Preface

This guide describes how to configure this adapter as a connection in an integration in Oracle Integration.

Note:

The use of this adapter may differ depending on the features you have, or whether your instance was provisioned using Standard or Enterprise edition. These differences are noted throughout this guide.

Topics:

- [Audience](#)
- [Documentation Accessibility](#)
- [Diversity and Inclusion](#)
- [Related Resources](#)
- [Conventions](#)

Audience

This guide is intended for developers who want to use this adapter in integrations in Oracle Integration.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <https://www.oracle.com/corporate/accessibility/>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <https://support.oracle.com/portal/> or visit [Oracle Accessibility Learning and Support](#) if you are hearing impaired.

Diversity and Inclusion

Oracle is fully committed to diversity and inclusion. Oracle respects and values having a diverse workforce that increases thought leadership and innovation. As part of our initiative to build a more inclusive culture that positively impacts our employees, customers, and partners, we are working to remove insensitive terms from our products and documentation.

We are also mindful of the necessity to maintain compatibility with our customers' existing technologies and the need to ensure continuity of service as Oracle's offerings and industry standards evolve. Because of these technical constraints, our effort to remove insensitive terms is ongoing and will take time and external cooperation.

Related Resources

See these Oracle resources:

- Oracle Cloud at <http://cloud.oracle.com>
- *Using Integrations in Oracle Integration 3*
- *Using the Oracle Mapper with Oracle Integration 3*
- Oracle Integration documentation on the Oracle Help Center.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
<code>monospace</code>	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

1

Understand the Salesforce REST Adapter

Review the following topics to learn about the Salesforce REST Adapter and how to use it as a connection in integrations in Oracle Integration. A typical workflow of adapter and integration tasks is also provided.

Topics:

- [Salesforce REST Adapter Capabilities](#)
- [What Application Version Is Supported?](#)
- [Workflow to Create and Add a Salesforce REST Adapter Connection to an Integration](#)

Salesforce REST Adapter Capabilities

The Salesforce REST Adapter enables you to create an integration in Oracle Integration that connects to a Salesforce application. You can configure the Salesforce REST Adapter as a trigger or invoke connection in an integration in Oracle Integration.

The Salesforce REST Adapter provides the following capabilities:

- For trigger endpoints:
 - Subscribes to platform events published on Salesforce.com
 - Subscribes to change data events published on Salesforce.com
- For invoke endpoints:
 - Supports connecting to private resources that are in your virtual cloud network (VCN) with a private endpoint. See [Connect to Private Resources in Provisioning and Administering Oracle Integration 3](#) and [Configure the Endpoint Access Type](#). This type of connection does not use the connectivity agent.
 - Performs operations such as Create, Update, Upsert, and Delete and on the Standard, Recommended, or Custom business objects.
 - Performs Salesforce Object Query Language (SOQL) and Salesforce Object Search Language (SOSL) queries, and retrieve query operations across all business objects.
 - Supports Core or Utility operations such as:
 - * Get User Info
 - * Get Deleted
 - * Get Updated
 - * Approval Process
 - * Send Email
 - Invokes Apex Services

The Salesforce REST Adapter supports OAuth 2.0 client credentials and OAuth 2.0 authorization code credentials authentication, referred to as a Web App Integrations Security Policy.

The Salesforce REST Adapter is one of many predefined adapters included with Oracle Integration. See the Adapters page in the Oracle Help Center.

What Application Version Is Supported?

For information about which application version is supported by this adapter, see the [Connectivity Certification Matrix](#).

Workflow to Create and Add a Salesforce REST Adapter Connection to an Integration

You follow a very simple workflow to create a connection with an adapter and include the connection in an integration in Oracle Integration.

This table lists the workflow steps for both adapter tasks and overall integration tasks, and provides links to instructions for each step.

Step	Description	More Information
1	Access Oracle Integration.	Go to https://instance_URL/ic/home
2	Create the adapter connections for the applications you want to integrate. The connections can be reused in multiple integrations and are typically created by the administrator.	Create a Salesforce REST Adapter Connection
3	Create the integration. When you do this, you add trigger (source) and invoke (target) connections to the integration.	Understand Integration Creation and Best Practices in <i>Using Integrations in Oracle Integration 3</i> and Add the Salesforce REST Adapter Connection to an Integration
4	Map data between the trigger connection data structure and the invoke connection data structure.	Map Data in <i>Using Integrations in Oracle Integration 3</i>
5	(Optional) Create lookups that map the different values used by those applications to identify the same type of object (such as gender codes or country codes).	Manage Lookups in <i>Using Integrations in Oracle Integration 3</i>
6	Activate the integration.	Activate an Integration in <i>Using Integrations in Oracle Integration 3</i>
7	Monitor the integration on the dashboard.	Monitor Integrations During Runtime in <i>Using Integrations in Oracle Integration 3</i>
8	Track payload fields in messages during runtime.	Assign Business Identifiers for Tracking Fields in Messages and Track Integration Instances in <i>Using Integrations in Oracle Integration 3</i>
9	Manage errors at the integration level, connection level, or specific integration instance level.	Manage Errors in <i>Using Integrations in Oracle Integration 3</i>

2

Create a Salesforce REST Adapter Connection

A connection is based on an adapter. You define connections to the specific cloud applications that you want to integrate.

Topics:

- [Prerequisites for Creating a Connection](#)
- [Create a Connection](#)
- [Upload a Certificate to Connect with External Services](#)

Prerequisites for Creating a Connection

You must satisfy the following prerequisites to create a connection with the Salesforce REST Adapter.

- [Obtain the Salesforce Domain URL](#)
- [Obtain the Current Salesforce API Version](#)
- [Generate Client ID and Client Secret](#)

Obtain the Salesforce Domain URL

1. Log in to the Salesforce sandbox instance.
2. Copy the domain name from the Salesforce home URL. For example:

```
https://yourDomain.my.salesforce.com/
```

Obtain the Current Salesforce API Version

1. Log in to the Salesforce sandbox instance.
2. Click **Setup** in the header or click your user name, then select **Setup**. See [Explore the Salesforce Setup Menu](#).
3. Search for **API** in the **Quick Find** box, then select **API** under **Develop**.
4. Click **Generate Enterprise WSDL**.
5. On the Generate Enterprise WSDL page, click **Generate**. The WSDL opens in a new browser tab and your current API version appears in the **Commented-out** section. For example:

```
Salesforce.com Enterprise Web Services API Version 35.0
```

Note:

If you're using the Lightning Experience UI on your Salesforce instance, switch to the Salesforce Classic UI. See [Toggle or switch between Lightning Experience and Salesforce Classic](#).

Generate Client ID and Client Secret

1. Log in to the Salesforce sandbox instance.
2. Click **Setup** in the header or click your user name, and then select **Setup**.
3. In the **Quick Find** box, search for `Apps`.
4. From the list that opens, select your connected app:
 - a. If you do not have a connected app, click **New** in the **Connected App** section.
 - b. On the New Connected App page that appears, enter the following:
 - Basic Information
 - API
 - Web App Settings
 - Mobile App Settings
 - Canvas App Settings
 - Custom Connected App Handler
 - c. In the **API (Enable OAuth Settings)** section:
 - i. Check the **Enable OAuth Settings** check box.
 - ii. To configure the OAuth 2.0 Authorization Code Credentials security policy:
 - i. From the **Available OAuth Scopes** list, you must add the following scopes to the **Selected OAuth Scopes** section.
 - **Access and manage your data(api)**
 - **Access your basic information(id)**
 - **Perform request on your behalf at any time(refresh_token)**These **(api, id, refresh_token)** are the minimum scopes required to configure a connection in Oracle Integration using the OAuth 2.0 Authorization Code Credentials security policy.
 - ii. Click **Save**.
A new connected app is now created.
 - iii. To configure the OAuth 2.0 Client Credentials security policy:
 - i. Check the **Enable Client Credentials Flow** check box.
A warning message is displayed.
 - ii. Click **Ok** if you accept the warning.
 - iii. Click **Save**.
A new connected app is created.
 - iv. In the **Connected App Details** section, click **Manage**.

- v. Click **Edit Policies**.
- vi. Go to the **Client Credentials Flow** section.
- vii. In the **Run As** text box, enter the Salesforce user for whom you want to configure the client credentials.
- viii. Save your changes.
You can see the following details under the **API (Enable OAuth Settings)** section.
 - Selected OAuth scopes
 - Consumer key and secret
 - i. To retrieve consumer information, click **Manage Consumer Details**. Salesforce now sends a verification code to your registered email.
 - ii. Once you enter the verification code, you can access the client ID (consumer key) and client (consumer) secret.

 **Note:**

These details are required to configure connection properties in Oracle Integration.

Create a Connection

Before you can build an integration, you must create the connections to the applications with which you want to share data.

To create a connection in Oracle Integration:

1. In the navigation pane, click **Design**, then **Connections**.
2. Click **Create**.

 **Note:**

You can also create a connection in the integration canvas. See Define Inbound Triggers and Outbound Invokes.

3. In the Create connection panel, select the adapter to use for this connection. To find the adapter, scroll through the list, or enter a partial or full name in the **Search** field.
4. Enter the information that describes this connection.

Element	Description
Name	Enter a meaningful name to help others find your connection when they begin to create their own integrations.
Identifier	Automatically displays the name in capital letters that you entered in the Name field. If you modify the identifier name, don't include blank spaces (for example, SALES OPPORTUNITY).

Element	Description
Role	<p>Select the role (direction) in which to use this connection (trigger, invoke, or both). Only the roles supported by the adapter are displayed for selection. When you select a role, only the connection properties and security policies appropriate to that role are displayed on the Connections page. If you select an adapter that supports both invoke and trigger, but select only one of those roles, you'll get an error when you try to drag the adapter into the section you didn't select.</p> <p>For example, assume you configure a connection for the Oracle Service Cloud (RightNow) Adapter as only an invoke. Dragging the adapter to a trigger section in the integration produces an error.</p>
Keywords	Enter optional keywords (tags). You can search on the connection keywords on the Connections page.
Description	Enter an optional description of the connection.
Share with other projects	<p>Note: This field only appears if you are creating a connection in a project.</p> <p>Select to make this connection publicly available in other projects. Connection sharing eliminates the need to create and maintain separate connections in different projects.</p> <p>When you configure an adapter connection in a different project, the Use a shared connection field is displayed at the top of the Connections page. If the connection you are configuring matches the same type and role as the publicly available connection, you can select that connection to reference (inherit) its resources.</p> <p>See Add and Share a Connection Across a Project.</p>

5. Click **Create**.

Your connection is created. You're now ready to configure the connection properties, security policies, and (for some connections) access type.

Configure Connection Properties

Enter connection information so your application can process requests.

1. Go to the **Properties** section.
2. In the **Subdomain** field, enter your subdomain. See [Obtain the Salesforce Domain URL](#).
3. In the **API Version** field, enter your current API version. See [Obtain the Current Salesforce API Version](#).

Configure Connection Security

Configure security for your Salesforce REST Adapter connection.

1. Go to the **Security** section.
2. From the **Security Policy** list, select the security policy:
 - **OAuth 2.0 Client Credentials**
 - **OAuth 2.0 Authorization Code Credentials**
3. If you select **OAuth 2.0 Client Credentials**.
 - a. In the **Client ID** field, enter the client Id that you obtained after performing the prerequisite steps. See [Generate Client ID and Client Secret](#).
 - b. In the **Client Secret** field, enter the client secret that you obtained after performing the prerequisite steps. See [Generate Client ID and Client Secret](#).
4. If you select **OAuth 2.0 Authorization Code Credentials**.
 - a. In the **Client ID** field, enter the client ID that you obtained after performing the prerequisite steps. See [Generate Client ID and Client Secret](#).
 - b. In the **Client Secret** field, enter the client secret that you obtained after performing the prerequisite steps. See [Generate Client ID and Client Secret](#).
 - c. In the **Optional Security** field, enter the scope that you obtained after performing the prerequisite steps. See [Generate Client ID and Client Secret](#).
 - d. Click **Provide Consent** to verify the connection properties.
 - e. You can now see an `Authenticated!!` message.

Configure the Endpoint Access Type

Configure access to your endpoint. Depending on the capabilities of the adapter you are configuring, options may appear to configure access to the public internet, to a private endpoint, or to an on-premises service hosted behind a fire wall.

- [Select the Endpoint Access Type](#)
- [Ensure Private Endpoint Configuration is Successful](#)

Select the Endpoint Access Type

Select the option for accessing your endpoint.

Option	This Option Appears If Your Adapter Supports ...
Public gateway	Connections to endpoints using the public internet.

Option	This Option Appears If Your Adapter Supports ...
Private endpoint	<p>Connections to endpoints using a private virtual cloud network (VCN).</p> <p>Note: To connect to private endpoints, you must complete prerequisite tasks in the Oracle Cloud Infrastructure Console. Failure to do so results in errors when testing the connection. See Connect to Private Resources in <i>Provisioning and Administering Oracle Integration 3</i> and Troubleshoot Private Endpoints in <i>Using Integrations in Oracle Integration 3</i>.</p>

Ensure Private Endpoint Configuration is Successful

- To connect to private endpoints, you must complete prerequisite tasks in the Oracle Cloud Infrastructure Console. Failure to do so results in errors when testing the connection. See [Connect to Private Resources in *Provisioning and Administering Oracle Integration 3*](#).
- When configuring an adapter on the Connections page to connect to endpoints using a private network, specify the fully-qualified domain name (FQDN) and *not* the IP address. If you enter an IP address, validation fails when you click **Test**.
- IPSec tunneling and FastConnect are not supported for use with private endpoints.

Test the Connection

Test your connection to ensure that it's configured successfully.

1. In the page title bar, click **Test**. What happens next depends on whether your adapter connection uses a Web Services Description Language (WSDL) file. Only some adapter connections use WSDLs.

If Your Connection...	Then...
Doesn't use a WSDL	The test starts automatically and validates the inputs you provided for the connection.
Uses a WSDL	<p>A dialog prompts you to select the type of connection testing to perform:</p> <ul style="list-style-type: none"> • Validate and Test: Performs a full validation of the WSDL, including processing of the imported schemas and WSDLs. Complete validation can take several minutes depending on the number of imported schemas and WSDLs. No requests are sent to the operations exposed in the WSDL. • Test: Connects to the WSDL URL and performs a syntax check on the WSDL. No requests are sent to the operations exposed in the WSDL.

2. Wait for a message about the results of the connection test.
 - If the test was successful, then the connection is configured properly.
 - If the test failed, then edit the configuration details you entered. Check for typos and verify URLs and credentials. Continue to test until the connection is successful.

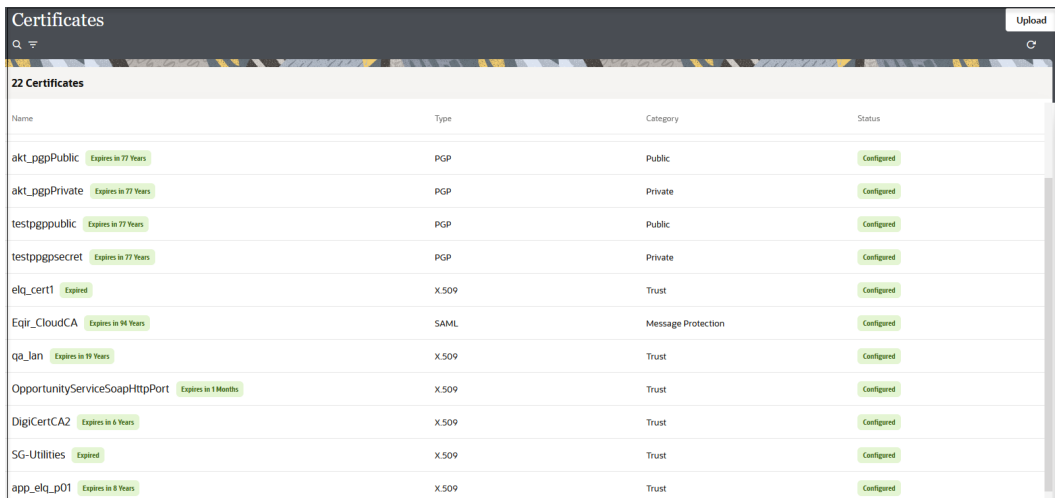

- When complete, click **Save**.

Upload a Certificate to Connect with External Services

Certificates allow Oracle Integration to connect with external services. If the external service/ endpoint needs a specific certificate, request the certificate and then import it into Oracle Integration.

If you make an SSL connection in which the root certificate does not exist in Oracle Integration, an exception error is thrown. In that case, you must upload the appropriate certificate. A certificate enables Oracle Integration to connect with external services. If the external endpoint requires a specific certificate, request the certificate and then upload it into Oracle Integration.

- Sign in to Oracle Integration.
- In the navigation pane, click **Settings**, then **Certificates**.
All certificates currently uploaded to the trust store are displayed on the Certificates page.
- Click **Filter**  to filter by name, certificate expiration date, status, type, category, and installation method (user-installed or system-installed). Certificates installed by the system cannot be deleted.

Name	Type	Category	Status
akt_ppgPublic <small>Expires in 77 Years</small>	PGP	Public	Configured
akt_ppgPrivate <small>Expires in 77 Years</small>	PGP	Private	Configured
testppgpublic <small>Expires in 77 Years</small>	PGP	Public	Configured
testppgsecret <small>Expires in 77 Years</small>	PGP	Private	Configured
elq_cert1 <small>Expired</small>	X.509	Trust	Configured
Eqjr_CloudCA <small>Expires in 94 Years</small>	SAML	Message Protection	Configured
qa_lan <small>Expires in 99 Years</small>	X.509	Trust	Configured
OpportunityServiceSoapHttpPort <small>Expires in 1 Months</small>	X.509	Trust	Configured
DigiCertCA2 <small>Expires in 6 Years</small>	X.509	Trust	Configured
SG-Utilities <small>Expired</small>	X.509	Trust	Configured
app_elq_p01 <small>Expires in 8 Years</small>	X.509	Trust	Configured

- Click **Upload** at the top of the page.
The Upload certificate panel is displayed.
- Enter an alias name and optional description.
- In the **Type** field, select the certificate type. Each certificate type enables Oracle Integration to connect with external services.
 - Digital Signature
 - X.509 (SSL transport)
 - SAML (Authentication & Authorization)
 - PGP (Encryption & Decryption)
 - Signing key

Digital Signature

The digital signature security type is typically used with adapters created with the Rapid Adapter Builder. See Learn About the Rapid Adapter Builder in Oracle Integration in *Using the Rapid Adapter Builder with Oracle Integration 3*.

1. Click **Browse** to select the digital certificate. The certificate must be an X509Certificate. This certificate provides inbound RSA signature validation. See Implement Digital Signature Validation (RSA) in *Using the Rapid Adapter Builder with Oracle Integration 3*.
2. Click **Upload**.

X.509 (SSL transport)

1. Select a certificate category.
 - a. **Trust**: Use this option to upload a trust certificate.
 - i. Click **Browse**, then select the trust file (for example, `.cer` or `.crt`) to upload.
 - b. **Identity**: Use this option to upload a certificate for two-way SSL communication.
 - i. Click **Browse**, then select the keystore file (`.jks`) to upload.
 - ii. Enter the comma-separated list of passwords corresponding to key aliases.

 **Note:**

When an identity certificate file (`.jks`) contains more than one private key, all the private keys must have the same password. If the private keys are protected with different passwords, the private keys cannot be extracted from the keystore.

- iii. Enter the password of the keystore being imported.
- c. Click **Upload**.

SAML (Authentication & Authorization)

1. Note that **Message Protection** is automatically selected as the only available certificate category and cannot be deselected. Use this option to upload a keystore certificate with SAML token support. Create, read, update, and delete (CRUD) operations are supported with this type of certificate.
2. Click **Browse**, then select the certificate file (`.cer` or `.crt`) to upload.
3. Click **Upload**.

PGP (Encryption & Decryption)

1. Select a certificate category. Pretty Good Privacy (PGP) provides cryptographic privacy and authentication for communication. PGP is used for signing, encrypting, and decrypting files. You can select the private key to use for encryption or decryption when configuring the stage file action.

- a. **Private:** Uses a private key of the target location to decrypt the file.
 - i. Click **Browse**, then select the PGP file to upload.
 - ii. Enter the PGP private key password.
- b. **Public:** Uses a public key of the target location to encrypt the file.
 - i. Click **Browse**, then select the PGP file to upload.
 - ii. In the **ASCII-Armor Encryption Format** field, select **Yes** or **No**.
 - **Yes** shows the format of the encrypted message in ASCII armor. ASCII armor is a binary-to-textual encoding converter. ASCII armor formats encrypted messaging in ASCII. This enables messages to be sent in a standard messaging format. This selection impacts the visibility of message content.
 - **No** causes the message to be sent in binary format.
 - iii. From the **Cipher Algorithm** list, select the algorithm to use. Symmetric-key algorithms for cryptography use the same cryptographic keys for both encryption of plain text and decryption of cipher text. The following supported cipher algorithms are FIPS-compliant:
 - AES128
 - AES192
 - AES256
 - TDES
- c. Click **Upload**.

Signing key

A signing key is a secret key used to establish trust between applications. Signing keys are used to sign ID tokens, access tokens, SAML assertions, and more. Using a private signing key, the token is digitally signed and the server verifies the authenticity of the token by using a public signing key. You must upload a signing key to use the OAuth Client Credentials using JWT Client Assertion and OAuth using JWT User Assertion security policies in REST Adapter invoke connections. Only PKCS1- and PKCS8-formatted files are supported.

1. Select **Public** or **Private**.
2. Click **Browse** to upload a key file.

If you selected **Private**, and the private key is encrypted, a field for entering the private signing key password is displayed after key upload is complete.
3. Enter the private signing key password. If the private signing key is not encrypted, you are not required to enter a password.
4. Click **Upload**.

3

Add the Salesforce REST Adapter Connection to an Integration

When you drag the Salesforce REST Adapter into the trigger or invoke area of an integration, the Adapter Endpoint Configuration Wizard is invoked. This wizard guides you through configuration of the Salesforce REST Adapter endpoint properties.

The following sections describe the wizard pages that guide you through configuration of the Salesforce REST Adapter as a trigger and an invoke in an integration.

Topics:

- [Trigger Basic Info Page](#)
- [Trigger Streaming API Page](#)
- [Invoke Basic Info Page](#)
- [Invoke Action Page](#)
- [Invoke Operations Page](#)
- [Summary Page](#)

Trigger Basic Info Page

Specify a name and description on the Basic Info page of each trigger connection in your integration.

Element	Description
What do you want to call your endpoint?	Provide a meaningful name so that others can understand the connection. For example, if you are creating a database connection for adding new employee data, you may want to name it <code>CreateEmployeeInDB</code> . You can include English alphabetic characters, numbers, underscores, and dashes in the name. You cannot include the following: <ul style="list-style-type: none">• Blank spaces (for example, <code>My DB Connection</code>)• Special characters (for example, <code>#;83&</code> or <code>right)now4</code>)• Multibyte characters
What does this endpoint do?	Enter an optional description of the connection's responsibilities.

Trigger Streaming API Page

Select the platform event or change data capture event to use.

Select the streaming event type appropriate to your integration requirements.

- [Subscribe to platform events published on Salesforce.com](#)

Select to receive event notifications from the Salesforce application based on the events you defined in Salesforce.com.

You must have already defined the platform events in Salesforce.com. See Define Your Platform Event in *Using the Salesforce Adapter with Oracle Integration 3*.

- [Subscribe to change data capture events published on Salesforce.com](#)
Select to receive change event notifications, whenever a data change in Salesforce occurs, for the entities (business objects) you selected in Salesforce.com

You must have already selected the change data capture events in Salesforce.com. See Select an Entity (Business Object) in *Using the Salesforce Adapter with Oracle Integration 3*.

 **Note:**

The Overflow event is not supported.

Subscribe to platform events published on Salesforce.com

Element	Description
Select a platform event	<p>Displays the list of platform events you defined in Salesforce.com. Select the platform event to receive notifications from the Salesforce application.</p> <p>Note:</p> <ul style="list-style-type: none"> • For a new integration, the Salesforce REST Adapter receives event notifications from the last 72 hours for the selected platform event channel because the subscription occurs with <code>replayId</code> set to -2. • For an existing integration, which was inactive for the last 72 hours or more and then activated again, it receives only new platform events for the subscribed channel because the subscription occurs with <code>replayId</code> set to -1.
Filter by: *<KEYWORD>*	Type a keyword or the initial letters of the event to filter the display of names in the list.

Subscribe to change data capture events published on Salesforce.com

Element	Description
Select a change event type	<p>Select one or both options:</p> <ul style="list-style-type: none"> • Normal: Select to receive the common change events notifications whenever a data change in Salesforce occurs. • Gap: Select this option if you want to receive gap event notifications. Gap events are generated instead of change events in special situations. See Gap Events.

Element	Description
Select a change type	<ul style="list-style-type: none"> • Create: Select to receive notifications whenever a new record is created under the selected entity. • Update: Select to receive notifications whenever a record is updated under the selected entity. • Delete: Select to receive notifications whenever a record is deleted under the selected entity. • Undelete: Select to receive notifications whenever a record is undeleted under the selected entity.
Select a business object	Displays the list of entities (business objects) you selected in Salesforce.com. Select the business object to receive change event notifications whenever a data change in Salesforce occurs for the selected entity.
Filter by: *<KEYWORD>*	Type a keyword or the initial letters of the event to filter the display of names in the list.

Invoke Basic Info Page

Specify a name and description on the Basic Info page of each invoke connection in your integration.

Element	Description
What do you want to call your endpoint?	Provide a meaningful name so that others can understand the connection. For example, if you are creating a database connection for adding new employee data, you may want to name it <code>CreateEmployeeInDB</code> . You can include English alphabetic characters, numbers, underscores, and dashes in the name. You cannot include the following: <ul style="list-style-type: none"> • Blank spaces (for example, <code>My DB Connection</code>) • Special characters (for example, <code>#;83&</code> or <code>right)now4</code>) • Multibyte characters
What does this endpoint do?	Enter an optional description of the connection's responsibilities.

Invoke Action Page

Select an action for the invoke connection to perform in your integration.

Element	Description
Select an appropriate action from the below categories	<ul style="list-style-type: none"> • Create, Update, Upsert, or Delete Information • Query Information • Core or Utility Operations • Invoke Apex Services

Invoke Operations Page

Select an operation for the invoke connection to perform in your integration.

- [Operations Page - Create, Update, Upsert, or Delete](#)
- [Operations Page - Query Information](#)
- [Operations Page - Core or Utility Operations](#)
- [Operations Page - Invoke Apex Services](#)

Operations Page - Create, Update, Upsert, or Delete

Configure the **Create, Update, Upsert, or Delete** selection.

Select an operation type:

- [Create](#)
- [Update](#)
- [Upsert](#)
- [Delete](#)

Create

This selection creates multiple records for different business objects.

Element	Description
Filter By object name	Type the initial letters to filter the display of business objects. You can also select a filter type: <ul style="list-style-type: none">• Recommended: Displays the most frequently used objects.• Custom: Displays objects you created. Custom business objects are appended with __c (two underscores).• Standard: Displays business objects delivered as part of the Salesforce application.• All: Displays all objects.

Element	Description
Select Business Objects	<p>Select a single or multiple business objects to include in the operation. For example:</p> <ul style="list-style-type: none"> • Account • Asset • Campaign • Case • Contact • Prospect/Lead • Opportunity • Price Book <p>If the operation supports multiple objects, you can select up to ten objects for one operation. You can use the arrow buttons to move the objects to the Your Selected Business Objects list.</p>
All or None	<p>Specifies the transactional behavior for Salesforce application operations.</p> <ul style="list-style-type: none"> • If selected, it maps to <code>UnexpectedErrorFault</code>. • If unselected, it returns the whole response even if it contains error elements along with success elements in the response.
Configure header properties (Optional)	<p>Specify the duplicate rule to see if the record being created is a duplicate of an existing record.</p> <ul style="list-style-type: none"> • Select to ignore the duplicate management rule: This selection allows you to save duplicate records. If not selected, duplicate management rules are followed. • Select to run the duplicate management rule: This selection allows the rule to run according to the current user's sharing rules. If not selected, the system's sharing rules are used. • Assignment Rule: This selection specifies the assignment rules to use while performing a Create operation on Account, Case, or Lead business objects. You can either use the Default Assignment Rule or mention a specific Assignment Rule ID. If Default Assignment Rule is set to True, then default (active) assignments are used. If set to False, then default (active) assignments are not used.

Update

This selection updates multiple records for different business objects.

Element	Description
Filter By Object Name	<p>Type the initial letters to filter the display of business objects. You can also select a filter type:</p> <ul style="list-style-type: none">• Recommended: Displays the most frequently used objects.• Custom: Displays objects you created. Custom business objects are appended with <code>__c</code> (two underscores).• Standard: Displays business objects delivered as part of the Salesforce application.• All: Displays all objects.
Select Business Objects	<p>Select a single or multiple business objects to include in the operation. For example:</p> <ul style="list-style-type: none">• Account• Asset• Campaign• Case• Contact• Prospect/Lead• Opportunity• Price Book <p>If the operation supports multiple objects, you can select up to ten objects for one operation. Element	Description
Configure header properties (Optional)	<p>Specify the duplicate rule to see if the record being updated is a duplicate of an existing record.</p> <ul style="list-style-type: none"> • Select to ignore the duplicate management rule: This selection allows you to save duplicate records. If not selected, duplicate management rules are followed. • Select to run the duplicate management rule: This selection allows the rule to run according to the current user's sharing rules. If not selected, the system's sharing rules are used. • Assignment Rule: This selection specifies the assignment rules to use while performing an Update operation on Account, Case, or Lead business objects. You can either use the Default Assignment Rule or mention a specific Assignment Rule ID. If Default Assignment Rule is set to True, then default (active) assignments are used. If set to False, then default (active) assignments are not used.

Upsert

This selection creates or updates multiple records using an external ID field for the same business object.

Element	Description
Filter By Object Name	<p>Type the initial letters to filter the display of business objects. You can also select a filter type:</p> <ul style="list-style-type: none"> • Recommended: Displays the most frequently used objects. • Custom: Displays objects you created. Custom business objects are appended with __c (two underscores). • Standard: Displays business objects delivered as part of the Salesforce application. • All: Displays all objects.
Select Business Objects	<p>Select a business object to include in the operation. For example:</p> <ul style="list-style-type: none"> • Account • Asset • Campaign • Case • Contact • Prospect/Lead • Opportunity • Price Book

Element	Description
Select external ID field	Select the external ID for the selected business object.
All or None	Specifies the transactional behavior for Salesforce application operations. <ul style="list-style-type: none"> If selected, it maps to <code>UnexpectedErrorFault</code>. If unselected, it returns the whole response even if it contains error elements along with success elements in the response.
Configure header properties (Optional)	Specify the duplicate rule to see if the record being upserted is a duplicate of an existing record. <ul style="list-style-type: none"> Select to ignore the duplicate management rule: This selection allows you to save duplicate records. If not selected, duplicate management rules are followed. Select to run the duplicate management rule: This selection allows the rule to run according to the current user's sharing rules. If not selected, the system's sharing rules are used. Assignment Rule: This selection specifies the assignment rules to use while performing an Upsert operation on Account, Case, or Lead business objects. You can either use the Default Assignment Rule or mention a specific Assignment Rule ID. If Default Assignment Rule is set to True, then default (active) assignments are used. If set to False, then default (active) assignments are not used.

Delete

This selection deletes multiple records for different business objects.

Element	Description
All or None	Specifies the transactional behavior for Salesforce application operations. <ul style="list-style-type: none"> If selected, it maps to <code>UnexpectedErrorFault</code>. If unselected, it returns the whole response even if it contains error elements along with success elements in the response.

Operations Page - Query Information

Configure the **Query Information** selection.

Select an operation type:

- [SOQL/SOSL Query](#)
- [Retrieve](#)

SOQL/SOSL Query

Execute a SOQL or SOSL query to fetch records or perform text-based searches across multiple business objects in Salesforce based upon the specified criteria.

Element	Description
Enter a SOQL (Salesforce Object Query Language) or SOSL (Salesforce Object Search Language) Query Statement	<p>Enter a valid query statement. SOQL statements evaluate to a list of sObjects, a single sObject, or an integer for <code>count</code> method queries. The following examples are provided:</p> <pre> "SELECT Id FROM Contact WHERE Name LIKE 'A%' AND MailingCity = 'California'" SELECT COUNT() FROM Contact </pre> <p>SOSL statements evaluate to a list of sObjects, where each list contains the search results for a particular sObject type. For example:</p> <pre> "SELECT a.name, a.id, a.accountNumber, c.name from Contact c, c.Account" </pre>
Refresh Binding Parameters	<p>Click to display any binding parameters.</p> <p>Displays any parameters included in the query. For example, <code>orgId</code> is a parameter in the following query:</p> <pre> SELECT a.name, a.id, a.accountNumber, c.name from Contact c, c.Account a WHERE a.name = "&orgId" </pre>
Test My Query	<p>This query displays a binding parameters text box in which to enter a test value for <code>orgId</code>.</p> <p>Click to validate the query against the Salesforce application. Query results are displayed. If errors occur, you receive results about how to correct the query.</p>
Configure header properties (Optional)	<p>Specify the number of records to return in a query call.</p> <p>The minimum value is 200 and the maximum value is 2000.</p>

Retrieve

Retrieve multiple records of the same business object.

Element	Description
Filter By Object Name	Type the initial letters to filter the display of business objects. You can also select a filter type: <ul style="list-style-type: none">• Recommended: Displays the most frequently used objects.• Custom: Displays objects you created. Custom business objects are appended with __c (two underscores).• Standard: Displays business objects delivered as part of the Salesforce application.• All: Displays all objects.
Select Business Object	Select a business object to include in the operation.

Operations Page - Core or Utility Operations

Configure the **Core or Utility Operations** selection.

Element	Description
Choose operation	<ul style="list-style-type: none">• Get User Info: Retrieves information about the current user being used in the Salesforce connection configuration. This operation does not take any input data. This operation returns user information such as userId, userFullName, userEmail, profileId, roleId, organizationId, and so on.• Get Deleted: Retrieves deleted IDs of the Salesforce record of a selected object for a limited time period (maximum of one month).• Get Updated: Retrieves IDs of an updated Salesforce record of a selected object for a limited time period (maximum of one month).• Approval Process: Related to the approval process in Salesforce.com. An approval process automates how records are approved, rejected, or removed in Salesforce.com. With the help of the Salesforce REST Adapter, you can use two process modes to submit the approval request and process the requests approval action. Process mode:<ul style="list-style-type: none">– ProcessSubmitRequest– ProcessWorkitemRequest• Send Email: Triggers a single email message request to Salesforce. This operation takes most standard email attributes, templateIds, targetObjectIds, and other attributes as input. This operation responds with the Boolean element Success that defines the status of the message triggered. If the email message is successfully triggered, it responds with true. Otherwise, it responds with false.<ul style="list-style-type: none">– Send Mass Email: Triggers a mass email message request to Salesforce. This operation takes most standard email attributes, templateIds, multiple targetObjectIds, and other attributes as input. This operation returns the Boolean element Success that defines the status of the message triggered. If the email message is successfully triggered, it responds with true. Otherwise, it responds with false.

Element	Description
Filter By Object Name (Displays if Get Deleted or Get Updated was selected.)	Type the initial letters to filter the display of business objects. You can also select a filter type: <ul style="list-style-type: none"> • Recommended: Displays the most frequently used objects. • Custom: Displays objects you created. Custom business objects are appended with __c (two underscores). • Standard: Displays business objects delivered as part of the Salesforce application. • All: Displays all objects.
Select Business Object (Displays if Get Deleted or Get Updated was selected.)	Select a business object to include in the operation.

Operations Page - Invoke Apex Services

Configure the **Invoke Apex Services** selection.

Element	Description
What is the endpoint's relative resource URI?	Specify the relative path associated with the resource. The path can contain template parameters specified with curly braces (for example, {order-id}). A resource is any source of specific information that can be addressed. The resource path follows a fixed, prefixed URL appended with the specified relative path. By default, the URL is prefixed with the following path: <pre>https:// yourInstance.salesforce.com/ services/apexrest/</pre>
What action do you want to perform on the endpoint?	Select a single HTTP action (method) for the endpoint to perform: <ul style="list-style-type: none"> • GET: Retrieves (reads) information (for example, makes queries). If you select this option, you cannot configure a request payload for this endpoint. • PUT: Updates information. • POST: Creates information. • DELETE: Deletes information. If you select this option, you cannot configure a request payload for this endpoint. • PATCH: Partially updates existing resources (for example, when you only need to update one attribute of the resource).

Element	Description
Select any options that you want to configure	<p>Based on your selections, you can add parameters or configure a request and/or response for this endpoint.</p> <ul style="list-style-type: none"> • Add and review parameters for this endpoint: Click Configure to specify the query parameters and view the template request parameters created as part of the resource URI for this endpoint. If you select this option, the Query and Template Parameters page is displayed. • Configure a request payload for this endpoint: Click Configure to configure the request payload for this endpoint, including specifying the JSON sample location. If you select this option, the Sample Request Payload page is displayed. Note: Only PUT and POST actions support this (Configure a request payload for this endpoint) option. Therefore, this option is displayed when you select the PUT or POST action. • Configure this endpoint to receive the response: Click Configure to configure the response payload for this endpoint, including specifying the JSON sample location. If you select this option, the Sample Response Payload page is displayed.

Summary Page

You can review the specified adapter configuration values on the Summary page.

Element	Description
Summary	<p>Displays a summary of the configuration values you defined on previous pages of the wizard.</p> <p>The information that is displayed can vary by adapter. For some adapters, the selected business objects and operation name are displayed. For adapters for which a generated XSD file is provided, click the XSD link to view a read-only version of the file.</p> <p>To return to a previous page to update any values, click the appropriate tab in the left panel or click Go back.</p> <p>To cancel your configuration details, click Cancel.</p>
