Preface

This guide describes how to configure this adapter as a connection in an integration in Oracle Integration.

Note:

The use of this adapter may differ depending on the features you have, or whether your instance was provisioned using Standard or Enterprise edition. These differences are noted throughout this guide.

Topics:

- [Audience](#)
- [Documentation Accessibility](#)
- [Diversity and Inclusion](#)
- [Related Resources](#)
- [Conventions](#)

Audience

This guide is intended for developers who want to use this adapter in integrations in Oracle Integration.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <https://www.oracle.com/corporate/accessibility/>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <https://support.oracle.com/portal/> or visit [Oracle Accessibility Learning and Support](#) if you are hearing impaired.

Diversity and Inclusion

Oracle is fully committed to diversity and inclusion. Oracle respects and values having a diverse workforce that increases thought leadership and innovation. As part of our initiative to build a more inclusive culture that positively impacts our employees, customers, and partners, we are working to remove insensitive terms from our products and documentation.

We are also mindful of the necessity to maintain compatibility with our customers' existing technologies and the need to ensure continuity of service as Oracle's offerings and industry standards evolve. Because of these technical constraints, our effort to remove insensitive terms is ongoing and will take time and external cooperation.

Related Resources

See these Oracle resources:

- Oracle Cloud at <http://cloud.oracle.com>
- *Using Integrations in Oracle Integration 3*
- *Using the Oracle Mapper with Oracle Integration 3*
- Oracle Integration documentation on the Oracle Help Center.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

1

Understand the AS2 Adapter

Review the following conceptual topics to learn about the AS2 Adapter and how to use it as a connection in integrations in Oracle Integration. A typical workflow of adapter and integration tasks is also provided.

Topics:

- [AS2 Adapter Capabilities](#)
- [AS2 Adapter Restrictions](#)
- [What Application Version Is Supported?](#)
- [Workflow to Create and Add an AS2 Adapter Connection to an Integration](#)

Note:

There are overall service limits for Oracle Integration. A service limit is the quota or allowance set on a resource. See [Service Limits](#).

AS2 Adapter Capabilities

The AS2 Adapter enables you to create an integration between an AS2 trading partner and Oracle Integration. Applicability Statement 2 (AS2) is a protocol for transporting structured business-to-business (B2B) data securely and reliably over the internet. Security is achieved by using digital certificates, encryption, and message compression.

See [What Is B2B for Oracle Integration](#) in *Using B2B for Oracle Integration 3*.

The AS2 Adapter provides the following benefits:

- Support for connecting to private resources that are in your virtual cloud network (VCN) with a private endpoint. See [Connect to Private Resources](#) in *Provisioning and Administering Oracle Integration 3* and [Configure the Endpoint Access Type](#). This type of connection does not use the connectivity agent.
- Trigger and invoke connections for handling inbound and outbound AS2 messages.
- Encryption/decryption, signing/signature verification, and compression/decompression of messages as per AS2 specifications.
- Supports the following payload types: EDI, XML, or anything that AS2 can support.
- Establishes a connection to the AS2-compliant B2B system to enable sending or receiving messages.
- Supports receiving and sending business messages or MDN acknowledgments.
- Enables you to configure outbound and inbound message delivery using the Adapter Endpoint Configuration Wizard.

- Sends business messages and consumes synchronous MDN acknowledgment in the outbound direction. Produces an encrypted, signed, and compressed business message.
- Consumes business messages and MDN acknowledgments in the inbound direction. Synchronous and asynchronous MDN acknowledgment deliveries are supported.
- Supports basic and advanced security policies. If you select the **Invoke** or **Trigger and invoke** role when creating an AS2 Adapter connection, you can optionally select to use two-way SSL connections in the outbound direction. See [Configure Connection Properties](#).

You can configure the AS2 Adapter as a trigger or an invoke connection in an integration in Oracle Integration. The AS2 Adapter is one of many predefined adapters included with Oracle Integration. See the Adapters page in the Oracle Help Center.

AS2 Adapter Restrictions

Note the following AS2 Adapter restrictions.

- When uploading an SSL certificate, select only the X.509 (SSL transport) type. The AS2 Adapter does not support selecting the SAML (Authentication & Authorization) or PGP (Encryption & Decryption) type. See [Upload a Certificate to Connect with External Services](#).
- Connectivity to an on-premises B2B system through the connectivity agent is not supported.
- Persistence of messages by the AS2 Adapter is not supported. Instead, design persistence in the overall integration.

What Application Version Is Supported?

For information about which application version is supported by this adapter, see the [Connectivity Certification Matrix](#).

Workflow to Create and Add an AS2 Adapter Connection to an Integration

You follow a very simple workflow to create a connection with an adapter and include the connection in an integration in Oracle Integration.

This table lists the workflow steps for both the adapter tasks and the overall integration tasks, and provides links to instructions for each step.

Step	Description	More Information
1	Access Oracle Integration.	Go to <code>https://instance_URL/ic/home/</code>
2	Create the adapter connections for the applications you want to integrate. The connections can be reused in multiple integrations and are typically created by the administrator.	Create an AS2 Adapter Connection

Step	Description	More Information
3	Create the integration. When you do this, you add trigger (source) and invoke (target) connections to the integration.	Create Integrations in <i>Using Integrations in Oracle Integration 3</i> and Add the AS2 Adapter Connection to an Integration
4	Map data between the trigger connection data structure and the invoke connection data structure.	Map Data in <i>Using Integrations in Oracle Integration 3</i>
5	(Optional) Create lookups that map the different values used by those applications to identify the same type of object (such as gender codes or country codes).	Manage Lookups in <i>Using Integrations in Oracle Integration 3</i>
6	Activate the integration.	Activate Integrations in <i>Using Integrations in Oracle Integration 3</i>
7	Monitor the integration on the dashboard.	Monitor Integrations in <i>Using Integrations in Oracle Integration 3</i>
8	Track payload fields in messages during runtime.	Assign Business Identifiers for Tracking Fields in Messages and Manage Business Identifiers for Tracking Fields in Messages in <i>Using Integrations in Oracle Integration 3</i>
9	Manage errors at the integration level, connection level, or specific integration instance level.	Manage Errors in <i>Using Integrations in Oracle Integration 3</i>

2

Create an AS2 Adapter Connection

A connection is based on an adapter. You define connections to the specific cloud applications that you want to integrate. The following topics describe how to define connections.

Topics:

- [Prerequisites for Creating a Connection](#)
- [Create a Connection](#)
- [Upload a Certificate to Connect with External Services](#)

Prerequisites for Creating a Connection

Satisfy the following prerequisites specific to your environment to create a connection with the AS2 Adapter:

This information is required to create an AS2 Adapter connection on the Connections page. See [Configure Connection Properties](#) and [Configure Connection Security](#).

- [Trading Partner Endpoint Prerequisites](#)
- [Certificate and Private Key Prerequisites](#)
- [AS2 Advanced Policy Prerequisites](#)
- [AS2 Basic Policy Prerequisites](#)
- [Two-Way SSL Connections in the Outbound Direction Prerequisites](#)

Trading Partner Endpoint Prerequisites

- Ensure that the trading partner's AS2 endpoint to use is reachable from Oracle Integration.
- Know the URL of the trading partner endpoint at which to receive AS2 messages.

Certificate and Private Key Prerequisites

Ensure that the necessary certificates and private keys used for encryption, decryption, signature generation, and signature verification are uploaded. See [Upload a Certificate to Connect with External Services](#).

AS2 Advanced Policy Prerequisites

To use the AS2 Advanced Policy, know the following information based on what you plan to configure on the Connections page:

- Asynchronous MDN username and password
- AS2 decryption private key alias and key password
- MDN signature private key alias and key password

- Inbound AS2 sign verify certificate alias
- Inbound MDN sign verify certificate alias
- AS2 endpoint username and password
- AS2 signature private key alias and password
- Outbound AS2 encrypt certificate alias
- Response MDN sign verify certificate alias

AS2 Basic Policy Prerequisites

To use the AS2 Basic Policy, know the following information based on what you plan to configure on the Connections page:

- HTTP authentication username and password
- Private key alias and password
- Partner certificate alias

Two-Way SSL Connections in the Outbound Direction Prerequisites

If you want to use two-way SSL connections in the outbound direction, perform the following steps.

Note:

Two-way SSL connections in the inbound (trigger) direction are not supported.

1. Generate a client certificate. The tasks are similar to what you perform for the REST Adapter or SOAP Adapter, except that the transport layer security (TLS) version is not needed. For an overview, see [Create a Keystore File for a Two-Way, SSL-Based Integration in *Using the REST Adapter with Oracle Integration 3*](#).
2. Upload the certificate as an X.509 Identity. See [Upload a Certificate to Connect with External Services](#).
3. Remember the key alias you use.
4. Configure a two-way SSL connection. See [Configure Connection Properties](#). The settings you configure on the Connections page are used at runtime by the AS2 Adapter to perform SSL client authentication for two types of outgoing messages:
 - An AS2 outbound business message.
 - An outgoing asynchronous MDN message sent in response to an inbound AS2 business message.

Create a Connection

Before you can build an integration, you must create the connections to the applications with which you want to share data.

To create a connection in Oracle Integration:

1. In the navigation pane, click **Design**, then **Connections**.
2. Click **Create**.

 **Note:**

You can also create a connection in the integration canvas. See Define Inbound Triggers and Outbound Invokes.

3. In the Create connection panel, select the adapter to use for this connection. To find the adapter, scroll through the list, or enter a partial or full name in the **Search** field.
4. Enter the information that describes this connection.

Element	Description
Name	Enter a meaningful name to help others find your connection when they begin to create their own integrations.
Identifier	Automatically displays the name in capital letters that you entered in the Name field. If you modify the identifier name, don't include blank spaces (for example, SALES OPPORTUNITY).
Role	Select the role (direction) in which to use this connection (trigger, invoke, or both). Only the roles supported by the adapter are displayed for selection. When you select a role, only the connection properties and security policies appropriate to that role are displayed on the Connections page. If you select an adapter that supports both invoke and trigger, but select only one of those roles, you'll get an error when you try to drag the adapter into the section you didn't select. For example, assume you configure a connection for the Oracle Service Cloud (RightNow) Adapter as only an invoke . Dragging the adapter to a trigger section in the integration produces an error.
Keywords	Enter optional keywords (tags). You can search on the connection keywords on the Connections page.
Description	Enter an optional description of the connection.

Element	Description
Share with other projects	<p>Note: This field only appears if you are creating a connection in a project.</p> <p>Select to make this connection publicly available in other projects. Connection sharing eliminates the need to create and maintain separate connections in different projects.</p> <p>When you configure an adapter connection in a different project, the Use a shared connection field is displayed at the top of the Connections page. If the connection you are configuring matches the same type and role as the publicly available connection, you can select that connection to reference (inherit) its resources. See Add and Share a Connection Across a Project.</p>

5. Click **Create**.

Your connection is created. You're now ready to configure the connection properties, security policies, and (for some connections) access type.

Configure Connection Properties

Enter AS2 Adapter connection information so your application can process requests.

1. Go to the **Properties** section.
2. In the **AS2 service URL** field, specify the URL of the trading partner endpoint at which AS2 messages are received.

This field is only displayed when configuring the AS2 Adapter as an invoke connection. There are no connection properties required when configuring the AS2 Adapter as a trigger connection.

3. If you selected the **Invoke** or **Trigger and invoke** role, optionally select to use two-way SSL connections in the outbound direction. This feature is not available if you select the **Trigger** role. Ensure that you have first completed all two-way SSL connection prerequisites. See [Prerequisites for Creating a Connection](#).

 **Note:**

If you need to use both asynchronous message disposition notifications (MDNs) and two-way SSL, ensure that you selected the **Trigger and invoke** role when creating the AS2 Adapter connection.

- a. From the **Enable two-way SSL for outbound connections** list, select **Yes** if you want to enable two-way SSL for outbound connections. Otherwise, select **No**.
- b. In the **Client identity key alias (two way SSL)** field, enter the certificate alias to use to establish client identity during two-way SSL communication.

If the test connection fails because two-way SSL communication didn't happen correctly, note that different servers may respond differently. See [Troubleshoot Two-Way SSL Connections](#).

Configure Connection Security

Configure security for your AS2 Adapter connection by selecting the security policy and associated credentials and certificates.

1. Go to the **Security** section.
2. Select the security policy and enter the associated credentials.

Note:

- All credential fields are optional by default. However, they are required for achieving various levels of message security. See the Comments column in the tables below.
- Import the partner certificates and private keys described in this section on the Certificates page available by selecting **Settings**, and then **Certificates**. Upload of only the **X.509 (SSL transport)** type is supported. See [Upload a Certificate to Connect with External Services](#).

a. If you select **AS2 Advanced Policy**:

This security policy provides finer control and flexibility for using separate certificates and keys for different operations (for example, encrypt, decrypt, sign, and sign verify). This security policy enables you to specify separate usernames and passwords for AS2 and MDN authentication.

Login Credentials	Comments
<ul style="list-style-type: none"> • Username (async MDN): Enter the username used by a trigger connection for authentication when sending an outbound MDN. This is used when asynchronous MDN is requested by an inbound AS2 message. • Password (async MDN): Enter the password used by a trigger connection for authentication when sending an outbound MDN. 	<p>These are optional fields, but are required for sending asynchronous MDN acknowledgments to a partner's secured endpoint.</p>
<ul style="list-style-type: none"> • Private key alias (AS2 decryption): Enter the private key alias used by a trigger connection for inbound data decryption. This is the same key that you upload for the Identity category of the X.509 (SSL transport) type by selecting Settings, and then Certificates. • Key password (AS2 decryption): Enter the password for the private key used by a trigger connection for inbound data decryption. 	<p>These are optional fields, but are required for inbound data decryption of business messages.</p>

Login Credentials	Comments
<ul style="list-style-type: none"> • Private key alias (MDN Signature): Enter the private key used by a trigger connection to deliver the signed MDN. This is the same key that you upload for the Identity category of the X.509 (SSL transport) type by selecting Settings, and then Certificates. • Key password (MDN signature): Enter the password for the private key used by a trigger connection to deliver the signed MDN. 	<p>These are optional fields, but are required for outbound signature generation of MDN acknowledgments.</p>
<ul style="list-style-type: none"> • Certificate alias (inbound AS2 sign verify): Enter the partner public certificate used by a trigger connection for inbound AS2 signature verification. This is the same certificate that you upload for the Trust category of the X.509 (SSL transport) type by selecting Settings, and then Certificates. 	<p>This is an optional field, but is required for inbound signature verification of business messages.</p>
<ul style="list-style-type: none"> • Certificate alias (inbound MDN sign verify): Enter the partner public certificate used by a trigger connection for inbound MDN signature verification. This is the same certificate that you upload for the Trust category of the X.509 (SSL transport) type by selecting Settings, and then Certificates. 	<p>This is an optional field, but is required for inbound signature verification of MDN acknowledgments.</p>
<ul style="list-style-type: none"> • Username (AS2 endpoint): Enter the username used by an invoke connection for sending an AS2 message to a protected partner endpoint. • Password (AS2 endpoint): Enter the password required for sending the AS2 message to the protected partner endpoint. 	<p>These are optional fields, but are required for sending business messages to a partner's secured endpoint.</p>
<ul style="list-style-type: none"> • Private key alias (AS2 signature): Enter the private key used by an invoke connection to send a signed AS2 message. This is the same key that you upload for the Identity category of the X.509 (SSL transport) type by selecting Settings, and then Certificates. • Key password (AS2 signature): Enter the password associated with the private key (AS2 signature) uploaded on the Certificates page by selecting Settings, and then Certificates. 	<p>These are optional fields, but are required for outbound signature generation of business messages.</p>
<ul style="list-style-type: none"> • Certificate alias (outbound AS2 encrypt): Enter the partner public certificate used by an invoke action for outbound AS2 message encryption. This is the same certificate that you upload for the Trust category of the X.509 (SSL transport) type by selecting Settings, and then Certificates. 	<p>This is an optional field, but is required for outbound data encryption of business messages.</p>

Login Credentials	Comments
<ul style="list-style-type: none"> • Certificate alias (response MDN sign verify): Enter the partner public certificate used by an invoke action for response MDN signature verification. This is the same certificate that you upload for the Trust category of the X.509 (SSL transport) type by selecting Settings, and then Certificates. 	This is an optional field, but is required for signature verification of synchronous MDN responses in adapter invoke operations.

b. If you select **AS2 Basic Policy**.

This security policy requires you to specify minimal configuration details to work in an integration.

Login Credentials	Comments
<ul style="list-style-type: none"> • Username: Enter the username used for HTTP authentication of the trading partner's protected endpoint. • Password: Enter the password used for HTTP authentication. 	These are optional fields, but are required for sending business messages and asynchronous MDN acknowledgments to a partner's secured endpoint.
<ul style="list-style-type: none"> • Private key alias: Enter the private key used for inbound data decryption and outbound signature generation. This is the same key that you upload for the Identity category of the X.509 (SSL transport) type by selecting Settings, and then Certificates. • Key password: Enter the password associated with the private key that you upload on the Certificates page by selecting Settings, and then Certificates. 	These are optional fields, but are required for inbound data decryption of business messages and outbound signature generation for business messages and MDN acknowledgments.
<ul style="list-style-type: none"> • Partner certificate alias: Enter the partner certificate used for outbound data encryption and inbound signature verification. This is the same key that you upload for the Trust category of the X.509 (SSL transport) type by selecting Settings, and then Certificates. 	This is an optional field, but is required for outbound data encryption of business messages, signature verification of synchronous MDN responses in adapter invoke operations, and inbound signature verification of business messages and MDN acknowledgments.

Configure the Endpoint Access Type

Configure access to your endpoint. Depending on the capabilities of the adapter you are configuring, options may appear to configure access to the public internet, to a private endpoint, or to an on-premises service hosted behind a fire wall.

- [Select the Endpoint Access Type](#)
- [Ensure Private Endpoint Configuration is Successful](#)

Select the Endpoint Access Type

Select the option for accessing your endpoint.

Option	This Option Appears If Your Adapter Supports ...
Public gateway	Connections to endpoints using the public internet.
Private endpoint	Connections to endpoints using a private virtual cloud network (VCN). Note: To connect to private endpoints, you must complete prerequisite tasks in the Oracle Cloud Infrastructure Console. Failure to do so results in errors when testing the connection. See Connect to Private Resources in <i>Provisioning and Administering Oracle Integration 3</i> and Troubleshoot Private Endpoints in <i>Using Integrations in Oracle Integration 3</i> .

Ensure Private Endpoint Configuration is Successful

- To connect to private endpoints, you must complete prerequisite tasks in the Oracle Cloud Infrastructure Console. Failure to do so results in errors when testing the connection. See Connect to Private Resources in *Provisioning and Administering Oracle Integration 3*.
- When configuring an adapter on the Connections page to connect to endpoints using a private network, specify the fully-qualified domain name (FQDN) and *not* the IP address. If you enter an IP address, validation fails when you click **Test**.
- IPSec tunneling and FastConnect are not supported for use with private endpoints.

Test the Connection

Test your connection to ensure that it's configured successfully.

1. In the page title bar, click **Test**. What happens next depends on whether your adapter connection uses a Web Services Description Language (WSDL) file. Only some adapter connections use WSDLs.

If Your Connection...	Then...
Doesn't use a WSDL	The test starts automatically and validates the inputs you provided for the connection.
Uses a WSDL	A dialog prompts you to select the type of connection testing to perform: <ul style="list-style-type: none"> • Validate and Test: Performs a full validation of the WSDL, including processing of the imported schemas and WSDLs. Complete validation can take several minutes depending on the number of imported schemas and WSDLs. No requests are sent to the operations exposed in the WSDL. • Test: Connects to the WSDL URL and performs a syntax check on the WSDL. No requests are sent to the operations exposed in the WSDL.

2. Wait for a message about the results of the connection test.
 - If the test was successful, then the connection is configured properly.

- If the test failed, then edit the configuration details you entered. Check for typos and verify URLs and credentials. Continue to test until the connection is successful.
3. When complete, click **Save**.

Upload a Certificate to Connect with External Services

Certificates allow Oracle Integration to connect with external services. If the external service/ endpoint needs a specific certificate, request the certificate and then import it into Oracle Integration.

If you make an SSL connection in which the root certificate does not exist in Oracle Integration, an exception error is thrown. In that case, you must upload the appropriate certificate. A certificate enables Oracle Integration to connect with external services. If the external endpoint requires a specific certificate, request the certificate and then upload it into Oracle Integration.

1. Sign in to Oracle Integration.
2. In the navigation pane, click **Settings**, then **Certificates**.
All certificates currently uploaded to the trust store are displayed on the Certificates page.
3. Click **Filter**  to filter by name, certificate expiration date, status, type, category, and installation method (user-installed or system-installed). Certificates installed by the system cannot be deleted.

Name	Type	Category	Status
akt_ppgPublic <small>Expires in 77 Years</small>	PGP	Public	Configured
akt_ppgPrivate <small>Expires in 77 Years</small>	PGP	Private	Configured
testppgpublic <small>Expires in 77 Years</small>	PGP	Public	Configured
testppgsecret <small>Expires in 77 Years</small>	PGP	Private	Configured
elq_cert1 <small>Expired</small>	X.509	Trust	Configured
Eqjr_CloudCA <small>Expires in 94 Years</small>	SAML	Message Protection	Configured
qa_lan <small>Expires in 99 Years</small>	X.509	Trust	Configured
OpportunityServiceSoapHttpPort <small>Expires in 1 Months</small>	X.509	Trust	Configured
DigiCertCA2 <small>Expires in 6 Years</small>	X.509	Trust	Configured
SG-Utilities <small>Expired</small>	X.509	Trust	Configured
app_elq_p01 <small>Expires in 8 Years</small>	X.509	Trust	Configured

4. Click **Upload** at the top of the page.
The Upload certificate panel is displayed.
5. Enter an alias name and optional description.
6. In the **Type** field, select the certificate type. Each certificate type enables Oracle Integration to connect with external services.
 - [Digital Signature](#)
 - [X.509 \(SSL transport\)](#)
 - [SAML \(Authentication & Authorization\)](#)
 - [PGP \(Encryption & Decryption\)](#)
 - [Signing key](#)

Digital Signature

The digital signature security type is typically used with adapters created with the Rapid Adapter Builder. See Learn About the Rapid Adapter Builder in Oracle Integration in *Using the Rapid Adapter Builder with Oracle Integration 3*.

1. Click **Browse** to select the digital certificate. The certificate must be an X509Certificate. This certificate provides inbound RSA signature validation. See Implement Digital Signature Validation (RSA) in *Using the Rapid Adapter Builder with Oracle Integration 3*.
2. Click **Upload**.

X.509 (SSL transport)

1. Select a certificate category.
 - a. **Trust**: Use this option to upload a trust certificate.
 - i. Click **Browse**, then select the trust file (for example, `.cer` or `.crt`) to upload.
 - b. **Identity**: Use this option to upload a certificate for two-way SSL communication.
 - i. Click **Browse**, then select the keystore file (`.jks`) to upload.
 - ii. Enter the comma-separated list of passwords corresponding to key aliases.

 **Note:**

When an identity certificate file (`.jks`) contains more than one private key, all the private keys must have the same password. If the private keys are protected with different passwords, the private keys cannot be extracted from the keystore.

- iii. Enter the password of the keystore being imported.
- c. Click **Upload**.

SAML (Authentication & Authorization)

1. Note that **Message Protection** is automatically selected as the only available certificate category and cannot be deselected. Use this option to upload a keystore certificate with SAML token support. Create, read, update, and delete (CRUD) operations are supported with this type of certificate.
2. Click **Browse**, then select the certificate file (`.cer` or `.crt`) to upload.
3. Click **Upload**.

PGP (Encryption & Decryption)

1. Select a certificate category. Pretty Good Privacy (PGP) provides cryptographic privacy and authentication for communication. PGP is used for signing, encrypting, and decrypting files. You can select the private key to use for encryption or decryption when configuring the stage file action.

- a. **Private:** Uses a private key of the target location to decrypt the file.
 - i. Click **Browse**, then select the PGP file to upload.
 - ii. Enter the PGP private key password.
- b. **Public:** Uses a public key of the target location to encrypt the file.
 - i. Click **Browse**, then select the PGP file to upload.
 - ii. In the **ASCII-Armor Encryption Format** field, select **Yes** or **No**.
 - **Yes** shows the format of the encrypted message in ASCII armor. ASCII armor is a binary-to-textual encoding converter. ASCII armor formats encrypted messaging in ASCII. This enables messages to be sent in a standard messaging format. This selection impacts the visibility of message content.
 - **No** causes the message to be sent in binary format.
 - iii. From the **Cipher Algorithm** list, select the algorithm to use. Symmetric-key algorithms for cryptography use the same cryptographic keys for both encryption of plain text and decryption of cipher text. The following supported cipher algorithms are FIPS-compliant:
 - AES128
 - AES192
 - AES256
 - TDES
- c. Click **Upload**.

Signing key

A signing key is a secret key used to establish trust between applications. Signing keys are used to sign ID tokens, access tokens, SAML assertions, and more. Using a private signing key, the token is digitally signed and the server verifies the authenticity of the token by using a public signing key. You must upload a signing key to use the OAuth Client Credentials using JWT Client Assertion and OAuth using JWT User Assertion security policies in REST Adapter invoke connections. Only PKCS1- and PKCS8-formatted files are supported.

1. Select **Public** or **Private**.
2. Click **Browse** to upload a key file.

If you selected **Private**, and the private key is encrypted, a field for entering the private signing key password is displayed after key upload is complete.
3. Enter the private signing key password. If the private signing key is not encrypted, you are not required to enter a password.
4. Click **Upload**.

Add the AS2 Adapter Connection to an Integration

When you drag the AS2 Adapter into the trigger or invoke area of an integration, the Adapter Endpoint Configuration Wizard is invoked. This wizard guides you through configuration of the AS2 Adapter endpoint properties.

The following sections describe the wizard pages that guide you through configuration of the AS2 Adapter as a trigger or invoke in an integration.

Topics:

- [Basic Info Page](#)
- [Trigger Actions Page](#)
- [Trigger Identifiers Page](#)
- [Invoke Identifiers Page](#)
- [Invoke Headers and Packaging Page](#)
- [Invoke MDN Options Page](#)
- [Summary Page](#)

Basic Info Page

You can enter a name and description on the Basic Info page of each adapter in your integration.

Element	Description
What do you want to call your endpoint?	Provide a meaningful name so that others can understand the responsibilities of this connection. You can include English alphabetic characters, numbers, underscores, and hyphens in the name. You can't include the following characters: <ul style="list-style-type: none">• No blank spaces (for example, My Inbound Connection)• No special characters (for example, #;83& or righ(t)now4) except underscores and hyphens• No multibyte characters
What does this endpoint do?	Enter an optional description of the connection's responsibilities. For example: <code>This connection receives an inbound request to synchronize account information with the cloud application.</code>

Element	Description
B2B Trading Partner mode	Select this option only if you want to: <ul style="list-style-type: none"> • Create B2B trading partners and agreements in your integration with the AS2 Adapter. See Manage Trading Partners in <i>Using B2B for Oracle Integration 3</i>. • Monitor B2B message communication between the trading partners during runtime from the Track B2B Messages page. See Track B2B Messages in <i>Using B2B for Oracle Integration 3</i>.
Standalone mode	Select this option to use the AS2 Adapter independent of any trading partners, agreements, or B2B message tracking functionality.

Trigger Actions Page

Select the type of inbound AS2 message for the endpoint to handle.

Element	Description
What type of inbound AS2 messages will this endpoint handle	<ul style="list-style-type: none"> • Business Messages: Select to receive inbound messages such as purchase orders. • MDN Acknowledgments: Select to receive the AS2 inbound message delivery notification (MDN) that your partner can send back to acknowledge the messages you sent them.

Trigger Identifiers Page

Specify the Oracle Integration host and remote trading partner AS2 identifiers to validate incoming messages. For incoming messages, all message decompression, signature verification, and decryption actions are handled by the AS2 Adapter trigger connection without the need for you to explicitly configure this security information.

Element	Description
Partner's AS2 Identifier (AS2-From):	Specify the remote trading partner that sends the inbound message.
Host AS2 Identifier (AS2-To):	Specify the Oracle Integration host that receives the inbound message.

Invoke Identifiers Page

Specify the Oracle Integration host and remote partner AS2 identifiers. AS2 identifiers identify trading partners in AS2 transactions.

Element	Description
Host AS2 Identifier (AS2-From):	Specify the Oracle Integration host that sends the message to the remote trading partner.

Element	Description
Partner's AS2 Identifier (AS2-To):	Specify the remote trading partner that receives the message.

Invoke Headers and Packaging Page

Configure the AS2 message for the outbound operation. You can specify message security details such as encryption, signing, and compression.

Element	Description
What is the subject for outbound AS2 messages?	Provide the subject of the message that is sent to the trading partner. You can override this value during runtime by specifying a value in the mapper.
What is the content type of the payload?	Select the payload content type (for example, <code>application/edi-x12</code>) to use from the list. To specify a content type that is not available in the list, select Other Media Type . This selection activates the Other Media Type field for you to enter the value. You can override this value during runtime by specifying a value in the mapper.
Encrypt Outbound Message	Select the checkbox, then select an algorithm from the Encryption Algorithm list to use to encrypt the message. The trading partner that receives the message must support the encryption algorithm you select. Note: The trading partner's public certificate is required. Ensure that the key is configured on the Connections page.
Sign Outbound Message	Select the checkbox, then select an algorithm from the Signing Algorithm list to use to sign the message. The trading partner that receives the message must support the signing algorithm you select. Note: A private key is required. Ensure that the key is configured on the Connections page.
Compress Outbound Message	<ul style="list-style-type: none"> • Digitally Sign first, then Compress: Sign the outbound message before compressing it. • Compress first, then Digitally Sign: Compress the outbound message before signing it. <p>The order you select is based on what the trading partner that receives the message can support.</p>

Invoke MDN Options Page

Specify if you want the recipient trading partner to send back a message delivery notification (MDN).

Element	Description
What type of MDN will this endpoint request to the trading partner?	<ul style="list-style-type: none"> • Sync: Request that the MDN be sent immediately in the response. • Async: Request that the MDN be sent separately from the outbound message. This option requires a separate integration to receive the MDN. • None: Request that no MDN be sent back.
Flow Identifier (if Async option is selected)	Specify the flow identifier name to receive the asynchronous MDN from the partner. (for example, <code>AS2_MDN_RECEIVER</code>). This is the name of a completely separate integration.
Flow Version (if Async option is selected)	Specify the complete flow version (for example, <code>01.00.0000</code>).
Request the MDN be digitally signed by the trading partner	<p>Select whether the adapter should request a digitally-signed MDN from the trading partner.</p> <p>Note: A partner public certificate is required to verify the signed MDN. The certificate to be configured depends on the synchronous or asynchronous MDN type.</p>

Summary Page

You can review the specified adapter configuration values on the Summary page.

Element	Description
Summary	<p>Displays a summary of the configuration values you defined on previous pages of the wizard.</p> <p>The information that is displayed can vary by adapter. For some adapters, the selected business objects and operation name are displayed. For adapters for which a generated XSD file is provided, click the XSD link to view a read-only version of the file.</p> <p>To return to a previous page to update any values, click the appropriate tab in the left panel or click Go back.</p> <p>To cancel your configuration details, click Cancel.</p>

Troubleshoot the AS2 Adapter

Review the following topics to learn about troubleshooting issues with the AS2 Adapter.

Topics:

- [Troubleshoot Two-Way SSL Connections](#)

Additional integration troubleshooting information is provided. See Troubleshoot Oracle Integration in *Using Integrations in Oracle Integration 3* and the [Oracle Integration Troubleshooting page](#) on the Oracle Help Center.

Troubleshoot Two-Way SSL Connections

If the test connection fails because two-way SSL communication didn't happen correctly, note that different servers may respond differently. The following two different behaviors are identified, but there can be other variations. When you test the connection on the Connections page, both of these cases are reported as failures.

- If a proper client certificate wasn't presented by the AS2 Adapter, the remote server can close the TCP connection unilaterally. On the client side, no response is received. The server instead closes the connection abruptly.
- A remote server may send a response with an HTTP status code such as 400 (bad request) or 403 (forbidden). The server may or may not include the reason in the response.
