by the administrator, select the Trust this computer for _ days check box to skip providing a second method of authentication for the number of days indicated when you log in from the same device. An administrator specifies the number of days.

4. (Optional) If you are unable to use the OMA app, for example, you don’t have your phone with you, click Show alternative login methods to use an alternative method to verify your identity.

   **Note:**
   You must have previously set up more than one verification method, such as using a bypass code that you previously generated and stored in a safe place. If you haven’t set up more than one verification method, you can call the help desk and have a bypass code generated for you.

5. (Optional) You can also select Show alternative login methods to change your default verification method.
   a) Click Show alternative login methods. All 2–Step Verification methods that you are enrolled in appear in the Alternative login methods section.
   b) Select a different verification method. You are then prompted to enter the required verification for that method.
   c) Enter the required verification.
   d) Select the Make this my default method check box to set this 2-Step Verification method as your default.
      The next time that you log in, you are prompted to verify your identity using this method of verification.

Using a Third-Party Authenticator App
After you enroll a third-party authenticator app as a 2–Step Verification method, use it to provide a second method of verification when you log in.

1. Enter your user name and password in an MFA-protected environment.
   The 2-Step Verification page appears, and then you are prompted for your second verification method.
   You are prompted to enter the passcode that is generated by the third-party authenticator app on your mobile device.
2. Enter that passcode into the Passcode box on the 2-Step Verification page.
3. (Optional) Select the Trust this computer for _ days check box (if enabled by your administrator) to skip providing a second method of authentication for the number of days indicated when you log in from the same device. The number of days is defined by your administrator.
4. Click Verify.
5. (Optional) If you are unable to use the App, for example, you don’t have your phone with you, click **Show alternative login methods** to use an alternative method to verify your identity.

**Note:**
You must have previously set up more than one verification method, such as using a bypass code that you previously generated and stored in a safe place. If you haven’t set up more than one verification method, you can call the help desk and have a bypass code generated for you.

6. Optional. You can also select **Use backup verification method** to change your default verification method.
   a) Click **Show alternative login methods**. All 2–Step Verification methods that you are enrolled in appear in the **Alternative login methods** section.
   b) Select a different verification method. You are then prompted to enter the required verification for that method.
   c) Enter the required verification.
   d) Select the **Make this my default method** check box to set this 2-Step Verification method as your default. The next time that you log in, you are prompted to verify your identity using this method of verification.

Using Security Questions
After you enroll in the security questions 2–Step Verification method, use it to provide a second method of verification when you log in.

1. Enter your user name and password in an MFA-protected environment.
   The **2-Step Verification** page appears, and then you are prompted for your second verification method.

2. Enter the answers to your security questions.

3. (Optional) If enabled by the administrator, select the **Trust this computer for _ days** check box to skip providing a second method of authentication for the number of days indicated when you log in from the same device. An administrator specifies the number of days.

4. Click **Verify**.

5. (Optional) If you forgot your answers, click **Show alternative login methods** to use an alternative method to verify your identity.

**Note:**
You must have previously set up more than one verification method, such as using a bypass code that you previously generated and stored in a safe place. If you haven’t set up more than one verification method, you can call the help desk and have a bypass code generated for you.

6. (Optional) You can also select **Show alternative login methods** to change your default verification method.
   a) Click **Show alternative login methods**. All 2–Step Verification methods that you are enrolled in appear in the **Alternative login methods** section.
   b) Select a different verification method. You are then prompted to enter the required verification for that method.
   c) Enter the required verification.
   d) Select the **Make this my default method** check box to set this 2-Step Verification method as your default. The next time that you log in, you are prompted to verify your identity using this method of verification.

Using a Recovery Email or Another Email Address
After you enroll your email as a 2–Step Verification method, use it to provide a second method of verification when you log in.

**Note:**
Depending on how your administrator has configured your email settings, you might see either **Recovery Email**, or **Email**, or both as 2–Step Verification options.
1. Enter your user name and password in an MFA-protected environment.

The 2-Step Verification page appears, and then you are prompted for your second verification method.

If email is your default 2–Step Verification method, an email that contains a passcode is sent to your email address.

If email isn’t your default 2–Step Verification method, you can click Show alternative login methods and select Recovery Email or Email from the list of alternative methods.

After you enroll in email as a 2–Step Verification method, if you change your email address and the change is verified, a passcode is automatically sent to the updated email address. You don't need to re-enroll.

2. Enter that passcode into the Passcode box on the Email Verification page.

If you didn’t receive the email, click Resend email.

3. (Optional) If enabled by the administrator, select the Trust this computer for _ days check box to skip providing a second method of authentication for the number of days indicated when you log in from the same device. An administrator specifies the number of days.

4. Click Verify.

5. (Optional) If you can’t receive an email, click Show alternative login methods to use an alternative method to verify your identity.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You must have previously set up more than one verification method, such as using a bypass code that you previously generated and stored in a safe place. If you haven’t set up more than one verification method, you can call the help desk and have a bypass code generated for you.</td>
</tr>
</tbody>
</table>

6. (Optional) You can also select Show alternative login methods to change your default verification method.

   a) Click Show alternative login methods. All 2–Step Verification methods that you are enrolled in appear in the Alternative login methods section.

   b) Select a different verification method. You are then prompted to enter the required verification for that method.

   c) Enter the required verification.

   d) Select the Make this my default method check box to set this 2-Step Verification method as your default. The next time that you log in, you are prompted to verify your identity using this method of verification.

Managing 2–Step Verification from the My Profile Console

If you skipped enrolling in 2-Step Verification when you signed in to an identity domain, then you can do so from the Security tab of the My Profile console.

2-Step Verification is an authentication method that requires you to use more than one way of verifying your identity, providing a second layer of security to your accounts. After you enter your user name and password at the login page, you use a second verification method, such as a passcode that is sent as an SMS to your mobile device. Second verification methods prevent anyone but you from logging in, even if they know your password. You can set up 2-Step Verification for your account during 2-Step Verification enrollment or using the My Profile console independent of enrollment.

You can set up more than one 2-Step Verification method. The identity domain administrator or security administrators choose which methods are available to you.

- **Mobile App:** Use a mobile app to generate a time-based passcode (OTP). A prompt appears for you to enter the passcode that you obtain from the mobile app. Or, a sign-in request is sent to the mobile app and you tap Allow to authenticate.

- **Mobile Number:** Send a passcode as a text message (SMS) to your phone that you then enter on the page.

- **Security Questions:** Answer security questions.
• **Recovery Email** or **Email**: Send an OTP to your email address.

  **Note:**
  Your administrator determines whether you see options for **Recovery Email**, **Email**, or both.

• **Bypass Code**: Generate a bypass code and store it for later use. You can also contact an administrator to obtain a bypass code for access.

• **Duo Security**: If Duo Security is enabled, use Duo Security as an MFA factor.

Enrolling in 2-step Verification After First Sign In
If your administrator made 2-Step Authentication optional, and you have clicked **Skip** each time you log in, you can enable 2-Step Authentication in the My Profile console **Security** tab.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **Security**.
2. In the **2-Step verification** section, click **Enable**.
3. In the **2-Step verification** dialog box, click the button for the method you want to enable as your default method.
4. Follow the prompts to complete your enrollment.

   See the topic for the method you selected, under Enroll in 2–Step Verification for Your Account, for more detailed instructions.

Adding Backup Verification Methods
When you need to log in and provide a second verification method, backup verification methods come in handy if you have left your device at home, for example.

To set up an additional method during Multi-Factor Authentication (MFA) enrollment, on the **Successfully Enrolled** page of the 2-Step Verification flow, select another method from the bottom of the page. You then complete the enrollment process for that method. Alternatively, you can set up another methods using the **My Profile** console, **Security** tab.

Trusting a Device
When you access an app for the first time using your 2-Step Verification method from your computer or a device, you can specify that your computer or device is "trusted." Trusted devices don’t require you to provide a second method of authentication each time that you log in.

This feature is similar to the “remember my computer” option that you often see during authentication on many websites. When you log in and provide your second verification method, select the **Trust this computer for _ days** check box. That device is then listed in the **Trusted devices** section of the **Security** tab in the **My Profile** console. See Manage 2–Step Verification from the My Profile Console.

If you choose not to trust the computer, you are prompted for 2-Step Verification each time that you log in from that device. You have the opportunity each time that you log in to trust the computer or device.

Removing a Trusted Device
If you no longer plan to connect to an identity domain using a trusted device, you can remove it from **Trusted Devices**.

• You must have enrolled in 2–Step Verification. See Enroll in 2–Step Verification for Your Account or Enroll in 2-Step Verification After First Sign In.

• You must have specified that a device is trusted. See Trust a Device.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **Security**.
2. Scroll down to the **Trusted devices** section.
3. In the pane for the trusted device that you want to remove, click the **Actions** menu and select **Remove**.
4. In the **Confirmation** dialog box, click **OK**.
   
   The next time that you log in from that device, you are prompted for a second verification method to log in.

Configuring an Additional 2–step Verification Method
Use the 2–Step Verification section of the Security tab in the My Profile console to configure an additional verification method for your account.

**Note:**

Only Mobile Number and Mobile App methods can be added from the My Profile console Security tab.

1. Click your user avatar, and then select My Profile. In the My Profile console, click Security.
2. Locate the method that you want to add, and in the pane for that method, click Configure.
3. Complete the enrollment wizard to add the method.

   These are the same steps that you perform when you set up an authentication method during enrollment. See the topic for the method you want to add under Enroll in 2–Step Verification for Your Account.

Removing a 2–Step Verification Method

Use the 2–Step Verification section of the Security tab in the My Profile console to remove a verification method from your account.

Enable 2-Step Verification. Users usually enable 2-step verification automatically when they first log in. However, if your administrator made 2-Step Authentication optional, and you have clicked Skip each time you log in, you can enable 2-Step Authentication in the My Profile console, Security tab. See Enrolling in 2-step Verification After First Sign In on page 3718.

1. Click your user avatar, and then select My Profile. In the My Profile console, click Security.
2. Click Security.
3. In the method pane for the method that you want to remove, click the Actions menu and select Remove.
4. Click OK when prompted to confirm the removal.

**Note:**

You can't remove all the methods. If you have only one method configured, an error message appears at the top of the page when you confirm the removal.

Renaming a 2–Step Verification Method

Use the 2–Step Verification section of the Security tab in the My Profile console to rename a verification method associated with your account.

Enable 2-Step Verification. Users usually enable 2-step verification automatically when they first log in. However, if your administrator made 2-Step Authentication optional, and you have clicked Skip each time you log in, you can enable 2-Step Authentication in the My Profile console, Security tab. See Enrolling in 2-step Verification After First Sign In on page 3718.

**Note:**

Only Mobile App methods can be renamed.

You might want to rename a method, for example, when you add another mobile number, and you want each name to be unique.

1. Click your user avatar, and then select My Profile. In the My Profile console, click Security.
2. In the method pane for the method that you want to remove, click the Actions menu and select Rename.
3. Enter a new name for the method, and then click Save.

Managing Security Questions

Use the 2–Step Verification section of the Security tab in the My Profile console to set up and manage security questions that are associated with your account.

Enable 2-Step Verification. Users usually enable 2-step verification automatically when they first log in. However, if your administrator made 2-Step Authentication optional, and you have clicked Skip each time you log in, you can
enable 2-Step Authentication in the My Profile console, Security tab. See Enrolling in 2-step Verification After First Sign In on page 3718.

1. Click your user avatar, and then select My Profile. In the My Profile console, click Security.
2. In the Security Questions pane:
   • If the Security questions pane is Configured, click the Configure link.
   • If the Security questions pane is Not configured, click the Action menu and select Edit.
3. In the Security questions dialog box:
   a) Select the questions, and then provide your answers.
   b) (Optional) Enter answer hints. The answer and the hint can’t be the same.
   c) Click Save.

Generating a Bypass Code
A bypass code is useful as a second verification method when you forgot your phone, don’t have service, or can’t access your computer. You can generate bypass codes after you enroll in 2-Step Verification, and then store the codes in a safe place.

Enable 2-Step Verification. Users usually enable 2-step verification automatically when they first log in. However, if your administrator made 2-Step Authentication optional, and you have clicked Skip each time you log in, you can enable 2-Step Authentication in the My Profile console, Security tab. See Enrolling in 2-step Verification After First Sign In on page 3718.

1. Click your user avatar, and then select My Profile. In the My Profile console, click Security.
2. In the Bypass codes section, click Generate.
3. In the Bypass code dialog box, copy your bypass code, and then store it in a safe place for use the next time that you need a backup verification method.
   
   **Note:**
   The Bypass code dialog box displays the number of uses allowed. Your bypass code doesn't expire, but you can only use it one time.

4. Click Done.
5. (Optional) To view and copy your bypass code, in the Bypass code pane, click the Reveal icon.
6. (Optional) To send the bypass code to yourself in an email:
   a) In the Bypass code pane, click the Actions menu and select Email.
   b) In the Confirmation dialog box, click Email.

Using a Bypass Code
After you generate bypass codes, you can use them as a second method of verification when you forget your phone, don’t have service, or can’t access your computer.

1. Enter your user name and password in an MFA-protected environment. The 2-Step Verification page appears, and then you are prompted for your second verification method.
2. If you can’t use your usual second verification method (for example, because you don’t have your phone or you have no Internet connectivity), click Show alternative login methods to use an alternative method to verify your identity.
3. In the Alternative login methods section of the page, click Use a bypass code.
   
   **Note:**
   You must have previously set up more than one verification method, such as using a bypass code that you previously generated and stored in a safe place. If you haven’t set up more than one verification method, you can call the help desk and have a bypass code generated for you.
4. Enter your code in the **Bypass code** box.
   If you can't locate your bypass code, contact the help desk to have an administrator generate a bypass code for you.

5. (Optional) If enabled by the administrator, select the **Trust this computer for _ days** check box to skip providing a second method of authentication for the number of days indicated when you log in from the same device. An administrator specifies the number of days.

6. Click **Verify**.

Setting a Default Verification Method

When you enable 2-Step Verification, you can set a 2-Step Verification method as your default.

You can change your default verification method the first time that you log in to an MFA protected environment, or you can use the **My Profile** console, **Security** page.

1. Enter your user name and password in an MFA-protected environment. On the **Enable 2-Step Verification** introduction page, click **Enable 2-Step Verification**. Or, from the **Security** page in the My Profile console, click **Enable**.

2. Click the Action menu icon at right end of the 2-Step Verification line and select **Change Default**.

3. In the **Select Default** dialog box, select a new verification method and click **Done**.

You can also change your default verification method during sign-in. See Change Your Default Verification Method During Login.

Changing Your Default Verification Method

If you are enrolled in more than one method, you can specify which verification method is the default.

Enable 2-Step Verification. Users usually enable 2-step verification automatically when they first log in. However, if your administrator made 2-Step Authentication optional, and you have clicked **Skip** each time you log in, you can enable 2-Step Authentication in the My Profile console, **Security** tab. See Enrolling in 2-step Verification After First Sign In on page 3718.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **Security**.
   A check mark on the method pane indicates your current default verification method.

2. In the 2-Step verification section, click the Actions menu and select Change default.

3. In the Change Default dialog box, select the method that you want to use as your default verification method.

   **Note:**
   Only those 2–Step Verification methods that you are enrolled in are displayed.

4. Click **Done**.

   The check mark appears on the method pane that you set as your default.

Disabling or Re-Enabling 2-Step Verification

If your administrator has made 2-Step Verification optional, you can disable and re-enable your enrollment from the **My Profile** console.

Enable 2-Step Verification. Users usually enable 2-step verification automatically when they first log in. However, if your administrator made 2-Step Authentication optional, and you have clicked **Skip** each time you log in, you can enable 2-Step Authentication in the My Profile console, **Security** tab. See Enrolling in 2-step Verification After First Sign In on page 3718.

1. Click your user avatar, and then select **My Profile**. In the My Profile console, click **Security**.
2. To disable 2-Step Verification:
   a) Open the **Actions** menu at the right end of the **2-Step verification** line and select **Disable**.
   b) In the **Disable 2-Step verification** dialog box, click **Disable**.

   **Note:**
   If your administrator has made 2-Step Verification required, disabling it from the My Profile console has no effect.

3. To re-enable 2-Step Verification:
   a) In the **2-Step verification** section, click **Enable**.
   b) In the **2-Step verification** dialog box, click the button for the method you want to enable as your default method.
   c) Follow the prompts to complete your enrollment.

   See the topic for the method you selected, under **Enroll in 2-Step Verification for Your Account**, for more detailed instructions.

### Using the Oracle Mobile Authenticator App

Use the Oracle Mobile Authenticator (OMA) App to perform tasks such as adding an account to the OMA App and then using the OMA App as a second verification method with IAM.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use the OMA App</td>
<td>Learn how to add an account to the OMA App by scanning the QR code, entering the key manually, or using the enrollment URL</td>
<td>Use the Oracle Mobile Authenticator App</td>
</tr>
<tr>
<td>Manage the Oracle Mobile Authenticator App</td>
<td>Learn how to switch between grid and list views, edit and delete accounts, manage your PIN, and view notification history.</td>
<td>Manage the OMA App</td>
</tr>
</tbody>
</table>

### Using the Console

**Using the Oracle Mobile Authenticator App**

The Oracle Mobile Authenticator (OMA) app is a mobile device app that you can use as a second verification method by tapping **Allow** on the login request notification sent to your phone or by using the one-time passcode (OTP) that the app generates.

A mobile authenticator app uses either OTP or push notifications to prove that the user has possession of the mobile device. Only the mobile authenticator app that is in possession of the user's secret key can generate a valid OTP. You can download the Oracle Mobile Authenticator app from the app store.

<table>

<tr>
<td>Version 1.0+</td>
<td>Windows 8.1+</td>
</tr>
</tbody>
</table>

Adding an Account to the OMA App by Scanning the QR Code
After you install the Oracle Mobile Authenticator (OMA) app, you can link the App to an account by scanning the quick response (QR) code.

**Prerequisite:** Complete the steps in Using the Oracle Mobile Authenticator App on page 3722.

1. Open the OMA app on your phone, and then tap **Add Account.**
2. Scan the QR code that displays on the Download and Configure the Mobile App page.

   After setup is complete, the **Successfully Enrolled** page appears.

   If you are scanning the offline QR code:
   a) After setup is complete, the OMA app displays a one-time passcode (OTP) for your account.
   b) Click **Verify.**

   The **Successfully Enrolled** page appears.

3. Click **Done.**

**Adding an Account to the OMA App by Entering the Key Manually**

After you install the Oracle Mobile Authenticator (OMA) app on your device, you can link the App to an account by entering the key manually.

**Prerequisite:** Complete the steps in <<link to Use the Oracle Mobile Authenticator App as an Authentication Method>>.

1. On the **Enable 2-Step Verification** page, select the **Scan offline QR code** check box, and then click **Enter key manually.**

   The enrollment instructions on the page switch to configuring the OMA app manually.

2. Open the OMA app on your phone, and then tap **Add Account.**

3. Tap **Enter Key Manually.**

4. Select **Oracle** as the Account Type, and then enter your user name as the **Account,** which is typically your email address.

5. On the **Enable 2-Step Verification** page, enter the key that displays, and then tap **Save.**

6. After setup is complete, the OMA app displays a one-time passcode (OTP) for your account. Enter that OTP on the **Enable 2-Step Verification** page.

7. Click **Verify.**

   The **Successfully Enrolled** page appears.

8. Click **Done.**

**Adding an Account to the OMA App Using the Enrollment URL**

After you install the Oracle Mobile Authenticator (OMA) app, you can link the App to an account by tapping the enrollment URL.

- Complete the steps in .
- You must perform these steps from your mobile device using a supported mobile browser: iOS – Safari, Android, and Windows – Any mobile browser.

1. On the **Enable 2-Step Verification** page from your mobile device, tap **Configure the App using this URL.** A window displays two options for using the enrollment URL:
   a) Tap the enrollment URL to open the OMA app on your device and start the configuration process. For iOS devices, you must use the Safari browser to launch the enrollment URL.
   b) Enter your email address, and then click **Send** to send the enrollment URL to your email address. Ensure to open the email on your device, and then tap the enrollment URL.

   The **Successfully Enrolled** page appears.

2. Tap **Done.**

**Managing the Oracle Mobile Authenticator App**

The Oracle Mobile Authenticator (OMA) app makes it easy for you to customize how you view your accounts, manage your PIN, and manage notifications.

**Switching Between Grid View and List View**
You can change how you view your list of accounts in the Oracle Mobile Authenticator (OMA) app.

1. Launch the OMA app, and then tap the menu icon in the upper-left corner.
2. Tap **Grid View** or **List View** to switch between the two views.

   For Windows phones, in the lower-right corner, tap the grid or list icon to switch between the two views.

Manually Checking for Pending Notifications

Oracle Mobile Authenticator (OMA) app automatically checks for authentication requests, but you can also manually check for your pending notifications.

How to check for pending notifications depends on which view you are using in the OMA app:

1. While in List View, pull down on the account list to check for any pending notifications for all accounts in the list. If there is a pending notification, it automatically appears. Tap **Allow** or **Deny**.
2. While in Grid View, pull down on an account tile to check for pending notifications for that account. If there is a pending notification, it automatically appears. Tap **Allow** or **Deny**.

   The number of notifications that require your attention also appear on the bell icon in the upper-right corner. Tap the bell icon to access the **Notification History** screen, tap a pending notification, and then tap **Allow** or **Deny**.

Editing Accounts in the OMA App

You can edit your accounts in the Oracle Mobile Authenticator (OMA) app.

The steps to edit an account in the OMA app vary between the supported operating systems.

- **iOS**: While in List View, swipe left on the account tile that you want to edit. While in Grid View, swipe up. Tap **Edit**, make your changes in the **Edit Account** screen, and then tap **SAVE**.

  
  **Note:**

  To edit an account when using VoiceOver mode, you must be in Grid View. The Edit option isn’t available in List View when using VoiceOver mode.

- **Android**: While in List View, long tap the account that you want to edit. While in Grid View, tap the account, and then long tap it when it appears in detail view. Tap the pencil icon that appears in the upper-right corner, make your changes in the **Edit Account** screen, and then tap **SAVE**.

- **Windows**: Tap and hold the account tile that you want to edit. A menu appears. Tap **Edit** and make your changes in the **Edit Account** screen, and then tap **Save**.

Syncing an Account

You can sync your accounts in the Oracle Mobile Authenticator (OMA) app.

The steps to sync your accounts in the OMA app vary between the supported operating systems.

- **iOS**: While in List View, swipe left on the account tile that you want to sync. While in Grid View, swipe up. Tap **Edit** and in the Edit Account screen, tap **Sync Account** to update the account with the latest policies and to refresh the shared secret.

  
  **Note:**

  To edit an account when using VoiceOver mode, you must be in Grid View. The Edit option isn’t available in List View when using VoiceOver mode.

- **Android**: While in List View, long tap the account that you want to sync. While in Grid View, tap the account, and then long tap it when it appears in detail view. Tap the pencil icon that appears in the upper-right corner, and in the Edit Account screen, tap **Sync Account** to update the account with the latest policies and to refresh the shared secret.

- **Windows**: Tap **Sync Account** to update the account with the latest policies and to refresh the shared secret. Tap **Edit** and in the Edit Account screen, tap **Sync Account** to update the account with the latest policies and to refresh the shared secret.

Reordering Accounts in the OMA App
You can change the order in which you view accounts in the Oracle Mobile Authenticator (OMA) app.

The steps to reorder your accounts in the OMA app vary between the supported operating systems.

- **iOS**: While in List View, long tap the account to enter editing mode, and then hold the reorder icon on the right to drag. Tap **Done** when you finish. While in Grid View, long tap the account tile, and then drag (supported in iOS9 and up).
- **Android**: Tap and hold the account tile, and then drag it.
- **Windows**: While in List View, long tap the account tile. From the menu that appears, tap **Reorder**, and then drag.

Deleting an Account in the OMA App

You can delete accounts in the Oracle Mobile Authenticator (OMA) app.

The steps to delete an account in the OMA app vary between the supported operating systems.

- **iOS**: While in List View, swipe left on the account tile that you want to delete. While in Grid View, swipe up. Tap **Delete**.

  **Note:**

  To delete an account when using VoiceOver mode, you must be in Grid View. The Delete option is not available in List View when using VoiceOver mode.

- **Android**: Tap and hold the account tile that you want to delete, tap the trash can icon that appears in the upper-right corner, and then in the Delete Account window, tap **Delete Account**.
- **Windows**: Tap and hold the account tile that you want to delete. A menu appears. Tap **Delete** and then tap **Delete Account** in the window that appears.

Enabling App Protection

Add an additional level of security to the Oracle Mobile Authenticator (OMA) app by using an app PIN, by using biometrics such as Touch ID or Fingerprint, and by using Screen Protection to protect the app.

App PIN protection requires a PIN to unlock the OMA app before you can generate a one-time passcode (OTP) or approve a notification. Biometric protection requires Touch ID or Fingerprint verification to unlock the App before you can generate an OTP or approve a notification. Screen Protection, enabled by default, prevents OMA App content from being captured by screen recording.

The OMA app doesn’t support biometrics using a Windows device, and Touch ID with the OMA app is only supported with iOS version 8 and higher.

1. To enable an app PIN:
   
   Your application may require you to set up a PIN when you enroll.
   
   a) Launch the OMA app, and then tap the menu icon in the upper-left corner.
   
   b) Tap **App Protection**.
   
   c) Tap to enable PIN or Touch ID protection for the OMA app.
   
   d) Enter your PIN at the prompt, enter it again to verify, and then tap **OK**. The next time that you access the OMA app, you are prompted to enter your PIN.

2. To enable Biometrics:

   When you initially enable Touch ID or Fingerprint, you are prompted to set your PIN if you haven’t. If you have set your PIN, you are prompted to enter your PIN first before enabling Touch ID or Fingerprint.
   
   a) Launch the OMA app, and then tap the menu icon in the upper-left corner.
   
   b) Tap **App Protection**.
   
   c) Tap to enable Touch ID protection for the OMA app.
   
   d) Enter your PIN at the prompt.
   
   e) Enter your PIN again to verify and tap **OK**.

   The next time that you open the App, you are prompted to use your fingerprint to gain access to the OMA app.
3. To disable Screen Protection:
   Screen Protection prevents OMA App content from being captured by screen recording (iOS only), AirPlay (iOS only), or Screen Mirroring and is enabled by default. Screen protection is available in iOS version 11 and higher.
   a) Launch the OMA app, and then tap the menu icon in the upper-left corner.
   b) Tap **App Protection**.
   c) Tap to disable Screen Protection for the App.

Changing Your OMA App PIN
Change your PIN in the Oracle Mobile Authenticator (OMA) app.
1. Launch the OMA app, and then tap the menu icon in the upper-left corner.
2. Tap **App Protection**, and then tap **Change PIN**.
3. Enter the current PIN, the new PIN, confirm the new PIN, and then tap **Done**.

Disabling OMA App PIN Protection
You can disable PIN protection for the Oracle Mobile Authenticator (OMA) app.
Your application may be configured to not allow you to disable PIN protection.
1. Launch the OMA app, and then tap the menu icon in the upper-left corner.
2. Tap **App Protection** and slide to disable PIN protection for the OMA app.
3. Enter your PIN and tap **Done**.

Managing Notification History in the OMA App
You can access and view details about your notification history in the Oracle Mobile Authenticator (OMA) app.
1. Launch the OMA app and tap the bell icon in the upper-right corner to launch the **Notifications** page.
   Alternatively, you can tap the menu icon in the upper-left corner and tap **Notifications**. The Notification History page displays all notifications for the account.
   For the iOS platform, pending notifications that are currently in the Notification center of your device don’t appear in the OMA app when you manually launch the OMA app.
2. The **Pending** tab displays notifications for login requests that require you to either allow or deny the request. Tap a notification to view login request details.
3. The **History** tab displays notifications for login requests that you already addressed. To clear the history, tap **Clear** in the upper-right corner of the **History** tab and tap **Clear** again at the prompt.

Deprecated IAM Service APIs
This topic lists deprecated APIs for the IAM service.

**Federation Management APIs**
Date of Notification: October 15, 2020

What is changing?
The following APIs for the management of federations are deprecated. Support for these APIs will end **October 15, 2021**. The replacement solution for managing federations is to set up the federation for your tenancy between the identity provider and your tenancy's Oracle Identity Cloud Service identity domain. See Managing Identity Providers for information on managing identity providers in IAM.

This chapter explains how to use Language.

Language

Language provides you with the artificial intelligence and machine learning capabilities to detect the language in your unstructured text. Also, it provides other tools to help you further gain insights about your text.

<table>
<thead>
<tr>

</tbody>
</table>

Language Overview

Language is serverless and multi-tenant service that is accessible using REST API calls. It provides pretrained models that are frequently retrained and monitored to provide you with the best results.

You can automate sophisticated text analysis at scale without any machine learning expertise.

The Language service contains these pretrained language processing capabilities:

**Aspect-Based Sentiment Analysis**

Identifies aspects from the given text and classifies each into positive, negative, or neutral polarity.

**Named Entity Recognition**

Identifies common entities, people, places, locations, email, and so on.

**Key Phrase Extraction**

Extracts an important set of phrases from a block of text.
**Language Detection**

Detects languages based on the given text, and includes a confidence score.

**Text Classification**

 Identifies the document category and subcategory that the text belongs to.

**Ways to Access Language**

You access Language using the Console, REST API, SDKs, or CLI.

Use any of the following options, based on your preference and its suitability for the task you want to complete:

- The OCI **Console** is an easy-to-use, browser-based interface. To access the Console, you must use a supported browser.
- The **REST APIs** provide the most functionality, but require programming expertise. API reference and endpoints provide endpoint details and links to the available API reference documents including the Artificial Intelligence Services REST API.
- OCI provides **SDKs** that interact with Language without the need to create a framework.
- The **CLI** provides both quick access and full functionality without the need for programming.

**Regions and Availability Domains**

OCI services are hosted in regions and availability domains. A region is a localized geographic area, and an availability domain is one or more data centers located in that region.

Language is hosted in these regions:

- Australia East (Sydney)
- Australia Southeast (Melbourne)
- Brazil East (Sao Paulo)
- Canada Southeast (Montreal)
- Canada Southeast (Toronto)
- Chile (Santiago)
- Germany Central (Frankfurt)
- India South (Hyderabad)
- India West (Mumbai)
- Japan Central (Osaka)
- Japan East (Tokyo)
- Netherlands Northwest (Amsterdam)
- South Korea Central (Seoul)
- South Korea North (Chuncheon)
- Switzerland North (Zurich)
- UAE East (Dubai)
- UK South (London)
- UK West (Newport)
- US East (Ashburn)
- US West (Phoenix)
- US West (San Jose)

**About Language Policies**

Learn about the resource policies including API permissions.

To control who has access to Language and the type of access for each group of users, you must create policies. By default, only the users in the Administrators group have access to all Language resources. For everyone else who's using the service, you must create new policies that assign them proper rights to Language resources. For a complete list of OCI policies, see Policy Reference.
Resource Types
Language offers both aggregate and individual resource-types for writing policies. You can use aggregate resource
types to write fewer policies. For example, instead of allowing a group to manage all of the individual resource types,
you can have a policy that allows the group to manage the aggregate resource type, ai-service-language-family.

Individual Resource Types

<table>
<thead>
<tr>
<th>Resource Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ai-service-language-entities</td>
</tr>
<tr>
<td>ai-service-dominant-language</td>
</tr>
<tr>
<td>ai-service-language-sentiments</td>
</tr>
<tr>
<td>ai-service-language-keyphrases</td>
</tr>
<tr>
<td>ai-service-language-text-classification</td>
</tr>
</tbody>
</table>

Aggregate Resource Type

<table>
<thead>
<tr>
<th>Resource Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ai-service-language-family</td>
</tr>
</tbody>
</table>

Example Policies

```
allow group <language-group> to use <ai-service-language-family> in tenancy
```

Permissions Required for Each API Operation

You can use the individual resource types with API calls to interact with the service.

The following table lists the API operations for the Language service in a logical order, grouped by resource type, and
the permissions required for resource types:

<table>
<thead>
<tr>
<th>API Operation</th>
<th>Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>DetectDominantLanguage</td>
<td>AI_SERVICE_DOMINANT_LANGUAGE_USE</td>
</tr>
<tr>
<td>DetectLanguageEntities</td>

</tr>
<tr>
<td>DetectLanguageKeyPhrases</td>
<td>AI_SERVICE_LANGUAGE_KEYPHRASES_USE</td>
</tr>
<tr>
<td>DetectLanguageSentiments</td>
<td>AI_SERVICE_LANGUAGE_SENTIMENTS_USE</td>
</tr>
<tr>
<td>DetectLanguageTextClassification</td>
<td>AI_SERVICE_LANGUAGE_TEXT_CLASSIFICATION_USE</td>
</tr>
</tbody>
</table>

Pretrained Model Tools

Learn about the Language service pretrained model tools.

Limitations Common to all Model Tools

- The Language Detection model tool supports numerous languages while the other model tools support English only.
- A minimum of one word.
- A maximum of 1,000 characters in a document. The performance might differ across domains.
- The API only supports the English language.
- If your text contains a mix of English and other languages or special non-ascii symbols, the service only processes
  the English text.
- If your text doesn't follow English grammar, the model performance could degrade.
About Aspect-Based Sentiment Analysis

Aspect-based sentiment analysis can be used to gauge the mood or the tone of text. Sentiment analysis analyzes the subjective information in an expression. For example, opinions, appraisals, emotions, or attitudes toward a topic, person, or entity. Expressions are classified, with a confidence score, as positive, negative, or neutral.

The Language service sentiment analysis uses natural language processing (NLP). The tool understands the text, returns positive, neutral, and negative sentiments, and a confidence score.

The Language service aspect-based sentiment analysis (ABSA) API supports this fine grained task by extracting the individual aspects in the input document. It classifies each of the aspects into one of the three polarity classes, positive, negative, and neutral. With the predicted sentiment for each aspect, the API also provides a confidence score for each of the classes and their corresponding offsets in the input.

In the service, the confidence score is a decimal number of up to four digits. However, the Language API returns long decimal numbers confidence scores.

Scores closer to 1 indicate a higher confidence in the label's classification, while lower scores indicate lower confidence score. The range of the confidence score for each class is between 0–1 and the cumulative scores of all the three classes sum to 1.

For example, a restaurant review "Food is marginal, but the service is so bad." contains positive sentiment toward the food aspect. Also, it has a strong negative sentiment toward the service aspect. Classifying the overall sentiment as negative would neglect the fact that food was good.

ABSA addresses this problem by referring to an aspect as an attribute (or component) of an entity. For example, the screen of a phone, or the picture quality of a camera. An ABSA task typically includes identifying relevant entities and aspects to determine the corresponding sentiment.

The return on investment of a marketing campaign can use sentiment analysis to analyze a sentiment from a tweet stream of a target audience. For example, a marketer wants to run a sentiment analysis on a set of tweets to understand how many positive or negative discussions occur within it.

If the input data is "I had a good day at work today", then the results are work is 100% positive, 0% neutral, and 0% negative.

Use Cases

Some business use cases are:

- Brand monitoring
- Monitoring market research
- Employee feedback analysis
- Customer reviews and emails analysis
- Product surveys

For example, customer and employee raw survey responses can be processed using the sentiment analysis tool. The results can then be aggregated for analysis and follow up, and to facilitate engagements.

Social media monitoring can be employed with sentiment analysis to specifically extract the overall mood swing of the customer. For example, when a new product is launched, or competitive market research is conducted.

Supported Features

- Aspect Level Sentiment

</tbody>
</table>

The JSON for this example is:

**API Request format:**

```
{
  "text" : "OCI recently added new services to existing compliance program including SOC, HIPAA, and ISO to enable our customers to solve their use cases. We also released new white papers and guidance documents related to Object Storage, the Australian Prudential Regulation Authority (APRA), and the Central Bank of Brazil. These resources help regulated customers better understand how OCI supports their regional and industry-specific compliance requirements. Not only are we expanding our number of compliance offerings and regulatory alignments, we continue to add regions and services at a faster clip."
}
```

**Response JSON:**

```
{
  "sentiments": {
    "aspects": [
      {
        "offset": 23,
        "length": 8,
        "text": "services",
```
The actual values, and input and output structure might vary by model version, see the SDK documentation.

Limitations

- The identified aspects might be partial matches or split aspects.
- When sentences are semantically or structurally incorrect, the aspects could differ from your expectations.
- Pronouns as an aspect are not supported.
- If no sentiment can be identified, the aspect is identified as neutral.
- Sarcasm is not recognized.

About Named Entity Recognition

Named Entity Recognition (NER) detects named entities in text.

The Language service NER tool uses natural language processing, which uses machine learning to find predefined named entities. This tool also provides a confidence score for each entity and is a value from zero to one.
**Use Cases**

The NER tool could be used effectively in these scenarios:

**Classifying content for news providers**

It can be difficult to classify and categorize news article content. The NER tool can automatically scan articles to identify the major people, organizations, and places in them. The extracted entities can be saved as tags with the related articles. Knowing the relevant tags for each article helps with automatically categorizing the articles in defined hierarchies, and enables content discovery.

**Customer support**

Recognizing relevant entities in customer complaints and feedback, like product specifications, department details, or company branch details, helps to classify the feedback appropriately. The entities can then be forwarded to the person responsible for the identified product.

Similarly, there could be feedback tweets where you can categorize them all based on their locations, and the products mentioned.

**Efficient search algorithms**

You could use NER to extract entities that are then searched against the query, instead of searching for a query across the millions of articles and websites online. When run on articles, all the relevant entities associated with each article are extracted and stored separately. This separation could speed up the search process considerably. The search term is only matched with a small list of entities in each article, leading to quick and efficient searches.

It can be used for searching content from millions of research papers, Wikipedia articles, blogs, articles, and so on.

**Content recommendations**

Extracting entities from a particular article, and recommending the other articles that have the most similar entities mentioned in them is possible with NER. For example, it can be used effectively to develop content recommendations for a media industry client. It enables the extraction of the entities associated with historical content or previous activities. NER compares them with the label assigned to other unseen content to filter relevant entities.

**Automatically summarizing job candidates**

The NER tool could facilitate the evaluation of job candidates, by simplifying the effort required to shortlist candidates with numerous applications. Recruiters could filter and categorize them based on identified entities like location, college degrees, employers, skills, designations, certifications, and patents.

**Supported Entities**

Red Bull Racing Honda, the four-time Formula-1 World Champion team, has chosen Oracle Cloud Infrastructure (OCI) as their infrastructure partner.

601-555-5555
303.555.5555

OCI recently added new services to existing compliance program including SOC, HIPAA, and ISO to enable our customers to solve their use cases. We also released new white papers and guidance documents related to Object Storage, the Australian Prudential Regulation Authority (APRA), and the Central Bank of Brazil. These resources help regulated customers better understand how OCI supports their regional and industry-specific compliance requirements. Not only are we expanding our number of compliance offerings and regulatory alignments, we continue to add regions and services at a faster clip.

The JSON for the first example is:

API Request format:

```
{
  "text": "Red Bull Racing Honda, the four-time Formula-1 World Champion team, has chosen Oracle Cloud Infrastructure (OCI) as their infrastructure partner."
}
```

Response JSON:

```
{
  "entities": [
    {
      "text": "Red Bull Racing Honda",
      "type": "ORG",
      "score": 0.9615446925163269,
      "offset": 0,
      "length": 21,
      "isPii": true
    },
    {
      "text": "Formula-1 World",
      "type": "EVENT",
      "score": 0.6783602237701416,
      "offset": 37,
      "length": 15,
      "isPii": false
    },
    {
      "text": "Oracle Cloud Infrastructure (OCI",
      "type": "ORG",
      "score": 0.945735681942749,
      "offset": 60,
      "length": 28,
      "isPii": true
    }
  ]
}
```
Limitations

- The text is broken into sentences and there is no minimum number of words. The entities might not get separated or combined as you expect.
- The tool is context-based so your text must contain contextual information for the entities to be extracted as you expect.
- Malformed text (structure and semantics) might reduce the performance.
- Age isn’t a separate entity so age-related periods might be identified as a date entity.
- Hierarchical or nested entities aren’t supported.

About Key Phrase Extraction

Keyword extraction is the automated process of extracting the words with the most relevance, and expressions from the input text. It helps summarize the content, and recognizes the main topics.

The key phrase extraction tool uses NLP and ML to find insights related to the main points of the text. It understands the unstructured input text, and returns key words and key phrases (KPs).

The KPs consists of subjects and objects that are being talked about in the document. Any modifiers, like adjectives associated with these subjects and objects, are also included in the output. Confidence scores for each key phrase that signify how confident we are about the KP are included. Confidence scores are a value from 0 to 1.

Use Cases

Some business use cases are:

- Brand monitoring
- Monitoring market research
- Competitive market analysis
- Customer support tickets
- Employee feedback analysis
- Customer reviews
- Email analysis
Supported Features

- Key phrases
- Confidence Scores
- English Language
- Single Requests

Response JSON:

```
{
}
```
Limitations

- Key phrases that are noun phrases with adjective modifiers are identified so words that don't follow this criteria could be ignored.
- This tool is case insensitive.
- Text that contains multiple punctuation between words might be flagged as a key phrase.
- URLs that are well formed (begin with http, https, or www) are identified.
- Numbers and numeric words aren't identified as key phrases.

About Language Detection

The Language service language detection tool identifies which natural language the input text is in.

For example, language detection can help make customer support interactions more personable and quicker. Customer service chatbots can interact with customers based on the language of their input text and respond accordingly. If a customer needs help with a product, the chatbot server can field the corresponding language product manual, or transfer to the call center for the specific language.

Supported Languages

      "code": "en",
      "score": 0.9918076646218955
    }
  ]
}
```

Limitations

- A mix of languages isn't supported. Use only one language.
- Utterances or shorter sentences of fewer than 10 words can have unpredictable results.

About Text Classification

Text classification analyses the text and identifies categories for the content with confidence score.

Text classification uses natural language processing (NLP) service that uses deep learning technique to find insights from textual data. It returns a category from a set of the predefined categories. This text classification uses NLP and relies on main objective lies on zero-shot learning. It classifies text with no or minimal data to train. The content of a collection of documents is analyzed to determine common themes.

For example, you could analyze a collection of financial documents to Credit and Lending, Insurance, Investing, Banking, and so on. The results are given in categories and subcategories format.

Supported Features

- Text Category
- Confidence Scores
- English Language
- Single Requests

Examples

<table>
<thead>
<tr>
<th>Input Text</th>
<th>Categories and Scores</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red Bull Racing Honda, the four-time Formula-1 World Champion team, has chosen Oracle Cloud Infrastructure (OCI) as their infrastructure partner.</td>
<td>sports and games/motor sports (0.9998)</td>
</tr>
</tbody>
</table>

The JSON for the first example is:

API Request format:

```json
{
}
```
Red Bull Racing Honda, the four-time Formula-1 World Champion team, has chosen Oracle Cloud Infrastructure (OCI) as their infrastructure partner.

Response JSON:

```json
{
    "textClassification": [
        {
            "label": "sports and games/motor sports",
            "score": 0.9998961687088013
        }
    ]
}
```

Limitations

- A minimum 10 words are required to identify the correct text category.
- If your text is about more than one category, the major category of the text is identified and could differ from human interpretation of the text.

Analyzing Text with the Console

You can use one or more of these text analysis tools to analyze your text with the Language service:

- Aspect-Based Sentiment Analysis
- Named Entity Recognition
- Key Phrase Extraction
- Language Detection
- Text Classification

Use the Console to analyze your text:

1. Open the navigation menu and click Analytics & AI. Under Artificial Intelligence, click Language.
2. Paste, or enter, your text into the dialog box.
3. Select the text analysis tools that you want to use.
4. Click Analyze.

You can reset the page by clicking Reset.

Viewing the Results

After you analyze your text, the Language service displays the results by category for the selected tools as follows:

**Sentiment Analysis**

Renders the results in horizontal bar graphs as a percentage.

**Named Entity Recognition**

Identifies the named entities that were found and their categories are indicated in square brackets.

**Key Phrase Extraction**

Lists the key phrases in a double-quotes delimited list.

**Language Detection**

Lists, by confidence percentage, the languages detected.
Text Classification

Lists the word, identified document category, and the confidence score.

You can click Show JSON to view these results in JSON format. You can copy the JSON text or download it. Click Return to Standard Results to leave the JSON view.

Analyzing with the API or CLI

You can use the Language API or CLI to analyze input text.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

- DetectDominantLanguage
- DetectLanguageEntities
- DetectLanguageKeyPhrases
- DetectLanguageSentiments
- DetectLanguageTextClassification

Using the Command Line Interface (CLI)

For information about using the CLI, see Command Line Interface (CLI). For a complete list of flags and options available for CLI commands, see the Command Line Reference.

Run the following commands:

```
oci ai language detect-language --text, -? | -h | --help
oci ai language detect-entities --text, -? | -h | --help, --is-pii, --model-version
oci ai language detect-key-phrases --text, -? | -h | --help
oci ai language detect-sentiments --text, -? | -h | --help
oci ai language detect-text-classification --text, -? | -h | --help
```

Frequently Asked Questions

Review often asked questions, with the answers, about the Language service.

General

How do I get started with the Language service?

Use the Language Overview on page 3728 then analyze your text with the Console or API.

How many languages can the service detect?

The language detection tool supports 101 languages.

The Language Detection model tool supports numerous languages while the other model tools support English only.

Can I request support for other languages?

Language detection supports numerous languages. If any you want support for a particular language support, contact us.
Is it possible to use the Language service in Government regions?
No, it is available only in commercial regions.

What does confidence score signify in aspect-based sentiment analysis?
The confidence score magnitude doesn't reflect the intensity of the sentiment. The score is based on the confidence of the model for a particular sentiment, positive, negative, and neutral.

Does Language spell check or grammar check?
No.

Can aspect-based sentiment analysis identify sarcasm?
No.

Why does key phrase extraction return some words, but not others?
Key phrase extraction considers nouns as candidates for output. Adjectives appearing prior to a noun are also considered as part of the key phrase. Once candidates are initialized, we measure the importance of each candidate with statistical measures and remove non-essential candidates.

Why does language detection return multiple languages for some text, but not others?
There are some cases where there is more than one dominant language in the input text, which causes the prediction to result in multiple languages with a confidence score for each.

Is the Language service GDPR compliant?
We don't have visibility into customer data and don't store any customer data in our service. The customer team is responsible for any customer data privacy guidelines.

How many entities does Named Entity Recognition (NER) support?
The service supports 18 entities.

How can contact Oracle for assistance, provide feedback, or report issues with Language service?
You can email us at oci_ai_language_preview_in grp@oracle.com, or contact us at Cloud Customer Connect. We monitor both regularly.

Data

Does Oracle look at or use the text that I input to the service?
No, Oracle does not use any of your content for any purpose except to provide you with the results in the service.

Does Oracle use my data for improving the service?
No, Oracle does not use the content you input to train and improve any AI services.

Is the text I send to the Language API, the results, or other information about the request itself be stored on Oracle servers?
When you send text to the Language API, it is processed in memory and no customer data is stored. Oracle temporarily logs some metadata about your API requests (like the time and size of the request) to improve the service for billing and metering, and to combat abuse.
API

What is the maximum size and number of requests I can make to the API?
Requests have a 1,000 characters limit and five concurrent requests per tenant. Exceeding these limits results in a 400 API request error.

My use case requires extra size or number of requests than the limit, what can I do?
We need to understand your use case to help you so contact us.

Is it possible to make a high volume call to Language API?
Yes, we need to understand your use case to help you so contact us.

What latencies can I expect from the Language service?
Latency is the amount of time it takes from when a request is made to the time it takes for the response to be returned. The Language service has a maximum latency of 500 milliseconds for every Language API request.

Is it possible to run the Language API in a batch processing mode for a large number of documents?
No, it isn't.

Is it possible to extract additional entities with NER API calls?
No, it isn't.
Chapter 30

Load Balancing

This chapter explains how to set up a load balancer.

Load Balancing

Use Load Balancing to provide automated traffic distribution from one entry point to multiple servers reachable from your virtual cloud network (VCN).

Overview of Load Balancing

The Oracle Cloud Infrastructure Load Balancing service provides automated traffic distribution from one entry point to multiple servers reachable from your virtual cloud network (VCN). The service offers a load balancer with your choice of a public or private IP address, and provisioned bandwidth.

A load balancer improves resource utilization, facilitates scaling, and helps ensure high availability. You can configure multiple load balancing policies and application-specific health checks to ensure that the load balancer directs traffic only to healthy instances. The load balancer can reduce your maintenance window by draining traffic from an unhealthy application server before you remove it from service for maintenance.
Load Balancing

Load Balancer Types
Learn about the types of load balancers you can create within your VCN.

The Load Balancing service enables you to create a public or private load balancer within your VCN. A public load balancer has a public IP address that is accessible from the internet. A private load balancer has an IP address from the hosting subnet, which is visible only within your VCN. You can configure multiple listeners for an IP address to load balance transport Layer 4 and Layer 7 (TCP and HTTP) traffic. Both public and private load balancers can route data traffic to any backend server that is reachable from the VCN.

The Load Balancing service does not support multiple listeners on same IP and port combination. You can use a single listener for multiple hostnames when combined with a Route Policy.

Public Load Balancers
To accept traffic from the internet, you create a public load balancer. The service assigns it a public IP address that serves as the entry point for incoming traffic. You can associate the public IP address with a friendly DNS name through any DNS vendor.

A public load balancer is regional in scope. If your region includes multiple availability domains, a public load balancer requires either a regional subnet (recommended) or two availability domain-specific (AD-specific) subnets, each in a separate availability domain. With a regional subnet, the Load Balancing service creates a primary load balancer and a standby load balancer, each in a different availability domain, to ensure accessibility even during an availability domain outage. If you create a load balancer in two AD-specific subnets, one subnet hosts the primary load balancer and the other hosts a standby load balancer. If the primary load balancer fails, the public IP address switches to the secondary load balancer. The service treats the two load balancers as equivalent and you cannot specify which one is "primary."

Whether you use regional or AD-specific subnets, each load balancer requires one private IP address from its host subnet. The Load Balancing service supplies a floating public IP address to the primary load balancer. The floating public IP address does not come from your backend subnets.

If your region includes only one availability domain, the service requires just one subnet, either regional or AD-specific, to host both the primary and standby load balancers. The primary and standby load balancers each requires a private IP address from the host subnet, in addition to the assigned floating public IP address. If an availability domain outage occurs, the load balancer has no failover.

Note:
You cannot specify a private subnet for your public load balancer.

Private Load Balancers
To isolate your load balancer from the internet and simplify your security posture, you can create a private load balancer. The Load Balancing service assigns it a private IP address that serves as the entry point for incoming traffic.

When you create a private load balancer, the service requires only one subnet to host both the primary and standby load balancers. The load balancer can be regional or AD-specific, depending on the scope of the host subnet. The load balancer is accessible only from within the VCN that contains the host subnet, or as further restricted by your security rules.

The assigned floating private IP address is local to the host subnet. The primary and standby load balancers each requires an extra private IP address from the host subnet.

If an availability domain outage occurs, a private load balancer created in a regional subnet within a multi-AD region provides failover capability. A private load balancer created in an AD-specific subnet, or in a regional subnet within a single availability domain region, has no failover capability in response to an availability domain outage.
All Load Balancers

Your load balancer has a backend set to route incoming traffic to your compute instances. The backend set is a logical entity that includes:

- A list of backend servers.
- A load balancing policy.
- A health check policy.
- Optional SSL handling.
- Optional session persistence configuration.

The backend servers (compute instances) associated with a backend set can exist anywhere, as long as the associated network security groups (NSGs), security lists, and route tables allow the intended traffic flow.

If your VCN uses network security groups (NSGs), you can associate your load balancer with an NSG. An NSG has a set of security rules that controls allowed types of inbound and outbound traffic. The rules apply only to the resources in the group. Contrast NSGs with a security list, where the rules apply to all the resources in any subnet that uses the list. For more information about NSGs, see Network Security Groups on page 4292.

If you prefer to use security lists for your VCN, the Load Balancing service can suggest appropriate security list rules. You also can configure them yourself through the Networking service. See Security Lists on page 4301 for more information.

See Security Rules on page 4284 for detailed information comparing NSGs and security lists.

Oracle recommends that you create your load balancer in a regional subnet.

Oracle recommends that you distribute your backend servers across all availability domains within the region.

To create a minimal system with a functioning load balancer, you must:

- For a public load balancer, create a VCN with an internet gateway and a public regional subnet.

  ![Note:](Note)

  You cannot specify a private subnet for your public load balancer.

  - For a private load balancer, create a VCN with at least one private subnet.
  - Create at least two compute instances, each in a separate availability domain.
  - Create a load balancer.
  - Create a backend set with a health check policy.
  - Add backend servers (compute instances) to the backend set.
  - Create a listener, with optional SSL handling.
  - Update the load balancer subnet security rules so they allow the intended traffic.

Private IP Address Consumption

A public load balancer created in one public subnet consumes two private IP addresses from the host subnet.

A public load balancer created in two public subnets consumes two private IP addresses, one from each host subnet.

A private load balancer created in a single subnet consumes three private IP addresses from the host subnet.
The following diagram provides a high-level view of a simple public load balancing system configuration. Far more sophisticated and complex configurations are common.
Load Balancing Concepts
Learn about Load Balancer concepts to better understand and use the feature.
The following concepts are essential to working with Load Balancing.

**BACKEND SERVER**
An application server responsible for generating content in reply to the incoming TCP or HTTP traffic. You typically identify application servers with a unique combination of overlay (private) IPv4 address and port, for example, 10.10.10.1:8080 and 10.10.10.2:8080.
See Backend Server Management on page 3801 for more information.

**BACKEND SET**
A logical entity defined by a list of backend servers, a load balancing policy, and a health check policy. SSL configuration is optional. The backend set determines how the load balancer directs traffic to the collection of backend servers.
See Backend Set Management on page 3786 for more information.

**CERTIFICATES**
If you use HTTPS or SSL for your listener, you must associate an SSL server certificate (X.509) with your load balancer. A certificate enables the load balancer to terminate the connection and decrypt incoming requests before passing them to the backend servers.
See SSL Certificate Management on page 3867 for more information.

**health check**
A health check is a test to confirm the availability of backend servers. A health check can be a request or a connection attempt. Based on a time interval you specify, the load balancer applies the health check policy to continuously monitor backend servers. If a server fails the health check, the load balancer takes the server temporarily out of rotation. If the server subsequently passes the health check, the load balancer returns it to the rotation.
You configure your health check policy when you create a backend set. You can configure TCP-level or HTTP-level health checks for your backend servers.

- TCP-level health checks attempt to make a TCP connection with the backend servers and validate the response based on the connection status.
- HTTP-level health checks send requests to the backend servers at a specific URI and validate the response based on the status code or entity data (body) returned.

The service provides application-specific health check capabilities to help you increase availability and reduce your application maintenance window.
See Health Check Management on page 3795 for more information.

**HEALTH STATUS**
An indicator that reports the general health of your load balancers and their components.
See Health Check Management on page 3795 for more information.

**HOSTNAME**
A virtual server name applied to a listener to enhance request routing.
See Hostname Management on page 3842 for more information.
LISTENER
A logical entity that checks for incoming traffic on the load balancer's IP address. You configure a listener's protocol and port number, and the optional SSL settings. To handle TCP, HTTP, and HTTPS traffic, you must configure multiple listeners.
Supported protocols include:

- TCP
- HTTP/1.0
- HTTP/1.1

See Listener Management on page 3809 for more information.

LOAD BALANCING POLICY
A load balancing policy tells the load balancer how to distribute incoming traffic to the backend servers. Common load balancer policies include:

- Round robin
- Least connections
- IP hash

See Load Balancing Policies on page 3756 for more information.

PATH ROUTE SET
A set of path route rules to route traffic to the correct backend set without using multiple listeners or load balancers.
See Request Routing Management on page 3828 for more information.

REGIONS AND availability domains
The Load Balancing service manages application traffic across availability domains within a region. A region is a localized geographic area, and an availability domain is one or more data centers located within a region. A region is composed of several availability domains.
See Regions and Availability Domains on page 206 for more information.

SESSION PERSISTENCE
A method to direct all requests originating from a single logical client to a single backend web server.
See Session Persistence on page 3759 for more information.

shape
A template that determines the load balancer's total pre-provisioned maximum capacity (bandwidth) for ingress plus egress traffic. Available shapes include 10 Mbps, 100 Mbps, 400 Mbps, and 8000 Mbps.
The 10 Mbps shape is Always Free eligible. For more information about Always Free resources, including other capabilities and limitations, see Oracle Cloud Infrastructure Free Tier on page 164.

Note:
Pre-provisioned maximum capacity applies to aggregated connections, not to a single client attempting to use the full bandwidth.

SSL
Secure Sockets Layer (SSL) is a security technology for establishing an encrypted link between a client and a server. You can apply the following SSL configurations to your load balancer:

SSL TERMINATION
The load balancer handles incoming SSL traffic and passes the unencrypted request to a backend server.
Load Balancing

**POINT-TO-POINT SSL**

The load balancer terminates the SSL connection with an incoming traffic client, and then initiates an SSL connection to a backend server.

**SSL TUNNELING**

If you configure the load balancer's listener for TCP traffic, the load balancer tunnels incoming SSL connections to your application servers.

Load Balancing supports the TLS 1.2 protocol with a default setting of strong cipher strength. The default supported ciphers include:

- ECDHE-RSA-AES256-GCM-SHA384
- ECDHE-RSA-AES256-SHA384
- ECDHE-RSA-AES128-GCM-SHA256
- ECDHE-RSA-AES128-SHA256
- DHE-RSA-AES256-GCM-SHA384
- DHE-RSA-AES256-SHA256
- DHE-RSA-AES128-GCM-SHA256
- DHE-RSA-AES128-SHA256

See [SSL Certificate Management](#) on page 3867 for more information.

**subnet**

A subdivision you define in a virtual cloud network (VCN), such as 10.0.0.0/24 and 10.0.1.0/24. A subnet can span a region or exist within a single availability domain. A subnet consists of a contiguous range of IP addresses that do not overlap with other subnets in the VCN. For each subnet, you specify the routing and security rules that apply to it.

See [VCNs and Subnets](#) on page 4267 and [Public IP Address Ranges](#) on page 4185 for more information on subnets.

**TAGS**

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the wanted tags. For general information about applying tags, see [Resource Tags](#) on page 239.

**VIRTUAL CLOUD NETWORK (VCN)**

A private network that you set up in the Oracle data centers, with firewall rules and specific types of communication gateways that you can choose to use. A VCN covers a single, contiguous IPv4 CIDR block of your choice in the allowed IP address ranges.

You need at least one virtual cloud network before you launch a load balancer.

For information about setting up virtual cloud networks, see [Networking Overview](#) on page 4178.

**VISIBILITY**

Specifies whether your load balancer is public or private.

**PUBLIC**

A public load balancer has a public IP address that clients can access from the internet.

**PRIVATE**

A private load balancer has a private IP address from a VCN local subnet. Clients can access the private load balancer using methods and technology that can provide access to a private IP, such as:

- Cross-VCN (through LPG peering)
- From another region (through RPC)
- From on-prem (through FC private peering)
For more information, see Load Balancer Management on page 3763.

**WORK REQUEST**

An object that reports on the current state of a Load Balancing request.
The Load Balancing service handles requests asynchronously. Each request returns a work request ID (OCID) as the response. You can view the work request item to see the status of the request.
For more information, see Work Request Management on page 3877.

**Resource Identifiers**
Learn about how Load Balancer resources use resource identifiers.

Most types of Oracle Cloud Infrastructure resources have a unique, Oracle-assigned identifier called an Oracle Cloud ID (OCID). For information about the OCID format and other ways to identify your resources, see Resource Identifiers.

**Ways to Access Oracle Cloud Infrastructure**
Learn the different ways you can access Oracle Cloud Infrastructure.

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface on page 6094.

To access the Console, you must use a supported browser.

Oracle Cloud Infrastructure supports the following browsers and versions:

- Google Chrome 69 or later
- Safari 12.1 or later
- Firefox 62 or later

For general information about using the API, see REST APIs on page 6275.

**Monitoring Resources**
Learn how to monitor the health, capacity, and performance of your Oracle Cloud Infrastructure resources by using metrics, alarms, and notifications.

You can monitor the health, capacity, and performance of your Oracle Cloud Infrastructure resources by using metrics, alarms, and notifications. For more information, see Monitoring on page 4024 and Notifications on page 4838.

For information about monitoring the traffic passing through your load balancer, see Load Balancing Metrics on page 3886.

**Authentication and Authorization**
Learn how the Load Balancing service uses authentication and authorization to manage access to its features and functionality.

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference on page 3298.

If you’re a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.
Limits on Load Balancing Resources
Learn about the limits on Load Balancer resources.

See Service Limits on page 243 for a list of applicable limits and instructions for requesting a limit increase.

Other limits include:

- You cannot convert an AD-specific load balancer to a regional load balancer or the reverse.
- The Load Balancing service supports IPv6 addresses for load balancers in the US Government Cloud only. IPv6 support is only for the load balancer itself, and not the backend.
- The maximum number of concurrent connections is limited when you use stateful security rules for your load balancer subnets. In contrast, no theoretical limit on concurrent connections exists if you use stateless security rules. The practical limitations depend on various factors. The larger your load balancer shape, the greater the connection capacity. Other considerations include system memory, TCP timeout periods, TCP connection state, and so forth.

Tip:
To accommodate high-volume traffic, Oracle strongly recommends that you use stateless security rules for your load balancer subnets.

- Each load balancer has the following configuration limits:
  - One IP address
  - 16 backend sets
  - 512 backend servers per backend set
  - 512 backend servers total
  - 16 listeners

Required IAM Policies
Learn about Identify and Access Management policies and how they apply to the Load Balancing service.

To use Oracle Cloud Infrastructure, you must be granted security access in a policy by an administrator. This access is required whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you get a message that you don’t have permission or are unauthorized, verify with your administrator what type of access you have and which compartment to work in.

For administrators: For a typical policy that gives access to load balancers and their components, see Let network admins manage load balancers.

Also, be aware that a policy statement with inspect load-balancers gives the specified group the ability to see all information about the load balancers. For more information, see Details for Load Balancing.

If you're new to policies, see Getting Started with Policies and Common Policies.

Load Balancing Policies
Learn how you can apply Load Balancer resource policies to control traffic distribution to your backend servers.

After you create a load balancer, you can apply policies to control traffic distribution to your backend servers. The Load Balancing service supports three primary policy types:

- Round Robin
- Least Connections
- IP Hash

When processing load or capacity varies among backend servers, you can refine each of these policy types with backend server weighting. Weighting affects the proportion of requests directed to each server. For example, a server weighted '3' receives three times the number of connections as a server weighted '1.' You assign weights based on criteria of your choosing, such as each server's traffic-handling capacity. Weight values must be from 1 to 100.
Load balancer policy decisions apply differently to TCP load balancers, cookie-based session persistent HTTP requests (sticky requests), and non-sticky HTTP requests.

- A TCP load balancer considers policy and weight criteria to direct an initial incoming request to a backend server. All subsequent packets on this connection go to the same endpoint.
- An HTTP load balancer configured to handle cookie-based session persistence forwards requests to the backend server specified by the cookie's session information.
- For non-sticky HTTP requests, the load balancer applies policy and weight criteria to every incoming request and determines an appropriate backend server. Multiple requests from the same client could be directed to different servers.

**Note:**

If you want to create a load balancer with a reserve IP, add this policy:

```
Allow group group_name to manage floating-ips in tenancy
```

See Managing Policies for general information on policies.

**Round Robin**

Round Robin is the default load balancer policy. This policy distributes incoming traffic sequentially to each server in a backend set list. After each server has received a connection, the load balancer repeats the list in the same order.

Round Robin is a simple load balancing algorithm. It works best when all the backend servers have similar capacity and the processing load required by each request does not vary significantly.

**Least Connections**

The Least Connections policy routes incoming non-sticky request traffic to the backend server with the fewest active connections. This policy helps you maintain an equal distribution of active connections with backend servers. As with the round robin policy, you can assign a weight to each backend server and further control traffic distribution.

**Note:**

In TCP use cases, a connection can be active but have no current traffic. Such connections do not serve as a good load metric.

**IP Hash**

The IP Hash policy uses an incoming request's source IP address as a hashing key to route non-sticky traffic to the same backend server. The load balancer routes requests from the same client to the same backend server as long as that server is available. This policy honors server weight settings when establishing the initial connection.

IP Hash ensures that requests from a particular client are always directed to the same backend server, as long as the backend server is available.

You cannot add a backend server marked as Backup to a backend set that uses the IP Hash policy.

**Important:**

Multiple clients that connect to the load balancer through a proxy or NAT router appear to have the same IP address. If you apply the IP Hash policy to your backend set, the load balancer routes traffic based on the incoming IP address and sends these proxied client requests to the same backend server. If the proxied client pool is large, the requests could flood a backend server.
HTTP "X" Headers and Host Header
Learn about using HTTP "X" headers in a Load Balancer resource.

HTTP requests and responses often include header fields that provide contextual information about the message. RFC 2616 defines a standard set of HTTP header fields. Some non-standard header fields, which begin with X-, are common. The Load Balancing service adds or modifies the Host header and the following X- headers when it passes requests to your servers. Because these headers are automatically added, they cannot be removed or modified using a rule set.

X-Forwarded-For
Provides a list of connection IP addresses.

The load balancer appends the last remote peer address to the X-Forwarded-For field from the incoming request. A comma and space precede the appended address. If the client request header does not include an X-Forwarded-For field, this value is equal to the X-Real-IP value. The original requesting client is the first (left-most) IP address in the list, assuming that the incoming field content is trustworthy. The last address is the last (most recent) peer, that is, the machine from which the load balancer received the request. The format is:

```
X-Forwarded-For: original_client, proxy1, proxy2
```

Example incoming field:
```
X-Forwarded-For: 202.1.112.187
```

Example field with appended proxy IP address:
```
X-Forwarded-For: 202.1.112.187, 192.168.0.10
```

X-Forwarded-Host
Identifies the original host and port requested by the client in the Host HTTP request header. This header helps you determine the original host, since the hostname or port of the reverse proxy (load balancer) might differ from the original server handling the request.

```
X-Forwarded-Host: www.oracle.com:8080
```

X-Forwarded-Port
Identifies the listener port number that the client used to connect to the load balancer. For example:

```
X-Forwarded-Port: 443
```

X-Forwarded-Proto
Identifies the protocol that the client used to connect to the load balancer, either http or https. For example:

```
X-Forwarded-Proto: https
```

X-Real-IP
Identifies the client's IP address. For the Load Balancing service, the "client" is the last remote peer.

Your load balancer intercepts traffic between the client and your server. Your server's access logs, therefore, include only the load balancer's IP address. The X-Real-IP header provides the client's IP address. For example:

```
X-Real-IP: 192.168.0.10
```
Host

Identifies the original host and optionally the port requested by the client in the Host HTTP request header. For example:

```
Host: www.oracle.com
```

Session Persistence

Learn about using session persistence with a Load Balancer resource to direct all requests originating from a single logical client to a single backend web server.

Session persistence is a method to direct all requests originating from a single logical client to a single backend web server. Backend servers that use caching to improve performance, or to enable log-in sessions or shopping carts, can benefit from session persistence.

You enable session persistence when you create a load balancer or when you create a backend set. You can also edit an existing backend set to enable, disable, or change the session persistence configuration.

Sticky Cookies

Learn about how to use the sticky cookies feature in a Load Balancer resource to manage session persistence.

The Load Balancing service offers two mutually exclusive cookie-based configurations for enabling session persistence:

- Application cookie stickiness
- Load balancer cookie stickiness

**Note:**

IP Address-driven Session Persistence

Some products offer session persistence support without cookies. These products depend on the IP address of the incoming request. ISP proxies and company exit gateways can issue many requests from a single IP address. In this case, a single backend server can be subject to high traffic volumes. Your backend fleet can become overwhelmed, one server at a time, even though effective load balancing is possible.

Another weakness of IP address-driven session persistence is that the originating IP address can change. In this case, session persistence can be lost or the request redirected to the wrong backend server.

Application Cookie Stickiness

To configure application cookie session persistence, you specify a cookie name and decide whether to disable fallback for unavailable servers.

The Load Balancing service activates application cookie session persistence (stickiness) when a backend server sends a `Set-Cookie` response header containing a recognized cookie name. The cookie name must match the name specified in the backend set configuration. If the configuration specifies a match-all pattern, `*`, any cookie set by the server activates session persistence. Unless a backend server activates session persistence, the service follows the load balancing policy specified when you created the load balancer.

Requirements:

- Your load balancer must operate in HTTP mode to support server side, cookie-driven session persistence.
- The client computer must accept cookies for Load Balancing session persistence feature to work.
Load Balancing

How It Works

The Load Balancing service calculates a hash of the configured cookie and other request parameters, and sends that value to the client in a cookie. The value stored in the cookie enables the service to route subsequent client requests to the correct backend server. If your backend servers change any of the defined cookies, the service recomputes the cookie's value and resends it to the client.

**Note:**
Oracle recommends that you treat cookie data as an opaque entity. Do not use it in your applications.

The backend server can stop application cookie persistence by deleting the session persistence cookie. If you used the match-all pattern, it must delete all cookies. You can delete cookies by sending a `Set-Cookie` response header with a past expiration date. The Load Balancing service routes subsequent requests using the configured load balancing policy.

Load Balancer Cookie Stickiness

When you configure load balancer cookie stickiness, the load balancer inserts a cookie into the response. The parameters configured within the cookie enable session stickiness. This method is useful when you have applications and web backend services that cannot generate their own cookies.

To configure load balancer cookie session persistence, you specify:

- *The cookie name.*
  
  If you do not specify a cookie name, the default name is `X-Oracle-BMC-LBS-Route`.

  **Note:**
  Ensure that the cookie name used at the backend application servers is different from the cookie name used at the load balancer. To minimize the chance of name collision, Oracle recommends that you use a prefix such as `X-Oracle-OCI-`.

  If both a backend server and the load balancer insert cookies with the same name, the client or browser behavior can vary depending on the domain value associated with the cookie. If the name and domain values of the `Set-cookie` header (generated by a backend server) and the `Set-cookie` header (generated by the load balancer) are the same, the client or browser treats them as one cookie. The client returns only one of the cookie values in subsequent requests. If both `Set-cookie` names are the same, but the domain names are different, the client or browser treats them as two different cookies.

- *The domain in which the cookie is valid.* The `Set-cookie` header inserted by the load balancer contains a domain attribute with the specified value.

  This attribute has no default value. If you do not specify a value, the load balancer does not insert the domain attribute into the `Set-cookie` header.

  **Note:**
  
  RFC 6265 - HTTP State Management Mechanism describes client and browser behavior when the domain attribute is present or not present in the `Set-cookie` header.

  If the value of the Domain attribute is `example.com` in the `Set-cookie` header, the client includes the same cookie in the `Cookie` header when making HTTP requests to `example.com`, `www.example.com`, and `www.abc.example.com`. If the
Domain attribute is not present, the client returns the cookie only for the domain to which the original request was made.

- Ensure that this attribute specifies the correct domain value. If the Domain attribute in the Set-cookie header does not include the domain to which the original request was made, the client or browser might reject the cookie. As specified in RFC 6265, the client accepts a cookie with the Domain attribute value example.com or www.example.com sent from www.example.com. It does not accept a cookie with the Domain attribute abc.example.com or www.abc.example.com sent from www.example.com.

- The URI path in which the cookie is valid. The Set-cookie header inserted by the load balancer contains a Path attribute with the specified value.

  Clients include the cookie in an HTTP request only if the path portion of the request-uri matches, or is a subdirectory of, the cookie's Path attribute.

  The default value is `/`.

- The amount of time the cookie remains valid. The Set-cookie header inserted by the load balancer contains a Max-Age attribute with the specified value.

  The specified value must be at least one second. No default value for this attribute exists. If you do not specify a value, the load balancer does not include the Max-Age attribute in the Set-cookie header. Usually, the client or browser retains the cookie until the current session ends, as defined by the client.

- Whether the Set-cookie header should contain the Secure attribute. The Secure attribute directs the client or browser to send the cookie only using a secure protocol.

  Note:

  If you set this field to true, you cannot associate the corresponding backend set with an HTTP listener.

- Whether the Set-cookie header should contain the HttpOnly attribute. The HttpOnly attribute limits the scope of the cookie to HTTP requests. This attribute directs the client or browser to omit the cookie when providing access to cookies through non-HTTP APIs. For example, it restricts the cookie from JavaScript channels.

- Whether to disable fallback for unavailable servers.

  Note:

  Path route rules take precedence to determine the target backend server. The load balancer verifies that session stickiness is enabled for the backend server and that the cookie configuration is valid for the target. The system ignores invalid cookies.

Fallback

Learn about using the fallback feature in a Load Balancer resource.

By default, the Load Balancing service directs traffic from a persistent session client to a different backend server when the original server is unavailable. You can configure the backend set to disable this fallback behavior. When you disable fallback, the load balancer fails the request and returns an HTTP 502 code. The service continues to return an HTTP 502 until the client no longer presents a persistent session cookie.

Important:

If fallback is disabled, cookies with a distant future expiration date can cause a client outage.

The Load Balancing service considers a server marked drain available for existing persisted sessions. New requests that are not part of an existing persisted session are not sent to that server.
Connection Management

Learn how to configure the timeout settings for your LoadBalancer resource.

Oracle Cloud Infrastructure load balancers support connection multiplexing. The load balancer can route many incoming requests from multiple clients to the destination backend server through a few (one or multiple) backend connections.

After your load balancer connects a client to a backend server, the connection can be closed because of inactivity. Also, you can configure load balancer listeners to control the maximum idle time allowed during each TCP connection or HTTP request and response pair. Oracle recommends that you do not allow your backend servers to close connections to the load balancer.

The following timeout settings affect your load balancer's behavior:

- **Keep-alive setting between the load balancer and the client**
  
  The Load Balancing service sets the keep-alive value to maintain the connection for 10,000 transactions or until it has been idle for 65 seconds, whichever limit occurs first.

  
<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You cannot change the value of this setting.</td>
</tr>
</tbody>
</table>

- **Keep-alive setting between the load balancer and backend server**

  The load balancer closes backend server connections that are idle for more than 300 seconds. See Keep-Alive Settings on page 3762 for more information.

- **Idle timeout**

  You can set the duration of the idle timeout when you create a listener. This setting applies to the time allowed between two successive receive or two successive send network input/output operations during the HTTP request-response phase. See Idle Timeout Settings on page 3762 for more information.

Keep-Alive Settings

Learn how the Load Balancer resource sets the keep-alive value to maintain a connection with backend servers.

The Load Balancing service does not honor keep-alive settings from backend servers. The load balancer closes backend server connections that are idle for more than 300 seconds. Oracle recommends that you do not allow your backend servers to close connections to the load balancer. To prevent possible 502 errors, ensure that your backend servers do not close idle connections in less than 310 seconds.

The Load Balancing service sets the keep-alive value to maintain the connection for 10,000 transactions or until it has been idle for 65 seconds, whichever limit occurs first.

Idle Timeout Settings

Learn about how to configure idle timeout settings for a Load Balancer resource.

When you create a TCP or HTTP listener, you can specify the maximum idle time in seconds. This setting applies to the time allowed between two successive receive or two successive send network input/output operations during the HTTP request-response phase. If the configured timeout has elapsed with no packets sent or received, the client's connection is closed. For HTTP and WebSocket connections, a send operation does not reset the timer for receive operations and a receive operation does not reset the timer for send operations.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>This timeout setting does not apply to idle time between a completed response and a subsequent HTTP request.</td>
</tr>
</tbody>
</table>

The default timeout values are:

- 300 seconds for TCP listeners.
- 60 seconds for HTTP listeners.
Modify the timeout parameter if either the client or the backend server requires more time to transmit data. Some examples include:

- The client sends a database query to the backend server and the database takes over 300 seconds to run. Therefore, the backend server does not transmit any data within 300 seconds.
- The client uploads data using the HTTP protocol. During the upload, the backend does not transmit any data to the client for more than 60 seconds.
- The client downloads data using the HTTP protocol. After the initial request, it stops transmitting data to the backend server for more than 60 seconds.
- The client starts transmitting data after establishing a WebSocket connection, but the backend server does not transmit data for more than 60 seconds.
- The backend server starts transmitting data after establishing a WebSocket connection, but the client does not transmit data for more than 60 seconds.

The maximum timeout value is 7200 seconds. Contact My Oracle Support to file a service request if you want to increase this limit for your tenancy. See Service Limits on page 243 for more information.

Load Balancer Management

Learn how to create and manage Load Balancer resources to provide automated traffic distribution from one entry point to multiple servers reachable from your virtual cloud network (VCN).

For the purposes of access control, you must specify the compartment where you want the load balancer to reside. Consult an administrator in your organization if you're not sure which compartment to use. For information about compartments and access control, see Managing Compartments.

When you create a load balancer within your VCN, you get a public or private IP address, and provisioned total bandwidth. If you need another IP address, you can create another load balancer.

A public load balancer in a region with multiple availability domains requires one public regional subnet or two public AD-specific subnets to host the primary load balancer and a standby. In the latter case, each AD-specific subnet must reside in a separate availability domain. A public load balancer in a region with only one availability domain requires a single public subnet to host the primary load balancer and a standby. For more information on VCNs and subnets, see Networking Overview on page 4178. You can associate the public IPv4 address with a DNS name from any vendor. You can use the public IP address as a front end for incoming traffic. The load balancer can route data traffic to any backend server that is reachable from the VCN.

A private load balancer requires only one subnet to host the primary load balancer and a standby. The private IP address is local to the subnet. The load balancer is accessible only from within the VCN that contains the associated subnet, or as further restricted by your security list rules. The load balancer can route data traffic to any backend server that is reachable from the VCN.

The essential components for load balancing include:

- A load balancer with pre-provisioned bandwidth.
- A backend set with a health check policy. See Backend Set Management on page 3786 for more information.
- Backend servers for your backend set. See Backend Server Management on page 3801 for more information.
- One or more listeners. See Listener Management on page 3809 for more information.
- Load balancer subnet security rules to allow the intended traffic. To learn more about these rules, see Security Rules on page 4284.

Note:

To accommodate high-volume traffic, Oracle strongly recommends that you use stateless security rules for your load balancer subnets. See Stateful Versus Stateless Rules on page 4290 for more information.

Optionally, you can associate your listeners with SSL server certificate bundles to manage how your system handles SSL traffic. See SSL Certificate Management on page 3867 for more information.
For information about the number of load balancers you can have, see Service Limits on page 243.

**Prerequisites**

To implement a working load balancer, you need:

- For a public load balancer in a region with multiple availability domains, you need a VCN with a public regional subnet or at least two public AD-specific subnets. In the latter case, each AD-specific subnet must reside in a separate availability domain. For more information on subnets, See VCNs and Subnets on page 4267 and Public IP Address Ranges on page 4185.

  **Note:** You cannot specify a private subnet for your public load balancer.

- For a public load balancer in a region with only one availability domain, you need a VCN with at least one public subnet.

- For a private load balancer in any region, you need a VCN with at least one private subnet.

- Two or more backend servers (compute instances) running your applications. For more information about compute instances, see Creating an Instance on page 1094.

**Private IP Address Consumption**

A public load balancer created in one public regional subnet consumes two private IPv4 addresses from the host subnet. The primary and secondary load balancers reside within the same subnet. Each load balancer requires a private IPv4 address from that subnet. The Load Balancing service assigns a floating public IPv4 address, which does not come from the host subnet. If the load balancer is enabled for IPv6, it receives an IPv6 address from the host subnet.

A public load balancer created in two public AD-specific subnets consumes two private IP addresses, one from each host subnet. The primary and secondary load balancers reside within different subnets. Each load balancer requires one private IP address from its host subnet. The Load Balancing service assigns a floating public IPv4 address, which does not come from the host subnets. If the load balancer is enabled for IPv6, it is assigned an IPv6 address from the host subnet.

A private load balancer created in a single subnet consumes three private IP addresses from the host subnet. The primary and secondary load balancers reside within the same subnet. Each load balancer requires a private IP address from that subnet. The floating private IP address also comes from the host subnet. Internet communication with a load balancer enabled for IPv6 and created in a private subnet is prohibited. You can't create a globally routable IPv6-enabled load balancer in a private subnet.

**Configuration Changes and Service Disruption**

For a running load balancer, some configuration changes lead to service disruptions. The following guidelines help you understand the effect of changes to your load balancer.

- Operations that add, remove, or modify a backend server create no disruptions to the Load Balancing service.

- Operations that edit an existing health check policy create no disruptions to the Load Balancing service.

- Operations that trigger a load balancer reconfiguration can produce a brief service disruption with the possibility of some terminated connections.

**Creating Load Balancers**

Create a Load Balancer resource.

Use one of the following methods to create a load balancer.

**To create a load balancer using the Console**

Use the OCI Console to create a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Choose a **Compartment** you have permission to work in under **List Scope**.

   **Note:**
   If you select a different compartment in the **Management** tab (under **Advanced Options**), that compartment contains the load balancer you are creating instead of the compartment specified here.

3. Click **Create Load Balancer**.

   The **Select Load Balancer Type** appears.

4. Select **Load Balancer** and click **Create Load Balancer**.

   The **Create Load Balancer** dialog box appears. Creating a load balancer consists of the following sections:

   - **Add Details**
   - **Choose Backends**
   - **Configure Listener**
   - **Manage Logging**

   By default, the **Add Details** page appears first.

5. Run each of the following workflows in order. You can return to a previous page by clicking **Previous**.

   **Step 1 - Add Details**

   Specify the attributes of the load balancer.

   - **Load Balancer Name**: Required. Accept the default name or specify a friendly name for the load balancer. It does not have to be unique, but it cannot be changed in the Console. You can, however, change it with the API.
   - **Choose Visibility Type**: Specify whether your load balancer is public or private.
     - **Public**: Choose this option to create a public load balancer. You can use the assigned public IP address as a front end for incoming traffic and to balance that traffic across all backend servers.
     - **Private**: Choose this option to create a private load balancer. You can use the assigned private IP address as a front end for incoming internal VCN traffic and to balance that traffic across all backend servers.
   - **Choose IP Address Type**: Specify whether the public IP address is reserved or ephemeral.
     - **Ephemeral IP Address**: Choose this option to let Oracle specify an ephemeral IP address for you from the Oracle IP pool. This is the default.
     - **Reserved IP Address**: Choose this option to specify an existing reserved IP address by name, or to create a new reserved IP address by assigning a name and selecting a source IP pool for the address. If you don't select a user-created pool, the default Oracle IP pool is used.

   See [Public IP Addresses](#) for more information.

   - **Bandwidth**: The Bandwidth shape options are the following:

     - **Flexible Shapes**: Specify **Minimum Bandwidth** and **Maximum Bandwidth** values to create an upper and lower size range for the load balancer's bandwidth shape. Possible sizes range from 10 Mbps to 8,000 Mbps. You can use the slider to specify the value or enter it directly into the box to the left of each slider.

       The _minimum bandwidth_ reflects the amount of bandwidth that is always available to provide instant readiness for the workloads.

       The _maximum bandwidth_ is the upper amount of bandwidth the load balancer supports during time of peak workload.

       If you want to specify a fixed shape size, for example 500 Mbps, set the minimum and maximum sliders to the same value.

       If you are creating the load balancer as a paid account user, you can create various shape options based on your limits and later adjust the bandwidth by changing the shape after the load balancer has been created. You can view your service limits and quotas in the Console by navigating to **Governance > Limits**.
Quotas and Usage. Select "LbaaS" from the Service list. Your bandwidth size options are listed. See Service Limits on page 243 for more information.

Billing is per minute for your load balancer base instance, plus a bandwidth usage fee. If the actual usage is below or equal to your specified minimum bandwidth, you are billed for the minimum bandwidth. If actual usage exceeds the minimum bandwidth, you are billed for the actual bandwidth used for that minute.

The Always Free option is incorporated into your paid account in your home region. The first 10 Mbps of your bandwidth is free, and is indicated as such on your bill.

Note:

Government accounts using pre-paid dynamic (fixed) shape sizes run the risk of overage charges when flexible bandwidth shapes exceed the predetermined size. Update government accounts to the flexible load balancer SKU, with the appropriate bandwidth quantity, in their contract before using the flexible load balancer feature.

If you are using non-universal credit SKUs, ensure that your contract includes the shape you are updating to so you can prevent incurring overage charges.

• Always Free: If you are creating the load balancer as an Always Free user, you can only select the Always Free (10 Mbps) option. Switching away from Always Free prompts you to upgrade to a paid account.

Always Free shape options are not available to Government accounts.

Note:

If you are creating a load balancer in an Always Free tenancy, the Always Free feature is enabled by default, and only Always Free shape options are available. Upgrading is the only way an Always Free tenancy can select a bandwidth shape option other than the default Always Free size. For more information about Always Free resources, including other capabilities and limitations, see Oracle Cloud Infrastructure Free Tier on page 164.

You can adjust the bandwidth shape to a different size after you have completed creating the load balancer. See Changing the Load Balancer Bandwidth Shape on page 3780: for more information.

• Enable IPv6 Address Assignment Available only in the US Government Cloud. Specify whether the load balancer supports IPv6 addresses for incoming requests.

Note:

• When you create a load balancer, you can optionally choose to have an IPv4/IPv6 dual-stack configuration. When you choose the IPv6 option, the Load Balancing service assigns both an IPv4 and an IPv6 address to the load balancer. The load balancer receives client traffic sent to the assigned IPv6 address. The load balancer uses only IPv4 addresses to communicate with backend servers. The load balancer and the backend servers do not use IPv6 communication.

• IPv6 address assignment occurs only at load balancer creation. You cannot assign an IPv6 address to an existing load balancer.

• Only VCNs in the US Government Cloud currently support IPv6 addressing. For more information about Oracle Cloud
• **Choose Networking**

   If the current compartment contains at least one VCN, the Console provides a list of VCNs for you to choose from.

   • **Virtual Cloud Network in <compartment>:** Required. Specify a VCN for the load balancer.

      By default, the Console shows a list of VCNs in the compartment you’re currently working in. Click the Change Compartment link to select a VCN from a different compartment.

   • **Subnet in <compartment>:** Required. Select an available subnet. For a public load balancer, it must be a public subnet.

      By default, the Console shows a list of subnets in the compartment you’re currently working in. Click the Change Compartment link to select a subnet from a different compartment.

      **Note:**

      In addition to public or private, subnets can be either regional or AD-specific. Oracle recommends using regional subnets. For more information, see Overview of VCNs and Subnets on page 4268.

• **Subnet (2 of 2) in <compartment>:** Required for a public load balancer when you specify an AD-specific subnet for Subnet. Select a second public subnet. The second subnet must reside in a separate availability domain from the first subnet.

      **Note:**

      • If you chose to create a private load balancer under Visibility Type, the form prompts you to select only one subnet.
If you are working in a region that includes only one availability
domain, a second subnet is not required. The form prompts you to
select only one subnet.

If the current compartment contains no virtual cloud networks, the Load Balancing service offers to create a
VCN for you.

- **Virtual Cloud Network in <compartment>:** When the current compartment contains no virtual cloud
  networks, the list is disabled. The system offers to create a VCN for you.

  If you want to use an existing VCN in another compartment, click the **Change Compartment** link and
  choose that compartment from the list.

  **Virtual Cloud Network Name:** Optional, when the system creates a VCN for you. Specify a friendly
  name for the new cloud network. It doesn't have to be unique, and it cannot be changed later in the Console
  (but you can change it with the API). Avoid entering confidential information.

  If you do not specify a name for the new VCN, the system generates a name for you.

- **Use Network Security Groups to Control Traffic:** Check this box if you want to add your load balancer to
  a network security group (NSG). For more information about NSGs, see Network Security Groups on page
  4292.

- **Network Security Groups in <compartment>:** Choose an NSG to add your load balancer to.

  By default, the Console shows a list of NSGs in the compartment you're currently working in. Click the
  **Change Compartment** link to select an NSG from a different compartment.

  - (Optional) Click **+ Another Network Security Group** to add your load balancer to another NSG.

  **Tip:**

  You can change the NSGs that your load balancer belongs to after you
  create it. On the Load Balancer Details page, click the **Edit** link that
  appears beside the list of associated network security groups.

- **Show Advanced Options:** Click this link to display the following options:

  **Security:**

  - **Use a Web Application Firewall Policy to protect against layer 7 attacks:** Check to apply web
    application firewall (WAF) policies to the load balancer as a safeguard against attack. Select a WAF
    policy available in the current compartment from the list. Click **Change Compartment** to access the
    WAF policies in a different compartment.

    See Overview of Web Application Firewall on page 5778 for more information about WAF policies.

  **Management:**

  - **Create in Compartment:** Optionally, you can select a different compartment to host the load balancer.
    The compartment you select here overrides the compartment listed under **Scope** selected when first
    creating the load balancer.

  - **Tagging:** If you have permissions to create a resource, then you also have permissions to apply free-form
tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For
  more information about tagging, see Resource Tags on page 239. If you are not sure whether to apply tags,
skip this option (you can apply tags later) or ask your administrator.

  **Note:**

  The following describes the Dynamic Shapes feature, which is only
  available to certain legacy customer accounts:

  **Dynamic Shapes:** Choose one of the following predefined shape sizes.

  - 10 Mbps
  - 100 Mbps
  - 400 Mbps
Load Balancing

- **8,000 Mbps**

If you are creating the load balancer as a paid account user, you can create various shape options based on your limits and later adjust the bandwidth by changing the shape after the load balancer has been created. You can view your service limits and quotas in the Console by navigating to Governance > Limits, Quotas and Usage. Select "LbaaS" from the Service list. Your bandwidth size options are listed. See Service Limits on page 243 for more information. You can also select the Always Free option if your one free tier account has not already been used.

You can adjust the bandwidth shape to a different size after you have completed creating the load balancer. See Changing the Load Balancer Bandwidth Shape on page 3780 for more information.

If you adjust a dynamic size value to a flexible size using the sliders, you cannot revert to a dynamic shape of any size. You can achieve the effect of having a dynamic (fixed) size by setting the minimum and maximum sliders to the same size.

**Step 2 - Choose Backends**

A load balancer distributes traffic to backend servers within a backend set. A backend set is a logical entity defined by a load balancing policy, a list of backend servers (compute instances), and a health check policy.

The load balancer creation workflow creates one backend set for your load balancer. Optionally, you can add backend sets and backend servers after you create the load balancer.

- **Specify a Load Balancing Policy**: Required. Choose the load balancer policy for the backend set. The available options are:
  - **Weighted Round Robin**: This policy distributes incoming traffic sequentially to each server in a backend set list.
  - **IP Hash**: This policy ensures that requests from a particular client are always directed to the same backend server.
  - **Least Connections**: This policy routes incoming request traffic to the backend server with the fewest active connections.

For more information on these policies, see Load Balancing Policies on page 3756.

- **Select Backend Servers**: Optional. Add backend servers to the backend set. Click Add Backends to select resources from a list of available compute instances.

**Important:**

When you add backend servers, the Load Balancing service automatically creates security list rules for you. If you prefer to create security list rules manually, click Show Advanced Options and choose...
the option to **Manually configure security list rules after the load balancer is created.**

- **Add Backends:** Select (check) the instances you want to include in the load balancer's backend set. To select instances from a different compartment, use the **Change Compartment** link and choose a compartment from the list.

  After you select the instances you want to add from the current compartment, click **Add Selected Backends.**

  **Tip:**

  - You can choose instances from one compartment at a time. After you add instances from one compartment, you can choose **Add More Backends** to add instances from another compartment.
Load Balancing

- You cannot add a backend server marked as **Backup** to a backend set that uses the IP Hash policy.

After you add instances to the backend set, they appear in the **Select Backend Servers** table. You can:

- Specify the server **Port** to which the load balancer must direct traffic. The default is port 80.
- Click the **Actions** icon (ıc) for a server and choose **Delete** to remove it from the backend set.
- **Specify Health Check Policy**: Required. Specify the test parameters that confirm the health of your backend servers.
  - **Protocol**: Required. Specify the protocol to use for health check queries, either HTTP or TCP.
    
    **Important:**
    
    Configure your health check protocol to match your application or service. See [Health Check Management](https://docs.oracle.com/en/cloud/oracle-cloud-infrastructure/user-guide/compute-Cloud-Instances.html#GUID-3795) on page 3795 for more information.

- **Port**: Optional. Specify the backend server port against which to run the health check.
  
  **Tip:**
  
  You can enter the value '0' to have the health check use the backend server's traffic port.

- **Interval in ms**: Optional. Specify how frequently to run the health check, in milliseconds. The default is 10000 (10 seconds).
- **Timeout in ms**: Optional. Specify the maximum time in milliseconds to wait for a reply to a health check. A health check is successful only if a reply returns within this timeout period. The default is 3000 (3 seconds).
- **Number of retries**: Optional. Specify the number of retries to attempt before a backend server is considered "unhealthy." This number also applies when recovering a server to the "healthy" state. The default is 3.
- **Status Code**: (HTTP only) Optional. Specify the status code a healthy backend server must return.
- **URL Path (URI)**: (HTTP only) Required. Specify a URL endpoint against which to run the health check.
- **Response Body Regex**: (HTTP only) Optional. Provide a regular expression for parsing the response body from the backend server.
- **Use SSL**: Optional. Check to apply SSL to the load balancer backend. If you select this option, complete the following:

  **Important:**

  If optimal security is required, it is your responsibility to always use HTTPS for traffic between the load balancer and the backend set.

- **SSL Certificate**: Select one of these options:
  - **Choose SSL Certificate File**: Drag and drop the certificate file into the **SSL Certificate** field. Alternatively, click **Select Files** and navigate your system to where you can select the certificate file.
for upload. Certificate files must be in PEM format and must have the .pem, .cer, or .crt file extensions.

**Important:**

If you submit a self-signed certificate for backend SSL, you must submit the same certificate in the corresponding CA Certificate field.

- **Paste SSL Certificate:** Copy and paste a certificate directly into this field.
- **Specify CA Certificate:** Optional. (Recommended for backend SSL termination configurations.) Check this box if you want to provide a CA certificate. See SSL Certificate Management on page 3867 for more information.
- **Specify Private Key:** Optional. (Required for SSL termination.) Check this box if you want to provide a private key for the certificate.
- **Show Advanced Options:** Click this link to access more options. Select the tab for the corresponding functionality:
  - **Backend Set Name:** Specify a name for the backend set. It must be unique within the load balancer, and it cannot be changed. If you do not specify a name, the Load Balancing service creates one for you. Use only alphanumeric characters, dashes ("-"), and underscores ("_") for backend set names. Backend set names cannot contain spaces. Avoid entering confidential information.
  - **Security List:** Choose to manually configure subnet security list rules to allow the intended traffic or allow the system to create security list rules for you. To learn more about these rules, see Parts of a Security Rule on page 4288.
    - **Manually configure security list rules after the load balancer is created:** When you choose this option, you must configure security list rules after load balancer creation.
    - **Automatically add security list rules:** Default. When you choose this option, the Load Balancing service creates security list rules for you. The system displays a table for egress rules and a table for ingress rules. Each table lets you choose the security list that applies to the relevant subnet. You can choose whether to apply the proposed rules for each affected subnet.
  - **Session Persistence:** Specify how the load balancer manages session persistence.
    - **Disable Session Persistence:** Choose this option to disable cookie-based session persistence.
    - **Enable Application Cookie Persistence:** Choose this option to enable persistent sessions from a single logical client when the backend application server response includes a Set-cookie header with the cookie name you specify.
      - **Cookie Name:** The cookie name used to enable session persistence. Specify * to match any cookie name. Avoid entering confidential information.
      - **Disable Fallback:** Check this box to disable fallback when the original server is unavailable.
    - **Enable Load Balancer Cookie Persistence:** Choose this option to enable persistent sessions based on a cookie inserted by the load balancer.
      - **Cookie Name:** Specify the name of the cookie used to enable session persistence. If blank, the default cookie name is X-Oracle-BMC-LBS-Route. Ensure that any cookie names used at the backend application servers are different from the cookie name used at the load balancer. Avoid entering confidential information.
      - **Disable Fallback:** Check this box to disable fallback when the original server is unavailable.
      - **Domain Name:** Optional. Specify the domain in which the cookie is valid.
This attribute has no default value. If you do not specify a value, the load balancer does not insert the domain attribute into the `Set-cookie` header.

- **Path**: Optional. Specify the path in which the cookie is valid. The default value is `/`.
- **Expiration Period in Seconds**: Optional. Specify the amount of time the cookie remains valid. If blank, the cookie expires at the end of the client session.

### Attributes

- **Secure**: Specify whether the `Set-cookie` header must contain the `Secure` attribute. If selected, the client sends the cookie only using a secure protocol.
  
  If you enable this setting, you cannot associate the corresponding backend set with an HTTP listener.

- **HTTP Only**: Specify whether the `Set-cookie` header must contain the `HttpOnly` attribute. If selected, the cookie is limited to HTTP requests. The client omits the cookie when providing access to cookies through non-HTTP APIs such as JavaScript channels.

- **SSL Policy**: Specify the type of cipher suite to use:
  
  - **TLS Version**: Required. Specify each of the Transport Layer Security (TLS) versions you want:
    
    - 1.0
    - 1.1
    - 1.2 (recommended. Required if using HTTP/2)

  You can select any combination of versions.

  - **Specify the Cipher Suite**: Required. Choose one of the following options:
    
    - **Select Cipher Suite**: Select a set of cipher suites from the list. (default).
      
      All cipher suites listed have at least one cipher from each of the TLS versions you selected.
    
    - **Create Custom Cipher Suite**: Add ciphers to a new suite.
      
      Perform the following:

      a. Enter the name of the customer cipher suite in the **Suite Name** field.
      
      b. Click **Choose Ciphers**.
        
        The Select Ciphers page appears.
      
      c. Check each cipher that you want to include in the suite.
        
        The TLS versions associated with each cipher are listed in the **Version** column. Ensure that any cipher you choose is compatible with the TLS versions you previously chose.
      
      d. Deselect any ciphers you want to exclude.

      **Note:**
      
      Assign at least one cipher to a cipher suite you create. You cannot create a cipher suite that contains no ciphers.

      e. Click **Select**. Then select that custom cipher suite (or whatever suite you want to use) from the **Select Cipher Suite** list.

      - Click **Show Cipher Suite Details** to display the individual ciphers the selected cipher suite contains.

### Step 3 - Configure Listener

Complete the following:

- **Listener Name**: Required. Specify a friendly name for the listener. The name must be unique, and cannot be changed. Avoid entering confidential information.

  If you do not specify a name, the Load Balancing service creates one for you.

- **Specify the type of traffic your listener handles**: Required. Specify the protocol to use. Choices are:
Load Balancing

- HTTPS
- HTTP/1.0
- HTTP/1.1
- HTTP/2
- TCP

**Specify the port your listener monitors for ingress traffic:** Required. Specify the port. Defaults are:

- **443** for HTTPS
- **80** for HTTP/1.0, 1.1
- **443** for HTTP/2
- **22** for TCP

If you chose the HTTPS or HTTP/2 protocols, or if you chose the TCP protocol and selected the Use SSL check box

- **Choose SSL Certificate File:** Required. Drag and drop the certificate file, in PEM format, into the **SSL Certificate** field.

  Alternatively, you can choose the **Paste SSL Certificate** option to paste a certificate directly into this field.

  **Important:**
  
  If you submit a self-signed certificate for backend SSL, you must submit the same certificate in the corresponding CA Certificate field.

- **Specify CA Certificate:** Optional. (Recommended for backend SSL termination configurations.) Select (check) this box if you want to provide a CA certificate. See **SSL Certificate Management** on page 3867 for more information.

  - **Choose CA Certificate File:** Drag and drop the CA certificate file, in PEM format, into the **CA Certificate** field.

    Alternatively, you can choose the **Paste CA Certificate** option to paste a certificate directly into this field.

- **Specify Private Key:** Optional. (Required for SSL termination.) Select (check) this box if you want to provide a private key for the certificate.

  - **Choose Private Key File:** Drag and drop the private key, in PEM format, into the **Private Key** field.

    Alternatively, you can choose the **Paste Private Key** option to paste a private key directly into this field.

  - **Enter Private Key Passphrase:** Optional. Specify the private key passphrase.

- **Use SSL:** Required for HTTPS and HTTP/2, optional for TCP, not available for HTTP. Check to apply SSL to the load balancer listener. If you select this option, complete the following:

  - **SSL Certificate:** Select one of these options:

    - **Choose SSL Certificate File:** Drag and drop the certificate file into the **SSL Certificate** field.

      Alternatively, click **Select Files** and navigate your system to where you can select the certificate file
for upload. Certificate files must be in PEM format and must have the .pem, .cer, or .crt file extensions.

**Important:**

If you submit a self-signed certificate for backend SSL, you must submit the same certificate in the corresponding CA Certificate field.

- **Paste SSL Certificate:** Copy and paste a certificate directly into this field.
- **Specify CA Certificate:** Optional. (Recommended for backend SSL termination configurations.) Check this box if you want to provide a CA certificate. See SSL Certificate Management on page 3867 for more information.
- **Specify Private Key:** Optional. (Required for SSL termination.) Check this box if you want to provide a private key for the certificate.
- **Show Advanced Options:** Click this link to access more options. Select the tab for the corresponding functionality:
  - **Timeout** tab: Specify the maximum idle time in seconds. This setting applies to the time allowed between two successive receive or two successive send network input/output operations during the HTTP request-response phase.

**Note:**

The maximum value is 7200 seconds. For more information, see Connection Management on page 3762.

- **SSL Policy** tab: Specify the type of cipher suite to use:
  - **TLS Version:** Required. Specify the Transport Layer Security (TLS) versions:
    - 1.0
    - 1.1
    - 1.2 (recommended)

    The HTTP/2 protocol only supports TLS 1.2.

  You can select any combination of versions. Choose the ones you want from the list.

  - **Specify the Cipher Suite:** Required. Choose one of the following options:
    - **Select Cipher Suite:** Select a predefined set of cipher suites. (default).
      
      Pick a choice from the Select Cipher Suite list. All cipher suites listed have at least one cipher from each of the TLS versions you selected.

      The HTTP/2 protocol only supports a default cipher. You cannot change it.

    - **Create Custom Cipher Suite:** Add ciphers to a new suite.

      Perform the following:

      a. Enter the name of the customer cipher suite in the Suite Name field.
      b. Click Choose Ciphers.

      The Select Ciphers page appears.
      c. Check each cipher that you want to include in the suite.

      The TLS versions associated with each cipher are listed in the Version column. Ensure that any cipher you choose is compatible with the TLS versions you previously chose.
      d. Deselect any ciphers you want to exclude.

**Note:**

Assign at least one cipher to a cipher suite you create. You cannot create a cipher suite that contains no ciphers.
e. Click **Select**. Then select that custom cipher suite (or whatever suite you want to use) from the **Select Cipher Suite** list.
   - Click **Show Cipher Suite Details** to display what ciphers the selected cipher suite contains.
   - **Server Order Preference:** Select **Enable** to give preference to the server ciphers over the client.

**Step 4 - Manage Logging**

Enabling error and access logs are optional, but recommended. Reviewing these logs can help you with diagnosing and fixing issues with your backend servers. Standard limits, restrictions, and rates apply when enabling the logging feature. See Log Management on page 3880 for general information on how the Load Balancing service uses logging.

- **Error Logs:** Optional. Enter the following:
  - **Compartment:** Select the compartment within which the log file resides from the list.
  - **Log Group:** Select an existing log group from the list or click **Create New Group** where you can enter the name and description of a new logging group within which your log resides.
  - **Log Name:** Enter the name of the log.
  - **Log Retention:** Select the time period in months each error logging entry is to be retained from the list.

See Managing Logs and Log Groups on page 3911 for more information on log and log groups, including naming syntax guidelines.

**Note:**

By default, error logging is enabled. Disable this feature if you do not want to pay the associated fees.

- **Access Logs:** Optional. Slide to enable feature. Enter the following:
  - **Compartment:** Select the compartment within which the log file resides from the list.
  - **Log Group:** Select an existing log group from the list or click **Create New Group** where you can enter the name and description of a new logging group within which your log resides.
  - **Log Name:** Enter the name of the log.
  - **Log Retention:** Select the time period in months each access logging entry is to be retained from the list.

See Managing Logs and Log Groups on page 3911 for more information on log and log groups, including naming syntax guidelines.

6. Click **Submit**.

After the system provisions the load balancer, details appear in the load balancer list. To view more details, click the load balancer name.

**Note:**

The following describes the Dynamic Shapes feature, which is only available to certain legacy customer accounts:

**Dynamic Shapes:** Choose one of the following predefined shape sizes.

- 10 Mbps
- 100 Mbps
- 400 Mbps
- 8,000 Mbps

If you are creating the load balancer as a paid account user, you can create various shape options based on your limits and later adjust the bandwidth by changing the shape after the load balancer has been created. You can view your service limits and quotas in the Console by navigating to Governance > Limits, Quotas and Usage. Select "LbaaS" from the Service list. Your bandwidth size options are listed. See Service Limits on page 243 for more
Load Balancing

You can also select the Always Free option if you have not used your one free tier account.

You can adjust the bandwidth shape to a different size after you have completed creating the load balancer. See Changing the Load Balancer Bandwidth Shape on page 3780 for more information.

If you adjust a dynamic size value to a flexible size using the sliders, you cannot revert to a dynamic shape of any size. You can achieve the effect of having a dynamic (fixed) size by setting the minimum and maximum sliders to the same size.

To create a load balancer using the CLI

Use the command line interface (CLI) to create a Load Balancer resource.

Enter the following command:

```
oci lb load-balancer create --compartment-id compartment_id --display-name display_name --shape-name shape_name --subnet-id subnet_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb load-balancer create --help
```

See oci lb load-balancer create for a complete description of the command.

To create a load balancer using the API

Use the API to create a Load Balancer resource.

Run the CreateLoadBalancer method to create a load balancer. See CreateLoadBalancer for a complete description.

Listing Load Balancers

List the Load Balancer resources in your OCI tenancy.

Use one of the following methods to display a list of load balancers in your tenancy.

To list the load balancers using the Console

Use the OCI Console to list the Load Balancer resources in your OCI tenancy.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.

To list the load balancers using the CLI

Use the command line interface (CLI) to list the Load Balancer resources in your OCI tenancy.

Enter the following command:

```
oci lb load-balancer list --compartment-id compartment_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb load-balancer list --help
```

See oci lb load-balancer list for a complete description of the command.
To list the load balancers using the API
Use the API to list the Load Balancer resources in your OCI tenancy.

Run the `ListLoadBalancers` method to create a load balancer. See `ListLoadBalancers` for a complete description.

Getting Load Balancer Details
Get the details of a Load Balancer resource.

Use one of the following methods to display the details of a selected load balancer.

To get the details of a load balancer using the Console
Use the OCI Console to get the details of a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Network Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer whose details you want to get.
   The Load Balancer Details dialog box appears.
   The Details page contains information about the load balancer, both general information and links to its resources.
   Some items in the page are read-only, while other items allow you to edit and update the load balancer's configuration. See Editing Load Balancers on page 3778.

To get the details of a load balancer using the CLI
Use the command line interface (CLI) to get the details of a Load Balancer resource.

Enter the following command:

```bash
oci lb load-balancer get --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb load-balancer get --help
```

See `oci lb load-balancer get` for a complete description of the command.

To get the details of a load balancer using the API
Use the API to get the details of a Load Balancer resource.

Run the `GetLoadBalancer` method to create a load balancer. See `GetLoadBalancer` for a complete description.

Editing Load Balancers
Update a Load Balancer resource.

Use one of the following methods to edit and update a selected load balancer.

To edit a load balancer using the Console
Use the OCI Console to update a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Network Load Balancer** under **Type** to only display load balancers.
5. Click the load balancer that you want to edit.
   The Load Balancer Details dialog box appears.

6. Click the various links under Resources to edit different aspects of the load balancer as wanted.
   See Creating Load Balancers on page 3764 for details on specific configurations.

**To edit a load balancer using the CLI**
Use the command line interface (CLI) to update a Load Balancer resource.

Enter the following command:
```bash
oci lb load-balancer update --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:
```bash
oci lb load-balancer update --help
```

See oci lb load-balancer update for a complete description of the command.

**To edit a load balancer using the API**
Use the API to update a Load Balancer resource.

Run the UpdateLoadBalancer method to edit a load balancer. See UpdateLoadBalancer for a complete description.

**Terminating Load Balancers**
Terminate a Load Balancer resource.

Use one of the following methods to terminate a selected load balancer.

**To terminate a load balancer using the Console**
Use the OCI Console to terminate a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.
5. Click the load balancer you want to terminate.
6. Click Terminate.
   Alternatively, click the Actions icon (consin) associated with the load balancer you want to delete and then click Terminate.
7. Confirm the deletion when prompted.

**To terminate a load balancer using the CLI**
Use the command line interface (CLI) to terminate a Load Balancer resource.

Enter the following command:
```bash
oci lb load-balancer delete --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:
```bash
oci lb load-balancer delete --help
```

See oci lb load-balancer delete for a complete description of the command.
To terminate a load balancer using the API
Use the API to terminate a Load Balancer resource.
Run the DeleteLoadBalancer method to terminate a load balancer. See DeleteLoadBalancer for a complete description.

Moving Load Balancers Between Compartments
Change the compartment of a Load Balancer resource.
Use one of the following methods to move a load balancer to a different compartment. See Managing Compartments for information about compartments and access control.

To move a load balancer between compartments using the Console
Use the OCI Console to change the compartment of a Load Balancer resource.
1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.
5. Click the Actions icon ( ) associated with the load balancer you want to move, then click Move Resource.
   The Move Resource dialog box appears.
6. Choose the destination compartment from the list.
7. Click Move Resource.

To move a load balancer between compartments using the CLI
Use the command line interface (CLI) to change the compartment of a Load Balancer resource.
Enter the following command:

```
oci lb load-balancer change-compartment --compartment-id compartment_id [OPTIONS]
```

See the CLI online help for a list of options:
```
oci lb load-balancer change-compartment --help
```

See oci lb load-balancer change-compartment for a complete description of the command.

To move a load balancer between compartments using the API
Use the API to change the compartment of a Load Balancer resource.
Run the ChangeLoadBalancerCompartment method to change the compartment of a load balancer. See ChangeLoadBalancerCompartment for a complete description.

Changing the Load Balancer Bandwidth Shape
Change a load balancer's bandwidth shape.
If you are not an Always Free user, you can adjust the size of the bandwidth to one of the other predefined sizes.

Note:
Always Free users cannot change the bandwidth of a load balancer. Upgrade to a different account if you want to increase your bandwidth size.

To change a load balancer's bandwidth shape using the Console
Use the OCI Console to change a load balancer's bandwidth shape.
1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the **Compartment** from the list.

All load balancers and network load balancers in that compartment are listed in tabular form.

3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.

4. (optional) Uncheck **Network Load Balancer** under **Type** to only display load balancers.

5. Click the load balancer whose bandwidth you want to change.

The selected load balancer's Details page appears.

6. Click **Update Shape**.

The Update Shape dialog box appears. The options displayed vary on what type of existing bandwidth size option you are using.

- Changing a flexible shape: Enter the values for the **Minimum Bandwidth** and **Maximum Bandwidth** shape sizes you want changed.

  ![Note:]
  
  Using flexible bandwidth shapes for Government accounts can result in overages if the pre-paid shape sizes are exceeded.

  If you want to specify a dynamic shape size, for example 500 Mbps, set the minimum and maximum sliders to the same value.

- Changing a dynamic shape: Select the new bandwidth of the load balancer from the **Choose Shape Size** list. The existing bandwidth size of the load balancer is unavailable to select.

  You can switch from a dynamic shape size to a flexible shape by checking the **Use a Flexible Load Balancer** option and specifying your shape size using the minimum and maximum sliders (see Changing a flexible shape).

  ![Note:]
  
  After you have switched to a flexible shape, you cannot revert to a dynamic shape.

7. Click **Save Changes**.

Changing the bandwidth size of the load balancer requires resetting all existing sessions of the load balancer.

8. Click **Confirm** to continue.

The Details page reappears.

**To change a load balancer's bandwidth shape using the CLI**

Use the command line interface (CLI) to change a load balancer's bandwidth shape.

Enter the following command:

```
oci lb load-balancer update-load-balancer-shape --load-balancer-id load_balancer_id --shape-name shape_name [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb load-balancer update-load-balancer-shape --help
```

See **oci lb load-balancer update-load-balancer-shape** for a complete description of the command.

**To change a load balancer's bandwidth shape using the API**

Use the API to change a load balancer's bandwidth shape.

Run the **UpdateLoadBalancerShape** method to change the bandwidth of a load balancer. See **UpdateLoadBalancerShape** for a complete description.
Listing Load Balancer Health Status Summaries
List the health status summaries for all Load Balancer resources in a specified compartment.

Use one of the following methods to display a list of health status summaries for a load balancers in a specified compartment.

To list the load balancer health status summaries using the Console
Use the OCI Console to list all the heath status summaries of the Load Balancer resources in a specified compartment in your tenancy.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   - All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.
5. Review the Overall Health column in the list for a summary of each load balancer.

   See Health Status Indicators on page 3795 for descriptions of the load balancer health indicators.

To list the load balancer health status summaries using the CLI
Use the command line interface (CLI) to list the health status summaries for the Load Balancer resources in your tenancy.

Enter the following command:

```
oci lb load-balancer-health list --compartment-id compartment_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb load-balancer-health list --help
```

See oci lb load-balancer-health list for a complete description of the command.

To list the load balancer health status summaries using the API
Use the API to list the health status summaries for the Load Balancer resources in your tenancy.

Run the ListLoadBalancerHealths method to display a list of health status summaries for a network load balancer. See ListLoadBalancerHealths for a complete description.

See Health Status Indicators on page 3795 for descriptions of the load balancer health indicators.

Getting Load Balancer Health Details
Get the health status details of a Load Balancer resource.

The following table lists the health status indicators and their meanings.

<table>
<thead>
<tr>
<th>Level</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical</td>
<td>Red</td>
<td>At least one backend set associated with the load balancer returns a status of Critical.</td>
</tr>
<tr>
<td>Level</td>
<td>Color</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Warning   | Yellow | All the following conditions are true:
  • At least one backend set associated with the load balancer returns a status of **Warning** or **Pending**.
  • No backend sets return a status of **Critical**.
  • The load balancer life-cycle state is **Active**. |
| Incomplete| Yellow | Any one of the following conditions is true:
  • No backend sets are defined for the load balancer.
  • All the following conditions are true:
    • More than half of the backend sets associated with the load balancer return a status of **Incomplete**.
    • None of the backend sets return a status of **Warning** or **Critical**.
    • The load balancer life-cycle state is **Active**. |
| Pending   | Yellow | Any one of the following conditions is true:
  • The load balancer life-cycle state is not **Active**.
  • All the following conditions are true:
    • More than half of the backend sets associated with the load balancer return a status of **Pending**.
    • None of the backend sets return a status of **Warning** or **Critical**.
    • The load balancer life-cycle state is **Active**.
    • The system could not retrieve metrics for any reason. |
| OK        | Green  | All backend sets associated with the load balancer return a status of **OK**. |

Use one of the following methods to display the health details of a selected load balancer.
To get load balancer health details using the Console

Use the OCI Console to get the health details of a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.
5. Click the load balancer that you want to edit.
   The Load Balancer Details dialog box appears.
6. View the Overall Health and Backend Sets Health indicators.
   See Getting Load Balancer Health Details on page 3782 for descriptions of the load balancer health indicators.

To get load balancer health details using the CLI

Use the command line interface (CLI) to get the health status of a Load Balancer resource.

Enter the following command:

```
oci lb load-balancer-health get --load-balancer-id load_balancer_id
[OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb load-balancer-health get --help
```

See oci lb load-balancer-health get for a complete description of the command.

See Getting Load Balancer Health Details on page 3782 for descriptions of the load balancer health indicators.

To get load balancer health details using the API

Use the API to get the health details for a Load Balancer resource.

Run the GetLoadBalancerHealth method to display the health details for a load balancer. See GetLoadBalancerHealth for a complete description.

See Getting Load Balancer Health Details on page 3782 for descriptions of the load balancer health indicators.

Tagging Load Balancers

Learn how to add metadata to Load Balancer resources, which enables you to define keys and values and associate them with resources.

You can apply tags to your Load Balancer resources to help you organize them according to your business needs. Apply tags at the time you create a network load balancer, or update the network load balancer with tags later. For more information about applying tags, see Tagging Overview on page 5572.

Note:

If you are not sure whether to apply tags, ask your administrator for guidance.

To apply tags at create using the Console

Use the OCI Console to add metadata to a Load Balancer resource when you create it.

1. Begin the steps for creating a load balancer using the OCI Console as described in Creating Load Balancers on page 3764.
2. At the end of Step 1 - Add Details, click Show Advanced Options.
   The advanced options appear.
3. Click the Tagging tab.
4. Complete the following. See Tagging Overview on page 5572 for descriptions of these fields.
   - Tag Namespace
   - Tag Key
   - Value

5. Click +Additional Tag to add another tag. Click X to remove the associated tag.

6. Click Next to continue with the network load balancer creation.

To apply tags at create using the CLI
Use the command line interface (CLI) to add metadata to a Load Balancer resource when you create it.

Use the --defined-tags or --freeform-tags options when running the following command:

```
oci lb load-balancer create [...] [--defined-tags | --freeform-tags] tags [OPTIONS]
```

See the CLI online help for more information on these options:

```
oci lb load-balancer create --help
```

See oci lb load-balancer create for a complete description of the command, including the tagging options.

To apply tags at create using the API
Use the API to add metadata to a Load Balancer resource when you create it.

Run the CreateLoadBalancer method to create a load balancer. Include the definedTags and freeformTags attributes and their values. See CreateLoadBalancer for a complete description of these attributes.

To apply tags at update using the Console
Use the OCI Console to add metadata to a Load Balancer resource when you update it.

1. Begin the steps for editing a load balancer using the OCI Console as described in Editing Load Balancers on page 3778.

2. In the Details page of the selected load balancer, click Add Tags.

   Alternatively, click the Actions icon (ثالث) for the load balancer to which you want to add tags, and then click Add Tags.

   The Add One or More Tags To This Resource dialog box appears.

3. Complete the following:
   - Tag Namespace
   - Tag Key
   - Value

   See Tagging Overview on page 5572 for descriptions of these fields.

4. Click +Additional Tag to add another tag. Click X to remove the associated tag.

5. Click Add Tags.

   The dialog box closes and you are returned to the Details page.

To apply tags at update using the CLI
Use the command line interface (CLI) to add metadata to a Load Balancer resource when you update it.

Use the --defined-tags or --freeform-tags options when running the following command:

```
oci lb load-balancer update --load-balancer-id load_balancer_id [--defined-tags | --freeform-tags] tags [OPTIONS]
```
See the CLI online help for more information on these options:

```
oci lb load-balancer update --help
```

See `oci lb load-balancer update` for a complete description of the command, including the tagging options.

**To apply tags at update using the API**

Use the API to add metadata to a Load Balancer resource when you update it.

Run the `updateLoadBalancer` method to create a network load balancer. Include the `definedTags` and `freeformTags` attributes and their values. See `UpdateLoadBalancer` for a complete description of these attributes.

### Backend Set Management

Learn how to use backend sets to create logical entities consisting of a load balancing policy, health check policy, and a list of backend servers for a Load Balancer resource.

A backend set is a logical entity defined by a load balancing policy, a health check policy, and a list of backend servers. To create a backend set, you must specify a load balancing policy and health check script, and then add a list of backend servers (compute instances). SSL and session persistence configuration is optional. A backend set must be associated with one or more listeners for the load balancer to work.

Changing the load balancing policy of a backend set temporarily interrupts traffic and can drop active connections.

Click **Backend Sets** under **Resources** in the Load Balancer Details page to display the Backend Sets page. This page contains a button for creating new backend sets.

**Note:**
You can set up backend servers as compute instance pools. See Creating Instance Pools on page 1179 for more information.

### Creating Backend Sets

Create a backend set for a Load Balancer resource.

Use one of the following methods to create a backend set for a selected load balancer.

**To create a backend set using the Console**

Use the OCI Console to create a backend set for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display network load balancers.
5. Click the load balancer whose backend set you want to edit.
6. Click **Backend Sets** under the **Resources** menu, then click **Create Backend Set**.

   The **Create Backend Set** dialog box appears.
7. Enter the following:

- **Name**: Required. Specify a friendly name for the backend set. It must be unique within the load balancer, and it cannot be changed.

  Valid backend set names include only alphanumeric characters, dashes, and underscores. Backend set names cannot contain spaces. Avoid entering confidential information.

- **Traffic Distribution Policy**: Required. Choose the load balancer policy for the backend set. The available options are:
  - **IP Hash**
  - **Least Connections**
  - **Weighted Round Robin**

  For more information on these policies, see *Load Balancing Policies* on page 3756.

  **Note:**
  You cannot add a backend server marked as **Backup** to a backend set that uses the IP Hash policy.

- **Use SSL**: Optional. Check this box to associate an SSL certificate resource with the backend set.

  The load balancer automatically detects changes and consumes the current version of the Certificates service entities (certificates, certificate authorities, and CABundles) for use in SSL configuration. See *Certificates* for more information on automated certificate rotations.

  If no certificate resources attached to the load balancer exist, this option is disabled.

  **Note:**
  If you check **Use SSL**, the **SSL Policies** fields appear at the bottom of the page.

- **Certificate Resource**: Select the certificate resource type from the list:

  The method of importing the certificate varies depending on the certificate resource type you select. See *SSL Certificate Management* on page 3867 for information on how load balancers use SSL certificates.

  See *Certificates* for general information on using SSL with your web application firewall policy.

  - **Certificate Service Managed Certificate**
    
    Select the certificate in the specified compartment from the **Certificate** list. Click **Change Compartment** to choose a different compartment from where to select the certificate.

    Advanced options are available with this selection. Click **Show Advanced Options** and select the **Advanced SSL** tab. This option is described later in this topic.

  - **Load Balancer Managed Certificate**: Select one of these options to import the certificate:

    - **Choose SSL Certificate File**: Required. Drag and drop the certificate file, in PEM format, into the **SSL Certificate** field.
    - Alternatively, you can choose the **Paste SSL Certificate** option to paste a certificate directly into this field.

      **Important:**
      If you submit a self-signed certificate for backend SSL, you must submit the same certificate in the corresponding CA Certificate field.

    - **Specify Private Key**: Optional. (Required for SSL termination.) Select (check) this box if you want to provide a private key for the certificate.
• **Choose Private Key File:** Drag and drop the private key, in PEM format, into the **Private Key** field.

Alternatively, you can choose the **Paste Private Key** option to paste a private key directly into this field.

• **Enter Private Key Passphrase:** Optional. Specify the private key passphrase.

• **Verify Peer Certificate:** Optional. Select this option to enable peer certificate verification. See SSL Certificate Management on page 3867 for more information.

• **Verify Depth:** Optional. Specify the maximum depth for certificate chain verification. See SSL Certificate Management on page 3867 for more information.

• **Session Persistence:** Optional. Specify how the load balancer manages session persistence.

  **Important:**

  See Session Persistence on page 3759 for important information on configuring these settings.

• **Disable Session Persistence:** Choose this option to disable cookie-based session persistence.

• **Enable Application Cookie Persistence:** Choose this option to enable persistent sessions from a single logical client when the response from a backend application server includes a `Set-cookie` header with the cookie name you specify.

  • **Cookie Name:** The cookie name used to enable session persistence. Specify * to match any cookie name. Avoid entering confidential information.

  • **Disable Fallback:** Check this box to disable fallback when the original server is unavailable.

• **Enable Load Balancer Cookie Persistence:** Choose this option to enable persistent sessions based on a cookie inserted by the load balancer.

  • **Cookie Name:** Specify the name of the cookie used to enable session persistence. If blank, the default cookie name is `X-Oracle-BMC-LBS-Route`.

  Ensure that any cookie names used at the backend application servers are different from the cookie name used at the load balancer. Avoid entering confidential information.

  • **Disable Fallback:** Check this box to disable fallback when the original server is unavailable.

  • **Domain Name:** Optional. Specify the domain in which the cookie is valid.

  This attribute has no default value. If you do not specify a value, the load balancer does not insert the domain attribute into the `Set-cookie` header.

  • **Path:** Optional. Specify the path in which the cookie is valid. The default value is `/`.

  • **Expiration Period in Seconds:** Optional. Specify the amount of time the cookie remains valid. If blank, the cookie expires at the end of the client session.

  • **Attributes**

  • **Secure:** Specify whether the `Set-cookie` header contains the `Secure` attribute. If selected, the client sends the cookie only using a secure protocol.

    If you enable this setting, you cannot associate the corresponding backend set with an HTTP listener.

  • **HTTP Only:** Specify whether the `Set-cookie` header contains the `HttpOnly` attribute. If selected, the cookie is limited to HTTP requests. The client omits the cookie when providing access to cookies through non-HTTP APIs such as JavaScript channels.

• **Health Check:** Required. Specify the test parameters to confirm the health of backend servers.

• **Protocol:** Required. Specify the protocol to use, either HTTP or TCP.

  **Important:**

  Configure your health check protocol to match your application or service. See Health Check Management on page 3795 for more information.
• **Port:** Optional. Specify the backend server port against which to run the health check.

| Tip: |
| You can enter the value 0 to have the health check use the backend server's traffic port. |

• **URL Path (URI):** (HTTP only) Required. Specify a URL endpoint against which to run the health check.

• **Interval in ms:** Optional. Specify how frequently to run the health check, in milliseconds. The default is 10000 (10 seconds).

• **Timeout in ms:** Optional. Specify the maximum time in milliseconds to wait for a reply to a health check. A health check is successful only if a reply returns within this timeout period. The default is 3000 (3 seconds).

• **Number of retries:** Optional. Specify the number of retries to attempt before a backend server is considered "unhealthy." This number also applies when recovering a server to the "healthy" state. The default is '3.'

• **Status Code:** (HTTP only) Optional. Specify the status code a healthy backend server must return.

• **Response Body Regex:** (HTTP only) Optional. Provide a regular expression for parsing the response body from the backend server.

• **Show Advanced Options:** Click this link to access more options. Select the tab for the corresponding functionality:

  • **Advanced SSL tab:** (Only present if the Certificate Service Managed Certificate certificate resource is selected.) Select one of these options if you picked Certificate Service Managed Certificate when selecting the certificate resource for the listener. See SSL Certificate Management on page 3867 for information on how load balancers use SSL certificates.

    • **CA Bundle:** Select the certificate authority bundle in the specified compartment from the list. Click **Change Compartment** to choose a different compartment from where to select the certificate authority bundle.

    • **Certificate Authority:** Select the certificate authority in the specified compartment from the list. Click **Change Compartment** to choose a different compartment from where to select the certificate authority bundle.

• **TLS Version:** Optional. Specify the Transport Layer Security (TLS) versions:

  • 1.0
  • 1.1
  • 1.2 (recommended)

You can select any combination of versions. Choose the ones you want from the list. If you do not specify the TLS versions, the default TLS is version 1.2 only.

  • **Select Cipher Suite** - Select a set of cipher suites from the list. (default).

    All choices present in the list have at least one cipher associated with each TLS version you selected.

8. Click **Create.**

After your backend set is provisioned, you must specify backend servers for the set. See Backend Server Management on page 3801 for more information.

**To create a backend set using the CLI**

Use the command line interface (CLI) to create a backend set for a Load Balancer resource.

Enter the following command:

```bash
ci lb backend-set create --name name --load-balancer-id load_balancer_id --health-checker-protocol [HTTP|TCP] [OPTIONS]
```
Load Balancing

See the CLI online help for a list of options:

```
oci lb backend-set create --help
```

See `oci lb backend-set create` for a complete description of the command.

**To create a backend set using the API**
Use the API to create a backend set for a Load Balancer resource.

Run the `CreateBackendSet` method to create a backend set for a load balancer. See `CreateBackendSet` for a complete description.

**Listing Backend Sets**
List the backend sets for a Load Balancer resource.

Use one of the following methods to display a list of backend sets for a selected load balancer.

**To list the backend sets using the Console**
Use the OCI Console to list the backend sets for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartments from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.
5. Click Backend Sets under Resources.

   The Backend Sets list appears. All backend sets are listed in tabular form.

**To list the backend sets using the CLI**
Use the command line interface (CLI) to list the backend sets for a Load Balancer resource.

Enter the following command:

```
oci lb backend-set list --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb backend-sets list --help
```

See `oci lb backend-set list` for a complete description of the command.

**To list the backend sets using the API**
Use the API to list the backend sets for a Load Balancer resource.

Run the `ListBackendSets` method to display a list of backend sets for a load balancer. See `ListBackendSets` for a complete description.

**Getting Backend Set Details**
Get the details of a backend set for a Load Balancer resource.

Use one of the following methods to display the details of a backend set for a selected load balancer.

**To get the details of a backend set using the Console**
Use the OCI Console to get the details of a backend set for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartments from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.
5. Click the load balancer for whose backend set you want to get details.
   The Load Balancer Details page appears.

6. Click **Backend Sets** under **Resources**.
   The **Backend Sets** list appears. All backend sets are listed in tabular form.

7. Click the backend set whose details you want to get.
   The Backend Set Details dialog box appears.

   The Details page contains information about the backend set, both general information and links to its resources. Some items in the page are read-only, while other items allow you to edit and update the backend set's configuration. See **Editing Backend Sets** on page 3791.

**To get the details of a backend set using the CLI**

Use the command line interface (CLI) to get the details of a backend set for a Load Balancer resource.

Enter the following command:

```
oci lb backend-set get --backend-set-name backend_set_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb backend-set get --help
```

See `oci lb backend-set get` for a complete description of the command.

**To get the details of a backend set using the API**

Use the API to get the details of a backend set for a Load Balancer resource.

Run the `GetBackendSet` method to display a list of backend sets for a load balancer. See `GetBackendSet` for a complete description.

**Editing Backend Sets**

Update a backend set for a Load Balancer resource.

When you edit a backed set, you can choose a new load balancing policy and modify the SSL configuration.

To modify the backend set's health check policy, see **Health Check Management** on page 3795 for more information.

To add or remove backend servers from the backend set, see **Backend Server Management** on page 3801 for more information.

**Note:**

Changing the load balancing policy of a backend set temporarily interrupts traffic and can drop active connections.

Use one of the following methods to edit and update the settings of a backend set for a selected load balancer.

**To edit a backend set using the Console**

Use the OCI Console to update a backend set for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Network Load Balancer** under **Type** to only display load balancers.
5. Click the load balancer whose backend set you want to edit.
   The Load Balancer Details page appears.
6. Click **Backend Sets** under **Resources**.
   The **Backend Sets** list appears. All backend sets are listed in tabular form.

7. Click the backend set you want to edit.
   The Backend Set Details dialog box appears.

8. Click **Edit Backend Set**.
   Alternatively, click the **Actions** icon (⋮) associated with the backend set you want to edit and click **Edit**.
   The Edit Backend Set dialog box appears.

9. Edit any of the following:
   - **Traffic Distribution Policy**
   - **Session Persistence**
   See **Creating Backend Sets** on page 3786 for more information.

10. Click **Update Backend Set**.

**To edit a backend set using the CLI**
Use the command line interface (CLI) to update a backend set for a Load Balancer resource.

Enter the following command:

```bash
oci lb backend-set update --backend-set-name backend_set_name --backends backends --load-balancer-id load-balancer_id --health-checker-protocol health_checker_protocol --policy policy [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb backend-set update --help
```

See **oci lb backend-set update** for a complete description of the command.

**To edit a backend set using the API**
Use the API to update a backend set for a Load Balancer resource.

Run the **UpdateBackendSet** method to edit a backend set for a load balancer. See **UpdateBackendSet** for a complete description.

**Deleting Backend Sets**
Delete a backend set from a Load Balancer resource.

Use one of the following methods to delete a backend set from a selected load balancer.

**Note:**
You cannot delete a backend set used by an active listener.

**To delete a backend set using the Console**
Use the OCI Console to delete a backend set from a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Network Load Balancer** under **Type** to only display load balancers.
5. Click the load balancer whose backend set you want to delete.
   The Load Balancer Details page appears.
6. Click **Backend Sets** under **Resources**.
   The **Backend Sets** list appears. All backend sets are listed in tabular form.

7. Click the backend set you want to delete.
   The Backend Set Details page appears.

8. Click **Delete**.

   Alternatively, click the **Actions** icon (.icon) associated with the backend set you want to delete and click **Delete**.

9. Confirm the deletion when prompted.

**To delete a backend set using the CLI**
Use the command line interface (CLI) to delete a backend set from a Load Balancer resource.

Enter the following command:

```bash
oci lb backend-set delete --backend-set-name backend_set_name --load-balancer-id load_balancer-id [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb backend-set delete --help
```

See **oci lb backend-set delete** for a complete description of the command.

**To delete a backend set using the API**
Use the API to delete a backend set from a Load Balancer resource.

Run the **DeleteBackendSet** method to delete a backend set from a load balancer. See **DeleteBackendSet** for a complete description.

**Getting Backend Set Health Details**
Get the health details of a backend set for a Load Balancer resource.

The following table lists the health levels and their descriptions:

<table>
<thead>
<tr>
<th>Level</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical</td>
<td>Red</td>
<td>Fewer than half of the backend set's backend servers return a status of OK.</td>
</tr>
<tr>
<td>Warning</td>
<td>Yellow</td>
<td>Both of the following conditions are true:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Half or more of the backend set's backend servers return a status of OK.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• At least one backend server returns a status of <strong>Warning</strong>, <strong>Critical</strong>, <strong>Pending</strong>, or <strong>Incomplete</strong>.</td>
</tr>
<tr>
<td>Incomplete</td>
<td>Yellow</td>
<td>The backend set does not have any backends attached.</td>
</tr>
</tbody>
</table>
Use one of the following methods to display the health details of a backend set for a selected load balancer.

**Getting Backend Set Health Details using the Console**
Use the OCI Console to get the health details of a backend set for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.
5. Click the load balancer whose backend set you want to edit.
   
   The Load Balancer Details page appears.
6. Click Backend Sets under Resources.
   
   The Backend Sets list appears. All backend sets are listed in tabular form.
7. Click the backend set you want to edit.
   
   The Backend Set Details dialog box appears.
8. View the Overall and Backend Health details.

   See Getting Backend Set Health Details on page 3793 for descriptions of the backend set health indicators.

**Getting Backend Set Health Details using the CLI**
Use the command line interface (CLI) to get the health details of a backend set for a Load Balancer resource.

Enter the following command:

```bash
oci lb backend-set-health get --backend-set-name backend_set_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb backend-set-health get --help
```

See oci lb backend-set-health get for a complete description of the command.

See Getting Backend Set Health Details on page 3793 for descriptions of the backend set health indicators.

**Getting Backend Set Health Details using the API**
Use the API to get the health details of a backend set for a Load Balancer resource.

Run the GetBackendSetHealth method to get the health details a backend set for a load balancer. See GetBackendSetHealth for a complete description.

See Getting Backend Set Health Details on page 3793 for descriptions of the backend set health indicators.
Health Check Management

Learn how to understand and use health status indicators to report on the general health of your Load Balancer resources and their components.

A health check is a test to confirm the availability of backend servers. A health check can be a request or a connection attempt. Based on a time interval you specify, the load balancer applies the health check policy to continuously monitor backend servers. If a server fails the health check, the load balancer takes the server temporarily out of rotation. If the server later passes the health check, the load balancer returns it to the rotation.

You configure your health check policy when you create a backend set. You can configure TCP-level or HTTP-level health checks for your backend servers.

- TCP-level health checks attempt to make a TCP connection with the backend servers and validate the response based on the connection status.
- HTTP-level health checks send requests to the backend servers at a specific URI and validate the response based on the status code or entity data (body) returned.

The service provides application-specific health check capabilities to help you increase availability and reduce your application maintenance window.

The backend set's Details page provides the same Overall Health status indicator found in the load balancer's list of backend sets. It also includes counters for the Backend Health status values reported by the backend set's backend servers.

The health status counter badges indicate the following:

- The number of child entities reporting the indicated health status level.
- If a counter corresponds to the overall health, the badge has a fill color.
- If a counter has a zero value, the badge has a light gray outline and no fill color.

Health Status Indicators

Learn about the different health status indicators for Load Balancer resources.

The Load Balancing service provides health status indicators that use your health check policies to report on the general health of your load balancers and their components.

The following table provides the general meaning of each level:

<table>
<thead>
<tr>
<th>Level</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical</td>
<td>Red</td>
<td>Some or all reporting entities require immediate attention.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The resource is not functioning or unexpected failure is imminent.</td>
</tr>
<tr>
<td>Warning</td>
<td>Yellow</td>
<td>Some reporting entities require attention.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The resource is not functioning at peak efficiency or the resource is</td>
</tr>
<tr>
<td></td>
<td></td>
<td>incomplete and requires further work.</td>
</tr>
<tr>
<td>Incomplete</td>
<td>Yellow</td>
<td>The load balancer does not have any backend sets configured or backend</td>
</tr>
<tr>
<td></td>
<td></td>
<td>sets exist that contain no attached backend servers.</td>
</tr>
<tr>
<td>Level</td>
<td>Color</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Pending</td>
<td>Yellow</td>
<td>The health status cannot be determined.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The resource is not responding or is in transition and might resolve to another status over time.</td>
</tr>
<tr>
<td>OK</td>
<td>Green</td>
<td>No attention required.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The resource is functioning as expected.</td>
</tr>
</tbody>
</table>

The precise meaning of each level differs among the following components:

- Load balancers
- Backend sets
- Backend servers

**Understanding Health Issues**

Learn more about how health issues affect a Load Balancer resource.

At the highest level, load balancer health reflects the health of its components. The health status indicators provide information you might need to drill down and investigate an existing issue. Some common issues that the health status indicators can help you detect and correct include:

**A health check is misconfigured.**

In this case, all the backend servers for one or more of the affected listeners report as unhealthy. If your investigation finds that the backend servers do not have problems, then a backend set probably includes a misconfigured health check.

**A listener is misconfigured.**

All the backend server health status indicators report **OK**, but the load balancer does not pass traffic on a listener.

The listener might be configured to:

- Listen on the wrong port.
- Use the wrong protocol.
- Use the wrong policy.

If your investigation shows that the listener is not at fault, check the security list configuration.

**A security rule is misconfigured.**

Health status indicators help you diagnose two cases of misconfigured security rules:

- All entity health status indicators report **OK**, but traffic does not flow (as with misconfigured listeners). If the listener is not at fault, check the security rule configuration.
- All entity health statuses report as unhealthy. You have checked your health check configuration and your services run properly on your backend servers.

In this case, your security rules might not include the IP range for the source of the health check requests. You can find the health check source IP on the Details page for each backend server. You can also use the API to find the IP in the `sourceIpAddress` field of the `HealthCheckResult` object.

**Note:**

Source IP
The source IP for health check requests comes from a compute instance managed by the Load Balancing service.

**One or more of the backend servers reports as unhealthy.**

A backend server might be unhealthy or the health check might be misconfigured. To see the corresponding error code, check the `status` field on the backend server's Details page. You can also use the API to find the error code in the `healthCheckStatus` field of the `HealthCheckResult` object.

**Other cases in which health status might prove helpful include:**

- VCN network security groups or security lists block traffic.
- Compute instances have misconfigured route tables.

Health status is updated every three minutes. No finer granularity is available.

Health status does not provide historical health data.

### Common Side Effects of Health Check Misconfiguration

Learn about the different health status indicators for Load Balancer resources.

The following are common side effects of health check misconfiguration, and can be used to troubleshoot issues.

- **Wrong Port**

  In this scenario, all backend servers are reported as unhealthy. If the backend servers do not have any problems, you might have made a mistake setting the port. The port must be a port that is listening and has allowed traffic on the backend.

  OCI Logging Error: `errno:EHOSTUNREACH, syscall:connect`

- **Wrong Patch**

  In this scenario, all the backend servers are reported as unhealthy. If the backend servers do not have any problems, you might have made a mistake setting the path for the HTTP health check it needs to match an actual application on the backend. In this scenario, you can use the `curl` utility to test from a system in the same network. For example: `$ curl -i http://backend_ip_address/health`

  You receive the configured status code in the response OCI Logging Error: "msg": "invalid statusCode", "statusCode": 404, "expected": "200".

- **Wrong Protocol**

  In this scenario, all the backend servers are reported as unhealthy. If the backend servers do not have any problems, you might have made a mistake setting the protocol it needs to match the protocol that is listening on the backend. For example: We only support TCP and HTTP health checks. If your backend is using HTTPS, then you would need to use TCP as the protocol.

  OCI Logging Error: `code:EPROTO, errno:EPROTO`

- **Wrong Status Code**

  In this scenario, all the backend servers are reported as unhealthy. If the backend servers do not have any problems, for an HTTP health check you might have made a mistake setting the status code to match the actual status code being returned from the backend. A common scenario is when a backend returns a 302 status code but you are expecting a 200 status code. This result is likely the backend sending you to a login page or another location on the server. In this scenario, you can either fix the backend to return the expected code or use 302 in your health check configuration.

  OCI Logging Error: `msg:invalid statusCode, statusCode:nnn, expected:200` where `nnn` to be the status code that is returned.

- **Wrong Regex Pattern**

  All the backend servers report as unhealthy. If the backend servers do not have any problems, you might have made a mistake setting an incorrect regex pattern consistent with the body, or the backend is not returning the
expected body. In this scenario, you can either change the backend to match the pattern or correct the pattern to
match the backend. The following are some specific pattern examples.

- Any Content - .*
- A page returning the value Status:OK - Status:OK:.*
- OCI Logging Error: response match result: failed

**Misconfigured Network Security Groups, Security Lists, or Local Firewall**

All or some of the backend servers report as unhealthy. If the backend servers do not have any problems, then
you might have improperly configured either the network security groups, security lists, or local firewalls (such
as firewalld, iptables, or SELinux). In this scenario, you can use either the curl or netcat utilities
to test from a system that belongs to the same subnet and network security group as your load balancer instance
HTTP. For example: $ curl -i http://backend_ip_address/health TCP and nc -zvw3
backend_ip_address 443.

You can check your local firewall by using the following command: firewall-cmd --list-all --
zone=public.. If your firewall is missing the expected rules, then you can use a command set like this to add the
service (this example is for HTTP port 80):

- firewall-cmd --zone=public --add-service=http
- firewall-cmd --zone=public --permanent --add-service=http

**Health Check Best Practices**

Learn about health check best practices for a Load Balancer resource.

Configure your health check protocol to match your application or service. If you run an HTTP service, then
configure an HTTP-level health check. If you run a TCP-level health check against an HTTP service, then you might
not get an accurate response. The TCP handshake can succeed and indicate that the service is up even when the
HTTP service is incorrectly configured or having other issues. Although the health check appears good, you might
experience transaction failures.

For example:

- The backend HTTP service has issues when communicating with the health check URL and the health check
  URL returns 5nn messages. An HTTP health check catches the message from the health check URL and marks
  the service as down. In this case, a TCP health check handshake succeeds and marks the service as healthy, even
  though the HTTP service might not be usable.
- The backend HTTP service responds with 4nn messages because of authorization issues or no configured content.
  A TCP health check does not catch these errors.

**Creating a Custom Health Check Page**

Create a custom health check page for Load Balancer resources.

In many scenarios, you might want to expose your own custom health check page to do a more thorough check. One
example scenario is to use the flask application, as in the following example, rather than relying on your existing
application. https://pypi.org/project/py-healthcheck/

```python
import tornado.web
from healthcheck import TornadoHandler, HealthCheck, EnvironmentDump
# add your own check function to the healthcheck
def redis_available():
    client = _redis_client()
    info = client.info()
    return True, "Redis Test Pass"
health = HealthCheck(checkers=[redis_available])
app = tornado.web.Application([(
    "/healthcheck", TornadoHandler, dict(checker=health)),])
```
In the preceding example, the test page is doing more than just ensuring the HTTP application is listening. This example checks for a redis client and waits for a response to ensure that the full application is healthy before returning a 200 status code. Some other command examples would be to check for disk space or the availability of an upstream dependency. In your health check configuration, specify the following:

- `/healthcheck` as your path
- `flask default 5000` as port
- `200` as status code

### Getting Health Check Policy Details

Get the details of a health check policy for a Load Balancer resource and backend set.

Use one of the following methods to get the details of a health check policy for a selected load balancer and backend set.

**To get the details of a health check policy using the Console**

Use the OCI Console to get the details of a health check policy for a Load Balancer resource and backend set.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   - All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Network Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for whose health check policies whose details you want to get.
   - The Load Balancer Details dialog box appears.
6. Click **Backend Sets** under **Resources**.
   - The **Backend Sets** list appears. All backend sets are listed in tabular form.
7. Click the backend set whose details you want to get.
   - The Backend Set Details dialog box appears.
8. Click **Update Health Check**.
   - Alternatively, click the Actions icon (‡) for the backend set whose health check you want to update, and then click **Update Health Check**.
   - The Update Health Check dialog box appears.

**To get the details of a health check policy using the CLI**

Use the command line interface (CLI) to get the details of a health check policy for a Load Balancer resource and backend set.

Enter the following command:

```bash
oci lb health-checker get --backend-set-name backend_set_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb health-checker get --help
```

See `oci lb health-checker get` for a complete description of the command.

**To get the details of a health check policy using the API**

Use the API to get the details of a health check policy for a Load Balancer resource and backend set.

Run the `GetHealthChecker` method to display the details of a health check policy of a backend set for a load balancer. See `GetHealthChecker` for a complete description.
Editing Health Check Policies
Update the health check policy for a Load Balancer resource and backend set.

Use one of the following methods to edit and update the health check policy for a selected load balancer and backend set.

To edit a health check policy using the Console
Use the OCI Console to update a health check policy of a backend set for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.
5. Select the load balancer for whose health check policies you want to edit.
   The Load Balancer Details dialog box appears.
6. Click Backend Sets under Resources.
   The Backend Sets list appears. All backend sets are listed in tabular form.
7. Click the backend set whose details you want to get.
   The Backend Set Details dialog box appears.
8. Click Update Health Check.
   Alternatively, click the Actions icon (idot) for the backend set whose health check you want to update, and then click Update Health Check.
   The Update Health Check dialog box appears.
9. Update any of the following:
   - **Protocol**: Required. Specify the protocol:
     - HTTP
     - TCP

<table>
<thead>
<tr>
<th>Important:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure your health check protocol to match your application or service. See Health Check Management on page 3795 for more information.</td>
</tr>
</tbody>
</table>

- **Port**: Optional. Specify the backend server port against which to run the health check.

<table>
<thead>
<tr>
<th>Tip:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You can enter the value '0' to have the health check use the backend server's traffic port.</td>
</tr>
</tbody>
</table>

- **Interval in MS**: Optional. Specify how frequently to run the health check, in milliseconds. The default is 10000 (10 seconds).
- **Timeout in MS**: Optional. Specify the maximum time in milliseconds to wait for a reply to a health check. A health check is successful only if a reply returns within this timeout period. The default is 3000 (3 seconds).
- **Number of retries**: Optional. Specify the number of retries to attempt before a backend server is considered "unhealthy." This number also applies when recovering a server to the "healthy" state. The default is 3.
- **Status Code**: (HTTP only) Optional. Specify the status code a healthy backend server must return.
- **URL Path (URI)**: (HTTP only) Required. Specify a URL endpoint against which to run the health check.
- **Response Body Regex**: (HTTP only) Optional. Provide a regular expression for parsing the response body from the backend server.

10. Click Save Changes.
To edit a health check policy using the CLI
Use the command line interface (CLI) to update a health check policy of a backend set for a Load Balancer resource.

Enter the following command:

```bash
```

See the CLI online help for a list of options:

```bash
oci lb health-checker update --help
```

See `oci lb health-checker update` for a complete description of the command.

To edit a health check policy using the API
Use the API to update a health check policy of a backend set for a network load balancer for a Load Balancer resource.

Run the `UpdateHealthChecker` method to edit a health check policy of a backend set for a network load balancer for a load balancer. See `UpdateHealthChecker` for a complete description.

Backend Server Management

When you create a Load Balancer resource, you must specify the backend servers (Compute instances) to include in each backend set. The load balancer routes incoming traffic to these backend servers based on the policies you specified for the backend set. You can use the Console to add and remove backend servers in a backend set.

To route traffic to a backend server, the Load Balancing service requires the IP address of the compute instance and the relevant application port. If the backend server resides within the same VCN as the load balancer, Oracle recommends that you specify the compute instance's private IP address. If the backend server resides within a different VCN, you must specify the public IP address of the compute instance. You also must ensure that the VCN's security rules allow Internet traffic.

**Important:**

When you add backend servers to a backend set, you specify either the instance OCID or an IP address for the server to add. An instance with multiple VNICs attached can have multiple IP addresses pointing to it.

- If you identify a backend server by OCID, Load Balancing uses the primary VNIC's primary private IP address.
- If you identify the backend servers to add to a backend set by their IP addresses, it is possible to point to the same instance more than once.

To enable backend traffic, your backend server subnets must have appropriate ingress and egress security rules. When you add backend servers to a backend set, you can specify the applicable network security groups (NSGs). If you prefer to use security lists for your VCN, the Load Balancing service Console can suggest security list rules for you. You also can configure them yourself through the Networking service. See Security Lists on page 4301 for more information.

**Note:**

To accommodate high-volume traffic, Oracle strongly recommends that you use stateless security rules for your load balancer subnets. See Stateful Versus Stateless Rules on page 4290 for more information.

You can add and remove backend servers without disrupting traffic.
Adding Backend Servers
Add a backend server to a backend set for a Load Balancer resource.

**Note:**
If the load balancer has no backend sets, you must create one before you can specify a backend server. See Creating Backend Sets on page 3786 for more information.

Use one of the following methods to add a backend server to a backend set for a selected load balancer.

**To add a backend server using the Console**
Use the OCI Console to add a backend server to a backend set for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.
5. Click the load balancer whose backend set you want to delete.
   
   The Load Balancer Details page appears.
6. Click Backend Sets under Resources.
   
   The Backend Sets list appears. All backend sets are listed in tabular form.
7. Click the name of the backend set to which you want to add one or more backend servers.
   
   The Backend Set Details page appears.
8. Click Backends under Resources.
   
   The Backends list appears. All backend servers are listed in tabular form.
9. Click Add Backends.
   
   The Add Backends dialog box appears.

**Tip:**
You cannot add a backend server marked as Backup to a backend set that uses the IP Hash policy.
10. **Choose how to add backend servers:** Specify how you want to add backend servers to the backend set:

- **Compute Instances:** Choose this option to select from a list of available compute instances.
- **Instances in <compartment>:** Select (check) the instances you want to include in the backend set.

  To select instances from a different compartment, use the **Change Compartment** link and choose a compartment from the list.

  **Tip:**
  
  You can choose instances from one compartment at a time. After you add instances from one compartment, you must repeat the **Add Backends** process to add instances from another compartment.

  After you select an instance to add to the backend set, you can specify:

  - **Port:** Required. The backend server port to which the load balancer must direct traffic.
  - **Weight:** The load balancing weight assigned to the server. For more information, see **Load Balancing Policies** on page 3756.
  - Choose to manually configure subnet security list rules that allow the intended traffic or let the Load Balancing service create security list rules for you. To learn more about these rules, see **Parts of a Security Rule** on page 4288.

    - **Manually configure security list rules after the load balancer is created:** When you choose this option, you must **create your own rules** after adding the backend servers.
    - **Automatically add security list rules:** When you choose this option, the Load Balancing service creates security list rules for you.

    The system displays a table for egress rules and a table for ingress rules. Each table lets you choose the security list that applies to the relevant subnet. You can then choose whether to apply the proposed rules for each affected subnet.

- **IP Addresses:** Choose this option to enter the IP addresses of the backend servers (Compute instances) to add.

  - **IP Address:** Required. Specify the IP address of a backend server you want to add to the backend set.
  - **Port:** Required. Specify the server port to which the load balancer must direct traffic.
  - **Weight:** Required. Specify the load balancing weight to apply to this server. For more information, see **Load Balancing Policies** on page 3756.

    You can click the plus + icon to add another server to the list or click the X icon to remove a list item.

11. **Click Add.**

**To add a backend server using the CLI**

Use the command line interface (CLI) to add a backend server to a backend set for a Load Balancer resource.

Enter the following command:

```
oci lb backend create --backend-set-name backend_set_name --load-balancer-id load_balancer_id --ip-address ip_address --port port [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb backend create --help
```

See **oci lb backend create** for a complete description of the command.

**To add a backend server using the API**

Use the API to add a backend server to a backend set for a Load Balancer resource.

Run the **CreateBackend** method to add a backend server to a backend set for a load balancer. See **CreateBackend** for a complete description.
Listing Backend Servers
List the backend servers contained within a backend set for a Load Balancer resource.

Use one of the following methods to display a list of backend servers contained within a backend set for a selected load balancer.

To list the backend servers using the Console
Use the OCI Console to list the backend servers contained within a backend set for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer containing the backend servers that you want to list.
   
   The Load Balancer Details dialog box appears.
6. Click Backend Sets under Resources.
   
   The Backend Sets list appears. All backend sets are listed in tabular form.
7. Click the backend set whose backend servers you want to list.
   
   The Backend Set Details dialog box appears.
8. Click Backends under Resources.
   
   The Backends list appears. All backend servers are listed in tabular form.

To list the backend servers using the CLI
Use the command line interface (CLI) to list the backend servers contained within a backend set for a Load Balancer resource.

Enter the following command:

```
oci lb backend list --backend-set-name backend_set_name --load-balance-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb backend list --help
```

See oci lb backend list for a complete description of the command.

To list the backend servers using the API
Use the API to list the backend servers contained within a backend set for a Load Balancer resource.

Run the ListBackends method to display a list of backend servers for a backend set for a load balancer. See ListBackends for a complete description.

Getting Backend Server Details
Get the details of a backend server contained within a backend set for a Load Balancer resource.

Use one of the following methods to display the details of a backend server contained within a backend set for a selected load balancer.

To get the details of a backend server using the Console
Use the OCI Console to get the details of a backend server contained within a backend set for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under Type to only display load balancers.
5. Select the load balancer containing the backend servers that you want to list.

   The Load Balancer Details dialog box appears.
6. Click **Backend Sets** under **Resources**.
   
   The **Backend Sets** list appears. All backend sets are listed in tabular form.
7. Click the backend set whose details you want to get.
   
   The Backend Set Details dialog box appears.
8. Click **Backends** under **Resources**.
   
   The Backends list appears. All backend servers are listed in tabular form.

**To get the details of a backend server using the CLI**

Use the command line interface (CLI) to get the details of a backend server contained within a backend set for a Load Balancer resource.

Enter the following command:

```bash
oci lb backend get --backend-name backend_name --backend-set-name backend_set_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb backend get --help
```

See **oci lb backend get** for a complete description of the command.

**To get the details of a backend server using the API**

Use the API to get the details of a backend server contained within a backend set for a Load Balancer resource.

Run the **GetBackend** method to get the details of a backend contained within a backend set for a load balancer. See **GetBackend** for a complete description.

**Editing Backend Servers**

Update a backend server contained within a backend set for a Load Balancer resource.

Use one of the following methods to edit and update the settings of a backend server contained within a backend set for a selected load balancer.

**To edit a backend server using the Console**

Use the OCI Console to update a backend server contained within a backend set for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under Type to only display load balancers.
5. Select the load balancer containing the backend server that you want to edit.
   
   The Load Balancer Details dialog box appears.
6. Click **Backend Sets** under **Resources**.
   
   The **Backend Sets** list appears. All backend sets are listed in tabular form.
7. Click the backend set whose backend server you want to edit.
   
   The Backend Set Details dialog box appears.
8. Click **Backends** under **Resources**.
   
   The Backends list appears. All backend servers are listed in tabular form.
9. Select (check) the row corresponding to the backend server you want to edit.
10. Choose an action from the Actions button list. The available actions include:

- **Edit**: Opens a single dialog box in which you can edit the port, weight, drain, offline, and backup settings.
- **Edit Port**: Opens a dialog box in which you can change the application port setting.
- **Edit Weight**: Opens a dialog box in which you can change the load balancing weight.
- **Edit Drain State**: Opens a dialog box in which you can change the drain state.

  If you set the server's drain status to true, the load balancer stops forwarding new TCP connections and new non-sticky HTTP requests to this backend server. This setting allows an administrator to take the server out of rotation for maintenance purposes.

- **Edit Offline State**: Opens a dialog box in which you can change the offline status.

  If you set the server's offline status to true, the load balancer forwards no ingress traffic to this backend server.

- **Edit Backup State**: Opens a dialog box in which you can change the backup status.

  If you set the server's backup status to true, the load balancer forwards ingress traffic to this backend server only when all other backend servers not marked as backup fail the health check policy. This configuration is useful for handling disaster recovery scenarios.

  **Note:**

  Backend servers marked as Backup are not compatible with a load balancer that uses the IP Hash policy.

- **Delete**: Removes the server from the backend set.

**Tip:**

You can select multiple servers to apply the same action to each one.

11. Click Save Changes.

To edit a backend server using the CLI

Use the command line interface (CLI) to update a backend server contained within a backend set for a Load Balancer resource.

Enter the following command:

```
oci lb backend update --backend-name backend_name --backend-set-name backend_set_name --load-balancer-id loadBalancer_id --backup [true|false] --drain [true|false] --offline [true|false] --weight weight [OPTIONS]
```

The **backup** parameter indicates whether (true) or not (false) the load balancer treats this server as a backup unit. If the value is true, the load balancer forwards no ingress traffic to this backend server unless all other backend servers not marked as "backup" fail the health check policy. You cannot add a backend server marked as backup to a backend set that uses the IP Hash policy.

The **drain** parameter indicates whether (true) or not (false) the load balancer drains this backend server. If the value is true, the backend server receives no new incoming traffic.

The **weight** parameter indicates the load balancing policy weight assigned to the server. Backend servers with a higher weight receive a larger proportion of incoming traffic. For example, a server weighted ‘3’ receives three times the number of new connections as a server weighted ‘1.’ For more information on load balancing policies, see How Load Balancing Policies Work.

See the CLI online help for a list of options:

```
oci lb backend update --help
```

See [oci lb backend get](https://docs.oracle.com/en-us/iaas/api/) for a complete description of the command.
To edit a backend server using the API
Use the API to update a backend server contained within a backend set for a Load Balancer resource.

Run the `UpdateBackend` method to get the details of a backend contained within a backend set for a load balancer. See `UpdateBackend` for a complete description.

Deleting Backend Servers
Delete a backend server contained within a backend set for a Load Balancer resource.

Use one of the following methods to delete a backend server contained within a backend set for a selected load balancer.

To delete a backend server using the Console
Use the OCI Console to delete a backend server contained within a backend set for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list. All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer containing the backend server that you want to delete.
   The Load Balancer Details dialog box appears.
6. Click Backend Sets under Resources.
   The Backend Sets list appears. All backend sets are listed in tabular form.
7. Select (check) the row corresponding to the backend server you want to edit.
8. Click Actions and select Delete from the list.

   Tip:
   You can select multiple servers to delete each one.

9. Confirm the deletion when prompted.

To delete a backend server using the CLI
Use the command line interface (CLI) to delete a backend server contained within a backend set for a Load Balancer resource.

Enter the following command:

```
oci lb backend delete --backend-name backend_name --backend-set-name backend_set_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb backend delete --help
```

See `oci lb backend delete` for a complete description of the command.

To delete a backend server using the API
Use the API to delete a backend server contained within a backend set for a Load Balancer resource.

Run the `DeleteBackend` method to delete a backend contained within a backend set for a load balancer. See `DeleteBackend` for a complete description.

Getting Backend Server Health Details
Get the health details of a backend server within a backend set for a Load Balancer resource.

The primary and standby load balancers both provide health check results that contribute to the health status.
The following table lists the health status indicators and their meanings.

<table>
<thead>
<tr>
<th>Level</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical</td>
<td>Red</td>
<td>Neither health check has returned a status of OK.</td>
</tr>
<tr>
<td>Warning</td>
<td>Yellow</td>
<td>One health check returned a status of OK and one did not.</td>
</tr>
<tr>
<td>Pending</td>
<td>Yellow</td>
<td>One or both health checks returned a status of Pending or the system was unable to retrieve metrics.</td>
</tr>
<tr>
<td>OK</td>
<td>Green</td>
<td>The primary and standby load balancer health checks both return a status of OK.</td>
</tr>
</tbody>
</table>

Use one of the following methods to display the health details of a backend server contained within a backend set for a selected load balancer.

**Getting Backend Server Health Details using the Console**

Use the OCI Console to get the health details of a backend server within a backend set for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer containing the backend servers that you want to list.
   
   The Load Balancer Details dialog box appears.
6. Click **Backend Sets** under **Resources**.
   
   The **Backend Sets** list appears. All backend sets are listed in tabular form.
7. Click the backend set whose details you want to get.
   
   The Backend Set Details dialog box appears.
8. Click **Backends** under **Resources**.
   
   The Backends list appears. All backend servers are listed in tabular form.
9. View the health status of the backend server under **Health**.
   
   See **Health Status Indicators** on page 3795 for descriptions of the load balancer health indicators.

**Getting Backend Server Health Details using the CLI**

Use the command line interface (CLI) to get the health details of a backend server within a backend set for a Load Balancer resource.

Enter the following command:

```
oci lb backend-health get --backend-name backend_name --backend-set-name backend_set_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb backend-health get --help
```

See **oci lb backend-health get** for a complete description of the command.
Getting Backend Server Health Details using the API
Use the API to get the health details of a backend server within a backend set for a Load Balancer resource.

Run the GetBackendHealth method to get the health details a backend set for a load balancer. See GetBackendHealth for a complete description.

See Health Status Indicators on page 3795 for descriptions of the load balancer health indicators.

Listener Management
Learn how to use listeners to check for incoming traffic on the load balancer's IP address.

A listener is a logical entity that checks for incoming traffic on the load balancer's IP address. To handle TCP, HTTP, and HTTPS traffic, you must configure at least one listener per traffic type. When you create a listener, you must ensure that your VCN's security rules allow the listener to accept traffic.

Tip:
To accommodate high-volume traffic, Oracle strongly recommends that you use stateless security rules for your load balancer subnets.

You can have one SSL certificate bundle per listener. You can configure two listeners, one each for ports 443 and 8443, and associate SSL certificate bundles with each listener. For more information about SSL certificates for load balancers, see SSL Certificate Management on page 3867.

Click Listeners under Resources in the Load Balancer Details page to display the Listeners page. This page contains a button for creating listeners.

Creating Listeners
Create a listener for a Load Balancer resource.

Use one of the following methods to create a listener for a selected load balancer.

To create a listener using the Console
Use the OCI Console to create a listener for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer for which you want to create a listener.
   The Load Balancer Details dialog box appears.
6. Click Listeners under Resources.
   The Listeners list appears. All listeners are listed in tabular form.
7. Click Create Listener.
   The Create Listener dialog box appears.
8. Enter the following:
   - Name: Required. Specify a friendly name for the listener. The name must be unique, and cannot be changed.
   - Hostname: Optional. Select up to 16 virtual hostnames for this listener.

   Note:
   To apply a virtual hostname to a listener, the name must be part of the load balancer's configuration. If the load balancer has no associated
Load Balancing

- **Protocol**: Required. Specify the protocol to use, either HTTP or TCP.
- **Port**: Required. Specify the port on which to listen for incoming traffic.
- **Use SSL**: Required for HTTP/2 and HTTPS, optional for HTTP and TCP (check box to enable). The following settings are required to associate an SSL certificate bundle with the listener to enable SSL handling. See SSL Certificate Management on page 3867 for more information on using SSL certificates with load balancers.

  The load balancer automatically detects changes and consumes the current version of the Certificates service entities (certificates, certificate authorities, and CABundles) for use in SSL configuration. See Certificates for more information on automated certificate rotations.

- **Certificate Resource**: Select the certificate resource type from the list:
  
  The method of importing the certificate varies depending on the certificate resource type you select.

  - **Certificate Service Managed Certificate**: Select the certificate in the specified compartment from the Certificate list. Click Change Compartment to choose a different compartment from where to select the certificate.

    Advanced options are available with this selection. Click Show Advanced Options and select the Advanced SSL tab. This option is described later in this topic.

  - **Load Balancer Managed Certificate**: Select one of these options to import the certificate:

    - **Choose SSL Certificate File**: Required. Drag and drop the certificate file, in PEM format, into the SSL Certificate field.
    - Alternatively, you can choose the Paste SSL Certificate option to paste a certificate directly into this field.

    **Important:**

    If you submit a self-signed certificate for backend SSL, you must submit the same certificate in the corresponding CA Certificate field.

    - **Specify Private Key**: Optional. (Required for SSL termination.) Select (check) this box if you want to provide a private key for the certificate.

    - **Choose Private Key File**: Drag and drop the private key, in PEM format, into the Private Key field.

    Alternatively, you can choose the Paste Private Key option to paste a private key directly into this field.

    - **Enter Private Key Passphrase**: Optional. Specify the private key passphrase.

    - **Verify Peer Certificate**: Optional. Select this option to enable peer certificate verification. See SSL Certificate Management on page 3867 for more information.

    - **Verify Depth**: Optional. Specify the maximum depth for certificate chain verification. See SSL Certificate Management on page 3867 for more information.

  - **Backend Set**: Required. Specify the default backend set to which the listener routes traffic.

  - **Idle Timeout in Seconds**: Optional. Specify the maximum idle time in seconds. This setting applies to the time allowed between two successive receive or two successive send network input/output operations during the HTTP request-response phase.

    **Note:**

    The maximum value is 7200 seconds. For more information, see Connection Management on page 3762.

  - **Routing Policy**: Optional. Specify the name of the routing policy that applies to this listener's traffic.

  Choose either a Routing Policy or a Path Route Set.

• **Path Route Set:** Optional. Specify the name of the set of path-based routing rules that applies to this listener's traffic.

  **Note:**

  • To apply a path route set to a listener, the set must be part of the load balancer's configuration.
  • To remove a path route set from an existing listener, choose **None** as the **Path Route Set** option. The path route set remains available for use by other listeners on this load balancer.

• **Show Advanced Options:** Click to display the following options:

  • **Advanced SSL** tab: (Only present if the Certificate Service Managed Certificate certificate resource is selected.) Select one of these options if you picked Certificate Service Managed Certificate when selecting the certificate resource for the listener.
    • **CA Bundle:** Select the certificate authority bundle in the specified compartment from the list. Click **Change Compartment** to choose a different compartment from where to select the certificate authority bundle.
    • **Certificate Authority:** Select the certificate authority in the specified compartment from the list. Click **Change Compartment** to choose a different compartment from where to select the certificate authority bundle.
  
  • **TLS Version:** Specify the Transport Layer Security (TLS) versions:
    • 1.0
    • 1.1
    • 1.2 (recommended)

  You can select any combination of versions. Choose the ones you want from the list. If you do not specify the TLS versions, the default TLS is version 1.2 only.

  • **Select Cipher Suite:** Select a set of cipher suites from the list. (default).

    All choices present in the list have at least one cipher associated with each TLS version you selected.

    • Click **Show Cipher Suite Details** to display the individual ciphers the selected cipher suite contains.

  • **Server Order Preference:** Select **Enable** to give preference to the server ciphers over the client.

9. Click **Create Listener**.

When you create a listener, you must also update your VCN’s security rules to allow traffic to that listener.

**To create a listener using the CLI**

Use the command line interface (CLI) to create a listener for a Load Balancer resource.

Enter the following command:

```
oci lb listener create --name name --default-backend-set-name default_backend_set_name --load-balancer-id load_balancer_id --port port --protocol protocol [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb listener create --help
```

See **oci lb listener create** for a complete description of the command.

**To create a listener using the API**

Use the API to create a listener for a Load Balancer resource.

Run the **CreateListener** method to create a listener for a load balancer. See **CreateListener** for a complete description.
**Listing Listeners**
List the listeners for a Load Balancer resource.

Use one of the following methods to display a list of listeners for a selected load balancer.

**To list the listeners using the Console**
Use the OCI Console to list the listeners for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer containing the listeners that you want to list.
   
   The Load Balancer Details dialog box appears.
6. Click **Listeners** under **Resources**.

   The **Listeners** list appears. All listeners are listed in tabular form.

**Getting Listener Details**
Get the details of a listener for a Load Balancer resource.

Use one of the following methods to display the details of a listener for a selected load balancer.

**To get the details of a listener using the Console**
Use the OCI Console to get the details of a listener for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer containing the listeners that you want to list.
   
   The Load Balancer Details dialog box appears.
6. Click **Listeners** under **Resources**.

   The **Listeners** list appears. All listeners are listed in tabular form.

   The following details are displayed for each listener:
   - **Name**
   - **Protocol**
   - **Port**
   - **Cipher Suite**
   - **Backend Set**
   - **Routing Policy**
   - **Path Route Set**
   - **Hostnames**
   - **Use SSL**

**Editing Listeners**
Update a listener for a Load Balancer resource.

Use one of the following methods to edit and update the settings of a listener for a selected load balancer.
To edit a listener using the Console

Use the OCI Console to update a listener for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer whose listener you want to edit.

   The Load Balancer Details dialog box appears.
6. Click Listeners under Resources.

   The Listeners list appears. All listeners are listed in tabular form.
7. Click the Actions icon ( ) associated with the listener set you want to edit and click Edit.

   The Edit Listener dialog box appears.
9. Click Update Listener.

To edit a listener using the CLI

Use the command line interface (CLI) to update a listener for a Load Balancer resource.

Enter the following command:

```bash
oci lb lister update --load-balancer-id load-balancer_id --listener-name listener_name --default-backend-set-name default_backend_set_name --port port --protocol protocol [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb listener update --help
```

See oci lb listener update for a complete description of the command.

To edit a listener using the API

Use the API to update a listener for a Load Balancer resource.

Run the UpdateListener method to edit a listener for a load balancer. See UpdateListener for a complete description.

Deleting Listeners

Delete a listener from a Load Balancer resource.

Use one of the following methods to delete a listener from a selected load balancer.

To delete a listener using the Console

Use the OCI Console to delete a listener from a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer whose listener you want to delete.

   The Load Balancer Details dialog box appears.
6. Click Listeners under Resources.

   The Listeners list appears. All listeners are listed in tabular form.
7. Click the **Actions** icon (identally) associated with the listener set you want to delete and click **Delete**.

8. Confirm the deletion when prompted.

**To delete a listener using the CLI**
Use the command line interface (CLI) to delete a listener from a Load Balancer resource.

Enter the following command:

```
oci lb lister delete --load-balancer-id load-balancer_id --listener-name listener_name [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb listener delete --help
```

See **oci lb listener delete** for a complete description of the command.

**To delete a listener using the API**
Use the API to delete a listener from a Load Balancer resource.

Run the **DeleteListener** method to edit a listener for a load balancer. See **DeleteListener** for a complete description.

**Enabling Listeners to Accept Traffic**

Use one of the following methods to enable a listener to accept traffic for a selected Load Balancer resource.

**To enable a listener to accept traffic using the Console**
Use the OCI Console to enable a listener to accept traffic for a Load Balancer resource.

To enable a listener to accept traffic, update your VCN's security rules:

1. Open the navigation menu, click **Networking**, and then click **Virtual Cloud Networks**.

   The list of VCNs in the current compartment appears.

2. Click the name of the VCN containing your load balancer, and then click **Security Groups** or **Security Lists**.

   A list of the security groups or lists in the cloud network appears.

3. Click the name of the NSG or security list that applies to your load balancer.

4. Add or edit the existing rules to allow access from the appropriate resources.

   An NSG's security rules appear on the **Network Security Group Details** page. From there you can add, edit, or remove rules.

   The **Security List Details** page provides access to separate tables in which you can add or edit **Ingress Rules** or **Egress Rules**.

   For details on rule configuration, see **Security Rules** on page 4284.

**Cipher Suite Management**

Learn how to use cipher suites with a load balancer to determine the security, compatibility, and speed of HTTPS traffic.

A cipher suite is a logical entity for a set of algorithms, or **ciphers**, using Transport Layer Security (TLS) to determine the security, compatibility, and speed of HTTPS traffic. All ciphers are associated with at least one version of TLS 1.0, 1.1, and 1.2.

**Note:**

Any cipher suite you use or create must contain individual ciphers that match the TLS version supported in your environment. Some ciphers can work with
Multiple TLS versions. If your environment supports at least one of the TLS versions associated with a given cipher, you can use it.

When you create or edit a listener, you add or can change the associated cipher suite. See Listener Management on page 3809 for more information.

Click Cipher Suites under Resources in the Load Balancer Details page to display the Cipher Suites page. This page contains a button for creating cipher suites.

This page also contains a list of all the currently available cipher suites, both ones that came originally preconfigured from Oracle Cloud Infrastructure (Predefined=Yes), and ones that you created yourself (Predefined=No). You can modify or delete those cipher suites you created yourself (Predefined=No). You cannot modify predefined cipher suites.

Creating Cipher Suites
Create a cipher suite for a Load Balancer resource.

After you create a hostname, the name becomes available for use with the associated load balance. You can apply the hostname to a listener. See Listener Management on page 3809 for more information.

Use one of the following methods to create a cipher suite for a selected load balancer.

To create a cipher suite using the Console
Use the OCI Console to create a cipher suite for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer for which you want to add a cipher suite.
   The Load Balancer Details dialog box appears.
6. Click Cipher Suites under Resources.
   The Cipher Suites page appears.
7. Click Create Cipher Suite.
   The Create Cipher Suite page appears.
8. Enter a name for the cipher suite you are creating in the Suite Name field.
9. Check those TLS versions under Filters from which you want to select.
   Ciphers associated with the TLS versions you checked (displaying which TLS versions they support) appear. Only select TLS versions that are supported in your environment.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign at least one cipher to a cipher suite you create. You cannot create a cipher suite that contains no ciphers.</td>
</tr>
</tbody>
</table>

10. Check those ciphers that you want to include in your cipher suite.

   The total number of ciphers available can span multiple pages. Use the Search Ciphers field to find a specific cipher.

   Uncheck a cipher to deselect it from the cipher suite.

11. Click Create Suite.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note the following related to creating cipher suites:</td>
</tr>
</tbody>
</table>

Oracle Cloud Infrastructure User Guide 3815
Load Balancing

- Ensure compatibility between specified SSL protocols and configured ciphers in the cipher suite, or else the SSL handshake is not successful.
- Ensure compatibility between configured ciphers in the cipher suite and configured certificates (for example, RSA-based ciphers require an RSA certificate whereas ECDSA-based ciphers require ECDSA certificates).
- For all load balancer and listener resources that were created before the cipher suites feature was available, the following apply:
  - When running a GET operation, the cipher suite value returned is by default "oci-default-ssl-cipher-suite-v1" inside the listener's SSL configuration. You can update this value by editing the load balancer or listener.
  - When running a GET operation, the cipher suite value returned is displayed as "oci-customized-ssl-cipher-suite" inside the listener's SSL configuration if the cipher configuration customized after the load balancer creation through Oracle operations.
  - For all existing load balancer backendsets that were created before the cipher suites feature was available, running a GET operation displays the cipher suite value as "oci-wider-compatible-ssl-cipher-suite-v1" inside the backendset's SSL configuration.
  - If running a GET operation on a load balancer listener displays the cipher suite value as "oci-customized-ssl-cipher-suite," then choose the appropriate cipher suite name (either pre-defined or custom defined cipher suites) when updating these load balancers.
- The cipher suite name "oci-customized-ssl-cipher-suite" is reserved for use by Oracle and is not acceptable as an available name for a custom cipher suite.

To create a cipher suite using the CLI

Use the command line interface (CLI) to create a cipher suite for a Load Balancer resource.

Enter the following command:

```
oci lb ssl-cipher-suite create --name name --load-balancer-id load-balancer_id --ciphers ciphers [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb ssl-cipher-suite create --help
```

See `oci lb ssl-cipher-suite create` for a complete description of the command.

To create a cipher suite using the API

Use the API to create a cipher suite for a Load Balancer resource.

Run the CreateSSLCipherSuite method to edit a listener for a load balancer. See CreateSSLCipherSuite for a complete description.

Listing Cipher Suites

List the cipher suites for a Load Balancer resource.

Use one of the following methods to display a list of cipher suites for a selected load balancer.

To list the cipher suites using the Console

Use the OCI Console to list the cipher suites for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   - All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to add a cipher suite.

   The Load Balancer Details dialog box appears.

6. Click **Cipher Suites** under **Resources**.

   The Cipher Suites page appears. All cipher suites are listed in tabular form.

**To list the cipher suites using the CLI**

Use the command line interface (CLI) to list the cipher suites for a Load Balancer resource.

Enter the following command:

```
oci lb ssl-cipher-suite list --load-balancer-id load-balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb ssl-cipher-suite list --help
```

See [oci lb ssl-cipher-suite list](#) for a complete description of the command.

**To list the cipher suites using the API**

Use the API to list the cipher suites for a Load Balancer resource.

Run the `ListSSLCipherSuites` method to list the cipher suites for a load balancer. See [ListSSLCipherSuites](#) for a complete description.

**Getting Cipher Suite Details**

Get the details of a cipher suite for a Load Balancer resource.

Use one of the following methods to display the details of a cipher suite for a selected load balancer.

**To get the details of a cipher suite using the Console**

Use the OCI Console to get the details of a cipher suite for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Click **Cipher Suites** under **Resources**.

   The Cipher Suites page appears. All cipher suites are listed in tabular form.
6. Click the cipher suite whose details you want to get.

   Alternatively, click the **Actions** icon ( Inspector) associated with the cipher suite whose details you want to get and click **View Details**.

   The Cipher Suite Details page appears. The Details page displays those ciphers currently included in the cipher suite.

**To get the details of a cipher suite using the CLI**

Use the command line interface (CLI) to get the details of a cipher suite for a Load Balancer resource.

Enter the following command:

```
oci lb ssl-cipher-suite get --name name --load-balancer-id load-balancer_id [OPTIONS]
```
See the CLI online help for a list of options:

```
oci lb ssl-cipher-suite get --help
```

See `oci lb ssl-cipher-suite get` for a complete description of the command.

**To get the details of a cipher suite using the API**

Use the API to get the details of a cipher suite for a Load Balancer resource.

Run the `GetSSLCipherSuite` method to get the details of a cipher suite for a load balancer. See `GetSSLCipherSuite` for a complete description.

**Editing Cipher Suites**

Update a cipher suite for a Load Balancer resource.

Use one of the following methods to edit and update the settings of a cipher suite for a selected load balancer.

**To edit a cipher suite using the Console**

Use the OCI Console to update a cipher suite for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   - All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Click Cipher Suites under Resources.
   - The Cipher Suites page appears. All cipher suites are listed in tabular form.
6. Click the Actions icon (faf) associated with the cipher suite you want to edit and click Edit.
   - The Manage Ciphers dialog box appears.
7. Modify the ciphers contained in the cipher suite:
   - To add ciphers, click Manage Cipher(s).
     - The Select Ciphers page appears. Check the ciphers that you want to add. The ciphers you add must be compatible with the TLS version you are using. Use the Filters to limit the available ciphers by the TLS versions they support. Click Select Ciphers. You are returned to the Details page.
   - To remove ciphers, check those ciphers listed in the Details page and click Remove. All the check ciphers are removed.
     - You can remove individual ciphers by clicking the Actions icon (faf) for the associated cipher, then click Delete.

   **Note:**

   You cannot delete all ciphers from a cipher suite. The cipher suite must contain at least one cipher after editing.

8. Click Update Ciphers.

**To edit a cipher suite using the CLI**

Use the command line interface (CLI) to update a cipher suite for a Load Balancer resource.

Enter the following command:

```
oci lb ssl-cipher-suite update --name name --load-balancer-id load-balancer_id --ciphers ciphers [OPTIONS]
```
Load Balancing

See the CLI online help for a list of options:

```bash
oci lb ssl-cipher-suite update --help
```

See `oci lb ssl-cipher-suite update` for a complete description of the command.

**To edit a cipher suite using the API**

Use the API to update a cipher suite for a Load Balancer resource.

Run the `UpdateSSLCipherSuite` method to edit a cipher suite for a load balancer. See `UpdateSSLCipherSuite` for a complete description.

**Deleting Cipher Suites**

Delete a cipher suite from a Load Balancer resource.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You cannot delete a cipher suite that is in use. Ensure all listeners and backend sets using the cipher suite you want to delete are managed to a different suite first. You might not have access to all compartments containing associated resources.</td>
</tr>
</tbody>
</table>

Use one of the following methods to a cipher suite from a selected load balancer.

**To delete a cipher suite using the Console**

Use the OCI Console to delete a cipher suite from a Load Balancer resource.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You can only delete a custom (Predefined=No) cipher suite.</td>
</tr>
</tbody>
</table>

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Click **Cipher Suites** under **Resources**.
   
   The Cipher Suites page appears. All cipher suites are listed in tabular form.
6. Click the cipher suite you want to delete.
   
   The Cipher Suite Details page appears.
7. Click **Delete**.
   
   Alternatively, click the **Actions** icon ( bicyclist ) associated with the cipher suite you want to delete and click **Delete**.
8. Confirm the deletion when prompted.

**To delete a cipher suite using the CLI**

Use the command line interface (CLI) to delete a cipher suite from a Load Balancer resource.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You can only delete a custom cipher suite.</td>
</tr>
</tbody>
</table>

Enter the following command:

```bash
oci lb ssl-cipher-suite delete --name name --load-balancer-id load-balancer_id [OPTIONS]
```
See the CLI online help for a list of options:

```
oci lb ssl-cipher-suite delete --help
```

See `oci lb ssl-cipher-suite delete` for a complete description of the command.

**To delete a cipher suite using the API**

Use the API to delete a cipher suite from a Load Balancer resource.

**Note:**

You can only delete a custom cipher suite.

Run the `DeleteSSLCipherSuite` method to delete a cipher suite from a load balancer. See `DeleteSSLCipherSuite` for a complete description.

**Supported Ciphers**

Learn about the ciphers supported by the Load Balancing service.

Here is a list of supported ciphers by TLS version.

**TLS version 1.2**

Learn the ciphers for TLS 1.2 for a Load Balancer resource.

**Predefined Cipher Suites**

Learn about the predefined cipher suites for a Load Balancer resource.

Here is a list of the cipher suites that are available for use with Load Balancing, along with the individual ciphers they include.

**oci-default-ssl-cipher-suite-v1**

Learn about the ciphers contained in the oci-default-ssl-cipher-suite-v1 cipher suite.

This cipher suite contains a restricted set of ciphers that are only supported in TLS version 1.2, and meets stricter compliance requirements.

- ECDHE-RSA-AES128-GCM-SHA256
- ECDHE-RSA-AES128-SHA256
- ECDHE-RSA-AES256-GCM-SHA384
- ECDHE-RSA-AES256-SHA384
- DHE-RSA-AES256-GCM-SHA384
- DHE-RSA-AES256-SHA256
- DHE-RSA-AES128-GCM-SHA256
• DHE-RSA-AES128-SHA256

**oci-modern-ssl-cipher-suite-v1**
Learn about the ciphers contained in the oci-modern-ssl-cipher-suite-v1 cipher suite.

This cipher suite offers a wider set of ciphers, but is only supported in TLS version 1.2.

• ECDHE-ECDSA-AES128-GCM-SHA256
• ECDHE-RSA-AES128-GCM-SHA256
• ECDHE-ECDSA-AES128-SHA256
• ECDHE-RSA-AES128-SHA256
• ECDHE-ECDSA-AES256-GCM-SHA384
• ECDHE-RSA-AES256-GCM-SHA384
• ECDHE-ECDSA-AES256-SHA384
• ECDHE-RSA-AES256-SHA384
• AES128-GCM-SHA256
• AES128-SHA256
• AES256-GCM-SHA384
• AES256-SHA256
• DHE-RSA-AES256-GCM-SHA384
• DHE-RSA-AES256-SHA256
• DHE-RSA-AES128-GCM-SHA256
• DHE-RSA-AES128-SHA256

**oci-compatible-ssl-cipher-suite-v1**
Learn about the ciphers contained in the oci-compatible-ssl-cipher-suite-v1 cipher suite.

This cipher suite supports the broadest set of ciphers. It contains ciphers supported by TLS versions 1.1 and 1.2.

• ECDHE-ECDSA-AES128-GCM-SHA256
• ECDHE-RSA-AES128-GCM-SHA256
• ECDHE-ECDSA-AES128-SHA256
• ECDHE-RSA-AES128-SHA256
• ECDHE-ECDSA-AES128-SHA
• ECDHE-RSA-AES128-SHA
• ECDHE-ECDSA-AES256-GCM-SHA384
• ECDHE-RSA-AES256-GCM-SHA384
• ECDHE-ECDSA-AES256-SHA384
• ECDHE-RSA-AES256-SHA384
• ECDHE-RSA-AES256-SHA
• ECDHE-ECDSA-AES256-SHA
• AES128-GCM-SHA256
• AES128-SHA256
• AES128-SHA
• AES256-GCM-SHA384
• AES256-SHA256
• AES256-SHA
• DHE-RSA-AES256-GCM-SHA384
• DHE-RSA-AES256-SHA256
• DHE-RSA-AES128-GCM-SHA256
• DHE-RSA-AES128-SHA256

**oci-wider-compatible-ssl-cipher-suite-v1**
Learn about the ciphers contained in the oci-wider-compatible-ssl-cipher-suite-v1 cipher suite.

This cipher suite contains all supported ciphers.

oci-customized-ssl-cipher-suite

This cipher suite reflects customized cipher tasks performed by Oracle on a client-specific basis occurring before the general release of the cipher suite feature.

Managing Cipher Suites in Listeners and Backend Sets

When you create a load balancer, specifying the cipher suite is part of configuring the listener and the backend set. See Creating Load Balancers on page 3764 for more information.
Request Routing Management

Learn how to route incoming requests to various backend sets.

The Load Balancing service enables you to route incoming requests to various backend sets. You can assign virtual hostnames to a listener or create route rules.

Virtual Hostnames

When used in concert with records you create in your DNS system, you can assign virtual hostnames to any listener you create for your load balancer. Hostnames associated with a listener correspond to the backend sets of that listener. These backend sets route traffic to specific backends which host different applications. Some advantages of virtual hostnames include:

- A single associated IP address. Multiple hostnames, backed by DNS entries that you create in your nameservers, can point to the same load balancer IP address.
- A single load balancer. You do not need a separate load balancer for each application.
- A single load balancer shape. Running multiple applications behind a single load balancer helps you manage aggregate bandwidth demands and optimize utilization.
- Simpler backend set management. Managing a set of backend servers under a single resource simplifies network configuration and administration.

You can define exact virtual hostnames, such as "app.example.com," or you can use wildcard names. Wildcard names include an asterisk (*) in place of the first or last part of the name. When searching for a virtual hostname, the service chooses the first matching variant in the following priority order:

1. Exact name match (no asterisk), such as app.example.com.
2. Longest wildcard name that begins with an asterisk, such as *.example.com.
3. Longest wildcard name that ends with an asterisk, such as app.example.*.

Note: Prefix wildcard names might require a wildcard certificate for HTTPS sites.

Note: Suffix wildcard names might require a multi-domain Subject Alternative Name (SAN) certificate for HTTPS sites.

You do not need to specify the matching pattern to apply. The pattern is inherent in the asterisk position, that is, starting, ending, or none.

The following considerations apply to virtual hostnames:

- You cannot use regular expressions.
- To apply virtual hostnames to a listener, you first create one or more virtual hostnames associated with a load balancer.
- Virtual hostname selection priority is not related to the listener's configuration order.
- You can apply a maximum of 16 virtual hostnames to a listener.
- You can associate a maximum of 16 virtual hostnames with a load balancer.

Note: The virtual hostnames feature supports HTTP and HTTPS listeners only, but does not support TCP listeners.

Note: Default Listener
If a listener has no virtual hostname specified, that listener is the default for the assigned port.

If all listeners on a port have virtual hostnames, the first virtual hostname configured for that port serves as the default listener.

See **Hostname Management** on page 3842 for more information on how to create and manage virtual hostnames.

### Routing Policies

Request routing policies allow you to route ingress traffic requests based on whether they match certain conditions you define. These rule conditions can use boolean and near-match operations. The rules are evaluated in the order you define and the evaluation stops at the first match. You can attach one such request routing rule set to your HTTP or HTTPS listeners. A well-formed request routing rule is made up of one or more match conditions and a single corresponding route action. You can create multiple routing rules. If an incoming request doesn't match any of the rules you created, the request is routed to a default backend set attached to the listener.

For HTTP headers, query data parameters, and cookies, the following match types are supported:

- **Contains**: `<key>` equals `<value>`
- **Does not contain**: `<key>` equals `<value>`
- **Exists**: `<key>`
- **Does not exist**: `<key>`

Routing policies also support rules that match against request URL paths. This behavior is similar to path route sets, but offers different match options. The following match types are supported in routing policies for path matching:

- **Is**: An exact match of the path, such as `/videos` or `/images`.
- **Is not**: Any path that doesn't exactly match the specified path.
- **Starts with**: A match happens if the path begins with the input value. If the parameter provided was `/videos`, then a request for `/videos/images` would still produce a match.
- **Does not start with**: A match happens if the path begins with anything other than the parameter provided. If the parameter provided was `/videos`, then a request for `/images/stills` would still produce a match.
- **Ends with**: A match happens if the path ends with the parameter. If the parameter provided was `/videos`, then a request for `/images/videos` or `/previews/videos` would both produce a match.
- **Does not end with**: A match happens if the path ends with anything other than the parameter provided. So if the parameter provided was `/videos`, then a request for `/videos/images` would produce a match.

**Note:**

Path route sets will be retired on Thursday, 24 March 2022. When path route sets are retired, these options take the place of path route sets rules.

The only supported routing rule action is:

- **Route to a specific backend set**: This choice routes the matched requests to a backend set that you specify.

See **Routing Policy Management** on page 3846 for more information on creating and managing routing policies.

### Path Route Sets

**Note:**

Path route sets will be retired on Thursday, 24 March 2022.

A *path route* is a string that the load balancer matches against an incoming URI to determine the appropriate destination backend set. Some applications have multiple endpoints or content types, each distinguished by a unique
Load Balancing

URI path. For example, /admin/, /data/, /video/, or /cgi/. You can use path route rules to route traffic to the correct backend set without using multiple listeners or load balancers.

A path route set includes all path route rules that define the data routing for a particular listener.

Note the following about path route sets:

• You cannot use asterisks in path route strings.
• You cannot use regular expressions.
• Path route string matching is case-insensitive.
• You can specify up to 20 path route rules per path route set.
• You can have one path route set per listener. The maximum number of listeners limits the number of path route sets you can specify for a load balancer.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Browsers often add an ending slash to the path in a request. If you specify a path such as /admin, you might want to configure the path both with and without the trailing slash. For example, /admin and /admin/.</td>
</tr>
</tbody>
</table>

A path route rule consists of a path route string and a pattern match type.

• Pattern match types include:
  • **EXACT_MATCH**
    Looks for a path string that exactly matches the incoming URI path.
    Applies case-insensitive regex:

    `^<path_string>$`

  • **FORCE_LONGEST_PREFIX_MATCH**
    Looks for the path string with the best, longest match of the beginning portion of the incoming URI path.
    Applies case-insensitive regex:

    `<path_string>.*`

  • **PREFIX_MATCH**
    Looks for a path string that matches the beginning portion of the incoming URI path.
    Applies case-insensitive regex:

    `^<path_string>.*`

  • **SUFFIX_MATCH**
    Looks for a path string that matches the ending portion of the incoming URI path.
    Applies case-insensitive regex:

    `.*<path_string>$`

• Path route rules apply only to HTTP and HTTPS requests and have no effect on TCP requests.

See Path Route Set Management on page 3850 for more information on creating and managing path route sets.

**Rule Priority**

The system applies the following priorities, based on match type, to the path route rules within a set:

• For one path route rule that specifies the EXACT_MATCH type, no cascade of priorities occurs. The listener looks for an exact match only.
• For two path route rules, one that specifies the EXACT_MATCH type and one that specifies any other match type, the exact match rule is evaluated first. If no match is found, then the system looks for the second match type.
• For multiple path route rules specifying various match types, the system applies the following priority cascade:
  1. EXACT_MATCH
  2. FORCE_LONGEST_PREFIX_MATCH
  3. PREFIX_MATCH or SUFFIX_MATCH
• The order of the rules within the path route set does not matter for EXACT_MATCH and FORCE_LONGEST_PREFIX_MATCH. The system applies the priority cascade no matter where these match types appear in the path route set.
• If matching cascades down to prefix or suffix matching, the order of the rules within the path route set DOES matter. The system chooses the first prefix or suffix rule that matches the incoming URI path.

See Rule Set Management on page 3855 for more information on creating and managing rule sets.

Virtual Hostname and Path Route Rules Combinations

Virtual hostnames and path route rules route requests to backend sets. Listeners with a virtual hostname receive priority over the default (no hostname) listener. The following example shows the results of a simple routing interaction.

The example system includes three listeners and one path route set:

Listener 1
• Virtual hostname: none
• Default backend set: A
• Path route set: PathRouteSet1

Listener 2
• Virtual hostname: captive.com
• Default backend set: B
• Path route set: PathRouteSet1

Listener 3
• Virtual hostname: wild.com
• Default backend set: C
• Path route set: PathRouteSet1

Path Route Set
• Path route set name: PathRouteSet1
  • Exact match on path string /tame/ routes to backend set B.
  • Exact match on path string /feral/ routes to backend set C.

The following configuration examples show how incoming routes URLs are routed:
• http://animals.com/ is routed to backend set A
  • Virtual hostname animals.com matches Listener 1.
  • Path / is not an EXACT_MATCH for any path route string in PathRouteSet1.
• http://animals.com/tame/ is routed to backend set B
  • Virtual hostname animals.com matches Listener 1.
  • Path /tame/ is an EXACT_MATCH for path route string /tame/ in PathRouteSet1.
• http://animals.com/feral/ is routed to backend set C
  • Virtual hostname animals.com matches Listener 1.
  • Path /feral/ is an EXACT_MATCH for path route string /feral/ in PathRouteSet1.
• http://captive.com/ is routed to backend set B
  • Virtual hostname captive.com matches Listener 2.
  • Path / is not an EXACT_MATCH for any path route string in PathRouteSet1.
• http://captive.com/tame/ is routed to backend set B
  • Virtual hostname captive.com matches Listener 2.
  • Path /tame/ is an EXACT_MATCH for path route string /tame/ in PathRouteSet1.
• http://captive.com/feral/ is routed to backend set C
  • Virtual hostname captive.com matches Listener 2.
  • Path /feral/ is an EXACT_MATCH for path route string /feral/ in PathRouteSet1.
• http://wild.com/ is routed to backend set C
  • Virtual hostname wild.com matches Listener 3.
  • Path / is not an EXACT_MATCH for any path route string in PathRouteSet1.
• http://wild.com/tame/ is routed to backend set B
  • Virtual hostname wild.com matches Listener 3.
  • Path /tame/ is an EXACT_MATCH for path route string /tame/ in PathRouteSet1.
• http://wild.com/feral/ is routed to backend set C
  • Virtual hostname wild.com matches Listener 3.
  • Path /feral/ is an EXACT_MATCH for path route string /feral/ in PathRouteSet1.

Routing Policy Language
Learn how to write routing policy condition statements that guide load balancer behavior.

To control how incoming requests to resources like web servers are routed, you must create policies. These policies take a general form of "If this, then forward traffic to a backend set." The backend set must be one you have already created.

Routing policies work in the following ways:
• Each HTTP request is evaluated against the rules.
• The rules are run in the order that is defined in the policy.
• Each rule has at least one condition and a backend set.
• If the HTTP request condition matches a rule, the request is forwarded to the backend set defined for the rule. The other rules in the policy are skipped and the request is not evaluated against them.

Example: One Path Rule
Here's an example of a routing policy rule set that contains only one path-based rule:

```json
{
   "name": "BasicPathBasedPolicy",
   "conditionLanguageVersion": "V1",
   "rules": [
      {
         "name": "Documents_rule",
         "condition": "any(http.request.url.path eq (i '/documents'))",
         "actions": [{
            "name": "FORWARD_TO_BACKENDSET",
            "backendSetName": "backendSetForDocuments"
         }]
      }
   ]
}
```

This example shows the following elements:
• The rule set is enclosed in curly brackets { } and contains a name for the rule set, the language version number, and a name for the set of rules.
• The rule set name in the example is "Example_policy". Rules in the set are contained inside square brackets.
• The sole rule in the set is named "Documents_rule".
• The condition for the rule says that if any of the conditions are met, then perform the action in "actions".
• The condition compares the incoming HTTP request URL path with /documents. The comparison is eq meaning equals, which could also be written as =.
• In the condition statement (i '/documents') declares that '/documents' is case-insensitive.
• When the condition is met, the action taken is to forward the request to a specific backend set, in this case "backendSetForDocuments." This backend set must exist for the rule to be valid.

The rule can be paraphrased as "If the requested URL path is an exact match for /documents then forward the request to the backend set backendSetForDocuments."

Example: Two Simple Path Rules

Here's an example of a routing policy rule set that contains two simple path-based rules. An incoming query is sent to a different backend set based on the request URL path, and forwarding happens if either the first condition or the second condition is met. Multiple rules are evaluated in their order in the policy. If a query happens to match both of these conditions, the action is performed on the first one matched and the second match is skipped.

```json
{
   "name": "PathBasedPolicy",
   "conditionLanguageVersion": "V1",
   "rules": [
   {
      "name": "Documents_rule",
      "condition": "any(http.request.url.path eq (i '/documents'))",
      "actions": [{
         "name": "FORWARD_TO_BACKENDSET",
         "backendSetName": "backendSetForDocuments"
      }]
   },
   {
      "name": "Videos_rule",
      "condition": "any(http.request.url.path eq (i '/videos'))",
      "actions": [{
         "name": "FORWARD_TO_BACKENDSET",
         "backendSetName": "backendSetForVideos"
      }]
   }
   ]
}
```

Example: One Rule with Two Conditions

The next policy has one rule with two conditions (each condition is separated by a comma). The first condition examines the request headers, and the second condition examines the request's query string:

```json
{
   "name": "Example_policy",
   "conditionLanguageVersion": "V1",
   "rules": [
   {
      "name": "HR_mobile_user_rule",
      "condition": "all(http.request.headers[(i 'user-agent') eq (i 'mobile'), http.request.url.query['department'] eq 'HR')]",
      "actions": [{
         "name": "FORWARD_TO_BACKENDSET",
         "backendSetName": "backendSetForHRMobileUsers"
      }]
   }
   ]
}
```
The rule now requires that two conditions are both true to forward a request to a backend set, since it begins with the **all** keyword. The conditions for the rule can be paraphrased as "If the requested **user-agent** value in the header is set to **mobile** and the **department** value in the header is **HR**, then forward to the specified backend set.

### Example: Two Rules

The final example shows two rules. Each rule has a different action, and both rules have two conditions. Importantly, the second rule begins with the keyword **any**, meaning that only one of the two conditions needs to be true to trigger the action. If more than two conditions specified, if any one of them is true the action is triggered.

```json
{
   "name": "Example_policy",
   "conditionLanguageVersion": "V1",
   "rules": [
      {
         "name": "HR_mobile_user_rule",
         "condition" : "all(http.request.headers[(i 'user-agent')] eq (i 'mobile'), http.request.url.query["department"] eq 'HR')",
         "actions": [
            {
               "name": "FORWARD_TO_BACKENDSET",
               "backendSetName": "backendSetForHRMobileUsers"
            }
         ]
      },
      {
         "name": "Documents_rule",
         "condition" : "any(http.request.url.path eq (i '/documents'), http.request.headers[(i 'host')] eq 'doc.myapp.com')",
         "actions": [
            {
               "name": "FORWARD_TO_BACKENDSET",
               "backendSetName": "backendSetForDocuments"
            }
         ]
      }
   ]
}
```

### Rule Conditions

Learn about the rule conditions of the routing policy language for a Load Balancer resource.

The rule conditions are written in the form of predicates. Multiple predicates can be used in one condition, using combinators. The two combinators: **any()** and **all()** behave like a logical OR or AND. A combinator can also be negated by putting the keyword **not** before it. A simple predicate can be expressed as:

```
<left value> <matcher> <right value>
```

A condition for a rule that must match if the HTTP request URL path starts with `/foo/bar` would be:

```
http.request.url.path sw '/foo/bar'
```

More details about the available matchers are in [Matchers on page 3835](#).

More details about the available variables are in [Variables on page 3837](#).

### Syntax for multiple predicates

```
not? any|all(<condition>,<condition>,...)
```
Example:

```text
all(http.request.url.path sw '/foo', 'bar' in (http.request.url.query))
```

**Condition examples**

Here are more examples of how conditions can be used. Here are more details on the exact syntax and functionality.

- To match an HTTP request if its URL path starts with "/category/element":

  ```text
  http.request.url.path sw '/category/element'
  ```

- To match an HTTP request if its URL path starts with "/category" or ends with "/id":

  ```text
  any(http.request.url.path sw '/category', http.request.url.path ew '/id')
  ```

- To match an HTTP request if its URL path contains "/category/" and contains "/element/":

  ```text
  all(http.request.url.path co '/category/', http.request.url.path co '/element/')
  ```

- To match an HTTP request if a "User-Agent" request header is present:

  ```text
  (i 'User-Agent') in (http.request.headers)
  ```

- To match an HTTP request if the header "User-Agent" has the value "Some User Agent":

  ```text
  http.request.headers[(i 'User-Agent')] eq 'Some User Agent'
  ```

- To match an HTTP request if the URL query string has a case-sensitive key "search", for example as in the URL https://www.example.com/category/?search=item+foo%20bar&page=1

  ```text
  'search' in (http.request.url.query)
  ```

- To match an HTTP request if the URL query string has a case-sensitive key "search" (case-sensitively) with a case-insensitive value "item+foo%20bar", for example as in the URL https://www.domain.com/category/?search=item+foo%20bar&page=1

  ```text
  http.request.url.query['search'] = (i 'item foo bar')
  ```

Matching for URL query (both keys and values) must be done using URL unescaped versions of their values.

- To case-insensitively match an HTTP request for a cookie named "tastycookie":

  ```text
  (i 'tastycookie') in (http.request.cookies)
  ```

- To case-insensitively match an HTTP request for a cookie named "tastycookie" that contains the case-sensitive value "strawberry":

  ```text
  http.request.cookies[(i 'tastycookie')] = 'strawberry'
  ```

**Matchers**

Learn how to use matchers in the routing policy language for a Load Balancer resource.

Multiple matchers are available to use in conditions.

**String Matchers**

The next table lists the matchers that operate on string values. Some matchers have alternative variants, meaning any of those variants can be used interchangeably for that matcher.

The examples for each matcher all match the http.request.url.path containing '/category/element/id'.
<table>
<thead>
<tr>
<th>Name</th>
<th>Alternatives</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>co</td>
<td></td>
<td>Matches if the value on the left-hand side contains the value on the right-hand side.</td>
<td>http.request.url.path co '/element/'</td>
</tr>
<tr>
<td>eq</td>
<td>=, ==, equal, equals</td>
<td>Matches if values on the left-hand and right-hand side of the matcher are equal.</td>
<td>http.request.url.path eq '/category/element/id'</td>
</tr>
<tr>
<td>ew</td>
<td></td>
<td>Matches if the value on the left-hand side ends with the value on the right-hand side.</td>
<td>http.request.url.path ew '/id'</td>
</tr>
<tr>
<td>sw</td>
<td></td>
<td>Matches if the value on the left-hand side starts with the value on the right-hand side.</td>
<td>http.request.url.path sw '/category'</td>
</tr>
<tr>
<td>not co</td>
<td></td>
<td>Matches if the value on the left-hand side does not contain the value on the right-hand side.</td>
<td>http.request.url.path not co '/not_element/'</td>
</tr>
<tr>
<td>not eq</td>
<td>!=, not equal, not equals</td>
<td>Matches if values on the left-hand and right-hand side of the matcher are not equal.</td>
<td>http.request.url.path not eq '/some/other/path'</td>
</tr>
<tr>
<td>not ew</td>
<td></td>
<td>Matches if the value on the left-hand side does not end with the value on the right-hand side.</td>
<td>http.request.url.path not ew '/not_id'</td>
</tr>
<tr>
<td>not sw</td>
<td></td>
<td>Matches if the value on the left-hand side does not start with the value on the right-hand side.</td>
<td>http.request.url.path not sw '/not_category'</td>
</tr>
</tbody>
</table>

**Partial Matchers**

Some of the variables used in the rules contain arbitrary key-value maps of data when the rules are run. For example `http.request.headers` contains the HTTP request headers. For more details on the available maps, see Variables on page 3837.

The matchers in and not in can be used to check if a map variable contains a specific key. It depends on the variable what the key actually represents.

The syntax for checking if a map variable contains a specific key is:

```
<key> in (<map variable>)
```

- `<key>` must be either a case-sensitive or case-insensitive string.
• The right-hand side value must be in parentheses.

For example, this condition matches if the HTTP request has a cookie with the name 'Foo':

'|Foo' in (http.request.cookies|

**Values**

Learn how to use values in the routing policy language for a Load Balancer resource.

The values used in predicates can be either constant values or variables which are evaluated at runtime.

**Constants**

Learn about the constants associated with the values in the routing policy language for a Load Balancer resource.

The rules support string constants written between single-quotes.

Example:

```java
http.request.url.path sw '/foo'
```

**String case-sensitivity**

String matching uses case-sensitive comparisons by default.

For example, if the HTTP request URL path for some request is /foo then the following predicate would not match for that request, because case-sensitive string comparison is used:

```java
http.request.url.path eq '/FOO'
```

Case-insensitive matching is done if at least one of the compared values is a case-insensitive string. The syntax for a case insensitive string is:

```java
(i '<string content>')
```

For example, these strings are all case-insensitive and are therefore equivalent, when used in predicates:

```java
(i 'foo')
(i 'Foo')
(i 'FOO')
```

In comparison to the original example - this predicate does match, because it uses case-insensitive comparison:

```java
http.request.url.path eq (i '/FOO')
```

**Variables**

Learn about the variables associated with the values in the routing policy language for a Load Balancer resource.

Variables are used in conditions to match against some particular value of the HTTP request. The actual values for each variable are determined when the rules are run, that is, during each individual HTTP request.

**Map Type Variables**

Some of the variables contain arbitrary key-value maps of request data, for example request headers or cookies. For each key, there can be one or more values. For example, there can be multiple request headers with the same name.

Generally map variables can be used in rules these ways:

• To check if a map has a specific key.
  • To check if a map has a specific key with a specific value.

  **Checking if a map has a specific key:**

Checking if a map variable has a specific key is done with the in matcher. For more details, refer to Routing Policy Language on page 3832.

For example:

```
'Foo' in (http.request.cookies)
```

This condition matches if the HTTP request has a cookie with the name 'Foo.'

**Checking if a map has a specific key with a specific value:**

Checking if a map has a specific key with a specific value is done using bracket notation to get the values at a specific key. The syntax for using bracket notation is:

```
<variable>[<key>]
```

The <key> must be specified as a case-sensitive or case-insensitive string.

The actual check for a specific value is done using the eq matcher to check if any of the values at that key are equal to that specific value. The predicate matches if at least one of the values at that key match that specific value.

Examples:

- To match if any value of the header "header-name" equals "header-value":
  
  ```
  http.request.headers[(i 'header-name')] eq 'header-value'
  ```

  Header name is compared case-insensitively, but header value is compared case-sensitively.

- To match if any value of the cookie "cookie-name" equals 'cookie-value':
  
  ```
  http.request.cookies['cookie-name'] eq 'cookie-value'
  ```

The not eq matcher can be used to check that none of the values at that key are equal to a specific value.

Examples:

- To match if no value of the header "header-name" equals "header-value":
  
  ```
  http.request.headers[(i 'header-name')] not eq 'header-value'
  ```

  Header name is compared case-insensitively. Header value is compared case-sensitively.

- To match if no value of the cookie "cookie-name" equals 'cookie-value':
  
  ```
  http.request.cookies['cookie-name'] not eq 'cookie-value'
  ```

**All Available Variables**

The variables available to be used in the conditions are:
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>http.request.headers</td>
<td>A map containing HTTP request headers.</td>
<td>- Correct usage:</td>
</tr>
<tr>
<td></td>
<td>This map has some special behavior - the keys (header names) must be case-insensitive strings.</td>
<td>(i 'User-Agent') in http.request.headers http.request.headers[(i 'User-Agent')] = 'Mobile'</td>
</tr>
<tr>
<td></td>
<td>Using case-sensitive strings for http.request.headers keys in predicates are not allowed.</td>
<td>- Incorrect usage:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'User-Agent' in http.request.headers http.request.headers['User-Agent'] = 'Foo'</td>
</tr>
<tr>
<td>http.request.url.path</td>
<td>HTTP request URL path. This is the request URL, without protocol, domain, port, and query string.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Example</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>http.request.url.query</td>
<td>A map containing HTTP request URL query elements. If the request URL does not have a query (does not have the ? character) or if the query is empty (the ? character is the last one in the URL), this map is empty.</td>
<td>URL: <a href="https://www.domain.com/path?key=value&amp;key=%61&amp;another%20key=another+value">https://www.domain.com/path?key=value&amp;key=%61&amp;another%20key=another+value</a></td>
</tr>
<tr>
<td></td>
<td>The query is parsed to produce the http.request.url.query map, by taking the query string part of the URL (which is the part after the first ? character) and splitting it into key-value pairs, by treating these characters as special:</td>
<td>The http.request.url.query data for a request with this URL would look like this expressed as JSON:</td>
</tr>
<tr>
<td></td>
<td>• &amp; character is the separator between different key-value pairs</td>
<td>{ &quot;key&quot;: [ &quot;value&quot;, &quot;a&quot;] ,</td>
</tr>
<tr>
<td></td>
<td>• = character is the separator between the key and value (inside a key-value pair)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The first ? character present in the URL marks the beginning of the query string. If extra ? characters appear after the first one, they are treated the same as any other character, without any special handling.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Inside a key-value pair, the first = character present separates the key from the value. If extra = characters are present, they are treated as being part of the value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Keys and values are unescaped according to URL escaping rules.</td>
<td>&quot;another key&quot;: [</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In this example, both key and value are matched case-sensitively. So if instead of key=value the URL contained KEY=value or key=VALUE the condition would not match.

However, a key-value pair from the URL query string is not added to the http.request.url.query map in these cases:

• If a = character is not present in a key-value pair

Example:

URL: https://www.example.com/path?no_key"

In this case, the query string element no_key is not present in the http.request.url.query map.

• If the left-hand side of the = character is empty (the key is not specified)

Example: URL: https://www.domain.com/path? =no_value

In this case - the query string element no_value is not present in the http.request.url.query map.

If the right-hand side of the = character is empty - then the value for that key-value pair is an empty string "."
### Load Balancing

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>http.request.cookies</td>
<td>A map containing HTTP request cookies, parsed from the &quot;Cookie&quot; request header as called out in RFC-6265, where the key is a cookie name and the value is the corresponding cookie value. If the &quot;Cookie&quot; request header is not present in the request - this map is empty.</td>
<td></td>
</tr>
</tbody>
</table>

#### Examples

An incoming HTTP/1.1 request looks like this (request line and headers):

```
GET /category/some_category?action=search&query=search+terms&filters[]=5&features[]=12 HTTP/1.1
Accept-Encoding: gzip, deflate, br
Cookie: cookie_a=1; cookie_b=foo
Host: www.domain.com
User-Agent: Browser Foo/1.0
X-Forwarded-For: 1.2.3.4, 5.6.7.8
X-Forwarded-For: 9.10.11.12
```

Then the variables available for rules would be populated with data from this request as follows:(the data for structured variables is shown in JSON format)

```
http.request.url.path: "/category/some_category"

http.request.url.query: {
  "action": ["search"],
  "query": ["search terms"],
  "filters\[]": ["5", "12"]
}

http.request.headers: {
  "Accept-Encoding": ["gzip, deflate, br"],
  "Cookie": ["some_cookie=1; another_cookie=foo"],
  "Host": ["www.domain.com"],
  "User-Agent": ["Browser Foo/1.0"],
  "X-Forwarded-For": ["1.2.3.4, 5.6.7.8", "9.10.11.12"]
}

http.request.cookies: {
  "cookie_a": ["1"],
  "cookie_b": ["foo"]
}
```

Here are some examples how we could match this request:

- If we wanted to match requests to domain "www.domain.com" and URL paths that start with "/category/" we would use a condition like this:

  ```
  all(http.request.headers[(i 'Host')] eq 'www.domain.com',
  http.request.url.path sw '/category')
  ```
Load Balancing

- To match requests where the URL path is exactly "/category/some_category" or request query element "action=search"

```
any(http.request.url.path eq '/category/some_category',
    http.request.url.query['action'] eq 'search')
```

- To match requests that have a query string element named "query" with value "search terms" (after URL unescaping)

```
http.request.url.query['query'] eq 'search terms'
```

- To match requests that have cookie "cookie_a" but don't have cookie "cookie_c":

```
all('cookie_a' in (http.request.cookies), 'cookie_c' not in (http.request.cookies))
```

Hostname Management

Learn to use hostnames with a load balancer for one or more listeners.

This topic describes how to manage your load balancer's hostnames for use with one or more listeners.

Creating Hostnames

Create a hostname for a Load Balancer resource.

Use one of the following methods to create a hostname for a selected load balancer.

To create a hostname using the Console

Use the OCI Console to create a hostname for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer for which you want to create a hostname.
   The Load Balancer Details dialog box appears.
6. Click Hostnames under Resources.
   The Hostnames list appears. All hostnames are listed in tabular form.
7. Click Create Hostname.
   The Create Hostname dialog box appears.
8. Enter the following:
   - Name: Required. Specify a friendly name for the hostname. The name must be unique, and cannot be changed.
   - Hostname: Required. Specify the virtual hostname. See Hostname Management on page 3842 for more information.
9. Click Create. The Work Request Submitted dialog box opens.
10. (optional) Click View All Work Requests to open the Work Requests page and view the status of the work request.
11. Click Close.

To create a hostname using the CLI

Use the command line interface (CLI) to create a hostname for a Load Balancer resource.

Enter the following command:

```
orci lb hostname create --hostname hostname --name name --load-balancer-id load_balancer_id [OPTIONS]
```
See the CLI online help for a list of options:

```bash
oci lb hostname create --help
```

See `oci lb hostname create` for a complete description of the command.

**To create a hostname using the API**

Use the API to create a hostname for a Load Balancer resource.

Run the `CreateHostname` method to create a listener for a load balancer. See `CreateHostname` for a complete description.

**Listing Hostnames**

List the hostnames for a Load Balancer resource.

Use one of the following methods to display a list of hostnames for a selected load balancer.

**To list the hostnames using the Console**

Use the OCI Console to list the hostnames for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer for which you want to create a hostname.
   
   The Load Balancer Details dialog box appears.
6. Click Hostnames under Resources.
   
   The Hostname list appears. All hostnames are listed in tabular form.

**To list the hostnames using the CLI**

Use the command line interface (CLI) to list the hostnames for a Load Balancer resource.

Enter the following command:

```bash
oci lb hostname list --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb hostname list --help
```

See `oci lb hostname list` for a complete description of the command.

**To list the hostnames using the API**

Use the API to list the hostnames for a Load Balancer resource.

Run the `ListHostnames` method to display a list of hostnames for a load balancer. See `ListHostnames` for a complete description.

**Getting Hostname Details**

Get the details of a hostname for a Load Balancer resource.

Use one of the following methods to display the details of a hostname for a selected load balancer.

**To get the details of a hostname using the Console**

Use the OCI Console to get the details of a hostname for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.

5. Select the load balancer for which you want to create a hostname.

   The Load Balancer Details dialog box appears.

6. Click **Hostnames** under **Resources**.

   The **Hostname** list appears. All hostnames are listed in tabular form.

   The following details are displayed for each hostname:
   - **Name**
   - **Hostname**

**To get the details of a hostname using the CLI**

Use the command line interface (CLI) to get the details of a hostname for a Load Balancer resource.

Enter the following command:

```
oci lb hostname get --name name --load-balancer-id load_balancer_id
[OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb hostname get --help
```

See **oci lb hostname get** for a complete description of the command.

**To get the details of a hostname using the API**

Use the API to get the details of a hostname for a Load Balancer resource.

Run the **GetHostname** method to get the details of a hostname for a load balancer. See **GetHostname** for a complete description.

**Editing Hostnames**

Update a hostname for a Load Balancer resource.

Use one of the following methods to edit and update the settings of a hostname for a selected load balancer.

**To edit a hostname using the Console**

Use the OCI Console to update a hostname for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.

2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.

3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.

4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.

5. Select the load balancer for which you want to create a hostname.

   The Load Balancer Details dialog box appears.

6. Click **Hostnames** under **Resources**.

   The **Hostnames** list appears. All hostnames are listed in tabular form.

   The following details are displayed for each hostname:
   - **Name**
   - **Hostname**

7. For the hostname you want to edit, click the Actions menu, and then click **Edit**.

8. In the **Edit Hostname** dialog box, enter your updates to the **Hostname** field.

   You cannot edit the **Name** field of an existing virtual hostname.

9. Click **Update**. The **Work Request Submitted** dialog box opens.
To close the dialog box, click Close. To open the Work Requests page and view the status of the work request, click View All Work Requests.

To edit a hostname using the CLI
Use the command line interface (CLI) to update a hostname for a Load Balancer resource.

Enter the following command:

```
oci lb hostname update --name name --load-balancer-id load_balancer_id
```

See the CLI online help for a list of options:

```
oci lb hostname update --help
```

See oci lb hostname get for a complete description of the command.

To edit a hostname using the API
Use the API to update a hostname for a Load Balancer resource.

Run the UpdateHostname method to edit a hostname for a load balancer. See UpdateHostname for a complete description.

Deleting Hostnames
Delete a hostname from a Load Balancer resource.

Use one of the following methods to delete a hostname from a selected load balancer.

To delete a hostname using the Console
Use the OCI Console to delete a hostname from a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer for whose hostname you want to delete.
   The Load Balancer Details dialog box appears.
6. Click Hostnames under Resources.
   The Hostnames list appears. All hostnames are listed in tabular form.
7. Click the Actions icon (estruction) associated with the hostname you want to delete and click Delete.
8. Confirm the deletion when prompted.

To delete a hostname using the CLI
Use the command line interface (CLI) to delete a hostname from a Load Balancer resource.

Enter the following command:

```
oci lb hostname delete --name name --load-balancer-id load_balancer_id
```

See the CLI online help for a list of options:

```
oci lb hostname delete --help
```

See oci lb hostname delete for a complete description of the command.
**To delete a hostname using the API**
Use the API to delete a hostname from a Load Balancer resource.

Run the `DeleteHostname` method to get the details of a hostname for a load balancer. See `DeleteHostname` for a complete description.

**Routing Policy Management**
Learn to use routing policies to apply a named ordered list of routing rules to a listener.

A routing policy is a named ordered list of routing rules that is applied to a listener.

**Creating Routing Policies**
Create a routing policy for a Load Balancer resource.

Use one of the following methods to create a routing policy for a selected load balancer.

**To create a routing policy using the Console**
Use the OCI Console to create a routing policy for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a routing policy.
   
   The Load Balancer Details dialog box appears.
6. Click **Routing Policies** under **Resources**.
    
    The **Routing Policy** list appears. All routing policies are listed in tabular form.
7. Click **Create Routing Policy**.
   
   The Create Routing Policy dialog box appears.
8. Enter a **Name** for the routing policy rule set. A name is required. The name must be unique, and cannot be changed. The name cannot begin with a period and cannot contain any of these characters: ; ? # / % \ [ ]. The name must start with an lower- or upper-case letter or an underscore, and the rest of the name can contain numbers, underscores, and upper- or lower-case letters.
9. To create a rule in the rule set:
   
   a. Choose **If All Match** (peer conditions use a logical AND) or **If Any Match** (peer conditions use a logical OR). In rules with multiple conditions, this selection guides whether one or all stated conditions produce an action. There can be up to five rule conditions, and you can have up to five nested conditions within a top-level condition. There can be up to 200 conditions total in a policy. Nested conditions can't have further conditions nested within them.
   
   b. Each top-level condition has a type, a match style, and a final criteria.
      
      - **Condition Type**: The setting can be **Path**, **Request Cookies**, **Request Header**, **URL Query**, or **Nested Match**. The available fields for a condition change depending on the condition type.
        
        A **Nested Match** also has a **Nested conditions match criteria** for conditions nested within, allowing you to have a mix of AND and OR in a condition. Click **+Another Nested Condition** to add another nested condition within the group. You can only nest conditions one level deep.
      
      - The match style for **Path** can be: **Is**, **Is not**, **Starts with**, **Does not start with**, **Ends with**, or **Does not end with**. The match style for **Request Header**, **Request Cookies**, and **URL Query** can be: **Contains**, **Does not contain**, **Exists**, or **Does not exist**.
      
      - The final criteria depends on the **Condition Type** selected, and can be a **URL String** (All Path conditions use this) a **Key,Value** pair or simply a **Key**.
    
   c. Select the Action. If you choose **Route to Backend Set**, select the destination backend set from the list of available sets.
   
   d. To create another rule, click **+ Another Rule**.
10. You can also click **Show Advanced Controls**. An editing window opens where you can directly enter text to define rules using the **Routing Policy Language** on page 3832.

11. Click **Next** after you finish defining the rules.

   The next step is to confirm the order of the rules.

12. In the right end of the order list row corresponding to that rule. Click the down arrow to see a summary of the conditions and actions set in a rule.

13. Click **Reorder** to move a rule up or down in the policy order.

   Choose from among **Move to Top**, **Move to Bottom**, **Move Up**, or **Move Down**. The last two options shift that rule up or down by one position in the order.

14. When the routing policy rules are created and in the right order, click **Create Routing Policy**.

To use a routing policy, you must create a listener that uses the policy.

**To create a routing policy using the CLI**

Use the command line interface (CLI) to create a routing policy for a Load Balancer resource.

Enter the following command:

```latex
oci lb routing-policy create --name name --load-balancer-id load_balancer_id --condition-language-version condition_language_version --rules rules [OPTIONS]
```

See the CLI online help for a list of options:

```latex
oci lb routing-policy create --help
```

See [oci lb routing-policy create](#) for a complete description of the command.

**To create a routing policy using the API**

Use the API to create a routing policy for a Load Balancer resource.

Run the [CreateRoutingPolicy](#) method to get the details of a hostname for a load balancer. See [CreateRoutingPolicy](#) for a complete description.

**Listing Routing Policies**

List the routing policies for a Load Balancer resource.

Use one of the following methods to display a list of routing policies for a selected load balancer.

**To list the routing policies using the Console**

Use the OCI Console to list the routing policies for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   - All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a routing policy.

The Load Balancer Details dialog box appears.

6. Click **Routing Policies** under **Resources**.
   - The **Routing Policy** list appears. All routing policies are listed in tabular form.

**To list the routing policies using the CLI**

Use the command line interface (CLI) to list the routing policies for a Load Balancer resource.

Enter the following command:

```latex
oci lb routing-policy list --load-balancer-id load_balancer_id [OPTIONS]
```
Load Balancing

See the CLI online help for a list of options:

```
oci lb routing-policy list --help
```

See `oci lb routing-policy list` for a complete description of the command.

**To list the routing policies using the API**

Use the API to list the routing policies for a Load Balancer resource.

Run the `ListRoutingPolicies` method to display a list of hostnames for a load balancer. See `ListRoutingPolicies` for a complete description.

### Getting Routing Policy Details

Get the details of a routing policy for a Load Balancer resource.

**To get the details of a routing policy using the Console**

Use the OCI Console to get the details of a routing policy for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a routing policy.
   
   The Load Balancer Details dialog box appears.
6. Click **Routing Policies** under **Resources**.
   
   The **Routing Policy** list appears. All routing policies are listed in tabular form.
7. Click the routing policy whose details you want to get.
   
   The Routing Policy Details page appears.

**To get the details of a routing policy using the CLI**

Use the command line interface (CLI) to get the details of a routing policy for a Load Balancer resource.

Enter the following command:

```
oci lb routing-policy get --routing-policy-name routing_policy_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb routing-policy get --help
```

See `oci lb routing-policy get` for a complete description of the command.

**To get the details of a routing policy using the API**

Use the API to get the details of a routing policy for a Load Balancer resource.

Run the `GetRoutingPolicy` method to get the details of a hostname for a load balancer. See `GetRoutingPolicy` for a complete description.

### Editing Routing Policy Details

Update a routing policy for a Load Balancer resource.

Use one of the following methods to edit and update the settings of a routing policy for a selected load balancer.

**To edit a routing policy using the Console**

Use the OCI Console to update a routing policy for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.

2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer whose routing policy you want to edit.
   The Load Balancer Details dialog box appears.
6. Click **Routing Policies** under **Resources**.
   The **Routing Policy** list appears. All routing policies are listed in tabular form.
7. Click the routing policy whose settings you want to edit.
   The Routing Policy Details page appears.
8. Click **Edit**.
   The Edit Routing Policy dialog box appears.
9. Make your edits.
   See **Creating Routing Policies** on page 3846 for details on the routing policy settings.
10. Click **Save Changes**.

**To edit a routing policy using the CLI**
Use the command line interface (CLI) to update a routing policy for a Load Balancer resource.

Enter the following command:

```
oci lb routing-policy update --routing-policy-name routing_policy_name --load-balancer-id load_balancer_id --rules rules [OPTIONS]
```

See the CLI online help for a list of options:
```
oci lb routing-policy update --help
```

See **oci lb routing-policy update** for a complete description of the command.

**To edit a routing policy using the API**
Use the API to update a routing policy for a Load Balancer resource.

Run the `UpdateRoutingPolicy` method to edit a routing policy for a load balancer. See `UpdateRoutingPolicy` for a complete description.

**Deleting Routing Policies**
Delete a routing policy from a Load Balancer resource.

Use one of the following methods to delete a routing policy from a selected load balancer.

**To delete a routing policy using the Console**
Use the OCI Console to delete a routing policy from a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer from which you want to delete a routing policy.
   The Load Balancer Details dialog box appears.
6. Click **Routing Policies** under **Resources**.
   The **Routing Policy** list appears. All routing policies are listed in tabular form.
7. Click the routing policy whose details you want to delete.

   The Routing Policy Details page appears.

8. Click Delete.

9. Confirm the deletion when prompted.

To delete a routing policy using the CLI

Use the command line interface (CLI) to delete a routing policy from a Load Balancer resource.

Enter the following command:

```bash
oci lb routing-policy delete --routing-policy-name routing_policy_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb routing-policy delete --help
```

See `oci lb routing-policy delete` for a complete description of the command.

To delete a routing policy using the API

Use the API to delete a routing policy from a Load Balancer resource.

Run the `DeleteRoutingPolicy` method to delete a routing policy from a load balancer. See `DeleteRoutingPolicy` for a complete description.

**Path Route Set Management**

Learn to use path route sets to apply a set of path routes to a Load Balancer resource.

To apply path route rules to a listener, you first create a path route set that contains the rules. The path route set becomes a part of the load balancer's configuration. You then specify the path route set to use when you create or update a listener for the load balancer. To remove a path route set from a listener, edit the listener and choose **None** as the Path Route Set option.

**Note:**

Path route rules will be retired on: Thursday, 24 March 2022. Instead, use routing policies. See `Routing Policy Management` on page 3846 for more information.

**Creating Path Route Sets**

Create a path route set for a Load Balancer resource.

Use one of the following methods to create a path route set for a selected load balancer.

To create a path route set using the Console

Use the OCI Console to create a path route set for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a path route set.

   The Load Balancer Details dialog box appears.
6. Click **Path Route Sets** under **Resources**.

   The **Path Route Sets** list appears. All routing policies are listed in tabular form.
7. Click **Create Path Route Set**.

   The Create Path Route Set dialog box appears.
8. Enter the following:

- **Name**: Required. Specify a friendly name for the path route set. The name must be unique, and cannot be changed.

  The path route set name cannot begin with a period and cannot contain the characters ;, ?, #, %, /, \, [, or ]. Avoid entering confidential information.

- **Path Route Rules**
  - **Order**: Optional. If you have multiple path route rules, you can click the up or down arrows to move the corresponding rule.

  **Note:**
  The order of the rules within the path route set usually does not matter. However, if matching cascades down to prefix or suffix matching, the system chooses the first prefix or suffix rule that matches the incoming URI path.

  - **Match Style**: Required. The type of matching to apply to incoming URIs. See Request Routing Management on page 3828 for more information.

  - **URL String**: Required. The path string to match against the incoming URI path, for example /admin/.

  - **Backend Set Name**: Required. The name of the target backend set for requests where the incoming URI matches the specified path.

  - Click **+ Additional Rule** to create another path route rule. You can have up to 20 path route rules in a set.

  - Click **X** to delete an existing rule.

9. Click **Create**.

After you create a path route set, the set becomes available for use with the associated load balance. Create or update a listener to apply the path route set.

*To create a path route set using the CLI*

Use the command line interface (CLI) to create a path route set for a Load Balancer resource.

Enter the following command:

```
oci lb path-route-set create --name name --load-balancer-id load_balancer_id --path-routes path_routes [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb path-route-set create --help
```

See **oci lb path-route-set create** for a complete description of the command.

*To create a path route set using the API*

Use the API to create a path route set for a Load Balancer resource.

Run the **CreatePathRouteSet** method to create a path route set for a load balancer. See **CreatePathRouteSet** for a complete description.

**Listing Path Route Sets**

List the path route sets for a Load Balancer resource.

Use one of the following methods to display a list of path route sets for a selected load balancer.

*To list the path route sets using the Console*

Use the OCI Console to list the path route sets for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.

  All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a path route set.

   The Load Balancer Details dialog box appears.

6. Click **Path Route Sets** under **Resources**.

   The **Path Route Sets** list appears. All path route sets are listed in tabular form.

**To list the path route sets using the CLI**

Use the command line interface (CLI) to list the path route sets for a Load Balancer resource.

Enter the following command:

```bash
oci lb path-route-set list --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb path-route-set list --help
```

See [oci lb path-route-set list](https://docs.oracle.com/en-us/iaas/tools/python-sdk-examples/latest/ load_balancer/list.html) for a complete description of the command.

**To list the path route sets using the API**

Use the API to list the path route sets for a Load Balancer resource.

Run the **ListPathRouteSets** method to display a list of path route sets for a load balancer. See [ListPathRouteSets](https://docs.oracle.com/en-us/iaas/tools/python-sdk-examples/latest/load_balancer/list.html) for a complete description.

**Getting Path Route Set Details**

Get the details of a path route set for a Load Balancer resource.

Use one of the following methods to display the details of a path route set for a selected load balancer.

**To get the details of a path route set using the Console**

Use the OCI Console to get the details of a path route set for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer whose path route set details you want to get.

   The Load Balancer Details dialog box appears.

6. Click **Path Route Sets** under **Resources**.

   The **Path Route Sets** list appears. All path route sets are listed in tabular form.

7. Click the path route set whose details you want to get.

   The Path Route Set Details page appears.

**To get the details of a path route set using the CLI**

Use the command line interface (CLI) to get the details of a path route set for a Load Balancer resource.

Enter the following command:

```bash
oci lb path-route-set get --path-route-set-name path_route_set_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb path-route-set get --help
```
See `oci lb path-route-set get` for a complete description of the command.

**To get the details of a path route set using the API**
Use the API to get the details of a path route set for a Load Balancer resource.

Run the `GetPathRouteSet` method to display the details of a path route set for a load balancer. See `GetPathRouteSet` for a complete description.

**Editing Path Route Sets**
Update a path route set for a Load Balancer resource.

**To edit a path route rule using the Console**
Use the OCI Console to update a path route set for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   - All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for whose path route set you want to update.
   - The Load Balancer Details dialog box appears.
6. Click **Path Route Sets** under **Resources**.
   - The **Path Route Sets** list appears. All path route sets are listed in tabular form.
7. Click the path route set whose settings you want to edit.
   - The Path Route Set Details page appears.
8. Click **Edit**.
   - Alternatively, click the **Actions** icon ( ☉ ) associated with the path route set you want to edit and click **Edit**.
   - The Edit Path Route Set dialog box appears.
9. Edit the following as needed for each rule you want to change:
   - **Order**: Optional. If you have multiple path route rules, you can click the up or down arrows to move the corresponding rule.

   **Note:**
   The order of the rules within the path route set usually does not matter. However, if matching cascades down to prefix or suffix matching, the system chooses the first prefix or suffix rule that matches the incoming URI path.

   - **Match Style**: Required. The type of matching to apply to incoming URIs. See **Request Routing Management** on page 3828 for more information.
   - **URL String**: Required. The path string to match against the incoming URI path, for example `/admin/`.
   - **Backend Set Name**: Required. The name of the target backend set for requests where the incoming URI matches the specified path.
   - Click `+ Additional Rule` to create another path route rule. You can have up to 20 path route rules in a set.
   - Click `X` to delete an existing rule.
10. Click **Save Changes**.
To edit a path route set using the CLI
Use the command line interface (CLI) to update a path route set for a Load Balancer resource.

Enter the following command:

```
oci lb path-route-set update --path-route-set-name path_route_set_name --load-balancer-id load_balancer_id --path-routes path_routes [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb path-route-set update --help
```

See `oci lb path-route-set update` for a complete description of the command.

To edit a path route set using the API
Use the API to update a path route set for a Load Balancer resource.

Run the `UpdatePathRouteSet` method to edit a path route set for a load balancer. See `UpdatePathRouteSet` for a complete description.

Deleting Path Route Sets
Delete a path route set from a Load Balancer resource.

Use one of the following methods to delete a path route set from a selected load balancer.

To delete a path route set using the Console
Use the OCI Console to delete a path route set from a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer for whose path route set you want to update.
6. The Load Balancer Details dialog box appears.
7. Click Path Route Sets under Resources.
   The Path Route Sets list appears. All path route sets are listed in tabular form.
8. Click the path route set whose settings you want to delete.
   The Path Route Set Details page appears.
9. Click Delete.

   Alternatively, click the Actions icon (●) associated with the path route set you want to delete and click Delete.
10. Confirm the deletion when prompted.

To delete a path route set using the CLI
Use the command line interface (CLI) to delete a path route set from a Load Balancer resource.

Enter the following command:

```
oci lb path-route-set delete --path-route-set-name path_route_set_name --load-balancer-id load_balancer_id --path-routes path_routes [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb path-route-set delete --help
```

See `oci lb path-route-set delete` for a complete description of the command.
To delete a path route set using the API
Use the API to delete a path route set from a Load Balancer resource.

Run the `DeletePathRouteSet` method to delete a path route set for a load balancer. See `DeletePathRouteSet` for a complete description.

Rule Set Management
Learn to use rule sets composed of actions that are applied to traffic at a Load Balancer resource's listener.

A rule set is a named set of rules associated with a load balancer and applied to one or more listeners on that load balancer. To apply a rule set to a listener, you first create the rule set that contains the rules. Rules are objects that represent actions applied to traffic at a load balancer listener. The rule set becomes a part of the load balancer's configuration. You can specify the rule set to use when you create or update a listener for the load balancer.

You can include the following types of rules in a rule set:

- **Access control rules**, which restrict access to application resources based on the source of the request.
- **Access method rules**, which specify the permitted HTTP methods.
- **URL redirect rules**, which route incoming HTTP requests to a different destination URL.
- **Request and response header rules**, which add, alter, or remove HTTP request or response headers.
- **HTTP header rules**, which specify the size of the HTTP header and whether period and underscore characters are permitted within the headers.

**Note:**
Rule sets apply only to HTTP listeners.

You can apply an existing rule set when you edit a listener. You can apply the same rule set to multiple listeners on the same load balancer.

Rule sets are not shared between load balancers. To use the same set of rules on another load balancer, you must create a new, identical rule set under that load balancer.

You can have up to 20 rules in a rule set. You can associate a maximum of 50 rules with a load balancer.

**Access Control Rules**
Learn about access control rules for Load Balancer resources.

Access control rules permit access to application resources based on user-specified IP address or address range match conditions. If you do not specify any access control rules, the default rule is to allow all traffic. If you add access control rules, the load balancer denies any traffic that does not match the rules.

The service accepts only classless inter-domain routing (CIDR) format (x.x.x.x/y or x:x:x:x/y) strings for the match condition.

Specify `0.0.0.0/0` or `::/0` to match all incoming traffic.

**Note:**
Only US Government Cloud regions currently permit IPv6 values.

**Access Method Rules**
Learn about access method rules for Load Balancer resources.

Access method rules specify the HTTP methods allowed at the associated listener. The load balancer does not forward a disallowed request to the backend servers and returns a 405 Method Not Allowed response with a list of the allowed methods. You can associate only one list of allowed methods with a given listener.

By default, you can specify only the standard HTTP methods defined in the HTTP Method Registry. The list of HTTP methods is extensible. If you need to configure custom HTTP methods, contact My Oracle Support to remove the restriction from your tenancy. Your backend application must be able to handle the specified methods.

The following list shows the default HTTP methods:
URL Redirect Rules
Learn about URL redirect rules for Load Balancer resources.

URL redirect rules specify how to route incoming HTTP requests to a different destination URL. URL redirect rules apply only to HTTP listeners. You configure each redirect rule for a particular listener and a designated path. A listener can have only one redirect rule for a given incoming URL path.

When you create a URL redirect rule, you specify the path string and match condition the service uses to evaluate an incoming URL for redirection. You also define the redirect URL and response code.

Incoming Path String Evaluation
You specify the path string, or pattern, to evaluate in the incoming URL. For example:

```
/video
```

You also specify the match condition to apply when evaluating the incoming URL for redirection. The available match types are:

- **FORCE_LONGEST_PREFIX_MATCH**
  The system looks for a redirect rule path string with the best, longest match of the beginning portion of the incoming URL path.
- **EXACT_MATCH**
  The incoming URL path must exactly and completely match the specified path string.
- **PREFIX_MATCH**
  The beginning portion of the incoming URL path must exactly match the specified path string.
- **SUFFIX_MATCH**
  The ending portion of the incoming URL path must exactly match the specified path string.
Redirection URL Construction

You define the redirect URL applied to the original request. URL redirect rules recognize the following URL components:

\[<\text{protocol}>://<\text{host}>:<\text{port}>/<\text{path}>?<\text{query}>\]

You can specify a literal string or provide a token for any component. Tokens extract values from the incoming HTTP request URL. Tokens are case-sensitive. For example, \{host\} is a valid token, but \{HOST\} is not.

- **Protocol**
  
  The HTTP protocol to use in the redirect URL. Valid values are HTTP and HTTPS.

  The \{protocol\} token extracts the protocol from the incoming HTTP request URL. It is the only valid token for this property.

- **Host**
  
  The valid domain name or IP address to use in the redirect URL.

  The \{host\} token extracts the host from the incoming HTTP request URL. All URL Redirect tokens are valid for this property. You can use any token more than once.

  Curly braces {} are valid in this property only to surround tokens.

- **Port**
  
  The communication port to use in the redirect URL. Valid values include integers from 1 to 65535.

  The \{port\} token extracts the port from the incoming HTTP request URL. It is the only valid token for this property.

- **Path**
  
  The HTTP URL path to use in the redirect URL. To omit the path from the redirect URL, set this value to an empty string.

  The \{path\} token extracts the path string from the incoming HTTP request URL. All URL Redirect tokens are valid for this property. You can use any token more than once.

  If the path string does not begin with the \{path\} token, it must begin with a forward slash `/`.

- **Query**
  
  The query string to use in the redirect URL. To omit all incoming query parameters from the redirect URL, set this value to an empty string.

  The \{query\} token extracts the query string from the incoming HTTP request URL. All URL Redirect tokens are valid for this property. You can use any token more than once.

  If the query string does not begin with the \{query\} token, it must begin with a question mark `?`.

  You can specify multiple query parameters as a single string. Separate each query parameter with an ampersand `&`.

  If the specified query string results in a redirect URL ending with `?` or `&`, the last character is truncated. For example, if the incoming URL is `http://host.com:8080/documents` and the query property value is `?lang=en\{query\}`, the redirect URL is `http://host.com:8080/documents?lang=en`. The system truncates the final ampersand `&` because the incoming URL included no value to replace the \{query\} token.

**Important:**

Failure to specify a value for at least one URL component field can result in a redirect loop.
**Manual Redirect URL Construction**

The Console provides text entry fields for each URL component. Alternatively, you can manually specify the full redirect URL.

You can retain the literal characters of a token when you specify values for the path and query properties of the redirect URL. Use a backslash \ as the escape character for the \, {, and } characters. For example, if the incoming HTTP request URL is /video, the path property value /example\{path\}123\{path\} appears in the constructed redirect URL as /example/video123{path}.

Some path and query string examples:

- /example/video/123 appears as /example/video/123 in the redirect URL.
- /example{path} appears as /example/video/123 in the redirect URL when /video/123 is the path in the incoming HTTP request URL.
- {path}/123 appears as /example/video/123 in the redirect URL when /example/video is the path in the incoming HTTP request URL.
- {path}123 appears as /example/video123 in the redirect URL when /example/video is the path in the incoming HTTP request URL.
- /{host}/123 appears as /example.com/123 in the redirect URL when example.com is the hostname in the incoming HTTP request URL.
- /{host}/{port} appears as /example.com/123 in the redirect URL when example.com is the hostname and 123 is the port in the incoming HTTP request URL.
- /{query} appears as /lang=en in the redirect URL when the query is lang=en in the incoming HTTP request URL.
- lang=en&time_zone=PST appears as lang=en&time_zone=PST in the redirect URL.
- {query} appears as lang=en&time_zone=PST in the redirect URL when lang=en&time_zone=PST is the query string in the incoming HTTP request. If the incoming HTTP request has no query parameters, the {query} token renders as an empty string.
- lang=en&{query}&time_zone=PST appears as lang=en&country=us&time_zone=PST in the redirect URL when country=us is the query string in the incoming HTTP request. If the incoming HTTP request has no query parameters, this value renders as lang=en&time_zone=PST.
- protocol={protocol}&hostname={host} appears as protocol=http&hostname=example.com in the redirect URL when the protocol is http and the hostname is example.com in the incoming HTTP request.
- port={port}&hostname={host} appears as port=8080&hostname=example.com in the redirect URL when the port is 8080 and the hostname is example.com in the incoming HTTP request URL.

**Response Code**

You can specify the HTTP status code to return when the incoming request is redirected. Valid response codes for redirection from the standard HTTP specification are:

- 301 Moved Permanently
- 302 Found
- 303 See Other
- 307 Temporary Redirect
- 308 Permanent Redirect

The default value is 302 Found.

**Request and Response Header Rules**

Learn about request and response header rules for Load Balancer resources.

Request and response header rules add, alter, or remove HTTP request or response headers. These rules can help you pass metadata to your backend servers to do things like:

- Identify which listener sent a request.
- Notify a backend server about SSL termination.
Examples of how rule sets can help you enhance site security include:

- Adding headers to prevent external domains from iframing your site.
- Removing debug headers, such as "Server," sent by backend servers. This action helps you hide the implementation details of your backend.
- Adding the "strict-transport-security" header, with a proper value, to responses. This header helps guarantee that access to your site is HTTPS only.
- Adding the "x-xss-protection" header with a proper value. This header helps you enforce the cross-site scripting (XSS) protection built into modern browsers.
- Adding the "x-content-type" header with a proper value. This header helps you prevent attacks based on content type shifting.

**Note:**

Adding or removing the built-in Host header or one of the X-Headers as described in HTTP "X-" Headers does not remove or override the header value. Instead, performing these actions can append other values or duplicate the header.

**Example: Notify WebLogic that the Load Balancer Terminated SSL**

You can configure your load balancer to perform SSL termination. Often, your backend applications require notification of this action. For example, HTTPS WebLogic e-commerce online transaction processing looks for the WL-Proxy-SSL header to confirm that a request came in over SSL. You can use rule sets to add this header at the load balancer listener.

**Note:**

For security reasons, WebLogic ignores this header unless you check the WebLogic Plugin Enabled box in WebLogic's Administration Console.

1. Create a rule set with the following settings. See Creating Rule Sets on page 3859 for more information.
   - Choose the Add Request Header option from the Action list.
   - Enter WL-Proxy-SSL as the Header name.
   - Set the header Value:
     - If your load balancer is configured to perform SSL termination, set this value to "true."
     - If the SSL termination point is in the web server where the plugin operates, set this value to "false."

2. Create a listener, or edit an existing listener, and add the new rule set. See Listener Management on page 3809 for more information.

**HTTP Header Rules**

Learn about HTTP header rules for Load Balancer resources.

HTTP header rules specify the size of the HTTP header and the kinds of characters that are permitted within the header. Because some applications require a URL header size greater than the default 8k to support their features, HTTP header rules allow you to set header buffers of up to 64k to avoid "414" (large URI requests) errors.

HTTP header rules allow periods (".") and underscores ("_") providing you more flexibility in your naming structures.

**Creating Rule Sets**

Create a rule set for a Load Balancer resource.

Use one of the following methods to create a rule set for a selected load balancer.

**To create a rule set using the Console**

Use the OCI Console to create a rule set for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.
   The Load Balancer Details dialog box appears.
6. Click **Rule Sets** under **Resources**.
   The **Rule Sets** list appears. All rule sets are listed in tabular form.
7. Click **Create Rule Set**.
   The Create Rule Set dialog box appears.
8. Enter the following:

- **Name:** Required. Specify a friendly name for the rule set. The name must be unique, and cannot be changed. Avoid entering confidential information.
- **Specify Access Control Rules:** Optional. Check this box to add access control rules.
  - **IP Address CIDR:** Enter the IP address CIDR block from which access is allowed.
  - **+ Another Access Control Rule:** Optional. Click this button to enter another IP address CIDR or click the corresponding X to remove an existing entry.
- **Specify Access Method Rules:** Optional. Check this box to add access method rules.
  - **Allowed Methods:** From the list, select the HTTP methods to allow. You can select multiple methods. Click the label's X to remove an existing method.
- **Specify URL Redirect Rules:** Optional. Check this box to add URL redirect rules.
  - **Source Path:** Specify the incoming path string that triggers the redirect rule. For example, /video.
  - **Match Type:** Choose the match condition to apply when evaluating an incoming path string. The available match types are:
    - **FORCE_LONGEST_PREFIX_MATCH**
      The system looks for a redirect rule path string with the best, longest match of the beginning portion of the incoming URL path.
    - **EXACT_MATCH**
      The incoming URL path must exactly and completely match the specified path string.
    - **PREFIX_MATCH**
      The beginning portion of the incoming URL path must exactly match the specified path string.
    - **SUFFIX_MATCH**
      The ending portion of the incoming URL path must exactly match the specified path string.
  - **Redirect to:** Specify a value for at least one URL component field. Any component fields that you do not modify retain the incoming URL’s values.
    Optionally, click the **Switch to full URL** link to enter the redirect URL manually.

    **Caution:**
    Failure to specify a value for at least one URL component field can result in a redirect loop.

    - **Protocol:** Specify the HTTP protocol to use in the redirect URL. Valid values are:
      - {protocol}
      - HTTPS
      - HTTP
    - **Host:** Specify a valid domain name (hostname) or IP address for the redirect URL. All redirect URL tokens are valid for this property.
    - **Port:** Specify the communication port to use in the redirect URL. Valid values include integers from 1 to 65535.
    - **Path:** The HTTP URL path to use in the redirect URL. All redirect URL tokens are valid for this property.

    **Important:**
    If the path string does not begin with the \{path\} token, it must begin with the forward slash character /.

    - **Query:** Specify the query string to use in the redirect URL. All redirect URL tokens are valid for this property.
Load Balancing

**Important:**

If the query string does not begin with the `{query}` token, it must begin with the question mark `?` character.

- **Response Code:** Specify the HTTP status code to return when the incoming request is redirected. The default response code is **302 Found**.

  Valid response codes for redirection from the standard HTTP specification are:
  - 301 Moved Permanently
  - 302 Found
  - 303 See Other
  - 307 Temporary Redirect
  - 308 Permanent Redirect

- **Another URL Redirect Rule** Optional. Click this button to create another rule or click the corresponding X to delete an existing rule.

- **Specify Request Header Rules:** Optional. Check this box to add request header rules.

  - **Order:** Optional. If you have multiple rules, you can click the up or down arrows to move the corresponding rule.

  - **Action:** Select the action that the rule applies. Available actions include:

    - **Add Request Header**
      
      Adds the specified header and value to the incoming request.
      
      If the specified header is already present, the system replaces it.
      
      If more than one header with the same name is present, the system removes all of them and adds one header corresponding to the specified header and value.

    - **Extend Request Header**
      
      Adds the specified prefix or suffix to the incoming request.
      
      Provide a prefix value, a suffix value, or both when you choose this action.
      
      The system does not support this rule for headers with multiple values.

    - **Remove Request Header**
      
      Removes the specified header.
      
      If the same header appears more than once in the request, the load balancer removes all occurrences of the specified header.

- **Note:**

  These rules apply only to HTTP or HTTP2 headers.

- **Header:** A header name that conforms to RFC 7230.

- **Caution:**

  The system does not distinguish between underscore and dash characters in headers. That is, it treats example_header_name and example-header-name as identical. Oracle recommends that you do...
Load Balancing

- **Value:** (Add rules only.) A header value that conforms to RFC 7230.
- **Prefix:** (Extend rules only.) A character string to add to the beginning of the existing header name. The resulting header must conform to RFC 7230.
- **Suffix:** (Extend rules only.) A character string to add to the end of the existing header name. The resulting header must conform to RFC 7230.
- **Another Request Header Rule** Optional. Click this button to create another rule or click the corresponding X to delete an existing rule.
- **Specify Response Header Rules:** Optional. Check this box to add response header rules.
- **Order:** Optional. If you have multiple rules, you can click the up or down arrows to move the corresponding rule.
- **Action:** Select the action that the rule applies. Available actions include:
  - **Add Response Header**
    Adds the specified header and value to the outgoing response.
    If the specified header is already present, the system replaces it.
    If more than one header with the same name is present, the system removes all of them and adds one header corresponding to the specified header and value.
  - **Extend Response Header**
    Adds the specified prefix or suffix to the incoming request.
    Provide a prefix value, a suffix value, or both when you choose this action.
    The system does not support this rule for headers with multiple values.
  - **Remove Response Header**
    Removes the specified header.
    If the same header appears more than once in the response, the load balancer removes all occurrences of the specified header.

**Note:**
These rules apply only to HTTP or HTTP2 headers.

- **Header:** A header name that conforms to RFC 7230.

**Caution:**
The system does not distinguish between underscore and dash characters in headers. That is, it treats example_header_name and example-header-name as identical. Oracle recommends that you do
Load Balancing

not rely on underscore or dash characters to uniquely distinguish header names.

• **Value:** (Add rules only.) A header value that conforms to RFC 7230.
• **Prefix:** (Extend rules only.) A character string to add to the beginning of the existing header name. The resulting header must conform to RFC 7230.
• **Suffix:** (Extend rules only.) A character string to add to the end of the existing header name. The resulting header must conform to RFC 7230.
• **Another Response Header Rule** Optional. Click this button to create another rule or click the corresponding X to delete an existing rule.

• **Specify HTTP Rules:** Optional. Check this box to specify HTTP header options for a listener.
  • **HTTP Header Buffer Size:** Select one of the following buffer sizes for the HTTP header from the list: None, 8k, 16k, 32k, 64k.
  • **Allow Invalid Characters in HTTP Header:** Check this box to allow periods (".") and underscores ("_") in the HTTP header.

• **Specify HTTP Header Options:** Optional. Check this box to specify HTTP header options for a listener.
  • **HTTP Header Buffer Size:** Select one of the following buffer sizes for the HTTP header from the list: None, 8k, 16k, 32k, 64k.
  • **Allow Invalid Characters in HTTP Header:** Optional. Check this box to allow invalid characters in the HTTP header.

9. **Click Create.**

After you create a rule set, the set becomes available for use with the associated load balancer. **Update a listener** to apply the rule set.

**To create a rule set using the CLI**

Use the command line interface (CLI) to create a rule set for a Load Balancer resource.

Enter the following command:

```bash
oci lb rule-set create --name name --load-balancer-id load_balancer_id --items items [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb rule-set create --help
```

See **oci lb rule-set create** for a complete description of the command.

**To create a rule set using the API**

Use the API to create a rule set for a Load Balancer resource.

Run the **CreateRuleSet** method to create a rule set for a load balancer. See **CreateRuleSet** for a complete description.

**Listing Rule Sets**

List the rule sets for a Load Balancer resource.

Use one of the following methods to display a list of rule sets for a selected load balancer.

**To list the Rule Sets using the Console**

Use the OCI Console to list the rule sets for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.

   The Load Balancer Details dialog box appears.

6. Click **Rule Sets** under **Resources**.

   The **Rule Sets** list appears. All rule sets are listed in tabular form.

**To list the Rule Sets using the CLI**

Use the command line interface (CLI) to list the rule sets for a Load Balancer resource.

Enter the following command:

```
oci lb rule-set list --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb rule-set list --help
```

See **oci lb rule-set list** for a complete description of the command.

**To list the Rule Sets using the API**

Use the API to list the rule sets for a Load Balancer resource.

Run the **ListRuleSets** method to list the rule sets for a load balancer. See **ListRuleSets** for a complete description.

**Getting Rule Set Details**

Get the details of a rule set for a Load Balancer resource.

Use one of the following methods to get the details of a rule set for a selected load balancer.

**To get the details of a rule set using the Console**

Use the OCI Console to get the details of a rule set for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.

2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.

3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.

4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.

5. Select the load balancer for which you want to create a rule set.

   The Load Balancer Details dialog box appears.

6. Click **Rule Sets** under **Resources**.

   The **Rule Sets** list appears. All rule sets are listed in tabular form.

7. Click the rule set whose details you want to get.

   The Rule Set Details page appears.

**To get the details of a rule set using the CLI**

Use the command line interface (CLI) to list the rule sets for a Load Balancer resource.

Enter the following command:

```
oci lb rule-set get --rule-set-name rule_set_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb rule-set get --help
```

See **oci lb rule-set get** for a complete description of the command.
To get the details of a rule set using the API
Use the API to get the details of a rule set for a Load Balancer resource.

Run the GetRuleSet method to get the details of a rule set for a load balancer. See GetRuleSet for a complete description.

Editing Rule Sets
Update a rule set for a Load Balancer resource.

Use one of the following methods to edit and update a rule set for a selected load balancer.

To edit a rule set using the Console
Use the OCI Console to update a rule set for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer for which you want to create a rule set.
   The Load Balancer Details dialog box appears.
6. Click Rule Sets under Resources.
   The Rule Sets list appears. All rule sets are listed in tabular form.
7. Click the rule set whose settings you want to edit.
   The Rule Set Details page appears.
8. Click Edit.
   The Edit Path Route Set dialog box appears.
9. Make your edits.
   See Creating Rule Sets on page 3859 for details on the rule set settings.
10. Click Save Changes.

To edit a rule set using the CLI
Use the command line interface (CLI) to update a rule set for a Load Balancer resource.

Enter the following command:

```
oci lb rule-set update --rule-set-name rule_set_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb rule-set update --help
```

See oci lb rule-set get for a complete description of the command.

Deleting Rule Sets
Delete a rule set from a Load Balancer resource.

Run the DeleteRuleSet method to delete a rule set from a load balancer. See DeleteRuleSet for a complete description.
To delete a rule set using the Console
Use the OCI Console to delete a rule set from a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer whose rule set you want to delete.
   The Load Balancer Details dialog box appears.
6. Click Rule Sets under Resources.
   The Rule Sets list appears. All rule sets are listed in tabular form.
7. Click the rule set whose settings you want to edit.
   The Rule Set Details page appears.
8. Click Delete.
   Alternatively, click the Actions icon (⋮) associated with the path route set you want to delete and click Delete.
9. Confirm the deletion when prompted.

To delete a rule set using the CLI
Use the command line interface (CLI) to delete a rule set from a Load Balancer resource.

Enter the following command:

```
oci lb rule-set delete --rule-set-name rule_set_name --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb rule-set delete --help
```

See `oci lb rule-set delete` for a complete description of the command.

To delete a rule set using the API
Use the API to delete a rule set from a Load Balancer resource.

Run the DeleteRuleSets method to delete a rule set from a load balancer. See `DeleteRuleSets` for a complete description.

SSL Certificate Management
Learn to use single socket layer (SSL) certificates with your Load Balancer resource.

To use standard SSL with a load balancer and its resources, you must supply a certificate.

To use mutual TLS (mTLS) with your load balancer, you must add one or more certificate authorities (CA) or certificate authority bundles (CA bundles) to your system.

- **Certificate Authority**: A private certificate authority capable of issuing leaf certificates. For a load balancer and its associated resources, the CA is a trust store created inside certificates service and is not user uploaded.
- **CA Bundle**: A collection of CA public certificates that you can upload as an aggregated group. CA bundles do not include private key or leaf certificates.

These are associated with the Certificate service. See Certificates for general information about using SSL with your web application firewall policy.
Load Balancers commonly use single domain certificates. However, load balancers with listeners that include request routing configuration (see Request Routing Management on page 3828) might require a subject alternative name (SAN) certificate (also called multi-domain certificate) or a wildcard certificate. The Load Balancing service supports each of these certificate types.

**Tip:**
It is recommended you upload the certificate bundles you want to use before you create the listeners or backend sets you want to associate them with.

**Note:**

- The Load Balancing service does not generate SSL certificates. It can only import an existing certificate that you already own. The certificate can be one issued by a vendor, such as Verisign or GoDaddy. You can also use a self-signed certificate that you generate with an open source tool, such as OpenSSL or Let’s Encrypt. Refer to the corresponding tool's documentation for instructions on how to generate a self-signed certificate.
- If you submit a self-signed certificate for backend SSL, you must submit the same certificate in the corresponding CA Certificate field.

Oracle Cloud Infrastructure accepts x.509 type certificates in PEM format only. The following is an example PEM encoded certificate:

```
-----BEGIN CERTIFICATE-----
<Base64_encoded_certificate>
-----END CERTIFICATE-----
```

**Converting to PEM Format**

If you receive your certificates and keys in formats other than PEM, you must convert them before you can upload them to the system. You can use OpenSSL to convert certificates and keys to PEM format. The following example commands provide guidance.

**Certificate or Certificate Chain from DER to PEM**

```
openssl x509 -inform DER -in <certificate_name>.der -outform PEM -out <certificate_name>.pem
```

**Private Key from DER to PEM**

```
openssl rsa -inform DER -in <private_key_name>.der -outform PEM -out <private_key_name>.pem
```

**Certificate Bundle from PKCS#12 (PFX) to PEM**

```
openssl pkcs12 -in <certificate_bundle_name>.p12 -out <certificate_bundle_name>.pem -nodes
```

**Certificate bundle from PKCS#7 to PEM**

```
openssl pkcs7 -in <certificate_bundle_name>.p7b -print_certs -out <certificate_bundle_name>.pem
```
Configuring Peer Certificate Verification

Peer certificate verification is used for client authentication. Peer certificate verification depth is the number of certificates in the chain that need to be verified for client authentication.

The following are expected values to be set:

• One intermediate certificate, client certificate, root certificate - 2
• Client certificate, root certificate - 1s

To determine if your peer certificate verification is configured incorrectly, note the following:

• The client indicates that it is unable to verify the certificate and results in a client SSL handshake failure. This error message varies based on the client type.
• In the load balancer logs, the following error appears: Client %s has SSL certificate verify error
• Use the OpenSSL utility to run the following command: openssl verify -verbose -CAfile RootCert.pem Intermediate.pem

An error occurs that shows at what depth the validation failure is occurring: error 20 at 0 depth lookup:unable to get local issuer certificate

To resolve this situation, provide the correct certificate depth and confirm that the client certificate and certificate authority certificate match and are in the correct order.

Uploading Certificate Chains

If you have multiple certificates that form a single certification chain (for example, any intermediate certificate authority certificates), then include all relevant certificates in one file in the correct order before you upload them to the system. The correct order begins with the certificate directly signed by the trusted root certificate authority at the bottom of the list. Any additional certificates are pasted above the signed certificate.

Combine the server certificate (SSL_Certificate.crt) and the intermediate certificate authority certificate (intermediateCA.crt) files into a single, concatenated file.

To get a single, concatenated file from the SSL certificate and the intermediate certificate authority certificate, open a command prompt and run the following command:

```bash
cat ssl_certificate.crt IntermediateCA.crt >> certbundle.pem
```

The following example of a concatenated certificate chain file includes four certificates:

```
-----BEGIN CERTIFICATE-----
Base64-encoded_certificate
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
Base64-encoded_certificate
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
Base64-encoded_certificate
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
Base64-encoded_certificate
-----END CERTIFICATE-----
```

Submitting Private Keys

Note:

Oracle recommends a minimum length of 2048 bits for your RSA private key.
If your private key submission returns an error, the three most common reasons are:

- You provided an incorrect passphrase.
- Your private key is malformed.
- The system does not recognize the encryption method used for your key.

**Key Pair Mismatch**

If you receive an error related to the private key and public key being mismatched, then before uploading, use the following OpenSSL commands to confirm that they are part of the same pair:

```
openssl x509 -in certificate_name.crt -noout -modulus | openssl sha1
openssl rsa -in private_key.key -noout -modulus | openssl sha1
```

Confirm that the returned `sha1` hash values match exactly. If they are different, then the private key provided is not used to sign the public certificate and cannot be used.

**Private Key Consistency**

If you receive an error related to the private key, then you can use OpenSSL to check its consistency:

```
openssl rsa -check -in <private_key>.pem
```

This command verifies that the key is intact, the passphrase is correct, and the file contains a valid RSA private key.

**Decrypting a Private Key**

If the system does not recognize the encryption technology used for your private key, decrypt the key. Upload the unencrypted version of the key with your certificate bundle. You can use OpenSSL to decrypt a private key:

```
openssl rsa -in <private_key>.pem -out <decrypted_private_key>.pem
```

**Updating an Expiring Certificate**

To ensure consistent service, you must update (rotate) expiring certificates:

1. Update your client or backend server to work with a new certificate bundle.

   **Note:**
   
   The steps to update your client or backend server are unique to your system.
2. **Upload the new SSL certificate bundle to the load balancer:**
   
a. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
   
b. Click the name of the **Compartment** that contains the load balancer you want to modify, and then click the load balancer's name.
   
c. Click the load balancer you want to configure.
   
d. In the **Resources** menu, click **Certificates**, and then click **Add Certificate**.
   
e. In the **Add Certificate** dialog box, enter the following:
      
      • **Certificate Name**: Required. Specify a friendly name for the certificate bundle. It must be unique within the load balancer, and it cannot be changed in the Console. (It can be changed using the API.) Avoid entering confidential information.
      
      • **Choose SSL Certificate File**: Required. Drag and drop the certificate file, in PEM format, into the **SSL Certificate** field. Alternatively, you can choose the **Paste SSL Certificate** option to paste a certificate directly into this field.
      
      • **Specify CA Certificate**: Optional. (Recommended for backend SSL termination configurations.) Select (check) this box if you want to provide a CA certificate.
      
      • **Choose CA Certificate File**: Drag and drop the CA certificate file, in PEM format, into the **CA Certificate** field. Alternatively, you can choose the **Paste CA Certificate** option to paste a certificate directly into this field.
      
      • **Specify Private Key**: Optional. (Required for SSL termination.) Select (check) this box if you want to provide a private key for the certificate.
      
      • **Choose Private Key File**: Drag and drop the private key, in PEM format, into the **Private Key** field. Alternatively, you can choose the **Paste Private Key** option to paste a private key directly into this field.
      
      • **Enter Private Key Passphrase**: Optional. Specify the private key passphrase.
      
   
f. Click **Add Certificate**.
3. Edit listeners or backend sets (as needed) so they use the new certificate bundle

Editing a listener:

a. Open the navigation menu, click Networking, and then click Load Balancers.
b. Choose the Compartment that contains the load balancer you want to modify, and then click the load balancer's name.
c. In the Resources menu, click Listeners.
d. For the listener you want to edit, click the Actions menu, and then click Edit Listener.
e. In the Certificate Name list, choose the new certificate bundle.
f. Click Submit.

Editing a backend set:

<table>
<thead>
<tr>
<th>Important:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Updating the backend set temporarily interrupts traffic and can drop active connections.</td>
</tr>
</tbody>
</table>

a. Open the navigation menu, click Networking, and then click Load Balancers.
b. Click the name of the Compartment that contains the load balancer you want to modify, and then click the load balancer's name.
c. In the Resources menu, click Backend Sets, and then click the name of the backend set you want to edit.
d. Click Edit Backend Set.
e. In the Edit Backend Set dialog box, select (check) Use SSL.
f. In the Certificate Name list, choose the new certificate bundle.
g. Click Save Changes.

4. (Optional) Remove the expiring SSL certificate bundle

<table>
<thead>
<tr>
<th>Important:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You cannot delete an SSL certificate bundle that is associated with a listener or backend set. Remove the bundle from any additional listeners or backend sets before deleting.</td>
</tr>
</tbody>
</table>

a. Open the navigation menu, click Networking, and then click Load Balancers.
b. Click the name of the Compartment that contains the load balancer you want to modify, and then click the load balancer's name.
c. Click the load balancer you want to configure.
d. In the Resources menu, click Certificates.
e. For the certificate you want to delete, click the Actions menu, and then click Delete.
f. Confirm when prompted.

Configuring SSL Handling

Learn about configuring SSL handling for a Load Balancer resource.

You can perform the following SSL handling tasks for a load balancer:

- Terminate SSL at the load balancer. This configuration is frontend SSL. Your load balancer can accept encrypted traffic from a client. No encryption of traffic exists between the load balancer and the backend servers.
- Implement SSL between the load balancer and your backend servers. This configuration is backend SSL. Your load balancer does not accept encrypted traffic from client servers. Traffic between the load balancer and the backend servers is encrypted.
- Implement point-to-point SSL. Your load balancer can accept SSL encrypted traffic from clients and encrypts traffic to the backend servers.
Terminating SSL at the Load Balancer

To terminate SSL at the load balancer, you must create a listener at a port such as 443, and then associate an uploaded certificate bundle with the listener. See Creating Listeners on page 3809 for more information.

Implementing Backend SSL

To implement SSL between the load balancer and your backend servers, you must associate an uploaded certificate bundle with the backend set. See Creating Backend Sets on page 3786 for more information.

**Note:**

- If you want to have more than one backend server in the backend set, sign your backend servers with an intermediate CA certificate. The intermediate CA certificate must be included as part of the certificate bundle.
- Your backend services must be able to accept and terminate SSL.

Implementing Point-to-Point SSL

To implement point-to-point SSL, you must associate uploaded certificate bundles with both the listener and the backend set. See Creating Listeners on page 3809 and Creating Backend Sets on page 3786 for more information.

Adding Certificates

Add a certificate to a Load Balancer resource.

Use one of the following methods to add a certificate to a selected load balancer.

**To add a certificate using the Console**

Use the OCI Console to add a certificate to a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer whose rule set you want to delete.
6. Click Certificates under Resources.
7. Select the Load Balancer Managed Certificate certificate resource type from the Certificate Resource list
8. Click Add Certificate.
   - The Add Certificate dialog box appears.
9. Enter the following:

- **Certificate Name**: Required. Specify a friendly name for the certificate bundle. It must be unique within the load balancer, and it cannot be changed in the Console. (It can be changed using the API.)

- **Choose SSL Certificate File**: Required. Drag and drop the certificate file, in PEM format, into the SSL Certificate field.

Alternatively, you can choose the Paste SSL Certificate option to paste a certificate directly into this field.

<table>
<thead>
<tr>
<th>Important:</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you submit a self-signed certificate for backend SSL, you must submit the same certificate in the corresponding CA Certificate field.</td>
</tr>
</tbody>
</table>

- **Specify CA Certificate**: Optional. (Recommended for backend SSL termination configurations.) Select (check) this box if you want to provide a CA certificate.

- **Choose CA Certificate File**: Drag and drop the CA certificate file, in PEM format, into the CA Certificate field.

Alternatively, you can choose the Paste CA Certificate option to paste a certificate directly into this field.

- **Specify Private Key**: Optional. (Required for SSL termination.) Select (check) this box if you want to provide a private key for the certificate.

- **Choose Private Key File**: Drag and drop the private key, in PEM format, into the Private Key field.

Alternatively, you can choose the Paste Private Key option to paste a private key directly into this field.

- **Enter Private Key Passphrase**: Optional. Specify the private key passphrase.

10. Click Add Certificate.

**To add a certificate using the CLI**

Use the command line interface (CLI) to list the certificates to a Load Balancer resource.

Enter the following command:

```
oci lb certificate create --certificate-name certificate_name --load-balancer-id load_balancer_id --items items [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb certificate create --help
```

See **oci lb certificate create** for a complete description of the command.

**To add a certificate using the API**

Use the API to add a certificate to a Load Balancer resource.

Run the CreateCertificate method to create a certificate for a load balancer. See **CreateCertificate** for a complete description.

**Listing Certificates**

List the certificates for a Load Balancer resource.

Use one of the following methods to display a list of certificates for a selected load balancer.

**To list the certificates using the Console**

Use the OCI Console to list the certificates for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer whose rule set you want to delete.
   The Load Balancer Details dialog box appears.
6. Click Certificates under Resources.
   The Certificates list appears. All certificates are listed in tabular form.
7. Select the certificate resource type from the Certificate Resource list:
   - Certificate Service Managed Certificate
   - Load Balancer Managed Certificate
   Those certificates associated with the certificate resource type you selected are displayed.

To list the certificates using the CLI
Use the command line interface (CLI) to list the certificates for a Load Balancer resource.

Enter the following command:

```
oci lb certificate list --certificate-name certificate_name --load-balancer-id load_balancer_id --items items [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb certificate list --help
```

See `oci lb certificate list` for a complete description of the command.

To list the certificates using the API
Use the API to list the certificates for a Load Balancer resource.

Run the ListCertificates method to list the certificates for a load balancer. See ListCertificates for a complete description.

Getting Certificate Details
Get the details of a certificate service management certificate, certificate authority, or certificate authority bundle for a Load Balancer resource.

Use one of the following methods to display the details of a certificate service management certificate certificate authority, or certificate authority bundle for a selected load balancer.

Getting Certificate Details using the Console
Get the details of a certificate service management certificate, certificate authority, or certificate authority bundle for a Load Balancer resource.

1. Open the navigation menu, click Networking, and then click Load Balancers.
2. Select the Compartment from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Load Balancer under Type to only display load balancers.
5. Select the load balancer whose rule set you want to delete.
   The Load Balancer Details dialog box appears.
6. Click Certificates under Resources.
   The Certificates list appears. All certificates are listed in tabular form.
   Only the Certificate Service Managed Certificate option allows you to view details of its associated certificates, certificate authorities, and certificate authority bundles.
   Those certificates associated with the certificate service managed certificate resource type you selected are displayed.
8. Select the entry details you want to get.

   The Details dialog box for the entry you selected appears.

   The Details page contains information about the certificate, both general information and links to its resources.
   The contents of the Details page differs depending on whether you selected a certificate, certificate authority, or certificate authority bundle.

**Deleting Certificates**

Delete a certificate from a Load Balancer resource.

<table>
<thead>
<tr>
<th>Important:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You cannot delete an SSL certificate that is associated with a listener or backend set. Remove the bundle from any listeners or backend sets before deleting.</td>
</tr>
</tbody>
</table>

Use one of the following methods to delete a certificate from a selected load balancer.

**To delete a certificate using the Console**

Use the OCI Console to delete a certificate, certificate authority, or certificate authority bundle from a Load Balancer resource.

<table>
<thead>
<tr>
<th>Important:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You cannot delete an SSL certificate that is associated with a listener or backend set. Remove the bundle from any listeners or backend sets before deleting.</td>
</tr>
</tbody>
</table>

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.

   All load balancers and network load balancers in that compartment are listed in tabular form.

2. Select the **Compartment** from the list.

3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.

4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.

5. Select the load balancer whose rule set you want to delete.

   The Load Balancer Details dialog box appears.

6. Click **Certificates** under **Resources**.

   The **Certificates** list appears. All certificates are listed in tabular form.

7. Select the certificate resource type from the **Certificate Resource** list:

   - **Certificate Service Managed Certificate**
   - **Load Balancer Managed Certificate**

   Those certificates associated with the certificate resource type you selected are displayed.

8. Delete the certificate depending on the certificate resource type you chose:

   - **Certificate Service Managed Certificate**:
     a. Click the link for the certificate, certificate authority, or certificate authority bundle from the list.

     The Details page for the certificate appears.

     b. Click **Delete**.

   - **Load Balancer Managed Certificate**:
     a. Click the **Actions** icon (🔗) associated with the certificate you want to delete and click **Delete**.

9. Confirm the deletion when prompted.
**To delete a certificate using the CLI**

Use the command line interface (CLI) to delete a certificate from a Load Balancer resource.

Enter the following command:

```
oci lb certificate delete --certificate-name certificate_name --load-balancer-id load_balancer_id --items items [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb certificate delete --help
```

See `oci lb certificate delete` for a complete description of the command.

**To delete a certificate using the API**

Use the API to delete a certificate from a Load Balancer resource.

Run the `DeleteCertificate` method to create a certificate for a load balancer. See `DeleteCertificate` for a complete description.

**Work Request Management**

This topic describes how to view the state of work requests associated with a given load balancer.

**Note:**

The Load Balancing service does not use the common Work Requests API to support work request operations. Instead, the Load Balancing API supports Load Balancing work requests. See Using the Console to View Work Requests on page 309 for information on viewing work requests for other services.

**Work Request Status**

Many of the Oracle Cloud Infrastructure Load Balancing service requests do not take effect immediately. In these cases, the request spawns an asynchronous workflow for fulfillment. To provide visibility for in-progress workflows, the Load Balancing service creates a work request object.

Because some operations depend on the completion of other operations, you must monitor each operation’s work request and confirm it has succeeded before proceeding to the next operation. For example, if you want to create a backend set and add a backend server to the new set, you first must create the backend set. After that operation completes, you can add the backend server. If you try to add a backend server before the backend set creation completes, the system cannot ensure that the request to add the server succeeds.

You can monitor the request to add a backend set to determine when that workflow is complete, and then add the backend server.

The following table lists the work request states:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accepted</td>
<td>The request is in the work request queue to be processed.</td>
</tr>
<tr>
<td>In Progress</td>
<td>A work request record exists for the specified request, but no associated WORK_COMPLETED record exists.</td>
</tr>
<tr>
<td>Succeeded</td>
<td>A work request record exists for this request and an associated WORK_COMPLETED record has the state Succeeded.</td>
</tr>
<tr>
<td>Status</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Failed | A work request record exists for this request and an associated WORK_COMPLETED record has the state Failed.

**Listing Work Requests**
List the work requests for a Load Balancer resource.

Use one of the following methods to display a list of work requests for a selected load balancer.

**To list the work requests using the Console**
Use the OCI Console to list the work requests for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer whose rule set you want to delete.
   The Load Balancer Details dialog box appears.
6. Click **Work Requests** under **Resources**.
   The **Work Requests** list appears. All work requests are listed in tabular form.

**To list the work requests using the CLI**
Use the command line interface (CLI) to list the work requests for a Load Balancer resource.

Enter the following command:

```bash
oci lb work-request list --load-balancer-id load_balancer_id [OPTIONS]
```

See the CLI online help for a list of options:

```bash
oci lb work-request list --help
```

See [oci lb work-request list](#) for a complete description of the command.

**To list the work requests using the API**
Use the API to list the work requests for a Load Balancer resource.

Run the `ListWorkRequests` method to delete a rule set from a load balancer. See [ListWorkRequests](#) for a complete description.

**Getting Work Request Details**
Get the details of a work request for a Load Balancer resource.

Use one of the following methods to get the details of a work request for a selected load balancer.

**To get the details of a work request using the Console**
Get the details of a work request for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer whose rule set you want to delete.
   The Load Balancer Details dialog box appears.

6. Click **Work Requests** under **Resources**.
   The **Work Requests** list appears. All work requests are listed in tabular form.

7. Find the work request whose details you want to get from the list. The following details for each work request are displayed:
   
   - **Status**: See [Work Request Status](#) for a list of statuses and their descriptions.
   - **Type**: API method used for run the work request.
   - **OCID**: Oracle Cloud identifier of the work request.
   - **Error Details**: Details of any errors associated with the work.
   - **Started**: UTC-based date-time group when the work request was started.
   - **Finished**: UTC-based date-time group when the work request was finished.

**To get the details of a work request using the CLI**

Use the command line interface (CLI) to get the details of a work request for a Load Balancer resource.

Enter the following command:

```
oci lb work-request get --work-request-id work_request_id [OPTIONS]
```

See the CLI online help for a list of options:

```
oci lb work-request get --help
```

See [oci lb work-request get](#) for a complete description of the command.

**To get the details of a work request using the API**

Use the API to get the details of a work request for a Load Balancer resource.

Run the `GetWorkRequest` method to get the details of a work request for a load balancer. See [GetWorkRequests](#) for a complete description.

**Diagnosing Load Balancer using Smart Check**

Use Smart Check to diagnose and fix Load Balancer configuration and environment issues.

Your load balancer includes Smart Check, which runs in the background to detect issues with the load balancer configuration and operating environment. Access the results of Smart Check activities through the Oracle Cloud Infrastructure Console as a resource of the load balancer.

Smart Check evaluates the load balancer approximately every 10 seconds. Each check reviews configuration issues such as the following:

- Load balancer's backend servers are in a drain or offline state.
- Protocol mismatches exist on the HTTP listener.
- Port mismatches exist on the HTTP backend servers.

Smart Check results are presented in tabular format within the load balancer's Details page. Each category of issues has an assigned status of High, Medium, Low, and OK. You can display details of each check, including recommendations for corrective actions where necessary. An Informational tab is also available to provide best practices and recommendations on how to make your load balancer work optimally.

**To run Smart Check Diagnostics from the Console**

Use the OCI Console to run Smart Check on a Load Balancer resource to detect any configuration issues.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a State from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck Network Load Balancer under Type to only display load balancers.
5. Click the load balancer on which you want to run Smart Check diagnostics.

The Load Balancer Details page appears.

6. Click Smart Check under Resources.

The Smart Check tab appears, containing the Smart Check list. All Smart Check diagnostic entries are listed in tabular form.

The Last Checked indicator displays the UTC-based date-time group the load balancer was last diagnosed. Checks occur every 10 seconds.

Each entry contains the following columns and associated values:

- **Risk Level**: Displays the risk of each entry using one of the following levels:
  - (red indicator) **High**: Smart Check detected a high-level severity configuration recommendation.
  - (yellow indicator) **Medium**: Smart Check detected a medium-level severity configuration recommendation.
  - (black indicator) **Low**: Smart Check detected a low-level severity configuration recommendation.
  - (green indicator) **OK**: Smart Check completed without any configuration recommendations.

- **Category**: Displays the area of the load balancer to which the Smart Check entry pertains, for example:
  - Logging

- **Risk Details**: Displays details on the issue, for example:
  - Not all logging is enabled.

- **Recommended Action**: Describes corrective action you can take for the issue, for example:
  - Enable all logging.
  - Click the "down" arrow at the end of the entry to display details, including links to where you can perform corrective or preemptive actions.

7. Click the Informational tab to display a list of best practices and recommendations to follow. Click the "down" arrow at the end of the entry to display details, including recommended fixes to any warnings or critical issues detected by Smart Check.

Each entry contains the following columns and associated values:

- **Category**: Displays the area of the load balancer to which the Smart Check entry pertains, for example:
  - Backend Timeout

- **Details**: Displays details on the issue, for example:
  - Set the listener idle timeout to at least 10 seconds less than backend's keep-alive timeout.

- **Recommended Action**: Describes corrective action you can take for the issue, for example:
  - Edit the listener and change the idle timeout.
  - Click the "down" arrow at the end of the entry to display details, including links to where you can perform corrective or preemptive actions.

### Log Management

Learn how to manage access and error logs for Load Balancer resources using the Oracle Cloud Infrastructure Console.

The Load Balancer service uses the OCI Logging service to managing logging. See Logging Overview on page 3909 for general information on logging, including how to name log files and create log groups.

See Details for Load Balancer Logs on page 3953 for information on how to understand load balancer log entries.
Creating Logs
Create access and error logs for a Load Balancer resource.

**Note:**
You can only create an access or error log when there are no existing logs of that type present. A load balancer can only have one access and one error log each.

Use one of the following methods to create access and error logs for a selected load balancer.

**To create an error log using the Console**
Use the OCI Console to enable error logging for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.
   The Load Balancer Details dialog box appears.
6. Click **Logs** under **Resources**.
   The **Logs** list appears. Entries for access and error logs are listed in tabular form.
7. Click the **Enable Log** switch for the error category to enable error logging.
   Alternatively, click the **Actions** icon (⋮) associated with the error category and click **Enable**.
   The Enable Log dialog box appears.
8. Enter the following:
   - **Compartment**: Select the compartment within which the log file resides from the list.
   - **Log Group**: Select an existing log group from the list or click **Create New Group** where you can enter the name and description of a new logging group within which your log resides.
   - **Log Name**: Enter the name of the log.
   - **Log Retention**: Select the time period in months each error logging entry is to be retained from the list.
   See **Managing Logs and Log Groups** on page 3911 for more information on log and log groups, including naming syntax guidelines.
9. Click **Enable Log**.
   The Logs list is updated to show the error log that you created. The error log is enabled by default.

**To create an access log using the Console**
Use the OCI Console to enable access logging for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.
   The Load Balancer Details dialog box appears.
6. Click **Logs** under **Resources**.
   The **Logs** list appears. Entries for access and error logs are listed in tabular form.
7. Click the **Enable Log** switch for the access category to enable access logging.

Alternatively, click the **Actions** icon ( ★ ) associated with the access category and click **Enable**.

The Enable Log dialog box appears.

8. Enter the following:
   - **Compartment**: Select the compartment within which the log file resides from the list.
   - **Log Group**: Select an existing log group from the list or click **Create New Group** where you can enter the name and description of a new logging group within which your log resides.
   - **Log Name**: Enter the name of the log.
   - **Log Retention**: Select the time period in months each access logging entry is to be retained from the list.

See Managing Logs and Log Groups on page 3911 for more information on log and log groups, including naming syntax guidelines.

9. Click **Enable Log**.

The Logs list is updated to show the access log that you created. The access log is enabled by default.

**Enabling Logging**

Enable disabled access or error logging for a Load Balance resource.

Use one of the following methods to enable disabled access or error logging for a selected load balancer.

**To enable error logging using the Console**

Use the OCI Console to enable disable error logging for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.

3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.

   The Load Balancer Details dialog box appears.

6. Click **Logs** under **Resources**.

   The **Logs** list appears. Entries for access and error logs are listed in tabular form.

7. Click the **Enable Log** switch for the error category to **Enabled**.

   Alternatively, click the **Actions** icon ( ★ ) associated with the error category and click **Enable**.

8. Confirm the enabling when prompted.

**To enable access logging using the Console**

Use the OCI Console to enable disabled access logging for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.

3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.

   The Load Balancer Details dialog box appears.

6. Click **Logs** under **Resources**.

   The **Logs** list appears. Entries for access and error logs are listed in tabular form.
7. Click the **Enable Log** switch for the access category to **Enable**.

Alternatively, click the **Actions** icon ( ) associated with the access category and click **Enable**.

8. Confirm the enabling when prompted.

### Getting Log Details

Get the details of an access or error log for a Load Balance resource.

Use one of the following methods to get the details of an access or error log for a selected load balancer.

#### To get the details of an error log using the Console

Get the details of an error log for a Load Balance resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.

   The Load Balancer Details dialog box appears.
6. Click **Logs** under **Resources**.

   The **Logs** list appears. Entries for access and error logs are listed in tabular form.
7. Click the error log link under **Log Name**.

   Alternatively, click the **Actions** icon ( ) associated with the error category and click **Edit Log**.

   The Log Details dialog box appears.

#### To get the details of an access log using the Console

Get the details of an access log for a Load Balance resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.

   The Load Balancer Details dialog box appears.
6. Click **Logs** under **Resources**.

   The **Logs** list appears. Entries for access and error logs are listed in tabular form.
7. Click the access log link under **Log Name**.

   Alternatively, click the **Actions** icon ( ) associated with the access category and click **Edit Log**.

   The Log Details dialog box appears.

### Renaming Logs

Rename an access or error log for a Load Balance resource.

Use one of the following methods to rename an access or error log for a selected load balancer.

#### To rename an error log using the Console

Use the OCI Console to rename an error log for a Load Balance resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.
   The Load Balancer Details dialog box appears.
6. Click **Logs** under **Resources**.
   The **Logs** list appears. Entries for access and error logs are listed in tabular form.
7. Click the access log link under **Log Name**.
   Alternatively, click the **Actions** icon (★) associated with the access category and click **Edit Log**.
   The Log Details dialog box appears.
8. Click **Edit**.
   The Edit Log dialog box appears.
9. Rename the log.
10. Click **Save Changes**.

**To rename an access log using the Console**
Use the OCI Console to rename an access log for a Load Balance resource.
1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.
   The Load Balancer Details dialog box appears.
6. Click **Logs** under **Resources**.
   The **Logs** list appears. Entries for access and error logs are listed in tabular form.
7. Click the access log link under **Log Name**.
   Alternatively, click the **Actions** icon (★) associated with the access category and click **Edit Log**.
   The Log Details dialog box appears.
8. Click **Edit**.
   The Edit Log dialog box appears.
9. Rename the log.
10. Click **Save Changes**.

**Deleting Logs**
Delete an access or error log from a Load Balance resource.
Use one of the following methods to delete an access or error log from a selected load balancer.

**To delete an error log using the Console**
Use the OCI Console to delete an error log from a Load Balance resource.
1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.

5. Select the load balancer for which you want to create a rule set.

   The Load Balancer Details dialog box appears.

6. Click **Logs** under **Resources**.

   The **Logs** list appears. Entries for access and error logs are listed in tabular form.

7. Click the error log link under **Log Name**.

   The Log Details dialog box appears.

8. Click **Delete**.

   Alternatively, click the **Actions** icon ((Link)) associated with the error category and click **Delete**.

9. Confirm the deletion when prompted.

**To delete an access log using the Console**

Use the OCI Console to delete an access log from a Load Balance resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.

2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.

3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.

4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.

5. Select the load balancer for which you want to create a rule set.

   The Load Balancer Details dialog box appears.

6. Click **Logs** under **Resources**.

   The **Logs** list appears. Entries for access and error logs are listed in tabular form.

7. Click the access log link under **Log Name**.

   The Log Details dialog box appears.

8. Click **Delete**.

   Alternatively, click the **Actions** icon (Link) associated with the access category and click **Delete**.

9. Confirm the deletion when prompted.

**Disabling Logging**

Disable access or error logging for a Load Balancer resource.

Use one of the following methods to disable access or error logging for a selected load balancer.

**To disable error logging using the Console**

Use the OCI Console to disable error logging for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.

2. Select the **Compartment** from the list.

   All load balancers and network load balancers in that compartment are listed in tabular form.

3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.

4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.

5. Select the load balancer for which you want to create a rule set.

   The Load Balancer Details dialog box appears.

6. Click **Logs** under **Resources**.

   The **Logs** list appears. Entries for access and error logs are listed in tabular form.

7. Click the **Enable Log** switch for the error category to **Disabled**.

   Alternatively, click the **Actions** icon (Link) associated with the error category and click **Disable**.
8. Confirm the disabling when prompted.

**To disable access logging using the Console**

Use the OCI Console to disable access logging for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer for which you want to create a rule set.
   
   The Load Balancer Details dialog box appears.
6. Click **Logs** under **Resources**.
   
   The **Logs** list appears. Entries for access and error logs are listed in tabular form.
7. Click the **Enable Log** switch for the access category to **Disabled**.
   
   Alternatively, click the **Actions** icon ( ) associated with the access category and click **Disable**.
8. Confirm the disabling when prompted.

### Load Balancing Metrics

You can monitor the health, capacity, and performance of your load balancers by using **metrics**, **alarms**, and **notifications**.

This topic describes the metrics emitted by the Load Balancing service in the **oci_lbaas** metric namespace.

Resources: Load balancers, listeners, and backend sets.

Your load balancer acts as an intermediary for data traffic between clients and your application servers. Clients send requests to your load balancer and the load balancer distributes the requests to your backend servers according to rules you establish. See the diagram in Overview of Load Balancing on page 3748 for a high-level view of a simple public load balancing system configuration.

The Load Balancing service metrics help you measure the number and type of connections, and quantity of data managed by your load balancer. You can use metrics data to diagnose and troubleshoot load balancer and client issues. The metrics also help you analyze the HTTP responses returned by the servers in your backend set.

To view a default set of metrics charts in the Console, navigate to the load balancer or backend set you're interested in, and then click **Metrics**. You also can use the Monitoring service to create **custom queries**.

### Prerequisites

- IAM policies: To monitor resources, you must be given the required type of access in a **policy** written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. The policy must give you access to the monitoring services as well as the resources being monitored. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which **compartment** you should work in. For more information on user authorizations for monitoring, see the Authentication and Authorization section for the related service: Monitoring or **Notifications**.
- The metrics listed on this page are automatically available for any load balancer, listener, and backend set you create. You do not need to enable monitoring on the resource to get these metrics.

### Available Metrics: **oci_lbaas**

Learn about the available metrics for the Load Balancing service.

The Load Balancing service metrics include the following **dimensions**:
### Load Balancing

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVAILABILITYDOMAIN</td>
<td>The availability domain in which the load balancer resides.</td>
</tr>
<tr>
<td>BACKENDSETNAME</td>
<td>The name of the backend set to which the metrics apply.</td>
</tr>
<tr>
<td>LBCOMPONENT</td>
<td>The load balancer component to which the metrics apply.</td>
</tr>
<tr>
<td>LBHOSTID</td>
<td>A unique ID that represents the current load balancer host. This ID is subject to change.</td>
</tr>
<tr>
<td>LISTENERNAME</td>
<td>The name of the listener to which the metrics apply.</td>
</tr>
<tr>
<td>REGION</td>
<td>The region in which the load balancer resides.</td>
</tr>
<tr>
<td>RESOURCEID</td>
<td>The OCID of the resource to which the metrics apply.</td>
</tr>
</tbody>
</table>

The tables on this page describe which data is valid for each of these dimension values. If you choose a metric that does not apply to the specified dimension value, the metric returns no data.

---

**Metrics for the lbComponent Dimension Value “Backendset”**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Metric Display Name</th>
<th>Unit</th>
<th>Description</th>
<th>Dimensions</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActiveConnections</td>
<td>Active Connections</td>
<td>count</td>
<td>The number of active connections from the load balancer to all backend servers.</td>
<td>availabilityDomain backendSetName lbComponent lbHostId region resourceId</td>
</tr>
<tr>
<td>BackendServers</td>
<td>Backend Servers</td>
<td>count</td>
<td>The number of backend servers in the backend set.</td>
<td>lbComponent lbHostId region resourceId</td>
</tr>
<tr>
<td>BackendTimeouts</td>
<td>Backend Timeouts</td>
<td>count</td>
<td>The number of timeouts across all backend servers.</td>
<td></td>
</tr>
<tr>
<td>BytesReceived</td>
<td>Bytes Received</td>
<td>bytes</td>
<td>The number of bytes received across all backend servers.</td>
<td></td>

</tbody>
</table>

**Viewing Load Balancer Metrics**

View metrics for a Load Balancer resource.

Use one of the following methods to view load balancer metrics.

**To view metrics for a single balancer**

Use the OCI Console to view metrics for a Load Balancer resource.

1. Open the navigation menu, click **Networking**, and then click **Load Balancers**.
2. Select the **Compartment** from the list.
   
   All load balancers and network load balancers in that compartment are listed in tabular form.
3. (optional) Select a **State** from the list to limit the load balancers displayed to that state.
4. (optional) Uncheck **Load Balancer** under **Type** to only display load balancers.
5. Select the load balancer whose metrics you want to view.

   The Load Balancer Details dialog box appears.
6. Click **Metrics** under **Resources**.

   The **Metrics** list appears. All routing policies are listed in tabular form.
7. In the **Resources** menu, click **Metrics** (if necessary).

   The **Metrics** page displays a default set of charts for the current load balancer.
8. Specify the following:
   
   • **Start Time**: The date-time group for when the metric period starts.
   • **End Time**: The date-time group for when the metric period ends.
   • **Quick Selects**: Select a pre-determined time period for the metric period from the list.
For more information about monitoring metrics and using alarms, see Monitoring on page 4024. For information about notifications for alarms, see Notifications on page 4838.

**To view metrics for all load balancers in a compartment**

1. Open the navigation menu and click **Observability & Management**. Under **Monitoring**, click **Service Metrics**. The Service Metrics page appears.
2. Select the **Compartment** from the list.
3. Select "oci_lbass" from the **Metric Namespace** list.

A default set of charts for the selected metric namespace appears in the Service Metrics page. For more information about the emitted metrics, see the foregoing table. You can also use the Monitoring service to create custom queries.

**Troubleshooting Load Balancing**

Learn about troubleshooting methods for addressing Load Balancing service issues.

Enable Oracle Cloud Infrastructure load balancing access and error logs to troubleshoot common errors. See Log Management on page 3880 for more information.

**Troubleshooting an HTTP 502 Bad Gateway Error**

Learn how to troubleshoot an HTTP 502 bad gateway error for a Load Balancer resource.

In addition to monitoring and management, load balancing logging helps you to identify, isolate, and troubleshoot issues with your load balancer infrastructure. The following procedure illustrates how to troubleshoot a 502 Bad Gateway error encountered when deploying a new web application, example.com. The example uses an Oracle Cloud Infrastructure public load balancer as the front end in a development environment. The task fails with a 502 Bad Gateway error on the browser. Troubleshoot the issue using load balancer access and error logs, as follows:

1. Confirm the error using the curl utility, as follows:

```
curl -v http://example.com
```

```
> GET / HTTP/1.1
> Host: 192.0.2.99
> User-Agent: curl/7.54.0
> Accept: */*
>
< HTTP/1.1 502 Bad Gateway
< Content-Type: text/html
< Content-Length: 161
< Connection: keep-alive
```
2. Search the load balancer access and error logs for "lbStatusCode" and "backendStatusCode."

• If the results include backendStatusCode: 502, then:

  **Possible causes:**
  • Issue is an improperly configured backend.
  • Backend is likely another reverse proxy or LB.

  **Possible resolutions:**
  • Examine upstream proxy logs to determine why the 502 error is being returned.
  • Resolve any issues on the ultimate backend that is causing the upstream proxy to return a 502 error.

• If the results include backendStatusCode: 504, then:

  **Possible causes:**
  • When a 504 error occurs from the backend, it typically indicates that the backend is another proxy or load balancer service instance. The error typically occurs when a proxy is unable to connect to an upstream server in a specified amount of time.
  • Examine the logs of the upstream system to determine what is causing the upstream proxy from connecting to the backend.

  **Possible resolutions:**
  • Increase the amount of time for the connection timeout.
  • Determine why the backend is taking longer to respond than usual using a utility, such as tcpdump, and built-in application tools.

• If the results include backendStatusCode: 500, then:

  **Possible causes:**
  • When a 500 error occurs from the backend, it typically indicates a server-side error, commonly known as an "Internal Server Error." Backend applications typically cause this error.
  • Inability to connect to upstream resources, such as databases, APIs, and services.

  **Possible resolutions:**
  Resolve application-level issue that is causing the error.

• If the results include backendStatusCode: with no error code, then:

  Typically, when no backend status code accompanies lbStatusCode: 502, no backend is available to send the connections.

  You might also notice a No healthy backends available in associated backendSet message in the load balancer error Logs.

  Ensure that the backends are healthy. If the backends are healthy, then confirm that the health check is properly configured.

### Debugging a Backend Server Timeout

Learn how to debug a timeout error associated with a backend server used by a Load Balancer resource.

When the backend server exceeds the response time when responding to a request, a 504 error occurs indicating that the backend server is either down or not responding to the request forwarded by the load balancer. The client application receives the following response code: HTTP/1.1 504 Gateway Timeout.

Errors can occur for the following reasons:

• The load balancer failed to establish a connection to the backend server before the connection timeout expired.
• The load balancer established a connection to the backend server but the backend did not respond before the idle timeout period elapsed.
• The security lists or network security groups for the subnet or the VNIC did not allow traffic from the backends to the load balancer.
• The backend server or application server failed.
Follow these steps to troubleshoot the backend server timeout errors:

1. Use the `curl` utility to directly test the backend server from a host in the same network.
   
   ```
curl -i http://backend_ip_address
   ```

   If this test takes longer than one second to respond, an application-level issue is causing latency. Oracle recommends that you check any upstream dependencies that might cause latency, including:
   
   - Network attached storage such as iSCSI or NFS
   - Database latency
   - An off-premise API
   - An application tier

2. Check the application by accessing it directly from the backend server. Check its access logs to determine if the application can be accessed and is functioning properly.

3. If the load balancer and the backend server are in different subnets, then check whether the security lists contain rules to allow traffic. If no rules exist, then traffic is not allowed.

4. Enter the following commands to determine whether firewall rules exist on the backend servers that block traffic:
   
   ```
   iptables -L lists all firewall rules enforced by `iptables`
   sudo firewall-cmd --list-all lists all firewall rules enforced by `firewalld`
   ```

5. Enable logging on the load balancer to determine whether the load balancer or the backend server is causing the latency.

**Testing TCP and HTTP Backend Servers**

Learn how to test the TCP and HTTP backend servers used by a Load Balancer resource.

This topic describes how to troubleshoot a load balancer connection. The topology used in this procedure has a public load balancer in a public subnet and the backends are in the same subnet.

Oracle recommends that you use the Oracle Cloud Infrastructure Logging service to troubleshoot issues. (See Details for Load Balancer Logs on page 3953.)

In addition to using Oracle Cloud Infrastructure logging, however, you can use other utilities listed in this section to troubleshoot the traffic that is processed by the load balancer and sent to a backend. To perform these tests, Oracle recommends that you create an instance in the same network as your load balancer and allow the traffic in the same network security groups and security lists. Use the following tools to troubleshoot:

- **ping**

  Before using the more advanced utilities listed here, Oracle recommends that you perform a basic ping test. For this test to succeed, you must allow ICMP traffic between the test instance and the backend.

  ```
  $ ping backend_ip_address
  ```

  The response should look similar to:

  ```
PING 192.0.2.2 (192.0.2.2) 56(84) bytes of data.
64 bytes from 192.0.2.2: icmp_seq=1 ttl=64 time=0.028 ms
64 bytes from 192.0.2.2: icmp_seq=2 ttl=64 time=0.044 ms
  ```

  If you receive a message that contains "64 bytes from...", then the ping succeeded.

  Receiving a message that contains "Destination Host Unreachable" indicates that the system does not exist.

  Receiving no message indicates that the system exists but the ICMP protocol is not allowed. Check all firewalls, security lists, and network security groups to ensure ICMP is allowed.
• **curl**

Use the `curl` utility to send HTTP requests to a specific host, port, or URL.

• The following example shows using `curl` to connect to a backend that is sending a 403 Forbidden error:

$ curl -I http://backend_ip_address/health
HTTP/1.1 403 Forbidden
Date: Tue, 17 Mar 2021 17:47:10 GMT
Content-Type: text/html; charset=UTF-8
Content-Length: 3539
Connection: keep-alive
Last-Modified: Tue, 10 Mar 2021 20:33:28 GMT
ETag: "dd3-5b3c6975e7600"
Accept-Ranges: bytes

In the preceding example, the health check fails, returning a 403 error, indicating that the backend does not have local file permissions configured properly for the health check page.

• The following example shows using `curl` to connect to a backend that is sending a 404 Not Found error:

$ curl -I http://backend_ip_address/health
HTTP/1.1 404 Not Found
Date: Tue, 17 Mar 2021 17:47:10 GMT
Content-Type: text/html; charset=UTF-8
Content-Length: 3539
Connection: keep-alive
Last-Modified: Tue, 10 Mar 2021 20:33:28 GMT
ETag: "dd3-5b3c6975e7600"
Accept-Ranges: bytes

In the preceding example, the health check fails, returning a 404 error, indicating that the health check page does not exist in the expected location.

• The following example shows a backend that exists and either a network security group, the security lists, or a local firewall is blocking the traffic:

$ curl -vz backend_ip_address
curl: (7) Failed connect to backend_ip_address:port; Connection refused

• The following example shows a backend that does not exist:

$ curl -vz backend_ip_address
curl: (7) Failed connect to backend_ip_address:port; No route to host

• **Netcat**

Netcat is a networking utility for reading from and writing to network connections using TCP or UDP.

• The following example shows using the `netcat` utility at the TCP level to ensure that the destination backend server can receive a connection:

$ nc -vz backend_ip_address port
Ncat: Connected to backend_ip_address:port.

In the preceding example, `port` is open for connections.

• $ nc -vn backend_ip_address port
Ncat: Connection timed out.

In the preceding example, `port` is closed.
• Tcpdump

Use the `tcpdump` utility to capture all traffic to a backend to ensure which traffic is coming from a load balancer and what is being returned to the load balancer.

```
sudo tcpdump -i any -A port port src load_balancer_ip_address
```

11:25:54.799014 IP 192.0.2.224.39224 > 192.0.2.224.80: Flags [P.], seq 1458768667:1458770008, ack 2440130792, win 704, options [nop,nop,TS val 461552632 ecr 208900561], length 1341: HTTP: POST /health HTTP/1.1

• OpenSSL

When troubleshooting SSL issues between the load balancer instance and the backend servers, Oracle recommends using the `openssl` utility. This utility opens an SSL connection to a specific host name and port, and prints the SSL certificate and other parameters.

Other options for troubleshooting issues are:

- `-showcerts`

  This option prints all certificates in the certificate chain presented by the backend server. Use this option to identify issues, such as a missing intermediate certificate authority certificate.

- `-cipher cipher_name`

  This option forces the client and server use a specific cipher suite and helps to rule out whether the backend is allowing specific ciphers.

• Netstat

Use the `netstat -natp` command to ensure that the application running on the backend server is up and running. For TCP or HTTP traffic, the backend application, IP address, and port must all be in `listen` mode. If the application port on the backend server is not in `listen` mode, then the TCP port of the application is not up.

To resolve this issue, ensure that the application is up and running by either restarting the application or the backend server.

Common Load Balancer Errors

Learn about common load balancer errors associated with the Load Balancing service.

Common load balancer errors include, series 500 and series 400 errors, health check errors, client errors, and SSL errors. The subsequent topics in this section describe these common errors and detail troubleshooting procedures for each, where applicable.

**Server Errors (500-599)**

Learn about common load balancer server errors (500-599) associated with the Load Balancing service.

504

**Error messages:**

- `lbStatusCode: "504"
- `backendStatusCode: ""

**Oracle Cloud Infrastructure log category:** Access log

**Symptoms:**

The client fails with a 504 error.

**Possible causes:**

The load balancer is not able to establish connections with any of the backends, even though the health check is marking the backends as available.

**Possible solutions:**

Configure the health check correctly.
Troubleshooting documentation: Editing Health Check Policies on page 3800

502, 502

Error messages:
- `lbStatusCode: "502"
- `backendStatusCode: "502"

Oracle Cloud Infrastructure log category: Access log and error log

Symptoms:
- The client fails with a 502 Bad Gateway error.
- The backend health check succeeds.
- The backend returns a 502 error.

Possible causes:
- An application on the backend is returning a 502 error.
- The backend is configured incorrectly.
- The backend is likely another reverse proxy or load balancer.

Possible solutions:
Examine the backend application logs to determine why a 502 error is returned.

Troubleshooting documentation: Troubleshooting an HTTP 502 Bad Gateway Error on page 3892 and Testing TCP and HTTP Backend Servers on page 3894.

502

Error messages:
- `lbStatusCode: "502"
- `backendStatusCode: ""
- No healthy backends available in associated backend set

Oracle Cloud Infrastructure log category: Access log and error log

Symptoms:
- The client fails with a 502 Bad Gateway error.
- The backend health check fails.
- No traffic observed to a specific backend or all backends.

Possible causes:
- A backend application is not responding to the health check with the expected response.
- If no error occurs from the backend, then a TCP health check is configured.
- A single backend or all backends are configured in `drain` mode.

Possible solutions:
- Determine why TCP health check is failing.
- Convert to HTTP health check.
- Change the `drain` mode to false (undrain) for a given backend or all backends.

Troubleshooting documentation: Troubleshooting an HTTP 502 Bad Gateway Error on page 3892 and Testing TCP and HTTP Backend Servers on page 3894.

Backend Connection Issue

Error:
Backend ip_address abruptly closes connection.

**Oracle Cloud Infrastructure log category:** Error log

**Symptoms:**
- The client fails with a 502 Bad Gateway error.
- The client reports IO error in load balancer metrics.

**Possible causes**
The backend connection timeout is configured incorrectly, with a lower timeout value than the load balancer.

**Possible solutions:**
- Determine why backend application is timing out.
- If the backend timeout value needs to be adjusted, then adjust it to be greater than the load balancer timeout value.

**Troubleshooting documentation:** Testing TCP and HTTP Backend Servers on page 3894

**Session Persistence Issue**

**Error message:**

```
Persistence selected backend ip_address which failed and no_fallback is selected
```

**Oracle Cloud Infrastructure log category:** Error log

**Symptoms:**
- The client fails with a 502 Bad Gateway error.
- Session persistence is failing.

**Possible causes**
- Backend set is configured with session persistence and the expected backend is not available because the connection failed or timed out.
- Fallback option is disabled.

**Possible solutions:**
- Determine why backend application is not reachable.
- Enable fallback option in case the selected server is unavailable.

**Troubleshooting documentation:** Fallback on page 3761

For all other 5nn errors, the most likely causes are issues with the backend server.

**Client Errors (400-499)**
Learn about common load balancer client errors (400-499) associated with the Load Balancing service.

**400**

**Error messages:**
- lbStatusCode: "400"
- backendStatusCode: ""
- 400 bad request header or cookie too large

**Oracle Cloud Infrastructure log category:** Access log

**Symptoms:**
- The load balancer returns a status code 400.
- The backend does not return a status code.
**Possible causes:**
The client is sending a request that exceeds the configured buffer size.

**Possible solutions:**
Increase the HTTP request header size on the load balancer. By default, the size limit is 8 KB but raising it to 64 KB resolves the issue.

**Troubleshooting documentation:** [HTTP Header Rules](https://example.com) on page 3859

### 404, 404

**Error messages:**
- `lbStatusCode: "404"`
- `backendStatusCode: "404"`

**Oracle Cloud Infrastructure log category:** Access log

**Symptoms:**
- The load balancer returns a 404 status code.
- The backend returns a 404 status code.

**Possible causes:**
The expected page does not exist on the backend.

**Possible solutions:**
- Create the missing page.
- Configure the client to call the correct page.

### 403, 403

**Error messages:**
- `lbStatusCode: "403"`
- `backendStatusCode: "403"`

**Oracle Cloud Infrastructure log category:** Access log

**Symptoms:**
- The load balancer returns a 403 status code.
- The backend returns a 403 status code.

**Possible causes:**
- Expected page does not have sufficient permission on the backend.
- Expected authentication token is missing or not being forwarded.

**Possible solutions:**
- Create missing permissions on backend.
- Adjust client configuration to ensure that tokens are sent properly.
- Ensure that all tokens being sent are arriving at the backend.
- If the header is missing:
  - Adjust header size on the load balancer or the client.
  - Allow headers with special characters.

**Troubleshooting documentation:** [HTTP Header Rules](https://example.com) on page 3859
**Health Check Errors**
Learn about health check errors associated with Load Balancer resources.

**No Healthy Backends**

**Error message:**

```
No healthy backends available in associated backendSet
```

**Oracle Cloud Infrastructure log category:** Error log

**Symptoms:**
The client fails with a 502 Bad Gateway error.

**Possible causes:**
- No backends in the backend set.
- No backends responding to health check.

**Possible solutions:**
- Determine why backends are not responding to health check.
- Check and adjust any health check settings, including status code, regular expressions, interval timeout, port, and protocol.

**Troubleshooting documentation:** Editing Health Check Policies on page 3800

**Status Code Issues**

**Backend health status failure reason:** Status code Mismatch

**Oracle Cloud Infrastructure category:** Backend Health Status

**Error message:**

```
"msg":"invalid statusCode","statusCode":XXX,"expected":"200"
```

**Oracle Cloud Infrastructure log category:** Error log

**Symptoms:**
- The backend fails the health check.
- The client fails with a 502 Bad Gateway error.
- invalid statusCode appears in the error logs.

**Possible causes:**
- The backend is responding with an incorrect response code.
- The backend health check fails because of response code mismatch.
- The health check failures are because of an unexpected status code in the regular expression body.

**Possible solutions:**
- Determine why the backend is sending the incorrect response code.
- Adjust the path or status code of the health check to match the backend.

**Troubleshooting documentation:** Editing Health Check Policies on page 3800

**Response Match Failed**

**Backend Health Status Failure Reason:** Regular expression mismatch

**Oracle Cloud Infrastructure category:** Backend Health Status
Error message:

"response match result: failed"

Oracle Cloud Infrastructure log category: Error log

Symptoms:

• The backend fails the health check.
• The client fails with a 502 Bad Gateway error.
• "response match result: failed" appears in the error logs.

Possible causes:

The backend health check fails because of regular expression mismatch, incorrect value returned, or incorrect value provided to the health check.

Possible solutions:

• Determine why the backend is sending the incorrect body.
• Adjust the path or regular expression pattern of the health check to match the backend.

Troubleshooting documentation: Editing Health Check Policies on page 3800

Unreachable Host

Backend Health Status Failure Reason: Connection failed

Oracle Cloud Infrastructure category: Backend Health Status

Error messages:

"errno":"EHOSTUNREACH","syscall":"connect"

"ECONNREFUSED","errno":"ECONNREFUSED"

Oracle Cloud Infrastructure log category: Error log

Symptoms:

• The backend fails the health check.
• The client fails with a 502 Bad Gateway error.
• "EHOSTUNREACH" appears in error logs.

Possible causes:

• The backend health check fails because of an unreachable host.
• The backend health check fails because of a connection reset.
• An application or firewall is actively refusing the connection.

Possible solutions:

• Check the local instance firewall to confirm that traffic is being allowed.
• Check the local instance to confirm that the application is running.
• Check the network security group and security lists to confirm that traffic is allowed.

Troubleshooting documentation: Access and Security on page 4281
**Health Status Issues**

**Error messages:**

- "healthStatus":"Unhealthy to Healthy"
- "healthStatus":"Healthy to Unhealthy"

**Oracle Cloud Infrastructure log category:** Error log

**Symptoms:**

- The client behaves as expected but fails periodically.
- The backend switches between passing and failing the health check.
- "Unhealthy to Healthy" or "Healthy to Unhealthy" appears in error logs.

**Possible causes:**

- An unhealthy backend becomes healthy.
- If the health status of the backend changes often, it can indicate a chronic problem.

**Possible solutions:**

- Ensure that the instance is not changing health status abnormally.
- Check application logs on the backend server for any application-specific issues.

**Connection Issues**

**Backend Health Status Failure Reason:** Timed out

**Oracle Cloud Infrastructure category:** Backend Health Status

**Error messages:**

- "msg":"connect timed out","elapsed":3000}

**Oracle Cloud Infrastructure log category:** Error log

**Symptoms:**

- The client fails with a 502 Bad Gateway error.
- The backend is periodically or chronically failing health checks.
- "connect timed out" appears in the error logs.

**Possible causes:**

- The backend server is not responding to health checks in the expected time period.
- Slow upstream dependency including, database, application service or API, or slow storage services, such as Oracle Cloud Infrastructure File Storage service, Elastic Block Store, or Object Storage.

**Possible solutions:**

- Perform a local test to the backend to eliminate the load balancer as a cause.
- Check the performance of all upstream dependencies.
- Check application logs on the backend server for any dependencies reporting any sort of timeout.

**Troubleshooting documentation:** Testing TCP and HTTP Backend Servers on page 3894.
SSL Errors
Learn about single socket layer (SSL) errors associated with Load Balancer resources.

SSL Virtual Listener Issues
Error message:

Not all SSL virtual listeners on port 443 have the same set of SSL protocols defined

Symptoms:
You cannot create backends for an existing load balancer nor can you add new servers to the backend created previously within the same load balancer.

Possible causes:
Mismatch of transport layer security (TLS) versions.

Possible solutions:
Match TLS versions on the listeners.

Troubleshooting documentation: SSL Certificate Management on page 3867

SSL Handshake Issues
Error message:

_SSL: error:140770FC:SSL routines:SSL23_GET_SERVER_HELLO:unknown protocol_ while SSL handshake error

Oracle Cloud Infrastructure log category: Client log

Symptoms:
The client experiences SSL handshake failures in Oracle Cloud Infrastructure metrics (see Load Balancing Metrics on page 3886).

Possible causes:
The backend is not configured to accept SSL.

Possible solutions:
• Confirm that the backend certificate matches the certificate authority that is provided.
• Ensure that all certificates in the chain are provided in the correct order in the Certificate field.
• Ensure that you provide the correct certificate depth.

Troubleshooting documentation: SSL Certificate Management on page 3867

Backend SSL Handshake Issues
Error messages:

Peer backend_ip_address closed connection in SSL handshake

Oracle Cloud Infrastructure log category: Error log

Symptoms:
• The client fails with a 502 Bad Gateway error.
• The client experiences SSL handshake failures in Oracle Cloud Infrastructure metrics (see Load Balancing Metrics on page 3886).
Possible causes:

• The backend is not configured to accept SSL.
• The backend certificate is invalid.

Possible solutions:

• Confirm that the backend certificate matches the certificate authority that is provided.
• Ensure that all certificates in the chain are provided in the correct order in the Certificate field.
• Ensure that you provide the correct certificate depth.

Troubleshooting documentation: SSL Certificate Management on page 3867

SSL Certificate Issues

Error:

Client backend_ip_address has SSL certificate verify error.

Oracle Cloud Infrastructure log category: Error log

Symptoms:

The client experiences SSL handshake failures in Oracle Cloud Infrastructure metrics (see Load Balancing Metrics on page 3886).

Possible causes:

• The client certificate is invalid.
• The client certificate is not trusted.
• Invalid peer certification verify depth.

Possible solutions:

• Ensure that the client certificate is valid.
• Remove Peer Cert Verify feature on the listener.

Troubleshooting documentation: Key Pair Mismatch on page 3870 and Private Key Consistency on page 3870.

Client SSL Certificate Issues

Error message:

Client backend_ip_address sent no required SSL certificate

Oracle Cloud Infrastructure log category: Error log

Symptoms:

• The client experiences a 400 Response error.
• no required SSL certificate appears in error logs.

Possible causes:

The client is not sending a client certificate.

Possible solutions:

• Update the client to send the correct client certificate.
• Remove Peer Cert Verify feature on the listener.
• Adjust the certificate verification depth.

Troubleshooting documentation: Configuring Peer Certificate Verification on page 3869.
SSL Error Causes Backend Health Check Failure

Error message:
```
"code":"EPROTO","errno":"EPROTO"
```

**Oracle Cloud Infrastructure log category:** Error log

**Symptoms:**
The backend health check fails because of the SSL error.

**Possible causes:**
The backend is configured to accept SSL but the health check protocol selected does not match that of the backend.

**Possible solutions:**
Confirm that you are using non-TLS health check on a backend that has TLS enabled.

**Troubleshooting documentation:** Editing Health Check Policies on page 3800

SSL Host Name Verification Fails

Error message:
```
SSL host name verification failed for host_name
```

**Oracle Cloud Infrastructure log category:** Error log

**Symptoms:**
- The client fails with a 502 Bad Gateway error.
- Error message contains SSL host name verification failed.

**Possible causes:**
Host name provided does not match what is expected.

**Possible solutions:**
- Configure client to use the expected host name.
- Configure certificate to match the host name sent by the client.

**Troubleshooting documentation:** SSL Certificate Management on page 3867

Client-Side Errors
Learn about client-side errors associated with Load Balancer resources.

Client Access Denied

**Error:**
Access for *client_ip_address* denied by HTTP ACL rule.

**Oracle Cloud Infrastructure log category:** Error log

**Symptoms:**
- The client fails with a 502 Bad Gateway error.
- The backend does not pass health check.
- forbidden by HTTP ACL rule appears in the error log.

**Possible causes:**
Access control rule set is enabled but does not include the source IP address.

**Possible solutions:**
Check and apply respective rule set to include the source IP address.

**Troubleshooting documentation:** [Access Control Rules](#) on page 3855

**Client Timeout Issue**

**Error:**

Client *client_name* timed out

**Oracle Cloud Infrastructure log category:** Error log

**Symptoms:**

- The client fails with a *502 Bad Gateway* error.
- The client experiences SSL handshake failures in Oracle Cloud Infrastructure metrics (see [Load Balancing Metrics](#) on page 3886).

**Possible causes:**

The client terminated the connection sooner than the configured timeout for the load balancer.

**Possible solutions:**

- Configure client timeout to match expected application configuration.
- Determine why the backend did not respond in the configured amount of time.

**Troubleshooting documentation:** [Testing TCP and HTTP Backend Servers](#) on page 3894.

**Load Balancer Troubleshooting FAQs**

Learn more about troubleshooting load balancers using these frequently asked questions (FAQs).

Q: Does a cipher suite get negated or removed while adding a new one?

A: There can only be one cipher suite attached to a listener at a time, which controls all allowable ciphers. The cipher suite attached to the listener must have all ciphers for which you require support.

---

**Get Started with Load Balancing**

*Your cloud applications: Highly available, scalable, and secure. Increase application availability and performance with highly available and provisioned bandwidth load balancing.*
## Features

**Public and private load balancers**

**Public load balancer**: Offers a public IP address to front-end internet traffic within a single availability domain, or across multiple availability domains. **Private load balancer**: Isolates your load balancer from the internet and simplifies your security posture. The Load Balancing service assigns it a private IP address that serves as the entry point for incoming traffic.

**High availability**

Highly available load balancers ensure the entry point to your network and application traffic does not have a single point of failure.

**Flexibility**

Manage your load balancer via API or web console to dynamically add and remove application nodes to the traffic flow. Load balance traditional or cloud native enterprise applications with your choice of TCP or HTTP protocols. Full end-to-end API capability to automate load balancer administration tasks.

**SSL**

**SSL offload**: Offload costly and CPU-intensive SSL handshakes to your load balancer. **End-to-end SSL**: Supports end-to-end SSL encryption.

**Content-based routing**

**Host-based routing**: Host multiple web applications using a single load balancer and common set of backend servers **Path-based routing**: Optimize resource utilization by routing to independent backend sets based on the URL paths

**Session persistence**

Supports session persistence and enables sticky sessions, whereby requests from a client are directed to the same backend server on the load balancer throughout the life of a session.

**Application cookie persistence**: Load Balancing service activates session persistence when a backend server(application) sends a set-cookie response header containing a recognized cookie name. **Load balancer cookie persistence**: Enables administrators to generate HTTP session cookie at the Load balancer and share the cookie with associated backend servers.

Oracle Cloud Infrastructure User Guide
Logging Overview

The Oracle Cloud Infrastructure Logging service is a highly scalable and fully managed single pane of glass for all the logs in your tenancy. Logging provides access to logs from Oracle Cloud Infrastructure resources. These logs include critical diagnostic information that describes how resources are performing and being accessed.

How Logging Works

Use Logging to enable, manage, and search logs. The three kinds of logs are the following:

- **Audit logs**: Logs related to events emitted by the Oracle Cloud Infrastructure Audit service. These logs are available from the Logging Audit page, or are searchable on the Search page alongside the rest of your logs.
- **Service logs**: Emitted by OCI native services, such as API Gateway, Events, Functions, Load Balancing, Object Storage, and VCN Flow Logs. Each of these supported services has pre-defined logging categories that you can enable or disable on your respective resources.
- **Custom logs**: Logs that contain diagnostic information from custom applications, other cloud providers, or an on-premise environment. Custom logs can be ingested through the API, or by configuring the Unified Monitoring Agent. You can configure an OCI compute instance/resource to directly upload Custom Logs through the Unified Monitoring Agent. Custom logs are supported in both a virtual machine and bare metal scenario.

A log is a first-class Oracle Cloud Infrastructure resource that stores and captures log events collected in a given context. For example, if you enable Flow Logs on a subnet, it has its own dedicated log. Each log has an OCID and is stored in a log group. A log group is a collection of logs stored in a compartment. Logs and log groups are searchable, actionable, and transportable.

To get started, enable a log for a resource. Services provide log categories for the different types of logs available for resources. For example, the Object Storage service supports the following log categories for storage buckets: read and write access events. Read access events capture download events, while write access events capture write events. Each service can have different log categories for resources. The log categories for one service have no relationship to the log categories of another service. As a result, the Functions service uses different log categories than the Object Storage service.

When you enable a log, you must add it to a log group that you create. Log groups are logical containers for logs. Use log groups to organize and streamline management of logs by applying IAM policy or grouping logs for analysis. For more information, see Managing Logs and Log Groups on page 3911.

Logs are indexed in the system, and searchable through the Console, API, and CLI. You can view and search logs on the Logging Search page. When searching logs, you can correlate across many logs simultaneously. For example, you can view results from multiple logs, multiple log groups, or even an entire compartment with one query. You can filter, aggregate, and visualize your logs. For more information, see Searching Logs on page 3983.

After you enable a log, log entries begin to appear on the detail page for the log (see Enabling Logging for a Resource on page 3924 for more information). If you need more archiving support, you can use Service Connector Hub (archiving to object storage, write to stream, and so on). For more information on service logs, see Service Log Reference on page 3926, and Service Connector Hub on page 5364.
Logging

Note:
You can view usage report detail for Logging by accessing Cost and Usage Reports.

Logging Workshop
See the OCI Logging Workshop for step-by-step, lab-based instructions on setting up your environment, enabling service logs, creating custom application logs, searching logs, and exporting log content to Object Storage.

Logging APIs
Oracle Cloud Infrastructure Logging has the following APIs available:

- Logging Management API
- Logging Ingestion API
- Logging Search API

Also see Using the (Logging Management) API, Using the (Logging Ingestion) API for custom logs, and Using the (Logging Search) API for more information on logging operations specific to each API.

Logging Concepts
The following concepts are essential to working with Logging.

Service Logs
Critical diagnostic information from supported Oracle Cloud Infrastructure services. See Supported Services on page 3924.

Custom Logs
Diagnostic information from custom applications, other cloud providers, or an on-premise environment. To ingest custom logs, call the API directly or configure the unified monitoring agent.

Audit Logs
Read-only logs from the Audit service, provided for you to analyze and search. Audit logs capture the information about API calls made to public endpoints throughout your tenancy. These include API calls made by the Console, Command Line Interface (CLI), Software Development Kits (SDK), your own custom clients, or other Oracle Cloud Infrastructure services.

Log Groups
Log groups are logical containers for logs. Use log groups to streamline log management, including applying IAM policy or searching sets of logs. You can move log groups from one compartment to another and all the logs contained in the log group moves with it.

Service Log Category
Services provide log categories for the different types of logs available for resources. For example, the Object Storage service supports the following log categories for storage buckets: read and write access events. Read access events capture download events, while write access events capture write events. Each service can have different log categories for resources. The log categories for one service have no relationship to the log categories of another service.

Service Connector Hub
Service Connector Hub moves logging data to other services in Oracle Cloud Infrastructure. For example, use Service Connector Hub to alarm on log data, send log data to databases, and archive log data to Object Storage. For more information, see Service Connector Hub on page 5364.
Unified Monitoring Agent

The fluentd-based agent that runs on customer machines (OCI instances), to help customers ingest custom logs.

Agent Configuration

A configuration of the Unified Monitoring Agent that specifies how custom logs are ingested.

Log Encryption

OCI logs are encrypted according to the following:

- Logs are encrypted in-flight, that is, while they are in the process of being ingested into Oracle Cloud Infrastructure Logging;
- After the logs are in the system, they are encrypted with disk-level encryption for commercial environments; and
- Logs are also encrypted when they are archived, and while in storage.

Resource Identifiers

Most types of Oracle Cloud Infrastructure resources have a unique, Oracle-assigned identifier called an Oracle Cloud ID (OCID). For information about the OCID format and other ways to identify your resources, see Resource Identifiers on page 224.

Ways to Access Oracle Cloud Infrastructure

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface on page 6094.

To access the Console, you must use a supported browser.

Oracle Cloud Infrastructure supports the following browsers and versions:

- Google Chrome 69 or later
- Safari 12.1 or later
- Firefox 62 or later

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference on page 3298.

If you’re a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

For administrators: Use the following topics to find examples of IAM policy for Logging:

- Required Permissions for Working with Logs and Log Groups on page 3912
- Required Permissions for Searching Logs on page 3984

Managing Logs and Log Groups

This topic describes how to manage logs and log groups.
Overview of Logs and Log Groups

Logs contain critical diagnostic information that tells you how your resources are performing and being accessed. You can enable logging on supported resources. To see a list of supported resources grouped by service, see Supported Services on page 3924.

Log groups are logical containers for organizing logs. Logs must always be inside log groups. You must create a log group to enable a log.

Use log groups to limit access to sensitive logs with IAM policy. With log groups, you don’t have to rely on complex compartment hierarchies to secure your logs. For example, say the default log group in a single compartment is where you store logs for the entire tenancy. You grant access to the compartment for log administrators with IAM policy as you normally would. However, let’s say some projects contain personally identifiable information (PII) and those logs can only be viewed by a select group of log administrators. Log groups allow you to put logs that contain PII into a separate log group, and then use IAM policy to restrict access to all but a few log administrators.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be granted security access in a policy by an administrator. This access is required whether you’re using the Console or the REST API with an SDK, CLI, or other tool. If you get a message that you don’t have permission or are unauthorized, verify with your administrator what type of access you have and which compartment to work in.

Administrators: for policy samples specific to logs and log groups, see Required Permissions for Working with Logs and Log Groups on page 3912.

If you’re new to policies, see Getting Started with Policies and Common Policies. If you want to know more about writing policies for Logging, see Details for Logging.

Required Permissions for Working with Logs and Log Groups

To enable service logs in a resource, a user must be granted manage access on the log group and access to the resource. In general, inspect access on the resource is enough, but check for specific resources. Inspect access provides permission to update the resource and permission for the log group that contains the log.

Logs and log groups use the log-group resource-type, but to search the contents of logs you must use a different resource-type.

Managing log groups and log objects

To manage groups or objects, use verbs for log-groups:

- Allow group A to use log-groups in compartment C
- Allow group B to manage log-groups in compartment C
- Allow group D to read log-groups in compartment C

This allows users in group A to create, update, or delete log groups and log objects in compartment C.
To provision agent configurations

Three different types of access are needed:

1. Access to operate on configurations.
2. Access to operate on log groups.
3. Inspect capabilities on dynamic groups or groups.

To have access to configurations, the policy must be:

Allow group B to use unified-configuration in compartment X

To create, update, or delete custom logs used as a destination in a configuration

This policy allows users in compartment B to create, update, or delete configurations in compartment X.

To provide a destination for the logs incoming from the configuration, you need log-groups access:

Allow group B to use log-groups in compartment X

To assign a configuration to a set of instances

To assign a configuration to a set of instances, you need inspect access to the dynamic group or group that identifies the instances:

Allow group B {IDENTITY_DYNAMIC_GROUP_INSPECT} in tenancy / Allow group B {IDENTITY_GROUP_INSPECT} in tenancy

Enable instances to push logs into the Logging service

To allow instances to push logs, the instances need to have access to get a configuration and push the logs. log-content controls this permission (where X is the compartment where the configurations are located):

Allow dynamic-group production-fleet to use log-content in compartment X

To view logs

To view logs in the Console (Search), the following is required:

Allow group Searchers to read log-content in compartment X

Example log search policy

To allow a group to read the contents of indexed logs:

allow group GroupA to read log-groups in tenancy
allow group GroupA to read log-content in tenancy

Example policies for logs and log groups

In these examples, policy statements use GroupA as the name of the group.

To allow a group to view the log groups in the tenancy (or in a compartment), requires inspect access:

allow group GroupA to inspect log-groups in tenancy

To allow a group to read metadata for logs or log groups, requires read access:

allow group GroupA to read log-groups in tenancy
To allow a group to update log groups, or the logs in them, requires use access:

allow group GroupA to use log-groups in tenancy

To enable a log on a resource (or to create and delete log groups and the logs in them), requires manage access:

allow group GroupA to manage log-groups in tenancy

To allow usage of a specific log group or groups, use a where clause with the target.loggroup.id variable. For example:

Allow group GroupA to manage loggroups in tenancy where target.loggroup.id='ocid1.loggroup.oc1.phx.<uniqueID>'

To specify multiple log groups:

Allow group GroupA to manage log-groups in tenancy where any {target.loggroup.id='ocid1.loggroup'}

Custom logs

For custom logs the following is required. This policy is needed to allow the user to search logs through the Console Search page:

allow group userGroup1 to read log-content in compartment c

Note:

Even though this policy is described for usage with custom logs, the policy is also true for all logs. LOG_CONTENT_READ allows reading logs from both custom and OCI service logs. It is identical in behavior to this policy:

allow group GroupA to read log-content in tenancy

The following is needed for the agent that uses the instance principal on the virtual machine to send logs:

allow dynamic-group dynamicgroup1 to use log-content in compartment c

Note:

If a user group is being used instead of a dynamic group for pushing custom logs, replace the dynamic group name with the user group name in these policies.

For custom logs, if you use allow dynamic-group dynamicGroup1 to use log-content in compartment c, the instances in that dynamic group get permission to download the configuration, send logs, and can search logs.

IAM Policy Requirements for Resources

In addition to the permissions to work with the log group, to add service logs to a resource you must have the update permission for the resource. For many resources, the update permission is granted with the use verb. For example, users who can use buckets in CompartmentA, can also enable logging on a bucket in CompartmentA.

However, some resources don't include permission to update a resource with the use verb. For example, to update a rule for the Events service, you must have the full manage permission. To enable a log on an Events rule (or any other resource that doesn't include the update permission with the use verb), you must have the manage permission.

To allow a group to enable logging for these resources, without granting the full permissions of manage, you can add a policy statement to grant only the <RESOURCE>_UPDATE permission (or, in the case of the Events service,
<RESOURCE>_MODIFY) from the manage verb. For example, to allow a group EventUsers to enable logs on Events rules in CompartmentA, you could write a policy like the following:

```plaintext
Allow group EventUsers to read cloudevents-rules in compartment CompartmentA
Allow group EventUsers to manage cloudevents-rules in compartment CompartmentA
  where request.permission='EVENTRULE_MODIFY'
```

For information about resource permissions, see Policy Reference on page 3298.

**VCN Flow Logs IAM Policy**

In addition to Required Permissions for Working with Logs and Log Groups on page 3912, subnet read and update permissions are required for managing VCN Flow Logs.

To provide subnet permissions, use one of the following policies, listed in order from broader to narrowed privileges:

```plaintext
Allow group FlowLogsEnablers to manage virtual-network-family in tenancy
Or:
Allow group FlowLogsEnablers to manage subnets in tenancy
Or:
Allow group FlowLogsEnablers to {SUBNET_READ, SUBNET_UPDATE} in tenancy
```

This group is similar to what is described for EventUsers in IAM Policy Requirements for Resources on page 3914.

**Example Scenario**

Your company has an Operations department. Within the Operations department are several costs centers. You want to be able to tag resources that belong to the Operations department with the appropriate cost center.

1. Create a log group called "confidential". Avoid entering confidential information.
2. Add logs with sensitive data to the "confidential" log group.

An employee named Alice already belongs to the group BucketManagers. Alice can manage buckets in CompartmentA. You want Alice and other members of BucketManagers group to be able to enable logs on buckets in CompartmentA.

To grant the BucketManagers group access to the sensitive data log group (and only the sensitive data log group), add the following statements to the BucketManagers policy:

```plaintext
Allow group BucketManagers to manage log-groups in compartment CompartmentA
  where
target.loggroups.id='ocid1.lumloggroup.oc1.phx.<uniqueID>'
```

Alice can now enable logs to bucket resources in CompartmentA.

**Move Log Groups to a Different Compartment**

You can move log groups from one compartment to another. When you move a log group to a new compartment, all the logs in the log group move with the log group to the new compartment. After you move the log group to the new compartment, the policies in the new compartment apply immediately, and affect access to the log group and any logs the log group contains.

For more information, see Moving Resources to a Different Compartment.

**Log and Log Group Names**

For log group names, the first character must start with a letter. Otherwise, the following guidelines apply to both log and log group names:
Logging

- Use from 1 to 256 characters.
- Valid characters are letters (upper or lower case), numbers, hyphens, underscores, and periods.
- Log and log group names are case-sensitive. Logging handles write-log and WRITE-log as separate logs.
- Avoid entering confidential information.

Legacy Archival

Legacy automatic log archival was previously available before general release. This is a toggle configurable for every log. If enabled, it automatically creates a bucket in your compartment, and places a copy of your log there. New and improved functionality is now available in Service Connector Hub on page 5364.

Using the Console

The Logs table lists both custom logs and service logs (indicated by the Log type field). The table is organized in terms of the following fields:

- Log name
- Log type
- Status
- Details
- Created

From this page you can click the Log name entry to go to the Log details page, or click the linked resource in Details to go directly to the resource. For example, if the log is for the Load Balancer service, clicking the link opens the Load Balancer Details page. From the action menu, you can edit the log, disable logging, change the log group, view tags, or delete the log.

To view the contents of logs

1. Open the navigation menu and click Observability & Management. Under Logging, click Logs.
2. Under List Scope, Compartment, choose a compartment you have permission to work in.
3. Under Log name, click the name of the log you want to view. The log detail page opens. This page displays the following on the Log Information tab:
   - OCID
   - Compartment
   - Log Group (click to view the log group contents)
   - Created date and time in UTC format
   - Retention Period

   Note:

   Retention period can be set in 30-day increments, up to a maximum of 180 days.

   - Legacy Archival mode
   - Status (Creating, Active, Updating, Inactive, Deleting, Deleted)
   - The Tags tab shows associated tags for this log.
   - Under Log Details, following is displayed: the Log Type (whether Service or Custom), Service (for service logs), Log Category, and Resource (click to view the linked resource).

   In the Explore Log resource, log data is displayed in a similar manner as the Log Data on the Search page. You can apply some simple filters, such as sorting by newest or oldest from the Sort field, or filtering by time from the corresponding Filter by Time field.

4. Click Explore with Log Search, which allows you to view this log on the Search page directly. After clicking this link, the Search page opens with the Select Logs to Search field populated with the log in the filter settings.
At this point, you can perform more analysis and investigation related to this log directly on the Search page. For more information, see Searching Logs on page 3983.

In addition to these functions in the Explore Log resource, you can also click the Metrics resource to view interactive charts for either a chosen time period (Start Time and End Time), or pre-selected ranges from Quick Selects. The charts display the Bytes Ingested (total bytes of log entries ingested) and the Search Success (number of successful search queries issued by the user).

Clicking anywhere in a chart displays a larger version of the chart. You can perform several chart actions from the Options menu (both in the Metrics resource and in the zoomed-in view):

- **View Query in Metrics Explorer**: Opens the chart in the Monitoring Metrics Explorer. See Metrics Explorer page on page 4053 for more information.
- **Copy Chart URL**
- **Copy Query (MQL)**
- **Create an Alarm on this Query**: Opens the Monitoring Create Alarm page. See To create an alarm on page 4094 for more information.
- **Table View**: Displays a tabular summary of the chart data. Select Chart View to switch back to the chart.

**To edit the name of a log**

1. Open the navigation menu and click Observability & Management. Under Logging, click Logs.
2. Under List Scope, Compartment, choose a compartment you have permission to work in.
3. Under Log name, click the name of the log you want to view. The log detail page opens.
4. Click Edit. The Edit Log panel is displayed. This panel indicates the resource, and allows you to change the log name in the associated field under Configure Log. You can also enable or disable the Enable Legacy Archival Logs setting (see Legacy Archival on page 3916). Avoid entering confidential information.

   From the main Logs page, for the log you want to edit, you can also click the the Actions menu, and then click Edit to access the Edit Log panel.
5. Make your changes and click Save Changes.

**To delete a log**

1. Open the navigation menu and click Observability & Management. Under Logging, click Logs.
2. Under List Scope, Compartment, choose a compartment you have permission to work in.
3. Under Log name, click the name of the log you want to view. The log detail page opens.
4. Click Delete. A confirmation dialog is displayed regarding the delete operation.
5. Confirm by clicking Delete.

   From the main Logs page, for the log you want to delete, you can also click the the Actions menu, and then click Delete.

**To move a log to a new log group**

1. Open the navigation menu and click Observability & Management. Under Logging, click Logs.
2. Under List Scope, Compartment, choose a compartment you have permission to work in.
3. Under Log name, click the name of the log you want to view. The log detail page opens.
4. Click Change Log Group. The Move to a Different Log Group dialog is displayed.
5. From the Choose New Group list, select the new group from the list, and click Chang Log Group. The new log group membership is reflected on the Log Information tab's Log Group field.

   From the main Logs page, for the log you want to move to a new group, you can also click the the Actions menu, and then click Change Log Group.

**To enable or disable an existing log**

1. Open the navigation menu and click Observability & Management. Under Logging, click Logs.
2. Under **List Scope, Compartment**, choose a compartment you have permission to work in.
3. Under **Log name**, click the name of the log you want to view. The log detail page opens.
4. Click **Disable Log/Enable Log**. A confirmation dialog is displayed regarding the disabling or enabling of the log.
5. Confirm by clicking **Disable Log/Enable Log**. The log detail page changes its status and displays **Inactive** (for a disabled log) or **Active** (for an enabled log) in the status field, both on the log detail page and the **Logs** page.

   From the main **Logs** page, for the log you want to enable or disable, you can also click the the Actions menu, and then click **Disable Logging/Enable Logging**.

### To create a log group

1. Open the navigation menu and click **Observability & Management**. Under **Logging**, click **Log Groups**.
2. Choose a compartment you have permission to work in and click **Create Log Group**. The **Create Log Group** panel is displayed.
3. Enter the following:
   - **Compartment**: The compartment in which you want to create the log group. This field is pre-filled based on your compartment choice.
   - **Name**: A name for this log group. The first character of a log group name must be a letter. For more, see **Log and Log Group Names** on page 3915. Avoid entering confidential information.
   - **Description**: A friendly description.
   - Optionally, enter tagging information.
4. Click **Create**. The log group detail page is then displayed. From this page you can:
   - Edit the group
   - Move resources
   - Add tags
   - Delete the log group
   - View log group information and tags
   - View log group resources (explore the log group, view the logs included in the log group, create custom or service logs, and view metrics)
   
   The **Metrics** resource in a log group detail page functions the same as in a log detail page. See **To view the contents of logs** on page 3916 for more information.

### To edit a log group

1. Open the navigation menu and click **Observability & Management**. Under **Logging**, click **Log Groups**.
2. Choose a compartment you have permission to work in and click the linked log group name under **Log Group** in the table. The log group detail page is displayed.
3. Click **Edit**. The **Edit Log Group** panel is displayed. From here, you can change the log group name and its description in the associated fields. Avoid entering confidential information. See **Log and Log Group Names** on page 3915 for more information on naming.

   From the main **Log Groups** page, for the log group you want to edit, you can also click the the Actions menu, and then click **Edit**.
4. Make your changes and click **Update**.

   **Note:**
   You cannot move, edit, or delete the default log group.

### To delete a log group

1. Open the navigation menu and click **Observability & Management**. Under **Logging**, click **Log Groups**.
2. Choose a compartment you have permission to work in and click the linked log group name under **Log Group** in the table. The log group detail page is displayed.

   **Tip:**
   You cannot delete a log group that contains logs.

3. Click **Delete**. A confirmation dialog is displayed regarding the delete operation.
4. Confirm by clicking **Delete**. The log group is removed from the **Log Groups** page.

From the main **Log Groups** page, for the log group you want to delete, you can also click the the Actions menu, and then click **Delete**.

   **Note:**
   You cannot move, edit, or delete the default log group.

**To move a log group to a different compartment**

1. Open the navigation menu and click **Observability & Management**. Under **Logging**, click **Log Groups**.
2. Choose a compartment you have permission to work in and click the linked log group name under **Log Group** in the table. The log group detail page is displayed.
3. Click **Move Resource**. The **Move Resource to a Different Compartment** dialog is displayed.
4. Choose the new compartment and then click **Move Resource**.

From the main **Log Groups** page, for the log group you want to move to a new compartment, you can also click the the Actions menu, and then click **Move Resource**.

   **Note:**
   You cannot move, edit, or delete the default log group.

**To list the logs in a log group**

1. Open the navigation menu and click **Observability & Management**. Under **Logging**, click **Log Groups**.
2. Choose a compartment you have permission to work in.
3. For the log group you want to inspect for logs, click the name of the log group under **Log Group** in the table. The log group detail page is displayed.
4. In **Resources**, click **Logs** to display a list of all the logs contained in the log group. This resource table of logs functions in the same manner as the main **Logs** page.

**Using the Command Line Interface (CLI)**

For more information on installing the CLI, see **Quickstart** on page 6062, and **logging-ingestion**, **logging**, and **logging-search** for command documentation.

**Agent Configuration Commands**

The following are Unified Monitoring Agent configuration-related commands.

**To create a unified agent configuration registration**

```
oci logging agent-configuration create --compartment-id <compartment_OCID>,
   --is-enabled <boolean>, --service-configuration <service_configure>
```

**To create a unified agent log configuration registration**

```
oci logging agent-configuration create-log-configuration --compartment-id <compartment_OCID>,
   --is-enabled <boolean>
```
To get a unified agent configuration for an ID

```
oci logging agent-configuration get --config-id <agent_configuration_OCID>
```

To list all agent configurations in the specified compartment

```
oci logging agent-configuration list --compartment-id | -c <compartment_OCID>
```

To update an existing unified agent configuration

```
oci logging agent-configuration update --config-id <agent_configuration_OCI>, --display-name <configuration_name>, --is-enabled <Boolean>, --service-configuration <service_configure>
```

This call fails if the log group does not exist.

To update an existing unified agent log configuration

```
oci logging agent-configuration update-log-configuration --config-id <agent_configuration_OCI>, --display-name <configuration_name>, --is-enabled <Boolean>
```

This call fails if the log group does not exist.

To move a unified agent configuration into a different compartment within the same tenancy

```
oci logging agent-configuration change-compartment --config-id <agent_configuration_OCID>
```

When provided, the If-Match is checked against the ETag values of the resource. For information about moving resources between compartments, see Moving Resources to a Different Compartment.

To delete a unified agent configuration

```
oci logging agent-configuration delete --config-id <agent_configuration_OCID>
```

Log Commands

The following are log commands.

Create a log within a specified log group

```
oci logging log create --display-name <log_name>, --log-group-id <log_group_OCID>, --log-type <SERVICE_or_CUSTOM>
```

This call fails if the log group has already been created with the same displayName or (service, resource, category) triplet.

Get the log object configuration for the log object OCID

```
oci logging log get --log-group-id <log_group_OCID>, --log-id <log_OCID>
```

List the specified log group’s log objects

```
oci logging log list --log-group-id <log_group_OCID>
```
Move a log into a different log group within the same tenancy

```
oci logging log change-log-group --log-group-id <log_group_OCID>, --log-id <log_OCID>
```

When provided, the If-Match is checked against the ETag values of the resource.

To delete a log object in a log group

If you have an issue with deleting a log object, open a command prompt and run the following command to delete it:

```
oci logging log delete --log-group-id <log_group_OCID>, --log-id <log_OCID>
```

To ingest logs associated with a logId

```
oci logging-ingestion put-logs --log-entry-batches, --log-id, --specversion
```

List all services supporting logging

```
oci logging service list
```

Update an existing log object with the associated configuration

```
oci logging log update --log-group-id <log_group_OCID>, --log-id <log_OCID>
```

This call fails if the log object does not exist.

Log Group Commands

The following are log group-related commands.

Create a new log group with a unique display name

```
oci logging log-group create --compartment-id | -c <compartment_OCID>, --display-name <log_group_name>
```

This call fails if the log group is already created with same displayName in the compartment.

Get a specified log group's information

```
oci logging log-group get --log-group-id <log_group_OCID>
```

List all log groups for the specified compartment or tenancy

```
oci logging log-group list --compartment-id | -c <compartment_OCID>
```

Updates an existing log group with the associated configuration

```
oci logging log-group update --log-group-id <log_group_OCID>
```

This call fails if the log group does not exist.

Move a log group into a different compartment within the same tenancy

```
oci logging log-group change-compartment --log-group-id <log_group_OCID>
```

When provided, the If-Match is checked against the ETag values of the resource. For information about moving resources between compartments, see Moving Resources to a Different Compartment.

To delete a specified log group

```
oci logging log-group delete --log-group-id <log_group_OCID>
```
**Work Request Commands**

The following are work request-related logging commands.

**Get the details of a work request with a given ID**

```bash
oci logging work-request get --work-request-id <work_request_OCID>
```

**List the work requests in a compartment**

```bash
oci logging work-request list --compartment-id | -c <compartment_OCID>
```

**List the errors for a given work request**

```bash
oci logging work-request-error list --work-request-id <work_request_OCID>
```

**List the logs for a given work request**

```bash
oci logging work-request-log list --work-request-id <work_request_OCID>
```

**Delete a work request that has not yet started**

```bash
oci logging work-request delete --work-request-id <work_request_OCID>
```

---

**Object Storage Example**

The following is a logging command example related to Object Storage.

**To create a log group and create a log in Object Storage**

```bash
oci logging log-group create --compartment-id <compartment_OCID> --display-name CLITestLogGroup
oci logging log create --display-name object_log_write --log-group-id <log_group_OCID> --log-type SERVICE --is-enabled true --configuration file://~/.oci/objectstorage_configuration.json
```

`objectstorage_configuration.json`:

```json
{
  "archiving": {
    "isEnabled": true
  },
  "compartmentId": "ocid1.compartment.oc1..<unique_ID>",
  "source": [
    {
      "category": "write",
      "parameters": null,
      "resource": "bucket-cli-sample",
      "service": "objectstorage",
      "sourceType": "OCISERVICE"
    }
  ]
}
```

---

**VCN Flow Logs Example**

The following are sample logging commands related to VCN Flow Logs.

**To create a log group**

```bash
oci logging log-group create --compartment-id <compartment_OCID> --display-name <log_group_name>
```
Logging

--description <description>

To create a flowlogs log object (enable Flow Logs)

oci logging log create --display-name <log_display_name> --log-group-id <log_group_OCID> --description <description> --log-type SERVICE --is-enabled <Boolean> --configuration file://input.json

Sample configuration file:

```json
{
    "compartment-id": "...", # CompartmentId of where the subnet resource is present.
    "source": {
        "resource": "ocid1.subnet.....", # OCID of subnet for which flowlogs is enabled.
        "service": "flowlogs", # "flowlogs" is the official service name and it should be all lowercase.
        "source-type": "OCISERVICE", # OCISERVICE is the name of the Logging source-type.
        "category": "all"
    }
}
```

To disable a flowlogs log object (disable Flow Logs)

oci logging log update --log-group-id <log_group_OCID> --log-id <log_OCID> --is-enabled false

To delete the log object

oci logging log delete --log-id <log_OCID>

Functions Example

The following is a sample Functions-related logging command.

To enable Functions logging

oci logging log create --display-name cli_test --log-group-id ocid1.loggroup.oc1.phx.<log_group_OCID> --log-type SERVICE --is-enabled true --configuration file://fnconfig.json

Sample fnconfig.json configuration file:

```json
{
    "compartment-id": "ocid1.compartment.oc1..<compartment_OCID>" "source": {
        "resource": "ocid1.fnapp.oc1.phx.<unique_ID>",
        "service": "functions",
        "source-type": "OCISERVICE",
        "category": "invoke"
    }
}
```

Using the API

For information about using the API and signing requests, see REST APIs on page 6275 and Security Credentials on page 205. For information about SDKs, see Software Development Kits and Command Line Interface on page 6094.

Use the following operations to manage logs:
Logging

- ListLogs
- GetLog
- CreateLog
- UpdateLog
- ChangeLogLogGroup
- DeleteLog

Use the following operations to manage log groups:

- ListLogGroups
- GetLogGroup
- CreateLogGroup
- UpdateLogGroup
- ChangeLogGroupCompartment
- DeleteLogGroup

Service Logs

Oracle Cloud Infrastructure services, such as API Gateway, DevOps, Email Delivery, Events, Functions, Integration, Load Balancing, Object Storage, VCN Flow Logs, and Site-to-Site VPN emit service logs. Each of these supported services has a Logs resource that allows you to enable or disable logging for that service.

Supported Services

You can enable service logs for the following Oracle Cloud Infrastructure services:

- API Gateway
- DevOps
- Email Delivery
- Events
- Functions
- Integration
- Load Balancers
- Object Storage
- VCN Flow Logs
- Site-to-Site VPN

Note:

Site-to-Site VPN logs are only supported with v2 IPSec connections. v1 connections are not supported.

Note:

This list of Oracle Cloud Infrastructure services is updated as supported services are added.

Enabling Logging for a Resource

Logs can be enabled in two places: directly on the resource itself, or on the central Logs page. When you enable a log on a specific resource, you specify the category. Different resources can have different categories. For example, rules in the Events Service have the Logs resource available for logging management. The rule can issue a log according to the category listed in the corresponding Category field. On this page, the logs are listed that the resource can create.

Note:

For Site-to-Site VPN logs, an error is displayed on the log details page if you attempt to enable logs for a v1 Site-to-Site VPN connection. Only v2 connections are supported.
Enabling Logging from the Resource page

For Oracle Cloud Infrastructure services that are compatible with Logging, the Logs resource allows you to manage the logs issued by the resource. You can view the following information:

- Category
- Status
- Log name
- Log group

In addition, you can enable or disable logging, edit the log, or delete it (the last two options are available in the action menu). When enabling logging, you also create the log object itself.

For a newly created resource, logging is automatically enabled. For a resource you want to enable logging on, under Resources click Logs, and then toggle Enable Logging. The Create Log panel is displayed, and the entry fields are pre-populated:

- **Compartment** (the same as your resource)
- **Log Group**: The first log group in your compartment. You can select another log group, or create a new group by clicking Create New Group.
- **Log Name**: Pre-populated as the name of your resource and the category, which are combined with an underscore (\(<resource>_\,<category>\)). For example, if the resource is named "resource" and the category is "ruleexecutionlog", the log name is "resource_ruleexecutionlog".

After logging is enabled, you can click the link under Log name or Log group to view the log details or log group details pages, respectively.

To disable logging, toggle the Enable log control, which displays a disable logging confirmation dialog. Click Disable Log to confirm. The Status field is set to INACTIVE to indicate the inactive status.

When creating a log, a log object is established. To delete the log, select Delete from the action menu. A confirmation is displayed confirming whether you want to delete the log. After clicking Delete, this removes the log object, as opposed to disabling it (which means the log object still exists but does not record new data into it).

Enabling Logging on the Logs page

1. Open the navigation menu and click Observability & Management. Under Logging, click Logs. The Logs page is displayed.
2. Click Enable Service Log. The Enable Resource Log panel is displayed.
3. Under Select Resource, Resource Compartment, choose a compartment you have permission to work in.
4. Select a service from the Service list (see Supported Services on page 3924 for the available services).
5. **Select a resource:**
   - In **Service**, select the service of the resource for which you want to enable the log.
   - In **Resource Compartment**, select the compartment of the resource.

   **Tip:**
   You can type in the list box to perform a filtered search of all compartments in the tenancy.

   - In **Resource** select a resource.

6. **Configure the log:**
   - In **Log Category** select a log category to specify the type of log to create. For example, Object Storage buckets have categories for read and write. Select read to enable a log with only read events. Select write for a log with only write events.
     
   You can only have one log for any combination of service, resource, and log category. For example, Object Storage buckets have two categories: read and write. Therefore:
     - You can enable a single read log and a single write log for *every* bucket in your tenancy.
     - You cannot enable more than two logs (one read and one write) for any *one* bucket.

   - In **Log Name**, type a name for the log. See Log and Log Group Names on page 3915 for more information. Avoid entering confidential information. Select **Enable Legacy Archival Logs** to automatically create a bucket in your compartment, and place a copy of your log there. See Legacy Archival on page 3916 for more information.

7. **To specify the log location (click Show Advanced Options if necessary):**
   - In **Compartment**, select the compartment for the log.

   **Tip:**
   You can type in the list box to perform a filtered search of all compartments in the tenancy.

   - In **Log Group**, select a log group for the log.

   **Tip:**
   To create a new log group, click **Create New Group**.

8. **In Log Retention**, select a value from the list:
   - 1 month (the default)
   - 2 months
   - 3 months
   - 4 months
   - 5 months
   - 6 months

9. **Apply any tagging-related information in the Tag Namespace, Tag Key, and Value fields.**

10. **Click Enable Log.**

    The log detail page is displayed, and the log is in the process of being created (a "Creating log" message is displayed). See Using the Console on page 3916 for more information on viewing and using this page.

**Service Log Reference**

The overarching logging schema is described in Logging Format Overview on page 3927, while each service that enables logging has its own specific logging details. This reference includes:

- Details for API Gateway on page 3930
- Details for DevOps Logging on page 3934
- Details For Email Delivery on page 3939
- Details for Events
Logging Format Overview

Every log line is normalized into a common event format for ease of correlation. This format is based on the JSON implementation of CloudEvents v1.0 specification. A log line has three key sections:

- Unified envelope
- Oracle-specific metadata (oracle.*)
- Contents of the log line (data)

Outer Envelope Format

All messages sent to the ingestion front end use the outer envelope format, and only change the message body based on the log type. The outer envelope format conforms to the CloudEvents v1.0 spec, with extension fields defined for logging purposes. The following table describes this format.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Position</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specification Version</td>
<td>Yes</td>
<td>Body: specversion</td>
<td>String</td>
<td>The version of the CloudEvents specification this message conforms to.</td>
</tr>
<tr>
<td>Id</td>
<td>Yes</td>
<td>Body: id</td>
<td>String</td>
<td>A source-unique identifier for this message. Duplicate messages can have the same ID. Consumers can assume events with the same IDs are unique.</td>
</tr>
<tr>
<td>Type</td>
<td>Yes</td>
<td>Body: type</td>
<td>String</td>
<td>The type of the message. Consumers use the type and specversion to determine how to interpret the body. Pattern: com.oraclecloud.{service}.(resource-type).{category}. For example: com.oraclecloud.compute.instance.terminated</td>
</tr>
<tr>
<td>Name</td>
<td>Required</td>
<td>Position</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>----------</td>
<td>--------------</td>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Source</td>
<td>Yes</td>
<td>Body: source</td>
<td>URI-reference</td>
<td>The message source. When emitted by a service, refers to the name of the resource that generated the message, for example, the Object Storage bucket name, Instance Name. When emitted by an agent, based on the source/input used to read events. For example, the instance name (not the OCID) or the hostname of the asset in an on-premise environment.</td>
</tr>
<tr>
<td>Subject</td>
<td>No</td>
<td>Body: subject</td>
<td>String</td>
<td>A specific subresource that generated the event, if applicable to the source. This is useful for sources with subresources. Examples:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Object Storage example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Source: my-bucket</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Subject: image.png</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Custom Logging example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Source: hostname</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Subject: /var/log/some.log</td>
</tr>
<tr>
<td>Name</td>
<td>Required</td>
<td>Position</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------</td>
<td>------------------</td>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Time</td>
<td>No</td>
<td>Body: time</td>
<td>Timestamp</td>
<td>The time the message was generated. If present, must adhere to the format specified in RFC 3339. If not provided, the wall clock of the ingestion host that receives the request is used.</td>
</tr>
<tr>
<td>Data Schema</td>
<td>No</td>
<td>Body: dataschema</td>
<td>String</td>
<td>The schema version for the data field. This is not required, and if not provided, is assumed to be the initial version.</td>
</tr>
<tr>
<td>Data Content Type</td>
<td>No</td>
<td>Body: datacontenttype</td>
<td>String</td>
<td>The format in which the message body is encoded. If not provided, the default is JSON (equivalent to datacontenttype: application/json).</td>
</tr>
<tr>
<td>Message Body</td>
<td>Yes</td>
<td>Body: data</td>
<td>Object</td>
<td>The message body encoded in the format defined by datacontenttype. If datacontenttype is not specified, this is expected to be JSON (equivalent to datacontenttype: application/json).</td>
</tr>
<tr>
<td>Oracle Cloud Metadata</td>
<td>Yes</td>
<td>Body: oracle</td>
<td>Object</td>
<td>More Oracle-specific metadata is provided in a map of attributes at the top level of the envelope. This conforms to CloudEvents v1 Attribute Extensions specification. See the following table for supported Oracle Cloud Infrastructure metadata attributes.</td>
</tr>
</tbody>
</table>
Oracle Metadata Attributes

The following attributes are supported in the `oci` extension field of the message format. Naming for these attributes conforms to the CloudEvents v1 Attribute Naming Convention, that is, they are lowercase alpha-numeric identifiers fewer than 20 characters long.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required for Ingestion</th>
<th>Required for Retrieval</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logid</td>
<td>Yes</td>
<td>-</td>
<td>String</td>
<td>The OCID of the log object the message was sent to.</td>
</tr>
<tr>
<td>loggroupid</td>
<td>No</td>
<td>Yes</td>
<td>String</td>
<td>The OCID of the log group the object resides in.</td>
</tr>
<tr>
<td>tenantid</td>
<td>No</td>
<td>Yes</td>
<td>String</td>
<td>The OCID of the tenant that owns the log object.</td>
</tr>
<tr>
<td>compartmentid</td>
<td>No</td>
<td>Yes</td>
<td>String</td>
<td>The OCID of the compartment the log object resided in at the time the message was ingested.</td>
</tr>
</tbody>
</table>

Details for API Gateway

This topic provides details for API Gateway logs.

Resources

- API deployment

Log Categories

<table>
<thead>
<tr>
<th>API value (ID):</th>
<th>Console (Display Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access</td>
<td>Access Logs</td>
<td>Access logs for an API deployment.</td>
</tr>
<tr>
<td>Execution</td>
<td>Execution Logs</td>
<td>Execution logs for an API deployment.</td>
</tr>
</tbody>
</table>

Availability

API Gateway Access/Execution logging is available in all the regions of the commercial realm.

API Deployment Access Log

API deployment access logs record a summary of every request and response that goes through the API gateway, matching a route on the API deployment. Each access log entry contains information about the request and response (time the request was received, server protocol, response status, and so on). For the complete list of fields, see Contents of an Access Log on page 3930.

Contents of an Access Log

Access logs appear as a value in the Log Data field. This value is JSON-formatted data with the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>httpMethod</td>
<td>GET</td>
<td>HTTP method derived from the request line.</td>
</tr>
<tr>
<td>requestUri</td>
<td>/example/</td>
<td>Request URI derived from the request line.</td>
</tr>
<tr>
<td>serverProtocol</td>
<td>HTTP/1.1</td>
<td>HTTP protocol derived from the request line.</td>
</tr>
</tbody>
</table>
### Field | Example | Description
---|---|---
bodyBytesSent | 45 | Total size of the response (in bytes) sent to the client.
gatewayId | ocid1.apigateway.oc1.iad.<unique_ID> | OCID of the API Gateway for the API deployment servicing the request.
httpUserAgent | Apache-HttpClient/4.5.9 (Java/1.8.0_252) | HTTP user agent for the request.
message | GET /example/ HTTP/1.1 | Request line received from the client.
opcRequestId | FF7F0B8A32246FC7526AE45A2FA8D5CE/A408784281BF81B0EE23596CE57CA93C/C06F7DDDFC7C505FAA0566D8F2FE0BB2 | Value of the opc-request-id HTTP header, or an internally generated request ID if none was specified in the request.
remoteAddr | 138.1.55.172 | IP address of the requesting client.
httpReferrer | https://www.example.com | The URL of the referral, if present.
requestDuration | 0.016 | Total time taken (in seconds, with millisecond precision), from when the gateway starts receiving request from the client, until it completes sending a response to the client.
status | 404 | Status code of the response from the gateway.

#### Sample Access Log

```json
{
    "httpMethod": "GET",
    "requestUri": "/example/",
    "serverProtocol": "HTTP/1.1",
    "bodyBytesSent": 45,
    "gatewayId": "ocid1.apigateway.oc1.iad.<unique_ID>",
    "httpUserAgent": "Apache-HttpClient/4.5.9 (Java/1.8.0_252)",
    "message": "GET /example/ HTTP/1.1",
    "opcRequestId": "FF7F0B8A32246FC7526AE45A2FA8D5CE/A408784281BF81B0EE23596CE57CA93C/C06F7DDDFC7C505FAA0566D8F2FE0BB2",
    "remoteAddr": "138.2.05.172",
    "requestDuration": 0.016,
    "status": 404
}
```

#### API Deployment Execution Log

API deployment execution logs record information about processing within the API gateway for an individual route, to help with troubleshooting and monitoring. Each execution log entry contains information (time the request was received, level to denote the severity of the log message, a message code, and so on). For the complete list of fields, see Contents of an Execution Log on page 3931.

#### Contents of an Execution Log

By default Log Level info is enabled. This value is JSON-formatted data with the following fields:
<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Example</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>code</td>
<td>request.loopDetected</td>
<td>Short code for the logging event encountered while running the request. For the complete list of message codes, see the &quot;Log Codes&quot; table Log Codes on page 3932.</td>
</tr>
<tr>
<td>gatewayId</td>
<td>ocid1.apigateway.oc1.iad.&lt;unique_ID&gt;</td>
<td>API gateway OCID for the API deployment servicing the request.</td>
</tr>
<tr>
<td>functionId</td>
<td>ocid1.fnfunc.oc1.iad.&lt;unique_ID&gt;</td>
<td>OCID of function that the API gateway invoked. This field is only present for function backends.</td>
</tr>
<tr>
<td>level</td>
<td>WARN</td>
<td>Log level for the execution log entry, whether INFO, WARN, or ERROR.</td>
</tr>
<tr>
<td>message</td>
<td>A request loop has been detected - requests for this gateway are being directed back to this gateway.</td>
<td>Execution message emitted while processing the request.</td>
</tr>
<tr>
<td>opcRequestId</td>
<td>FF7F0B8A32246FC7526AE45A2FA8A408784281BF81B0EE23596CE57CA9C/C06F7DDDFC7C505FAA0566D8F2F8EH883</td>
<td>Value of the opc-request-id HTTP header, or an internally generated request ID if none was specified in the request.</td>
</tr>
<tr>
<td>functionCode</td>
<td>FunctionInvokeSyslogUnavailable</td>
<td>A code provided by Oracle Functions to uniquely define the function's error. This field is only present for function backends.</td>
</tr>
<tr>
<td>functionMessage</td>
<td>Syslog endpoint unavailable</td>
<td>A message provided by Oracle Functions to describe the function's error. This field is only present for function backends.</td>
</tr>
<tr>
<td>functionStatusCode</td>
<td>502</td>
<td>The HTTP status code returned by Oracle Functions. This field is only present for function backends.</td>
</tr>
</tbody>
</table>

### Log Codes

<table>
<thead>
<tr>
<th>Log Code</th>
<th>Description</th>
<th>Related Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>httpBackend.timeout</td>
<td>Request to the HTTP backend timed out.</td>
<td>HTTP Backend</td>
</tr>
<tr>
<td>httpBackend.dnsResolutionFailed</td>
<td>Failed to resolve the HTTP backend URL.</td>
<td></td>
</tr>
<tr>
<td>httpBackend.sslHandshakeFailed</td>
<td>SSL Handshake failed with the HTTP backend.</td>
<td></td>
</tr>
<tr>
<td>httpBackend.successfulRequest</td>
<td>Successful request to the HTTP backend.</td>
<td></td>
</tr>
<tr>
<td>httpBackend.responseReceived</td>
<td>Response received from the HTTP backend.</td>
<td></td>
</tr>
<tr>
<td>httpBackend.requestSent</td>
<td>Request sent to the HTTP backend.</td>
<td></td>
</tr>
<tr>
<td>Log Code</td>
<td>Description</td>
<td>Related Feature</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------</td>
</tr>
<tr>
<td>functionBackend.successfulRequest</td>
<td>Successful invocation of the Oracle Function.</td>
<td>Oracle Functions Backend</td>
</tr>
<tr>
<td>functionBackend.notFoundOrNotAuthorized</td>
<td>Failed to invoke the Oracle Function due to 404 from Oracle Functions service.</td>
<td></td>
</tr>
<tr>
<td>functionBackend.rateLimited</td>
<td>Rate limited when invoking the Oracle Function.</td>
<td></td>
</tr>
<tr>
<td>functionBackend.serviceUnavailable</td>
<td>Oracle Functions service unavailable.</td>
<td></td>
</tr>
<tr>
<td>functionBackend.badGateway</td>
<td>Received &quot;Bad Gateway&quot; when invoking the Oracle Function.</td>
<td></td>
</tr>
<tr>
<td>functionBackend.timeout</td>
<td>Oracle Function invocation timed out.</td>
<td></td>
</tr>
<tr>
<td>functionBackend.internalServiceError</td>
<td>Internal service error when invoking the Oracle Function.</td>
<td></td>
</tr>
<tr>
<td>specification.badVariableReference</td>
<td>The context variable couldn't be resolved.</td>
<td>Incorrect Specification at run-time</td>
</tr>
<tr>
<td>specification.invalidAuthenticationPolicy</td>
<td>Invalid authentication policy.</td>
<td></td>
</tr>
<tr>
<td>specification.badTransformationPolicy</td>
<td>Bad transformation policy.</td>
<td></td>
</tr>
<tr>
<td>specification.badHeaderTransformationPolicy</td>
<td>Bad Header Transformation policy.</td>
<td></td>
</tr>
<tr>
<td>specification.badQueryParameterTransformationPolicy</td>
<td>Bad Query Parameter Transformation policy.</td>
<td></td>
</tr>
<tr>
<td>request.internalServiceError</td>
<td>Internal service error.</td>
<td>Request processing</td>
</tr>
<tr>
<td>request.loopDetected</td>
<td>A request loop condition has been detected, whereby requests for the gateway are being redirected to itself creating a cycle.</td>
<td></td>
</tr>
<tr>
<td>request.possibleLoopDetected</td>
<td>A possible request loop condition has been detected, whereby requests for the gateway are being redirected to itself creating a cycle.</td>
<td></td>
</tr>
<tr>
<td>request.headersTruncated</td>
<td>Request headers were truncated.</td>
<td></td>
</tr>
<tr>
<td>request.queryParametersTruncated</td>
<td>Request query parameters were truncated.</td>
<td></td>
</tr>
<tr>
<td>authorization.unauthorizedRequest</td>
<td>Authorization failed for the request.</td>
<td>Request Authorization</td>
</tr>
<tr>
<td>authorization.scopeCheckFailed</td>
<td>Failed to check the scope for the request.</td>
<td></td>
</tr>
<tr>
<td>customAuthentication.successfulFunctionInvoke</td>
<td>Successfully invoked the Oracle Function.</td>
<td>Custom Authentication</td>
</tr>
<tr>
<td>customAuthentication.failedFunctionInvoke</td>
<td>Failed to invoke the Oracle Function.</td>
<td></td>
</tr>
<tr>
<td>customAuthentication.successfulAuthentication</td>
<td>Authentication successful.</td>
<td></td>
</tr>
<tr>
<td>customAuthentication.authenticationFailed</td>
<td>Authentication failed.</td>
<td></td>
</tr>
</tbody>
</table>
## Sample Execution Logs

- **Type:** Request
- **Scenario:** Request Loop Detected
- **Description:** A request loop condition has been detected, whereby requests for the gateway are being redirected to itself creating a cycle.
- **Example:**

```json
{
   "code": "request.loopDetected",
   "gatewayId": "ocid1.apigateway.oc1.iad.<unique_ID>",
   "level": "WARN",
   "message": "A request loop has been detected - requests for this gateway are being directed back to this gateway.",
   "opcRequestId": "FF7F0B8A32246FC7526AE45A2FA8D5CE/A408784281BF81B0EE23596CE57CA93C/C06F7DDDFC7C505FA0566D8F2FE0BB2",
}
```

## Details for DevOps Logging

This topic provides details for DevOps logs.

## Resources

- devopsproject
Log Categories

<table>
<thead>
<tr>
<th>API value (ID):</th>
<th>Console (Display Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>DevOps Logs</td>
<td>Includes all DevOps service-related logs.</td>
</tr>
</tbody>
</table>

Availability

DevOps logging is available in all the regions of the commercial realm.

Comments

You can enable DevOps logs for a given project, which means deployments are logged for all the pipelines inside that project. For more information, see DevOps Logs.

Contents of a DevOps Log

A DevOps log record contains the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>specversion</td>
<td>Oracle Cloud Infrastructure Logging schema version.</td>
<td>1.0</td>
</tr>
<tr>
<td>type</td>
<td>Category of the log. Possible values: build, deployment</td>
<td>com.oraclecloud.devops.build, com.oraclecloud.devops.deployment</td>
</tr>
<tr>
<td>source</td>
<td>Name of the Project the log is associated with or OCID of the build pipeline to which the log belongs to.</td>
<td>myDemoProject, ocid1.devopsbuildpipeline.oc1.&lt;region_ID&gt;.&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>subject</td>
<td>OCID of the target resource where the deployment is getting executed or OCID of the build run for the build pipeline to which the logs belong to. Possible values for target resource: instance, fnfunc, cluster</td>
<td>ocid1.devopsbuildrun.oc1.&lt;region_ID&gt;.&lt;unique_ID&gt;, ocid1.instance.oc1.&lt;region_ID&gt;.&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>id</td>
<td>Random UUID, unique to each log entry.</td>
<td>e3002eaa-d717-472e-8474-d024943a0f27</td>
</tr>
<tr>
<td>time</td>
<td>Time the log was generated in the DevOps Service.</td>
<td>2021-02-18T18:21:52.024Z</td>
</tr>
<tr>
<td>oracle.loggroupid</td>
<td>OCID of the log group.</td>
<td>ocid1.&lt;loggroup&gt;.oc1.&lt;region_ID&gt;.&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>oracle.logid</td>
<td>OCID of the service log object.</td>
<td>ocid1.log.oc1.&lt;region_id&gt;.&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>oracle.tenantid</td>
<td>OCID of the tenancy.</td>
<td>ocid1.&lt;tenancy&gt;.oc1..&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>oracle.compartmentid</td>
<td>OCID of the compartment that the log group belongs to.</td>
<td>ocid1.&lt;compartment&gt;.oc1..&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>oracle.ingestedtime</td>
<td>The time the log was ingested by OCILogging.</td>
<td>2021-02-18T18:22:01.453Z</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
<td>Example</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>data.buildRunId</td>
<td>OCID of the build run with which log message is associated.</td>
<td>ocid1.devopsbuildrun.oc1.&lt;region_ID&gt;.&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>data.buildPipelineId</td>
<td>OCID of the build pipeline with which the log message is associated.</td>
<td>ocid1.devopsbuildpipeline.oc1.&lt;region_ID&gt;.&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>data.buildStageId</td>
<td>OCID of the build pipeline stage with which the log message is associated.</td>
<td>ocid1.devopsbuildpipelinestage.oc1.&lt;region_ID&gt;.&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>data.deploymentId</td>
<td>OCID of the deployment with which log message is associated.</td>
<td>ocid1.devopsdeployment.oc1.&lt;region_ID&gt;.&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>data.deployPipelineId</td>
<td>OCID of the deployment pipeline ID with which the log message is associated.</td>
<td>ocid1.devopsdeploypipeline.oc1.&lt;region_ID&gt;.&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>data.deployStageId</td>
<td>OCID of the deploy stage ID with which the log message is associated.</td>
<td>ocid1.devopsdeploystage.oc1.&lt;region_ID&gt;.&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>data.producer</td>
<td>Producer of the log message. Some of the logs are produced by the DevOps</td>
<td>DEVOPS_SERVICE</td>
</tr>
<tr>
<td></td>
<td>service code, while other logs are produced by scripts from the customer.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For example, the deployment service can run scripts provided by the</td>
<td></td>
</tr>
<tr>
<td></td>
<td>customer during the deployment to instance groups. Such customer-</td>
<td></td>
</tr>
<tr>
<td></td>
<td>provided scripts could produceSTDOUT and STDERR messages, which are</td>
<td></td>
</tr>
<tr>
<td></td>
<td>also included in the log. The producer field can distinguish them</td>
<td></td>
</tr>
<tr>
<td></td>
<td>accordingly. Possible Values:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• DEVOPS_SERVICE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• USER_SCRIPT</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• USER_COMMAND</td>
<td></td>
</tr>
</tbody>
</table>

**Sample DevOps Logs**

**Sample build log:**

```json
{
    "specversion": "1.0",
    "type": "com.oraclecloud.devops.build",
    "source": "OCID of the build pipeline to which the log belongs",

<tr>
<td>emaildelivery.emaildomain.outboundrelayed</td>
<td>emaildelivery.emaildomain.outboundrelayed</td>
<td>Logs for successful and failed email submissions for outbound delivery.</td>
</tr>
</tbody>
</table>

Policies

EMAIL_DOMAIN_UPDATE permission is required, along with Logging policies, to perform Logging-related operations. For details on Email Delivery policies, see Details for the Email Delivery Service.

Contents of an OutboundAccepted Email Log

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>recipient</td>
<td>Email address of the recipient. This may not be present in logs with error type Authorization failure, Reset, or Disconnected.</td>
<td><a href="mailto:user@example.com">user@example.com</a></td>
</tr>
<tr>
<td>sender</td>
<td>The first email address in the &quot;From:&quot; header in the email message.</td>
<td><a href="mailto:support@example.com">support@example.com</a></td>
</tr>
<tr>
<td>action</td>
<td>Provides context for the data in the log. Supported values for Acceptance Logs: • Accept: Log provides information around acceptance status for an email. Automated processors must tolerate logs with unrecognized action values.</td>
<td>accept</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
<td>Example</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------------------</td>
</tr>
</tbody>
</table>
| errorType   | Provides information for troubleshooting issues. This is omitted for successfully accepted emails. Supported values for acceptance logs:  
- Suppressed: Email was suppressed and not relayed.  
- Authorization failure: Email was not accepted due to authorization failures.  
- Recipient Address Rejected: Email could not be accepted due to invalid recipient address.  
- Daily Limit reached: Email could not be accepted due to limits.  
- Sender Rate Limit reached: Email could not be accepted due to limits.  
- Message size limit exceeded: Email could not be accepted due to message size limit exceeded.  
- Reset: The client cancelled the mail transaction (via SMTP RSET).  
- Disconnected: The client connection to the service was lost before the mail transaction was complete.  
- Message parse error: Email could not be accepted due to invalid message format. Only authorization failures are logged.  
Oracle reserves the right to add new values to this field as needed, so parsers must be able to tolerate unrecognized values. | Daily limit reached |
<p>| smtpStatus  | SMTP status in acceptance logs will contain the SMTP error, or status returned to the SMTP submission client for this recipient. | 250 2.1.5 <a href="mailto:user@example.com">user@example.com</a> and options Ok |
| messageId   | MessageId is a unique ID that represents an email send operation. It is used to track an email end-to-end. MessageId is either provided by the customer, or will be generated by the MTA while processing email. This will not be present in acceptance logs that fail before receiving message data. | <a href="mailto:06a9aa8e-0542-4ddf-8255-ec9c2f5e02a3@smtp-ad3-fd1-303-us-phoenix-1.imtaad3.vendpphpx.oraclevcn.com">06a9aa8e-0542-4ddf-8255-ec9c2f5e02a3@smtp-ad3-fd1-303-us-phoenix-1.imtaad3.vendpphpx.oraclevcn.com</a> See <a href="https://datatracker.ietf.org/doc/html/rfc5322#section-3.6.4">https://datatracker.ietf.org/doc/html/rfc5322#section-3.6.4</a> for more information. |
| envelopeSender | The initial envelope sender (MAIL FROM) address provided when the email was submitted, which is used to authorize email sending. Unlike Body:sender (aka header From), this is provided for acceptance failure cases, as this is available for failures prior to transfer of message content. | <a href="mailto:support@example.com">support@example.com</a> |
| senderId    | Approved sender OCID. This will be the OCID associated with the Body:sender if that is present, otherwise, it will be the OCID associated with Body:envelopeSender. This may not be present on authorization failures. | ocid1.emailsender.oc1.phx.&lt;unique_ID&gt; |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>senderCompartmentId</td>
<td>Compartment OCID of the approved sender. This will be the compartment OCID associated with the Body:.data.senderId. This may not be present on authorization failures.</td>
<td>ocid1.compartment.oc1..&lt;unique_ID&gt;</td>
</tr>
<tr>
<td>headers</td>
<td>(Available in future) Configurable headers at approved sender level. Set up through a support request, and is a maximum of four headers.</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;X-Campaign-ID&quot;: &quot;campaign1&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;Recipient-Group-ID&quot;: &quot;group1&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;Sub-Account-ID&quot;: &quot;account1&quot;</td>
</tr>
<tr>
<td>receivingDomain</td>
<td>Email domain of the recipient. Although this is redundant with the domain name portion of the recipient field, this can be useful for aggregation views of the logs.</td>
<td>example.com</td>
</tr>
<tr>
<td>messageSizeInKiB</td>
<td>Message size in kibibytes (rounded to an integer with rounding mode ceiling).</td>
<td>5</td>
</tr>
<tr>
<td>authzOpcRequestId</td>
<td>OPC request ID for the authorization call made from the Email Delivery Service to Identity, to authorize an approved sender.</td>
<td>6D6E701D166D728B8BCB781647CDBF781647CDBF781647CDBF781647CDBF781647CD</td>
</tr>
<tr>
<td>message</td>
<td>A summary of the log event.</td>
<td>Accepted email <a href="mailto:support@example.com">support@example.com</a> # <a href="mailto:user@example.com">user@example.com</a></td>

### Contents of an OutboundRelayed Email Log

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>recipient</td>
<td>Email address of the recipient.</td>
<td><a href="mailto:user@example.com">user@example.com</a></td>
</tr>
<tr>
<td>sender</td>
<td>&quot;From:&quot; header in the email message.</td>
<td><a href="mailto:support@example.com">support@example.com</a></td>
</tr>
<tr>
<td>action</td>
<td>Provides context for the data in the log. Supported values for relayed, bounce, and complaint logs:</td>
<td>• relay</td>
</tr>
<tr>
<td></td>
<td>• Relay: Successfully relayed to the receiving mail server.</td>
<td>• bounce</td>
</tr>
<tr>
<td></td>
<td>• Bounce: Bounced back from receiving mail server.</td>
<td>• complaint</td>
</tr>
<tr>
<td></td>
<td>• Complaint: Recipient marked email as spam, and mailbox provider supports a complaint feedback loop.</td>
<td></td>
</tr>
<tr>
<td>errorType</td>
<td>Provides information for troubleshooting issues. Only present in &quot;Bounce&quot; logs.</td>
<td>soft</td>
</tr>
<tr>
<td>bounceCategory</td>
<td>Category of bounce. Only present in &quot;Bounce&quot; logs.</td>
<td>bad-mailbox</td>
</tr>
</tbody>
</table>

**Note:**
Not all receiving domains provide complaint feedback.
Automated processors must tolerate logs with unrecognized action values.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>reportGeneratedTime</td>
<td>Time when action is generated. Only present in some &quot;Bounce&quot; and &quot;Complaint&quot; logs.</td>
<td>2021-02-04T17:26:03.120Z</td>
</tr>
<tr>
<td>originalMessageAcceptedTime</td>
<td>Time when the original message is accepted by the Email Delivery service. Refers to the original time stamp for bounced messages only, so this is not present in all relayed logs.</td>
<td>2021-02-04T17:26:03.120Z</td>
</tr>
<tr>
<td>bounceCode</td>
<td>An SMTP response code, such as 5.5.0, 4.7.1. Only present in &quot;Bounce&quot; logs. See <a href="https://www.ietf.org/rfc/rfc1893.txt">https://www.ietf.org/rfc/rfc1893.txt</a> for more information.</td>
<td>5.5.0</td>
</tr>
</tbody>
</table>
| smtpStatus           | SMTP status includes the information generated by a remote SMTP server on the internet, and is usually not controlled by Email Delivery. | "250 2.1.5 Recipient ok"
"550 5.1.1 <user@example.com> recipient does not exist here."
"550 5.1.1 unknown or illegal alias: b0c-4031-8d85-33d136229fc3-bmta-ad1-fd1-101-us-ashburn-1@iad1.rp.oracleemaildelivery.com"
"550 5.7.0 Local Policy Violation"
| messageId            | MessageId is a unique ID that represents an email send operation. It is used to track an email end-to-end. MessageId is either provided by the customer, or will be generated by the MTA while processing email. | 06a9aa8e-0542-4ddf-8255-ec9c2f5e02a3@smtpfad3-fd1-303-us-phoenix-1.imtaad3.vcdnphx.oraclecloud.com|
| senderId             | Approved sender OCID.                                                       | ocid1.emailsender.oc1.phx.<unique_ID>                                  |
| senderCompartmentId  | Compartment OCID of the approved sender.                                    | ocid1.compartment.oc1.<unique_ID>                                     |
| sourceAddress        | Source IP is the external public IP address used for the outgoing connection. This is only present on successful "Relay" logs, and "bounce" logs for internal hard bounces. | 192.29.103.192                                                        |
| dkimSelector         | The "User" defined DKIM selector value. Only present in "Relay" logs. The DKIM selector is a term-of-art defined formally in RFC 6376. | prod-phx-20191217                                                     |
| dkimError            | DKIM signing error text. Only present on "Relay" logs.                      | "Operation cannot be started: DKIM 0 no private key for identity '@mail.integration.us-ashburn-1.ocp.oraclecloud.com'" |
### Property Description Example

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>messageSizeInKiB</td>
<td>Message size in kibibytes (rounded to an integer with rounding mode ceiling).</td>
<td>5</td>
</tr>
<tr>
<td>headers</td>
<td>(Available in future) Configurable headers at approved sender level. Set up through a support request, and is a maximum of four headers.</td>
<td>{ &quot;X-Campaign-ID&quot;:&quot;campaign1&quot;, &quot;Recipient-Group-ID&quot;:&quot;group1&quot;, &quot;Sub-Account-ID&quot;:&quot;account1&quot; }</td>

Details for Events
This topic provides details for Events logs.

Resources
- rules

Log Categories

<table>
<thead>
<tr>
<th>API value (ID):</th>
<th>Console (Display Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ruleexecutionlog</td>
<td>Rule Execution Logs</td>
<td>Describes how rules were evaluated against events emitted from resources.</td>
</tr>
</tbody>
</table>

Availability
Events logging is available in all the regions of the commercial realm. Events logging is not available in regions within the Government Cloud realm.
Contents of an Events Log

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logTime</td>
<td>The time of the event, expressed in RFC 3339 timestamp format.</td>
</tr>
<tr>
<td>ruleId</td>
<td>The events rule ID.</td>
</tr>
<tr>
<td>eventId</td>
<td>The UUID of the event. This identifier is not an OCID, but just a unique ID for the event.</td>
</tr>
<tr>
<td>message</td>
<td>The event message.</td>
</tr>
<tr>
<td>target</td>
<td>The rule action. For example:</td>
</tr>
<tr>
<td></td>
<td>• For streaming, it means that the event was delivered to the stream.</td>
</tr>
<tr>
<td></td>
<td>• For a notification, it means it was delivered to the email subscribed to the topic.</td>
</tr>
<tr>
<td></td>
<td>• For a function, it means it triggered the function with the event data.</td>
</tr>
</tbody>
</table>

An Example Events Log

For events there are two types of messages:

```json
{
   "specversion": "1.0",
   "type": "com.oraclecloud.eventsservice.eventrule.ruleexecutionlog",
   "source": "Flowlogs",
   "id": "6e6dbfd3-4bce-4484-848d-af53f19bd6c9",
   "time": "2020-08-24T23:31:44Z",
   "oracle": {
      "logId": "ocid1.log.oc1.iad.<unique_ID>",
      "loggroupId": "ocid1.loggroup.oc1.iad.<unique_ID>",
      "compartmentId": "ocid1.compartment.oc1..<unique_ID>",
      "tenantId": "ocid1.tenancy.oc1..<unique_ID>",
      "ingestedtime": "2020-08-19T15:33:30.832Z"
   },
   "data": {
      "ruleId": "ocid1.eventrule.oc1.iad.<unique_ID>",
      "eventId": "24bc7219-efec-4ccd-350b-be2d833439d2",
      "message": "Event failed to deliver to FAAS. Exception from FAAS endpoint
https://ptktjbkp22a.us-ashburn-1.functions.oci.oraclecloud.com,

statuscode 502", "target": "ocid1.fnfunc.oc1.iad.<unique_ID>"
   }
}
```
Logging

```
"tenantid": "ocid1.tenancy.oc1..<unique_ID>",
"ingestedtime": "2020-08-19T15:33:30.832Z"
},
"data": {
"ruleId": "ocid1.eventrule.oc1.phx.<unique_ID>",
"eventId": "30bde0fa-af8a-f50c-aa01-4fc42f28acb9",
"message": "Rule has matched event"
}
```

**Events Log Object Name**

Objects that store Events log data use the following naming format:

```
Rule_Execution_Log/<event_rule_OCID>/<YYYY-MM-DDTHH_MMZ>[_<seqNum>].log.gz
```

For example:

```
Rule_Execution_Log/
ocid1.eventrule.oc1.phx.<unique_ID>/2019-03-21T00_00Z.log.gz
Rule_Execution_Log/
ocid1.eventrule.oc1.phx.<unique_ID>/2019-03-21T00_00Z_2.log.gz
```

**Details for Functions**

This topic provides details for Functions logs.

**Resources**

- applications

**Log Categories**

<table>
<thead>
<tr>
<th>API value (ID):</th>
<th>Console (Display Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>invoke</td>
<td>Function Invocation Logs</td>
<td>Logs entries each time a function in an application is invoked.</td>
</tr>
</tbody>
</table>

**Availability**

Functions logging is available in all the regions of the [commercial realm](https://docs.oracle.com/en/cloudoinfrastructure/)

**Comments**

To use Functions logging, you must add a print statement to your function.

**Examples:**

For node js:

```
console.log('Entering Hello Node.js function');
```

For java:

```
System.out.println("Entering Java Hello World Function");
```

For go:

```
fmt.Println("Entering Hello Go function")
```
## Contents of a Functions Log

<table>

<tr>
<td>data.message</td>
<td>User-generated line of output from the function.</td>
</tr>
</tbody>
</table>

### An Example Functions Log

```json
{
  "specversion": "1.0",
  "type": "com.oraclecloud.functions.application.functioninvoke",
  "source": "Application display name",
  "subject": "Function display name",
  "id": "487c8669-f384-4c79-950a-d6df47246093",
  "time": "2020-08-19T15:33:29.000Z",
  "oracle": {
    "logid": "ocid1.log.oc1.iad.<unique_ID>",
    "loggroupid": "ocid1.loggroup.oc1.iad.<unique_ID>",
    "compartmentid": "ocid1.compartment.oc1..<unique_ID>",
    "tenantid": "ocid1.tenancy.oc1..<unique_ID>",
    "ingestedtime": "2020-08-19T15:33:30.832Z"
  },
  "data": {
    "applicationId": "ocid1.fnapp.oc1.iad.<unique_ID>",
    "containerId": "01EG3NMHG600000000000022S",
    "functionId": "ocid1.fnfunc.oc1.iad.<unique_ID>"
  }
}
```
Logging

"requestId": "/01EG3NN3C11BT19PGZJ00000VZ/01EG3NN3C11BT19PGZJ00000W0",
"opcRequestId": "/01EG3NN3C11BT19PGZJ00000VZ/01EG3NN3C11BT19PGZJ00000W0",
"src": "STDERR",
"message": "2020-08-19 15:33:29,124 - fdk.event_handler - INFO - request execution completed"
}

Functions Log Object Name

Objects that store Functions log data use the following naming format:

log/<function-OCID>/<YYYY-MM-DDTHH_MMZ>[<seqNum>].log.gz

For example:

log/ocid1.function.oc1.phx.<unique_ID>/2019-03-21T00_00Z.log.gz
log/ocid1.function.oc1.phx.<unique_ID>/2019-03-21T00_00Z_2.log.gz

Using the Command Line Interface (CLI)

See Functions Example on page 3923 for an example command to enable Functions logging.

Details for Load Balancer Logs

This topic provides details for load balancer access logs. See Log Management on page 3880 for more information on Load Balancer logging.

Resources

• load balancer

Log Categories

<table>
<thead>
<tr>
<th>API value (ID):</th>
<th>Console (Display Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access</td>
<td>Access Logs</td>
<td>Load balancer access logs.</td>
</tr>
<tr>
<td>Error</td>
<td>Error Logs</td>
<td>Load balancer error logs.</td>
</tr>
</tbody>
</table>

Availability

LBaaS access logs are available in all the regions of the commercial realm.

Load Balancer Access Log

Load balancer access logs capture detailed information about requests sent to the load balancer. Each access log entry contains:

• The time the request was received.
• Client and intermediate HTTP proxy IP addresses.
• Time taken at the load balancer and backend to process the request.

Limitations and Considerations

Some traffic might not be logged during a capture window because of capacity issues or system errors. In such cases, the following error log message is logged.

{"timestamp":"2020-08-05T00:12:39+00:00","errorLog":
{"type":"General","errorDetails": "Missed 100 access logs" }}
For traffic destined to the public IP of a load balancer, access logs record the corresponding private IP.

## Contents of an Access Log

Access logs appear as a value in the **Log Data** field. This value is a JSON-formatted data with the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timestamp</td>
<td>2020-04-20T00:56:18+00:00</td>
<td>Log entry generation time in ISO-8601 format.</td>
</tr>
<tr>
<td>clientAddr</td>
<td>192.168.0.33:7870</td>
<td>IP address and port number of the requesting client.</td>
</tr>
<tr>
<td>forwardedForAddr</td>
<td>192.168.0.33</td>
<td>IP address of the client and http proxies between client and load balancer.</td>
</tr>
<tr>
<td>host</td>
<td>a.com</td>
<td>Domain name which resolves to VIP address assigned to the load balancer.</td>
</tr>
<tr>
<td>backendAddr</td>
<td>192.168.0.34:8080</td>
<td>IP address and port number of the backend server, which processed the client request.</td>
</tr>
<tr>
<td>requestProcessingTime</td>
<td>0.003</td>
<td>Total time taken (in seconds, with millisecond precision), from when the load balancer starts receiving request from the client, until it completes sending responses to the client.</td>
</tr>
<tr>
<td>backendConnectTime</td>
<td>0.00</td>
<td>Time spent (in seconds, with millisecond precision), to establish backend server connection.</td>
</tr>
<tr>
<td>backendProcessingTime</td>
<td>0.002</td>
<td>Total time taken from the load balancer establishing a connection to a backend, until it completes receiving the response from the backend.</td>
</tr>
<tr>
<td>lbStatusCode</td>
<td>200</td>
<td>Status code of the response from the load balancer.</td>
</tr>
<tr>
<td>backendStatusCode</td>
<td>200</td>
<td>Status code of the response from the target.</td>
</tr>
<tr>
<td>receivedBytes</td>
<td>150</td>
<td>Total size of the request (in bytes), received from the client.</td>
</tr>
<tr>
<td>sentBytes</td>
<td>450</td>
<td>Total size of the response (in bytes), sent to the client from the load balancer.</td>
</tr>
<tr>
<td>request</td>
<td>&quot;GET / HTTP/1.1&quot;</td>
<td>Request line received from the client.</td>
</tr>
<tr>
<td>sslCipher</td>
<td>ECDHE-RSA-AES256-GCM-SHA384</td>
<td>Negotiated SSL cipher between the client and the load balancer.</td>
</tr>
<tr>
<td>listenerName</td>
<td>http_listener_1</td>
<td>Listener which received the incoming traffic request on the load balancer's IP address.</td>
</tr>
<tr>
<td>sslProtocol</td>
<td>TLSv1.2</td>
<td>Negotiated SSL protocol between the client and the load balancer.</td>
</tr>
<tr>
<td>userAgent</td>
<td>curl/7.29.0</td>
<td>User Agent, which sent the request to the load balancer.</td>
</tr>
<tr>
<td>routingRulesMatchedRule</td>
<td>RoutingPolicy_test_rule1</td>
<td>Routing policy rule name, which is matched for this specific client request.</td>
</tr>
<tr>
<td>routingRulesRuleHits</td>
<td>1</td>
<td>Number of routing rules getting matched for the request. Either 1 (for a match) or 0 (for no match).</td>
</tr>
</tbody>
</table>
Logging

<table>
<thead>
<tr>
<th>Field</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routingRulesRuleMisses</td>
<td>4</td>
<td>Number of routing rules evaluated to false for the request.</td>
</tr>
<tr>
<td>routingRulesEngineErrors</td>
<td>0</td>
<td>Routing rule engine error during policy evaluation for the request. Either 0 (no error) or 1 when any error occurs. If an error occurs, requests are forwarded to the default backend set attached to the listener.</td>
</tr>
</tbody>
</table>

Load Balancer Error Log

Load balancer error logs capture detailed information about requests related to troubleshooting and monitoring. Each Error Log entry contains information such as the time the request was received, error type, and extra details related to the specific error.

Contents of an Error Log

This value is JSON-formatted data with the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timestamp</td>
<td>2020-08-04T21:25:27+00:00</td>
<td>Log entry generation time in ISO-8601 format.</td>
</tr>
<tr>
<td>type</td>
<td>frontDoor</td>
<td>Error log Category.</td>
</tr>
<tr>
<td>errorDetails</td>
<td>Access for client 160.34.88.6 forbidden by ACL rule</td>
<td>Detailed description of the error message.</td>
</tr>
</tbody>
</table>

Sample Error Logs

```
Timestamp: "2020-08-05T00:12:39+00:00","errorLog":{"type":"healthChecker","errorDetails":
    "healthChecker":
      "HealthStatus":"Healthy to Unhealthy",
      "check":
        "backendSetName":"newtest","backend":"10.10.100.7:80","details":
        "date":1596586352368,"failures":3,"successes":6,"skips":0,"message":
        {"msg":"connect timed out","elapsed":3000}}}}}

Timestamp: "2020-08-04T23:08:07+00:00","errorLog":{"type":"healthChecker","errorDetails":
  "healthChecker":
    "HealthStatus":"Healthy to Unhealthy",
    "check":
      "backendSetName":"newtest","backend":"10.10.100.7:80","details":
      "date":1596582477049,"failures":3,"successes":0,"skips":0,"message":
      {"msg":"invalid statusCode","statusCode":404,"expected":"200"}}}}}
```

Oracle Cloud Infrastructure User Guide
<table>
<thead>
<tr>
<th>Type</th>
<th>Details</th>
</tr>
</thead>
</table>
| healthChecker | **RegEx Mismatch**  
Failure because of RegEx mismatch. |
| healthChecker | **Connection Refused**  
Failure because of connection RST. |
| healthChecker | **Host Unreachable**  
Failure because of unreachable host. |
| healthChecker | **Success (Unhealthy to healthy)**  
Unhealthy backend became healthy. |
| healthChecker | **SSL Backend, with some SSL error**  
Failure because of SSL error. |
## Details for Object Storage

This topic provides details for Object Storage logs.

### Resources
- buckets

### Log Categories

<table>
<thead>
<tr>
<th>API value (ID)</th>
<th>Console (Display Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>write</td>
<td>Write Access Events</td>
<td>Includes logs for write events.</td>
</tr>
</tbody>
</table>
## Logging

### API value (ID): read

<table>
<thead>
<tr>
<th>Console (Display Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read Access Events</td>
<td>Includes logs for read events.</td>
</tr>
</tbody>
</table>

### Availability

Object Storage logging is available in all the regions of the commercial realm.

### Comments

Choose the log category for the type of information that you want to log. For example, if you enable a write log, the `requestAction` property would contain values of PUT, POST, or DELETE. If you enable a read log, `requestAction` would contain values of GET, LIST, or HEAD.

**Note:**

Service logs for Object Storage are delivered on a best effort basis. In limited situations, a small number of log entries may not be delivered successfully.

### Contents of an Object Storage Log

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalDetails</td>
<td>Includes the following fields when applicable to the particular log:</td>
</tr>
<tr>
<td></td>
<td>• versionId: From PutObject and DeleteObject responses</td>
</tr>
<tr>
<td></td>
<td>• isDeleteMarker: From the DeleteObjectVersion response</td>
</tr>
<tr>
<td></td>
<td>• retentionRuleName</td>

<td>OCID of the compartment</td>
</tr>
<tr>
<td>compartmentName</td>
<td>Name of the compartment</td>
</tr>
<tr>
<td>credentials</td>
<td>Request security credentials</td>
</tr>
<tr>
<td>endTime</td>
<td>Request end timestamp</td>
</tr>
<tr>
<td>errorCode</td>
<td>If present, a short error code meant for programmatic parsing that defines</td>
</tr>
<tr>
<td></td>
<td>the error</td>
</tr>
<tr>
<td>eTag</td>
<td>Entity tag (ETag) for the resource</td>
</tr>
</tbody>
</table>
### Property | Description
---|---
**isPar** | Boolean describing whether this is a pre-authenticated request:
  * true
  * false
**message** | Human-readable string describing the request
**namespace** | Object Storage namespace used for the request
**objectName** | Name of the object
**opcRequestId** | Client request ID for tracing
**principalId** | OCID of the requestor
**principalName** | Name of the requestor
**region** | Region identifier
**requestAction** | HTTP method of the request (DELETE/GET/HEAD/POST/PUT)
**requestResourcePath** | Resource path of the request
**startTime** | Request start timestamp
**statusCode** | Response status code
**tenantId** | OCID of the tenant
**tenantName** | OCID of the tenant
**userAgent** | User Agent that sent the request to Object Storage

Object Storage Log Object Name

Objects that store Object Storage data use the following naming format:

public_log/<bucket_name>/<YYYY-MM-DDTHH_MMZ>[_<seqNum>].log.gz

For example:

public_log/example_bucket/2019-03-21T00_00Z.log.gz
public_log/example_bucket/2019-03-21T00_00Z_2.log.gz

Using the Command Line Interface (CLI)

See Object Storage Example on page 3922 for example commands.

Details for VCN Flow Logs

This topic provides details for VCN Flow logs.

Resources

- subnet

Log Categories

<table>
<thead>
<tr>
<th>API value (ID):</th>
<th>Console (Display Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Flow Logs (All records)</td>
<td>Includes both accept and reject records in VCN flow logs.</td>
</tr>
</tbody>
</table>

Availability

VCN Flow Logs are available in all the regions of the commercial realm. See the Oracle Cloud Infrastructure Government Cloud section for information about availability in the Government Cloud realm.

Comments

Each instance in a VCN has one or more virtual network interface cards (VNICs). The Networking service uses security rules to determine what traffic is allowed through a given VNIC. Security rules can be defined using Security lists or Network security groups.

To help troubleshoot the traffic in and out of your VNICs, you can set up VCN flow logs. Flow logs record details about traffic that has been accepted or rejected based on the security rules set up for your VCN.
You can enable flow logs for a given subnet, which means traffic is logged for all existing and future VNICs in that subnet. Each flow log contains information about traffic for a single VNIC.

**Note:**

Certain traffic to core Oracle infrastructure services hosted on link-local (169.254.0.0/16) IP addresses do not appear in flow logs. This includes items such as VCN DNS, DHCP, and block storage. Also excluded is network management traffic, such as ARP.

## Contents of a VCN Flow Log

A flow log record contains the following fields:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Sample Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>data.action</td>
<td>Type of record. Possible values:</td>
<td>ACCEPT</td>
</tr>
<tr>
<td></td>
<td>• ACCEPT: This record's traffic was accepted by</td>
<td></td>
</tr>
<tr>
<td></td>
<td>the security lists.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• REJECT: This record's traffic was rejected by</td>
<td></td>
</tr>
<tr>
<td></td>
<td>the security lists.</td>
<td></td>
</tr>
<tr>
<td>data.bytesOut</td>
<td>Number of bytes recorded in the capture window.</td>
<td>17114</td>
</tr>
<tr>
<td>data.destinationAddress</td>
<td>IP address of the destination, either in IPv4 dot,</td>
<td>10.0.99.4</td>
</tr>
<tr>
<td></td>
<td>or IPv6 colon notation.</td>
<td>8222:91f5:88bb:2bf0:94a:e71b:65d3:4bd7</td>
</tr>
<tr>
<td>data.destinationPort</td>
<td>IANA port number of the destination.</td>
<td>36266</td>
</tr>
<tr>
<td>data.endTime</td>
<td>End time of the capture window in UNIX epoch</td>
<td>1598917970</td>
</tr>
<tr>
<td>data.flowid</td>
<td>Hash of key fields (source and destination</td>
<td>a6a73770</td>
</tr>
<tr>
<td></td>
<td>addresses, ports, and protocol).</td>
<td></td>
</tr>
<tr>
<td>data.packets</td>
<td>Number of packets recorded in the capture</td>
<td>250</td>
</tr>
<tr>
<td>data.protocol</td>
<td>IANA protocol number.</td>
<td>6</td>
</tr>
<tr>
<td>data.protocolName</td>
<td>IANA name for protocol.</td>
<td>TCP</td>
</tr>
<tr>
<td>data.sourceAddress</td>
<td>IP address of the source, either in IPv4 dot, or</td>
<td>123.0.0.1</td>
</tr>
<tr>
<td></td>
<td>IPv6 colon notation.</td>
<td>1fde:9f1c:2433:4038:68fc:e0b:73f3:355f</td>
</tr>
<tr>
<td>data.sourcePort</td>
<td>IANA port number of the source.</td>
<td>443</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
<td>Sample Value</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------------------------------------------------</td>
<td>--------------</td>
</tr>
</tbody>
</table>
| data.startTime | Start time of the capture window in Unix epoch seconds. UNIX epoch time uses a fixed point in the past to reference the current time. That means that every second of the current time can be expressed as a number, such as 1576090259 (which is Wednesday, December 11, 2019 6:50:59 PM GMT). Each flow log record records a one-minute interval (0 to 59 seconds) of data flow, using epoch start and end times to indicate the time that data appears during the 60-second interval for that record. Let's consider the epoch time entries that would appear for data flow during a fixed interval of 140 seconds. At five seconds past a particular minute, you open a connection to your host and begin to continuously send data over that connection for the next 140 seconds (< three minutes, three records). Epoch start and end times would appear in the log according to the following:  
• The first record would show an epoch start time at the five seconds past the minute mark and an epoch end time at the end of that minute (54 seconds later).  
• The next record would show an epoch start time at the zero-seconds mark, and epoch end time at the end of that minute (59 seconds later). This assumes you sent the data continuously. If your transmission had been intermittent, the epoch times would reflect the first and last second data flow that occurred during that 60-second interval (the absolute time).  
• The final record would show an epoch start time at the zero-seconds mark, and an epoch end time for 20 seconds later (since the total flow life was only 140 seconds, or 20 seconds into the third one-minute logging interval recorded by each record). | 1598917969 |
| data.status  | Status of data capture window. Possible values:  
• OK: Normal packet log.  
• NODATA: No traffic was recorded during the capture window, in which case, only the following data fields are set: endTime, startTime, status, and version. The remaining data fields are set to null: action, bytesOut, destinationAddress, destinationPort, flowid, packets, protocol, protocolName, sourceAddress, and sourcePort.  
• SKIPDATA: Some traffic was not logged during the capture window because of system errors or capacity issues, in which case, only data fields endTime, startTime, status, and version are set, and the remaining data fields are set to null. The flow log can contain other records for accepted or rejected traffic in the capture window. | OK |
<p>| data.version | Version of the flow log record schema.                                                         | 2            |
| datetime     | Timestamp in milliseconds. Same as the oracle.ingestedtime field but in milliseconds.         | 1598917955000 |
| id           | Random UUID, unique to each log entry.                                                        | abcdeadbced-abcd-abcd-abcdabcdabdc |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Sample Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>oracle.compartmentid</td>
<td>OCID of the compartment the log group is in.</td>
<td>ocid1.compartment.oc1.&lt;region-id&gt;..&lt;unique-id&gt;</td>
</tr>
<tr>
<td>oracle.ingestedtime</td>
<td>Time the log was ingested by OCI Logging.</td>
<td>2020-08-31T23:53:54Z</td>
</tr>
<tr>
<td>oracle.loggroupid</td>
<td>OCID of the log group.</td>
<td>ocid1.loggroup.oc1.&lt;region-id&gt;..&lt;unique-id&gt;</td>
</tr>
<tr>
<td>oracle.logid</td>
<td>OCID of the log.</td>
<td>ocid1.log.oc1.&lt;region-id&gt;..&lt;unique-id&gt;</td>
</tr>
<tr>
<td>oracle.tenantid</td>
<td>OCID of the tenant.</td>
<td>ocid1.tenancy.oc1..&lt;region-id&gt;..&lt;unique-id&gt;</td>
</tr>
<tr>
<td>oracle.vniccompartmentocid</td>
<td>OCID of the compartment to which the VNIC belongs.</td>
<td>ocid1.compartment.oc1..&lt;region-id&gt;..&lt;unique-id&gt;</td>
</tr>
<tr>
<td>oracle.vnicocid</td>
<td>OCID of the VNIC.</td>
<td>ocid1.vnic.oc1.&lt;region-id&gt;..&lt;unique-id&gt;</td>
</tr>
<tr>
<td>oracle.vnicsubnetocid</td>
<td>OCID of the subnet to which the VNIC belongs.</td>
<td>ocid1.subnet.oc1.&lt;region-id&gt;..&lt;unique-id&gt;</td>
</tr>
<tr>
<td>specversion</td>
<td>OCI logging schema version.</td>
<td>1.0</td>
</tr>
<tr>
<td>time</td>
<td>Same as startTime.</td>
<td>2020-08-31T23:52:35Z</td>
</tr>
<tr>
<td>type</td>
<td>Category of log: DataEvent, QualityEvent.NoData, or QualityEvent.SkipData.</td>
<td>com.oraclecloud.vcn.flowlogs.DataEvent</td>
</tr>
</tbody>
</table>

**Limitations and Considerations**

- Some traffic might not be logged during a capture window because of capacity issues or system errors. In such cases, NODATA, or SKIPDATA log status is recorded.
- Some services manage VNICs. For example, the Load Balancing service manages VNICs attached to load balancers. Flow logs for managed VNICs are captured, and identified by VNIC ID. Flow logs, however, currently do not include a field to indicate what service such VNICs belong to.
- For traffic over the public IP of a compute instance, flow logs records the corresponding private IP.

**Using the Command Line Interface (CLI)**

See [VCN Flow Logs Example](#) on page 3922 for example commands.

**Details for Site-to-Site VPN**

This topic provides details for Site-to-Site VPN logs.

**Resources**

- IPSecConnection

**Log Categories**

<table>
<thead>
<tr>
<th>API value (ID):</th>
<th>Console (Display Name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>read</td>
<td>IPSec Logs</td>
<td>Includes Site-to-Site VPN logs for read access.</td>
</tr>
</tbody>
</table>
**Availability**

See [Site-to-Site VPN v2 availability](#) on page 4609 for up-to-date information on Site-to-Site VPN logging availability.

**Comments**

Site-to-Site VPN logs contain all status-related information of the IPSec tunnels associated with the site-to-site type of IPSec connections. This includes bringing of tunnels up or down, and accompanying negotiation information. Each IPSec connection has two IPSec tunnels created, thus the Site-to-Site VPN logs will contain status on both tunnels. Amongst other types of filtering, IPSec tunnels can be distinguished and thus filtered on their `data.TunnelId` (see [Contents of a Site-to-Site VPN Log](#) on page 3964 below for details).

Most Site-to-Site VPN log messages begin with a connection name. The connection name is unique for each IPSec tunnel. Its base form is comprised of ten numeric digits (see the sample value for the `data.message` property in the table below). In total, a connection name has three additional variants, and which variant(s) are used is based on the following:

1. Each IPSec tunnel has a unique ten-digit key assigned to (for example, 9123456789) which is contained in the beginning of many of the IPSec log messages. This is the form for IPv4 tunnels.
2. If the given IPSec tunnel is also configured for IPv6, IPSec log messages can also contain the same ten-digit key with a `_v6` appended to it (for example, 9123456789_v6).
3. If the tunnel is policy-based (that is, MED is enabled) there can be multiple SAs depending on the configuration. The form of the ten-digit key for IPv4 tunnels with multiple SAs is a sequence of `_1`, `_2`, `_3`, and accordingly depending on the number of SAs (for example, 9123456789_1, 9123456789_2, 9123456789_3).
4. If the given policy-based tunnel is also configured for IPv6, IPSec log messages can also contain the same ten-digit key and SA index, along with v6 (for example, 9123456789_v6_1).

**Contents of a Site-to-Site VPN Log**

A Site-to-Site VPN log contains the following fields:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Sample Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>data.message</td>
<td>The Site-to-Site VPN log message.</td>
<td>&quot;2062988354&quot;: terminating SAs using this connection</td>
</tr>
<tr>
<td>data.tunneld</td>
<td>The IPSec tunnel OCID of one of the IPSec connection's IPSec tunnels.</td>
<td>ocid1.ipsectunnel.region1.sea.&lt;uniqueId&gt;</td>
</tr>
<tr>
<td>id</td>
<td>Random UUID, unique to each log entry.</td>
<td>e3002eaa-d717-472e-8474-d024943a0f27</td>
</tr>
<tr>
<td>oracle.compartmentid</td>
<td>OCID of the compartment that the log group belongs to.</td>
<td>ocid1.tenancy.region1.&lt;uniqueId&gt;</td>
</tr>
<tr>
<td>oracle.ingestedtime</td>
<td>Time the log was ingested by Oracle Cloud Infrastructure Logging.</td>
<td>2021-02-18T18:22:01.453Z</td>
</tr>
<tr>

  "type": "com.oraclecloud.vpn.ipseclog.read"
}
```

Troubleshooting

An error is displayed on the log details page if you attempt to enable logs for a v1 Site-to-Site VPN connection. Only v2 connections are supported.

Audit Logs

On the Audit page, you can explore audit logs. Audit logs are also searchable on the Search page, and you can view Audit logs in every compartment by selecting the /Audit log group on the Search page. For an overview of Audit, see Overview of Audit on page 612.

Note:

This page replaces the classic Audit page features found in the Governance & Administration portion of the Console, which will eventually be deprecated. As a result, a new and improved Audit experience is now part of Oracle Cloud Infrastructure Logging, and we recommend you use this latest version of Audit instead.

Required Permissions for Audit Logs

To view and search Audit logs, you must have the corresponding Audit-related permissions. See Details for the Audit Service and Required Permissions for Searching Logs on page 3984 for more information.

Filtering Audit Logs

To filter Audit logs:
1. Open the navigation menu and click **Observability & Management**. Under **Logging**, click **Audit**. The list of audit logs in the current compartment is displayed.

2. Choose a compartment you have permission to work in.

3. In **User**, add user filters. Multiple users can be added.

4. In **Resource**, add resource filters. Multiple resources can be filtered on.

5. In **Request Action Types**, select an action operation:
   - GET
   - POST
   - PUT
   - PATCH
   - DELETE

Multiple request action types can be filtered on.

6. In **Event Type**, add event filters. Multiple event filters can be added.

7. In **Custom Filters**, start typing to automatically display filter settings, along with operators. For example, entering `d` displays filters starting with that letter. Use the up or down arrow keys to select from the list, or continue typing to enter what you want to filter on. This functions the same as this field on the Logging **Search** page.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you want to find log events with a specific status code, include quotes (&quot;), around the code to avoid results that have those numbers embedded in a longer string.</td>
</tr>
</tbody>
</table>

8. In **Filter by Time**, select from one of the preset time periods:
   - Past 5 Minutes (the default)
   - Past 15 Minutes
   - Past Hour
   - Past 3 Hours
   - Today
   - Custom (choose your own using the **Start Date** and **End Date** fields)

9. After entering your search text or filters, click **Apply**.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Since the <strong>Audit</strong> page automatically refreshes after applying filters, you do not need to click the <strong>Apply</strong> button as you select different filters. You will, however, need to click <strong>Apply</strong> again after some time has passed and new logs have appeared.</td>
</tr>
</tbody>
</table>

The **Convert to search** option allows viewing your Audit Log results in the **Search** page, to further search and perform analysis across other logs in the system. When you use this option, the Advanced Search version of the **Search** page is filled with the chosen filter parameters (available in the **Query** field).

Click **View query syntax** to view the actual syntax query statement(s) associated with your filter settings. If you have applied multiple filters for a field, you can view how the query is constructed in terms of the combined OR and AND statements.

### Exploring the Details of Events

On the **Explore Events** tab, each log entry is organized in terms of the **Event Time**, **User**, **Resource**, **Type**, **Action**, and **Status**. Click and expand an audit log entry. Each entry displays the log data in a JSON field view, similar to the **Search** page, where you can collapse and expand nodes, or click the copy icon to copy the log entry to the clipboard.

### To export log data

At the top right portion of **Explore Events**, click **Export Log Data (JSON)**. This feature allows you to export the log data to a JSON file that you can save to your system.
Viewing the Activity Stream

Click the Activity Stream tab to view the audit logs as a visual sequential list (by date, from newest to oldest log event). You click and expand an event to display the event in JSON format, and you can click the copy icon to copy the audit event to the clipboard.

Exporting Audit Events

Audit events can be exported using Service Connector Hub on page 5364.

Audit Schema

See Version 2 Audit Log Schema on page 613 for more information on the audit logging schema.

Custom Logs

Custom logs are logs that contain diagnostic information from custom applications, other cloud providers, or an on-premise environment. Custom logs can be ingested in the following ways:

- By using PutLogs to ingest custom logs directly. See the Logging Ingestion API and REST APIs on page 6275 for more information. Also see Using the API on page 3983 for an example log entry payload that can be used with PutLogs.
- By configuring the Unified Monitoring Agent. See Installing the Agent on page 3969 for instructions.

Custom logs can be viewed in the Oracle Cloud Infrastructure Compute instance page, and have an associated Logs resource. They can also be viewed on the Logging Search page, Logs page, or within an associated Log Groups detail page. Custom logs are also supported in bare metal instances.

The agent can be installed on many machines, and it pulls logs from local directories, where your apps or systems emit logs. The agent can also parse your logs for you. All of this is configured in Agent Configurations. You can create an agent configuration separately, and then associate a custom log with it, or create a custom log and then later create its agent configuration.

An agent configuration is the central mechanism for defining:

- What hosts you want logs from.
- What specific logs you want from the hosts.
- Additional parsers.
- The custom log destination.

Creating a custom log is a two-step process, in that you create the custom log object first, and then second, create its associated agent configuration. See Creating Custom Logs on page 3967 for more information on creating custom logs and agent configurations, and Agent Management on page 3969 for more information on setting up and managing the agent.

Creating Custom Logs

To create custom logs:

1. Open the navigation menu and click Observability & Management. Under Logging, click Logs.

Note:

For the agent to run correctly, ensure that your firewall settings allow the following URI endpoints:

- https://auth.<your region>.oraclecloud.com
2. Under **List Scope, Compartment**, choose a compartment you have permission to work in.
3. In **Custom Log Name**, enter a name for the custom log. Avoid entering confidential information.
4. From **Compartment**, choose a compartment you have permission to work in.
5. From **Log Group**, select a log group to place the custom log into.
6. Optionally, select a log retention value from **Log Retention**, and add any applicable tags in **Add Tags**.
7. Click **Create Log Object**. The Create Agent Configuration panel is displayed. You can next create a new configuration, to define the parameters for the associated log data (the default), or add it later.
8. In **Name and compartment**, enter a **Configuration Name** in the corresponding field, and select a **Compartment** you have permissions to work in.
9. In **Choose Host Groups**, which allows you to define which VMs apply to this configuration, select a **Group Type** from the list, whether **Dynamic Group** or **User Group**.

   For the **Dynamic Group** case, **Dynamic Group** refers to a group of instances, which you can create in the IAM feature of the Console. See **About Dynamic Groups** for more information. These Dynamic Groups can be selected from the **Groups** field when setting up Dynamic Group settings.

   For the **User Group** case, select the group from the **Groups field**. User Groups also refer to the IAM Groups feature of the Console. See **Managing Groups** for more information.

   Click **Add Host Group** to add more groups. You can add a combination of Group Types for the agent configuration, that is, both **Dynamic Groups** and **User Groups** can be set up in the configuration.

   **Note:**

   A maximum of five groups per configuration are allowed, and a host can be in a maximum of five different groups.

10. Next, in the configuration, you need to define the format of the logs (that is, what logs do you want to watch for) in **Configure Log Inputs**. Select an **Input Type** form the list, whether **Windows Event Log** or **Log Directory**.

    - For **Windows Event Log**, enter an **Input Name** and select an **Event Channels** option from the list.
    - For **Log Directory**, enter an **Input Name** and a **Path** in the corresponding fields. For example, `/<log_path>/<log_name>`. Multiple paths can be entered.

   Click **Advanced Parser Options**, which opens the Advanced Parser Options panel. This allows you to specify how to parse the log, according to the following parsers. Some of the parsers require further input and have more options, depending on the type chosen.

    - **AUDITD**
    - **JSON**
    - **TSV**
    - **CSV**
    - **NONE** (the default)
    - **SYSLOG**
    - **APACHE2**
    - **APACHE_ERROR**
    - **MSGPACK**
    - **REEXP**
    - **MULTILINE**

   For example for **JSON**, you must select a **Time Type** value from the list, while optionally, you can specify event time and null field settings. Meanwhile for **REEXP**, you specify the regular expression for matching logs, along with the time format. See **Log Inputs and Parsers** on page 3975 for more information.

11. After configuring the log inputs and the parser, you can optionally specify any tag settings. Click **Submit** to save your changes, and create the custom log and its associated agent configuration.

In summary, the agent configuration defines what instances the configuration applies to (**Choose Host Groups**), which log files are obtained and what parser (if any) is used (**Configure Log Inputs**), and to what log object in the
Oracle Cloud Infrastructure system that the records are pushed to (Select log destination). The latter is already set up since this was set during the custom log creation step.

The custom log object is now created, as well as the agent configuration, which pulls data from instances, and pushes into the custom log object.

**Agent Management**

To ingest events from your applications into your custom log, you can install the Oracle fluentd-based agent. This agent allows you to control exactly which logs you want to collect, how to parse them, and more.

**Note:**
The Unified Monitoring Agent is a fully managed agent, and custom client configuration is not officially supported. For example, gathering logs from remote sources is not recommended, since doing so can have serious security implications (because the log source cannot be verified).

Oracle Cloud Infrastructure Logging provides an easy mechanism ([Agent Configurations](#)) to enable and manage the agent for a set of supported operating systems. **Agent Configurations** give you a central experience to easily configure what custom logs you want to ingest across your fleet of hosts. The following are the supported operating systems for agent configurations:

- Oracle Linux 7, Oracle Linux 8
- CentOS 7, CentOS 8
- Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04

**Note:**
For Linux, only register Linux-specific input types, such as "Log Path", for a dynamic group that includes only a Linux instance. For Windows, only register Windows-specific input types, such as "Windows event log", for a dynamic group that includes only a Windows instance. Otherwise, the Unified Monitoring Agent malfunctions if you register a Windows input type for a Linux instance, and vice versa.

**Installing the Agent**

**New Oracle Cloud Infrastructure Instances**

For supported operating systems, you can enable the agent directly during creation time. The Custom Logs Monitoring plugin must be enabled, and all plugins must be running. See [Managing Plugins with Oracle Cloud Agent](#) on page 1205 for more information.

**Existing Oracle Cloud Infrastructure Instances**

For existing instances with supported operating systems, the Custom Logs Monitoring plugin must be enabled, and all plugins must be running. See [Managing Plugins with Oracle Cloud Agent](#) on page 1205 for more information.

If you already have the monitoring plugin enabled, then your instance will be automatically patched to install the agent by September 18, 2020. Otherwise, you can follow the manual installation instructions:

**Linux:**

1. Connect to the instance.
2. You can obtain the agent by using this script, and then run the script to download the agent. For example:

```
./downloadAgent.sh centos7
./downloadAgent.sh centos8
./downloadAgent.sh oel7
./downloadAgent.sh oel8
```
Otherwise, you can download the agent for the following individual operating systems:

- **Oracle Linux 7 RPM**: https://objectstorage.us-phoenix-1.oraclecloud.com/n/axmjwnk4dzjv/b/unified-monitoring-agent-ol-bucket/o/unified-monitoring-agent-ol-7-0.1.1.rpm
- **Oracle Linux 8 RPM**: https://objectstorage.us-phoenix-1.oraclecloud.com/n/axmjwnk4dzjv/b/unified-monitoring-agent-ol-bucket/o/unified-monitoring-agent-ol-8-0.1.1.rpm
- **CentOS 7 RPM**: https://objectstorage.us-phoenix-1.oraclecloud.com/n/axmjwnk4dzjv/b/unified-monitoring-agent-cl-bucket/o/unified-monitoring-agent-cl-7-0.1.1.rpm
- **CentOS 8 RPM**: https://objectstorage.us-phoenix-1.oraclecloud.com/n/axmjwnk4dzjv/b/unified-monitoring-agent-cl-bucket/o/unified-monitoring-agent-cl-8-0.1.1.rpm
- **Ubuntu 16 DEB**: https://objectstorage.us-phoenix-1.oraclecloud.com/n/axmjwnk4dzjv/b/unified-monitoring-agent-ub-bucket/o/unified-monitoring-agent-ub-16-0.1.1.deb

For the FIPS-enabled agent:

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Performance is impacted when using the FIPS-enabled agent.</td>
</tr>
</tbody>
</table>

- **CentOS 7 RPM**: https://objectstorage.us-langley-1.oraclegovcloud.com/n/iaashydra/b/agent-manual-download-centos7/o/unified-monitoring-agent.rpm
- **CentOS 8 RPM**: https://objectstorage.us-langley-1.oraclegovcloud.com/n/iaashydra/b/agent-manual-download-centos8/o/unified-monitoring-agent.rpm

3. Run the following command to install the RPM:

```
yum install -y <rpm-name>
```

For Ubuntu:

```
apt install -y <deb-package-name>
```

**Windows**:

1. **Connect to the instance**.
2. **Download the agent from**: https://objectstorage.us-phoenix-1.oraclecloud.com/n/axmjwnk4dzjv/b/unified-monitoring-agent-windows-repo/o/unified-monitoring-agent-0.0.7.msi
3. Open an elevated command prompt (running as Administrator), and run the MSI command (installation can take up to five minutes to complete):

   `C:\path\to\file\unified-monitoring-agent-0.0.2.msi`

4. For a more advanced version of the preceding command (to debug MSI installation issues), run:

   `msiexec /i "C:\path\to\file\unified-monitoring-agent-0.0.2.msi" /l*v "C:\unified-monitoring-agent_msi.log"`

### Instances Created from Custom Images and Non-Oracle Cloud Infrastructure Instances

1. Install the agent according to the same steps in Existing Oracle Cloud Infrastructure Instances on page 3969.
2. Configure User API keys for the instance you are running on. To generate the user API key, follow the instructions described in How to Generate an API Signing Key on page 6046.
   - (Linux) Step 2a. Place the ".oci" directory and its contents under /etc/unified-monitoring-agent.
   - (Windows) Step 2a. For Windows, there are a few steps that differ, so ensure to follow the appropriate steps. Create the ".oci" folder and its contents in the directory C:\oracle_unified_agent.
3. Follow the instructions described in Creating a Profile in the Oracle Cloud Infrastructure CLI Configuration File on page 3048, to create the configuration file with the modifications in the next step.
4. After following the steps in Creating a Profile in the Oracle Cloud Infrastructure CLI Configuration File on page 3048, ensure to name the profile (<profile-name>) for this section as "UNIFIED_MONITORING_AGENT".

The following is an example of what the configuration looks like for the Unified Monitoring Agent to use for authentication with the service:

   ```
   [UNIFIED_MONITORING_AGENT]
   user=ocid1.user.region..aaa...
   fingerprint=<cert fingerprint>
   key_file=/path/to/ocifolder/.oci/private.pem
   tenancy=ocid1.tenancy.region..aaa...
   region=<instances region>
   pass_phrase="pashphrase1234"
   ```

### Verify Agent Installation

**Windows:***

1. Connect to the instance.
2. Open Services.msc (Start menu and type services.msc). Scroll until you see the "Oracle Unified Monitoring Agent" and that the agent is in a "Running" state.
3. In the Task Scheduler under Task Scheduler Library, verify that the UnifiedAgentConfigUpdater exists, and has (or will) run successfully. After the initial install, it can take up to 20 minutes for the first run. If preferred, this can be run manually.
4. After the UnifiedAgentConfigUpdater task has run, verify that a "unified-monitoring-agent.conf" file in exists in C:\oracle_unified_agent.
5. After a few minutes, supervisor (unified-monitoring-agent-supervisor-0.log) logs and worker (unified-monitoring-agent-0.log) logs appear in the C:\oracle_unified_agent directory.
6. The preceding logs contain the Fluentd parser and plugin output.

**Oracle Linux 7, Oracle Linux 8, CentOS 7, CentOS 8, Ubuntu 16, Ubuntu 18, and Ubuntu 20:**

1. Connect to the instance.
2. Check that the agent is running by running the following command:

   `systemctl status unified-monitoring-agent`
3. The status looks like the following:

```
Loaded: loaded (/usr/lib/systemd/system/unified-monitoring-agent.service; enabled; vendor preset: disabled)
Active: active (running) since Thu 2020-09-10 18:11:45 GMT; 2h 14min ago
Docs: https://docs.cloud.oracle.com/
```

Managing Agent Configurations

To use agent configurations, you must be running an Oracle Cloud Infrastructure instance with the supported operating system (see Agent Management on page 3969). Agent configurations give you a central experience to easily configure what custom logs you want to ingest across your fleet of hosts. A configuration allows you to select:

- Which hosts you want to collect logs from.
- Exactly which logs you want to ingest from those hosts.
- A log group/log destination.

Configurations are managed through the Console and Logging API. In addition, since you can choose to create an agent configuration later after creating a custom log, you can use the Agent Configurations page to set up the agent configuration and point it to your custom log.

The Agent Configurations page is organized in terms of the following:

- Name
- Config OCID
- Status
- Created

To create a new agent configuration

1. Open the navigation menu and click Observability & Management. Under Logging, click Agent Configurations. The Agent Configurations page is displayed.
2. Under List Scope, Compartment, choose a compartment you have permission to work in.
3. Click Create Agent Config. The Agent Configurations panel is displayed.
4. In Name and compartment, enter a Configuration Name in the corresponding field, and select a Compartment you have permissions to work in. Avoid entering confidential information.
5. In Choose Host Groups, select a Group Type from the list, whether Dynamic Group or User Group. Click Add Host Group to add more groups.
6. In Configure Log Inputs, select an Input Type from the list, whether Windows Event Log or Log Directory.
   - For Windows Event Log, enter an Input Name and select an Event Channels option from the list.
   - For Log Directory, enter an Input Name and a Path in the corresponding fields.
7. In Select log destination, the User Group or Dynamic Group in the configuration that you select in Compartment needs to have permission to work in the compartment. Select the Log Group, and the Log Name from the corresponding drop-down lists. The Log Name can only point to a custom log and the custom log must exist in the chosen log group for the configuration to work.
8. Optionally, after clicking Show Additional Options, specify any preferred tag settings.
9. Click Create. The agent configuration is created and appears in the Agent Configurations page.

To view an agent configuration

1. Open the navigation menu and click Observability & Management. Under Logging, click Agent Configurations. The Agent Configurations page is displayed.
2. Under List Scope, Compartment, choose a compartment you have permission to work in.
To edit an agent configuration

1. Open the navigation menu and click Observability & Management. Under Logging, click Agent Configurations. The Agent Configurations page is displayed.
2. Under List Scope, Compartment, choose a compartment you have permission to work in.
3. Click the linked agent configuration name under Name in the table. The agent configuration detail page is displayed.
4. Click Edit. The Agent Configurations panel is displayed.

   From the main Agent Configurations page, for the agent configuration you want to edit, you can also click the Actions menu, and then click Edit to access the Agent Configurations panel.
5. Make your changes and click Update.

To enable or disable an existing agent configuration

1. Open the navigation menu and click Observability & Management. Under Logging, click Agent Configurations. The Agent Configurations page is displayed.
2. Under List Scope, Compartment, choose a compartment you have permission to work in.
3. Click the linked agent configuration name under Name in the table. The agent configuration detail page is displayed.
4. Click Disable/Enable. A confirmation dialog is displayed regarding the disabling or enabling of the agent configuration.
5. Confirm by clicking Disable/Enable. The agent configuration detail page changes its status and displays Inactive (for a disabled configuration), or Active (for an enabled configuration) in the status field, both on the agent configuration detail page and the Agent Configurations page.

   From the main Agent Configurations page, for the agent configuration you want to disable/enable, you can also click the Actions menu, and then click Disable/Enable.

To delete an agent configuration

1. Open the navigation menu and click Observability & Management. Under Logging, click Agent Configurations. The Agent Configurations page is displayed.
2. Under **List Scope, Compartment**, choose a compartment you have permission to work in.
3. Click the linked agent configuration name under **Name** in the table. The agent configuration detail page is displayed.
4. Click **Delete**. A confirmation dialog is displayed regarding the delete operation.
5. Confirm by clicking **Delete**. The agent configuration is removed from the **Agent Configurations** page.

From the main **Agent Configurations** page, for the agent configuration you want to delete, you can also click the Actions menu, and then click **Delete**.

**To move an agent configuration to a different compartment**

1. Open the navigation menu and click **Observability & Management**. Under **Logging**, click **Agent Configurations**. The **Agent Configurations** page is displayed.
2. Under **List Scope, Compartment**, choose a compartment you have permission to work in.
3. Click the linked agent configuration name under **Name** in the table. The agent configuration detail page is displayed.
4. Click **Move Resource**. The **Move Resource to a Different Compartment** dialog is displayed.
5. Choose the new compartment and then click **Move Resource**.

From the main **Agent Configurations** page, for the agent configuration you want to move to a new compartment, you can also click the the Actions menu, and then click **Move Resource**.

**Selecting Target Hosts with Dynamic Groups**

To set up a configuration for multiple hosts, you can use the **Dynamic Group** feature from IAM. The overall process first involves creating a compartment, then placing all the instances in the compartment you want to collect logs from. Next, you can create the Dynamic Group. The Dynamic Group policy statement would then point to the compartment that contains the instances. Lastly, create a log group, custom log, and its associated agent configuration.

Set the following policy statement:

```plaintext
allow dynamic-group <dynamic_group_name> to use log-content in tenancy
```

This policy statement allows the agent configuration to push logs to the Logging service backend, which you can later see in the Logging Service’s **Search** page.

In the Dynamic Groups configuration, set up your Dynamic Group to have a rule that includes all the agents that you want to use to send logs to the Logging service. For example, in a Rule inside the Dynamic Group it can state:

```plaintext
ANY {instance.id = 'ocid1.instance.<region>.<location>.<unique_ID>',
instance.compartment.id = 'ocid1.compartment.<region>..<unique_ID>}'
```

If you remove `instance.id = 'ocid1.instance.<region>.<location>.<unique_ID>}' and just have:

```plaintext
ANY {instance.compartment.id = 'ocid1.compartment.<region>..<unique_ID>}'
```

this means use all the instances under this compartment to send logs. For more information on Dynamic Groups, see **About Dynamic Groups**.

Next, create the log group (see **To create a log group** on page 3918). After the log group is created, you can then create the custom log and the agent configuration (see **Creating Custom Logs** on page 3967 for steps to create the custom log and agent configuration). During the agent configuration, you can use the Dynamic Group you created earlier and select it in the **Choose Host Groups** section of the **Agent Configurations** panel. This links the log configuration with the instance you want to send logs to. Once the agent configuration is active, the logs you see are sent by the instance, inside the Dynamic Group you earlier set up. You can later click **Explore with Log Search** in the agent configuration to view the logs through the **Search** page (see **Searching Logs** on page 3983).
Logging

Log Inputs and Parsers

Agent configurations allow you to easily select which types of logs you want to ingest, and how to parse them. The following are the supported log inputs in agent configurations:

- Windows Event Logs
- Log Directory (Tail)

For Log Directory inputs, you can specify parsers to structure your logs. The following are the list of supported parsers:

- None
- Auditd (https://github.com/linux-audit/audit-documentation/wiki)
- JSON (https://docs.fluentd.org/parser/json)
- CSV (https://docs.fluentd.org/parser/csv)
- TSV (https://docs.fluentd.org/parser/tsv)
- Syslog (https://docs.fluentd.org/parser/syslog)
- Apache2 (https://docs.fluentd.org/parser/apache2)
- Apache_Error (https://docs.fluentd.org/parser/apache_error)
- Msgpack (https://docs.fluentd.org/parser/msgpack)
- Regexp (https://docs.fluentd.org/parser/regexp)
- Multiline (https://docs.fluentd.org/parser/multiline)

Log Destination

You can choose the exact log group and log object where you want your log events to be indexed. All incoming log events from your hosts are ingested and indexed in your selected log object. After they are ingested, you can view and search your log events on the Search page (see Searching Logs on page 3983). All existing Oracle Cloud Infrastructure Identity and Access Management policies in both the log group and compartment apply both during ingestion and search. So, only authorized users can view and ingest logs in your tenancy.

Viewing Custom Logs in a Compute Instance

The Logs resource on an Instance Details page allows you to view logging details for the instance in the selected compartment. Logging Search APIs are called and any available logs are pulled for the instance. Instances can have a customer application running on them (for example, a gaming server), and they can configure logs from the gaming server to be collected by the Unified Monitoring Agent, and then be pushed into the Logging service and be indexed there. Logs are pulled and displayed on the Logs resource. As such, when a customer views their compute instance, they can see that their application is pushing logs to the Logging service. Logs, however, cannot be enabled or created from this interface.

Under Explore Logs, you can sort log entries (Newest, the default or Oldest), or filter by time (the default Past 5 minutes, Past 15 minutes, Past hour, Past 24 hours, Today, Custom). Otherwise the functionality is the same as when you are viewing logs under Log Data in the central logging Search page (see Using the Console on page 3984).

Click Explore with Log Search to open the central logging Search page, where you can add or remove filters and so on. The Search page loads with instanceid of the instance already set as a filter under Filters.

Click Create Custom Log to open the central Logs page, where you can create custom logs for the instance. Custom logs are sent from Oracle Cloud Infrastructure compute VM instances.

For the Logs resource to be available on such an instance, the following is required:

- The Custom Logs Monitoring plugin must be enabled, and all plugins must be running. For more information, see Managing Plugins with Oracle Cloud Agent on page 1205.
• The instance must have one of the supported operating systems:
  - Oracle Linux 7, Oracle Linux 8
  - CentOS 7, CentOS 8
  - Windows 2012 R2, 2016, 2019
  - Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04

If the operating system is not supported, then this Logs resource is not displayed. If the operating system is supported by the Oracle Cloud Agent and is not enabled, a warning is displayed that you must enable the agent to create logs.

**Agent Troubleshooting**

The following topics describe troubleshooting tips related to the Unified Monitoring Agent, for both Linux and Windows.

**Hardware Requirements**

Depending on your logging requirements and configuration (number of logs, type of buffering, and so on), the hardware requirements and performance of the Unified Monitoring Agent can vary widely. When no operational pressure is present (less than 1.000 log events per minute), the agent should not consume more than 200 MB of RAM, and 20% of a CPU core. The Unified Monitoring Agent service hard-coded limits are 5 GB RAM, and 40% of a core. 1 GB of RAM is also recommended.

**Enabling Monitoring**

Monitoring can aid with troubleshooting. See Enabling Monitoring for Compute Instances on page 1241 for more information on how you can enable monitoring (metrics and logging) in your Oracle Cloud Infrastructure Compute instances.

**Linux**

**systemd Units**

The Unified Monitoring Agent is based on systemd units, and is composed of the following components:

1. unified-monitoring-agent.service: The main Unified Monitoring Agent service.
2. unified-monitoring-agent_config_downloader.service: The configuration automatic updater service.
3. unified-monitoring-agent_config_downloader.timer: The timer unit, which triggers the automatic downloader service on specified, randomized, intervals.
4. unified-monitoring-agent_restarter.path: The path unit, which triggers the reload of the configuration by the Unified Monitoring Agent, if a change is detected (because of a new configuration being downloaded by the automatic updater service).

**Note:**

Remember that most of the systemctl or journalctl commands must be run with super user privileges (either as root, or through sudo).

To verify the correct operation of these systemd units, you can use the systemctl command like the following:

```
systemctl status <unit_name>
```

Where `<unit_name>` must be replaced with one of the following values:

1. unified-monitoring-agent.service
2. unified-monitoring-agent_config_downloader.service
3. unified-monitoring-agent_config_downloader.timer
4. unified-monitoring-agent_restarter.path
Typically these systemctl commands show output similar to the following:

```bash
systemctl status unified-monitoring-agent.service
# unified-monitoring-agent.service - unified-monitoring-agent: Fluentd based data
collector for Oracle Cloud Infrastructure
    Loaded: loaded (/usr/lib/systemd/system/unified-monitoring-agent.service;
  enabled; vendor preset: disabled)
    Active: active (running) since Tue 2020-09-29 13:54:03 UTC; 1min 37s ago
    Docs: https://docs.cloud.oracle.com/
    Process: 2337 ExecReload=/bin/kill -USR2 ${MAINPID} (code=exited, status=0/
  SUCCESS)
    Process: 2321 ExecStart=/opt/unified-monitoring-agent/embedded/bin/fluentd --
  --log-rotate-age 10 $EXTRA_OPTIONS (code=exited, status=0/SUCCESS)
    Main PID: 2327 (fluentd)
    Memory: 66.3M (limit: 5.0G)
    CGroup: /system.slice/unified-monitoring-agent.service
      ##2327 /opt/unified-monitoring-agent/embedded/bin/ruby /opt/unified-
      monitoring-agent/embedded/bin/fluentd --log /var/log/unified-monitoring-agent/
      unified-monitoring-agent.log --daemon /var/run/unif...
      var/log/unified-monitoring-agent/unified-monitoring-agent.lo...
```

```bash
systemctl status unified-monitoring-agent_config_downloader.service
# unified-monitoring-agent_config_downloader.service - unified-monitoring-agent
Fluentd configuration downloader.
    Loaded: loaded (/usr/lib/systemd/system/unified-monitoring-
  agent_config_downloader.service; enabled; vendor preset: disabled)
    Active: inactive (dead) since Tue 2020-09-29 13:54:38 UTC; 1min 30s ago
    Process: 2333 ExecStart=/opt/unified-monitoring-agent/embedded/bin/fluent_config_updater.rb -c /etc/unified-
  monitoring-agent/conf.d/ -b 10 (code=exited, status=0/SUCCESS)
    Main PID: 2333 (code=exited, status=0/SUCCESS)
```

```bash
systemctl status unified-monitoring-agent_config_downloader.timer
# unified-monitoring-agent_config_downloader.timer - Run unified-monitoring-
agent configuration automatic updater.
    Loaded: loaded (/usr/lib/systemd/system/unified-monitoring-
  agent_config_downloader.timer; enabled; vendor preset: disabled)
    Active: active (waiting) since Tue 2020-09-29 13:54:03 UTC; 3min 57s ago
```

```bash
systemctl status unified-monitoring-agent_restarter.path
# unified-monitoring-agent_restarter.path - "Monitor the /etc/unified-
monitoring-agent/conf.d/ directory for changes"
    Loaded: loaded (/usr/lib/systemd/system/unified-monitoring-
  agent_restarter.path; enabled; vendor preset: disabled)
    Active: active (waiting) since Tue 2020-09-29 13:54:03 UTC; 4min 9s ago
```

The most important parts of the systemctl command output are the Loaded and Active fields. The Loaded field has the value loaded for all system units. The Active field has the following values:

- active (running) for the unified-monitoring-agent.service unit.
- active (waiting) or active (running) for the unified-monitoring-agent_restarter.path and the unified-monitoring-agent_config_downloader.timer units.
- active (running) or inactive (dead) for the unified-monitoring-agent_config_downloader.service unit. For the latter value, the field Main PID includes the value code=exited, status=0/SUCCESS).
Logging

Processes

Another way to further verify the correct operation of the Unified Monitoring Agent, is to check the system’s running processes. When operating correctly, the Unified Monitoring Agent runs two processes: one supervisor process, and one worker process. You can verify their existence by running the following command in a terminal (sample output included):

```
ps aux | grep unified-monitoring-agente[t]
```

As shown in the preceding sample, there are two processes running, with the same arguments, except for the extra `-under-supervisor` added to the second one. This denotes the worker process, thus making the process without this parameter the supervisor.

Logs

**Note:**

Remember that most of the `systemctl` or `journalctl` commands must be run with super user privileges (either as `root`, or through `sudo`).

The Unified Monitoring Agent logs are available at `/var/log/unified-monitoring-agent/unified-monitoring-agent.log`. This file includes logs from the Unified Monitoring Agent itself.

Besides the agent’s logs, which do not contain system-related events (for example, service start, service stop, and so on), you can also view the logs from `journald`, systemd’s system logging service. To view the system logs specific to a unit, you can use the `journalctl` command like the following:

```
journalctl -u <unit_name>
```

Where `<unit_name>` must be replaced with one of the following values:

1. `unified-monitoring-agent.service`
2. `unified-monitoring-agent_config_downloader.service`
3. `unified-monitoring-agent_config_downloader.timer`
4. `unified-monitoring-agent_restarter.path`

When querying `journald` logs through `journalctl`, you can also define specific time ranges:

```
journalctl --since "2020-12-30 00:00:01" --until "2020-12-31 23:59:59"
```

The date format used is YYYY-MM-DD HH:MM:SS.

You can also tail the journal logs, by adding the `-f` parameter:

```
journalctl -f
```

Troubleshooting Scenarios

**Problem:** The Unified Monitoring Agent is not installed.
**Solution:** For newly created instances, it can take up to 25 minutes for the automatic installation of the agent. If it is not installed after this time period, check the following:

1. The network connectivity of the instance.
2. Whether monitoring is enabled in the Console.

You can also check the log file `/var/log/oracle-cloud-agent/plugins/unifiedmonitoring/unifiedmonitoring.log` for information regarding the installation of the Unified Monitoring Agent by the Oracle Cloud Agent.

**Problem:** The Unified Monitoring Agent is not running. Its status is not loaded/active, nor are both supervisor and worker processes running.

**Solution:** Restart the Unified Monitoring Agent and check the logs for any problems:

```
systemctl restart unified-monitoring-agent
```

**Problem:** Configuration is not automatically downloaded.

**Solution:** Ensure you have followed the steps in Installing the Agent on page 3969 and Verify Agent Installation on page 3971. Consult the journal of the automatic configuration updater service by running:

```
journalctl -u unified-monitoring-agent_config_downloader.service
```

**Problem:** Configuration is not automatically reloaded.

**Solution:** Ensure you have followed the steps in Installing the Agent on page 3969 and Verify Agent Installation on page 3971. Consult the journal of all the units:

1. The timer unit must have run at least one time.
2. The automatic configuration download service must have run after the relevant time unit has triggered it. You can verify from its logs that the configuration has been downloaded and extracted to the Unified Monitoring Agent's configuration directory. You can also verify this by listing the files in that directory: `ls -lhatR /etc/unified-monitoring-agent`.
3. Verify that the path unit is active by checking its status: `systemctl status unified-monitoring-agent_restarter.path`.
4. Verify that a reload signal has been received by the Unified Monitoring Agent, by inspecting its journal: `journalctl -u unified-monitoring-agent_config_downloader.service | grep "Reloading unified-monitoring-agent"` appears in the output of this command.

**Problem:** You are testing your parsing pattern and need to force the agent to download the configuration right away.

**Solution:** Run the following command:

```
systemctl restart unified-monitoring-agent_config_downloader
```

**Note:**

Automatic update of the configuration on the agent side can take up to 30 minutes.

**Data Collection**

If you want to open a ticket so an engineer can help you with your problem regarding the Unified Monitoring Agent, include the output of the following commands. Super user privileges might be required for some of them.

```
yum info unified-monitoring-agent
rpm -ql unified-monitoring-agent | xargs sha512sum
systemctl status --full unified-monitoring-agent.service
systemctl status --full unified-monitoring-agent_config_downloader.service
systemctl status --full unified-monitoring-agent_config_downloader.timer
systemctl status --full unified-monitoring-agent_restarter.path
```
Logging

journalctl -a --no-pager -u unified-monitoring-agent.service
journalctl -a --no-pager -u unified-monitoring-agent_config_downloader.service
journalctl -a --no-pager -u unified-monitoring-agent_config_downloader.timer
journalctl -a --no-pager -u unified-monitoring-agent_restarter.path

For Ubuntu use a command like the following:

apt show unified-monitoring-agent
dpkg -L unified-monitoring-agent | xargs sha512sum

Also include an archive of the files under /var/log/unified-monitoring-agent/ and /var/log/oracle-cloud-agent/. You can create a gzipped tar archive of these directories with the command:

tar cvzf agent_logs_$(date +%s).tar.gz /var/log/unified-monitoring-agent/ /var/log/oracle-cloud-agent/

If the Unified Monitoring Agent is running but has erratic behavior, you can also include backtrace and memory profile information, by running the following command and including the files /tmp/sigdump-<integer>.log in your report (where <integer> is an integer with 1–6 digits, even though in rare cases it might have more than that).

ps aux | grep unified-monitoring-agent | grep ruby | awk '{print $2}' | xargs kill -SIGCONT

What this command does is to find the Unified Monitoring Agent process PIDs, and send them the SIGCONT signal, which causes a dump to be generated in /tmp/sigdump-<integer>.log.

Uninstall and Reinstall

You can remove the Unified Monitoring Agent, without removing the agent's configuration, by running the following command:

yum -y remove unified-monitoring-agent

For Ubuntu:

apt -y remove unified-monitoring-agent

The agent's configuration remains under the /etc/unified-monitoring-agent/ directory. If you do not want to keep the configuration for a future (re)installation of the Unified Monitoring Agent package, you need to remove it manually:

# use the following command to print the contents of the agent's configuration directory
find /etc/unified-monitoring-agent/
# use the following command to remove the directory and all of its contents (this step cannot be undone)
rm -rf /etc/unified-monitoring-agent/

The agent is automatically reinstalled by the Oracle Cloud Agent, at most 25 minutes. You need to have monitoring enabled for your instance in the Console for this to occur. See Managing Plugins with Oracle Cloud Agent on page 1205 for more information.

Windows

Unified Monitoring Agent Troubleshooting Steps

Check the service status:
1. The agent runs as part of a Windows service, to see its status, open the start menu and type Services.msc and open it. Go to the service **Oracle Cloud Unified Monitoring Service** to see the status.

2. Right-click the service and select **Properties** for more information. Start/stop/restart are available here.

3. From the **Start** menu type cmd, right-click on **Command Prompt** and select **Run as Administrator**. Run the following commands:

   - To view Unified Monitoring Agent service status:
     ```
     sc query unified-monitoring-agent
     ```

   - Restart the Unified Monitoring Agent service:
     ```
     sc stop unified-monitoring-agent
     sc start unified-monitoring-agent
     ```

     **Note:**
     The preceding commands do not work in PowerShell, so you must instead use the Windows Command Prompt.

**Find Windows Service errors:**

1. From the **Start** menu, type **Event Viewer** and select it.

2. Open **Windows Logs**, then **System**. Every time a service starts or stops, fails to do either, or crashes suddenly, it is recorded here.

   **Note:**
   On most Windows machines, there is a cap on how many events can be in the event viewer. As a result, if an event happened a long time ago, the logs might not be available.

**Fluentd logs:**

1. Open explorer.exe (file icon on the task bar)

2. Go to C:\oracle_unified_agent.

3. If there is only one file, it means that there isn’t a valid configuration file on the machine.

4. If there are two files, then there is a **supervisor** log that will have all the setup/start-up logs, and a **worker** log with all the parsing/output logs. unified-monitoring-agent.conf is the name of the configuration file if it has been downloaded properly.

5. Run Fluentd manually. Try the preceding steps to identify the issue, but if needed, you can debug an issue by manually running Fluentd.

   **Note:**
   Running Fluentd manually runs it in the Windows service, which stops the service from running as normally, which is different behavior than on Linux.

6. Use the following command to run Fluentd manually. This can be run in PowerShell or Command Prompt, but it needs to be run as Administrator:

   ```
   C:\oracle_unified_agent\unified-monitoring-agent\embedded\bin\fluentd -c C:\oracle_unified_agent\unified-monitoring-agent.conf -vv
   ```

**Automatic Configuration Updater Troubleshooting Steps**

1. Verify Task Scheduler is running as expected.

2. From the **Start** menu, and type **Task Scheduler**.

3. Go to **Task Scheduler (Local)**, then **Task Scheduler Library**. Find the task named **UnifiedAgentConfigUpdater**.
4. **Verify the Last Run Time.** If it was at an invalid date, or it says *not run*, then the Next Run time will be when it should run for the first time. For debugging, select the task and select **Run** if you need it to run immediately.

5. **Last Run Result** specifies the outcome of downloading the configuration from the control plane. If there is an error result, you need to run it manually to determine what happened. Task Scheduler does not keep output logs.

6. Run the configuration updater manually.

   **Note:**
   Run the updater in PowerShell as an Administrator for the best experience.

   ```
   C:\oracle_unified_agent\unified-monitoring-agent\embedded\bin\ruby.exe
   C:\oracle_unified_agent\unified-monitoring-agent\embedded\lib\ruby\gems
   \2.6.0\gems\fluent-public-config-updater*\lib\fluent_config_updater.rb -c
   C:\oracle_unified_agent -b 10
   ```

**Oracle Cloud Agent Troubleshooting Steps**

Check the Oracle Cloud Agent logs. For Windows Server 2012r2 or 2016, the log file locations are:

- `C:\Users\OCA\AppData\Local\Local\OracleCloudAgent\agent.log`
- `C:\Users\OCAUM\AppData\Local\OracleCloudAgent\plugins\unifiedmonitoring\unifiedmonitoring.log` (runtime logs)
- `C:\Users\OCAUM\AppData\Local\OracleCloudAgent\plugins\unifiedmonitoring\unifiedmonitoring_msi.log` (install logs)
- `C:\oracle_unified_agent\unified-monitoring-agent-0.log` (agent worker log, which might not exist depending on state)
- `C:\oracle_unified_agent\unified-monitoring-agent-supervisor-0.log` (agent supervisor log, which might not exist depending on state)

**Windows Server 2019 log file locations:**

- `C:\Windows\ServiceProfiles\OCA\AppData\Local\OracleCloudAgent\agent.log`
- `C:\Windows\ServiceProfiles\OCAUM\AppData\Local\OracleCloudAgent\plugins\unifiedmonitoring\unifiedmonitoring.log` (runtime logs)
- `C:\Windows\ServiceProfiles\OCAUM\AppData\Local\OracleCloudAgent\plugins\unifiedmonitoring\unifiedmonitoring_msi.log` (install logs)
- `C:\oracle_unified_agent\unified-monitoring-agent-0.log` (agent worker log, which might not exist depending on state)
- `C:\oracle_unified_agent\unified-monitoring-agent-supervisor-0.log` (agent supervisor log, which may not exist depending on state)

**Intermittent Failed MSI Install**

An intermittent failed MSI install can occur for one of two reasons:

1. An MSI installation was interrupted (system reboot, process stop, and so on), and on the second run, the msiexec.exe process is still holding a file handle to a folder that it created.
2. During an upgrade where the MSI fails to get access to the main agent folder, because Ruby.exe doesn’t end like it should (a Fluentd issue). This causes the MSI to fail and to clean up the system, removing much of the agent (not the position or buffer files though).

In both instances, a second install or letting Oracle Cloud Agent run through the install a second time resolves this issue. If it still is stuck in this state do the following:

1. Stop all msiexec and ruby processes in Task Manager, Details.
2. Rename `C:\oracle_unified_agent` to `C:\oracle_unified_agent_old`.
3. Install the agent again, or wait for Oracle Cloud Agent to install it.
Using the API

For information about using the API and signing requests, see REST APIs on page 6275 and Security Credentials on page 205. For information about SDKs, see Software Development Kits and Command Line Interface on page 6094.

Use the following operation to ingest custom logs directly:

- **PutLogs**

The following is a sample log entry payload that can be used with **PutLogs**:

```json
{
    "specversion": "1.0",
    "logEntryBatches": [
        {
            "entries": [
                {
                    "data": "Random test",
                    "id": "sha123",
                    "time": "2020-11-25T21:10:29.600Z"
                }
            ],
            "source": "hostname",
            "type": "sampleType",
            "subject": "/var/application.log",
            "defaultlogentrytime": "2020-11-25T21:10:29.600Z"
        }
    ]
}
```

Searching Logs

This topic describes how to search your logs using the **Search** page.

Overview of Log Search

Logging provides a powerful tool to search indexed logs. Use the Console to perform any of the following tasks:

- Search logs, whether in a basic user interface mode, or by typing custom queries in an advanced mode.
- Filter on values in logs, whether by log fields, text search, or time intervals, all in terms of chosen compartments or log groups.
- Visualize log data in a bar chart view, along with accompanying tabular data.
- Explore each log line in more detail. View the raw JSON payload, and view before/after information.
- Export search results to a JSON file.

Logs are indexed by default, which allows them to be searched using the Console.

**Note:**

For logs to be available and to be searchable from a certain time frame, they must first be enabled, and you can only search for logs after they start ingesting.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be granted security access in a **policy** by an administrator. This access is required whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you get a message that you don’t have permission or are unauthorized, verify with your administrator what type of access you have and which **compartment** to work in.

**Administrators:** For specific examples of policy, see Required Permissions for Searching Logs on page 3984.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to know more about writing policies for Logging, see Details for Logging.
**Required Permissions for Searching Logs**

To search indexed logs, a user must have the *read* permission on the log content and *read* access to the log group.

```plaintext
allow group GroupA to read log-groups in tenancy
allow group GroupA to read log-content in tenancy
```

To search indexed logs, you must have access to the log group that contains the indexed logs. For more information, see **Required Permissions for Working with Logs and Log Groups** on page 3912.

To view and search Audit Logs on page 3965, you must also have the corresponding Audit-related permissions. See **Details for the Audit Service** for more information. For example:

- search "compartment" requires AUDIT_EVENT_READ, and if there are any log objects, it would also require LOG_CONTENT_READ
- search "compartment/_Audit" requires just AUDIT_EVENT_READ.
- search "compartmentOcid/logGroupNameOrOcid/logNameOrOcid" requires LOG_CONTENT_READ only.
- search "compartmentOcid1/_Audit" "compartmentOcid2/logGroupNameOrOcid/ logNameOrOcid" requires LOG_CONTENT_READ on logGroupNameOrOcid and AUDIT_EVENT_READ on compartmentOcid1.

**Using the Console**

You can perform log searches by using either the **Basic mode** filter controls in the interface, or the **Advanced mode** custom query language interface. See **Basic Search Queries** on page 3984 and **Advanced Search Queries** on page 3985 for more information.

**Note:**

Only a 14-day range is available when performing log search queries.

**Basic Search Queries**

To search and filter logs:

1. Open the navigation menu and click **Observability & Management**. Under **Logging**, click **Search**.
2. In **Custom filters**, you can start typing to automatically display filter settings, along with operators. For example, entering `compartment` displays filters starting with that letter. Use the up or down arrow keys to select from the list, or continue typing to enter what you want to filter on. For example, `data.compartmentName='<tenancy_name>'`.
3. In **Select logs to search**, the root compartment is already selected by default for filtering. Click this field to open the **Select Logs to Search** panel, where you can filter by compartments you have permission to work in, in addition to filtering by Log Groups and Logs. You can filter by multiple compartments and log groups. For any filters you create in this panel that you want to remove, click the filter `X` icon in the **Select Logs to Search** field.
4. The log data in the **Explore** and **Visualize** tabs is reloaded according to your filter settings, or you can click **Search** to apply the filter.

**Note:**

Since the **Search** page automatically refreshes after applying filters and selecting logs, you do not need to click the **Search** button as you select different filters. You will, however, need to click **Search** again after some time has passed and new logs have appeared. When performing Advanced Mode queries however, you do need to always click this button to submit a query.

**Note:**

Filter settings are maintained when switching to **Advanced Mode**.

To remove a filter(s) from the **Search** page, under **Filters**, click the `X` icon next to the filter.
To search with Quick Start Queries

You can quickly search according to several predetermined queries. From Quick Start Queries, select a query from the list. The Search page displays the results for the chosen query.

To limit results to a specific time range

In Filter By Time, select a time range from the list, or select Custom to specify a date range in the calendar Start Date and End Date. You can also specify a time value in the box next to the calendar. Use an end time to refine the time window.

Didn't get the result you expected?

Try specifying a time range:

- Under Filter by time, select a predetermined time range or specify a custom date range. Use an end time to refine the time window.

Advanced Search Queries

When performing a search on the Logging Search page, you can click Show Advanced Mode to enter your own custom log search queries. In addition, Advanced Mode searching provides more comprehensive search options that are not available in Basic Mode.

Be default, the following is displayed in the Query field after clicking Show Advanced Mode:

```
search "ocid1.tenancy.oc1..<unique_id>" | sort by datetime desc
```

For example, you can modify this default search by entering:

```
search "ocid1.tenancy.oc1..<unique_id>" | sort by datetime desc
| summarize count() as cnt by rounddown(datetime, '15m') as interval
```

This returns (“interval”: 1600364700000,”cnt”: 31) and (“interval”: 1600365600000,”cnt”: 220) under Log Data in the Explore tab.

When entering search queries, auto-complete hints are providing as you type (which you can select from a pop-up menu as you type), and syntax validation is performed in real time in the background as you type a query.

Note:

When you switch from Advanced Mode to Basic Mode, the query is lost and is not available in Basic Mode. A warning is displayed for this scenario to confirm your preference.

The Advanced Mode search uses a specific syntax, using the Logging query language, which is described in Logging Query Language Specification on page 3994.

To search with Quick Start Queries

You can quickly search according to several predetermined queries. From Quick Start Queries, select a query from the list. The Search page displays the results for the chosen query.

Saved Searches

You can save the search parameters that you use for any searches performed in both Basic Mode and Advanced Mode.

To save a search:

1. Open the navigation menu and click Observability & Management. Under Logging, click Saved Searches.
2. Under List Scope, Compartment, choose a compartment you have permission to work in. The Saved Searches page is displayed.
3. You can start the save operation using one of these two methods:
   • From the Saved Searches page, click New Search, which opens the Logging Search page, where you can begin a search.
   • From the Search page directly, whether in Basic Mode and Advanced Mode.
4. Apply filter and search settings as described in Basic Search Queries on page 3984 and Advanced Search Queries on page 3985.
5. Click Save Search. The New Saved Search panel is displayed.
6. In Search Name, enter a name to associate with your saved search. Avoid entering confidential information.
7. In Compartment, select a compartment you have permissions to work in.
8. In Description, enter a description for the saved search.
9. Click Save Search to save your search.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Search Query field cannot be edited and is view-only. It only displays the contents of your search parameters.</td>
</tr>
</tbody>
</table>

10. The search is saved and a message appears with the linked name of your saved search. Clicking the linked saved search name opens the details page for the saved search, where you can view more information about it. This page displays the following on the Saved Search Information tab:
   • OCID
   • Region
   • Compartment
   • Description
   • Created: date and time in UTC format.
   • Last Modified: date and time in UTC format.
   • Search Query: view-only description of the search parameters in the saved search.
   • The Tags tab shows associated tags for this log.
   • Under Latest Results, log data is displayed under Saved Search Data, in a similar manner as the Log Data on the Search page. You can apply some simple filters, such as sorting by newest or oldest from the Sort field, or filtering by time from the corresponding Filter by Time field.

11. Click Explore with Log Search, which allows you to view this saved search on the Search page directly. After clicking this link, the Search page opens with the saved search loaded, whether it is a basic or advanced mode search. At this point, you can perform more analysis and investigation related to this search directly on the Search page. For more information, see Searching Logs on page 3983.

While on the Search page, you can also switch between any of the saved searches by selecting them from the Saved Searches list.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>When editing a saved search from the Saved Searches page, you can only change the Search Name, Compartment, and Description fields in the Edit Saved Search panel. If you need to change the search parameters, create a new saved search.</td>
</tr>
</tbody>
</table>

Viewing and Working with Search Results

After you get an initial set of results, you can view more details, whether in terms of the log fields, JSON, or before and after states, and visually as a chart. On the Explore tab under Log Data, a Number of Log Events Per Minute bar graph displays the number of log events, according to your filter settings.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You will need to click Click Enter to search after time has passed, to see the latest logs.</td>
</tr>
</tbody>
</table>
Logging

Note:
For any actions taken on the Explore and Visualize tabs, you can define how often to refresh the data on the Search page, by selecting a value from the Autorefresh list (choose from OFF, 5 Minutes, or 15 Minutes). The default is OFF.

To examine a single log entry
• In the Explore tab under Log Data, click the down arrow (▼) to expand the log entry in JSON view.

      The JSON view is displayed. In JSON view you can view the log data fields and values, collapse and expand nodes, or click the copy icon to copy the log entry to the clipboard.

To switch between JSON and Before & After view
• In the Explore tab under Log Data, click the down arrow (▼) to expand the log entry and click JSON.

      The JSON view is displayed. Click the Before & After tab to switch to its view.

To examine Before & After view
• In the Explore tab under Log Data, click the down arrow (▼) to expand the log entry and click Before & After.

      The Before & After view is displayed. In contrast to the entry labeled as Current, this view displays the exact preceding and successive logging lines in the log object.

Right-click to view more log options
• In the Explore tab, each entry has three interactive header columns, which correspond to: the log time stamp, the plugin where the log occurred, and the log message.

      Right-click one of the log entry columns to open a context-sensitive menu for that entry and the column header.

      These options are available whether the log entry is collapsed or expanded. The following right-click options are available:

      • Copy value

Note:
This is the only option available for the third column's right-click menu.

• Filter matching
• Filter not matching
• Remove from summary view

To export log data
At the top-left portion of Log Data, click Export Log Data (JSON). This feature allows you to export the log data to a JSON file that you can save to your system.

To visualize log data as a chart
You can view log data graphically as a chart, along with accompanying tabular data.

Select from the following chart settings:
• **Visualization Type:** Select Bar. The Bar charts are organized in terms of time (UTC) on the X-axis, with time on the Y-axis. You can hover the mouse over bars when stacked bars appear, which displays the number of log records in a tool tip.

• **Interval:** Select from 1 minute (the default), 5 minutes, 15 minutes, 30 minutes, or 1 hour.

• **Group By:** Select a logging field to group the results by.

      For any chart type being viewed, you can click to expand the `<number of> records found` list below the chart, which lists the total record sum, and the number of records at each time interval.
Using the Command Line Interface (CLI)

For more information on installing the CLI, see Quickstart on page 6062, and logging-search for command documentation.

Submit a query to search logs

```
oci logging-search search-logs --search-query, --time-end, --time-start
```

To search within a compartment

```
oci logging-search search-logs --search-query 'search "ocid1.tenancy.oc1..<unique_ID>"' --time-start 2021-06-22T00:30:00Z --time-end 2021-06-22T00:35:00Z
```

Using the API

For information about using the API and signing requests, see REST APIs on page 6275 and Security Credentials on page 205. For information about SDKs, see Software Development Kits and Command Line Interface on page 6094.

Use the following operation to search logs:

- **SearchLogs**

Use the following for saved searches:

- **LogSavedSearch**

SearchLogs SDK Examples

See the following SearchLogs SDK examples for:

- Java
- Python
- Go
- TypeScript
- .NET C#
- Ruby

Java example:

```java
/** To make this code sample work in your Oracle Cloud tenancy, please replace the values for the following placeholders:
<compartment_OCID> - the ocid of your compartment where the logs are stored;
<log_group_OCID> - the ocid of your log group under the above compartment;
<log_OCID> - the ocid of your log object under the above log group. */

import com.oracle.bmc.ConfigFileReader;
import com.oracle.bmc.auth.AuthenticationDetailsProvider;
import com.oracle.bmc.auth.ConfigFileAuthenticationDetailsProvider;
import com.oracle.bmc.loggingsearch.LogSearchClient;
import com.oracle.bmc.loggingsearch.model.*;
import com.oracle.bmc.loggingsearch.requests.*;
import com.oracle.bmc.loggingsearch.responses.*;
import java.math.BigDecimal;
import java.util.ArrayList;
import java.util.HashMap;
import java.util.Date;
import java.util.Arrays;
```
public class SearchLogsExample {
    public static void main(String[] args) throws Exception {
        /**
         * Create a default authentication provider that uses the DEFAULT
         * profile in the configuration file.
         * Refer to <see href="https://docs.cloud.oracle.com/en-us/iaas/
         * Content/API/Concepts/sdkconfig.htm#SDK_and_CLI_Configuration_File>the public
         * documentation</see> on how to prepare a configuration file.
         */
        final ConfigFileReader.ConfigFile configFile =
                ConfigFileReader.parseDefault();
        final AuthenticationDetailsProvider provider = new
                ConfigFileAuthenticationDetailsProvider(configFile);

        /* Create a service client */
        LogSearchClient client = new LogSearchClient(provider);

        /* Create a request and dependent object(s). */
        SearchLogsDetails searchLogsDetails = SearchLogsDetails.builder()
                .timeStart(new Date("Mon May 10 01:02:29 UTC 2021"))
                .timeEnd(new Date("Mon May 10 02:02:29 UTC 2021"))
                .searchQuery("search "$<compartment_OCID>/<log_group_OCID>/
                        <log_OCID>" | where level = 'INFO')
                .isReturnFieldInfo(false).build();
        SearchLogsRequest searchLogsRequest = SearchLogsRequest.builder()
                .searchLogsDetails(searchLogsDetails)
                .opcRequestId("RIJJ87OXLQBMPBRN6ZWO/OpcRequestIdExample/
                        UniqueRequestId")
                .limit(10).build();

        /* Send request to the Client */
        SearchLogsResponse response = client.searchLogs(searchLogsRequest);

        System.out.println("opc-request-id: " + response.getOpcRequestId());
        System.out.println("Got results: " +
                response.getSearchResponse().getResults().stream().count());
    }
}

Python example:

# To make this code sample work in your Oracle Cloud tenancy,
# please replace the values for the following placeholders:
# <compartment_OCID> - the ocid of your compartment where the logs are
# stored;
# <log_group_OCID> - the ocid of your log group under the above compartment;
# <log_OCID> - the ocid of your log object under the above log group.

from datetime import datetime
import oci

# Create a default config using DEFAULT profile in default location
# Refer to
# https://docs.cloud.oracle.com/en-us/iaas/Content/API/Concepts/sdkconfig.htm#SDK_and_CLI_Configuration_File
# for more info
config = oci.config.from_file()

# Initialize service client with default config file
loggingsearch_client = oci.loggingsearch.LogSearchClient(config)
# Send the request to service, some parameters are not required, see API doc for more info

```go
send_logs_request = loggingsearch_client.search_logs(
    search_logs_details=oci.loggingsearch.models.SearchLogsDetails(
        time_start=datetime.strptime("2021-05-10T01:02:29.600Z", "%Y-%m-%dT%H:%M:%S.%fZ"),
        time_end=datetime.strptime("2021-05-10T02:02:29.600Z", "%Y-%m-%dT%H:%M:%S.%fZ"),
        search_query="search "<compartment_OCID>/<log_group_OCID>/<log_OCID>" | where level = 'INFO'",
        is_return_field_info=False,
    ),
    opc_request_id="RIJJ870XLBMPFRN6ZWO/OpcRequestIdExample/UniqueRequestId",
    limit=10,
)

# Get the data from response
print(send_logs_response.data)
```

**Go example:**

```go
// To make this code sample work in your Oracle Cloud tenancy,
// please replace the values for the following placeholders:
// <compartment_OCID> - the ocid of your compartment where the logs are stored;
// <log_group_OCID> - the ocid of your log group under the above compartment;
// <log_OCID> - the ocid of your log object under the above log group.

package main

import {
    "context"
    "fmt"
    "time"

    "github.com/oracle/oci-go-sdk/common"
    "github.com/oracle/oci-go-sdk/example/helpers"
    "github.com/oracle/oci-go-sdk/loggingsearch"
}

func main() {
    // Create a default authentication provider that uses the DEFAULT profile in the configuration file.
    // Refer to <see href="https://docs.cloud.oracle.com/en-us/iaas/Content/API/Concepts/sdkconfig.htm#SDK_and_CLI_Configuration_File">the public documentation</see> on how to prepare a configuration file.
    client, err := loggingsearch.NewLogSearchClientWithConfigurationProvider(common.DefaultConfigProvider().helpers.FatalIfError(err)

    // Create a request and dependent object(s).
    start, _ := time.Parse(time.RFC3339, "2021-05-10T01:02:29.600Z")
    end, _ := time.Parse(time.RFC3339, "2021-05-10T02:02:29.600Z")
```
req := loggingsearch.SearchLogsRequest{OpcRequestId: common.String("RIJJ870XLQBMPBRN6ZWO/OpcRequestIdExample/UniqueRequestId"),

            {
                TimeStart = DateTime.Parse("05/10/2021 01:02:29"),
                TimeEnd = DateTime.Parse("05/10/2021 02:02:29"),
                SearchQuery = "search "<compartment_OCID>/<log_group_OCID>/"
                <log_OCID>" | where level = 'INFO'",
                IsReturnedFieldInfo = false
            };
            var searchLogsRequest = new
            Oci.LoggingsearchService.Requests.SearchLogsRequest
            {
                SearchLogsDetails = searchLogsDetails,
                OpcRequestId = "RIJJ87OXLQBMPBRN6ZWO/OpcRequestIdExample/
                UniqueRequestId",
                Limit = 10
            };

            // Create a default authentication provider that uses the
            DEFAULT
            // profile in the configuration file.
            // Refer to <see href="https://docs.cloud.oracle.com/en-us/iaas/
            Content/API/Concepts/sdkconfig.htm#SDK_and_CLI_Configuration_File>the public
documentation</see> on how to prepare a configuration file.
            var provider = new
            ConfigFileAuthenticationDetailsProvider("DEFAULT");
            try
            {
                // Try to send the request.
                var searchLogsResponse = await client.searchLogs(searchLogsRequest);
                // Log the response.
                console.log("opc-request-id: " + searchLogsResponse.opcRequestId);
                console.log("Got results: " + searchLogsResponse.searchResponse.results.length);
            }
            catch (error) {
                console.log("searchLogs Failed with error " + error);
            }
        }
    }
}
{  // Create a service client and send the request.
    using (var client = new LogSearchClient(provider, new
        ClientConfiguration()))
    {
        var response = await
            client.SearchLogs(searchLogsRequest);
        // Retrieve value from the response.
        var resultsValue = response.SearchResponse.Results;
        Console.WriteLine("opc-request-id: " +
            response.OpcRequestId);
        Console.WriteLine("Got results: " +
            response.SearchResponse.Results.Count);
    }
    catch (Exception e)
    {
        Console.WriteLine("SearchLogs Failed with {e.Message}");
        throw e;
    }
}

Ruby example:

```ruby
# To make this code sample work in your Oracle Cloud tenancy,
# please replace the values for the following placeholders:
# <compartment_OCID> - the ocid of your compartment where the logs are
# stored;
# <log_group_OCID> - the ocid of your log group under the above compartment;
# <log_OCID> - the ocid of your log object under the above log group.

require 'oci'
require 'date'

# Create a default config using DEFAULT profile in default location
# Refer to https://docs.cloud.oracle.com/en-us/iaas/Content/API/Concepts/
# sdkconfig.htm#SDK_and_CLI_Configuration_File for more info
config = OCI::ConfigFileLoader.load_config

# Initialize service client with default config file
loggingsearch_client = OCI::Loggingsearch::LogSearchClient.new(config: config)

# Send the request to service, some parameters are not required, see API doc
# for more info
search_logs_response =
    loggingsearch_client.search_logs(
        OCI::Loggingsearch::Models::SearchLogsDetails.new(
            time_start:
                DateTime.strptime('2021-05-10T01:02:29Z', '%Y-%m-%dT%H:%M:%SZ'),
            time_end:
                DateTime.strptime('2021-05-10T02:02:29Z', '%Y-%m-%dT%H:%M:%SZ'),
            search_query: 'search "<compartment_OCID>/<log_group_OCID>/<log_OCID>"
                         | where level = '"INFO"',
                         is_return_field_info: false
        ),
        opc_request_id: 'RIJJ87OXLQMPBRN6ZWO/OpcRequestIdExample/
```

Oracle Cloud Infrastructure User Guide 3993
Logging

```ruby
limit: 10
)

# Get the data from response
puts "#{search_logs_response.data}"
```

Logging Query Language Specification

This topic describes the query syntax components that can be used with Advanced Search Queries on page 3985 and Saved Searches on page 3985.

Query Components

The logging query language processing is based on a data flow model. Each query can reference one or more logs, and produces a table dataset as a result. The query language provides several operators for searching, filtering, and aggregating structured and unstructured logs.

A logging query includes the following components:

- **Log streams**
- **Fields**
- **Data types**
- **Stream expressions**
- **Pipe expressions**
- **Operators**

Log Streams

To begin your search, you must first define the set of logs you want to search. You can choose to search specific log objects, log groups, or compartments. You can mix and match as many logs as you need. The search scope is defined using the following pattern:

```
search <log_stream> (,? <log_stream>)*
```

The query language fetches log entries from the scope you provide, and constructs a log stream that you can filter, aggregate, and visualize.

Log stream:

```
<log_stream> ::= "<compartment_ocid> ( /<log_goup_ocid> ( /<log_object_ocid> )? )?"
```

Examples:

```
search "compartmentOcid/logGroupNameOrOcid/logNameOrOcid"

search "compartmentOcid/logGroupNameOrOcid"

search "compartmentOcid"

search "compartmentOcid/logGroupNameOrOcid/logNameOrOcid", "compartmentOcid_2/logGroupNameOrOcid_2", "compartmentOcid_3"
```
Logging

Fields
All fields in log streams are case-sensitive. Although actual logs have indexed fields in lower case only, you can also create new fields in the query with mixed case:

```
search "..."
   | select event as EventName
```

Fields are in JSON notation, therefore, special characters must be in quotes.

```
Fields: <field_name> := <identifier> (DOT <identifier>)*
```

For Identifier:

```
<identifier> := a-zA-Z[a-zA-Z_0-9] | ("" (~"" | """")* ")"
```

Examples:
- type
- data.message
- data.request.URL
- "type"
- "data".message"
- "data.message" (not the same as "data".message"
- data."$event"
- data."first name"
- data."an example of escaped ("" double quotes"

Data Types
The following key data types are supported by the query language. These are (long and double) 8 bytes.

For details about the representation of the values of the corresponding types, see Literals on page 4001.

- Strings
- Numbers (integer, float-point)
- Arrays
- Booleans
- Timestamps
- Intervals

Stream Expressions
All expressions which produce a stream are stream expressions. Stream expressions can be formed using the following operators:

- Tabular operators
- Aggregate operators

Pipe Expressions
A pipe (|) applies an operator on the left side to a stream expression on the right side. The pipe expression is a stream expression.

The operator on the right side of a pipe must consume only one stream (for example, aggregate operations, filters).
Logging

The left side becomes the "current stream" for the right side expression, making all fields in the current stream available according to short names. For example:

```ruby
search "application"  
  | where level = 'ERROR'

>>
{"timestamp": "2019-01-03T00:04:01", "level":"ERROR", "host":"host1",  
  "message":"download failed...", "impact":2}
{"timestamp": "2019-01-03T00:06:39", "level":"ERROR", "host":"host2",  
  "message":"reached 90% file size limit...", "impact":4}
{"timestamp": "2019-01-03T00:06:59", "level":"ERROR", "host":"host2",  
  "message":"reached 95% file size limit...", "impact":5}
```

Operators

The following are supported when performing advanced queries:

- Tabular operators
- Scalar operators
- Aggregate operators

Tabular Operators

A tabular operator creates or modifies a log stream by filtering out or changing log entries. Also refer to BNF syntax notation. The following are tabular operators:

- `search`
- `where`
- `top`
- `sort`
- `dedup`
- `select`
- `extend`

**search**

Constructs a log stream from actual log objects. Also see Log Streams on page 3994 for details, and Using the Command Line Interface (CLI) on page 3988 for additional examples.

```
search "compartmentOCID/loggroup1/logname1" "compartmentOCID/loggroup2/logname2" "compartmentOCID/loggroup3/logname3"
```

**where**

Filters the current log stream using a Boolean expression.

```
search "application"  
  | where level = 'ERROR'

>>
{"timestamp": "2019-01-03T00:04:01", "level":"ERROR", "host":"host1",  
  "message":"download failed...", "impact":2}
{"timestamp": "2019-01-03T00:06:39", "level":"ERROR", "host":"host2",  
  "message":"reached 90% file size limit...", "impact":4}
{"timestamp": "2019-01-03T00:06:59", "level":"ERROR", "host":"host2",  
  "message":"reached 95% file size limit...", "impact":5}
```

where is optional:

```
search "application"
```
Logging

| level = 'ERROR'

Some example comparisons with numbers and Boolean field comparisons are the following:

| data.statusCode = 200
| data.isPar

You can perform a full text search by specifying a filter on the entire content of the log. A search on logContent returns any log line where a value matches your string. This functionality supports wildcards. For example:

search "application"  
  | where logContent = 'ERROR' -- returns log lines with a value matching "ERROR"

search "application"  
  | where logContent = '*ERROR*' -- returns log lines with a value containing "ERROR"

**top**

Fetches only a specified number of rows from the current log stream, sorted based on some expression.

<top> := top [0-9]+ by <expr>

Examples:
- top 3 by datetime
- top 3 by *
- top 3 by (a + b)

A number of rows must be a constant positive integer, and a sorting expression must be provided.

search "application"  
  | top 3 by impact

> >>

{"timestamp": "2019-01-03T00:06:59", "level":"ERROR", "host":"host2",  
"message":"reached 95% file size limit... ", "impact":5}
{"timestamp": "2019-01-03T00:06:39", "level":"ERROR", "host":"host2",  
"message":"reached 90% file size limit... ", "impact":4}
{"timestamp": "2019-01-03T00:04:01", "level":"ERROR", "host":"host1",  
"message":"download failed...", "impact":2}

**sort**

Sorts the current log stream by the specified columns, in either ascending (default) or descending order. The operator uses the "DESC" and "ASC" keywords to specify the type of the order. The default sort order is asc.

<sort> := sort by <sort_expr> (, <sort_expr>)*  
<sort_expr> := <expr> (asc | desc)?

Example:

search "application"  
  | sort by impact desc

> >>

{"timestamp": "2019-01-03T00:06:59", "level":"ERROR", "host":"host2",  
"message":"reached 95% file size limit... ", "impact":5}
{"timestamp": "2019-01-03T00:06:39", "level":"ERROR", "host":"host2",  
"message":"reached 90% file size limit... ", "impact":4}
More than one column can be used to specify the order:

```plaintext
search "application"  
| sort by host, impact desc  
>>
```

Examples:

```plaintext
search "application"  
| dedup host  
>>
```

```plaintext
search "application"  
| dedup host, impact  
```
<select_expr> := ( * | <expr> (as <identifier>)? )

Example:

```
search "application"
   | select level, host, impact+10 as impact, timestamp
>>
{"level":"ERROR", "host":"host1", "impact": 12, "timestamp": "2019-01-03T00:04:01"}
{"level":"INFO", "host":"host1", "timestamp": "2019-03T00:04:05"}
{"level":"WARNING", "host":"host2", "impact": 11, "timestamp": "2019-01-03T00:05:33"}
{"level":"ERROR", "host":"host2", "impact": 14, "timestamp": "2019-01-03T00:06:39"}
{"level":"ERROR", "host":"host2", "impact": 15, "timestamp": "2019-01-03T00:06:59"}
{"level":"INFO", "host":"host2", "timestamp": "2019-01-03T00:06:59"}
```

### extend

Extends the current log stream with a computed column.

<extend> := extend <expr> (as <identifier>)?

Example:

```
search "application"
   | extend concat(host, 'us.oracle.com') as fqn
>>
{"timestamp": "2019-01-03T00:04:01", "level":"ERROR", "host":"host1",
 "message":"download failed...", "impact":2, "fqn": "host1.us.oracle.com"}
{"timestamp": "2019-01-03T00:04:05", "level":"INFO", "host":"host1",
 "message":"host list updated...", "fqn": "host1.us.oracle.com"}
{"timestamp": "2019-01-03T00:05:33", "level":"WARNING", "host":"host2",
 "message":"reached 70% file size limit...", "impact":1, "fqn":
 "host2.us.oracle.com"}
{"timestamp": "2019-01-03T00:06:39", "level":"ERROR", "host":"host2",
 "message":"reached 90% file size limit...", "impact":4, "fqn":
 "host2.us.oracle.com"}
{"timestamp": "2019-01-03T00:06:59", "level":"ERROR", "host":"host2",
 "message":"reached 95% file size limit...", "impact":5, "fqn":
 "host2.us.oracle.com"}
{"timestamp": "2019-01-03T00:06:59", "level":"INFO", "host":"host2",
 "message":"fs clean up started...", "fqn": "host2.us.oracle.com"}
```

### Scalar Operators

Scalar operators are applicable to individual values.

Arithmetic operations are the following:

- +
- -
- *
- /

Boolean operators are the following:

- and
- or

Unary operator:
• \( -(\text{<expr>}) \)

Comparison operators are the following (numeric expressions only):

• \( \text{<expr>} > \text{<expr>} \)
• \( \text{<expr>} >= \text{<expr>} \)
• \( \text{<expr>} <= \text{<expr>} \)
• \( \text{<expr>} < \text{<expr>} \)
• \( \text{<expr>} = \text{<expr>} \)
• \( \text{<expr>} != \text{<expr>} \)

String comparison:

• \( \text{<expr>} = \text{<expr>} \)

Functions:

• \( \text{not (\text{<expr>})} \)
• \( \text{contains_ci/contains_cs (\text{<expr>}, \text{<expr>}, (\text{true} | \text{false}))} \)

  The last parameter is case-sensitive.
• \( \text{rounddown (\text{<expr>}, '[0-9]+(d | h | m | s)')} \)

  The last parameter is the time interval in days, hours, minutes, or seconds.
• \( \text{concat (\text{axpr}, \text{<expr>} }) \)
• \( \text{upper (\text{<expr>})} \)
• \( \text{lower (\text{<expr>})} \)
• \( \text{substr (\text{<expr>}, [0-9]+ (, [0-9]+)?} \)

  The second argument is the start index, while the third argument is optional, namely, how many characters to take.
• \( \text{isnull (\text{<expr>})} \)
• \( \text{isnotnull (\text{<expr>})} \)

Aggregate Operators

\text{count}

Calculates a number of rows in the current log stream:

```
search "application"
 | count
 >>
{"count": 6}
```

\text{summarize}

Groups the current log stream by the specified columns and time interval, and aggregates using named expressions. If grouping columns are not specified, \text{summarize} aggregates over the whole stream.

```
search "application"
 | summarize count(impact) as impact by level, rounddown(datetime, '1m') as timestamp
```

Special Columns

\text{logContent}

\text{logContent} is a special column which represents the text of the whole original message. For example:

```
search "application"
 | where logContent = '*ERROR*' -- returns log lines with a value containing "ERROR"
```
Comments

Both single line and multi-line comments are supported, for example:

```sql
search "application"
    | count -- this is a single line comment

/* this is a
   multi-line
   comment */
```

Identifiers

Identifiers are the names of all available entities in the query. An identifier can reference a field in the current log stream, or a parameter defined in the beginning of the query. Identifiers have the following format:

```sql
name: \$?[a-zA-Z_][a-zA-Z_0-9]*
```

For example: `level`, `app_severity`, `$level`.

The quoted form allows special symbols in the names (except double quotes):

```sql
name: "[^"]+"
```

For example: "opc-request-id", "-level".

All parameter references start with a dollar sign ($), for example: `$level`.

Literals

<table>
<thead>
<tr>
<th>Type</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>'hello', 'world!'</td>
</tr>
<tr>
<td>wildcard pattern</td>
<td>&quot;acc-*&quot;</td>
</tr>
<tr>
<td>integer</td>
<td>-1, 0, +200</td>
</tr>
<tr>
<td>float</td>
<td>1.2, 0.0001, 1.2e10</td>
</tr>
<tr>
<td>array</td>
<td>[1,2,3,4], []</td>
</tr>
<tr>
<td>interval</td>
<td>3h, 2m</td>
</tr>
<tr>
<td>nullable</td>
<td>null</td>
</tr>
</tbody>
</table>

Functions

Scalar functions are the following:

- `isnull(expr1)`
- `concat(expr1, ...)`

Aggregate functions are the following:

- `sum(expr1)`
- `min(expr1)`
- `max(expr1)`
- `count()`: Counts a number of rows.
- `count(expr)`: Counts a number of non-null expr values.
System parameters

All parameters with the prefix "query." are reserved. The following parameters are supported:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query.from</td>
<td>String with date time in ISO 8601 format.</td>
<td>'2007-04-05T14:30'</td>
<td>Specifies starting time of the query window.</td>
</tr>
<tr>
<td>query.to</td>
<td>String with date time in ISO 8601.</td>
<td>'2007-04-05T14:30+05:00'</td>
<td>Specifies end time of the query window.</td>
</tr>
</tbody>
</table>
Chapter 32

Marketplace

This chapter explains how to work with listings in the Oracle Cloud Infrastructure Marketplace.

Marketplace

The Oracle Cloud Infrastructure Marketplace service provides an online store where you can find an image or a stack listing, and deploy a listing on an Oracle Compute instance.

Overview of Marketplace

Oracle Cloud Infrastructure Marketplace is an online store that offers solutions specifically for customers of Oracle Cloud Infrastructure. In the Oracle Cloud Infrastructure Marketplace catalog, you can find listings for two types of solutions from Oracle and trusted partners: images and stacks. These listing types include different categories of applications. Also, some listings are free and others require payment.

Images are templates of virtual hard drives that determine the operating system and software to run on an instance. You can deploy image listings on an Oracle Cloud Infrastructure Compute instance. Marketplace also offers stack listings. Stacks represent definitions of groups of Oracle Cloud Infrastructure resources that you can act on as a group. Each stack has a configuration consisting of one or more declarative configuration files. With an image or a stack, you have a customized, more streamlined way of getting started with a publisher's software.

Besides being an online store, Oracle Cloud Infrastructure Marketplace offers a way for members of the Oracle Cloud Infrastructure community to share custom images with other community members. You can take a custom image that you imported to Oracle Cloud Infrastructure Compute and make it available as a community application. The application appears alongside other images that users can choose from during the process of creating an instance.
Resource Identifiers

Most types of Oracle Cloud Infrastructure resources have a unique, Oracle-assigned identifier called an Oracle Cloud ID (OCID). For information about the OCID format and other ways to identify your resources, see Resource Identifiers on page 224.

While the resources created from Marketplace images and stacks have an OCID to identify them, the listings themselves have a listing ID and a package version ID for every package version in the listing. Listing IDs are numeric values. Package version IDs are string values. These identifiers are unique to Marketplace and unrelated to OCIDs.

Ways to Access Oracle Cloud Infrastructure

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface on page 6094.

To access the Console, you must use a supported browser.

Oracle Cloud Infrastructure supports the following browsers and versions:

- Google Chrome 69 or later
- Safari 12.1 or later
- Firefox 62 or later

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference on page 3298.

If you’re a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

For the actual policy statements required to perform tasks related to Marketplace, see the topic specific to the task.

Working with Listings

This topic describes how to work with listings in the Oracle Cloud Infrastructure Marketplace catalog. You can do the following:

- Search for listings to find what you want to deploy
- Filter listings to refine application results
- View a listing to learn about the product that it offers
- Launch an instance from an image listing
- Launch stack resources from a stack listing
- Download Terraform configuration files from stack listings to update deployed applications

By default, Marketplace displays all listings in its catalog. However, an individual's ability to see or launch particular listings varies by tenancy, according to what permissions the individual has, and the pricing model for the listing.

Listings are either image listings or stack listings. Image listings have a Launch Instance button. Stack listings have a Launch Stack button.

For information about pricing and how it affects whether you can see a listing, see Pricing for Listings on page 4006.
Pricing for Listings

Marketplace listings belong to one of several pricing models available to and set by the publisher when the publisher creates the listing. Pricing models include:

- **Free**: usage incurs no charge
- **BYOL**: usage relies on software licenses that you already own
- **Paid**: usage incurs charges based on hourly rates, either according to OCPU hours consumed or according to the number of instances (irrespective of OCPU hours consumed by each)

The listing price does not include any additional fees that you might incur for the use of infrastructure resources.

For a cloud account to access paid listings, it must have a United States mailing address and the form of payment provided when the account was created must support payment in United States dollars. United States-based customers can deploy most paid listings in any commercial region data center, but some paid listings can only be deployed in United States commercial regions. These listings have a region restriction label that marks them as **US-only**.

Customers in US Government Cloud realms can see all paid listings from Oracle and third-party publishers. Users in United Kingdom government tenancies do not have access to any paid listings.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be granted security access in a policy by an administrator. This access is required whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you get a message that you don’t have permission or are unauthorized, verify with your administrator what type of access you have and which compartment to work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

For administrators, the policies you need to create to provide users with access to Marketplace depend on whether the tenancy is in a commercial region, the United Kingdom Government Cloud region, or the United States Government Cloud realm.

**Note:**

In commercial regions and the United Kingdom Government Cloud region, administrators do not need to write policies to grant users the ability to list or read listings. In these regions, you can see individual listings and lists of listings by default. Furthermore, to reduce the scope of access to a particular compartment, specify the specific compartment instead of the tenancy in the policy statement.

**For a Tenancy in a Commercial Region or the United Kingdom Government Cloud**

- The following policy gives the specified example group, MarketplaceUsers, the ability to list accepted terms of use agreements. However, it does not include the ability to accept a terms of use agreement. The terms of use agreement for a given listing must be viewed and accepted prior to launch. For a policy that includes the ability to use listings, see the policy statements later in this section that grant access to the type of listing you want to launch, whether an image listing or a stack listing.

  ```
  Allow group MarketplaceUsers to inspect compartments in tenancy
  Allow group MarketplaceUsers to read app-catalog-listing in tenancy
  ```

- The following policy gives the specified example group, MarketplaceUsers, the ability to not only list and read, but also use Marketplace listings. It does not include the ability to create instances using images from listings. (For that, see the next set of policy statements.)

  ```
  Allow group MarketplaceUsers to inspect compartments in tenancy
  Allow group MarketplaceUsers to manage app-catalog-listing in tenancy
  ```
The following policy gives the specified example group, MarketplaceUsers, general access to managing instances and images, along with the required level of access to attach existing block volumes to the instances. Use this policy in conjunction with the preceding policy for users who need to launch instances from image listings. For users who need to launch stacks from stack listings, use this policy in conjunction with the next set of policy statements.

- Allow group MarketplaceUsers to manage instance-family in compartment ABC
- Allow group MarketplaceUsers to read app-catalog-listing in tenancy
- Allow group MarketplaceUsers to use volume-family in compartment ABC
- Allow group MarketplaceUsers to use virtual-network-family in compartment XYZ

The policies described in IAM Policies on page 5307 grant access to stacks and jobs in the tenancy. Use the appropriate policy statements to give a group the ability to list, read, and use Marketplace stack listings. (Users do not need permission to run destroy jobs to launch a stack from a Marketplace listing, but they do need permissions to run plan jobs and apply jobs.)

If you need to write more restrictive policies, see the policy references on which these policies were based, Details for the Core Services and Details for Resource Manager, as needed.

For a Tenancy in the US Government Cloud Realm

**Note:**
The following policies assume you already have existing policies for the specified groups to address the ability to inspect anything in the tenancy, including all compartments.

- The following policy gives the specified example group, MarketplaceUsers, the ability to view all listings in the specified example compartment:

  Allow group MarketplaceUsers to read marketplace-listings in compartment ABC

- The following policy gives the specified example group, MarketplaceUsers, the ability to work with all listings in the specified example compartment in any way possible. The statements include the ability to accept terms of use agreements, view listings, and create images and stacks from listings:

  Allow group MarketplaceUsers to manage app-catalog-listings in compartment ABC
  Allow group MarketplaceUsers to use marketplace-listings in compartment ABC
  Allow group MarketplaceUsers to manage instance-family in compartment ABC
  Allow group MarketplaceUsers to use volume-family in compartment ABC
  Allow group MarketplaceUsers to manage virtual-network-family in compartment ABC
  Allow group MarketplaceUsers to manage orm-stack in compartment ABC
  Allow group MarketplaceUsers to manage orm-job in compartment ABC

- The following policy gives the specified example group, MarketplaceUsers, the ability to work with specific listings in the specified example compartment in any way possible. The statements include the ability to list and subscribe to images and the ability to create images and stacks from listings:

  Allow group MarketplaceUsers to manage app-catalog-listings in compartment ABC
  Allow group MarketplaceUsers to use marketplace-listings in compartment ABC where any {listing.id='123456', listing.id='987654'}
  Allow group MarketplaceUsers to manage instance-family in compartment ABC
  Allow group MarketplaceUsers to use volume-family in compartment ABC
Marketplace

Allow group MarketplaceUsers to manage virtual-network-family in compartment ABC
Allow group MarketplaceUsers to manage orm-stack in compartment ABC
Allow group MarketplaceUsers to manage orm-job in compartment ABC

• The following policy gives the specified example group, AgreementAcceptors, the ability to accept the terms of use agreement for any listing in the specified example compartment. The statements make it possible for anyone with the appropriate permissions to launch an image or stack from a listing without having the permission to accept the terms of use agreement themselves:

Allow group AgreementAcceptors to read marketplace-listings in compartment ABC
Allow group AgreementAcceptors to manage app-catalog-listings in compartment ABC

If you need to write more restrictive policies, see the policy reference on which policies for tenancies in the US Government Cloud realm were based, Details for the Marketplace Service.

Using the Console

To find a listing

1. Open the navigation menu and click Marketplace. Under Marketplace, click All Applications.
2. Click the Search for listings by entering a name, ID, category, or publisher name text box.
3. Provide a search string, and then press ENTER. (If you provide a listing ID, it must contain the full, exact listing ID to match. Marketplace supports partial matching for other listing search types.)

Marketplace displays all current listings that contain the search string in either the name, listing ID, application category, or publisher name. To refine the results, you can filter them.

To filter listings

1. Open the navigation menu and click Marketplace. Under Marketplace, click All Applications.
2. Under Filters, do one or more of the following:
   • To display listings of a certain deployment type, click Type, and then click either Image or Stack.
   • To display listings from a specific publisher, click Publisher, and then click a publisher name.
   • To display listings from a particular product category, click Category, and then click a category name.
   • To display listings according to price, click Price, and then click a pricing model.

You can combine multiple filters to further narrow down listings. You can also clear filters to expand the list of listings that you see.

To view a listing’s details

1. Open the navigation menu and click Marketplace. Under Marketplace, click All Applications.
2. Click the listing that you're interested in.
3. Marketplace displays the listing overview by default. To view other details, do the following:
   • To view information about the publisher, click Provider.
   • To view other listings from the same publisher, click More Apps.
   • To view instructions for using the instance that you create from the listing, click Usage Information.

To launch an instance based on an image

Tip:

When you create an instance, several other resources are involved (for example, an image, a cloud network, or a subnet). Those other resources can be in the same compartment with the instance or in other compartments. You must have the required level of access to each of the compartments involved in order to launch the instance. This is also true when you attach a volume to
1. Open the navigation menu and click **Marketplace**. Under **Marketplace**, click **All Applications**.
2. Click the listing that you're interested in.
3. Review the **Usage Instructions** tab to ensure you understand what you will need to deploy and to access the instance after you launch it. Both Linux and Windows instances require a cloud network to launch the instance into. For more information, see **Networking Overview** on page 4178. Depending on the type of instance, to access it, you might need an SSH key pair or a security list that enables Remote Desktop Protocol. For more information, see **Managing Key Pairs on Linux Instances** on page 1121 and **Creating a Windows Instance** on page 1103.
4. Under **Version**, click the package version of the image that you want to install. By default, the menu displays the latest version.
5. Under **Compartment**, click the name of the compartment where you want to launch the instance. (If you don't have permissions to launch the instance in the selected compartment, it will be launched in the root compartment instead.)
6. Select the check box to accept the terms of use, and then click **Launch Instance**.
7. To finish launching the instance, follow the instructions in **Creating an Instance**.

**Important:**

Be aware of the following information about minimum-bill instances:

- Some Marketplace images, for example, Microsoft SQL Server image cannot be resized because of minimum-bill licensing constraints. This behavior can be overridden by enabling such instances to be added to an allow-list category. If you want to resize a Microsoft SQL Server image, contact support.
- Once you're added to an allow-list category, wait at least the number of minimum-bill hours (that is, a month) after the instance is launched before you attempt to resize a minimum-bill instance. This approach does not incur any additional costs when you resize a minimum-bill instance.
- For more information about resizing an instance, see **Changing the Shape of an Instance**.

The information you need to connect to an instance after you create it might be in the **Usage Information** or the **Related Documents** sections of the listing.

**To launch a stack**

**Tip:**

When you create a stack, potentially many other resources are involved (for example, an instance, a cloud network, or a subnet), aside from the stacks and jobs resources. You must have the required access to all involved resources to create a stack. Those other resources can be in the same compartment with the instance or in other compartments. You must have the required level of access to each of the compartments involved in order to launch the instance. This is also true when you attach a volume to an instance; they don't have to be in the same compartment, but if they're not, you need the required level of access to each of the compartments.

1. Open the navigation menu and click **Marketplace**. Under **Marketplace**, click **All Applications**.
2. Click the listing that you're interested in.
3. Review the **Usage Instructions** tab and ensure you understand what you will need to deploy and to access the instance after the stack finishes deployment.
4. Under **Version**, click the package version of the stack that you want to install. By default, the menu displays the latest version.
5. Under **Compartment**, click the name of the compartment where you want to launch the instance. (If you don’t have permissions to launch the instance in the selected compartment, it will be launched in the root compartment instead.)

6. Select the check box to accept the terms of use, and then click **Launch Stack**.

7. On the **Stack Information** page, configure the following:

   - **Name**. Optionally, provide a name by which you can refer to the stack after it’s deployed. Avoid entering confidential information.
   - **Description**. Optionally, provide a description of the stack. For example, you can specify the name of the application that will run on the instance after the stack is deployed.
   - **Create in Compartment**. This is the compartment where the stack will be created in the tenancy. (Stacks are attached to a specific region. However, where necessary, the resources on a given stack can be deployed across multiple regions.)
   - **Tags**. If you have permissions to create a resource, then you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see *Resource Tags* on page 239. If you are not sure whether to apply tags, skip this option (you can apply tags later) or ask your administrator.

When you are ready, click **Next**.

8. On the **Configure Variables** page, verify that the values for variables extracted from the Terraform configuration file are as you want them. Some variables might be required, but don't have a default value and must be configured before you can proceed. These vary from listing to listing, but often include the following: availability domain and compartment. Optionally, you can change default values, such as any display names automatically given to resources, to help differentiate them. For some stacks, you can customize additional variables by selecting the **Additional Customization** or **WLS Instance Advanced Configuration** check box. The variables in these sections otherwise use default values. When you are ready, click **Next**.

9. On the **Review** page, confirm that variables have been configured properly. (Marketplace does not display variables that have default values or variables that you didn’t change.) Then, click **Create**.

Resource Manager runs the plan job and the apply job to create stack resources accordingly. The information you need to connect to the instance created as part of the stack can appear in the **Application Information** tab or in the **Usage Information** or **Related Documents** sections of the listing.

### To download a Terraform configuration file

1. Open the navigation menu and click **Marketplace**. Under **Marketplace**, click **All Applications**.
2. Click the listing that you're interested in.
3. Under **Version**, click the package version of the stack that you want. By default, the menu displays the latest version.
4. Under **Compartment**, click the name of any compartment. (You must select a compartment in order to accept the terms of use in the next step.)
5. Select the check box to accept the terms of use, and then click **Download**.
6. Follow the prompts to save the configuration file locally.

For information about how to use the file to edit a stack or create a stack, see *Managing Stacks and Jobs* on page 5102.

### Using the Command Line Interface (CLI)

For information about using the CLI, see *Command Line Interface (CLI)*. For a complete list of flags and options available for CLI commands, see the *Command Line Reference*.
**To filter listings**

Open a command prompt and run `oci marketplace listing list` to view listings that meet specified filter criteria:

```
oci marketplace listing list --package-type <package_type> --publisher-id <unique_publisher_ID> --category <product_category> --pricing <pricing_model>
```

For example, the following command lists only image listings:

```
oci marketplace listing list --package-type image
```

The following command lists only listings from the specified publisher:

```
oci marketplace listing list --publisher-id 29367738
```

The following command lists only listings from the specified product category:

```
oci marketplace listing list --category "database management"
```

The following command lists only listings that have the specified pricing model:

```
oci marketplace listing list --pricing byol
```

**To view a listing's details**

Open a command prompt and run `oci marketplace listing get` to view detailed information about a listing:

```
oci marketplace listing get --listing-id <listing_ID>
```

For example:

```
oci marketplace listing get --listing-id 29367738
```

**To launch an instance**

Open a command prompt and run `oci compute instance launch` to launch an instance:

```
oci compute instance launch --availability-domain <availability_domain> --compartment-id <compartment_OCID> --shape <instance_shape> --subnet-id <subnet_OCID> --image-id <image_OCID>
```

For example:

```
oci compute instance launch --availability-domain Uocm:PHX-AD-1 --compartment-id ocid1.compartment.oc1..example1example25qrlpo4agcmothkbgqmuz2zzum45ibploogqtabwkw3zz --shape VM.Standard1.2 --subnet-id ocid1.subnet.oc1.phx.exampleahetdvobxad5cvbqfcjmw2ddryahoqrp4ot2fauxvbdeirpa2gpt2a --image-id ocid1.image.oc1.phx.exampleae44ah3b5xyet6t1vl123cvtetuyugfckfwgg6fywrkk3fauxscyq
```

**Using the API**

For information about using the API and signing requests, see [REST APIs](#) and [Security Credentials](#). For information about SDKs, see [Software Development Kits](#) and [Command Line Interface](#).

Use the following operations to work with listings:
Publishing Listings

Applications listed in Oracle Cloud Infrastructure Marketplace are provided by publishers. Publishers belong to the Oracle PartnerNetwork. Oracle reviews and approves the applications submitted by publishers. If you would like to become a publisher, see How do I become a marketplace publisher? in the Oracle Cloud Marketplace Partner Portal documentation.

If you simply want to share a custom image that you imported to Oracle Cloud Infrastructure through Compute, see Publishing Community Applications on page 4012.

Publishing Community Applications

This topic describes how to share and manage a custom image as a community application.

With Marketplace, you can take custom images that you imported to Oracle Cloud Infrastructure Compute and publish them to make them available to others in the Oracle Cloud Infrastructure community. Community applications are custom images provided to the community by the community. Community members can select from community applications when launching an instance, similarly to how they might select an Oracle image, partner image, or other image.

Anyone who uses community applications does so at their own risk. As with all images, terms of use exist between the publisher of the image and the customer, and you must accept any terms of use agreement associated with an image if you want to use the image.

Community applications appear alongside other images, such as platform images or partner images, to users of Compute during the instance creation workflow. Compute users can select from community images when they select an image to launch an instance. Community applications do not appear in Marketplace alongside applications from publishers in the Oracle PartnerNetwork.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be granted security access in a policy by an administrator. This access is required whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you get a message that you don’t have permission or are unauthorized, verify with your administrator what type of access you have and which compartment to work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

For administrators, the following policies enable the creation of community applications in Marketplace for community use and provide access to community applications to users. For any policies, if you want to reduce the scope of access to a particular compartment, specify the compartment instead of the tenancy.

- The following policy gives the specified example group the ability to list, view, create, update, delete, or move community applications.

```plaintext
Allow group PublicationAdmins to manage marketplace-publications in tenancy where listing.type='Community'
```

- The following policy gives the Marketplace service the ability to do everything with Compute custom images, including listing, viewing, creating, updating, deleting, and moving them.

```plaintext
Allow service Marketplace to manage instance-images in tenancy
```
The following policy gives the specified example group the ability to list community applications when selecting an image while launching an instance and to see the terms of use agreements associated with the images:

| Allow group CommunityApplicationLaunchers to read marketplace-community-listings in tenancy |
| Allow group CommunityApplicationLaunchers to inspect compartments in tenancy |
| Allow group CommunityApplicationLaunchers to read app-catalog-listing in tenancy |

If you need to write more restrictive policies, see the policy reference on which these policies were based, Details for the Marketplace Service and Details for the Core Services, as needed.

Using the Console

To create a community application

1. Open the navigation menu and click Marketplace. Under Marketplace, click All Applications. Then, click Community Applications.

2. Under List Scope, in the Compartment list, click the name of the compartment where you want to create a community application.

3. Click Create.

4. In the Create Community Application dialog box, click Name, and then enter a name for the community application. The same name is used in the listing that Marketplace makes available for use.

5. Click Short Description, and then enter a short description of the community application. The short description accompanies the listing and is shown wherever the listing displays in a condensed format.

6. Optionally, click Long Description, and then enter a longer description of the community application. The long description accompanies the listing and is shown wherever the listing displays in full.

7. Under Contact Information, enter the name and email address that you want others to use to contact you if they need support with the community application. Avoid entering any confidential information.

8. Next, under Specify Listing, do one of the following to choose the custom image that you want to share:

   - To select from a list of custom images available to you, click Choose Image, choose the compartment where the image exists, and then select the check box of the image that you want to publish.
   - To specify a custom image by its OCID, click Provide OCID, click the text box, and then enter the OCID of the image that you want to publish.

9. Click Community Application's Terms of Use, and then enter the terms of use that you want community members to agree to if they want to use the image.

10. To confirm that you have the authority to create the community application and share the image with community members, select the I represent that I have the right and authority to share this Community Application in accordance with my agreement with Oracle applicable to the Services and with the related Service Specifications check box. You must select the check box to proceed.

11. When you are finished, click Create.

To view a community application's details

1. Open the navigation menu and click Marketplace. Under Marketplace, click All Applications. Then, click Community Applications.

2. Under List Scope, in the Compartment list, click the name of the compartment that contains the community application you want to view.

3. From the list of community applications in the compartment, click the community application name.
4. The console displays the following information:
   • **OCID:** The unique, Oracle-assigned ID of the community application.
   • **Created:** The date and time when you initially created the community application.
   • **Compartment:** The unique, Oracle-assigned ID of the compartment that contains the community application.
   • **Original Source:** The custom image that formed the basis of the community application.
   • **Contact Information:** The name and email address that users of the community application can contact when they need support.
   • **Short Description:** A short description of the community application that displays to users when the listing is condensed.
   • **Long Description:** A longer description of the community application that displays to users when the listing is expanded.

To view all community applications in a compartment

1. Open the navigation menu and click **Marketplace.** Under **Marketplace,** click **All Applications.** Then, click **Community Applications.**
2. Under **List Scope,** in the **Compartment** list, click the name of the compartment that contains the community applications you want to view.

The console displays a list of all community applications in the compartment that you have permission to view.

To update a community application

1. Open the navigation menu and click **Marketplace.** Under **Marketplace,** click **All Applications.** Then, click **Community Applications.**
2. Under **List Scope,** in the **Compartment** list, click the name of the compartment that contains the community application that you want to update.
3. Click the name of the community application, and then click **Edit Details.**
4. In the **Edit Community Application** dialog box, update information as needed. Avoid entering any confidential information.
5. When you are finished, click **Save.**

To delete a community application

1. Open the navigation menu and click **Marketplace.** Under **Marketplace,** click **All Applications.** Then, click **Community Applications.**
2. Under **List Scope,** in the **Compartment** list, click the name of the compartment that contains the community application that you want to delete.
3. Click the name of the community application, and then click **Delete.**
4. To confirm, click **Delete** again.

To move a community application to another compartment

1. Open the navigation menu and click **Marketplace.** Under **Marketplace,** click **All Applications.** Then, click **Community Applications.**
2. Under **List Scope,** in the **Compartment** list, click the name of the compartment that contains the community application that you want to move.
3. Click the name of the community application, and then click **Move Resource.**
4. Choose the compartment to which you want to move the community application, and then click **Move Resource.**
Using the Command Line Interface (CLI)

For information about using the CLI, see Command Line Interface (CLI). For a complete list of flags and options available for CLI commands, see the Command Line Reference.

To create a community application

Open a command prompt and run `oci marketplace publication create` to create a new community application:

```
oci marketplace publication create --compartment-id <target_compartment_id> --name '<publication_name>' --short-description '<short_application_description>' --contact-name '<name_of_support_contact>' --contact-email '<email_of_support_contact>' --image-id <custom_image_OCID> --terms-of-use '<text_of_application_terms_of_use>'
```

For example:

```
oci marketplace publication create --compartment-id ocid1.compartment.oc1..example1example25qrlpo4agcmothkbqgmmo2zzum45ibplooqtabwk3zz --name 'My Best Application' --short-description 'This application will change your life.' --contact-name 'John Doe' --contact-email 'john@example.com' --image-id ocid1.image.oc1.phx.exampleanquwmne2sptdsemm32pmp4faux7yah44sncjocyfcvbgzvft77a --terms-of-use 'I agree to use this software at my own risk.'
```

Avoid entering confidential information.

To view a community application's details

Open a command prompt and run `oci marketplace publication get` to view a community application's details:

```
oci marketplace publication get --publication-id <target_publication_id>
```

For example:

```
oci marketplace publication get --publication-id ocid1.marketplacecommunitylisting.oc1..examplea3o7jtytz3lsfauxeq6sp5ye3ex624rgsw2ol4cvb
```

To view all community applications in a compartment

Open a command prompt and run `oci marketplace publication get` to view all community applications in a compartment:

```
oci marketplace publication get --publication-id <target_publication_id>
```

For example:

```
oci marketplace publication get --publication-id ocid1.marketplacecommunitylisting.oc1..examplea3o7jtytz3lsfauxeq6sp5ye3ex624rgsw2ol4cvb
```

To update a community application

```
Note:
You can update the name of a community application, its descriptions, or its contact information. You cannot update the image or terms of use for an
```

Oracle Cloud Infrastructure User Guide 4015
existing community application. To publish a different custom image, create a new community application.

Open a command prompt and run `oci marketplace publication update` to update an existing community application:

```
oci marketplace publication update --publication-id <target_publication_id> --name '<publication_name>'
```

For example:

```
oci marketplace publication update --publication-id ocid1.marketplacecommunitylisting.oc1..examplea3o7jtytz3lsfauxeq6sp5ye3ex624rgsw2ol4cvb --name 'New Application Name'
```

Avoid entering confidential information.

**To delete a community application**

Open a command prompt and run `oci marketplace publication delete` to delete a community application:

```
oci marketplace publication delete --publication-id <target_publication_id>
```

For example:

```
oci marketplace publication delete --publication-id ocid1.marketplacecommunitylisting.oc1..examplea3o7jtytz3lsfauxeq6sp5ye3ex624rgsw2ol4cvb
```

**To move a community application to another compartment**

Open a command prompt and run `oci marketplace publication change-compartment` to move a community application from one compartment to another:

```
oci marketplace publication change-compartment --compartment-id <target_compartment_id> --publication-id <target_publication_id>
```

For example:

```
oci marketplace publication change-compartment --compartment-id ocid1.compartment.oc1..example1example25qrlpo4agcmothkgmuz2zzum45iaplo0qtabwk3zz --publication-id ocid1.marketplacecommunitylisting.oc1..examplea3o7jtytz3lsfauxeq6sp5ye3ex624rgsw2ol4cvb
```

**Using the API**

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations to work with community applications:

- ListPublications
- GetPublication
- CreatePublication
- UpdatePublication
- DeletePublication
- ChangePublicationCompartment
Service Catalog

A Service Catalog enables your organization to create and manage catalogs of applications that are approved for use in your tenancy. These applications are offered through marketplace in the form of image and stack listings. Applications can be a public application available on marketplace or a private application offered within the organization. The Service Catalog allows organizations to centrally manage applications and helps achieve consistent governance and compliance requirements. Approved or restricted sets of applications can reduce risks of misuse or overspending by end users, giving administrators peace of mind. End users can quickly deploy only approved applications that follow constraints set by the organization.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be granted security access in a policy by an administrator. This access is required whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you get a message that you don’t have permission or are unauthorized, verify with your administrator what type of access you have and which compartment to work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

For administrators, the following policies enable the creation of applications in a Service Catalog and provide access to those applications to users. For any policies, if you want to reduce the scope of access to a particular compartment, specify the compartment instead of the tenancy.

- The following policy gives the specified example group the ability to list, view, create, update, delete, or move Private Applications in all compartments.

```
allow group CatalogAdmins to manage private-applications in tenancy
```

- The following policy gives the specified example group the ability to list, view, create, update, delete, or move Service Catalogs in all compartments.

```
allow group CatalogAdmins to manage service-catalogs in tenancy
```

- The following policy gives the specified example group the ability to browse and launch Service Catalog applications in all compartments:

```
allow group CatalogUsers to inspect service-catalog-contents in tenancy
```

- The following policy gives the specified example group the ability to browse and launch applications only from within a specific service catalog:

```
allow group CatalogUsers to inspect service-catalog-contents in tenancy where service-catalog.id='ocid1.servicecatalog.oc1.iad.aaaaaaaaexampleocid'
```

- The following policy gives the specified example group the ability to browse and launch applications only from within those service catalog which are hosted in the compartment Project-A:

```
allow group CatalogUsers to inspect service-catalog-contents in compartment Project-A
```

If you need to write more restrictive policies, see the policy reference on which these policies were based: Details for the Marketplace Service and Details for the Core Services, as needed.

Working with Service Catalogs

This section describes how to create, edit, view, and delete Service Catalogs.
Using the Console

To create a Service Catalog

1. Open the navigation menu. Under the Solutions and Platform group, go to Service Catalog. Then, click Catalog Manager. The Catalog Manager page appears, showing the list of Service Catalogs.
2. You can select a compartment with the Compartment drop-down list in the List Scope section on the left side of the page.
3. Click the Create Service Catalog button at the top of the list of Service Catalogs. The Create Service Catalog dialog appears.
4. Enter the name of the Service Catalog in the Name text box.
5. Select the compartment using the Create in Compartment drop-down list.
6. You can optionally select one or more Marketplace or Private applications to share in this catalog from the Applications list:
   a. Select an application by clicking the check box next to it.
   b. You can type in a search term in the Search for applications text box at the top of the list.
   c. You can filter the list by selecting a filter from the available drop-down lists in the Filter section to the left of the list of applications.
7. Click the Create button.

To view a Service Catalog’s details

1. Open the navigation menu. Under the Solutions and Platform group, go to Service Catalog. Then, click Catalog Manager. The Catalog Manager page appears, showing the list of Service Catalogs.
2. You can select the compartment scope of the displayed Service Catalogs with the Compartment drop-down list in the List Scope section on the left side of the page.
3. Click on the name of the Service Catalog in the list. The Service Catalog’s details page displays.

To update a Service Catalog

1. Open the navigation menu. Under the Solutions and Platform group, go to Service Catalog. Then, click Catalog Manager. The Catalog Manager page appears, showing the list of Service Catalogs.
2. Click on the name of the Service Catalog in the list. The Service Catalog’s details page displays.
3. Click the Edit button.
4. You can update the name of the Service Catalog by modifying the value in the Name text box.
5. You can add or remove applications in the Applications list.
   a. You can search by name or filter the list by selecting one or more filters in Filter section to the left of the list of applications.
   b. Check or uncheck the box next to the application name that you want to include or remove.
6. When you are finished, click Save Changes.

To delete a Service Catalog

1. Open the navigation menu. Under the Solutions and Platform group, go to Service Catalog. Then, click Catalog Manager. The Catalog Manager page appears, showing the list of Service Catalogs.
2. There are two ways to delete a Service Catalog:
   a. From the list of Service Catalogs on the Catalog Manager page:
      1. Click the context menu icon to the right of the Service Catalog you want to delete, then click Delete.
      2. To confirm, click Delete again.
   b. From the Edit Service Catalog page:
      1. Click the Delete button.
      2. To confirm, click Delete again.

To view all Service Catalogs in a compartment

1. Open the navigation menu. Under the Solutions and Platform group, go to Service Catalog. Then, click Catalog Manager. The Catalog Manager page appears, showing the list of Service Catalogs.
2. You can select a compartment with the **Compartment** drop-down list in the **List Scope** section on the left side of the page.

**To move a Service Catalog application to another compartment**

1. Open the navigation menu. Under the **Solutions and Platform** group, go to **Service Catalog**. Then, click **Catalog Manager**. The **Catalog Manager** page appears, showing the list of Service Catalogs.
2. Click on the name of the Service Catalog you want to move. The details page for that Service Catalog appears.
3. Click the **Move Resource** button.
4. Select the destination compartment from the **Choose New Compartment** list, then click **Move Resource**.

**Browsing and Launching Service Catalog Applications**

1. Open the navigation menu. Under the **Solutions and Platform** group, go to **Service Catalog**. Then, click **Catalog Manager**. The **Catalog Manager** page appears, showing the list of Service Catalogs.
2. Click on the name of the Service Catalog you want to move. The details page for that Service Catalog appears.
3. Click the **Move Resource** button.
4. Select the destination compartment from the **Choose New Compartment** list, then click **Move Resource**.

**Working with Private Applications**

This section describes how to create, edit, view, and delete Private Applications.

**Using the Console**

**To create a Private Application**

1. Open the navigation menu. Under the **Solutions and Platform** group, go to **Service Catalog**. Then, click **Private Applications**. The **Private Applications** page appears, showing the list of Private Applications.
2. You can select a compartment with the **Compartment** drop-down list in the **List Scope** section on the left side of the page.
3. Click the **Create** button at the top of the list. The **Create Private Application** dialog appears.
4. Enter the name of the Private Application in the **Name** text box.
5. You can add an icon by dragging and dropping the JPG or PNG file into the **Application Icon** box or by clicking the **Browse** link and selecting a file. If you don't provide an icon, a default icon is provided.
6. Enter a short description in the **Short Description** text box.
7. Enter a more detailed description in the **Long Description** text box. This description will be displayed to the user at launch time.
8. Enter the version of the application into the **Application Version** field.
9. Upload a Terraform configuration file by dragging and dropping the file into the **Upload File Containing Terraform Configuration** box or by clicking the **Browse** link and selecting a file.

**Note:**

10. Click the **Create** button.

**To view a Private Application's details**

1. Open the navigation menu. Under the **Solutions and Platform** group, go to **Service Catalog**. Then, click **Private Applications**. The **Private Applications** page appears, showing the list of Private Applications.
2. Click the name of the Private Application that you want to view. The **Private Application Details** page appears.

**To update a Private Application**

1. Open the navigation menu. Under the **Solutions and Platform** group, go to **Service Catalog**. Then, click **Private Applications**. The **Private Applications** page appears, showing the list of Private Applications.
2. Click on the **Edit** button.
3. Update the name of the Private Application in the **Name** text box.
4. Change the icon by dragging and dropping the JPG or PNG file into the **Application Icon** box or by clicking the **Browse** link and selecting a file.
5. Update the short description in the **Short Description** text box.
6. Update the detailed description in the **Long Description** text box. This description will be displayed to the user at launch time.
7. Click the **Save** button.

**To delete a Private Application**

1. Open the navigation menu. Under the **Solutions and Platform** group, go to **Service Catalog**. Then, click **Private Applications**. The **Private Applications** page appears, showing the list of Private Applications.
2. There are two ways to delete a Private Application:
   a. From the list of Private Applications on the **Private Applications** page:
      1. Click the context menu icon to the right of the Private Application you want to delete, then click **Delete**.
      2. To confirm, click **Delete** again.
   b. From the **Edit Private Application** screen:
      1. Click the **Delete** button.
      2. To confirm, click **Delete** again.

**To view all Private Applications in a compartment**

1. Open the navigation menu. Under the **Solutions and Platform** group, go to **Service Catalog**. Then, click **Private Applications**. The **Private Applications** page appears, showing the list of Private Applications.
2. You can select a compartment with the **Compartment** drop-down list in the **List Scope** section on the left side of the page.

**To move a Private Application to another compartment**

1. Open the navigation menu. Under the **Solutions and Platform** group, go to **Service Catalog**. Then, click **Private Applications**. The **Private Applications** page appears, showing the list of Private Applications.
2. Click on the name of the Private Application you want to move. The details page for that Private Application appears.
3. Click the **Move Resource** button.
4. Select the destination compartment from the **Choose New Compartment** list, then click **Move Resource**.

**Viewing Accepted Terms of Use Agreements**

Before you can launch an image or a stack from a Marketplace listing, you must first read and accept all software terms of use agreements associated with the package version that you choose. This topic describes how to see what terms of use agreements you have accepted through Oracle Cloud Infrastructure Marketplace. Your organization might need or want to review the specific terms of use associated with a particular package version after you deploy one or more Marketplace listings.

**Required IAM Policy**

To use Oracle Cloud Infrastructure, you must be granted security access in a **policy** by an administrator. This access is required whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you get a message that you don’t have permission or are unauthorized, verify with your administrator what type of access you have and which **compartment** to work in.

If you're new to policies, see **Getting Started with Policies** and **Common Policies**.

For administrators, the following policies provide access to Marketplace.

- The following policy gives the specified group the ability to list accepted terms of use agreements. The terms of use agreement for a given listing must be viewed and accepted prior to launch. The policy does not include the
ability to list, read, or use listings themselves. For that, see the policy statements that grant access to the type of listing you want to launch, whether an image listing or a stack listing.

<table>
<thead>
<tr>
<th>Allow group &lt;IAM_group_name&gt; to inspect compartments in tenancy</th>
</tr>
</thead>
</table>

- The following policy gives the specified group the ability to list, read, and use Marketplace image listings. It does not include the ability to create instances using images from listings. (For that, see the next policy.) Furthermore, to reduce the scope of access to just creating subscriptions in a particular compartment, specify that compartment instead of the tenancy.

<table>
<thead>
<tr>
<th>Allow group &lt;IAM_group_name&gt; to manage app-catalog-listing in tenancy</th>
</tr>
</thead>
</table>

- The following policy gives the specified group general access to managing instances and images, along with the required level of access to attach existing block volumes to the instances. Use this policy in conjunction with the preceding policy for users who need to launch instances from image listings. For users who need to launch stacks from stack listings, use this policy in conjunction with the next set of policies.

| Allow group <IAM_group_name> to manage instance-family in compartment ABC |
| Allow group <IAM_group_name> to read app-catalog-listing in tenancy |
| Allow group <IAM_group_name> to use volume-family in compartment ABC |
| Allow group <IAM_group_name> to use virtual-network-family in compartment XYZ |

- The policies described in IAM Policies on page 5307 grant access to stacks and jobs in the tenancy. Use the appropriate policy statements to give a group the ability to list, read, and use Marketplace stack listings. (Users do not need permission to run destroy jobs to launch a stack from a Marketplace listing, but they do need permissions to run plan jobs and apply jobs.)

If you need to write more restrictive policies, see the policy references on which these policies were based, Details for the Core Services and Details for Resource Manager, as needed.

**Using the Console**

To view the accepted terms of use agreements for a given compartment

1. Open the navigation menu and click Marketplace. Under Marketplace, click All Applications.
2. Click Accepted Agreements.
3. Under List Scope, click Compartment, and then click the name of the compartment where you accepted a terms of use agreement that you now want to view.
4. In the list, next to the listing that you're interested in, click the Actions menu (⋮). (Marketplace independently lists package versions with their distinct terms of use agreements. Also, Marketplace tracks what agreements you accept regardless of whether you actually complete the software deployment. Therefore, the list might show the names of listings that you didn't actually finish deploying in your tenancy.)
5. To review any of the terms of use agreements you accepted for the specified listing and package version, click its name.

**Using the Command Line Interface (CLI)**

For information about using the CLI, see Command Line Interface (CLI). For a complete list of flags and options available for CLI commands, see the Command Line Reference.

To view the accepted terms of use agreements for a given compartment

Open a command prompt and run `oci marketplace accepted-agreement list` to view a list of terms of use agreements that you previously accepted:

```bash
oci marketplace accepted-agreement list --compartment-id <compartment_id>
```
For example:

```
oci marketplace accepted-agreement list --compartment-id
ocid1.compartment.oc1..exampleexample25qrlpo4agcmothkbqgmuz2zzum45ibploojabkw3zz
```

**Using the API**

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations to work with a listing's terms of use agreements:

- CreateAcceptedAgreement
- DeleteAcceptedAgreement
- GetAcceptedAgreement
- GetAgreement
- ListAcceptedAgreements
- ListAgreements
- UpdateAcceptedAgreement

**Oracle Cloud Microsoft Workloads Competency Partners**

Oracle Cloud helps you build, deploy, scale, and manage Windows-based applications quickly, easily, securely, and cost-effectively.

The Oracle Partner Finder helps customers select the qualified partners for deploying Microsoft workloads on Oracle Cloud Infrastructure (OCI).

- Find OCI Microsoft partners

The Oracle Cloud Marketplace helps customers find qualified Microsoft solutions from the Oracle Partner Network (OPN) program.

- Find Microsoft solutions in the OCI Marketplace
Chapter 33

Monitoring

This chapter explains how to actively and passively monitor performance and usage metrics for your resources.

Monitoring

Use Monitoring to query metrics and manage alarms. Metrics and alarms help monitor the health, capacity, and performance of your cloud resources.

Overview of Monitoring

The Oracle Cloud Infrastructure Monitoring service enables you to actively and passively monitor your cloud resources using the Metrics and Alarms features.
How Monitoring Works

The Monitoring service uses **metrics** to monitor resources and **alarms** to notify you when these metrics meet alarm-specified triggers.

Metrics are emitted to the Monitoring service as raw **data points**, or timestamp-value pairs, along with **dimensions** and metadata. Metrics come from a variety of sources:

- Resource metrics automatically posted by Oracle Cloud Infrastructure **resources**. For example, the Compute service posts metrics for monitoring-enabled compute instances through the `oci_computeagent` namespace. One such metric is `CpuUtilization`. See [Supported Services](#) on page 4035 and [Viewing Default Metric Charts](#) on page 4038.
- **Custom metrics** published using the Monitoring API.
- Data sent to new or existing metrics using [Service Connector Hub](#).

Metric data posted to the Monitoring service is only presented to you or consumed by the Oracle Cloud Infrastructure features that you enable to use metric data.

When you query a metric, the Monitoring service returns aggregated data according to the specified parameters. You can specify a range (such as the last 24 hours), **statistic**, and **interval**. The Console displays one monitoring chart per metric for selected resources. The aggregated data in each chart reflects your selected statistic and interval. API requests can optionally filter by **dimension** and specify a **resolution**. API responses include the metric name along with its source compartment and **metric namespace**. You can feed the aggregated data into a visualization or graphing library.

Metric and alarm data is accessible via the Console, CLI, and API. For retention periods, see [Storage Limits](#) on page 4038.

The Alarms feature of the Monitoring service publishes alarm **messages** to configured destinations managed by the Notifications service. Each destination is a **topic** with a set of **subscribers**. For more information about the Notifications service, see [Notifications](#) on page 4838.

**Message types**

The message type indicates the reason that the message was sent.

- **OK_TO_FIRING**: The alarm changed from **OK** status to **FIRING** status.
- **FIRING_TO_OK**: The alarm changed from **FIRING** status to **OK** status.
- **REPEAT**: The alarm is maintaining a **FIRING** status and repeat notifications are configured.
• **RESET:** The alarm is not detecting the metric firing; the metric is no longer being emitted. The resource that was emitting the metric might have been moved or terminated.

**Important:**
When a **RESET** status change occurs, determine the health of the resource.

**Message format and examples**

Alarm message format:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dedupekey</td>
<td>string</td>
</tr>
<tr>
<td>Required</td>
<td>Unique identifier for all the alarm messages of the alarm. Use for de-duplication.</td>
</tr>
<tr>
<td>title</td>
<td>string</td>
</tr>
<tr>
<td>Required</td>
<td>The alarm's configured display name.</td>
</tr>
<tr>
<td>body</td>
<td>string</td>
</tr>
<tr>
<td></td>
<td>The alarm's configured message body.</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
</tr>
<tr>
<td>Required</td>
<td>The reason for sending the notification message. Valid values: See Message types on page 4025.</td>
</tr>
<tr>
<td>severity</td>
<td>string</td>
</tr>
<tr>
<td>Required</td>
<td>The highest severity level of the listed alarms. Valid values: CRITICAL, ERROR, WARNING, and INFO</td>
</tr>
<tr>
<td>timestampEpochMillis</td>
<td>long</td>
</tr>
<tr>
<td>Required</td>
<td>The time when the alarm was triggered, in milliseconds since epoch time.</td>
</tr>
<tr>
<td>timestamp</td>
<td>string</td>
</tr>
<tr>
<td>Required</td>
<td>The time when the alarm was triggered, in ISO-8601 format. Same information as in timestampEpochMillis.</td>
</tr>
</tbody>
</table>
| alarmMetadata        | array of objects
| Required             | List of alarms related to this notification message. |
| version              | int      |
| Required             | The version of the alarm message format.          |

**alarmMetadata format:**

<table>
<thead>
<tr>

https://cloud.oracle.com/monitoring/alarms/status
Metrics Feature Overview
The Metrics feature relays metric data about the health, capacity, and performance of your cloud resources. A
metric is a measurement related to health, capacity, or performance of a given resource. Resources, services, and
applications emit metrics to the Monitoring service. Common metrics reflect data related to:
•
•
•
•

Availability and latency
Application uptime and downtime
Completed transactions
Failed and successful operations

Oracle Cloud Infrastructure User Guide

4029


Monitoring

- Key performance indicators (KPIs), such as sales and engagement quantifiers

By querying Monitoring for this data, you can understand how well the systems and processes are working to achieve the service levels you commit to your customers. For example, you can monitor the CPU utilization and disk reads of your compute instances. You can then use this data to determine when to launch more instances to handle increased load, troubleshoot issues with your instance, or better understand system behavior.

**Example Metric: Failure Rate**

For application health, one of the common KPIs is failure rate, for which a common definition is the number of failed transactions divided by total transactions. This KPI is usually delivered through application monitoring and management software.

As a developer, you can capture this KPI from your applications using custom metrics. Simply record observations every time an application transaction takes place and then post that data to the Monitoring service. In this case, set up metrics to capture failed transactions, successful transactions, and transaction latency (time spent per completed transaction).

**Alarms Feature Overview**

![Diagram showing the flow from resources emitting metric data points to Monitoring, triggering an alarm, and sending a message to a configured topic, which then sends the message on to all of the topic's subscriptions.](image)

The Alarms feature of the Monitoring service works with the Notifications service to notify you when metrics meet alarm-specified triggers. The previous illustration depicts the flow, starting with resources emitting metric data points to Monitoring. When triggered, an alarm sends an alarm message to the configured topic (in Notifications), which then sends the message on to all of the topic's subscriptions. (This illustration does not cover raw and aggregated metric data. For these details, see the "Monitoring Overview" illustration.)

When configured, repeat notifications remind you of a continued firing state at the configured repeat interval. You are also notified when an alarm transitions back to the OK state, or when an alarm is reset.

You can search for alarms using Search-supported attributes. For more information about Search, see Overview of Search on page 5220.

**Search-Supported Attributes for Alarms**

For attribute descriptions, see Alarm Reference.

- `id`
- `displayName`
- `compartmentId`
Monitoring Concepts

The following concepts are essential to working with Monitoring.

aggregated data

The result of applying a statistic and interval to a selection of raw data points for a given metric. For example, you can apply the statistic max and interval 1h (one hour) to the last 24 hours of raw data points for the metric CpuUtilization. Aggregated data is displayed in default metric charts in the Console. You can also build metric queries for specific sets of aggregated data. For instructions, see Viewing Default Metric Charts on page 4038 and Building Metric Queries on page 4073.

alarm

The alarm query to evaluate and the notification destination to use when the alarm is in the firing state, along with other alarm properties. For instructions on managing alarms, see Managing Alarms on page 4094.

alarm query

The Monitoring Query Language (MQL) expression to evaluate for the alarm. An alarm query must specify a metric, statistic, interval, and a trigger rule (threshold or absence). The Alarms feature of the Monitoring service interprets results for each returned time series as a Boolean value, where zero represents false and a non-zero value represents true. A true value means that the trigger rule condition has been met. For more information, see Building Metric Queries on page 4073 and the query attribute description in the Alarm API reference.

data point

A timestamp-value pair for the specified metric. Example: 2018-05-10T22:19:00Z, 10.4

A data point is either raw or aggregated. Raw data points are posted by the metric namespace to the Monitoring service using the PostMetricData operation. The frequency of the data points posted varies by metric namespace. For example, your custom namespace might send data points for a given metric at a 20-second frequency.

Aggregated data points are the result of applying a statistic and interval to raw data points. The interval of the aggregated data points is determined by the SummarizeMetricsData request. For example, a request specifying the statistic sum and interval 1h (one hour) returns a sum value for each hour of available raw data points for the given metric.

dimension

A qualifier provided in a metric definition. Example: Resource identifier (resourceId), provided in the definitions of oci_computeagent metrics. Use dimensions to filter or group metric data. Example dimension name-value pair for filtering by availability domain: availabilityDomain = "VeBZ:PHX-AD-1"
frequency

The time period between each posted raw data point for a given metric. (Raw data points are posted by the metric namespace to the Monitoring service.) While frequency varies by metric, default service metrics typically have a frequency of 60 seconds (that is, one data point posted per minute). See also resolution.

interval

The time window used to convert the given set of raw data points.

The timestamp of the aggregated data point corresponds to the end of the time window during which raw data points are assessed. For example, for a five-minute interval, the timestamp "2:05" corresponds to the five-minute time window from 2:00:00 to 2:05:00.

The following example query specifies a 5-minute interval. CpuUtilization[5m].max() For supported values, see Monitoring Query Language (MQL) Reference on page 4119.

Note:

Supported values for interval depend on the specified time range in the metric query (not applicable to alarm queries). More interval values are supported for smaller time ranges. For example, if you select one hour for the time range, then all interval values are supported. If you select 90 days for the time range, then only the 1h or 1d interval values are supported.

To specify an interval value that is not available in Basic Mode in the Console, such as 12 hours, switch to Advanced mode.

See also resolution.

message

The content that the Alarms feature of the Monitoring service publishes to topics in the alarm’s configured notification destinations. A message is sent when the alarm transitions to another state, such as from "OK" to "FIRING." For more information about messages, see How Monitoring Works on page 4025.

metadata

A reference provided in a metric definition. Example: unit (bytes), provided in the definition of the oci COMPUTEAGENT metricDiskBytesRead. Use metadata to determine additional information about a given metric. For metric definitions, see Supported Services on page 4035.

metric

A measurement related to health, capacity, or performance of a given resource. Example: The oci COMPUTEAGENT metricCpuUtilization, which measures usage of a compute instance. For metric definitions, see Supported Services on page 4035.

Note:

Metric resources do not have OCIDs.
**Monitoring**

**metric definition**
A set of references, qualifiers, and other information provided by a *metric namespace* for a given *metric*. For example, the `oci_computeagent metric DiskBytesRead` is defined by *dimensions* (such as resource identifier) and *metadata* (specifying bytes for unit) as well as identification of its *metric namespace* (`oci_computeagent`). Each posted set of *data points* carries this information. Use the `ListMetricData` API operation to get metric definitions. For metric definitions, see Supported Services on page 4035.

**metric namespace**
Indicator of the *resource*, service, or application that emits the *metric*. Provided in the *metric definition*. For example, the `CpuUtilization metric definition` emitted by the Oracle Cloud Agent software on compute *instances* lists the *metric namespace* `oci_computeagent` as the source of the `CpuUtilization metric`. For metric definitions, see Supported Services on page 4035.

**metric stream**
An individual set of aggregated *data* for a *metric*. A stream can be either specific to a single *resource* or aggregated across all resources in the compartment. Within a *metric chart* in the Console, each metric stream is represented as a line. By default, metric streams are resource-specific, so the chart displays a line for each resource. If you choose to aggregate all metric streams, then the chart displays one line for all resources.

**notification destination**
Protocol and other details for sending *messages* when the *alarm* transitions to another state, such as from "OK" to "FIRING." The details and setup may vary by destination service. For the Notifications service, each destination includes a topic and subscription protocol (such as PagerDuty). For more information about messages, topics, and subscriptions, see Notifications on page 4838.

**Oracle Cloud Agent software**
Software that allows a compute instance to post raw *data points* to the Monitoring service. Automatically installed with the latest versions of supported images. See Enabling Monitoring for Compute Instances on page 1241.

**query**
The Monitoring Query Language (MQL) expression to evaluate for returning aggregated *data*. The query must specify a *metric*, *statistic*, and *interval*. For more information, see Building Metric Queries on page 4073.

**resolution**
The period between time windows, or the regularity at which time windows shift. For example, use a resolution of `1m` to retrieve aggregations every minute.

To specify a non-default resolution that differs from the interval, use the `SummarizeMetricsData` operation.

**Note:**
For metric queries, the *interval* you select drives the default *resolution* of the request, which determines the maximum time range of data returned.

For more information about the *resolution* parameter as used in metric queries, see SummarizeMetricsData.

**Maximum time range returned for a query**
The maximum time range returned for a metric query depends on the resolution. By default, for metric queries, the resolution is the same as the query interval.

The maximum time range is calculated using the current time, regardless of any specified end time. Following are the maximum time ranges returned for each interval selection available in the Console.
(Basic mode). To specify an interval value that is not available in Basic Mode in the Console, such as 12 hours, switch to Advanced mode.

<table>
<thead>
<tr>

<td>7 days</td>
</tr>
</tbody>
</table>

To specify a non-default resolution that differs from the interval, use the `SummarizeMetricsData` operation.

See examples of returned data

Example 1: One-minute interval and resolution up to the current time, sent at 10:00 on January 8th. No resolution or end time is specified, so the resolution defaults to the interval value of 1m, and the end time defaults to the current time (2019-01-08T10:00:00.789Z). This request returns a maximum of 7 days of metric data points. The earliest data point possible within this seven-day period would be 10:00 on January 1st (2019-01-01T10:00:00.789Z).

Example 2: Five-minute interval with one-minute resolution up to two days ago, sent at 10:00 on January 8th. Because the resolution drives the maximum time range, a maximum of 7 days of metric data points is returned. While the end time specified was 10:00 on January 6th (2019-01-06T10:00:00.789Z), the earliest data point possible within this seven-day period would be 10:00 on January 1st (2019-01-01T10:00:00.789Z). Therefore, only 5 days of metric data points can be returned in this example.

For alarm queries, the specified `interval` has no effect on the `resolution` of the request. The only valid value of the resolution for an alarm query request is 1m. For more information about the resolution parameter as used in alarm queries, see `Alarm`.

As shown in the following illustration, `resolution` controls the start time of each aggregation window relative to the previous window while `interval` controls the length of the windows. Both requests apply the statistic max to the data within each five-minute window (from the interval), resulting in a single aggregated `data point` representing the highest CPUUtilization counter for that window. Only the resolution value differs. This resolution changes the regularity at which the aggregation windows shift, or the start times of successive aggregation windows. Request A does not specify a resolution and thus uses the default value equal to the interval (5 minutes). This request's five-minute aggregation windows are thus taken from the sets of data points emitted from 0:n to 5:00, 5:n to 10:00, and so forth. Request B specifies a 1-minute resolution, so its five-minute aggregation windows are taken from the set of data points emitted every minute from 0:n to 5:00, 1:n to 6:00, and so forth.
**resource group**

A custom string provided with a custom metric that can be used as a filter or to aggregate results. The resource group must exist in the definition of the posted metric. Only one resource group can be applied per metric.

**statistic**

The aggregation function applied to the given set of raw data points. For supported statistics, see Monitoring Query Language (MQL) Reference on page 4119.

**suppression**

A configuration to avoid publishing messages during the specified time range. Useful for suspending alarm notifications during system maintenance. Each suppression applies to a single alarm. In the Console, you can apply one definition of a suppression to multiple alarms. The result is an individual suppression for each alarm. For instructions on suppressing alarms, see To suppress alarms on page 4116.

**trigger rule**

The condition that must be met for the alarm to be in the firing state. A trigger rule can be based on a threshold or absence of a metric.

**Availability**

The Monitoring service is available in all Oracle Cloud Infrastructure commercial regions. See About Regions and Availability Domains on page 206 for the list of available regions, along with associated locations, region identifiers, region keys, and availability domains.

**Supported Services**

The following services have resources or components that can emit metrics to Monitoring:

- API Gateway - see API Gateway Metrics on page 470
- Application Performance Monitoring - see Application Performance Monitoring Metrics
- Bastion - see Bastion Metrics
- Big Data - see View Cluster Metrics
- Block Volume - see Block Volume Metrics on page 783
- Blockchain Platform - see Blockchain Platform Metrics

Monitoring

Resource Identifiers
Most types of Oracle Cloud Infrastructure resources have a unique, Oracle-assigned identifier called an Oracle Cloud ID (OCID). For information about the OCID format and other ways to identify your resources, see Resource Identifiers.

Note:
Metric resources do not have OCIDs.

Ways to Access Monitoring
You can access the Monitoring service using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface on page 6094.

Console: To access Monitoring using the Console, you must use a supported browser.

Oracle Cloud Infrastructure supports the following browsers and versions:
- Google Chrome 69 or later
- Safari 12.1 or later
- Firefox 62 or later

Open the navigation menu and click Observability & Management. Under Monitoring, click Service Metrics.

API: To access Monitoring through APIs, use Monitoring API for metrics and alarms and Notifications API for notifications (used with alarms).

Moving Alarms to a Different Compartment
You can move alarms from one compartment to another. When you move an alarm to a new compartment, its associated metrics remain where they are. After you move the alarm to the new compartment, inherent policies apply immediately and affect access to the alarm through the Console. For more information on moving resources to other compartments, see To move a resource to a different compartment.

Important:
To move resources between compartments, resource users must have sufficient access permissions on the compartment that the resource is being moved to, as well as the current compartment. For more information about permissions for Monitoring resources, see Details for Monitoring.

Authentication and Authorization
Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference on page 3298.

If you’re a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Administrators: For common policies that give groups access to metrics, see Let users view metric definitions in a compartment and Restrict user access to a specific metric namespace. For a common alarms policy, see Let users view alarms. To authorize resources, such as instances, to make API calls, add the resources to a dynamic group.
Use the dynamic group's matching rules to add the resources, and then create a policy that allows that dynamic group access to metrics. See Let instances make API calls to access monitoring metrics in the tenancy.

**Limits on Monitoring**

See Monitoring Limits on page 267 for a list of applicable limits and instructions for requesting a limit increase.

Other limits include the following.

**Storage Limits**

<table>
<thead>
<tr>
<th>Item</th>
<th>Time range stored</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric definitions</td>
<td>14 days</td>
</tr>
<tr>
<td>Alarm history entries</td>
<td>90 days</td>
</tr>
</tbody>
</table>

**Returned Data Limits (Metrics)**

When you query metrics and view metric charts, the returned data is subject to certain limits. Limits information for returned data includes the 100,000 data point maximum and time range maximums (determined by resolution, which relates to interval). See MetricData Reference.

**Troubleshooting Limits**

If you see an error that the query has exceeded the maximum number of **metric streams**, then update the query to evaluate a number of metric streams that is within the limit. For example, you can reduce the metric streams by specifying dimensions. You can continue to evaluate all metric streams that were in the original query by spreading the metric streams across multiple queries (or alarms).

**Security**

This topic describes security for Monitoring.

For information about how to secure Monitoring, including security information and recommendations, see Securing Monitoring on page 5296.

**Viewing Default Metric Charts**

This topic describes how to view **metric** charts for selected **resources** or a single resource and create **alarms** based on queries used for charts. Charts are available using the Console.

**Prerequisites**

- IAM policies: Viewing metric charts is part of monitoring. To monitor resources, you must be given the required type of access in a **policy** written by an administrator, whether you’re using the Console or the REST API with an SDK, CLI, or other tool. The policy must give you access to the monitoring services as well as the resources being monitored. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you’ve been granted and which **compartment** you should work in. For more information on user authorizations for monitoring, see the Authentication and Authorization section for the related service: Monitoring or Notifications. For common policies that give groups access to metrics, see Let users view metric definitions in a compartment and Restrict user access to a specific metric namespace.
- Metrics exist in Monitoring: The resources that you want to monitor must emit metrics to the Monitoring service.
- Compute instances: To emit metrics, the Compute Instance Monitoring plugin must be enabled on the instance, and plugins must be running. The instance must also have either a service gateway or a public IP address to send metrics to the Monitoring service. For more information, see Enabling Monitoring for Compute Instances on page 1241.

**Working with Default Metric Charts**

For background information on metrics in Oracle Cloud Infrastructure, see Metrics Feature Overview on page 4029. For default metrics by service, see Supported Services on page 4035.
Default metric charts use predefined service queries. You can select resources of interest and update the interval, statistic, and time range.

**Note:**

Very small or large values are indicated by International System of Units (SI units), such as M for mega (10 to the sixth power). Units correspond to the selected metric and do not change by statistic.

**Using the Console**

**To view default metric charts for all resources**

1. Open the navigation menu and click **Observability & Management**. Under **Monitoring**, click **Service Metrics**.
2. Choose a **Compartment** you have permission to work in.
   
   The list of metric namespaces is updated for the selected compartment.
3. Choose the **Metric namespace** for the resource types of interest in the selected compartment.
   
   For example, choose **oci_lbaas** to see metrics for load balancers.

Default charts are displayed for all resources in the selected **Metric namespace** and **Compartment**. Very small or large values are indicated by International System of Units (SI units), such as M for mega (10 to the sixth power).

**Don’t see all expected resources or metrics?**

- Try a different time range.
- Make sure the correct **Compartment** is selected.
- Metric namespaces are shown only when associated resources exist in the selected compartment. For example, the **oci_autonomous_database** namespace is shown only when Autonomous Databases exist in the selected compartment.
- Confirm that the missing resources are emitting metrics. See Enabling Monitoring for Compute Instances on page 1241.
- Review limits information. Limits information for returned data includes the 100,000 data point maximum and time range maximums (determined by resolution, which relates to interval). See MetricData Reference.

**To investigate missing resources or metrics**

- Try a different time range.
- Make sure the correct **Compartment** is selected.
- Metric namespaces are shown only when associated resources exist in the selected compartment. For example, the **oci_autonomous_database** namespace is shown only when Autonomous Databases exist in the selected compartment.
- Confirm that the missing resources are emitting metrics. See Enabling Monitoring for Compute Instances on page 1241.
- Review limits information. Limits information for returned data includes the 100,000 data point maximum and time range maximums (determined by resolution, which relates to interval). See MetricData Reference.

**To filter results**

Filter results to limit the data plotted on the metric chart. For example, filter results to a resource or region of interest.

Filtering of default metric charts is done through selected dimensions; available dimensions vary by metric.

1. Open the navigation menu and click **Observability & Management**. Under **Monitoring**, click **Service Metrics**.
2. Choose a **Compartment** and **Metric namespace** to view the default charts for the resources of interest.
3. To the right of **Dimensions**, click **Add**.
4. In the **Edit dimensions** dialog box, select a **Dimension name** and **Dimension value**.

**Dimension fields**

- **Dimension name**: A qualifier specified in the metric definition. For example, the dimension `resourceId` is specified in the metric definition for `CpuUtilization`.

**Note:**

Long lists of dimensions are trimmed.

- To view dimensions by name, type one or more characters in the box. A refreshed (trimmed) list shows matching dimension names.
- To retrieve all dimensions for a given metric, use the following API operation: `ListMetrics`

- **Dimension value**: The value you want to use for the specified dimension. For example, the resource identifier for your instance of interest.
- + **Additional dimension**: Adds another name-value pair for a dimension.

5. Click **Done**.

The default charts show the filtered results of your query.

**To select different resources**

1. Open the navigation menu and click **Observability & Management**. Under **Monitoring**, click **Service Metrics**.
2. Choose a **Compartment** and **Metric namespace** to view the default charts for the resources of interest.
3. To select resources on a different compartment, select the **Compartment** and then re-select the **Metric namespace**.

The default charts update to show results for the selected compartment.

4. To select a specific resource within the selected compartment, filter results by a resource-specific dimension, such as `resourceDisplayName`:
   a. To the right of **Dimensions**, click **Add**.
   b. For **Dimension name**, select `resourceDisplayName` or other resource-specific dimension.

   **Note:**
   
   Long lists of dimensions are trimmed.
   
   - To view dimensions by name, type one or more characters in the box. A refreshed (trimmed) list shows matching dimension names.
   - To retrieve all dimensions for a given metric, use the following API operation: `ListMetrics`
   
   c. For **Dimension value**, select the value corresponding to the resource you want.
   d. Click **Done**.

   The default charts update to show filtered results.

**To aggregate data from all metric streams**

Aggregate all **metric streams** to return the combined value of all metric streams for the selected statistic. For example, aggregate all metric streams for CPU Utilization to return the combined value across all **resources**.

By default, a chart represents each metric stream with a line, which results in multiple lines per chart. When you aggregate metric streams, a chart represents all metric streams with a single line, which results in just one line per chart.

The **Aggregate metric streams** option is equivalent to the `grouping()` query component.

1. Open the navigation menu and click **Observability & Management**. Under **Monitoring**, click **Service Metrics**.
2. Choose a **Compartment** and **Metric namespace** to view the default charts for the resources of interest.
3. Select **Aggregate metric streams**.
To change the time range

Supported values for interval depend on the specified time range in the metric query (not applicable to alarm queries). More interval values are supported for smaller time ranges. For example, if you select one hour for the time range, then all interval values are supported. If you select 90 days for the time range, then only the \textbf{1h} or \textbf{1d} interval values are supported.

For metric queries, the \textit{interval} you select drives the default \textit{resolution} of the request, which determines the maximum time range of data returned.

For more information about the resolution parameter as used in metric queries, see \texttt{SummarizeMetricsData}.

Maximum time range returned for a query

The maximum time range returned for a metric query depends on the resolution. By default, for metric queries, the resolution is the same as the query interval.

The maximum time range is calculated using the current time, regardless of any specified end time. Following are the maximum time ranges returned for each interval selection available in the Console (Basic mode). To specify an interval value that is not available in Basic Mode in the Console, such as 12 hours, switch to \texttt{Advanced mode}.

<table>
<thead>
<tr>
<th>Interval</th>
<th>Default resolution (metric queries)</th>
<th>Maximum time range returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>1d</td>
<td>1 day</td>
<td>90 days</td>
</tr>
<tr>
<td>1h</td>
<td>1 hour</td>
<td>90 days</td>
</tr>
<tr>
<td>5m</td>
<td>5 minutes</td>
<td>30 days</td>
</tr>
<tr>
<td>1m</td>
<td>1 minute</td>
<td>7 days</td>
</tr>
</tbody>
</table>

To specify a non-default resolution that differs from the interval, use the \texttt{SummarizeMetricsData} operation.

See examples of returned data

Example 1: One-minute interval and resolution up to the current time, sent at 10:00 on January 8th. No resolution or end time is specified, so the resolution defaults to the interval value of \textit{1m}, and the end time defaults to the current time (2019-01-08T10:00:00.789Z). This request returns a maximum of 7 days of metric data points. The earliest data point possible within this seven-day period would be 10:00 on January 1st (2019-01-01T10:00:00.789Z).

Example 2: Five-minute interval with one-minute resolution up to two days ago, sent at 10:00 on January 8th. Because the resolution drives the maximum time range, a maximum of 7 days of metric data points is returned. While the end time specified was 10:00 on January 6th (2019-01-06T10:00:00.789Z), the earliest data point possible within this seven-day period would be 10:00 on January 1st (2019-01-01T10:00:00.789Z). Therefore, only 5 days of metric data points can be returned in this example.

1. Open the navigation menu and click \texttt{Observability & Management}. Under \texttt{Monitoring}, click \texttt{Service Metrics}.
2. Choose a \texttt{Compartment} and \texttt{Metric namespace} to view the default charts for the resources of interest.
3. Select a period of time from \texttt{Quick Selects}.
   For example, \texttt{Last hour}.
4. To specify the start or end of a period time, click in \texttt{Start time} or \texttt{End time} and then type a value.

To change a chart interval or statistic

Supported values for interval depend on the specified time range in the metric query (not applicable to alarm queries). More interval values are supported for smaller time ranges. For example, if you select one hour for the time range, then all interval values are supported. If you select 90 days for the time range, then only the \textbf{1h} or \textbf{1d} interval values are supported.

For metric queries, the \textit{interval} you select drives the default \textit{resolution} of the request, which determines the maximum time range of data returned.

For more information about the resolution parameter as used in metric queries, see \texttt{SummarizeMetricsData}.
**Maximum time range returned for a query**

The maximum time range returned for a metric query depends on the resolution. By default, for metric queries, the resolution is the same as the query interval.

The maximum time range is calculated using the current time, regardless of any specified end time. Following are the maximum time ranges returned for each interval selection available in the Console (Basic mode). To specify an interval value that is not available in Basic Mode in the Console, such as 12 hours, switch to **Advanced mode**.

<table>
<thead>
<tr>
<th>Interval</th>
<th>Default resolution (metric queries)</th>
<th>Maximum time range returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>1d</td>
<td>1 day</td>
<td>90 days</td>
</tr>
<tr>
<td>1h</td>
<td>1 hour</td>
<td>90 days</td>
</tr>
<tr>
<td>5m</td>
<td>5 minutes</td>
<td>30 days</td>
</tr>
<tr>
<td>1m</td>
<td>1 minute</td>
<td>7 days</td>
</tr>
</tbody>
</table>

To specify a non-default resolution that differs from the interval, use the **SummarizeMetricsData** operation.

**See examples of returned data**

Example 1: One-minute interval and resolution up to the current time, sent at 10:00 on January 8th. No resolution or end time is specified, so the resolution defaults to the interval value of 1m, and the end time defaults to the current time (2019-01-08T10:00:00.789Z). This request returns a maximum of 7 days of metric data points. The earliest data point possible within this seven-day period would be 10:00 on January 1st (2019-01-01T10:00:00.789Z).

Example 2: Five-minute interval with one-minute resolution up to two days ago, sent at 10:00 on January 8th. Because the resolution drives the maximum time range, a maximum of 7 days of metric data points is returned. While the end time specified was 10:00 on January 6th (2019-01-06T10:00:00.789Z), the earliest data point possible within this seven-day period would be 10:00 on January 1st (2019-01-01T10:00:00.789Z). Therefore, only 5 days of metric data points can be returned in this example.

1. Open the navigation menu and click **Observability & Management**. Under **Monitoring**, click **Service Metrics**.
2. Choose a **Compartment** and **Metric namespace** to view the default charts for the resources of interest.
3. At the top of the chart you want, select an **Interval** or **Statistic**.

   For supported values, see **Monitoring Query Language (MQL) Reference** on page 4119.

**To go back to the default charts**

On the upper right of the **Service Metrics** page, click **Reset charts**.

**To view chart details**

Chart details include the **query** as a Monitoring Query Language (MQL) expression and the names and OCIDs of represented **resources**.

1. Open the navigation menu and click **Observability & Management**. Under **Monitoring**, click **Service Metrics**.
2. Choose a **Compartment** and **Metric namespace** to view the default charts for the resources of interest.
3. Click the chart you want.
4. To view a list of resources represented in the chart, click the arrow to the left of the query displayed under the chart.

   You can copy the OCID for a resource by clicking **Copy** to the right of the resource OCID.

**To share a chart**

**Note:**

The person you share the chart with must have the required IAM policies for access to metrics.
On the Service Metrics page, on the upper right of the chart you want, go to Options, and then click Copy Chart URL.

**To view a query in Metrics Explorer**

On the Service Metrics page, on the upper right of the chart you want, go to Options, and then click View Query in Metrics Explorer.

**To copy a query (MQL expression)**

On the Service Metrics page, on the upper right of the chart you want, go to Options, and then click Copy Query (MQL).

**To view default metric charts for a single resource**

On the page for the resource of interest, under Resources, click Metrics.

For example, to view metric data for a compute instance:

1. Open the navigation menu and click Compute. Under Compute, click Instances.
2. Click the instance you're interested in.
3. On the instance details page, under Resources, click Metrics.

A chart is shown for each metric. For a list of metrics related to Compute instances, see Compute Instance Metrics on page 1245.

The Console displays the last hour of metric data for the selected resource. A chart is shown for each metric emitted by the selected resource.

For a list of metrics emitted by your resource, see Supported Services on page 4035.

**To create an alarm from a chart query**

Follow the instructions for the page on which the query appears: Service Metrics or Metrics Explorer.

*Service Metrics page*

To create an alarm from a chart query (Service Metrics)

2. Choose a Compartment and Metric namespace to view the default charts for the resources of interest.
3. At the top of the chart you're interested in, go to Options, and then select Create an Alarm on this Query.
4. On the Create Alarm page, under Define alarm, add the trigger, and fill in or update other alarm settings as needed:

   **Alarm settings**

   **Basic Mode (default)**

   By default, this page uses Basic Mode, which separates the metric from its dimensions and its trigger rule.

   • **Alarm name:**

   User-friendly name for the new alarm. This name is sent as the title for notifications related to this alarm. Avoid entering confidential information.

   **Rendering of the title by protocol**

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Rendering of the title</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email</td>
<td>Subject line of the email message.</td>
</tr>
<tr>
<td>HTTPS (Custom URL)</td>
<td>Not rendered.</td>
</tr>
<tr>
<td>PagerDuty</td>
<td>Title field of the published message.</td>
</tr>
<tr>
<td>Slack</td>
<td>Not rendered.</td>
</tr>
</tbody>
</table>
• **Alarm severity**: The perceived type of response required when the alarm is in the firing state.

• **Alarm body**: The human-readable content of the notification delivered. Oracle recommends providing guidance to operators for resolving the alarm condition. Consider adding links to standard runbook practices. Example: "High CPU usage alert. Follow runbook instructions for resolution."

• **Tags (optional)**: If you have permissions to create a resource, then you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags on page 239. If you are not sure whether to apply tags, skip this option (you can apply tags later) or ask your administrator.

• **Metric description**: The metric to evaluate for the alarm condition.
  
  • **Compartment**: The compartment containing the resources that emit the metrics evaluated by the alarm. The selected compartment is also the storage location of the alarm. By default, the first accessible compartment is selected.
  
  • **Metric namespace**: The service or application emitting metrics for the resources that you want to monitor.
  
  • **Resource group (optional)**: The group that the metric belongs to. A resource group is a custom string provided with a custom metric. Not applicable to service metrics.
  
  • **Metric name**: The name of the metric. Only one metric can be specified. Example: `CpuUtilization`

  • **Interval**: The aggregation window, or the frequency at which data points are aggregated.

  **Interval values**

  **Note:**

  Valid alarm intervals depend on the frequency at which the metric is emitted. For example, a metric emitted every five minutes requires a 5-minute alarm interval or higher. Most metrics are emitted every minute, which means most metrics support any alarm interval. To determine valid alarm intervals for a given metric, check the relevant service's metric reference.

  • **1m** - 1 minute
  • **5m** - 5 minutes
  • **1h** - 1 hour
  • **1d** - 1 day

  **Note:**

  For alarm queries, the specified *interval* has no effect on the *resolution* of the request. The only valid value of the resolution for an alarm
query request is 1m. For more information about the resolution parameter as used in alarm queries, see Alarm.

- **Statistic**: The aggregation function.

**Statistic values**

- **Count**: The number of observations received in the specified time period.
- **Max**: The highest value observed during the specified time period.
- **Mean**: The value of Sum divided by Count during the specified time period.
- **Min**: The lowest value observed during the specified time period.
- **P50**: The value of the 50th percentile.
- **P90**: The value of the 90th percentile.
- **P95**: The value of the 95th percentile.
- **P99**: The value of the 99th percentile.
- **P99.5**: The value of the 99.5th percentile.
- **Rate**: The per-interval average rate of change.
- **Sum**: All values added together.

- **Metric dimensions**: Optional filters to narrow the metric data evaluated.

**Dimension fields**

- **Dimension name**: A qualifier specified in the metric definition. For example, the dimension resourceId is specified in the metric definition for CpuUtilization.

**Note:**

Long lists of dimensions are trimmed.

- To view dimensions by name, type one or more characters in the box. A refreshed (trimmed) list shows matching dimension names.
To retrieve all dimensions for a given metric, use the following API operation: `ListMetrics`

- **Dimension value**: The value you want to use for the specified dimension. For example, the resource identifier for your instance of interest.
- **+ Additional dimension**: Adds another name-value pair for a dimension.
- **Aggregate metric streams**: Returns the combined value of all metric streams for the selected statistic. The **Aggregate metric streams** option is equivalent to the `grouping()` query component.
- **Trigger rule**: The condition that must be satisfied for the alarm to be in the firing state. The condition can specify a threshold, such as 90% for CPU Utilization, or an absence.
- **Operator**: The operator used in the condition threshold.
  - **Operator values**
    - greater than
    - greater than or equal to
    - equal to
    - less than
    - less than or equal to
    - **between** (inclusive of specified values)
    - **outside** (inclusive of specified values)
    - absent
- **Value**: The value to use for the condition threshold.
- **Trigger delay minutes**: The number of minutes that the condition must be maintained before the alarm is in firing state.

**Advanced Mode**

Click **Switch to Advanced Mode** to view the alarm query as a Monitoring Query Language (MQL) expression. Edit your query using MQL syntax to aggregate results by group or for additional parameter values. See **Monitoring Query Language (MQL) Reference** on page 4119.

- **Alarm name**: User-friendly name for the new alarm. This name is sent as the title for notifications related to this alarm. Avoid entering confidential information.

**Rendering of the title by protocol**

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Rendering of the title</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email</td>
<td>Subject line of the email message.</td>
</tr>
<tr>
<td>HTTPS (Custom URL)</td>
<td>Not rendered.</td>
</tr>
<tr>
<td>PagerDuty</td>
<td>Title field of the published message.</td>
</tr>
<tr>
<td>Slack</td>
<td>Not rendered.</td>
</tr>
<tr>
<td>SMS</td>
<td>Not rendered.</td>
</tr>
</tbody>
</table>

- **Alarm severity**: The perceived type of response required when the alarm is in the firing state.
- **Alarm body**: The human-readable content of the notification delivered. Oracle recommends providing guidance to operators for resolving the alarm condition. Consider adding links to standard runbook practices. Example: "High CPU usage alert. Follow runbook instructions for resolution."
- **Tags (optional)**: If you have permissions to create a resource, then you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For
more information about tagging, see Resource Tags on page 239. If you are not sure whether to apply tags, skip this option (you can apply tags later) or ask your administrator.

- **Metric description, dimensions, and trigger rule**: The metric to evaluate for the alarm condition, including dimensions and the trigger rule.
  - **Compartment**: The *compartment* containing the resources that emit the metrics evaluated by the alarm. The selected compartment is also the storage location of the alarm. By default, the first accessible compartment is selected.
  - **Metric namespace**: The service or application emitting metrics for the resources that you want to monitor.
  - **Resource group** (optional): The group that the metric belongs to. A resource group is a custom string provided with a custom metric. Not applicable to service metrics.
  - **Query code editor** box: The alarm query as a Monitoring Query Language (MQL) expression.

  **Note:**

  Valid alarm intervals depend on the frequency at which the metric is emitted. For example, a metric emitted every five minutes requires a 5-minute alarm interval or higher. Most metrics are emitted every minute, which means most metrics support any alarm interval. To determine valid alarm intervals for a given metric, check the relevant service's metric reference.

  Example alarm query:

  ```
  CpuUtilization[1m]
  {availabilityDomain=AD1}.groupBy(poolId).percentile(0.9) > 85
  ```

  For query syntax and examples, see Working with Metric Queries on page 4073.

  - **Trigger delay minutes**: The number of minutes that the condition must be maintained before the alarm is in firing state.

  The chart below the Define alarm section dynamically displays the last six hours of emitted metrics according to currently selected fields for the query. Very small or large values are indicated by International System of Units (SI units), such as M for mega (10 to the sixth power).
5. Under Notifications, select or create at least one notification destination:

Notifications settings

- **Destinations**
  - **Destination service**: The provider of the destination to use for notifications.
    - Available options:
      - **Notifications Service**.
      - **Compartment**: The compartment storing the topic to be used for notifications. Can be a different compartment from the alarm and metric. By default, the first accessible compartment is selected.
      - **Topic**: The topic to use for notifications. Each topic supports a subscription protocol, such as PagerDuty.
      - **Create a topic**: Sets up a topic and subscription protocol in the selected compartment, using the specified destination service.

- **Topic name**: User-friendly name for the new topic. Example: "Operations Team" for a topic used to notify operations staff of firing alarms. Avoid entering confidential information.
- **Topic description**: Description of the new topic.
- **Message Format**: Determines the appearance of the messages you receive from this alarm:
  - **Send formatted messages**: Simplified, user-friendly layout.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>To view supported subscription protocols and message types for formatted messages (options other than Raw), see <strong>Friendly Formatting</strong>.</td>
</tr>
</tbody>
</table>

- **Send Pretty JSON messages (raw text with line breaks)**: JSON with new lines and indents.
- **Send raw messages**: Raw JSON blob.

- **Subscription protocol**: Medium of communication to use for the new topic. Configure your subscription for the protocol you want:
  - **Email subscription**: Sends an email message when you publish a message to the subscription's parent topic.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Follow best practices for integrating with Email Delivery. See <strong>Maintain a Positive Email Sender Reputation</strong> on page 4846 and <strong>Set Up Custom Domains for Email</strong> on page 4846.</td>
</tr>
</tbody>
</table>

Message contents and appearance vary by message type. See alarm messages, event messages, and service connector messages.

Some message types allow friendly formatting.

- **Subscription protocol**: Select Email.
- **Subscription Email**: Type an email address.

- **Function subscription**: Runs the specified function when you publish a message to the subscription's parent topic. For example, runs a function to resize VMs when an associated alarm is triggered.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You must have FN_INVOCATION permission against the function to be able to add the function as a subscription to a topic.</td>
</tr>
</tbody>
</table>
The Notifications service has no information about a function after it's invoked. For more details, see the troubleshooting information at Function not invoked or run on page 4876.
Monitoring

Confirmation is not required for function subscriptions.

- **Subscription protocol**: Select **Function**.
- **Function Compartment**: Select the compartment containing your function.
- **Function Application**: Select the application containing your function.
- **Function**: Select your function.

**HTTPS (Custom URL) subscription**

Sends specified information when you publish a *message* to the subscription's parent *topic*.

Endpoint format (URL using HTTPS protocol):

```
https://<anyvalidURL>
```

**Authentication**: Only Basic Access Authentication is supported. For more information, see [RFC-2617](https://example.com). You can specify a username and password in the URL, as in `https://user:password@domain.com` or `https://user@domain.com`.

**Certificates**: Only valid certificate authority (CA) certificates are trusted. No self-signed certificates are allowed.

**Encryption**: As with any subscription protocol, data in the endpoint (including username and password if supplied in the URL) is encrypted in transit over the SSL connection established when using HTTPS, and at rest in the service database.

**POST calls**: The endpoint that you provide must accept POST calls. The Notifications service uses POST calls to send messages to HTTPS (custom URL) endpoints.

**Not supported**: Query parameters are not allowed in URLs. Custom HTTP header parameters are not supported. When sending a message to the URL endpoint, the Notifications service adds standard metadata to the HTTP request in the header.

- **Subscription protocol**: Select **HTTPS (Custom URL)**.
- **Subscription URL**: Type (or copy and paste) the URL you want to use as the endpoint.

**PagerDuty subscription**

Creates a PagerDuty incident by default when you publish a *message* to the subscription's parent *topic*.

Endpoint format (URL):

```
https://events.pagerduty.com/integration/<integrationkey>/enqueue
```

Query parameters are not allowed in URLs.

To create an endpoint for a PagerDuty subscription (set up and retrieve an integration key), see the [PagerDuty documentation](https://example.com).

- **Subscription protocol**: Select **PagerDuty**.
- **Subscription URL**: Type (or copy and paste) the *integration key* portion of the URL for your PagerDuty subscription. (The other portions of the URL are hard-coded.)

**Slack subscription**

Sends a message to the specified Slack channel by default when you publish a *message* to the subscription's parent *topic*.

Message contents and appearance vary by message type. See [alarm messages](https://example.com), [event messages](https://example.com), and [service connector messages](https://example.com).

Sends a message to the specified Slack channel by default when you publish a *message* to the subscription's parent *topic*. 
Endpoint format (URL):

https://hooks.slack.com/services/<webhook-token>

The <webhook-token> portion of the URL contains two slashes (/).

Query parameters are not allowed in URLs.

To create an endpoint for a Slack subscription (using a webhook for your Slack channel), see the Slack documentation.

- **Subscription protocol**: Select Slack.
- **Subscription URL**: Type (or copy and paste) the Slack endpoint, including your webhook token.

**SMS subscription**

Sends a text message using Short Message Service (SMS) to the specified phone number when you publish a *message* to the subscription's parent *topic*. Supported endpoint formats: E.164 format.

**Note:**

International SMS capabilities are required if SMS messages come from a phone number in another country. We continuously add support for more countries so that more users can receive SMS messages from local phone numbers.

SMS subscriptions are enabled only for messages sent by the following Oracle Cloud Infrastructure services: Monitoring, Service Connector Hub. SMS messages sent by unsupported services are dropped. **Troubleshoot dropped messages.**

The Notifications service delivers SMS messages from a preconfigured pool of numbers. You might receive SMS messages from multiple numbers.

Message contents and appearance vary by message type. See alarm messages, event messages, and service connector messages.

**Available Countries and Regions**

You can use Notifications to send SMS messages to the following countries and regions:

<table>
<thead>
<tr>
<th>Country or region</th>
<th>ISO code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Australia</td>
<td>AU</td>
</tr>
<tr>
<td>Brazil</td>
<td>BR</td>
</tr>
<tr>
<td>Canada</td>
<td>CA</td>
</tr>
<tr>
<td>Chile</td>
<td>CL</td>
</tr>
<tr>
<td>China</td>
<td>CN</td>
</tr>
<tr>
<td>Costa Rica</td>
<td>CR</td>
</tr>
<tr>
<td>Croatia</td>
<td>HR</td>
</tr>
<tr>
<td>Czechia</td>
<td>CZ</td>
</tr>
<tr>
<td>France</td>
<td>FR</td>
</tr>
<tr>
<td>Germany</td>
<td>DE</td>
</tr>
<tr>
<td>Hungary</td>
<td>HU</td>

<tr>
<td>Ukraine</td>
<td>UA</td>
</tr>
<tr>
<td>United Arab Emirates</td>
<td>AE</td>
</tr>
<tr>
<td>United Kingdom</td>
<td>GB</td>
</tr>
</tbody>
</table>
Subscription protocol: Select SMS.
Country: Select the country for the phone number.
Phone Number: Enter the phone number, using E.164 format. Example: +14255550100
+ Additional destination service: Adds another destination service and topic to use for notifications.

Note:
Each alarm is limited to one destination per supported destination service.

Repeat notification?: While the alarm is in the firing state, resends notifications at the specified interval.
Notification frequency: The period of time to wait before resending the notification.
Suppress notifications: Sets up a suppression time window during which to suspend evaluations and notifications. Useful for avoiding alarm notifications during system maintenance periods.

Suppression description
Start time
End time
