- You can enable query offload for an elastic pool leader or for an elastic pool member with no Refreshable Clones. After you enable query offloading you can add Refreshable Clones and the query offload feature dynamically adjusts to make use of the refreshable clones.
- A Refreshable Clone that is a candidate for query offload must:
  - Have the elastic pool leader as its source database and be in the same region as the elastic pool leader.

    or

    Have an elastic pool member as its source database and be in the same region as the elastic pool member.
  - Be an elastic pool member.

To enable query offload:

1. Verify that the Autonomous Database instance is an elastic pool leader or an elastic pool member:
   a. Use the following query to verify that an instance is an elastic pool leader:

      ```
      SELECT sys_context('userenv', 'is_elastic_pool_leader') FROM DUAL;
      ```

      This query should return `YES`.
   b. Use the following query to verify that an instance is an elastic pool member:

      ```
      SELECT sys_context('userenv', 'is_elastic_pool_member') FROM DUAL;
      ```

      This query should return `YES`.

> **Note:**
>
> There may be a delay of up to 15 minutes for the `sys_context` value to reflect the current value if the elastic pool has recently been created or modified.

2. Enable query offload.

   There are two choices: you can enable query offload for queries from any session or limit query offload to the sessions you specify by module or action name.

   - To enable query offload for all sessions run `DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD` without parameters. For example:

     ```
     EXEC DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD;
     ```

   - To enable query offload for specific sessions by module name or action name, run `DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD` with the `module_name` or `action_name` parameters.

     See Enable Query Offload for Named Modules or Actions for more information.

When query offload is enabled for a session you can find the name of the Refreshable Clone to which queries are offloaded. For example, from the session run this query:

```
SELECT sys_context('userenv', 'con_name') FROM DUAL;
```

If queries are not being offloaded to a Refreshable Clone this query shows the name of the elastic pool leader (or of the elastic pool member that is not a refreshable clone).

See SYS_CONTEXT for more information.

See ENABLE_READ_ONLY_OFFLOAD Procedure for more information.

- Enable Query Offload for Named Modules or Actions
  Describes how to enable query offload for sessions with named modules or actions.

Enable Query Offload for Named Modules or Actions

Describes how to enable query offload for sessions with named modules or actions.

To enable query offload for specific sessions by module name or action name:

1. Verify that the instance is an elastic pool leader or an elastic pool member.
   a. Use the following query to verify that an instance is an elastic pool leader:

      ```
      SELECT sys_context('userenv', 'is_elastic_pool_leader') FROM DUAL;
      ```

      This query should return `YES`.

   b. Use the following query to verify that an instance is an elastic pool member:

      ```
      SELECT sys_context('userenv', 'is_elastic_pool_member') FROM DUAL;
      ```

      This query should return `YES`.

> **Note:**
>
> There may be a delay of up to 15 minutes for the `sys_context` value to reflect the current value if the elastic pool has recently been created or modified.

2. Use the routines `SET_ACTION` or `SET_MODULE` in `DBMS_APPLICATION_INFO` to set the module name and or the action name in the current session.

   For example

```
CREATE or replace PROCEDURE add_employee(
  name VARCHAR2,
  salary NUMBER,
  manager NUMBER,
  title VARCHAR2,
  commission NUMBER,
  department NUMBER) AS
BEGIN
  DBMS_APPLICATION_INFO.SET_MODULE(
    module_name => 'add_employee',
    action_name => 'insert into emp');
  INSERT INTO emp
    (ename, empno, sal, mgr, job, hiredate, comm, deptno)
    VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
            commission, department);
  DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

   See DBMS_APPLICATION_INFO for more information.

3. Enable query offload and specify the eligible sessions by module name or by action name (or by both module name and action name).

   For example:

```
DECLARE
   mod_values clob := to_clob('["mod1", "mod2"]');
   act_values clob := to_clob('["act1", "act2"]');
BEGIN
   DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD(
      module_name => mod_values,
      action_name => act_values);
END;
/
```

When query offload is enabled for a session, from the session you can find the name of the Refreshable Clone to which queries are offloaded. For example:

```
SELECT sys_context('userenv', 'con_name') FROM DUAL;
```

If queries are not being offloaded to a Refreshable Clone this query shows the name of the elastic pool leader (or of the elastic pool member that is not a refreshable clone).

See SYS_CONTEXT for more information.

The views `DBA_PROXY_SQL_ACTIONS` and `DBA_PROXY_SQL_MODULES` display the list of modules or actions that are configured for query offload. You must query these views from a session that is not enabled for query offload. See DBA_PROXY_SQL Views for more information.

See ENABLE_READ_ONLY_OFFLOAD Procedure for more information.

Disable Query Offload

Describes how to disable query offload for an elastic pool leader or for an elastic pool member.

On the instance that is offloading queries, disable query offload.

For example:

```
EXEC DBMS_PROXY_SQL.DISABLE_READ_ONLY_OFFLOAD;
```

See DISABLE_READ_ONLY_OFFLOAD Procedure for more information.

Query Offload from PL/SQL

When query offload is enabled, queries are offloaded to Refreshable Clones even if they are embedded within PL/SQL. The PL/SQL can be stored procedures, functions, packages, or anonymous blocks.

For example, you can demonstrate a query being offloaded to a Refreshable Clone when you enable query offload for a specific module and action. In this example, assume that the leader's data has been updated and the Refreshable Clone has not yet been updated (so the Refreshable Clone's data is out of date and different). In this example, with different values on the elastic pool leader and the Refreshable Clone, you can see when data is coming from either the leader or from the Refreshable Clone.

1. Enable query offload and specify the eligible sessions by module name and action name. For example, '`mod1`', '`act1`'.

```
DECLARE
   mod_values clob := to_clob('["mod1"]');
   act_values clob := to_clob('["act1"]');
BEGIN
   DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD(
      module_name => mod_values,
      action_name => act_values);
END;
/
```

2. Define the function `f1` to test query offload.

```
SQL> create or replace function f1 (n number)
  2  return number
  3  as
  4    l_cnt number;
  5  begin
  6    select sum(c1) into l_cnt from u2.tab1;
  7    return l_cnt;
  8  end;
  9  /
```

```
Function created.
```

3. Run the function `f1`. The query with function `f1` runs on the elastic pool leader (or on an elastic pool member that has offload query enabled). This session runs with unspecified module and action names that do not match those specified for query offload in Step 1.

```
SQL> -- expected to fetch from Elastic Pool Leader and returns value 40
SQL> select f1(3) from dual;
     F1(3)
----------
        40

1 row selected.
```

4. Specify the module name and action name for the session to match the names specified in Step 1. The queries from this session are now eligible to be offloaded to a Refreshable Clone.

```
SQL> exec dbms_application_info.set_module('mod1', 'act1');

PL/SQL procedure successfully completed.
```

5. Run the function `f1` again. In this case the module name and action name match the names specified in Step 1. The query in function `f1` is offloaded to a Refreshable Clone.

```
SQL> -- Expected to fetch from Refreshable Clone and returns value 10
SQL> select f1(3) from dual;

     F1(3)
----------
        10

1 row selected.
```

6. Specify the module and action names as something other than `mod1` and `act1`. The queries from this session are no longer eligible to be offloaded to a Refreshable Clone, due to the module and action names not matching those specified in Step 1.

```
SQL> exec dbms_application_info.set_module('random', 'random');

PL/SQL procedure successfully completed.
```

7. Run the query with function `f1`. Because the module and action name for this session do not match those set in Step 1, this query is not offloaded and runs on the elastic pool leader.

```
SQL> -- expected to fetch from Elastic Pool Leader and returns value 40
SQL> select f1(3) from dual;
     F1(3)
----------
        40

1 row selected.
```

Query Offload from a Scheduler Job

When query offload is enabled, queries from within an Oracle Scheduler job action are offloaded to Refreshable Clones. The queries are offloaded whether the job runs in the foreground or in the background.

For example, similar to the previous example for PL/SQL, you can demonstrate a query being offloaded to a Refreshable Clone when you enable query offload for an Oracle Scheduler job. In this example, assume that the leader's data has been updated and the Refreshable Clone has not yet been updated (so the Refreshable Clone's data is out of date and different). In this example, with different values on the elastic pool leader and the Refreshable Clone, you can see when data is coming from either the leader or from the Refreshable Clone.

```
SQL> create or replace procedure sproc1 (n number)
  2  as
  3    l_cnt number;
  4  begin
  5    select sum(c1) into l_cnt from u2.tab1;
  6    dbms_output.put_line('l_cnt is ' || l_cnt);
  7  end;
  8  /

Procedure created.

Offload Queries from Elastic Pool Leader to Member Refreshable Clones

SQL> create or replace procedure sproc1 (n number)
  2  as
  3    l_cnt number;
  4  begin
  5    select sum(c1) into l_cnt from u2.tab1;
  6    dbms_output.put_line('l_cnt is ' || l_cnt);
  7  end;
  8  /

Procedure created.

SQL>
SQL> BEGIN
  2    dbms_scheduler.create_job(job_name    => 'PROXYTEST1',
  3                              job_type    => 'PLSQL_BLOCK',
  4                              job_action  => 'BEGIN sproc1(3); END;',
  5                              enabled     => FALSE);
  6  END;
  7  /

PL/SQL procedure successfully completed.

SQL>
SQL> -- Job runs in the foreground in the current session
SQL> -- expected to fetch from Leader: 40
SQL> exec dbms_scheduler.RUN_JOB(job_name => 'PROXYTEST1',
use_current_session => true);
l_cnt is 40
```

```
PL/SQL procedure successfully completed.

SQL>
SQL> exec dbms_proxy_sql.enable_read_only_offload;

PL/SQL procedure successfully completed.

SQL> show con_name

CON_NAME
------------------------------
CDB1_PDB1
SQL>
SQL> set serveroutput on
SQL> -- Job runs in the foreground in the current session
SQL> -- expected to fetch from Refreshable Clone: 10
SQL> exec dbms_scheduler.RUN_JOB(job_name => 'PROXYTEST1',
use_current_session => true);
l_cnt is 10

PL/SQL procedure successfully completed.

SQL>
SQL> -- Job runs in the background and is expected to fetch from Refreshable
Clone: 10
SQL> exec dbms_scheduler.RUN_JOB(job_name => 'PROXYTEST1',
use_current_session => false);

PL/SQL procedure successfully completed.
```

Notes for Offloading Queries

Provides additional notes for the query offload feature.

Notes for query offload:

- **Addition or Removal of a Refreshable Clone**: When a Refreshable Clone is added as an elastic pool member, there can be a delay of up to fifteen minutes for the addition to be reflected in the elastic pool leader. A newly added Refreshable Clone is not considered as a target for query offloads until the leader is aware of the newly added elastic pool member.

  Similarly, when a Refreshable Clone is removed from the elastic pool, there can be a delay of up fifteen minutes for the removal to be reflected in the elastic pool leader. The removed Refreshable Clone is considered as a target for query offloads until the leader knows that the member has been removed from the elastic pool.
- **Refresh of Refreshable Clone**: When a Refreshable Clone is being refreshed, queries that are offloaded to the Refreshable Clone may be delayed.
- **Public and Private Endpoint Support**: Query offload is supported for instances on a public endpoint and for instances on a private endpoint.
- **Disconnected Refreshable Clone**: If a Refreshable Clone becomes disconnected, it is no longer eligible as a target for query offload. There can be a delay of up to fifteen minutes for the elastic pool leader to detect that a Refreshable Clone has become disconnected and to stop offloading queries to it.

To ensure that a Refreshable Clone remains available for query offloading, either enable automatic refreshes or periodically manually refresh the Refreshable Clone.

See Refresh a Refreshable Clone on Autonomous Database for more information.

- **Case Sensitive Module Name and Action Name**: When you offload queries from a list of sessions that you specify by module or action name, the module name and action name set with `DBMS_APPLICATION_INFO` are case sensitive. `DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD` adheres to this case sensitive behavior. For example, when a session has a lowercase module name, or mixed case module name, the case must match in the parameter values when you enable query offload with `DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD` and you include the `module_name` or `action_name` parameters.

  You can check the module name and action name for the current session using `DBMS_APPLICATION_INFO.READ_MODULE`:

```
set serveroutput on;
declare
  l_mod varchar2(50);
  l_act varchar2(50);
BEGIN
DBMS_APPLICATION_INFO.READ_MODULE(l_mod, l_act);
  DBMS_OUTPUT.PUT_LINE('l_mod: ' || l_mod);
  DBMS_OUTPUT.PUT_LINE('l_act: ' || l_act);
END;
/
```

- **Typical Use Case**: One use case for query offload is to enable the feature during peak hours to take load off of the Elastic Pool Leader (or off of the Elastic Pool Member where query offload is enabled). During quiet hours, you can disable query offload to perform maintenance operations such as refreshing the Refreshable Clones.

Remove Pool Members from an Elastic Pool

As an elastic pool member you can remove yourself from an elastic pool. As an elastic pool leader you can remove pool members from an elastic pool.

Perform the following prerequisite steps as necessary:

- Open the Oracle Cloud Infrastructure Console by clicking the ☰ next to Cloud.
- From the Oracle Cloud Infrastructure left navigation menu click **Oracle Database** and then click **Autonomous Database**.
- On the Autonomous Databases page select an Autonomous Database from the links under the **Display name** column.

As a pool member, you can remove your instance from an elastic pool:

1. On the **Details** page, under **Resource allocation**, in the **Elastic pool** field click **Leave pool**.

   This shows the **Leave pool** confirmation dialog.
2. In the **Leave pool** confirmation dialog, enter the database name.
3. Click **Leave**.

When you click **Leave**, the **Lifecycle state** changes to **Updating**. After the **Lifecycle state** changes to **Available** the changes apply immediately.

- As Pool Leader Remove Members from an Elastic Pool
  An elastic pool leader can remove pool members from an elastic pool.
- Notes for Leaving an Elastic Pool
  Provides information about resources when a member or the leader leaves an elastic pool.

As Pool Leader Remove Members from an Elastic Pool

An elastic pool leader can remove pool members from an elastic pool.

1. On the Autonomous Database Details page, select the **Elastic pool members** tab.

   This shows the **Elastic pool members** tab, with a list showing details for each instance that is an elastic pool member.

2. Click ... at the end of a row for an instance you want to remove and in the drop down list select **Remove from pool**.

   This shows the **Remove from pool** confirmation dialog.

3. Click **Leave** to confirm.

   When you click **Leave**, the **Lifecycle state** changes to **Updating**. After the **Lifecycle state** changes to **Available** the changes apply immediately.

Notes for Leaving an Elastic Pool

Provides information about resources when a member or the leader leaves an elastic pool.

- When a pool member or the leader leaves an elastic pool, auto scaling is disabled. After leaving the elastic pool you can enable auto-scaling for the instance.
- When a pool member leaves an elastic pool, the elastic pool has more resources available. For example, if the elastic pool were fully allocated up to the pool capacity, and an instance with 10 ECPUs leaves the pool, the elastic pool would have 10 available ECPUs.
- Billing for an Autonomous Database instance that leaves an elastic pool returns to individual instance billing, based on the compute and storage resources that the individual instance uses:
  - If a pool member with 2 ECPUs or more leaves the pool, the individual instance's ECPU allocation remains and the instance is billed for that number of ECPUs.
  - If a pool member with 1 ECPU leaves the pool, the ECPU allocation is automatically set to 2 ECPUs and the instance is billed for 2 ECPUs going forward, unless it's scaled up.

Terminate an Elastic Pool

Shows the steps to terminate an elastic pool. Only the pool leader can terminate an elastic pool.

> **Note:**
>
> Terminating an elastic pool is only allowed when there are no pool members in the elastic pool.

- Open the Oracle Cloud Infrastructure Console by clicking the ☰ next to Cloud.
- From the Oracle Cloud Infrastructure left navigation menu click **Oracle Database** and then click **Autonomous Database**.
- On the Autonomous Databases page select the Autonomous Database that is the pool leader from the links under the **Display Name** column.

To terminate an elastic pool:

1. On the Autonomous Database Details page, click **More actions** and select **Manage resource allocation**.
2. In the **Elastic pool** area, select **Terminate pool**.
3. Click **Apply** to terminate the elastic pool.

When you click **Apply**, the Lifecycle state changes to **Updating**. After the Lifecycle state changes to **Available** the changes apply immediately.

Elastic Pool Notes

Provides information about elastic pool usage.

Notes for elastic pool usage:

- Starting and stopping Autonomous Database instances that are members of an elastic pool does not depend on the state of the leader. That is, you can independently stop and start each instance that is part of an elastic pool, including the leader and members of the elastic pool that are not the leader.
- By default each instance in an elastic pool is automatically assigned a maintenance window. By selecting a pool shape that is 1024 ECPUs or greater, you have the option of assigning a custom 2-hour maintenance window during which the leader and all elastic pool members are patched together. To select a custom maintenance window for your elastic pool, file a Service Request at Oracle Cloud Support.
- Provisioning a pool leader or a member is subject to service limits enforced at the tenancy or compartment levels.
- In an elastic pool, the pool leader's licensing selections determine the license requirements for the entire pool. If you want to use BYOL for an elastic pool and set a **BYOL License Limit**, you must set the limit value on the pool leader's instance. The license selections for pool members, including any **BYOL License Limit** do not apply while an instance is a member of a pool. The license selections, including any **BYOL License Limit**, come into effect only if a pool member or the pool leader leaves the elastic pool.

  For example, if an elastic pool includes a member instance that uses Autonomous Data Guard with an 8 ECPU Primary with the BYOL license type set, the Primary and Standby instance's licensing selection is set as follows:

  – When the Primary is a pool member, the license type of the Primary can be set but it is does not apply for the Primary; the Primary uses the license type of the elastic pool leader. The license type selection on the Primary will apply when and if the Primary leaves the elastic pool.

  – For a local Standby, the Standby instance is in the elastic pool. In this case, the local Standby uses the same license type as the Primary.

  – For a cross-region Standby, the Standby instance is either in the pool (as a pool member or as the pool leader), or is not in the elastic pool, as follows:

* When a cross-region Standby is not in the elastic pool, that is it is not either the pool leader or a pool member, then the cross-region Standby license type can be set but it is does not apply; the Standby uses the license type of the elastic pool leader. The license type selection on the Standby will apply when and if the Standby leaves the elastic pool.
* When a cross-region Standby is not in the elastic pool, that is it is not either the pool leader or a pool member, then the cross-region Standby license type can be set but it is does not apply; the Standby uses the license type of the elastic pool leader. The license type selection on the Standby will apply when and if the Standby leaves the elastic pool.
* When a cross-region Standby is not in the elastic pool, that is it is not either the pool leader or a pool member, then the cross-region Standby license type can be set but it is does not apply; the Standby uses the license type of the elastic pool leader. The license type selection on the Standby will apply when and if the Standby leaves the elastic pool.

Notes for Using Parent and Child Tenancies with Elastic Pools

Provides notes for using elastic pools with Oracle Cloud Infrastructure Organization Management (Parent and Child Tenancies).

- When you create an elastic pool in a child tenancy, the elastic pool is only visible to the child tenancy. This means when you create an elastic pool in a child tenancy, the elastic pool cannot add members from the parent tenancy or from another child tenancy.
- There is no difference for elastic pool billing or capacity management when an elastic pool includes instances from one or more child tenancies. The pool members in the child tenancy are not billed individually (the pool leader is billed based on the pool shape).
- If a child tenancy is removed, that is the parent/child relationship is broken, all the pool members from the child tenancy become regular instances and do not belong to an elastic pool.

See About Elastic Pool Billing for more information.

Migrate to Autonomous Database

Database migration is the process of migrating your database from a source database to a target database.

To migrate your database to an Autonomous Database, Oracle provides different migration options.

- Migrate Oracle Databases to Autonomous Database
- Migrate Applications from Non-Oracle SQL to Oracle SQL
  Application migration involves moving an application from one environment to another. The migration process includes a variety of tasks, including migrating SQL statements from a non-Oracle database to Oracle SQL.

Migrate Oracle Databases to Autonomous Database

Oracle provides options to migrate your database to Autonomous Database.
You can choose one of these options depending on the amount of data you want to migrate, downtime requirements during the migration, network bandwidth between your source database and your Oracle Cloud Infrastructure region, and whether you want manual control over the migration.

- Migration Prerequisites
  Before starting your migration, it is recommended to run the Cloud Premigration Advisor Tool (CPAT), which helps you evaluate your source database for compatibility with the Autonomous Database.
- Recommended Migration Methods
  Following are the recommended migration methods to migrate your database into an Autonomous Database.
- Migrate Existing SQL Execution Plans to Autonomous Database to Mitigate the Risk of SQL Performance Regressions
  Describes how to reduce the risk of SQL performance regressions when you migrate to Autonomous Database.

Migration Prerequisites

Before starting your migration, it is recommended to run the Cloud Premigration Advisor Tool (CPAT), which helps you evaluate your source database for compatibility with the Autonomous Database.

CPAT identifies potential actions you may need to take before or during the migration, prioritizing their importance and suggesting resolutions. Some migration tools and services automatically run this advisor.

See Cloud Premigration Advisor Tool for more information.

Recommended Migration Methods

Following are the recommended migration methods to migrate your database into an Autonomous Database.

Online Migration

If your source database needs to be always online and you can only take minimal downtime for the migration, you can use one of the online migration services and tools below, independent of your database size. Note that both options require the source database to be on version 11.2.0.4 or later. If your source database is using an older version, you need to upgrade it first if you want to use one of the online migration methods.

Following are the online migration methods:

- **OCI Database Migration**: OCI Database Migration, a managed cloud service, provides validated, cross-version, fault-tolerant, and incremental Oracle Database migrations for online and offline use cases. You can choose this option if you want a fully managed cloud service that handles the migration for you.

  See OCI Database Migration for more information.
- **Zero Downtime Migration (ZDM)**: Zero Downtime Migration (ZDM) is a tool with a command line interface that you install and run on a host you provision. Zero Downtime Migration provides online and offline migration options. You can use this option if you want more control over the migration.

  See Zero Downtime Migration for more information.

> **Note:**
>
> These methods also run the Cloud Premigration Advisor Tool (CPAT) to check your source database for compatibility with the Autonomous Database and use Oracle Data Pump and Oracle GoldenGate to carry out the migration for you.

Offline Migration

If you can take your source database offline for the migration, you can use one of the following migration options in addition to OCI Database Migration and Zero Downtime Migration (ZDM).

> **Note:**
>
> This is a manual method; you must orchestrate the export/import manually.

Following is the offline migration method:

- **Oracle Data Pump**: Oracle Data Pump technology enables very high-speed movement of data and metadata from one database to another. You can export your source database or individual schemas as dump files and import them into the Autonomous Database. You can store the dump files on the Object Store or a network filesystem (NFS) that you can attach to your source database and to your Autonomous Database.

  See Overview of Oracle Data Pump for the product documentation for Oracle Data Pump.

  See Import Data Using Oracle Data Pump on Autonomous Database for more information about how to export and import your source schemas into the Autonomous Database.

Other Migration Methods

In addition to the recommended migration tools and services, you can use the following offline data migration methods:

> **Note:**
>
> These methods require more manual steps, coding, and advanced knowledge of each method. You must also migrate your source schema metadata using your own `DDL` scripts or tools such as Oracle Data Pump before initiating the data load using these methods. These options may be preferable for small data sets for which you want to avoid installing additional tools or using cloud migration services.

Following are the other offline migration methods:

- **Database Links**: You can create database links from your Autonomous Database to your source database and insert data into your tables by running queries over the database link. You can use multiple sessions to load multiple tables concurrently to improve the performance of the data load.

  See Create Database Links from Autonomous Database to Another Autonomous Database for more information about creating database links from your Autonomous Database to your source databases.

- **Unload and Load Using Files**: You can unload data from your source database into files and load those files into your target tables in your Autonomous Database. Autonomous

Database supports loading data from different file formats including CSV, JSON, Parquet, and more. You can place the files on the Object Store or a network filesystem (NFS) attached to your Autonomous Database.

See Load Data from Files in the Cloud for more information about how to load data from files in the object store.

See Attach Network File System to Autonomous Database for attaching NFS directories to your Autonomous Database.

See Load Data or Query Data from Files in a Directory for more information about loading data from files on a filesystem.

- **Materialized Views**: Using database links from your Autonomous Database to your source database, you can also create materialized views in your target database. As changes happen on your source tables, you can refresh the materialized views to keep them updated during the migration.

  See Managing Read-Only Materialized Views for more information about using materialized views to replicate data.

> **Note:**
>
> Deciding the migration tool or service depends on multiple factors such as your source database, source data format, data volume, and complexity. To help you identify the most optimal solution for migrating your data to the Autonomous Database, Oracle provides an advisory utility called Oracle Cloud Migration Advisor. See Migrate Oracle Databases to OCI for more information about this utility.

Migrate Existing SQL Execution Plans to Autonomous Database to Mitigate the Risk of SQL Performance Regressions

Describes how to reduce the risk of SQL performance regressions when you migrate to Autonomous Database.

- About Migrating to Autonomous Database with Real-time SQL Plan Management (SPM)
  Describes using Real-time SQL Plan Management when you migrate from a source Oracle Database to Autonomous Database.
- Enable Automatic SQL Tuning Set on the Source Oracle Database
  Before you migrate to Autonomous Database enable Automatic SQL Tuning Set (ASTS) on your source Oracle Database.
- Migrate Your Data to Autonomous Database
  After you capture a sufficient amount of SQL on the source Oracle Database with Automatic SQL Tuning Set (ASTS) enabled, perform the migration to Autonomous Database.
- Export Automatic SQL Tuning Set from Your Source Oracle Database
  After you perform the migration to Autonomous Database, export the Automatic SQL Tuning Set (ASTS) from your source Oracle Database.
- Import Automatic SQL Tuning Set to Autonomous Database
  After you perform the migration to Autonomous Database and you export the Automatic SQL Tuning Set (ASTS) from the source Oracle Database you are migrating, import the ASTS to your Autonomous Database.
- Verify Your Real-time SPM Setting on Autonomous Database
  Describes the steps to verify that real-time SPM is enabled on Autonomous Database.

About Migrating to Autonomous Database with Real-time SQL Plan Management (SPM)

Describes using Real-time SQL Plan Management when you migrate from a source Oracle Database to Autonomous Database.

When you migrate from a source Oracle Database to Autonomous Database you can use Real-time SQL Plan Management (SPM). This enables you to capture the SQL execution plans from your source database and move them into Automatic SQL Tuning Set (ASTS) on Autonomous Database so that plans continue to perform with the same or better performance after the migration. Real-time SPM allows plans to change on Autonomous Database, but if Real-time SPM sees poor performance, it may use a plan that came from the pre-migrated database if that plan provides better performance (Real-time SPM uses the plans in Automatic SQL Tuning Set (ASTS) only if they provide better performance).

Keep the following in mind for using Real-time SPM with a migration to Autonomous Database:

- SPM relies on repeatable SQL statements. SPM is not suitable for databases that use literal values in SQL statements or for SQL that is highly dynamic, such as in ad-hoc query environments. However, if the SQL statements use literal values and the `CURSOR_SHARING` parameter is set to `FORCE`, SPM will work.
- In the source Oracle Database that you are migrating to Autonomous Database you capture application SQL statements in a SQL tuning set (`SYS_AUTO_SYS`). This can consume space in `SYSAUX`, but typically consumes no more than a few gigabytes (even for large systems). You can monitor the `SYSAUX` usage and increase the size of the tablespace, if necessary.
- Real-time SPM cannot prevent all performance regressions, but it can significantly reduce the risk of performance regressions happening due to SQL execution plan changes.

Perform the following steps to enable SQL Plan Management (SPM) on your source Oracle Database and to migrate the database to Autonomous Database:

1. Enable Automatic SQL Tuning Set on the Source Oracle Database
2. Migrate Your Data to Autonomous Database
3. Export Automatic SQL Tuning Set from Your Source Oracle Database
4. Import Automatic SQL Tuning Set to Autonomous Database
5. Verify Your Real-time SPM Setting on Autonomous Database

See the following for more information:

- CURSOR_SHARING
- What is Real-time SQL plan Management?
- Using the Automatic SQL Tuning Set in Oracle Database 19c

Enable Automatic SQL Tuning Set on the Source Oracle Database

Before you migrate to Autonomous Database enable Automatic SQL Tuning Set (ASTS) on your source Oracle Database.

ASTS needs to run for enough time to cover your workload and capture all or most of the SQL statements and their execution plans. So, consider enabling ASTS with lead time in advance of the migration to Autonomous Database. For example, for a financial or sales application, capture month-end or year-end processing.

On the source Oracle Database, as DBA user enable Automatic SQL Tuning Set (ASTS):

1. On the database you want to migrate, enable ASTS.

```
BEGIN
  dbms_auto_task_admin.enable(
    client_name => 'Auto STS Capture Task',
    operation   => NULL,
    window_name => NULL);
END;
/
```

   See DBMS_AUTO_TASK_ADMIN for more information.

2. Verify that the ASTS background task is enabled.

```
SELECT task_name, interval,status, last_schedule_time, enabled
    FROM   dba_autotask_schedule_control
    WHERE  dbid = sys_context('userenv','con_dbid') AND
           task_name = 'Auto STS Capture Task';
```

If you want to monitor the SQL that's being captured, view `DBA_SQLSET_STATEMENTS`. For example:

```
SELECT substr(sql_text,1,100) txt, executions
    FROM dba_sqlset_statements
    WHERE sqlset_name = 'SYS_AUTO_STS';
```

As required, you can monitor the size and free space of `SYSAUX`. For example:

```
SELECT sum(bytes)/(1024*1024*1024) size_gb
    FROM   dba_data_files
    WHERE tablespace_name = 'SYSAUX' GROUP BY tablespace_name;

SELECT sum(bytes)/(1024*1024*1024) free_gb
    FROM dba_free_space
    WHERE tablespace_name = 'SYSAUX' GROUP BY tablespace_name;
```

Migrate Your Data to Autonomous Database

After you capture a sufficient amount of SQL on the source Oracle Database with Automatic SQL Tuning Set (ASTS) enabled, perform the migration to Autonomous Database.

See Migrate Oracle Databases to Autonomous Database for options for migrating to Autonomous Database.

Export Automatic SQL Tuning Set from Your Source Oracle Database

After you perform the migration to Autonomous Database, export the Automatic SQL Tuning Set (ASTS) from your source Oracle Database.

1. On the source Oracle Database, create and populate a staging table for ASTS data.

   As a DBA user, create the staging table:

```
BEGIN
   dbms_sqlset.create_stgtab('ASTS_TABLE');
```

```
   dbms_sqlset.pack_stgtab('SYS_AUTO_STS','SYS','ASTS_TABLE');
END;
/
```

After this operation completes the staging table contains the SQL statements that were captured on the source Oracle Database.

2. Export the staging table.

   For example, export the staging table using Oracle Data Pump:

```
CREATE DIRECTORY dpdir AS '/export_directory';
expdp user/password@database tables=asts_table directory=directory
dumpfile=filename
```

See DBMS_SQLSET for more information.

Import Automatic SQL Tuning Set to Autonomous Database

After you perform the migration to Autonomous Database and you export the Automatic SQL Tuning Set (ASTS) from the source Oracle Database you are migrating, import the ASTS to your Autonomous Database.

1. Import the staging file to your Autonomous Database.

   Use Oracle Data Pump to import the staging table into Autonomous Database. First upload the dump file you exported from your source Oracle Database to a Cloud Object Storage bucket and then import the dump file.

   For example, as the ADMIN user run these commands:

   a. Create the credential to access the Cloud Object Store bucket.

```
BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'BUCKET_CREDENTIAL',
    username => 'oracleidentitycloudservice/aaaaa@bbbbb.com',
    password => 'password'
  );
END;
/
```

   See Create Credentials to Access Cloud Services for more information.

   b. Use Oracle Data Pump to import the dump file with the ASTS data to your Autonomous Database instance.

```
impdp admin/password@db_adb_high \
     directory=data_pump_dir \
     credential=BUCKET_CREDENTIAL \
     dumpfile= https://namespace-string.objectstorage.us-
ashburn-1.oci.customer-oci.com/n/namespace-string/b/bucketname/o/
asts_staging.dmp \
     tables=asts_table
```

   See Import Data Using Oracle Data Pump on Autonomous Database for more information.

> **Note:**
>
> Make sure that the timezone file in Autonomous Database matches the value in the source Oracle Database where you created the dump file. If there is a timezone mismatch, the database raises the following error:
>
> ```
> ORA-39002: invalid operation' error raised by
> dbms_datapump.start_job'
> ```
>
> See Datetime Data Types and Time Zone Support and Manage Time Zone File Updates on Autonomous Database for more information.

2. In the migrated Autonomous Database, unpack the SQL statements from the staging table and load them into the destination ASTS.

```
BEGIN
   dbms_sqlset.unpack_stgtab('SYS_AUTO_STS','SYS',TRUE,'ASTS_TABLE');
END;
/
```

See DBMS_SQLSET for more information.

Verify Your Real-time SPM Setting on Autonomous Database

Describes the steps to verify that real-time SPM is enabled on Autonomous Database.

Real-time SPM is enabled by default on Autonomous Database. You can verify the Real-time SPM mode as follows:

```
SELECT parameter_value spm_mode
    FROM   dba_sql_management_config
    WHERE  parameter_name = 'AUTO_SPM_EVOLVE_TASK';
```

The mode `AUTO` (automatic) real-time SPM indicates real-time SPM is enabled.

If real-time SPM is not enabled, use the following command to enable it:

```
EXEC dbms_spm.configure('AUTO_SPM_EVOLVE_TASK', 'AUTO')
```

Migrate Applications from Non-Oracle SQL to Oracle SQL

Application migration involves moving an application from one environment to another. The migration process includes a variety of tasks, including migrating SQL statements from a non-Oracle database to Oracle SQL.

The `DBMS_CLOUD_MIGRATION` package facilitates the translation of SQL statements written for a non-Oracle database to Oracle SQL. This allows you to easily migrate applications to Autonomous Database, when the applications were developed for non-Oracle databases that use a different SQL flavor.

The `DBMS_CLOUD_MIGRATION` package supports migration of SQL code from the following non-Oracle databases:

- PostgreSQL
- MySQL
- SQL Server

The `DBMS_CLOUD_MIGRATION` package provides routines that allow you to:

- Translate individual SQL statements from a non-Oracle database to Oracle SQL.
- Translate files containing SQL code from a non-Oracle database to Oracle SQL, and generate a new file containing the translated Oracle SQL.
- Work interactively in a session, entering SQL statements from a non-Oracle system. In this case, the non-Oracle statements are translated and run interactively in your session.

> **Note:**
>
> To run the subprograms in `DBMS_CLOUD_MIGRATION` you must be logged in as the `ADMIN` user or have `EXECUTE` privilege on `DBMS_CLOUD_MIGRATION`.

Topics

- Migrate Applications from PostgreSQL Databases to Autonomous Database
  You can migrate SQL statements from PostgreSQL to Oracle SQL and run the statements on Autonomous Database.
- Migrate Applications from MySQL Databases to Autonomous Database
  You can migrate SQL statements from MySQL to Oracle SQL and run the statements on Autonomous Database.
- Migrate Applications from SQL Server Databases to Autonomous Database
  You can migrate SQL statements from SQL Server to Oracle SQL and run the statements on Autonomous Database.

Migrate Applications from PostgreSQL Databases to Autonomous Database

You can migrate SQL statements from PostgreSQL to Oracle SQL and run the statements on Autonomous Database.

- Translate PostgreSQL Statements to Oracle SQL
  You can translate SQL statements written in PostgreSQL to Oracle SQL and run the translated statements on Autonomous Database.
- Run PostgreSQL Statements in Autonomous Database
  You can interactively translate and run PostgreSQL statements in your Autonomous Database.
- Migrate PostgreSQL Files to Oracle SQL
  You can migrate a file containing PostgreSQL statements to a file containing Oracle SQL statements.
- Limitations for Migration and Translation of PostgreSQL Statements to Oracle SQL
  This section summarizes the limitations for migrating SQL statements from PostgreSQL to Oracle SQL.

Translate PostgreSQL Statements to Oracle SQL

You can translate SQL statements written in PostgreSQL to Oracle SQL and run the translated statements on Autonomous Database.

Use `DBMS_CLOUD_MIGRATION.MIGRATE_SQL` to translate the PostgreSQL statement to Oracle SQL. There are procedure and function variants of `DBMS_CLOUD_MIGRATION.MIGRATE_SQL`.

Migrate PostgreSQL statement to Oracle SQL with MIGRATE_SQL Procedure

The following example accepts the SQL statement written in PostgreSQL as input, translates the statement to Oracle SQL, assigns the translated SQL statement to `output_sql_result`, and prints the result:

```
SET SERVEROUTPUT ON
   declare output_sql_result CLOB;
BEGIN
  DBMS_CLOUD_MIGRATION.MIGRATE_SQL(
    original_sql => 'SELECT e.employee_id, e.last_name, e.salary FROM
employees AS e;',
    output_sql   => output_sql_result,
    source_db    => 'POSTGRES');
    DBMS_OUTPUT.PUT_LINE (output_sql_result);
END;
/

Output
----------------------------------------------------------------
SELECT e.employee_id, e.last_name, e.salary FROM employees e;
```

The `original_sql` parameter specifies the PostgreSQL statement.

The `output_sql` parameter stores the translated SQL.

The `source_db` parameter specifies the PostgreSQL database name.

See MIGRATE_SQL Procedure and Function for more information.

Migrate PostgreSQL statement to Oracle SQL with MIGRATE_SQL Function

The following example shows the `DBMS_CLOUD_MIGRATION.MIGRATE_SQL` function within a `SELECT` statement. The function input is a PostgreSQL statement and the function returns the translated statement in Oracle SQL:

```
SELECT DBMS_CLOUD_MIGRATION.MIGRATE_SQL(
     'CREATE TABLE IF NOT EXISTS cars (brand VARCHAR(255), model
VARCHAR(255), year INT)',
     'POSTGRES') AS output FROM DUAL;

OUTPUT
--------------------------------------------------------------------------------
create table cars (brand VARCHAR2(255), model VARCHAR2(255), year NUMBER(10);
```

See MIGRATE_SQL Procedure and Function for more information.

Notes for running `DBMS_CLOUD_MIGRATION.MIGRATE_SQL`:

- You may encounter an error during the translation if the input SQL statement is not supported in Oracle SQL. See Limitations for Migration and Translation of PostgreSQL **Statements** to Oracle SQL for more information.
- The `DBMS_CLOUD_MIGRATION.MIGRATE_SQL` subprograms only accept one SQL statement as input. So, only a single SQL statement can be translated per call.

Run PostgreSQL Statements in Autonomous Database

You can interactively translate and run PostgreSQL statements in your Autonomous Database.

Use the `ENABLE_TRANSLATION` procedure to enable real-time translation of SQL statements written in PostgreSQL. After you enable translation in a session, PostgreSQL statements are automatically translated and run as Oracle SQL statements, and you can see the results.

For example, after you enable translation by running `ENABLE_TRANSLATION` you can interactively do the following in a session:

- Create the tables. For example, create the tables `MOVIE` and `INVENTORY`.
- Insert data into tables.
- Query tables.
- Perform JOIN operations on tables. For example, you can perform a left outer join on tables.

To enable translation with PostgreSQL and run commands:

1. Connect to your Autonomous Database using a SQL client.

   See Connect to Autonomous Database for more information.

   > **Note:**
   >
   > `DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION` is not supported in Database Actions and is not supported with the Oracle APEX Service.

2. Run `DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION` to enable real-time SQL translation in your session.

   ```
   BEGIN
    DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION('POSTGRES');
   END;
   /
   ```

   Use the following query to verify the SQL translation language for your session:

   ```
   SELECT SYS_CONTEXT('USERENV','SQL_TRANSLATION_PROFILE_NAME') FROM DUAL;
   ```

   See ENABLE_TRANSLATION Procedure for more information.

3. Enter PostgreSQL statements. For example:

```
CREATE TABLE movie (film_id int, title varchar(255));

Table MOVIE created.
```

This automatically translates and runs the PostgreSQL `CREATE TABLE` statement.

You can verify using the `DESC` command. For example:

```
DESC movie;

Name        Null?     Type
-------     -----     -------------
FILM_ID               NUMBER(38)
TITLE                 VARCHAR2(255)
```

The `MOVIE` table is created and the datatypes of each of the columns are automatically converted to Oracle datatypes.

You may encounter an error during the translation if the input SQL statement is not supported. See Limitations for Migration and Translation of PostgreSQL **Statements** to Oracle SQL for more information.

4. Insert data into the `MOVIE` table. For example:

```
INSERT INTO movie (film_id, title) VALUES (123, 'Tangled');

1 row inserted.

INSERT INTO movie (film_id, title) VALUES (234, 'Frozen');

1 row inserted.
```

Verify the data insertion by querying the `MOVIE` table. For example:

```
SELECT * FROM movie;

FILM_ID  TITLE
-------- ---------
123      Tangled
234      Frozen
```

5. Create an `INVENTORY` table:

```
CREATE TABLE inventory (film_id int, inventory_id int);

Table INVENTORY created.
```

You can verify this step with the `DESC` command. For example:

```
DESC inventory;

Name        Null?     Type
```

```
-------     -----     -------------
FILM_ID               NUMBER(38)
INVENTORY_ID          NUMBER(38)
```

The `INVENTORY` table is created and the datatypes of each of the columns are automatically converted to Oracle datatypes.

6. Insert data into the `INVENTORY` table. For example:

```
INSERT INTO inventory(film_id, inventory_id) VALUES (123, 223);

1 row inserted.

INSERT INTO inventory(film_id, inventory_id) VALUES (234, 334);

1 row inserted.
```

Verify the data insertion by querying `INVENTORY`. For example:

```
SELECT * FROM inventory;

FILM_ID  INVENTORY_ID
-------- -------------
123     223
234     334
```

7. Perform a left outer join on tables `MOVIE` and `INVENTORY`:

```
SELECT m.film_id, m.title, inventory.inventory_id
    FROM movie AS m LEFT JOIN inventory
    ON inventory.film_id = m.film_id;

  FILM_ID  TITLE       INVENTORY_ID
---------- ---------- ------------
       234 Frozen      334
       123 Tangled     223
```

This example performs a `LEFT OUTER JOIN` on the `movie` and `inventory` tables. The `AS` keyword for table aliases in the `FROM` clause is not supported in Oracle SQL. The query is first translated to Oracle SQL and then run in your session.

8. Use `DBMS_CLOUD_MIGRATION.DISABLE_TRANSLATION` procedure to disable real-time SQL language translation for your session.

```
BEGIN
 DBMS_CLOUD_MIGRATION.DISABLE_TRANSLATION;
END;
/
```

This returns an error if SQL language translation is not enabled for your session.

See DISABLE_TRANSLATION Procedure

You can query the `V$MAPPED_SQL` view to list the PostgreSQL statements that are translated and mapped in memory to Oracle SQL statements.

For example:

```
SELECT v.*
    FROM v$mapped_sql v, dba_objects o
    WHERE v.sql_translation_profile_id = o.object_id
        AND o.object_name = 'POSTGRES'
        AND o.object_type = 'TRANSLATION PROFILE';
```

See V$MAPPED_SQL for more information.

Migrate PostgreSQL Files to Oracle SQL

You can migrate a file containing PostgreSQL statements to a file containing Oracle SQL statements.

The `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` procedure translates SQL statements in a PostgreSQL file in Object Storage and generates a new file containing Oracle SQL.

As a prerequisite, upload one or more PostgreSQL files with a `.sql` extension to a location on Object Storage. The following examples use the file `postgrestest.sql` that is uploaded to Object Storage. See Put data into object storage for more information.

To migrate PostgreSQL files to Oracle SQL:

1. Connect to your Autonomous Database instance.

   See Connect to Autonomous Database for more information.

2. Configure access to Cloud Object Storage using a resource principal or by creating a credential object.

   This step provides access to the Cloud Object Storage where you put the files you are migrating:

   - **Use a resource principal to access Cloud Object Storage**:

     Define policies and roles to access Oracle Cloud Infrastructure Object Storage with a resource principal. See Use Resource Principal to Access Oracle Cloud Infrastructure Resources and Use Resource Principal with DBMS_CLOUD for more information.

     If your files reside in another vendor's Cloud Object Storage, define the appropriate policies and roles to access the resource. See Configure Policies and Roles to Access Resources for more information.

   - **Create a credential to access Cloud Object Storage:**

     You can create a credential to access Cloud Object Storage.

     For example:

     ```
     BEGIN
       DBMS_CLOUD.CREATE_CREDENTIAL (
         credential_name => 'OBJ_STORE_CRED',
         username        => 'user1@example.com',
         password        => 'password'
       );
     END;
     /
     ```

     See CREATE_CREDENTIAL Procedure for more information.

3. Optionally, you can list the files in Object Storage. For example:

```
VAR function_list CLOB;
SELECT object_name FROM DBMS_CLOUD.LIST_OBJECTS
   (credential_name => 'OCI$RESOURCE_PRINCIPAL', location_uri => 'https://
objectstorage.region.oraclecloud.com/n/namespace/b/bucket/o/files');

OBJECT_NAME
--------------------
postgrestest.sql
```

Alternatively, if you create a credential instead of the resource principal, `OCI$RESOURCE_PRINCIPAL`, specify the credential name in the `credential_name` parameter.

See LIST_OBJECTS Function for more information.

4. Run `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` to migrate the PostgreSQL file to Oracle SQL:

```
BEGIN
 DBMS_CLOUD_MIGRATION.MIGRATE_FILE (
     credential_name => 'OCI$RESOURCE_PRINCIPAL',
     location_uri    => 'https://objectstorage.region.oraclecloud.com/n/
namespace/b/bucket/o/files/postgrestest.sql',
     source_db       => 'POSTGRES'
    );
END;
/
```

The `credential_name` parameter specifies the credential to access the Cloud Object Storage URI. The user that runs `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` must have `EXECUTE` privilege for the credential object used to access the Object Storage URI. That is, the credential you specify with the `credential_name` parameter. If you use a credential instead of a resource principal, specify the credential name in the `credential_name` parameter.

The `location_uri` parameter specifies the source file URI. The format of the URI depends on the Cloud Object Storage service you are using. See DBMS_CLOUD URI Formats for more information.

The `source_db` parameter specifies the PostgreSQL as database language. Use the value `POSTGRES` to translate PostgreSQL files to Oracle SQL.

Running this command translates the PostgreSQL file `postgrestest.sql` to Oracle SQL and generates a new file with the name *original_filename*`_oracle.sql`.

For this example, running `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` with the input file `postgrestest.sql` generates `postgrestest_oracle.sql`. After the translation step the procedure uploads `postgrestest_oracle.sql` to Object Storage.

Optionally, use the `target_uri` parameter to specify the location where the translated file is uploaded. The default value for this parameter is `NULL`, which means the translated file is uploaded to the same location as specified in the `location_uri` parameter.

See MIGRATE_FILE Procedure for more information.

5. Verify that the output file was generated.

```
SELECT object_name FROM DBMS_CLOUD.LIST_OBJECTS (
    credential_name => 'OCI$RESOURCE_PRINCIPAL', location_uri => 'https://
objectstorage.region.oraclecloud.com/n/namespace/b/bucket/o/files');

OBJECT_NAME
--------------------
postgrestest.sql
postgrestest_oracle.sql
```

Alternatively, if you create a credential instead of the resource principal, `OCI$RESOURCE_PRINCIPAL`, specify the credential name in the `credential_name` parameter.

See LIST_OBJECTS Function for more information.

Run the following query to view the content of the `postgrestest_oracle.sql` file:

```
SELECT UTL_RAW.CAST_TO_VARCHAR2 (DBMS_CLOUD.GET_OBJECT(
   credential_name => 'OCI$RESOURCE_PRINCIPAL',
   object_uri => 'https://objectstorage.region.oraclecloud.com/n/namespace/b/
bucket/o/files'))
FROM dual;

UTL_RAW.CAST_TO_VARCHAR2(DBMS_CLOUD.GET_OBJECT(CREDENTIAL_NAME=>'CRED1',OBJECT
_U
--------------------------------------------------------------------------------
--
SELECT f.film_id, f.title, inventory_id
FROM film f LEFT JOIN inventory
ON inventory.film_id = f.film_id;
```

Alternatively, if you create a credential instead of the resource principal, `OCI$RESOURCE_PRINCIPAL`, specify the credential name in the `credential_name` parameter.

See GET_OBJECT Procedure and Function for more information.

Limitations for Migration and Translation of PostgreSQL **Statements** to Oracle SQL

This section summarizes the limitations for migrating SQL statements from PostgreSQL to Oracle SQL.

The following list of PostgreSQL statements are not supported when migrating to Autonomous Database:

- `CREATE DOMAIN`
- `CREATE EXTENSION`
- `CREATE DATABASE`
- `CREATE TYPE`
- `SET`

The following list of PostgreSQL statements are supported with restrictions:

- `ALTER TABLE`: Only `ALTER TABLE ADD CONSTRAINT` is supported when migrating to Autonomous Database.

- `DELETE`: The `RETURNING *` keyword in the `DELETE` statement is not supported in Autonomous Database. You must replace the `RETURNING *` clause with the `RETURNING INTO` clause. For example, `DELETE FROM tasks WHERE status = 'DONE' RETURNING *;`. See RETURNING INTO Clause for more information.
- `CREATE FUNCTION`: Following are not supported with `CREATE FUNCTION`:
  - The `SETOF` return type, you must replace `SETOF` with `CURSORS` or `COLLECTIONS` return types.
  - The `IMMUTABLE` clause.
  - The parameter declarations in the format `FUNCTION_NAME (DATATYPE, DATATYPE)`.
- `ALTER FUNCTION`: The `ALTER FUNCTION` function arguments, for example, `RENAME TO`, `OWNER TO`, `SET SCHEMA` are not supported.

Migrate Applications from MySQL Databases to Autonomous Database

You can migrate SQL statements from MySQL to Oracle SQL and run the statements on Autonomous Database.

- Translate MySQL Statements to Oracle SQL
  You can translate SQL statements written in MySQL to Oracle SQL and run the translated statements on Autonomous Database.
- Run MySQL Statements in Autonomous Database
  You can interactively translate and run MySQL statements in your Autonomous Database.
- Migrate MySQL Files to Oracle SQL
  You can migrate a file containing MySQL statements to a file containing Oracle SQL statements.
- Limitations for Migration and Translation of MySQL Statements to Oracle SQL
  This section summarizes the limitations for migrating SQL statements from MySQL to Oracle SQL.

Translate MySQL Statements to Oracle SQL

You can translate SQL statements written in MySQL to Oracle SQL and run the translated statements on Autonomous Database.

Use `DBMS_CLOUD_MIGRATION.MIGRATE_SQL` to translate a MySQL statement to Oracle SQL. There are procedure and function variants of `DBMS_CLOUD_MIGRATION.MIGRATE_SQL`.

Migrate MySQL Statement to Oracle SQL with MIGRATE_SQL Procedure

The following example accepts the SQL statement written in MySQL as input, translates the statement to Oracle SQL, assigns the translated SQL statement to `output_sql_result`, and prints the result:

```
SET SERVEROUTPUT ON
   declare output_sql_result CLOB;
BEGIN
  DBMS_CLOUD_MIGRATION.MIGRATE_SQL(
    original_sql => 'CREATE TABLE movie (movie_id INT, title VARCHAR(255));',
    output_sql   => output_sql_result,
    source_db    => 'MYSQL');
    DBMS_OUTPUT.PUT_LINE (output_sql_result);
END;
```

```
/

OUTPUT
--------------------------------------------------------------
CREATE TABLE movie (movie_id NUMBER(10), title VARCHAR2(255));
```

The `original_sql` parameter specifies the MySQL statement.

The `output_sql` parameter stores the translated SQL.

The `source_db` parameter specifies MySQL as the database name.

See MIGRATE_SQL Procedure and Function for more information.

Migrate MySQL Statement to Oracle SQL with MIGRATE_SQL Function

The following example shows the `DBMS_CLOUD_MIGRATION.MIGRATE_SQL` function within a `SELECT` statement. The function input is a MySQL statement and the function returns the translated statement in Oracle SQL:

```
SELECT DBMS_CLOUD_MIGRATION.MIGRATE_SQL(
     'CREATE TABLE movie (film_id INT, title VARCHAR(255));','MYSQL') AS
output FROM DUAL;

OUTPUT
--------------------------------------------------------------------------------
create table cars (brand VARCHAR2(255), model VARCHAR2(255);
```

See MIGRATE_SQL Procedure and Function for more information.

Notes for running `DBMS_CLOUD_MIGRATION.MIGRATE_SQL`:

- You may encounter an error during the translation if the input SQL statement is not supported in Oracle SQL. See Limitations for Migration and Translation of MySQL Statements to Oracle SQL for more information.
- The `DBMS_CLOUD_MIGRATION.MIGRATE_SQL` subprograms only accept one SQL statement as input. So, only a single SQL statement can be translated per call.

Run MySQL Statements in Autonomous Database

You can interactively translate and run MySQL statements in your Autonomous Database.

Use the `ENABLE_TRANSLATION` procedure to enable real-time translation of SQL statements written in MySQL. After you enable translation in a session, MySQL statements are automatically translated and run as Oracle SQL statements, and you can see the results.

For example, after you enable translation by running `ENABLE_TRANSLATION` you can interactively do the following in a session:

- Create the tables. For example, create the tables `MOVIE` and `INVENTORY`.
- Insert data into tables.
- Query tables.
- Perform JOIN operations on tables. For example, you can perform a left outer join on tables.

To enable translation with MySQL and run commands:

1. Connect to your Autonomous Database using a SQL client.

   See Connect to Autonomous Database for more information.

   > **Note:**
   >
   > `DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION` is not supported in Database Actions and is not supported with the Oracle APEX Service.

2. Run `DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION` to enable real-time SQL translation in your session. Use the `MYSQL` parameter to translate from MySQL.

   ```
   BEGIN
    DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION('MYSQL');
   END;
   /
   ```

   Use the following query to verify the SQL translation language for your session:

   ```
   SELECT SYS_CONTEXT('USERENV','SQL_TRANSLATION_PROFILE_NAME') FROM DUAL;
   ```

   See ENABLE_TRANSLATION Procedure for more information.

3. Enter MySQL statements. For example:

   ```
   CREATE TABLE movie (film_id int, title varchar(255));

   Table MOVIE created.
   ```

   This automatically translates and runs the MySQL `CREATE TABLE` statement.

   You can verify using the `DESC` command. For example:

   ```
   DESC movie;

   Name         Null?     Type
   -------      -----     -------------
   FILM_ID                NUMBER(38)
   TITLE                  VARCHAR2(255)
   ```

   The `MOVIE` table is created and the datatypes of each of the columns are automatically converted to Oracle datatypes.

   You may encounter an error during the translation if the input SQL statement is not supported. See Limitations for Migration and Translation of MySQL Statements to Oracle SQL for more information.

4. Insert data into the `MOVIE` table. For example:

   ```
   INSERT INTO movie (film_id, title) VALUES (123, 'Tangled');

   1 row inserted.

   INSERT INTO movie (film_id, title) VALUES (234, 'Frozen');
   ```

```
1 row inserted.
```

Verify the data insertion by querying the `MOVIE` table. For example:

```
SELECT * FROM movie;

FILM_ID  TITLE
-------- ---------
123      Tangled
234      Frozen
```

5. Create an `INVENTORY` table:

```
CREATE TABLE inventory (film_id int, inventory_id int);

Table INVENTORY created.
```

You can verify this step with the `DESC` command. For example:

```
DESC inventory;

Name         Null?     Type
-------      -----     -------------
FILM_ID                NUMBER(38)
INVENTORY_ID           NUMBER(38)
```

The `INVENTORY` table is created and the datatypes of each of the columns are automatically converted to Oracle datatypes.

6. Insert data into the `INVENTORY` table. For example:

```
INSERT INTO inventory(film_id, inventory_id) VALUES (123, 223);

1 row inserted.

INSERT INTO inventory(film_id, inventory_id) VALUES (234, 334);

1 row inserted.
```

Verify the data insertion by querying `INVENTORY`. For example:

```
SELECT * FROM inventory;

FILM_ID  INVENTORY_ID
-------- -------------
123      223
234      334
```

7. Perform a left outer join on tables `MOVIE` and `INVENTORY`:

```
SELECT m.film_id, m.title, inventory_id
    FROM movie AS m LEFT JOIN inventory
```

```
    ON inventory.film_id = m.film_id;

  FILM_ID  TITLE       INVENTORY_ID
---------- ---------- ------------
       234 Frozen      334
       123 Tangled     223
```

This example performs a `LEFT OUTER JOIN` on the `movie` and `inventory` tables. The `AS` keyword for table aliases in the `FROM` clause is not supported in Oracle SQL. The query is first translated to Oracle SQL and then run in your session.

8. Use `DBMS_CLOUD_MIGRATION.DISABLE_TRANSLATION` procedure to disable real-time SQL language translation for your session.

```
BEGIN
 DBMS_CLOUD_MIGRATION.DISABLE_TRANSLATION;
END;
/
```

This returns an error if SQL language translation is not enabled for your session.

See DISABLE_TRANSLATION Procedure

You can query the `V$MAPPED_SQL` view to list the MySQL statements that are translated and mapped in memory to Oracle SQL statements.

For example:

```
SELECT v.*
    FROM v$mapped_sql v, dba_objects o
    WHERE v.sql_translation_profile_id = o.object_id
        AND o.object_name = 'MYSQL'
        AND o.object_type = 'TRANSLATION PROFILE';
```

See V$MAPPED_SQL for more information.

Migrate MySQL Files to Oracle SQL

You can migrate a file containing MySQL statements to a file containing Oracle SQL statements.

The `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` procedure translates SQL statements in a MySQL file in Object Storage and generates a new file containing Oracle SQL.

As a prerequisite, upload one or more MySQL files with a `.sql` extension to a location on Object Storage. The following examples use the file `mysqltest.sql` that is uploaded to Object Storage. See Put data into object storage for more information.

To migrate MySQL files to Oracle SQL:

1. Connect to your Autonomous Database instance.

   See Connect to Autonomous Database for more information.

2. Configure access to Cloud Object Storage using a resource principal or by creating a credential object.

This step provides access to the Cloud Object Storage where you put the files you are migrating:

- **Use a resource principal to access Cloud Object Storage**:

  Define policies and roles to access Oracle Cloud Infrastructure Object Storage with a resource principal. See Use Resource Principal to Access Oracle Cloud Infrastructure Resources and Use Resource Principal with DBMS_CLOUD for more information.

  If your files reside in another vendor's Cloud Object Storage, define the appropriate policies and roles to access the resource. See Configure Policies and Roles to Access Resources for more information.

- **Create a credential to access Cloud Object Storage:**

  You can create a credential to access Cloud Object Storage.

  For example:

```
BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL (
    credential_name => 'OBJ_STORE_CRED',
    username        => 'user1@example.com',
    password        => 'password'
  );
END;
/
```

  See CREATE_CREDENTIAL Procedure for more information.

3. Optionally, you can list the files in Object Storage. For example:

```
VAR function_list CLOB;
SELECT object_name FROM DBMS_CLOUD.LIST_OBJECTS
   (credential_name => 'OCI$RESOURCE_PRINCIPAL', location_uri => 'https://
objectstorage.region.oraclecloud.com/n/namespace/b/bucket/o/files');

OBJECT_NAME
--------------------
mysqltest.sql
```

   Alternatively, if you create a credential instead of the resource principal, `OCI$RESOURCE_PRINCIPAL`, specify the credential name in the `credential_name` parameter.

   See LIST_OBJECTS Function for more information.

4. Run `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` to migrate the MySQL file to Oracle SQL:

```
BEGIN
 DBMS_CLOUD_MIGRATION.MIGRATE_FILE (
     credential_name => 'OCI$RESOURCE_PRINCIPAL',
     location_uri    => 'https://objectstorage.region.oraclecloud.com/n/
namespace/b/bucket/o/files/mysqltest.sql',
     source_db       => 'MYSQL'
    );
END;
/
```

The `credential_name` parameter specifies the credential to access the Cloud Object Storage URI. The user that runs `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` must have `EXECUTE` privilege for the credential object used to access the Object Storage URI. That is, the credential you specify with the `credential_name` parameter. If you use a credential instead of a resource principal, specify the credential name in the `credential_name` parameter.

The `location_uri` parameter specifies the source file URI. The format of the URI depends on the Cloud Object Storage service you are using. See DBMS_CLOUD URI Formats for more information.

The `source_db` parameter specifies MySQL as the database language. Use the value `MYSQL` to translate MySQL files to Oracle SQL.

Running this command translates the MySQL file `mysqltest.sql` to Oracle SQL and generates a new file with the name *original_filename*`_oracle.sql`.

For this example, running `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` with the input file `mysqltest.sql` generates `mysqltest_oracle.sql`. After the translation step the procedure uploads `mysqltest_oracle.sql` to Object Storage.

Optionally, use the `target_uri` parameter to specify the location where the translated file is uploaded. The default value for this parameter is `NULL`, which means the translated file is uploaded to the same location as specified in the `location_uri` parameter.

See MIGRATE_FILE Procedure for more information.

5. Verify that the output file was generated.

```
SELECT object_name FROM DBMS_CLOUD.LIST_OBJECTS (
    credential_name => 'OCI$RESOURCE_PRINCIPAL', location_uri => 'https://
objectstorage.region.oraclecloud.com/n/namespace/b/bucket/o/files');

OBJECT_NAME
--------------------
mysqltest.sql
mysqltest_oracle.sql
```

Alternatively, if you create a credential instead of the resource principal, `OCI$RESOURCE_PRINCIPAL`, specify the credential name in the `credential_name` parameter.

See LIST_OBJECTS Function for more information.

Run the following query to view the content of the `mysqltest_oracle.sql` file:

```
SELECT UTL_RAW.CAST_TO_VARCHAR2 (DBMS_CLOUD.GET_OBJECT(
   credential_name => 'OCI$RESOURCE_PRINCIPAL',
   object_uri => 'https://objectstorage.region.oraclecloud.com/n/namespace/b/
bucket/o/files'))
FROM dual;

UTL_RAW.CAST_TO_VARCHAR2(DBMS_CLOUD.GET_OBJECT(CREDENTIAL_NAME=>'CRED1',OBJECT
_U
--------------------------------------------------------------------------------
--
DROP TABLE movie;
DROP TABLE inventory;
CREATE TABLE movie (film_id NUMBER(10), title VARCHAR2(255));
INSERT INTO movie (film_id, title) VALUES (123, 'Tangled');
```

```
INSERT INTO movie (film_id, title) VALUES (234, 'Frozen');
CREATE TABLE movie (film_id NUMBER(10), inventory_id NUMBER(10));
INSERT INTO movie (film_id, inventory_id) VALUES (123, 223);
INSERT INTO inventory (film_id, inventory_id) VALUES (234, 334);
SELECT * FROM movie;
```

Alternatively, if you create a credential instead of the resource principal, `OCI$RESOURCE_PRINCIPAL`, specify the credential name in the `credential_name` parameter.

See GET_OBJECT Procedure and Function for more information.

Limitations for Migration and Translation of MySQL Statements to Oracle SQL

This section summarizes the limitations for migrating SQL statements from MySQL to Oracle SQL.

Note the following restrictions when migrating from MySQL database flavor to Oracle SQL:

- User-Defined Global Variables: MySQL user-defined global variables declared using `@var_name` format are not supported when translating to Oracle SQL.
- Quoted Identifiers: MySQL identifiers that are enclosed with backticks (`), such as `` `var_name` ``, are not supported when translating to Oracle SQL. Only identifiers that are without quotes or are enclosed in double quotation marks are supported.
- Delimiters:
  - For functions and procedures, only `$$` and `//` delimiters are supported.
  - For SQL statements only `;` delimiter is supported.

The following list of MySQL functions are not supported:

- `ADDTIME(datetime, time)`
- `AES_DECRYPT(crypt_str, key_str)`
- `AES_ENCRYPT(str, key_str)`
- `BIN(num)`
- `CONV(num, from_base, to_base)`
- `CONVERT_TZ(datetime, from, to)`
- `CRC32(exp)`
- `DATE_ADD(date, interval)`

Migrate Applications from SQL Server Databases to Autonomous Database

You can migrate SQL statements from SQL Server to Oracle SQL and run the statements on Autonomous Database.

- Translate SQL Server Statements to Oracle SQL
  You can translate SQL statements written in SQL Server to Oracle SQL and run the translated statements on Autonomous Database.
- Run SQL Server Statements in Autonomous Database
  You can interactively translate and run SQL Server statements in your Autonomous Database.

- Migrate SQL Server Files to Oracle SQL
  You can migrate a file containing SQL Server statements to a file containing Oracle SQL statements.
- Limitations for Migration and Translation of SQL Server Statements to Oracle SQL
  This section summarizes the limitations for migrating SQL statements from SQL Server to Oracle SQL.

Translate SQL Server Statements to Oracle SQL

You can translate SQL statements written in SQL Server to Oracle SQL and run the translated statements on Autonomous Database.

Use `DBMS_CLOUD_MIGRATION.MIGRATE_SQL` to translate a SQL Server statement to Oracle SQL. There are procedure and function variants of `DBMS_CLOUD_MIGRATION.MIGRATE_SQL`.

Migrate SQL Server Statement to Oracle SQL with MIGRATE_SQL Procedure

The following example accepts the SQL statement written in SQL Server as input, translates the statement to Oracle SQL, assigns the translated SQL statement to `output_sql_result`, and prints the result:

```
SET SERVEROUTPUT ON
   declare output_sql_result CLOB;
BEGIN
  DBMS_CLOUD_MIGRATION.MIGRATE_SQL(
    original_sql => 'CREATE TABLE [dbo].[movie] ([film_id] [int], [title]
[varchar](20));',
    output_sql   => output_sql_result,
    source_db    => 'SQLSERVER');
    DBMS_OUTPUT.PUT_LINE (output_sql_result);
END;
/

Output
----------------------------------------------------------------
CREATE TABLE movie (film_id NUMBER(10), title VARCHAR2(20));
```

The `original_sql` parameter specifies the SQL Server SQL statement.

The `output_sql` parameter stores the translated SQL.

The `source_db` parameter specifies the SQL Server database.

See MIGRATE_SQL Procedure and Function for more information.

Migrate SQL Server Statement to Oracle SQL with MIGRATE_SQL Function

The following example shows the `DBMS_CLOUD_MIGRATION.MIGRATE_SQL` function within a `SELECT` statement. The function input is a SQL Server statement and the function returns the translated statement in Oracle SQL:

```
SELECT DBMS_CLOUD_MIGRATION.MIGRATE_SQL(
     'CREATE TABLE [dbo].[movie] ([film_id] [int], [title] [varchar]
(20));','SQLSERVER') AS OUTPUT
     FROM DUAL;
```

```
OUTPUT
--------------------------------------------------------------------------------
CREATE TABLE movie (film_id NUMBER(10), title VARCHAR2(20));
```

Use the `SQLSERVER` parameter to translate from Microsoft SQL Server.

See MIGRATE_SQL Procedure and Function for more information.

Notes for running `DBMS_CLOUD_MIGRATION.MIGRATE_SQL`:

- You may encounter an error during the translation if the input SQL statement is not supported in Oracle SQL. See Limitations for Migration and Translation of SQL Server Statements to Oracle SQL for more information.
- The `DBMS_CLOUD_MIGRATION.MIGRATE_SQL` subprograms only accept one SQL statement as input. So, only a single SQL statement can be translated per call.

Run SQL Server Statements in Autonomous Database

You can interactively translate and run SQL Server statements in your Autonomous Database.

Use the `ENABLE_TRANSLATION` procedure to enable real-time translation of SQL statements written in SQL Server. After you enable translation in a session, non-Oracle SQL statements are automatically translated and run as Oracle SQL statements, and you can see the results.

For example, after you enable translation by running `ENABLE_TRANSLATION` you can interactively do the following in a session:

- Create the tables. For example, create the tables `MOVIE` and `INVENTORY`.
- Insert data into tables.
- Query tables.
- Perform JOIN operations on tables. For example, you can perform a left outer join on tables.

To enable translation with SQL Server statements and run commands:

1. Connect to your Autonomous Database using a SQL client.

   See Connect to Autonomous Database for more information.

   > **Note:**
   >
   > `DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION` is not supported in Database Actions and is not supported with the Oracle APEX Service.

2. Run `DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION` to enable real-time SQL translation in your session. Use the `SQLSERVER` parameter to translate from Microsoft SQL Server.

```
BEGIN
 DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION('SQLSERVER');
END;
/
```

Use the following query to verify the SQL translation language for your session:

```
SELECT SYS_CONTEXT('USERENV','SQL_TRANSLATION_PROFILE_NAME') FROM DUAL;
```

See ENABLE_TRANSLATION Procedure for more information.

3. Enter SQL Server SQL statements. For example:

```
CREATE TABLE [dbo].[movie] ([film_id] [int], [title] [varchar](20));

Table [dbo].[movie] created.
```

This automatically translates and runs the SQL Server `CREATE TABLE` statement.

You can verify using the `DESC` command. For example:

```
DESC movie;

Name        Null?     Type
-------     -----     -------------
FILM_ID               NUMBER(38)
TITLE                 VARCHAR2(255)
```

The `MOVIE` table is created and the datatypes of each of the columns are automatically converted to Oracle datatypes.

4. Insert data into the `MOVIE` table. For example:

```
INSERT INTO movie([film_id], [title]) VALUES (123, 'Tangled');

1 row inserted.

INSERT INTO movie([film_id], [title]) VALUES (234, 'Frozen');

1 row inserted.
```

Verify the data insertion by querying the `MOVIE` table. For example:

```
SELECT * FROM movie;

FILM_ID  TITLE
-------- ---------
123     Tangled
234     Frozen
```

5. Create an `INVENTORY` table:

```
CREATE TABLE [dbo].[inventory] ([film_id] [int], [title] [inventory_id]
(20));

Table INVENTORY created.
```

You can verify this step with the `DESC` command. For example:

```
DESC inventory;

Name         Null?     Type
-------      -----     -------------
FILM_ID                NUMBER(38)
INVENTORY_ID           NUMBER(38)
```

The `INVENTORY` table is created and the datatypes of each of the columns are automatically converted to Oracle datatypes.

6. Insert data into the `INVENTORY` table. For example:

```
INSERT INTO inventory([film_id], [inventory_id]) VALUES (123, 223);

1 row inserted.

INSERT INTO inventory(film_id, inventory_id) VALUES (234, 334);

1 row inserted.
```

Verify the data insertion by querying `INVENTORY`. For example:

```
SELECT * FROM inventory;

FILM_ID  INVENTORY_ID
-------- -------------
123      223
234      334
```

7. Perform a left outer join on tables `MOVIE` and `INVENTORY`:

```
SELECT m.film_id, m.title, inventory.inventory_id
    FROM movie AS m LEFT JOIN inventory
    ON inventory.film_id = m.film_id;

  FILM_ID  TITLE       INVENTORY_ID
---------- ---------- ------------
       234 Frozen      334
       123 Tangled     223
```

This example performs a `LEFT OUTER JOIN` on the `movie` and `inventory` tables. The query is first translated to Oracle SQL and then run in your session.

8. Use `DBMS_CLOUD_MIGRATION.DISABLE_TRANSLATION` procedure to disable real-time SQL language translation for your session.

```
BEGIN
 DBMS_CLOUD_MIGRATION.DISABLE_TRANSLATION;
END;
/
```

This returns an error if SQL language translation is not enabled for your session.

See DISABLE_TRANSLATION Procedure

You can query the `V$MAPPED_SQL` view to list the SQL Server statements that are translated and mapped in memory to Oracle SQL statements.

For example:

```
SELECT v.*
    FROM v$mapped_sql v, dba_objects o
    WHERE v.sql_translation_profile_id = o.object_id
        AND o.object_name = 'SQLSERVER'
        AND o.object_type = 'TRANSLATION PROFILE';
```

See V$MAPPED_SQL for more information.

Migrate SQL Server Files to Oracle SQL

You can migrate a file containing SQL Server statements to a file containing Oracle SQL statements.

The `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` procedure translates SQL statements in a SQL Server file in Object Storage and generates a new file containing Oracle SQL.

As a prerequisite, upload one or more SQL Server files with a `.sql` extension to a location on Object Storage. The following examples use the file `mssqltest.sql` that is uploaded to Object Storage. See Put data into object storage for more information.

To migrate SQL Server files to Oracle SQL:

1. Connect to your Autonomous Database instance.

   See Connect to Autonomous Database for more information.

2. Configure access to Cloud Object Storage using a resource principal or by creating a credential object.

   This step provides access to the Cloud Object Storage where you put the files you are migrating:

   - **Use a resource principal to access Cloud Object Storage**:

     Define policies and roles to access Oracle Cloud Infrastructure Object Storage with a resource principal. See Use Resource Principal to Access Oracle Cloud Infrastructure Resources and Use Resource Principal with DBMS_CLOUD for more information.

     If your files reside in another vendor's Cloud Object Storage, define the appropriate policies and roles to access the resource. See Configure Policies and Roles to Access Resources for more information.

   - **Create a credential to access Cloud Object Storage:**

     You can create a credential to access Cloud Object Storage.

     For example:

     ```
     BEGIN
       DBMS_CLOUD.CREATE_CREDENTIAL (
         credential_name => 'OBJ_STORE_CRED',
         username        => 'user1@example.com',
         password        => 'password'
       );
     ```

```
END;
/
```

See CREATE_CREDENTIAL Procedure for more information.

3. Optionally, you can list the files in Object Storage. For example:

```
VAR function_list CLOB;
SELECT object_name FROM DBMS_CLOUD.LIST_OBJECTS
   (credential_name => 'OCI$RESOURCE_PRINCIPAL', location_uri => 'https://
objectstorage.region.oraclecloud.com/n/namespace/b/bucket/o/files');

OBJECT_NAME
--------------------
mssqltest.sql
```

Alternatively, if you create a credential instead of the resource principal, `OCI$RESOURCE_PRINCIPAL`, specify the credential name in the `credential_name` parameter.

See LIST_OBJECTS Function for more information.

4. Run `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` to migrate the SQL Server file to Oracle SQL:

```
BEGIN
 DBMS_CLOUD_MIGRATION.MIGRATE_FILE (
     credential_name => 'OCI$RESOURCE_PRINCIPAL',
     location_uri    => 'https://objectstorage.region.oraclecloud.com/n/
namespace/b/bucket/o/files/mssqltest.sql',
     source_db       => 'SQLSERVER'
    );
END;
/
```

The `credential_name` parameter specifies the credential to access the Cloud Object Storage URI. The user that runs `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` must have `EXECUTE` privilege for the credential object used to access the Object Storage URI. That is, the credential you specify with the `credential_name` parameter. If you use a credential instead of a resource principal, specify the credential name in the `credential_name` parameter.

The `location_uri` parameter specifies the source file URI. The format of the URI depends on the Cloud Object Storage service you are using. See DBMS_CLOUD URI Formats for more information.

The `source_db` parameter specifies SQL Server as the database language. Use the value `SQLSERVER` to translate SQL Server files to Oracle SQL.

Running this command translates the SQL Server file `mssqltest.sql` to Oracle SQL and generates a new file with the name *original_filename*`_oracle.sql`.

For this example, running `DBMS_CLOUD_MIGRATION.MIGRATE_FILE` with the input file `mssqltest.sql` generates `mssqltest_oracle.sql`. After the translation step the procedure uploads `mssqltest_oracle.sql` to Object Storage.

Optionally, use the `target_uri` parameter to specify the location where the translated file is uploaded. The default value for this parameter is `NULL`, which means the translated file is uploaded to the same location as specified in the `location_uri` parameter.

See MIGRATE_FILE Procedure for more information.

5. Verify that the output file was generated.

```
SELECT object_name FROM DBMS_CLOUD.LIST_OBJECTS (
    credential_name => 'OCI$RESOURCE_PRINCIPAL', location_uri => 'https://
objectstorage.region.oraclecloud.com/n/namespace/b/bucket/o/files');

OBJECT_NAME
----------------------
mssqltest.sql
mssqltest_oracle.sql
```

Alternatively, if you create a credential instead of the resource principal, `OCI$RESOURCE_PRINCIPAL`, specify the credential name in the `credential_name` parameter.

See LIST_OBJECTS Function for more information.

Run the following query to view the content of the `mssqltest_oracle.sql` file:

```
SELECT UTL_RAW.CAST_TO_VARCHAR2 (DBMS_CLOUD.GET_OBJECT(
   credential_name => 'OCI$RESOURCE_PRINCIPAL',
   object_uri => 'https://objectstorage.region.oraclecloud.com/n/namespace/b/
bucket/o/files'))
FROM dual;

UTL_RAW.CAST_TO_VARCHAR2(DBMS_CLOUD.GET_OBJECT(CREDENTIAL_NAME=>'CRED1',OBJECT
_U
--------------------------------------------------------------------------------
--
DROP TABLE movie;
CREATE TABLE movie (film_id NUMBER(10), title VARCHAR2(20));

INSERT INTO movie (film_id, title) VALUES (123, 'Tangled');
INSERT INTO movie (film_id, title) VALUES (234, 'Frozen');

CREATE TABLE inventory(film_id NUMBER(10), inventory_id NUMBER(10));
INSERT INTO inventory(film_id, inventory_id) VALUES (123, 223);
INSERT INTO inventory(film_id, inventory_id) VALUES (234, 334);

SELECT * FROM movie;
SELECT * FROM inventory;
SELECT m.film_id, m.title, inventory_id FROM movie m LEFT JOIN inventory ON
inventory.film_id = m.film_id;
```

Alternatively, if you create a credential instead of the resource principal, `OCI$RESOURCE_PRINCIPAL`, specify the credential name in the `credential_name` parameter.

See GET_OBJECT Procedure and Function for more information.

Limitations for Migration and Translation of SQL Server Statements to Oracle SQL

This section summarizes the limitations for migrating SQL statements from SQL Server to Oracle SQL.

The following list of SQL Server functions are not supported when migrating from SQL Server database flavor to Oracle SQL:

- `ISJSON()`
- `OPENJSON()`

Use Database In-Memory with Autonomous Database

The Database In-Memory feature available on Autonomous Database can significantly improve performance for real-time analytics and mixed workloads.

- About Database In-Memory
  Oracle Database In-Memory (Database In-Memory) is a suite of features that greatly improves performance for real-time analytics and mixed workloads.
- Enabling Objects for In-Memory Population
  You can enable and disable objects for population in the In-Memory column store.
- Sizing the In-Memory Column Store
  When your Autonomous Database instance has 16 or more ECPUs, the Database In-Memory feature is enabled by default, and up to 50% of the SGA can be used by In-Memory.
- Disabling the In-Memory Column Store
  You can disable the In-Memory column store for your Autonomous Database by modifying the maximum In-Memory size to 0.

About Database In-Memory

Oracle Database In-Memory (Database In-Memory) is a suite of features that greatly improves performance for real-time analytics and mixed workloads.

The Database In-Memory feature is useful when:

- You have enabled the In-Memory feature for your on-premises database and are now migrating from the on-premises database to Autonomous Database.
- Queries in your database spend most of their run time scanning and filtering data, as well as performing joins and group-by aggregations.
- You need to improve the response time of your queries that are analytical in nature.

The In-Memory column store is the key feature of Database In-Memory. The In-Memory column store resides in the In-Memory Area, which is an optional portion of the System Global Area (SGA). When enabled for In-Memory, tables, partitions, sub-partitions and materialized views are populated in a columnar format in the In-Memory column store. This columnar format is optimized for very fast scans, which can enable analytic queries to run orders of magnitude faster than row format-based queries. See Oracle Database In-Memory for more information.

The In-Memory column store dynamically grows over time to accommodate the hottest `INMEMORY` objects. You can use the `PRIORITY` table clause or have continuous table scans to ensure that the In-Memory column store grows large enough for your workload. See Sizing the In-Memory Column Store for more information.

You can use the `INMEMORY` clause in DDL statements to enable In-Memory for the following objects:

- Tables (including external tables)
- Partitions or sub-partitions
- Materialized views

See Enabling Objects for In-Memory Population for more information.

Note the following for enabling Database In-Memory:

- Database In-Memory is only available for an Autonomous Database instance with:
  - The ECPU compute model
  - A minimum of 16 ECPUs
- If you restart the database, objects enabled for `INMEMORY` require re-population into the In-Memory column store. Depending on the priority setting, re-population may happen automatically or on first access. If you are monitoring performance you will notice slower performance until the object is repopulated.

Enabling Objects for In-Memory Population

You can enable and disable objects for population in the In-Memory column store.

Only objects with the `INMEMORY` clause are eligible for population into the In-Memory column store. Use DDL statements `CREATE TABLE` or `ALTER TABLE` to apply the `INMEMORY` clause.

By default, objects are created with the `NO INMEMORY` attribute, which means they are not eligible for population into the In-Memory column store.

Enabling an object as `INMEMORY` is specifying that an object can potentially reside in the In-Memory column store. In-Memory population is a separate step that occurs when the database reads existing row-format data, transforms it into columnar format, and then stores it in the In-Memory column store. By default, all of the columns in an object with the `INMEMORY` attribute are populated into the In-Memory column store.

Setting the `INMEMORY` attribute on an object implies that the object is a candidate for population in the In-Memory column store. The object is not immediately populated to the In-Memory column store. However, you can use the `PRIORITY` clause with the `INMEMORY` attribute to control the priority of population into the In-Memory column store. The `PRIORITY` clause can be specified with the following values:

- `CRITICAL`: Object is populated immediately after the database is opened.
- `HIGH` : Object is populated after all `CRITICAL` objects have been populated, if space remains available in the In-Memory column store.
- `MEDIUM`: Object is populated after all `CRITICAL` and `HIGH` objects have been populated, and space remains available in the In-Memory column store.
- `LOW`: Object is populated after all `CRITICAL`, `HIGH`, and `MEDIUM` objects have been populated, if space remains available in the In-Memory column store.
- `NONE`: Objects are only populated after they are scanned for the first time, if space is available in the In-Memory column store. The priority `NONE` is the default priority.

Example to create a table with the `INMEMORY` attribute:

```
CREATE TABLE im_emp (
    id  NUMBER,  name VARCHAR2(20),
    depno NUMBER,  sal   NUMBER,
    mgr   NUMBER,
    loc   VARCHAR2(20))
    INMEMORY;
```

This example creates the `im_emp` table with the `INMEMORY` attribute. The example uses the default priority of `NONE` for the `INMEMORY` clause, which means the table is populated only after it is scanned for the first time.

Example to use the `PRIORITY` clause with the `INMEMORY` attribute:

```
CREATE TABLE im_emp_1 (
    id  NUMBER,  name VARCHAR2(20),
    depno NUMBER,  sal   NUMBER,
    mgr   NUMBER,
    loc   VARCHAR2(20))
    INMEMORY PRIORITY CRITICAL;
```

Example to set the `INMEMORY` attribute for an existing table:

```
ALTER TABLE employees INMEMORY;
```

This example sets the in the `INMEMORY` attribute for the `employees` table.

You can also alter a table to set the `INMEMORY` attribute only for a subset of columns in the table. For example:

```
ALTER TABLE im_emp_tb INMEMORY NO INMEMORY(depno);
```

This example sets the in the `INMEMORY` attribute for the `im_emp_tb`, but it excludes the `depno` column.

See INMEMORY_TABLE_CLAUSE for more information.

After `INMEMORY` is enabled for a table, you can query the `V$IM_SEGMENTS` view to determine if data from the table is populated in the In-Memory column store. For example:

```
SELECT SEGMENT_NAME, POPULATE_STATUS
FROM   V$IM_SEGMENTS
WHERE  SEGMENT_NAME = 'IM_EMP';
```

See V$IM_SEGMENTS for more information.

After the object is populated in the In-Memory column store, the object is only evicted when the object is dropped or moved, or the object is updated with the `NO INMEMORY` attribute. For example:

```
ALTER TABLE im_emp NO INMEMORY;
```

See How In-Memory Population Works for more information.

Notes for enabling objects for In-Memory population:

- The database does not automatically populate In-Memory objects with the `PRIORITY` setting of `NONE`. However, you can manually populate these objects into In-Memory column store. See Populating the IM Column Store Manually and DBMS_INMEMORY.POPULATE Procedure for more information.

- There must be continuous table scans to ensure that the In-Memory column store will automatically grow large enough for your workload. If an object is partially populated, the table scan can use both In-Memory and Exadata Smart Scan.

Sizing the In-Memory Column Store

When your Autonomous Database instance has 16 or more ECPUs, the Database In-Memory feature is enabled by default, and up to 50% of the SGA can be used by In-Memory.

The memory for the In-Memory Area is not reserved upfront, and the initial size of the In-Memory Area is 0. The In-Memory Area grows gradually each time there is insufficient space for the In-Memory population.

Objects in the In-Memory column store are dynamically managed by Automatic In-Memory (AIM). Automatic In-Memory is by default enabled for your Autonomous Database.

AIM uses internal statistics to determine how frequently In-Memory objects and columns are accessed. If the In-Memory column store is full and other more frequently accessed segments would benefit from population in the In-Memory column store, then the In-Memory column store evicts inactive segments.

To ensure that the working data set is always populated, AIM automatically evicts cold (infrequently accessed) segments. See Automating Management of In-Memory Objects for more information.

The default maximum In-Memory size for your Autonomous Database can be up to 50% of the SGA size. However, you can modify the maximum In-Memory size for your Autonomous Database:

- By changing the ECPU count for your Autonomous Database.
- By using the `DBMS_INMEMORY_ADMIN.SET_SGA_PERCENTAGE` procedure to modify the maximum In-Memory size. You can specify a value in the range between 0 and 70. Specifying a zero (0) value disables the Database In-Memory. For example:

  ```
  BEGIN
      DBMS_INMEMORY_ADMIN.SET_SGA_PERCENTAGE(60);
  END;
  /
  ```

  This example modifies the maximum In-Memory size to 60% of the SGA size.

See SET_SGA_PERCENTAGE Procedure for more information.

Query the `V$INMEMORY_AREA` view to retrieve the information about space allocation inside the In-Memory area. For example:

```
SELECT * FROM V$INMEMORY_AREA;
```

See V$INMEMORY_AREA for more information.

Disabling the In-Memory Column Store

You can disable the In-Memory column store for your Autonomous Database by modifying the maximum In-Memory size to 0.

For example:

```
BEGIN
    DBMS_INMEMORY_ADMIN.SET_SGA_PERCENTAGE(0);
END;
/
```

This example modifies the maximum In-Memory size value to zero (0) and disables Database In-Memory for the instance.

See SET_SGA_PERCENTAGE Procedure for more information.

December 2024

Feature	Description
Immutable Backup Retention	The **Immutable backup retention** option allows you to lock the automatic backup retention period. If locked, Autonomous Database does not allow changes to the retention period for automatic backups. See About Backup and Recovery on Autonomous Database for more information.
AutoML Pipeline	AutoML Pipeline automates the three major stages of the machine learning pipeline: • Algorithm selection • Adaptive data reduction (feature and sample size selection) • Hyperparameter optimization See AutoML Pipeline for more information.
OML4Py Metrics	OML4Py Metrics provides metrics to evaluate the performance of machine learning models. See OML4Py Metrics for more information.

Feature	Description
SQL Query Performance Event: `QueryPerformanceDegradationDetected`	The `QueryPerformanceDegradationDetected` information event is triggered when the average elapsed time of a query has exceeded ten times its average elapsed time over the past seven (7) days. See Information Events on Autonomous Database for more information.
Refreshable Clone Events: `AutomaticRefreshEnd` and `AutomaticRefreshFailed`	The `AutomaticRefreshEnd` and `AutomaticRefreshFailed` information events are generated when a scheduled Automatic Refresh completes or when a scheduled Automatic Refresh fails. See Information Events on Autonomous Database for more information.

November 2024

Feature	Description
Data Marketplace in Data Studio	Data Marketplace provides an innovative platform to access and share datasets effortlessly with Autonomous Database. The Data Marketplace is a part of the Data Studio suite of tools that provides you access to load and query datasets for your organizational requirements. You can access and discover data sets curated by data providers. See The Data Marketplace Tool for more information.
PAR URL Table View with Column Level Group By and UI Options	You can access Pre-Authenticated Request (PAR) URL data from a browser and group the data by the values of cells in a column. You can also specify view options such as sorting, filtering, and cell color by column. See Generate a Table Hyperlink with UI Features Specified on Columns for more information.
Network Usage Events: `NetworkUsageInbound` and `NetworkUsageOutbound`	The `NetworkUsageInbound` and `NetworkUsageOutbound` information events are triggered when the average incoming network traffic or average outgoing network traffic to your Autonomous Database over the previous 24 hours has exceeded 50% of the average incoming or outgoing traffic. See Information Events on Autonomous Database for more information.
Maintenance Window Details on OCI Console	The Oracle Cloud Infrastructure Console Autonomous Database details page shows additional information on upcoming maintenance. When Autonomous Data Guard is enabled this includes maintenance information for a local standby database. See About Scheduled Maintenance and Patching for more information.
Microsoft SharePoint Support for Database Links with Oracle-Managed Heterogeneous Connectivity	Use Autonomous Database Oracle-managed heterogeneous connectivity to create database links to Microsoft SharePoint. When you use database links with Oracle-managed heterogeneous connectivity, Autonomous Database configures and sets up the connection. See Create Database Links to Non-Oracle Databases with Oracle-Managed Heterogeneous Connectivity for more information.
Customer-Managed Keys with Cross-Region Disaster Recovery	Replication of key vaults across regions for a cross-region Disaster Recovery Peer is now supported both with OCI Vault default vault and virtual private vault options. See Manage Master Encryption Keys in OCI Vault for more information.

October 2024

Feature	Description
Bring Your Own License (BYOL) Option Moved for Provisioning and Cloning	During provisioning or cloning the Bring Your Own License (BYOL) option is moved to advanced options in the Configure the database area. See Choose Bring Your Own License Option While Provisioning or Cloning for more information.
Blocking Sessions Metric	The `BlockingSessions` metric shows the number of current blocking sessions. See Available Metrics: oci_autonomous_database for more information.
Control Lockdown Profile Errors	Autonomous Database uses lockdown profiles to restrict certain database functionality and features. The `LOCKDOWN_ERRORS` parameter allows you to suppress lockdown profile errors. See LOCKDOWN_ERRORS for more information.
NVIDIA GPU Compute Capabilities with Oracle Machine Learning Notebooks	Oracle Machine Learning Notebooks offers support for NVIDIA GPUs (Graphics Processing Unit) compute capabilities. The GPU capabilities in OML Notebooks allow you to run advanced machine learning algorithms such as deep learning models, transformers (embedding models) for generating vectors, and small LLMs. The GPU feature is enabled for Autonomous Database instances with Transaction Processing or Data Warehouse workloads with 16 ECPUs or more specified for the OML application. GPU resources are not available on Always Free or Autonomous Database for Developers instances. See Enable GPU Compute Capabilities in a Notebook through the Python Interpreter for more information.
Customer-Managed Encryption Keys	In addition to Oracle Cloud Infrastructure Vault, Autonomous Database can be configured to use encryption keys with the following key providers: • Azure Key Vault • AWS Key Management System (KMS) • Oracle Key Vault (OKV) See Manage Encryption Keys on Autonomous Database for more information.
Select AI with Hugging Face	Autonomous Database can interact with AI service providers. Select AI supports OpenAI, Anthropic, Azure OpenAI Service, CohereAI, Google Gemini, Hugging Face, and OCI Generative AI. This feature supports having LLMs work with Oracle database by generating SQL from natural language prompts. This allows you to talk to your database. See Use Select AI for Natural Language Interaction with your Database for more information.
Zero Trust Packet Routing	Oracle Cloud Infrastructure Zero Trust Packet Routing (ZPR) protects sensitive data from unauthorized access through intent-based security policies that you write for resources, such as an Autonomous Database on a private endpoint, that you assign security attributes to. See Use Zero Trust Packet Routing on Autonomous Database for more information.

Feature	Description
Select AI with Anthropic	Autonomous Database can interact with AI service providers. Select AI supports OpenAI, Anthropic, Azure OpenAI Service, CohereAI, Google Gemini, Hugging Face, and OCI Generative AI. This feature supports having LLMs work with Oracle database by generating SQL from natural language prompts. This allows you to talk to your database. See Use Select AI for Natural Language Interaction with your Database for more information.
Data Studio Enhancements	The Data Studio is updated with new features and changes in the following areas: • Data Load in Data Studio- Public APIs for Data Load Live Feed: The LiveFeed Data Studio feature now has public PL/SQL APIs. See DBMS_LIVE_FEED Package Reference for more information. • Data Studio Settings Changes: – **Support for non-Oracle Cloud Infrastructure (OCI) Cloud Services** Data Studio now supports loading and linking to data in AWS and Azure. In addition, it supports AI Profiles from AWS. – **Support for Policy checking in Data Studio** Data Studio utilizes many OCI services to enrich your experience. If your OCI credential is missing policies, these features fail, typically silently. The Data Studio Settings UI now allows you to test your credential and see which features are likely to work, and which require missing policies. – **Improved Day-one user experience** Several improvements around Settings experiences have been added, so users are successful in their tasks. See Data Studio Settings for more information. • Data Studio Analysis- Explain query using AI: The Data Analysis tool already had AI support to generate SQL from a text prompt. You can now utilize AI to explain the SQL queries the tool generates in text format. See Generate Natural Language explanation from SQL Query using AI Explain for more information. • Data Studio Analysis- Vector Search for Text: You can use Oracle AI Vector Search capabilities to search for relevant text from your source data on a specific column. The Vector Search helps quickly locate and match data that is similar to the text you provide as your search input. See Vector Search in the Data Analysis Tool for more information.

September 2024

Feature	Description
Implicit Partitioning for External Tables	You can create implicit partitioned external tables on your Autonomous Database from Hive style partitioned data or from simple folder partitioned data stored on your Cloud Object Store. See Query External Tables with Implicit Partitioning for more information.

Feature	Description
Use Select AI to Generate Synthetic Data	You can generate synthetic data using LLMs that conforms to your schema for solution testing, proofs of concept, and other uses. Synthetic data can be used for better testing of your applications when real data is not available and can also be used to populate an Autonomous Database clone or a metadata clone. See Synthetic Data Generation for more information.
Use Select AI Retrieval Augmented Generation (RAG)	Select AI enables SQL access to generative AI using Large Language Models (LLMs) and embedding models. This includes support for natural language to SQL query generation and retrieval augmented generation, among other features. See Use Select AI for Natural Language Interaction with your Database for more information.
Select AI with Google Gemini	Autonomous Database can interact with AI service providers. Select AI supports Google Gemini, OCI Generative AI, Azure OpenAI Service, OpenAI, and CohereAI. This feature supports having LLMs work with Oracle database by generating SQL from natural language prompts. This allows you to talk to your database. See Use Select AI for Natural Language Interaction with your Database for more information.
Undelete Database	With the ECPU compute model, you have the option to undelete a terminated Autonomous Database instance. See Undelete a Terminated Autonomous Database Instance for more information.

August 2024

Feature	Description
Use Database In-Memory with Autonomous Database	You can now declare your tables as in-memory to enable the Database In-Memory feature on Autonomous Database. This feature can significantly improve performance for real-time analytics and mixed workloads. See Use Database In-Memory with Autonomous Database for more information.
Disaster Recovery Peer Lag Metric	The `PeerLag` metric shows the total time in seconds by which the Disaster Recovery peer lags behind its Primary database. See Available Metrics: oci_autonomous_database for more information.
Create Credential Cloud Shell script enhancements	The `adb-create-cred.sh` Create Credential Cloud Shell script used to create OCI Native Credentials and Auth Token in your Autonomous Database supports new arguments: `username` and `credential`. See Create Credentials to Access Cloud Services in Cloud Shell for more information.
Upgrade by Cloning from Oracle Database 19c to Oracle Database 23ai	When you clone an Autonomous Database instance and the source database version is Oracle Database 19c, in regions where Oracle Database 23ai is available, you can choose either Oracle Database 19c or Oracle Database 23ai for the clone. See Upgrade to Oracle Database 23ai by Creating a Full Clone for more information.

Feature	Description
View Network Information on the OCI Console	On the Oracle Cloud Infrastructure Console you can view the network information for your Autonomous Database. See View Network Information on the OCI Console for more information.
Export and Import Operations Run as Jobs in Data Transforms	You can now use the Jobs page to see the status of the export or import process that is currently running. See Export Objects for more information.

July 2024

Feature	Description
Migrate Applications from Non-Oracle Databases to Autonomous Database	You can translate SQL statements written for a non-Oracle SQL database to Oracle SQL in your Autonomous Database. See Migrate Applications from PostgreSQL Databases to Autonomous Database for more information.
Autonomous Database 23ai Available in the Paid Tier	Autonomous Database with Oracle Database 23ai in the Paid tier is available in all commercial public cloud regions. See Provision an Autonomous Database Instance and Clone an Autonomous Database Instance for more information.
Update for Oracle-Managed Heterogeneous Connectivity Database Links	Autonomous Database support for Oracle-managed heterogeneous connectivity with database links for Azure, the two optional parameters include: `auth_method` and `domain` to support NTLM/AD authentication. Autonomous Database support for Oracle-managed heterogeneous connectivity with database links for Snowflake, the optional parameters include: `role`, `schema`, and `warehouse`. These values specify a different schema, role, or warehouse value, other than the default. See Create Database Links to Non-Oracle Databases with Oracle-Managed Heterogeneous Connectivity for more information.
OCI Full Stack Disaster Recovery	You can enable the Oracle Cloud Infrastructure Full Stack Disaster Recovery on Autonomous Database. See Use OCI Full Stack Disaster Recovery with Autonomous Database for more information.
Updated Object Storage URL Format using Dedicated Endpoints for commercial (OC1) realms	Autonomous Database supports Oracle Cloud Infrastructure Object Storage URI formats for commercial (OC1) realms. See Import Data Using Oracle Data Pump on Autonomous Database and Move Data with Data Pump Export to Object Store, for Oracle Data Pump examples.
Pre-Authenticated Request (PAR) URL Enhancements	Pre-Authenticated Request (PAR) URL enhancements include: • Bind variables are supported when generating a PAR URL and when accessing data. See Use Table Hyperlinks for Read Only Data Access on Autonomous Database for further information. • Request a PAR URL that uses HIGH, MEDIUM or LOW service-level guarantees and resources when accessing an object or SQL statement. See Generate a Table Hyperlink for a Table or a View and Generate a Table Hyperlink with a Select Statement for details. • The expiration time and access count for a PAR URL can be extended. See Generate a Table Hyperlink for a Table or a View and Generate a Table Hyperlink with a Select Statement for details.
Use `RESULT_CACHE` Hint to Cache Data for a Cloud Links Consumer	You can enable caching on a data set consumer to cache the results of a query or for a query fragment that accesses Cloud Link data. See Enable Caching for a Cloud Link Consumer for more information.

Feature	Description
Updated Object Storage URL Format in DBMS_CLOUD	Autonomous Database supports the updated Oracle Cloud Infrastructure Object Storage URI formats in DBMS_CLOUD for: • OCI Native • Swift • S3 Compatible • Pre-Authenticated Requests (PAR) See DBMS_CLOUD URI Formats for further information.
Text Indexing and Search on JSON Files in Object Storage	You can build a JSON search index on documents residing in files stored in Object Storage, which allows you to search fields in your JSON documents using `JSON_TEXTCONTAINS`, and use wildcards in your search. See Use JSON Search on Documents in Object Storage for more information.
Documentation Addition: Go Application Connection Information	You can connect Go applications to your Autonomous Database instance either with a wallet (mTLS) or without a wallet (TLS). See Connect Go Applications to Autonomous Database for more information.

Feature	Description
Database Actions Data Studio Updates	The Data Studio in Database Actions is updated with new features and changes in the following areas: • New Catalog page: The new catalog page features faceted search for easy filtering, presentation by entity type, better defaults for catalog features, and many other small improvements. See The Catalog Tool. • Data Load support for Boolean data type: The Data Load tool now supports loading Boolean data from source files into the new Oracle Database 23ai Boolean data type. See Loading Data. • Data Load from Image Files: The Data Load tool supports loading images of tabular data into relational tables. The supported file formats are `PDF`, `Tif` and `JPEG` formats. See Use OCI Document Understanding to extract Tables from Images. • Data Load support for Vector data type: The Data Load tool supports loading into the 23ai `VECTOR` data type. See Loading Data. • Support data load from Iceberg files: Data Studio can now link and create an external table on or load Iceberg tables from the object store. See Load Apache Iceberg Tables. • Rectify Geometry support for data load from GeoJSON files: Data Studio supports `RECTIFY` feature of GeoJSON spatial issues along with expression support for area and length. See Add Spatial Expression for GeoJSON columns. • Support for Language Detection using OCI AI Services: You can now add expressions to your target table to identify the language used in a column. See Use OCI Language Service Capabilities in Data Studio. • Data Studio enhancements for AWS Glue Administration: You can now add a new Glue Catalog and sync with a Glue catalog from the Data Studio tool. See Create Amazon Web Services (AWS) Credentials.

June 2024

Feature	Description
Autonomous Database 23ai Available in the Paid Tier	Autonomous Database with Oracle Database 23ai in the Paid tier is available in all commercial public cloud regions. See Provision an Autonomous Database Instance and Clone an Autonomous Database Instance for more information.
Elastic Pool Usage Details in Oracle Cloud Infrastructure Usage Report and in `OCI_USAGE_DATA` View	You can obtain a detailed breakdown of elastic pool usage in the Oracle Cloud Infrastructure usage report and this information is also shown in the `OCI_USAGE_DATA` view. See About Elastic Pool Billing for more information.

Feature	Description
Documentation Addition: Provide Steps to Reduce Latency for Database Connections with Autonomous Data Guard	Provides information on the steps to take to configure an Autonomous Data Guard standby environment to reduce latency for database connections when you connect after a failover or after a switchover (when the standby becomes the Primary). See Steps to Reduce Latency for Database Connections for Databases with Autonomous Data Guard for more information.
Bring Your Own License (BYOL) Input Option for BYOL Flexibility	Enable the option **BYOL ECPU limit** to select the BYOL flexible license option. See Choose Bring Your Own License Option While Provisioning or Cloning and Choose Bring Your Own License on Autonomous Database (ECPU Compute Model) for more information.
Automate Creation of OCI Credentials using a Cloud Shell Script	Use the Cloud Shell to run a script that creates OCI Native Credentials and Auth Token in your Autonomous Database. See Example: Create OCI Native Credentials and Run in Autonomous Database for more information.
Public Access Allowed for an Autonomous Database on a Private Endpoint	When you want to configure an Autonomous Database to use a private endpoint and you also want to allow connections from allowed public IPs or public VCNs, you can select the **Allow public access** option. This adds a public endpoint for a database that is configured on a private endpoint. See Use a Private Endpoint with Public Access Allowed for more information.
TCP Fast Open (TFO) to Connect Clients to Autonomous Database	Use TCP Fast Open (TFO) connections when your application is sensitive to network latency and you want to decrease the network latency between your application and the database. TFO connections can improve application performance by decreasing network latency for client connections. See Use TCP Fast Open (TFO) to Connect Clients to Autonomous Database for more information.
Oracle APEX 24.1	Autonomous Database uses Oracle APEX Release 24.1. See Create Applications with Oracle APEX in Autonomous Database for more information.
Documentation Addition: Load Data from Google Cloud Storage	Provides an example for loading data into an Autonomous Database instance from Google Cloud Storage. See Load Data into Autonomous Database from Google Cloud Storage for more information.
Shrink Storage for Tables with LONG Columns	Autonomous Database shrink operations will succeed for tables with LONG columns. See Shrink Storage for more information.
Cross Tenancy Autonomous Standby	You can add a cross tenancy Autonomous Data Guard standby database. This creates an Autonomous Data Guard standby that resides in a different tenancy. The cross tenancy standby can be in the same region (local) or in a different region (cross-region) See Use a Cross Tenancy Autonomous Data Guard Standby Database for more information.
Oracle Spatial AI Features for OML	Oracle Spatial AI is a set of capabilities in OML4Py for detecting patterns and making predictions from geospatial data. It includes features for end-to-end workflows, including spatial machine learning pipelines. See About Oracle Spatial AI for more information.

Feature	Description
YouTube Support for Database Links with Oracle-Managed Heterogeneous Connectivity	Use Autonomous Database Oracle-managed heterogeneous connectivity to create database links to YouTube. When you use database links with Oracle-managed heterogeneous connectivity, Autonomous Database configures and sets up the connection. See Create Database Links to Non-Oracle Databases with Oracle-Managed Heterogeneous Connectivity for more information.
Data Transforms Updates	Data Transforms is updated with new features and changes in the following areas: • Export and Import Objects You can move Data Transforms objects such as projects, connections, data loads, data flows, workflows, and schedules from a Development environment to a Production environment. See Export Objects for more information. • Variables You can now create variables and use them as steps within data flows and workflows. See Create a Variable for more information. • Purge jobs Data Transforms allows you to purge older jobs to keep the repository clean and optimize performance. See Create and Manage Jobs for more information. • Load Views to target servers In addition to tables, Data Load allows you to load views from the source server. Views are stored as tables in the target server. • Support for the new Object Storage URL format Data Transforms includes support for the Object Storage URL format when you create an Object Storage connection. See Create an Oracle Object Storage Connection for more information. • OAuth 2.0 support for NetSuite connections You can now use OAuth 2.0 authentication to connect to Oracle NetSuite data sources. See Create and Use an Oracle NetSuite Connection for more information.

May 2024

Feature	Description
Multiple Peers for Cross-Region Disaster Recovery	With the ECPU billing model, you have the option to create one or more cross-region standby databases for Autonomous Data Guard and multiple cross-region Backup-Based Disaster Recovery peers. See Use Standby Databases with Autonomous Data Guard for Disaster Recovery and Use Backup-Based Disaster Recovery for more information.
Table Format with PAR URLs	You can access PAR URLs with a browser and view the returned data in table format. See Use Table Hyperlinks to Access Data in Table Format for more information.

Feature	Description
Cross-Tenancy Access for IAM Users to Autonomous Database	Identity and Access Management (IAM) cross-tenancy user access to an Autonomous Database instance is similar to a single tenancy scenario except that tenancy information is required for mappings and token requests and a policy is required in both tenancies to allow this cross tenancy database resource access See Accessing a Database Cross-Tenancy Using an IAM Integration for more information.
External Calls with a Customer-Managed Wallet	When your Autonomous Database instance is on a private endpoint you can use a customer-managed wallet with procedures in `UTL_HTTP`, `DBMS_LDAP`, `UTL_SMTP`, or `UTL_TCP`. You can also use a customer-managed wallet when the scheduler sends SMTP email notifications for various events related to scheduler jobs. See Make External Calls Using a Customer-Managed Wallet for more information.
Allow Different ACLs on Cross-Region Disaster Recovery Peer	You can independently modify network ACLs on a remote disaster recovery peer database. See Manage Remote Peer Network ACLs and Update Remote Peer Network ACLs for a Backup-Based Disaster Recovery Peer for more information.
Documentation Addition: Best Practices for Low Latency Connections	Provides information on steps you can take to reduce the latency for connections between an application and Autonomous Database. See Best Practices for Low Latency Connections with Autonomous Database for more information.
Always Free with Oracle Database 23ai	The Oracle Database versions available for Always Free Autonomous Database are: Oracle Database 19c or Oracle Database 23ai. See Always Free Autonomous Database for more information.
Autonomous Database Free Container Image with Oracle Database 23ai	The Oracle Database versions available for Autonomous Database Free Container Image are: Oracle Database 19c or Oracle Database 23ai. See Use the Autonomous Database Free Container Image for more information.

April 2024

Feature	Description
Cross-Region Cloud Links	You can use Cloud Links in multiple regions, where the source region contains the data set's source database and one or more remote regions contain refreshable clones of the source database. See Register or Unregister a Data Set in a Different Region for more information.
Test Workloads Against an Upcoming Patch	Using the workload auto replay feature you can automatically capture a workload from a production database that is on the regular patch level and replay the workload on a target refreshable clone that is on the early patch level. This feature allows you to test an upcoming patch by running an existing workload that is in production against a patch before the patch reaches production. See Test Workloads Against an Upcoming Patch for more information.
Cloning Permissions	You can control and limit cloning operations on Autonomous Database with IAM permissions. See Cloning Permissions in IAM Permissions and API Operations for Autonomous Database for more information.

Feature	Description
Data Studio Updates	The Data Studio is updated with new features and changes in the following areas: • Data Load Dashboard: A new Data Load Dashboard is available which displays summaries of the recent load jobs and their status and view details about the data you load. See The Data Load Page for more information. • Sentiment Analysis and Key Phrase Extraction on text-based columns: You can now perform Sentiment Analysis and Key Phrase Extraction on the Data Load tool to analyze text-based data. See Use OCI Language Service Capabilities in Data Studio for more information. • Data Load support to access Amazon Web Services (AWS) Glue Catalogs: The Data Load tool of Data Studio allows you to synchronize Autonomous Database with Amazon Web Service (AWS) Glue Data Catalog metadata. See Register AWS Glue Catalog for more information. • Data Load support for registration and synchronization of OCI Data Catalogs: The Data Load tool enables you to register and synchronize OCI Data Catalogs to create external tables in Autonomous Database. See Register OCI Data Catalog for more information. • Data Load support to load GeoJSON files: The Data Load tool supports loading GeoJSON files in Autonomous Database. See Use GeoJSON in Data Load for more information. • Data Load support to enable loading into other schemas: The Data Load tool allows an ADMIN to create and load data into other schemas. See Loading Data From Local Files for more information. • Enable Resource Principal using Data Studio: You can enable Resource Principals using Data Studio to authenticate and access Oracle Cloud Infrastructure resources. See Manage Resource Principal using Data Studio for more information.
Manage Oracle Cloud Operator Access	Oracle Cloud Operators do not have authorization to access your data or any other information in your database schemas. When access to your database schemas is required to troubleshoot or mitigate an issue, you can allow a cloud operator to access your Autonomous Database schemas for a limited time. See Manage Oracle Cloud Operator Access for more information.
Apache Iceberg External Tables	Autonomous Database supports querying of Apache Iceberg tables stored in Amazon Web Services (AWS) or in Oracle Cloud Infrastructure Object Storage. See Query Apache Iceberg Tables for more information.

Feature	Description
Cloud Tables	You can create Cloud Tables where table data resides on Oracle managed Cloud Storage and the table data does not consume database storage. See Use Cloud Tables to Store Logging and Diagnostic Information for more information.
Cloud Links Offload Targets Without Specifying Database IDs	Cloud Links support with the optional `offload_targets` parameter lets you specify that access is offloaded to refreshable clones. This parameter now supports the `ANY` keyword, where all data set requests from consumers are offloaded to a refreshable clone. See Register a Data Set with Offload Targets for Data Set Access for more information.
Live Data Sharing Using Database Actions in Autonomous Database	Use Data Sharing to share data, as of the latest database commit, with Autonomous Databases in the same region. A Data Sharing recipient always views the latest data. See Overview of the Data Share Tool for more information.
Updated Version of Autonomous Database Free Container Image	A new version of the Autonomous Database Free Container Image is available with updates and new features. Use the Autonomous Database Free Container Image to run Autonomous Database in a container in your own environment, without requiring access to Oracle Cloud Infrastructure Console or to the internet. See Use the Autonomous Database Free Container Image for more information.

March 2024

Feature	Description
Refreshable Clone Automatic Refresh Option	When you enable the automatic refresh option Autonomous Database automatically refreshes a refreshable clone with data from the source database. See Refreshable Clone with Automatic Refresh Enabled and Edit Automatic Refresh Policy for Refreshable Clone for more information.
Invoke External Procedures	You can invoke external procedures written in the C language from Autonomous Database as SQL functions. You do not install external procedures on Autonomous Database. To use an external procedure, the procedure is hosted remotely on a VM running in an Oracle Cloud Infrastructure Virtual Cloud Network (VCN). See Invoke External Procedures as SQL Functions for more information.
Network File System (NFS) NFSv4 Support	You can attach a Network File System to a directory location in your Autonomous Database. This allows you to load data from Oracle Cloud Infrastructure File Storage in your Virtual Cloud Network (VCN) or from any other Network File System in on-premises data centers. Depending on the version of the Network File System you want to access, both NFSv3 and NFSv4 are supported. See Access Network File System from Autonomous Database for more information.
Support for Regular Expressions in DBMS_CLOUD Procedures	The format option `regexuri` is supported with the following `DBMS_CLOUD` procedures: `COPY_COLLECTION`, `COPY_DATA`, `CREATE_EXTERNAL_TABLE`, `CREATE_EXTERNAL_PART_TABLE`, and `CREATE_HYBRID_PART_TABLE`. See DBMS_CLOUD Package Format Options for more information

Feature	Description
Encrypt or Decrypt Data	For greater security you can encrypt data that you export to Object Storage. When data on Object Storage is encrypted you can decrypt the data you import or when you use the data in an external table. See Encrypt Data While Exporting or Decrypt Data While Importing for more information.
`JOB_QUEUE_PROCCESSES` Initialization Parameter	You can set the `JOB_QUEUE_PROCESSES` initialization parameter. Setting this parameter to 0 disables non-Oracle supplied Scheduler jobs. See JOB_QUEUE_PROCESSES for more information.
Pre-Authenticated Request URLs Access Information	You can generate and manage Pre-Authenticated Request (PAR) URLs for data on Autonomous Database and Autonomous Database provides views that allow you to monitor PAR URL usage. See Monitor and View Table Hyperlink Usage for more information.
`UTL_HTTP` allows `HTTP_PROXY` Connections	With `UTL_HTTP`, when the Autonomous Database instance is on a private endpoint you can call `UTL_HTTP.set_proxy` and both `HTTPS` and `HTTP_PROXY` connections are allowed. See Submit an HTTP Request to a Private Host and PL/SQL Package Notes for Autonomous Database for more information.

February 2024

Feature	Description
Pre-Authenticated Request URLs for Read Only Data Access	You can generate and manage Pre-Authenticated Request (PAR) URLs for data on Autonomous Database. See Use Table Hyperlinks for Read Only Data Access on Autonomous Database for more information.
Replicate Backups to a Cross-Region Disaster Recovery Peer	You can enable replication of automatic backups from a primary database to a cross-region disaster recovery peer. Up to seven days of automatic backups are available in the remote region when this feature is enabled. See Replicating Backups to a Cross-Region Autonomous Data Guard Standby and Replicating Backups to a Cross-Region Backup Based Disaster Recovery Peer for more information.
Select AI with OCI Generative AI	Autonomous Database can interact with AI service providers. Select AI now supports OCI Generative AI, Azure OpenAI Service, OpenAI, and CohereAI. This feature supports having LLMs work with Oracle database by generating SQL from natural language prompts. This allows you to talk to your database. See Use Select AI for Natural Language Interaction with your Database for more information.

January 2024

Feature	Description
ECPU Compute Model for all Workload Types	Autonomous Database offers two compute models when you create or clone an instance: ECPU and OCPU. Previously only the workload types Data Warehouse and Transaction Processing supported the ECPU compute model. Now all workload types support the ECPU compute model, including JSON and APEX. See Compute Models in Autonomous Database for more information.
Manage Time Zone File Updates	Autonomous Database provides several options to automatically update time zone files. See Manage Time Zone File Updates on Autonomous Database for more information.
Custom Kerberos Service Name Support for Kerberos Authentication	You can use a custom Kerberos service name when you configure Kerberos to authenticate Autonomous Database users. Using a custom service name you can use the same Keytab files on multiple Autonomous Database instances when you enable Kerberos authentication (you do not need to create and upload different Keytab files for each Autonomous Database instance). See Configure Kerberos Authentication with Autonomous Database for more information.
Clone Database to Change Workload Type	You can create a clone of an Autonomous Database and select a different workload type for the cloned database. See Clone Autonomous Database to Change Workload Type for more information.

2023 What's New

Announcements for the noteworthy changes made to Oracle Autonomous Database Serverless in the year 2023.

- December 2023
- November 2023
- October 2023
- September 2023
- August 2023
- July 2023
- June 2023

- April 2023
- March 2023
- February 2023
- January 2023

December 2023

Feature	Description
Cross Tenancy Cloning	You can clone an Autonomous Database instance from one tenancy, source tenancy, to a different tenancy (destination tenancy). The cross tenancy cloning option is only available using the CLI or the Autonomous Database REST APIs. This option is not available using the Oracle Cloud Infrastructure Console. See Cross Tenancy and Cross-Region Cloning for more information.
Invoke Azure Remote Functions	You can invoke Azure remote functions in your Autonomous Database as SQL functions. See Steps to Invoke Azure Functions as SQL Functions for more information.
Create Database Links to Oracle RAC Database	You can create database links from an Autonomous Database to a target Oracle RAC database and specify multiple hostnames. See Create Database Links from Autonomous Database to an Oracle Database on a Private Endpoint for more information.
New Cloud Links Views	Obtain information on the Cloud Link specific privileges granted to all users or to the current user. See Monitor and View Cloud Links Information for more information.
Documentation Addition: Load Data from AWS S3	Provides an example for loading data into an Autonomous Database instance from AWS S3. See Load Data into Autonomous Database from AWS S3 for more information.

November 2023

Feature	Description
Oracle APEX 23.2	Autonomous Database uses Oracle APEX Release 23.2. See Create Applications with Oracle APEX in Autonomous Database for more information.
Select AI with Azure OpenAI Service	Autonomous Database can interact with AI service providers. Select AI now supports the Azure OpenAI Service, OpenAI, and CohereAI. One way LLMs can work with Oracle database is by generating SQL from natural language prompts that allow you to talk to your database. See Use Select AI for Natural Language Interaction with your Database for more information.
Break Glass Access with `SAAS_ADMIN` User	Autonomous Database supports break glass access for SaaS providers. Break glass access allows a SaaS operations team, when explicitly authorized by a SaaS customer, to access a customer's database to perform critical or emergency operations. See Break Glass Access for SaaS on Autonomous Database for more information.
Database Links Without a Wallet (TLS)	You can create database links from one Autonomous Database instance to a publicly accessible Autonomous Database without a wallet (TLS). See Create Database Links from Autonomous Database to a Publicly Accessible Autonomous Database without a Wallet (TLS) for more information.

October 2023

Feature	Description
Vault Secret Credential Objects	You can use vault secret credentials to access cloud resources or to access other databases (use vault secret credentials anywhere where username/password type credentials are required). Supported vaults are: • Oracle Cloud Infrastructure Vault • Azure Key Vault • AWS Secrets Manager • GCP Secret Manager See Use Vault Secret Credentials for more information.
Documentation Addition: Billing Information	Documentation includes summary and detailed Autonomous Database billing information. See How Is Autonomous Database Billed? for more information.
Documentation Addition: Oracle Database Migration Information	Documentation includes information on migrating your Oracle Database to Autonomous Database. See Migrate Oracle Databases to Autonomous Database for more information.
ServiceNow Support for Database Links with Oracle-Managed Heterogeneous Connectivity	Autonomous Database support for Oracle-managed heterogeneous connectivity makes it easy to create database links to ServiceNow. When you use database links with Oracle-managed heterogeneous connectivity, Autonomous Database configures and sets up the connection. See Create Database Links to Non-Oracle Databases with Oracle-Managed Heterogeneous Connectivity for more information.
Invoke Oracle Cloud Infrastructure Functions or AWS Lambda Remote Functions	You can invoke Oracle Cloud Infrastructure Functions and AWS Lambda remote functions in your Autonomous Database as SQL functions. See Invoke User Defined Functions for more information.

September 2023

Feature	Description
Use Select AI to Generate SQL from Natural Language Prompts	Autonomous Database can interact with AI service providers including: OpenAI and CohereAI to provide access to Generative AI capability from Oracle Database that uses Large Language Models (LLMs). One way LLMs can work with Oracle database is by generating SQL from natural language prompts that allow you to talk to your database. See Use Select AI for Natural Language Interaction with your Database for more information.
Cloud Links Usability and Security	Cloud Links provide a cloud-based method to collaborate between Autonomous Databases. Cloud Links now allow you to set a data set owner. Cloud Links can be configured to require an additional authorization step, where a data set only allows specified databases to access the data set. When you register a data set, you can also specify refreshable clones to offload access to the data set. See Use Cloud Links for Read Only Data Access on Autonomous Database for more information.

Feature	Description
Elastic Pools	Use an elastic pool to consolidate your Autonomous Database instances, in terms of their allocation of compute resources, and to provide up to 87% cost savings. See Use and Manage Elastic Pools on Autonomous Database for more information.
Free Container Image	Use the Autonomous Database Free Container Image to run Autonomous Database in a container in your own environment, without requiring access to the Oracle Cloud Infrastructure Console or to the internet. See Use the Autonomous Database Free Container Image for more information.
ECPU-based Databases with Transaction Processing Workload Type Support per-Gigabyte Increments of Storage	You may now provision, clone, and scale using Gigabyte (GB) increments of storage for ECPU-based Autonomous Databases provisioned with the Transaction Processing workload type. The minimum storage allowed for an Autonomous Database instance in ECPU compute model with Transaction Processing workload is 20 GB. See Provision an Autonomous Database Instance for more information.
Google Analytics Support for Database Links with Oracle-Managed Heterogeneous Connectivity	Use Autonomous Database Oracle-managed heterogeneous connectivity to create database links to Google Analytics. When you use database links with Oracle-managed heterogeneous connectivity, Autonomous Database configures and sets up the connection. See Create Database Links to Non-Oracle Databases with Oracle-Managed Heterogeneous Connectivity for more information.

August 2023

Feature	Description
`DBMS_SHARE` Package	You can use the subprograms and views in the `DBMS_SHARE` package to share data with external systems. See DBMS_SHARE Package for more information.
Logical Partition Change Tracking (LPCT)	Logical Partition Change Tracking enables you to create logical partitions on base tables. It evaluates the staleness of the base tables for individual logical partitions without using a materialized view log or requiring any of the tables used in the materialized view to be partitioned. Logical Partition Change Tracking provides the capability to leverage the user-supplied logical partitioning information of base tables of materialized view for a more fine-grained, partition-level tracking of stale data for both refresh and rewrite purposes. While classical Partitioning Change Tracking (PCT) relies on the physical partitioning of tables, LPCT has no dependency on tables being physically partitioned; you can use LPCT with both partitioned and nonpartitioned tables. See Logical Partition Change Tracking and Materialized Views for more information.
Update OCPU to ECPU Compute Model	You can update an Autonomous Database instance from the OCPU billing model to the ECPU billing model. See Update to ECPU Billing Model on Autonomous Database for more information.

Feature	Description
Choose Backup Retention Period with ECPU Compute Model	With the ECPU billing model you have the option to select the backup retention period for automatic backups, with a retention period between 1 day and up to 60 days. See Edit Automatic Backup Retention Period on Autonomous Database for more information.
AWS Glue Data Catalog Integration	Autonomous Database allows you to synchronize with Amazon Web Services (AWS) Glue Data Catalog metadata. You can query data stored in S3 from Autonomous Database without having to manually derive the schema for the external data sources and create external tables. See Query External Data with AWS Glue Data Catalog for more information.

July 2023

Feature	Description
Track Table Changes with Flashback Time Travel	Use Flashback Time Travel to view past states of database objects or to return database objects to a previous state without using point-in-time media recovery. See Tracking Table Changes with Flashback Time Travel for more information.
Database Actions Quick Links	Database Actions on the Oracle Cloud Infrastructure Console provides quick links to select Database Actions cards or to select the Database Actions Launchpad. See Access Database Actions as ADMIN for more information.
Object Storage and REST Endpoint Management	`DBMS_CLOUD` supports a number of preconfigured Object Store and REST endpoints. `DBMS_CLOUD` also allows you to access additional customer-managed endpoints. See DBMS_CLOUD Endpoint Management for more information.
`detectfieldorder` DBMS_CLOUD Format Option	The `detectfieldorder` format option specifies that the fields in external data files are in a different order than the columns in the table. Specify this option with `DBMS_CLOUD.COPY_DATA`, `DBMS_CLOUD.CREATE_EXTERNAL_TABLE`, `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE`, or `DBMS_CLOUD.CREATE_HYBRID_PART_TABLE` to detect the order of fields using the first row of each external data file and map it to the columns of the table. See DBMS_CLOUD Package Format Options for more information.
Vault Secret Credential Objects	You can create vault secret credentials with secrets stored in Oracle Cloud Infrastructure Vault. You can use vault secret credentials to access cloud resources or to access other databases (use vault secret credentials anywhere where username/password type credentials are required). See Use Vault Secret Credentials for more information.
Export to Directory with `DBMS_CLOUD.EXPORT_DATA`	Export files as text or as Oracle Data Pump dump files to a directory. See Export Data to a Directory for more information.

June 2023

Feature	Description
Oracle Cloud Infrastructure Signing Key Based Authentication for Oracle Data Pump Import	Oracle Data Pump import using `impdp` supports credentials created using Oracle Cloud Infrastructure key based attributes. See Import Data Using Oracle Data Pump on Autonomous Database for more information.
Configurable Automatic Failover Data Loss Limit for a Local Standby Database	For Autonomous Data Guard you can specify an automatic failover data loss limit between 0 and 3600 seconds. Autonomous Data Guard performs automatic failover to a local standby database when a local standby database is available and the system can guarantee either the default zero data loss RPO or up to the data loss limit you specify. See Automatic Failover with a Standby Database for more information.
Oracle Workspace Manager	Oracle Workspace Manager provides an infrastructure that enables applications to create workspaces and group different versions of table row values in different workspaces. Use Oracle Workspace Manager to version-enable one or more user tables in the database. See Using Oracle Workspace Manager on Autonomous Database for more information.
Automatic Failover Begin and Automatic Failover End Events	The `AutonomousDatabase-AutomaticFailoverBegin` and `AutonomousDatabase-AutomaticFailoverEnd` events are generated when an automatic failover begins and ends. These events are only be triggered if you are using Autonomous Data Guard. See About Critical Events on Autonomous Database for more information.
Operator Access Event	The `OperatorAccess` event is generated when operator access is detected for the database. Autonomous Database operations team never access your data unless you explicitly grant permission through a Service Request for a specified duration. See Information Events on Autonomous Database for more information.
Built-in Tool Availability Service Level Objective (SLO)	Oracle will use commercially reasonable efforts to have the listed built-in tools meet the Availability objectives as defined in Service Level Objective (SLO) documentation. See Availability Service Level Objectives (SLOs) for more information.
CMU-AD with Active Directory Servers on a Private Endpoint	There are now two options for configuring Autonomous Database with Centrally Managed Users (CMU) with Microsoft Active Directory: • Active Directory (AD) servers publicly accessible: the Active Directory servers are accessible from Autonomous Database through the public internet. • Active Directory (AD) servers reside on a private endpoint: the Active Directory servers reside on a private endpoint and are not accessible from Autonomous Database through the public internet. See Use Microsoft Active Directory with Autonomous Database for more information.

May 2023

Feature	Description
Oracle APEX 23.1	Autonomous Database uses Oracle APEX Release 23.1. See Creating Applications with Oracle APEX in Autonomous Database for more information.
Google BigQuery Support for Database Links with Oracle-Managed Heterogeneous Connectivity	Autonomous Database support for Oracle-managed heterogeneous connectivity to create database links to Google BigQuery. When you use database links with Oracle-managed heterogeneous connectivity, Autonomous Database configures and sets up the connection. See Create Database Links to Non-Oracle Databases with Oracle-Managed Heterogeneous Connectivity for more information.
Log File Options for `DBMS_CLOUD`	`DBMS_CLOUD` provides `format` parameter options for logging customization: `enablelogs`, `logprefix`, `logdir`, and `logretention`. See DBMS_CLOUD Package Format Options for more information.
`RESULT_CACHE_MODE` Parameter is Modifiable at Session and System Level	Set the `RESULT_CACHE_MODE` parameter to specify which queries are eligible to store result sets in the result cache. Only query execution plans with the result cache operator will attempt to read from or write to the result cache. See RESULT_CACHE_MODE for more information.
Stripe Financial Views	Stripe is an online payment processing and credit card processing platform for businesses. The Stripe views allow you to query views created on top of Stripe APIs with `DBMS_CLOUD` to get Stripe information such as products, invoices, plans, accounts, subscriptions, and customers. See Stripe Views on Autonomous Database for more information.
Oracle GoldenGate Parallel Replicat (Integrated Mode)	Integrated Parallel Replicat (iPR) supports GoldenGate replication apply for procedural replication, Automatic CDR, and DML handlers. See Deciding Which Apply Method to Use and About Parallel Replicat for more information.
Persistent Messaging in `DBMS_PIPE`	The `DBMS_PIPE` package has extended functionality on Autonomous Database to support persistent messaging, where messages are stored in Cloud Object Store. See Use Persistent Messaging with Messages Stored in Cloud Object Store for more information.
Access Oracle Cloud Infrastructure Logging Data with Autonomous Database Views	Using the Oracle Cloud Infrastructure Logging Interface you can access log data from an Autonomous Database instance, in relational format. You can query log data in Oracle Cloud Infrastructure across all compartments and regions. See Oracle Cloud Infrastructure Logging Interface Views for more information.

April 2023

Feature	Description
Oracle Spatial Features for Geocoding Address Data and Reverse Geocoding Location Data	Oracle Spatial on Autonomous Database includes features for geocoding address data and for reverse geocoding longitude/latitude data to a street address. See Using Oracle Spatial with Autonomous Database for more information.

Feature	Description
Kerberos Authentication for CMU-AD	You can configure Autonomous Database to use Kerberos authentication for CMU with Microsoft Active Directory users. This configuration allows CMU Active Directory (CMU-AD) users to access an Autonomous Database instance using Kerberos credentials.
User Defined Notification Handler for Scheduler Jobs	Database Scheduler provides an email notification mechanism to track the status of periodically running or automated jobs. In addition to this, the Database Scheduler also supports user-defined PL/SQL Scheduler job notification handler procedure. Adding a scheduler job notification handler procedure allows you to monitor scheduled or automated jobs running in your Autonomous Database. See User Defined Notification Handler for Scheduler Jobs for more information.
Database Links with Customer-Managed Heterogeneous Connectivity to Non-Oracle Databases on a Private Endpoint	You can create database links from an Autonomous Database to an customer-managed Oracle Database Gateway to access Non-Oracle databases that are on a private endpoint. See Create Database Links with Customer-Managed Heterogeneous Connectivity to Non-Oracle Databases on a Private Endpoint for more information.
Oracle Machine Learning Notebooks Early Adopter	Oracle Machine Learning Notebooks Early Adopter is an enhanced web-based notebook platform for data engineers, data analyst, R and Python users, and data scientists. You can write code, text, create visualizations, and perform data analytics including machine learning. Notebooks work with interpreters in the back-end. In Oracle Machine Learning, notebooks are available in a project within a workspace, where you can create, edit, delete, copy, move, and even save notebooks as templates. See Get Started with Notebooks Early Adopter for Data Analysis and Data Visualization for more information.
Salesforce Support for Database Links with Oracle-Managed Heterogeneous Connectivity	Autonomous Database support for Oracle-managed heterogeneous connectivity to create database links to Salesforce databases. When you use database links with Oracle-managed heterogeneous connectivity, Autonomous Database configures and sets up the connection. See Create Database Links to Non-Oracle Databases with Oracle-Managed Heterogeneous Connectivity for more information.
Snapshot Standbys for Cross-Region Disaster Recovery	A disaster recovery cross-region peer can be converted to a snapshot standby. This converts either an Autonomous Data Guard cross-region standby database or a cross-region Backup-Based Disaster Recovery peer to a read-write database for up to two days. See Convert Cross Region Peer to Snapshot Standby for more information.
Singleton Pipe in `DBMS_PIPE`	Singleton Pipe is an addition to the `DBMS_PIPE` package that allows you to cache a custom message. Using a Singleton Pipe you can send and retrieve a custom message and share the message across multiple database sessions with concurrent reads. See Caching Messages with Singleton Pipes for more information.
Migrate Databases Across Regions with Minimal Downtime Using Autonomous Data Guard	You may now terminate, as well as perform all other Primary database actions on a remote Autonomous Data Guard standby when it becomes the Primary database, after a switchover or after a failover. This enables you to use a remote peer for migrating your database to the remote region. See Using Standby Databases with Autonomous Data Guard for Disaster Recovery for more information.

Feature	Description
Send Microsoft Teams Notifications	Use Microsoft Teams notifications. You can send messages, alerts, or the output of a query from Autonomous Database to a Microsoft Teams Channel. See Send Microsoft Teams Notifications from Autonomous Database for more information.
Send Email Using `DBMS_CLOUD_NOTIFICATION`	You can send email to a public SMTP endpoint using the Oracle Cloud Infrastructure Email Delivery service. See Send Email from Autonomous Database Using DBMS_CLOUD_NOTIFICATION for more information.

March 2023

Feature	Description
Cloud Links	Cloud Links provide a cloud-based method to collaborate between Autonomous Databases. Using Cloud Links you can access read-only data based on the cloud identities of Autonomous Database instances. The scope of collaboration can be the region where an Autonomous Database resides, individual tenancies, compartments, or particular Autonomous Database instances. See Using Cloud Links for Read Only Data Access on Autonomous Database for more information.
Backup-Based Disaster Recovery	Backup-Based Disaster Recovery uses backups to instantiate a peer database at the time of switchover or failover. For local Backup-Based Disaster Recovery, existing local backups are utilized and there are no additional costs. Cross-Region Backup-Based Disaster Recovery is also available and incurs additional costs. See Using Backup-Based Disaster Recovery for more information.
Documentation Addition: Oracle Machine Learning with Autonomous Database	Provides information on options for using Oracle Machine Learning with Autonomous Database. See Machine Learning with Autonomous Database for more information.
Export Data to Cloud Object Storage as Parquet	Use `DBMS_CLOUD.EXPORT_DATA` to export data as text. The text format export options are CSV, JSON, Parquet, or XML. See Export Data to Object Store as Text (CSV, JSON, Parquet, or XML) for more information.
Oracle Real Application Testing Capture and Replay	Use Capture and Replay from one Autonomous Database instance to another Autonomous Database instance. This enables you to compare workloads across different Autonomous Database instances. These Autonomous Database instances may vary at patch levels, database versions, or regions. See Using Oracle Real Application Testing for more information.
Availability Domain Information	You can obtain tenancy details, including the Availability Domain (AD) for an Autonomous Database instance. See Obtain Tenancy Details for more information.
Provision an Autonomous Database Instance and Save as Stack	The provisioning option Save as Stack allows you to create and deploy an Autonomous Database instance using Resource Manager. See Provision Autonomous Database and Overview of Resource Manager for more information.

Feature	Description
Oracle Client for Microsoft Tools (OCMT)	Oracle Client for Microsoft Tools (OCMT) is a graphical user interface (GUI) native Microsoft Software installer (MSI) that simplifies ODP.NET setup and provides Autonomous Database connectivity to multiple Microsoft data tools. See Connect Power BI and Microsoft Data Tools to Autonomous Database for more information.
Long-Term Backups	You can create long-term backups on Autonomous Database with a retention period between three months and up to ten years. When you create a long-term backup you can create a one-time backup or set a schedule to automatically create backups that are taken weekly, monthly, quarterly, or annually (yearly). See About Backup and Recovery on Autonomous Database and Create Long-Term Backups on Autonomous Database for more information.
Use Directories to Load Data with `DBMS_CLOUD` Procedures	As an alternative to an object store location URI, you can specify a directory with `DBMS_CLOUD` procedures to load or unload data from files in a directory, including directories created on attached network file systems. See Load Data from Directories in Autonomous Database for more information.

February 2023

Feature	Description
Maximum Storage Space Metric	The `StorageMax` metric shows the maximum amount of storage reserved for the database. See Autonomous Database Metrics and Dimensions for more information.
Oracle Cloud Infrastructure Vault Secret for ADMIN Password	When you create or clone an Autonomous Database instance or when you reset the ADMIN password, you can use an Oracle Cloud Infrastructure vault secret to specify the ADMIN password. See Use Oracle Cloud Infrastructure Vault Secret for ADMIN Password for more information.
Inactive Connections Detected Event	The `InactiveConnectionsDetected` event is generated when the number of inactive database connections detected is above a certain ratio, compared to all database connections for the Autonomous Database instance. Subscribing to this event can help you keep track of unused connections. See About Information Events on Autonomous Database for more information.
Enable Automatic Time Zone File Updates	Autonomous Database lets you choose to enable the feature that automatically updates time zone files on your Autonomous Database instance. See Manage Time Zone File Version on Autonomous Database for more information.

Feature	Description
Database Relocate and Failed Logon Events	The `FailedLoginWarning` event is generated when the number of failed login attempts reaches 3 * number of total users in the last three (3) hours. The `InstanceRelocateBegin` and `InstanceRelocateEnd` events are triggered when an Autonomous Database instance is relocated to another Exadata infrastructure due to server maintenance, hardware refresh, a hardware issue, or as part of a resource scale up. See About Critical Events on Autonomous Database for more information.

January 2023

Feature	Description
ECPU Compute Model	Autonomous Database offers two compute models when you create or clone an instance: ECPU and OCPU. See Compute Models in Autonomous Database for more information.
Configure Built-in Tools	Autonomous Database includes built-in tools that you can enable and disable when you provision or clone a database, or at any time for an existing database. See Managing Autonomous Database Built-in Tools for more information.
Configure a Custom Private IP Address for a Private Endpoint	You can configure a private endpoint when you provision or clone an Autonomous Database instance, or if your instance is configured to use a public endpoint you can change the configuration to use a private endpoint. Optionally when you configure a private endpoint you can enter a custom private IP address. Providing a custom IP address allows you to preserve an existing private IP address when you migrate from another system. See Configure Private Endpoints for more information.
Cross-Region Clone from Backup	Autonomous Database provides the option to create a clone in another region when you are cloning a database and you select **Clone from a backup**. In this case, you choose your preferred region to select the region where you want to create the clone. See Clone an Autonomous Database from a Backup for more information.
Send Slack Notifications	You can send slack notifications from Autonomous Database. This allows you to send messages to a Slack channel or send the results of a query to a Slack channel. See Send Slack Notifications from Autonomous Database for more information.

2022 What's New

Announcements for the noteworthy changes made to Oracle Autonomous Database Serverless in the year 2022.

- December 2022
- November 2022
- October 2022

- September 2022
- August 2022
- July 2022
- June 2022
- May 2022
- April 2022
- March 2022
- February 2022
- January 2022

December 2022

Feature	Description
Data Pipelines for Loading and Exporting	Data pipelines allow you to repeatedly load data from object store, or export data to object store. Load pipelines provide continuous incremental data loading from external sources (as data arrives on object store it is loaded to a database table). Export pipelines provide continuous incremental data exporting to object store (as new data appears in a database table it is exported to object store). See Using Data Pipelines for Continuous Load and Export for more information.
Credential Objects for use with `UTL_HTTP`, `UTL_SMTP`, and `DBMS_LDAP`	You can use credential objects to set authentication for use with `UTL_HTTP`, `UTL_SMTP` or `DBMS_LDAP`. See Use Credential Objects to set SMTP Authentication, Use Credential Objects to Set HTTP Authentication, and PL/SQL Packages for more information.
Medium and High Service Limits with Auto Scaling	The number of concurrent statements for the high and medium services increases by three times when OCPU Auto Scaling is enabled. See Service Concurrency for more information.
Multiple Data Catalog Support	Instead of each Autonomous Database instance supporting a single connection to a Data Catalog instance, this feature allows connections to multiple Data Catalog instances. See About Querying with Data Catalog for more information.

November 2022

Feature	Description
Cloud Code Repository Branch Management and Schema Export and Install	Additions and improvements for Cloud Code Repository in the `DBMS_CLOUD_REPO` package for (Git) repository branch management and schema export and install. See Using and Managing a Cloud Code Repository with Autonomous Database for more information.
Log File Prefix and Retention Format Options for `COPY_DATA`	`DBMS_CLOUD.COPY_DATA` supports the format parameter options: `logretention` and `logprefix`. See DBMS_CLOUD Package Format Options for more information.

Feature	Description
Cross-Region Autonomous Data Guard: Remove Second Hostname from Database Connection Strings	The `wallet.zip` and the connection strings provided for a database with cross-region Autonomous Data Guard enabled no longer contain both the primary and standby database hostnames in a single connection string or wallet. To avoid connection retry delays and optimize your disaster recovery setup, it is recommended to use the Primary database wallet or connection string to connect to the Primary database, and the remote database wallet or connection string to connect to the remote database (when the remote database is Available to connect to, after a switchover or failover). See Cross-Region Autonomous Data Guard Connection Strings and Wallets for more information.
Data Transforms in Database Actions	Data Transforms is a built-in data integration tool and is accessible from Database Actions. Data Transforms is a simple-to-use, drag-and-drop, no-code tool to load and transform data from heterogeneous sources to Autonomous Database. Use Data Transforms for all data integration needs such as building data warehouses and feeding analytics applications. See The Data Transforms Page for more information.
Access Network File System (NFS) Directories	You can attach a Network File System to a directory location in your Autonomous Database. This allows you to load data from Oracle Cloud Infrastructure File Storage in your Virtual Cloud Network (VCN) or from any other Network File System in on-premises data centers. See Access Network File System from Autonomous Database for more information.
Customer Managed Keys with Cross-Region Autonomous Data Guard	Autonomous Database fully supports using customer-managed keys with a remote standby database with Autonomous Data Guard. See Autonomous Data Guard with Customer Managed Keys and Notes for Customer-Managed Keys with Autonomous Data Guard for more information.
Cross-Region Refreshable Clones	Create one or more clones in regions other than the region of your primary (source) database. Clones in remote regions can be refreshed from the source database. See Using Refreshable Clones with Autonomous Database for more information.
Use Text Index to Query Text on Object Storage	You can build an Oracle Text index on object store files. This allows you to search the object store for text and use wildcards with your search. See Query Text in Object Storage for more information.
Documentation Addition: Data Lake Capabilities with Autonomous Database	A new section provides information on using Autonomous Database as a data lakehouse. See Using Data Lake Capabilities with Autonomous Database for more information.
Bulk Operations for Files in the Cloud	The PL/SQL package `DBMS_CLOUD` offers parallel execution support for bulk file upload, download, copy, and transfer activities, which streamlines the user experience and delivers optimal performance for bulk file operations. See Bulk Operations for Files in the Cloud for more information.

October 2022

Feature	Description
Clone from Backup Select Latest Available Timestamp Option	When you clone an Autonomous Database instance you can select clone from latest backup. This option selects the latest available backup timestamp as the clone source. You can select this option if a database becomes unavailable and you want to create a clone, or for any reason when you want to create a clone based on the most recent backup. See Clone Autonomous Database from a Backup for more information.
Use Customer-Managed Encryption Keys Located in a Different Tenancy	You can use customer-managed master encryption keys with the Vault and Keys in a different tenancy. The Vault and the Autonomous Database instance can be in a different tenancy, but they must be in the same region. See Use Customer-Managed Encryption Key Located in a Remote Tenancy for more information.
Use Google Service Account to Access GCP Resources	You can use a Google service account to access Google Cloud Platform (GCP) resources from an Autonomous Database instance. See Use Google Service Account to Access Google Cloud Platform Resources for more information.
`SYSDATE_AT_DBTIMEZONE` Parameter is Modifiable at Session and System Level	Depending on the value of `SYSDATE_AT_DBTIMEZONE`, you see either the date and time based on the default Autonomous Database time zone, Coordinated Universal Time (UTC), or based on the time zone that you set in your database. See SYSDATE_AT_DBTIMEZONE for more information.
View Oracle Cloud Operations Actions	The `DBA_OPERATOR_ACCESS` view stores information on the actions that Oracle Cloud Infrastructure cloud operations performs on your Autonomous Database. This view will not show results if Oracle Cloud Infrastructure cloud operations hasn't performed any actions or run any statements in your Autonomous Database instance. See View Oracle Cloud Infrastructure Operations Actions for more information.

September 2022

Feature	Description
Expanded list of Databases with Oracle-Managed Heterogeneous Connectivity	Autonomous Database support for Oracle-managed heterogeneous connectivity makes it easy to create database links to non-Oracle databases. When you use database links with Oracle-managed heterogeneous connectivity, Autonomous Database configures and sets up the connection to the non-Oracle database. The list of supported non-Oracle databases is expanded to include Hive and MongoDB. See Create Database Links to Non-Oracle Databases with Oracle-Managed Heterogeneous Connectivity for more information.
Oracle APEX Upgrade Events	The `APEXUpgradeBegin` and `APEXUpgradeEnd` events are generated when you are using Oracle APEX and your Autonomous Database instance begins an upgrade or completes an upgrade to a new Oracle APEX release. See About Events Based Notification and Automation on Autonomous Database for more information.

Feature	Description
Oracle MTS (OraMTS) Recovery Service	Use Oracle MTS (OraMTS) Recovery Service to resolve in-doubt Microsoft Transaction Server transactions on Autonomous Database. See Using OraMTS Recovery Feature on Autonomous Database for more information.

August 2022

Feature	Description
Documentation Addition: Updated Python Connection Information	You can connect Python applications to your Autonomous Database instance either with a wallet (mTLS) or without a wallet (TLS), using the python-oracledb driver. See Connect Python Applications to Autonomous Database for more information.
Autonomous Data Guard SLA	Autonomous Database provides a higher 99.995% availability SLA service commitment with Autonomous Data Guard enabled with a standby database. Database availability SLA is calculated based on the "Monthly Uptime Percentage" described in the Oracle PaaS and IaaS Public Cloud Services Pillar Document, document under **Delivery Policies**.
Oracle Machine Learning for R (OML4R)	Oracle Machine Learning for R (OML4R) is a component of the Oracle Machine Learning family of products, which integrates R with Autonomous Database. Use Oracle Machine Learning for R to: • Perform data exploration and data preparation while seamlessly leveraging Oracle Database as a high-performance computing environment. • Run user-defined R functions on database spawned and controlled R engines, with system-supported data-parallel and task-parallel capabilities. • Access and use powerful in-database machine learning algorithms from R language. See About Oracle Machine Learning for R for more information.
Synchronization with Data Catalog Enhancements	Use the `DBMS_DCAT$SYNC_LOG` view to easily access the log for the latest Data Catalog synchronization execution. See DBMS_DCAT SYNC_LOG View for more information.
Regional Availability Metrics	You can view regional availability metrics by data center for Oracle Autonomous Database. See Monitor Regional Availability of Autonomous Databases for more information.

July 2022

Feature	Description
Use Oracle Java	Autonomous Database supports Oracle JVM. Oracle JVM is a standard, Java-compatible environment that runs any pure Java application. See Using Oracle Java on Autonomous Database for more information.

Feature	Description
Oracle APEX 22.1	Autonomous Database uses Oracle APEX Release 22.1. See Creating Applications with Oracle APEX in Autonomous Database for more information.
Wallet Rotation with a Grace Period	Autonomous Database allows you to rotate wallets for an Autonomous Database instance or for all instances that a cloud account owns in a region, with a grace period of 1 hour to 24 hours. See Rotate Wallets for Autonomous Database for more information.
Change Display Name	You can change the display name for an Autonomous Database instance. See Update the Display Name for an Autonomous Database Instance for more information.
Default Database Name	The default database name and the matching default display name supplied when you provision or clone an instance is a generated 16-character string. See Provision Autonomous Database and Clone an Autonomous Database Instance for more information.
Oracle Real Application Testing: Database Replay	You can use Oracle Real Application Testing Database Replay to capture workload from an on-premises or other cloud service database and replay it on an Autonomous Database instance. This enables you to compare workloads between an on-premises database or other cloud service database and an Autonomous Database. See Using Oracle Real Application Testing - Database Replay for more information.
Export Data with Column Names in Header Row	You can optionally write column names as the first line in output files when you use the `EXPORT_DATA` procedure with CSV output. See EXPORT_DATA Procedure and DBMS_CLOUD Package Format Options for EXPORT_DATA with Text Files (CSV, JSON, and XML for more information.

June 2022

Feature	Description
Character Set Support	The Autonomous Database default database character set is Unicode AL32UTF8 and the default national character set is AL16UTF16. When you provision a database, depending on the workload type, you can select a database character set and a national character set. See Choose a Character Set for Autonomous Database for more information.
Support for Oracle LogMiner	Autonomous Database supports using Oracle LogMiner. See Oracle LogMiner for more information.
Synchronization with Data Catalog Enhancements	Synchronize Data Catalog partitioned metadata with Autonomous Database to create partitioned external tables. See the DBMS_DCAT RUN_SYNC procedure.
Database Actions Changes	Database Actions includes new features. See Changes in Oracle Database Actions for more information.

Feature	Description
Network Security Group (NSG) Configuration with Private Endpoint	For a private endpoint, the incoming and outgoing connections are limited by the combination of ingress and egress rules defined in NSGs and in the Security Lists associated with the private endpoint's VCN. Adding an NSG is now optional; when you do not include an NSG the ingress and egress rules defined in the Security Lists for the VCN still apply. See Configuring Network Access with Private Endpoints for more information.
Simplified Configuration Steps with CMU for Microsoft Active Directory	You can configure Autonomous Database to authenticate and authorize Microsoft Active Directory users. The configuration steps are simplified for enabling Autonomous Database with Centrally Managed Users (CMU). See Use Microsoft Active Directory with Autonomous Database for more information.

May 2022

Feature	Description
Azure Active Directory (Azure AD) Integration	Azure Active Directory (Azure AD) users can connect to an Autonomous Database instance using Azure OAuth2 access tokens. See Use Azure Active Directory (Azure AD) with Autonomous Database for more information.
OCPU Limit for License Type Bring Your Own License (BYOL)	The license type Bring Your Own License (BYOL), Oracle Database Standard Edition sets the maximum number of OCPUs that you can use to 8. See View and Update Your License and Oracle Database Edition on Autonomous Database for more information.
Kerberos Authentication Support	You can use Kerberos to authenticate Autonomous Database users. See Configure Kerberos Authentication for more information.
Autonomous Data Guard Standby State	Autonomous Data Guard shows a standby database in "Standby" state. See Autonomous Database Standby Database State for more information.
Database Actions Additions	Database Actions provides all the functionality that is available on the Autonomous Database Service Console. The Service Console will be deprecated soon. See Service Console Replacement with Database Actions for more information on where to find Service Console functionality in Database Actions.
Autonomous Data Guard Support for Terraform	Autonomous Data Guard supports operation from Terraform scripts See the following for more information: • Use the API • oci_database_autonomous_database • Oracle Cloud Infrastructure Provider • Terraform Registry Data Source: Data Source: oci_database_autonomous_database
Use Azure Service Principal	You can use an Azure service principal with Autonomous Database to access Azure resources without having to create and store your own credential objects in the database. See Use Azure Service Principal to Access Azure Resources for more information.

Feature	Description
Monitor Autonomous Database Availability	You can monitor availability information for your Autonomous Database instance form the Oracle Cloud Infrastructure Console or by viewing metrics. See Monitor Autonomous Database Availability and View Metrics for an Autonomous Database Instance for more information.
Database Names Length Limit	The length limit for database names when you create or clone your database has been increased from 14 to 30 characters. This change provides more flexibility, giving you the option to create longer database names. See Provision Autonomous Database or Clone an Autonomous Database Instance for more information.
Egress Rules for all Outbound Connections with Private Endpoints	When you define a private endpoint for your Autonomous Database instance you can provide enhanced security by setting a database property to enforce that all outgoing connections to a target host are subject to and limited by the private endpoint's egress rules. See Enhanced Security for Outbound Connections with Private Endpoints for more information.

April 2022

Feature	Description
Display Autonomous Database Availability	You can monitor Autonomous Database availability from the Oracle Cloud Infrastructure Console or using metrics. See Monitor Autonomous Database Availability for more information.
OML4Py SQL API for Embedded Python Execution	OML4Py embedded Python execution on Autonomous Database supports a SQL API in addition to the REST API. Embedded execution allows you to run user-defined Python functions in database-spawned and managed Python engines, along with data-parallel and task-parallel automation. See SQL API for Embedded Python Execution with On-premises Database for more information.
Create Database Links from Autonomous Database to Oracle Databases on a Private Endpoint without a Wallet	You can create database links from an Autonomous Database to a target Oracle Database that is on a private endpoint and connect without a wallet (TCP). See Create Database Links from Autonomous Database to Oracle Databases on a Private Endpoint without a Wallet for more information.
Availability Service Level Objectives (SLOs)	Describes the Service Level Objectives (SLOs) for Oracle Autonomous Database. See Availability Service Level Objectives (SLOs) for more information.
Synchronization with Data Catalog Enhancements	The `DBMS_DCAT RUN_SYNC` procedure has new parameters to give you more control over what objects are synchronized and how the synchronization is performed. See CREATE_SYNC_JOB Procedure and RUN_SYNC Procedure for more information.
Data Catalog Views	Discover all accessible data catalogs in the current region or across all regions. See ALL_DCAT_GLOBAL_ACCESSIBLE_CATALOGS View and ALL_DCAT_LOCAL_ACCESSIBLE_CATALOGS View for more information.

March 2022

Feature	Description
Oracle APEX 21.2	Autonomous Database uses Oracle APEX Release 21.2. See Creating Applications with Oracle APEX in Autonomous Database for more information.
OML4Py Client Access	A new client package for OML4Py provides a “universal" client in that users can access Autonomous Database from a standalone Python engine on Linux to connect to Autonomous Database as well as 19c and newer Oracle Database releases. This supports working with OML4Py on Autonomous Database, local third-party IDEs, and other notebook environments, like JupyterLab. It further allows switching between on-premises and Autonomous Database instances using the same client package. See Install OML4Py Client for Linux for Use With Autonomous Database for more information.
Oracle APEX Upgrade Available Event	The `APEXUpgradeAvailable` event is generated when you are using Oracle APEX and a new release becomes available. See About Events Based Notification and Automation on Autonomous Database for more information.
Database Links with Oracle-Managed Heterogeneous Connectivity	Autonomous Database support for Oracle-managed heterogeneous connectivity makes it easy to create database links to non-Oracle databases. When you use database links with Oracle-managed heterogeneous connectivity, Autonomous Database configures and sets up the connection to the non-Oracle database. See Create Database Links to Non-Oracle Databases with Oracle-Managed Heterogeneous Connectivity for more information.
Metadata Columns in External Tables	To identify which file each row is coming from in your external tables, you can query the columns named `file$name` and `file$path` to find the source file name and the Object Store path URL for that file. See External Table Metadata Columns for more information.
External Tables with Partitioning Specified in Source Files	When you use external file partitioning with the partitions specified in external source files, Autonomous Database analyzes Cloud Object Store path information to determine the partition columns and data types. See Query External Tables with Partitioning Specified in Source Files for more information.
Identity and Access Management (IAM) Authentication Additional Features	You can configure Autonomous Database to use Oracle Cloud Infrastructure Identity and Access Management (IAM) authentication and authorization to allow IAM users to access an Autonomous Database with IAM credentials. New additions for IAM support include the following: defining global user mapping, defining global roles mapping, support for resource principal usage with IAM, and proxy user support. See Use Identity and Access Management (IAM) Authentication with Autonomous Database for more information.
Storage Auto Scaling	With **Storage auto scaling** enabled the Autonomous Database can expand to use up to three times the reserved base storage. If you need additional storage, the database automatically uses the reserved storage without any manual intervention required. Storage auto scaling is disabled by default. See Storage Auto Scaling for more information.

Feature	Description
Documentation Addition: Get Help, Search Forums, and Contact Support	When you use Autonomous Database, sometimes you need to get help from the community or to talk to someone in Oracle support. This documentation addition provides information about getting help by viewing and posting questions on forums and using Oracle Cloud Support to create a support request. See Get Help, Search Forums, and Contact Support for more information.

February 2022

Feature	Description
Track Oracle Cloud Infrastructure Resources, Cost and Usage	Autonomous Database provides details on Oracle Cloud Infrastructure resources, cost and usage. See Track Oracle Cloud Infrastructure Resources, Cost and Usage Reports with Autonomous Database Views for more information.
Critical Events with Customer-Managed Keys	Autonomous Database events are triggered when an instance is using customer-managed keys and the database becomes inaccessible or when the database recovers from being inaccessible. See About Critical Events on Autonomous Database for more information.
Time Zone Handling in Calls to `SYSDATE` and `SYSTIMESTAMP`	The initialization parameter `SYSDATE_AT_DBTIMEZONE` parameter enables special handling in a session for the date and time value returned in calls to `SYSDATE` and `SYSTIMESTAMP`. Depending on the value of `SYSDATE_AT_DBTIMEZONE`, you see either the date and time based on the default Autonomous Database time zone, Coordinated Universal Time (UTC), or based on the time zone that you set in your database. See SYSDATE_AT_DBTIMEZONE for more information.

January 2022

Feature	Description
Use a Cloud Code Repository	Autonomous Database provides routines to manage and store files in Cloud Code (Git) Repositories. The supported Cloud Code Repositories are: GitHub Repository, AWS CodeCommit, and Azure Repos. See Using and Managing a Cloud Code Repository with Autonomous Database for more information.
Oracle Machine Learning Notebooks Repository	Oracle Machine Learning Notebooks repositories are stored in a schema on the Autonomous Database instance. This enables database instance-specific backup and restore of Oracle Machine Learning Notebooks as well as support for cross-region Autonomous Data Guard. See What's New in Oracle Machine Learning on Autonomous Database for more information.
Oracle Machine Learning Notebooks Import and Export of Jupyter Format Notebooks	Oracle Machine Learning Notebooks supports importing and exporting Jupyter format notebooks. This makes it easier for users to interoperate with other notebook environments. See Export a Notebook and Import a Notebook for more information.

Feature	Description
Add My IP Address Button	When you provision an Autonomous Database instance and configure network access with Access Control Lists (ACLs) or when you update network access, click **Add My IP Address** to add your current IP address to the ACL entry. See Configuring Network Access with Access Control Rules (ACLs) for more information.
Reconnect a Disconnected Refreshable Clone	You can reconnect a refreshable clone to the source database. This allows you to use a refreshable clone as a test database and run DML and make changes while the database is disconnected. When you are done with your testing you can reconnect to the source database, which refreshes the clone to the point where it was when you disconnected. See Reconnect a Refreshable Clone to the Source Database for more information.
GitHub Raw URL support in `DBMS_CLOUD`	Use GitHub Raw URLs with `DBMS_CLOUD` APIs to access source files that reside on a GitHub Repository. See GitHub Raw URL Format for more information.
View Maintenance Status and Timezone Version Notifications	The `DB_NOTIFICATIONS` view stores information about maintenance status notifications and timezone version upgrade notifications for your Autonomous Database instance. See View Maintenance Status and Timezone Version Notifications for more information.
One-way TLS Connections on Linux x64 Clients using Oracle Call Interface without a Wallet	Using TLS authentication for Oracle Call Interface connections on Linux x64, a wallet is not required when the client program connects with Oracle Instant Client 19.13. Using TLS authentication for Oracle Call Interface connections on all other platforms, or without Oracle Instant Client 19.13, clients must provide a generic CA root certificate wallet. See Prepare for Oracle Call Interface, ODBC, and JDBC OCI Connections Using TLS Authentication for more information.

2021 What's New

Announcements for the noteworthy changes made to Oracle Autonomous Database Serverless Deployment in the year 2021.

- December 2021
- November 2021
- October 2021
- September 2021
- August 2021
- July 2021
- June 2021
- May 2021
- April 2021
- March 2021
- February 2021
- January 2021

December 2021

Feature	Description
Oracle Database API for MongoDB	Oracle Database API for MongoDB lets applications interact with collections of JSON documents in Autonomous Database using MongoDB commands. See Using Oracle Database API for MongoDB for more information.
Oracle Data Miner Access to Autonomous Database	Oracle Data Miner in SQL Developer can be used with Oracle Autonomous Database. Oracle Data Miner is a SQL Developer extension that enables users to create, schedule, and deploy analytical workflows through a drag-and-drop user interface. Oracle Data Miner serves as a productivity tool for data scientists and an enabler for citizen data scientists with a no-code machine learning environment that automates some common machine learning steps. See Oracle Data Miner for more information.
Autonomous Data Guard Paired Regions	The Autonomous Data Guard paired region list is expanded with additional regions. Autonomous Data Guard paired regions are remote regions where you can create a cross-region standby database. See Autonomous Data Guard Paired Regions for more information.
`DBMS_PIPE` PL/SQL Package	The `DBMS_PIPE` package that lets two or more sessions in the same instance communicate is available in Autonomous Database.
Cross-Region Cloning	When you clone an Autonomous Database instance using the Oracle Cloud Infrastructure Console, you can select your preferred region for the clone. You can create the clone in the current region or in a remote region. The list of available regions to create a clone only shows the regions that you are subscribed to. See Clone an Autonomous Database Instance for more information.
Identity and Access Management (IAM) Authentication	You can configure Autonomous Database to use Oracle Cloud Infrastructure Identity and Access Management (IAM) authentication and authorization to allow IAM users to access an Autonomous Database with IAM credentials. See Use Identity and Access Management (IAM) Authentication with Autonomous Database for more information.
Schedule Start and Stop Times	When you enable an Auto Start/Stop Schedule for an Autonomous Database instance, the instance automatically starts and stops according to the schedule you specify. This allows you to reduce costs by scheduling shutdown periods for times when a system is not in use. See Schedule Start and Stop Times for an Autonomous Database Instance for more information.
PL/SQL API for Switching Consumer Groups	Use the `CS_SESSION` Package to switch the database service and consumer group of an existing session. See CS_SESSION Package for more information.
Export Data as CSV, JSON, or XML Data Files	You can export data from Autonomous Database as text in the following formats: CSV, JSON, or XML. See Move Data to Object Store as CSV, JSON, or XML Using EXPORT_DATA for more information.
Use Database Links with a Target Database on a Private Endpoint	Create database links from an Autonomous Database source to a target Oracle Database that is on a private endpoint. To create a database link to a target database on a private endpoint, the target database must be accessible from the source database's Oracle Cloud Infrastructure VCN. See Create Database Links from Autonomous Database to Oracle Databases on a Private Endpoint for more information.

November 2021

Feature	Description
Database Management	The **Associated Services** area on the Oracle Cloud Infrastructure Console includes a **Database Management** link. You can use Database Management service to monitor the health of a single Autonomous Database or a fleet of Autonomous Databases. See Use Database Management Service to Monitor Databases for more information.
Database Actions Access	Access Database Actions on the Oracle Cloud Infrastructure Console with **Database Actions** button. See Connect with Built-in Oracle Database Actions for more information.
DBMS_LDAP and UTL_TCP Packages	The DBMS_LDAP and UTL_TCP packages are available, with some restrictions. See Restrictions and Notes for Database PL/SQL Packages for more information.
Concurrent Operations with Lifecycle Management Actions	When you initiate operations that take some time to complete, including scaling the system (Scale Up/Down), these operations no longer prevent you from performing other operations. For example, if you perform certain database lifecycle management actions such as stopping the database during a long-running operation, depending on the operation, the long running operation is either canceled or paused. See Concurrent Operations on Autonomous Database for more information.

October 2021

Feature	Description
Import JSON Data from Cloud Object Store	You can import JSON data from Cloud Object Store into a table. This import method supports all the Cloud Object Stores supported by Autonomous Database, and you can use an Oracle Cloud Infrastructure resource principal to access your Oracle Cloud Infrastructure Object Store or Amazon Resource Names (ARNs) to access AWS Simple Storage Service (S3). See Create Credentials and Copy JSON Data into an Existing Table for more information.
Blockchain Tables Support	Blockchain tables are insert-only tables that organize rows into a number of chains. Blockchain tables protect data that records important actions, assets, entities, and documents from unauthorized modification or deletion by criminals, hackers, and fraud. Blockchain tables prevent unauthorized changes made using the database and detect unauthorized changes that bypass the database. See Managing Blockchain Tables for more information.
Immutable Tables Support	Immutable tables are read-only tables that prevent unauthorized data modifications by insiders and accidental data modifications resulting from human errors. See Managing Immutable Tables for more information.
Integrate with Oracle Cloud Infrastructure Data Catalog	OCI Data Catalog metadata is synchronized with Autonomous Database creating schemas and external tables. You are allowed to immediately query data available in object store. See Query External Data with Data Catalog for more information.

Feature	Description
Oracle APEX 21.1	Autonomous Database uses Oracle APEX Release 21.1. See Creating Applications with Oracle Application Express in Autonomous Database for more information.

September 2021

Feature	Description
TLS and Mutual TLS Connections	Autonomous Database by default supports Mutual TLS (mTLS) connections. You have the option to configure an Autonomous Database instance to support both mTLS and TLS connections. See the following for more information: • About Connecting to an Autonomous Database Instance • Update Network Options to Allow TLS or Require Only Mutual TLS (mTLS) Authentication on Autonomous Database
Vanity URLs for APEX, ORDS and Database Tools	You can configure a custom domain name or vanity URL for your APEX apps, Oracle REST Data Services (ORDS), and developer tools by placing an Oracle Cloud Infrastructure Load Balancer directly in front of your Autonomous Database. See the following for additional details, including prerequisites and step-by-step instructions: • Access Oracle APEX, Oracle REST Data Services, and Developer Tools Using a Vanity URL • Access Oracle REST Data Services, Oracle APEX, and Developer Tools Using a Vanity URL

August 2021

Feature	Description
Cross-Region Autonomous Data Guard	Autonomous Data Guard allows you to enable a cross-region standby (peer) database to provide data protection and disaster recovery for your Autonomous Database instance. When you enable Autonomous Data Guard, the system creates a standby database that is continuously updated with the changes from the primary database. You can enable Autonomous Data Guard with a standby in the current region, a local standby, or with a standby in a different region, a cross-region standby. You can also enable Autonomous Data Guard with both a local standby and a cross-region standby. See Using Standby Databases with Autonomous Database for Disaster Recovery for more information.
SQL Tracing for Database Session	Use SQL tracing to help you identify the source of an excessive database workload, such as a high load SQL statement in your application. See Perform SQL Tracing on Autonomous Database for more information.

Feature	Description
Export Data as JSON to Cloud Object Store	Use the procedure `DBMS_CLOUD.EXPORT_DATA` to export data to your Cloud Object Store as JSON, by specifying a query. This export method supports all the Cloud Object Stores supported by Autonomous Database, and you can use an Oracle Cloud Infrastructure resource principal to access your Oracle Cloud Infrastructure Object Store or Amazon Resource Names (ARNs) to access AWS Simple Storage Service (S3). See Move Data to Object Store as JSON Data Using EXPORT_DATA for more information.
Documentation Addition: Load Data from a Source File with Fixed Width Data	The documentation provides an example for loading data from a fixed-width source file to an external table. See Example Loading Data from a Fixed Width File for more information.
Set Patch Level	When you provision or clone an Autonomous Database instance you can select a patch level to apply upcoming patches. There are two patch level options: Regular and Early. After your provision or clone an Autonomous Database instance and set the patch level to Early, maintenance windows for the instance are scheduled and applied one week before instances with the patch level set to Regular. The Early patch level allows you to use and to test upcoming patches before they are applied to all systems. See Set the Patch Level for more information.

July 2021

Feature	Description
View Patch Details	You can view Autonomous Database patch information, including a list of resolved issues. See View Patch Information for more information.
Include Developer Tools Links in Wallet Readme File	The wallet `README` file includes links for Autonomous Database tools and resources, including: Database Actions, Graph Studio, Oracle APEX, Oracle Machine Learning Notebooks, Autonomous Database Service Console, and SODA drivers. See Wallet README File for more information.

June 2021

Feature	Description
Change MEDIUM Service Concurrency Limit from Service Console	If your application requires a customized concurrency limit not available with the predefined services, you can modify the concurrency limit for the MEDIUM service from the Autonomous Database Service Console or using PL/SQL procedures. See Change MEDIUM Service Concurrency Limit for more information.

Feature	Description
Automatic Partitioning	Automatic partitioning analyzes and automates partition creation for tables and indexes of a specified schema to improve performance and manageability in Autonomous Database. Automatic partitioning, when applied, is transparent and does not require user interaction or maintenance. Automatic partitioning does not interfere with existing partitioning strategies and manually partitioned tables are excluded as candidates for automatic partitioning. See Manage Automatic Partitioning on Autonomous Database for more information.
Use Customer-Managed Encryption Keys	Autonomous Database provides two options for Transparent Data Encryption (TDE) to encrypt data in the database: • Oracle-managed encryption keys • Customer-managed encryption keys See Managing Encryption Keys on Autonomous Database for more information.
Autonomous Database RMAN Recovery Catalog	You can use Autonomous Database as a Recovery Manager (RMAN) recovery catalog. A recovery catalog is a database schema that RMAN uses to store metadata about one or more Oracle databases. See Autonomous Database RMAN Recovery Catalog for more information.
Read-Only Mode for Sessions	You can set the Autonomous Database operation mode to read-only for a session. In read-only mode users for the session can only run queries. See Change Autonomous Database Operation Mode for a Session for more information.
Documentation Addition: `CS_RESOURCE_MANAGER` Package	The `CS_RESOURCE_MANAGER` package provides procedures to list and update consumer group parameters, and to revert parameters to default values. See CS_RESOURCE_MANAGER Package for more information.

May 2021

Feature	Description
Transparent Application Continuity (TAC) on Autonomous Database	Autonomous Database provides application continuity features for making connections to the database. You enable Application Continuity on Autonomous Database in one of two configurations: Application Continuity(AC) or Transparent Application Continuity (TAC). Application Continuity hides outages for thin Java-based applications, Oracle Database Oracle Call Interface, and ODP.NET based applications with support for open-source drivers, such as Node.js, and Python. Transparent Application Continuity (TAC) transparently tracks and records session and transactional state so the database session can be recovered following recoverable outages. This is done with no reliance on application knowledge or application code changes. See Using Application Continuity on Autonomous Database for more information.

Feature	Description
Amazon Resource Names (ARNs) to Access AWS Resources	You can use Amazon Resource Names (ARNs) to access AWS resources with Autonomous Database. When you use ARN role based authentication with Autonomous Database, you can securely access AWS resources without creating and saving credentials based on long-term AWS IAM access keys. See Use Amazon Resource Names (ARNs) to Access AWS Resources for more information.
Resource Principal to Access Oracle Cloud Infrastructure Resources	When you use a resource principal with Autonomous Database, you or your tenancy administrator define the Oracle Cloud Infrastructure policies in a dynamic group that allows you to access resources. With a resource principal you do not need to create a credential object and Autonomous Database creates and secures the resource principal credentials you use to access the Oracle Cloud Infrastructure resources specified in the dynamic group. See Use Resource Principal to Access Oracle Cloud Infrastructure Resources for more information.
Graph Studio	Graph Studio features include automated modeling to create graphs from database tables, an integrated notebook to run graph queries and analytics, and native graph and other visualizations. You can invoke nearly 60 pre-built graph algorithms and visualize your data with many visualization options. Graph Studio is a fully integrated, automated feature with Autonomous Database. See Using Oracle Graph with Autonomous Database for more information.

April 2021

Feature	Description
Change MEDIUM Service Concurrency Limit	If your application requires a customized concurrency limit not available with the predefined services, you can modify the concurrency limit for the MEDIUM service. See Change MEDIUM Service Concurrency Limit for more information.
DBMS_CLOUD REST API Results Cache	The DBMS_CLOUD REST API functions allow you to make HTTP requests and obtain and save results. Saving results in the cache allows you to view past results with the `SESSION_CLOUD_API_RESULTS` view. Saving and querying historical results of `DBMS_CLOUD` REST API requests can help you when you need to work with previous results in your applications. See DBMS_CLOUD REST API Results Cache for more information.
View and Manage Customer Contacts for Operational Issues and Announcements	When customer contacts are set, Oracle sends notifications to the specified email addresses to inform you of service-related issues. Contacts in the customer contacts list receive unplanned maintenance notices and other notices, including but not limited to notices for database upgrades and upcoming wallet expiration. See View and Manage Customer Contacts for Operational Issues and Announcements for more information.

Feature	Description
Always Free Autonomous JSON Database	You have the option to create a limited number of Always Free Autonomous JSON Databases that do not consume cloud credits. Always Free Autonomous JSON Databases can be created in Oracle Cloud Infrastructure accounts that are in a trial period, have paying status, or are always free. See Always Free Autonomous Database for more information.
Always Free Oracle APEX Application Development	You have the option to create a limited number of Always Free APEX Services that do not consume cloud credits. Always Free APEX Service can be created in Oracle Cloud Infrastructure accounts that are in a trial period, have paying status, or are always free. See Always Free Oracle APEX Application Development for more information.
Expiring Wallets Notification	Starting six weeks before the wallet expiration date Oracle sends notification emails each week, indicating the wallet expiration date. These emails provide notice before your wallet expires that you need to download a new wallet. You can also use the `WalletExpirationWarning` event to be notified when a wallet is due to expire. See Download Client Credentials (Wallets) for more information.
Documentation Addition: Oracle Graph	Oracle Graph with Autonomous Database enables you to create graphs from data in your Autonomous Database. With graphs you can analyze your data based on connections and relationships between data entities. See Using Oracle Graph with Autonomous Database for more information.
Documentation Addition: Oracle Spatial	Oracle Spatial with Autonomous Database allows developers and analysts to get started easily with location intelligence analytics and mapping services. See Using Oracle Spatial with Autonomous Database for more information.
Download Data Pump Dump File Set with Script	To support using Oracle Data Pump Import to import a dump file set to a target database, you can use a script that supports substitution characters to download all the dump files from your Object Store in a single command. See Download Dump Files, Run Data Pump Import, and Clean Up Object Store for more information.

March 2021

Feature	Description
Autonomous Database Tools for Database Actions	Autonomous Database provides the following data tools: • **Data Load**: helps you select data to load from your local computer, from tables in other databases, or from cloud storage. Then you can add the data you select to new or existing tables or views in Autonomous Database. See The Data Load Page for more information. • **Catalog**: helps you to see information about the entities in your Autonomous Database, and to see the effect that changing an object has on other objects. Catalog provides a tool for you to examine data lineage and understand the impact of changes. See The Catalog Page for more information. • **Data Insights**: crawls a table or business model and discovers hidden patterns, anomalies, and outliers in your data. Insights are automatically generated by built-in analytic functions. The results of the insight analysis appear as bar charts in the Data Insights dashboard. See The Data Insights Page for more information. • **Business Models**: describes the business entities that are derived from data in your Autonomous Database schema or from other sources. This allows you to create a semantic model on top of your data identifying hierarchies, measures, and dimensions. See The Business Models Page for more information.
Maintenance History	You can view Autonomous Database maintenance history to see details about past maintenance, such as the start time and stop time for past maintenance events. See About Autonomous Database Maintenance Windows and History for more information.
Oracle Machine Learning AutoML User Interface	AutoML User Interface (AutoML UI) is an Oracle Machine Learning interface that provides you with no-code automated machine learning. When you create and run an experiment in AutoML UI, it automatically performs algorithm and feature selection, as well as model tuning and selection, thereby enhancing productivity as well as model accuracy and performance. See Get Started with AutoML for more information.
Oracle Machine Learning Models	REST endpoints are available so that you can store Machine Learning models and create scoring endpoints for the models. The REST API for Oracle Machine Learning Services supports both Oracle Machine Learning models and ONNX format models. See REST API for Oracle Machine Learning Services for more information.
ADMIN Password Expiration Warning Event	The `AdminPasswordWarning` event produces an event when the Autonomous Database ADMIN password is expiring within 30 days or is expired. See About Events Based Notification and Automation on Autonomous Database for more information.

Feature	Description
Oracle Machine Learning for Python (OML4Py)	Oracle Machine Learning for Python (OML4Py) on Autonomous Database provides a Python API to explore and prepare data, and build and deploy machine learning models using the database as a high-performance compute engine. OML4Py is available through the Python interpreter in Oracle Machine Learning Notebooks. See Get Started with Notebooks for Data Analysis and Data Visualization for more information.

February 2021

Feature	Description
Oracle Database Actions	SQL Developer Web is now called Database Actions. Database Actions is a web-based interface that provides development tools, data tools, administration, and monitoring features for Autonomous Database. Using Database Actions you can load data and run SQL statements, queries, and scripts in a worksheet. See Connect with Built-in Oracle Database Actions for more information.
Query Big Data Service Hadoop (HDFS) Data	Big Data Service provides enterprise-grade Hadoop as a service, with end-to-end security, high performance, and ease of management and upgradeability. After deploying the Oracle Cloud SQL Query Server to Big Data Service, you can easily query data available on Hadoop clusters at scale from Autonomous Database using SQL. See Query Big Data Service Hadoop (HDFS) Data from Autonomous Database for more information.

January 2021

Feature	Description
Autonomous Database Events	Autonomous Database generates events that you can subscribe to with Oracle Cloud Infrastructure Events. There are two new Information events: `ScheduledMaintenanceWarning` and `WalletExpirationWarning`. See Use Autonomous Database Events for more information.
Private Endpoint Support for Tools (Oracle Machine Learning Notebooks are supported with Private Endpoints)	You can access Oracle APEX, Oracle SQL Developer Web, Oracle REST Data Services, and Oracle Machine Learning Notebooks with Private Endpoints. See Configuring Network Access with Private Endpoints for more information.

December 2020

Feature	Description
Replicate Data and Capture Data with Oracle GoldenGate	Using Oracle GoldenGate you can capture changes from an Oracle Autonomous Database and replicate to any target database or platform that Oracle GoldenGate supports, including another Oracle Autonomous Database. See Oracle GoldenGate Capture for Oracle Autonomous Database for more information.
Oracle APEX Application Development	Oracle APEX Application Development (APEX Service) is a low cost Oracle Cloud service offering convenient access to the Oracle Application Express platform for rapidly building and deploying low-code applications. See Oracle APEX Application Development for more information.
Oracle Database 21c with Always Free Autonomous Database	Oracle Database 21c is available with Always Free Autonomous Database. See the following for more information: • Always Free Autonomous Database • Always Free Autonomous Database Oracle Database 21c Features
Oracle APEX 20.2	Autonomous Database uses Oracle APEX 20.2. See Creating Applications with Oracle Application Express in Autonomous Database for more information.

November 2020

Feature	Description
Amazon S3 Presigned URLs	You can use a presigned URL in any `DBMS_CLOUD` procedure that takes a URL to access files in Amazon Simple Storage Service, without the need to create a credential. See Amazon S3 Compatible URI Format for more information.
Azure Blob Storage Shared Access Signatures (SAS) URLs	You can use Shared Access Signatures (SAS) URL in any `DBMS_CLOUD` procedure that takes a URL to access files in Azure Blob Storage, without the need to create a credential. See Azure Blob Storage URI Format for more information.

October 2020

Feature	Description
User-Defined Profiles Minimum Password Length	If you create a user-defined profile with a Password Verification Function (PVF), then the minimum password length can be 8 characters. See Manage Password Complexity on Autonomous Database for more information.
PL/SQL SDK for Oracle Cloud Infrastructure Resources	PL/SQL SDK for Oracle Cloud Infrastructure enables you to write code to manage Oracle Cloud Infrastructure resources. The PL/SQL SDK is on all Autonomous Database Serverless products. See PL/SQL SDK for more information.
Documentation Addition: Oracle Database Actions User Management	You can quickly create users and modify account settings for users with Oracle Database Actions. See Create Users on Autonomous Database for more information.
Autonomous Database Events	Autonomous Database generates events that you can subscribe to with Oracle Cloud Infrastructure Events. Subscribing to Autonomous Database events allows you to create automation and to receive notifications when the events occur. See Use Autonomous Database Events for more information.

September 2020

Feature	Description
Private Endpoint Support for Tools	You can access Oracle APEX, Oracle SQL Developer Web, and Oracle REST Data Services with Private Endpoints. See Configuring Network Access with Private Endpoints for more information.
Read-Only and Restricted Modes	You can select an Autonomous Database operation mode. The default mode is Read/Write. If you select Read-Only mode users can only run queries. In addition, for either mode you can restrict access to only allow privileged users to connect to the database. See Change Autonomous Database Mode to Read/Write or Read-Only for more information.
Refreshable Clones	Autonomous Database provides cloning where you can choose to create a full clone of the active instance, create a metadata clone, or create a refreshable clone. With a refreshable clone the system creates a clone that can be easily updated with changes from the source database. See Using Refreshable Clones with Autonomous Database for more information.
Documentation Addition: Auditing Autonomous Database	This new chapter describes the auditing features that allow you to track, monitor, and record activity on your database. Auditing can help you detect security risks and improve regulatory compliance for your database. See Auditing Autonomous Database for more information.

August 2020

Feature	Description
Autonomous JSON Database	If your database version is Oracle Database 19c or higher, you can provision an Autonomous JSON Database. Autonomous JSON Database is an Oracle Cloud service that is specialized for developing NoSQL-style applications that use JavaScript Object Notation (JSON) documents. See About Autonomous JSON Database for more information.
Amazon S3-Compatible Object Stores	Autonomous Database supports Amazon S3-Compatible object stores, such as Oracle Cloud Infrastructure Object Storage, Google Cloud Storage, and Wasabi Hot Cloud Storage. See Load Data from Files in the Cloud for more information.
Asynchronous Requests using `SEND_REQUEST`	The `DBMS_CLOUD SEND_REQUEST` function supports long running requests with the additional parameters: `async_request_url`, `wait_for_states`, and `timeout`. See SEND_REQUEST Function for more information.
Rename Database	If your database version is Oracle Database 19c or higher, you can rename your Autonomous Database. See Rename Autonomous Database for more information.

July 2020

Feature	Description
Oracle APEX Release 20.1	Autonomous Database supports Oracle APEX Release 20.1. See Creating Applications with Oracle Application Express in Autonomous Database for more information. If your Autonomous Database instance is on Oracle Database 18c, to use APEX 20.1 you must upgrade to Oracle Database 19c. After you upgrade to Oracle Database 19c, APEX is automatically upgraded to APEX 20.1.
Use a Standby Database	Autonomous Database provides the Autonomous Data Guard feature to enable a standby (peer) database to provide data protection and disaster recovery for your Autonomous Database instance. See Using a Standby Database with Autonomous Database for more information.
Create and Alter User Profiles	You can create and alter database user profiles. See Manage User Profiles with Autonomous Database for more information.
Manage Time Zone File Versions	The time zone files are periodically updated to reflect the latest time zone specific changes. Autonomous Database automatically picks up the updated time zone files. See Manage Time Zone File Version on Autonomous Database for more information.

Feature	Description
Network Access Changes	If your Autonomous Database network access is configured to use a private endpoint you can change the configuration to use a public endpoint. Likewise, if your Autonomous Database instance is configured to use a public endpoint, you can change the configuration to use a private endpoint. Autonomous Database network access changes from a public to a private endpoint, or from a private to a public endpoint are only supported with database versions Oracle Database 19c onwards. See Configuring Network Access with Access Control Rules (ACLs) and Private Endpoints for more information.
Use Database Links to Access Non-Oracle Databases	You can create database links from an Autonomous Database to an Oracle Database Gateway to access Non-Oracle databases. See Create Database Links to an Oracle Database Gateway to Access Non-Oracle Databases for more information.

June 2020

Feature	Description
ORC Format and Complex Types	Autonomous Database supports loading and querying data in object store in ORC format, in addition to Avro and Parquet. Also, for ORC, Avro, and Parquet structured file types you can load and query complex data types. Support for ORC format and complex types requires Oracle Database 19c. See Load Data from Files in the Cloud and Query External Data with ORC, Parquet, or Avro Source Files for more information.
`PUT_OBJECT` Maximum File Transfer Size Increase	The `DBMS_CLOUD.PUT_OBJECT` procedure maximum size limit for file transfers to Oracle Cloud Infrastructure Object Storage is increased to 50 GB. See PUT_OBJECT Procedure for more information.
Customer Managed Oracle REST Data Services	You can use a customer managed environment to run Oracle REST Data Services (ORDS) if you want to control the configuration and management of ORDS. Installing and configuring a customer managed environment for ORDS allows you to run ORDS with configuration options that are not possible using the default Oracle managed ORDS available with Autonomous Database. See About Customer Managed Oracle REST Data Services on Autonomous Database for more information.

May 2020

Feature	Description
Move Selective Data to Object Store	You can export data to Oracle Data Pump dump files on Object Store by specifying a query to select the data to export. See Move Data to Object Store as Oracle Data Pump Files Using EXPORT_DATA for more information.

Feature	Description
Obtain Tenancy Details for a Service Request	When you file a service request for Autonomous Database, you need to provide the tenancy details for your instance. Tenancy details for the instance are available on the Oracle Cloud Infrastructure console or you can obtain these details by querying the database. See Obtain Tenancy Details to File a Service Request for more information.
Upgrade Autonomous Database to Oracle Database 19c	If your Autonomous Database instance is on Oracle Database 18c, you can upgrade to Oracle Database 19c by clicking **Upgrade to 19c**.

April 2020

Feature	Description
SODA Documents and Collections	Autonomous Database supports loading and using Simple Oracle Document Architecture (SODA) documents and collections. SODA allows you to store, search, and retrieve document collections, typically JSON documents, without using SQL. You can also access document collections with SQL/JSON operators, providing you with the simplicity of a document database but with the power of a relational database. See Using JSON Documents with Autonomous Database for more information.
Load Data with Oracle Data Pump Access Driver Dump Files	You can use Oracle Data Pump dump files in the Cloud as source files to load your data. The files for this load type must be exported from the source system using the `ORACLE_DATAPUMP` access driver in External Tables. See Create Credentials and Load Data Pump Dump Files into an Existing Table for more information.
Create External Tables and Query Data with Oracle Data Pump Access Driver Dump Files	You can query Oracle Data Pump dump files in the Cloud by creating an external table. The source files to create this type of external table must be exported from the source system using the `ORACLE_DATAPUMP` access driver in External Tables. See Query External Data Pump Dump Files for more information.
Oracle Extensions for IDEs	You can use Oracle extensions for IDEs to develop applications on Autonomous Database. Extensions are available for Eclipse, Microsoft Visual Studio, and Microsoft Visual Studio Code (VS Code). These extensions enable you to connect to, browse, and manage Autonomous Databases in Oracle Cloud directly from the IDE. See Use Oracle Extensions for IDEs to Develop Applications for more information.
Per-Second Billing	Autonomous Database instance CPU and storage usage is billed by the second, with a minimum usage period of 1 minute. Previously Autonomous Database billed in one-hour minimum increments and partial usage of an hour was rounded up to a full hour.
Stateful Rule Support in Private Endpoints	When you configure a private endpoint you define a security rule(s) in a Network Security Group (NSG); this creates a virtual firewall for your Autonomous Database and allows connections to the Autonomous Database instance. The NSG can now be configured with stateful rules. See Configure Private Endpoints with Autonomous Database for more information.

Feature	Description
Wallet zip File Contains `README` File	The wallet file that contains client credentials (wallet files) for your Autonomous Database instance now also has a `README` file with wallet expiration information. Wallet files that were downloaded prior to April 2020 do not contain this file. See Download Client Credentials (Wallets) for more information.

March 2020

Feature	Description
Restart Autonomous Database instance	Use **Restart** to restart an Autonomous Database instance. See Restart Autonomous Database for more information.
Oracle Data Pump Direct Export to Object Store	Depending on your cloud object store, you can use Oracle Data Pump to directly export to your object store to move data between Autonomous Database and other Oracle databases. See Move Data with Data Pump Export to Object Store for more information.
Oracle Data Pump Pre-authenticated URLs for Dump Files	If your source files reside on Oracle Cloud Infrastructure Object Storage, you can use pre-authenticated URLs with Oracle Data Pump. See Import Data Using Oracle Data Pump on Autonomous Database for more information.
Documentation Addition: Upgrade Autonomous Database to Oracle Database 19c	Provides information on upgrading to Oracle Database 19c if your Autonomous Database instance is on Oracle Database 18c.
Oracle Database Versions by Region	Depending on the region where you provision or clone your database, Autonomous Database supports one or more Oracle Database versions. Oracle Database 19c is available in all commercial regions.
Oracle Application Express Release 19.2	Autonomous Database supports Oracle Application Express Release 19.2. See Creating Applications with Oracle Application Express in Autonomous Database for more information.

February 2020

Feature	Description
Private Endpoints	This configuration option assigns a private endpoint, private IP and hostname, to a database and allows traffic only from the VCN you specify; access to the database from all public IPs or VCNs is blocked. This allows you to define security rules at the Network Security Group (NSG) level and to control traffic to your Autonomous Database. See About Network Access Options for more information.
Oracle Database Vault	Oracle Database Vault implements powerful security controls for your database. These unique security controls restrict access to application data by privileged database users, reducing the risk of insider and outside threats and addressing common compliance requirements. See Using Oracle Database Vault with Autonomous Database for more information.

Feature	Description
Oracle Application Express Release 19.2	If your database instance is an Always Free Autonomous Database or is a database with Oracle Database release 19c, then your database has Oracle Application Express Release 19.2. See Creating Applications with Oracle Application Express in Autonomous Database for more information.
Database Resident Connection Pool (DRCP)	Using DRCP provides you with access to a connection pool in your database that enables a significant reduction in key database resources required to support many client connections. See Use Database Resident Connection Pooling with Autonomous Database for more information.

January 2020

Feature	Description
Clone from a backup	Clone from a backup lets you create a clone by selecting a backup from a list of backups, or with a timestamp for a point-in-time to clone. See Clone Autonomous Database from a Backup for more information.
Check and set `MAX_STRING_SIZE` value	By default the database uses extended data types and the value of `MAX_STRING_SIZE` is set to the value `EXTENDED`. To support migration from older Oracle Databases or applications you can set `MAX_STRING_SIZE` to the value `STANDARD`. See Checking and Setting MAX_STRING_SIZE for more information.
Number of concurrent statements increased depending on the service you use	The maximum number of concurrent statements is increased, depending on the connection service you are using. See Predefined Database Service Names for Autonomous Database for more information.
Documentation addition showing available Oracle Database versions	The documentation shows the Oracle Database version available with Autonomous Database by region. See Oracle Database Version Availability by Region for more information.
`DBMS_CLOUD` REST API functions	The `DBMS_CLOUD` REST API functions allow you to make HTTP requests using `DBMS_CLOUD.SEND_REQUEST`. These functions provide a generic API that lets you call REST APIs from supported cloud services. See DBMS_CLOUD REST APIs for more information.
Documentation addition to describe sending mail with `UTL_SMTP`	The documentation is updated to provide the steps and sample code for sending email using `UTL_SMTP`. See Sending Mail with Email Delivery on Autonomous Database for more information.
Use ACLs to control access for Autonomous Database tools	You can now use Virtual Cloud Network, Virtual Cloud Network (OCID), IP address, or CIDR block ACLs to control access to Oracle APEX (APEX), RESTful services, and SQL Developer Web. See Use an Access Control List with Autonomous Database for more information.

2019 What's New

Announcements for the noteworthy changes made to Oracle Autonomous Database Serverless Deployment in the year 2019.

- December 2019
- November 2019
- October 2019
- September 2019
- August 2019
- July 2019
- June 2019
- May 2019
- April 2019
- March 2019
- February 2019
- January 2019

December 2019

Feature	Description
Support for `UTL_HTTP` and `UTL_SMTP` PL/SQL Packages with restrictions	Autonomous Database supports the Oracle Database PL/SQL packages `UTL_HTTP`, `UTL_SMTP`, and `DBMS_NETWORK_ACL_ADMIN` with restrictions. See Restrictions for Database PL/SQL Packages for more information.
Microsoft Active Directory Users	You can configure Autonomous Database to authenticate and authorize Microsoft Active Directory users. This allows Active Directory users to access a database using their Active Directory credentials. See Use Microsoft Active Directory with Autonomous Database for more information.
Validate external partitioned tables and hybrid partitioned tables	You can validate individual partitions of an external partitioned table or a hybrid partitioned table with the procedures `DBMS_CLOUD.VALIDATE_EXTERNAL_PART_TABLE` and `DBMS_CLOUD.VALIDATE_HYBRID_PART_TABLE`. See Validate External Partitioned Data and Validate Hybrid Partitioned Data for more information.
Use ACL IP address or CIDR block settings to control access for Autonomous Database tools	You can now use IP address and CIDR based ACLs to control access to Oracle APEX (APEX), RESTful services, and SQL Developer Web. See Use an Access Control List with Autonomous Database for more information.
Use Oracle Data Safe	Oracle Data Safe provides features that help you protect sensitive and regulated data in your database. See Safeguard Your Data with Data Safe on Autonomous Database for more information.

November 2019

Feature	Description
Use ACLs to specify Oracle Cloud Infrastructure VCNs	Use ACLs to specify Oracle Cloud Infrastructure VCNs that can connect to your Autonomous Database. See Use an Access Control List with Autonomous Database for more information.
SQL Developer Web Data Loading	In SQL Developer Web in the Worksheet page, you can upload data from local files into an existing table. See Load Data from Local Files with SQL Developer Web for more information.
Access APEX from Oracle Cloud Infrastructure Console	The Tools Tab provides access to APEX from Oracle Cloud Infrastructure Console. See Access Oracle Application Express Administration Services for more information.
Access SQL Developer Web from Oracle Cloud Infrastructure Console	The Tools Tab provides access to SQL Developer Web from Oracle Cloud Infrastructure Console. See Access SQL Developer Web as ADMIN for more information.
Access Oracle Machine Learning from Oracle Cloud Infrastructure Console	The Tools Tab provides access to Oracle Machine Learning User Administration from Oracle Cloud Infrastructure Console. See Work with Oracle Machine Learning for Data Access, Analysis, and Discovery for more information.
View Maintenance Schedule from Oracle Cloud Infrastructure Console	The Autonomous Database Information tab shows the schedule for upcoming maintenance. See About Autonomous Database Maintenance Windows for more information.
New fields with `LIST_FILES` and `LIST_OBJECTS`	The functions `DBMS_CLOUD.LIST_FILES` and `DBMS_CLOUD.LIST_OBJECTS` produce additional metadata for files and objects. See LIST_FILES Function and LIST_OBJECTS Function for more information.

October 2019

Feature	Description
Preview Version for Autonomous Database	Oracle periodically provides a preview version of Autonomous Database that allows you to test your applications and to become familiar with features in the next release of Autonomous Database. See Preview Versions for Autonomous Database for more information.
Download database specific instance wallets or regional wallets	You can download database specific instance wallets or regional wallets. See Download Client Credentials (Wallets) for more information.
Rotate database specific instance wallets or regional wallets	You can rotate database specific instance wallets or regional wallets. See Rotate Wallets for Autonomous Database for more information.
Create partitioned external tables with `DBMS_CLOUD`	You can create and validate external partitioned tables with the `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE` and `DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE` statements. See Query External Partitioned Data for more information.

Feature	Description
Numeric Formats	With the `numberformat` and `numericcharacters` format options Autonomous Database supports formats to interpret numeric strings correctly. See DBMS_CLOUD Package Format Options for more information.

September 2019

Feature	Description
Always Free Autonomous Database	You have the option to create a limited number of Always Free Autonomous Databases that do not consume cloud credits. Always Free databases can be created in Oracle Cloud Infrastructure accounts that are in a trial period, have paying status, or are always free. See Always Free Autonomous Database for more information.
Autonomous Database Metrics	You can monitor the health, capacity, and performance of your databases with metrics, alarms, and, notifications. You can use Oracle Cloud Infrastructure console or Monitoring APIs to view metrics. See Monitor Performance with Autonomous Database Metrics for more information.
Object Store Using Public URL	If your source files reside on an Object Store that provides public URLs, you can use public URLs with `DBMS_CLOUD` procedures. Public means the Object Storage service supports anonymous, unauthenticated access to the Object Store files. See URI Format Using Public URL for more information.
Work Requests	Work Requests are available in the Oracle Cloud Infrastructure console. Work Requests let you track progress of database lifecycle management operations such as creating, terminating, backing up (manual), restoring, scaling, and cloning an Autonomous Database. Work requests allow you to track the progress and steps completed in a database operation. See About Work Requests for more information.

August 2019

Feature	Description
Create Directory and Drop Directory commands	The `data_pump_dir` directory is available in a database. You can use `CREATE DIRECTORY` to create additional directories. To drop a directory, you can use the `DROP DIRECTORY` command. See Creating and Managing Directories for more information.

July 2019

Feature	Description
Performance Hub	Oracle Cloud Infrastructure console includes Performance Hub for Autonomous Database. You can view real-time and historical performance data from the Performance Hub. See Monitor Autonomous Database with Performance Hub for more information.

Feature	Description
Oracle Cloud Infrastructure Native Object Store Authentication	Autonomous Database supports native authentication with Oracle Cloud Infrastructure Object Store. Using native authentication you can use key based authentication to access the Object Store (instead of using a username and password). See CREATE_CREDENTIAL Procedure for more information.
Move to a different Compartment	You can move a database to a different Oracle Cloud Infrastructure compartment. See Move an Autonomous Database to a Different Compartment for more information.

June 2019

Feature	Description
Application Express (APEX)	Oracle APEX (APEX) is a low-code development platform that enables you to build scalable, secure enterprise applications with world-class features that can be deployed anywhere. Each Autonomous Database instance includes a dedicated instance of Oracle APEX; you can use this instance to create multiple workspaces. A workspace is a shared work area where you can build applications. See About Oracle Application Express for more information.
SQL Developer Web	Oracle SQL Developer Web provides a provides a development environment and a data modeler interface for Autonomous Database. See About SQL Developer Web for more information.
Oracle REST Data Services (ORDS)	You can develop and deploy RESTful Services with native Oracle REST Data Services (ORDS) support on a database See Developing RESTful Services in Autonomous Database for more information.
Auto Scaling	Enabling auto scaling allows a database to use up to three times more CPU and IO resources than the currently specified CPU Core Count. When auto scaling is enabled, if your workload requires additional CPU and IO resources the database automatically uses the resources without any manual intervention required. See Use Auto Scaling for more information.
Azure object store with Data Pump	Autonomous Database now supports Microsoft Azure cloud storage with Oracle Data Pump. See Import Data Using Oracle Data Pump on Autonomous Database for more information.

May 2019

Feature	Description
Support for creating database links	You can create database links with `DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK` to access objects on another database. See Use Database Links with Autonomous Database for more information.
Oracle Spatial and Graph with limitations	

Feature	Description
Oracle Text with limitations	See Restrictions for Oracle Text for more information.
Oracle Cloud Infrastructure Native URI Format Supported with Oracle Data Pump	For importing data from Data Pump files using `impdp`, if your source files reside on the Oracle Cloud Infrastructure Object Storage you can use the Oracle Cloud Infrastructure native URIs in addition to the Swift URIs. See DBMS_CLOUD Package File URI Formats for more information.
Oracle Cloud Infrastructure Pre-Authenticated URI Format Supported with `DBMS_CLOUD`	If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use the Oracle Cloud Infrastructure Pre-Authenticated URIs. When you create a pre-authenticated request, a unique URL is generated. You can use a pre-authenticated URL in any `DBMS_CLOUD` procedure that takes a URL to access files in the Oracle Cloud Infrastructure object store, without the need to create a credential. See DBMS_CLOUD Package File URI Formats for more information.
Oracle XML DB with limitations	Oracle XML DB is a high-performance, native XML storage and retrieval technology that is delivered as a part of Oracle Database. Limitations apply to Oracle XML DB with Autonomous Database database. See Restrictions for Oracle XML DB for more information.
Modify CPU/IO Shares from Service Console	Autonomous Database comes with predefined CPU/IO shares assigned to different consumer groups. You can modify predefined CPU/IO shares if your workload requires different CPU/IO resource allocations.You can change CPU/IO shares from the Service Console or using a PL/SQL package. See Manage CPU/IO Shares on Autonomous Database for more information.

April 2019

Feature	Description
Support for Network Access Control Lists	Autonomous Database now supports setting a network Access Control List (ACL) to restrict access to a specific Autonomous Database database. When you set a network ACL the database only accepts connections from addresses specified on the ACL and rejects all other client connections. See Configuring Network Access with Access Control Rules (ACLs) for more information.
Support for Updating License Type	You can now update your license type from the Oracle Cloud Infrastructure console **Actions** list. See Update License Type on Autonomous Database for more information.
Access Avro files in Object Stores	Autonomous Database allows you to directly query and load data stored as Apache Avro format files (Apache Parquet format files are also supported). You can create external tables for Parquet or Avro format data files. See DBMS_CLOUD Package Format Options for Parquet and Avro and CREATE_EXTERNAL_TABLE Procedure for Parquet or Avro Files for more information.

Feature	Description
Enhanced newline handling for file record delimiter with `DBMS_CLOUD`	Now, when reading a file, by default `DBMS_CLOUD` tries to automatically find the correct newline character to use as the record delimiter, either for Windows, newline character "`\r\n`", or for UNIX/Linux newline character "`\n`". If `DBMS_CLOUD` finds one of these it sets the record delimiter for the file. You can specify the record delimiter explicitly if you want to override the default behavior. See DBMS_CLOUD Package Format Options for more information.
Modify CPU/IO Shares	Autonomous Database comes with predefined CPU/IO shares assigned to different consumer groups. You can modify these predefined CPU/IO shares if your workload requires different CPU/IO resource allocations. See Manage CPU/IO Shares on Autonomous Database for more information.

March 2019

Feature	Description
Clone Your Database	Autonomous Database provides cloning where you can choose to clone either the full database or only the database metadata. See Cloning a Database with Autonomous Database for more information.
Oracle Cloud Infrastructure Native URI Format Supported with `DBMS_CLOUD`	If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use the Oracle Cloud Infrastructure native URIs in addition to the Swift URIs. See DBMS_CLOUD Package File URI Formats for more information.
UI/API Unification and Workload Type field	Oracle Cloud Infrastructure Console and the Oracle Cloud Infrastructure APIs for Autonomous Data Warehouse and Autonomous Transaction Processing are converged to a single, unified framework. These changes allow you to more easily manage both types of Autonomous Databases. There is a new Workload Type field on the console showing values of either “Transaction Processing” or “Data Warehouse”, depending on the type of database you are viewing. You can also select a Workload Type when you provision an Autonomous Database. See Workload Types for more information.
Service Gateway	You can now set up a Service Gateway with Autonomous Database. A service gateway allows connectivity to Autonomous Database from private IP addresses in private subnets without requiring an Internet Gateway in your VCN. See Access Autonomous Database with Service Gateway and Access to Oracle Services: Service Gateway for more information.
Documentation changes	The procedure `DBMS_CLOUD.DELETE_ALL_OPERATIONS` is now documented. See DELETE_ALL_OPERATIONS Procedure for more information.

February 2019

Feature	Description
Application Continuity	You can now enable and disable Application Continuity. Application Continuity masks outages from end users and applications by recovering the in-flight work for impacted database sessions following outages. Application Continuity performs this recovery beneath the application so that the outage appears to the application as a slightly delayed execution. See Using Application Continuity on Autonomous Database for more information.
Documentation changes	Autonomous Database documentation includes a new chapter that describes moving data to other Oracle databases. See Moving Data from Autonomous Database to Other Oracle Databases for more information.

January 2019

Feature	Description
Access Parquet files in Object Stores	Autonomous Database allows you to directly query and load data stored as parquet files in object stores. You can also create external parquet format tables in object stores. See COPY_DATA Procedure for Parquet Files and CREATE_EXTERNAL_TABLE Procedure for Parquet Files for more information.

2018 What's New

Announcements for the noteworthy changes made to Oracle Autonomous Database Serverless Deployment in the year 2018.

- October 2018
- September 2018
- August 2018
- July 2018
- June 2018
- May 2018
- April 2018

October 2018

Feature	Description
Oracle Cloud Infrastructure Console changes	The Autonomous Database console has a new layout and provides new buttons that improve the usability of Autonomous Database. These changes include a new **DB Connection** button that makes it easier to download client credentials.

September 2018

Feature	Description
Table compression methods	In addition to Hybrid Columnar Compression all table compression types are now available in Autonomous Database. For more information, see Managing DML Performance and Compression.
Idle timeout changes	The idle timeout of 60 minutes is now lifted. Idle sessions that do not hold resources required by other sessions will not be terminated after 60 minutes now. For more information, see Manage Concurrency and Priorities on Autonomous Database.

August 2018

Feature	Description
The Oracle Cloud Infrastructure page has a new option Autonomous Transaction Processing	The sign in for Oracle Cloud Infrastructure now lists the new product, Oracle Autonomous Transaction Processing, in addition to Oracle Autonomous Database.

July 2018

Feature	Description
SQL Developer 18.2.0 and later without Keystore Password field for connections	When you connect to Autonomous Database with SQL Developer 18.2.0 or later, you do not need to supply a keystore password. The keystore password was required in previous SQL Developer versions.

June 2018

Feature	Description
New management interfaces	Autonomous Database is now provisioned and managed using the native Oracle Cloud Infrastructure. This provides a more intuitive user interface to make managing your Autonomous Database instances easier with additional capabilities including sorting and filtering. For more information, see Oracle Help Center.
Better authorization management	With OCI Identity and Access Management (IAM) you can better organize and isolate your Autonomous Database instances using Compartments and control what type of access a user or group of users have.
Built-in auditing	The OCI Audit service records use of Autonomous Database application programming interface (API) endpoints as log events in JSON format. You can view, copy, and analyze audit events with standard log analysis tools or using the Audit service Console, the Audit APIs, or the Java SDK.
Availability of the Phoenix region	Autonomous Database is now available in the Phoenix region in addition to Ashburn and Frankfurt regions.
User Assistance changes	The documentation, videos, and examples are updated on the Oracle Help Center to include the procedures to create and control Autonomous Database instances with the Oracle Cloud Infrastructure Console. A new Related Resources page shows related resources including the Autonomous Data Warehouse Forum .
Idle timeouts in database services	The idle timeouts for three database services, high, medium, and low, have now been relaxed. The previous idle timeout setting of 5 minutes will now apply to only idle sessions that hold resources needed by other active users. See Manage Concurrency and Priorities on Autonomous Database.

May 2018

Feature	Description
Oracle Cloud Infrastructure Object Storage Credentials	The name Swift Password is now Auth token. Use of Swift password in the documentation is now replaced with Auth token.

April 2018

Feature	Description
Microsoft Azure Blob Storage or Azure Data Lake Storage integration	Autonomous Database now supports Microsoft Azure Blob Storage or Azure Data Lake Storage for data loading and querying external data. You can load data from or run queries on files residing on Azure Blob Storage. See Loading Data from Files in the Cloud.

Feature	Description
Manage files on the local file system	You can now list files residing on the local file system on Autonomous Database, see LIST_FILES Function. You can also remove files from the local file system. See DELETE_FILE Procedure.

Sample Star Schema Benchmark (SSB) Queries and Analytic Views

The SSB schema contains the tables: lineorder, customer, supplier, part, and dwdate. The following is a list of sample queries and analytic views you can use against the SSB schema. Note that you need to prefix the table names with the schema name SSB in your queries.

> **Note:**
>
> Both SH and SSB are provided as schema-only users, so you cannot unlock or drop those users or set a password. And the storage of the sample data sets does not count towards your database storage.

- Star Schema Benchmark Queries
- Star Schema Benchmark Analytic Views

Star Schema Benchmark Queries

Star Schema Benchmark Analytic Views

SSB Analytic Views

Analytic views make it easy to extend a star schema with a hierarchical business model, aggregation and measure calculation rules, presentation and application-specific metadata that can be used to enhance the content of a data set and to simplify the development of business intelligence applications. The SSB schema includes an analytic view and four hierarchies that use the tables of the star schema. Use the following queries to query the analytic Sample SSB view. Note that the analytic view is in the SSB schema.

```
SELECT
  dwdate_hier.member_name as year,

Autonomous Database Supplied Package Reference

This appendix provides information about the packages you use with Autonomous Database. The `DBMS_CLOUD` topic also covers the `DBMS_CLOUD REST APIs`.

- DBMS_CLOUD Package
  The DBMS_CLOUD package provides database routines for working with cloud resources.
- DBMS_CLOUD_ADMIN Package
  The DBMS_CLOUD_ADMIN package provides administrative routines for configuring a database.
- DBMS_CLOUD_AI Package
  The DBMS_CLOUD_AI package, with Select AI, facilitates and configures the translation of natural language prompts to generate, run, explain SQL statements. Also, enables retrieval augmented generation and natural language-based interactions, including chatting with LLMs.
- DBMS_CLOUD_FUNCTION Package
  The DBMS_CLOUD_FUNCTION package allows you invoke OCI and AWS Lambda remote functions in your Autonomous Database as SQL functions.
- DBMS_CLOUD_LINK Package
  The DBMS_CLOUD_LINK package allows a user to register a table or a view as a data set for read only access with Cloud Links.
- DBMS_CLOUD_LINK_ADMIN Package
- DBMS_CLOUD_MACADM Package
  This section covers the DBMS_CLOUD_MACADM subprograms provided with Autonomous Database.
- DBMS_CLOUD_MIGRATION Package
  The DBMS_CLOUD_MIGRATION package facilitates translation of the SQL code from a non-Oracle SQL flavor to Oracle SQL.
- DBMS_CLOUD_NOTIFICATION Package
  The DBMS_CLOUD_NOTIFICATION package allows you to send messages or the output of a SQL query to a provider.
- DBMS_CLOUD_PIPELINE Package
  The DBMS_CLOUD_PIPELINE package allows you to create data pipelines for loading and exporting data in the cloud. This package supports continuous incremental data load of files in object store into the database. DBMS_CLOUD_PIPELINE also supports continuous incremental export of table data or query results from the database to object store based on a timestamp column.
- DBMS_CLOUD_REPO Package
  The DBMS_CLOUD_REPO package provides for use of and management of cloud hosted code repositories from Oracle Database. Supported cloud code repositories include GitHub, AWS CodeCommit , and Azure Repos.
- DBMS_AUTO_PARTITION Package
  The DBMS_AUTO_PARTITION package provides administrative routines for managing automatic partitioning of schemas and tables.
- DBMS_DATA_ACCESS Package
  The DBMS_DATA_ACCESS package provides routines to generate and manage Table Hyperlinks for data sets.
- DBMS_DCAT Package
  The DBMS_DCAT package provides functions and procedures to help Autonomous Database users leverage the data discovery and centralized metadata management system of OCI Data Catalog.

- DBMS_INMEMORY_ADMIN Package
  The DBMS_INMEMORY_ADMIN package enables you to manage the In-Memory area and In-Memory FastStart.
- DBMS_MAX_STRING_SIZE Package
  The DBMS_MAX_STRING_SIZE package provides an interface for checking and changing the value of the DBMS_MAX_STRING_SIZE initialization parameter.
- DBMS_PIPE Package
- DBMS_PROXY_SQL
  Describes the procedures to enable and disable query offload for an elastic pool leader.
- DBMS_SHARE Package
  The DBMS_SHARE subprograms and views are used to share local data with external systems.
- CS_RESOURCE_MANAGER Package
  The CS_RESOURCE_MANAGER package provides an interface to list and update consumer group parameters, and to revert parameters to default values.
- CS_SESSION Package
  The CS_SESSION package provides an interface to switch the database service and consumer group of the existing session.

DBMS_CLOUD Package

The DBMS_CLOUD package provides database routines for working with cloud resources.

- DBMS_CLOUD Endpoint Management
- DBMS_CLOUD Subprograms and REST APIs
  This section covers the DBMS_CLOUD subprograms and REST APIs provided with Autonomous Database.
- DBMS_CLOUD URI Formats
  Describes the format of the source file URIs in operations with DBMS_CLOUD. The format depends on the object storage service you are using.
- DBMS_CLOUD Package Format Options
  The format argument in DBMS_CLOUD specifies the format of source files.
- DBMS_CLOUD Package Format Options for EXPORT_DATA
  Describes the valid format parameter options for DBMS_CLOUD.EXPORT_DATA with text file formats, CSV, JSON, Parquet, or XML, and for Oracle Data Pump.
- DBMS_CLOUD Avro, ORC, and Parquet Support
  This section covers the DBMS_CLOUD Avro, ORC, and Parquet support provided with Autonomous Database.
- DBMS_CLOUD Exceptions
  The following table describes exceptions for DBMS_CLOUD.

DBMS_CLOUD Endpoint Management

Describes the format of pre-configured endpoint URIs in operations with DBMS_CLOUD.
The DBMS_CLOUD package supports a number of object store and REST endpoints that are all pre-configured for the service. This package also allows you to access additional non-preconfigured endpoints after properly enabling such endpoints through network access control lists (**ACLs**).

The authentication for pre-configured endpoints is automatically understood and derived in `DBMS_CLOUD`. In order to know the proper authentication type for additional, customer-managed endpoints, `DBMS_CLOUD` supports `URI` schemes to indicate the authentication type for the URI endpoint. The `URI` endpoint must support HTTPS on port 443 for secure HTTP requests.

- For more information on pre-configured URIs, see DBMS_CLOUD URI Formats.
- For more information on customer-managed URIs, see Additional Customer-Managed URI Formats

DBMS_CLOUD Subprograms and REST APIs

This section covers the `DBMS_CLOUD` subprograms and REST APIs provided with Autonomous Database.

> **Note:**
>
> To run `DBMS_CLOUD` subprograms with a user other than ADMIN you need to grant `EXECUTE` privileges to that user. For example, run the following command as ADMIN to grant privileges to `adb_user`:
>
> ```
> GRANT EXECUTE ON DBMS_CLOUD TO adb_user;
> ```

The `DBMS_CLOUD` package is made up of the following:

- DBMS_CLOUD for Access Management
  The subprograms for credential management within the DBMS_CLOUD package, including creating, deleting, and updating credentials.
- DBMS_CLOUD for Objects and Files
  The subprograms for object and file management within the DBMS_CLOUD package.
- DBMS_CLOUD for Bulk File Management
  The subprograms for bulk file operations within the DBMS_CLOUD package.
- DBMS_CLOUD REST APIs
  This section covers the `DBMS_CLOUD` REST APIs provided with Autonomous Database.

DBMS_CLOUD for Access Management

The subprograms for credential management within the DBMS_CLOUD package, including creating, deleting, and updating credentials.

Subprogram	Description
CREATE_CREDENTIAL Procedure	This procedure stores cloud service credentials in Autonomous Database.
DROP_CREDENTIAL Procedure	This procedure removes an existing credential from Autonomous Database.
REFRESH_VAULT_CREDENTIAL Procedure	This procedure immediately refreshes the vault secret of a vault secret credential to get the latest version of the vault secret for the specified `credential_name` in Autonomous Database.

Subprogram	Description
UPDATE_CREDENTIAL Procedure	This procedure updates cloud service credential attributes in Autonomous Database.

- CREATE_CREDENTIAL Procedure
  This procedure stores cloud service credentials in Autonomous Database.
- DROP_CREDENTIAL Procedure
  This procedure removes an existing credential from Autonomous Database.
- REFRESH_VAULT_CREDENTIAL Procedure
  This procedure refreshes the vault secret of a vault secret credential.
- UPDATE_CREDENTIAL Procedure
  This procedure updates an attribute with a new value for a specified `credential_name`.

CREATE_CREDENTIAL Procedure

This procedure stores cloud service credentials in Autonomous Database.

Use stored cloud service credentials to access the cloud service for data loading, for querying external data residing in the cloud, or for other cases when you use `DBMS_CLOUD` procedures with a `credential_name` parameter. This procedure is overloaded:

- Use the Oracle Cloud Infrastructure-related parameters, including: `user_ocid`, `tenancy_ocid`, `private_key`, and `fingerprint` only when you are using Oracle Cloud Infrastructure Signing Keys authentication.
- Use the `params` parameter for one of the following:
  - Amazon Resource Names (ARNs) credentials
  - Google Analytics or Google BigQuery credentials
  - Vault secret credentials for use with a supported vault:
    - Oracle Cloud Infrastructure Vault
    - Azure Key Vault
    - AWS Secrets Manager
    - GCP Secret Manager

Syntax

```
DBMS_CLOUD.CREATE_CREDENTIAL (
      credential_name   IN VARCHAR2,
      username          IN VARCHAR2,
      password          IN VARCHAR2 DEFAULT NULL,
      comments          IN VARCHAR2 DEFAULT NULL);

DBMS_CLOUD.CREATE_CREDENTIAL (
      credential_name   IN VARCHAR2,
      user_ocid         IN VARCHAR2,
      tenancy_ocid      IN VARCHAR2,
      private_key       IN VARCHAR2,
      fingerprint       IN VARCHAR2,
      comments          IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_CLOUD.CREATE_CREDENTIAL (
      credential_name  IN VARCHAR2,
      params           IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to be stored. The `credential_name` parameter must conform to Oracle object naming conventions. The `credential_name` parameter can be defined as a nonquoted identifier or as a quoted identifier. See Database Object Naming Rules for more information.
`username`	The `username` and `password` arguments together specify your cloud service credentials. See the usage notes for what to specify for the `username` and `password` for different cloud services.
`password`	The `username` and `password` arguments together specify your cloud service credentials.
`comments`	Specifies comment text for the credential. This field can be useful to describe and distinguish between credentials. The maximum comment length is 3800 characters.
`user_ocid`	Specifies the user's OCID. See Where to Get the Tenancy's OCID and User's OCID for details on obtaining the User's OCID.
`tenancy_ocid`	Specifies the tenancy's OCID. See Where to Get the Tenancy's OCID and User's OCID for details on obtaining the Tenancy's OCID.
`private_key`	Specifies the generated private key. Private keys generated with a passphrase are not supported. You need to generate the private key without a passphrase. See How to Generate an API Signing Key for details on generating a key pair in PEM format.
`fingerprint`	Specifies a fingerprint. After a generated public key is uploaded to the user's account the fingerprint is displayed in the console. Use the displayed fingerprint for this argument. See How to Get the Key's Fingerprint and How to Generate an API Signing Key for more details.
`params`	Specifies credential parameters for one of the following: • Amazon Resource Names (ARNs) credentials • Google Analytics or Google BigQuery credentials • Vault secret credentials for use with username/password type credentials where you store the password in a supported vault: – Oracle Cloud Infrastructure Vault – Azure Key Vault – AWS Secrets Manager – GCP Secret Manager To create a vault secret credential you must have `EXECUTE` privilege on the `DBMS_CLOUD` package.

Usage Notes

- This operation stores the credentials in the database in an encrypted format.
- You can see the credentials in your schema by querying the `user_credentials` table.

- You can see the credential comments in your schema by querying the `user_credentials` table. For example:

```
SELECT comments FROM user_credentials
        WHERE credential_name = 'MY_CRED';
```

- The `ADMIN` user can see all the credentials by querying the `dba_credentials` table.
- You only need to create credentials once unless your cloud service credentials change. Once you store the credentials you can then use the same credential name for `DBMS_CLOUD` procedures that require a `credential_name` parameter.
- This procedure is overloaded. If you provide one of the key based authentication attributes, `user_ocid`, `tenancy_ocid`, `private_key`, or `fingerprint`, the call is assumed to be an Oracle Cloud Infrastructure Signing Key based credential.
- You can list credentials from the view `ALL_CREDENTIALS`. For example, run the following command to list credentials:

```
SELECT credential_name, username, comments FROM all_credentials;
```

Oracle Cloud Infrastructure Credentials (Auth Tokens)

For Oracle Cloud Infrastructure the `username` is your Oracle Cloud Infrastructure user name. The `password` is your Oracle Cloud Infrastructure auth token. See Working with Auth Tokens.

For example:

```
BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'DEF_CRED_NAME',
    username => 'adb_user@example.com',
    password => 'password' );
END;
/
```

Use Auth Token based credentials when you are authenticating calls to OCI Object Storage. For calls to any other type of Oracle Cloud Infrastructure cloud service, use Oracle Cloud Infrastructure Signing Key Based Credentials.

For OCI Object Storage, `username` parameter value must include the Identity domain and the user name from your profile. You can find the Identity domain associated with a user in the Oracle Cloud Infrastructure Console.

For example:

```
oracleidentitycloudservice/adb_user@example.com
```

With the default Identity domain you are not required to include the domain name `Default`. For example:

```
adb_user@example.com
```

Oracle Cloud Infrastructure Signing Key Based Credentials

Use the Oracle Cloud Infrastructure signing key related parameters, including: `user_ocid`, `tenancy_ocid`, `private_key`, and `fingerprint` with Oracle Cloud Infrastructure Signing Keys authentication.

For example:

```
BEGIN
   DBMS_CLOUD.CREATE_CREDENTIAL (
       credential_name => 'OCI_KEY_CRED',
       user_ocid       =>
'ocid1.user.oc1..aaaaaaaauq54mi7zdyfhw33ozkwuontjceel7fok5nq3bf2vwetkpqsoa',
       tenancy_ocid    =>
'ocid1.tenancy.oc1..aabbbbbbaafcue47pqmrf4vigneebgbcmmoy5r7xvoypicjqqge32ewnrc
yx2a',
       private_key     =>
'MIIEogIBAAKCAQEAtUnxbmrekwgVac6FdWeRzoXvIpA9+0r1.....wtnNpESQQQ0QLGPD8NM//
JEBg=',
       fingerprint     => 'f2:db:f9:18:a4:aa:fc:94:f4:f6:6c:39:96:16:aa:27');
END;
/
```

Private keys generated with a passphrase are not supported. You need to generate the private key without a passphrase. See How to Generate an API Signing Key for more information.

Oracle Cloud Infrastructure Object Storage Classic Credentials

If your source files reside in Oracle Cloud Infrastructure Object Storage Classic, the `username` is your Oracle Cloud Infrastructure Classic user name and the `password` is your Oracle Cloud Infrastructure Classic password.

Amazon Web Services (AWS) Credentials

If your source files reside in Amazon S3 or you are calling an AWS API, the `username` is your AWS access key ID and the `password` is your AWS secret access key. See AWS Identity and Access Management.

Microsoft Azure Credentials

If your source files reside in Azure Blob Storage or Azure Data Lake Storage or you are calling an Azure API, the `username` is your Azure storage account name and the `password` is an Azure storage account access key. See About Azure storage accounts.

Amazon S3-Compatible Credentials

Service	Credentials Information
Oracle Cloud Infrastructure (Customer Secret Keys)	If your source files reside in Oracle Cloud Infrastructure, then you need to use Customer Secret Keys with S3-compatible URLs. See Working with Customer Secret Keys for more information.

Service	Credentials Information
Google Cloud Storage	If your source files reside in Google Cloud Storage or you are calling Google Cloud Storage APIs, then you need to set a default Google project and obtain an HMAC key to create credentials to supply with Google Cloud Storage S3-compatible URLs. Use the HMAC key id as the username, and the HMAC secret as the password. See Projects and HMAC Keys for more information.
Wasabi Hot Cloud Storage	If your source files reside in Wasabi Hot Cloud Storage or you are calling Wasabi Hot Cloud Storage APIs, then you need Access Keys to create credentials to supply with S3-compatible URLs. Use the Wasabi Hot Cloud Storage Access Key as the username, and the Wasabi Hot Cloud Storage Secret Key as the password. See Creating a Wasabi API Access Key Set for more information.

AWS Amazon Resource Names (ARN) Credentials

If your source files reside in Amazon S3 or you are calling an AWS API, use `params` to specify the parameters for the Amazon Resource Names (ARN).

Parameter	Value
`aws_role_arn`	Specifies the Amazon Resource Name (ARN) that identifies the AWS role. If this parameter is not supplied when creating the credential, `ORA-20041` is raised.
`external_id_type`	Optionally set the `external_id_type` to use the Autonomous Database compartment OCID, database OCID, or tenancy OCID by supplying one of: `compartment_ocid`, `database_ocid`, or `tenant_ocid`. If this parameter is not given when creating the credential, the default value is `database_ocid`.

For example:

```
BEGIN DBMS_CLOUD.CREATE_CREDENTIAL(
        credential_name      => 'MY_CRED',
        params               => JSON_OBJECT(
               'aws_role_arn'      value 'arn:aws:iam::123456:role/
AWS_ROLE_ARN',
               'external_id_type'  value 'database_ocid'));
END;
/
```

GitHub Personal Access Token

If your source files reside in a GitHub repository or you are calling a GitHub API, the `username` is your GitHub email and the `password` is your GitHub personal access token. See Creating a personal access token for more information.

For example:

```
BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'MY_GITHUB_CRED',
```

```
    username => 'user@example.com',
    password => 'your_personal_access_token' );
END;
/
```

Google Analytics or Google BigQuery Credentials

If you are accessing Google Analytics or Google BigQuery, use the `params` parameter to specify the Google OAuth 2.0 credential parameters.

Parameter	Value
`gcp_oauth2`	Specifies OAuth 2.0 access for Google Analytics or Google BigQuery with a JSON object that includes the following parameters and their values: • `client_id`: See the Google API Console to obtain the client ID. • `client_secret`: See the Google API Console to obtain the client secret. • `refresh_token`: A refresh token allows your application to obtain new access tokens. See Using OAuth 2.0 to Access Google APIs for more information on Google OAuth credentials.

For example:

```
BEGIN DBMS_CLOUD.CREATE_CREDENTIAL(
      credential_name => 'GOOGLE_BIGQUERY_CRED',
      params => JSON_OBJECT('gcp_oauth2' value
                                  JSON_OBJECT(
                                       'client_id'     value 'client_id',
                                       'client_secret' value 'client_secret',
                                       'refresh_token' value
'refresh_token' )));
END;
/
```

Vault Secret Credentials with Oracle Cloud Infrastructure Vault

To create vault secret credentials with Oracle Cloud Infrastructure Vault, use the `params` parameter to specify the required parameters:

- `username`: Specifies the username of any type of username/password credential such as the username of OCI Swift password. For example, if you have a Swift credential with username as “scott” and password as “*password*”, provide “scott” as the `username` parameter.
- `secret_id`: Is the vault secret ID. Specify the `secret_id` value as the vault secret OCID. See Overview of Vault for more information.
- `region`: Is an optional parameter that specifies the oracle cloud region identifier. The region, when specified, indicates the location where Oracle Cloud Infrastructure Vault secret is located.

  By default, `CREATE_CREDENTIAL` uses the `region` mapped from the region key in the `secret_id`. An example of a region is `us-ashburn-1`.

  See Regions and Availability Domains for a complete list of regions.

For example:

```
BEGIN DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'OCI_SECRET_CRED',
    params => JSON_OBJECT(
                'username'   value 'scott',
                'region'     value 'us-ashburn-1',
                'secret_id'  value 'ocid1.vaultsecret.co1.ap-
mumbai-1.example..aaaaaaaauq5ok5nq3bf2vwetkpqsoa'));
END;
/
```

Notes for using an Oracle Cloud Infrastructure Vault secret to store vault secrets:

- When you use an Oracle Cloud Infrastructure Vault, on the Autonomous Database instance you must enable principal authentication with `DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL`.
- On Oracle Cloud Infrastructure you must specify a policy for the resource principal to access the secret.

To create a vault secret credential you must have `EXECUTE` privilege on the `DBMS_CLOUD` package.

Vault Secret Credentials with Azure Key Vault

To create Azure Key Vault credentials, use the `params` parameter to specify the required parameters:

- `username`: Specifies the username associated with the key.
- `secret_id`: Specifies the secret name.
- `azure_vault_name`: Specifies the name of the vault where the secret is located.

See Create a key vault for more information.

To create a vault secret credential you must have `EXECUTE` privilege on the `DBMS_CLOUD` package.

Vault Secret Credentials with AWS Secrets Manager

To create vault secret credentials with AWS Secrets Manager, use the `params` parameter to specify the required parameters:

- `username`: Specifies the AWS Secrets Manager access key.
- `secret_id`: Is the AWS Secrets Manager AWS ARN.
- `region`: (Optional) Specifies the AWS service region where the vault and secret are located. An example of the AWS region is "us-east-2". The default `region` is the region specified with the ARN in the `secret_id` parameter.

  See Managing AWS Regions for more information.

  To create a vault secret credential you must have `EXECUTE` privilege on the `DBMS_CLOUD` package.

Vault Secret Credentials with GCP Secret Manager

To create GCP Secret Manager credentials, use the `params` parameter to specify the required parameters:

- `username`: Specifies the username associated with the secret.
- `secret_id`: Is the secret name.
- `gcp_project_id`: Specifies the ID of the project where the secret is located.

See Secret Manager for more information.

To create a vault secret credential you must have `EXECUTE` privilege on the `DBMS_CLOUD` package.

DROP_CREDENTIAL Procedure

This procedure removes an existing credential from Autonomous Database.

Syntax

```
DBMS_CLOUD.DROP_CREDENTIAL (
   credential_name      IN VARCHAR2);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to be removed.

REFRESH_VAULT_CREDENTIAL Procedure

This procedure refreshes the vault secret of a vault secret credential.

This procedure lets you immediately refresh the vault secret of a vault secret credential to get the latest version of the vault secret for the specified `credential_name`.

Syntax

```
DBMS_CLOUD.REFRESH_VAULT_CREDENTIAL (
    credential_name    IN VARCHAR2);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to refresh.

Usage Notes

- The `ADMIN` user can see all the credentials by querying the `dba_credentials` table.

- You can list credentials from the view `ALL_CREDENTIALS`. For example, run the following command to list credentials:

```
SELECT credential_name, username, comments FROM all_credentials;
```

Example

```
BEGIN
  DBMS_CLOUD.REFRESH_VAULT_CREDENTIAL(
     credential_name => 'AZURE_SECRET_CRED');
END;
/
```

UPDATE_CREDENTIAL Procedure

This procedure updates an attribute with a new value for a specified `credential_name`.

Use stored credentials for data loading, for querying external data residing in the Cloud, or wherever you use `DBMS_CLOUD` procedures with a `credential_name` parameter.

Syntax

```
DBMS_CLOUD.UPDATE_CREDENTIAL (
    credential_name   IN VARCHAR2,
    attribute         IN VARCHAR2,
    value             IN VARCHAR2);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to be updated.
`attribute`	Name of attribute to update. For a username/password type credential, the valid `attribute` values are: `USERNAME` and `PASSWORD`. For a credential for an Amazon ARN, the valid `attribute` values are: `aws_role_arn` and `external_id_type`. For a credential for Google BigQuery or Google Analytics, the valid `attribute` values are: `client_id`, `client_secret`, and `refresh_token`. Depending on the vault you are using, for Vault Secret Credentials the valid `attribute` values are: • Oracle Cloud Infrastructure Vault: `secret_id`, `region` • Azure Key Vault: `secret_id`, `azure_vault_name` • AWS Secrets Manager: `secret_id`, `region` • GCP Secret Manager: `secret_id`, `gcp_project_id` See CREATE_CREDENTIAL Procedure for more information.
`value`	New value for the specified attribute.

Usage Notes

- The username value is case sensitive. It cannot contain double quotes or spaces.

- The `ADMIN` user can see all the credentials by querying `dba_credentials`.
- You only need to create credentials once unless your cloud service credentials change. Once you store the credentials you can then use the same credential name for `DBMS_CLOUD` procedures that require a `credential_name` parameter.
- You can list credentials from the view `ALL_CREDENTIALS`. For example, run the following command to list credentials:

```
SELECT credential_name, username, comments FROM all_credentials;
```

Examples

```
BEGIN
  DBMS_CLOUD.UPDATE_CREDENTIAL(
     credential_name => 'OBJ_STORE_CRED',
     attribute => 'PASSWORD',
     value => 'password');
END;
/

BEGIN
  DBMS_CLOUD.UPDATE_CREDENTIAL(
     credential_name => 'ARN_CRED',
     attribute => 'aws_role_arn',
     value => 'NEW_AWS_ARN');
END;
/
```

DBMS_CLOUD for Objects and Files

The subprograms for object and file management within the DBMS_CLOUD package.

Subprogram	Description
COPY_COLLECTION Procedure	This procedure loads data into existing SODA collection either from Cloud Object Storage or from files in a directory.
COPY_DATA Procedure	This procedure loads data into existing Autonomous Database tables either from Cloud Object Storage or from files in a directory.
COPY_DATA Procedure for Avro, ORC, or Parquet Files	This procedure with the `format` parameter `type` set to the value `orc`, `parquet`, or `avro` loads data into existing Autonomous Database tables from ORC, Parquet, or Avro files in the Cloud or from ORC, Parquet, or Avro files in a directory. Similar to text files, the data is copied from the source ORC, Parquet, or Avro file into the preexisting internal table.
COPY_OBJECT Procedure	This procedure copies files from one Cloud Object Storage bucket to another.
CREATE_EXTERNAL_TABLE Procedure	This procedure creates an external table on files in the Cloud or on files in a directory. This allows you to run queries on external data from Autonomous Database.
CREATE_CLOUD_TABLE Procedure	This procedure creates a cloud table where all persistent data is stored in Oracle-Managed Object Storage.

Subprogram	Description
CREATE_EXTERNAL_TABLE Procedure for Apache Iceberg	This procedure creates external tables for Apache Iceberg tables in the supported configurations.
CREATE_EXTERNAL_TABLE Procedure for Avro, ORC, or Parquet Files	This procedure with the `format` parameter `type` set to the value `parquet`, `orc`, or `avro`, creates an external table with either Parquet, ORC, or Avro format files in the Cloud or in a directory. This allows you to run queries on external data from Autonomous Database.
CREATE_EXTERNAL_PART_TABLE Procedure	This procedure creates an external partitioned table on files in the Cloud. This allows you to run queries on external data from Autonomous Database.
CREATE_EXTERNAL_TEXT_INDEX Procedure	This procedure creates text index on the object store files.
CREATE_HYBRID_PART_TABLE Procedure	This procedure creates a hybrid partitioned table. This allows you to run queries on hybrid partitioned data from Autonomous Database.
DELETE_ALL_OPERATIONS Procedure	This procedure clears either all data load operations logged in the `user_load_operations` table in your schema or clears all the data load operations of the specified type, as indicated with the `type` parameter.
DELETE_FILE Procedure	This procedure removes the specified file from the specified directory on Autonomous Database
DELETE_OBJECT Procedure	This procedure deletes the specified object on object store.
DELETE_OPERATION Procedure	This procedure accepts an `operation_id` as input and deletes the logs associated with the specified `operation_id`.
DROP_EXTERNAL_TEXT_INDEX Procedure	This procedure drops text index on the object store files.
EXPORT_DATA Procedure	This procedure exports data from Autonomous Database to files in the Cloud based on the result of a query. The overloaded form enables you to use the `operation_id` parameter. Depending on the `format` parameter `type` option specified, the procedure exports rows to the Cloud Object store as text with options of CSV, JSON, Parquet, or XML; or using the ORACLE_DATAPUMP access driver to write data to a dump file.
GET_OBJECT Procedure and Function	This procedure is overloaded. The procedure form reads an object from Cloud Object Storage and copies it to Autonomous Database. The function form reads an object from Cloud Object Storage and returns a `BLOB` to Autonomous Database.
LIST_FILES Function	This function lists the files in the specified directory. The results include the file names and additional metadata about the files such as file size in bytes, creation timestamp, and the last modification timestamp.
LIST_OBJECTS Function	This function lists objects in the specified location on object store. The results include the object names and additional metadata about the objects such as size, checksum, creation timestamp, and the last modification timestamp.
MOVE_OBJECT Procedure	This procedure moves an object from one Cloud Object Storage bucket to another one.

Subprogram	Description
PUT_OBJECT Procedure	This procedure is overloaded. In one form the procedure copies a file from Autonomous Database to the Cloud Object Storage. In another form the procedure copies a `BLOB` from Autonomous Database to the Cloud Object Storage.
SYNC_EXTERNAL_PART_TABLE Procedure	This procedure simplifies updating an external partitioned table from files in the Cloud. Run this procedure whenever new partitions are added or when partitions are removed from the Object Store source for the external partitioned table.
VALIDATE_EXTERNAL_TABLE Procedure	This procedure validates the source files for an external table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Autonomous Database.
VALIDATE_EXTERNAL_PART_TABLE Procedure	This procedure validates the source files for an external partitioned table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Autonomous Database.
VALIDATE_HYBRID_PART_TABLE Procedure	This procedure validates the source files for a hybrid partitioned table, generates log information, and stores the rows that do not match the format options specified for the hybrid table in a *badfile* table on Autonomous Database.

- COPY_COLLECTION Procedure
  This procedure loads data into a SODA collection from Cloud Object Storage or from a directory. If the specified SODA collection does not exist, the procedure creates it. The overloaded form enables you to use the `operation_id` parameter.
- COPY_DATA Procedure
  This procedure loads data into existing Autonomous Database tables from files in the Cloud, or from files in a directory. The overloaded form enables you to use the `operation_id` parameter.
- COPY_DATA Procedure for Avro, ORC, or Parquet Files
- COPY_OBJECT Procedure
  This procedure copies an object from one Cloud Object Storage bucket or folder to another.
- CREATE_CLOUD_TABLE Procedure
  This procedure creates a Cloud Table. All Cloud Table data is stored in Oracle managed Object Storage (Cloud Tables only store their metadata in the database).
- CREATE_EXTERNAL_PART_TABLE Procedure
  This procedure creates an external partitioned table on files in the Cloud, or from files in a directory. This allows you to run queries on external data from Autonomous Database.
- CREATE_EXTERNAL_TABLE Procedure
  This procedure creates an external table on files in the Cloud or from files in a directory. This allows you to run queries on external data from Autonomous Database.
- CREATE_EXTERNAL_TABLE Procedure for Apache Iceberg
  This procedure creates external tables for Apache Iceberg tables in the supported configurations.
- CREATE_EXTERNAL_TABLE Procedure for Avro, ORC, or Parquet Files
- CREATE_EXTERNAL_TEXT_INDEX Procedure
  This procedure creates a text index on Object Storage files.

- CREATE_HYBRID_PART_TABLE Procedure
  This procedure creates a hybrid partitioned table. This allows you to run queries on hybrid partitioned data from Autonomous Database using database objects and files in the Cloud, or database objects and files in a directory.
- DELETE_ALL_OPERATIONS Procedure
  This procedure clears either all data load operations logged in the `user_load_operations` table in your schema or clears all the data load operations of the specified type, as indicated with the `type` parameter.
- DELETE_FILE Procedure
  This procedure removes the specified file from the specified directory on Autonomous Database.
- DELETE_OBJECT Procedure
  This procedure deletes the specified object on object store.
- DELETE_OPERATION Procedure
  This procedure clears the data load entries for the specified operation ID logged in the `user_load_operations` or `dba_load_operations` tables in your schema.
- DROP_EXTERNAL_TEXT_INDEX Procedure
  This procedure drops text index on the Object Storage files.
- EXPORT_DATA Procedure
- GET_OBJECT Procedure and Function
  This procedure is overloaded. The procedure form reads an object from Cloud Object Storage and copies it to Autonomous Database. The function form reads an object from Cloud Object Storage and returns a `BLOB` to Autonomous Database.
- LIST_FILES Function
  This function lists the files in the specified directory. The results include the file names and additional metadata about the files such as file size in bytes, creation timestamp, and the last modification timestamp.
- LIST_OBJECTS Function
  This function lists objects in the specified location on object store. The results include the object names and additional metadata about the objects such as size, checksum, creation timestamp, and the last modification timestamp.
- MOVE_OBJECT Procedure
  This procedure moves an object from one Cloud Object Storage bucket or folder to another.
- PUT_OBJECT Procedure
  This procedure is overloaded. In one form the procedure copies a file from Autonomous Database to the Cloud Object Storage. In another form the procedure copies a `BLOB` from Autonomous Database to the Cloud Object Storage.
- SYNC_EXTERNAL_PART_TABLE Procedure
  This procedure simplifies updating an external partitioned table from files in the Cloud. Run this procedure whenever new partitions are added or when partitions are removed from the Object Store source for the external partitioned table.
- VALIDATE_EXTERNAL_PART_TABLE Procedure
  This procedure validates the source files for an external partitioned table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Autonomous Database. The overloaded form enables you to use the `operation_id` parameter.

- VALIDATE_EXTERNAL_TABLE Procedure
  This procedure validates the source files for an external table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Autonomous Database. The overloaded form enables you to use the `operation_id` parameter.
- VALIDATE_HYBRID_PART_TABLE Procedure
  This procedure validates the source files for a hybrid partitioned table, generates log information, and stores the rows that do not match the format options specified for the hybrid table in a *badfile* table on Autonomous Database. The overloaded form enables you to use the `operation_id` parameter.

COPY_COLLECTION Procedure

This procedure loads data into a SODA collection from Cloud Object Storage or from a directory. If the specified SODA collection does not exist, the procedure creates it. The overloaded form enables you to use the `operation_id` parameter.

Syntax

```
DBMS_CLOUD.COPY_COLLECTION (
    collection_name   IN VARCHAR2,
    credential_name   IN VARCHAR2 DEFAULT NULL,
    file_uri_list     IN CLOB,
    format            IN CLOB     DEFAULT NULL
);

DBMS_CLOUD.COPY_COLLECTION (
    collection_name   IN VARCHAR2,
    credential_name   IN VARCHAR2 DEFAULT NULL,
    file_uri_list     IN CLOB,
    format            IN CLOB     DEFAULT NULL,
    operation_id      OUT NOCOPY NUMBER
);
```

Parameters

Parameter	Description
`collection_name`	The name of the SODA collection into which data will be loaded. If a collection with this name already exists, the specified data will be loaded, otherwise a new collection is created.
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. This parameter is not used when you specify a directory with `file_uri_list`.

Parameter	Description
file_uri_list	This parameter specifies either a comma-delimited list of source file URIs or one or more directories and source files. **Cloud source file URIs** You can use wildcards as well as regular expressions in the file names in Cloud source file URIs. Regular expressions can only be used when the regexuri format parameter is set to TRUE. The characters "*" and "?" are considered wildcard characters when the regexuri parameter is set to FALSE. When the regexuri parameter is set to TRUE the characters "*" and "?" are part of the specified regular expression pattern. Regular expression patterns are only supported for the file name or subfolder path in your URIs and the pattern matching is identical to that performed by the REGEXP_LIKE function. For example: `file_uri_list => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o(/)*year=[0-9]+(/)*month=[0-9]+(/)*[a-z]+[1-3]??.csv'` The format of the URIs depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats. See REGEXP_LIKE Condition for more information on REGEXP_LIKE condition. **Directory** You can specify one directory and one or more file names or use a comma separated list of directories and file names. The format to specify a directory is: '*MY_DIR*:*filename.ext*'. By default the directory name *MY_DIR* is a database object and is case-insensitive. The file name is case sensitive. Regular expressions are not supported when specifying the file names in a directory. You can only use wildcards to specify file names in a directory. The character "*" can be used as the wildcard for multiple characters, and the character "?" can be used as the wildcard for a single character. For example: '*MY_DIR*:*" or '*MY_DIR*:test?' To specify multiple directories, use a comma separated list of directories: For example: '*MY_DIR1*:*, *MY_DIR2*:test?' Use double quotes to specify a case-sensitive directory name. For example: '"*my_dir1*":*, "*my_dir2*":Test?' To include a quote character, use two quotes. For example: '*MY_DIR*:''filename.ext'. This specifies the filename starts with a quote ('').
format	The options describing the format of the source files. These options are specified as a JSON string. Supported formats are: characterset, compression, encryption, ignoreblanklines, jsonpath, maxdocsize, recorddelimiter, rejectlimit, type, unpackarrays, keyassignment, and keypath. Apart from the mentioned formats for JSON data, Autonomous Database supports other formats too. For the list of format arguments supported by Autonomous Database, see DBMS_CLOUD Package Format Options.

Parameter	Description
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.

Example

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(
            credential_name => 'OBJ_STORE_CRED',
            username        => 'user_name@oracle.com',
            password        => 'password'
            );

    DBMS_CLOUD.COPY_COLLECTION(
            collection_name => 'myCollection',
            credential_name => 'OBJ_STORE_CRED',
            file_uri_list   => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/adbexample/b/json/o/myCollection.json'
            );
END;
/
```

COPY_DATA Procedure

This procedure loads data into existing Autonomous Database tables from files in the Cloud, or from files in a directory. The overloaded form enables you to use the operation_id parameter.

Syntax

```
DBMS_CLOUD.COPY_DATA (
    table_name         IN VARCHAR2,
    credential_name    IN VARCHAR2 DEFAULT NULL,
    file_uri_list      IN CLOB,
    schema_name        IN VARCHAR2,
    field_list         IN CLOB,
    format             IN CLOB);

DBMS_CLOUD.COPY_DATA (
    table_name         IN VARCHAR2,
    credential_name    IN VARCHAR2 DEFAULT NULL,
    file_uri_list      IN CLOB DEFAULT NULL,
    schema_name        IN VARCHAR2 DEFAULT NULL,
    field_list         IN CLOB DEFAULT NULL,
    format             IN CLOB DEFAULT NULL
    operation_id       OUT NOCOPY NUMBER);
```

Parameters

Parameter	Description
table_name	The name of the target table on the database. The target table needs to be created before you run COPY_DATA.

Parameter	Description
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. This parameter is not used when you specify a directory or Table Hyperlink URL with `file_uri_list`.

Parameter	Description

file_uri_list	This parameter specifies one of the following:
	• Comma-delimited list of source file URIs
	• Comma-delimited list of Table Hyperlink URLs
	• One or more directories and source files
	You can use wildcards as well as regular expressions in the file names in Cloud source file URIs.
	Cloud source file URIs
	This parameter specifies either a comma-delimited list of source file URIs or one or more directories and source files.
	Regular expressions can only be used when the regexuri format parameter is set to TRUE.
	The characters "*" and "?" are considered wildcard characters when the regexuri parameter is set to FALSE. When the regexuri parameter is set to TRUE the characters "*" and "?" are part of the specified regular expression pattern.
	Regular expression patterns are only supported for the file name or subfolder path in your URIs and the pattern matching is identical to that performed by the REGEXP_LIKE function.
	For example:
	`file_uri_list => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o(/)*year=[0-9]+(/)*month=[0-9]+(/)*[a-z]+[1-3]??.csv'`
	The format of the URIs depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats.
	See REGEXP_LIKE Condition for more information on REGEXP_LIKE condition.
	Table Hyperlink URL
	You can use a Table Hyperlink in the following ways:
	• Specify a single Table Hyperlink URL.
	For example:
	`file_uri_list => 'https://dataaccess.adb.us-chicago-1.oraclecloudapps.com/adb/p/K6XExample/data'`
	• Specify a comma-delimited list of Table Hyperlink URLs, you must ensure that all included Table Hyperlinks have the same column names, column order, and column data types.
	For example:
	`file_uri_list => 'https://dataaccess.adb.us-chicago-1.oraclecloudapps.com/adb/p/K6XExample/data','https://dataaccess.adb.us-chicago-1.oraclecloudapps.com/adb/p/K7XExample/data'`
	See About Table Hyperlinks on Autonomous Database and GET_PREAUTHENTICATED_URL Procedure for more information.
	Directory
	You can specify one directory and one or more file names or use a comma separated list of directories and file names. The format to specify a directory is: '*MY_DIR*:*filename.ext*'. By default the directory name

Parameter	Description
	MY_DIR is a database object and is case-insensitive. The file name is case sensitive. Regular expressions are not supported when specifying the file names in a directory. You can only use wildcards to specify file names in a directory. The character "*" can be used as the wildcard for multiple characters, and the character "?" can be used as the wildcard for a single character. For example: '*MY_DIR*:*" or '*MY_DIR*:test?' To specify multiple directories, use a comma separated list of directories: For example: '*MY_DIR1*:*, *MY_DIR2*:test?' Use double quotes to specify a case-sensitive directory name. For example: '"*my_dir1*":*, "*my_dir2*":Test?' To include a quote character, use two quotes. For example: '*MY_DIR*:''filename.ext'. This specifies the `filename` starts with a quote (`'`).
`schema_name`	The name of the schema where the target table resides. The default value is NULL meaning the target table is in the same schema as the user running the procedure.
`field_list`	Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the target table definition. This argument's syntax is the same as the `field_list` clause in regular Oracle external tables. For more information about `field_list` see *Oracle® Database Utilities*. When the `format` parameter `type` option value is `json`, this parameter is ignored. For an example using `field_list`, see CREATE_EXTERNAL_TABLE Procedure.
`format`	The options describing the format of the source, log, and bad files. For the list of the options and how to specify the values see DBMS_CLOUD Package Format Options. For Avro, ORC, or Parquet file format options, see DBMS_CLOUD Package Format Options for Avro, ORC, or Parquet.
`operation_id`	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the `USER_LOAD_OPERATIONS` view.

Usage Note

The default record delimiter is `detected newline`. With `detected newline`, `DBMS_CLOUD` tries to automatically find the correct newline character to use as the record delimiter. `DBMS_CLOUD` first searches for the Windows newline character `\r\n`. If it finds the Windows newline character, this is used as the record delimiter for all files in the procedure. If a Windows newline character is not found, `DBMS_CLOUD` searches for the UNIX/Linux newline character `\n`, and if it finds one it uses `\n` as the record delimiter for all files in the procedure. If the source files use a combination of different record delimiters, you may encounter an error such as, "`KUP-04020: found record longer than buffer size supported`". In this case, you need to either modify the source files to use the same record delimiter or only specify the source files that use the same record delimiter.

See DBMS_CLOUD Package Format Options for information on the `recorddelmiter` format option.

Examples

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(
            credential_name => 'DEF_CRED_NAME',
            username        => 'user_name@oracle.com',
            password        => 'password'
            );
END;
/
```

```
BEGIN
 DBMS_CLOUD.COPY_DATA(
    table_name =>'CHANNELS',
    credential_name =>'DEF_CRED_NAME',
    file_uri_list =>'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/channels.txt',
    format => json_object('delimiter' value ',')
 );
END;
/
```

```
BEGIN
    DBMS_CLOUD.COPY_DATA(
            table_name      => 'ORDERS',
            schema_name     => 'TEST_SCHEMA',
            credential_name => 'DEF_CRED_NAME',
         file_uri_list   => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/adbexample/b/json/o/orde[r]s.tbl.1'
            format          =>  json_object('ignoreblanklines' value TRUE,
                                            'rejectlimit' value '0',
                                            'dateformat' value 'yyyy-mm-dd',
                                            'regexuri' value TRUE)
            );
END;
/
```

COPY_DATA Procedure for Avro, ORC, or Parquet Files

This procedure with the `format` parameter `type` set to the value `avro`, `orc`, or `parquet` loads data into existing Autonomous Database tables from Avro, ORC, or Parquet files in the Cloud or from files in a directory.

Similar to text files, the data is copied from the source Avro, ORC, or Parquet file into the preexisting internal table.

Syntax

```
DBMS_CLOUD.COPY_DATA (
    table_name        IN VARCHAR2,
    credential_name   IN VARCHAR2 DEFAULT NULL,
    file_uri_list     IN CLOB,
    schema_name       IN VARCHAR2 DEFAULT,
```

```
    field_list          IN CLOB DEFAULT,
    format              IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`table_name`	The name of the target table on the database. The target table needs to be created before you run `COPY_DATA`.
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. This parameter is not used when you specify a directory with `file_uri_list`.

Parameter	Description
file_uri_list	This parameter specifies either a comma-delimited list of source file URIs or one or more directories and source files. **Cloud source file URIs** You can use wildcards as well as regular expressions in the file names in Cloud source file URIs. Regular expressions can only be used when the regexuri format parameter is set to TRUE. The characters "*" and "?" are considered wildcard characters when the regexuri parameter is set to FALSE. When the regexuri parameter is set to TRUE the characters "*" and "?" are part of the specified regular expression pattern. Regular expression patterns are only supported for the file name or subfolder path in your URIs and the pattern matching is identical to that performed by the REGEXP_LIKE function. For example: `file_uri_list => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o(/)*year=[0-9]+(/)*month=[0-9]+(/)*[a-z]+[1-3]??.csv'` The format of the URIs depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats. See REGEXP_LIKE Condition for more information on REGEXP_LIKE condition. **Directory** You can specify one directory and one or more file names or use a comma separated list of directories and file names. The format to specify a directory is: '*MY_DIR*:*filename.ext*'. By default the directory name *MY_DIR* is a database object and is case-insensitive. The file name is case sensitive. Regular expressions are not supported when specifying the file names in a directory. You can only use wildcards to specify file names in a directory. The character "*" can be used as the wildcard for multiple characters, and the character "?" can be used as the wildcard for a single character. For example: '*MY_DIR*:*" or '*MY_DIR*:test?' To specify multiple directories, use a comma separated list of directories: For example: '*MY_DIR1*:*, *MY_DIR2*:test?' Use double quotes to specify a case-sensitive directory name. For example: '"*my_dir1*":*, "*my_dir2*":Test?' To include a quote character, use two quotes. For example: '*MY_DIR*:''filename.ext'. This specifies the filename starts with a quote (') .
schema_name	The name of the schema where the target table resides. The default value is NULL meaning the target table is in the same schema as the user running the procedure.

Parameter	Description
field_list	Ignored for Avro, ORC, or Parquet files. The fields in the source match the external table columns by name. Source data types are converted to the external table column data type. For ORC files, see DBMS_CLOUD Package ORC to Oracle Data Type Mapping. For Parquet files, see DBMS_CLOUD Package Parquet to Oracle Data Type Mapping for details on mapping. For Avro files, see DBMS_CLOUD Package Avro to Oracle Data Type Mapping for details on mapping.
format	The options describing the format of the source files. For Avro, ORC, or Parquet files, only two options are supported: see DBMS_CLOUD Package Format Options for Avro, ORC, or Parquet.

Usage Notes

- As with other data files, Avro, ORC, and Parquet data loads generate logs that are viewable in the tables dba_load_operations and user_load_operations. Each load operation adds a record to dba[*user*]_load_operations that indicates the table containing the logs.

  The log table provides summary information about the load.

- For Avro, ORC, or Parquet, when the format parameter type is set to the value avro, orc, or parquet, the BADFILE_TABLE table is always empty.
  - For Parquet files, PRIMARY KEY constraint errors throw an ORA error.
  - If data for a column encounters a conversion error, for example, the target column is not large enough to hold the converted value, the value for the column is set to NULL. This does not produce a rejected record.

COPY_OBJECT Procedure

This procedure copies an object from one Cloud Object Storage bucket or folder to another.

The source and target bucket or folder can be in the same or different Cloud Object store provider.

When the source and target are in distinct Object Stores or have different accounts with the same cloud provider, you can give separate credential names for the source and target locations.

The source credential name is by default also used by the target location when target credential name is not provided.

Syntax

```
DBMS_CLOUD.COPY_OBJECT (
    source_credential_name  IN  VARCHAR2 DEFAULT NULL,
    source_object_uri       IN  VARCHAR2,
    target_object_uri       IN  VARCHAR2,
    target_credential_name  IN  VARCHAR2 DEFAULT NULL
);
```

Parameters

Parameter	Description
source_credential_name	The name of the credential to access the source Cloud Object Storage. You can use 'OCI$RESOURCE_PRINCIPAL' as the credential_name when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a source_credential_name value, the credential_name is set to NULL.
source_object_uri	Specifies URI, that point to the source Object Storage bucket or folder location. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
target_object_uri	Specifies the URI for the target Object Store. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
target_credential_name	The name of the credential to access the target Cloud Object Storage location. You can use 'OCI$RESOURCE_PRINCIPAL' as the credential_name when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a target_credential_name value, the target_object_uri is set to the source_credential_name value.

Example

```
BEGIN
DBMS_CLOUD.COPY_OBJECT (
    source_credential_name => 'OCI_CRED',
    source_object_uri    => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname1/bgfile.csv',
    target_object_uri    => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname2/myfile.csv'
);
END;
/
```

CREATE_CLOUD_TABLE Procedure

This procedure creates a Cloud Table. All Cloud Table data is stored in Oracle managed Object Storage (Cloud Tables only store their metadata in the database).

Syntax

```
DBMS_CLOUD.CREATE_CLOUD_TABLE (
    table_name       IN VARCHAR2,
    column_list      IN CLOB,
    params           IN CLOB);
```

Parameters

Parameter	Description
table_name	The name of the Cloud Table.
column_list	Comma-delimited list of column names and data types for the Cloud Table.

Usage Notes

- DEFAULT attributes: The column_list can include DEFAULT clause, which functions like the DEFAULT clause in an ordinary CREATE TABLE. See CREATE TABLE for information on the behavior of the DEFAULT clause.
- Use DROP TABLE to drop a Cloud Table. Cloud Tables do not support the recycle bin.

  For example:

  ```
  DROP TABLE CLOUD_TAB1;
  ```

- You can grant SELECT, INSERT, and UPDATE privileges for a Cloud Table. No other privileges can be granted to a Cloud Table.

  See Configuring Privilege and Role Authorization for more information.

Examples

```
EXEC DBMS_CLOUD.CREATE_CLOUD_TABLE( 'CLOUD_TAB1', 'I INTEGER, J INTEGER' );

BEGIN
  DBMS_CLOUD.CREATE_CLOUD_TABLE(
   table_name  => 'CLOUD_TABLE_WITH_DEFAULT',
   column_list => 'I INTEGER,
                   A VARCHAR2(32) DEFAULT ''ABC''' );
END;
/
```

CREATE_EXTERNAL_PART_TABLE Procedure

This procedure creates an external partitioned table on files in the Cloud, or from files in a directory. This allows you to run queries on external data from Autonomous Database.

Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE (
    table_name           IN VARCHAR2,
    credential_name      IN VARCHAR2,
    partitioning_clause  IN CLOB,
    column_list          IN CLOB,
    field_list           IN CLOB DEFAULT,
    format               IN CLOB DEFAULT);

DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE (
```

```
    table_name           IN VARCHAR2,
    credential_name      IN VARCHAR2,
    file_uri_list        IN VARCHAR2,
    column_list          IN CLOB,
    field_list           IN CLOB DEFAULT,
    format               IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`table_name`	The name of the external table.
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information.
`partitioning_clause`	Specifies the complete partitioning clause, including the location information for individual partitions. If you use the `partitioning_clause` parameter, the `file_uri_list` parameter is not allowed.
`file_uri_list`	This parameter specifies either a comma-delimited list of source file URIs or one or more directories and source files. **Cloud source file URIs** You can use wildcards as well as regular expressions in the file names in Cloud source file URIs. Regular expressions can only be used when the `regexuri format` parameter is set to `TRUE`. The characters "*" and "?" are considered wildcard characters when the `regexuri` parameter is set to `FALSE`. When the `regexuri` parameter is set to `TRUE` the characters "*" and "?" are part of the specified regular expression pattern. Regular expression patterns are only supported for the file name or subfolder path in your URIs and the pattern matching is identical to that performed by the `REGEXP_LIKE` function. This option is only supported with external tables that are created on a file in the Object Storage. For example: `file_uri_list => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o(/)*year=[0-9]+(/)*month=[0-9]+(/)*[a-z]+[1-3]??.csv'` If you use the parameter `file_uri_list`, the `partitioning_clause` parameter is not allowed. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information. See REGEXP_LIKE Condition for more information on `REGEXP_LIKE` condition.

Parameter	Description
column_list	Comma-delimited list of column names and data types for the external table. This parameter has the following requirements, depending on the type of the data files specified with the file_uri_list parameter: • The column_list parameter is required with unstructured files. Using unstructured files, for example with CSV text files, the column_list parameter must specify all the column names and data types inside the data file as well as the partition columns derived from the object name. • The column_list parameter is optional with structured files. For example, with Avro, ORC, or Parquet data files, the column_list is not required. When the column_list is not included, the format parameter partition_columns option must include specifications for both column names (name) and data types (type).
field_list	Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the *column_list* parameter. This argument's syntax is the same as the field_list clause in regular Oracle external tables. For more information about field_list see *Oracle® Database Utilities*.

Parameter	Description
format	The format option partition_columns specifies the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE column names and data types of partition columns when the partition columns are derived from the file path, depending on the type of data file, structured or unstructured: • When the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE includes the column_list parameter and the data files are unstructured, such as with CSV text files, partition_columns does not include the data type. For example, use a format such as the following for this type of partition_columns specification: '"partition_columns":["state","zipcode"]' The data type is not required because it is specified in the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE column_list parameter. • When the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE does not include the column_list parameter and the data files are structured, such as Avro, ORC, or Parquet files, the partition_columns option includes both the column name, name sub-clause, and the data type, type sub-clause. For example, the following shows a partition_columns specification: '"partition_columns":[{"name":"country", "type":"varchar2(10)"}, {"name":"year", "type":"number"}, {"name":"month", "type":"varchar2(10)"}]' If the data files are unstructured and the type sub-clause is specified with partition_columns, the type sub-clause is ignored. For object names that are not based on hive format, the order of the partition_columns specified columns must match the order as they appear in the object name in the file path specified in the file_uri_list parameter. To see all the format parameter options describing the format of the source files, see DBMS_CLOUD Package Format Options.

Usage Notes

- You cannot call this procedure with both partitioning_clause and file_uri_list parameters.
- Specifying the column_list parameter is optional with structured data files, including Avro, Parquet, or ORC data files. If column_list is not specified, the format parameter partition_columns option must include both name and type.
- The column_list parameter is required with unstructured data files, such as CSV text files.
- The procedure DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE supports external partitioned files in the supported cloud object storage services, including:
  - Oracle Cloud Infrastructure Object Storage

  - Azure Blob Storage or Azure Data Lake Storage
  - Amazon S3
  - Amazon S3-Compatible, including: Oracle Cloud Infrastructure Object Storage, Google Cloud Storage, and Wasabi Hot Cloud Storage.
  - GitHub Repository

  See DBMS_CLOUD URI Formats for more information.

- The procedure `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE` supports external partitioned files in directories, either in a local file system or in a network file system.
- When you call `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE` with the `file_uri_list` parameter, the types for columns specified in the Cloud Object Store file name must be one of the following types:

  ```
  VARCHAR2(n)
  NUMBER(n)
  NUMBER(p,s)
  NUMBER
  DATE
  TIMESTAMP(9)
  ```

- The default record delimiter is `detected newline`. With `detected newline`, `DBMS_CLOUD` tries to automatically find the correct newline character to use as the record delimiter. `DBMS_CLOUD` first searches for the Windows newline character `\r\n`. If it finds the Windows newline character, this is used as the record delimiter for all files in the procedure. If a Windows newline character is not found, `DBMS_CLOUD` searches for the UNIX/Linux newline character `\n`, and if it finds one it uses `\n` as the record delimiter for all files in the procedure. If the source files use a combination of different record delimiters, you may encounter an error such as, "`KUP-04020: found record longer than buffer size supported`". In this case, you need to either modify the source files to use the same record delimiter or only specify the source files that use the same record delimiter.

  See DBMS_CLOUD Package Format Options for information on the `recorddelmiter` format option.
- The external partitioned tables you create with `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE` include two invisible columns `file$path` and `file$name`. These columns help identify which file a record is coming from.
  - `file$path`: Specifies the file path text up to the beginning of the object name.
  - `file$name`: Specifies the object name, including all the text that follows the bucket name.

Examples

Example using the `partitioning_clause` parameter:

```
BEGIN
   DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
      table_name =>'PET1',
      credential_name =>'OBJ_STORE_CRED',
      format => json_object('delimiter' value ',', 'recorddelimiter' value
'newline', 'characterset' value 'us7ascii'),
      column_list => 'col1 number, col2 number, col3 number',
      partitioning_clause => 'partition by range (col1)
```

```
                                        (partition p1 values less than (1000) location
                                            ( ''&base_URL//file_11.txt'')
                                         ,
                                         partition p2 values less than (2000) location
                                            ( ''&base_URL/file_21.txt'')
                                         ,
                                         partition p3 values less than (3000)
location
                                            ( ''&base_URL/file_31.txt'')
                                         )'

     );
   END;
/

BEGIN
    DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
       table_name          => 'PET',
       format              => json_object('delimiter'value ','),
       column_list         => 'name varchar2(20), gender varchar2(10), salary
number',
       partitioning_clause => 'partition by range (salary)
              (   -- Use test1.csv in the DEFAULT DIRECTORY DATA_PUMP_DIR
                  partition p1 values less than (100) LOCATION
(''test1.csv''),
                   -- Use test2.csv in a specified directory MY_DIR
                  partition p2 values less than (300) DEFAULT DIRECTORY
MY_DIR LOCATION (''test2.csv'')        )'   );
END;
/
```

Example using the `file_uri_list` and `column_list` parameters with unstructured data files:

```
BEGIN
  DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
   table_name => 'MYSALES',
   credential_name => 'DEF_CRED_NAME',
   file_uri_list     => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-
string/b/bucketname/o/*.csv',
   column_list       => 'product varchar2(100), units number, country varchar2(100), year
number, month varchar2(2)',
   field_list        => 'product, units', --[Because country, year and month are not in the
file, they are not listed in the field list]
   format            => '{"type":"csv", "partition_columns":["country","year","month"]}');
END;
/
```

Example using the `file_uri_list` without the `column_list` parameter with structured data files:

```
BEGIN
  DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
  table_name => 'MYSALES',
  credential_name => 'DEF_CRED_NAME',
  DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
```

```
    table_name      => 'MYSALES',
    credential_name => 'DEF_CRED_NAME',
    file_uri_list   => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-
string/b/bucketname/o/*.parquet',
    format          =>
        json_object('type' value 'parquet', 'schema' value 'first',
                    'partition_columns' value
                          json_array(
                                json_object('name' value 'country', 'type' value
'varchar2(100)'),
                                json_object('name' value 'year', 'type' value 'number'),
                                json_object('name' value 'month', 'type' value 'varchar2(2)')
                          )
         )
    );
END;
/
```

CREATE_EXTERNAL_TABLE Procedure

This procedure creates an external table on files in the Cloud or from files in a directory. This allows you to run queries on external data from Autonomous Database.

Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_TABLE (
    table_name       IN VARCHAR2,
    credential_name  IN VARCHAR2 DEFAULT NULL,
    file_uri_list    IN CLOB,
    column_list      IN CLOB,
    field_list       IN CLOB DEFAULT,
    format           IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`table_name`	The name of the external table.
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. This parameter is not used when you specify a directory or a Table Hyperlink URL with `file_uri_list`.

Parameter	Description

file_uri_list	This parameter specifies one of the following:
	• Comma-delimited list of source file URIs.
	• Comma-delimited list of Table Hyperlink URLs.
	• One or more directories and source files.
	Cloud source file URIs
	You can use wildcards as well as regular expressions in the file names in Cloud source file URIs.
	Regular expressions can only be used when the regexuri format parameter is set to TRUE.
	The characters "*" and "?" are considered wildcard characters when the regexuri parameter is set to FALSE. When the regexuri parameter is set to TRUE the characters "*" and "?" are part of the specified regular expression pattern.
	Regular expression patterns are only supported for the file name or subfolder path in your URIs and the pattern matching is identical to that performed by the REGEXP_LIKE function.
	This option is only supported with external tables that are created on a file in the Object Storage.
	For example:
	`file_uri_list => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o(/)*year=[0-9]+(/)*month=[0-9]+(/)*[a-z]+[1-3]??.csv'`
	The format of the URIs depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats.
	See REGEXP_LIKE Condition for more information on REGEXP_LIKE condition.
	Table Hyperlink URL
	You can use a Table Hyperlink URL to create an external table in the following ways:
	• Specify a single Autonomous Database Table Hyperlink URL, you can also apply filters and clauses on the data when you read data from the table. For example, you can filter the data using the WHERE clause or sort it using the ORDER BY clause.
	For example:
	`file_uri_list => 'https://dataaccess.adb.us-chicago-1.oraclecloudapps.com/adb/p/K6XExample/data'`
	• Specify a comma-delimited list of Autonomous Database Table Hyperlinks URLs, you must ensure that all included Table Hyperlinks must have the same column names, column order, and column data types in the same schema.
	For example:
	`file_uri_list => 'https://dataaccess.adb.us-chicago-1.oraclecloudapps.com/adb/p/K6XExample/data','https://dataaccess.adb.us-`

Parameter	Description
	chicago-1.oraclecloudapps.com/adb/p/K7XExample/data'
	Note: Table Hyperlink URLs do not support wildcards.
	See About Table Hyperlinks on Autonomous Database and GET_PREAUTHENTICATED_URL Procedure for more information.
	Directory You can specify one directory and one or more file names or use a comma separated list of directories and file names. The format to specify a directory is:'*MY_DIR*:*filename.ext*'. By default the directory name *MY_DIR* is a database object and is case-insensitive. The file name is case sensitive. Regular expressions are not supported when specifying the file names in a directory. You can only use wildcards to specify file names in a directory. The character "*" can be used as the wildcard for multiple characters, and the character "?" can be used as the wildcard for a single character. For example:'*MY_DIR*:*" or '*MY_DIR*:test?' To specify multiple directories, use a comma separated list of directories: For example:'*MY_DIR1*:*, *MY_DIR2*:test?' Use double quotes to specify a case-sensitive directory name. For example:'"*my_dir1*":*, "*my_dir2*":Test?' To include a quote character, use two quotes. For example:'*MY_DIR*:''filename.ext'. This specifies the filename starts with a quote ('').
column_list	Comma-delimited list of column names and data types for the external table.
field_list	Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the column_list parameter. This argument's syntax is the same as the field_list clause in regular Oracle Database external tables. For more information about field_list see ORACLE_LOADER Access Driver field_list under field_definitions Clause in *Oracle Database Utilities*.
format	The options describing the format of the source files. For the list of the options and how to specify the values see DBMS_CLOUD Package Format Options. For Avro, ORC, or Parquet format files, see CREATE_EXTERNAL_TABLE Procedure for Avro, ORC, or Parquet Files.

Usage Notes

- The procedure DBMS_CLOUD.CREATE_EXTERNAL_TABLE supports external partitioned files in the supported cloud object storage sources, including:
  - Oracle Cloud Infrastructure Object Storage
  - Azure Blob Storage or Azure Data Lake Storage

  - Amazon S3
  - Amazon S3-Compatible, including: Oracle Cloud Infrastructure Object Storage, Google Cloud Storage, and Wasabi Hot Cloud Storage.
  - GitHub Repository
  - Oracle Cloud Infrastructure Object Storage with Table Hyperlink URLs

  The credential is a table level property; therefore, the external files must be on the same object store.

  See DBMS_CLOUD URI Formats for more information.

- The default record delimiter is `detected newline`. With `detected newline`, `DBMS_CLOUD` tries to automatically find the correct newline character to use as the record delimiter. `DBMS_CLOUD` first searches for the Windows newline character `\r\n`. If it finds the Windows newline character, this is used as the record delimiter for all files in the procedure. If a Windows newline character is not found, `DBMS_CLOUD` searches for the UNIX/Linux newline character `\n`, and if it finds one it uses `\n` as the record delimiter for all files in the procedure. If the source files use a combination of different record delimiters, you may encounter an error such as, "`KUP-04020: found record longer than buffer size supported`". In this case, you need to either modify the source files to use the same record delimiter or only specify the source files that use the same record delimiter.

  See DBMS_CLOUD Package Format Options for information on the `recorddelimiter` format option.

Example

```
BEGIN
   DBMS_CLOUD.CREATE_EXTERNAL_TABLE(
      table_name =>'WEATHER_REPORT_DOUBLE_DATE',
      credential_name =>'OBJ_STORE_CRED',
      file_uri_list =>'&base_URL/
Charlotte_NC_Weather_History_Double_Dates.csv',
      format => json_object('type' value 'csv', 'skipheaders' value '1'),
      field_list => 'REPORT_DATE DATE''mm/dd/yy'',
                     REPORT_DATE_COPY DATE ''yyyy-mm-dd'',
                     ACTUAL_MEAN_TEMP,
                     ACTUAL_MIN_TEMP,
                     ACTUAL_MAX_TEMP,
                     AVERAGE_MIN_TEMP,
                     AVERAGE_MAX_TEMP,
                     AVERAGE_PRECIPITATION',
      column_list => 'REPORT_DATE DATE,
                     REPORT_DATE_COPY DATE,
                     ACTUAL_MEAN_TEMP NUMBER,
                     ACTUAL_MIN_TEMP NUMBER,
                     ACTUAL_MAX_TEMP NUMBER,
                     AVERAGE_MIN_TEMP NUMBER,
                     AVERAGE_MAX_TEMP NUMBER,
                     AVERAGE_PRECIPITATION NUMBER');
   END;
/

SELECT * FROM WEATHER_REPORT_DOUBLE_DATE where
   actual_mean_temp > 69 and actual_mean_temp < 74
```

CREATE_EXTERNAL_TABLE Procedure for Apache Iceberg

This procedure creates external tables for Apache Iceberg tables in the supported configurations.

For a description of supported configurations, see About Querying Apache Iceberg Tables.

Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_TABLE (
    table_name       IN VARCHAR2,
    credential_name  IN VARCHAR2 DEFAULT NULL,
    file_uri_list    IN CLOB,
    column_list      IN CLOB DEFAULT NULL,
    field_list       IN CLOB DEFAULT NULL,
    format           IN CLOB DEFAULT NULL
);
```

Parameters

Parameter	Description
`table_name`	The name of the external table.
`credential_name`	The name of the credential used to access the data files, the metadata files and the Iceberg Catalog (if used). For AWS and OCI configurations, the credential should be created as described in CREATE_CREDENTIAL Procedure. AWS Amazon Resource Names (ARN) credentials are currently not supported.
`file_uri_list`	Must be NULL if an Iceberg catalog is specified (see `format` parameter below). If an iceberg catalog is not used, then the `file_uri_list` must contain the URI to the iceberg metadata file.
`column_list`	Must be NULL, as the column names and types are automatically derived from Iceberg metadata. The column names match the names found in the underlying data files (Parquet, Avro, ORC). The Oracle data types are derived using the Parquet/Avro/ORC mappings between Iceberg and the Parquet, Avro and ORC data types. Therefore users cannot specify the `column_list`.
`field_list`	Must be NULL, as column names and data types are automatically derived from the Iceberg metadata.
`format`	The `format` parameter has a different structure depending on the type of Iceberg table, AWS or OCI, and what information is used to create the external table, for example information from a data catalog or a direct metadata URI. For examples and further information: see the examples below, Iceberg Support on OCI Data Flow Samples, DBMS_CLOUD URI Formats.

Example AWS Iceberg tables using an AWS Glue Catalog

The `format` parameter when creating tables over an AWS Iceberg table using an AWS Glue Catalog is as follows:

```
format => json_object('access_protocol' value
       json_object('protocol_type' value 'iceberg',
```

```
                    'protocol_config' value
                     json_object('iceberg_catalog_type' value 'aws_glue',
                                 'iceberg_glue_region'  value 'glue region',
                                 'iceberg_table_path'   value
'database_name.table_name')));
```

Where, the `access_protocol` parameter contains a JSON object with two elements as follows:

- `protocol_type`: Must be 'iceberg'
- `protocol_config`: A nested JSON object specifying the iceberg catalog details.
  - `iceberg_catalog_type`: Must be `'aws_glue'`
  - `iceberg_glue_region`: The catalog region, e.g. `'us-west-1'`
  - `iceberg_table_path`: A *`glue database.glue table name`* path.

Example AWS Iceberg table using a metadata file URI

The `format` parameter when creating tables over an AWS Iceberg table using a metadata file URI, is as follows:

```
format => json_object('access_protocol' value
       json_object('protocol_type' value 'iceberg')
```

Example OCI Iceberg table using HadoopCatalog catalog

The `format` parameter when creating tables over an OCI Iceberg table created by OCI Data Flow using HadoopCatalog catalog, is as follows:

```
format => json_object('access_protocol' value
       json_object('protocol_type'   value 'iceberg',
                   'protocol_config' value
                   json_object('iceberg_catalog_type'  value 'hadoop',
                               'iceberg_warehouse'     value '<OCI folder
URI>',
                               'iceberg_table_path'    value
'database_name.table_name')));
```

Where, the `access_protocol` parameter contains a JSON object with two elements as follows:

- `protocol_type`: Must be `'iceberg'`
- `protocol_config`: A nested JSON object specifying the iceberg catalog details.
  - `iceberg_catalog_type`: Must be `'hadoop'`
  - `iceberg_warehouse`: The warehouse directory path used when generating the table, in native URI format.
  - `iceberg_table_path`: The *`database_name.table name`* path used when creating the table.

Example OCI Iceberg table using the URI of the metadata file

The `format` parameter when creating tables over an OCI Iceberg table using the URI of the metadata file, is as follows:

```
format => json_object('access_protocol' value
       json_object('protocol_type' value 'iceberg')
```

Where, the `access_protocol` parameter contains a JSON object with one element as follows:

- `protocol_type`: Must be `'iceberg'`

CREATE_EXTERNAL_TABLE Procedure for Avro, ORC, or Parquet Files

This procedure with the `format` parameter `type` set to the value `avro`, `orc`, or `parquet` creates an external table with either Avro, ORC, or Parquet format files in the Cloud or in a directory.

This allows you to run queries on external data from Autonomous Database.

Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_TABLE (
    table_name       IN VARCHAR2,
    credential_name  IN VARCHAR2 DEFAULT NULL,
    file_uri_list    IN CLOB,
    column_list      IN CLOB,
    field_list       IN CLOB DEFAULT,
    format           IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`table_name`	The name of the external table.
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. This parameter is not used when you specify a directory with `file_uri_list`.

Parameter	Description
file_uri_list	This parameter specifies either a comma-delimited list of source file URIs or one or more directories and source files. **Cloud source file URIs** You can use wildcards as well as regular expressions in the file names in Cloud source file URIs. Regular expressions can only be used when the regexuri format parameter is set to TRUE. The characters "*" and "?" are considered wildcard characters when the regexuri parameter is set to FALSE. When the regexuri parameter is set to TRUE the characters "*" and "?" are part of the specified regular expression pattern. Regular expression patterns are only supported for the file name or subfolder path in your URIs and the pattern matching is identical to that performed by the REGEXP_LIKE function. This option is only supported with external tables that are created on a file in the Object Storage. For example: `file_uri_list => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o(/)*year=[0-9]+(/)*month=[0-9]+(/)*[a-z]+[1-3]??.parquet'` The format of the URIs depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats. See REGEXP_LIKE Condition for more information on REGEXP_LIKE condition. **Directory** You can specify one directory and one or more file names or use a comma separated list of directories and file names. The format to specify a directory is:'*MY_DIR*:*filename.ext*'. By default the directory name *MY_DIR* is a database object and is case-insensitive. The file name is case sensitive. Regular expressions are not supported when specifying the file names in a directory. You can only use wildcards to specify file names in a directory. The character "*" can be used as the wildcard for multiple characters, and the character "?" can be used as the wildcard for a single character. For example:'*MY_DIR*:*" or '*MY_DIR*:test?' To specify multiple directories, use a comma separated list of directories: For example:'*MY_DIR1*:*, *MY_DIR2*:test?' Use double quotes to specify a case-sensitive directory name. For example:'"*my_dir1*":*, "*my_dir2*":Test?' To include a quote character, use two quotes. For example:'*MY_DIR*:''filename.ext'. This specifies the filename starts with a quote ().

Parameter	Description
column_list	(Optional) This field, when specified, overrides the format->schema parameter which specifies that the schema, columns, and data types, are derived automatically. See the format parameter for details. When the column_list is specified for Avro, ORC, or Parquet source, the column names must match those columns found in the file. Oracle data types must map appropriately to the Avro, ORC, or Parquet data types. For Parquet files, see DBMS_CLOUD Package Parquet to Oracle Data Type Mapping for details. For ORC files, see DBMS_CLOUD Package ORC to Oracle Data Type Mapping for details. For Avro files, see DBMS_CLOUD Package Avro to Oracle Data Type Mapping for details.
field_list	Ignored for Avro, ORC, or Parquet files. The fields in the source match the external table columns by name. Source data types are converted to the external table column data type. For ORC files, see DBMS_CLOUD Package ORC to Oracle Data Type Mapping For Parquet files, see DBMS_CLOUD Package Parquet to Oracle Data Type Mapping for details. For Avro files, see DBMS_CLOUD Package Avro to Oracle Data Type Mapping for details.
format	For Avro, ORC, or Parquet type source files, see DBMS_CLOUD Package Format Options for Avro, ORC, or Parquet for details.

Examples ORC

```
format => '{"type":"orc", "schema": "all"}'
```

```
format => json_object('type' value 'orc', 'schema' value 'first')
```

Examples Avro

```
format => '{"type":"avro", "schema": "all"}'
```

```
format => json_object('type' value 'avro', 'schema' value 'first')
```

Examples Parquet

```
format => '{"type":"parquet", "schema": "all"}'
```

```
format => json_object('type' value 'parquet', 'schema' value 'first')
```

Avro, ORC, or Parquet Column Name Mapping to Oracle Column Names

See DBMS_CLOUD Package Avro, ORC, and Parquet to Oracle Column Name Mapping for information on column name mapping and column name conversion usage in Oracle SQL.

CREATE_EXTERNAL_TEXT_INDEX Procedure

This procedure creates a text index on Object Storage files.

The `CREATE_EXTERNAL_TEXT_INDEX` procedure creates text index on the Object Storage files specified at the `location_uri` location. The index is refreshed at regular intervals, for any new additions or deletions done with files on location URI.

Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_TEXT_INDEX (
      credential_name  IN  VARCHAR2 DEFAULT NULL,
      location_uri     IN  VARCHAR2,
      index_name       IN  VARCHAR2,
      format           IN  CLOB     DEFAULT NULL
);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to access the Cloud Object Storage location. For public, pre-authenticated, or pre-signed bucket URIs, a NULL can be specified. See Configure Policies and Roles to Access Resources for more information. If you do not supply a `credential_name` value, the `credential_name` is set to a `NULL` value.
`location_uri`	Specifies the Object Store bucket or folder URI. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
`index_name`	Specifies the name of the index you are building on the files located at the `location_uri` location. This parameter is mandatory.

Parameter	Description
format	Specifies additional configuration options. Options are specified as a JSON string. The supported format options are: refresh_rate: Specifies the frequency in minutes at which the local index is refreshed. New file uploads and deletions result in an index refresh. The default value is 5 minutes. binary_files: Specifies if the contents of the files to be indexed are binary. For example, PDF, MS-Word, The default value is FALSE. json_index: Specifies if the contents of the files to be indexed are JSON or row JSON. The default value is FALSE. json_index_doc_sep: Specifies the separator used for preprocessing row JSON documents. The default value is '\n' (new line). json_index_doc_len: Specifies the length of each JSON document in the object. The default value is 32767 and the maximum value is 200000. file_compression: Specifies the compression format of the JSON files. The default value is gzip. stop_words: Specifies a list of stop words can be supplied when you create indexes. The stop_words value indicates if it is a list of stop words or a table of stop words. When a JSON array is provided the stop words parameter it is treated as a list, otherwise the stop words parameter is treated as a table name whose column "STOP_WORDS" is used to read in the list of stop words. You can specify stop words using the following methods: • JSON Array: For example: format := '{"stop_words": ["king","queen"]}' • Stop word table name: For example: format := '{"stop_words":"STOP_WORDS_TABLE"}' If you do not supply a format parameter, the format is set to a NULL value.

Example

```
BEGIN
DBMS_CLOUD.CREATE_EXTERNAL_TEXT_INDEX (
        credential_name => 'DEFAULT_CREDENTIAL',
        location_uri    => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o/ts_data/'
        index_name      => 'EMP',
        format          => JSON_OBJECT ('refresh_rate' value 10)
);
END;
/
```

CREATE_HYBRID_PART_TABLE Procedure

This procedure creates a hybrid partitioned table. This allows you to run queries on hybrid partitioned data from Autonomous Database using database objects and files in the Cloud, or database objects and files in a directory.

Syntax

```
DBMS_CLOUD.CREATE_HYBRID_PART_TABLE (
    table_name           IN VARCHAR2,
    credential_name      IN VARCHAR2,
    partitioning_clause  IN CLOB,
    column_list          IN CLOB,
    field_list           IN CLOB DEFAULT,
    format               IN CLOB DEFAULT);
```

Parameters

Parameter	Description
table_name	The name of the external table.
credential_name	The name of the credential to access the Cloud Object Storage. You can use 'OCI$RESOURCE_PRINCIPAL' as the credential_name when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information.
partitioning_clause	Specifies the complete partitioning clause, including the location information for individual partitions. To use directories, the partitioning clause supports the LOCATION and DEFAULT DIRECTORY values. You can use wildcards as well as regular expressions in the file names in Cloud source file URIs. Regular expressions can only be used when the regexuri format parameter is set to TRUE. The characters "*" and "?" are considered wildcard characters when the regexuri parameter is set to FALSE. When the regexuri parameter is set to TRUE the characters "*" and "?" are part of the specified regular expression pattern. Regular expression patterns are only supported for the file name or subfolder path in your URIs and the pattern matching is identical to that performed by the REGEXP_LIKE function. Regular expression patterns are not supported for directory names. For example: `partitioning_clause => 'partition by range (col1) (partition p1 values less than (1000) external location ( ''https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o(/)*year=[0-9]+(/)*month=[0-9]+(/)*[a-z]+[1-3]??.txt''),….` See REGEXP_LIKE Condition for more information on REGEXP_LIKE condition.
column_list	Comma-delimited list of column names and data types for the external table.

Parameter	Description
field_list	Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the *column_list* parameter. This argument's syntax is the same as the field_list clause in regular Oracle external tables. For more information about field_list see *Oracle® Database Utilities*.
format	The options describing the format of the source files. For the list of the options and how to specify the values see DBMS_CLOUD Package Format Options.

Usage Notes

- The procedure DBMS_CLOUD.CREATE_HYBRID_PART_TABLE supports external partitioned files in the supported cloud object storage services, including:
  - Oracle Cloud Infrastructure Object Storage
  - Azure Blob Storage or Azure Data Lake Storage
  - Amazon S3
  - Amazon S3-Compatible, including: Oracle Cloud Infrastructure Object Storage, Google Cloud Storage, and Wasabi Hot Cloud Storage.
  - GitHub Repository

  The credential is a table level property; therefore, the external files must be on the same object store.

  See DBMS_CLOUD URI Formats for more information.
- The procedure DBMS_CLOUD.CREATE_HYBRID_PART_TABLE supports hybrid partitioned files in directories, either in a local file system or in a network file system.
- The external partitioned tables you create with DBMS_CLOUD.CREATE_HYBRID_PART_TABLE include two invisible columns file$path and file$name. These columns help identify which file a record is coming from.
  - file$path: Specifies the file path text up to the beginning of the object name.
  - file$name: Specifies the object name, including all the text that follows the bucket name.

Examples

```
BEGIN
   DBMS_CLOUD.CREATE_HYBRID_PART_TABLE(
      table_name =>'HPT1',
      credential_name =>'OBJ_STORE_CRED',
      format => json_object('delimiter' value ',', 'recorddelimiter' value
'newline', 'characterset' value 'us7ascii'),
      column_list => 'col1 number, col2 number, col3 number',
      partitioning_clause => 'partition by range (col1)
                                (partition p1 values less than (1000)
external location
                                    ( ''&base_URL/file_11.txt'')
                                ,
                                partition p2 values less than (2000)
external location
```

```
                                    ( ''&base_URL/file_21.txt'')
                                  ,
                                  partition p3 values less than (3000)
                                  )'
     );
   END;
/

BEGIN
   DBMS_CLOUD.CREATE_HYBRID_PART_TABLE(
    table_name  => 'HPT1',
    format      => json_object('delimiter'value ',', 'recorddelimiter'value
'newline'),
    column_list => 'NAME VARCHAR2(30), GENDER VARCHAR2(10), BALANCE number',
    partitioning_clause => 'partition by range (B  2  ALANCE)
               (partition p1 values less than (1000) external DEFAULT
DIRECTORY DATA_PUMP_DIR LOCATION (''Scott_male_1000.csv''),
                partition p2 values less than (2000) external DEFAULT
DIRECTORY DATA_PUMP_DIR LOCATION (''Mary_female_3000.csv''),
                partition p3 values less than (3000))' );
END;
/
```

DELETE_ALL_OPERATIONS Procedure

This procedure clears either all data load operations logged in the `user_load_operations` table in your schema or clears all the data load operations of the specified type, as indicated with the `type` parameter.

Syntax

```
DBMS_CLOUD.DELETE_ALL_OPERATIONS (
    type      IN VARCHAR DEFAULT NULL);
```

Parameters

Parameter	Description
`type`	Specifies the type of operation to delete. Type values can be found in the `TYPE` column in the `user_load_operations` table. If no `type` is specified all rows are deleted.

Usage Notes

- This procedure does not delete currently running operations (operations in a "Running" status).
- This procedure deletes any logging tables and log files associated with the operations.

DELETE_FILE Procedure

This procedure removes the specified file from the specified directory on Autonomous Database.

Syntax

```
DBMS_CLOUD.DELETE_FILE (
      directory_name     IN VARCHAR2,
      file_name          IN VARCHAR2,
      force              IN BOOLEAN DEFAULT FALSE);
```

Parameters

Parameter	Description
`directory_name`	The name of the directory on the Autonomous Database instance.
`file_name`	The name of the file to be removed.
`force`	Ignore and do not report errors if the file does not exist. Valid values are: `TRUE` and `FALSE`. The default value is `FALSE`.

> **Note:**
>
> To run `DBMS_CLOUD.DELETE_FILE` with a user other than ADMIN you need to grant write privileges on the directory that contains the file to that user. For example, run the following command as ADMIN to grant write privileges to `adb_user`:
>
> ```
> GRANT WRITE ON DIRECTORY data_pump_dir TO adb_user;
> ```

Example

```
BEGIN
   DBMS_CLOUD.DELETE_FILE(
      directory_name =>  'DATA_PUMP_DIR',
      file_name => 'exp1.dmp' );
   END;
/
```

DELETE_OBJECT Procedure

This procedure deletes the specified object on object store.

Syntax

```
DBMS_CLOUD.DELETE_OBJECT (
      credential_name      IN VARCHAR2,
      object_uri           IN VARCHAR2,
      force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Parameter	Description
credential_name	The name of the credential to access the Cloud Object Storage. You can use 'OCI$RESOURCE_PRINCIPAL' as the credential_name when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information.
object_uri	Object or file URI for the object to delete. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats.
force	Ignore and do not report errors if object does not exist. Valid values are: TRUE and FALSE. The default value is FALSE.

Example

```
BEGIN
   DBMS_CLOUD.DELETE_OBJECT(
       credential_name => 'DEF_CRED_NAME',
       object_uri => 'https://objectstorage.us-ashburn-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/exp1.dmp' );
   END;
/
```

DELETE_OPERATION Procedure

This procedure clears the data load entries for the specified operation ID logged in the user_load_operations or dba_load_operations tables in your schema.

Syntax

```
DBMS_CLOUD.DELETE_OPERATION (
    id      IN NUMBER);
```

Parameters

Parameter	Description
id	Specifies the operation ID associated with the log file entries you want to delete.

Usage Note

- This procedure deletes any logging tables and log files associated with the operation ID specified in the input.

Example

```
SELECT id FROM user_load_operations WHERE type LIKE '%BAD%';
EXEC DBMS_CLOUD.DELETE_OPERATION(id);
```

DROP_EXTERNAL_TEXT_INDEX Procedure

This procedure drops text index on the Object Storage files.

The `DROP_EXTERNAL_TEXT_INDEX` procedure drops the specified index created with the `CREATE_EXTERNAL_TEXT_INDEX` procedure.

Syntax

```
DBMS_CLOUD.DROP_EXTERNAL_TEXT_INDEX (
      index_name       IN  VARCHAR2,
);
```

Parameters

Parameter	Description
`index_name`	Specifies the name of the index you are dropping. The index name must match the name provided at the time of the index creation. This parameter is mandatory.

Example

```
BEGIN
DBMS_CLOUD.DROP_EXTERNAL_TEXT_INDEX (
        index_name => 'EMP',
);
END;
/
```

EXPORT_DATA Procedure

This procedure exports data from Autonomous Database based on the result of a query. This procedure is overloaded and supports writing files to the cloud or to a directory.

Based on the `format type` parameter, the procedure exports files to the Cloud or to a directory location as text files in CSV, JSON, Parquet, or XML format, or using the ORACLE_DATAPUMP access driver to write data to an Oracle Datapump dump file.

Syntax

```
DBMS_CLOUD.EXPORT_DATA (
      credential_name   IN VARCHAR2 DEFAULT NULL,
      file_uri_list     IN CLOB,
      format            IN CLOB,
      query             IN CLOB);

DBMS_CLOUD.EXPORT_DATA (
      credential_name   IN VARCHAR2 DEFAULT NULL,
      file_uri_list     IN CLOB DEFAULT NULL,
      format            IN CLOB DEFAULT NULL,
```

```
    query             IN CLOB DEFAULT NULL,
    operation_id      OUT NOCOPY NUMBER);
```

Parameters

Parameter	Description
credential_name	The name of the credential to access the Cloud Object Storage. You can use 'OCI$RESOURCE_PRINCIPAL' as the credential_name when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. When the credential parameter is not included, this specifies output to a directory.
file_uri_list	There are different forms, depending on the value of the format parameter and depending on whether you include a credential parameter: • When the format parameter type value is json: The JSON on Object Store or to the specified directory location is saved with a generated file name based on the value of the file_uri_list parameter. See File Naming for Text Output (CSV, JSON, Parquet, or XML) for more information. • When the format parameter type value is datapump, the file_uri_list is a comma-delimited list of the dump files. This specifies the files to be created on the Object Store. Use of wildcard and substitution characters is not supported in the file_uri_list. • When the credential_name parameter is not specified you provide a directory name in file_uri_list. The format of the URIs depend on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats.
format	A JSON string that provides export format options. Supported option is: • type: The type format option is required and must have one of the values: csv | datapump | json | parquet | xml. See DBMS_CLOUD Package Format Options for EXPORT_DATA.
query	Use this parameter to specify a SELECT statement so that only the required data is exported. The query determines the contents of the files you export as text files CSV, JSON, Parquet, or XML, or as dump files. For example: SELECT warehouse_id, quantity FROM inventories For information with the format type value datapump, see Oracle Data Pump Export Data Filters and Unloading and Loading Data with the ORACLE_DATAPUMP Access Driver for more information. When the format type value is json, each query result is checked and if it is not JSON, as determined with the function: JSON_OBJECT_T.parse(), DBMS_CLOUD.EXPORT_DATA transforms the query to include JSON_OBJECT function to convert the row into JSON. See JSON_OBJECT_T Object Type for more information. For example: SELECT JSON_OBJECT(* RETURNING CLOB) from(SELECT warehouse_id, quantity FROM inventories)
operation_id	Use this parameter to track the progress and final status of the export operation as the corresponding ID in the USER_LOAD_OPERATIONS view.

Usage Notes:

- The `query` parameter value that you supply can be an advanced query, if required, such as a query that includes joins or subqueries.
- Depending on the format parameter specified, `DBMS_CLOUD.EXPORT_DATA` outputs the results of the specified query on the Cloud Object Store or to a directory location in one of these formats:
  - CSV, JSON, Parquet, or XML files.

    See Export Data to Object Store as Text and Export Data to a Directory for more information on using `DBMS_CLOUD.EXPORT_DATA` with CSV, JSON, Parquet, or XML output files.
  - Using the ORACLE_DATAPUMP access driver to write data to a dump file.
- For CSV, JSON, or XML output, by default when a generated file contains 10MB of data a new output file is created. However, if you have less than 10MB of result data you may have multiple output files, depending on the database service and the number of ECPUs (OCPUs if your database uses OCPUs) for the Autonomous Database instance.

  See File Naming for Text Output (CSV, JSON, Parquet, or XML) for more information.

  The default output file chunk size is 10MB for CSV, JSON, or XML. You can change this value with the `format` parameter `maxfilesize` option. See DBMS_CLOUD Package Format Options for EXPORT_DATA for more information.
- For Parquet output, each generated file is less than 128MB and multiple output files may be generated. However, if you have less than 128MB of result data, you may have multiple output files depending on the database service and the number of ECPUs (OCPUs if your database uses OCPUs) for the Autonomous Database instance.

  See File Naming for Text Output (CSV, JSON, Parquet, or XML) for more information.

Usage Notes for ORACLE_DATAPUMP Output (`DBMS_CLOUD.EXPORT_DATA` with `format` parameter `type` option `datapump`):

- `EXPORT_DATA` uses `DATA_PUMP_DIR` as the default logging directory. So the write privilege on `DATA_PUMP_DIR` is required when using `ORACLE_DATAPUMP` output.
- Autonomous Database export using `DBMS_CLOUD.EXPORT_DATA` with `format` parameter `type` option `datapump` only supports Oracle Cloud Infrastructure Object Storage, Oracle Cloud Infrastructure Object Storage Classic object stores or directory output.
- When you specify `DBMS_CLOUD.EXPORT_DATA` with the `format` parameter `type` option `datapump`, the `credential_name` parameter value cannot be an OCI resource principal.
- Oracle Data Pump divides each dump file part into smaller chunks for faster uploads. The Oracle Cloud Infrastructure Object Storage console shows multiple files for each dump file part that you export. The size of the actual dump files will be displayed as zero (0) and its related file chunks as 10mb or less. For example:

  ```
  exp01.dmp
  exp01.dmp_aaaaaa
  exp02.dmp
  exp02.dmp_aaaaaa
  ```

  Downloading the zero byte dump file from the Oracle Cloud Infrastructure console or using the Oracle Cloud Infrastructure CLI will not give you the full dump files. To download the

full dump files from the Object Store, use a tool that supports Swift such as curl, and provide your user login and Swift auth token.

```
curl -O -v -X GET -u 'user1@example.com:auth_token' \
   https://swiftobjectstorage.us-ashburn-1.oraclecloud.com/v1/namespace-
string/bucketname/exp01.dmp
```

If you import a file with the DBMS_CLOUD procedures that support the format parameter type with the value 'datapump', you only need to provide the primary file name. The procedures that support the 'datapump' format type automatically discover and download the chunks.

When you use DBMS_CLOUD.DELETE_OBJECT, the procedure automatically discovers and deletes the chunks when the procedure deletes the primary file.

- The DBMS_CLOUD.EXPORT_DATA procedure creates the dump file(s) from the file_uri_list values that you specify, as follows:
  - As more files are needed, the procedure creates additional files from the file_uri_list.
  - The procedure does not overwrite files. If a dump file in the file_uri_list exists, DBMS_CLOUD.EXPORT_DATA reports an error.
  - DBMS_CLOUD.EXPORT_DATA does not create buckets.
- The number of dump files that DBMS_CLOUD.EXPORT_DATA generates is determined when the procedure runs. The number of dump files that are generated depends on the number of file names you provide in the file_uri_list parameter, as well as on the number of Autonomous Database OCPUs available to the instance, the service level, and the size of the data.

  For example, if you use a 1 OCPU Autonomous Database instance or the low service, then a single dump file is exported with no parallelism, even if you provide multiple file names. If you use a 4 OCPU Autonomous Database instance with the medium or high service, then the jobs can run in parallel and multiple dump files are exported if you provide multiple file names.
- The dump files you create with DBMS_CLOUD.EXPORT_DATA cannot be imported using Oracle Data Pump impdp. Depending on the database, you can use these files as follows:
  - On an Autonomous Database, you can use the dump files with the DBMS_CLOUD procedures that support the format parameter type with the value 'datapump'. You can import the dump files using DBMS_CLOUD.COPY_DATA or you can call DBMS_CLOUD.CREATE_EXTERNAL_TABLE to create an external table.
  - On any other Oracle Database, such as Oracle Database 19c on-premise, you can import the dump files created with the procedure DBMS_CLOUD.EXPORT_DATA using the ORACLE_DATAPUMP access driver. See Unloading and Loading Data with the ORACLE_DATAPUMP Access Driver for more information.
- The query parameter value that you supply can be an advanced query, if required, such as a query that includes joins or subqueries.

Usage Notes for DBMS_CLOUD.EXPORT_DATA with Output to a Directory

- The provided directory must exist and you must be logged in as the ADMIN user or have WRITE access to the directory.
- DBMS_CLOUD.EXPORT_DATA does not create directories.

- The procedure does not overwrite files. For example, if a dump file in the `file_uri_list` exists, `DBMS_CLOUD.EXPORT_DATA` reports an error such as:

```
ORA-31641: unable to create dump file  "/u02/exports/123.dmp"
ORA-27038: created file already exists
```

Examples

The following example shows `DBMS_CLOUD.EXPORT_DATA` with the format `type` parameter with the value `datapump`:

```
BEGIN
   DBMS_CLOUD.EXPORT_DATA(
      credential_name =>'OBJ_STORE_CRED',
      file_uri_list =>'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/exp1.dmp',
      format => json_object('type' value 'datapump', 'compression' value
'basic', 'version' value 'latest'),
      query => 'SELECT warehouse_id, quantity FROM inventories'
     );
   END;
/
```

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

The following example shows `DBMS_CLOUD.EXPORT_DATA` with the format `type` parameter with the value `json`:

```
BEGIN
   DBMS_CLOUD.EXPORT_DATA(
      credential_name => 'OBJ_STORE_CRED',
      file_uri_list   => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o/exp1.json',
      query           => 'SELECT * FROM DEPT',
      format          => JSON_OBJECT('type' value 'json', 'compression' value
'gzip'));
     );
   END;
/
```

The following example shows `DBMS_CLOUD.EXPORT_DATA` with the format `type` parameter with the value `xml`:

```
BEGIN
   DBMS_CLOUD.EXPORT_DATA(
      credential_name => 'OBJ_STORE_CRED',
      file_uri_list   => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o/exp1.xml',
      query           => 'SELECT * FROM DEPT',
      format          => JSON_OBJECT('type' value 'xml', 'compression' value
'gzip'));
```

```
     );
   END;
/
```

The following example shows `DBMS_CLOUD.EXPORT_DATA` with the format `type` parameter with the value `csv`:

```
BEGIN
   DBMS_CLOUD.EXPORT_DATA(
      credential_name => 'OBJ_STORE_CRED',
      file_uri_list   => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o/exp.csv',
      query           => 'SELECT * FROM DEPT',
      format          => JSON_OBJECT('type' value 'csv', 'delimiter' value
'|', 'compression' value 'gzip', 'header' value true, 'encryption' value
('user_defined_function' value 'ADMIN.decryption_callback')));
     );
   END;
/
```

The following example shows `DBMS_CLOUD.EXPORT_DATA` exporting data to a directory location with the `type` parameter with the value `datapump`:

```
BEGIN
 DBMS_CLOUD.EXPORT_DATA(
    file_uri_list => 'export_dir:sales.dmp',
    format        => json_object('type' value 'datapump'),
    query         => 'SELECT * FROM sales'
 );
END;
/
```

GET_OBJECT Procedure and Function

This procedure is overloaded. The procedure form reads an object from Cloud Object Storage and copies it to Autonomous Database. The function form reads an object from Cloud Object Storage and returns a `BLOB` to Autonomous Database.

Syntax

```
DBMS_CLOUD.GET_OBJECT (
       credential_name      IN VARCHAR2,
       object_uri           IN VARCHAR2,
       directory_name       IN VARCHAR2,
       file_name            IN VARCHAR2 DEFAULT  NULL,
       startoffset          IN NUMBER DEFAULT  0,
       endoffset            IN NUMBER DEFAULT  0,
       compression          IN VARCHAR2 DEFAULT  NULL);

DBMS_CLOUD.GET_OBJECT(
       credential_name      IN VARCHAR2 DEFAULT NULL,
       object_uri           IN VARCHAR2,
       startoffset          IN NUMBER DEFAULT  0,
```

```
      endoffset             IN NUMBER DEFAULT  0,
      compression           IN VARCHAR2 DEFAULT  NULL)
RETURN BLOB;
```

Parameters

Parameter	Description
credential_name	The name of the credential to access the Cloud Object Storage. You can use 'OCI$RESOURCE_PRINCIPAL' as the credential_name when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information.
object_uri	Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats.
directory_name	The name of the directory on the database. 1 You can use a Table Hyperlink URL in the following ways: • Specify a single Autonomous Database Table Hyperlink URL. • Specify comma-delimited list of Autonomous Database Table Hyperlinks URLs, you must ensure that all included Table Hyperlinks must have the same column names, column order, and column data types in the same schema. See About Table Hyperlinks on Autonomous Database and GET_PREAUTHENTICATED_URL Procedure for more information.
file_name	Specifies the name of the file to create. If file name is not specified, the file name is taken from after the last slash in the object_uri parameter. For special cases, for example when the file name contains slashes, use the file_name parameter.
startoffset	The offset, in bytes, from where the procedure starts reading.
endoffset	The offset, in bytes, until where the procedure stops reading.
compression	Specifies the compression used to store the object. When compression is set to 'AUTO' the file is uncompressed (the value 'AUTO' implies the object specified with object_uri is compressed with Gzip).

> **Note:**
>
> To run DBMS_CLOUD.GET_OBJECT with a user other than ADMIN you need to grant WRITE privileges on the directory to that user. For example, run the following command as ADMIN to grant write privileges to adb_user:
>
> ```
> GRANT WRITE ON DIRECTORY data_pump_dir TO adb_user;
> ```

Return Values

The function form reads from Object Store and DBMS_CLOUD.GET_OBJECT returns a BLOB.

Examples

```
BEGIN
   DBMS_CLOUD.GET_OBJECT(
```

```
     credential_name => 'OBJ_STORE_CRED',
     object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/file.txt',
     directory_name => 'DATA_PUMP_DIR');
END;
/
```

To read character data from a file in Object Store:

```
SELECT to_clob(
     DBMS_CLOUD.GET_OBJECT(
       credential_name => 'OBJ_STORE_CRED',
       object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/file.txt'))
FROM DUAL;
```

To add an image stored on Object Store in a `BLOB` in the database:

```
DECLARE
   l_blob BLOB := NULL;
BEGIN
   l_blob := DBMS_CLOUD.GET_OBJECT(
     credential_name => 'OBJ_STORE_CRED',
     object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/MyImage.gif' );
END;
/
```

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

LIST_FILES Function

This function lists the files in the specified directory. The results include the file names and additional metadata about the files such as file size in bytes, creation timestamp, and the last modification timestamp.

Syntax

```
DBMS_CLOUD.LIST_FILES (
    directory_name      IN VARCHAR2)
       RETURN TABLE;
```

Parameters

Parameter	Description
`directory_name`	The name of the directory on the database.

Usage Notes

- To run `DBMS_CLOUD.LIST_FILES` with a user other than ADMIN you need to grant read privileges on the directory to that user. For example, run the following command as ADMIN to grant read privileges to `adb_user`:

  ```
  GRANT READ ON DIRECTORY data_pump_dir TO adb_user;
  ```

- This is a pipelined table function with return type as `DBMS_CLOUD_TYPES.list_object_ret_t`.
- `DBMS_CLOUD.LIST_FILES` does not obtain the checksum value and returns `NULL` for this field.

Example

This is a pipelined function that returns a row for each file. For example, use the following query to use this function:

```
SELECT * FROM DBMS_CLOUD.LIST_FILES('DATA_PUMP_DIR');

OBJECT_NAME       BYTES   CHECKSUM      CREATED              LAST_MODIFIED
------------ ---------- ----------    ---------------------
---------------------
cwallet.sso        2965               2018-12-12T18:10:47Z
2019-11-23T06:36:54Z
```

LIST_OBJECTS Function

This function lists objects in the specified location on object store. The results include the object names and additional metadata about the objects such as size, checksum, creation timestamp, and the last modification timestamp.

Syntax

```
DBMS_CLOUD.LIST_OBJECTS (
       credential_name      IN VARCHAR2,
       location_uri         IN VARCHAR2)
   RETURN TABLE;
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information.
`location_uri`	Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats.

Usage Notes

- Depending on the capabilities of the object store, `DBMS_CLOUD.LIST_OBJECTS` does not return values for certain attributes and the return value for the field is `NULL` in this case.

  All supported Object Stores return values for the `OBJECT_NAME`, `BYTES`, and `CHECKSUM` fields.

  The following table shows support for the fields `CREATED` and `LAST_MODIFIED` by Object Store:

Object Store	CREATED	LAST_MODIFIED
Oracle Cloud Infrastructure Native	Returns timestamp	Returns timestamp
Oracle Cloud Infrastructure Swift	Returns `NULL`	Returns timestamp
Oracle Cloud Infrastructure Classic	Returns `NULL`	Returns timestamp
Amazon S3	Returns `NULL`	Returns timestamp
Amazon S3-Compatible	Returns `NULL`	Returns timestamp
Azure	Returns timestamp	Returns timestamp
GitHub Repository		

- The checksum value is the MD5 checksum. This is a 32-character hexadecimal number that is computed on the object contents. It is expected to have a different checksum value if `OCI$RESOURCE_PRINCIPAL` credential is used.
- This is a pipelined table function with return type as `DBMS_CLOUD_TYPES.list_object_ret_t`.

Example

This is a pipelined function that returns a row for each object. For example, use the following query to use this function:

```
SELECT * FROM DBMS_CLOUD.LIST_OBJECTS('OBJ_STORE_CRED',
    'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/
bucketname/o/');

OBJECT_NAME   BYTES              CHECKSUM
CREATED         LAST_MODIFIED
------------ ---------- --------------------------------
--------------------- --------------------
cwallet.sso   2965      2339a2731ba24a837b26d344d643dc07
2019-11-23T06:36:54Z
```

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

MOVE_OBJECT Procedure

This procedure moves an object from one Cloud Object Storage bucket or folder to another.

The source and target bucket or folder can be in the same or different Cloud Object store provider.

When the source and target are in distinct Object Stores or have different accounts with the same cloud provider, you can give separate credential names for the source and target locations.

The source credential name is by default also used by the target location when target credential name is not provided.

Syntax

```
DBMS_CLOUD.MOVE_OBJECT (
    source_credential_name  IN  VARCHAR2 DEFAULT NULL,
    source_object_uri       IN  VARCHAR2,
    target_object_uri       IN  VARCHAR2,
    target_credential_name  IN  VARCHAR2 DEFAULT NULL
);
```

Parameters

Parameter	Description
`source_credential_name`	The name of the credential to access the source Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a `source_credential_name` value, the `credential_name` is set to `NULL`.
`source_object_uri`	Specifies URI, that point to the source Object Storage bucket or folder location. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
`target_object_uri`	Specifies the URI for the target Object Storage bucket or folder, where the files need to be moved. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
`target_credential_name`	The name of the credential to access the target Cloud Object Storage location. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a `target_credential_name` value, the `target_object_uri` is set to the `source_credential_name` value.

Example

```
BEGIN
DBMS_CLOUD.MOVE_OBJECT (
    source_credential_name => 'OCI_CRED',
    source_object_uri    => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname1/bgfile.csv',
    target_object_uri    => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname2/myfile.csv'
);
```

```
END;
/
```

PUT_OBJECT Procedure

This procedure is overloaded. In one form the procedure copies a file from Autonomous Database to the Cloud Object Storage. In another form the procedure copies a `BLOB` from Autonomous Database to the Cloud Object Storage.

Syntax

```
DBMS_CLOUD.PUT_OBJECT (
       credential_name      IN VARCHAR2,
       object_uri           IN VARCHAR2,
       directory_name       IN VARCHAR2,
       file_name            IN VARCHAR2
       compression          IN VARCHAR2 DEFAULT  NULL);

DBMS_CLOUD.PUT_OBJECT (
       credential_name      IN VARCHAR2,
       object_uri           IN VARCHAR2,
       contents             IN BLOB
       compression          IN VARCHAR2 DEFAULT  NULL);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information.
`object_uri`	Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats.
`directory_name`	The name of the directory on the Autonomous Database. 1
`contents`	Specifies the `BLOB` to copy from Autonomous Database to the Cloud Object Storage.
`file_name`	The name of the file in the specified directory.
`compression`	Specifies the compression used to store the object. Default value: `NULL`

> **Note:**
>
> To run `DBMS_CLOUD.PUT_OBJECT` with a user other than ADMIN you need to grant read privileges on the directory to that user. For example, run the following command as ADMIN to grant read privileges to `adb_user`:
>
> ```
> GRANT READ ON DIRECTORY data_pump_dir TO adb_user;
> ```

Example

To handle `BLOB` data after in-database processing and then store the data directly into a file in the object store:

```
DECLARE
      my_blob_data BLOB;
BEGIN
 /* Some processing producing BLOB data and populating my_blob_data */
DBMS_CLOUD.PUT_OBJECT(
     credential_name => 'OBJ_STORE_CRED',
     object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/my_new_file',
     contents => my_blob_data));
END;
/
```

Usage Notes

Depending on your Cloud Object Storage, the size of the object you transfer is limited as follows:

Cloud Object Storage Service	Object Transfer Size Limit
Oracle Cloud Infrastructure Object Storage	50 GB
Amazon S3	5 GB
Azure Blob Storage or Azure Data Lake Storage	256 MB
Amazon S3-Compatible	Set by the object store provider. For more information, refer to the provider's documentation.

Oracle Cloud Infrastructure object store does not allow writing files into a public bucket without supplying credentials (Oracle Cloud Infrastructure allows users to download objects from public buckets). Thus, you must supply a credential name with valid credentials to store an object in an Oracle Cloud Infrastructure public bucket using `PUT_OBJECT`.

See DBMS_CLOUD URI Formats for more information.

SYNC_EXTERNAL_PART_TABLE Procedure

This procedure simplifies updating an external partitioned table from files in the Cloud. Run this procedure whenever new partitions are added or when partitions are removed from the Object Store source for the external partitioned table.

Syntax

```
DBMS_CLOUD.SYNC_EXTERNAL_PART_TABLE (
    table_name         IN VARCHAR2,
    schema_name        IN VARCHAR2 DEFAULT,
    update_columns     IN BOOLEAN DEFAULT);
```

Parameters

Parameter	Description
table_name	The name of the target table. The target table needs to be created before you run DBMS_CLOUD.SYNC_EXTERNAL_PART_TABLE.
schema_name	The name of the schema where the target table resides. The default value is NULL meaning the target table is in the same schema as the user running the procedure.
update_columns	The new files may introduce a change to the schema. Updates supported include: new columns, deleted columns. Updates to existing columns, for example a change in the data type throw errors. Default Value: False

VALIDATE_EXTERNAL_PART_TABLE Procedure

This procedure validates the source files for an external partitioned table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Autonomous Database. The overloaded form enables you to use the operation_id parameter.

Syntax

```
DBMS_CLOUD.VALIDATE_EXTERNAL_PART_TABLE (
       table_name                IN VARCHAR2,
       partition_name            IN CLOB DEFAULT,
       subpartition_name         IN CLOB DEFAULT,
       schema_name               IN VARCHAR2 DEFAULT,
       rowcount                  IN NUMBER DEFAULT,
       partition_key_validation  IN BOOLEAN DEFAULT,
       stop_on_error             IN BOOLEAN DEFAULT);

DBMS_CLOUD.VALIDATE_EXTERNAL_PART_TABLE (
       table_name                IN VARCHAR2,
       operation_id              OUT NUMBER,
       partition_name            IN CLOB DEFAULT,
       subpartition_name         IN CLOB DEFAULT,
       schema_name               IN VARCHAR2 DEFAULT,
       rowcount                  IN NUMBER DEFAULT,
       partition_key_validation  IN BOOLEAN DEFAULT,
       stop_on_error             IN BOOLEAN DEFAULT);
```

Parameters

Parameter	Description
table_name	The name of the external table.
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.
partition_name	If defined, then only a specific partition is validated. If not specified then read all partitions sequentially until rowcount is reached.
subpartition_name	If defined, then only a specific subpartition is validated. If not specified then read from all external partitions or subpartitions sequentially until rowcount is reached.
schema_name	The name of the schema where the external table resides. The default value is NULL meaning the external table is in the same schema as the user running the procedure.
rowcount	Number of rows to be scanned. The default value is NULL meaning all the rows in the source files are scanned.
partition_key_validation	For internal use only. Do not use this parameter.
stop_on_error	Determines if the validate should stop when a row is rejected. The default value is TRUE meaning the validate stops at the first rejected row. Setting the value to FALSE specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the rowcount parameter.

VALIDATE_EXTERNAL_TABLE Procedure

This procedure validates the source files for an external table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Autonomous Database. The overloaded form enables you to use the operation_id parameter.

Syntax

```
DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE (
    table_name      IN VARCHAR2,
    schema_name     IN VARCHAR2 DEFAULT,
    rowcount        IN NUMBER DEFAULT,
    stop_on_error   IN BOOLEAN DEFAULT);

DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE(
    table_name      IN VARCHAR2,
    operation_id    OUT NOCOPY NUMBER,
    schema_name     IN VARCHAR2 DEFAULT NULL,
    rowcount        IN NUMBER DEFAULT 0,
    stop_on_error   IN BOOLEAN DEFAULT TRUE);
```

Parameters

Parameter	Description
table_name	The name of the external table.
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.
schema_name	The name of the schema where the external table resides. The default value is NULL meaning the external table is in the same schema as the user running the procedure.
rowcount	Number of rows to be scanned. The default value is NULL meaning all the rows in the source files are scanned.
stop_on_error	Determines if the validate should stop when a row is rejected. The default value is TRUE meaning the validate stops at the first rejected row. Setting the value to FALSE specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the rowcount parameter. If the external table refers to Avro, ORC, or Parquet files then the validate stops at the first rejected row. When the external table specifies the format parameter type set to the value avro, orc, or parquet, the parameter stop_on_error effectively always has the value TRUE. Thus, the table badfile will always be empty for an external table referring to Avro, ORC, or Parquet files.

Usage Notes

- DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE works with both partitioned external tables and hybrid partitioned tables. This potentially reads data from all external partitions until rowcount is reached or stop_on_error applies. You do not have control over which partition, or parts of a partition, is read in which order.

VALIDATE_HYBRID_PART_TABLE Procedure

This procedure validates the source files for a hybrid partitioned table, generates log information, and stores the rows that do not match the format options specified for the hybrid table in a *badfile* table on Autonomous Database. The overloaded form enables you to use the operation_id parameter.

Syntax

```
DBMS_CLOUD.VALIDATE_HYBRID_PART_TABLE (
       table_name                IN VARCHAR2,
       partition_name            IN CLOB DEFAULT,
       subpartition_name         IN CLOB DEFAULT,
       schema_name               IN VARCHAR2 DEFAULT,
       rowcount                  IN NUMBER DEFAULT,
       partition_key_validation  IN BOOLEAN DEFAULT,
       stop_on_error             IN BOOLEAN DEFAULT);

DBMS_CLOUD.VALIDATE_HYBRID_PART_TABLE (
       table_name                IN VARCHAR2,
       operation_id              OUT NUMBER,
       partition_name            IN CLOB DEFAULT,
```

```
subpartition_name           IN CLOB DEFAULT,
schema_name                 IN VARCHAR2 DEFAULT,
rowcount                    IN NUMBER DEFAULT,
partition_key_validation    IN BOOLEAN DEFAULT,
stop_on_error               IN BOOLEAN DEFAULT);
```

Parameters

Parameter	Description
table_name	The name of the external table.
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.
partition_name	If defined, then only a specific partition is validated. If not specified then read from all external partitions sequentially until rowcount is reached.
subpartition_name	If defined, then only a specific subpartition is validated. If not specified then read from all external partitions or subpartitions sequentially until rowcount is reached.
schema_name	The name of the schema where the external table resides. The default value is NULL meaning the external table is in the same schema as the user running the procedure.
rowcount	Number of rows to be scanned. The default value is NULL meaning all the rows in the source files are scanned.
partition_key_validation	For internal use only. Do not use this parameter.
stop_on_error	Determines if the validate should stop when a row is rejected. The default value is TRUE meaning the validate stops at the first rejected row. Setting the value to FALSE specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the rowcount parameter.

DBMS_CLOUD for Bulk File Management

The subprograms for bulk file operations within the DBMS_CLOUD package.

Subprogram	Description
BULK_COPY Procedure	This procedure copies files from one Cloud Object Storage bucket to another.
BULK_DELETE Procedure	The procedure deletes files from Cloud Object Storage bucket or folder.
BULK_DOWNLOAD Procedure	This procedure downloads files from Cloud Object store bucket to a directory in Autonomous Database.
BULK_MOVE Procedure	This procedure moves files from one Cloud Object Storage bucket to another.
BULK_UPLOAD Procedure	This procedure uploads files from a directory in Autonomous Database to the Cloud Object Storage.

- BULK_COPY Procedure
  This procedure bulk copies files from one Cloud Object Storage bucket to another. The overloaded form enables you to use the operation_id parameter.

- BULK_DELETE Procedure
  This procedure bulk deletes files from the Cloud Object Storage. The overloaded form enables you to use the `operation_id` parameter. You can filter the list of files to be deleted using a regular expression pattern compatible with `REGEXP_LIKE` operator.
- BULK_DOWNLOAD Procedure
  This procedure downloads files into an Autonomous Database directory from Cloud Object Storage. The overloaded form enables you to use the `operation_id` parameter. You can filter the list of files to be downloaded using a regular expression pattern compatible with `REGEXP_LIKE` operator.
- BULK_MOVE Procedure
  This procedure bulk moves files from one Cloud Object Storage bucket or folder to another. The overloaded form enables you to use the `operation_id` parameter.
- BULK_UPLOAD Procedure
  This procedure copies files into Cloud Object Storage from an Autonomous Database directory. The overloaded form enables you to use the `operation_id` parameter.

BULK_COPY Procedure

This procedure bulk copies files from one Cloud Object Storage bucket to another. The overloaded form enables you to use the `operation_id` parameter.

You can filter the list of files to be deleted using a regular expression pattern compatible with `REGEXP_LIKE` operator.

The source and target bucket or folder can be in the same or different Cloud Object store provider.

When the source and target are in distinct Object Stores or have different accounts with the same cloud provider, you can give separate credential names for the source and target locations.

The source credential name is by default also used by the target location.

Syntax

```
DBMS_CLOUD.BULK_COPY (
      source_credential_name  IN  VARCHAR2 DEFAULT NULL,
      source_location_uri     IN  VARCHAR2,
      target_location_uri     IN  VARCHAR2,
      target_credential_name  IN  VARCHAR2 DEFAULT NULL,
      regex_filter            IN  VARCHAR2 DEFAULT NULL,
      format                  IN  CLOB     DEFAULT NULL
);

DBMS_CLOUD.BULK_COPY (
      source_credential_name  IN  VARCHAR2 DEFAULT NULL,
      source_location_uri     IN  VARCHAR2,
      target_location_uri     IN  VARCHAR2,
      target_credential_name  IN  VARCHAR2 DEFAULT NULL,
      regex_filter            IN  VARCHAR2 DEFAULT NULL,
      format                  IN  CLOB     DEFAULT NULL,
      operation_id            OUT NUMBER
);
```

Parameters

Parameter	Description
source_credential_name	The name of the credential to access the Cloud Object Storage. You can use 'OCI$RESOURCE_PRINCIPAL' as the credential_name when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a source_credential_name value, the credential_name is set to NULL.
source_location_uri	Specifies URI, that point to the source Object Storage bucket or folder location. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
target_location_uri	Specifies the URI for the target Object Storage bucket or folder, where the files need to be copied. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
target_credential_name	The name of the credential to access the target Cloud Object Storage location. You can use 'OCI$RESOURCE_PRINCIPAL' as the credential_name when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a target_credential_name value, the target_location_uri is set to the source_credential_name value.
regex_filter	Specifies the REGEX expression to filter files. The REGEX expression pattern must be compatible with the REGEXP_LIKE operator. If you do not supply a regex_filter value, the regex_filter is set to NULL. See REGEXP_LIKE Condition for more information.

Parameter	Description
format	Specifies the additional configuration options for the file operation. These options are specified as a JSON string. The supported format options are: • logretention: It accepts an integer value that determines the duration in days for which the status table is retained for a bulk operation. The default value is 2 days. • logprefix: It accepts a string value that determines the bulk operation status table name prefix string. The operation type is the default value. For BULK_COPY, the default logprefix value is COPYOBJ. • priority: It accepts a string value that determines the number of file operations performed concurrently. An operation with a higher priority consumes more database resources and should run faster. It accepts the following values: – HIGH: Determines the number of parallel files handled using the database's **ECPU count** (**OCPU count** if your database uses OCPUs) – MEDIUM: Determines the number of simultaneous processes using the concurrency limit for Medium service. The default value is 4. – LOW: Process the files in serial order. The default value is MEDIUM. The maximum number of concurrent file operations is limited to 64. If you do not supply a format value, the format is set to NULL.
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.

Usage Notes

- An error is returned when the source and target URI point to the same Object Storage bucket or folder.

Example

```
BEGIN
DBMS_CLOUD.BULK_COPY (
     source_credential_name => 'OCI_CRED',
     source_location_uri    => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname1/o',
     target_location_uri    => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname2/o',
     format       => JSON_OBJECT ('logretention' value 7, 'logprefix' value
'BULKOP')
);
END;
/
```

BULK_DELETE Procedure

This procedure bulk deletes files from the Cloud Object Storage. The overloaded form enables you to use the `operation_id` parameter. You can filter the list of files to be deleted using a regular expression pattern compatible with `REGEXP_LIKE` operator.

Syntax

```
 DBMS_CLOUD.BULK_DELETE(
     credential_name  IN  VARCHAR2 DEFAULT NULL,
     location_uri     IN  VARCHAR2,
     regex_filter     IN  VARCHAR2 DEFAULT NULL,
     format           IN  CLOB     DEFAULT NULL
);

DBMS_CLOUD.BULK_DELETE (
     credential_name  IN  VARCHAR2 DEFAULT NULL,
     location_uri     IN  VARCHAR2,
     regex_filter     IN  VARCHAR2 DEFAULT NULL,
     format           IN  CLOB     DEFAULT NULL,
     operation_id     OUT NUMBER
);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a `credential_name` value, the `credential_name` is set to `NULL`.
`location_uri`	Specifies URI, that point to an Object Storage location in the Autonomous Database. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
`regex_filter`	Specifies the REGEX expression to filter files. The REGEX expression pattern must be compatible with the `REGEXP_LIKE` operator. If you do not supply a `regex_filter` value, the `regex_filter` is set to `NULL`. See REGEXP_LIKE Condition for more information.

Parameter	Description
format	Specifies the additional configuration options for the file operation. These options are specified as a JSON string. The supported format options are: • logretention: It accepts an integer value that determines the duration in days for which the status table is retained for a bulk operation . The default value is 2 days. • logprefix: It accepts a string value that determines the bulk operation status table name prefix string. The operation type is the default value. For BULK_DELETE, the default logprefix value is DELETE. • priority: It accepts a string value that determines the number of file operations performed concurrently. An operation with a higher priority consumes more database resources and is completed sooner. It accepts the following values: – HIGH: Determines the number of parallel files handled using the database's **ECPU count** (**OCPU count** if your database uses OCPUs). – MEDIUM: Determines the number of simultaneous processes using the concurrency limit for Medium service. The default value is 4. – LOW: Process the files in serial order. The default value is MEDIUM. The maximum number of concurrent file operations is limited to 64. If you do not supply a format value, the format is set to NULL.
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.

Example

```
BEGIN
DBMS_CLOUD.BULK_DELETE (
     credential_name => 'OCI_CRED',
     location_uri    => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o',
     format          => JSON_OBJECT ('logretention' value 5, 'logprefix'
value 'BULKDEL')
);
END;
/
```

BULK_DOWNLOAD Procedure

This procedure downloads files into an Autonomous Database directory from Cloud Object Storage. The overloaded form enables you to use the operation_id parameter. You can filter the list of files to be downloaded using a regular expression pattern compatible with REGEXP_LIKE operator.

Syntax

```
DBMS_CLOUD.BULK_DOWNLOAD (
     credential_name  IN  VARCHAR2 DEFAULT NULL,
     location_uri     IN  VARCHAR2,
     directory_name   IN  VARCHAR2,
     regex_filter     IN  VARCHAR2 DEFAULT NULL,
     format           IN  CLOB     DEFAULT NULL
);

DBMS_CLOUD.BULK_DOWNLOAD (
     credential_name  IN  VARCHAR2 DEFAULT NULL,
     location_uri     IN  VARCHAR2,
     directory_name   IN  VARCHAR2,
     regex_filter     IN  VARCHAR2 DEFAULT NULL,
     format           IN  CLOB     DEFAULT NULL,
     operation_id     OUT NUMBER
);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a `credential_name` value, the `credential_name` is set to `NULL`.
`location_uri`	Specifies URI, that point to an Object Storage location in the Autonomous Database. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
`directory_name`	The name of the directory on the Autonomous Database from where you want to download the files. This parameter is mandatory.
`regex_filter`	Specifies the REGEX expression to filter files. The REGEX expression pattern must be compatible with the `REGEXP_LIKE` operator. If you do not supply a `regex_filter` value, the `regex_filter` is set to `NULL`. See REGEXP_LIKE Condition for more information.

Parameter	Description
format	Specifies the additional configuration options for the file operation. These options are specified as a JSON string. The supported format options are: • logretention: It accepts an integer value that determines the duration in days for which the status table is retained for a bulk operation. The default value is 2 days. • logprefix: It accepts a string value that determines the bulk operation status table name prefix string. For BULK_DOWNLOAD, the default logprefix value is DOWNLOAD. The operation type is the default value. • priority: It accepts a string value that determines the number of file operations performed concurrently. An operation with a higher priority consumes more database resources and is completed sooner. It accepts the following values: – HIGH: Determines the number of parallel files handled using the database's **ECPU count** (**OCPU count** if your database uses OCPUs). – MEDIUM: Determines the number of simultaneous processes using the concurrency limit for Medium service. The default value is 4. – LOW: Process the files in serial order. The default value is MEDIUM. The maximum number of concurrent file operations is limited to 64. If you do not supply a format value, the format is set to NULL.
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.

Example

```
BEGIN
DBMS_CLOUD.BULK_DOWNLOAD (
     credential_name => 'OCI_CRED',
     location_uri    => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o',
     directory_name  => 'BULK_TEST',
     format          => JSON_OBJECT ('logretention' value 7, 'logprefix'
value 'BULKOP')
 );
END;
/
```

BULK_MOVE Procedure

This procedure bulk moves files from one Cloud Object Storage bucket or folder to another. The overloaded form enables you to use the operation_id parameter.

You can filter the list of files to be deleted using a regular expression pattern compatible with REGEXP_LIKE operator.

The source and target bucket or folder can be in the same or different Cloud Object store provider.

When the source and target are in distinct Object Stores or have different accounts with the same cloud provider, you can give separate credential names for the source and target locations.

The source credential name is by default also used by the target location when target credential name is not provided.

The first step in moving files is copying them to the target location, then deleting the source files, once they are successfully copied.

The object is renamed rather than moved if Object Store allows renaming operations between source and target locations.

Syntax

```
DBMS_CLOUD.BULK_MOVE (
      source_credential_name  IN  VARCHAR2 DEFAULT NULL,
      source_location_uri     IN  VARCHAR2,
      target_location_uri     IN  VARCHAR2,
      target_credential_name  IN  VARCHAR2 DEFAULT NULL,
      regex_filter            IN  VARCHAR2 DEFAULT NULL,
      format                  IN  CLOB     DEFAULT NULL
);

DBMS_CLOUD.BULK_MOVE (
      source_credential_name  IN  VARCHAR2 DEFAULT NULL,
      source_location_uri     IN  VARCHAR2,
      target_location_uri     IN  VARCHAR2,
      target_credential_name  IN  VARCHAR2 DEFAULT NULL,
      regex_filter            IN  VARCHAR2 DEFAULT NULL,
      format                  IN  CLOB     DEFAULT NULL,
      operation_id            OUT NUMBER
);
```

Parameters

Parameter	Description
`source_credential_name`	The name of the credential to access the source Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a `source_credential_name` value, the `credential_name` is set to `NULL`.
`source_location_uri`	Specifies URI, that point to the source Object Storage bucket or folder location. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.

Parameter	Description
target_location_uri	Specifies the URI for the target Object Storage bucket or folder, where the files need to be moved. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
target_credential_name	The name of the credential to access the target Cloud Object Storage location. You can use 'OCI$RESOURCE_PRINCIPAL' as the credential_name when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a target_credential_name value, the target_location_uri is set to the source_credential_name value.
regex_filter	Specifies the REGEX expression to filter files. The REGEX expression pattern must be compatible with the REGEXP_LIKE operator. If you do not supply a regex_filter value, the regex_filter is set to NULL. See REGEXP_LIKE Condition for more information.
format	Specifies the additional configuration options for the file operation. These options are specified as a JSON string. The supported format options are: • logretention: It accepts an integer value that determines the duration in days for which the status table is retained for a bulk operation. The default value is 2 days. • logprefix: It accepts a string value that determines the bulk operation status table name prefix string. The operation type is the default value. For BULK_MOVE, the default logprefix value is MOVE. • priority: It accepts a string value that determines the number of file operations performed concurrently. An operation with a higher priority consumes more database resources and is completed sooner. It accepts the following values: – HIGH: Determines the number of parallel files handled using the database's **ECPU count** (**OCPU count** if your database uses OCPUs). – MEDIUM: Determines the number of simultaneous processes using the concurrency limit for Medium service. The default value is 4. – LOW: Process the files in serial order. The default value is MEDIUM. The maximum number of concurrent file operations is limited to 64. If you do not supply a format value, the format is set to NULL.
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.

Example

```
BEGIN
DBMS_CLOUD.BULK_MOVE (
```

```
     source_credential_name => 'OCI_CRED',
     source_location_uri    => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname1/o',
     target_location_uri    => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname2/o',
     format                 => JSON_OBJECT ('logretention' value 7,
'logprefix' value 'BULKMOVE')
);
END;
/
```

> **Note:**
>
> An error is returned when the source and target URI point to the same Object Storage bucket or folder.

BULK_UPLOAD Procedure

This procedure copies files into Cloud Object Storage from an Autonomous Database directory. The overloaded form enables you to use the `operation_id` parameter.

Syntax

```
DBMS_CLOUD.BULK_UPLOAD (
     credential_name  IN  VARCHAR2 DEFAULT NULL,
     location_uri     IN  VARCHAR2,
     directory_name   IN  VARCHAR2,
     regex_filter     IN  VARCHAR2 DEFAULT NULL,
     format           IN  CLOB     DEFAULT NULL
);

DBMS_CLOUD.BULK_UPLOAD (
     credential_name  IN  VARCHAR2 DEFAULT NULL,
     location_uri     IN  VARCHAR2,
     directory_name   IN  VARCHAR2,
     regex_filter     IN  VARCHAR2 DEFAULT NULL,
     format           IN  CLOB     DEFAULT NULL,
     operation_id     OUT NUMBER
);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to access the Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information. If you do not supply a `credential_name` value, the `credential_name` is set to `NULL`.

Parameter	Description
location_uri	Specifies URI, that points to an Object Storage location to upload files. This parameter is mandatory. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information.
directory_name	The name of the directory on the Autonomous Database from where you upload files. This parameter is mandatory.
regex_filter	Specifies the REGEX expression to filter files. The REGEX expression pattern must be compatible with REGEXP_LIKE operator. If you do not supply a regex_filter value, the regex_filter is set to NULL. See REGEXP_LIKE Condition for more information.
format	Specifies the additional configuration options for the file operation. These options are specified as a JSON string. The supported format options are: • logretention: It accepts an integer value that determines the duration in days for which the status table is retained for a bulk operation. The default value is 2 days. • logprefix: It accepts a string value that determines the bulk operation status table name prefix string. The operation type is the default value. For BULK_UPLOAD, the default logprefix value is UPLOAD. • priority: It accepts a string value that determines the number of file operations performed concurrently. An operation with a higher priority consumes more database resources and is completed sooner. It accepts the following values: – HIGH: Determines the number of parallel files handled using the database's **ECPU count** (**OCPU count** if your database uses OCPUs). – MEDIUM: Determines the number of simultaneous processes using the concurrency limit for Medium service. The default value is 4. – LOW: Process the files in serial order. The default value is MEDIUM. The maximum number of concurrent file operations is limited to 64. If you do not supply a format value, the format is set to NULL.
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.

Example

```
BEGIN
DBMS_CLOUD.BULK_UPLOAD (
     credential_name => 'OCI_CRED',
     location_uri    => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o',
     directory_name  => 'BULK_TEST',
     format          => JSON_OBJECT ('logretention' value 5, 'logprefix'
```

```
value 'BULKUPLOAD')
 );
END;
/
```

DBMS_CLOUD REST APIs

This section covers the `DBMS_CLOUD` REST APIs provided with Autonomous Database.

REST API	Description
GET_RESPONSE_HEADERS Function	This function returns the HTTP response headers as JSON data in a JSON object in Autonomous Database.
GET_RESPONSE_RAW Function	This function returns the HTTP response in RAW format Autonomous Database. This is useful if the HTTP response is expected to be binary format.
GET_RESPONSE_STATUS_CODE Function	This function returns the HTTP response status code as an integer in Autonomous Database. The status code helps to identify if the request is successful.
GET_RESPONSE_TEXT Function	This function returns the HTTP response in TEXT format (`VARCHAR2` or `CLOB`) in Autonomous Database. Usually, most Cloud REST APIs return JSON response in text format. This function is useful if you expect the HTTP response is in text format.
GET_API_RESULT_CACHE_SIZE Function	This function returns the configured result cache size.
SEND_REQUEST Function and Procedure	This function begins an HTTP request, gets the response, and ends the response in Autonomous Database. This function provides a workflow for sending a Cloud REST API request with arguments and a return response code and payload.
SET_API_RESULT_CACHE_SIZE Procedure	This procedure sets the maximum cache size for current session.

- DBMS_CLOUD REST API Overview
  When you use PL/SQL in your application and you need to call Cloud REST APIs you can use `DBMS_CLOUD.SEND_REQUEST` to send the REST API requests.
- DBMS_CLOUD REST API Constants
  Describes the `DBMS_CLOUD` constants for making `HTTP` requests using `DBMS_CLOUD.SEND_REQUEST`.
- DBMS_CLOUD REST API Results Cache
  You can save `DBMS_CLOUD` REST API results when you set the `cache` parameter to true with `DBMS_CLOUD.SEND_REQUEST`. The `SESSION_CLOUD_API_RESULTS` view describes the columns you can use when REST API results are saved.
- GET_RESPONSE_HEADERS Function
  This function returns the HTTP response headers as JSON data in a JSON object.
- GET_RESPONSE_RAW Function
  This function returns the HTTP response in RAW format. This is useful if the HTTP response is expected to be binary format.
- GET_RESPONSE_STATUS_CODE Function
  This function returns the HTTP response status code as an integer. The status code helps to identify if the request is successful.

- GET_RESPONSE_TEXT Function
  This function returns the HTTP response in TEXT format (VARCHAR2 or CLOB). Usually, most Cloud REST APIs return JSON response in text format. This function is useful if you expect the HTTP response is in text format.
- GET_API_RESULT_CACHE_SIZE Function
  This function returns the configured result cache size. The cache size value only applies for the current session.
- SEND_REQUEST Function and Procedure
  This function and procedure begins an HTTP request, gets the response, and ends the response. This function provides a workflow for sending a cloud REST API request with arguments and the function returns a response code and payload. If you use the procedure, you can view results and response details from the saved results with the SESSION_CLOUD_API_RESULTS view.
- SET_API_RESULT_CACHE_SIZE Procedure
  This procedure sets the maximum cache size for current session. The cache size value only applies for the current session.
- DBMS_CLOUD REST API Examples
  Shows examples using DBMS_CLOUD.SEND_REQUEST to create and delete an Oracle Cloud Infrastructure Object Storage bucket, and an example to list all compartments in the tenancy.

DBMS_CLOUD REST API Overview

When you use PL/SQL in your application and you need to call Cloud REST APIs you can use DBMS_CLOUD.SEND_REQUEST to send the REST API requests.

The DBMS_CLOUD REST API functions allow you to make HTTP requests using DBMS_CLOUD.SEND_REQUEST and obtain and save results. These functions provide a generic API that lets you call any REST API with the following supported cloud services:

- Oracle Cloud Infrastructure
  See API Reference and Endpoints for information on Oracle Cloud Infrastructure REST APIs.
- Amazon Web Services (AWS)
  See Guides and API References for information on Amazon Web Services REST APIs.
- Azure Cloud [1]
  See Azure REST API Reference for information on Azure REST APIs.
- Oracle Cloud Infrastructure Classic
  See All REST Endpoints for information on Oracle Cloud Infrastructure Classic REST APIs.
- GitHub Repository
  See GitHub REST API for more information.

DBMS_CLOUD REST API Constants

Describes the DBMS_CLOUD constants for making HTTP requests using DBMS_CLOUD.SEND_REQUEST.

DBMS_CLOUD supports GET, PUT, POST, HEAD and DELETE HTTP methods. The REST API method to be used for an HTTP request is typically documented in the Cloud REST API documentation.

[1] Support for Azure Cloud REST API calls is limited to the domain "blob.windows.net".

Name	Type	Value
METHOD_DELETE	VARCHAR2(6)	'DELETE'
METHOD_GET	VARCHAR2(3)	'GET'
METHOD_HEAD	VARCHAR2(4)	'HEAD'
METHOD_POST	VARCHAR2(4)	'POST'
METHOD_PUT	VARCHAR2(3)	'PUT'

DBMS_CLOUD REST API Results Cache

You can save DBMS_CLOUD REST API results when you set the cache parameter to true with DBMS_CLOUD.SEND_REQUEST. The SESSION_CLOUD_API_RESULTS view describes the columns you can use when REST API results are saved.

By default DBMS_CLOUD REST API calls do not save results for your session. In this case you use the DBMS_CLOUD.SEND_REQUEST function to return results.

When you use DBMS_CLOUD.SEND_REQUEST and set the cache parameter to TRUE, results are saved and you can view past results in the SESSION_CLOUD_API_RESULTS view. Saving and querying historical results of DBMS_CLOUD REST API requests can help you when you need to work with your previous results in your applications.

For example, to query recent DBMS_CLOUD REST API results, use the view SESSION_CLOUD_API_RESULTS:

```
SELECT timestamp FROM SESSION_CLOUD_API_RESULTS;
```

When you save DBMS_CLOUD REST API results with DBMS_CLOUD.SEND_REQUEST the saved data is only available within the same session (connection). After the session exits, the saved data is no longer available.

Use DBMS_CLOUD.GET_API_RESULT_CACHE_SIZE and DBMS_CLOUD.SET_API_RESULT_CACHE_SIZE to view and set the DBMS_CLOUD REST API cache size, and to disable caching.

- DBMS_CLOUD REST API Results cache_scope Parameter
  When you save DBMS_CLOUD REST API results with DBMS_CLOUD.SEND_REQUEST, access to the results in SESSION_CLOUD_API_RESULTS is provided based on the value of cache_scope.
- DBMS_CLOUD REST API SESSION_CLOUD_API_RESULTS View
  You can save DBMS_CLOUD REST API results when you set the cache parameter to true with DBMS_CLOUD.SEND_REQUEST. The SESSION_CLOUD_API_RESULTS view describes the columns you can use when REST API results are saved.

DBMS_CLOUD REST API Results cache_scope Parameter

When you save DBMS_CLOUD REST API results with DBMS_CLOUD.SEND_REQUEST, access to the results in SESSION_CLOUD_API_RESULTS is provided based on the value of cache_scope.

By default cache_scope is 'PRIVATE' and only the current user of the session can access the results. If you set the cache_scope to 'PUBLIC', then all session users can access the results. The default value for cache_scope specifies that each user can only see DBMS_CLOUD.SEND_REQUEST REST API results generated by the procedures they invoke with invoker's rights. When you invoke DBMS_CLOUD.SEND_REQUEST in a session, there are three possibilities that determines if the current user can see results in the cache, based on the cache_scope value:

- You directly execute `DBMS_CLOUD.SEND_REQUEST` as a top-level statement and the call to `DBMS_CLOUD.SEND_REQUEST` and the REST API results are saved with the same username. In this case you have access to all results with the default value, `'PRIVATE'`, set for `cache_scope`.
- You write a wrapper invoker's rights procedure and as the current user your call with `DBMS_CLOUD.SEND_REQUEST` calls the procedure and the REST API results are saved with the same username. In this case, and you have access to all results with the default value, `'PRIVATE'`, set for `cache_scope`.
- You write a wrapper definer's rights procedure and the procedure is owned by another user. When you call `DBMS_CLOUD.SEND_REQUEST` inside the procedure, the results are saved with the username of the procedure owner.

  For this case, a different definer's rights user is invoking `DBMS_CLOUD.SEND_REQUEST`, and the REST API results are saved with that definers procedure's owner. For this case, by default when `cache_scope` is `PRIVATE'`, the invoker's session cannot see the results.

  If the definer's procedure owner wants to make the results available to any invoking session user, then they must set `cache_scope` to `'PUBLIC'` in the `DBMS_CLOUD.SEND_REQUEST`.

DBMS_CLOUD REST API SESSION_CLOUD_API_RESULTS View

You can save `DBMS_CLOUD` REST API results when you set the `cache` parameter to true with `DBMS_CLOUD.SEND_REQUEST`. The `SESSION_CLOUD_API_RESULTS` view describes the columns you can use when REST API results are saved.

The view `SESSION_CLOUD_API_RESULTS` is the view created if you cache results with `DBMS_CLOUD.SEND_REQUEST`. You can query historical results which belong to your user session. When the session ends, the data in the `SESSION_CLOUD_API_RESULTS` is purged.

Column	Description
`URI`	The `DBMS_CLOUD` REST API request URL
`TIMESTAMP`	The `DBMS_CLOUD` REST API response timestamp
`CLOUD_TYPE`	The `DBMS_CLOUD` REST API cloud type, such as Oracle Cloud Infrastructure, AMAZON_S3, and AZURE_BLOB
`REQUEST_METHOD`	The `DBMS_CLOUD` REST API request method, such as `GET`, `PUT`, `HEAD`
`REQUEST_HEADERS`	The `DBMS_CLOUD` REST API request headers
`REQUEST_BODY_TEXT`	The `DBMS_CLOUD` REST API request body in `CLOB`
`RESPONSE_STATUS_CODE`	The `DBMS_CLOUD` REST API response status code, such as `200(OK)`, `404(Not Found)`
`RESPONSE_HEADERS`	The `DBMS_CLOUD` REST API response headers
`RESPONSE_BODY_TEXT`	The `DBMS_CLOUD` REST API response body in `CLOB`
`SCOPE`	The `cache_scope` set by `DBMS_CLOUD.SEND_REQUEST`. Valid values are `PUBLIC` or `PRIVATE`.

GET_RESPONSE_HEADERS Function

This function returns the HTTP response headers as JSON data in a JSON object.

Syntax

```
DBMS_CLOUD.GET_RESPONSE_HEADERS(
       resp           IN DBMS_CLOUD_TYPES.resp)
   RETURN JSON_OBJECT_T;
```

Parameters

Parameter	Description
resp	HTTP Response type returned from DBMS_CLOUD.SEND_REQUEST.

Exceptions

Exception	Error	Description
invalid_response	ORA-20025	Invalid response type object passed to DBMS_CLOUD.GET_RESPONSE_HEADERS.

GET_RESPONSE_RAW Function

This function returns the HTTP response in RAW format. This is useful if the HTTP response is expected to be binary format.

Syntax

```
DBMS_CLOUD.GET_RESPONSE_RAW(
       resp           IN DBMS_CLOUD_TYPES.resp)
   RETURN BLOB;
```

Parameters

Parameter	Description
resp	HTTP Response type returned from DBMS_CLOUD.SEND_REQUEST.

Exceptions

Exception	Error	Description
invalid_response	ORA-20025	Invalid response type object passed to DBMS_CLOUD.GET_RESPONSE_RAW.

GET_RESPONSE_STATUS_CODE Function

This function returns the HTTP response status code as an integer. The status code helps to identify if the request is successful.

Syntax

```
DBMS_CLOUD.GET_RESPONSE_STATUS_CODE(
       resp           IN DBMS_CLOUD_TYPES.resp)
   RETURN PLS_INTEGER;
```

Parameters

Parameter	Description
resp	HTTP Response type returned from DBMS_CLOUD.SEND_REQUEST.

Exceptions

Exception	Error	Description
invalid_response	ORA-20025	Invalid response type object passed to DBMS_CLOUD.GET_RESPONSE_STATUS_CODE.

GET_RESPONSE_TEXT Function

This function returns the HTTP response in TEXT format (VARCHAR2 or CLOB). Usually, most Cloud REST APIs return JSON response in text format. This function is useful if you expect the HTTP response is in text format.

Syntax

```
DBMS_CLOUD.GET_RESPONSE_TEXT(
       resp           IN DBMS_CLOUD_TYPES.resp)
   RETURN CLOB;
```

Parameters

Parameter	Description
resp	HTTP Response type returned from DBMS_CLOUD.SEND_REQUEST.

Exceptions

Exception	Error	Description
invalid_response	ORA-20025	Invalid response type object passed to DBMS_CLOUD.GET_RESPONSE_TEXT.

GET_API_RESULT_CACHE_SIZE Function

This function returns the configured result cache size. The cache size value only applies for the current session.

Syntax

```
DBMS_CLOUD.GET_API_RESULT_CACHE_SIZE()
   RETURN NUMBER;
```

SEND_REQUEST Function and Procedure

This function and procedure begins an HTTP request, gets the response, and ends the response. This function provides a workflow for sending a cloud REST API request with arguments and the function returns a response code and payload. If you use the procedure, you can view results and response details from the saved results with the `SESSION_CLOUD_API_RESULTS` view.

Syntax

```
DBMS_CLOUD.SEND_REQUEST(
       credential_name    IN VARCHAR2,
       uri                IN VARCHAR2,
       method             IN VARCHAR2,
       headers            IN CLOB DEFAULT NULL,
       async_request_url  IN VARCHAR2 DEFAULT NULL,
       wait_for_states    IN DBMS_CLOUD_TYPES.wait_for_states_t DEFAULT NULL,
       timeout            IN NUMBER DEFAULT 0,
       cache              IN PL/SQL BOOLEAN DEFAULT FALSE,
       cache_scope        IN VARCHAR2 DEFAULT 'PRIVATE',
       body               IN BLOB DEFAULT NULL)
   RETURN DBMS_CLOUD_TYPES.resp;

DBMS_CLOUD.SEND_REQUEST(
       credential_name    IN VARCHAR2,
       uri                IN VARCHAR2,
       method             IN VARCHAR2,
       headers            IN CLOB DEFAULT NULL,
       async_request_url  IN VARCHAR2 DEFAULT NULL,
       wait_for_states    IN DBMS_CLOUD_TYPES.wait_for_states_t DEFAULT NULL,
       timeout            IN NUMBER DEFAULT 0,
       cache              IN PL/SQL BOOLEAN DEFAULT FALSE,
       cache_scope        IN VARCHAR2 DEFAULT 'PRIVATE',
       body               IN BLOB DEFAULT NULL);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential for authenticating with the corresponding cloud native API. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. See ENABLE_RESOURCE_PRINCIPAL for more information.
`uri`	HTTP URI to make the request.
`method`	HTTP Request Method: `GET`, `PUT`, `POST`, `HEAD`, `DELETE`. Use the `DBMS_CLOUD` package constant to specify the method. See DBMS_CLOUD REST API Constants for more information.

Parameter	Description
headers	HTTP Request headers for the corresponding cloud native API in JSON format. The authentication headers are set automatically, only pass custom headers.
async_request_url	An asynchronous request URL. To obtain the URL select your request API from the list of APIs (see https://docs.cloud.oracle.com/en-us/iaas/api/). Then, navigate to find the API for your request in the left pane. For example, Database Services API → Autonomous Database → StopAutonomousDatabase. This page shows the API home (and shows the base endpoint). Then, append the base endpoint with the relative path obtained for your work request WorkRequest link.
wait_for_states	Wait for states is a status of type: DBMS_CLOUD_TYPES.wait_for_states_t. The following are valid values for expected states: 'ACTIVE', 'CANCELED', 'COMPLETED', 'DELETED', 'FAILED', 'SUCCEEDED'. Multiple states are allowed for wait_for_states. The default value for wait_for_states is to wait for any of the expected states: 'ACTIVE', 'CANCELED', 'COMPLETED', 'DELETED', 'FAILED', 'SUCCEEDED'.
timeout	Specifies the timeout, in seconds, for asynchronous requests with the parameters async_request_url and wait_for_states. Default value is 0. This indicates to wait for completion of the request without any timeout.
cache	If TRUE specifies the request should be cached in REST result API cache. The default value is FALSE, which means REST API requests are not cached.
cache_scope	Specifies whether everyone can have access to this request result cache. Valid values: "PRIVATE" and "PUBLIC". The default value is "PRIVATE".
body	HTTP Request Body for PUT and POST requests.

Exceptions

Exception	Error	Description
invalid_req_method	ORA-20023	Request method passed to DBMS_CLOUD.SEND_REQUEST is invalid.
invalid_req_header	ORA-20024	Request headers passed to DBMS_CLOUD.SEND_REQUEST are not in valid JSON format.

Usage Notes

- If you are using Oracle Cloud Infrastructure, you must use a Signing Key based credential value for the credential_name. See CREATE_CREDENTIAL Procedure for more information.
- The optional parameters async_request_url, wait_for_states, and timeout allow you to handle long running requests. Using this asynchronous form of send_request, the function waits for the completion status specified in wait_for_states before returning. With these parameters in the send request, you pass the expected return states in the wait_for_states parameter, and you use the async_request_url parameter to specify an

associated work request, the request does not return immediately. Instead, the request probes the `async_request_url` until the return state is one of the expected states or the `timeout` is exceeded (`timeout` is optional). If no `timeout` is specified, the request waits until a state found in `wait_for_states` occurs.

SET_API_RESULT_CACHE_SIZE Procedure

This procedure sets the maximum cache size for current session. The cache size value only applies for the current session.

Syntax

```
DBMS_CLOUD.SET_API_RESULT_CACHE_SIZE(
       cache_size          IN NUMBER);
```

Parameters

Parameter	Description
`cache_size`	Set the maximum cache size to the specified value `cache_size`. If the new maximum cache size is smaller than the current cache size, older records are dropped until the number of rows is equal to the specified maximum cache size. The maximum value is `10000`. If the cache size is set to `0`, caching is disabled in the session. The default cache size is `10`.

Exceptions

Exception	Error	Description
`invalid API result cache size`	`ORA-20032`	The minimum value is 0 and the maximum value is 10000. This exception is shown when the input value is less than 0 or is larger than 10000.

Example

```
EXEC DBMS_CLOUD.SET_API_RESULT_CACHE_SIZE(101);
```

DBMS_CLOUD REST API Examples

Shows examples using `DBMS_CLOUD.SEND_REQUEST` to create and delete an Oracle Cloud Infrastructure Object Storage bucket, and an example to list all compartments in the tenancy.

> **Note:**
>
> These examples show Oracle Cloud Infrastructure request APIs and require that you use a Signing Key based credential for the `credential_name`. Oracle Cloud Infrastructure Signing Key based credentials include the `private_key` and `fingerprint` arguments.
>
> For example:
>
> ```
> BEGIN
>    DBMS_CLOUD.CREATE_CREDENTIAL (
>        credential_name => 'OCI_KEY_CRED',
>        user_ocid       =>
> 'ocid1.user.oc1..aaaaaaaauq54mi7zdyfhw33ozkwuontjceel7fok5nq3bf2vwetkp
> qsoa',
>        tenancy_ocid    =>
> 'ocid1.tenancy.oc1..aabbbbbbaafcue47pqmrf4vigneebgbcmmoy5r7xvoypicjqqg
> e32ewnrcyx2a',
>        private_key     =>
> 'MIIEogIBAAKCAQEAtUnxbmrekwgVac6FdWeRzoXvIpA9+0r1.....wtnNpESQQQ0QLGPD
> 8NM//JEBg=',
>        fingerprint     =>
> 'f2:db:f9:18:a4:aa:fc:94:f4:f6:6c:39:96:16:aa:27');
> END;
> /
> ```
>
> See CREATE_CREDENTIAL Procedure for information on `DBMS_CLOUD.CREATE_CREDENTIAL`.

Create Bucket Example

Shows an example using `DBMS_CLOUD.SEND_REQUEST` with HTTP `POST` method to create an object store bucket named *`bucketname`*.

See CreateBucket for details on the Oracle Cloud Infrastructure Object Storage Service API for this example.

```
SET SERVEROUTPUT ON
DECLARE
  resp DBMS_CLOUD_TYPES.resp;
BEGIN
  -- Send request
  resp := DBMS_CLOUD.send_request(
            credential_name => 'OCI_KEY_CRED',
            uri => 'https://objectstorage.region.oraclecloud.com/n/namespace-
string/b/',
            method => DBMS_CLOUD.METHOD_POST,
            body => UTL_RAW.cast_to_raw(
                        JSON_OBJECT('name' value 'bucketname',
                                    'compartmentId' value 'compartment_OCID'))
          );

  -- Response Body in TEXT format
  dbms_output.put_line('Body: ' || '------------' || CHR(10) ||
```

```
  DBMS_CLOUD.get_response_text(resp) || CHR(10));

  -- Response Headers in JSON format
  dbms_output.put_line('Headers: ' || CHR(10) || '------------' || CHR(10) ||
  DBMS_CLOUD.get_response_headers(resp).to_clob || CHR(10));

  -- Response Status Code
  dbms_output.put_line('Status Code: ' || CHR(10) || '------------' ||
CHR(10) ||
  DBMS_CLOUD.get_response_status_code(resp));

END;
/
```

Notes:

- In this example, *namespace-string* is the Oracle Cloud Infrastructure object storage namespace and *bucketname* is the bucket name. See Understanding Object Storage Namespaces for more information.
- Where: *region* is an endpoint region. See Object Storage API reference in API Reference and Endpoints for more information. For example, where *region* is: `us-phoenix-1`.

Delete Bucket Example

Shows an example using `DBMS_CLOUD.SEND_REQUEST` with HTTP `DELETE` method to delete an object store bucket named *bucketname*.

See DeleteBucket for details on the Oracle Cloud Infrastructure Object Storage Service API for this example.

```
SET SERVEROUTPUT ON
DECLARE
  resp DBMS_CLOUD_TYPES.resp;
BEGIN
  -- Send request
  resp := DBMS_CLOUD.send_request(
            credential_name => 'OCI_KEY_CRED',
            uri => 'https://objectstorage.region.oraclecloud.com/n/namespace-
string/b/bucketname',
            method => DBMS_CLOUD.METHOD_DELETE
          );

  -- Response Body in TEXT format
  dbms_output.put_line('Body: ' || '------------' || CHR(10) ||
  DBMS_CLOUD.get_response_text(resp) || CHR(10));

  -- Response Headers in JSON format
  dbms_output.put_line('Headers: ' || CHR(10) || '------------' || CHR(10) ||
  DBMS_CLOUD.get_response_headers(resp).to_clob || CHR(10));

  -- Response Status Code
  dbms_output.put_line('Status Code: ' || CHR(10) || '------------' ||
CHR(10) ||
  DBMS_CLOUD.get_response_status_code(resp));
```

```
END;
/
```

Notes:

- In this example, *namespace-string* is the Oracle Cloud Infrastructure object storage namespace and *bucketname* is the bucket name. See Understanding Object Storage Namespaces for more information.
- Where: *region* is an endpoint region. See Object Storage API reference in API Reference and Endpoints for more information. For example, where *region* is: `us-phoenix-1`.

List Compartments Example

Shows an example using `DBMS_CLOUD.SEND_REQUEST` with HTTP `GET` method to list all compartments in the tenancy (root compartment). This example shows how to pass request headers in the `DBMS_CLOUD.SEND_REQUEST`.

See ListCompartments for details on the Oracle Cloud Infrastructure Identity and Access Management Service API for this example.

```
--
-- List compartments
--
DECLARE
  resp DBMS_CLOUD_TYPES.resp;
  root_compartment_ocid VARCHAR2(512) := '&1';
BEGIN
  -- Send request
  dbms_output.put_line('Send Request');
  resp := DBMS_CLOUD.send_request(
            credential_name => 'OCI_KEY_CRED',
            uri => 'https://identity.region.oraclecloud.com/20160918/
compartments?compartmentId=' || root_compartment_ocid,
            method => DBMS_CLOUD.METHOD_GET,
            headers => JSON_OBJECT('opc-request-id' value 'list-compartments')
          );
  dbms_output.put_line('Body: ' || '------------' || CHR(10) ||
DBMS_CLOUD.get_response_text(resp) || CHR(10));
  dbms_output.put_line('Headers: ' || CHR(10) || '------------' || CHR(10) ||
DBMS_CLOUD.get_response_headers(resp).to_clob || CHR(10));
  dbms_output.put_line('Status Code: ' || CHR(10) || '------------' ||
CHR(10) || DBMS_CLOUD.get_response_status_code(resp));
  dbms_output.put_line(CHR(10));
END;
/
```

Where: *region* is an endpoint region. See Identity and Access Management (IAM) API reference in API Reference and Endpoints for more information. For example, where *region* is: `uk-london-1`.

Asynchronous Request Example

Shows an example using `DBMS_CLOUD.SEND_REQUEST` with HTTP `POST` method to perform the Autonomous Database stop operation and wait for status. This example shows how to use

DBMS_CLOUD.SEND_REQUEST with the async_request_url, wait_for_states, and timeout parameters.

```
--
-- Sent Work Request Autonomous Database Stop Request with Wait for Status
DECLARE
    l_resp DBMS_CLOUD_TYPES.resp;
    l_resp_json JSON_OBJECT_T;
    l_key_shape JSON_OBJECT_T;
    l_body JSON_OBJECT_T;
    status_array DBMS_CLOUD_TYPES.wait_for_states_t;
BEGIN
  status_array := DBMS_CLOUD_TYPES.wait_for_states_t('SUCCEEDED');
  l_body := JSON_OBJECT_T('{}');
  l_body.put('autonomousDatabaseId', 'ocid');
-- Send request
  dbms_output.put_line(l_body.to_clob);
  dbms_output.put_line('Send Request');
  l_resp := DBMS_CLOUD.send_request(
                        credential_name    => 'NATIVE_CRED_OCI',
                        uri                => 'https://
database.region.oraclecloud.com/20160918/autonomousDatabases/ocid/actions/
stop',
                        method             => DBMS_CLOUD.METHOD_POST,
                        body               =>
UTL_RAW.cast_to_raw(l_body.to_clob),
                        async_request_url  => 'https://
iaas.region.oraclecloud.com/20160918/workRequests',
                        wait_for_states    => status_array,
                        timeout            => 600
                    );
   dbms_output.put_line('resp body: '||DBMS_CLOUD.get_response_text(l_resp));
   dbms_output.put_line('resp headers: '||
DBMS_CLOUD.get_response_headers(l_resp).to_clob);
END;
/
```

Where: *region* is an endpoint region. See Identity and Access Management (IAM) API reference in API Reference and Endpoints for more information. For example, where *region* is: uk-london-1.

The *ocid* is the Oracle Cloud Infrastructure resource identifier. See Resource Identifiers for more information.

DBMS_CLOUD URI Formats

Describes the format of the source file URIs in operations with DBMS_CLOUD. The format depends on the object storage service you are using.

DBMS_CLOUD guarantees secure communication and any URI that you specify must use HTTPS, with https:// as the prefix for the URI.

- Oracle Cloud Infrastructure Object Storage Native URI Format
- Oracle Cloud Infrastructure Object Storage Swift URI Format

- Oracle Cloud Infrastructure Object Storage URI Format Using Pre-Authenticated Request URL
- URI Format Using Public URL
- Oracle Cloud Infrastructure Object Storage Classic URI Format
- Amazon S3 URI Format
- Azure Blob Storage or Azure Data Lake Storage URI Format
- Amazon S3 Compatible URI Format
- GitHub Raw URL Format
  `DBMS_CLOUD` supports GitHub Raw URLs to access data from a GitHub Repository.
- Additional Customer-Managed URI Formats

Oracle Cloud Infrastructure Object Storage Native URI Format

If your source files reside on Oracle Cloud Infrastructure Object Storage in the commercial realm (OC1), it is recommended that you use the following URI format which uses Object Storage Dedicated Endpoints. See Object Storage Dedicated Endpoints, for further information.

```
https://namespace-string.objectstorage.region.oci.customer-oci.com/n/
namespace-string/b/bucketname/o/filename
```

> **Note:**
>
> OCI Object Store dedicated endpoint URLs are only supported in commercial realms (OC1).

If your source files reside on Oracle Cloud Infrastructure Object Storage and are not in the commercial realm (OC1), you must use the following format:

```
https://objectstorage.region.oraclecloud.com/n/namespace-string/b/bucket/o/
filename
```

For example, in the commercial realm (OC1) the Native URI for the file `channels.txt` in the *bucketname* bucket in the `Phoenix` data center is:

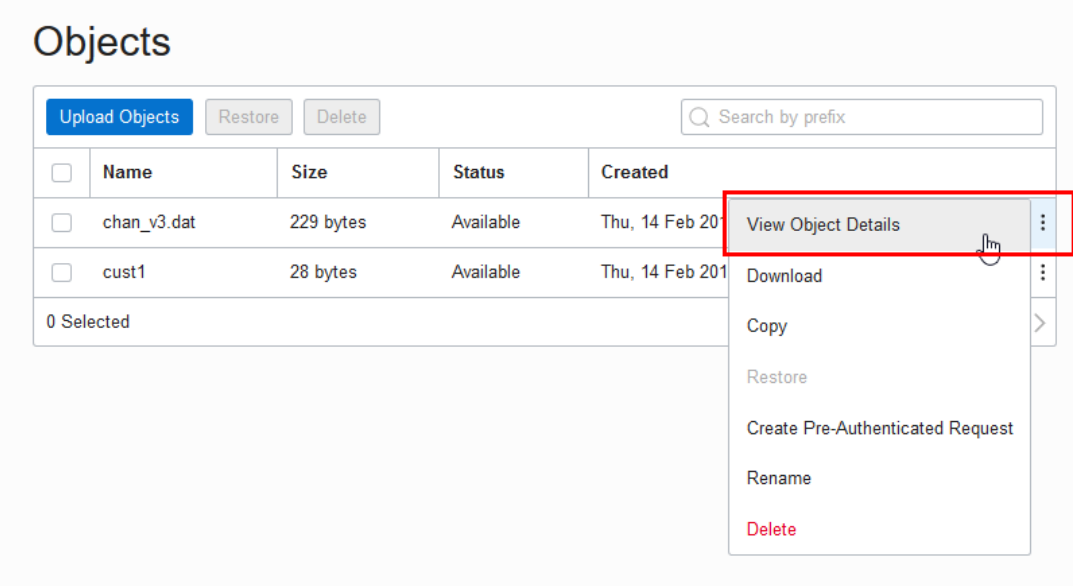
```
https://namespace.objectstorage.region.oci.customer-oci.com/n/namespace/b/
bucketname/o/channels.txt
```

In this example, *namespace-string* is the Oracle Cloud Infrastructure object storage namespace and *bucketname* is the bucket name. See Understanding Object Storage Namespaces for more information.

You can find the URI from the Oracle Cloud Infrastructure Object Storage "Object Details" in the right hand side ellipsis menu in the Object Store:

1. Open the Oracle Cloud Infrastructure Console by clicking the ☰ next to Oracle Cloud.

2. From the Oracle Cloud Infrastructure left navigation menu click **Core Infrastructure**. Under **Object Storage**, click **Object Storage**.
3. Under List Scope, select a **Compartment**.
4. From the **Name** column, select a bucket.
5. In the Objects area, click **View Object Details**.



6. On the **Object Details** page, the **URL Path (URI)** field shows the URI to access the object.

> **Note:**
>
> The source files need to be stored in an Object Storage tier bucket. Autonomous Database does not support buckets in the Archive Storage tier. See Overview of Object Storage for more information.

Oracle Cloud Infrastructure Object Storage Swift URI Format

If your source files reside on Oracle Cloud Infrastructure Object Storage in the commercial realm (OC1), it is recommended that you use the following URI format which uses Object Storage Dedicated Endpoints. See Object Storage Dedicated Endpoints, for further information.

```
https://namespace-string.swiftobjectstorage.region.oci.customer-oci.com/v1/
namespace-string/bucket/filename
```

> **Note:**
>
> OCI Object Store dedicated endpoint URLs are only supported in the commercial realms (OC1).

If your source files reside on Oracle Cloud Infrastructure Object Storage and are not in the commercial realm (OC1), you must use the following format:

```
https://swiftobjectstorage.region.oraclecloud.com/v1/namespace-string/bucket/
filename
```

For example, in the commercial realm (OC1) the Swift URI for the file `channels.txt` in the *bucketname* bucket in the `Phoenix` data center is:

```
https://namespace-string.swiftobjectstorage.us-phoenix-1.oci.customer-
oci.com/v1/namespace-string/bucketname/channels.txt
```

In this example, *namespace-string* is the Oracle Cloud Infrastructure object storage namespace and *bucketname* is the bucket name. See Understanding Object Storage Namespaces for more information.

> **Note:**
>
> The source files need to be stored in an Object Storage tier bucket. Autonomous Database does not support buckets in the Archive Storage tier. See Overview of Object Storage for more information.

Oracle Cloud Infrastructure Object Storage URI Format Using Pre-Authenticated Request URL

If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use Oracle Cloud Infrastructure pre-authenticated URIs. When you create a pre-authenticated request, a unique URL is generated. You can then provide the unique URL to users in your organization, partners, or third parties to access the Object Storage resource target identified in the pre-authenticated request.

> **Note:**
>
> Carefully assess the business requirement for and the security ramifications of pre-authenticated access. When you create the pre-authenticated request URL, note the **Expiration** and the **Access type** to make sure they are appropriate for your use. A pre-authenticated request URL gives anyone who has the URL access to the targets identified in the request for as long as the request is active. In addition to considering the operational needs of pre-authenticated access, it is equally important to manage its distribution.

If your source files reside on Oracle Cloud Infrastructure Object Storage in the commercial realm (OC1), it is recommended that you use the following URI format which uses Object Storage Dedicated Endpoints. See Object Storage Dedicated Endpoints, for further information.

```
https://namespace-string.objectstorage.region.oci.customer-oci.com/p/encrypted_string/n/
namespace-string/b/bucket/o/filename
```

> **Note:**
>
> OCI Object Store dedicated endpoint URLs are only supported in the commercial realms (OC1).

If your source files reside on Oracle Cloud Infrastructure Object Storage and are not in the commercial realm (OC1), you must use the following format:

```
https://objectstorage.region.oraclecloud.com.com/p/encrypted_string/n/namespace-string/b/
bucket/o/filename
```

For example, in the commercial realm (OC1) a sample pre-authenticated URI for the file `channels.txt` in the *bucketname* bucket in the `Phoenix` data center is:

```
https://namespace-string.objectstorage.us-phoenix-1.oci.customer-oci.com/p/2xN-
uDtWJNsiD910UCYGue/n/namespace-string/b/bucketname/o/channels.txt
```

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

You can use a pre-authenticated URL in any `DBMS_CLOUD` procedure that takes a URL to access files in Oracle Cloud Infrastructure object store, without the need to create a credential. You need to either specify the `credential_name` parameter as `NULL` or not supply a `credential_name` parameter.

For example:

```
BEGIN
  DBMS_CLOUD.COPY_DATA(
     table_name =>'CHANNELS',
     file_uri_list =>'https://objectstorage.us-phoenix-1.oraclecloud.com/p/
unique-pre-authenticated-string/n/namespace-string/b/bucketname/o/
channels.txt',
     format => json_object('delimiter' value ',') );
END;
/
```

> **Note:**
>
> A list of mixed URLs is valid. If the URL list contains both pre-authenticated URLs and URLs that require authentication, `DBMS_CLOUD` uses the specified `credential_name` to access the URLs that require authentication and for the pre-authenticated URLs the specified `credential_name` is ignored.

See Using Pre-Authenticated Requests for more information.

URI Format Using Public URL

If your source files reside on an Object Store that provides public URLs, you can use public URLs with `DBMS_CLOUD` procedures. Public means the Object Storage service supports anonymous, unauthenticated access to the Object Store files. See your Cloud Object Storage service for details on how to make an object public in a supported Object Store.

> **Note:**
>
> Carefully assess the business requirement for and the security ramifications of using public URLs. When you use public URLs, due to the file content not being authenticated, make sure this is appropriate for your use.

You can use a public URL in any `DBMS_CLOUD` procedure that takes a URL to access files in your object store, without the need to create a credential. You need to either specify the `credential_name` parameter as `NULL` or not supply a `credential_name` parameter.

For example the following uses `DBMS_CLOUD.COPY_DATA` without a `credential_name`:

```
BEGIN
  DBMS_CLOUD.COPY_DATA(
     table_name =>'CHANNELS',
     file_uri_list =>'https://objectstorage.us-ashburn-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/chan_v3.dat',
     format => json_object('delimiter' value ',') );
END;
/
```

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

> **Note:**
>
> A list of mixed URLs is valid. If the URL list contains both public URLs and URLs that require authentication, `DBMS_CLOUD` uses the specified `credential_name` to access the URLs that require authentication and for the public URLs the specified `credential_name` is ignored.

See Public Buckets for information on using Oracle Cloud Infrastructure public buckets.

Oracle Cloud Infrastructure Object Storage Classic URI Format

If your source files reside in Oracle Cloud Infrastructure Object Storage Classic, see the REST page for a description of the URI format for accessing your files: About REST URLs for Oracle Cloud Infrastructure Object Storage Classic Resources.

Amazon S3 URI Format

If your source files reside in Amazon S3, see the following for a description of the URI format for accessing your files: Accessing a bucket.

For example the following refers to the file `channels.txt` in the `adb` bucket in the `us-west-2` region.

```
https://s3-us-west-2.amazonaws.com/adb/channels.txt
```

You can use a presigned URL in any `DBMS_CLOUD` procedure that takes a URL to access files in Amazon S3 object store, without the need to create a credential. To use a presigned URL in

any DBMS_CLOUD procedure, either specify the credential_name parameter as NULL, or do not supply a credential_name parameter.

See Share an Object with Others for more information.

> **Note:**
>
> DBMS_CLOUD supports the standard Amazon S3 endpoint syntax to access your buckets. DBMS_CLOUD does not support Amazon S3 legacy endpoints. See Legacy Endpoints for more information.

Azure Blob Storage or Azure Data Lake Storage URI Format

If your source files reside in Azure Blob Storage or Azure Data Lake Storage, see the following for a description of the URI format for accessing your files: Resource URI Syntax.

For example the following refers to the file channels.txt in the adb container in the storage account adb_user:

```
https://adb_user.blob.core.windows.net/adb/channels.txt
```

> **Note:**
>
> You can use Shared Access Signatures (SAS) URL in any DBMS_CLOUD procedure that takes a URL to access files in Azure Blob Storage or Azure Data Lake Storage, without the need to create a credential. To use a Shared Access Signature (SAS) URL, either specify the credential_name parameter as NULL, or do not supply a credential_name parameter.
> See Grant Limited Access to Azure Storage Resources Using Shared Access Signatures (SAS) for more information.

Amazon S3 Compatible URI Format

DBMS_CLOUD supports object storage service implementations that support Amazon S3 compatible URLs, including the following services:

- Oracle Cloud Infrastructure Object Storage with Amazon S3 compatible URL
- Google Cloud Storage with Amazon S3 compatible URL
- Wasabi Hot Cloud Storage with Amazon S3 compatible URL

> **Note:**
>
> To use DBMS_CLOUD with an Amazon S3 compatible object store you need to provide valid credentials. See CREATE_CREDENTIAL Procedure for more information.

If your source files reside on a service that supports Amazon S3 compatible URIs, use the following URI format to access your files:

- **Oracle Cloud Infrastructure Object Storage S3 Compatible URL**

  If your source files reside on Oracle Cloud Infrastructure Object Storage in the commercial realm (OC1), it is recommended that you use the object URL and bucket URL formats listed below for commercial realm (OC1). See Object Storage Dedicated Endpoints, for further information.

  > **Note:**
  >
  > OCI Object Store dedicated endpoint URLs are only supported in the commercial realms (OC1).

  Object URL Formats

  – Supported only in the commercial realm (OC1):

  ```
  https://mynamespace.compat.objectstorage.region.oci.customer-oci.com/
  bucket_name/object_name
  ```

  – Supported in all zones:

  ```
  https://mynamespace.compat.objectstorage.region.oraclecloud.com/
  bucket_name/object_name
  ```

  Bucket URL Formats:

  – Supported only in the commercial realm (OC1):

  ```
  https://mynamespace.compat.objectstorage.region.oci.customer-oci.com/
  bucket_name
  ```

  – Supported in all zones:

  ```
  https://mynamespace.compat.objectstorage.region.oraclecloud.com/
  bucket_name
  ```

  See Amazon S3 Compatibility and Object Storage Service API for more information.

- **Google Cloud Storage S3 Compatible URL**

  Object URL Format:

  ```
  https://bucketname.storage.googleapis.com/object_name
  ```

  Bucket URL Format:

  ```
  https://bucketname.storage.googleapis.com/
  ```

  See Migrating from Amazon S3 to Cloud Storage and Request Endpoints for more information.

- **Wasabi S3 Compatible URL**

Object URL Format:

```
https://bucketname.s3.region.wasabisys.com/object_name
```

Bucket URL Format:

```
https://bucketname.s3.region.wasabisys.com/
```

See Wasabi S3 API Reference and Service URLs for Wasabi's Storage Regions for more information.

GitHub Raw URL Format

DBMS_CLOUD supports GitHub Raw URLs to access data from a GitHub Repository.

> **Note:**
>
> For DBMS_CLOUD access with GitHub Raw URLs, repository access is limited to read-only functionality. The DBMS_CLOUD APIs such as DBMS_CLOUD.PUT_OBJECT that write data are not supported with DBMS_CLOUD APIs on a GitHub Repository.
> As an alternative, use DBMS_CLOUD_REPO.PUT_FILE to upload data to a GitHub Repository.

Use GitHub Raw URLs with DBMS_CLOUD APIs to access source files that reside on a GitHub Repository. When you browse to a file on GitHub and click the **Raw** link, this shows the GitHub Raw URL. The raw.githubusercontent.com domain provides unprocessed versions of files stored in GitHub repositories.

For example, using DBMS_CLOUD.GET_OBJECT:

```
BEGIN
 DBMS_CLOUD.GET_OBJECT(
   credential_name => 'MY_CRED',
   object_uri      => 'https://raw.githubusercontent.com/myaccount/myrepo/
master/data-management-library/autonomous-database/adb-loading.csv',
   directory_name  => 'DATA_PUMP_DIR'
  );
END;
/
```

For example, using DBMS_CLOUD.CREATE_EXTERNAL_TABLE:

```
BEGIN
  DBMS_CLOUD.CREATE_EXTERNAL_TABLE(
    credential_name => 'MY_CRED',
    table_name      => 'EMPLOYEES_EXT',
    file_uri_list   => 'https://raw.githubusercontent.com/myaccount/myrepo/
master/data-management-library/autonomous-database/*.csv',
    column_list     => 'name varchar2(30), gender varchar2(30), salary
number',
    format          => JSON_OBJECT('type' value 'csv')
```

```
  );
END;
/
SELECT * FROM employees_ext;
```

DBMS_CLOUD procedures that take a URL to access a GitHub Repository do not require credentials with public visibility GitHub repositories. To use a public visibility URL you can specify the credential_name parameter as NULL or not supply a credential_name parameter. See Setting repository visibility for more information.

Additional Customer-Managed URI Formats

In addition to the pre-configured, recognized URIs with their fully-qualified domain names (FQDNs), DBMS_CLOUD cannot determine the proper authentication scheme for customer-managed endpoints URIs. In those cases, DBMS_CLOUD relies on the proper URI scheme to identify the authentication scheme for the customer-managed endpoint.

URI Scheme	Authentication Type	Access Method Description	URI Example
basic://	Basic authentication	Username and password stored in database credential object is used to authenticate the HTTP request	basic://api.github.com/users/myaccount
bearer://	Bearer token authentication	Bearer token stored in the password field in database credential object is used to specify the Authorization header for the HTTP request	bearer://api.sendgrid.com/v3/resource
oci://	OCI native	OCI signing key obtained from database credential object stored and used to sign requests using the OCI authentication protocol	oci://objectstorage.us-ashburn-1.oraclecloud.com
public://	No authentication	Public URLs	public://cms.data.gov/
s3://	Amazon Web Services S3-compatible	Access key and secret key obtained from the username/password field of database credential object, and S3-compatible authentication performed for the HTTP request.	s3://bucket.myprivatesite.com/file1.csv

Examples:

Customer-managed endpoint using S3-compatible authentication.

This example shows how for new URIs, customers can add the public or private host name pattern using DBMS_NETWORK_ACL_ADMIN package. The code block, executed by user ADMIN, enables HTTPS access for user SCOTT to endpoints in domain *.myprivatesite.com. It then shows how user SCOTT accesses the newly enabled endpoint. Note that credential MY_CRED for

user SCOTT must store the access key and secret key for S3-compatible authentication performed for the HTTP request indicated by the URI prefix.

```
BEGIN
   DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE(
         host => '*.myprivatesite.com',
         ace => xs$ace_type(privilege_list => xs$name_list('http'),
                            principal_name => 'SCOTT',
                            principal_type => xs_acl.ptype_db),
         private_target => TRUE   );
END;
/

BEGIN
   DBMS_CLOUD.get_object(
       credential_name => 'MY_CRED',
       object_uri      => 's3://bucket.myprivatesite.com/file1.csv',
       directory_name  => 'MY_DIR'  );
END;
/
```

Customer-managed endpoint with public access

This example shows how to register the SCOTT user to access public REST APIs. The ADMIN user creates a network ACL for the host to provide access to SCOTT user.

```
BEGIN
   DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE(
         host => 'data.cms.gov',
         ace => xs$ace_type(privilege_list => xs$name_list('http'),
                            principal_name => 'SCOTT',
                            principal_type => xs_acl.ptype_db)
   );
END;
/

SELECT DBMS_CLOUD.get_response_text(
          DBMS_CLOUD.send_request(
              uri     => 'public://data.cms.gov/provider-data/api/1/datastore/
imports/a',
              method  => DBMS_CLOUD.METHOD_GET,
              headers => JSON_OBJECT('Accept' VALUE 'application/json')
          )
       )
   FROM DUAL;
/
```

DBMS_CLOUD Package Format Options

The format argument in DBMS_CLOUD specifies the format of source files.

The two ways to specify the format argument are:

```
format => '{"format_option" : "format_value" }'
```

And:

```
format => json_object('format_option' value 'format_value'))
```

Examples:

```
format => json_object('type' VALUE 'CSV')
```

To specify multiple format options, separate the values with a ",".

For example:

```
format => json_object('ignoremissingcolumns' value 'true', 'removequotes' value 'true',
                          'dateformat' value 'YYYY-MM-DD-HH24-MI-SS', 'blankasnull'
value 'true', 'logretention' value 7)
```

> **Note:**
>
> For Avro, ORC, or Parquet format options, see DBMS_CLOUD Package Format Options for Avro, ORC, or Parquet.

As noted in the **Format Option** column, a limited set of format options are valid with `DBMS_CLOUD.COPY_COLLECTION` or with `DBMS_CLOUD.COPY_DATA` when the `format type` is JSON.

Format Option	Description	Syntax
`access_protocol`	Specifies the type of Apache Iceberg table, such as AWS or OCI Object Storage, and what information is used to create the external table, for example information from a data catalog or from a direct metadata URI.	See CREATE_EXTERNAL_TABLE Procedure for Apache Iceberg, for details on the `access_protocol` syntax.
`blankasnull`	When set to `true`, loads fields consisting of spaces as null.	`blankasnull : true` Default value: `False`
`characterset` Valid with `format` JSON and `COPY_DATA`	Specifies the characterset of source files	`characterset`: *string* Default value: Database characterset
`columnpath` Only use with `format` JSON and `COPY_DATA`	Array of JSON path expressions that correspond to the fields that need to be extracted from the JSON records. Each of the JSON path expressions in the array should follow the rules described in SQL/JSON Path Expressions. Only use with format JSON and `DBMS_CLOUD.COPY_DATA`.	JSON Array of json path expressions expressed in string format. For example: 'columnpath' value `'["$.WEATHER_STATION_ID", "$.WEATHER_STATION_NAME"]'`
`compression` Option valid with JSON data	Specifies the compression type of the source file. ZIP archiving format is not supported. Specifying the value `auto` checks for the compression types: `gzip, zlib, zstd, bzip2`.	`compression`: `auto|gzip|zlib|zstd|bzip2` Default value: Null value meaning no compression.
`conversionerrors`	If a row is rejected because of data type conversion errors, the related columns are stored as null or the row is rejected.	`conversionerrors : reject_record | store_null` Default value: `reject_record`

Format Option	Description	Syntax

`dateformat`	Specifies the date format in the source file. The format option `AUTO` searches for the following formats:
	
	`J`
	`MM-DD-YYYYBC`
	`MM-DD-YYYY`
	`YYYYMMDD HHMISS`
	`YYMMDD HHMISS`
	`YYYY.DDD`
	`YYYY-MM-DD`
		`dateformat` : *string*
		Default value: Database date format

`delimiter`	Specifies the field delimiter. To use a special character as the delimiter, specify the HEX value of the ASCII code of the character. For example, the following specifies the TAB character as the delimiter: `format => json_object('delimiter' value 'X''9''')`	`delimiter` : *character* Default value `|` (pipe character)

Format Option	Description	Syntax
detectfieldorder	Specifies that the fields in the external data files are in a different order than the columns in the table. Detect the order of fields using the first row of each external data file and map it to the columns of the table. The field names in external data files are compared in case insensitive manner with the names of the table columns. This format option is applicable for the following procedures: • DBMS_CLOUD.COPY_DATA • DBMS_CLOUD.CREATE_EXTERNAL_TABLE • DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE • DBMS_CLOUD.CREATE_HYBRID_PART_TABLE Restrictions for detectfieldorder: • Field names in the data file must appear in the first record line and must not contain any white spaces between the field names. • The field delimiter in the field names record must be the same as the field delimiter for the data in the file. • Quoted field names are not supported. The field names in data files are compared, in case insensitive manner, with the names of the external table columns. • Embedded field delimiters are not allowed in the field names. • The number of columns in the table must match the number of fields in the data files. • This format option is not applicable for Bigdata or Oracle Data Pump formats, as those formats have precise column metadata information in the binary file format. The text formats, CSV, JSON, Parquet, or XML can benefit from this automatic field order detection when the first line contains the field names. See FIELD NAMES and the description for ALL FILES for more information.	detectfieldorder: true Default value: false
enablelogs	The format option enablelogs is used with the following DBMS_CLOUD procedures: • COPY_DATA • COPY_COLLECTION • EXPORT_DATA enablelogs specifies a boolean value, when set to TRUE, logs are generated. When set to FALSE, logs are not generated. For example: format => JSON_OBJECT('enablelogs' value FALSE)	enablelogs: false Default value: true

Format Option	Description	Syntax
`encryption`	The format option `encryption` specifies the encryption and decryption options to export and import data to and from the Object Store. Use `encryption` to specify the following parameters to encrypt and decrypt: • `user_defined_function`: Specifies a fully qualified user defined function to decrypt or encrypt the specified BLOB (binary large object). It returns a decrypted or encrypted BLOB. `user_defined_function` is mutually exclusive with other parameters for `encryption`. For example, `ADMIN.DECRYPTION_CALLBACK`. • `type`: Specifies the `DBMS_CRYPTO` encryption algorithm to decrypt or encrypt. `type` accepts values in the *Block Cipher Algorithms* + *Block Cipher Chaining Modifiers* + *Block Cipher Padding Modifiers* format. Supported Block Cipher Algorithms are: – `DBMS_CRYPTO.ENCRYPT_AES256` Supported Block Cipher Chaining Modifiers are: – `DBMS_CRYPTO.CHAIN_CBC` – `DBMS_CRYPTO.CHAIN_CFB` – `DBMS_CRYPTO.CHAIN_ECB` – `DBMS_CRYPTO.CHAIN_OFB` Supported Block Cipher Padding Modifiers are: – `DBMS_CRYPTO.PAD_PKCS5` – `DBMS_CRYPTO.PAD_NONE` – `DBMS_CRYPTO.PAD_ZERO` – `DBMS_CRYPTO.PAD_ORCL` • `credential_name`: Specifies the credential used to store the encryption key. The Block Cipher Chaining Modifiers and Block Cipher Padding Modifiers values defaults to `DBMS_CRYPTO.CHAIN_CBC` and `DBMS_CRYPTO.PAD_PKCS5`, if you do not specify values for these parameters. The format option `encryption` is used with the following `DBMS_CLOUD` procedures: • Used to pass parameters to decrypt for these procedures: – `DBMS_CLOUD.COPY_DATA` – `DBMS_CLOUD.CREATE_EXTERNAL_TABLE` – `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE` – `DBMS_CLOUD.CREATE_HYBRID_PART_TABLE` For `DBMS_CLOUD.CREATE_HYBRID_PART_TABLE` this option is only applicable to the Object Storage files. – `DBMS_CLOUD.COPY_COLLECTION`	`encryption:`*value* Where *value* is a JSON string that provides additional parameters for encryption: `type`: *value* Specifies the encryption type. `credential_name`: *value* Specifies the credential used to store the encryption key. `user_defined_function`: *value* Specifies a fully qualified user-defined function to decrypt or encrypt the specified BLOB (binary large object).

Format Option	Description	Syntax
	• Used to pass parameters to encrypt for these procedure: – DBMS_CLOUD.EXPORT_DATA For example: `format => JSON_OBJECT('encryption' value json_object ('type' value DBMS_CRYPTO.ENCRYPT_AES256 + DBMS_CRYPTO.CHAIN_CBC + DBMS_CRYPTO.PAD_PKCS5, 'credential_name' value 'ENCRYPTION_CRED'))`	
`endquote`	Data can be enclosed between two delimiters, specified with `quote` and `endquote`. The `quote` and `endquote` characters are removed during loading when specified. For example: `format => JSON_OBJECT('quote' value '(', 'endquote' value ')')`	`endquote:character` Default value: Null, meaning no `endquote`.
`escape`	The character "\" is used as the escape character when specified.	`escape : true` Default value: `false`
`ignoreblanklines` Option valid with JSON data	Blank lines are ignored when set to true.	`ignoreblanklines : true` Default value: `False`
`ignoremissingcolumns`	If there are more columns in the `field_list` than there are in the source files, the extra columns are stored as null.	`ignoremissingcolumns : true` Default value `False`

Format Option	Description	Syntax

`implicit_partition_columns`	Enable implicit partitioning and specify the partition column names by using the `implicit_partition_columns` format option with `DBMS_CLOUD.CREATE_EXTERNAL_TABLE`.
	Implicit partitioning is enabled in the following ways:
	• Use `implicit_partition_columns` to provide a list of partition columns and specify the `implicit_partition_type`. For example:
	`format => '{"implicit_partition_type":"hive", "implicit_partition_columns": ["country","year","month"]}'`
	• Use `implicit_partition_columns` to provide a list of partition columns without providing the partition type. The partition type is automatically detected as hive or non-hive. For example:
	`format => '{"implicit_partition_columns": ["country","year","month"]}'`
	• Use `implicit_partition_type` to provide the type of partition columns without providing a list of partition columns. The automatic discovery of the partition keys in HIVE-style partitioned data is triggered to determine column names. For example:
	`format => '{"partition_type":"hive"}'`
	See `implicit_partition_type` for the option description and syntax.
		`implicit_partition_columns` : *array of strings*
		Default value: If `implicit_partition_type` is specified, the column names are derived through automatic discovery of the partition keys in HIVE-style partitioned data. Otherwise, the default is null and implicit partitioning is not enabled.

`implicit_partition_type`	Enable implicit partitioning and specify the data types of partition columns by using the `implicit_partition_type` format option with `DBMS_CLOUD.CREATE_EXTERNAL_TABLE`. See `implicit_partition_columns` for further information on enabling implicit partitioning and examples.	`implicit_partition_type` : hive Default value: If `implicit_partition_columns` is specified, the type is automatically detected as hive or non-hive. Otherwise, the default is null and implicit partitioning is not enabled.
`jsonpath` Only use with `COPY_COLLECTION`	JSON path to identify the document to load. This option is valid only for JSON collection data with `DBMS_CLOUD.COPY_COLLECTION`.	`jsonpath`: *string* Default value: Null
`keyassignment` Only use with `COPY_COLLECTION`	Specifies whether a new collection is created as a mongo-compatible collection or as a SODA collection. When the value is set to `embedded_oid`, a new collection is created as a mongo-compatible collection. By default this parameter is not set, meaning a new collection is created as a SODA collection.	`keyassignment`: `embedded_oid` Default: `keyassignment` is not set

Format Option	Description	Syntax
`keypath` Only use with `COPY_COLLECTION`	Specifies an attribute in the data to be loaded as the `'_id'` value. If `keypath` is specified then you must also specify the `keyassignment` value as `embedded_oid`. Set the value to a path, for example, `'$.mykey'`, to pick the value of the path as `'_id'` value. This parameter is optional and is only valid for loading into mongo-compatible collections. If not specified, Oracle generates a 12-byte unique system ID and populates that as the `'_id'` attribute, if an `'_id'` attribute is not already present in the data being loaded.	`keypath`: *`string`* Default: `keypath` is not set. When `keypath` is set, the default *string* value is `NULL`.
`language`	Specifies a language name (for example, FRENCH), from which locale-sensitive information can be derived.	`language`: *string* Default value: Null See Locale Data in *Oracle Database Globalization Support Guide* for a listing of Oracle-supported languages.

`logdir`	Specifies a string value that determines the directory object name where the `logfile_table` or `badfile_table` files are saved.
	By default, the `logdir` is not case-sensitive, but the case is reserved when the specified value is enclosed in double-quotes.
	For example:
	`format => JSON_OBJECT ('logdir' value 'test_log')`
	The `logdir` format option specified in the above example saves the `logfile_table` or `badfile_table` files in the `TEST_LOG` directory object.
	`format => JSON_OBJECT ('logdir' value '"test_log"')`
	The `logdir` format option specified in the above example saves the `logfile_table` or `badfile_table` files in the `test_log` directory object.
		`logdir`: *string*
		Default value: `DATA_PUMP_DIR`

`logprefix`	Specifies a string value that determines the prefix for the `logfile_table` and `badfile_table` files. The log table name format is: *logprefix*`$`*operation_id* By default, the logprefix is in upper case, but the case is reserved when the specified value is enclosed in double-quotes. For example: `format => JSON_OBJECT ('logprefix' value 'TEST')` Log files then use the `TEST` prefix, such as: `TEST$2_LOG` and `TEST$2_BAD`.	`logprefix`: *string* Default value: `COPY`

Format Option	Description	Syntax
`logretention`	Specifies a positive integer duration, in days, for which the `logfile_table` and `badfile_table` files are retained. Valid values: `0` to `99999` For example: `format => JSON_OBJECT ('logretention' value 7)`	`logretention`: *number* Default value: `2`
`maxdocsize` This option is valid only with JSON data	Maximum size of JSON documents.	`maxdocsize`: *number* Default value: 1 Megabyte Maximum allowed value: 2 Gigabytes
`numericcharacters`	Specifies the characters to use as the group separator and decimal character. *decimal_character*: The decimal separates the integer portion of a number from the decimal portion. *group_separator*: The group separator separates integer groups (that is, thousands, millions, billions, and so on).	`numericcharacters:` '*decimal_character group_separator*' Default value: `"."` See NLS_NUMERIC_CHARACTERS in *Oracle Database Globalization Support Guide* for more information.
`numberformat`	Specifies the number format model. Number format models cause the number to be rounded to the specified number of significant digits. A number format model is composed of one or more number format elements. This is used in combination with `numericcharacters`.	`numberformat:` *number_format_model* Default value: is derived from the setting of the `NLS_TERRITORY` parameter See Number Format Models in *SQL Language Reference* for more information.

Format Option	Description	Syntax
partition_columns	The format option partition_columns is used with DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE to specify the column names and data types of partition columns when the partition columns are derived from the file path, depending on the type of data file, structured or unstructured: • When the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE includes the column_list parameter and the data file is unstructured, such as with CSV text files, partition_columns does not include the data type. For example, use a format such as the following for this type of partition_columns specification: '"partition_columns": ["state","zipcode"]' The data type is not required because it is specified in the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE column_list parameter. • When the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE does not include the column_list parameter and the data files are structured, such as Avro, ORC, or Parquet files, the partition_columns option includes the data type. For example, the following shows a partition_columns specification: '"partition_columns":[{"name":"country", "type":"varchar2(10)"}, {"name":"year", "type":"number"}, {"name":"month", "type":"varchar2(10)"}]' If the data files are unstructured and the type sub-clause is specified with partition_columns, the type sub-clause is ignored. For object names that are not based on hive format, the order of the partition_columns specified columns must match the order as they appear in the object name in the file_uri_list.	
quote	Specifies the quote character for the fields, the quote characters are removed during loading when specified.	quote: *character* Default value: Null meaning no quote

Format Option	Description	Syntax

`recorddelimiter`
Option valid with JSON data
	Specifies the record delimiter.
	By default, `DBMS_CLOUD` tries to automatically find the correct newline character as the delimiter. It first searches the file for the Windows newline character "`\r\n`". If it finds the Windows newline character, this is used as the record delimiter for all files in the procedure. If a Windows newline character is not found, it searches for the UNIX/Linux newline character "`\n`" and if it finds one it uses "`\n`" as the record delimiter for all files in the procedure.
	Specify this argument explicitly if you want to override the default behavior, for example:
	`format => json_object('recorddelimiter' VALUE '''\r\n''')`
	To indicate that there is no record delimiter you can specify a `recorddelimiter` that does not occur in the input file. For example, to indicate that there is no delimiter, specify the control character 0x01 (SOH) as a value for the `recorddelimiter` and set the `recorddelimiter` value to "`0x''01''`" (this character does not occur in JSON text). For example:
	`format => '{"recorddelimiter" : "0x''01''"}'`
	The `recorddelimiter` is set once per procedure call. If you are using the default value, `detected newline`, then all files use the same record delimiter, if one is detected.
		`recorddelimiter`: *character*
		Default value: detected newline

Format Option	Description	Syntax
`regexuri`	The format option `regexuri` is used with the following DBMS_CLOUD procedures: • `COPY_COLLECTION` • `COPY_DATA` • `CREATE_EXTERNAL_TABLE` • `CREATE_EXTERNAL_PART_TABLE` • `CREATE_HYBRID_PART_TABLE` When the value of `regexuri` is set to `TRUE`, you can use wildcards as well as regular expressions in the file names in Cloud source file URIs. The characters "*" and "?" are considered wildcard characters when the `regexuri` parameter is set to `FALSE`. When the `regexuri` parameter is set to `TRUE` the characters "*" and "?" are part of the specified regular expression pattern. Regular expression patterns are only supported for the file name or subfolder path in your URIs and the pattern matching is identical to that performed by the `REGEXP_LIKE` function. Regular expression patterns are not supported for directory names. For external tables, this option is only supported with the tables that are created on a file in the Object Storage. For example: `format => JSON_OBJECT('regexuri' value TRUE)` See REGEXP_LIKE Condition for more information on `REGEXP_LIKE` condition.	`regexuri`: `True` Default value : `False`
`rejectlimit`	The operation will error out after specified number of rows are rejected.	`rejectlimit`: *number* Default value: `0`
`removequotes`	Removes any quotes that are around any field in the source file.	`removequotes`: `true` Default value: `False`
`skipheaders`	Specifies how many rows should be skipped from the start of the file.	`skipheaders`: *number* Default value: 0 if not specified, 1 if specified without a value
`territory`	Specifies a territory name to further determine input data characteristics.	`territory`: *string* Default value: Null See Locale Data in *Oracle Database Globalization Support Guide* for a listing of Oracle-supported territories.

`timestampformat`	Specifies the timestamp format in the source file. The format option `AUTO` searches for the following formats:
	`YYYY-MM-DD HH:MI:SS.FF`
	`YYYY-MM-DD HH:MI:SS.FF3`
	`YYYY-MM-DD HH24:MI:SS.FF3`
	`MM/DD/YYYY HH:MI:SS.FF3`
		`timestampformat` : *string*
		Default value: Database timestamp format
		The string can contain wildcard characters such as "$".

Format Option	Description	Syntax

`timestampltzformat`	Specifies the timestamp with local timezone format in the source file. The format option `AUTO` searches for the following formats:
	`DD Mon YYYY HH:MI:SS.FF TZR`
	`MM/DD/YYYY HH:MI:SS.FF TZR`
	`YYYY-MM-DD HH:MI:SS+/-TZR`
	`YYYY-MM-DD HH:MI:SS.FF3`
	`DD.MM.YYYY HH:MI:SS TZR`
		`timestampltzformat` : *string*
		Default value: Database timestamp with local timezone format

`timestamptzformat`	Specifies the timestamp with timezone format in the source file. The format option `AUTO` searches for the following formats:
	`DD Mon YYYY HH:MI:SS.FF TZR`
	`MM/DD/YYYY HH:MI:SS.FF TZR`
	`YYYY-MM-DD HH:MI:SS+/-TZR`
	`YYYY-MM-DD HH:MI:SS.FF3`
	`DD.MM.YYYY HH:MI:SS TZR`
		`timestamptzformat`: *string*
		Default value: Database timestamp with timezone format

`trimspaces`	Specifies how the leading and trailing spaces of the fields are trimmed. See the description of trim_spec.	`trimspaces`: `rtrim| ltrim| notrim| lrtrim| ldrtrim` Default value: `notrim`
`truncatecol`	If the data in the file is too long for a field, then this option will truncate the value of the field rather than reject the row.	`truncatecol`:`true` Default value: `False`

Format Option	Description	Syntax
`type`	Specifies the source file type. See the description of `CSV` in field_definitions Clause If the `type` is `datapump`, then the only other valid format option is `rejectlimit`. If the `type` is `datapump`, then the only Object Stores supported are Oracle Cloud Infrastructure Object Storage and Oracle Cloud Infrastructure Object Storage Classic. See DBMS_CLOUD Package Format Options for Avro, ORC, or Parquet for `type` values `avro`, `orc`, or `parquet`. For JSON data with `DBMS_CLOUD.COPY_COLLECTION` `type` has two valid values: `json` (default) and `ejson`. For `DBMS_CLOUD.COPY_COLLECTION` these values both specify that the input is JSON data. The value `ejson` causes extended objects in the textual JSON input data to be translated to scalar JSON values in the native binary JSON collection. The value `json` does not perform this transformation and all objects in the input data are converted to binary JSON format. For JSON data with `DBMS_CLOUD.COPY_DATA` `type` has one valid value: `json`. This value specifies that the input is JSON data. • See COPY_COLLECTION Procedure for information on loading JSON objects. • See Textual JSON Objects That Represent Extended Scalar Values for information about extended JSON objects, which are interpreted when parameter `type` has value `ejson`.	`type: csv|csv with embedded|csv without embedded |avro||datapump| orc|parquet` **Note:** Not all `DBMS_CLOUD` procedures support all of these types. `csv` is the same as `csv without embedded`. Default value: Null For JSON data there are two valid `type` values for use with `DBMS_CLOUD.COPY_COLLECTION`: `json|ejson` In this case the default value is `json`. For JSON data with `DBMS_CLOUD.COPY_DATA`, only `json` is valid.
`unpackarrays` Only use with `COPY_COLLECTION`	When set to `true`, if a loaded document is an array, then the contents of the array are loaded as documents rather than the array itself. This only applies to the top-level array. When set to `true`, the entire array is inserted as a single document. This option is valid only for JSON collection data with `DBMS_CLOUD.COPY_COLLECTION`.	`unpackarrays: true` Default value: `False`

DBMS_CLOUD Package Format Options for EXPORT_DATA

Describes the valid format parameter options for `DBMS_CLOUD.EXPORT_DATA` with text file formats, CSV, JSON, Parquet, or XML, and for Oracle Data Pump.

These are the valid `format` parameters for use with `DBMS_CLOUD.EXPORT_DATA`. You specify text file output when you use the `format type` option and the value is one of: `csv`, `json`, `parquet`, or `xml`. This also shows the `format` options when the `format type` is `datapump`.

The two ways to specify the format argument are:

```
format => '{"format_option" : "format_value" }'
```

And:

```
format => json_object('format_option' value 'format_value'))
```

Examples:

```
format => json_object('type' VALUE 'json')
```

To specify multiple format options, separate the values with a ",".

For example:

```
format => json_object('compression' value 'gzip', 'type' value 'json')
```

This table covers the format options for `DBMS_CLOUD.EXPORT_DATA` when the `format` parameter `type` option is one of: CSV, JSON, Parquet, or XML. For other procedures and other output types, see DBMS_CLOUD Package Format Options for the list of format options.

Format Option	Description	Syntax

`compression`	Specifies the compression type of the source file.
	Note: ZIP archiving format is not supported.
	When the `format type` is `csv`, `json`, or `xml`, the default compression is Null, meaning no compression.
	When the `format type` is `parquet`, the default compression is `snappy`.
	When the `format type` is `datapump` you can specify supported Oracle Data Pump access parameters:
	• `compression`: The valid values are: `BASIC`, `LOW`, `MEDIUM`, and `HIGH`.
	• `version`: The valid values are: `COMPATIBLE`, `LATEST`, and a specified *`version_number`*.
		When the `type` is:`csv` | `json` | `xml`
		`compression:gzip | zlib | zstd | bzip2`
		Default value: Null value meaning no compression.
		When the `type` is `parquet`
		`compression: gzip` | `snappy`
		Default value: `snappy`
		When the type is `datapump`
		`compression: BASIC|LOW|MEDIUM|HIGH`

`delimiter`	Specifies a custom field delimiter. `format => json_object('delimiter' value '|')` The delimiter value cannot be an ASCII code or an escape character. **Note:** This option only applies with `csv type`.	`delimiter` : *character* Default value , (comma)
`endquote`	Specifies that fields can be enclosed between two delimiters, with `quote` and `endquote`. If `endquote` is not specified, then the `quote` character will be used by default as the `endquote` character. For example: `format => JSON_OBJECT('quote' value '(', 'endquote' value ')')` **Note:** This option only applies with `csv type`.	`endquote`:*character* Default value: Null, meaning no `endquote`.

Format Option	Description	Syntax
`escape`	Specifies the occurrence of quote character in the field value using `"\"` character.	`escape : true` Default value: `false`

> **Note:**
>
> This option only applies with `csv type`.

Format Option	Description	Syntax
`encryption`	The format option `encryption` specifies the encryption and decryption options to export and import data to and from the Object Store. Use `encryption` to specify the following parameters to encrypt and decrypt: • `user_defined_function`: Specifies a fully qualified user-defined function to decrypt or encrypt the specified BLOB (binary large object). It returns a decrypted or encrypted BLOB. This parameter is mutually exclusive with other parameters for `encryption`. For example, `ADMIN.DECRYPTION_CALLBACK`. • `type`: Specifies the built-in encryption algorithm to decrypt or encrypt. `user_defined_function` and `type` are mutually exclusive. `type` accepts values in the *Block Cipher Algorithms* + *Block Cipher Chaining Modifiers* + *Block Cipher Padding Modifiers* format. Supported Block Cipher Algorithms are: – `DBMS_CRYPTO.ENCRYPT_AES256` Supported Block Cipher Chaining Modifiers are: – `DBMS_CRYPTO.CHAIN_CBC` – `DBMS_CRYPTO.CHAIN_CFB` – `DBMS_CRYPTO.CHAIN_ECB` – `DBMS_CRYPTO.CHAIN_OFB` Supported Block Cipher Padding Modifiers are: – `DBMS_CRYPTO.PAD_PKCS5` – `DBMS_CRYPTO.PAD_NONE` – `DBMS_CRYPTO.PAD_ZERO` – `DBMS_CRYPTO.PAD_ORCL` • `credential_name`: Specifies the credential used to store the encryption key. The Block Cipher Chaining Modifiers and Block Cipher Padding Modifiers values defaults to `DBMS_CRYPTO.CHAIN_CBC` and `DBMS_CRYPTO.PAD_PKCS5`, if you do not specify values for these parameters. The format option `encryption` is used with the following `DBMS_CLOUD` procedures: • Used to pass parameters to decrypt for these procedures: – `DBMS_CLOUD.COPY_DATA` – `DBMS_CLOUD.CREATE_EXTERNAL_TABLE` – `DBMS_CLOUD.CREATE_HYBRID_TABLE` – `DBMS_CLOUD.COPY_COLLECTION` • Used to pass parameters to encrypt for these procedure: – `DBMS_CLOUD.EXPORT_DATA` For example: `format => JSON_OBJECT('encryption' value json_object ('type' value DBMS_CRYPTO.ENCRYPT_AES256 +`	`encryption:`*value* Where *value* is a JSON string that provides additional parameters for encryption: `type`: *value* Specifies the encryption type. `credential_name`: *value* Specifies the credential used to store the encryption key. `user_defined_function`: *value* Specifies a fully qualified user-defined function to decrypt or encrypt the specified BLOB (binary large object).

Format Option	Description	Syntax
	`DBMS_CRYPTO.CHAIN_CBC + DBMS_CRYPTO.PAD_PKCS5, 'credential_name' value 'ENCRYPTION_CRED'))`	
`header`	Writes column names as the first line in output files of `csv` type. The `header` option can accept a `boolean` or a `string` value. The valid values are: • `false`: Skips the header row. • `true`: Includes the header row. The column names are based on the `SELECT` statement in the `query` parameter. You must specify column aliases in the `SELECT` statement when using virtual columns or expressions. • *`String to define custom header names`*: Enables you to define header rows with custom names. The number of columns and delimiters in the string value must match the number of columns and delimiters in the `SELECT` statement. The default delimiter is comma (,). For example: `format => JSON_OBJECT('type' value 'csv', 'delimiter' value '|', 'compression' value 'gzip', 'header' value true)` **Note:** This option only applies with `csv type`.	`header: true| false| String to define custom header names` Default value: `false`
`fileextension`	Custom file extension to override the default choice for the format type. This applies to text formats with `DBMS_CLOUD.EXPORT_DATA`: CSV, JSON, Parquet, or XML. If the specified string does not start with period (dot), then a dot is automatically inserted before the file extension in the final file name. If no file extension is desired, use the value: `fileextension ='none'`	Valid values: Any file extension. Default value: Depends on the `format type` option: • CSV format: `.csv` • JSON format: `.json` • PARQUET format: `.parquet` • XML format: `.xml`
`maxfilesize`	Number in bytes for maximum size of output generated. This applies to text based formats for exporting data with `DBMS_CLOUD.EXPORT_DATA` when the `format type` option is set to,`csv`, `json`, or `xml`. Note: This option is not valid when the `format type` option is `parquet`.	Minimum value: `10485760` (10 MB) Maximum value: 1 GB Default value: `10485760` (10 MB)

Format Option	Description	Syntax
`quote`	In CSV format, fields can be enclosed between two delimiters. Specify the delimiters with `quote` and `endquote`. If `endquote` is not specified, then the `quote` character will be used by default as the `endquote` character. **Note:** This option only applies with `csv type`.	`quote`: *character* Default value: Null meaning do not enclose fields with quotes.
`trimspaces`	Specifies how the leading and trailing spaces of the fields are trimmed for CSV format. Trim spaces is applied before quoting the field, if the `quote` parameter is specified. See the description of trim_spec. **Note:** This option only applies with `csv type`.	`trimspaces: rtrim| ltrim| notrim| lrtrim| ldrtrim` Default value: `notrim`
`type`	Specifies the output file type. `csv`: specifies Character Separated Values (CSV) format that allows you to export query results as a set of column values separated by any custom character. `json`: specifies to export the query results as JSON files. `parquet`: specifies to export the query results as Parquet files. `xml`: specifies to export query results as rows of valid XML documents. Each row is encapsulated in a root XML tag of `<RECORD> </RECORD>`. The query result is automatically transformed into XML format using XMLFOREST SQL function. Use Column Aliases to customize the XML tag names for columns. When the `format type` is `datapump` you can specify supported Oracle Data Pump access parameters: • `compression`: The valid values are: `BASIC`, `LOW`, `MEDIUM`, and `HIGH`. • `version`: The valid values are: `COMPATIBLE`, `LATEST`, and a specified *`version_number`*. See access_parameters Clause for more information.	`type: csv|datapump|json| parquet|xml`

DBMS_CLOUD Avro, ORC, and Parquet Support

This section covers the `DBMS_CLOUD` Avro, ORC, and Parquet support provided with Autonomous Database.

- DBMS_CLOUD Package Format Options for Avro, ORC, or Parquet
  The format argument in DBMS_CLOUD specifies the format of source files.
- DBMS_CLOUD Package Avro to Oracle Data Type Mapping
  Describes the mapping of Avro data types to Oracle data types.
- DBMS_CLOUD Package ORC to Oracle Data Type Mapping
  Describes the mapping of ORC data types to Oracle data types.
- DBMS_CLOUD Package Parquet to Oracle Data Type Mapping
  Describes the mapping of Parquet data types to Oracle data types.
- DBMS_CLOUD Package Oracle Data Type to Parquet Mapping
  Describes the mapping of Oracle data types to Parquet data types.
- DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types
  Describes the mapping of Avro, ORC, and Parquet complex data types to Oracle data types.
- DBMS_CLOUD Package Avro, ORC, and Parquet to Oracle Column Name Mapping
  Describes rules for how Avro, ORC, and Parquet column names are converted to Oracle column names.

DBMS_CLOUD Package Format Options for Avro, ORC, or Parquet

The format argument in DBMS_CLOUD specifies the format of source files.

The two ways to specify the format argument are:

```
format => '{"format_option" : "format_value" }'
```

And:

```
format => json_object('format_option' value 'format_value'))
```

Examples:

```
format => json_object('type' VALUE 'CSV')
```

To specify multiple format options, separate the values with a ",".

For example:

```
format => json_object('ignoremissingcolumns' value 'true', 'removequotes' value 'true',
'dateformat' value 'YYYY-MM-DD-HH24-MI-SS', 'blankasnull' value 'true')
```

Format Option	Description	Syntax
maxvarchar	Controls the default maximum varchar2() length for character columns when creating external tables on Avro, ORC, or Parquet format files. The options are: • standard: Specifies that the length limit for varchar2() columns is 4000 bytes. This is equivalent to auto on systems with MAX_STRING_SIZE = standard. On systems with MAX_STRING_SIZE = extended, when you create an external table on Avro, ORC, or Parquet and you specify maxvarchar as standard, this shortens character columns to varchar2(4000). • extended: Specifies that the length limit for varchar2() columns is 32767 bytes. This is equivalent to auto on systems with MAX_STRING_SIZE = extended. This value raises an error on systems with MAX_STRING_SIZE = standard. • auto: The system automatically picks the varchar2() maximum byte size, based on the MAX_STRING_SIZE value. The value auto is the default value for maxvarchar.	maxvarchar: standard | extended | auto Default value:auto
regexuri	When the value of regexuri is set to TRUE, you can use wildcards as well as regular expressions in the file names in Cloud source file URIs. The characters "*" and "?" are considered wildcard characters when the regexuri parameter is set to FALSE. When the regexuri parameter is set to TRUE the characters "*" and "?" are part of the specified regular expression pattern. Regular expression patterns are only supported for the file name or subfolder path in your URIs and the pattern matching is identical to that performed by the REGEXP_LIKE function. Regular expression patterns are not supported for directory names. For external tables, this option is only supported with the tables that are created on a file in the Object Storage. For example: format => JSON_OBJECT('regexuri' value TRUE) See REGEXP_LIKE Condition for more information on REGEXP_LIKE condition.	regexuri: True Default value:False
type	Specifies the file type.	type : avro | orc | parquet

Format Option	Description	Syntax
schema	When schema is set to first or all, the external table columns and data types are automatically derived from the Avro, ORC, or Parquet file metadata. The column names will match those found in Avro, ORC, or Parquet. The data types are converted from Avro, ORC, or Parquet data types to Oracle data types. All columns are added to the table. The value first specifies to use the metadata from the first Avro, ORC, or Parquet file in the file_uri_list to auto generate the columns and their data types. Use first if all of the files have the same schema. The value all specifies to use the metadata from all Avro, ORC, or Parquet files in the file_uri_list to auto generate the columns and their data types. Use all (slower) if the files may have different schemas. **Default**: If column_list is specified, then the schema value, if specified is ignored. If column_list is not specified then the schema default value is first. **Note**: For Avro, ORC, or Parquet format files the schema format option is not available and the column_list parameter must be specified for partitioned external tables using the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE procedure.	schema : first | all

DBMS_CLOUD Package Avro to Oracle Data Type Mapping

Describes the mapping of Avro data types to Oracle data types.

> **Note:**
>
> Complex types, such as maps, arrays, and structs are supported starting with Oracle Database 19c. See DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types for information on using Avro complex types.

Avro Type	Oracle Type
INT	NUMBER(10)
LONG	NUMBER(19)
BOOL	NUMBER(1)
UTF8 BYTE_ARRAY	RAW(2000)
FLT	BINARY_FLOAT
DBL	BINARY_DOUBLE
DECIMAL(p)	NUMBER(p)
DECIMAL(p,s)	NUMBER(p,s)
DATE	DATE
STRING	VARCHAR2
TIME_MILLIS	VARCHAR2(20 BYTE)
TIME_MICROS	VARCHAR2(20 BYTE)
TIMESTAMP_MILLIS	TIMESTAMP(3)

Avro Type	Oracle Type
TIMESTAMP_MICROS	TIMESTAMP(6)
ENUM	VARCHAR2(*n*) Where: "*n*" is the actual maximum length of the AVRO ENUM's possible values
DURATION	RAW(2000)
FIXED	RAW(2000)
NULL	VARCHAR2(1) BYTE

See DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types for information on using Avro complex types.

DBMS_CLOUD Package ORC to Oracle Data Type Mapping

Describes the mapping of ORC data types to Oracle data types.

See DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types for information on using ORC complex types.

ORC Type	Oracle Type	More Information
array	VARCHAR2(*n*) JSON format	DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types
bigint (64 bit)	NUMBER(19)	
binary	BLOB	
boolean (1 bit)	NUMBER(1)	
char	CHAR(*n*)	
date	DATE	
double	BINARY_DOUBLE	
float	BINARY_FLOAT	
int (32 bit)	NUMBER(10)	
list	VARCHAR2(*n*) JSON format	DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types
map	VARCHAR2(*n*) JSON format	DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types
smallint (16 bit)	NUMBER(5)	
string	VARCHAR2(4000) or VARCHAR2(32767)	Depending on the value of the format parameter option `maxvarchar` and on the `MAX_STRING_SIZE` value. See DBMS_CLOUD Package Format Options for Avro, ORC, or Parquet for more information.
struct	VARCHAR2(*n*) JSON format	DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types
timestamp	TIMESTAMP	
tinyint (8 bit)	NUMBER(3)	
union	VARCHAR2(*n*) JSON format	DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types

ORC Type	Oracle Type	More Information
varchar	VARCHAR2(*n*)	

DBMS_CLOUD Package Parquet to Oracle Data Type Mapping

Describes the mapping of Parquet data types to Oracle data types.

> **Note:**
>
> Complex types, such as maps, arrays, and structs are supported starting with Oracle Database 19c. See DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types for information on using Parquet complex types.

Parquet Type	Oracle Type
UINT_64	NUMBER(20)
INT_64	NUMBER(19)
UINT_32	NUMBER(10)
INT_32	NUMBER(10)
UINT_16	NUMBER(5)
INT_16	NUMBER(5)
UINT_8	NUMBER(3)
INT_8	NUMBER(3)
BOOL	NUMBER(1)
UTF8 BYTE_ARRAY	VARCHAR2(4000 BYTE)
FLT	BINARY_FLOAT
DBL	BINARY_DOUBLE
DECIMAL(p)	NUMBER(p)
DECIMAL(p,s)	NUMBER(p,s)
DATE	DATE
STRING	VARCHAR2(4000) or VARCHAR2(32767) Depending on the value of the format parameter option `maxvarchar` and on the Autonomous Database `MAX_STRING_SIZE` value. See DBMS_CLOUD Package Format Options for Avro, ORC, or Parquet for more information.
TIME_MILLIS	VARCHAR2(20 BYTE)
TIME_MILLIS_UTC	VARCHAR2(20 BYTE)
TIME_MICROS	VARCHAR2(20 BYTE)
TIME_MICROS_UTC	VARCHAR2(20 BYTE)
TIMESTAMP_MILLIS	TIMESTAMP(3)
TIMESTAMP_MILLIS_UTC	TIMESTAMP(3)
TIMESTAMP_MICROS	TIMESTAMP(6)
TIMESTAMP_MICROS_UTC	TIMESTAMP(6)
TIMESTAMP_NANOS	TIMESTAMP(9)

See DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types for information on using Parquet complex types.

DBMS_CLOUD Package Oracle Data Type to Parquet Mapping

Describes the mapping of Oracle data types to Parquet data types.

Oracle Type	Parquet Type
BINARY_DOUBLE	DBL
BINARY_FLOAT	FLT
DATE	DATE
NUMBER(p,s)	DECIMAL(p,s)
NUMBER(p)	DECIMAL(p)
TIMESTAMP(3)	TIMESTAMP_MILLIS
TIMESTAMP(3)	TIMESTAMP_MILLIS_UTC
TIMESTAMP(6)	TIMESTAMP_MICROS
TIMESTAMP(6)	TIMESTAMP_MICROS_UTC
TIMESTAMP(9)	TIMESTAMP_NANOS
VARCHAR2(4000)	STRING

NLS Session Parameters

The NLS session parameters `NLS_DATE_FORMAT`, `NLS_TIMESTAMP_FORMAT`, `NLS_TIMESTAMP_TZ_FORMAT` and `NLS_NUMERIC_CHARACTERS` define how the date, timestamp, timestamp with time zone format, and radix separator for timestamp with decimal marker should be shown when a table with those column types are queried.

In addition, when you export data using `DBMS_CLOUD.EXPORT_DATA` and specify Parquet output, Autonomous Database reads the values of these parameters from the `NLS_SESSION_PARAMETERS` table. Autonomous Database uses these values to convert the Oracle data types `DATE` or `TIMESTAMP` to Parquet types.

The `NLS_SESSION_PARAMETERS` parameters support an `RR` format mask (two character year specification).

The `RR` format mask for the year is not supported for these parameters when you export data to Parquet with `DBMS_CLOUD.EXPORT_DATA`. An application error is raised if you attempt to export to parquet and the `NLS_SESSION_PARAMETERS` are set to use the `RR` format mask (the default value for the `RR` format depends on the value of the `NLS_TERRITORY` parameter).

When one of the parameters `NLS_DATE_FORMAT`, `NLS_TIMESTAMP_FORMAT` or `NLS_TIMESTAMP_TZ_FORMAT` uses the `RR` format mask, you must change the format value to supported value to export data to Parquet with `DBMS_CLOUD.EXPORT_DATA`. For example:

```
ALTER SESSION SET NLS_DATE_FORMAT = "MM/DD/YYYY";
ALTER SESSION SET NLS_TIMESTAMP_FORMAT = 'YYYY-MM-DD HH:MI:SS.FF';
ALTER SESSION SET  NLS_TIMESTAMP_TZ_FORMAT='YYYY-MM-DD HH:MI:SS.FF TZH:TZM';
```

After you change the value, you can verify the change by querying the `NLS_SESSION_PARAMETERS` view:

```
SELECT value FROM NLS_SESSION_PARAMETERS
       WHERE parameter IN
('NLS_DATE_FORMAT','NLS_TIMESTAMP_FORMAT','NLS_TIMESTAMP_TZ_FORMAT');
```

If `NLS_DATE_FORMAT` is set, it applies to the columns with `DATE` datatype. If `NLS_TIMESTAMP_FORMAT` is set, it applies to the columns with `TIMESTAMP` datattype. If `NLS_TIMESTAMP_TZ_FORMAT` is set, it applies to the columns with `TIMESTAMP WITH TIME ZONE` datatype.

See Date and Time Parameters and NLS Data Dictionary Views for more information.

DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types

Describes the mapping of Avro, ORC, and Parquet complex data types to Oracle data types.

Autonomous Database supports complex data types, including the following complex types:

- struct
- list
- map
- union
- array

When you specify a source file type of Avro, ORC, or Parquet and the source file includes complex columns, Autonomous Database queries return JSON for the complex columns. This simplifies processing of query results; you can use Oracle's powerful JSON parsing features consistently across the file types and data types. The following table shows the format for the complex types in Autonomous Database:

> **Note:**
>
> The complex fields map to `VARCHAR2` columns and `VARCHAR2` size limits apply.

Type	Parquet	ORC	Avro	Oracle
List: sequence of values	List	List	Array	`VARCHAR2` (JSON format)
Map: list of objects with single key	Map	Map	Map	`VARCHAR2` (JSON format)
Union: values of different type	Not Available	Union	Union	`VARCHAR2` (JSON format)
Object: zero or more key-value pairs	Struct	Struct	Record	`VARCHAR2` (JSON format)

If your ORC, Parquet, or Avro source files contain complex types, then you can query the JSON output for these common complex types. For example, the following shows an ORC file, `movie-info.orc`, with a complex type (the same complex type handling applies for Parquet and Avro source files).

Consider the `movie-info.orc` file with the following schema:

```
id    int
original_title string
overview       string
poster_path    string
release_date   string
```

```
vote_count     int
runtime        int
popularity     double
genres         array<struct<id:int,name:string>
```

Notice that each movie is categorized by multiple `genres` using an array of `genres`. The `genres` array is an `array` of `structs` and each item has an `id` (`int`) and a `name` (`string`). The `genres` array is considered a complex type. You can create a table over this ORC file using `DBMS_CLOUD.CREATE_EXTERNAL_TABLE` as follows:

```
BEGIN
DBMS_CLOUD.CREATE_EXTERNAL_TABLE(
        table_name =>'movie_info',
        credential_name =>'OBJ_STORE_CRED',
        file_uri_list =>'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
mytenancy/b/movies/o/movie-info.orc',
        format => '{"type":"orc", "schema": "first"}');
END;
/
```

When you create the external table the database automatically generates the columns based on the schema in the ORC file (if you are using Avro or Parquet, the same applies). For this example, the `DBMS_CLOUD.CREATE_EXTERNAL_TABLE` creates a table in your database as follows:

```
CREATE TABLE "ADMIN"."MOVIE_INFO"
    ( "ID"
      NUMBER(10,0),
      "ORIGINAL_TITLE"  VARCHAR2(4000 BYTE) COLLATE "USING_NLS_COMP",
      "OVERVIEW"        VARCHAR2(4000 BYTE) COLLATE "USING_NLS_COMP",
      "POSTER_PATH"     VARCHAR2(4000 BYTE) COLLATE "USING_NLS_COMP",
      "RELEASE_DATE"    VARCHAR2(4000 BYTE) COLLATE "USING_NLS_COMP",
      "VOTE_COUNT"      NUMBER(10,0),
      "RUNTIME"         NUMBER(10,0),
      "POPULARITY"      BINARY_DOUBLE,
      "GENRES"          VARCHAR2(4000 BYTE) COLLATE "USING_NLS_COMP"
    )  DEFAULT COLLATION "USING_NLS_COMP"
    ORGANIZATION EXTERNAL
     ( TYPE      ORACLE_BIGDATA
       DEFAULT DIRECTORY "DATA_PUMP_DIR"
       ACCESS PARAMETERS
       ( com.oracle.bigdata.credential.name=OBJ_STORE_CRED
         com.oracle.bigdata.fileformat=ORC
   )
       LOCATION
        (
      'https://objectstorage.us-phoenix-1.oraclecloud.com/n/mytenancy/b/
movies/o/movie-info.orc'
           )
     )
   REJECT LIMIT UNLIMITED
   PARALLEL;
 )
```

Now you can query the movie data:

```
SELECT original_title, release_date, genres
     FROM movie_info
     WHERE release_date > '2000'
     ORDER BY original_title;
```

This produces the following output:

```
original_title              release_date   genres
(500) Days of Summer        2009           [{"id":3,"name":"Drama"},
{"id":6,"name":"Comedy"},{"id":17,"name":"Horror"},{"id":19,"name":"Western"},
{"id":18,"name":"War"},{"id":15,"name":"Romance"}]
10,000 BC                   2008           [{"id":6,"name":"Comedy"}]
11:14                       2003           [{"id":9,"name":"Thriller"},
{"id":14,"name":"Family"}]
127 Hours                   2010           [{"id":6,"name":"Comedy"},
{"id":3,"name":"Drama"}]
13 Going on 30              2004           [{"id":6,"name":"Comedy"},
{"id":3,"name":"Drama"},{"id":18,"name":"War"},{"id":15,"name":"Romance"}]
1408                        2007           [{"id":45,"name":"Sci-Fi"},
{"id":6,"name":"Comedy"},{"id":17,"name":"Horror"},{"id":6,"name":"Comedy"},
{"id":18,"name":"War"}]
```

Notice that the complex type `genres` is returned as a JSON array.

To make the JSON data more useful, you can transform the column using Oracle's JSON functions. For example, you can use the JSON "." notation as well as the more powerful transform functions such as `JSON_TABLE`.

See Simple Dot-Notation Access to JSON Data for information on "." notation.

See SQL/JSON Function JSON_TABLE for information on `JSON_TABLE`.

The following example shows a query on the table that takes each value of the array and turns the value into a row in the result set:

```
SELECT original_title, release_date, m.genre_name, genres
    FROM movie_info mi,
       JSON_TABLE(mi.genres, '$.name[*]'
        COLUMNS (genre_name VARCHAR2(25) PATH
      '$')
                 ) AS m
 WHERE rownum < 10;
```

The `JSON_TABLE` creates a row for each value of the array, think outer join, and the struct is parsed to extract the name of the genre. This produces the following output:

```
original_title                  release_date         genre_name        genres
(500) Days of Summer            2009                 Drama
[{"id":3,"name":"Drama"},{"id":6,"name":"Comedy"},

{"id":17,"name":"Horror"},{"id":19,"name":"Western"},
```

```
{"id":18,"name":"War"},{"id":15,"name":"Romance"}]
(500) Days of Summer              2009                  Comedy

DBMS_CLOUD Package Avro, ORC, and Parquet to Oracle Column Name Mapping

Describes rules for how Avro, ORC, and Parquet column names are converted to Oracle column names.

The following are supported for Avro, ORC, and Parquet column names, but may require use of double quotes for Oracle SQL references in external tables. Thus, for ease of use and to avoid having to use double quotes when referencing column names, if possible do not use the following in Avro, ORC, and Parquet column names:

- Embedded blanks
- Leading numbers
- Leading underscores
- Oracle SQL reserved words

The following table shows various types of Avro, ORC, and Parquet column names, and rules for using the column names in Oracle column names in external tables.

Avro, ORC, or Parquet Name	CREATE TABLE Name	Oracle CATALOG	Valid SQL	Notes

part, Part, or PART	part, Part, PART	PART	`select part`
			`select Part`
			`select paRt`
			`select PART`
				Oracle implicitly uppercases unquoted column names

Ord No	"Ord No"	Ord No	`select "Ord No"`	Double quotes are required when there are embedded blanks, which also preserves the character case
__index_key__	"__index_key__"	__index_key__	`select "__index_key__"`	Double quotes are required when there is a leading underscore, which also preserves the character case
6Way	"6Way"	6Way	`select "6Way"`	Double quotes are required when there is a leading numeric digit, which also preserves the character case

Avro, ORC, or Parquet Name	CREATE TABLE Name	Oracle CATALOG	Valid SQL	Notes
create, Create, or CREATE, and so on. (any case variation) partition, Partition, PARTITION, and so on (for an Oracle Reserved word)	"CREATE" "PARTITION"	CREATE PARTITION	`select "CREATE"` `select "PARTITION"`	Double quotes are required around Oracle SQL Reserved words. These are forced to uppercase, but must always be double-quoted when used anywhere in SQL

rowid, Rowid, ROWid, and so on (for ROWID see notes)	rowid		`select "rowid"`
			`select "Rowid"`
			`select "ROWid"`
			`select "rowid"`
				For ROWID, any mixed or lower-case variation of ROWID preserves the case and must always be double-quoted and use the original case variations. Due to the inherent conflict with Oracle ROWID for the table, if you specify upper-case ROWID, it is automatically stored as lower-case "rowid" and must always be double-quoted when referenced.

Notes:

- In general a column name in an external table can be referenced without double quotes.
- Unless there is an embedded blank, a leading underscore ("_") or leading numeric digit ("0" through "9") in the column name, the original case of the column name is preserved, and it must always be referenced with double quotes and using the original case (upper, lower or mixed-case) of the Avro, ORC, or Parquet column name.
- After using `DBMS_CLOUD.CREATE_EXTERNAL_TABLE` to create an external table with the format specified as `avro`, `orc`, or `parquet`, use the `DESCRIBE` command in SQL*Plus to view the table's column names.
- When Oracle SQL Reserved Words are used in Avro, ORC, or Parquet column names, they must always be double-quoted when referenced anywhere in SQL. See Oracle SQL Reserved Words for more information.

DBMS_CLOUD Exceptions

The following table describes exceptions for `DBMS_CLOUD`.

Exception	Code	Description
`reject_limit`	20003	The reject limit of an external table was reached.
`credential_not_exist`	20004	A credential object does not exist.
`table_not_exist`	20005	A table does not exist.
`unsupported_obj_store`	20006	An unsupported object store URI was provided.
`iden_too_long`	20008	An identifier is too long.
`invalid_format`	20009	A format argument is not valid.
`missing_credential`	20010	Mandatory credential object information was not specified.
`invalid_object_uri`	20011	An invalid object URI was provided.
`invalid_partitioning_clause`	20012	An partitioning clause is missing or was not provided.
`unsupported_feature`	20013	An unsupported feature was used that is not existent in the current database version.
`part_not_exist`	20014	A partition or subpartition does not exist, or a table is not a partitioned external table or hybrid partitioned table.
`invalid_table_name`	20016	An invalid table name was used.
`invalid_schema_name`	20017	An invalid schema name was used.
`invalid_dir_name`	20018	An invalid directory name was used.
`invalid_file_name`	20019	An invalid file name was used.
`invalid_cred_attribute`	20020	Invalid credential attributes were specified.
`table_exist`	20021	A table already exists.
`credential_exist`	20022	A credential object already exists.
`invalid_req_method`	20023	A request method is either too long or invalid.
`invalid_req_header`	20024	An invalid request header was specified.
`file_not_exist`	20025	A file does not exist.
`invalid_response`	20026	An HTTP response was not valid.
`invalid_operation`	20027	An invalid task class or ID was specified.
`invalid_user_name`	20028	An invalid username was specified.

DBMS_CLOUD_ADMIN Package

The `DBMS_CLOUD_ADMIN` package provides administrative routines for configuring a database.

- Summary of DBMS_CLOUD_ADMIN Subprograms
  This section covers the `DBMS_CLOUD_ADMIN` subprograms provided with Autonomous Database.
- DBMS_CLOUD_ADMIN Exceptions
  The following table describes exceptions for `DBMS_CLOUD_ADMIN`.

Summary of DBMS_CLOUD_ADMIN Subprograms

This section covers the `DBMS_CLOUD_ADMIN` subprograms provided with Autonomous Database.

Subprogram	Description
ATTACH_FILE_SYSTEM Procedure	This procedure attaches a file system in a directory on your database.
CANCEL_WORKLOAD_CAPTURE Procedure	This procedure cancels the current workload capture.
CREATE_DATABASE_LINK Procedure	This procedure creates a database link to a target database. There are options to create a database link to another Autonomous Database instance, to an Oracle Database that is not an Autonomous Database, or to a non-Oracle Database using Oracle-managed heterogeneous connectivity.
DETACH_FILE_SYSTEM Procedure	This procedure detaches a file system from a directory on your database.
DISABLE_APP_CONT Procedure	This procedure disables database application continuity for the session associated with the specified service name in Autonomous Database.
DISABLE_EXTERNAL_AUTHENTICATION Procedure	This procedure disables external authentication for the Autonomous Database instance.
DISABLE_OPERATOR_ACCESS Procedure	Immediately revokes Cloud Operator access on the Autonomous Database Database instance.
DISABLE_PRINCIPAL_AUTH Procedure	This procedure revokes principal based authentication for the specified provider and applies to the ADMIN user or to the specified user.
DISABLE_RESOURCE_PRINCIPAL Procedure	This procedure disables resource principal credentials for the database or for the specified schema. With a user name specified, other than ADMIN, the procedure revokes the specified schema access to the resource principal credential.
DROP_DATABASE_LINK Procedure	This procedure drops a database link.
ENABLE_APP_CONT Procedure	This procedure enables database application continuity for the session associated with the specified service name in Autonomous Database.
ENABLE_AWS_ARN Procedure	This procedure enables a user to create AWS ARN credentials in Autonomous Database.
ENABLE_EXTERNAL_AUTHENTICATION Procedure	This procedure enables a user to logon to Autonomous Database using the specified external authentication scheme.
ENABLE_FEATURE Procedure	This procedure enables the specified feature on the Autonomous Database instance.
ENABLE_OPERATOR_ACCESS Procedure	Grants the Cloud Operator access to an Autonomous Database instance for a specified number of hours.
ENABLE_PRINCIPAL_AUTH Procedure	This procedure enables principal authentication for the specified provider and applies to the ADMIN user or the specified user.

Subprogram	Description
ENABLE_RESOURCE_PRINCIPAL Procedure	This procedure enables resource principal credential and creates the credential `OCI$RESOURCE_PRINCIPAL`. With a user name specified, other than ADMIN, the procedure grants the specified schema access to the resource principal credential.
FINISH_WORKLOAD_CAPTURE Procedure	This procedure stops the workload capture and uploads capture files to object storage.
PREPARE_REPLAY Procedure	This procedure prepares replay for the refreshable clone.
PURGE_FLASHBACK_ARCHIVE Procedure	This procedure purges historical data from the Flashback Data Archive.
REPLAY_WORKLOAD Procedure	This procedure is overloaded. It initiates the workload replay.
SET_FLASHBACK_ARCHIVE_RETENTION Procedure	This procedure enables ADMIN users to modify the retention period for Flashback Time Travel `flashback_archive`.
START_WORKLOAD_CAPTURE Procedure	This procedure initiates a workload capture.

- ATTACH_FILE_SYSTEM Procedure
  This procedure attaches a file system in the database.
- CANCEL_WORKLOAD_CAPTURE Procedure
  This procedure cancels any ongoing workload capture on the database.
- CREATE_DATABASE_LINK Procedure
- DETACH_FILE_SYSTEM Procedure
  This procedure detaches a file system from the database.
- DISABLE_APP_CONT Procedure
  This procedure disables database application continuity for the session associated with the specified service name in Autonomous Database.
- DISABLE_EXTERNAL_AUTHENTICATION Procedure
  Disables user authentication with external authentication schemes for the database.
- DISABLE_FEATURE Procedure
  This procedure disables the specified feature on the Autonomous Database instance.
- DISABLE_OPERATOR_ACCESS Procedure
  This procedure immediately revokes Cloud Operator access on the Autonomous Database instance.
- DISABLE_PRINCIPAL_AUTH Procedure
  This procedure revokes principal based authentication for a specified provider on Autonomous Database and applies to the ADMIN user or to the specified user.
- DISABLE_RESOURCE_PRINCIPAL Procedure
  Disable resource principal credential for the database or for the specified schema.
- DROP_DATABASE_LINK Procedure
  This procedure drops a database link.
- ENABLE_APP_CONT Procedure
  This procedure enables database application continuity for the session associated with the specified service name in Autonomous Database.

- ENABLE_AWS_ARN Procedure
  This procedure enables an Autonomous Database instance to use Amazon Resource Names (ARNs) to access AWS resources.
- ENABLE_EXTERNAL_AUTHENTICATION Procedure
  Enable users to login to the database with external authentication schemes.
- ENABLE_FEATURE Procedure
  This procedure enables the specified feature on the Autonomous Database instance.
- ENABLE_OPERATOR_ACCESS Procedure
  Oracle Cloud Operations does not access your Autonomous Database instance and access is disallowed by default. When access is required to troubleshoot or mitigate an issue, you can allow a cloud operator access to the database schemas for a limited time.
- ENABLE_PRINCIPAL_AUTH Procedure
  This procedure enables principal authentication on Autonomous Database for the specified provider and applies to the ADMIN user or the specified user.
- ENABLE_RESOURCE_PRINCIPAL Procedure
  Enable resource principal credential for the database or for the specified schema. This procedure creates the credential `OCI$RESOURCE_PRINCIPAL`.
- FINISH_WORKLOAD_CAPTURE Procedure
  This procedure finishes the current workload capture, stops any subsequent workload capture requests to the database, and uploads the capture files to Object Storage.
- PREPARE_REPLAY Procedure
  The `PREPARE_REPLAY` procedure prepares the refreshable clone for a replay.
- PURGE_FLASHBACK_ARCHIVE Procedure
  This procedure enables ADMIN users to purge historical data from Flashback Data Archive. You can either purge all historical data from Flashback Data Archive `flashback_archive` or selective data based on timestamps or System Change Number.
- REPLAY_WORKLOAD Procedure
  This procedure initiates a workload replay on your Autonomous Database instance. The overloaded form enables you to replay the capture files from an Autonomous Database instance, on-premises database, or other cloud service databases.
- SET_FLASHBACK_ARCHIVE_RETENTION Procedure
  This procedure allows ADMIN users to modify the retention period for Flashback Data Archive `flashback_archive`.
- START_WORKLOAD_CAPTURE Procedure
  This procedure initiates a workload capture on your Autonomous Database instance.

ATTACH_FILE_SYSTEM Procedure

This procedure attaches a file system in the database.

The `DBMS_CLOUD_ADMIN.ATTACH_FILE_SYSTEM` procedure attaches a file system in your database and stores information about the file system in the `DBA_CLOUD_FILE_SYSTEMS` view.

Syntax

```
DBMS_CLOUD_ADMIN.ATTACH_FILE_SYSTEM (
    file_system_name         IN VARCHAR2,
    file_system_location     IN VARCHAR2,
    directory_name           IN VARCHAR2,
    description              IN VARCHAR2 DEFAULT NULL,
```

```
    params                    IN CLOB DEFAULT NULL
);
```

Parameters

Parameter	Description
`file_system_name`	Specifies the name of the file system. This parameter is mandatory.
`file_system_location`	Specifies the location of the file system. The value you supply with `file_system_location` consists of a Fully Qualified Domain Name (FQDN) and a file path in the form: *FQDN*`:`*file_path*. For example: • FQDN: `myhost.sub000445.myvcn.oraclevcn.com` For Oracle Cloud Infrastructure File Storage set the FQDN in **Show Advanced Options** when you create a file system. See Creating File Systems for more information. • File Path: `/results` This parameter is mandatory.
`directory_name`	Specifies the directory name for the attached file system. The directory must exist. This parameter is mandatory.
`description`	(Optional) Provides a description of the task.
`params`	A JSON string that provides an additional parameter for the file system. • `nfs_version`: Specifies the NFS version to use when NFS is attached (NFSv3 or NFSv4). Valid values: 3, 4. Default value: 3

Examples:

Attach to an NFSv3 file system:

```
BEGIN
   DBMS_CLOUD_ADMIN.ATTACH_FILE_SYSTEM (
    file_system_name      => 'FSS',
    file_system_location  => 'myhost.sub000445.myvcn.oraclevcn.com:/results',
    directory_name        => 'FSS_DIR',
    description           => 'Source NFS for sales data'
  );
END;
/
```

Attach to an NFSv4 file system:

```
BEGIN
   DBMS_CLOUD_ADMIN.ATTACH_FILE_SYSTEM (
    file_system_name      => 'FSS',
    file_system_location  => 'myhost.sub000445.myvcn.oraclevcn.com:/results',
    directory_name        => 'FSS_DIR',
    description           => 'Source NFS for sales data',
    params                => JSON_OBJECT('nfs_version' value 4)
);
```

```
END;
/
```

Usage Notes

- To run this procedure you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN`.
- You must have `WRITE` privilege on the directory object in the database to attach a file system using `DBMS_CLOUD_ADMIN.ATTACH_FILE_SYSTEM`.
- The `DBMS_CLOUD_ADMIN.ATTACH_FILE_SYSTEM` procedure can only attach a private File Storage Service in databases with Private Endpoints enabled.

  See OCI File Storage Service and Configure Network Access with Private Endpoints for more information.
- The `DBMS_CLOUD_ADMIN.ATTACH_FILE_SYSTEM` procedure looks up the Network File System hostname on the customer's virtual cloud network (VCN). The error `"ORA-20000: Mounting NFS fails"` is returned if the hostname specified in the location cannot be located.
- Oracle Cloud Infrastructure File Storage uses NFSv3 to share
- If you attach to non-Oracle Cloud Infrastructure File Storage systems, the procedure supports NFSv3 and NFSv4
- If you have an attached NFS server that uses NFSv3 and the NFS version is updated to NFSv4 in the NFS server, you must run `DBMS_CLOUD_ADMIN.DETACH_FILE_SYSTEM` and then `DBMS_CLOUD_ADMIN.ATTACH_FILE_SYSTEM` (using the `params` parameter with `nfs_version` set to 4). This attaches NFS with the matching protocol so that Autonomous Database can access the NFSv4 Server. Without detaching and then reattaching, the NFS server will be inaccessible and you may see an error such as: `"Protocol not supported"`.

CANCEL_WORKLOAD_CAPTURE Procedure

This procedure cancels any ongoing workload capture on the database.

This procedure cancels the current workload capture and enables refresh on the refreshable clone.

Syntax

```
DBMS_CLOUD_ADMIN.CANCEL_WORKLOAD_CAPTURE;
```

Example

```
BEGIN
   DBMS_CLOUD_ADMIN.CANCEL_WORKLOAD_CAPTURE;
END;
/
```

Usage Note

- To run this procedure you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN`.

CREATE_DATABASE_LINK Procedure

This procedure creates a database link to a target database in the schema calling the API.

The overloaded forms support the following:

- When you use the `gateway_params` parameter, this enables you to create a database link with Oracle-managed heterogeneous connectivity where the link is to a supported non-Oracle database.
- When you use the `rac_hostnames` parameter, this enables you to create a database link from an Autonomous Database on a private endpoint to a target Oracle RAC database. In this case, you use the `rac_hostnames` parameter to specify the host names of one or more individual nodes of the target Oracle RAC database.

Syntax

```
DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK(
       db_link_name          IN VARCHAR2,
       hostname              IN VARCHAR2,
       port                  IN NUMBER,
       service_name          IN VARCHAR2,
       ssl_server_cert_dn    IN VARCHAR2 DEFAULT,
       credential_name       IN VARCHAR2 DEFAULT,
       directory_name        IN VARCHAR2 DEFAULT,
       gateway_link          IN BOOLEAN DEFAULT,
       public_link           IN BOOLEAN DEFAULT,
       private_target        IN BOOLEAN DEFAULT
       gateway_params        IN CLOB DEFAULT);

DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK(
       db_link_name          IN VARCHAR2,
       rac_hostnames         IN CLOB,
       port                  IN NUMBER,
       service_name          IN VARCHAR2,
       ssl_server_cert_dn    IN VARCHAR2 DEFAULT,
       credential_name       IN VARCHAR2 DEFAULT,
       directory_name        IN VARCHAR2 DEFAULT,
       gateway_link          IN BOOLEAN DEFAULT,
       public_link           IN BOOLEAN DEFAULT,
       private_target        IN BOOLEAN DEFAULT);
```

Parameters

Parameter	Description
db_link_name	The name of the database link to create.

Parameter	Description
hostname	The hostname for the target database. Specifying localhost for hostname as is not allowed. When you specify a connection with Oracle-managed heterogeneous connectivity by supplying the gateway_params parameter, note the following: • When the db_type value is google_bigquery the hostname is not used and you can provide value such as example.com. • When the db_type value is snowflake the hostname is the Snowflake account identifier. To find your Snowflake account identifier, see Account Identifier Formats by Cloud Platform and Region. Use this parameter or rac_hostnames, do not use both. The DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK input should mention the scan name of the target Dedicated Autonomous Database as the 'hostname' parameter.
rac_hostnames	Specifies hostnames for the target Oracle RAC database. The value is a JSON array that specifies one or more individual host names for the nodes of the target Oracle RAC database. Multiple host names can be passed in JSON, separated by a ",". For example: `'["sales1-svr1.domain", "sales1-svr2.domain", "sales1-svr3.domain"]'` When the target is an Oracle RAC database, use the rac_hostnames parameter to specify one or more hostnames with DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK. This allows you to take advantage of the high availability capabilities of Oracle RAC. Using an IP address, a SCAN IP, or a SCAN hostname in the rac_hostnames value is not supported. When you specify a list of host names in the rac_hostnames parameter, CREATE_DATABASE_LINK uses all of the specified host names as addresses in the connect string. If one of the specified hosts is not available on the target Oracle RAC database, Autonomous Database automatically attempts to connect using another host name from the list. Use this parameter or hostname, do not use both. Specifying localhost for a rac_hostname value is not allowed.

Parameter	Description
port	Specifies the port for the connections to the target database. When you specify a connection with Oracle-managed heterogeneous connectivity using the gateway_params parameter, set the port based on the db_type value: • awsredshift: use port 5439 • azure: use port 1433 • db2: use port 2500 for Db2 versions >= 11.5.6 • db2: use port 5000 for Db2 versions <= 11.5.5 • google_analytics: use port 443 • google_bigquery: use port 443 • google_drive: use port 443 • hive: use port 433 • mongodb: use port 27017 • mysql: use port 3306 • mysql_community: use port 3306 • postgres: use port 5432 • salesforce: use port 19937 • servicenow: use port 443 • sharepoint: use port 443 • snowflake: use port 443 • youtube: use port 443 See Oracle-Managed Heterogeneous Connectivity Database Types and Ports for more information.
service_name	The service_name for the database to link to. For a target Autonomous Database, find the service name by one of the following methods: • Look in the tnsnames.ora file in the wallet.zip that you download from an Autonomous Database for your connection. • Click **Database connection** on the Oracle Cloud Infrastructure Console. In the **Connection Strings** area, each connection string includes a service_name entry with the connection string for the corresponding service. When both Mutual TLS (mTLS) and TLS connections are allowed, under **TLS authentication** select **TLS** to view the TNS names and connection strings for connections with TLS authentication. See View TNS Names and Connection Strings for an Autonomous Database Instance for more information. • Query V$SERVICES view. For example: `SELECT name FROM V$SERVICES;` When you specify a connection with Oracle-managed heterogeneous connectivity using the gateway_params parameter, the service_name is the database name of the non-Oracle database.

Parameter	Description
ssl_server_cert_dn	The DN value found in the server certificate. Oracle-managed heterogeneous connectivity is preconfigured with a wallet that contains most of the common trusted root and intermediate SSL certificates. The ssl_server_cert_dn must be NULL when you supply the gateway_params parameter or do not include the ssl_server_cert_dn parameter (the default value is NULL). **Public Endpoint Link to an Autonomous Database Target without a Wallet:** To connect to an Autonomous Database target on a public endpoint without a wallet (TLS): • The directory_name parameter must be NULL. • The ssl_server_cert_dn parameter must be NULL or do not include this parameter (the default value is NULL). **Private Endpoint Link without a Wallet:** To connect to an Oracle Database on a private endpoint without a wallet: • The target database must be on a private endpoint. • The directory_name parameter must be NULL. • The ssl_server_cert_dn parameter must be NULL or do not include this parameter (the default is NULL). • The private_target parameter must be TRUE.
credential_name	The name of a stored credential created with DBMS_CLOUD.CREATE_CREDENTIAL. This is the credentials to access the target database.
directory_name	The directory for the cwallet.sso file. The default value for this parameter is 'data_pump_dir'. Oracle-managed heterogeneous connectivity is preconfigured with a wallet that contains most of the common trusted root and intermediate SSL certificates. The directory_name parameter is not required when you supply the gateway_params parameter. **Public Endpoint Link to an Autonomous Database Target without a Wallet:** To connect to an Autonomous Database on a public endpoint without a wallet (TLS): • The directory_name parameter must be NULL. • The ssl_server_cert_dn parameter must be NULL or do not include this parameter (the default value is NULL). In addition, to connect to an Autonomous Database with TCP, the ssl_server_cert_dn parameter must be NULL or do not include this parameter (the default value is NULL). **Private Endpoint Link without a Wallet:** To connect to a target Oracle Database on a private endpoint without a wallet: • The target database must be on a private endpoint. • The directory_name parameter must be NULL. • The ssl_server_cert_dn parameter must be NULL or do not include this parameter (the default value is NULL). • The private_target parameter must be TRUE.

Parameter	Description
gateway_link	Indicates if the database link is created to another Oracle Database or to an Oracle Database Gateway. If gateway_link is set to FALSE, this specifies a database link to another Autonomous Database or to another Oracle Database. If gateway_link is set to TRUE, this specifies a database link to a non-Oracle system. This creates a connect descriptor in the database link definition that specifies (HS=OK). When gateway_link is set to TRUE and gateway_params is NULL, this specifies a database link to a customer-managed Oracle gateway. The default value for this parameter is FALSE.
public_link	Indicates if the database link is created as a public database link. To run DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK with this parameter set to TRUE, the user invoking the procedure must have EXECUTE privilege on the credential associated with the public database link and must have the CREATE PUBLIC DATABASE LINK system privilege. The EXECUTE privilege on the credential can be granted either by the ADMIN user or by the credential owner. The default value for this parameter is FALSE.
private_target	When a database link accesses a hostname that needs to be resolved in a VCN DNS server, specify the private_target parameter with value TRUE. When private_target is TRUE, the hostname parameter must be a single hostname (on a private endpoint, using an IP address, a SCAN IP, or a SCAN hostname is not supported). The default value for this parameter is FALSE.

Parameter	Description
gateway_params	db_type This parameter specifies the target database type for Oracle-managed heterogeneous connectivity to connect to non-Oracle databases. The db_type value is one of: • awsredshift • azure * See Usage Notes for additional supported gateway_params when db_type is azure. • db2 • google_analytics • google_bigquery * See Usage Notes for additional supported gateway_params when db_type is google_bigquery. • google_drive * See Usage Notes for additional supported gateway_params when db_type is google_drive. • hive * See Usage Notes for additional supported gateway_params when db_type is hive. • mongodb • mysql • postgres • salesforce * See Usage Notes for additional supported gateway_params when db_type is salesforce. • servicenow * See Usage Notes for additional supported gateway_params when db_type is servicenow. • sharepoint * See Usage Notes for additional supported gateway_params when db_type is sharepoint. • snowflake * See Usage Notes for additional supported gateway_params when db_type is snowflake. • youtube * See Usage Notes for additional supported gateway_params when db_type is youtube. • NULL When gateway_params is NULL and gateway_link is set to TRUE, this specifies a database link to a customer-managed Oracle gateway. Specify the parameter with the json_object form. For example: gateway_params => json_object('db_type' value 'awsredshift') See Oracle-Managed Heterogeneous Connectivity Database Types and Ports for required port values for each database type. When gateway_params is NULL and private_target is TRUE, if directory_name is NULL, a TCP-based database link is created. When gateway_params is NULL and private_target is TRUE, if directory_name is NULL, a TCPS-based database link is created. enable_ssl: For a database on a private endpoint, the gateway_params parameter supports the optional enable_ssl parameter. Set this parameter to

Parameter	Description
	`true` to support SSL/TLS connections for a remote target database on a private endpoint. By default `enable_ssl` is `false`. For example: `gateway_params => JSON_OBJECT( 'db_type' value 'snowflake', 'enable_ssl' value true)`

Usage Notes

- When you specify the `gateway_params` parameter, for some `db_type` values, additional `gateway_params` parameters are supported:

db_type	Additional gateway_params Values
`azure`	When the `db_type` value is `azure` there are two optional parameters, `auth_method` and `domain` to support NTLM/AD authentication. When NTLMv2 is configured, set `auth_method=10` and set `domain` to the Windows domain value. To use an Azure Active Directory password, set `auth_method=13`. Do not use `auth_method=13` to access an Oracle on-premises Database. See Microsoft SQL Server Authentication Method for more information.
`google_analytics`	When the `db_type` is `google_analytics`, the credential you specify must be a Google OAuth credential (`gcp_oauth2`). See CREATE_CREDENTIAL Procedure for more information.
`google_bigquery`	When the `db_type` is `google_bigquery`, the credential you specify must be a Google OAuth credential (`gcp_oauth2`) See CREATE_CREDENTIAL Procedure for more information. When `db_type` is `google_bigquery`, the parameter `project` is valid. This parameter specifies the project name for `google_bigquery` and is required. The table name you specify when you use `SELECT` with Google BigQuery must be in quotes. For example: `SELECT * FROM "sales"@GOOGLE_BIGQUERY_LINK`

db_type	Additional gateway_params Values

google_drive	For db_type google_drive, the credential you supply with DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK must be an OAuth type credential using the params parameter with gcp_oauth2 values specified (client_id, client_secret, and refresh_token).
	To connect to Google Drive and get data you must supply the gateway parameters directory_name and file_name. These parameters specify a model file (auto REST file) that maps the JSON response to the relational model. The model file specifies the endpoints, table mapping, and HTTP response code for processing the JSON response. See Model file syntax and Example Model file for more information.
	When you use gateway_params parameter with db_type google_drive you must supply the gateway_params parameter db_type with the value 'google_drive' and the directory_name and file_name parameters, along with OAuth type credentials:
	The directory_name parameter specifies the directory with the REST config file. You could create this directory as follows:
	`create or replace directory google_drive_dir as 'GOOGLE_DRIVE_DIR';`
	Obtain and download the auto REST file to the specified directory. For example:
	`exec DBMS_CLOUD.get_object('google_drive_dir_cred', 'https://objectstorage.<...>/ google_drive.rest','GOOGLE_DRIVE_DIR');`
	Set the file_name value to the name of the auto REST file you downloaded, "google_drive.rest". Then you can use the REST config file with OAuth 2.0.

hive	When db_type is hive, the parameter http_path is valid. This parameter specifies the HttpPath value, if required, to connect to the Hive instance.
salesforce	When the db_type is salesforce, the parameter: security_token is valid. A security token is a case-sensitive alphanumeric code. Supplying a security_token value is required to access Salesforce. For example: `gateway_params => JSON_OBJECT( 'db_type' value 'salesforce', 'security_token' value 'security_token_value' )` See Reset Your Security Token for more information.

db_type	Additional gateway_params Values

servicenow	To connect to ServiceNow and get data you must supply the gateway parameters directory_name and file_name. These parameters specify a model file (REST config file) that maps the JSON response to the relational model. The model file specifies the endpoints, table mapping, and HTTP response code for processing the JSON response. See Model file syntax and Example Model file for more information.
	When you use gateway_params parameter with db_type servicenow, there are two supported options:
	– Basic Authentication: you must supply the gateway_params parameter db_type with the value 'servicenow', and supply the directory_name and file_name parameters along with username/password type credentials.
	– OAuth 2.0 Authentication: you must supply the gateway_params parameter db_type with the value 'servicenow', and the directory_name, file_name, and token_uri parameters, along with OAuth type credentials.
	The directory_name parameter specifies the directory with the ServiceNow REST config file. You could create this directory as follows:
	`create or replace directory servicenow_dir as 'SERVICENOW_DIR';`
	Obtain and download the ServiceNow REST config file to the specified directory. For example:
	`exec DBMS_CLOUD.get_object('servicenow_dir_cred', 'https://objectstorage.<...>/servicenow.rest','SERVICENOW_DIR');`
	Set the file_name value to the name of the REST config file you downloaded, "servicenow.rest".
	Then you can use the ServiceNow REST config file with either basic authentication or OAuth2.0.
	Then you can use the ServiceNow REST config file with either basic authentication or OAuth2.0. See HETEROGENEOUS_CONNECTIVITY_INFO View for samples.

db_type	Additional gateway_params Values
sharepoint	When you use gateway_params parameter with db_type sharepoint, also specify values for auth_uri, scope, service_url, and token_uri. For db_type sharepoint, the credential you supply with DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK must be an OAuth type credential using the params parameter with gcp_oauth2 values specified (client_id, client_secret, and refresh_token). See CREATE_CREDENTIAL Procedure for more information. Generate the refresh_token for *tenant_id*.sharepoint.com/.default offline_access. See the following for more information: Determine the scope and OAuth 2.0 authentication. Set values for gateway_params for db_type sharepoint: – auth_uri: Set the auth_uri from Azure. See Obtain application client information and endpoints for more information. – scope: Set the scope. See Connection option descriptions for more information. – service_url: Set the service_url. See Service URL for more information. – token_uri: Get the token_uri from Azure. See Obtain application client information and endpoints for more information.

snowflake	When the db_type is SNOWFLAKE, the optional parameters: role, schema, and warehouse are valid. These values specify a different schema, role, or warehouse value, other than the default. For example:
	`gateway_params => JSON_OBJECT(`
	`'db_type' value 'snowflake',`
	`'role' value 'ADMIN',`
	`'schema' value 'PUBLIC',`
	`'warehouse' value 'TEST' )`

db_type	Additional gateway_params Values

youtube	To connect to Youtube and get data you must supply the gateway parameters directory_name and file_name. These parameters specify a model file (REST config file) that maps the JSON response to the relational model. The model file specifies the endpoints, table mapping, and HTTP response code for processing the JSON response. See Model file syntax and Example Model file for more information.
	When you use gateway_params parameter with db_type youtube, the credential you specify must be a Google OAuth credential (gcp_oauth2) See CREATE_CREDENTIAL Procedure for more information.
	OAuth 2.0 Authentication: you must supply the gateway_params parameter db_type with the value youtube, and the directory_name and file_name parameters, along with OAuth type credentials.
	The directory_name parameter specifies the directory with the ServiceNow REST config file. You could create this directory as follows:
	`create or replace directory youtube_dir as 'YOUTUBE_DIR';`
	Obtain and download the ServiceNow REST config file to the specified directory. For example:
	`exec DBMS_CLOUD.get_object('youtube_dir_cred', 'https://objectstorage.<...>/ youtube.rest','YOUTUBE_DIR');`
	Set the file_name value to the name of the REST config file you downloaded, "youtube.rest".
	Then you can use the ServiceNow REST config file with OAuth2.0. See HETEROGENEOUS_CONNECTIVITY_INFO View for samples.

- To run DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK with a user other than ADMIN, you need to grant EXECUTE and CREATE DATABASE LINK privileges to that user. For example, run the following command as ADMIN to grant privileges to adb_user:

```
GRANT EXECUTE ON DBMS_CLOUD_ADMIN TO adb_user;
GRANT CREATE DATABASE LINK TO adb_user;
```

  In addition, when you create a Database Link in a schema other than the ADMIN schema, for example in a schema named adb_user, the adb_user schema must own the credential you use with DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK.

- Only one wallet file is valid per directory specified with the directory_name parameter. You can only upload one cwallet.sso at a time to the directory you choose for wallet files. This means with a cwallet.sso in a directory, you can only create database links to the databases for which the wallet in that directory is valid. To use multiple cwallet.sso files with database links you need to create additional directories and put each cwallet.sso in a different directory.

  See Create Directory in Autonomous Database for information on creating directories.

- To create a database link to an Autonomous Database, set `GLOBAL_NAMES` to `FALSE` on the source database (non-Autonomous Database).

```
SQL> ALTER SYSTEM SET GLOBAL_NAMES = FALSE;

System altered.

SQL> SHOW PARAMETER GLOBAL_NAMES
NAME                      TYPE        VALUE
------------------------  ----------- -----------
global_names              boolean     FALSE
```

- When the `private_target` parameter is `TRUE`, the `hostname` parameter specifies a private host inside the VCN.

Examples

```
BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL(
     credential_name => 'DB_LINK_CRED',
     username => 'adb_user',
     password => 'password');
  DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK(
     db_link_name => 'SALESLINK',
     hostname => 'adb.eu-frankfurt-1.oraclecloud.com',
     port => '1522',
     service_name => 'example_medium.adb.example.oraclecloud.com',
     ssl_server_cert_dn => 'CN=adb.example.oraclecloud.com,OU=Oracle BMCS
FRANKFURT,O=Oracle Corporation,L=Redwood City,ST=California,C=US',
     credential_name => 'DB_LINK_CRED');
END;
/

BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'AWS_REDSHIFT_LINK_CRED',
    username => 'NICK',
    password => 'password'
  );
DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK(
          db_link_name => 'AWSREDSHIFT_LINK',
          hostname => 'example.com',
          port => '5439',
          service_name => 'example_service_name',
          ssl_server_cert_dn => NULL,
          credential_name => 'AWS_REDSHIFT_LINK_CRED',
          gateway_params => JSON_OBJECT('db_type'  value 'awsredshift'));
END;
/

BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'PRIVATE_ENDPOINT_CRED',
    username => 'db_user',
```

```
    password => 'password'
  );
DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK(
          db_link_name => 'PRIVATE_ENDPOINT_DB_LINK',
          hostname => 'exampleHostname',
          port => '1521',
          service_name => 'exampleServiceName',
          credential_name => 'PRIVATE_ENDPOINT_CRED',
          ssl_server_cert_dn => NULL,
          directory_name => NULL,
          private_target => TRUE);
END;
/

BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'GOOGLE_BIGQUERY_CRED',
    params => JSON_OBJECT( 'gcp_oauth2' value JSON_OBJECT(
          'client_id' value 'client_id',
          'client_secret' value 'client_secret',
          'refresh_token' value 'refresh_token' )));

DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK(
          db_link_name => 'GOOGLE_BIGQUERY_LINK',
          hostname => 'example.com',
          port => '443',
          service_name => 'example_service_name',
          credential_name => 'GOOGLE_BIGQUERY_CRED',
          gateway_params => JSON_OBJECT(
                    'db_type' value 'google_bigquery',
                    'project' value 'project_name1' ));
END;
/
```

The table name you specify when you use `SELECT` with Google BigQuery or Google Analytics must be in quotes. For example:

```
SELECT * FROM "sales"@GOOGLE_BIGQUERY_LINK
```

Use the `rac_hostnames` parameter with a target Oracle RAC database on a private endpoint.

```
BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL(
     credential_name => 'DB_LINK_CRED1',
     username => 'adb_user',
     password => 'password');
      DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK(
     db_link_name => 'SALESLINK',
     rac_hostnames => '["sales1-svr1.example.adb.us-
ashburn-1.oraclecloud.com",
                        "sales1-svr2.example.adb.us-
ashburn-1.oraclecloud.com",
                        "sales1-svr3.example.adb.us-
ashburn-1.oraclecloud.com"]',
```

```
     port => '1522',
     service_name => 'example_high.adb.oraclecloud.com',
     ssl_server_cert_dn => 'CN=adb.example.oraclecloud.com,OU=Oracle BMCS
FRANKFURT,O=Oracle Corporation,L=Redwood City,ST=California,C=US',
     credential_name => 'DB_LINK_CRED1',
     directory_name => 'EXAMPLE_WALLET_DIR',
     private_target => TRUE);
END;
/
```

DETACH_FILE_SYSTEM Procedure

This procedure detaches a file system from the database.

The `DBMS_CLOUD_ADMIN.DETACH_FILE_SYSTEM` procedure detaches a file system from your database. In addition to that, the `DBMS_CLOUD_ADMIN.DETACH_FILE_SYSTEM` procedure also removes the information about the file system from the `DBA_CLOUD_FILE_SYSTEMS` view.

Syntax

```
DBMS_CLOUD_ADMIN.DETACH_FILE_SYSTEM(
    file_system_name         IN VARCHAR2
);
```

Parameters

Parameter	Description
`file_system_name`	Specifies the name of the file system. This parameter is mandatory.

Example:

```
BEGIN
   DBMS_CLOUD_ADMIN.DETACH_FILE_SYSTEM (
    file_system_name      => 'FSS'
  );
END;
/
```

Usage Notes

- To run this procedure, you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN`.
- You must have the `WRITE` privilege on the directory object in the database, to detach a file system from a directory using the `DBMS_CLOUD_ADMIN.DETACH_FILE_SYSTEM` procedure.
- The `DBMS_CLOUD_ADMIN.DETACH_FILE_SYSTEM` procedure can only detach a private File Storage Service in databases with Private Endpoints enabled.

  See OCI File Storage Service and Configure Network Access with Private Endpoints for more information.

- The `DBMS_CLOUD_ADMIN.DETACH_FILE_SYSTEM` procedure looks up the Network File System hostname on the customer's virtual cloud network (VCN). The error `"ORA-20000: Mounting NFS fails"` is returned if the hostname specified in the location cannot be located.

DISABLE_APP_CONT Procedure

This procedure disables database application continuity for the session associated with the specified service name in Autonomous Database.

Syntax

```
DBMS_CLOUD_ADMIN.DISABLE_APP_CONT(
    service_name      IN VARCHAR2);
```

Parameters

Parameter	Description
`service_name`	The `service_name` for the Autonomous Database service. To find service names: • Look in the `tnsnames.ora` file in the `wallet.zip` that you download from an Autonomous Database for your connection. • Click **Database connection** on the Oracle Cloud Infrastructure Console. In the **Connection strings** area, each connection string includes a `service_name` entry that contains the connection string for the corresponding service. When both Mutual TLS (mTLS) and TLS connections are allowed, under **TLS authentication** select **TLS** to view the TNS names and connection strings for connections with TLS authentication. See View TNS Names and Connection Strings for an Autonomous Database Instance for more information. • Query `V$SERVICES` view. For example: `SELECT name FROM V$SERVICES;`

Usage Notes

See Overview of Application Continuity for more information on Application Continuity.

Example

```
BEGIN
    DBMS_CLOUD_ADMIN.DISABLE_APP_CONT(
        service_name => 'nv123abc1_adb1_high.adb.oraclecloud.com' );
END;
/
```

Verify the value as follows:

```
SELECT name, failover_type FROM DBA_SERVICES;

NAME                                                  FAILOVER_TYPE
----------------------------------------------------- --------------
nv123abc1_adb1_high.adb.oraclecloud.com
```

DISABLE_EXTERNAL_AUTHENTICATION Procedure

Disables user authentication with external authentication schemes for the database.

Syntax

```
DBMS_CLOUD_ADMIN.DISABLE_EXTERNAL_AUTHENTICATION;
```

Exceptions

Exception	Error	Description
invalid_ext_auth	ORA-20004	See the accompanying message for a detailed explanation.

Example

```
BEGIN
   DBMS_CLOUD_ADMIN.DISABLE_EXTERNAL_AUTHENTICATION;
END;
/

PL/SQL procedure successfully completed.
```

DISABLE_FEATURE Procedure

This procedure disables the specified feature on the Autonomous Database instance.

Syntax

```
DBMS_CLOUD_ADMIN.DISABLE_FEATURE(
    feature_name    IN  VARCHAR2);
```

Parameters

Parameter	Description
feature_name	Specifies the feature type to be disabled. Supported values are: • 'AUTO_DST_UPGRADE': Disable AUTO DST feature. • 'AUTO_DST_UPGRADE_EXCL_DATA': Disable AUTO DST EXCL DATA feature. • 'ORAMTS': Disable OraMTS feature. • 'OWM': Disable Oracle Workspace Manager. • 'WORKLOAD_AUTO_REPLAY': Disable workload auto replay feature. This parameter is mandatory.

Examples

```
BEGIN
DBMS_CLOUD_ADMIN.DISABLE_FEATURE(
    feature_name => 'ORAMTS');
```

```
END;
/

BEGIN
DBMS_CLOUD_ADMIN.DISABLE_FEATURE(
    feature_name => 'AUTO_DST_UPGRADE');
END;
/

BEGIN
DBMS_CLOUD_ADMIN.DISABLE_FEATURE(
    feature_name => 'AUTO_DST_UPGRADE_EXCL_DATA');
END;
/

BEGIN
DBMS_CLOUD_ADMIN.DISABLE_FEATURE(
    feature_name => 'OWM');
END;
/

BEGIN
DBMS_CLOUD_ADMIN.DISABLE_FEATURE(
    feature_name => 'WORKLOAD_AUTO_REPLAY');
END;
/
```

Usage Notes

- To disable the `OraMTS`, `AUTO_DST_UPGRADE`, `AUTO_DST_UPGRADE_EXCL_DATA`, `OWM`, or `WORKLOAD_AUTO_REPLAY` features for your Autonomous Database instance, you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN`.
- When both `AUTO_DST_UPGRADE` and `AUTO_DST_UPGRADE_EXCL_DATA` are disabled, if new time zone versions are available the Autonomous Database instance does not upgrade to use the latest available time zone files.
- Query `dba_cloud_config` to verify that `AUTO_DST_UPGRADE` is disabled.

  ```
  SELECT param_name, param_value FROM dba_cloud_config WHERE
         LOWER(param_name) = 'auto_dst_upgrade';

  0 rows selected.
  ```

- Query `dba_cloud_config` to verify that `AUTO_DST_UPGRADE_EXCL_DATA` is disabled.

  ```
  SELECT param_name, param_value FROM dba_cloud_config WHERE
         LOWER(param_name) = 'auto_dst_upgrade_excl_data';

  0 rows selected.
  ```

DISABLE_OPERATOR_ACCESS Procedure

This procedure immediately revokes Cloud Operator access on the Autonomous Database instance.

Syntax

```
DBMS_CLOUD_ADMIN.DISABLE_OPERATOR_ACCESS;
```

Example

```
BEGIN
    DBMS_CLOUD_ADMIN.DISABLE_OPERATOR_ACCESS;
END;
/
```

DISABLE_PRINCIPAL_AUTH Procedure

This procedure revokes principal based authentication for a specified provider on Autonomous Database and applies to the ADMIN user or to the specified user.

Syntax

```
DBMS_CLOUD_ADMIN.DISABLE_PRINCIPAL_AUTH(
       provider    IN VARCHAR2,
       username    IN VARCHAR2 DEFAULT 'ADMIN' );
```

Parameters

Parameter	Description
`provider`	Specifies the type of provider. Valid values: • `AWS` • `AZURE` • `GCP` • `OCI`
`username`	Specifier the user to disable principal based authentication for. A null value is valid for the `username`. If `username` is not specified, the procedure applies for the "`ADMIN`" user.

Usage Notes

- When the provider value is `AZURE` and the `username` is `ADMIN`, the procedure disables Azure service principal based authentication on Autonomous Database and deletes the Azure application on the Autonomous Database instance.
- When the provider value is `AZURE` and the `username` is a user other than the `ADMIN` user, the procedure revokes the privileges from the specified user. The `ADMIN` user and other users that are enabled to use the Azure service principal can continue to use `ADMIN.AZURE$PA` and the application that is created for the Autonomous Database instance remains on the instance.

Examples

```
BEGIN
     DBMS_CLOUD_ADMIN.DISABLE_PRINCIPAL_AUTH(
       provider => 'AZURE',
       username => 'SCOTT');
END;
/

BEGIN
     DBMS_CLOUD_ADMIN.DISABLE_PRINCIPAL_AUTH(
       provider => 'GCP');
END;
/
```

DISABLE_RESOURCE_PRINCIPAL Procedure

Disable resource principal credential for the database or for the specified schema.

Syntax

```
DBMS_CLOUD_ADMIN.DISABLE_RESOURCE_PRINCIPAL(
   username         IN VARCHAR2);
```

Parameter

Parameter	Description
`username`	Specifies an optional user name. The name of the database schema to remove resource principal access. If you do not supply a `username`, the `username` is set to ADMIN and the command removes the `OCI$RESOURCE_PRINCIPAL` credential.

Exceptions

Exception	Error	Description
`resource principal is already disabled`	`ORA-20031`	If you attempt to disable the resource principal when it is already disabled.

Usage Notes

- Resource principal is not available with refreshable clones.
- You must set up a dynamic group and policies for the dynamic group before you call `DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL`.

  See the following for more information on creating policies, creating a dynamic group, and creating rules:

  – Use Resource Principal to Access Oracle Cloud Infrastructure Resources

  – Managing Dynamic Groups

  - Managing Policies

- Verify that a resource principal credential is enabled by querying one of the views: DBA_CREDENTIALS or ALL_TAB_PRIVS.

  For example, as the ADMIN user query the view `DBA_CREDENTIALS`:

```
SELECT owner, credential_name FROM dba_credentials
        WHERE credential_name = 'OCI$RESOURCE_PRINCIPAL' AND owner =
'ADMIN';

OWNER  CREDENTIAL_NAME
-----  ----------------------
ADMIN  OCI$RESOURCE_PRINCIPAL
```

  For example, as a non-ADMIN user query the view `ALL_TAB_PRIVS`:

```
SELECT grantee, table_name, grantor, FROM ALL_TAB_PRIVS
          WHERE  grantee = 'ADB_USER';

GRANTEE   TABLE_NAME GRANTOR
--------- -----------------------------------
ADB_USER  OCI$RESOURCE_PRINCIPAL ADMIN
```

Example

```
EXEC DBMS_CLOUD_ADMIN.DISABLE_RESOURCE_PRINCIPAL();

PL/SQL procedure successfully completed.

SQL> select owner, credential_name from dba_credentials where credential_name
= 'OCI$RESOURCE_PRINCIPAL';

No rows selected.
```

DROP_DATABASE_LINK Procedure

This procedure drops a database link.

Syntax

```
DBMS_CLOUD_ADMIN.DROP_DATABASE_LINK(
        db_link_name      IN VARCHAR2,
        public_link       IN BOOLEAN DEFAULT);
```

Parameters

Parameter	Description
`db_link_name`	The name of the database link to drop.
`public_link`	To run `DBMS_CLOUD_ADMIN.DROP_DATABASE_LINK` with `public_link` set to `TRUE`, you must have the `DROP PUBLIC DATABASE LINK` system privilege. The default value for this parameter is `FALSE`.

Examples

```
BEGIN
    DBMS_CLOUD_ADMIN.DROP_DATABASE_LINK(
        db_link_name => 'SALESLINK' );
END;
/

BEGIN
    DBMS_CLOUD_ADMIN.DROP_DATABASE_LINK(
        db_link_name => 'SALESLINK'
        public_link => TRUE );
END;
/
```

Usage Notes

After you are done using a database link and you run `DBMS_CLOUD_ADMIN.DROP_DATABASE_LINK`, to ensure security of your Oracle database remove any stored wallet files. For example:

- Remove the wallet file in Object Store.
- Use `DBMS_CLOUD.DELETE_FILE` to remove the wallet file from the `data_pump_dir` directory or from the user defined directory where the wallet file was uploaded.

ENABLE_APP_CONT Procedure

This procedure enables database application continuity for the session associated with the specified service name in Autonomous Database.

Syntax

```
DBMS_CLOUD_ADMIN.ENABLE_APP_CONT(
    service_name      IN VARCHAR2);
```

Parameters

Parameter	Description
service_name	The service_name for the Autonomous Database service. To find service names: • Look in the tnsnames.ora file in the wallet.zip that you download from an Autonomous Database for your connection. • Click **Database connection** on the Oracle Cloud Infrastructure Console. In the **Connection strings** area, each connection string includes a service_name entry that contains the connection string for the corresponding service. When both Mutual TLS (mTLS) and TLS connections are allowed, under **TLS authentication** select **TLS** to view the TNS names and connection strings for connections with TLS authentication. See View TNS Names and Connection Strings for an Autonomous Database Instance for more information. • Query V$SERVICES view. For example: `SELECT name FROM V$SERVICES;`

Usage Notes

See Overview of Application Continuity for more information on Application Continuity.

Example

```
BEGIN
    DBMS_CLOUD_ADMIN.ENABLE_APP_CONT(
        service_name => 'nvthp2ht_adb1_high.adb.oraclecloud.com'
    );
END;
/
```

Verify the value as follows:

```
SELECT name, failover_type FROM DBA_SERVICES;

NAME                                                  FAILOVER_TYPE
----------------------------------------------------- -------------
nvthp2ht_adb1_high.adb.oraclecloud.com                TRANSACTION
```

ENABLE_AWS_ARN Procedure

This procedure enables an Autonomous Database instance to use Amazon Resource Names (ARNs) to access AWS resources.

Syntax

```
DBMS_CLOUD_ADMIN.ENABLE_AWS_ARN(
       username     IN VARCHAR2 DEFAULT NULL,
       grant_option IN BOOLEAN DEFAULT FALSE);
```

Parameters

Parameter	Description
username	Name of the user to enable to use Amazon Resource Names (ARNs). A null value is valid for the username. If username is not specified, the procedure applies for the "ADMIN" user.
grant_option	When username is supplied, if grant_option is TRUE the specified username can enable Amazon Resource Names (ARNs) usage for other users.

Example

```
BEGIN
    DBMS_CLOUD_ADMIN.ENABLE_AWS_ARN(
        username => 'adb_user');
END;
/
```

Usage Note

- You must be the ADMIN user to run the procedure DBMS_CLOUD_ADMIN.ENABLE_AWS_ARN.

See Use Amazon Resource Names (ARNs) to Access AWS Resources for more information.

ENABLE_EXTERNAL_AUTHENTICATION Procedure

Enable users to login to the database with external authentication schemes.

Syntax

```
DBMS_CLOUD_ADMIN.ENABLE_EXTERNAL_AUTHENTICATION(
   type         IN VARCHAR2,
   force        IN BOOLEAN DEFAULT FALSE,
   params       IN CLOB DEFAULT NULL
);
```

Parameter

Parameter	Description
type	Specifies the external authentication type. Valid values: or . • 'OCI_IAM' • 'AZURE_AD' • 'CMU' • 'KERBEROS'
force	(Optional) Override a currently enabled external authentication scheme. Valid values are TRUE or FALSE. The default value is FALSE.

Parameter	Description
params	A JSON string that provides additional parameters for the external authentication. CMU parameters: • location_uri: specifies the cloud storage URI for the bucket where files required for CMU are stored. If you specify location_uri there is a fixed name directory object CMU_WALLET_DIR created in the database at the path 'cmu_wallet' to save the CMU configuration files. In this case, you do not need to supply the directory_name parameter. • credential_name: specifies the credentials that are used to download the CMU configuration files from the Object Store to the directory object. Default value is NULL which allows you to provide a Public, Preauthenticated, or pre-signed URL for Object Store bucket or subfolder. • directory_name: specifies the directory name where configuration files required for CMU are stored. If directory_name is supplied, you are expected to copy the CMU configuration files dsi.ora and cwallet.sso to this directory object. KERBEROS parameters: • location_uri: specifies the cloud storage URI for the bucket where the files required for Kerberos are stored. If you specify location_uri there is a fixed name directory object KERBEROS_DIR created in the database to save the Kerberos configuration files. In this case, you do not need to supply the directory_name parameter. • credential_name: specifies the credential that are used to download Kerberos configuration files from the Object Store location to the directory object. Default value is NULL which allows you to provide a Public, Preauthenticated, or pre-signed URL for Object Store bucket or subfolder. • directory_name: specifies the directory name where files required for Kerberos are stored. If directory_name is supplied, you are expected to copy the Kerberos configuration files to this directory object. • kerberos_service_name: specifies a name to use as the Kerberos service name. This parameter is optional. Default value: When not specified, the kerberos_service_name value is set to the Autonomous Database instance's GUID. AZURE_AD parameters: • tenant_id: Tenant ID of the Azure Account. Tenant Id specifies the Autonomous Database instance's Azure AD application registration. • application_id: Azure Application ID created in Azure AD to assign roles/schema mappings for external authentication in the Autonomous Database instance. • application_id_uri: Unique URI assigned to the Azure Application. This it the identifier for the Autonomous Database instance. The name must be domain qualified (this supports cross tenancy resource access). The maximum length for this parameter is 256 characters.

Exceptions

Exception	Error	Description
invalid_ext_auth	ORA-20004	See the accompanying message for a detailed explanation.

Usage Notes

- With `type OCI_IAM`, if the resource principal is not enabled on the Autonomous Database instance, this routine enables resource principal with `DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL`.
- This procedure sets the system parameters `IDENTITY_PROVIDER_TYPE` and `IDENTITY_PROVIDER_CONFIG` to required users to access the instance with Oracle Cloud Infrastructure Identity and Access Management authentication and authorization.

Examples

Enable `OCI_IAM` Authentication

```
BEGIN DBMS_CLOUD_ADMIN.ENABLE_EXTERNAL_AUTHENTICATION(
     type => 'OCI_IAM',
     force=> TRUE );
END;
/

PL/SQL procedure successfully completed.
```

Enable `CMU` Authentication for Microsoft Active Directory

You pass in a directory name that contains the CMU configuration files through `params` JSON argument.

```
BEGIN DBMS_CLOUD_ADMIN.ENABLE_EXTERNAL_AUTHENTICATION(
     type => 'CMU',
     force => TRUE,
     params => JSON_OBJECT('directory_name' value 'CMU_DIR'); // CMU_DIR
directory object already exists
END;
/

PL/SQL procedure successfully completed.
```

You pass in a location URI pointing to an Object Storage location that contains CMU configuration files through `params` JSON argument.

```
BEGIN
   DBMS_CLOUD_ADMIN.ENABLE_EXTERNAL_AUTHENTICATION(
       type     => 'CMU',
       params   => JSON_OBJECT('location_uri' value 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o',
                               'credential_name' value 'my_credential_name')
   );
```

```
END;
/

PL/SQL procedure successfully completed.
```

Enable Azure AD Authentication

```
BEGIN DBMS_CLOUD_ADMIN.ENABLE_EXTERNAL_AUTHENTICATION(
     type => 'AZURE_AD',
     force => TRUE,
     params   => JSON_OBJECT( 'tenant_id' VALUE '....',
                              'application_id' VALUE '...',
                              'application_id_uri' VALUE '.....' ));
END;
/

PL/SQL procedure successfully completed.
```

Enable Kerberos Authentication

You pass in a directory name that contains Kerberos configuration files through `params` JSON argument.

```
BEGIN DBMS_CLOUD_ADMIN.ENABLE_EXTERNAL_AUTHENTICATION(
     type => 'KERBEROS',
     force => TRUE,
     params => JSON_OBJECT('directory_name' value 'KERBEROS_DIR'); //
KERBEROS_DIR directory object already exists
END;
/

PL/SQL procedure successfully completed.
```

You pass in a location URI pointing to an Object Storage location that contains Kerberos configuration files through `params` JSON argument:

```
BEGIN DBMS_CLOUD_ADMIN.ENABLE_EXTERNAL_AUTHENTICATION(
     type => 'KERBEROS',
     force => TRUE,
     params => JSON_OBJECT('location_uri' value 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o',
                           'credential_name' value 'my_credential_name');
END;
/
```

You pass in a service name with the `kerberos_service_name` in the `params` JSON argument:

```
BEGIN DBMS_CLOUD_ADMIN.ENABLE_EXTERNAL_AUTHENTICATION(
     type => 'KERBEROS',
     force => TRUE,
     params => JSON_OBJECT('directory_name' value 'KERBEROS_DIR', //
KERBEROS_DIR directory object already exists
                           'kerberos_service_name' value 'oracle' ));
```

```
END;
/
```

After Kerberos is enabled on your Autonomous Database instance, use the following query to view the Kerberos service name:

```
SELECT SYS_CONTEXT('USERENV','KERBEROS_SERVICE_NAME') FROM DUAL;
```

ENABLE_FEATURE Procedure

This procedure enables the specified feature on the Autonomous Database instance.

Syntax

```
DBMS_CLOUD_ADMIN.ENABLE_FEATURE(
    feature_name     IN VARCHAR2,
    params           IN  CLOB    DEFAULT NULL);
```

Parameters

Parameter	Description
feature_name	Name of the feature to enable. The supported values are: • 'AUTO_DST_UPGRADE': Enable AUTO DST feature. • 'AUTO_DST_UPGRADE_EXCL_DATA': Enable AUTO DST EXCL DATA feature. • 'JAVAVM': Enable JAVAVM feature. • 'OLAP': Enable OLAP feature. OLAP requires that Java is enabled. When you enable OLAP, Java is automatically enabled along with the OLAP feature. • 'ORAMTS': Enable OraMTS feature. • 'OWM': Enable Oracle Workspace Manager. • 'WORKLOAD_AUTO_REPLAY': Enable the workload auto replay feature. This parameter is mandatory.

Parameter	Description
params	A JSON string that provides additional parameters for some features. For the OraMTS feature the params parameter is: • location_uri: the location_uri accepts a string value. The value specifies the HTTPS URL for the OraMTS server in a customer network. For the WORKLOAD_AUTO_REPLAY feature the params parameters are: • target_db_ocid: A string value. The value specifies the OCID of a target refreshable clone database on which the captured workload is replayed. The refreshable clone must have the **Early** patch level set. This parameter is mandatory. • capture_duration: A number value. The value specifies the duration in minutes for which the workload is captured on the production database. The value must be in the range between 1 and 720 minutes. This parameter is mandatory. • capture_day: A string value. The value specifies the day of the week the workload capture on the production database should begin. This parameter is optional. • capture_time: A value in the HH24:MM format. The value specifies the time of the day the workload capture on the production database should begin. This parameter is optional. By default the workload capture starts when you enable WORKLOAD_AUTO_REPLAY. If the optional capture_day and capture_time are specified, the capture and the replay happen at the specified timestamp. For example, if capture_day is Monday and capture_time is 15:00, the first capture happens at 3PM on the next Monday. The day of week and time are also used to schedule the later replay on the refreshable clone.

Example to Enable JAVAVM Feature:

```
BEGIN
   DBMS_CLOUD_ADMIN.ENABLE_FEATURE (
        feature_name => 'JAVAVM' );
END;
/
```

Example to Enable Auto DST Feature:

```
BEGIN
   DBMS_CLOUD_ADMIN.ENABLE_FEATURE (
        feature_name => 'AUTO_DST_UPGRADE' );
END;
/
```

Example to Enable Auto DST EXCL Data Feature:

```
BEGIN
   DBMS_CLOUD_ADMIN.ENABLE_FEATURE (
        feature_name => 'AUTO_DST_UPGRADE_EXCL_DATA' );
END;
/
```

Example to Enable OraMTS Feature:

```
BEGIN
   DBMS_CLOUD_ADMIN.ENABLE_FEATURE(
        feature_name => 'ORAMTS',
        params       => JSON_OBJECT('location_uri' VALUE 'https://
mymtsserver.mycorp.com')
   );
END;
/
```

Example to Enable OWM Feature:

```
BEGIN
   DBMS_CLOUD_ADMIN.ENABLE_FEATURE(
        feature_name => 'OWM' );
END;
/
```

Example to Enable Workload Auto Replay Feature

```
BEGIN
   DBMS_CLOUD_ADMIN.ENABLE_FEATURE(
        feature_name => 'WORKLOAD_AUTO_REPLAY',
        params       => JSON_OBJECT('target_db_ocid' VALUE
'OCID1.autonomousdatabase.REGION..ID1', 'capture_duration' VALUE 120,
'capture_day' VALUE 'MONDAY', 'capture_time' VALUE '15:00'));
END;
/
```

A an error value of `ORA-20000: Invalid argument for target_db_ocid` could indicate that the OCID you supplied is not a refreshable clone. In this case, you need to supply an OCID with a value for a refreshable clone.

Usage Notes

- You must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN` to run `DBMS_CLOUD_ADMIN.ENABLE_FEATURE`.
- After you run `DBMS_CLOUD_ADMIN.ENABLE_FEATURE` with `feature_name` value `'JAVAVM'`, you must restart the Autonomous Database instance to install Oracle Java.

  After you restart the Autonomous Database instance, the Java installation proceeds for some time after the database is opened.

  See Check Oracle Java Version for details on checking the status of the Java installation.
- After you run `DBMS_CLOUD_ADMIN.ENABLE_FEATURE` with `feature_name` value `'OWM'`, you must restart the Autonomous Database instance to enable Oracle Workspace Manager. Oracle.
- To enable `AUTO_DST_UPGRADE`, `AUTO_DST_UPGRADE_EXCL_DATA`, `ORAMTS`, `JAVAVM`, `OWM`, or `WORKLOAD_AUTO_REPLAY` features for your database, you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN`.

- By default, both `AUTO_DST_UPGRADE` and `AUTO_DST_UPGRADE_EXCL_DATA` are disabled. You can enable one or the other of these options, but not both.
- After you enable `AUTO_DST_UPGRADE`, the next time you restart, or stop and then start the Autonomous Database instance, the instance upgrades to use the latest available time zone files. After `AUTO_DST_UPGRADE` is enabled, when new time zone files are available, the instance continues to upgrade to the latest available version on every subsequent restart or stop and start, until the feature is disabled.

  Query `dba_cloud_config` to verify that `AUTO_DST_UPGRADE` is enabled.

```
SELECT param_name, param_value FROM dba_cloud_config WHERE
       LOWER(param_name) = 'auto_dst_upgrade';

PARAM_NAME       PARAM_VALUE
---------------- --------------
auto_dst_upgrade enabled
```

- After you enable `AUTO_DST_UPGRADE_EXCL_DATA` the Autonomous Database instance upgrades to use the latest available time zone files. After this feature is enabled, every subsequent maintenance window upgrades the instance to use the latest available time zone version. This feature assures that the time zone files are upgraded for the database (enabling `AUTO_DST_UPGRADE_EXCL_DATA` does not update any affected rows).

  Query `dba_cloud_config` to verify that `AUTO_DST_UPGRADE_EXCL_DATA` is enabled.

```
SELECT param_name, param_value FROM dba_cloud_config WHERE
       LOWER(param_name) = 'auto_dst_upgrade_excl_data';

PARAM_NAME                    PARAM_VALUE
----------------------------  -----------
auto_dst_upgrade_excl_data    enabled
```

ENABLE_OPERATOR_ACCESS Procedure

Oracle Cloud Operations does not access your Autonomous Database instance and access is disallowed by default. When access is required to troubleshoot or mitigate an issue, you can allow a cloud operator access to the database schemas for a limited time.

Syntax

```
DBMS_CLOUD_ADMIN.ENABLE_OPERATOR_ACCESS(
    auth_duration    IN  NUMBER  DEFAULT 1
);
```

Parameters

Parameter	Description
`auth_duration`	Specifies the number of Hours for which Cloud Operator is granted access. Valid values: must be whole numbers in the range of 1 to 24. Default value: 1

Example

```
BEGIN
   DBMS_CLOUD_ADMIN.ENABLE_OPERATOR_ACCESS(
       auth_duration => 12 );
END;
/
```

Usage Notes

- `ORA-20000: Operator access is already enabled` indicates that operator access was already granted. In this case you have two options:
  - Wait for operator access to expire, and then grant operator access again with `DBMS_CLOUD_ADMIN.ENABLE_OPERATOR_ACCESS`
  - Explicitly disable operator access with DISABLE_OPERATOR_ACCESS Procedure.
- `DBMS_CLOUD_ADMIN.ENABLE_OPERATOR_ACCESS` allows access only to the Cloud Operator and does not enable access for any other user. All operations performed by the Cloud Operator are stored in the view `DBA_OPERATOR_ACCESS`. See View Oracle Cloud Infrastructure Operations Actions for more information.
- You allow a cloud operator to access the database schemas by running the procedure `DBMS_CLOUD_ADMIN.ENABLE_OPERATOR_ACCESS`. This means if you file a service request with Oracle Cloud Support and Oracle Cloud Operators need to access your database schemas, you must also enable operator access by running`DBMS_CLOUD_ADMIN.ENABLE_OPERATOR_ACCESS`.

ENABLE_PRINCIPAL_AUTH Procedure

This procedure enables principal authentication on Autonomous Database for the specified provider and applies to the ADMIN user or the specified user.

Syntax

```
DBMS_CLOUD_ADMIN.ENABLE_PRINCIPAL_AUTH(
       provider    IN VARCHAR2,
       username    IN VARCHAR2 DEFAULT 'ADMIN',
       params      IN CLOB DEFAULT NULL);
```

Parameters

Parameter	Description
`provider`	Specifies the type of provider. Valid values: • `AWS`: Enable use of Amazon Resource Names (ARNs) • `AZURE`: Enable use of Azure Service Principal • `GCP`: Enable use of Google Service Account • `OCI`: Enable use of Resource Principal
`username`	Name of the user who has principal authentication usage enabled. A null value is valid for the `username`. If `username` is not specified, the procedure applies for the "`ADMIN`" user.

Parameter	Description
params	Specifies the configuration parameters. When the provider parameter is AWS, GCP, or OCI, params is not required. The default value is NULL. grant_option: This parameter is valid for all providers and is a Boolean value TRUE or FALSE. The default is FALSE. When TRUE and a username is specified, the specified user can use ENABLE_PRINCIPAL_AUTH to enable other users. **When the provider parameter is AWS, these options are also valid:** • aws_role_arn: Specifies the AWS role ARN. • external_id_type: Specifies the external ID type. Valid values are: "TENANT_OCID", "DATABASE_OCID", or "COMPARTMENT_OCID". The default value for external_id_type is "DATABASE_OCID". See Perform AWS Management Prerequisites to Use Amazon Resource Names (ARNs) for details on the values for external_id_type. **When the provider parameter is AZURE, this option is also valid:** • azure_tenantid: with the value of the Azure tenant ID.

Usage Notes

- When the provider parameter is AZURE, the params parameter must include the azure_tenantid in the following cases:
  - When DBMS_CLOUD_ADMIN.ENABLE_PRINCIPAL_AUTH is called for the first time.
  - When DBMS_CLOUD_ADMIN.ENABLE_PRINCIPAL_AUTH is called for the first time after DBMS_CLOUD_ADMIN.DISABLE_PRINCIPAL_AUTH is called with the provider parameter AZURE and the username ADMIN.
- When the provider parameter is AWS:
  - After you enable ARN on the Autonomous Database instance by running DBMS_CLOUD_ADMIN.ENABLE_PRINCIPAL_AUTH, the credential named AWS$ARN is available to use with any DBMS_CLOUD API that takes a credential as the input.

Examples

```
BEGIN
     DBMS_CLOUD_ADMIN.ENABLE_PRINCIPAL_AUTH(
       provider => 'AZURE',
       username => 'SCOTT',
       params   => JSON_OBJECT('azure_tenantid' value 'azure_tenantid'));
END;
/

BEGIN
     DBMS_CLOUD_ADMIN.ENABLE_PRINCIPAL_AUTH(
     provider => 'GCP',
     username => 'SCOTT',
     params => JSON_OBJECT(
         'grant_option' value 'TRUE' ));
```

```
END;
/

BEGIN
     DBMS_CLOUD_ADMIN.ENABLE_PRINCIPAL_AUTH(
     provider => 'AWS',
     username => 'SCOTT',
     params => JSON_OBJECT(
         'aws_role_arn' value 'arn:aws:iam::123456:role/AWS_ROLE_ARN',
          'external_id_type' value 'TENANT_OCID'));
END;
/
```

ENABLE_RESOURCE_PRINCIPAL Procedure

Enable resource principal credential for the database or for the specified schema. This procedure creates the credential `OCI$RESOURCE_PRINCIPAL`.

Syntax

```
DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL(
   username         IN VARCHAR2,
   grant_option     IN BOOLEAN DEFAULT FALSE);
```

Parameter

Parameter	Description
`username`	Specifies an optional user name. The name of the database schema to be granted resource principal access. If you do not supply a `username`, the `username` is set to ADMIN.
`grant_option`	When `username` is supplied, if `grant_option` is `TRUE` the specified `username` can enable resource principal usage for other users.

Exceptions

Exception	Error	Description
`resource principal is already enabled`	`ORA-20031`	If you attempt to enable the resource principal when it is already enabled.

Usage Notes

- You must call `DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL` with the ADMIN `username` or with no arguments before you call `DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL` with a `username` for a database user schema.
- You must set up a dynamic group and policies for the dynamic group before you call `DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL`.

  See the following for more information on policies, creating a dynamic group, and creating rules:

  – Use Resource Principal to Access Oracle Cloud Infrastructure Resources

  - Managing Dynamic Groups
  - Managing Policies

- Enabling the resource principal with `DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL` is one-time operation. You do not need to enable the resource principal again, unless you run `DBMS_CLOUD_ADMIN.DISABLE_RESOURCE_PRINCIPAL` to disable the resource principal.
- Resource principal is not available with refreshable clones.

Example

```
EXEC DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL();

PL/SQL procedure successfully completed.

SQL> select owner, credential_name from dba_credentials where credential_name
= 'OCI$RESOURCE_PRINCIPAL';

OWNER    CREDENTIAL_NAME
-------  ---------------
ADMIN    OCI$RESOURCE_PRINCIPAL
```

FINISH_WORKLOAD_CAPTURE Procedure

This procedure finishes the current workload capture, stops any subsequent workload capture requests to the database, and uploads the capture files to Object Storage.

Example

```
BEGIN
    DBMS_CLOUD_ADMIN.FINISH_WORKLOAD_CAPTURE
END;
/
```

Usage Notes

- To run this procedure you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN`.
- When you pass the `duration` parameter to `START_WORKLOAD_CAPTURE`, the capture finishes when it reaches the specified time. However, if you call `FINISH_WORKLOAD_CAPTURE`, this stops the workload capture (possibly before the time specified with the duration parameter).

  You can query the `DBA_CAPTURE_REPLAY_STATUS` view to check the finish workload status. See DBA_CAPTURE_REPLAY_STATUS View for more information.

> **Note:**
>
> You must subscribe to the Information event `com.oraclecloud.databaseservice.autonomous.database.information` to be notified about the completion of `FINISH_WORKLOAD_CAPTURE` as well as the Object Storage link to download the capture file. This PAR URL is contained in the `captureDownloadURL` field of the event and is valid for 7 days from the date of generation. See Information Events on Autonomous Database for more information.

PREPARE_REPLAY Procedure

The `PREPARE_REPLAY` procedure prepares the refreshable clone for a replay.

Parameters

Parameter	Description
`capture_name`	Specifies the name of the workload capture. This parameter is mandatory.

Syntax

```
DBMS_CLOUD_ADMIN.PREPARE_REPLAY(
        capture_name IN VARCHAR2);
```

Example

```
BEGIN
    DBMS_CLOUD_ADMIN.PREPARE_REPLAY
      capture_name => 'cap_test1');
END;
/
```

This example prepares the refreshable clone to replay the workload indicated by the `capture_name` parameter, which involves bringing it up to the capture start time and then disconnecting it.

Usage Note

- To run this procedure you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN`.

PURGE_FLASHBACK_ARCHIVE Procedure

This procedure enables ADMIN users to purge historical data from Flashback Data Archive. You can either purge all historical data from Flashback Data Archive `flashback_archive` or selective data based on timestamps or System Change Number.

Syntax

```
DBMS_CLOUD_ADMIN.PURGE_FLASHBACK_ARCHIVE(
   scope       IN VARCHAR2,
```

```
    before_scn IN INTEGER DEFAULT NULL,
    before_ts  IN TIMESTAMP DEFAULT NULL);
```

Parameter	Description
scope	This specifies the scope to remove data from the flashback data archive. • all implies PURGE ALL;before_scn and before_timestamp must both be NULL. • scn implies PURGE BEFORE SCN;before_scn must be non-NULL and before_timestamp must be NULL. • TIMESTAMP implies PURGE BEFORE timestamp;before_scn must be NULL and before_timestamp must be non-NULL.
before_scn	This specifies the system change number before which all the data is removed from the flashback archive.
before_timestamp	This specifies the timestamp before which all the data is removed from the flashback archive.

Example

```
BEGIN
    DBMS_CLOUD_ADMIN.PURGE_FLASHBACK_ARCHIVE(
           scope => 'ALL'); // Purge all historical data from Flashback Data
Archive flashback_archive
END;
/
```

REPLAY_WORKLOAD Procedure

This procedure initiates a workload replay on your Autonomous Database instance. The overloaded form enables you to replay the capture files from an Autonomous Database instance, on-premises database, or other cloud service databases.

Syntax

```
DBMS_CLOUD_ADMIN.REPLAY_WORKLOAD(
        capture_name                 IN VARCHAR2,
        replay_name                  IN VARCHAR2 DEFAULT NULL,
        capture_source_tenancy_ocid  IN VARCHAR2 DEFAULT NULL,
        capture_source_db_name       IN VARCHAR2 DEFAULT NULL);

DBMS_CLOUD_ADMIN.REPLAY_WORKLOAD(
        location_uri      IN VARCHAR2,
        credential_name   IN VARCHAR2 DEFAULT NULL,
        synchronization   IN BOOLEAN  DEFAULT TRUE,
        process_capture   IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Parameter	Description
CAPTURE_NAME	Specifies the name of the workload capture. This parameter is mandatory.

Parameter	Description
REPLAY_NAME	Specifies the replay name. If you do not supply a REPLAY_NAME value, the REPLAY_NAME is auto-generated with the format *REPLAY_RANDOMNUMBER*, for example, REPLAY_1678329506.
CAPTURE_SOURCE_TENANCY_OCID	Specifies the source tenancy OCID of the workload capture. If you do not supply a CAPTURE_SOURCE_TENANCY_OCID value, the CAPTURE_SOURCE_TENANCY_OCID is set to NULL. This parameter is only mandatory when running the workload capture in a full clone.
CAPTURE_SOURCE_DB_NAME	Specifies the source database name of the workload capture If you do not supply a CAPTURE_SOURCE_DB_NAME value, the CAPTURE_SOURCE_DB_NAME is set to NULL. This parameter is only mandatory when running the workload capture in a full clone.
LOCATION_URI	Specifies URI that points to an Object Storage location that contains the captured files. This parameter is mandatory.
CREDENTIAL_NAME	Specifies the credential to access the object storage bucket. If you do not supply a credential_name value, the database's default credentials are used.
SYNCHRONIZATION	Specifies the synchronization method used during workload replay. • TRUE specifies that the synchronization is based on SCN. • FALSE specifies that the synchronization is based on TIME. If you do not supply a synchronization value, the synchronization is set to TRUE.
PROCESS_CAPTURE	Specifies whether or not you need to specify process_capture value. It can be set to FALSE only when you replay the same workload on the target database repeatedly. If you do not supply a process_capture value, the process_capture is set to TRUE.

Example to replay the workload from an on-premises database on an Autonomous Database instance:

```
BEGIN
  DBMS_CLOUD_ADMIN.REPLAY_WORKLOAD(
        location_uri    => 'https://objectstorage.us-
phoenix-1.oraclecloud.com/n/namespace-string/b/bucketname/o',
        credential_name => 'CRED_TEST',
        synchronization => TRUE,
        process_capture => TRUE);
END;
/
```

When you run this example, it:

- Downloads the capture files from the Object Storage location specified in location_uri and processes the capture files based on the process_capture parameter value.
- Replays the captured workload based on the synchronization parameter value.

In this example, *namespace-string* is the Oracle Cloud Infrastructure object storage namespace and *bucketname* is the bucket name. See Understanding Object Storage Namespaces for more information.

See Navigate to Oracle Cloud Infrastructure Object Storage and Create Bucket for more information on Object Storage.

See Upload Files to Your Oracle Cloud Infrastructure Object Store Bucket for more information on uploading files to Object Storage.

The `credential_name` you use in this step is the credentials for the Object Store.

You don't need to create a credential to access Oracle Cloud Infrastructure Object Store if you enable resource principal credentials. See Use Resource Principal to Access Oracle Cloud Infrastructure Resources for more information.

Example to replay the workload from an Autonomous Database instance on another Autonomous Database:

```
BEGIN
  DBMS_CLOUD_ADMIN.REPLAY_WORKLOAD(
        capture_name => 'CAP_TEST1');
END;
/
```

When you run this example, it:

- Disconnects the current Autonomous Database instance.
- Downloads the capture files from the Object Storage.
- Replays the captured workload.
- Uploads replay report after a replay.

Usage Notes for Replaying the Workload from an On-Premises or Other Cloud Service Database on another Autonomous Database

- To run this procedure you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN`.
- Before you start replay, you should upload the `cap` and `capfiles` subdirectories, which contain the workload capture files, to the object storage location.

Usage Notes for Replaying the Workload from an Autonomous Database instance on another Autonomous Database

- To run this procedure you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN`.
- The replay files are automatically uploaded to the Object Store as a zip file.
- You can query the `DBA_CAPTURE_REPLAY_STATUS` view to check the workload replay status.

  See DBA_CAPTURE_REPLAY_STATUS View for more information.

> **Note:**
>
> You must subscribe to the Information event `com.oraclecloud.databaseservice.autonomous.database.information` to be notified about the start and completion of the `REPLAY_WORKLOAD` as well as the Object Storage link to download the replay reports. This PAR URL is contained in the `replayDownloadURL` field of the event and is valid for 7 days from the date of generation. See Information Events on Autonomous Database for more information.

SET_FLASHBACK_ARCHIVE_RETENTION Procedure

This procedure allows ADMIN users to modify the retention period for Flashback Data Archive `flashback_archive`.

Syntax

```
DBMS_CLOUD_ADMIN.SET_FLASHBACK_ARCHIVE_RETENTION (
    retention_days INTEGER);
```

Parameter	Description
`retention_days`	This specifies the length of time in days that the archived data should be retained for. The value of `retention_days` must be greater than 0.

Example

```
BEGIN
     DBMS_CLOUD_ADMIN.SET_FLASHBACK_ARCHIVE_RETENTION(
           retention_days => 90); // sets the retention time to 90 days
END;
/
```

START_WORKLOAD_CAPTURE Procedure

This procedure initiates a workload capture on your Autonomous Database instance.

Syntax

```
DBMS_CLOUD_ADMIN.START_WORKLOAD_CAPTURE(
        capture_name  IN VARCHAR2,
        duration      IN NUMBER   DEFAULT NULL);
```

Parameters

Parameter	Description
`capture_name`	Specifies the name of the workload capture. This parameter is mandatory.
`duration`	Specifies the duration in minutes for which you want to run the workload capture. • If you do not supply a `duration` value, the `duration` is set to NULL. • If set to NULL, the workload will continue until you run the `FINISH_WORKLOAD_CAPTURE` procedure.

Example

```
BEGIN
  DBMS_CLOUD_ADMIN.START_WORKLOAD_CAPTURE(
        capture_name => 'test');
END;
/
```

Usage Notes

- To run this procedure you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_CLOUD_ADMIN`.
- To measure the impacts of a system change on a workload, you must ensure that the capture and replay systems are in the same logical state.
- Before initiating a workload capture, you should consider provisioning a refreshable clone to ensure the same start point for the replay.

> **Note:**
>
> You must subscribe to the Information event `com.oraclecloud.databaseservice.autonomous.database.information` to be notified at the start of `START_WORKLOAD_CAPTURE`. See Information Events on Autonomous Database for more information.

DBMS_CLOUD_ADMIN Exceptions

The following table describes exceptions for `DBMS_CLOUD_ADMIN`.

Exception	Code	Description
`invalid_service`	20001	An invalid service was specified.
`service_not_exist`	20002	A service specified does not exist.
`default_service`	20003	A service specified cannot be modified.
`invalid_char_set`	20029	Missing precondition or invalid (national) character set.
`invalid_enc_key_attr`	20030	Missing or invalid argument for key management.
`Already Using Oracle Managed Key`	000000	The Database is already using an Oracle managed key. You are trying to call the procedure while already using an Oracle managed key.
`Argument Provided for the procedure`	ORA-0000	An argument is provided for the procedure. Expected error message:No arguments required for this procedure.

DBMS_CLOUD_AI Package

The `DBMS_CLOUD_AI` package, with Select AI, facilitates and configures the translation of natural language prompts to generate, run, explain SQL statements. Also, enables retrieval augmented generation and natural language-based interactions, including chatting with LLMs.

- DBMS_CLOUD_AI Overview
  Describes the use of the `DBMS_CLOUD_AI` package.
- Summary of DBMS_CLOUD_AI Subprograms
  This section covers the `DBMS_CLOUD_AI` subprograms provided with Autonomous Database.

> **See Also:**

> Use Select AI for Natural Language Interaction with your Database

DBMS_CLOUD_AI Overview

Describes the use of the `DBMS_CLOUD_AI` package.

Use the `DBMS_CLOUD_AI` package to create AI profiles and configure them for access to a Large Language Model (LLM). Set the AI profile in the current database user session to perform tasks such as generating, running, and explaining SQL. Additionally, enable retrieval augmented generation and natural language-based interactions, including chatting with LLMs.

To know more about supported platforms and LLMs, see About Select AI.

Summary of DBMS_CLOUD_AI Subprograms

This section covers the `DBMS_CLOUD_AI` subprograms provided with Autonomous Database.

Subprogram	Description
CREATE_PROFILE Procedure	This procedure creates a new AI profile for translating natural language prompts to SQL statements.
Profile Attributes	Provides AI profile attributes that you can configure.
DISABLE_PROFILE Procedure	This procedure disables an AI profile in the current database.
DROP_PROFILE Procedure	This procedure drops an existing AI profile.
ENABLE_PROFILE Procedure	This procedure enables an AI profile to use in the current database.
GENERATE Function	This function enables you to use Select AI in a stateless manner with your existing profile.
GENERATE_SYNTHETIC_DATA Function	This function generates synthetic data.
GET_PROFILE Function	This function returns the profile name used in the current session.
GET_PROFILE Procedure	This procedure returns the profile name and the owner of the profile in the current session.
SET_ATTRIBUTE Procedure	This procedure sets AI profile attributes.
SET_PROFILE Procedure	This procedure sets AI profile for the current database.
ENABLE_DATA_ACCESS Procedure	Use this procedure to enable sending data to your LLM.
DISABLE_DATA_ACCESS Procedure	Use this procedure to disable sending data to your LLM.
CREATE_VECTOR_INDEX Procedure	This procedure creates a vector index in the specified vector database, and populates it with data from an object store using an asynchronous scheduler job.
DROP_VECTOR_INDEX Procedure	This procedure removes a vector store index. It normally removes the vector store index object and deletes the vector database.
DISABLE_VECTOR_INDEX Procedure	This procedure disables a vector index object in the current database. When disabled, an AI profile cannot use the vector index, and the system does not load data into the vector store.

Subprogram	Description
ENABLE_VECTOR_INDEX Procedure	This procedure enables or activates a previously disabled vector index object.
UPDATE_VECTOR_INDEX Procedure	This procedure updates an existing vector store index with a specified value of the vector index attribute.
Vector Index Attributes	Provides vector index profile attributes that you can configure.

- CREATE_PROFILE Procedure
  The procedure creates a new AI profile for translating natural language prompts to SQL statement.
- DROP_PROFILE Procedure
  The procedure drops an existing AI profile. If the profile does not exist, then the procedure throws an error.
- ENABLE_PROFILE Procedure
  This procedure enables the AI profile that the user specifies. The procedure changes the status of the AI profile to `ENABLED`.
- DISABLE_PROFILE Procedure
  This procedure disables the AI profile in the current database. The status of the AI profile is changed to `DISABLED` by this procedure.
- GET_PROFILE Function
  This function returns the AI profile name set in the current session.
- GET_PROFILE Procedure
  This procedure returns the AI profile name and the owner set in the current session.
- SET_ATTRIBUTE Procedure
  This procedure enables you to set AI profile attributes. It is overloaded to accept attribute values of various types.
- SET_PROFILE Procedure
  This procedure sets AI profile for current session.
- GENERATE Function
- GENERATE_SYNTHETIC_DATA Function
- Profile Attributes
- ENABLE_DATA_ACCESS Procedure
  This procedure enables sending data to LLM for applicable Select AI features, which is the default behavior. Only an administrator can run this procedure.
- DISABLE_DATA_ACCESS Procedure
  This procedure disables sending data to LLM for applicable Select AI features. Only an administrator can run this procedure.
- CREATE_VECTOR_INDEX Procedure
  This procedure creates a vector index in the specified vector database, and populates it with data from an object store using an asynchronous scheduler job.
- DROP_VECTOR_INDEX Procedure
  This procedure removes a vector store index. It normally removes the vector store index object and deletes the vector store. If set to `FALSE`, the argument `include_data` ensures the procedure only removes the vector store index object while retaining the vector store.

- DISABLE_VECTOR_INDEX Procedure
  This procedure disables a vector index object in the current database. When disabled, an AI profile cannot use the vector index, and the system does not load data into the vector store as new data is added to the object store and does not perform indexing, searching or querying based on the index.
- ENABLE_VECTOR_INDEX Procedure
  This procedure enables or activates a previously disabled vector index object. Generally, when you create a vector index, by default it is enabled such that the AI profile can use it to perform indexing and searching.
- UPDATE_VECTOR_INDEX Procedure
  This procedure updates an existing vector store index with a specified value of the vector index attribute. It is overloaded to accept attribute values of various types.
- Vector Index Attributes

CREATE_PROFILE Procedure

The procedure creates a new AI profile for translating natural language prompts to SQL statement.

Syntax

```
DBMS_CLOUD_AI.CREATE_PROFILE
   profile_name        IN  VARCHAR2,
   attributes          IN  CLOB      DEFAULT NULL,
   status              IN  VARCHAR2  DEFAULT NULL,
   description         IN  CLOB      DEFAULT NULL
);
```

Parameters

Parameter	Description
profile_name	A name for the AI profile. The profile name must follow the naming rules of Oracle SQL identifier. Maximum length of profile name is 125 characters. This is a mandatory parameter.
attributes	Profile attributes in JSON format. See AI Profile Attributes for more details. The default value is NULL.
status	Status of the profile. The default value is enabled.
description	Description for the AI profile. The default value is NULL.

Example

```
BEGIN
     DBMS_CLOUD_AI.CREATE_PROFILE(
          profile_name    => 'OpenAI',
          attributes      => JSON_OBJECT('provider' value 'openai',
                                         'credential_name' value
'openai_cred'),
```

```
        status     => 'enabled',
          description     => 'AI profile to use OpenAI for SQL translation'
    );
END;
/
```

Related Topics

- USER_CLOUD_AI_PROFILE_ATTRIBUTES View

DROP_PROFILE Procedure

The procedure drops an existing AI profile. If the profile does not exist, then the procedure throws an error.

Syntax

```
DBMS_CLOUD_AI.DROP_PROFILE(
       profile_name        IN   VARCHAR2,
       force               IN   BOOLEAN DEFAULT FALSE
 );
```

Parameters

Parameter	Description
`profile_name`	Name of the AI profile
`force`	If `TRUE`, then the procedure ignores errors if AI profile does not exist. The default value for this parameter is `FALSE`.

Example

```
BEGIN
     DBMS_CLOUD_AI.DROP_PROFILE(profile_name => 'OPENAI');
END;
/
```

Usage Notes

Use `force` to drop a profile and ignore errors if AI profile does not exist.

ENABLE_PROFILE Procedure

This procedure enables the AI profile that the user specifies. The procedure changes the status of the AI profile to `ENABLED`.

Syntax

```
DBMS_CLOUD_AI.ENABLE_PROFILE(
     profile_name         IN   VARCHAR2
 );
```

Parameters

Parameter	Description
profile_name	Name for the AI profile to enable This parameter is mandatory.

Example to Enable AI Profile

```
BEGIN
     DBMS_CLOUD_AI.ENABLE_PROFILE(
         profile_name    => 'OPENAI'
     );
END;
/
```

DISABLE_PROFILE Procedure

This procedure disables the AI profile in the current database. The status of the AI profile is changed to `DISABLED` by this procedure.

Syntax

```
DBMS_CLOUD_AI.DISABLE_PROFILE(
      profile_name  IN  VARCHAR2
);
```

Parameters

Parameter	Description
profile_name	Name for the AI profile. This parameter is mandatory.

Example

```
BEGIN
     DBMS_CLOUD_AI.DISABLE_PROFILE(
         profile_name    => 'OPENAI'
     );
END;
/
```

GET_PROFILE Function

This function returns the AI profile name set in the current session.

Syntax

```
DBMS_CLOUD_AI.GET_PROFILE(
    profile_name      IN  VARCHAR2
);
```

Parameters

Parameter	Description
profile_name	A name for the AI profile in the current session. This parameter is mandatory.

Example

This example shows how you can display the name of the profile in the current session.

```
SELECT DBMS_CLOUD_AI.GET_PROFILE
from DUAL;
```

GET_PROFILE Procedure

This procedure returns the AI profile name and the owner set in the current session.

Syntax

```
DBMS_CLOUD_AI.GET_PROFILE(

      profile_name  OUT  VARCHAR2,
      profile_owner OUT  VARCHAR2
);
```

Parameters

Parameter	Description
profile_name	A name for the AI profile in the current session. This parameter is mandatory.
profile_owner	Identifies the owner of the AI profile in the current session.

Example

This example shows how you can display the name and owner of the profile in the current session.

```
DECLARE
       l_profile_name  DBMS_ID;
       l_profile_owner DBMS_ID;
     BEGIN
       DBMS_CLOUD_AI.GET_PROFILE(profile_name => l_profile_name,
```

```
                                        profile_owner => l_profile_owner);
    END;
```

- DBA_CLOUD_AI_PROFILE_ATTRIBUTES View
- USER_CLOUD_AI_PROFILE_ATTRIBUTES View

SET_ATTRIBUTE Procedure

This procedure enables you to set AI profile attributes. It is overloaded to accept attribute values of various types.

Syntax

```
DBMS_CLOUD_AI.SET_ATTRIBUTE(
      profile_name         IN   VARCHAR2,
      attribute_name       IN   VARCHAR2,
      attribute_value      IN   {BOOLEAN|VARCHAR2}
);

DBMS_CLOUD_AI.SET_ATTRIBUTE(
      profile_name         IN   VARCHAR2,
      attribute_name       IN   VARCHAR2,
      attribute_value      IN   CLOB DEFAULT NULL
);
```

Parameters

Only the owner can set or modify the attributes of the AI profile. For a list of supported attributes, see Profile Attributes.

Parameter	Description
`profile_name`	Name of the AI profile for which you want to set the attributes. This parameter is mandatory.
`attribute_name`	Name of the AI profile attribute This parameter is mandatory.
`attribute_value`	Value of the profile attribute. Value can be `BOOLEAN`, `CLOB`, `NUMBER` or `VARCHAR2` type. The default value is NULL.

Examples

```
BEGIN
 DBMS_CLOUD_AI.SET_ATTRIBUTE(
   profile_name    => 'OPENAI',
   attribute_name  => 'credential_name',
   attribute_value => 'OPENAI_CRED_NEW'
 );
END;
/
```

The following example accepts `NUMBER` type as the `attribute_value`.

```
BEGIN
 DBMS_CLOUD_AI.SET_ATTRIBUTE(
   profile_name    => 'OCI_PROFILE',
   attribute_name  => 'temperature',
   attribute_value => 0.5
 );
END;
/
```

The following example accepts `BOOLEAN` type as the `attribute_value`.

```
BEGIN
 DBMS_CLOUD_AI.SET_ATTRIBUTE(
   profile_name    => 'OCI_PROFILE',
   attribute_name  => 'comments',
   attribute_value => 'true'
 );
END;
/
```

The following example accepts `VARCHAR2` type as the `attribute_value`.

```
BEGIN
 DBMS_CLOUD_AI.SET_ATTRIBUTE(
   profile_name    => 'OCI_PROFILE',
   attribute_name  => 'model',
   attribute_value => 'meta.llama-3.3-70b-instruct'
 );
END;
/
```

SET_PROFILE Procedure

This procedure sets AI profile for current session.

After setting an AI profile for the database session, any SQL statement with the prefix `SELECT AI` is considered a natural language prompt. Depending on the action the you specify with the `AI` prefix, a response is generated using AI. To use the `AI` prefix, see Examples of Using Select AI and Use AI Keyword to Enter Prompts. Optionally, it is possible to override the profile attributes or modify attributes by specifying them in JSON format. See SET_ATTRIBUTE Procedure for setting the attributes.

The AI profile can only be set for current session if the owner of the AI profile is the session user.

To set an AI profile for all sessions of a specific database user or all user sessions in the database, consider using a database event trigger for `AFTER LOGON` event on the specific user or the entire database. See CREATE TRIGGER Statement for more details.

Syntax

```
DBMS_CLOUD_AI.SET_PROFILE(
    profile_name      IN  VARCHAR2,
);
```

Parameters

Parameter	Description
`profile_name`	A name for the AI profile in the current session. This parameter is mandatory.

Example

```
BEGIN
     DBMS_CLOUD_AI.SET_PROFILE(
       profile_name    => 'OPENAI'
     );
END;
/
```

GENERATE Function

This function provides AI translation in a stateless manner. With your existing AI profile, you can use this function to perform the supported actions such as `showsql`, `runsql`, `explainsql`, `narrate`, and `chat`. The default action is `showsql`.
Overriding some or all of the profile attributes is also possible using this function.

Syntax

```
DBMS_CLOUD_AI.GENERATE(
    prompt          IN  CLOB,
    profile_name    IN  VARCHAR2 DEFAULT NULL,
    action          IN  VARCHAR2 DEFAULT NULL,
    attributes      IN  CLOB     DEFAULT NULL
) RETURN CLOB;
```

Parameters

Parameter	Description
`prompt`	Natural language prompt to translate using AI. The prompt can include `SELECT AI <action>` as the prefix. The action can also be supplied separately as an "action" parameter. The *action* supplied in prompt overrides the "action" parameter. Default action is `showsql`. This parameter is mandatory.

Parameter	Description
profile_name	Name of the AI profile. This parameter is optional if an AI profile is already set in the session using DBMS_CLOUD_AI.SET_PROFILE. The default value is NULL. The following conditions apply: • If a profile is set in the current session, the user may omit profile_name argument in the DBMS_CLOUD_AI.GENERATE function. • If the profile_name argument is supplied in the DBMS_CLOUD_AI.GENERATE function, it overrides any value set in the session using the DBMS_CLOUD_AI.SET_PROFILE procedure. • If there is no profile set in the session using the DBMS_CLOUD_AI.SET_PROFILE procedure, the profile_name argument must be supplied in the DBMS_CLOUD_AI.GENERATE function.

Note:

For Database Actions, you can either specify profile_name argument in DBMS_CLOUD_AI.GENERATE or you can run two steps as a PL/SQL script: DBMS_CLOUD_AI.SET_PROFILE and DBMS_CLOUD_AI.GENERATE.

```
EXEC
DBMS_CLOUD_AI.set_profile('OPENAI')
;

-----------------------------------
------------
SELECT
DBMS_CLOUD_AI.GENERATE(prompt
 => 'how many customers',

profile_name => 'OPENAI',

action       => 'runsql')
FROM dual;
-----------------------------------
------------

SELECT
DBMS_CLOUD_AI.GENERATE(prompt
 => 'how many customers',

profile_name => 'OPENAI',

action       => 'showsql')
FROM dual;
-----------------------------------
------------
SELECT
```

Parameter	Description
	DBMS_CLOUD_AI.GENERATE(prompt => 'how many customers', profile_name => 'OPENAI', action => 'explainsql') FROM dual; ---------- ---------- SELECT DBMS_CLOUD_AI.GENERATE(prompt => 'how many customers', profile_name => 'OPENAI', action => 'narrate') FROM dual; ---------- -------- SELECT DBMS_CLOUD_AI.GENERATE(prompt => 'what is oracle autonomous database', profile_name => 'OPENAI', action => 'chat') FROM dual; See Executing SQL Statements in the Code Editor for more information.
action	Action for translating natural prompt using AI. The supported actions include runsql (default), showsql, explainsql, narrate, and chat. Descriptions of actions are included in Use AI Keyword to Enter Prompts.
attributes	Override specific AI profile attributes by supplying attributes in JSON format. See Profile Attributes for more details.

Examples

The following examples illustrate runsql, showsql, explainsql, narrate, and chat actions that can be used with the DBMS_CLOUD_AI.GENERATE function. See also Use AI Keyword to Enter Prompts for more details.

An example with runsql action is as follows:

```
SELECT DBMS_CLOUD_AI.GENERATE(prompt       => 'how many customers',
                              profile_name => 'OPENAI',
                              action       => 'runsql')
FROM dual;
```

An example with `showsql` action is as follows:

```
SELECT DBMS_CLOUD_AI.GENERATE(prompt       => 'how many customers',
                              profile_name => 'OPENAI',
                              action       => 'showsql')
FROM dual;
```

An example with `explainsql` action is as follows:

```
SELECT DBMS_CLOUD_AI.GENERATE(prompt       => 'how many customers',
                              profile_name => 'OPENAI',
                              action       => 'explainsql)
FROM dual;
```

An example with `narrate` action is as follows:

```
SELECT DBMS_CLOUD_AI.GENERATE(prompt       => 'how many customers',
                              profile_name => 'OPENAI',
                              action       => 'narrate')
FROM dual;
```

An example with `chat` action is as follows:

```
SELECT DBMS_CLOUD_AI.GENERATE(prompt       => 'what is oracle autonomous
database',
                              profile_name => 'OPENAI',
                              action       => 'chat')
FROM dual;
```

You can use `DBMS_CLOUD_AI.GENERATE` in a procedure and run the function. The following example takes an `ai_prompt`, `profile_name`, and `action` as input parameters and calls `DBMS_CLOUD_AI.GENERATE`

```
create or replace FUNCTION call_select_ai (ai_prompt  IN VARCHAR2,
                                           ai_profile IN VARCHAR2,
                                           ai_action  IN VARCHAR2) -- valid
for 'chat', 'narrate', 'showsql'
                                           RETURN CLOB AS sai_resp clob;
BEGIN
  sai_resp := DBMS_CLOUD_AI.GENERATE(prompt       => ai_prompt,
                                     profile_name => ai_profile,
                                     action       => ai_action);
  return(sai_resp);
END call_select_ai;
```

GENERATE_SYNTHETIC_DATA Function

Use this procedure to generate synthetic data for a single table, multiple tables or a full schema.
The following is the syntax to generate synthetic data for a single table.

Syntax

```
DBMS_CLOUD_AI.GENERATE_SYNTHETIC_DATA(
  profile_name         IN  VARCHAR2,
  object_name          IN  DBMS_ID,
  owner_name           IN  DBMS_ID,
  record_count         IN  NUMBER,
  user_prompt          IN  CLOB DEFAULT NULL,
  params               IN  CLOB DEFAULT NULL
);
```

The following is the syntax to generate synthetic data for multiple tables.

```
DBMS_CLOUD_AI.GENERATE_SYNTHETIC_DATA(
  profile_name         IN  VARCHAR2,
  object_list          IN  CLOB,
  params               IN  CLOB DEFAULT NULL
);
```

If you do not want table data or vector search documents to be sent to an LLM, a user with administrator privileges can disable such access for all users of the given database. This, in effect, disables the `narrate` action.

Parameters

Parameter	Mandatory	Description
`profile_name`	Yes	The AI profile containing necessary LLM service information. This can be created by CREATE_PROFILE Procedure.
`object_name`	Yes	Specify a table name to populate synthetic data. • `SELECT` and `INSERT` privilege on the table objects are needed for the user using it. • The table is either empty or have records in it.
`owner_name`	No	Specify the database user who owns the referenced object. If no specific owner is provided, the procedure defaults to using the schema of the user running it.
`record_count`	No	The number of records to be synthetically generated.
`user_prompt`	No	Additional information that a user can mention to generate synthetic data. For example, to generate a record for a table called `MOVIE` with a `release_date` column, the `user_prompt` can be: *the release date for the movies should be in 2019*
`params`	No	Optional attributes provided in JSON object string format to modify the behavior of an API. See Optional Parameters.

Parameter	Mandatory	Description
`object_list`	Yes	Use this parameter for generating synthetic data on multiple tables. This parameter takes in table object information along with it's arguments and contains the same arguments provided in the single table. See object_list Parameters.

Optional Parameters

Parameter	Value Datatype	Value	Description
`sample_rows`	Number	`0 <= sample_rows <= 100`	Specify the number of rows from the table to use as a sample to guide the LLM in data generation. A value of 0 means no sample rows will be used. The default value is `0`.
`table_statistics`	Boolean	• `True` • `False`	Enable or disable the use of table statistics information. The default value is `False`.

Parameter	Value Datatype	Value	Description
`priority`	String	Valid values: • `HIGH` • `MEDIUM` • `LOW`	Assign a priority value that defines the number of parallel requests sent to the LLM for generating synthetic data. Tasks with a higher priority will consume more database resources and complete faster. The default value is `HIGH` • `HIGH`: Specifies the number of parallel LLM requests based on the database's ECPU count (or OCPU count if your database uses OCPUs). • `MEDIUM`: Sets the number of concurrent processes according to the concurrency limit for Medium service. The default value is 4. • `LOW`: Runs the pipeline job in a serial order, without parallel processing. The maximum number of concurrent parallel processes used for synthetic data generation is limited to 64.
`comments`	Boolean	• `True` • `False`	Enable or disable sending comments to the LLM to guide data generation. The default value is `False`.

object_list Parameters

Parameter	Value Datatype	Mandatory	Description
`owner`	String	Yes	Specifies the database user who owns the object being referenced. If no specific owner is provided, the procedure will default to using the schema of the user running it.
`name`	String	No	Specify a table name to populate synthetic data. `SELECT` and `INSERT` privilege on the table objects are needed for the user using it.The table is either empty or have records in it.
`record_count`	Number	No	The number of records to be synthetically generated. Provide a number greater than 0. Supply `record_count` or `record_count_percentage`.

Parameter	Value Datatype	Mandatory	Description
record_count_percentage	Number	No	The percentage of number of records to be synthetically generated. Provide a number greater than 0. For a Metadata Clone database, where the table metadata including statistics is preserved, the record_count_percentage parameter is supported. Supply record_count or record_count_percentage. When using the record_count_percentage parameter, the final record count in the table is calculated as: Original_Num_Rows * record_count_percentage
user_prompt	String	No	Same as user_prompt in Parameters. The user_prompt is associated with a specific table object.

Examples

The following examples show the DBMS_CLOUD_AI.GENERATE_SYNTHETIC_DATA function for generating synthetic data for a single table and multiple tables. For a complete example and to view more examples, see Example: Generate Synthetic Data.

```
BEGIN
    DBMS_CLOUD_AI.GENERATE_SYNTHETIC_DATA(
        profile_name => 'GENAI',
        object_name  => 'Director',
        owner_name   => 'ADB_USER',
        record_count => 5
    );
END;
```

```
/
PL/SQL procedure successfully completed.

BEGIN
    DBMS_CLOUD_AI.GENERATE_SYNTHETIC_DATA(
        profile_name => 'GENAI',
        object_list => '[{"owner": "ADB_USER", "name":
"Director","record_count":5},
                        {"owner": "ADB_USER", "name":
"Movie_Actor","record_count":5},
                        {"owner": "ADB_USER", "name":
"Actor","record_count":10},
                        {"owner": "ADB_USER", "name":
"Movie","record_count":5,"user_prompt":"all movies are released in 2009"}]'
    );
END;
/
PL/SQL procedure successfully completed.
```

Profile Attributes

Attributes of an AI profile help to manage and configure the behavior of the AI profile. Some attributes are optional and have a default value.

Attributes

Attribute Name	Description
`annotations`	Provides additional metadata about your database tables and columns using the 23ai annotations feature. The valid values are `TRUE` or `FALSE`. The default value is `FALSE`. The values are not case sensitive. `TRUE`: Augments the user prompt with table-level and column-level annotations in addition to other metadata to the LLM. `FALSE`: Does not include annotations as part of the augmented prompt metadata.
`azure_deployment_name`	Name of the Azure OpenAI Service deployed model. The name can only include alphanumeric characters, underscore character (_) and a hyphen (-) character. The name cannot end with an underscore (_) or a hyphen (-). To know how to get the `azure_deployment_name`, see Create and deploy an Azure OpenAI Service resource.
`azure_embedding_deployment_name`	Name of the Azure OpenAI deployed embedding model. The name can only include alphanumeric characters, underscore, and hyphen. The name can't start or end with a hyphen or underscore.
`azure_resource_name`	Name of the Azure OpenAI Service resource. The resource name can only include alphanumeric characters and hyphens, and can't start or end with a hyphen. To know how to get the `azure_resource_name`, see Create and deploy an Azure OpenAI Service resource.

Attribute Name	Description
case_sensitive_values	Specifies whether Select AI should instruct the LLM to generate case-insensitive SQL for columns containing string or text values. The supported values are: • true: Indicates the LLM to generate SQL queries with case-sensitive string values. • false: Indicates the LLM to generate SQL queries that ignore case for string values. The default value is false.
comments	Includes table-level comments and column comments in the metadata used for translating natural language prompts using AI. BOOLEAN data type is supported. The valid values are TRUE or FALSE for a string with VARCHAR2 data type. The values are not case sensitive. **Note:** For DBMS_CLOUD_AI.SET_ATTRIBUTE procedure, when setting a single attribute, supply the attribute_value parameter as a string ('true' or 'false') because the attribute_value parameter is of CLOB data type.
constraints	Manages whether to include referential integrity constraints such as primary and foreign keys in the metadata sent to the LLM. The valid values are TRUE or FALSE. The default value is FALSE. The values are not case sensitive. TRUE: Includes referential constraints in the augmented prompt metadata that is sent to the LLM. FALSE: Does not include referential integrity constraints.
conversation	A VARCHAR2 attribute that indicates if conversation history is enabled for a profile. Valid values are true or false. The default value is false. The values are not case sensitive.
credential_name	The name of the credential to access the AI provider APIs. Credential using bearer tokens can be created by using the provider name as the user name and bearer token as the password. Vault Secret credentials are also supported. Principal authentication, for example, Azure service principal, is also supported. For more information on how to configure it, see Use Azure Service Principal to Access Azure Resources. This is a mandatory attribute. See CREATE_CREDENTIAL Procedure.

Attribute Name	Description
`embedding_model`	The embedding model defined in the AI profile. The following are the supported AI providers for the embedding models with their default values: • OCI GenAI: `cohere.embed-english-v3.0` • OpenAI: `text-embedding-ada-002` • Azure OpenAI: `text-embedding-ada-002` • Cohere: `embed-english-v2.0` • Google: `text-embedding-004` **Note:** • The `embedding_model` parameter is not applicable for Anthropic and Hugging Face. • For in-database models, specify the model name imported into your database if you want to use Select AI with in-database transformer model. You can get the model name by querying `USER_MINING_MODELS`. **Syntax:** The following is the syntax for using in-database transformer model for `embedding_model`: `"embedding_model": "[<model_schema>.]<model_name>"`
`enforce_object_list`	Specifies whether to restrict the LLM to generate SQL that uses only tables covered by the object list. The supported values are: • `true`: Enforces the use of only the tables specified in the object list. • `false`: Allows the LLM to use tables accessible to the user. The values are not case sensitive. The default value is `false`.
`max_tokens`	Denotes the number of tokens to predict per generation. Default is 1024. See Tokens and Tokenizers for more details.

Attribute Name	Description
`model`	The name of the AI model being used to generate responses. See Select your AI Provider and LLMs and specify the model name. **Note:** • **Cohere**: Smaller, "light" models are faster, while larger models perform better. Custom models can also be supplied with their full ID. • **OCI Generative AI**: The Chat Models are supported for all Select AI actions such as `runsql`, `showsql`, `explainsql`, `narrate`, and `chat`. Select AI supports pretrained models for OCI Generative AI. Custom models can also be supplied with their full OCIDs. If you are supplying OCID or `oci_endpoint_id`, be sure to provide either `oci_runtimetype` or `oci_apiformat` depending on the OCI Chat models. To know more about supported models in OCI Generative AI, see Pretrained Foundational Models in Generative AI. • This parameter is not used for Azure as the model is determined when you create your deployment in the Azure OpenAI Service portal.

Attribute Name	Description
object_list	Array of JSON objects specifying the owner and object names that are eligible for natural language translation to SQL. To include all objects of a given user, omit the "name" and only specify the "owner" key in the JSON object. The following types of objects can be used: • tables • views • materialized views • global temporary tables • external tables • synonyms on the above object types For translation natural language to SQL, the object name, object owner, object columns and comments are sent to the AI provider using HTTPS requests. Avoid specifying objects with sensitive object name, column names or comments in the object list. AI providers may have limit on the size of metadata allowed in translation requests. Consider limiting the list of objects suitable for the natural language prompts by your application users. **Format:** `[ {"owner": "SH", "name": "SALES", {"owner": "TEST_USER"} ]` External tables created using sync of OCI Data Catalog or AWS Glue can also be used the object list. This helps in managing metadata in central Data Catalogs and use the metadata directly for translating natural language prompts using AI.
object_list_mode	Specifies whether to send metadata for the most relevant tables or all tables to the LLM. Supported values are: • automated: Sends metadata only for the specific tables identified as most relevant to the query. • all: Sends metadata for all tables accessible to the user. When object_list_mode is set to automated, Select AI automatically creates a vector index, named <profile_name>_OBJECT_LIST_VECINDEX with default attributes. See

Attribute Name	Description
oci_apiformat	Specifies the format in which the API expects data to be sent and received. Use this attribute to generate text responses. This attribute applies to OCI Generative AI Chat Models in a dedicated AI cluster. Specify this attribute when you specify a model OCID in the model attribute or provide an endpoint in the oci_endpoint_id attribute. Supported values are: • COHERE • GENERIC **Note:** Use this attribute for OCI Generative AI Chat Models
oci_compartment_id	Specifies the OCID of the compartment you are permitted to access when calling the OCI Generative AI service. The compartment ID can contain alphanumeric characters, hyphens and dots. The default is the compartment ID of the PDB.
oci_endpoint_id	This attributes indicates the endpoint OCID of the Oracle dedicated AI hosting cluster. The endpoint ID can contain alphanumeric characters, hyphens and dots. To find the endpoint OCID, see Getting an Endpoint's Details in Generative AI. When you want to use the Oracle dedicated AI cluster, you must provide the endpoint OCID of the hosting cluster. By default, the endpoint ID is empty and the model is on-demand on a shared infrastructure.
oci_runtimetype	This attribute indicates the runtime type of the provided model. This attribute is applicable to OCI Generate Text models in a dedicated AI cluster. Specify this attribute when you specify a model OCID in the model attribute or provide an endpoint in the oci_endpoint_id attribute. All permitted values can be found in OCI Generative AI runtimeType. See LlmInferenceRequest Reference. The supported values are: • COHERE • LLAMA **Note:** This attribute is deprecated. Use oci_apiformat.

Attribute Name	Description
`provider`	AI provider for the AI profile. Supported providers: • openai • cohere • azure • database • oci • google • anthropic • huggingface This is a mandatory attribute.
`region`	This attribute indicates the location of the Generative AI cluster that you want to use. The region can contain alphanumeric characters and hyphen characters. **Note:** The Oracle Generative AI cluster is available in Chicago, Frankfurt, and London regions. See Pretrained Foundational Models in Generative AI. The default region is `us-chicago-1`.
`stop_tokens`	The generated text will be terminated at the beginning of the earliest stop sequence. Sequence will be incorporated into the text. The attribute value must be a valid array of string values in JSON format. `stop_tokens` takes a JSON array as input. To learn more about stop tokens or stop sequences, see OpenAI or Cohere documentation.
`temperature`	Sampling from Generate Text models incorporates randomness, so that the same prompt may yield different outputs each time you hit "generate". Temperature is a non-negative float number used to tune the degree of randomness. Lower temperatures mean less random generations. See Temperature for more details. This parameter is applicable to all the supported service providers.
`vector_index_name`	Name of the vector index. The vector index name must follow the naming rules of Oracle SQL identifier. Maximum length of the vector store name is 125 characters.

The following example is using Cohere as the provider and displays custom profile attributes:

```
BEGIN
  DBMS_CLOUD_AI.CREATE_PROFILE(
     profile_name => 'COHERE',
     attributes =>
      '{"provider": "cohere",
        "credential_name": "COHERE_CRED",
        "object_list": [{"owner": "ADB_USER"}],
        "max_tokens":512,
        "stop_tokens": [";"],
        "model": "command-nightly",
        "temperature": 0.5,
```

```
        "comments": true
       }');
END;
/
```

The following example shows custom profile attributes using OCI Generative AI:

```
BEGIN
  DBMS_CLOUD_AI.CREATE_PROFILE(
      profile_name =>
'GENAI',
      attributes => '{"provider":
"oci",
        "credential_name": "GENAI_CRED",
        "object_list": [{"owner": "SH", "name": "customers"},
                        {"owner": "SH", "name": "countries"},
                        {"owner": "SH", "name": "supplementary_demographics"},
                        {"owner": "SH", "name": "profits"},
                        {"owner": "SH", "name": "promotions"},
                        {"owner": "SH", "name": "products"}],
        "oci_compartment_id": "ocid1.compartment.oc1...",
    "oci_endpoint_id": "ocid1.generativeaiendpoint.oc1.us-chicago-1....",
    "region": "us-chicago-1",
    "model": "cohere.command-light",
    "oci_apiformat": "COHERE"
       }');
END;
/
```

ENABLE_DATA_ACCESS Procedure

This procedure enables sending data to LLM for applicable Select AI features, which is the default behavior. Only an administrator can run this procedure.

This procedure controls data access for the following Select AI capabilities:

- `narrate` action
- Retrieval Augmented Generation (RAG)
- Synthetic Data Generation

Syntax

```
DBMS_CLOUD_AI.ENABLE_DATA_ACCESS();
```

Parameters

This procedure does not require any parameters.

Example to Enable Data Access

```
BEGIN
  DBMS_CLOUD_AI.ENABLE_DATA_ACCESS();
```

```
END;
/
```

DISABLE_DATA_ACCESS Procedure

This procedure disables sending data to LLM for applicable Select AI features. Only an administrator can run this procedure.

This procedure limits the following Select AI capabilities:

- `narrate` action
- Retrieval Augmented Generation (RAG)
- Synthetic Data Generation

Syntax

```
DBMS_CLOUD_AI.DISABLE_DATA_ACCESS();
```

Parameters

This procedure does not require any parameters.

Example to Disable Data Access

```
BEGIN
  DBMS_CLOUD_AI.DISABLE_DATA_ACCESS();
END;
/
```

CREATE_VECTOR_INDEX Procedure

This procedure creates a vector index in the specified vector database, and populates it with data from an object store using an asynchronous scheduler job.

Syntax

```
PROCEDURE CREATE_VECTOR_INDEX(
   index_name          IN  VARCHAR2,
   attributes          IN  CLOB      DEFAULT NULL,
   status              IN  VARCHAR2  DEFAULT NULL,
   description         IN  CLOB      DEFAULT NULL
);
```

Parameters

Parameter	Description
`index_name`	Name of the vector index. The vector index name must follow the naming rules of Oracle SQL identifier. Maximum length of vector store name is 125 characters. This is a mandatory parameter.

Parameter	Description
attributes	Custom attributes for the vector index in JSON. To see a list of configurable parameters, see Vector Index Attributes. The default value is NULL.
status	Status of the vector index. The possible values are: • Enabled • Disabled The default value is Disabled.
description	Description for the vector index. The default value is NULL.

Example

The following example demonstrates how to create a vector index and configure the attributes as JSON parameters.

```
BEGIN
       DBMS_CLOUD_AI.CREATE_VECTOR_INDEX(
            index_name    => 'MY_INDEX'
            attributes    => JSON_OBJECT(
                       'vector_db_provider' value 'oracle',
                       'vector_table_name'  value
'oracle_mycollection',
                       'profile_name'      value 'OCIGENAI',
                       'location'          value
                         'https://objectstorage.us-phoenix-1.' ||
                         'oraclecloud.com/n/mynamespace/b/mybucket',
                       'object_store_credential_name'   value
'OS_CRED',
                       'chunk_size'        value 2048,
                       'chunk_overlap'     value 256,
                       'refresh_rate'      value 720)
       );
END;
/
```

DROP_VECTOR_INDEX Procedure

This procedure removes a vector store index. It normally removes the vector store index object and deletes the vector store. If set to FALSE, the argument include_data ensures the procedure only removes the vector store index object while retaining the vector store.

Syntax

```
PROCEDURE DROP_VECTOR_INDEX(
   index_name          IN  VARCHAR2,
   include_data        IN  BOOLEAN DEFAULT TRUE,
```

```
   force               IN  BOOLEAN DEFAULT FALSE
);
```

Parameters

Parameter	Description
index_name	Name of the vector index. The vector index name must follow the naming rules of Oracle SQL identifier. Maximum length of vector store name is 125 characters. This is a mandatory parameter.
include_data	Indicates whether to delete both the customer's vector store and vector index along with the vector index object. Possible values: • TRUE • FALSE The default value is TRUE.
force	Indicates whether to ignore errors that occur if the vector index does not exist. Possible values: • TRUE • FALSE If set to TRUE, this parameter bypasses any errors that occur if the vector index does not exist. The default value is FALSE.

Example

```
BEGIN
DBMS_CLOUD_AI.DROP_VECTOR_INDEX(
        index_name     => 'MY_INDEX',
        include_data   => FALSE,
        force          => TRUE
    );
END;
/
```

DISABLE_VECTOR_INDEX Procedure

This procedure disables a vector index object in the current database. When disabled, an AI profile cannot use the vector index, and the system does not load data into the vector store as new data is added to the object store and does not perform indexing, searching or querying based on the index.

Syntax

```
DBMS_CLOUD_AI.DISABLE_VECTOR_INDEX(

   index_name       IN  VARCHAR2
);
```

Parameters

Parameter	Description
index_name	Name of the vector index. The vector index name must follow the naming rules of Oracle SQL identifier. Maximum length of vector store name is 125 characters. This is a mandatory parameter.

Example

You can disable a vector index by providing the name of the vector index.

```
BEGIN
   DBMS_CLOUD_AI.DISABLE_VECTOR_INDEX(index_name => 'MY_INDEX');
END;
/
```

ENABLE_VECTOR_INDEX Procedure

This procedure enables or activates a previously disabled vector index object. Generally, when you create a vector index, by default it is enabled such that the AI profile can use it to perform indexing and searching.

When enabled, a vector index allows an AI profile to use it for loading new data from an object store into a vector store at a user-specified refresh rate. You can specify the `refresh_rate` parameter through the JSON object list. To configure the JSON attributes, see Vector Index Attributes.

Syntax

```
DBMS_CLOUD_AI.ENABLE_VECTOR_INDEX(

   index_name       IN  VARCHAR2
);
```

Parameters

Parameter	Description
index_name	Name of the vector index. The vector index name must follow the naming rules of Oracle SQL identifier. Maximum length of vector store name is 125 characters. This is a mandatory parameter.

Example

You can enable or activate a vector index by specifying the vector index name as follows:

```
BEGIN
   DBMS_CLOUD_AI.ENABLE_VECTOR_INDEX(index_name => 'MY_INDEX');
END;
/
```

UPDATE_VECTOR_INDEX Procedure

This procedure updates an existing vector store index with a specified value of the vector index attribute. It is overloaded to accept attribute values of various types.

Syntax

```
DBMS_CLOUD_AI.UPDATE_VECTOR_INDEX(
     index_name          IN  VARCHAR2,
     attribute_name      IN  VARCHAR2,
     attribute_value     IN  VARCHAR2
);

DBMS_CLOUD_AI.UPDATE_VECTOR_INDEX(

     index_name          IN  VARCHAR2,
     attribute_name      IN  VARCHAR2,
     attribute_value     IN  CLOB     DEFAULT NULL
  );
```

Parameters

Parameter	Description
`index_name`	Name of the vector index. The vector index name must follow the naming rules of Oracle SQL identifier. Maximum length of vector store name is 125 characters. This is a mandatory parameter.
`attribute_name`	Name of the custom attributes specified as JSON parameters in `CREATE_VECTOR_INDEX` procedure. You cannot modify the following attributes: • `location` • `vector_table_name` • `chunk_size` • `chunk_overlap` • `vector_distance_metric` • `vector_dimension` This is a mandatory parameter.
`attribute_value`	User specified value for the custom `attribute_name`. Value can be `CLOB`, `NUMBER` or `VARCHAR2` type. The default value is NULL.

Example

```
BEGIN
   DBMS_CLOUD_AI.UPDATE_VECTOR_INDEX(
      index_name       => 'MY_INDEX',
      attribute_name   => 'object_storage_credential_name',
      attribute_value  => 'NEW_CRED'
   );
END;
/
```

The following example accepts `NUMBER` type as the `attribute_value`.

```
BEGIN
   DBMS_CLOUD_AI.UPDATE_VECTOR_INDEX(
      index_name       => 'MY_INDEX',
      attribute_name   => 'match_limit',
      attribute_value  => 10
   );
END;
/
```

The following example accepts `VARCHAR2` type as the `attribute_value`.

```
BEGIN
   DBMS_CLOUD_AI.UPDATE_VECTOR_INDEX(
      index_name       => 'MY_INDEX',
      attribute_name   => 'profile_name',
      attribute_value  => 'AI_PROF2'
   );
END;
/
```

Vector Index Attributes

Attributes of a vector index help to manage and configure the behavior of the vector index. You can add custom index attributes as necessary. Some attributes are optional and have a default value.

Attributes

Attribute Name	Value	Mandatory	Description
`chunk_size`	`1024` (default)	N	Text size of chunking the input data. For text data, this means the number of characters.
`chunk_overlap`	`128` (default)	N	Specifies the amount of overlapping characters between adjacent chunks of text. This attribute is useful for ensuring contextual continuity and accuracy in text processing by allowing overlaps between segments, which helps prevent loss of contextual information at chunk boundaries.
`location`	NA	Y	Location of the object store. The files in this location can be documents in formats such as PDF, DOC, JSON, XML, or HTML. See Supported Document Formats.
`match_limit`	`5` (default)	N	Specifies the maximum number of results to return in a vector search query, controlling the output size and improving the efficiency of data retrieval operations.

Attribute Name	Value	Mandatory	Description
object_storage_credential_name	NA	Yes	Specifies the name of the credentials for accessing an object storage.
pipeline_name	<vector_index_name>$VECPIPELINE	No	Specifies the name of the vector index data load pipeline. This attribute is automatically set for the vector index, you cannot specify or modify. The pipeline name can be used to monitor the vector index data load using Monitor and Troubleshoot Pipelines.
profile_name	NA	Yes	Name of the AI profile which is used for embedding resource data and user prompts.
refresh_rate	1440 minutes (default)	No	Interval of updating data in the vector store. The unit is minutes.
similarity_threshold	0 (default)	No	Defines the minimum level of similarity required for two items to be considered a match, useful for filtering results in matching algorithms to ensure relevance.
vector_distance_metric	A string corresponding to one of the values specified in the description.	No	Specifies the type of distance calculation used to compare vectors in a database, determining how similarity between items is quantified. Valid values for Oracle 23ai: • EUCLIDEAN • L2_SQUARED (EUCLIDEAN_SQUARED) • COSINE (default) • DOT • MANHATTAN • HAMMING
vector_db_provider	oracle	Yes	Specifies the provider name that manages and serves as the vector store.
vector_dimension	NA	No	Specifies the number of elements in each vector within the vector store, defining the size and structure of the data representation.
vector_table_name	<vector_index_name>$VECTAB (default)	No	Specifies the name of the table or collection to store vector embeddings and chunked data.

The following example demonstrates creating a vector index with OCI Generative AI vector store.

```
BEGIN
       DBMS_CLOUD_AI.CREATE_VECTOR_INDEX(
         index_name  => 'MY_INDEX',
         attributes  => '{"vector_db_provider": "oracle",
```

```
                          "location": "https://swiftobjectstorage.us-
phoenix-1.oraclecloud.com/v1/my_namespace/my_bucket/my_data_folder",
                          "object_storage_credential_name": "OCI_CRED",
                          "profile_name": "OPENAI_ORACLE",
                          "vector_dimension": 1024,
                          "vector_distance_metric": "cosine",
                          "chunk_overlap":128,
                          "chunk_size":1024
      }');
END;

```

DBMS_CLOUD_FUNCTION Package

The `DBMS_CLOUD_FUNCTION` package allows you invoke OCI and AWS Lambda remote functions in your Autonomous Database as SQL functions.

- Summary of DBMS_CLOUD_FUNCTION Subprograms
  This table summarizes the subprograms included in the `DBMS_CLOUD_FUNCTION` package.

Summary of DBMS_CLOUD_FUNCTION Subprograms

This table summarizes the subprograms included in the `DBMS_CLOUD_FUNCTION` package.

Subprogram	Description
CREATE_CATALOG Procedure	This procedure creates a catalog.
CREATE_FUNCTION Procedure	This procedure creates functions in a catalog.
DROP_CATALOG Procedure	This procedure drops a catalog and functions created using the catalog
DROP_FUNCTION Procedure	This procedure drops functions from a catalog.
LIST_FUNCTIONS Procedure	This procedure lists all the functions in a catalog.
SYNC_FUNCTIONS Procedure	This procedure creates a PL/SQL wrapper for adding new functions to the catalog and removing wrappers for functions that have been deleted from the catalog.

- CREATE_CATALOG Procedure
  This procedure creates a catalog in the database. The `DBMS_CLOUD_FUNCTION.CREATE_CATALOG` procedure creates a catalog. A catalog is a set of functions that creates the required infrastructure to execute subroutines. This procedure is overloaded.
- CREATE_FUNCTION Procedure
  This procedure creates functions in a catalog. There are two overloaded `DBMS_CLOUD_FUNCTION.CREATE_FUNCTION` procedures.
- DROP_CATALOG Procedure
  The `DBMS_CLOUD_FUNCTION.DROP_CATALOG` procedure drops the catalog and functions created using the catalog. This procedure is overloaded.
- DROP_FUNCTION Procedure
  The `DBMS_CLOUD_FUNCTION.DROP_FUNCTION` procedure drops the function. This procedure is overloaded.

- LIST_FUNCTIONS Procedure
  This procedure lists all the functions in a catalog.
- SYNC_FUNCTIONS Procedure
  This procedure creates a PL/SQL wrapper for adding new functions to the catalog and removing wrappers for functions that have been deleted from the catalog.

CREATE_CATALOG Procedure

This procedure creates a catalog in the database. The `DBMS_CLOUD_FUNCTION.CREATE_CATALOG` procedure creates a catalog. A catalog is a set of functions that creates the required infrastructure to execute subroutines. This procedure is overloaded.

Syntax

```
DBMS_CLOUD_FUNCTION.CREATE_CATALOG (
    credential_name             IN VARCHAR2,
    catalog_name                IN VARCHAR2,
    service_provider            IN VARCHAR2,
    cloud_params                IN CLOB
);

DBMS_CLOUD_FUNCTION.CREATE_CATALOG (
    library_name                IN VARCHAR2,
    library_listener_url        IN VARCHAR2,
    library_wallet_dir_name     IN VARCHAR2,
    library_ssl_server_cert_dn  IN VARCHAR2,
    library_remote_path         IN VARCHAR2
);
```

Parameters

Parameter	Description
`credential_name`	Specifies the name of the credential for authentication. This parameter is mandatory.
`service_provider`	Specifies the type of the service provider. This parameter can have `OCI` or `AWS` or `AZURE` or `GCP` as a parameter value. This parameter is mandatory.
`catalog_name`	Specifies the catalog name. This parameter is mandatory.
`cloud_params`	Provides parameter to the function. For example, Compartment OCID, Regions and Azure subscription_id. This parameter is mandatory.
`library_name`	Specifies the name of the library when creating a remote library. This parameter is mandatory.
`library_listener_url`	Specifies the remote location of the library. The parameter accepts a String value in *`host_name:port_number`* format. For example: `EHRPMZ_DBDOMAIN.adb-us-phoenix1.com:16000` This parameter is mandatory.

Parameter	Description
library_remote_path	Specifies the remote library path. You must provide the full absolute path to the remote library. For example:/u01/app/oracle/product/21.0.0.0/client_1/lib/libst_shape.so This parameter is mandatory.
library_wallet_dir_name	Specifies the directory where the self-signed wallet is stored. This parameter is mandatory.
library_ssl_server_cert_dn	Specifies the server certificate Distinguished Name (DN). This parameter is mandatory.

Errors

Error Code	Description
ORA-20000	This error is raised in either of the following conditions: • cloud_params value is missing or incorrect parameter values are passed. • library_name value is not unique when creating a library.
ORA-20001	This error is raised in either of the following conditions: • The credential referenced in the credential_name does not exist. • The Listener specified at the library_listener_url is not reachable when creating a library.
ORA-20002	This error is raised in either of the following conditions: • This error is raised when the catalog already exists. • The specified Server certificate directory is empty when creating a library.
ORA-20009	This error is raised when the service provider doesn't exist.

Examples

```
BEGIN
    DBMS_CLOUD_FUNCTION.CREATE_CATALOG (
        credential_name  => 'DEFAULT_CREDENTIAL',
        catalog_name     => 'OCI_DEMO_CATALOG',
        service_provider => 'OCI',
        cloud_params     => ("region_id":"us-phoenix-1",
"compartment_id":"compartment_id"
 );
END;
/

BEGIN
    DBMS_CLOUD_FUNCTION.CREATE_CATALOG (
        credential_name  => 'AZURE$PA',
        catalog_name     => 'AZURE_DEMO_CATALOG',
        service_provider => 'AZURE',
        cloud_params     => '{"subscription_id":"44495e6a-8ff1-4161-
b387-0e14e675b878"}'
 );
```

```
END;
/

BEGIN
    DBMS_CLOUD_FUNCTION.CREATE_CATALOG (
    library_name               => 'EXT_DEMOLIB',
    library_listener_url       => 'remote_extproc_hostname:16000',
    library_wallet_dir_name    => 'WALLET_DIR',
    library_ssl_server_cert_dn => 'CN=VM Hostname',
    library_remote_path        => '/u01/app/oracle/extproc_libs/library name'
 );
END;
/

BEGIN
    DBMS_CLOUD_FUNCTION.CREATE_CATALOG (
        credential_name  => 'GCP$PA',
        catalog_name     => 'GCP_DEMO_CATALOG',
        service_provider => 'GCP',
        cloud_params     => '{"project_id":"example_XXXXXX"}'
 );
END;
/
```

Usage Note

- To create a catalog you must be logged in as the `ADMIN` user or have privileges on the following:
  - `DBMS_CLOUD_OCI_FNC_FUNCTIONS_INVOKE`
  - `DBMS_CLOUD_OCI_FNC_FUNCTIONS_INVOKE_INVOKE_FUNCTION_RESPONSE_T`
  - `DBMS_CLOUD`
  - Read privilege on `USER_CLOUD_FUNCTION`
  - Read privilege on `USER_CLOUD_FUNCTION_CATALOG`

CREATE_FUNCTION Procedure

This procedure creates functions in a catalog. There are two overloaded `DBMS_CLOUD_FUNCTION.CREATE_FUNCTION` procedures.

The `DBMS_CLOUD_FUNCTION.CREATE_FUNCTION` procedure is only supported for cloud functions.

`CREATE_FUNCTION` Syntax

```
DBMS_CLOUD_FUNCTION.CREATE_FUNCTION (
    credential_name   IN VARCHAR2,
    catalog_name      IN VARCHAR2,
    function_name     IN VARCHAR2,
    function_id       IN VARCHAR2,
    input_args        IN CLOB      DEFAULT NULL,
    return_type       IN VARCHAR2  DEFAULT 'CLOB',
```

```
    response_handler  IN VARCHAR2  DEFAULT NULL
);
```

Response Handler signature

```
<USER DEFINED TYPE> response_handler_name(function_response in CLOB)RETURNS
CLOB;
```

The return type of this is user defined type or PL/SQL type. The `function_response` is of JSON with fields.

```
'{
"STATUS":"<RESPONCE STATUS>",
"RESPONSE_BODY":"<FUNCTION RESPONSE>"
}'
```

`CREATE_FUNCTION` Parameters

Parameter	Description
`credential_name`	Specifies the name of the credential for authentication. This parameter is mandatory.
`catalog_name`	Specifies the catalog name. This parameter is mandatory.
`function_name`	Specifies the PL/SQL function name. This parameter is mandatory.
`function_id`	The `function_id` parameter value refers to the OCI function, AWS Lambda or Azure function. This parameter is mandatory.
`input_args`	Specifies the key value JSON pair accepting input arguments and their types.
`return_type`	Defines the return type of the function. The return type is of `CLOB` data type.
`response_handler`	Specifies the user defined callback to handle response.

`CREATE_FUNCTION` Exceptions

Error Code	Description
`ORA-20001`	This error is raised when the credential referenced in the `credential_name` does not exist.
`ORA-20003`	This error is raised when the specified catalog does not exist.
`ORA-20004`	This error is raised when the specified function already exists.
`ORA-20005`	This error is raised when the function ID or function Amazon Resource Names (ARN) does not exist.
`ORA-20006`	This error is raised when the input arguments are invalid.
`ORA-20007`	This error is raised when the return type is missing or invalid.
`ORA-20008`	This error is raised when the response handler is missing or invalid.

CREATE_FUNCTION Example

```
VAR function_args CLOB;
EXEC :function_args := TO_CLOB('{"command": "VARCHAR2", "value":
"VARCHAR2"}');
BEGIN
    DBMS_CLOUD_FUNCTION.CREATE_FUNCTION (
    credential_name  => 'DEFAULT_CREDENTIAL',
       catalog_name     => 'OCI_DEMO_CATALOG',
       function_name    => 'demo_function',
       function_id      =>
'ocid1.fnfunc.oc1.phx.aaaaaaaazkrbjv6ntowwxlbbp5ct4otsj4o2hdw4ayosyosv4sthmya2
lyza',
       input_args       => :function_args);
 );
END;
/
```

CREATE_FUNCTION Syntax

```
DBMS_CLOUD_FUNCTION.CREATE_FUNCTION (
  library_name          IN VARCHAR2,
  function_name         IN VARCHAR2,
  function_id           IN VARCHAR2 DEFAULT NULL,
  plsql_params          IN CLOB DEFAULT NULL,
  external_params       IN CLOB DEFAULT NULL,
  api_type              IN VARCHAR2 DEFAULT 'FUNCTION',
  with_context          IN BOOLEAN DEFAULT FALSE,
  return_type           IN VARCHAR2 DEFAULT NULL
);
```

CREATE_FUNCTION Parameters

Parameter	Description
library_name	Specifies the remote library name. This parameter is mandatory.
function_name	Specifies the PL/SQL function name. This parameter is mandatory.
function_id	The function_id parameter value refers to the external procedures (extproc). If the value for function_id is not provided, the value in the function_name is used.

Parameter	Description
plsql_params	Specifies the key value JSON pair accepting the parameters for the PL/SQL wrapper. The values must be provided in the "var_name":"modetype, datatype" format. • var_name : is the name of the variable. This parameter is mandatory. • modetype : specifies the variable mode. The variable mode can be one of the following: – IN – OUT – IN OUT • datatype : specifies the variable datatype. This parameter is mandatory. The default value for plsql_params is NULL.
external_params	Specifies the parameters that need to be provided to the external C function. If value is not provided for external_params, the PL/SQL parameters are used.
api_type	Specifies the type of API (function or procedure). The default value for api_type is function.
with_context	Specifies that a context pointer is passed to the external procedure. This context is used by the external C library for connecting back to the database. The default value for with_context is FALSE.
return_type	Specifies the return type of the function created.

CREATE_FUNCTION Example

```
DECLARE
    plsql_params clob    := TO_CLOB('{"sal": "IN, FLOAT", "comm" :"IN,
FLOAT"}');
    external_params clob := TO_CLOB('sal FLOAT, sal INDICATOR SHORT, comm
FLOAT, comm INDICATOR SHORT,
    RETURN INDICATOR SHORT, RETURN FLOAT');
BEGIN
DBMS_CLOUD_FUNCTION.CREATE_FUNCTION (
    LIBRARY_NAME    => 'demolib',
    FUNCTION_NAME   => '"PercentComm"',
    PLSQL_PARAMS    => plsql_params,
    EXTERNAL_PARAMS => external_params,
    API_TYPE        => 'FUNCTION',
    WITH_CONTEXT    => FALSE,
    RETURN_TYPE     => 'FLOAT'
);
END;
/
```

DROP_CATALOG Procedure

The `DBMS_CLOUD_FUNCTION.DROP_CATALOG` procedure drops the catalog and functions created using the catalog. This procedure is overloaded.

Syntax

```
DBMS_CLOUD_FUNCTION.DROP_CATALOG (
    catalog_name      IN VARCHAR2
 );

DBMS_CLOUD_FUNCTION.DROP_CATALOG (
    library_name      IN VARCHAR2
 );
```

Parameters

Parameter	Description
`catalog_name`	Specifies the catalog name. This parameter is mandatory.
`library_name`	Specifies the library name. This parameter is mandatory.

Errors

Error Code	Description
`ORA-20003`	This error is raised when the specified catalog doesn't exist.

Example:

```
BEGIN
    DBMS_CLOUD_FUNCTION.DROP_CATALOG (
      catalog_name     => 'OCI_DEMO_CATALOG'
  );
END;
/
```

Example:

```
BEGIN
    DBMS_CLOUD_FUNCTION.DROP_CATALOG (
      library_name     => 'library_name'
  );
END;
/
```

DROP_FUNCTION Procedure

The `DBMS_CLOUD_FUNCTION.DROP_FUNCTION` procedure drops the function. This procedure is overloaded.

The `DBMS_CLOUD_FUNCTION.DROP_FUNCTION` procedure is only supported for cloud functions.

Syntax

```
DBMS_CLOUD_FUNCTION.DROP_FUNCTION (
    catalog_name      IN VARCHAR2,
    function_name     IN VARCHAR2
);

DBMS_CLOUD_FUNCTION.DROP_FUNCTION (
    library_name     IN VARCHAR2,
    function_name    IN VARCHAR2
);
```

Parameters

Parameter	Description
`catalog_name`	Specifies the catalog name. This parameter is mandatory.
`function_name`	Specifies the name of the function to be dropped. This parameter is mandatory.
`library_name`	Specifies the library name. This parameter is mandatory.

Examples

```
BEGIN
    DBMS_CLOUD_FUNCTION.DROP_FUNCTION (
       catalog_name     => 'OCI_DEMO_CATALOG',
       function_name    => 'demo_function');
END;
/

BEGIN
    DBMS_CLOUD_FUNCTION.DROP_FUNCTION (
       library_name     => 'EXTPROC_DEMO_LIBRARY',
       function_name    => 'demo_function');
END;
/
```

LIST_FUNCTIONS Procedure

This procedure lists all the functions in a catalog.

Syntax

```
DBMS_CLOUD_FUNCTION.LIST_FUNCTIONS (
    credential_name   IN VARCHAR2,
    catalog_name      IN VARCHAR2,
    function_list     OUT VARCHAR2
);
```

Parameters

Parameter	Description
`credential_name`	Specifies the name of the credential for authentication. This parameter is mandatory.
`function_list`	Returns the list of functions in JSON format. This parameter is mandatory.
`catalog_name`	Specifies the catalog name. This parameter is mandatory.

Errors

Error Code	Description
`ORA-20000`	This error is raised when `cloud_params` value is missing or incorrect parameter values are passed.
`ORA-20001`	This error is raised when the credential referenced in the `credential_name` does not exist.
`ORA-20003`	This error is raised when the specified catalog does not exist.

Example:

```
VAR function_list CLOB;
BEGIN
    DBMS_CLOUD_FUNCTION.LIST_FUNCTIONS (
    credential_name  => 'DEFAULT_CREDENTIAL',
    catalog_name     => 'OCI_DEMO_CATALOG',
    function_list    => :function_list);
 );
END;
/
SELECT JSON_QUERY(:function_list, '$' RETURNING VARCHAR2(32676) pretty) AS
search_results FROM dual;
```

SYNC_FUNCTIONS Procedure

This procedure creates a PL/SQL wrapper for adding new functions to the catalog and removing wrappers for functions that have been deleted from the catalog.

Syntax

```
DBMS_CLOUD_FUNCTION.SYNC_FUNCTIONS (
    catalog_name      IN VARCHAR2,
    refresh_rate     IN VARCHAR2 DEFAULT 'DAILY'
);
```

Parameters

Parameter	Description
`catalog_name`	Specifies the catalog name. This parameter is mandatory.
`refresh_rate`	Specifies the refresh rate of the function. `refresh_rate` can accept the following values: • `HOURLY` • `DAILY` • `WEEKLY` • `MONTHLY` The default value for this parameter is `DAILY`.

Errors

Error Code	Description
`ORA-20003`	This error is raised when the specified catalog does not exist.
`ORA-20004`	This error is raised when an invalid value is passed for the `refresh_rate` parameter.

Example:

```
BEGIN
    DBMS_CLOUD_FUNCTION.SYNC_FUNCTIONS (
       catalog_name     => 'OCI_DEMO_CATALOG'
 );
END;
/
```

DBMS_CLOUD_LINK Package

The `DBMS_CLOUD_LINK` package allows a user to register a table or a view as a data set for read only access with Cloud Links.

- DBMS_CLOUD_LINK Overview
  Describes the use of the `DBMS_CLOUD_LINK` package.

- Summary of DBMS_CLOUD_LINK Subprograms
  Shows a table with a summary of the subprograms included in the DBMS_CLOUD_LINK package.

DBMS_CLOUD_LINK Overview

Describes the use of the DBMS_CLOUD_LINK package.

The DBMS_CLOUD_LINK package provides the REGISTER procedure that allows you to register a table or a view as a data set for use with Cloud Links. Before you can register a data set, the ADMIN user must grant a user permission to register a data set using the DBMS_CLOUD_LINK_ADMIN.GRANT_REGISTER procedure. After the ADMIN runs GRANT_REGISTER, a user can register a table or a view they own as a registered data set (or register an object in another schema if the user has READ WITH GRANT OPTION privilege on the object). Registered data sets provide remote access to the registered object with Cloud Links, subject to the scope specified with the REGISTER procedure.

To run DBMS_CLOUD_LINK.REGISTER, DBMS_CLOUD_LINK.UPDATE_REGISTRATION, or DBMS_CLOUD_LINK.UNREGISTER you have to have execute privilege on DBMS_CLOUD_LINK package, in addition to having previously run DBMS_CLOUD_LINK_ADMIN.GRANT_REGISTER. By default only the ADMIN user and schemas with PDB_DBA role have execute privilege on DBMS_CLOUD_LINK.

Summary of DBMS_CLOUD_LINK Subprograms

Shows a table with a summary of the subprograms included in the DBMS_CLOUD_LINK package.

Subprogram	Description
DESCRIBE Function	This function retrieves the description for a data set. The description is provided when a data set is registered with DBMS_CLOUD_LINK.REGISTER.
FIND Procedure	Retrieves the namespace, name, and description for data sets that match the search string. Matching data sets are only shown if they are accessible to the user, based on access restrictions.
GET_DATABASE_ID Function	Returns a unique identifier for the Autonomous Database instance. Repeated calls to DBMS_CLOUD_LINK.GET_DATABASE_ID on the same instance always return the same value.
GRANT_AUTHORIZATION Procedure	Grants authorization to a specified database to access the specified data set.
REGISTER Procedure	Registers a table or view as data set.
REVOKE_AUTHORIZATION Procedure	Revokes authorization for a specified database to access the specified data set.
UNREGISTER Procedure	Removes a registered data set.
UPDATE_REGISTRATION Procedure	Updates attributes of a data set that has been registered using DBMS_CLOUD_LINK.REGISTER.

- DESCRIBE Function
- FIND Procedure
- GET_DATABASE_ID Function
- GRANT_AUTHORIZATION Procedure
- REGISTER Procedure

- REVOKE_AUTHORIZATION Procedure
- UNREGISTER Procedure
- UPDATE_REGISTRATION Procedure

DESCRIBE Function

This function retrieves the description for a data set. The description is provided when a data set is registered with `DBMS_CLOUD_LINK.REGISTER`.

Syntax

```
DBMS_CLOUD_LINK.DESCRIBE(
      namespace         IN   VARCHAR2,
      name              IN   VARCHAR2
) return CLOB;
```

Parameters

Parameter	Description
`namespace`	Specifies the namespace of registered data set.
`name`	Specifies the name of a registered data set.

Usage Note

You can use this function subject to the access restrictions imposed at registration time with `DBMS_CLOUD_LINK.REGISTER`. If a data set is not accessible to a database, then its description will not be retrieved.

FIND Procedure

This procedure retrieves the namespace, name, and description for data sets that match the search string. Matching data sets are only shown if they are accessible to the user, based on access restrictions.

Syntax

```
DBMS_CLOUD_LINK.FIND(
      search_string         IN   VARCHAR2,
      search_result         OUT   CLOB
);
```

Parameters

Parameter	Description
`search_string`	Specifies the search string. The search string is not case sensitive.
`search_result`	A JSON document that includes the namespace, name, and description values for the data set.

Usage Note

The search string is not case sensitive and the package leverages free text search using Oracle Text.

GET_DATABASE_ID Function

The function returns a unique identifier for the Autonomous Database instance. Repeated calls to `DBMS_CLOUD_LINK.GET_DATABASE_ID` on the same instance always return the same value.

You can call this function on a database that is accessing a registered data set remotely to obtain the database ID. This allows you to provide the database iD so that a data set owner can leverage a more fine-grained data access control, for example with VPD, based on a specified database IDs from remote sites.

A database ID identifies each remote database that accesses a registered data set, to track and audit access in the V$CLOUD_LINK_ACCESS_STATS and GV$CLOUD_LINK_ACCESS_STATS Views on the database that owns a registered data set.

Syntax

```
DBMS_CLOUD_LINK.GET_DATABASE_ID()
  RETURN VARCHAR2;
```

Usage Notes

Cloud links use the unique identifier that `DBMS_CLOUD_LINK.GET_DATABASE_ID` returns to identify individual databases that are accessing a data set remotely. The database owning the registered data set tracks and audits the database ID as a record of the origin for data set access in the V$CLOUD_LINK_ACCESS_STATS and GV$CLOUD_LINK_ACCESS_STATS Views.

The `DBMS_CLOUD_LINK.GET_DATABASE_ID` identifier is available as a `SYS_CONTEXT` value so that you can programmatically obtain this information about a connecting remote session using `SYS_CONTEXT`, to further restrict and control what specific data can be accessed remotely by individual Autonomous Database instances with Virtual Private Databases (VPD)s.

Return Values

A unique identifier for the Autonomous Database instance of `VARCHAR2`.

GRANT_AUTHORIZATION Procedure

This procedure grants authorization to a specified database to access the specified data set.

Syntax

```
DBMS_CLOUD_LINK.GRANT_AUTHORIZATION(
      database_id         IN   VARCHAR2,
      namespace           IN   VARCHAR2 DEFAULT,
      name                IN   VARCHAR2
);
```

Parameters

Parameter	Description
database_id	Specifies the database ID for an Autonomous Database instance. Use DBMS_CLOUD_LINK.GET_DATABASE_ID to obtain the database ID.
namespace	Specifies the data set namespace to grant access authorization for the specified database_id.
name	Specifies the data set name to grant access authorization for the specified database_id.

REGISTER Procedure

The procedure registers a table or a view as a data set to allow remote read only access, subject to restrictions imposed by the scope parameter.

Syntax

```
DBMS_CLOUD_LINK.REGISTER(
     schema_name      IN VARCHAR2,
     schema_object    IN VARCHAR2,
     namespace        IN VARCHAR2,
     name             IN VARCHAR2,
     description      IN CLOB,
     scope            IN CLOB,
     auth_required    IN BOOLEAN DEFAULT,
     data_set_owner   IN VARCHAR2 DEFAULT,
     offload_targets  IN CLOB DEFAULT

);
```

Parameters

Parameter	Description
schema_name	Specifies the owner of the table or view specified with the schema_object parameter.
schema_object	Specifies the name of a table or a view. Valid objects are: • Tables (including Heap, External or Hybrid) • Views • Materialized Views • Cloud Tables Other objects such as analytic views or synonyms are not supported.
namespace	Specifies the namespace for the data set. A NULL value specifies a system-generated namespace value, unique to the Autonomous Database instance.
name	Specifies the name for the data set.
description	Specifies text to describe the data.

Parameter	Description
scope	Describes who is allowed to access the data set. The value is a comma separated list consisting of one or more of the following: • Database OCID: Access to the data set is allowed for the specific Autonomous Database instances identified by OCID. • Compartment OCID: Access to the data set is allowed for databases in the compartments identified by compartment OCID. • Tenancy OCID: Access to the data set is allowed for databases in the tenancies identified by tenancy OCID. • Region name: Access to the data set is allowed for databases in the region identified by the named region. By scope, Cloud Links access is limited to within a single region and is not cross-region. A consumer in a different region can access a data set only when a cross-region Refreshable Clone of the database that is the data set owner exists in the consumer database's region. See Register or Unregister a Data Set in a Different Region for more information. • MY$COMPARTMENT: Access to the data set is allowed for databases in the same compartment as the data set owner. • MY$TENANCY: Access to the data set is allowed for databases in the same tenancy as the data set owner. • MY$REGION: Access to the data set is allowed for databases in the same region as the data set owner. • List of regions: Access to the data set is allowed for databases in the specified regions For example: `scope => 'us-phoenix-1,us-ashburn-1',` A consumer in a different region can access a data set only when a cross-region Refreshable Clone of the database that is the data set owner exists in the consumer database's region. The scope values, MY$REGION, MY$TENANCY, and MY$COMPARTMENT are variables that act as convenience macros and resolve to OCIDs.
auth_required	Specifies that an additional authorization is required for databases to read from the data set. The following cases are possible: • Databases that are within the SCOPE specified and have been authorized with DBMS_CLOUD_LINK.GRANT_AUTHORIZATION can view rows from the data set. • Any databases that are within the specified SCOPE but have not been authorized with DBMS_CLOUD_LINK.GRANT_AUTHORIZATION cannot view data set rows. In this case, consumers without authorization see the data set as empty. • Databases that are not within the SCOPE specified see an error when attempting to access the data set.
data_set_owner	Specifies the data set owner. This is indicates who the data set belongs to or who is responsible for updating and maintaining the data set. For example, you can set the data_set_owner to the email address of the person who registered the data set.

Parameter	Description
offload_targets	Specifies one or more Autonomous Database OCIDs of refreshable clones where access to data sets is offloaded, from the Autonomous Database where the data set is registered. The offload_targets value is a JSON document that defines one or more CLOUD_LINK_DATABASE_ID and OFFLOAD_TARGET key value pairs: • CLOUD_LINK_DATABASE_ID is one of: – A database ID: This specifies a database ID for the data set consumer whose request is offloaded to the corresponding refreshable clone specified with the OFFLOAD_TARGET value. Obtain the database ID by running DBMS_CLOUD_LINK.GET_DATABASE_ID. See GET_DATABASE_ID Function for more information. – ANY: This specifies that any data set consumer's request is offloaded to the corresponding offload target. A consumer's data set request will be routed to the corresponding offload target. If you specify ANY without specifying database IDs, all data set requests from consumers are offloaded to the refreshable clone specified with the OFFLOAD_TARGET value. If you specify both database IDs and ANY, data set requests from consumers that do not match a database ID are offloaded to the refreshable clone specified with the OFFLOAD_TARGET value. • The OFFLOAD_TARGET is the OCID for an Autonomous Database instance that is a refreshable clone. For example, the following shows a JSON sample with three OFFLOAD_TARGET/CLOUD_LINK_DATABASE_ID value pairs: `{ "OFFLOAD_TARGETS": [{ "CLOUD_LINK_DATABASE_ID": "34xxxxx69708978", "OFFLOAD_TARGET": "ocid1.autonomousdatabase.oc1..xxxxx3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfabc" }, { "CLOUD_LINK_DATABASE_ID": "34xxxxx89898978", "OFFLOAD_TARGET": "ocid1.autonomousdatabase.oc1..xxxxx3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfdef" }, { "CLOUD_LINK_DATABASE_ID": "34xxxxx4755680", "OFFLOAD_TARGET": "ocid1.autonomousdatabase.oc1..xxxxx3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfghi" }] }` When a data set consumer requests access to a data set that you register with offload_targets with the ANY keyword, then any request for access is offloaded to the refreshable clone identified with OFFLOAD_TARGET in the

Parameter	Description

	supplied JSON (except requests that have an explicit entry in the supplied JSON).
	For example, the following shows a JSON sample with one explicit `OFFLOAD_TARGET`/`CLOUD_LINK_DATABASE_ID` value pair, and one `ANY` entry:
	
	`{`
	`  "OFFLOAD_TARGETS": [`
	`    {`
	`      "CLOUD_LINK_DATABASE_ID": "ANY",`
	`      "OFFLOAD_TARGET":`
	`"ocid1.autonomousdatabase.oc1..xxxxx3pv6wkcr4jqae5f44n2b2`
	`m2yt2j6rx32uzr4h25vqstifsfdef"`
	`    },`
	`    {`
	`      "CLOUD_LINK_DATABASE_ID": "34xxxxx4755680",`
	`      "OFFLOAD_TARGET":`
	`"ocid1.autonomousdatabase.oc1..xxxxx3pv6wkcr4jqae5f44n2b2`
	`m2yt2j6rx32uzr4h25vqstifsfghi"`
	`    }`
	`  ]`
	`}`
	
	`DBMS_CLOUD_LINK.REGISTER` reports an error if the OCID supplied as an `OFFLOAD_TARGET` value is not an OCID of a refreshable clone in the same region.
	See Use Refreshable Clones with Autonomous Database for information on using refreshable clones.

Usage Notes

- After you register an object, users may need to wait up to ten (10) minutes to access the object with Cloud Links.
- Use the procedure `DBMS_CLOUD_LINK.UPDATE_REGISTRATION` to change the attributes for an existing data set.

  The wait time for the update to complete can be up to 10 minutes for a registration change to be propagated and accessible through Cloud Links. This delay can impact the accuracy of the data in the both the `DBA_CLOUD_LINK_REGISTRATIONS` and `DBA_CLOUD_LINK_ACCESS` views.
- You can register a table or view that resides in another user's schema when the you have `READ WITH GRANT OPTION` privileges for the table or view.
- The scope you set when you register a data set is only honored when it matches or is more restrictive than the value set with `DBMS_CLOUD_LINK_ADMIN.GRANT_REGISTER`. For example, assume the ADMIN granted the scope `'MY$TENANCY'` with `GRANT_REGISTER`, and the user specifies `'MY$REGION'` when they register a data set with `DBMS_CLOUD_LINK.REGISTER`. In this case they would see an error such as the following:

  ```
  ORA-20001: Share privileges are not enabled for current user or it is
  enabled but not for scope MY$REGION
  ```

- Certain hierarchical validity checks for registration cannot happen at registration time. Invalid registrations will not be visible, discoverable, or even accessible to anyone.
- To use `DBMS_CLOUD_LINK.REGISTER`, you must have execute privilege on the `DBMS_CLOUD_LINK` package, in addition to the register privilege assigned with `DBMS_CLOUD_LINK_ADMIN.GRANT_REGISTER`. Only the ADMIN user and schemas with `PDB_DBA` have this privilege by default.
- When you register a data set on a refreshable clone in a remote region, the invocation of `DBMS_CLOUD_LINK.REGISTER` on the remote region clone must use the same parameters with the same values as on the source database, with the exception of the `offload_targets` parameter.

  For example, when you run `DBMS_CLOUD_LINK.REGISTER` with scope set to `MY$COMPARTMENT` on the source Autonomous Database instance, run the procedure again on the cross-region refreshable clone with the same scope parameter value (`MY$COMPARTMENT`).
- If you specify the `offload_targets` parameter with `DBMS_CLOUD_LINK.REGISTER` on source, you should omit this parameter when you register the data set on a cross-region refreshable clone.

REVOKE_AUTHORIZATION Procedure

This procedure revokes authorization for a specified database to access the specified data set.

Syntax

```
DBMS_CLOUD_LINK.REVOKE_AUTHORIZATION(
      database_id         IN   VARCHAR2,
      namespace           IN   VARCHAR2 DEFAULT,
      name                IN   VARCHAR2
);
```

Parameters

Parameter	Description
`database_id`	Specifies the database ID for an Autonomous Database instance. Use `DBMS_CLOUD_LINK.GET_DATABASE_ID` to obtain the database ID.
`namespace`	Specifies the data set namespace to revoke access authorization for the specified `database_id`.
`name`	Specifies the data set name to revoke access authorization for the specified `database_id`.

UNREGISTER Procedure

The procedure allows a user who previously registered a table or a view with the `REGISTER` procedure to unregister the table or view so that it no longer is available for remote access.

Syntax

```
DBMS_CLOUD_LINK.UNREGISTER(
      namespace         IN   VARCHAR2,
      name              IN   VARCHAR2
);
```

Parameters

Parameter	Description
namespace	Specifies a username.
name	Specifies the name for the data set.

Usage Note

DBMS_CLOUD_LINK.UNREGISTER may also take up to ten (10) minutes to fully propagate, after which the data can longer be accessed remotely.

UPDATE_REGISTRATION Procedure

The procedure updates one or more of the attributes for a data set that was registered using DBMS_CLOUD_LINK.REGISTER.

Syntax

```
DBMS_CLOUD_LINK.UPDATE_REGISTRATION(
     namespace         IN VARCHAR2,
     name              IN VARCHAR2,
     description       IN CLOB      DEFAULT,
     scope             IN CLOB      DEFAULT,
     auth_required     IN BOOLEAN   DEFAULT,
     data_set_owner    IN VARCHAR2  DEFAULT,
     offload_targets   IN CLOB      DEFAULT

);
```

Parameters

Parameter	Description
namespace	Specifies the namespace of the data set to be updated.
name	Specifies the name of the data set to be updated.
description	Specifies the updated text to describe the data. If NULL is passed in for this parameter value, the attribute is not modified. By default this attribute is not updated.

Parameter	Description
scope	Update the scope with the specified value. The scope describes who is allowed to access the data set. The value is a comma separated list consisting of one or more of the following: • Database OCID: Access to the data set is allowed for the specific Autonomous Database instances identified by OCID. • Compartment OCID: Access to the data set is allowed for databases in the compartments identified by compartment OCID. • Tenancy OCID: Access to the data set is allowed for databases in the tenancies identified by tenancy OCID. • Region name: Access to the data set is allowed for databases in the region identified by the named region. By scope, Cloud Links access is limited to within a single region and is not cross-region. A consumer in a different region can access a data set only when a cross-region Refreshable Clone of the database that is the data set owner exists in the consumer database's region. See Register or Unregister a Data Set in a Different Region for more information. • MY$COMPARTMENT: Access to the data set is allowed for databases in the same compartment as the data set owner. • MY$TENANCY: Access to the data set is allowed for databases in the same tenancy as the data set owner. • MY$REGION: Access to the data set is allowed for databases in the same region as the data set owner. • List of regions: Access to the data set is allowed for databases in the specified regions For example: `scope => 'us-phoenix-1,us-ashburn-1',` A consumer in a different region can access a data set only when a cross-region Refreshable Clone of the database that is the data set owner exists in the consumer database's region. The scope values, MY$REGION, MY$TENANCY, and MY$COMPARTMENT are variables that act as convenience macros and resolve to OCIDs. If NULL is passed in for this parameter value, the attribute is not modified. By default this attribute is not updated.
auth_required	Specifies that an additional authorization is required for databases to read from the data set. The following cases are possible: • Databases that are within the SCOPE specified and have been authorized with DBMS_CLOUD_LINK.GRANT_AUTHORIZATION can view rows from the data set. • Any databases that are within the specified SCOPE but have not been authorized with DBMS_CLOUD_LINK.GRANT_AUTHORIZATION cannot view data set rows. In this case, consumers without authorization see the data set as empty. • Databases that are not within the SCOPE specified see an error when attempting to access the data set. If NULL is passed in for this parameter value, the attribute is not modified. By default this attribute is not updated.

Parameter	Description
`data_set_owner`	Specifies the data set owner. This is indicates who the data set belongs to or who is responsible for updating and maintaining the data set. For example, you can set the `data_set_owner` to the email address of the person who registered the data set. If `NULL` is passed in for this parameter value, the attribute is not modified. By default this attribute is not updated.

Parameter	Description
offload_targets	Specifies one or more Autonomous Database OCIDs of refreshable clones where access to data sets is offloaded, from the Autonomous Database where the data set is registered. The offload_targets value is a JSON document that defines one or more CLOUD_LINK_DATABASE_ID and OFFLOAD_TARGET key value pairs: • CLOUD_LINK_DATABASE_ID is one of: – A database ID: This specifies a database ID for the data set consumer whose request is offloaded to the corresponding refreshable clone specified with the OFFLOAD_TARGET value. Obtain the database ID by running DBMS_CLOUD_LINK.GET_DATABASE_ID. See GET_DATABASE_ID Function for more information. – ANY: This specifies that any data set consumer's request is offloaded to the corresponding offload target. A consumer's data set request will be routed to the corresponding offload target. If you specify ANY without specifying database IDs, all data set requests from consumers are offloaded to the refreshable clone specified with the OFFLOAD_TARGET value. If you specify both database IDs and ANY, data set requests from consumers that do not match a database ID are offloaded to the refreshable clone specified with the OFFLOAD_TARGET value. • The OFFLOAD_TARGET is the OCID for an Autonomous Database instance that is a refreshable clone. For example, the following shows a JSON sample with three OFFLOAD_TARGET/CLOUD_LINK_DATABASE_ID value pairs: `{ "OFFLOAD_TARGETS": [{ "CLOUD_LINK_DATABASE_ID": "34xxxxx69708978", "OFFLOAD_TARGET": "ocid1.autonomousdatabase.oc1..xxxxx3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfabc" }, { "CLOUD_LINK_DATABASE_ID": "34xxxxx89898978", "OFFLOAD_TARGET": "ocid1.autonomousdatabase.oc1..xxxxx3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfdef" }, { "CLOUD_LINK_DATABASE_ID": "34xxxxx4755680", "OFFLOAD_TARGET": "ocid1.autonomousdatabase.oc1..xxxxx3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfghi" }] }` When a data set consumer requests access to a data set that you register with offload_targets with the ANY keyword, then any request for access is offloaded to the refreshable clone identified with OFFLOAD_TARGET in the

Parameter	Description

	supplied JSON (except requests that have an explicit entry in the supplied JSON).
	For example, the following shows a JSON sample with one explicit `OFFLOAD_TARGET`/`CLOUD_LINK_DATABASE_ID` value pair, and one `ANY` entry:
	
	`{`
	`  "OFFLOAD_TARGETS": [`
	`    {`
	`      "CLOUD_LINK_DATABASE_ID": "ANY",`
	`      "OFFLOAD_TARGET":`
	`"ocid1.autonomousdatabase.oc1..xxxxx3pv6wkcr4jqae5f44n2b2`
	`m2yt2j6rx32uzr4h25vqstifsfdef"`
	`    },`
	`    {`
	`      "CLOUD_LINK_DATABASE_ID": "34xxxxx4755680",`
	`      "OFFLOAD_TARGET":`
	`"ocid1.autonomousdatabase.oc1..xxxxx3pv6wkcr4jqae5f44n2b2`
	`m2yt2j6rx32uzr4h25vqstifsfghi"`
	`    }`
	`  ]`
	`}`
	
	`DBMS_CLOUD_LINK.REGISTER` reports an error if the OCID supplied as an `OFFLOAD_TARGET` value is not an OCID of a refreshable clone in the same region.
	See Use Refreshable Clones with Autonomous Database for information on using refreshable clones.
	If `NULL` is passed in for this parameter value, the attribute is not modified.
	By default this attribute is not updated.

Usage Notes

- The `schema_name` and `schema_object` attributes for a data set cannot be updated.
- After you update the registration for an object, users may need to wait up to ten (10) minutes to access the object using the updated attributes with Cloud Links.
- You can update the registration for a table or view that resides in another user's schema when the you have `READ WITH GRANT OPTION` privileges for the table or view.
- The scope you set when you update the registration of a data set is only honored when it matches or is more restrictive than the value set with `DBMS_CLOUD_LINK_ADMIN.GRANT_REGISTER`. For example, assume the ADMIN granted the scope `'MY$TENANCY'` with `GRANT_REGISTER`, and the user specifies `'MY$REGION'` when they update the registration for the data set with `DBMS_CLOUD_LINK.UPDATE_REGISTRATION`. In this case they would see an error such as the following:

  ```
  ORA-20001: Share privileges are not enabled for current user or it is
  enabled but not for scope MY$REGION
  ```

- Certain hierarchical validity checks for an updated registration cannot happen when at the time the registration is updated. Invalid registrations will not be visible, discoverable, or even accessible to anyone.

- The user who registered a data set can update its attributes with `DBMS_CLOUD_LINK.UPDATE_REGISTRATION`. In addition, you must have execute privilege on the `DBMS_CLOUD_LINK` package and the register privilege assigned with `DBMS_CLOUD_LINK_ADMIN.GRANT_REGISTER`. Only the ADMIN user and schemas with `PDB_DBA` have this privilege by default.
- When you update the registration for a data set on a refreshable clone in a remote region, the invocation of `DBMS_CLOUD_LINK.UPDATE_REGISTRATION` on the remote region clone must use the same parameters with the same values as on the source database, with the exception of the `offload_targets` parameter.

  For example, when you run `DBMS_CLOUD_LINK.UPDATE_REGISTRATION` with scope set to `MY$COMPARTMENT` on the source Autonomous Database instance, run the procedure again on the cross-region refreshable clone with the same scope parameter value (`MY$COMPARTMENT`).
- If you specify the `offload_targets` parameter with `DBMS_CLOUD_LINK.REGISTER` on the source, you should omit this parameter when you register the data set on a cross-region refreshable clone.

DBMS_CLOUD_LINK_ADMIN Package

The `DBMS_CLOUD_LINK_ADMIN` package allows the ADMIN user to enable a database user to register data sets or to access registered data sets for a given Autonomous Database instance, subject to the access restrictions as defined with the granted scope.

Privileges can also be disabled for a user that has the privileges set to register data sets or access registered data sets.

- DBMS_CLOUD_LINK_ADMIN Overview
  Describes use of the `DBMS_CLOUD_LINK_ADMIN` package.
- Summary of DBMS_CLOUD_LINK_ADMIN Subprograms
  This table summarizes the subprograms included in the `DBMS_CLOUD_LINK_ADMIN` package.

DBMS_CLOUD_LINK_ADMIN Overview

Describes use of the `DBMS_CLOUD_LINK_ADMIN` package.

Cloud Links provide a cloud-based method to remotely access read only data on an Autonomous Database instance. The `DBMS_CLOUD_LINK_ADMIN` package leverages Oracle Cloud Infrastructure access mechanisms to make data sets accessible within a specific scope and in addition there is a optional authorization step.

Summary of DBMS_CLOUD_LINK_ADMIN Subprograms

This table summarizes the subprograms included in the `DBMS_CLOUD_LINK_ADMIN` package.

Subprogram	Description
ADD_SERVICE_MAPPING Procedure	The procedure associates a Cloud Links consumer database with a database service.
GRANT_AUTHORIZE Procedure	Grants a user the permission to invoke `DBMS_CLOUD_LINK.GRANT_AUTHORIZATION` and `DBMS_CLOUD_LINK.REVOKE_AUTHORIZATION` procedures.

Subprogram	Description
GRANT_READ Procedure	Allows a user to read registered data sets, subject to access restrictions imposed on data sets at registration.
GRANT_REGISTER Procedure	Allows a user to register a data set for remote access.
REMOVE_SERVICE_MAPPING Procedure	Remove a service mapping for a specified database.
REVOKE_AUTHORIZE Procedure	Revokes a user's permission to invoke `DBMS_CLOUD_LINK.GRANT_AUTHORIZATION` and `DBMS_CLOUD_LINK.REVOKE_AUTHORIZATION` procedures.
REVOKE_READ Procedure	Disallows a user from accessing registered data sets of the Autonomous Database instance.
REVOKE_REGISTER Procedure	Disallows a user from registering data sets for remote access. Data sets that were already registered by the user are unaffected.

- ADD_SERVICE_MAPPING Procedure
- GRANT_AUTHORIZE Procedure
- GRANT_READ Procedure
- GRANT_REGISTER Procedure
- REMOVE_SERVICE_MAPPING Procedure
- REVOKE_AUTHORIZE Procedure
- REVOKE_READ Procedure
- REVOKE_REGISTER Procedure

ADD_SERVICE_MAPPING Procedure

The procedure `DBMS_CLOUD_LINK_ADMIN.ADD_SERVICE_MAPPING` associates a consumer database with a database service.

Syntax

```
DBMS_CLOUD_LINK_ADMIN.ADD_SERVICE_MAPPING(
      database_id         IN   VARCHAR2,
      service_name        IN   VARCHAR2
);
```

Parameters

Parameter	Description
`database_id`	Specifies the database ID for an Autonomous Database instance that is a Cloud Link consumer. Use `DBMS_CLOUD_LINK.GET_DATABASE_ID` to obtain the database ID. The value "`ANY`" associates the specified `service_name` value with all consumer databases that do not have an entry that matches their database identifier. That is, any `database_id` whose `service_name` has not been set with `DBMS_CLOUD_LINK_ADMIN.ADD_SERVICE_MAPPING`. Valid values: a database ID or "`ANY`".

Parameter	Description
service_name	Specifies the database service name. Valid values depend on the workload type: • **Data Warehouse**: Valid values are: HIGH, MEDIUM, LOW • **Transaction Processing**, **JSON Database**, or **APEX**: Valid values are: TP, TPURGENT, HIGH, MEDIUM, LOW

Usage Notes

- Only the ADMIN user and schemas with PDB_DBA role can run DBMS_CLOUD_LINK_ADMIN.ADD_SERVICE_MAPPING.
- You must run DBMS_CLOUD_LINK_ADMIN.ADD_SERVICE_MAPPING on the data set owner's Autonomous Database instance.

GRANT_AUTHORIZE Procedure

The procedure grants a user permission to invoke the DBMS_CLOUD_LINK.GRANT_AUTHORIZATION and DBMS_CLOUD_LINK.REVOKE_AUTHORIZATION procedures.

Syntax

```
DBMS_CLOUD_LINK_ADMIN.GRANT_AUTHORIZE(
      username         IN    VARCHAR2
);
```

Parameters

Parameter	Description
username	Specifies a username.

Usage Notes

- To enable authorization for a data set with DBMS_CLOUD_LINK.GRANT_AUTHORIZATION, you have to have granted the privilege with DBMS_CLOUD_LINK_ADMIN.GRANT_AUTHORIZE. This is true for ADMIN user as well; however ADMIN user can grant this privilege to themself.

GRANT_READ Procedure

The procedure allows a user to read registered data sets, subject to the access restrictions imposed on data sets when a data set is registered using DBMS_CLOUD_LINK_ADMIN.GRANT_REGISTER.

Syntax

```
DBMS_CLOUD_LINK_ADMIN.GRANT_READ(
      username         IN    VARCHAR2
);
```

Parameters

Parameter	Description
username	Specifies a username.

Usage Notes

- To read data sets, you have to have granted the privilege with DBMS_CLOUD_LINK_ADMIN.GRANT_READ. This is true for ADMIN user as well; however ADMIN user can grant this privilege to themself.
- A user can query SYS_CONTEXT('USERENV', 'CLOUD_LINK_READ_ENABLED') to check if they are enabled for READ access to a data set.

  For example, the following query:

  ```
  SELECT SYS_CONTEXT('USERENV', 'CLOUD_LINK_READ_ENABLED') FROM DUAL;
  ```

  Returns 'YES' or 'NO'.

GRANT_REGISTER Procedure

The procedure allows a user to register a data set for remote access.

Syntax

```
DBMS_CLOUD_LINK_ADMIN.GRANT_REGISTER(
      username        IN   VARCHAR2,
      scope           IN   CLOB
);
```

Parameters

Parameter	Description
username	Specifies a user name.
scope	Specifies the scope in which permissions to publish are to be granted to the specified user. Valid values are: • 'MY$REGION' • 'MY$TENANCY' • 'MY$COMPARTMENT'

Usage Notes

- To register data sets, you have to have granted the privilege with DBMS_CLOUD_LINK_ADMIN.GRANT_REGISTER. This is true for ADMIN user as well; however ADMIN user can grant this privilege to themself.
- A user can query SYS_CONTEXT('USERENV', 'CLOUD_LINK_REGISTER_ENABLED') to check if they are enabled for registering data sets.

For example, the following query:

```
SELECT SYS_CONTEXT('USERENV', 'CLOUD_LINK_REGISTER_ENABLED') FROM DUAL;
```

Returns 'YES' or 'NO'.

REMOVE_SERVICE_MAPPING Procedure

The procedure DBMS_CLOUD_LINK_ADMIN.REMOVE_SERVICE_MAPPING removes a service mapping for a specified database.

Syntax

```
DBMS_CLOUD_LINK_ADMIN.REMOVE_SERVICE_MAPPING(
      database_id         IN    VARCHAR2
);
```

Parameters

Parameter	Description
database_id	Specifies the database ID for an Autonomous Database instance. Use DBMS_CLOUD_LINK.GET_DATABASE_ID to obtain the database ID. The value "ANY" removes any specified service_name value with all consumer databases that do not have an entry that matches their database identifier. That is, any database_id whose service_name has not been set with DBMS_CLOUD_LINK_ADMIN.ADD_SERVICE_MAPPING. Valid values: a database ID or "ANY".

Usage Note

Only the ADMIN user and schemas with PDB_DBA role can run DBMS_CLOUD_LINK_ADMIN.REMOVE_SERVICE_MAPPING.

REVOKE_AUTHORIZE Procedure

This procedure disallows a user from invoking DBMS_CLOUD_LINK.GRANT_AUTHORIZATION and DBMS_CLOUD_LINK.REVOKE_AUTHORIZATION procedures.

Syntax

```
DBMS_CLOUD_LINK_ADMIN.REVOKE_AUTHORIZE(
      username         IN    VARCHAR2
);
```

Parameters

Parameter	Description
username	Specifies a username.

REVOKE_READ Procedure

This procedure disallows a user from accessing registered data sets on the Autonomous Database instance.

Syntax

```
DBMS_CLOUD_LINK_ADMIN.REVOKE_READ(
      username         IN    VARCHAR2
);
```

Parameters

Parameter	Description
`username`	Specifies a username.

Usage Note

- A user can query `SYS_CONTEXT('USERENV', 'CLOUD_LINK_READ_ENABLED')` to check if they are enabled for `READ` access to a data set.

  For example, the following query:

  ```
  SELECT SYS_CONTEXT('USERENV', 'CLOUD_LINK_READ_ENABLED') FROM DUAL;
  ```

  Returns '`YES`' or '`NO`'.

REVOKE_REGISTER Procedure

The procedure disallows a user from registering data sets for remote access. Data sets that were already registered by the user are unaffected.

Syntax

```
DBMS_CLOUD_LINK_ADMIN.REVOKE_REGISTER(
      username         IN    VARCHAR2
);
```

Parameters

Parameter	Description
`username`	Specifies a user name.

Usage Note

- A user can query `SYS_CONTEXT('USERENV', 'CLOUD_LINK_REGISTER_ENABLED')` to check if they are enabled for registering data sets.

  For example, the following query:

  ```
  SELECT SYS_CONTEXT('USERENV', 'CLOUD_LINK_REGISTER_ENABLED') FROM DUAL;
  ```

Returns 'YES' or 'NO'.

DBMS_CLOUD_MACADM Package

This section covers the DBMS_CLOUD_MACADM subprograms provided with Autonomous Database.

- CONFIGURE_DATABASE_VAULT Procedure
  This procedure configures the initial two Oracle Database user accounts, which are granted the DV_OWNER and DV_ACCTMGR roles, respectively for Autonomous Database.
- DISABLE_DATABASE_VAULT Procedure
  This procedure disables Oracle Database Vault on Autonomous Database. To use this procedure you must have the DV_OWNER role.
- DISABLE_USERMGMT_DATABASE_VAULT Procedure
  This procedure disallows user management related operations for specified components on Autonomous Database with Oracle Database Vault enabled.
- ENABLE_DATABASE_VAULT Procedure
  This procedure enables Oracle Database Vault on Autonomous Database. To use this procedure you must have the DV_OWNER role.
- ENABLE_USERMGMT_DATABASE_VAULT Procedure
  This procedure allows user management with Oracle Database Vault enabled for specified components on Autonomous Database.

CONFIGURE_DATABASE_VAULT Procedure

This procedure configures the initial two Oracle Database user accounts, which are granted the DV_OWNER and DV_ACCTMGR roles, respectively for Autonomous Database.

Syntax

```
DBMS_CLOUD_MACADM.CONFIGURE_DATABASE_VAULT(
       dvowner_uname    IN VARCHAR2,
       dvacctmgr_uname  IN VARCHAR2);
```

Parameters

Parameter	Description
dvowner_uname	Name of the user who will be the Database Vault Owner. This user will be granted the DV_OWNER role.
dvacctmgr_uname	Name of the user who will be the Database Vault Account Manager. This user will be granted the DV_ACCTMGR role. If you omit this setting, the user specified by the dvowner_uname parameter is made the Database Vault Account Manager and granted the DV_ACCTMGR role.

Usage Notes

- Only the ADMIN user can run the DBMS_CLOUD_MACADM.CONFIGURE_DATABASE_VAULT procedure.
- The DBMS_CLOUD_MACADM.CONFIGURE_DATABASE_VAULT procedure does not allow the ADMIN user to be specified as an input for the dvowner_uname or dvacctmgr_uname arguments.

Example

```
BEGIN
   DBMS_CLOUD_MACADM.CONFIGURE_DATABASE_VAULT(
       dvowner_uname         => 'adb_dbv_owner',
       dvacctmgr_uname       => 'adb_dbv_acctmgr');
END;
/
```

DISABLE_DATABASE_VAULT Procedure

This procedure disables Oracle Database Vault on Autonomous Database. To use this procedure you must have the `DV_OWNER` role.

Syntax

```
DBMS_CLOUD_MACADM.DISABLE_DATABASE_VAULT;
```

Usage Notes

After you run `DBMS_CLOUD_MACADM.DISABLE_DATABASE_VAULT` you must restart the Autonomous Database instance.

To use this procedure you must have the `DV_OWNER` role.

Example

```
EXEC DBMS_CLOUD_MACADM.DISABLE_DATABASE_VAULT;
```

DISABLE_USERMGMT_DATABASE_VAULT Procedure

This procedure disallows user management related operations for specified components on Autonomous Database with Oracle Database Vault enabled.

Syntax

```
DBMS_CLOUD_MACADM.DISABLE_USERMGMT_DATABASE_VAULT('component_name');
```

Where: *component_name* is the component name. Valid value is: `APEX`.

APEX is the Oracle APEX component.

Usage Notes

If you enable Oracle Database Vault with Autonomous Database and you want to enforce strict separation of duty to disallow user management related operations for the APEX, use the `DBMS_CLOUD_MACADM.DISABLE_USERMGMT_DATABASE_VAULT` procedure.

To use this procedure you must have the `DV_ACCTMGR` and `DV_ADMIN` roles.

Example

The following example disables user management for the APEX component:

```
EXEC DBMS_CLOUD_MACADM.DISABLE_USERMGMT_DATABASE_VAULT('APEX');
```

ENABLE_DATABASE_VAULT Procedure

This procedure enables Oracle Database Vault on Autonomous Database. To use this procedure you must have the `DV_OWNER` role.

Syntax

```
DBMS_CLOUD_MACADM.ENABLE_DATABASE_VAULT;
```

Usage Notes

After you run `DBMS_CLOUD_MACADM.ENABLE_DATABASE_VAULT` you must restart the Autonomous Database instance.

To use this procedure you must have the `DV_OWNER` role.

Example

The following example enables Oracle Database Vault:

```
BEGIN
   DBMS_CLOUD_MACADM.ENABLE_DATABASE_VAULT;
END;
/
```

ENABLE_USERMGMT_DATABASE_VAULT Procedure

This procedure allows user management with Oracle Database Vault enabled for specified components on Autonomous Database.

Syntax

```
DBMS_CLOUD_MACADM.ENABLE_USERMGMT_DATABASE_VAULT('component_name');
```

Where: *`component_name`* is the component name. Valid value is: `APEX`.

`APEX` is the Oracle APEX component.

Usage Notes

To use this procedure you must have the `DV_ACCTMGR` and `DV_ADMIN` roles.

Example

The following example enables user management for the APEX component:

```
EXEC DBMS_CLOUD_MACADM.ENABLE_USERMGMT_DATABASE_VAULT('APEX');
```

DBMS_CLOUD_MIGRATION Package

The `DBMS_CLOUD_MIGRATION` package facilitates translation of the SQL code from a non-Oracle SQL flavor to Oracle SQL.

- Summary of DBMS_CLOUD_MIGRATION Subprograms
  This table summarizes the subprograms included in the `DBMS_CLOUD_MIGRATION` package.

Summary of DBMS_CLOUD_MIGRATION Subprograms

This table summarizes the subprograms included in the `DBMS_CLOUD_MIGRATION` package.

Subprogram	Description
MIGRATE_SQL Procedure and Function	The `MIGRATE_SQL` facilitates the translation of SQL statements written in non-Oracle SQL to Oracle SQL. The supported SQL flavors are PostgreSQL, MySQL, and SQL Server.
MIGRATE_FILE Procedure	This procedure translates a file containing SQL statements from a specified source database as an input and translates the SQL statements to Oracle SQL.
ENABLE_TRANSLATION Procedure	This procedure enables real-time SQL translation and running of non-Oracle SQL statements in an Autonomous Database. The supported SQL flavors are PostgreSQL, MySQL, and SQL Server.
DISABLE_TRANSLATION Procedure	This procedure disables the SQL language translation.

- MIGRATE_SQL Procedure and Function
  The MIGRATE_SQL facilitates the translation of SQL statements written in non-Oracle SQL to Oracle SQL. This procedure is overloaded and has function and procedure variants.
- MIGRATE_FILE Procedure
  `MIGRATE_FILE` takes a file containing SQL statements from a specified source database as an input and translates the SQL statements to Oracle SQL.
- ENABLE_TRANSLATION Procedure
  The `ENABLE_TRANSLATION` procedure enables real-time SQL translation and the running of non-Oracle SQL statements in your Autonomous Database.
- DISABLE_TRANSLATION Procedure
  The `DISABLE_TRANSLATION` procedure disables the SQL language translation. An error is returned if the SQL language translation is not enabled for your session.

MIGRATE_SQL Procedure and Function

The MIGRATE_SQL facilitates the translation of SQL statements written in non-Oracle SQL to Oracle SQL. This procedure is overloaded and has function and procedure variants.

Syntax

```
DBMS_CLOUD_MIGRATION.MIGRATE_SQL (
   original_sql  IN  CLOB,
   output_sql    OUT CLOB,
   source_db     IN  VARCHAR2);
```

```
DBMS_CLOUD_MIGRATION.MIGRATE_SQL (
   original_sql   IN  CLOB,
   source_db      IN  VARCHAR2);
RETURN CLOB;
```

Parameters

Parameter	Description
original_sql	Specifies the original SQL statement in the source database that needs to be translated into Oracle SQL. This parameter is mandatory.
output_sql	Returns the translated SQL statement. This parameter is mandatory.
source_db	Specifies the name of the source database. The valid values for this parameter are POSTGRES, MYSQL, SQLSERVER. This parameter is mandatory.

Return Values

The function form of DBMS_CLOUD_MIGRATION.MIGRATE_SQL returns a CLOB that contains the translated Oracle SQL version of the ORIGINAL_SQL input.

Usage Notes

- You may encounter an error during the translation if the input SQL statement is not supported in Oracle SQL. See the following for more information:
  - Limitations for Migration and Translation of PostgreSQL **Statements** to Oracle SQL
  - Limitations for Migration and Translation of MySQL Statements to Oracle SQL
  - Limitations for Migration and Translation of SQL Server Statements to Oracle SQL
- The DBMS_CLOUD_MIGRATION.MIGRATE_SQL subprograms only accept one SQL statement as input. So, only a single SQL statement can be translated per call.
- You must be logged in as the ADMIN user or have the EXECUTE privilege on the DBMS_CLOUD_MIGRATION package to run the DBMS_CLOUD_MIGRATION.MIGRATE_SQL procedure.

Examples

Procedure form of DBMS_CLOUD_MIGRATION.MIGRATE_SQL to translate the PostgreSQL statement to Oracle SQL:

```
BEGIN
  DBMS_CLOUD_MIGRATION.MIGRATE_SQL(
    original_sql => 'SELECT e.employee_id, e.last_name, e.salary FROM
employees AS e;',
    output_sql   => output_variable,
    source_db    => 'POSTGRES');
END;
/
```

Function form of DBMS_CLOUD_MIGRATION.MIGRATE_SQL to translate the PostgreSQL statement to Oracle SQL:

```
SELECT DBMS_CLOUD_MIGRATION.MIGRATE_SQL
    ('CREATE TABLE IF NOT EXISTS cars (brand VARCHAR(255), model
VARCHAR(255), year INT)', 'POSTGRES') AS output
    FROM DUAL;

OUTPUT
--------------------------------------------------------------------------------
create table cars (brand VARCHAR2(255), model VARCHAR2(255), year NUMBER(10);
```

MIGRATE_FILE Procedure

MIGRATE_FILE takes a file containing SQL statements from a specified source database as an input and translates the SQL statements to Oracle SQL.

Syntax

```
DBMS_CLOUD_MIGRATION.MIGRATE_FILE (
    credential_name  IN VARCHAR2,
    location_uri     IN VARCHAR2,
    target_uri       IN VARCHAR2 DEFAULT NULL,
    source_db        IN VARCHAR2,
    params           IN CLOB
```

Parameters

Parameter	Description
credential_name	The name of the credential to access the Cloud Object Storage. This parameter is mandatory. Optionally, the credential you use to access your Cloud Object Store can be defined by configuring policies and roles. See Configure Policies and Roles to Access Resources for more information.
location_uri	The source file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats. This parameter is mandatory.
target_uri	The target file URI, where the translated file should be stored. If you do not provide a value for this parameter, the translated file is stored at the same location as the source file. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats.
source_db	Specifies the source database language. The valid values for this parameter are POSTGRES, MYSQL, SQLSERVER. This parameter is mandatory.
params	Specifies the additional parameters that can be passed in JSON format.

Usage Notes

- To run DBMS_CLOUD_MIGRATION.MIGRATE_FILE you must be logged in as the ADMIN user or have the EXECUTE privilege on DBMS_CLOUD_MIGRATION.

- The credential_name parameter specifies the credential to access the Cloud Object Storage URI. The user that runs `DBMS_CLOUD_MIGRATION.MIGRATE_FILE`.must have `EXECUTE` privilege for the credential object used to access the Object Storage URI. That is, the credential you specify with the `credential_name` parameter.

Example

```
BEGIN
 DBMS_CLOUD_MIGRATION.MIGRATE_FILE (
     credential_name => 'OBJ_STORE_CRED',
     location_uri    => 'https://objectstorage.region.oraclecloud.com/n/
namespace/b/bucket/o/files/postgrestest.sql',
     source_db       => 'POSTGRES'
    );
END;
/
```

The `credential_name` parameter specifies the credential to access the Cloud Object Storage URI.

The `location_uri` is the the source file URI. The format of the URI depends on the Cloud Object Storage service you are using. See DBMS_CLOUD URI Formats for more information.

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

ENABLE_TRANSLATION Procedure

The `ENABLE_TRANSLATION` procedure enables real-time SQL translation and the running of non-Oracle SQL statements in your Autonomous Database.

Syntax

```
DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION (
   source_db  IN  VARCHAR2);
```

Parameters

Parameter	Description
`source_db`	Specifies the source database language. The valid values for this parameter are `POSTGRES`, `MYSQL`, `SQLSERVER`. This parameter is mandatory.

Usage Note

- To run `DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION` you must be logged in as the `ADMIN` user or have the `EXECUTE` privilege on `DBMS_CLOUD_MIGRATION`.

Example

```
BEGIN
  DBMS_CLOUD_MIGRATION.ENABLE_TRANSLATION (source_db => 'POSTGRES');
```

```
END;
/
```

DISABLE_TRANSLATION Procedure

The `DISABLE_TRANSLATION` procedure disables the SQL language translation. An error is returned if the SQL language translation is not enabled for your session.

Syntax

```
DBMS_CLOUD_MIGRATION.DISABLE_TRANSLATION();
```

Usage Note

- To run `DBMS_CLOUD_MIGRATION.DISABLE_TRANSLATION` you must be logged in as the `ADMIN` user or have the `EXECUTE` privilege on `DBMS_CLOUD_MIGRATION`.

Example

```
BEGIN
  DBMS_CLOUD_MIGRATION.DISABLE_TRANSLATION();
END;
/
```

DBMS_CLOUD_NOTIFICATION Package

The `DBMS_CLOUD_NOTIFICATION` package allows you to send messages or the output of a SQL query to a provider.

- DBMS_CLOUD_NOTIFICATION Overview
  Describes the `DBMS_CLOUD_NOTIFICATION` package.
- Summary of DBMS_CLOUD_NOTIFICATION Subprograms
  This table summarizes the subprograms included in the package.

DBMS_CLOUD_NOTIFICATION Overview

Describes the `DBMS_CLOUD_NOTIFICATION` package.

The supported providers with `DBMS_CLOUD_NOTIFICATION` are: Email, Microsoft Teams, OCI Notifications (ONS), and Slack.

When you use the OCI Notifications service with `DBMS_CLOUD_NOTIFICATION` package, only the `DBMS_CLOUD_NOTIFICATION.SEND_MESSAGE` procedure is supported (the `DBMS_CLOUD_NOTIFICATION.SEND_DATA` procedure is not supported)

Summary of DBMS_CLOUD_NOTIFICATION Subprograms

This table summarizes the subprograms included in the package.

Subprogram	Description
SEND_DATA Procedure	Send SQL query output to a provider.
SEND_MESSAGE Procedure	Send a text message to a provider.

- SEND_DATA Procedure
  The SEND_DATA procedure sends the results of the specified query to a provider.
- SEND_MESSAGE Procedure
  The procedure sends a text message to a provider.

SEND_DATA Procedure

The SEND_DATA procedure sends the results of the specified query to a provider.

Syntax

```
DBMS_CLOUD_NOTIFICATION.SEND_DATA(
       provider           IN  VARCHAR2,
       credential_name    IN  VARCHAR2,
       query              IN  CLOB,
       params             IN  CLOB
 );
```

Parameters

Parameter	Description
provider	Specifies the provider. Valid values are: 'email', 'msteams', and 'slack' This parameter is mandatory.
credential_name	The name of the credential object to access the provider. For the email provider, the credential is the name of the credential of the SMTP approved sender that contains its username and password. For the msteams provider, the credential is the name of the credential. For the Slack provider, the credential's username must be "SLACK_TOKEN" and the password is the Slack Bot Token. This parameter is mandatory.
query	Specifies the SQL query to run. Results are sent to the provider. This parameter is mandatory.

Parameter	Description
params	Specifies specific parameters for the provider in JSON format. For the provider type email, the valid parameters are: • sender. This specifies the Email ID of the approved sender in a String value. • smtp_host. This specifies the SMTP host name in a String value. • subject. This specifies the subject of the email in a String value The maximum size is 100 characters. • recipient. This specifies the email IDs of recipients in a String value. Use a comma between email IDs when there are multiple recipients. • to_cc. This specifies the email IDs that are receiving a CC of the email. It is a String value. Use a comma between email IDs when there are multiple CC recipients. • to_bcc. This specifies the email IDs that are receiving a BCC of the email. It is a String value. Use a comma between email IDs when there are multiple BCC recipients. • message. This specifies the message text in a String value. • type. This specifies the output format in a String value as either CSV or JSON. • title. This specifies the title of the attachment of SQL output in a String value. The title should only contain letters, digits, underscores, hyphens, or dots as characters in its value due to it being used to generate a file name. For the provider type msteams, the valid parameters are: • tenant. This specifies the tenant ID in a String format. • team. This specifies the team ID in a String format. • channel. This specifies the channel ID in a String format. • title. This specifies the title of the file in a String format. The maximum size is 50 characters. • type. This specifies the output format in a String value. Valid values are CSV or JSON. For the provider type slack, the valid parameters are: • channel. This specifies the Channel ID in a String value. The Channel ID is a unique ID for a channel and is different from the channel name. In Slack, when you view channel details you can find the Channel ID on the “About” tab. • type. This specifies the output format in a String value. Valid values are CSV or JSON. This parameter is mandatory.

Usage Notes

- Use the procedure DBMS_CLOUD.CREATE_CREDENTIAL(credential_name, username, password) to create the credential object.

  See CREATE_CREDENTIAL Procedure for more information.

- For the email provider, note the following:
  - The user requires an SMTP connection endpoint for the Email Delivery server to obtain smtp_host. The user also requires an SMTP approved sender and its credentials to authenticate with the Email Delivery server to obtain the credential_name. The SMTP connection must be configured and the SMTP credentials must be generated and approved.

  - The maximum message size supported when using `DBMS_CLOUD_NOTIFICATION.SEND_DATA` with the `email` provider is 32k bytes.
  - You can only use `DBMS_CLOUD_NOTIFICATION` for mail notifications with Autonomous Database version 19.21 and above.

- For the `msteams` provider, the user requires the Microsoft Teams App and a bot configured in it. The app needs to be published to the org and installed after obtaining approval from the admin from the admin center. The user also requires access for `Files.ReadWrite.All` and `ChannelSettings.Read.All` permission for Graph API from their Azure Portal. To generate the required token, the user requires `bot_id` in the username and `bot_secret` in the password.

  The maximum file size supported when using `DBMS_CLOUD_NOTIFICATION.SEND_DATA` for Microsoft Teams is 4MB.

- For the `slack` provider, the `username` value can be any valid string and the `password` is the Slack bot token.

Examples

Send SQL output with the `email` provider:

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'EMAIL_CRED',
    username        => 'username',
    password        => 'password');
END;
/

BEGIN
   DBMS_CLOUD_NOTIFICATION.SEND_DATA(
        provider        => 'email',
        credential_name => 'EMAIL_CRED',
        query           => 'SELECT tablespace_name FROM dba_tablespaces',
        params          => json_object('recipient' value  'mark@oracle.com,
suresh@oracle.com',
                                       'to_cc'  value 'nicole@oracle.com1,
jordan@oracle.com',
                                       'to_bcc' value 'manisha@oracle.com',
                                       'subject' value 'Test subject',
                                       'type' value 'json',
                                       'title' value 'mytitle',
                                       'message' value 'This is the message',
                                       'smtp_host' value
'smtp.email.example.com',
                                       'sender'    value
'approver_sender@oracle.com' )
   );
   END;
/
```

Send SQL output with the `msteams` provider:

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(credential_name => 'TEAMS_CRED',
```

```
        username        => 'bot_id',
        password        => 'bot_secret');
END;
/

BEGIN
     DBMS_CLOUD_NOTIFICATION.SEND_MESSAGE(provider => 'msteams',
        credential_name => 'TEAMS_CRED',
        query           => 'SELECT tablespace_name FROM dba_tablespaces',
        params          => json_object('tenant'value '5b743bc******c0286',
                                       'team'value '0ae401*********5d2bd',
                                       'channel'value
'19%3a94be023*****%40thread.tacv2',
                                       'title'value 'today',
                                       'type'value 'csv'));
END;
/
```

Send SQL output with the `slack` provider:

```
BEGIN
   DBMS_CLOUD.CREATE_CREDENTIAL(
     credential_name => 'SLACK_CRED',
     username        => 'SLACK_TOKEN',
     password        => 'password');
END;
/
BEGIN
  DBMS_CLOUD_NOTIFICATION.SEND_DATA(
      provider        => 'slack',
      credential_name => 'SLACK_CRED',
      query           => 'SELECT username, account_status, expiry_date FROM
USER_USERS WHERE rownum < 5',
      params          => json_object('channel' value 'C0....08','type' value
'csv'));
END;
/
```

SEND_MESSAGE Procedure

The procedure sends a text message to a provider.

Syntax

```
DBMS_CLOUD_NOTIFICATION.SEND_MESSAGE(
       provider           IN  VARCHAR2,
       credential_name    IN  VARCHAR2,
       message            IN  CLOB,
       params             IN  CLOB
 );
```

Parameters

Parameter	Description
`provider`	Specifies the provider. Valid values are: '`email`', '`msteams`', '`slack`', and '`oci`'. This parameter is mandatory.
`credential_name`	The name of the credential object to access the provider. • `email` provider: the credential is the name of the credential of the SMTP approved sender that contains its username and password. • `msteams` provider: the credential must contain the `bot_id` and the `bot_secret` key in both the `username` and the `password`. • `slack` provider: the credential's `username` must be "`SLACK_TOKEN`" and the `password` is the Slack Bot Token. • `oci` provider: the credential is either a valid Oracle Cloud Infrastructure signing key based credential or resource principal credential. This parameter is mandatory. Use the procedure `DBMS_CLOUD.CREATE_CREDENTIAL` to create the credential object. See CREATE_CREDENTIAL Procedure for more information.
`message`	Specifies the message text. This parameter is mandatory.
`params`	Specifies specific parameters for the `provider` in JSON format. For the provider type `email`, the valid parameters are: • `sender`: Specifies the Email ID of the approved sender in a `String` value. • `smtp_host`: Specifies the SMTP host name in a `String` value. • `subject`: Specifies the subject of the email in a `String` value. The maximum size is 100 characters. • `recipient`: Specifies the email IDs of recipients in a `String` value. Use a comma between email IDs when there are multiple recipients. • `to_cc`: Specifies the email IDs that are receiving a CC of the email. Use a comma between email IDs when there are multiple CC recipients. • `to_bcc`: Specifies the email IDs that are receiving a BCC of the email. Use a comma between email IDs when there are multiple BCC recipients. For the provider type `msteams`, the valid parameter is: • `channel`: Specifies the Channel ID in a `String` value. For the provider type `slack`, the valid parameter is: • `channel`. Specifies the Channel ID in a `String` value. This parameter is mandatory. The Channel ID is a unique ID for a channel and is different from the channel name. In Slack, when you view channel details you can find the Channel ID on the “About” tab. For the provider OCI Notifications with the type `oci`, the valid parameters are: • `topic_ocid`: Specifies • `title`: Specifies for the subject line of the message. With the `oci` provider, there are different possible endpoints for a message, based on the subscriptions. The `title` parameter is treated differently for different subscriptions: • email: The `title` specifies the subject line of the message. • Slack: The `title` value is not used. If it is included the value is ignored.

Usage Note for Email Provider

For the `email` provider, the user requires an SMTP connection endpoint for the Email Delivery server to obtain `smtp_host`. The user also requires an SMTP approved sender and its credentials to authenticate with the Email Delivery server to obtain the `credential_name`. SMTP connection must be configured, and SMTP credentials must be generated and approved.

Usage Note for the Msteams Provider

For the `msteams` provider, the user requires the Microsoft Teams App and a bot configured in it. The app needs to be published to the org and installed after obtaining approval from the admin from the admin center. The user also requires access for `Files.ReadWrite.All` and `ChannelSettings.Read.All` permission for Graph API from their Azure Portal. To generate the required token, the user requires `bot_id` in the username and `bot_secret` in the password.

Usage Note for the Slack Provider

For the `slack` provider, the `username` value can be any valid string and the `password` is the Slack bot token.

Usage Notes for the OCI Provider OCI Notifications

The `DBMS_CLOUD_NOTIFICATION` supports the OCI Notifications provider. See Overview of Notifications for details on the OCI Notifications provider.

- To use the OCI Notifications provider, you must do the following:
  - Create a topic. See Creating a Topic for details on creating a topic
  - Create the required subscriptions. See Creating a Subscription for details on creating a subscription.
  - After you create the subscriptions, confirm the subscriptions. Messages are only published to confirmed subscriptions. See Confirming a Subscription for details on confirming subscriptions.
- The the Autonomous Database instance, the credential, if you are using user credentials, and the subscription topic must all be located in the same region.
- Note the following limitations:
  - Message Size Limit: The message size limit per request is 64KB. Messages exceeding this size cannot be sent or processed within a single request.
  - Message Delivery Rate Limit: There are different message delivery rate limits depending on the protocol used.
    * `email` protocol: the limit is 10 messages per minute per endpoint.

    This restriction may impact the speed at which messages can be transmitted and received.
  - Transactions Per Minute (TPM) per-Tenancy Limit: There is a TPM limit of 60 per topic for this operation. This limit represents the maximum number of messages per minute that can be processed or handled for a given topic. Exceeding this limit may result in messages not being processed or processed at a slower rate.

Examples

Send a text message with the `email` provider:

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'EMAIL_CRED',
    username        => 'username',
    password        => 'password');
END;
/

BEGIN
   DBMS_CLOUD_NOTIFICATION.SEND_MESSAGE(
        provider        => 'email',
        credential_name => 'EMAIL_CRED',
        message         => 'Subject content',
        params          => json_object('recipient' value  'mark@oracle.com,
suresh@oracle.com',
                                       'to_cc'  value 'nicole@oracle.com,
jordan@oracle.com',
                                       'to_bcc' value 'manisha@oracle.com',
                                       'subject' value 'Test subject',
                                       'smtp_host' value
'smtp.email.example.com',
                                       'sender'    value
'approver_sender@oracle.com' )
   );
   END;
/
```

Send a text message with the `msteams` provider:

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(credential_name => 'TEAMS_CRED',
        username        => 'bot_id',
        password        => 'bot_secret');
END;
/

BEGIN
     DBMS_CLOUD_NOTIFICATION.SEND_MESSAGE(
        provider        => 'msteams',
        credential_name => 'TEAMS_CRED',
        message         => 'text from new teams api',
        params          => json_object('channel'value
'C0....08'),'region'value 'india');
END;
/
```

Send a text message with the `slack` provider:

```
BEGIN
   DBMS_CLOUD.CREATE_CREDENTIAL(
     credential_name => 'SLACK_CRED',
     username        => 'SLACK_TOKEN',
     password        => 'password');
END;
/
BEGIN
   DBMS_CLOUD_NOTIFICATION.SEND_MESSAGE(
      provider          => 'slack',
      credential_name   => 'SLACK_CRED',
      message           => 'Send text from Autonomous Database.',
      params            => json_object('channel' value 'C0....08'));
END;
/
```

Send a text message with the OCI Notifications, type `oci` provider:

```
BEGIN
   DBMS_CLOUD_NOTIFICATION.SEND_MESSAGE(
      provider          => 'oci',
      credential_name  => 'OCI_CRED',
      message          => 'Text message for you.',
      params           => json_object('topic_ocid'  value 'oci********pa',
      'title'  value 'Title for message subject' ));
END;
/
```

```
BEGIN
   DBMS_CLOUD_NOTIFICATION.SEND_MESSAGE(
      provider          => 'oci',
      credential_name  => 'OCI$RESOURCE_PRINCIPAL',
      message          => 'Text message for you.',
      params           => json_object('topic_ocid'  value 'oci********pa',
      'title'  value 'Title for message subject' ));
END;
/
```

DBMS_CLOUD_PIPELINE Package

The `DBMS_CLOUD_PIPELINE` package allows you to create data pipelines for loading and exporting data in the cloud. This package supports continuous incremental data load of files in object store into the database. `DBMS_CLOUD_PIPELINE` also supports continuous incremental export of table data or query results from the database to object store based on a timestamp column.

- Summary of DBMS_CLOUD_PIPELINE Subprograms
  This table summarizes the subprograms included in the `DBMS_CLOUD_PIPELINE` package.

- DBMS_CLOUD_PIPELINE Attributes
  Attributes help to control and configure the behavior of a data pipeline.
- DBMS_CLOUD_PIPELINE Views
  The `DBMS_CLOUD_PIPELINE` package uses the following views.

Summary of DBMS_CLOUD_PIPELINE Subprograms

This table summarizes the subprograms included in the `DBMS_CLOUD_PIPELINE` package.

Subprogram	Description
CREATE_PIPELINE Procedure	Creates a new data pipeline.
DROP_PIPELINE Procedure	Drops an existing data pipeline.
RESET_PIPELINE Procedure	Resets the tracking state of a data pipeline. Use reset pipeline to restart the pipeline from the initial state of data load or export. Optionally reset pipeline can purge data in the database or in object store, depending on the type of pipeline.
RUN_PIPELINE_ONCE Procedure	Performs an on-demand run of the pipeline in the current foreground session, instead of a scheduled job.
SET_ATTRIBUTE Procedure	Sets pipeline attributes. There are two overloaded procedures, one to set a single attribute and another to set multiple attributes using a JSON document of attribute name/value pairs
START_PIPELINE Procedure	Starts the data pipeline. When a pipeline is started, the pipeline operation will continuously run in a scheduled job according to the "interval" configured in pipeline attributes.
STOP_PIPELINE Procedure	Stops the data pipeline. When a pipeline is stopped, no future jobs are scheduled for the pipeline.

- CREATE_PIPELINE Procedure
  The procedure creates a new data pipeline.
- DROP_PIPELINE Procedure
  The procedure drops an existing data pipeline. If a pipeline has been started, then it must be stopped before it can be dropped.
- RESET_PIPELINE Procedure
  Resets the tracking state of a data pipeline. Use reset pipeline to restart the pipeline from the initial state of data load or export. Optionally reset pipeline can purge data in the database or in object store, depending on the type of pipeline. A data pipeline must be in stopped state to reset it.
- RUN_PIPELINE_ONCE Procedure
  This procedure performs an on-demand run of the pipeline in the current foreground session, instead of a running in a scheduled job. Use `DBMS_CLOUD_PIPELINE.RUN_PIPELINE_ONCE` to test a pipeline before you start the pipeline as a continuous job.
- SET_ATTRIBUTE Procedure
  This procedure sets pipeline attributes. There are two overloaded procedures, one to set a single attribute and another to set multiple attributes using a JSON document of attribute name/value pairs.
- START_PIPELINE Procedure
- STOP_PIPELINE Procedure
  The procedure stops the data pipeline. When a pipeline is stopped, no future jobs are scheduled for the pipeline.

CREATE_PIPELINE Procedure

The procedure creates a new data pipeline.

Syntax

```
DBMS_CLOUD_PIPELINE.CREATE_PIPELINE(
      pipeline_name        IN   VARCHAR2,
      pipeline_type        IN   VARCHAR2,
      attributes           IN   CLOB        DEFAULT NULL,
      description          IN   VARCHAR2    DEFAULT NULL
);
```

Parameters

Parameter	Description
`pipeline_name`	Specifies a name for the pipeline. The pipeline name must follow the naming rules of Oracle SQL identifiers. See Identifiers for more information. This parameter is mandatory.
`pipeline_type`	Specifies the pipeline type. Valid values: `LOAD`, `EXPORT` This parameter is mandatory.
`attributes`	Pipeline attributes in JSON format. Default value: `NULL` See DBMS_CLOUD_PIPELINE Attributes for more information.
`description`	Description for the pipeline. Default value: `NULL`

DROP_PIPELINE Procedure

The procedure drops an existing data pipeline. If a pipeline has been started, then it must be stopped before it can be dropped.

Syntax

```
DBMS_CLOUD_PIPELINE.DROP_PIPELINE(
       pipeline_name        IN   VARCHAR2,
       force                IN   BOOLEAN DEFAULT FALSE
 );
```

Parameters

Parameter	Description
`pipeline_name`	Specifies a pipeline name. This parameter is mandatory.
`force`	Forcibly drop a pipeline, even if it is in started state. Valid values: `TRUE`, `FALSE` Default value: `FALSE`

Usage Note

- In order to drop a pipeline that is in started state, set the `force` parameter to `TRUE`.

RESET_PIPELINE Procedure

Resets the tracking state of a data pipeline. Use reset pipeline to restart the pipeline from the initial state of data load or export. Optionally reset pipeline can purge data in the database or in object store, depending on the type of pipeline. A data pipeline must be in stopped state to reset it.

Syntax

```
DBMS_CLOUD_PIPELINE.RESET_PIPELINE(
       pipeline_name        IN   VARCHAR2,
       purge_data           IN   BOOLEAN DEFAULT FALSE
 );
```

Parameters

Parameter	Description
`pipeline_name`	Specifies a name for the pipeline. This parameter is mandatory.
`purge_data`	Purge data applies for either a load pipeline or an export pipeline: • For a load pipeline, when `TRUE`, truncate the data in database table. • For an export pipeline, when `TRUE`, delete the files in the object store location. Valid values: `TRUE`, `FALSE` Default value: `FALSE`

Usage Notes

- A data pipeline must be in stopped state to reset it. See STOP_PIPELINE Procedure for more information.
- For a load pipeline, resetting the pipeline clears the record of the files being loaded by the pipeline. When you call either `START_PIPELINE` or `RUN_PIPELINE_ONCE` after resetting a load pipeline, the pipeline repeats the data load and includes all the files present in the object store location.

  When `purge_data` is set to `TRUE`, `DBMS_CLOUD_PIPELINE.RESET_PIPELINE` does the following:

  – Truncates the data in the pipeline's database table you specify with `table_name` attribute.

  – Drops the pipeline's status table, and the pipeline's bad file table and error table (if they exist).
- For an export pipeline, resetting the pipeline clears the last tracked data in the database table. When you call either `START_PIPELINE` or `RUN_PIPELINE_ONCE` after resetting an export pipeline, the pipeline repeats exporting data from the table or query.

  When `purge_data` set to `TRUE`, `DBMS_CLOUD_PIPELINE.RESET_PIPELINE` deletes existing files in the object store location specified with the `location` attribute.

RUN_PIPELINE_ONCE Procedure

This procedure performs an on-demand run of the pipeline in the current foreground session, instead of a running in a scheduled job. Use `DBMS_CLOUD_PIPELINE.RUN_PIPELINE_ONCE` to test a pipeline before you start the pipeline as a continuous job.

Syntax

```
DBMS_CLOUD_PIPELINE.RUN_PIPELINE_ONCE(
       pipeline_name   IN  VARCHAR2
);
```

Parameters

Parameter	Description
`pipeline_name`	Specifies a name for the pipeline to run. This parameter is mandatory.

Usage Notes

- After you perform a test run of a pipeline you can reset the pipeline state using `DBMS_CLOUD_PIPELINE.RESET_PIPELINE`. This allows you to reset the pipeline state before you start the pipeline in a scheduled job.
- If a pipeline is in the started state, then it cannot be run in the foreground session.

SET_ATTRIBUTE Procedure

This procedure sets pipeline attributes. There are two overloaded procedures, one to set a single attribute and another to set multiple attributes using a JSON document of attribute name/value pairs.

Syntax

```
PROCEDURE DBMS_CLOUD_PIPELINE.SET_ATTRIBUTE(
      pipeline_name         IN   VARCHAR2,
      attribute_name        IN   VARCHAR2,
      attribute_value       IN   CLOB
);

PROCEDURE DBMS_CLOUD_PIPELINE.SET_ATTRIBUTE(
      pipeline_name         IN   VARCHAR2,
      attributes            IN   CLOB
);
```

Parameters

Parameter	Description
`pipeline_name`	Specifies a name for the pipeline to set attributes. This parameter is mandatory.

Parameter	Description
attribute_name	Specifies the attribute name for the attribute to be set. See DBMS_CLOUD_PIPELINE Attributes for more information.
attribute_value	Specifies the value for the pipeline attribute to set. See DBMS_CLOUD_PIPELINE Attributes for more information.
attributes	Specifies a JSON document containing attribute names and values. See DBMS_CLOUD_PIPELINE Attributes for more information.

Usage Note

- When you use DBMS_CLOUD_PIPELINE.SET_ATTRIBUTE to set multiple attributes with the attributes parameter, all the existing attributes are deleted and overwritten with the specified attributes from the JSON document.

START_PIPELINE Procedure

The procedure starts the data pipeline. When a pipeline is started, the pipeline operation runs continuously in a scheduled job according to the interval configured with the pipeline attributes.

Syntax

```
DBMS_CLOUD_PIPELINE.START_PIPELINE(
      pipeline_name         IN   VARCHAR2,
      start_date            IN   TIMESTAMP WITH TIME ZONE DEFAULT NULL
);
```

Parameters

Parameter	Description
pipeline_name	Specifies a name for the pipeline. This parameter is mandatory.
start_date	Specifies the starting date for the pipeline job. Default value: NULL

Usage Notes

- By default, a pipeline job begins immediately, as soon as the pipeline is started. To start a pipeline job at a later time specify a valid date or timestamp using the start_date parameter.
- See DBMS_CLOUD_PIPELINE Attributes for information on the pipeline interval and other pipeline attributes.

STOP_PIPELINE Procedure

The procedure stops the data pipeline. When a pipeline is stopped, no future jobs are scheduled for the pipeline.

Syntax

```
DBMS_CLOUD_PIPELINE.STOP_PIPELINE(
      pipeline_name        IN   VARCHAR2,
      force                IN   BOOLEAN  DEFAULT  FALSE
);
```

Parameters

Parameter	Description
`pipeline_name`	Specifies a name for the pipeline. This parameter is mandatory.
`force`	If force parameter is passed as `TRUE`, then it will terminate any running jobs for the pipeline. Valid values: `TRUE, FALSE` Default value: `FALSE`

DBMS_CLOUD_PIPELINE Attributes

Attributes help to control and configure the behavior of a data pipeline.

Attributes

> **Note:**
>
> As indicated in the **Pipeline Type** column, depending on the pipeline type `LOAD` or `EXPORT`, a pipeline supports a different set of attributes.

Attribute Name	Description	Pipeline Type	Modifiable After Pipeline Starts
`credential_name`	The name of the credential to access the source Cloud Object Storage. You can use `'OCI$RESOURCE_PRINCIPAL'` as the `credential_name` when resource principal is enabled. Credentials specified with the following are also supported: Amazon Resource Names, Azure Service Principal or Google Service Account. See Configure Policies and Roles to Access Resources for more information. Default value: `NULL`. If you do not supply a `credential_name`, `credential_name` is set to `NULL`.	`LOAD`, `EXPORT`	Yes

Attribute Name	Description	Pipeline Type	Modifiable After Pipeline Starts
`field_list`	Identifies the fields in the source files and their data types. This argument's syntax is the same as the `field_list` clause in regular Oracle external tables. For more information about `field_list` see *Oracle® Database Utilities*. Default value: `NULL` The default value specifies the fields and their data types are determined by the columns in the table specified in `table_name` attribute.	`LOAD`	Yes
`format`	The options describing the format for the type of pipeline. • For a load pipeline, see DBMS_CLOUD Package Format Options. • For an export pipeline, see DBMS_CLOUD Package Format Options for EXPORT_DATA Datapump `format` is not supported for an export pipeline. This attribute is mandatory for both `LOAD` and `EXPORT` pipelines.	`LOAD`, `EXPORT`	Yes
`interval`	The time interval in minutes between consecutive executions of scheduled pipeline job. Default value: 15 minutes	`LOAD`, `EXPORT`	Yes
`key_column`	A timestamp or date column in the specified `table` or `query` for exporting newer data continuously to object store. The last execution timestamp or date is tracked by Export pipeline and compared with the value in the `key_column` to identify new data for exporting to object store. Default value: NULL If `key_column` is not specified for an export pipeline, the entire contents of the `table` or `query` are uploaded to object store in each pipeline job execution.	`EXPORT`	No
`location`	Specifies a URI that points to an Object Storage location. The format of the URI depends on the Cloud Object Storage service. See DBMS_CLOUD URI Formats for more information. This attribute is mandatory for both `LOAD` and `EXPORT` pipelines.	`LOAD`, `EXPORT`	No

Attribute Name	Description	Pipeline Type	Modifiable After Pipeline Starts
priority	Specifies a string value that determines the number of parallel operations performed for the pipeline. • In a load pipeline, it determines the number of files loaded in parallel. • In an export pipeline, it determines the degree of parallelism for fetching data from the database. An operation with a higher priority consumes more database resources and is completed sooner. Valid values: • HIGH: Determines the number of parallel files handled using the database's **ECPU count** (**OCPU count** if your database uses OCPUs). • MEDIUM: Determines the number of simultaneous processes using the concurrency limit for Medium service. The default value is 4. • LOW: Run the pipeline job in serial order. Default value: MEDIUM The maximum number of concurrent file operations is limited to 64.	LOAD, EXPORT	Yes
query	Specifies a SELECT statement so that only the required data is exported. The query determines the contents of the files you export as text files (CSV, JSON, Parquet, or XML) or dump files. For example: `SELECT warehouse_id, quantity FROM inventories` Default value: NULL For an export pipeline, either table_name or query is mandatory.	EXPORT	No
table_name	Specifies the name of the target table for loading or exporting data. For a load pipeline table_name is mandatory. For an export pipeline, either table_name or query is mandatory.	LOAD, EXPORT	No
table_owner	The name of the schema where the target table resides for loading or exporting data. Default value: NULL With a NULL value the target table is in the same schema as the user running the procedure.	LOAD, EXPORT	No

DBMS_CLOUD_PIPELINE Views

The DBMS_CLOUD_PIPELINE package uses the following views.

- DBA_CLOUD_PIPELINES View

- USER_CLOUD_PIPELINES View
- DBA_CLOUD_PIPELINE_HISTORY View
- USER_CLOUD_PIPELINE_HISTORY View
- DBA_CLOUD_PIPELINE_ATTRIBUTES View
- USER_CLOUD_PIPELINE_ATTRIBUTES View

DBMS_CLOUD_REPO Package

The `DBMS_CLOUD_REPO` package provides for use of and management of cloud hosted code repositories from Oracle Database. Supported cloud code repositories include GitHub, AWS CodeCommit , and Azure Repos.

- DBMS_CLOUD_REPO Overview
  The `DBMS_CLOUD_REPO` package provides easy access to files in Cloud Code (Git) Repositories, including: GitHub, AWS CodeCommit, and Azure Repos.
- DBMS_CLOUD_REPO Data Structures
  The `DBMS_CLOUD_REPO` package defines record types and a generic JSON object type `repo`.
- DBMS_CLOUD_REPO Subprogram Groups
  The `DBMS_CLOUD_REPO` package subprograms can be grouped into four categories: Initialization Operations, Repository Management Operations, File Operations, and SQL Install Operations.
- Summary of DBMS_CLOUD_REPO Subprograms
  This section covers the `DBMS_CLOUD_REPO` subprograms provided with Autonomous Database.

DBMS_CLOUD_REPO Overview

The `DBMS_CLOUD_REPO` package provides easy access to files in Cloud Code (Git) Repositories, including: GitHub, AWS CodeCommit, and Azure Repos.

This package is a single interface for access to Multicloud Code repositories and allows you to upload SQL files to Git repositories or install SQL scripts directly from Cloud Code Repositories. This package also allows you to use a Cloud Code Repository to manage code versions for SQL scripts and to install or patch application code from Git repositories.

Concepts

- Git Version Control System: Git is software for tracking changes in any set of files, usually used for coordinating work among programmers collaboratively developing source code during software development. Its goals include speed, data integrity, and support for distributed, non-linear workflows.
- Git Repository: A Git repository is a virtual storage of your project. It allows you to save versions of your code, which you can access when needed.

Architecture

`DBMS_CLOUD_REPO` package provides four feature areas:

- Repository Initialization with Generic Cloud Code Repository Handle
  - Initialize a GitHub Code Repository
  - Initialize an AWS CodeCommit Code Repository

  - Initialize an Azure Repos Code Repository
- Repository Management Operations
  - Create a repository
  - Update a repository
  - List repositories
  - Delete a repository
- Repository File Management Operations
  - Upload a file to Code Repository from Oracle Database.
  - Download a file from Code Repository to Oracle Database.
  - Delete files from Code Repository.
  - List files from Code Repository.
- SQL Install Operations
  - Export Database object metadata DDL to repository.
  - Install SQL statements from a file in the Code Repository in Oracle Database.
  - Install SQL statements from a buffer.

DBMS_CLOUD_REPO Data Structures

The `DBMS_CLOUD_REPO` package defines record types and a generic JSON object type `repo`.

REPO JSON Object

A `DBMS_CLOUD_REPO REPO` is an opaque JSON object to represent a Cloud Code Repository of a specific cloud provider. A REPO object can be passed to different `DBMS_CLOUD_REPO` APIs. This opaque object ensures that `DBMS_CLOUD_REPO` procedures and functions are multicloud compatible; you do not have to change any code when you migrate from one Cloud Code Repository provider to another Cloud Code Repository.

DBMS_CLOUD_REPO Subprogram Groups

The `DBMS_CLOUD_REPO` package subprograms can be grouped into four categories: Initialization Operations, Repository Management Operations, File Operations, and SQL Install Operations.

- DBMS_CLOUD_REPO Initialization Operations
  Lists the subprograms for initialization operations within the `DBMS_CLOUD_REPO` package.
- DBMS_CLOUD_REPO Repository Management Operations
  Shows the subprograms for repository management operations within the `DBMS_CLOUD_REPO` package.
- DBMS_CLOUD_REPO Repository Branch Management Operations
  Lists the subprograms for repository branch management operations within the `DBMS_CLOUD_REPO` package.
- DBMS_CLOUD_REPO File Operations
  Lists the subprograms for file operations within the `DBMS_CLOUD_REPO` package.
- DBMS_CLOUD_REPO SQL Install Operations
  Lists the subprograms for SQL install operations within the `DBMS_CLOUD_REPO` package.

DBMS_CLOUD_REPO Initialization Operations

Lists the subprograms for initialization operations within the `DBMS_CLOUD_REPO` package.

Subprogram	Description
INIT_AWS_REPO Function	This function initializes an AWS repository handle and returns an opaque type.
INIT_AZURE_REPO Function	This function initializes an Azure repository handle and returns an opaque type.
INIT_GITHUB_REPO Function	This function initializes a GitHub repository handle and returns an opaque type.
INIT_REPO Function	This function initializes a Cloud Code Repository handle and returns an opaque JSON object.

DBMS_CLOUD_REPO Repository Management Operations

Shows the subprograms for repository management operations within the `DBMS_CLOUD_REPO` package.

Subprogram	Description
CREATE_REPOSITORY Procedure	This procedure creates a Cloud Code Repository identified by the `repo` handle argument.
DELETE_REPOSITORY Procedure	This procedure deletes the Cloud Code Repository identified by the `repo` handle argument.
LIST_REPOSITORIES Function	This function lists all the Cloud Code Repositories identified by the `repo` handle argument.
UPDATE_REPOSITORY Procedure	This procedure updates a Cloud Code repository identified by the `repo` handle argument. The procedure supports updating the name, description, or private visibility status, as supported by the Cloud Code repository.

DBMS_CLOUD_REPO Repository Branch Management Operations

Lists the subprograms for repository branch management operations within the `DBMS_CLOUD_REPO` package.

Subprogram	Description
CREATE_BRANCH Procedure	This procedure creates a branch in a Cloud Code Repository identified by the `repo` handle argument.
DELETE_BRANCH Procedure	This procedure deletes a branch in a Cloud Code Repository identified by the `repo` handle argument.
LIST_BRANCHES Function	This function lists all the Cloud Code Repository branches identified by the `repo` handle argument.
LIST_COMMITS Function	This function lists all the commits in a Cloud Code Repository branch identified by the `repo` handle argument.
MERGE_BRANCH Procedure	This procedure merges a Cloud Code Repository branch into another specified branch in a Cloud Code Repository identified by the `repo` handle argument.

DBMS_CLOUD_REPO File Operations

Lists the subprograms for file operations within the `DBMS_CLOUD_REPO` package.

Subprogram	Description
DELETE_FILE Procedure	This procedure deletes a file from the Cloud Code repository identified by the `repo` handle argument.
GET_FILE Procedure and Function	The function downloads the contents of a file from the Cloud Code repository. The procedure allows you to download the contents of a file from the Cloud Code repository and save the file in a directory.
LIST_FILES Function	This function downloads a file from Cloud Code repository. Optionally, file content can be accessed from either a specific branch, tag or commit name. By default, the file is accessed from the default repository branch.
PUT_FILE Procedure	This procedure uploads a file to the Cloud Code repository identified by the `repo` handle argument. The procedure is overloaded to support either uploading a file from a directory object or uploading the contents from a CLOB to the repository file.

DBMS_CLOUD_REPO SQL Install Operations

Lists the subprograms for SQL install operations within the `DBMS_CLOUD_REPO` package.

Subprogram	Description
EXPORT_OBJECT Procedure	This procedure uploads the DDL metadata of a database object to the Cloud Code repository identified by the `repo` handle argument.
EXPORT_SCHEMA Procedure	This procedure exports metadata of all objects in a schema to a Cloud Code Repository branch identified by the `repo` handle argument.
INSTALL_FILE Procedure	This procedure installs SQL statements from a file in the Cloud Code repository identified by the `repo` handle argument.
INSTALL_SQL Procedure	This procedure installs SQL statements from a buffer given as input.

Summary of DBMS_CLOUD_REPO Subprograms

This section covers the `DBMS_CLOUD_REPO` subprograms provided with Autonomous Database.

The `DBMS_CLOUD_REPO` package is made up of the following:

- DBMS_CLOUD_REPO Initialization Operations
- DBMS_CLOUD_REPO Repository Management Operations
- DBMS_CLOUD_REPO File Operations
- DBMS_CLOUD_REPO SQL Install Operations
- CREATE_BRANCH Procedure
  This procedure creates a branch in the Cloud Code Repository identified by the `repo` handle argument.
- CREATE_REPOSITORY Procedure
  This procedure creates a Cloud Code Repository identified by the `repo` handle argument.
- DELETE_BRANCH Procedure
  This procedure deletes a branch in the Cloud Code repository identified by the `repo` handle argument.
- DELETE_FILE Procedure
  This procedure deletes a file from the Cloud Code repository identified by the `repo` handle argument.

- DELETE_REPOSITORY Procedure
  This procedure deletes the Cloud Code Repository identified by the `repo` handle argument.
- EXPORT_OBJECT Procedure
  This procedure uploads the DDL metadata of a database object to the Cloud Code repository identified by the `repo` handle argument. This procedure is an easy way to upload the metadata definition of a database object in single step.
- EXPORT_SCHEMA Procedure
  This procedure exports metadata of all objects in a schema to the Cloud Code Repository branch identified by the `repo` handle argument.
- GET_FILE Procedure and Function
  The function downloads the contents of a file from the Cloud Code repository. The procedure allows you to download the contents of a file from the Cloud Code repository and save the file in a directory.
- INIT_AWS_REPO Function
  This function initializes an AWS repository handle and returns an opaque type.
- INIT_AZURE_REPO Function
  This function initializes an Azure repository handle and returns an opaque type. This function is only supported for Azure cloud provider.
- INIT_GITHUB_REPO Function
  This function initializes a GitHub repository handle and returns an opaque type.
- INIT_REPO Function
  This function initializes a Cloud Code Repository handle and returns an opaque JSON object. This function is a generic interface to accept a JSON document, and avoids having to change code, you only need to change a JSON document, when moving a code repository from one Cloud Code repository to another Cloud Code repository.
- INSTALL_FILE Procedure
  This procedure installs SQL statements from a file in the Cloud Code repository identified by the `repo` handle argument.
- INSTALL_SQL Procedure
  This procedure installs SQL statements from a buffer given as input.
- LIST_BRANCHES Function
  This function lists branches in the Cloud Code Repository branch identified by the `repo` handle argument.
- LIST_COMMITS Function
  This function lists commits in the Cloud Code Repository branch identified by the `repo` handle argument.
- LIST_FILES Function
  This function downloads a file from Cloud Code repository. Optionally, file content can be accessed from either a specific branch, tag or commit name. By default, the file is accessed from the default repository branch. The results include the file names and additional metadata about the files.
- LIST_REPOSITORIES Function
  This function lists all Cloud Code Repositories identified by the `repo` handle argument. If the `repo` handle has a repository name specified, the function does not restrict the listing to the specified repository name; it lists all repositories accessible to the user.

- MERGE_BRANCH Procedure
  This procedure merges a repository branch into another specified branch in the Cloud Code Repository identified by the `repo` handle argument. The `MERGE_BRANCH` procedure is currently not supported in Azure.
- PUT_FILE Procedure
  This procedure uploads a file to the Cloud Code repository identified by the `repo` handle argument. The procedure is overloaded to support either uploading a file from a directory object or uploading the contents from a BLOB to the repository file.
- UPDATE_REPOSITORY Procedure
  This procedure updates a Cloud Code repository identified by the `repo` handle argument. UPDATE_REPOSITORY supports updating the name, description, or private visibility status, as supported by the Cloud Code repository.

CREATE_BRANCH Procedure

This procedure creates a branch in the Cloud Code Repository identified by the `repo` handle argument.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.CREATE_BRANCH(
    repo               IN   CLOB,
    branch_name        IN   VARCHAR2,
    parent_branch_name IN   VARCHAR2 DEFAULT NULL,
    parent_commit_id   IN   VARCHAR2 DEFAULT NULL
 );
```

Parameters

Parameter	Description
`repo`	Specifies the repository handle. This parameter is mandatory and supported for all cloud providers.
`branch_name`	Specifies the repository branch name. This parameter is mandatory and supported for all cloud providers.
`parent_branch_name`	Creates the new branch using the head commit of the specified parent branch. This parameter is supported for all cloud providers. If you do not supply a `parent_branch_name` value, the `parent_branch_name` is set to `main`.
`parent_commit_id`	Creates the new branch using the specified repository commit. This parameter is supported for all cloud providers. If you do not supply a `parent_commit_id` value, the `parent_commit_id` is set to a NULL value.

> **Note:**
>
> To create a branch in a Cloud Code repository, you must specify the parent branch or the parent commit id.

Example

```
BEGIN
  DBMS_CLOUD_REPO.CREATE_BRANCH (
    repo                 => l_repo,
    branch_name          => 'test_branch',
    parent_branch_name   => 'main'
    );
END;
/
```

Usage Note

To run the `DBMS_CLOUD_REPO.CREATE_BRANCH` procedure, you must be logged in as the ADMIN user or have `EXECUTE` privilege on `DBMS_CLOUD_REPO`.

CREATE_REPOSITORY Procedure

This procedure creates a Cloud Code Repository identified by the `repo` handle argument.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.CREATE_REPOSITORY(
      repo                 IN   CLOB,
      description          IN   CLOB     DEFAULT NULL,
      private              IN   BOOLEAN  DEFAULT TRUE
);
```

Parameters

Parameter	Description
`repo`	Specifies the repository handle. This parameter is supported for all cloud providers.
`description`	A short text description for the repository. This parameter is supported for GITHUB and AWS cloud provider.
`private`	Repository is private and only accessible with valid credentials This parameter is only supported for the GITHUB cloud provider.

Example

```
BEGIN
  DBMS_CLOUD_REPO.CREATE_REPOSITORY(
    repo        => l_repo,
    description => 'My test repo',
    private => TRUE
    );
END;
/
```

DELETE_BRANCH Procedure

This procedure deletes a branch in the Cloud Code repository identified by the `repo` handle argument.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.DELETE_BRANCH (
      repo              IN  CLOB,
      branch_name       IN  VARCHAR2  DEFAULT NULL
 );
```

Parameters

Parameter	Description
`repo`	Specifies the repository handle. This parameter is mandatory and supported for all cloud providers.
`branch_name`	Delete branch from a specific repository. This parameter is mandatory and supported for all cloud providers.

Example

```
BEGIN
  DBMS_CLOUD_REPO.DELETE_BRANCH (
      repo        => l_repo,
      branch_name => 'test_branch'
  );
END;
/
```

Usage Note

To run the `DBMS_CLOUD_REPO.DELETE_BRANCH` procedure, you must be logged in as the ADMIN user or have `EXECUTE` privilege on `DBMS_CLOUD_REPO`.

DELETE_FILE Procedure

This procedure deletes a file from the Cloud Code repository identified by the `repo` handle argument.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.DELETE_FILE(
      repo              IN  CLOB,
      file_path         IN  VARCHAR2,
      branch_name       IN  VARCHAR2  DEFAULT NULL,
      commit_details    IN  CLOB      DEFAULT NULL
);
```

Parameters

Parameter	Description
repo	Specifies the repository handle.
file_path	File path to delete file in the repository.
branch_name	Delete file from a specific branch.
commit_details	Commit Details as a JSON document {"message": "Commit message", "author": {"name": "Committing user name", "email": "Email of committing user" } }

Example

```
BEGIN
  DBMS_CLOUD_REPO.DELETE_FILE(
      repo        => l_repo,
      file_path   => 'scripts/test3.sql',
      branch_name => 'test_branch'
  );
END;
/
```

DELETE_REPOSITORY Procedure

This procedure deletes the Cloud Code Repository identified by the `repo` handle argument.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.DELETE_REPOSITORY(
      repo           IN   CLOB
);
```

Parameters

Parameter	Description
repo	Specifies the repository handle.

Example

```
BEGIN
  DBMS_CLOUD_REPO.DELETE_REPOSITORY(
       repo => l_repo
  );
END;
/
```

EXPORT_OBJECT Procedure

This procedure uploads the DDL metadata of a database object to the Cloud Code repository identified by the `repo` handle argument. This procedure is an easy way to upload the metadata definition of a database object in single step.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.EXPORT_OBJECT(
      repo              IN  CLOB,
      file_path         IN  VARCHAR2,
      object_type       IN  VARCHAR2,
      object_name       IN  VARCHAR2 DEFAULT NULL,
      object_schema     IN  VARCHAR2 DEFAULT NULL,
      branch_name       IN  VARCHAR2 DEFAULT NULL,
      commit_details    IN  CLOB     DEFAULT NULL,
      append            IN  BOOLEAN  DEFAULT FALSE
);
```

Parameters

Parameter	Description
`repo`	Specifies the repository handle.
`file_path`	File path to upload object metadata in the repository.
`object_type`	Object type supported by DBMS_METADATA. See DBMS_METADATA: Object Types table for details.
`object_name`	Name of the database object to retrieve metadata.
`object_schema`	Owning schema of the database object.
`branch_name`	Put file to a specific branch.
`commit_details`	Commit Details as a JSON document:`{"message": "Commit message", "author": {"name": "Committing user name", "email": "Email of committing user" } }`
`append`	Append metadata DDL to existing file.

Usage Note

For customized control on the object DDL, you can use `DBMS_METADATA.GET_DDL` along with `DBMS_CLOUD_REPO.PUT_FILE`. In order to get metadata definition of the object, the current user must be privileged to retrieve the object metadata. See DBMS_METADATA for the security requirements of the package.

Example

```
BEGIN
  DBMS_CLOUD_REPO.EXPORT_OBJECT(
     repo        => l_repo,
     object_type => 'PACKAGE',
     object_name => 'MYPACK',
     file_path   => 'mypack.sql'
  );
```

```
END;
/
```

EXPORT_SCHEMA Procedure

This procedure exports metadata of all objects in a schema to the Cloud Code Repository branch identified by the `repo` handle argument.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.EXPORT_SCHEMA(
    repo            IN CLOB,
    file_path       IN VARCHAR2,
    schema_name     IN VARCHAR2,
    filter_list     IN CLOB         DEFAULT NULL,
    branch_name     IN VARCHAR2     DEFAULT NULL,
    commit_details  IN CLOB         DEFAULT NULL
);
```

Parameters

Parameter	Description
`repo`	Specifies the repository handle. This parameter is mandatory and supported for all cloud providers.
`file_path`	Specifies the name of the schema file to upload to the repo. This parameter is mandatory and supported for all cloud providers.
`schema_name`	Specifies the name of the schema for which a DDL script is to be uploaded to the Cloud Code Repository branch. This parameter is mandatory and supported for all cloud providers.
`filter_list`	Specifies the CLOB of the JSON array that defines the filter conditions to include or exclude the objects whose metadata needs to be exported. This parameter is supported for all cloud providers. JSON parameters for `filter_list` are: • `match_type`: Specifies the type of filter to be applied to the object types or object names. Valid `match_type` values are: – `in/not_in` – `like/not_like` – `equal/not_equal` • `type`: Specifies the type of object by which to filter. • `name`: Specifies the name of the object by which to filter.
`branch_name`	Specifies the repository branch name. This parameter is supported for all cloud providers. If you do not supply a `branch_name` value, the `branch_name` is set to the default repository branch.

Parameter	Description
commit_details	Commit Details as a JSON document {"message": "Commit message", "author": {"name": "Committing user name", "email": "Email of committing user" } } This parameter is supported for all cloud providers. If you do not supply a commit_details value, the commit_details is set to the default commit message that includes the information about the current database session user and database name performing the commit.

Example

```
BEGIN
  DBMS_CLOUD_REPO.EXPORT_SCHEMA(
    repo          => l_repo,
    schema_name   => 'USER1',
    file_path     => 'myschema_ddl.sql'
    filter_list   =>
        to_clob('[
             { "match_type":"equal",
                "type":"table"
             },
             { "match_type":"not_equal",
                "type":"view"
             },
             { "match_type":"in",
                "type":"table",
                "name": " ''EMPLOYEE_SALARY'',''EMPLOYEE_ADDRESS'' "
             },
             { "match_type":"equal",
                "type":"sequence",
                "name": "EMPLOYEE_RECORD_SEQ"
             },
             { "match_type":"like",
                "type":"table",
                "name": "%OFFICE%"
             }
        ]'
     );
  );
END;
/
```

Usage Note

To run the DBMS_CLOUD_REPO.EXPORT_SCHEMA procedure, you must be logged in as the ADMIN user or have EXECUTE privilege on DBMS_CLOUD_REPO.

GET_FILE Procedure and Function

The function downloads the contents of a file from the Cloud Code repository. The procedure allows you to download the contents of a file from the Cloud Code repository and save the file in a directory.

Syntax

```
FUNCTION DBMS_CLOUD_REPO.GET_FILE(
      repo              IN  CLOB,
      file_path         IN  VARCHAR2,
      branch_name       IN  VARCHAR2  DEFAULT NULL,
      tag_name          IN  VARCHAR2  DEFAULT NULL,
      commit_name       IN  VARCHAR2  DEFAULT NULL
) RETURN CLOB;

PROCEDURE DBMS_CLOUD_REPO.GET_FILE(
      repo              IN  CLOB,
      file_path         IN  VARCHAR2,
      directory_name    IN  VARCHAR2,
      target_file_name  IN  VARCHAR2  DEFAULT NULL,
      branch_name       IN  VARCHAR2  DEFAULT NULL,
      tag_name          IN  VARCHAR2  DEFAULT NULL,
      commit_name       IN  VARCHAR2  DEFAULT NULL
);
```

Parameters

Parameter	Description
repo	Specifies the repository handle.
file_path	File path in the repository.
directory_name	Directory object name to save the file contents.
target_file_name	Target file name to save contents in directory.
branch_name	Get file from a specific branch.
tag_name	Get file from a specific Tag.
commit_name	Get file from a specific commit.

Example

```
BEGIN
  DBMS_CLOUD_REPO.GET_FILE(
     repo             =>  l_repo,
     file_path        => 'test3.sql',
     directory_name   => 'DATA_PUMP_DIR',
     target_file_name => 'test2.sql'
  );
END;
/
```

INIT_AWS_REPO Function

This function initializes an AWS repository handle and returns an opaque type.

Syntax

```
FUNCTION DBMS_CLOUD_REPO.INIT_AWS_REPO(
      credential_name IN  VARCHAR2,
      repo_name       IN  VARCHAR2,
      region          IN  VARCHAR2
)  RETURN repo;
```

Parameters

Parameter	Description
credential_name	Credential object specifying AWS CodeCommit accesskey/secretkey.
repo_name	Specifies the repository name.
region	Specifies the AWS region for the CodeCommit repository.

Example

```
BEGIN
  :repo := DBMS_CLOUD_REPO.INIT_AWS_REPO(
                credential_name => 'AWS_CRED',
                repo_name       => 'my_repo',
                region          => 'us-east-1'
           );
END;
/
```

INIT_AZURE_REPO Function

This function initializes an Azure repository handle and returns an opaque type. This function is only supported for Azure cloud provider.

Syntax

```
FUNCTION DBMS_CLOUD_REPO.INIT_AZURE_REPO(
      credential_name IN  VARCHAR2,
      repo_name       IN  VARCHAR2,
      organization    IN  VARCHAR2,
      project         IN  VARCHAR2
)  RETURN repo;
```

Parameters

Parameter	Description
credential_name	Credential object specifying Azure, with a Username and Personal Access Token (PAT).
repo_name	Specifies the repository name.

Parameter	Description
organization	Specifies the Azure DevOps Organization.
project	Azure Team Project name.

Example

```
BEGIN
  :repo := DBMS_CLOUD_REPO.INIT_AZURE_REPO(
                credential_name => 'AZURE_CRED',
                repo_name       => 'my_repo',
                organization    => 'myorg',
                project         => 'myproj',
           );
END;
/
```

INIT_GITHUB_REPO Function

This function initializes a GitHub repository handle and returns an opaque type.

Syntax

```
FUNCTION DBMS_CLOUD_REPO.INIT_GITHUB_REPO(
      credential_name IN  VARCHAR2  DEFAULT NULL,
      repo_name       IN  VARCHAR2,
      owner           IN  VARCHAR2)
RETURN repo;
```

Parameters

Parameter	Description
credential_name	Credential object specifying GitHub. User Email and Personal Access Token (PAT).
repo_name	Specifies the repository name.
owner	Specifies the repository owner.

Example

```
BEGIN
  :repo := DBMS_CLOUD_REPO.INIT_GITHUB_REPO(
                credential_name => 'GITHUB_CRED',
                repo_name       => 'my_repo',
                owner           => 'foo'
           );
END;
/
```

INIT_REPO Function

This function initializes a Cloud Code Repository handle and returns an opaque JSON object. This function is a generic interface to accept a JSON document, and avoids having to change code, you only need to change a JSON document, when moving a code repository from one Cloud Code repository to another Cloud Code repository.

Syntax

```
FUNCTION DBMS_CLOUD_REPO.INIT_REPO(
     params       IN   CLOB)
RETURN CLOB;
```

Parameters

JSON Parameter	Description

`provider`	Cloud code repository provider from the following:
	`DBMS_CLOUD_REPO.GITHUB_REPO ('GITHUB')`
	`DBMS_CLOUD_REPO.AWS_REPO ('AWS')`
	`DBMS_CLOUD_REPO.AZURE_REPO ('AZURE')`

`repo_name`	Specifies the repository name. `DBMS_CLOUD_REPO.PARAM_REPO_NAME`
`owner`	GitHub Repository Owner. `DBMS_CLOUD_REPO.PARAM_OWNER` This parameter is only applicable for GitHub cloud provider.
`region`	AWS Repository Region `DBMS_CLOUD_REPO_PARAM_REGION` This parameter is only applicable for AWS cloud provider.
`organization`	Azure Organization `DBMS_CLOUD_REPO_PARAM_ORGANIZATION` This parameter is only applicable for Azure cloud provider.
`project`	Azure Team Project `DBMS_CLOUD_REPO_PARAM_PROJECT` This parameter is only applicable for Azure cloud provider

Example

```
BEGIN
  :repo := DBMS_CLOUD_REPO.INIT_REPO(
           params => JSON_OBJECT('credential_name' value 'mycred',
                                 'repo_name'       value 'myrepo',
                                 'repo_owner'      value 'foo')
         );
END;
/
```

INSTALL_FILE Procedure

This procedure installs SQL statements from a file in the Cloud Code repository identified by the `repo` handle argument.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.INSTALL_FILE(
      repo              IN  CLOB,
```

```
      file_path          IN  VARCHAR2,
      branch_name        IN  VARCHAR2  DEFAULT NULL,
      tag_name           IN  VARCHAR2  DEFAULT NULL,
      commit_name        IN  VARCHAR2  DEFAULT NULL,
      stop_on_error      IN  BOOLEAN   DEFAULT TRUE
);
```

Parameters

Parameter	Description
repo	Specifies the repository handle.
file_path	File path in the repository.
branch_name	Branch to install file from a specific branch.
tag_name	Tag to install file from a specific Tag.
commit_name	Commit ID to install file from a specific commit.
stop_on_error	Stop executing the SQL statements on first error.

Usage Notes

- You can install SQL statements containing nested SQL from a Cloud Code repository file using the following:
  - `@`: includes a SQL file with a relative path to the ROOT of the repository.
  - `@@`: includes a SQL file with a path relative to the current file.
- The scripts are intended as schema install scripts and not as generic SQL scripts:
  - Scripts cannot contain SQL*Plus client specific commands.
  - Scripts cannot contain bind variables or parameterized scripts.
  - SQL statements must be terminated with a slash on a new line (/).
  - Scripts can contain DDL, DML PLSQL statements, but direct `SELECT` statements are not supported. Using SELECT within a PL/SQL block is supported.

  Any SQL statement that can be run using `EXECUTE IMMEDIATE` will work if it does not contain bind variables or defines.

Example

```
BEGIN
     DBMS_CLOUD_REPO.INSTALL_FILE(
         repo          => l_repo,
         file_path     => 'test3.sql',
         stop_on_error => FALSE
     );
END;
/
```

INSTALL_SQL Procedure

This procedure installs SQL statements from a buffer given as input.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.INSTALL_SQL(
      content           IN  CLOB,
      stop_on_error     IN  BOOLEAN  DEFAULT TRUE
);
```

Parameters

Parameter	Descriptions
content	Is the CLOB containing the SQL statements to run.
stop_on_error	Stop executing the SQL statements on first error.

Usage Notes

- The scripts are intended as schema install scripts and not as generic SQL scripts:
  - Scripts cannot contain SQL*Plus client specific commands.
  - Scripts cannot contain bind variables or parameterized scripts.
  - SQL statements must be terminated with a slash on a new line (/).
  - Scripts can contain DDL, DML PLSQL statements, but direct `SELECT` statements are not supported. Using SELECT within a PL/SQL block is supported.

  Any SQL statement that can be run using `EXECUTE IMMEDIATE` will work if it does not contain bind variables or defines.

Example

```
BEGIN
  DBMS_CLOUD_REPO.INSTALL_SQL(
      content   => 'create table t1 (x varchar2(30))' || CHR(10) || '/',
      stop_on_error => FALSE
  );
END;
/
```

LIST_BRANCHES Function

This function lists branches in the Cloud Code Repository branch identified by the `repo` handle argument.

Syntax

```
FUNCTION DBMS_CLOUD_REPO.LIST_BRANCHES(
    repo           IN   CLOB
) RETURN list_branch_ret_tab PIPELINED PARALLEL_ENABLE;
```

Parameters

Parameter	Description
repo	Specifies the repository handle. This parameter is mandatory and supported for all cloud providers.

Example

```
SELECT * FROM DBMS_CLOUD_REPO.LIST_BRANCHES (repo => l_repo);
```

Usage Notes

- This is a pipelined table function with return type as `list_branch_ret_tab`.
- `DBMS_CLOUD_REPO.LIST_BRANCHES` returns the column: `name`, which indicates the name of the Cloud Code Repository branch.

LIST_COMMITS Function

This function lists commits in the Cloud Code Repository branch identified by the `repo` handle argument.

Syntax

```
FUNCTION DBMS_CLOUD_REPO.LIST_COMMITS(
      repo               IN  CLOB,
      branch_name        IN  VARCHAR2  DEFAULT NULL,
      file_path          IN  VARCHAR2 DEFAULT NULL,
      commit_id          IN  VARCHAR2  DEFAULT NULL
) RETURN list_commit_ret_tab PIPELINED PARALLEL_ENABLE;
```

Parameters

Parameter	Description
repo	Specifies the repository handle. This parameter is mandatory and supported for all cloud providers.
branch_name	List commits from a specific branch. This parameter is supported for all cloud providers. If you do not supply a `branch_name` value, the `branch_name` is set to `main`.
file_path	List files under the specified subfolder path in the repository. This parameter is only supported for Git and Azure cloud providers. If you do not supply a `file_path` value, the `file_path` is set to a NULL value.
commit_id	List files starting from the specified `sha/id` This parameter is supported for all cloud providers. If you do not supply a `commit_id` value, the `commit_id` is set to a NULL value.

Example

```
SELECT name FROM DBMS_CLOUD_REPO.LIST_COMMITS(repo => l_repo);
```

Example

```
SELECT name FROM DBMS_CLOUD_REPO.LIST_COMMITS (
    repo        => l_repo,
    commit_id   => '66dd2b23b74cd0afabd11af66c6aa9c550540ba6',
    file_path   => 'sub_dir/test11.sql'
);
```

Usage Notes

- This is a pipelined table function with a return type as `list_commit_ret_tab`.
- `DBMS_CLOUD_REPO.LIST_COMMITS` returns the column: `commit_id`.

LIST_FILES Function

This function downloads a file from Cloud Code repository. Optionally, file content can be accessed from either a specific branch, tag or commit name. By default, the file is accessed from the default repository branch. The results include the file names and additional metadata about the files.

Syntax

```
FUNCTION DBMS_CLOUD_REPO.LIST_FILES(
      repo              IN  CLOB,
      path              IN  VARCHAR2  DEFAULT NULL,
      branch_name       IN  VARCHAR2  DEFAULT NULL,
      tag_name          IN  VARCHAR2  DEFAULT NULL,
      commit_id         IN  VARCHAR2  DEFAULT NULL
) RETURN list_file_ret_tab PIPELINED PARALLEL_ENABLE;
```

Parameters

Parameter	Description
`repo`	Specifies the repository handle.
`path`	List files under the specified subfolder path in the repository.
`branch_name`	List files from a specific branch.
`tag_name`	List files from a specific Tag.
`commit_name`	List files from a specific commit.

Usage Notes

- This is a pipelined table function with return type as `list_file_ret_tab`.
- `DBMS_CLOUD_REPO.LIST_FILES` returns the columns: `id`, `name`, `url`, and `bytes`.

Example

```
SELECT name FROM DBMS_CLOUD_REPO.LIST_FILES(repo => l_repo);

NAME
------------------------
test3.sql
```

LIST_REPOSITORIES Function

This function lists all Cloud Code Repositories identified by the `repo` handle argument. If the `repo` handle has a repository name specified, the function does not restrict the listing to the specified repository name; it lists all repositories accessible to the user.

Syntax

```
FUNCTION DBMS_CLOUD_REPO.LIST_REPOSITORIES(
      repo                 IN   CLOB
) RETURN list_repo_ret_tab PIPELINED PARALLEL_ENABLE;
```

Parameters

Parameter	Description
`repo`	Specifies the repository handle. This parameter is supported by all cloud providers.

Usage Notes

- This is a pipelined table function with return type as `list_repo_ret_tab`.
- `DBMS_CLOUD_REPO.LIST_REPOSITORIES` returns the columns: `id`, `name`, `owner`, `description`, `private`, `url`, `bytes`, `created`, and `last_modified`.

Example

```
SELECT name description FROM DBMS_CLOUD_REPO.LIST_REPOSITORIES(:repo);

NAME                 DESCRIPTION
-------------------- ---------------
TestRepo1            My test repo
```

MERGE_BRANCH Procedure

This procedure merges a repository branch into another specified branch in the Cloud Code Repository identified by the `repo` handle argument. The `MERGE_BRANCH` procedure is currently not supported in Azure.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.MERGE_BRANCH (
    repo               IN   CLOB,
    branch_name        IN   VARCHAR2,
```

```
    parent_branch_name IN   VARCHAR2 DEFAULT NULL,
    commit_details     IN   CLOB      DEFAULT NULL
 );
```

Parameters

Parameter	Description
`repo`	Specifies the repository handle. This parameter is mandatory and supported for GITHUB and AWS cloud providers.
`branch_name`	Specifies the Git branch name to merge. This parameter is mandatory and supported for all cloud providers.
`target_branch_name`	Specifies the target branch name to merge into. This parameter is mandatory and supported for all cloud providers.
`commit_details`	Commit Details as a JSON document `{"message": "Commit message", "author": {"name": "Committing user name", "email": "Email of committing user" } }` If you do not supply a `commit_details`value, the `commit_details` is set to the default commit message that includes the information about current database session user and database name performing the commit.

Example

```
BEGIN
  DBMS_CLOUD_REPO.MERGE_BRANCH (
    repo               => l_repo,
    branch_name        => 'test_branch',
    target_branch_name => 'main'
    );
END;
/
```

Usage Note

To run the `DBMS_CLOUD_REPO.MERGE_BRANCH` procedure, you must be logged in as the ADMIN user or have `EXECUTE` privilege on `DBMS_CLOUD_REPO`.

PUT_FILE Procedure

This procedure uploads a file to the Cloud Code repository identified by the `repo` handle argument. The procedure is overloaded to support either uploading a file from a directory object or uploading the contents from a BLOB to the repository file.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.PUT_FILE(
      repo              IN  CLOB,
      file_path         IN  VARCHAR2,
      contents          IN  BLOB,
      branch_name       IN  VARCHAR2  DEFAULT NULL,
      commit_details    IN  CLOB      DEFAULT NULL
```

```
);

PROCEDURE DBMS_CLOUD_REPO.PUT_FILE(
      repo              IN  CLOB,
      file_path         IN  VARCHAR2,
      directory_name    IN  VARCHAR2,
      source_file_name  IN  VARCHAR2  DEFAULT NULL,
      branch_name       IN  VARCHAR2  DEFAULT NULL,
      commit_details    IN  CLOB      DEFAULT NULL
);
```

Parameters

Parameter	Description
repo	Specifies the repository handle.
file_path	File path to upload file in the repository.
contents	BLOB containing the file contents.
directory_name	Directory object name containing the file name.
source_file_name	Source file name to upload to repository.
branch_name	Put file to a specific branch.
commit_details	Commit Details as a JSON document: `{"message": "Commit message", "author": {"name": "Committing user name", "email": "Email of committing user" } }`

Example

```
BEGIN
  DBMS_CLOUD_REPO.PUT_FILE(
     repo   => l_repo,
  );
END;
/
```

UPDATE_REPOSITORY Procedure

This procedure updates a Cloud Code repository identified by the `repo` handle argument. UPDATE_REPOSITORY supports updating the name, description, or private visibility status, as supported by the Cloud Code repository.

Syntax

```
PROCEDURE DBMS_CLOUD_REPO.UPDATE_REPOSITORY(
      repo                IN OUT  CLOB,
      new_name            IN      VARCHAR2 DEFAULT NULL,
      description         IN      CLOB     DEFAULT NULL,
      private             IN      BOOLEAN  DEFAULT NULL
);
```

Parameters

Parameter	Description
repo	Specifies the repository handle. This parameter is supported for all cloud providers.
new_name	New name for repository. This parameter is supported for all cloud providers.
description	A short text description for the repository. This parameter is supported for GITHUB and AWS cloud providers.
private	Repository is private and only accessible with valid credentials. This parameter is supported for the GITHUB cloud provider.

Example

```
BEGIN
  DBMS_CLOUD_REPO.UPDATE_REPOSITORY(
     repo         => l_repo,
     new_name     => 'repo2'
  );
END;
/
```

DBMS_AUTO_PARTITION Package

The `DBMS_AUTO_PARTITION` package provides administrative routines for managing automatic partitioning of schemas and tables.

- CONFIGURE Procedure
  This procedure configures settings for automatic partitioning in Autonomous Database.
- VALIDATE_CANDIDATE_TABLE Function
  This function checks if the given table is a valid candidate for automatic partitioning in Autonomous Database.
- RECOMMEND_PARTITION_METHOD Function
  This function returns a recommendation ID that can be used with `APPLY_RECOMMENDATION` procedure to apply the recommendation, or can be used with `DBA_AUTO_PARTITION_RECOMMENDATIONS` view to retrieve details of the recommendations for automatic partitioning in Autonomous Database.
- APPLY_RECOMMENDATION Procedure
  This procedure applies the given recommendation in an Autonomous Database.
- REPORT_ACTIVITY Function
  This function returns a report of the automatic partitioning operations executed during a specific period in an Autonomous Database.
- REPORT_LAST_ACTIVITY Function
  This function returns a report of the most recent automatic partitioning operation executed in an Autonomous Database.

CONFIGURE Procedure

This procedure configures settings for automatic partitioning in Autonomous Database.

Syntax

```
DBMS_AUTO_PARTITION.CONFIGURE (
     PARAMETER_NAME     IN VARCHAR2,
     PARAMETER_VALUE    IN VARCHAR2,
     ALLOW              IN BOOLEAN    DEFAULT TRUE);
```

Parameters

Parameter	Description
PARAMETER_NAME	Name of the automatic partitioning configuration parameter to update. It can have one of the following values: • AUTO_PARTITION_MODE • AUTO_PARTITION_SCHEMA • AUTO_PARTITION_TABLE • AUTO_PARTITION_REPORT_RETENTION AUTO_PARTITION_MODE sets the mode of automatic partitioning operation, and has one of the following values: • IMPLEMENT: In this mode, automatic partitioning generates a report and modifies the existing table using the recommended partition method. • REPORT ONLY: In this mode, automatic partitioning generates a report but existing tables are not modified. This is the default value. • OFF: In this mode, automatic partitioning is prevented from generating, considering, or applying recommendations. It does not disable existing automatic partitioned tables. AUTO_PARTITION_SCHEMA sets schemas to include or exclude from using automatic partitioning. Its behavior is controlled by the allow parameter. The automatic partitioning process manages two schema lists. 1. Inclusion list is the list of schemas, case-sensitive, that can use automatic partitioning. 2. Exclusion list is the list of schemas, case-sensitive, that cannot use automatic partitioning. Initially, both lists are empty, and all schemas in the database can use automatic partitioning. If the inclusion list contains one or more schemas, then only the schemas listed in the inclusion list can use automatic partitioning. If the inclusion list is empty and the exclusion list contains one or more schemas, then all schemas use automatic partitioning except the schemas listed in the exclusion list. If both lists contain one or more schemas, then all schemas use automatic partitioning except the schemas listed in the exclusion list. AUTO_PARTITION_TABLE sets tables to include or exclude from using auto partitioning. The parameter value is <schema_name>.<table_name>. The automatic partitioning process manages two table lists. 1. Inclusion list is the list of tables, case-sensitive, that can use automatic partitioning. 2. Exclusion list is the list of tables, case-sensitive, that cannot use automatic partitioning. Initially, both lists are empty, and all tables in the database can use automatic partitioning. If the inclusion list contains one or more tables, then only the tables listed in the inclusion list can use automatic partitioning. If the inclusion list is empty and the exclusion list contains one or more tables, then all tables use automatic partitioning except the tables listed in the exclusion list. If both lists contain one or more tables, then all tables use automatic partitioning except the tables listed in the exclusion list. If a table is not on either list, the schema inclusion and exclusion lists decide if a table is a candidate table for automatic partitioning. If there is a conflict between the schema level lists and the table level lists, the table level lists take precedence.

Parameter	Description
	To remove all tables from inclusion and exclusion lists run: `DBMS_AUTO_PARTITION.CONFIGURE('AUTO_PARTITION_TABLE', NULL);` `AUTO_PARTITION_REPORT_RETENTION` sets the number of days for which automatic partitioning logs are retained in the database before they are deleted. An automatic partitioning report cannot be generated for a period beyond the value specified for this value. Default value is 90 days.
`PARAMETER_VALUE`	Value for the configuration setting specified in `parameter_name`. When set to `NULL`, the configuration setting is assigned its default value.
`ALLOW`	Applicable only for the `AUTO_PARTITION_SCHEMA` or `AUTO_PARTITION_TABLE` configuration settings with one of the following values: • `TRUE` adds specified schema or table to the inclusion list. • `FALSE` removes specified schema or table from the exclusion list. • `NULL` removes specified schema or table from the list to which currently assigned. Refer to the description of the `AUTO_PARTITION_SCHEMA` and `AUTO_PARTITION_TABLE` configuration settings for more information about inclusion lists and exclusion lists.

Usage Notes

- You can check the current setting for automatic partitioning configuration using the following SQL:

  ```
  SELECT * FROM DBA_AUTO_PARTITION_CONFIG;
  ```

- Unlike automatic indexing, automatic partitioning does not run periodically as a background task. Automatic partitioning only runs when you invoke it using the `DBMS_AUTO_PARTITION.RECOMMEND_PARTITION_METHOD` function.

VALIDATE_CANDIDATE_TABLE Function

This function checks if the given table is a valid candidate for automatic partitioning in Autonomous Database.

Valid Candidate

To be a valid candidate, the following tests must pass:

- Table passes inclusion and exclusion tests specified by `AUTO_PARTITION_SCHEMA` and `AUTO_PARTITION_TABLE` configuration parameters.
- Table exists and has up-to-date statistics.
- Table is at least 64 GB.
- Table has 5 or more queries in the SQL tuning set that scanned the table.
- Table does not contain a `LONG` data type column.
- Table is not manually partitioned.

- Table is not an external table, an internal/external hybrid table, a temporary table, an index-organized table, or a clustered table.
- Table does not have a domain index or bitmap join index.
- Table is not an advance queuing, materialized view, or flashback archive storage table.
- Table does not have nested tables, or certain other object features.

Returns:

- `VALID` if the table is a valid candidate for autonomous partitioning
- `INVALID: <reason>` if the table is not a valid candidate for autonomous partitioning, and <reason> is a string describing why the table is not a valid candidate.

Syntax

```
DBMS_AUTO_PARTITION.VALIDATE_CANDIDATE_TABLE
    ( SQLSET_OWNER  IN VARCHAR2   DEFAULT 'SYS',
      SQLSET_NAME   IN VARCHAR2   DEFAULT 'SYS_AUTO_STS',
      TABLE_OWNER   IN VARCHAR2,
      TABLE_NAME    IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Parameter	Description
`SQLSET_OWNER`, `SQLSET_NAME`	Name of SQL tuning set representing the workload to be evaluated.
`TABLE_OWNER`, `TABLE_NAME`	Name of a table to validate as a candidate for automatic partitioning.

Usage Notes

- As an example, you can check the validity of a sample table, `LINEORDER` in schema `TEST`, with the following SQL:

```
SELECT DBMS_AUTO_PARTITION.VALIDATE_CANDIDATE_TABLE
    ( TABLE_OWNER => 'TEST',
      TABLE_NAME  => 'LINEORDER')
FROM DUAL;
```

RECOMMEND_PARTITION_METHOD Function

This function returns a recommendation ID that can be used with `APPLY_RECOMMENDATION` procedure to apply the recommendation, or can be used with `DBA_AUTO_PARTITION_RECOMMENDATIONS` view to retrieve details of the recommendations for automatic partitioning in Autonomous Database.

Syntax

```
DBMS_AUTO_PARTITION.RECOMMEND_PARTITION_METHOD
    ( SQLSET_OWNER     IN VARCHAR2   DEFAULT 'SYS',
      SQLSET_NAME      IN VARCHAR2   DEFAULT 'SYS_AUTO_STS',
      TABLE_OWNER      IN VARCHAR2   DEFAULT NULL,
```

```
    TABLE_NAME       IN VARCHAR2   DEFAULT NULL,
    TIME_LIMIT       IN INTERVAL DAY TO SECOND DEFAULT INTERVAL '1' DAY,
    REPORT_TYPE      IN VARCHAR2   DEFAULT 'TEXT',
    REPORT_SECTION   IN VARCHAR2   DEFAULT 'SUMMARY',
    REPORT_LEVEL     IN VARCHAR2   DEFAULT 'TYPICAL')
 RETURN RAW;
```

Parameters

Parameter	Description
SQLSET_OWNER, SQLSET_NAME	Name of SQL tuning set representing the workload to be evaluated.
TABLE_OWNER, TABLE_NAME	Name of a table to validate as a candidate for automatic partitioning.
TIME_LIMIT	When the function chooses the tables for which to generate recommendations, TABLE_OWNER and TABLE_NAME are NULL), parameter limits how long the function runs before it stops looking for new candidate tables to partition. Once started processing a table, process will not terminate. It is expected that the function may run longer than this parameter. If this parameter is NULL there is no time limit. The default is 1 day.
REPORT_TYPE	Used to generate report for recommended partition method. See REPORT_ACTIVITY Function for details.
REPORT_SECTION	Used to generate persistent report for recommended partition method. See REPORT_ACTIVITY Function for details.
REPORT_LEVEL	Used to generate report for recommended partition method. See REPORT_ACTIVITY Function for details.

Usage Notes

- The AUTO_PARTITION_MODE controls the actions taken by this function:
  - IMPLEMENT: In this mode, automatic partitioning generates a report and modifies the existing table using the recommended partition method.
  - REPORT ONLY: In this mode, automatic partitioning generates a report generated but existing tables are not modified. This is the default value.
  - OFF: In this mode, automatic partitioning prevented from producing, considering, or applying new recommendations. It does not disable existing automatic partitioned tables.
- Unlike automatic indexing, automatic partitioning does not run periodically as a background task. Automatic partitioning only runs when you invoke it using the DBMS_AUTO_PARTITION.RECOMMEND_PARTITION_METHOD function.

Return Values

This function returns a recommendation ID that can be used as follows: DBMS_AUTO_PARTITION.APPLY_RECOMMENDATION to apply the recommendation,

- Use with DBMS_AUTO_PARTITION.APPLY_RECOMMENDATION to apply the recommendation.

- Use with DBA_AUTO_PARTITION_RECOMMENDATIONS view to retrieve details of the recommendations. For example:

```
SELECT PARTITION_METHOD, PARTITION_KEY
     FROM DBA_AUTO_PARTITION_RECOMMENDATIONS
     WHERE RECOMMENDATION_ID = :RECOMMENDATION_ID;
```

APPLY_RECOMMENDATION Procedure

This procedure applies the given recommendation in an Autonomous Database.

Syntax

```
DBMS_AUTO_PARTITION.APPLY_RECOMMENDATION
    ( RECOMMENDATION_ID  IN RAW,
      TABLE_OWNER        IN VARCHAR2   DEFAULT NULL,
      TABLE_NAME         IN VARCHAR2   DEFAULT NULL);
```

Parameters

Parameter	Description
RECOMMENDATION_ID	Recommendation ID returned from RECOMMEND_PARTITION_METHOD function or queried from DBA_AUTO_PARTITION_RECOMMENDATIONS view.
TABLE_OWNER, TABLE_NAME	When a single recommendation ID has recommendations for multiple tables, this optional parameter allows you to control which tables are partitioned. • If parameters are NULL, partition all tables recommended in the given recommendation ID. • If a table name is given, partition only the named table. • If either TABLE_OWNER or TABLE_NAME is NOT NULL, they must both be NOT NULL.

Usage Note:

Regardless of AUTO_PARTITION_MODE, this procedure raises an ORA-20000: recommendation_id was not found if either there are no accepted recommendations associated with the RECOMMENDATION_ID, or all accepted recommendations associated with the RECOMMENDATION_ID have already been applied. The first case applies if RECOMMENDATION_ID was generated with AUTO_PARTITION_MODE = OFF. The second case applies if RECOMMENDATION_ID was generated with AUTO_PARTITION_MODE = IMPLEMENT.

REPORT_ACTIVITY Function

This function returns a report of the automatic partitioning operations executed during a specific period in an Autonomous Database.

Syntax

```
DBMS_AUTO_PARTITION.REPORT_ACTIVITY
    ( ACTIVITY_START     IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
      ACTIVITY_END       IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
      TYPE               IN VARCHAR2                 DEFAULT 'TEXT',
```

```
      SECTION            IN VARCHAR2                DEFAULT 'ALL',
      LEVEL              IN VARCHAR2                DEFAULT 'TYPICAL')
RETURN CLOB;
```

Parameters

Parameter	Description
ACTIVITY_START	Starting time automatic partitioning operations use for the report. If no value is specified, or NULL is specified, the report is generated for the last automatic partitioning operation that was executed.
ACTIVITY_END	Ending time automatic partitioning operations use for the report. If no value is specified, or NULL is specified, then the report is generated for the last automatic partitioning operation that was executed.
TYPE	Format of the report that has one of the following values: • TEXT (default) • HTML • XML
SECTION	Sections to include in the report that has one of the following values: • SUMMARY - Include only the workload summary in the report • ALL = Include all the sections in the report. (default)
level	Level of information to include in the report that has one of the following values: • TYPICAL - Include typical automatic partitioning information in the report (default). • CHANGED - Include only SQL with changed performance in the report. • IMPROVED - Include only SQL with improved performance in the report. • REGRESSED - Include only SQL with regressed performance in the report. • UNCHANGED - Include only SQL with unchanged performance in the report. • ALL - Include all automatic partitioning information in the report.

Usage Notes

Returns: A performance analysis report for workload executed on database after recommendation is applied. This report is not stored persistently with the recommendation.

REPORT_LAST_ACTIVITY Function

This function returns a report of the most recent automatic partitioning operation executed in an Autonomous Database.

Syntax

```
DBMS_AUTO_PARTITION.REPORT_LAST_ACTIVITY
    ( TYPE    IN VARCHAR2 DEFAULT 'TEXT',
      SECTION IN VARCHAR2 DEFAULT 'ALL',
      LEVEL   IN VARCHAR2 DEFAULT 'TYPICAL')
RETURN CLOB;
```

Parameters

Parameter	Description
TYPE	The output format of the report, see REPORT_ACTIVITY Function for information.
SECTION	The sections included in the report, see REPORT_ACTIVITY Function for information.
LEVEL	The level of information included in the report, see REPORT_ACTIVITY Function for information.

Usage Notes

Returns: A performance analysis report for workload executed on database after latest recommendation is applied. This report is not stored persistently with the recommendation.

DBMS_DATA_ACCESS Package

The DBMS_DATA_ACCESS package provides routines to generate and manage Table Hyperlinks for data sets.

- DBMS_DATA_ACCESS Overview
  Describes the use of the DBMS_DATA_ACCESS package.
- DBMS_DATA_ACCESS Security Model
  Security on this package can be controlled by granting EXECUTE on this package to selected users or roles.
- Summary of DBMS_DATA_ACCESS Subprograms
  This section covers the DBMS_DATA_ACCESS subprograms provided with Autonomous Database.

DBMS_DATA_ACCESS Overview

Describes the use of the DBMS_DATA_ACCESS package.

DBMS_DATA_ACCESS supports these operations:

- Generation of a Table Hyperlink
- Manual invalidation of a Table Hyperlink
- Listing of active Table Hyperlinks

DBMS_DATA_ACCESS Security Model

Security on this package can be controlled by granting EXECUTE on this package to selected users or roles.

When a user has been granted EXECUTE on DBMS_DATA_ACCESS they are able to create, list or invalidate the Table Hyperlinks that are created by the user. In addition, by default the ADMIN user has the following privileges:

- The ADMIN user with PDB_DBA role has EXECUTE privilege on DBMS_DATA_ACCESS.
- The ADMIN user with the PDB_DBA role is able to list or invalidate any Table Hyperlink in an Autonomous Database instance.

Summary of DBMS_DATA_ACCESS Subprograms

This section covers the `DBMS_DATA_ACCESS` subprograms provided with Autonomous Database.

Subprogram	Description
GET_PREAUTHENTICATED_URL Procedure	This procedure generates a Table Hyperlink.
EXTEND_URL Procedure	This procedure extends the life of a Table Hyperlink.
INVALIDATE_URL Procedure	This procedure invalidates a Table Hyperlink.
LIST_ACTIVE_URLS Function	This function lists all the currently active Table Hyperlinks.

- GET_PREAUTHENTICATED_URL Procedure
- EXTEND_URL Procedure
  This procedure extends the life of a Table Hyperlink.
- INVALIDATE_URL Procedure
  This procedure invalidates a Table Hyperlink.
- LIST_ACTIVE_URLS Function
  This function lists all the currently active Table Hyperlinks and Table Hyperlink Groups.

GET_PREAUTHENTICATED_URL Procedure

This procedure generates a Table Hyperlink.

There are two forms, one to generate the Table Hyperlink for a specific object (table or view). The overloaded form, using the `sql_statement` parameter, generates a Table Hyperlink for a SQL statement.

Syntax

```
DBMS_DATA_ACCESS.GET_PREAUTHENTICATED_URL(
    schema_name           IN VARCHAR2,
    schema_object_name    IN VARCHAR2,
    application_user_id   IN VARCHAR2,
    expiration_minutes    IN NUMBER,
    expiration_count      IN NUMBER,
    service_name          IN VARCHAR2,
    column_lists          IN CLOB,
    inherit_acl           IN BOOLEAN  DEFAULT FALSE,
    result                OUT CLOB);

DBMS_DATA_ACCESS.GET_PREAUTHENTICATED_URL(
    sql_statement         IN CLOB,
    application_user_id   IN VARCHAR2,
    default_bind_values   IN CLOB,
    expiration_minutes    IN NUMBER,
    expiration_count      IN NUMBER,
    service_name          IN VARCHAR2,
    column_lists          IN CLOB,
    inherit_acl           IN BOOLEAN  DEFAULT FALSE,
    result                OUT CLOB);
```

Parameters

Parameter	Description
schema_name	Specifies the owner of the object.
schema_object_name	Specifies the schema object (table or view).
sql_statement	Specifies the SELECT statement query text. Bind variable support is available for NUMBER and VARCHAR2 column types.
application_user_id	Specifies an application user ID value. When the Table Hyperlink is accessed, the value of application_user_id specified during Table Hyperlink generation is available through: sys_context('DATA_ACCESS_CONTEXT$', 'USER_IDENTITY') You can define VPD Policies that make use of this value in the Application Context to restrict the rows visible to the application user.
default_bind_values	Specifes the default value(s) of one or more bind variables (for a sql_statement specified with bind variables). This allows a table hyperlink consumer to access the table hyperlink data with default bind values, without providing the bind values as query parameters.
expiration_minutes	Duration in minutes of validity of Table Hyperlink. The maximum allowed expiration time is 90 days (129600 minutes). If the value is set to greater than 129600, the value used is 129600 minutes (90 days). If expiration_minutes is specified as a non-null value, expiration_count must not be set to a non-null value. Both cannot be non-null at the same time. Default value: when expiration_minutes is not provided or when expiration_minutes is provided as NULL, the value is set to 90 days (129600 minutes).
expiration_count	Number of accesses allowed on the Table Hyperlink. There is no default value. If expiration_count is not specified and expiration_minutes is not specified, expiration_minutes is set to 90 days (129600 minutes). If expiration_count is specified as a non-null value, expiration_minutes must not be set to a non-null value. Both cannot be non-null at the same time.
service_name	The database service to use for data retrieval when using the Table Hyperlink. Specify the service-level guarantee and resources used to service this Table Hyperlink. For example, access to an object or SQL statement can be mapped to services HIGH or MEDIUM, whereas access to another object or SQL statement can be mapped to the LOW service. Supported values are HIGH, MEDIUM, LOW. The default value is LOW.

Parameter	Description

column_lists	A JSON value that specifies options by column. The supported options specified in the column_lists parameter are one or more of:
	• order_by_columns: specifies the columns that support sorting.
	• filter_columns: specifies the columns that support filtering
	• default_color_columns: specifies to only use the default coloring for the specified columns.
	• group_by_columns: specifies that group by is allowed for the specified columns (viewing the data by grouping the specified column is allowed).
	The column_lists parameter is JSON that contains a list of JSON arrays of columns defining Table Hyperlink functionality. Use this parameter to specify the columns for one or more of the options: order_by_columns, filter_columns, default_color_columns, or group_by_columns.
	The form is:
	`"column_lists" : { "order_by_columns": [order_by_columns_list], "filter_columns": [filter_columns_list], "default_color_columns": [default_color_columns_list], "group_by_columns": [group_by_columns_list] },`
	For example:
	`"column_lists" : { "order_by_columns": ["NAME", "DEPARTMENT"], "filter_columns": ["ID", "NAME", "DEPARTMENT"], "default_color_columns": ["DEPARTMENT"], "group_by_columns": ["DEPARTMENT"] },`
	Default values:
	If column_lists is not specified for order_by_columns and filter_columns options, sorting and filtering is enabled for all columns.
	If column_lists is not specified for group_by_columns, the group by option is not enabled for any column. By default, columns defined to enable as group_by_columns are also be enabled as filter_columns.

inherit_acl	Set the value of this parameter to TRUE to inherit ACLs. When inherit is true, an incoming Table Hyperlink consumer's IP address is validated with the ACL lists on the producer database before allowing access to data. When the parameter is not supplied or the parameter value is set to FALSE, ACL checks are not applied. If the producer database does not have ACLs configured, the inherit_acl value is ignored and data access is allowed without any ACL checks. The default value is FALSE.
result	JSON that indicates the outcome of the operation.

Usage Notes

- There is a limit of 128 active Table Hyperlinks on an Autonomous Database instance.
- When using a Table Hyperlink from a browser, the following options are supported:
  - View the returned data in table format with no coloring (default), by appending the `?view=table` query parameter to the Table Hyperlink.
  - View the returned data in table format and select the column or columns you want colored with preset colors based on column values. To do this, append the `?view=table&colored_column_names=`*`column_name_1`*`,`*`column_name_2`*`,...`*`column_name_n`* query parameter to the Table Hyperlink, where *`column_name_1`* through *`column_name_n`* are the names of the columns you want colored.
  - View the returned data in table format and select a specific column data type you want colored with preset colors, by appending the `?view=table&colored_column_types=`*`data_type`* query parameter. The supported *`data_type`* parameter values are `VARCHAR` and `NONE`.
  - The `sql_statement` parameter value must be a `SELECT` statement. The `SELECT` statement supports bind variables.

    If bind variables are included in the select statement and values are not set in the `default_bind_values` parameter, bind variable values must be appended to the generated Table Hyperlink as a query parameter when accessing the data.

    When you include the `default_bind_values` parameter, when you access the data you can omit the bind variable values when default values are specified in the `default_bind_values` parameter. You can override a default bind variable value specified with `default_bind_values` by explicitly supplying the bind variable value as a query parameter.
- When you generate a Table Hyperlink on an Autonomous Database instance with a private endpoint, the result includes a name `private_preauth_url` with the value of the form: "`https://`*`private-endpoint`*`/adb/p/`*`parurl-token`*`/data`".

  When you generate a Table Hyperlink on an Autonomous Database instance with a private endpoint and the private endpoint is configured with **Allow public access** enabled, the result includes both the `preauth_url` for the public endpoint and `private_preauth_url`.

  See Configure Private Endpoints and Use a Private Endpoint with Public Access Allowed for more information.

Example - Table Hyperlink Generated for a Specific Object

The following example generates a Table Hyperlink for `STUDENTS_VIEW`:

```
DECLARE
   status CLOB;
   BEGIN
   DBMS_DATA_ACCESS.GET_PREAUTHENTICATED_URL(
      schema_name => 'USER1',
      schema_object_name => 'STUDENTS_VIEW',
      expiration_minutes => 120,
      service_name => 'HIGH',
      result => status);
   dbms_output.put_line(status);
```

```
END;
/
```

Example - Table Hyperlink Generated for a SQL Statement

The following example generates a Table Hyperlink for a `SELECT` SQL statement:

```
DECLARE
   status CLOB;
   par_url_app_string CLOB;
   BEGIN
       par_url_app_string := 1919292929;
       DBMS_DATA_ACCESS.GET_PREAUTHENTICATED_URL(
            sql_statement => 'SELECT student_id, student_name FROM
STUDENTS_VIEW ORDER BY student_id',
            application_user_id => par_url_app_string,
            expiration_count => 25,
            result => status);
END;
/
```

Example - Table Hyperlink Generated for a SQL Statement with a Bind Variable

The following example uses a bind variable in the `SELECT` statement to generate the Table Hyperlink:

```
set serveroutput on
DECLARE
  status clob;
BEGIN
  DBMS_DATA_ACCESS.GET_PREAUTHENTICATED_URL(
    sql_statement => 'select * from TREE_DATA WHERE COUNTY = :countyNAME',
    expiration_minutes => 3000,
    result => status);
    dbms_output.put_line('status : '||status);
END;
/
```

To use the generated Table Hyperlink, the bind variable value must be passed. The following example uses the generated Table Hyperlink to access tree data for the first county:

```
https://dataaccess.adb.us-chicago-1.oraclecloudapps.com/adb/p/gTlbq...example/
data?countyNAME=First
```

Use Table Hyperlink to Access Data with Bind Variables

The following example uses a bind variable in the `SELECT` statement and includes the `default_bind_values` parameter to generate the Table Hyperlink:

```
set serveroutput on
DECLARE
  status clob;
BEGIN
  DBMS_DATA_ACCESS.GET_PREAUTHENTICATED_URL(
```

```
    sql_statement = 'SELECT * FROM TREE_DATA WHERE COUNTY = :countyNAME',
    default_bind_values => '{"countyNAME" : "First"}',
    expiration_minutes => 3000,
    result => status);
    dbms_output.put_line('status : '||status);
END;
/
```

In this case, case the default bind variable value is used and you do not need to provide the value as a query parameter. For example:

```
curl https://dataaccess.adb.us-chicago-1.oraclecloudapps.com/adb/p/
K6X...example/data

curl https://dataaccess.adb.us-chicago-1.oraclecloudapps.com/adb/p/
K6X...example/data

{"items":[
{"COUNTY":"First","SPECIES":"Pine","HEIGHT":16},
{"COUNTY":"First","SPECIES":"Spruce","HEIGHT":6},
{"COUNTY":"First","SPECIES":"Hawthorn","HEIGHT":19},
{"COUNTY":"First","SPECIES":"Cherry","HEIGHT":20},
{"COUNTY":"First","SPECIES":"Chestnut","HEIGHT":51}],
"hasMore":false,
"limit":100,
"offset":0,
"count":6,
"links":
[
{"rel":"self",
"href":"https://dataaccess.adb.us-ashburn-1.oraclecloudapps.com/adb/p/
gTlbq...example/data"}
]}
```

You can override the default bind variable value by explicitly specifying the value as a query parameter. For example:

```
curl https://dataaccess.adb.us-chicago-1.oraclecloudapps.com/adb/p/
K6X...example/data?countyNAME=MAIN
```

See GET_PREAUTHENTICATED_URL Procedure for more information.

Example - Table Hyperlink Generated for a Specific Object with Group By Columns

The following example generates a Table Hyperlink for a specific table with Group By columns specified:

```
DECLARE
   status CLOB;
   BEGIN
      DBMS_DATA_ACCESS.GET_PREAUTHENTICATED_URL(
          schema_name => 'ADMIN',
          schema_object_name    => 'TREE_DATA',
```

```
          expiration_minutes    => 360,
          service_name          => 'HIGH',
          column_lists          => {"group_by_columns": ["COUNTY",
"SPECIES"]}',
          result                => status);

       dbms_output.put_line(status);
    END;
/
```

EXTEND_URL Procedure

This procedure extends the life of a Table Hyperlink.

Syntax:

```
DBMS_DATA_ACCESS.EXTEND_URL(
    id                              IN VARCHAR2,
    extend_expiration_minutes_by    IN NUMBER,
    extend_expiration_count_by      IN NUMBER,
    result                          OUT CLOB);
```

Parameters

Parameter	Description
`id`	Specifies the ID of the Table Hyperlink to extend.
`extend_expiration_minutes_by`	Number of minutes by which to extend expiration time of the Table Hyperlink. The expiration time is set to the current expiration time plus the value of `extend_expiration_minutes_by`. The value for `extend_expiration_minutes_by` plus the current expiration time must not exceed 129600 (which corresponds to 90 days). If `extend_expiration_minutes_by` is null, `extend_expiration_count_by` must not be null. Both cannot be null at the same time. Default value is NULL.
`extend_expiration_count_by`	The number of accesses on the Table Hyperlink is extended by this count. The expiration count is set to the current expiration count plus the value of `extend_expiration_count_by`. If `extend_expiration_count_by` is null, `extend_expiration_minutes_by` must not be null. Both cannot be null at the same time. Default value is null.
`result`	JSON that indicates the outcome of the operation.

Example - Extend Expiration Minutes of Table Hyperlink

```
set serveroutput on
declare
  status clob;
  js_status json_object_t;
  js_arr    json_array_t;
  url_id varchar2(4000);
```

```
begin
  -- Initially sets the expiration time to 60 minutes
  dbms_data_access.get_preauthenticated_url(
    schema_name        => 'SCOTT',     -- Schema name
    schema_object_name => 'EMPLOYEE',  -- Schema object name
    expiration_minutes => 60,          -- Expiration minutes
    service_name       => 'HIGH',
    result             => status);
   js_status := json_object_t.parse(status);
  url_id := js_status.get_string('id');
  dbms_output.put_line('The url id of url: ' || url_id);
  dbms_output.put_line('Initial Expiration Time: ' ||
                       js_status.get_string('expiration_ts'));
  -- Extend the expiration minutes by 1 day, the url would now expire
  -- 24 hours later than the previous expiration time
  dbms_data_access.extend_url(
    id                           => url_id,
    extend_expiration_minutes_by => 1440,
    result                       => status);
   -- List urls created
  status := dbms_data_access.list_active_urls;
  js_arr := json_array_t.parse(status);
  for indx in 0.. js_arr.get_size - 1
  loop
    js_status := TREAT (js_arr.get (indx) AS json_object_t);
    if js_status.get_string('id') = url_id then
      dbms_output.put_line('New Expiration Time : ' ||
                           js_status.get_string('expiration_time'));
      exit;
    end if;
  end loop;
end;
/
```

Example - Extend Expiration Count of Table Hyperlink

```
set serveroutput on
declare  status clob;
  js_status json_object_t;
  js_arr    json_array_t;
  url_id varchar2(4000);
begin
  -- Initially sets the expiration count to 100
  dbms_data_access.get_preauthenticated_url(
    schema_name        => 'SCOTT',     -- Schema name
    schema_object_name => 'EMPLOYEE',  -- Schema object name
    expiration_count   => 100,         -- Expiration count
    service_name       => 'HIGH',
    result             => status);
  js_status := json_object_t.parse(status);
  url_id := js_status.get_string('id');
  dbms_output.put_line('The url id of url: ' || url_id);
  dbms_output.put_line('Initial Expiration Count: ' ||
                       js_status.get_string('expiration_count'));
  -- Extends access count by 100 so url would expire after 200 accesses
```

```
  dbms_data_access.extend_url(
    id                        => url_id,
    extend_expiration_count_by => 100,
    result                    => status);
  -- List urls created
  status := dbms_data_access.list_active_urls;
  js_arr := json_array_t.parse(status);
  for indx in 0.. js_arr.get_size - 1
  loop
    js_status := TREAT (js_arr.get (indx) AS json_object_t);
     if js_status.get_string('id') = url_id then
      dbms_output.put_line('New Expiration Count : ' ||
                           js_status.get_string('expiration_count'));
      exit;
    end if;
  end loop;
end;
/
```

INVALIDATE_URL Procedure

This procedure invalidates a Table Hyperlink.

Syntax

```
DBMS_DATA_ACCESS.INVALIDATE_URL(
    id                  IN VARCHAR2,
    kill_sessions       IN BOOLEAN DEFAULT FALSE,
    result              OUT CLOB);
```

Parameters

Parameter	Description
`id`	Specifies the owner of the object.
`kill_sessions`	By default, existing sessions that may be in the middle of accessing data using a Table Hyperlink are not killed. When TRUE, this parameter specifies that such existing sessions should be killed, so that the invalidation does not leave any ongoing access to the data set. Valid values: `TRUE` | `FALSE`.
`result`	Provides JSON to indicate whether invalidation is a success or a failure (`CLOB`).

LIST_ACTIVE_URLS Function

This function lists all the currently active Table Hyperlinks and Table Hyperlink Groups.

Syntax

```
DBMS_DATA_ACCESS.LIST_ACTIVE_URLS RETURN CLOB;
```

Parameters

Parameter	Description
RETURN	The return value is a JSON array.

Example

```
DECLARE
   result CLOB;
   BEGIN
       result := DBMS_DATA_ACCESS.LIST_ACTIVE_URLS;
       DBMS_OUTPUT.PUT_LINE(result);
   END;
```

```
[{"id":"pT36lYHFGA4s3UXSNBCRO13v3D4_example1",
"created_by":"SCOTT",
"service_name":"HIGH",
"expiration_time":"2025-07-28T16:38:02.723Z",
"expiration_count":10,
"access_count":0,
"created":"2025-04-29T16:38:02.977Z",
"inherit_acl":true,
"is_group_url":false,
"group_ids":[null],
"sql_statement":"select * FROM TREE_DATA WHERE COUNTY = :county"}]
```

Usage Notes

- The behavior of `DBMS_DATA_ACCESS.LIST_ACTIVE_URLS` is dependent on the invoker. If the invoker is ADMIN or any user with `PDB_DBA` role, the function lists all active Table Hyperlinks, regardless of the user who generated the Table Hyperlink. If the invoker is not the ADMIN user and not a user with `PDB_DBA` role, the list includes only the active Table Hyperlinks generated by the invoker.
- When you generate and list a Table Hyperlink on an Autonomous Database instance with a private endpoint, the result includes a name `private_preauth_url` with the value of the form: "`https://`*`private-endpoint`*`/adb/p/`*`parurl-token`*`/data`".

  When you generate and list a Table Hyperlink on an Autonomous Database instance with a private endpoint and the private endpoint is configured with **Allow public access** enabled, the result includes both the `preauth_url` for the public endpoint and `private_preauth_url`.

  See Configure Private Endpoints and Use a Private Endpoint with Public Access Allowed for more information.
- When a Table Hyperlink is a group member the `DBMS_DATA_ACCESS.LIST_ACTIVE_URLS` response entry shows "`group_ids`" with a non-null value that includes one or more IDs. The IDs show Table Hyperlink Group IDs that the Table Hyperlink (group member) is a member of.

DBMS_DCAT Package

The `DBMS_DCAT` package provides functions and procedures to help Autonomous Database users leverage the data discovery and centralized metadata management system of OCI Data Catalog.

Data Catalog harvests metadata from a data lake's object storage assets. The harvesting process creates logical entities, which can be thought of as tables with columns and associated data types. `DBMS_DCAT` procedures and functions connect Autonomous Database to Data Catalog and then synchronize the assets with the database, creating protected schemas and external tables. You can then query object store using those external tables, easily joining external data with data stored in Autonomous Database. This dramatically simplifies the management process; there is a single, centrally managed metadata store that is shared across multiple OCI services (including Autonomous Databases). There are also Autonomous Database dictionary views that allow you to inspect the contents of Data Catalog using SQL, and show you how these Data Catalog entities map to your Autonomous Database schemas and tables.

- Data Catalog Users and Roles
  The `DBMS_DCAT` package supports synced users/schemas, `dcat_admin` users and local users. Users must have the `dcat_sync` role to be able to use this package.
- Required Credentials and IAM Policies
  This topic describes the Oracle Cloud Infrastructure Identity and Access Management (IAM) user credentials and policies required to give Autonomous Database users permission to manage a data catalog and to read from object storage.
- Summary of Connection Management Subprograms
  This table lists the `DBMS_DCAT` package procedures used to create, query and drop Data Catalog connections.
- Summary of Synchronization Subprograms
  Running a synchronization, creating and dropping a synchronization job, and dropping synchronized schemas can be performed with the procedures listed in this table.
- Summary of Data Catalog Views
  Data Catalog integration with Autonomous Database provides numerous tables and views.

Data Catalog Users and Roles

The `DBMS_DCAT` package supports synced users/schemas, `dcat_admin` users and local users. Users must have the `dcat_sync` role to be able to use this package.

Data Catalog Users

- Synced users/schemas
  The synced external tables are organized into database schemas corresponding to Data Asset/Bucket combinations, or according to custom properties set by the user. The synced schemas are automatically created/dropped during Data Catalog synchronization. They are created as no authentication users without the CREATE SESSION privilege. The synced schemas are also created using the protected clause, so that they cannot be altered by local users (not even the PDB admin) and can only be modified through the synchronization.
- User `dcat_admin`

User `dcat_admin` is a local database user that can run a sync and grant READ privilege on synced tables to other users or roles. The user is created as a no authentication user without the CREATE SESSION privilege.

- Local users
  Database users querying the external tables must be explicitly granted READ privileges on the synced external tables by users `dcat_admin` or ADMIN. By default, after the sync is completed, only users `dcat_admin` and ADMIN have access to the synced external tables.

Data Catalog Roles

- `dcat_sync`
  The `dcat_sync` role has all the required privileges for using the `DBMS_DCAT` package. Users must have this role to be able to use the API for navigating the Data Catalog and running the sync.

Required Credentials and IAM Policies

This topic describes the Oracle Cloud Infrastructure Identity and Access Management (IAM) user credentials and policies required to give Autonomous Database users permission to manage a data catalog and to read from object storage.

OCI Data Catalog Credential and Policy Requirements:

- A credential object with permission to manage a Data Catalog instance is required. Credential objects containing OCI native authentication or resource principals credentials are supported. Credential objects based on authentication token user principals are not supported.
  For information on managing credentials, see DBMS_CLOUD for Access Management.

  For OCI native authentication examples, see Example: Creating an OCI Native Authentication Credential Object and Autonomous Database Now Supports Accessing the Object Storage with OCI Native Authentication.

  For examples using resource principal, see Example: Using Autonomous Database Resource Principal and Accessing Oracle Cloud Infrastructure Resources from Your Autonomous Database using Resource Principal.
- The manage Data Catalog privilege is required in order for Autonomous Database to add custom properties to the Data Catalog namespace. These privileges allow you to override schema names, table names, column names and more.

  For further information on Data Catalog permissions, see Permissions Required for Each API Operation.
- The read object storage privilege on buckets is required so that Autonomous Database can query data files.

  For further Oracle Object Storage Policy Examples, see Policy Examples.

AWS Glue Data Catalog Credential and Policy Requirements

The following user credentials and policies are required to give Autonomous Database users permission to access Amazon Web Services (AWS) Glue Data Catalogs and to read from the S3 object storage:

- A credential object with permission to access an AWS Glue Data Catalog is required. For information on managing credentials, see DBMS_CLOUD for Access Management.
  For accessing an AWS Glue Data Catalog the following privileges are required: glue:GetDatabases , glue:GetTables , and glue:GetTable.

In addition, privilege s3:GetBucketLocation is needed during synchronization for generating resolvable https urls pointing to the underlying S3 objects.

- A credential object with permission to access the files stored in S3 is required so that Autonomous Database can query data files.
- AWS credentials are supported. AWS Amazon Resource Names (ARN) credentials are not supported.

Example: Creating an OCI Native Authentication Credential Object

In this example, we create an OCI native authentication credential that can be used when creating a data catalog or an object store credential object. For more details, see DBMS_DCAT SET_DATA_CATALOG_CREDENTIAL Procedure and DBMS_DCAT SET_OBJECT_STORE_CREDENTIAL Procedure respectively.

In OCI native authentication, the `DBMS_CLOUD.CREATE_CREDENTIAL` procedure includes these parameters: `credential_name`, `user_ocid`, `tenancy_ocid`, `private_key`, and `fingerprint`. See DBMS_CLOUD CREATE_CREDENTIAL Procedure for a complete description of this procedure.

The `credential_name` is the name of the credential object. The `user_ocid` and `tenancy_ocid` parameters correspond to the user's and tenancy's OCIDs respectively.

The `private_key` parameter specifies the generated private key in PEM format. Private keys created with a passphrase are not supported. Therefore, we need to make sure we generate a key with no passphrase. See How to Generate an API Signing Key for more details on how to create a private key with no passphrase. Also, the private key that we provide for this parameter must only contain the key itself without any header or footer (e.g. '-----BEGIN RSA PRIVATE KEY-----', '-----END RSA PRIVATE KEY-----').

The `fingerprint` parameter specifies the fingerprint that is obtained either after uploading the public key to the console, or using the OpenSSL commands. See How to Upload the Public Key and How to Get the Key's Fingerprint for further details on obtaining the fingerprint.

Once all the necessary information is gathered and the private key is generated, we're ready to run the following `CREATE_CREDENTIAL` procedure:

```
BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL (
    credential_name => 'OCI_NATIVE_CRED',
    user_ocid             =>
'ocid1.user.oc1..aaaaaaaatfn77fe3fxux3o5lego7glqjejrzjsqsrs64f4jsjrhbsk5qzndq'
,
    tenancy_ocid          =>
'ocid1.tenancy.oc1..aaaaaaaapwkfqz3upqklvmelbm3j77nn3y7uqmlsod75rea5zmtmbl574v
e6a',
    private_key           =>
'MIIEogIBAAKCAQEA...t9SH7Zx7a5iV7QZJS5WeFLMUEv+YbYAjnXK+dOnPQtkhOblQwCEY3Hsblj
7Xz7o=',
    fingerprint           =>
'4f:0c:d6:b7:f2:43:3c:08:df:62:e3:b2:27:2e:3c:7a');
END;
/
```

After creating the credential object, it displays in the `dba_credentials` table:

```
SELECT owner, credential_name
FROM dba_credentials
WHERE credential_name LIKE '%NATIVE%';

OWNER CREDENTIAL_NAME
----- ---------------
ADMIN OCI_NATIVE_CRED
```

Example: Using Autonomous Database Resource Principal

In this example, a dynamic group is created that includes appropriate resource members, the dynamic group is given permission to manage a Data Catalog, and then the dynamic group is given permission to read from object storage.

1. Create a dynamic group named `adb-grp-1`. Add a matching rule to `adb-grp-1` that includes the Autonomous Database instance with OCID `ocid1.autonomousdatabase.oc1.iad.abuwcljr...fjkfe` as a resource member.

   Dynamic group matching rule:

   ```
   resource.id = 'ocid1.autonomousdatabase.oc1.iad.abuwcljr...fjkfe'
   ```

2. Define a policy granting the `adb-grp-1` dynamic group full access to the Data Catalog instances, in the `mycompartment` compartment.

   ```
   allow dynamic-group adb-grp-1 to manage data-catalog-family in compartment
   mycompartment
   ```

3. Define a policy that allows the `adb-grp-1` dynamic group to read any bucket in the compartment named `mycompartment`.

   ```
   allow dynamic-group adb-grp-1 to read objects in compartment mycompartment
   ```

Example: Using User Principals

In this example, `user1` is a member of the group `adb-admins`. All members of this group are given permission to manage all data catalogs in `mycompartment`, and to read from object-store in `mycompartment`.

1. Allow users that are members of `adb-admins` to manage all data catalogs within `mycompartment`.

   ```
   allow group adb-admins to manage data-catalog-family in compartment
   mycompartment
   ```

2. Allow users that are members of `adb-admins` to read any object in any bucket within `mycompartment`.

   ```
   allow group adb-admins to read objects in compartment mycompartment
   ```

Summary of Connection Management Subprograms

This table lists the `DBMS_DCAT` package procedures used to create, query and drop Data Catalog connections.

Subprogram	Description
SET_DATA_CATALOG_CONN Procedure	Create a connection to the given data catalog
SET_DATA_CATALOG_CREDENTIAL Procedure	Set the data catalog access credential used by a specific connection to the data catalog
SET_OBJECT_STORE_CREDENTIAL Procedure	Set the credential used by the given unique connection identifier for accessing the Object Store
UNSET_DATA_CATALOG_CONN Procedure	Remove an existing Data Catalog connection

- SET_DATA_CATALOG_CREDENTIAL Procedure
  This procedure sets the Data Catalog access credential used by a specific connection to the Data Catalog.
- SET_OBJECT_STORE_CREDENTIAL Procedure
  This procedure sets the credential that is used by the given unique connection identifier for accessing the Object Store. Changing the Object Store access credential alters all existing synced tables to use the new credential.
- SET_DATA_CATALOG_CONN Procedure
  This procedure creates a connection to the given Data Catalog. The connection is required to synchronize metadata with Data Catalog. An Autonomous Database instance can connect to multiple Data Catalog instances and supports connecting to OCI Data Catalogs and AWS Glue Data Catalogs.
- UNSET_DATA_CATALOG_CONN Procedure
  This procedure removes an existing Data Catalog connection.

SET_DATA_CATALOG_CREDENTIAL Procedure

This procedure sets the Data Catalog access credential used by a specific connection to the Data Catalog.

Syntax

```
PROCEDURE DBMS_DCAT.SET_DATA_CATALOG_CREDENTIAL(
    credential_name VARCHAR2(128) DEFAULT NULL,
    dcat_con_id     VARCHAR2 DEFAULT NULL
  );
```

Parameters

Parameter	Description
`credential_name`	(Optional) The credential used for accessing the Data Catalog.
`dcat_con_id`	The unique Data Catalog connection identifier. This credential is used for the connection identified by `dcat_con_id`. The default is Null.

Usage

This credential must have Manage Data Catalog permissions; see Data Catalog Policies. The default is the resource principal; see Access Cloud Resources by Configuring Policies and Roles.

SET_OBJECT_STORE_CREDENTIAL Procedure

This procedure sets the credential that is used by the given unique connection identifier for accessing the Object Store. Changing the Object Store access credential alters all existing synced tables to use the new credential.

Syntax

```
PROCEDURE DBMS_DCAT.SET_OBJECT_STORE_CREDENTIAL(
    credential_name  VARCHAR2(128),
    dcat_con_id      IN VARCHAR2 DEFAULT NULL
  );
```

Parameters

Parameter	Description
`credential_name`	The credential used by the external tables for accessing the Object Store.
`dcat_con_id`	The unique Data Catalog connection identifier. The default is NULL.

SET_DATA_CATALOG_CONN Procedure

This procedure creates a connection to the given Data Catalog. The connection is required to synchronize metadata with Data Catalog. An Autonomous Database instance can connect to multiple Data Catalog instances and supports connecting to OCI Data Catalogs and AWS Glue Data Catalogs.

Syntax

```
PROCEDURE DBMS_DCAT.SET_DATA_CATALOG_CONN (
   region       VARCHAR2 DEFAULT NULL,
   endpoint     VARCHAR2 DEFAULT NULL,
   catalog_id   VARCHAR2 DEFAULT NULL,
   dcat_con_id  VARCHAR2 DEFAULT NULL,
   catalog_type VARCHAR2 DEFAULT NULL
 );
```

Parameters

Parameter	Description
`region`	The Data Catalog region. If the `endpoint` is specified, `region` is optional. If both `endpoint` and `region` are given, then the `endpoint` takes precedence. Default is NULL.
`endpoint`	The Data Catalog endpoint. If the `region` is specified, `endpoint` is optional. If both `endpoint` and `region` are given, then the `endpoint` takes precedence. Default is NULL.

Parameter	Description
catalog_id	The unique Oracle Cloud Identifier (OCID) for the Data Catalog instance. When connecting to AWS Glue Data Catalogs, catalog_id is optional.
dcat_con_id	A unique Data Catalog connection identifier. This identifier is required when connecting to multiple Data Catalogs and is optional when connecting to only one. It is used to refer to the Data Catalog connection in subsequent calls or when querying views. If no identifier is specified this procedure generates a NULL connection identifier. The following restrictions apply for dcat_con_id: • It must be unique within the Autonomous Database instance. • It must start with a letter. • It may contain alphanumeric characters, underscores (_), dollar signs ($), and pound signs (#). • It must be at least 16 characters long.
catalog_type	The type of data catalog to connect. Allowed values: • OCI_DCAT - OCI Data Catalog • AWS_GLUE - AWS Glue Data Catalog • NULL - The catalog type is automatically detected from the provided region or endpoint.

Usage

You only need to call this procedure once to set the connection. As part of the connection process, Autonomous Database adds custom properties to Data Catalog. These custom properties are accessible to Data Catalog users and allow you to override default names (for schemas, tables and columns) and column data types.

Before creating a connection, credentials must be created and set. For a description of the connection process, see Typical Workflow with Data Catalog for OCI Data Catalogs and User Workflow for Querying with AWS Glue Data Catalog for AWS Glue Data Catalogs.

Example: Connecting with a known OCID

In this example, Autonomous Database is connecting to Data Catalog in the uk-london-1 region. The catalog_id parameter uses the Oracle Cloud Identifier (ocid) for the Data Catalog instance. The type of Data Catalog is automatically determined: AWS Glue Data Catalog or OCI Data Catalog.

```
BEGIN
  DBMS_DCAT.SET_DATA_CATALOG_CONN(
    region=>'uk-london-1',
    catalog_id=>'ocid1.datacatalog.oc1.uk-london-1...');
END;
/
```

Example: Connecting to an AWS Glue Data Catalog

A connection is the association between an Autonomous Database instance and an AWS Glue Data Catalog. After a successful connection, the Autonomous Database instance is able to synchronize with AWS Glue. Each AWS account has one AWS Glue Data Catalog per region and each catalog can be accessed using the corresponding service endpoint for each region. An Autonomous Database instance can be associated with an AWS Glue Data Catalog by invoking the API DBMS_DCAT.SET_DATA_CATALOG_CONN and specify the endpoint for the region where the catalog resides.

See AWS Glue endpoints and quotas.

In this example, Autonomous Database is connecting to an AWS Glue Data Catalog in the `uk-london-1` region. Because this is an AWS Glue Data Catalog connection, the `catalog_id` parameter is not needed.

```
BEGIN
  DBMS_DCAT.SET_DATA_CATALOG_CONN(
    region=>'uk-london-1',
    catalog_type=>'AWS_GLUE'
END;
/
```

UNSET_DATA_CATALOG_CONN Procedure

This procedure removes an existing Data Catalog connection.

> **Note:**
>
> Invoking this procedure drops all of the protected schemas and external tables that were created as part of previous synchronizations. It does not impact the metadata in Data Catalog.

Syntax

```
PROCEDURE DBMS_DCAT.UNSET_DATA_CATALOG_CONN (
    dcat_con_id IN VARCHAR2 DEFAULT NULL
);
```

Parameters

Parameter	Description
`dcat_con_id`	The unique Data Catalog connection identifier. Default is Null.

Summary of Synchronization Subprograms

Running a synchronization, creating and dropping a synchronization job, and dropping synchronized schemas can be performed with the procedures listed in this table.

> **Note:**
>
> On April 4, 2022, the `sync_option` and `grant_read` parameters were added to the `DBMS_DCAT.RUN_SYNC` procedure. To ensure correct performance of scheduled sync jobs created prior to that date, you need to drop and recreate the scheduled sync jobs. See DBMS_DCAT.DROP_SYNC_JOB Procedure and DBMS_DCAT.CREATE_SYNC_JOB Procedure.

Subprogram	Description
CREATE_SYNC_JOB Procedure	Create a scheduler job to invoke RUN_SYNC periodically
DROP_SYNC_JOB Procedure	Drop an existing sync job for the given unique connection identifier
DROP_SYNCED_SCHEMAS Procedure	Drop all previously synchronized schemas for the given unique connection identifier
RUN_SYNC Procedure	Run a synchronization operation

- RUN_SYNC Procedure
  This procedure runs a synchronization operation and is the entry point to the synchronization. As an input, it takes lists of selected data catalog assets, folders and entities and materializes them by creating, dropping, and altering external tables.
- CREATE_SYNC_JOB Procedure
  This procedure creates a scheduler job to invoke RUN_SYNC periodically.
- DROP_SYNC_JOB Procedure
  This procedure drops an existing sync job for the given unique connection identifier.
- DROP_SYNCED_SCHEMAS Procedure
  This procedure drops all previously synchronized schemas for the given unique connection identifier.

RUN_SYNC Procedure

This procedure runs a synchronization operation and is the entry point to the synchronization. As an input, it takes lists of selected data catalog assets, folders and entities and materializes them by creating, dropping, and altering external tables.

The sync_option parameter specifies which operation the RUN_SYNC procedure performs: SYNC, DELETE or REPLACE. The operation is performed over entities within the scope of the synced_objects parameter.

Every call to the RUN_SYNC procedure returns a unique operation_id that can be used to query the USER_LOAD_OPERATIONS view to obtain information about the status of the sync and the corresponding log_table. The DBMS_DCAT$SYNC_LOG view can be queried for easy access to the log_table for the last sync operation executed by the current user. For further details, see DBMS_DCAT$SYNC_LOG View, and Monitoring and Troubleshooting Loads.

> **Note:**
>
> On April 4, 2022, the sync_option and grant_read parameters were added to the RUN_SYNC procedure. To ensure correct performance of scheduled sync jobs created prior to that date, you need to drop and recreate the scheduled sync jobs. See DBMS_DCAT.DROP_SYNC_JOB Procedure and DBMS_DCAT.CREATE_SYNC_JOB Procedure.

Synchronizing Partitioned Logical Entities or Glue Tables

The RUN_SYNC procedure creates a partitioned external table for each logical entity or Glue table when all three of the following apply:

1. The OCI data catalog logical entity or Glue table has one or more partitioned attributes.

2. For OCI data catalogs, the logical entity is derived from a prefix-based filename pattern. Partitioned logical entities derived from regex-based patterns are not supported.
3. For OCI data catalogs, the logical entity is based on partitioned data that follows the hive-style or non-hive folder format. Logical entities based on partitioned data that follow the non-hive style format using object names are not supported.

   - Example 1. Logical entities based on harvested objects that follow the Hive style partitioning format with prefix-based filename patterns.

     Consider the following objects:

     ```
     Bucket: MYBUCKET
     cluster1/db1.db/sales/country=USA/year=2020/month=01/sales1.csv
     cluster1/db1.db/sales/country=USA/year=2020/month=01/sales2.csv
     cluster1/db1.db/sales/country=USA/year=2020/month=02/sales1.csv
     ```

     Harvesting the bucket using a filename pattern with a starting folder prefix of `cluster1/db1.db` generates a logical entity named `SALES` with three partition attributes: `country`, `year`, and `month`. The type for partitioned attributes is `Partition` while the type for non-partitioned attributes is `Primitive`.

   - Example 2. Logical entities based on harvested objects that follow the non-Hive style partitioning format with prefix-based filename patterns.
     Consider the following objects:

     ```
     Bucket: MYBUCKET
     cluster2/db2.db/sales/USA/2020/01/sales1.csv
     cluster2/db2.db/sales/USA/2020/01/sales2.csv
     cluster2/db2.db/sales/USA/2020/02/sales1.csv
     ```

     Harvesting the bucket using a filename pattern with a starting folder prefix of `cluster2/db2.db` generates a logical entity named `SALES` with three partition attributes: `name0`, name1, and `name2`. The only difference between the generated logical entity compared to Example 1, is that the names of partitioned attributes are auto generated, while in Example 1 they are extracted from the URL (`country`, `year`, and `month` respectively).

For a complete end to end example of synchronizing partitioned logical entities, see Example: A Partitioned Data Scenario.

Incremental Synchronization of Partitioned Logical Entities/Glue Tables

Every call to the `RUN_SYNC` procedure specifies a set of OCI data catalog logical entities or AWS Glue tables to be synced with the database. When a logical entity or Glue table is present in two `RUN_SYNC` calls, the second call preserves and possibly alters existing external tables. The following table shows which logical entity or Glue table changes are supported when the logical entity or Glue table is partitioned:

Logical Entity or Glue Table Change	Action
Addition, removal, or update of a partition	All partitions of the external partitioned table are updated, regardless of whether a change has been detected by the data catalog.
Addition of a partitioned attribute	Adding a partitioned column to an external partitioned table is not supported. An exception is raised.

Logical Entity or Glue Table Change	Action
Deletion of a partition attribute	Dropping a partitioned column from an external partitioned table is not supported. An exception is raised.
Renaming of a partitioned attribute	Renaming a partitioned column in an external partitioned table is not supported. An exception is raised.

Syntax

```
PROCEDURE DBMS_DCAT.RUN_SYNC (
    synced_objects   IN  CLOB,
    sync_option      IN VARCHAR2 DEFAULT 'SYNC',
    error_semantics  IN VARCHAR2 DEFAULT 'SKIP_ERRORS',
    log_level        IN VARCHAR2 DEFAULT 'INFO',
    grant_read       IN VARCHAR2 DEFAULT NULL,
    dcat_con_id      IN VARCHAR2 DEFAULT NULL
 );
PROCEDURE DBMS_DCAT.RUN_SYNC (
    synced_objects   IN  CLOB,
    sync_option      IN VARCHAR2 DEFAULT 'SYNC',
    error_semantics  IN VARCHAR2 DEFAULT 'SKIP_ERRORS',
    log_level        IN VARCHAR2 DEFAULT 'INFO',
    grant_read       IN VARCHAR2 DEFAULT NULL,
    operation_id     OUT NOCOPY NUMBER,
    dcat_con_id      IN VARCHAR2 DEFAULT NULL
 );
```

Parameters

Parameter	Description
`synced_objects`	This parameter is a JSON document that specifies the data catalog objects to synchronize. For OCI Data Catalogs, the JSON document specifies a set of entities in multiple granularity: data assets, folders (Object Store buckets) or logical entities. It contains an `asset_list` that is either an array of asset objects or an array containing a single "*" string that stands for 'sync all (object store) data assets in the catalog'. For AWS Glue Data Catalogs, the JSON document specifies a list of tables in multiple granularity: databases, tables. The document specifies a list of databases. Users can restrict the set of tables to be synced by specifying individual tables within a database.

Parameter	Description
sync_option	(Optional) There are three options: • SYNC (Default) - This option ensures that what is in the data catalog, over the synced_objects scope, is represented in the Autonomous Database. If a logical entity or Glue table was deleted from the data catalog, since the last sync operation, then it is deleted in the Autonomous Database. The following operations are performed over the synced_objects scope: – Adds tables for new data catalog entities – Removes tables for deleted data catalog entities – Updates properties (such as name, columns and data types) for existing tables • DELETE - Deletes tables within the synced_objects scope. • REPLACE - Replaces all currently synced objects with the objects within the synced_objects scope.
error_semantics	(Optional) This parameter specifies the error behavior. If set to SKIP_ERRORS, the sync attempts to continue despite errors encountered for individual entities. If set to STOP_ON_ERROR, the procedure fails on the first encountered error. The default is SKIP_ERRORS.
log_level	(Optional) This parameter specifies the following values in increasing level of logging detail: (OFF, FATAL, ERROR, WARN, INFO, DEBUG, TRACE, ALL). The default is INFO.
grant_read	(Optional) This parameter is a list of users/roles that are automatically granted READ privileges on all external tables processed by this invocation of RUN_SYNC. All users/roles in the grant_read list are given READ privileges on all new or already existing external tables that correspond to entities specified by the synced_objects parameter. The RUN_SYNC procedure preserves already granted privileges on synced external tables.
operation_id	(Optional) This parameter is used to find the corresponding entry in USER_LOAD_OPERATIONS for the sync and determine the name of the log table. Note: A version of RUN_SYNC that does not return an operation_id is available so users can query USER_LOAD_OPERATIONS for the latest sync.
dcat_con_id	This parameter is the unique data catalog connection identifier that was specified when the connection to the data catalog was created. See DBMS_DCAT SET_DATA_CATALOG_CONN Procedure. This parameter identifies which connection is used for synchronization and becomes a part of the derived schema name. See Synchronization Mapping for a description of how the schema name is derived. The parameter default is NULL.

Example: Synchronize All OCI Data Catalog Entities

In the following example, all Data Catalog entities are synchronized.

```
EXEC DBMS_DCAT.RUN_SYNC(synced_objects=>'{"asset_list":["*"]}');
```

Example: synced_objects Parameter for Synchronizing All OCI Data Catalog Data Assets

The following is an example synced_objects parameter for synchronizing all (Object Storage) data assets in the Data Catalog.

```
{"asset_list" : ["*"]}
```

Example: `synced_objects` Parameter for Synchronizing Specific OCI Data Catalog Data Assets

The following is an example `synced_objects` parameter for synchronizing two data assets.

```
{"asset_list": [
        {
            "asset_id":"0b320de9-8411-4448-91fb-9e2e7f78fd5f"
        },
        {
            "asset_id":"0b320de9-8411-4448-91fb-9e2e7f74523"
        }
    ]}
```

Example: `synced_objects` Parameter for Synchronizing Specific OCI Data Catalog Entities within a Data Asset

The following shows an example `synced_objects` parameter for synchronizing two entities within the data asset.

```
{"asset_list": [
        {
            "asset_id":"0b320de9-8411-4448-91fb-9e2e7f78fd5f",
            "folder_list":[
                "f1",
                "f2"
           ]
        }
    ]}
```

Example: `synced_objects` Parameter for Synchronizing Specific OCI Data Catalog Folders and Entities within a Data Asset

The following shows an example `synced_objects` parameter for synchronizing two folders and two entities within the data asset.

```
{"asset_list":[
        {
            "asset_id":"0b320de9-8411-4448-91fb-9e2e7f78fd5f",
            "entity_list": [
                "entity1",
                "entity2"
            ],
             "folder_list": [
                "f1",
                "f2"
            ]
        }
    ]}
```

Example: `synced_objects` Parameter for Synchronizing All AWS Glue Data Catalog Databases

The following shows an example `synced_objects` parameter for synchronizing all databases in the AWS Glue Data Catalog.

```
{"database_list":["*"]}
```

Example: `synced_objects` Parameter for Synchronizing Two AWS Glue Data Catalog Databases

The following shows an example `synced_objects` parameter for synchronizing two AWS Glue Data Catalog databases.

```
{"database_list":[
    {"database":"tpcdscsv"},
    {"database":"tpcdsparquet"} ]}
```

Example: `synced_objects` Parameter for Synchronizing Three AWS Glue Data Catalog Databases

The following shows an example `synced_objects` parameter for synchronizing three tables from an AWS Glue Data Catalog database.

```
{"database_list":[
 {"database":"tpcdsparquet",
     "table_list": [ "tpcdsparquet_customer",
                     "tpcdsparquet_item",
                     "tpcdsparquet_web_sales" ] } ]}
```

CREATE_SYNC_JOB Procedure

This procedure creates a scheduler job to invoke `RUN_SYNC` periodically.

It takes as input the set of objects to be synced, the error semantics, the log level, and a repeat interval. See DBMS_DCAT RUN_SYNC Procedure for further details on how synchronization works.

There can only be a single sync job. The `CREATE_SYNC_JOB` procedure fails if another job is already specified, unless the force parameter is set to `TRUE`. If force is set to `TRUE` the previous job is dropped.

If a scheduler job attempts to run while another sync is in progress, the scheduler job fails.

> **Note:**
>
> On April 4, 2022, the `sync_option` and `grant_read` parameters were added to the `RUN_SYNC` procedure. To ensure correct performance of scheduled sync jobs created prior to that date, you need to drop and recreate the scheduled sync jobs. See DBMS_DCAT.DROP_SYNC_JOB Procedure and DBMS_DCAT.CREATE_SYNC_JOB Procedure.

Syntax

```
PROCEDURE DBMS_DCAT.CREATE_SYNC_JOB (
    synced_objects   IN CLOB,
    error_semantics  IN VARCHAR2 DEFAULT 'SKIP_ERRORS',
    log_level        IN VARCHAR2 DEFAULT 'INFO',
    repeat_interval  IN VARCHAR2,
    force            IN VARCHAR2 DEFAULT 'FALSE',
    grant_read       IN VARCHAR2 DEFAULT NULL,
    sync_option      IN VARCHAR2 DEFAULT 'SYNC',
    dcat_con_id      IN VARCHAR2 DEFAULT NULL
);
```

Parameters

Parameter	Description
synced_objects	A JSON object specifying the objects to be synced, as described in the RUN_SYNC procedure.
error_semantics	(Optional) Error behavior, as specified for RUN_SYNC. Default is SKIP_ERRORS.
log_level	(Optional) Logging level, as specified for RUN_SYNC. Default is INFO.
repeat_interval	Repeat interval for the job, with the same semantics as the repeat interval parameter of the DBMS_SCHEDULER.CREATE_JOB procedure. For details on the repeat_interval, see Overview of Creating Jobs.
force	(Optional) If TRUE, existing sync jobs are deleted first. If FALSE, the CREATE_SYNC_JOB procedure fails if a sync job already exists. Default is FALSE.
grant_read	(Optional) List of users/roles to be granted READ on the synced external tables, as described for procedure RUN_SYNC. See DBMS_DCAT.RUN_SYNC Procedure.
sync_option	(Optional) Behavior with respect to entities that have already been synced through a previous RUN_SYNC operation, as described for procedure RUN_SYNC. See DBMS_DCAT.RUN_SYNC Procedure.
dcat_con_id	This parameter is the unique Data Catalog connection identifier that was specified when the connection to Data Catalog was created. See DBMS_DCAT SET_DATA_CATALOG_CONN Procedure. This parameter identifies which connection is used for synchronization and becomes a part of the derived schema name. See Synchronization Mapping for a description of how the schema name is derived. The parameter default is NULL.

DROP_SYNC_JOB Procedure

This procedure drops an existing sync job for the given unique connection identifier.

Syntax

```
PROCEDURE DBMS_DCAT.DROP_SYNC_JOB (
    dcat_con_id IN VARCHAR2 DEFAULT NULL
  );
```

Parameters

Parameter	Description
dcat_con_id	The unique Data Catalog connection identifier. The default is NULL.

DROP_SYNCED_SCHEMAS Procedure

This procedure drops all previously synchronized schemas for the given unique connection identifier.

Syntax

```
PROCEDURE DBMS_DCAT.DROP_SYNCED_SCHEMAS (
    dcat_con_id IN VARCHAR2 DEFAULT NULL
  );
```

Parameters

Parameter	Description
dcat_con_id	The unique Data Catalog connection identifier. The default is NULL.

Summary of Data Catalog Views

Data Catalog integration with Autonomous Database provides numerous tables and views.

These tables and views help you understand:

- Available Data Catalog assets. Get information about any type of Data Catalog asset - including databases, object stores, and more.
- Information about the Data Catalog Object Storage assets and entities that have been synchronized with Autonomous Database. This includes details about how Data Catalog items (assets, folders and entities) map to Autonomous Database objects (i.e. schemas and external tables).
- Metadata sync executions. Review details about sync jobs, including any issues that may have occurred during synchronization.

This table lists the tables and views provided by the DBMS_DCAT package.

View	Description
ALL_CLOUD_CATALOG_DATABASES View	Display information about OCI Data Catalog data assets and AWS Glue Data Catalog databases
ALL_CLOUD_CATALOG_TABLES View	Used to display information about data entities for OCI Data Catalogs and tables for AWS Glue Data Catalogs
ALL_DCAT_ASSETS View	List data catalog assets that this database is authorized to access
ALL_DCAT_ATTRIBUTES View	List data catalog attributes this database is authorized to access
ALL_DCAT_CONNECTIONS View	A view that contains information about the data catalog(s) connected to this instance
ALL_DCAT_ENTITIES View	Lists logical entities this database is authorized to access

View	Description
ALL_DCAT_FOLDERS View	List metadata for the Object Storage buckets containing the data files for the Logical Entities
ALL_DCAT_GLOBAL_ACCESSIBLE_CATALOGS View	List all accessible catalogs across all regions, along with the level of access privileges for each catalog
ALL_DCAT_LOCAL_ACCESSIBLE_CATALOGS View	List all accessible catalogs in the current region, along with the level of access privileges for each catalog
ALL_GLUE_DATABASES View	Lists the AWS Glue Data Catalog databases that the data catalog credential is authorized to access
ALL_GLUE_TABLES View	Shows all AWS Glue Data Catalog tables that the data catalog credential is authorized to access
DCAT_ATTRIBUTES View	List the mapping of logical entity attributes to external table columns
DCAT_ENTITIES View	Describes the mapping of logical entities to external tables
DBMS_DCAT$SYNC_LOG View	Provides easy access to the log table for the last sync operation executed by the current user

- ALL_CLOUD_CATALOG_DATABASES View
  Use view `ALL_CLOUD_CATALOG_DATABASES` to display information about OCI Data Catalog data assets and AWS Glue Data Catalog databases.
- ALL_CLOUD_CATALOG_TABLES View
  View `ALL_CLOUD_CATALOG_TABLES` is used to display information about data entities for OCI Data Catalogs and tables for AWS Glue Data Catalogs.
- ALL_DCAT_ASSETS View
  The Data Catalog assets that this database is authorized to access.
- ALL_DCAT_ATTRIBUTES View
  The Data Catalog attributes this database is authorized to access.
- ALL_DCAT_CONNECTIONS View
  A view that contains information about the data catalog(s) connected to this instance.
- ALL_DCAT_ENTITIES View
  The Data Catalog logical entities this database is authorized to access.
- ALL_DCAT_FOLDERS View
  Metadata for the Object Storage buckets containing the data files for the Logical Entities.
- ALL_DCAT_GLOBAL_ACCESSIBLE_CATALOGS View
  This view lists all accessible catalogs across all regions, along with the level of access privileges for each catalog.
- ALL_DCAT_LOCAL_ACCESSIBLE_CATALOGS View
  This view lists all accessible catalogs in the current region, along with the level of access privileges for each catalog.
- ALL_GLUE_DATABASES View
  The AWS Glue Data Catalog databases that the data catalog credential is authorized to access.
- ALL_GLUE_TABLES View
  This view shows all AWS Glue Data Catalog tables that the data catalog credential is authorized to access.
- DCAT_ATTRIBUTES View
  Lists the mapping of logical entity attributes to external table columns.
- DCAT_ENTITIES View
  Describes the mapping of logical entities to external tables.

- DBMS_DCAT$SYNC_LOG View
  The DBMS_DCAT$SYNC_LOG view provides easy access to the log table for the last sync operation executed by the current user.

ALL_CLOUD_CATALOG_DATABASES View

Use view ALL_CLOUD_CATALOG_DATABASES to display information about OCI Data Catalog data assets and AWS Glue Data Catalog databases.

Column	Description
DCAT_CON_ID	CON1
CATALOG_ID	Data catalog unique identifier. **OCI Data Catalog example**: ocid1.datacatalog.oc1.ap-mumbai-1.….y35a **AWS Glue Data Catalog example**: NULL 579294766787
NAME	Name of the data asset (OCI)/ database (AWS Glue). **OCI Data Catalog example**: OBJECT_STORE_AT_ASHBURN **AWS Glue Data Catalog example**: OBJECT_STORE_AT_N_CALIFORNIA
DESCRIPTION	Description of the data asset (OCI)/ database (AWS Glue). **OCI Data Catalog example**: Data stored in S3 (N. California) **AWS Glue Data Catalog example**: Data stored in S3 (N. California)
TIME_CREATED	The date and time the data asset (OCI) / databases (AWS Glue) were created in the data catalog. **OCI Data Catalog example**: 26-SEP-22 10.56.01.395000 PM +00:00 **AWS Glue Data Catalog example**: 2022-06-15T09:45:35+01:00

Column	Description

DETAILS	JSON document with metadata about each data entity (OCI) / database (AWS Glue).
	OCI Data Catalog example:
	
	`{`
	`  "catalog-id": "ocid1.datacatalog.oc1.ap-mumbai-1.amaaa...",`
	`  "description": null,`
	`  "display-name": "OBJECT_STORE_AT_ASHBURN",`
	`  "external-key": "https://swiftobjectstorage.us-ashburn-1....",`
	`  "key": "bc95181c-3ac3-4959-9e5f-4e460d3fb82a",`
	`  "lifecycle-state": "ACTIVE",`
	`  "time-created": "2022-09-26T22:56:01.395000+00:00",`
	`  "type-key": "3ea65bc5-f60d-477a-a591-f063665339f9",`
	`  "uri": "/dcat/20190325/dataAssets/bc95181c-3ac3-4959-9e5f-4e460d3fb82a"`
	`}`
	
	AWS Glue Data Catalog example:
	
	`{`
	`    "Name": "dbmsdcatpoc",`
	`    "Parameters": {`
	`        "somekey": "somevalue"`
	`    },`
	`    "CreateTime": "2022-06-15T09:45:35+01:00",`
	`    "CreateTableDefaultPermissions": [`
	`        {`
	`            "Principal": {`
	`                "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"`
	`            },`
	`            "Permissions": [`
	`                "ALL"`
	`            ]`
	`        }`
	`    ],`
	`    "CatalogId": "579294766787"`
	`}`

ALL_CLOUD_CATALOG_TABLES View

View ALL_CLOUD_CATALOG_TABLES is used to display information about data entities for OCI Data Catalogs and tables for AWS Glue Data Catalogs.

Column	Description
DCAT_CON_ID	Unique identifier of the data catalog. The connection id. **OCI Data Catalog example**: CON1 **AWS Glue Data Catalog example**: CON1

Column	Description
CATALOG_ID	Data catalog unique identifier. **OCI Data Catalog example**: ocid1.datacatalog.oc1.ap-mumbai-1.….y35a **AWS Glue Data Catalog example**: NULL 579294766787
DATABASE_NAME	Name of the data asset (OCI)/ database (AWS Glue). **OCI Data Catalog example**: OBJECT_STORE_AT_ASHBURN **AWS Glue Data Catalog example**: OBJECT_STORE_AT_N_CALIFORNIA
NAME	Name of the data entity (OCI) / table (AWS Glue). **OCI Data Catalog example**: BIKES_TRIPS **AWS Glue Data Catalog example**: BIKES_TRIPS
DESCRIPTION	Description of the data entity (OCI) / table (AWS Glue). **OCI Data Catalog example**: Table storing bike trips **AWS Glue Data Catalog example**: Table storing bike trips
TIME_CREATED	The date and time the data entity (OCI) / table (AWS Glue) was created in the data catalog. **OCI Data Catalog example**: 26-SEP-22 10.56.01.395000 PM +00:00 **AWS Glue Data Catalog example**: 2022-06-15T09:45:35+01:00
TIME_UPDATED	Last time a change was made to the data entity (OCI) / table (AWS Glue). **OCI Data Catalog example**: 26-SEP-22 10.56.01.395000 PM +00:00 **AWS Glue Data Catalog example**: 2022-06-15T09:45:35+01:00

Column	Description

DETAILS	JSON document with metadata about each each data entity (OCI) / table (AWS Glue)
	OCI Data Catalog example:
	
	`{`
	`  "business-name": null,`

Example

ALL_DCAT_ASSETS View

The Data Catalog assets that this database is authorized to access.

Column	Datatype	Description
DCAT_CON_ID	VARCHAR2 (4000)	Connection identifier that is unique within the instance
KEY	VARCHAR2(4000)	Asset key
DISPLAY_NAME	VARCHAR2(4000)	Asset display name
DESCRIPTION	VARCHAR2(4000)	Asset description
CATALOG_ID	VARCHAR2(4000)	OCID for the Data Catalog containing the asset
EXTERNAL_KEY	VARCHAR2(4000)	Base Object Storage URI for the asset
URI	VARCHAR2(4000)	Asset URI for the Data Catalog API
TIME_CREATED	TIMESTAMP(6) WITH TIMEZONE	The date and time the data asset was created
TYPE_KEY	VARCHAR2(4000)	The key of the data asset type (currently, only Object Storage data assets are supported). Type keys can be found via the '/types' Data Catalog endpoint.

Column	Datatype	Description
LIFECYCLE_STATE	VARCHAR2(4000)	The current state of the data asset. For more information on possible life cycle states, see the Data Catalog DataAsset Reference for a list of possible states for `lifecycleState`.

ALL_DCAT_ATTRIBUTES View

The Data Catalog attributes this database is authorized to access.

Column	Datatype	Description
DCAT_CON_ID	VARCHAR2 (4000)	Connection identifier that is unique within the instance
KEY	NUMBER	Attribute key
DISPLAY_NAME	VARCHAR2(4000)	Attribute display name
BUSINESS_NAME	VARCHAR2(4000)	Attribute business name
DESCRIPTION	VARCHAR2(4000)	Attribute description
DATA_ASSET_KEY	VARCHAR2(4000)	Data asset key
FOLDER_KEY	VARCHAR2(4000)	Folder key
ENTITY_KEY	VARCHAR2(4000)	Entity key
EXTERNAL_KEY	VARCHAR2(4000)	Unique external key for the attribute
LENGTH	NUMBER	Maximum allowed length of the attribute value
PRECISION	NUMBER	Precision of the attribute value (usually applies to float data type)
SCALE	NUMBER	Scale of the attribute value (usually applies to float data type)
IS_NULLABLE	NUMBER	Identifies if this attribute can be assigned null values
URI	VARCHAR2(4000)	URI to the attribute instance in the Data Catalog API
LIFECYCLE_STATE	VARCHAR2(4000)	The current state of the attribute. For more information on possible life cycle states, see the Data Catalog Attribute Reference for a list of possible states for `lifecycleState`.
TIME_CREATED	TIMESTAMP(6) WITH TIME ZONE	The date and time the attribute was created
EXTERNAL_DATA_TYPE	VARCHAR2(4000)	Data type of the attribute as defined in the external system
MIN_COLLECTION_COUNT	NUMBER	Minimum number of elements, if the type of the attribute is a collection type
MAX_COLLECTION_COUNT	NUMBER	Maximum number of elements, if the type of the attribute is a collection type
DATATYPE_ENTITY_KEY	VARCHAR2(4000)	Entity key that represents the datatype of this attribute, applicable if this attribute is a complex type
EXTERNAL_DATATYPE_ENTITY_KEY	VARCHAR2(4000)	External entity key that represents the datatype of this attribute, applicable if this attribute is a complex type

Column	Datatype	Description
PARENT_ATTRIBUTE_KEY	VARCHAR2(4000)	Attribute key that represents the parent attribute of this attribute, applicable if the parent attribute is of complex datatype
EXTERNAL_PARENT_ATTRIBUTE_KEY	VARCHAR2(4000)	External attribute key that represents the parent attribute of this attribute, applicable if the parent attribute is of complex type
PATH	VARCHAR2(4000)	Full path of the attribute

ALL_DCAT_CONNECTIONS View

A view that contains information about the data catalog(s) connected to this instance.

Column	Datatype	Description
DCAT_CON_ID	VARCHAR2(4000)	Connection identifier that is unique within the instance
COMPARTMENT_ID	VARCHAR2(4000)	OCID for the compartment where the Data Catalog instance resides
INSTANCE_ID	VARCHAR2(4000)	OCID for the Data Catalog instance
REGION	VARCHAR2(4000)	Region for the Data Catalog instance
ENDPOINT	VARCHAR2(4000)	Endpoint for the Data Catalog instance
CREATED	TIMESTAMP	When the Data Catalog instance was created
NAME	VARCHAR2(4000)	Name of the Data Catalog instance
LAST_UPDATED	TIMESTAMP	Timestamp of the last update of the connection to the Data Catalog instance
LATEST_OPERATION_ID	NUMBER	The id of the last synchronization operation
DATA_CATALOG_CREDENTIAL	VARCHAR2(128)	Credential used for accessing the Data Catalog
OBJECT_STORE_CREDENTIAL	VARCHAR2(128)	Credential used by the external table driver for accessing the Object Store

ALL_DCAT_ENTITIES View

The Data Catalog logical entities this database is authorized to access.

Column	Datatype	Description
DCAT_CON_ID	VARCHAR2(4000)	Connection identifier that is unique within the instance
CATALOG_ID	VARCHAR2(4000)	OCID for the Data Catalog containing the asset
KEY	VARCHAR2(4000)	Entity key
DISPLAY_NAME	VARCHAR2(4000)	Entity display name
BUSINESS_NAME	VARCHAR2(4000)	Entity business name
DESCRIPTION	VARCHAR2(4000)	Logical entity description
DATA_ASSET_KEY	VARCHAR2(4000)	Asset key
FOLDER_KEY	VARCHAR2(4000)	Folder unique key
FOLDER_NAME	VARCHAR2(4000)	Folder name (bucket)

Column	Datatype	Description
EXTERNAL_KEY	VARCHAR2(4000)	External key for the logical entity
PATTERN_KEY	VARCHAR2(4000)	Key of the associated pattern for the logical entity
REALIZED_EXPRESSION	VARCHAR2(4000)	The regular expression used to obtain the files for this logical entity
PATH	VARCHAR2(4000)	Full path for the logical entity
TIME_CREATED	TIMESTAMP(6) WITH TIME ZONE	Date and time the entity was created
TIME_UPDATED	TIMESTAMP(6) WITH TIME ZONE	Last time a change was made to the data entity
UPDATED_BY_ID	VARCHAR2(4000)	OCID of the user who updated this object in the Data Catalog
URI	VARCHAR2(4000)	URI of the entity instance in the API
LIFECYCLE_STATE	VARCHAR2(4000)	The current state of the entity. For more information on possible life cycle states, see the Data Catalog Entity Reference for a list of possible states for `lifecycleState`.

ALL_DCAT_FOLDERS View

Metadata for the Object Storage buckets containing the data files for the Logical Entities.

Column	Datatype	Description
DCAT_CON_ID	VARCHAR2(4000)	Connection identifier that is unique within the instance
CATALOG_ID	VARCHAR2(4000)	OCID for the Data Catalog containing the asset
KEY	VARCHAR2(4000)	Folder key
DISPLAY_NAME	VARCHAR2(4000)	Folder display name
BUSINESS_NAME	VARCHAR2(4000)	Folder business name
DESCRIPTION	VARCHAR2(4000)	Folder description
DATA_ASSET_KEY	VARCHAR2(4000)	Key for the data asset containing the folder
PARENT_FOLDER_KEY	VARCHAR2(4000)	Key for the parent folder (currently, this is the data asset key)
PATH	VARCHAR2(4000)	Full path for the folder
EXTERNAL_KEY	VARCHAR2(4000)	Object Storage URI for the bucket
TIME_EXTERNAL	TIMESTAMP(6) WITH TIMEZONE	The last modified timestamp of this folder
TIME_CREATED	TIMESTAMP(6) WITH TIMEZONE	The date/time the folder was created
URI	VARCHAR2(4000)	URI to the folder instance in the Data Catalog API.
LIFECYCLE_STATE	VARCHAR2(4000)	The current state of the folder. For more information on possible life cycle states, see the Data Catalog Folder Reference for a list of possible states for `lifecycleState`.

ALL_DCAT_GLOBAL_ACCESSIBLE_CATALOGS View

This view lists all accessible catalogs across all regions, along with the level of access privileges for each catalog.

Column	Datatype	Description
CATALOG_ID	VARCHAR2(4000)	Catalog OCID
CATALOG_NAME	VARCHAR2(4000)	Name of the catalog
CATALOG_REGION	VARCHAR2(4000)	Name of the catalog region
CATALOG_SCORE	NUMBER	The catalog score is a numeric value calculated from the privileges configured for the Data Catalog access credential. A higher catalog score means greater privileges, which may equate to a higher likelihood that this catalog is intended for use with this Autonomous Database instance.

ALL_DCAT_LOCAL_ACCESSIBLE_CATALOGS View

This view lists all accessible catalogs in the current region, along with the level of access privileges for each catalog.

Column	Datatype	Description
CATALOG_ID	VARCHAR2(4000)	Catalog OCID
CATALOG_NAME	VARCHAR2(4000)	Name of the catalog
CATALOG_SCORE	NUMBER	The catalog score is a numeric value calculated from the privileges configured for the Data Catalog access credential. A higher catalog score means greater privileges, which may equate to a higher likelihood that this catalog is intended for use with this Autonomous Database instance.

ALL_GLUE_DATABASES View

The AWS Glue Data Catalog databases that the data catalog credential is authorized to access.

Column	Data Type	Description
DCAT_CON_ID	VARCHAR2(4000)	Unique identifier of data catalog connection id.
CATALOG_ID	VARCHAR2(255)	Data Catalog unique identifier.
NAME	VARCHAR2(255)	Name of the database.
DESCRIPTION	VARCHAR2(2048)	Description of the database.
LOCATION_URI	VARCHAR2(1024)	The location of the database.
CREATE_TIME	TIMESTAMP	The time that the database was created in the data catalog.

Column	Data Type	Description
PARAMETERS	CLOB	JSON document with key-value pairs that define parameters and properties of the database.
TARGET_DATABASE	VARCHAR2(4000)	JSON document that describes a target database for resource linking in AWS.

ALL_GLUE_TABLES View

This view shows all AWS Glue Data Catalog tables that the data catalog credential is authorized to access.

Column	Data Type	Description
DCAT_CON_ID	VARCHAR2(4000)	Unique identifier of data catalog connection id.
CATALOG_ID	VARCHAR2(255)	Catalog identifier
DATABASE_NAME	VARCHAR2(255)	Database name
NAME	VARCHAR2(255)	Table name
TABLE_TYPE	VARCHAR2(255)	Table type
CLASSIFICATION	VARCHAR2(255)	
DESCRIPTION	VARCHAR2(2048)	Table description
OWNER	VARCHAR2(255)	Table owner
CREATED_BY	VARCHAR2(255)	Table creator
CREATE_TIME	TIMESTAMP	The time the table was created in the data catalog.
LAST_ANALYZED_TIME	TIMESTAMP	The last time column statistics were computed for this table.
LAST_ACCESS_TIME	TIMESTAMP	The last time the table was accessed.
UPDATE_TIME	TIMESTAMP	The last time the table was updated.
IS_REGISTERED_WITH_LAKE_FORMATION	NUMBER	Indicates whether the table is registered with AWS lake formation.
PARAMETERS	CLOB	JSON document with key-value pairs that define properties of the table.
PARTITION_KEYS	CLOB	JSON document with a list of columns by which the table is partitioned.
RETENTION	NUMBER	The retention time for this table.
STORAGE_DESCRIPTION	CLOB	JSON document with information about the physical storage of a table.
TARGET_TABLE	VARCHAR2(4000)	JSON document describing a target table used for resource linking in AWS.
VERSION_ID	VARCHAR2(255)	The version identifier for the table.
VIEW_EXPANDED_TEXT	CLOB	Introduced by AWS Glue for compatibility with Hive. Not used by AWS Glue.
VIEW_ORIGINAL_TEXT	CLOB	Introduced by AWS Glue for compatibility with Hive. Not used by AWS Glue.

DCAT_ATTRIBUTES View

Lists the mapping of logical entity attributes to external table columns.

Column	Datatype	Description
DCAT_CON_ID	VARCHAR2 (4000)	Connection identifier that is unique within the instance
ASSET_KEY	VARCHAR2(4000)	Data Catalog asset key
ENTITY_KEY	VARCHAR2(4000)	Data Catalog entity key
ATTRIBUTE_KEY	VARCHAR2(4000)	Data Catalog attribute key
ORACLE_COLUMN_NAME	VARCHAR2(128)	Mapped column name

DCAT_ENTITIES View

Describes the mapping of logical entities to external tables.

Column	Datatype	Description
DCAT_CON_ID	VARCHAR2(4000)	Connection identifier that is unique within the instance
ASSET_KEY	VARCHAR2(4000)	Data Catalog asset key
ENTITY_KEY	VARCHAR2(4000)	Data Catalog entity key
FOLDER_KEY	VARCHAR2(4000)	Data Catalog folder key
ORACLE_TABLE_NAME	VARCHAR2(128)	Mapped table name
ORACLE_SCHEMA_NAME	VARCHAR2(128)	Mapped schema name
ENTITY_ORACLE_DB_SCHEMA	VARCHAR2(4000)	The entity's oracle-db-schema custom property used to derive the schema
ASSET_ORACLE_DB_SCHEMA	VARCHAR2(4000)	The data asset's oracle-db-schema custom property used to derive the schema
FOLDER_ORACLE_DB_SCHEMA	VARCHAR2(4000)	The folder's oracle-db-schema custom property used to derive the schema

DBMS_DCAT$SYNC_LOG View

The DBMS_DCAT$SYNC_LOG view provides easy access to the log table for the last sync operation executed by the current user.

Every call to the RUN_SYNC procedure is logged to a new log table, pointed to by the LOGFILE_TABLE field of USER_LOAD_OPERATIONS. The log tables are automatically dropped after 2 days, and users can clear all sync logs using the DELETE_ALL_OPERATIONS Procedure where type is DCAT_SYNC.

The DBMS_DCAT$SYNC_LOG view automatically identifies the latest log table. The schema for the DBMS_DCAT$SYNC_LOG view is described below and the access permissions are identical to those of the individual log tables. By default READ is granted to the dbms_dcat role and to the ADMIN user.

The log tables have the following format:

Column	Datatype	Description
LOG_TIMESTAMP	TIMESTAMP	Timestamp for the log entry.
LOG_LEVEL	VARCHAR2(32)	The entry log level can have one of the following values: OFF, FATAL, ERROR, WARN, INFO, DEBUG, TRACE, ALL.
LOG_DETAILS	VARCHAR2(32767)	The log message.

DBMS_INMEMORY_ADMIN Package

The DBMS_INMEMORY_ADMIN package enables you to manage the In-Memory area and In-Memory FastStart.

- Summary of DBMS_INMEMORY_ADMIN Subprograms
  This table summarizes the subprograms included in the DBMS_INMEMORY_ADMIN package.

Summary of DBMS_INMEMORY_ADMIN Subprograms

This table summarizes the subprograms included in the DBMS_INMEMORY_ADMIN package.

Subprogram	Description
AIM_GET_PARAMETER Procedure	This procedure obtains the current values for parameters that control Automatic In-Memory.
AIM_SET_PARAMETER Procedure	The procedure customizes the execution environment of Automatic In-Memory.
FASTSTART_DISABLE Procedure	This procedure disables the In-Memory FastStart (IM FastStart) feature.
FASTSTART_ENABLE Procedure	This procedure enables IM FastStart and assigns a tablespace.
FASTSTART_MIGRATE_STORAGE Procedure	This procedure moves all IM FastStart data and metadata from the existing tablespace to the specified new tablespace.
GET_FASTSTART_TABLESPACE Function	This function returns the name of the tablespace that is currently designated for IM FastStart.
IME_CAPTURE_EXPRESSIONS Procedure	This procedure captures the 20 most frequently accessed (“hottest”) expressions in the database in the specified time interval.
IME_CLOSE_CAPTURE_WINDOW Procedure	This procedure signals the end of the current expression capture window.
IME_DROP_ALL_EXPRESSIONS Procedure	This procedure drops all SYS_IME expression virtual columns in the database.
IME_GET_CAPTURE_STATE Procedure	This procedure returns the current capture state of the expression capture window and the timestamp of the most recent modification.
IME_OPEN_CAPTURE_WINDOW Procedure	This procedure signals the beginning of an expression capture window.
IME_POPULATE_EXPRESSIONS Procedure	This procedure forces the population of expressions captured in the latest invocation of DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS.
POPULATE_WAIT Function	Initiates population of all INMEMORY objects that have a priority greater than or equal to the specified priority, and sets a timeout interval within which population must occur.

Subprogram	Description
SET_SGA_PERCENTAGE Procedure	This procedure modifies the maximum In-Memory size for your database.

- SET_SGA_PERCENTAGE Procedure
  Use `DBMS_INMEMORY_ADMIN.SET_SGA_PERCENTAGE` to modify the maximum In-Memory size for your database.

SET_SGA_PERCENTAGE Procedure

Use `DBMS_INMEMORY_ADMIN.SET_SGA_PERCENTAGE` to modify the maximum In-Memory size for your database.

Syntax

```
DBMS_INMEMORY_ADMIN.SET_SGA_PERCENTAGE (
     sga_percentage IN NUMBER);
```

Parameter	Description
`sga_percentage`	This specifies a value for the maximum In-Memory size for your Autonomous Database. The supplied `sga_percentage` value must be in the range of 0 and 70. This parameter is mandatory.

Usage Note

To run `DBMS_INMEMORY_ADMIN.SET_SGA_PERCENTAGE` you must be logged in as the ADMIN user or have the `EXECUTE` privilege on `DBMS_INMEMORY_ADMIN`.

Example

```
BEGIN
     DBMS_INMEMORY_ADMIN.SET_SGA_PERCENTAGE(60);
END;
/
```

DBMS_MAX_STRING_SIZE Package

The `DBMS_MAX_STRING_SIZE` package provides an interface for checking and changing the value of the `DBMS_MAX_STRING_SIZE` initialization parameter.

- CHECK_MAX_STRING_SIZE Function
  This function checks if the `MAX_STRING_SIZE` parameter can be updated to a given value and returns a list of violations that would prevent the parameter from being updated.
- MODIFY_MAX_STRING_SIZE Procedure
  This procedure updates the value of the `MAX_STRING_SIZE` parameter to a given value.

CHECK_MAX_STRING_SIZE Function

This function checks if the `MAX_STRING_SIZE` parameter can be updated to a given value and returns a list of violations that would prevent the parameter from being updated.

Syntax

```
DBMS_MAX_STRING_SIZE.CHECK_MAX_STRING_SIZE(
       new_value    IN VARCHAR2)
RETURN DBMS_MAX_STRING_SIZE_TBL;
```

Parameters

Parameter	Description
`new_value`	Specifies the new `MAX_STRING_SIZE` parameter value to be set. The only valid value is: `'STANDARD'`.

Usage Notes

If the return list is empty, then there are no violations and the `MAX_STRING_SIZE` update can be performed.

Example

```
SELECT * FROM TABLE(DBMS_MAX_STRING_SIZE.CHECK_MAX_STRING_SIZE('STANDARD'));

TYPE   OBJECT_OWNER OBJECT_NAME COLUMN_NAME
REASON
------ ------------ ----------- --------------
-------------------------------------------
COLUMN ADMIN        SALES       CUST_NOTES     Physical column exceeds
STANDARD length limit
1 rows selected.
```

MODIFY_MAX_STRING_SIZE Procedure

This procedure updates the value of the `MAX_STRING_SIZE` parameter to a given value.

Syntax

```
DBMS_MAX_STRING_SIZE.MODIFY_MAX_STRING_SIZE(
         new_value    IN VARCHAR2);
```

Where: *user_account* is the user account name (schema name).

Parameters

Parameter	Description
`new_value`	Specifies the new `MAX_STRING_SIZE` parameter value to be set. The only valid value is: `'STANDARD'`.

Usage Notes

- Using `DBMS_MAX_STRING_SIZE.MODIFY_MAX_STRING_SIZE` is a one-way change that cannot be reverted. After a database is switched back to the `STANDARD` style of supporting a maximum length of 4000 bytes for the `VARCHAR2`, `NVARCHAR2`, and `RAW` data types, you cannot re-enable `EXTENDED` data types.
- The ADMIN user is granted `EXECUTE` privilege `WITH GRANT OPTION` clause on `DBMS_MAX_STRING_SIZE`. Oracle recommends that you do not `GRANT EXECUTE` on this package to other users.
- The error `ORA-20000` is raised if any object exists that would prevent `MAX_STRING_SIZE` from being updated.
- The ADMIN user is granted `EXECUTE` privilege `WITH GRANT OPTION` clause on `DBMS_MAX_STRING_SIZE`. Oracle recommends that you do not `GRANT EXECUTE` on this package to other users.

Example

```
SELECT NAME, VALUE FROM V$PARAMETER WHERE NAME = 'max_string_size';

NAME                 VALUE
max_string_size      EXTENDED

   BEGIN
     DBMS_MAX_STRING_SIZE.MODIFY_MAX_STRING_SIZE('STANDARD');
   END;
/

PL/SQL procedure successfully completed.

SELECT NAME, VALUE FROM V$PARAMETER WHERE NAME = 'max_string_size';

NAME                 VALUE
max_string_size      STANDARD
```

DBMS_PIPE Package

The `DBMS_PIPE` package lets two or more sessions in the same instance communicate.

Oracle Autonomous Database supports core `DBMS_PIPE` functionality as available in Oracle Database 19c, plus extensions.

See DBMS_PIPE for details about the core `DBMS_PIPE` functionality provided in Oracle Database.

- DBMS_PIPE Overview for Singleton Pipes
  Pipe functionality has several potential applications: external service interface, debugging, independent transactions, and alerts.
- Summary of DBMS_PIPE Subprograms for Singleton Pipes
  This table lists the `DBMS_PIPE` subprograms and briefly describes them.

- DBMS_PIPE Overview for Persistent Messaging Pipes
  Pipe functionality has several potential applications: external service interface, debugging, independent transactions, and alerts.
- Summary of DBMS_PIPE Subprograms for Persistent Messaging
  This table lists the `DBMS_PIPE` subprograms and briefly describes them.

DBMS_PIPE Overview for Singleton Pipes

Pipe functionality has several potential applications: external service interface, debugging, independent transactions, and alerts.

On Autonomous Database the DBMS_PIPE package has extended functionality to support singleton pipes.

Singleton pipe features in `DBMS_PIPE` provide the following:

- Ability to cache and retrieve a custom message, of up to 32,767 bytes, in Oracle database memory. The message size maximum of 32,767 bytes is applicable to all Pipes, including Singleton Pipes. Previous versions of `DBMS_PIPE` had a smaller maximum message size.
- Share the cached message across multiple database sessions with concurrent reads.
- Cache Invalidation methods:
  - Explicit cache invalidation controlled by user.
  - Cache invalidation after a user specified parameter (`shelflife`) time interval (in seconds).
- Declarative and easy to use PL/SQL APIs for caching.
- Supports both Read-Only and Read-Write databases.

A Singleton Pipe can be any one of the supported `DBMS_PIPE` types:

- **Implicit Pipe:** Automatically created when a message is sent with an unknown pipe name using the `DBMS_PIPE.SEND_MESSAGE` function.
- **Explicit Pipe:** Created using the `DBMS_PIPE.CREATE_PIPE` function with a user specified pipe name.
- **Public Pipe:** Accessible by any user with `EXECUTE` permission on `DBMS_PIPE` package
- **Private Pipe:** Accessible by sessions with the same user as the pipe creator.

Summary of DBMS_PIPE Subprograms for Singleton Pipes

This table lists the `DBMS_PIPE` subprograms and briefly describes them.

Table 6-1 DBMS_PIPE Package Subprograms

Subprogram	Description
CREATE_PIPE Function	Creates a pipe (necessary for private pipes)
NEXT_ITEM_TYPE Function	Returns datatype of next item in buffer
PACK_MESSAGE Procedures	Builds message in local buffer
PURGE Procedure	Purges contents of named pipe
RECEIVE_MESSAGE Function	Copies message from named pipe into local buffer
RESET_BUFFER Procedure	Purges contents of local buffer

Table 6-1 (Cont.) DBMS_PIPE Package Subprograms

Subprogram	Description
REMOVE_PIPE Function	Removes the named pipe
SEND_MESSAGE Function	Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist
UNIQUE_SESSION_NAME Function	Returns unique session name
UNPACK_MESSAGE Procedures	Accesses next item in buffer

- CREATE_PIPE Function
  This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.
- RECEIVE_MESSAGE Function
  This function copies the message into the local message buffer.
- SEND_MESSAGE Function
  This function sends a message on the named pipe.

CREATE_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

In order to create a Singleton Pipe, set the `singleton` parameter to `TRUE`. The following arguments are applicable to Singleton Pipes:

- `singleton`: Indicates that the pipe should be created as a Singleton Pipe (default value: `FALSE`).
- `shelflife`: Optionally specify a shelflife expiration (in seconds) of cached message in the Singleton Pipe. It can be used for implicit invalidation of message in Singleton Pipe.

  The message `shelflife` in Singleton Pipe can also be specified when you send a message message (see SEND_MESSAGE Function).

Syntax

```
DBMS_PIPE.CREATE_PIPE (
   pipename     IN VARCHAR2,
   maxpipesize  IN INTEGER DEFAULT 66536,
   private      IN BOOLEAN DEFAULT TRUE,
   singleton    IN BOOLEAN DEFAULT FALSE,
   shelflife    IN INTEGER DEFAULT 0)
RETURN INTEGER;
```

Parameters

Table 6-2 CREATE_PIPE Function Parameters

Parameter	Description
pipename	Name of the pipe you are creating. You must use this name when you call SEND_MESSAGE and RECEIVE_MESSAGE. This name must be unique across the instance. Caution: Do not use pipe names beginning with ORA$. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.
maxpipesize	The maximum size allowed for the pipe, in bytes. The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default maxpipesize is 66536 bytes. The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value use the existing, larger value. The default maxpipesize of 65536 is applicable for all Pipes.
private	Uses the default, TRUE, to create a private pipe. Public pipes can be implicitly created when you call SEND_MESSAGE.
singleton	Use TRUE to create a Singleton Pipe. Default value: FALSE
shelflife	Expiration time in seconds of a message cached in Singleton Pipe. After the specified shelflife time is exceeded, the message is no longer accessible from the Pipe. The parameter shelflife is only applicable to a Singleton Pipe. Default value is 0, implying that the message never expires.

Return Values

Table 6-3 CREATE_PIPE Function Return Values

Return	Description
0	Successful. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.
6	Failed to convert existing pipe to singleton pipe. • Implicit pipe with more than one existing message cannot be converted to a Singleton Pipe. • For an explicit pipe that is not Singleton, DBMS_PIPE.SEND_MESSAGE cannot send a message with singleton argument set to TRUE.
7	A non-zero value is given for the shelflife parameter and the pipe is not a singleton pipe.

Table 6-3 (Cont.) CREATE_PIPE Function Return Values

Return	Description
ORA-23322	Failure due to naming conflict. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Exceptions

Table 6-4 CREATE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Pipe with the same name already exists, and you are not allowed to use it.

Example

Create a Singleton Pipe with shelflife of 1 hour.

```
DECLARE
  l_status INTEGER;
BEGIN
  l_status := DBMS_PIPE.create_pipe(pipename  => 'MY_PIPE1',
                                    private   => TRUE,
                                    singleton => TRUE,
                                    shelflife => 3600);
END;
/
```

RECEIVE_MESSAGE Function

This function copies the message into the local message buffer.

Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
   pipename      IN VARCHAR2,
   timeout       IN INTEGER      DEFAULT maxwait,
   cache_func    IN VARCHAR2     DEFAULT NULL)
RETURN INTEGER;
```

Parameters

Table 6-5 RECEIVE_MESSAGE Function Parameters

Parameter	Description
pipename	Name of the pipe on which you want to receive a message. Names beginning with ORA$ are reserved for use by Oracle.

Table 6-5 (Cont.) RECEIVE_MESSAGE Function Parameters

Parameter	Description
timeout	Time to wait for a message, in seconds. A timeout of 0 lets you read without blocking. The timeout does not include the time spent in execution cache function specified in the cache_func parameter. Default value: is the constant MAXWAIT, which is defined as 86400000 (1000 days).
cache_func	Cache function name to automatically cache a message in a Singleton Pipe. The name of the function should be fully qualified with the owner schema: • *OWNER.FUNCTION_NAME* • *OWNER.PACKAGE.FUNCTION_NAME* Default value: NULL

Return Values

Table 6-6 RECEIVE_MESSAGE Function Return Values

Return	Description
0	Success
1	Timed out. If the pipe was implicitly-created and is empty, then it is removed.
2	Record in the pipe is too large for the buffer.
3	An interrupt occurred.
8	Cache function can only be specified when using a Singleton Pipe.
ORA-23322	User has insufficient privileges to read from the pipe.

Usage Notes

To receive a message from a pipe, first call RECEIVE_MESSAGE. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call RECEIVE_MESSAGE does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to UNPACK_MESSAGE to access the individual items in the message. The UNPACK_MESSAGE procedure is overloaded to unpack items of type DATE, NUMBER, VARCHAR2, and there are two additional procedures to unpack RAW and ROWID items. If you do not know the type of data that you are attempting to unpack, then call NEXT_ITEM_TYPE to determine the type of the next item in the buffer.

Cache Function Parameter

Singleton Pipes support cache function to automatically cache a message in the pipe in case of the following two scenarios:

- Singleton Pipe is empty.
- Message in Singleton Pipe is invalid due to `shelflife` time elapsed.

The name of the function should be fully qualified with the owner schema:

- *OWNER.FUNCTION_NAME*
- *OWNER.PACKAGE.FUNCTION_NAME*

To use a cache function the current session user that invokes `DBMS_PIPE.RECEIVE_MESSAGE` must have required privileges to execute the cache function.

Cache Function Syntax

```
CREATE OR REPLACE FUNCTION cache_function_name (
       pipename  IN VARCHAR2
) RETURN INTEGER;
```

Parameter	Datatype	Description
pipename	VARCHAR2	Name of the Singleton Pipe.

Return	Description
0	Success
Non-zero	Failure value returned from DBMS_PIPE.RECEIVE_MESSAGE

Define a cache function to provide encapsulation and abstraction of complexity from the reader sessions of Singleton Pipe. The typical operations within a cache function would be:

- Create a Singleton Pipe, for an Explicit Pipe, using `DBMS_PIPE.CREATE_PIPE`.
- Create the message to cache in the Singleton Pipe.
- Send Message to Singleton Pipe, optionally specifying a `shelflife` for the implicit message.

Exceptions

Table 6-7 RECEIVE_MESSAGE Function Exceptions

Exception	Description
Null pipe name	Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.

Example

```
DECLARE
  l_status INTEGER;
BEGIN
  l_status := DBMS_PIPE.receive_message(pipename   => 'MY_PIPE1',
                                        timeout    => 1,
                                        cache_func =>
'MY_USER.MY_CACHE_FUNC');
```

```
END;
/
```

SEND_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to `PACK_MESSAGE`. You can create a pipe explicitly using `CREATE_PIPE`, otherwise, it is created implicitly.

To create an implicit Singleton pipe, set the `singleton` parameter to `TRUE`. The following arguments are applicable to Singleton Pipes:

- `singleton`: Indicates that the pipe should be created as a Singleton Pipe (default value: `FALSE`).
- `shelflife`: Optionally specify a shelflife expiration of cached message in the Singleton Pipe. It can be used for implicit invalidation of message in Singleton Pipe.
  This argument is applicable for implicit as well as explicit Singleton pipes. A `shelflife` value specified in SEND_MESSAGE Function overwrites the `shelflife` specified for the Explicit Singleton Pipe in CREATE_PIPE Function and will be the default for any new messages cached in the Singleton Pipe.

Syntax

```
DBMS_PIPE.SEND_MESSAGE (
    pipename     IN VARCHAR2,
    timeout      IN INTEGER DEFAULT MAXWAIT,
    maxpipesize  IN INTEGER DEFAULT 65536,
    singleton    IN BOOLEAN DEFAULT FALSE,
    shelflife    IN INTEGER DEFAULT 0)
RETURN INTEGER;
```

Parameters

Table 6-8 SEND_MESSAGE Function Parameters

Parameter	Description
`pipename`	Name of the pipe on which you want to place the message. If you are using an explicit pipe, then this is the name that you specified when you called `CREATE_PIPE`. Caution: Do not use pipe names beginning with '`ORA$`'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.
`timeout`	Time to wait while attempting to place a message on a pipe, in seconds. The default value is the constant `MAXWAIT`, which is defined as 86400000 (1000 days).

Table 6-8 (Cont.) SEND_MESSAGE Function Parameters

Parameter	Description
maxpipesize	Maximum size allowed for the pipe, in bytes. The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 65536 bytes. The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value simply use the existing, larger value. Specifying maxpipesize as part of the SEND_MESSAGE procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional maxpipesize parameter to override the creation pipe size specifications. The default maxpipesize of 65536 is applicable for all Pipes.
singleton	Use TRUE to create a Singleton Pipe. Default value: FALSE
shelflife	Expiration time in seconds of a message cached in Singleton Pipe. After the specified shelflife time is exceeded, the message is no longer accessible from the Pipe. The parameter shelflife is only applicable to a Singleton Pipe. Default value is 0, implying that the message never expires.

Return Values

Table 6-9 SEND_MESSAGE Function Return Values

Return	Description
0	Success. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
1	Timed out. This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.
3	An interrupt occurred. If the pipe was implicitly created and is empty, then it is removed.
6	Failed to convert existing pipe to singleton pipe. • Implicit pipe with more than one existing message cannot be converted to a Singleton Pipe. • For an explicit pipe that is not Singleton, DBMS_PIPE.SEND_MESSAGE cannot send a message with singleton argument set to TRUE.
7	A non-zero value is given for the shelflife parameter and the pipe is not a singleton pipe.

Table 6-9 (Cont.) SEND_MESSAGE Function Return Values

Return	Description
ORA-23322	Insufficient privileges. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Exceptions

Table 6-10 SEND_MESSAGE Function Exception

Exception	Description
Null pipe name	Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.

DBMS_PIPE Overview for Persistent Messaging Pipes

Pipe functionality has several potential applications: external service interface, debugging, independent transactions, and alerts.

On Autonomous Database the DBMS_PIPE package has extended functionality to support persistent messaging pipes.

Persistent Messages in DBMS_PIPE:

- Support the ability to send and retrieve very large messages.
- Support a large number of pipe messages.
- Support sharing of messages within a single database, across multiple databases, and across databases in different regions.
- Support multiple pipes using the same Cloud Object Store location URI.

  Persistent messaging functionality allows two or more database sessions to communicate with messages that are stored in Cloud Object Store. Using this functionality messages in a pipe can be made available to only the current database or they can be made available to multiple databases in the same region or across different regions.

  A Persistent Messaging Pipe can be any one of the supported DBMS_PIPE types:

  - **Implicit Pipe:** Automatically created when a message is sent with an unknown pipe name using the DBMS_PIPE.SEND_MESSAGE function.
  - **Explicit Pipe:** Created using the DBMS_PIPE.CREATE_PIPE function with a user specified pipe name.
  - **Public Pipe:** Accessible by any user with EXECUTE permission on DBMS_PIPE package.
  - **Private Pipe:** Accessible by sessions with the same user as the pipe creator.

> **Note:**
>
> When send and receive messages across different databases using persistent messages, Oracle recommends you call `DBMS_PIPE.CREATE_PIPE` before sending or receiving messages. Creating an explicit pipe with `DBMS_PIPE.CREATE_PIPE` ensures that a pipe is created with the access permissions you want, either public or private (by setting the `PRIVATE` parameter to `FALSE` or using the default value `TRUE`).

DBMS_PIPE Limitation

The `DBMS_PIPE` package does not support sending messages between databases that use different character sets. For example, if you have one Autonomous Database instances that uses AL32UTF8 and another instance that uses WE8MSWIN1252, you cannot send messages with `DBMS_PIPE` between these two databases. In this case, you the system will raise the error `ORA-12704` if you attempt to send messages with `DBMS_PIPE` between these two databases.

See Choose a Character Set for Autonomous Database for more information.

Summary of DBMS_PIPE Subprograms for Persistent Messaging

This table lists the `DBMS_PIPE` subprograms and briefly describes them.

Table 6-11 DBMS_PIPE Package Subprograms

Subprogram	Description
CREATE_PIPE Function	Creates a pipe (necessary for private pipes).
GET_CREDENTIAL_NAME Function	Returns the global `credential_name` variable value.
GET_LOCATION_URI Function	Returns the global `location_uri` variable value that is used as a default location URI for use when a message is stored in Cloud Object Store.
NEXT_ITEM_TYPE Function	Returns datatype of next item in buffer.
PACK_MESSAGE Procedures	Builds message in local buffer.
RECEIVE_MESSAGE Function	Copies message from named pipe into local buffer.
RESET_BUFFER Procedure	Purges contents of local buffer.
REMOVE_PIPE Function	Removes the named pipe.
SEND_MESSAGE Function	Sends message on a named pipe: This implicitly creates a public pipe if the named pipe does not exist.
SET_CREDENTIAL_NAME Procedure	Sets the `credential_name` variable that is used as a default credential for messages that are stored in Cloud Object Store.
SET_LOCATION_URI Procedure	Sets the global `location_uri` variable that is used as a default location URI for messages that are stored in Cloud Object Store.
UNIQUE_SESSION_NAME Function	Returns unique session name.
UNPACK_MESSAGE Procedures	Accesses next item in buffer.

- CREATE_PIPE Function
  This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

- GET_CREDENTIAL_NAME Function
  This function returns the global `credential_name` variable value for use when messages are stored to Cloud Object Store.
- GET_LOCATION_URI Function
  This function returns the global `location_uri` variable value that can be used as a default location URI when pipe messages are stored to Cloud Object Store.
- RECEIVE_MESSAGE Function
  This function copies the message into the local message buffer.
- SEND_MESSAGE Function
  This function sends a message on the named pipe.
- SET_CREDENTIAL_NAME Procedure
  This procedure sets the `credential_name` variable that is used as a default credential when pipe messages are stored in Cloud Object Store.
- SET_LOCATION_URI Procedure
  This procedure sets the global `location_uri` variable.

CREATE_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

Syntax

```
DBMS_PIPE.CREATE_PIPE (
   pipename     IN VARCHAR2,
   maxpipesize  IN INTEGER DEFAULT 66536,
   private      IN BOOLEAN DEFAULT TRUE)
RETURN INTEGER;
```

Parameters

Table 6-12 CREATE_PIPE Function Parameters

Parameter	Description
`pipename`	Name of the pipe you are creating. You must use this name when you call `SEND_MESSAGE` and `RECEIVE_MESSAGE`. This name must be unique across the instance. Caution: Do not use pipe names beginning with `ORA$`. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.

Table 6-12 (Cont.) CREATE_PIPE Function Parameters

Parameter	Description
`maxpipesize`	The maximum size allowed for the pipe, in bytes. The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default `maxpipesize` is 66536 bytes. The `maxpipesize` for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of `SEND_MESSAGE` with larger values cause the `maxpipesize` to be increased. Callers with a smaller value use the existing, larger value. The default `maxpipesize` of 65536 is applicable for all Pipes.
`private`	Uses the default, `TRUE`, to create a private pipe. Public pipes can be implicitly created when you call `SEND_MESSAGE`.

Return Values

Table 6-13 CREATE_PIPE Function Return Values

Return	Description
`0`	Successful. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.
`ORA-23322`	Failure due to naming conflict. If a pipe with the same name exists and was created by a different user, then Oracle signals error `ORA-23322`, indicating the naming conflict.

Exceptions

Table 6-14 CREATE_PIPE Function Exception

Exception	Description
`Null pipe name`	Permission error: Pipe with the same name already exists, and you are not allowed to use it.

Example

Create an explicit private named `MY_PIPE1`

```
DECLARE
  l_status INTEGER;
BEGIN
  l_status := DBMS_PIPE.create_pipe(
      pipename  => 'MY_PIPE1',
      private   => TRUE);
END;
/
```

GET_CREDENTIAL_NAME Function

This function returns the global `credential_name` variable value for use when messages are stored to Cloud Object Store.

Syntax

```
DBMS_PIPE.GET_CREDENTIAL_NAME
         RETURN VARCHAR2;
```

Return Values

Return Value	Description
`credential_name`	The name of the credential to access the Cloud Object Storage.

Example

```
DECLARE
  credential_name     VARCHAR2(400)
BEGIN
  credential_name := DBMS_PIPE.GET_CREDENTIAL_NAME;
END;
/
```

GET_LOCATION_URI Function

This function returns the global `location_uri` variable value that can be used as a default location URI when pipe messages are stored to Cloud Object Store.

Syntax

```
DBMS_PIPE.GET_LOCATION_URI
        RETURN VARCHAR2;
```

Return Value

Return Value	Description
`location_uri`	The object URI.

Example

```
DECLARE
  location_uri     VARCHAR2(400)
BEGIN
  location_uri := DBMS_PIPE.GET_LOCATION_URI;
END;
/
```

RECEIVE_MESSAGE Function

This function copies the message into the local message buffer.

Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
   pipename          IN VARCHAR2,
   timeout           IN INTEGER  DEFAULT maxwait,
   credential_name   IN VARCHAR2 DEFAULT null,
   location_uri      IN VARCHAR2)
RETURN INTEGER;
```

Parameters

Table 6-15 RECEIVE_MESSAGE Function Parameters

Parameter	Description
`pipename`	Name of the pipe on which you want to receive a message. Names beginning with `ORA$` are reserved for use by Oracle.
`timeout`	Time to wait for a message, in seconds. A timeout of 0 lets you read without blocking. The timeout does not include the time spent running the cache function specified with the `cache_func` parameter. Default value: is the constant `MAXWAIT`, which is defined as 86400000 (1000 days).
`credential_name`	The credential name for the cloud store used to store messages. The `credential_name` is a package argument that is by default initialized as `NULL`. You can set this value before calling `DBMS_PIPE.RECEIVE_MESSAGE`. The passed parameter value takes precedence over the global variable's value. The credential object must have `EXECUTE` and `READ/WRITE` privileges by the user running `DBMS_PIPE.RECEIVE_MESSAGE`. The `credential_name` value can be an OCI resource principal, Azure service principal, Amazon Resource Name (ARN), or a Google service account. See Configure Policies and Roles to Access Resources for more information on resource principal based authentication.
`location_uri`	The location URI for the cloud store used to store messages. The `location_uri` is a global variable that by default is initialized as `NULL`. You can set this value before calling `DBMS_PIPE.RECEIVE_MESSAGE`. The passed parameter value takes precedence over the global variable's value.

Return Values

Table 6-16 RECEIVE_MESSAGE Function Return Values

Return	Description
`0`	Success

Table 6-16 (Cont.) RECEIVE_MESSAGE Function Return Values

Return	Description
1	Timed out. If the pipe was implicitly-created and is empty, then it is removed.
2	Record in the pipe is too large for the buffer.
3	An interrupt occurred.
ORA-23322	User has insufficient privileges to read from the pipe.

Usage Notes

- To receive a message from a pipe, first call `RECEIVE_MESSAGE`. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.
- If the pipe that you specify when you call `RECEIVE_MESSAGE` does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.
- After receiving the message, you must make one or more calls to `UNPACK_MESSAGE` to access the individual items in the message. The `UNPACK_MESSAGE` procedure is overloaded to unpack items of type `DATE`, `NUMBER`, `VARCHAR2`, and there are two additional procedures to unpack `RAW` and `ROWID` items. If you do not know the type of data that you are attempting to unpack, then call `NEXT_ITEM_TYPE` to determine the type of the next item in the buffer.
- Persistent messages are guaranteed to either be written or read by exactly one process. This prevents message content inconsistency due to concurrent writes and reads. Using a persistent messaging pipe, `DBMS_PIPE` allows only one operation, sending a message or a receiving message to be active at a given time. However, if an operation is not possible due to an ongoing operation, the process retries periodically until the `timeout` value is reached.
- If you use Oracle Cloud Infrastructure Object Storage to store messages, you can use Oracle Cloud Infrastructure Native URIs or Swift URIs. However, the location URI and the credential must match in type as follows:
  - If you use a native URI format to access Oracle Cloud Infrastructure Object Storage, you must use Native Oracle Cloud Infrastructure Signing Keys authentication in the credential object.
  - If you use Swift URI format to access Oracle Cloud Infrastructure Object Storage, you must use an auth token authentication in the credential object.

Exceptions

Table 6-17 RECEIVE_MESSAGE Function Exceptions

Exception	Description
`Null pipe name`	Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.

SEND_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to `PACK_MESSAGE`. You can create a pipe explicitly using `CREATE_PIPE`, otherwise, it is created implicitly.

Syntax

```
DBMS_PIPE.SEND_MESSAGE (
    pipename          IN VARCHAR2,
    timeout           IN INTEGER DEFAULT MAXWAIT,
    credential_name   IN VARCHAR2 DEFAULT null,
    location_uri      IN VARCHAR2 )
RETURN INTEGER;
```

Parameters

Table 6-18 SEND_MESSAGE Function Parameters

Parameter	Description
`credential_name`	The credential name for the cloud store used to store messages. The `credential_name` is a package argument that is by default initialized as `NULL`. You can set this value before calling `DBMS_PIPE.SEND_MESSAGE`. The passed parameter value takes precedence over the global variable's value. The credential object must have `EXECUTE` and `READ/WRITE` privileges by the user running `DBMS_PIPE.SEND_MESSAGE`. The `credential_name` value can be an OCI resource principal, Azure service principal, Amazon Resource Name (ARN), or a Google service account. See Configure Policies and Roles to Access Resources for more information on resource principal based authentication.
`location_uri`	The location URI for the cloud store used to store messages. The `location_uri` is a global variable that by default is initialized as `NULL`. You can set this value before calling `DBMS_PIPE.SEND_MESSAGE`. The passed parameter value takes precedence over the global variable's value.
`maxpipesize`	Maximum size allowed for the pipe, in bytes. The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 65536 bytes. The `maxpipesize` for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of `SEND_MESSAGE` with larger values cause the `maxpipesize` to be increased. Callers with a smaller value simply use the existing, larger value. Specifying `maxpipesize` as part of the `SEND_MESSAGE` procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional `maxpipesize` parameter to override the creation pipe size specifications. The default `maxpipesize` of 65536 is applicable for all Pipes.

Table 6-18 (Cont.) SEND_MESSAGE Function Parameters

Parameter	Description
pipename	Name of the pipe on which you want to place the message. If you are using an explicit pipe, then this is the name that you specified when you called CREATE_PIPE. Caution: Do not use pipe names beginning with 'ORA$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.
timeout	Time to wait while attempting to place a message on a pipe, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days).

Return Values

Table 6-19 SEND_MESSAGE Function Return Values

Return	Description
0	Success. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
1	Timed out. This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.
3	An interrupt occurred. If the pipe was implicitly created and is empty, then it is removed.
ORA-23322	Insufficient privileges. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Usage Notes

- Persistent messages are guaranteed to either be written or read by exactly one process. This prevents message content inconsistency due to concurrent writes and reads. Using a persistent messaging pipe, DBMS_PIPE allows only one operation, sending a message or a receiving message to be active at a given time. However, if an operation is not possible due to an ongoing operation, the process retries periodically until the timeout value is reached.
- If you use Oracle Cloud Infrastructure Object Storage to store messages, you can use Oracle Cloud Infrastructure Native URIs or Swift URIs. However, the location URI and the credential must match in type as follows:
  - If you use a native URI format to access Oracle Cloud Infrastructure Object Storage, you must use Native Oracle Cloud Infrastructure Signing Keys authentication in the credential object.

- If you use Swift URI format to access Oracle Cloud Infrastructure Object Storage, you must use an auth token authentication in the credential object.

Exceptions

Table 6-20 SEND_MESSAGE Function Exception

Exception	Description
`Null pipe name`	Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.

SET_CREDENTIAL_NAME Procedure

This procedure sets the `credential_name` variable that is used as a default credential when pipe messages are stored in Cloud Object Store.

Syntax

```
DBMS_PIPE.SET_CREDENTIAL_NAME (
   credential_name    IN VARCHAR2 );
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to access the Cloud Object Storage. The `credential_name` value can be an OCI resource principal, Azure service principal, Amazon Resource Name (ARN), or a Google service account. See Configure Policies and Roles to Access Resources for more information on resource principal based authentication.

Usage Note

If you use Oracle Cloud Infrastructure Object Storage to store messages, you can use Oracle Cloud Infrastructure Native URIs or Swift URIs. However, the location URI and the credential must match in type as follows:

- If you use a native URI format to access Oracle Cloud Infrastructure Object Storage, you must use Native Oracle Cloud Infrastructure Signing Keys authentication in the credential object.
- If you use Swift URI format to access Oracle Cloud Infrastructure Object Storage, you must use an auth token authentication in the credential object.

Example

```
BEGIN
     DBMS_PIPE.SET_CREDENTIAL_NAME(
       credential_name =>  'my_cred1');
END;
/
```

SET_LOCATION_URI Procedure

This procedure sets the global `location_uri` variable.

Syntax

```
DBMS_PIPE.SET_LOCATION_URI (
   location_uri    IN VARCHAR2 );
```

Parameter

Parameter	Description
`location_uri`	Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD URI Formats.

Usage Note

If you use Oracle Cloud Infrastructure Object Storage to store messages, you can use Oracle Cloud Infrastructure Native URIs or Swift URIs. However, the location URI and the credential must match in type as follows:

- If you use a native URI format to access Oracle Cloud Infrastructure Object Storage, you must use Native Oracle Cloud Infrastructure Signing Keys authentication in the credential object.
- If you use Swift URI format to access Oracle Cloud Infrastructure Object Storage, you must use an auth token authentication in the credential object.

Example

```
BEGIN
  DBMS_PIPE.GET_LOCATION_URI(
      location_uri  => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname1/');
END;
/
```

DBMS_PROXY_SQL

Describes the procedures to enable and disable query offload for an elastic pool leader.

- DISABLE_READ_ONLY_OFFLOAD Procedure
  This procedure disables query offload for an Autonomous Database elastic pool leader or for an elastic pool member.
- ENABLE_READ_ONLY_OFFLOAD Procedure
  This procedure enables query offload for an Autonomous Database elastic pool leader or for an elastic pool member.

DISABLE_READ_ONLY_OFFLOAD Procedure

This procedure disables query offload for an Autonomous Database elastic pool leader or for an elastic pool member.

Syntax

```
DBMS_PROXY_SQL.DISABLE_READ_ONLY_OFFLOAD;
```

Example

```
EXEC DBMS_PROXY_SQL.DISABLE_READ_ONLY_OFFLOAD;
```

ENABLE_READ_ONLY_OFFLOAD Procedure

This procedure enables query offload for an Autonomous Database elastic pool leader or for an elastic pool member.

Syntax

```
DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD(
      module_name       IN CLOB,
      action_name       IN CLOB);
```

Parameters

Parameter	Description
`module_name`	Specifies a list of module names as a comma-separated list. The list specifies the modules where queries are considered for offload (where a session's module name matches a value in the list). The default value for this parameter is `NULL`, which means that a session's module name can be any value and the session is considered for offloading.
`action_name`	Specifies a list of action names as a comma-separated list. The list specifies the action names where queries are considered for offloading (where a session's action name matches a value in the list). The default value for this parameter is `NULL`, which means that a session's action name can be any value and the session is considered for offloading

Usage Notes

- If both `module_name` and `action_name` are specified, a session's module name must match a value in the list of module names and it's action name must match a value in the list of action names for the session to be considered for offload.
- When query offload is enabled for a session you can find the name of the Refreshable Clone to which queries are offloaded. For example:

  ```
  SELECT sys_context('userenv', 'con_name') from dual;
  ```

  If queries are not being offloaded to a Refreshable Clone, this query shows the name of the elastic pool leader (or the name of the elastic pool member).
- The views `DBA_PROXY_SQL_ACTIONS` and `DBA_PROXY_SQL_MODULES` display the list of modules or actions that are configured for query offload. You must query these views from a session that is not enabled for query offload.

  See DBA_PROXY_SQL Views for more information.

- When you offload queries from a list of sessions that you specify by module or action name, the module name and action name set with `DBMS_APPLICATION_INFO` are case sensitive. `DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD` adheres to this case sensitive behavior. For example, when a session has a lowercase module name, or mixed case module name, the case must match in the parameter values when you enable query offload with `DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD` and you include the `module_name` or `action_name` parameters.

  You can check the module name and action name for the current session using `DBMS_APPLICATION_INFO.READ_MODULE`:

```
set serveroutput on;
declare
  l_mod varchar2(50);
  l_act varchar2(50);
BEGIN
DBMS_APPLICATION_INFO.READ_MODULE(l_mod, l_act);
  DBMS_OUTPUT.PUT_LINE('l_mod: ' || l_mod);
  DBMS_OUTPUT.PUT_LINE('l_act: ' || l_act);
END;
/
```

Examples

```
EXEC DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD;
```

```
DECLARE
   mod_values clob := to_clob('["mod1", "mod2"]');
   act_values clob := to_clob('["act1", "act2"]');
BEGIN
   DBMS_PROXY_SQL.ENABLE_READ_ONLY_OFFLOAD(
      module_name => mod_values,
      action_name => act_values);
END;
/
```

DBMS_SHARE Package

The `DBMS_SHARE` subprograms and views are used to share local data with external systems.

- Summary of Share Producer Subprograms
  This table lists the `DBMS_SHARE` package procedures and functions used to produce shares for recipients.
- Summary of Share Consumer Subprograms
  This table lists the `DBMS_SHARE` package procedures and functions used to consume shares.
- Summary of Share Producer Views
  This table lists the share producer views for the `DBMS_SHARE` package.
- Summary of Share Consumer Views
  This table lists the `DBMS_SHARE` package views.

- DBMS_SHARE Constants
  These constants are used by the `DBMS_SHARE` package.

Summary of Share Producer Subprograms

This table lists the `DBMS_SHARE` package procedures and functions used to produce shares for recipients.

Subprogram	Description
ADD_TO_SHARE Procedure	Add a table or view to a share.
ASSERT_SHAREABLE_OBJECT Procedure	Return without error, if the object exists and can be shared.
ASSERT_SHARING_ID Procedure	Run basic validation checks against a sharing id and return one in canonical form.
CAN_CREATE_SHARE Function	This function checks to see if the current schema can create share recipients.
CAN_CREATE_SHARE_RECIPIENT Function	This function checks to see if the current schema can create share recipients.
CLEAR_RECIPIENT_EVENTS Procedure	Clear events from the share recipient event log.
CLEAR_SHARE_EVENTS Procedure	Clear events from the share event log.
CREATE_BEARER_TOKEN_CREDENTIAL Procedure	Create a credential suitable for use with delta share providers.
CREATE_CLOUD_STORAGE_LINK Procedure	Create a named cloud storage URI link.
CREATE_OR_REPLACE_CLOUD_STORAGE_LINK Procedure	Create or replace a named cloud storage URI.
CREATE_OR_REPLACE_SHARE_RECIPIENT Procedure	Create or replace a share recipient.
CREATE_SHARE Procedure	Create a named share object.
CREATE_SHARE_RECIPIENT Procedure	Create a new share recipient.
DROP_CLOUD_STORAGE_LINK Procedure	Drop a cloud storage link.
DROP_RECIPIENT Procedure	Drop a recipient.
DROP_SHARE Procedure	Drop a share and all of its contents.
DROP_SHARE_LINK_VIEW Procedure	Drop a view that was created by the `CREATE_SHARE_LINK_VIEW` procedure.
DROP_SHARE_VERSION Procedure	Drop a single share version.
DROP_SHARE_VERSIONS Procedure	Drop a range of share versions.
DROP_UNUSED_SHARE_VERSIONS Procedure	Drop any share version that is not currently in use.
ENABLE_SCHEMA Procedure	Enable or disable a schema for sharing.
GET_ACTIVATION_LINK Function	Generate the link that gets put into emails to the authorized recipient.

Subprogram	Description
GET_PUBLISHED_IDENTITY Function	Get data about the current user that was set by SET_PUBLISHED_IDENTITY.
GET_RECIPIENT_PROPERTY Function	Return the value of a property for a recipient.
GET_SHARE_PROPERTY Function	Get the property value of an existing share.
GET_SHARE_TABLE_PROPERTY Function	Get the property value of an existing share table.
GRANT_TO_RECIPIENT Procedure	Grant access on a share to a specific recipient.
POPULATE_SHARE_PROFILE Procedure	Generate a delta profile for a recipient.
PUBLISH_SHARE Procedure	Publish a share and return immediately.
PUBLISH_SHARE_WAIT Procedure	Publish a share and wait until the background job is complete.
PURGE_DETACHED_FILES Procedure	Delete or forget parquet files that have become detached from their shares.
REMOVE_FROM_SHARE Procedure	Remove a table or view from a share.
RENAME_RECIPIENT Procedure	Rename a recipient.
RENAME_SHARE Procedure	Rename a share.
RENAME_SHARE_LINK Procedure	Rename a registered share link.
RENAME_SHARE_SCHEMA Procedure	Rename a share schema.
RENAME_SHARE_TABLE Procedure	Rename a share table.
REVOKE_FROM_RECIPIENT Procedure	Revoke access on a share from a specific recipient.
SET_CURRENT_SHARE_VERSION Procedure	Change the current version of a share.
SET_PUBLISHED_IDENTITY Procedure	Set data about the current user that will be supplied to recipients of published ORACLE shares.
SET_RECIPIENT_LOG_LEVEL Procedure	Change the log level for an existing share recipient.
SET_SHARE_LOG_LEVEL Procedure	Change the log level for an existing share.
SET_STORAGE_CREDENTIAL Procedure	Set the access credential name for the given storage.
STOP_JOB Procedure	Stop a running share job.
UNPUBLISH_SHARE Procedure	Unpublish a share.
UPDATE_DEFAULT_RECIPIENT_PROPERTY Procedure	Update the default recipient property values.
UPDATE_DEFAULT_SHARE_PROPERTY Procedure	Update the default share property values.
UPDATE_RECIPIENT_PROPERTY Procedure	Update a property of an existing recipient.

Subprogram	Description
UPDATE_SHARE_JOB_PROPERTY Procedure	Modify properties of a running share job.
UPDATE_SHARE_PROPERTY Procedure	Update a property of an existing share.
UPDATE_SHARE_TABLE_PROPERTY Procedure	Update the property value of an existing share table.
VALIDATE_CREDENTIAL Function	Validate a credential name, converting it to canonical form first if required.
VALIDATE_SHARE_STORAGE Procedure	Check to see if the given storage is suitable for versioned shares.
WAIT_FOR_JOB Procedure	This procedure waits until the specified share job is complete.

- ADD_TO_SHARE Procedure
  Add a table or view to a share. The object becomes visible to any external user who has been granted access to the share.
- ASSERT_SHAREABLE_OBJECT Procedure
  Return without error, if the object exists and can be shared.
- ASSERT_SHARING_ID Procedure
  Run basic validation checks against a sharing id and return one in canonical form. An exception is raised if the id is obviously invalid.
- CAN_CREATE_SHARE Function
  This function checks to see if the current schema can create share recipients. If shares can be created, a 1 is returned and 0 otherwise.
- CAN_CREATE_SHARE_RECIPIENT Function
  This function checks to see if the current schema can create share recipients. If shares can be created a 1 is returned, and 0 otherwise.
- CLEAR_RECIPIENT_EVENTS Procedure
  Clear events from the share recipient event log.
- CLEAR_SHARE_EVENTS Procedure
  Clear events from the share event log.
- CREATE_BEARER_TOKEN_CREDENTIAL Procedure
  Create a credential suitable for use with delta share providers.
- CREATE_CLOUD_STORAGE_LINK Procedure
  Create a named cloud storage URI link. A cloud storage link is a named association between an OCI bucket URI, and a local credential name.
- CREATE_OR_REPLACE_CLOUD_STORAGE_LINK Procedure
  Create or replace a named cloud storage URI. A cloud storage link is a named association between an OCI bucket URI, and a local credential name.
- CREATE_OR_REPLACE_SHARE_RECIPIENT Procedure
  Create or replace a share recipient. You must provide at least an email address or sharing id.
- CREATE_SHARE Procedure
  Create a named share object.
- CREATE_SHARE_RECIPIENT Procedure
  Create a new share recipient.
- DROP_CLOUD_STORAGE_LINK Procedure
  Drop a cloud storage link.

- DROP_RECIPIENT Procedure
  Drop a recipient. All access to the recipient will be revoked.
- DROP_SHARE Procedure
  Drop a share and all of its contents. Future access to the share by consumers will end.
- DROP_SHARE_LINK_VIEW Procedure
  Drop a view that was created by the `CREATE_SHARE_LINK_VIEW` procedure.
- DROP_SHARE_VERSION Procedure
  Drop a single share version. Note that you cannot drop the current version.
- DROP_SHARE_VERSIONS Procedure
  Drop a range of share versions. Note that you cannot drop the current version using this procedure.
- DROP_UNUSED_SHARE_VERSIONS Procedure
  Drop any share version that is not currently in use.
- ENABLE_SCHEMA Procedure
  Enable or disable a schema for sharing. This procedure must be run by the ADMIN user.
- GET_ACTIVATION_LINK Function
  Generate the link that gets put into emails to the authorized recipient. This activation link leads to the download page, where the recipient clicks a button to get the delta profile.
- GET_PUBLISHED_IDENTITY Function
  Get data about the current user that was set by `SET_PUBLISHED_IDENTITY`.
- GET_RECIPIENT_PROPERTY Function
  Return the value of a property for a recipient.
- GET_SHARE_PROPERTY Function
  Get the property value of an existing share.
- GET_SHARE_TABLE_PROPERTY Function
  Get the property value of an existing share table.
- GRANT_TO_RECIPIENT Procedure
  Grant access on a share to a specific recipient. The share and recipient must both belong to the same schema.
- POPULATE_SHARE_PROFILE Procedure
  Generate a delta profile for a recipient. You could print this to the screen or upload it somewhere. For example, to an object bucket using `DBMS_CLOUD.EXPORT_DATA`.
- PUBLISH_SHARE Procedure
  Publish a share and return immediately.
- PUBLISH_SHARE_WAIT Procedure
  Publish a share and wait until the background job is complete. The publication continues even if the call is interrupted.
- PURGE_DETACHED_FILES Procedure
  Delete or forget parquet files that have become detached from their shares.
- REMOVE_FROM_SHARE Procedure
  Remove a table or view from a share.
- RENAME_RECIPIENT Procedure
  Rename a recipient. This procedure only changes the local name of the recipient. The external definition of the recipient, for example the name of the OAUTH user or sharing id, is not changed.

- RENAME_SHARE Procedure
  Rename a share. Care should be take with this procedure since the change effects any existing consumers whose access is based on the previous name. Consumers are not notified directly or updated.
- RENAME_SHARE_LINK Procedure
  Rename a registered share link.
- RENAME_SHARE_SCHEMA Procedure
  Rename a share schema.
- RENAME_SHARE_TABLE Procedure
  Rename a share table.
- REVOKE_FROM_RECIPIENT Procedure
  Revoke access on a share from a specific recipient.
- SET_CURRENT_SHARE_VERSION Procedure
  Change the current version of a share.
- SET_PUBLISHED_IDENTITY Procedure
  Set data about the current user that will be supplied to recipients of published ORACLE shares.
- SET_RECIPIENT_LOG_LEVEL Procedure
  Change the log level for an existing share recipient.
- SET_SHARE_LOG_LEVEL Procedure
  Change the log level for an existing share.
- SET_STORAGE_CREDENTIAL Procedure
  Set the credential name used by the current user when it attempts to access the given storage.
- STOP_JOB Procedure
  Attempt to stop a running share job. The procedure should return quickly, but it may take some time for the associated job to stop.
- UNPUBLISH_SHARE Procedure
  Unpublish a share.
- UPDATE_DEFAULT_RECIPIENT_PROPERTY Procedure
  Update the default recipient property values. This procedure requires the user to have admin privileges.
- UPDATE_DEFAULT_SHARE_PROPERTY Procedure
  Update the default share property values.
- UPDATE_RECIPIENT_PROPERTY Procedure
  Update a property of an existing recipient.
- UPDATE_SHARE_JOB_PROPERTY Procedure
  Modify properties of a running share job. The procedure should return quickly, but it may take some time for the changes to take effect.
- UPDATE_SHARE_PROPERTY Procedure
  Update a property of an existing share.
- UPDATE_SHARE_TABLE_PROPERTY Procedure
  Update the property value of an existing share table.
- VALIDATE_CREDENTIAL Function
  Validate a credential name, converting it to canonical form first if required.
- VALIDATE_SHARE_STORAGE Procedure
  Check to see if the given storage is suitable for versioned shares.

- WAIT_FOR_JOB Procedure
  This procedure waits until the specified share job is complete.

ADD_TO_SHARE Procedure

Add a table or view to a share. The object becomes visible to any external user who has been granted access to the share.

Syntax

```
PROCEDURE ADD_TO_SHARE
(
    share_name           IN VARCHAR2,
    table_name           IN VARCHAR2,
    owner                IN VARCHAR2 := NULL,
    share_table_name     IN VARCHAR2 := NULL,
    share_schema_name    IN VARCHAR2 := NULL,
    object_metadata      IN SYS.JSON_OBJECT_T := NULL,
    replace_existing     IN BOOLEAN := FALSE,
    share_owner          IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
share_name	The name of an existing share to which the object is granted.
table_name	The name of the entity to share (for example, a table or view name).
owner	The owner of the entity to share. The default is to current schema.
share_table_name	The externally visible name of the table. By default, this is the uppercased table_name.
share_schema_name	The externally visible schema where the table will be placed. By default this is the uppercased table owner. The schema is created automatically if it does not already exist.
object_metadata	Optional metadata to associate with the shared entity.
replace_existing	If TRUE, and this share_table_name already exists, the existing table_name is dropped from the share and replaced with this table_name. If FALSE, and this share_table_name already exists, an exception is raised indicating the share table is already used.
share_owner	The owner of the share.
auto_commit	If TRUE, this procedure call commits changes that are not visible externally until the commit takes place. The default value is FALSE, which means that the user must COMMIT after running this call in order to make the change visible.

ASSERT_SHAREABLE_OBJECT Procedure

Return without error, if the object exists and can be shared.

Syntax

```
PROCEDURE ASSERT_SHAREABLE_OBJECT
(
  object_name          IN VARCHAR2,
  object_owner         IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
`object_name`	The name of the object.
`object_owner`	The owner of the object. Defaults to current schema.

ASSERT_SHARING_ID Procedure

Run basic validation checks against a sharing id and return one in canonical form. An exception is raised if the id is obviously invalid.

Syntax

```
PROCEDURE ASSERT_SHARING_ID
(
    sharing_id              IN OUT NOCOPY VARCHAR2,
    out_sharing_id_type     IN OUT NOCOPY VARCHAR2
);
```

Parameters

Parameter	Description
`sharing_id`	The id to check.
`out_sharing_id_type`	The type of the id, if valid. For example, `TENANCY` or `DATABASE`.

CAN_CREATE_SHARE Function

This function checks to see if the current schema can create share recipients. If shares can be created, a 1 is returned and 0 otherwise.

Syntax

```
FUNCTION CAN_CREATE_SHARE
RETURN NUMBER;
```

Example: Before and after enabling the admin schema

```
SQL> select dbms_share.can_create_share from dual;
 CAN_CREATE_SHARE
----------------
               0
SQL> exec dbms_share.enable_schema('admin')
PL/SQL procedure successfully completed.
SQL> select dbms_share.can_create_share from dual;
CAN_CREATE_SHARE
----------------
               1
```

CAN_CREATE_SHARE_RECIPIENT Function

This function checks to see if the current schema can create share recipients. If shares can be created a 1 is returned, and 0 otherwise.

Syntax

```
FUNCTION CAN_CREATE_SHARE_RECIPIENT
RETURN NUMBER;
```

CLEAR_RECIPIENT_EVENTS Procedure

Clear events from the share recipient event log.

Syntax

```
PROCEDURE CLEAR_RECIPIENT_EVENTS
(
   recipient_name       IN VARCHAR2,
   from_time            IN TIMESTAMP WITH TIME ZONE := NULL,
   to_time              IN TIMESTAMP WITH TIME ZONE := NULL,
   recipient_owner      IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
recipient_name	The local name of the share recipient.
from_time	Earliest time for events that should be cleared or NULL.
to_time	Latest time for events that should be cleared or NULL.
recipient_owner	The schema that owns the recipient.

CLEAR_SHARE_EVENTS Procedure

Clear events from the share event log.

Syntax

```
PROCEDURE CLEAR_SHARE_EVENTS
(
    share_name           IN VARCHAR2,
    from_time            IN TIMESTAMP WITH TIME ZONE := NULL,
    to_time              IN TIMESTAMP WITH TIME ZONE := NULL,
    share_owner          IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
share_name	The name of the share.
from_time	Earliest time for events that should be cleared or NULL.
to_time	Latest time for events that should be cleared or NULL.
share_owner	The schema that owns the share.

CREATE_BEARER_TOKEN_CREDENTIAL Procedure

Create a credential suitable for use with delta share providers.

This is similar to the CREATE_CREDENTIALS call, but it takes explicit values instead of a delta sharing profile. See CREATE_CREDENTIALS Procedure and Function for further information.

Syntax

```
PROCEDURE CREATE_BEARER_TOKEN_CREDENTIAL
(
   credential_name      IN VARCHAR2,
   bearer_token         IN VARCHAR2 := NULL,
   token_endpoint       IN VARCHAR2 := NULL,
   client_id            IN VARCHAR2 := NULL,
   client_secret        IN VARCHAR2 := NULL,
   token_refresh_rate   IN PLS_INTEGER := 3600
);
```

Parameters

Parameter	Description
credential_name	The name of the new credential.
bearer_token	The bearer token, if known.
token_endpoint	The endpoint to call to get a new token.
client_id	The username to send to the token_endpoint.
client_secret	The password to send to the token_endpoint.
token_refresh_rate	An optional refresh time, in seconds.

Example: Credential with a fixed bearer token

In its simplest form, this procedure is equivalent to calling `DBMS_CREDENTIAL` with a user name of `'BEARER_TOKEN'` and the bearer token itself as password.

```
SQL> exec dbms_share.create_bearer_token_credential('MY_FIXED_CREDENTIAL',
'FF42322D27D4C2DEE05392644664351E')
PL/SQL procedure successfully completed.
SQL> select username from user_credentials where credential_name =
'MY_FIXED_CREDENTIAL';
USERNAME
--------------------------------------------------------------------------------
----------------------------------------
BEARER_TOKEN
```

Example: Credential with a renewable bearer token

Create a credential that contains a short lived bearer token obtained from a token endpoint. The bearer token will be refreshed once every hour using a second credential, which is populated from the client id and secret.

```
SQL> BEGIN
  2    dbms_share.create_bearer_token_credential(
  3      credential_name=>'MY_RENEWABLE_CREDENTIAL',
  4      token_endpoint=>'https://myserver/ords/share_provider/oauth/token',
  5      client_id=>'VXGQ_44s6qJ-K4WHUNM2yQ..',
  6      client_secret=>'y9ddppgwEmZl7adDHFQndw..');
  7  END;
  8  /
 PL/SQL procedure successfully completed.
 SQL> select credential_name, username from user_credentials where
credential_name LIKE 'MY_RENEWABLE_CREDENTIAL%';
 CREDENTIAL_NAME                             USERNAME
------------------------------------------
-------------------------------------
MY_RENEWABLE_CREDENTIAL                      BEARER_TOKEN
MY_RENEWABLE_CREDENTIAL$TOKEN_REFRESH_CRED   VXGQ_44s6qJ-K4WHUNM2yQ..
```

CREATE_CLOUD_STORAGE_LINK Procedure

Create a named cloud storage URI link. A cloud storage link is a named association between an OCI bucket URI, and a local credential name.

> **Note:**
>
> Use the SET_STORAGE_CREDENTIAL Procedure to add a credential to the storage link.

Syntax

```
PROCEDURE CREATE_CLOUD_STORAGE_LINK
(
```

```
  storage_link_name     IN VARCHAR2,
  uri                   IN VARCHAR2,
  owner                 IN VARCHAR2 := NULL,
  metadata              IN SYS.JSON_OBJECT_T := NULL,
  auto_commit           IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
`storage_link_name`	The name of the cloud storage link. The name of the link should follow standard Oracle naming conventions.
`uri`	The URI of the storage bucket. The URI should be of the form `https://objectstorage.`*`region`*`.oraclecloud.com/n/`*`namespace-string`*`/b/`*`bucket`*`/o`
`owner`	The owner of the storage link. Leave as NULL for the current user.
`metadata`	(Optional) A JSON metadata document containing additional information.
`auto_commit`	The default is TRUE. If TRUE, this transaction is committed. If FALSE, the user must commit the transaction. Changes are not visible until the commit takes place.

Example

In this example, a cloud storage link named `MY_SHARE_STORAGE` is created on the given URL.

```
SQL> BEGIN
  2    dbms_share.create_cloud_storage_link(
  3      'MY_SHARE_STORAGE',
  4      'https://objectstorage.../n/abcdef/b/my_bucket/o' );
  5  END;
  6  /

PL/SQL procedure successfully completed.

SQL> select storage_link_name from user_lineage_cloud_storage_links;

STORAGE_LINK_NAME
--------------------------------------------------------------------------------
----------
MY_SHARE_STORAGE
```

CREATE_OR_REPLACE_CLOUD_STORAGE_LINK Procedure

Create or replace a named cloud storage URI. A cloud storage link is a named association between an OCI bucket URI, and a local credential name.

> **Note:**
>
> Use the SET_STORAGE_CREDENTIAL Procedure to add a credential to the storage link.

Syntax

```
PROCEDURE CREATE_OR_REPLACE_CLOUD_STORAGE_LINK
(
    storage_link_name    IN VARCHAR2,
    uri                  IN VARCHAR2,
    owner                IN VARCHAR2 := NULL,
    metadata             IN SYS.JSON_OBJECT_T := NULL,
    auto_commit          IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
storage_link_name	The name of the cloud storage link. The name of the link should follow standard Oracle naming conventions. See Database Object Names and Qualifiers
uri	The URI of the storage bucket. The URI should be of the form *https://objectstorage.region.oraclecloud.com/n/namespace-string/b/bucket/o*
owner	The owner of the storage link. Defaults to the current schema.
metadata	An optional JSON metadata document containing additional information.
auto_commit	If TRUE, the changes automatically commit after creating the link. The default is TRUE.

CREATE_OR_REPLACE_SHARE_RECIPIENT Procedure

Create or replace a share recipient. You must provide at least an email address or sharing id.

Syntax

```
PROCEDURE CREATE_OR_REPLACE_SHARE_RECIPIENT
(
    recipient_name       IN VARCHAR2,
    description          IN VARCHAR2 := NULL,
    recipient_owner      IN VARCHAR2 := NULL,
    email                IN VARCHAR2 := NULL,
    sharing_id           IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
recipient_name	The local name of the share recipient. Some names are not allowed (e.g. MY_TENANCY).
description	A description of the recipient.
recipient_owner	The schema that owns the recipient.
email	An email that will be registered for the OAUTH user.
sharing_id	The sharing id of the recipient, from GET_SHARING_ID Function.

CREATE_SHARE Procedure

Create a named share object.

Syntax

```
PROCEDURE CREATE_SHARE
(
  share_name           IN VARCHAR2,
  share_type           IN VARCHAR2 := SHARE_TYPE_VERSIONED,
  storage_link_name    IN VARCHAR2 := NULL,
  storage_link_owner   IN VARCHAR2 := NULL,
  description          IN VARCHAR2 := NULL,
  public_description   IN VARCHAR2 := NULL,
  configuration        IN SYS.JSON_OBJECT_T := NULL,
  force_create         IN BOOLEAN  := FALSE,
  share_owner          IN VARCHAR2 := NULL,
  auto_commit          IN BOOLEAN := FALSE,
  log_level            IN PLS_INTEGER := LOG_LEVEL_BASIC,
  run_storage_tests    IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
share_name	The name of the share. This name is uppercased since delta shares are case insensitive. The name follows standard Oracle conventions, so it must be 128 characters or fewer and must be double quoted if it is not a simple identifier. The only difference is that it will be uppercased even if it is double quoted.
share_type	The type of share. For information on constants used for this parameter, see descriptions for **Share Types** in DBMS_SHARE Constants.
storage_link_name	The name of the cloud storage link where the objects are created. The user must have read/write access to this storage and have the ability to create pre-authenticated requests on the storage. The parameter is required for versioned shares, and optional for current shares.
storage_link_owner	The owner of the cloud storage link where objects are created.
description	A local description for the share.
public_description	A public description for the share.
configuration	A configuration document that defines how objects are created.
force_create	Set force_create to TRUE to redefine the share if it exists.
share_owner	The owner of the share.
auto_commit	If TRUE, this procedure call commits changes that are not visible externally until the commit takes place. The default value is FALSE, which means that the user must COMMIT after running this call in order to make the change visible.
log_level	Event logging level. This controls the amount of detail recorded in the ALL_SHARE_EVENTS View. For information on constants used for this parameter, see descriptions for **Log Level** in DBMS_SHARE Constants.

Parameter	Description
run_storage_tests	If this parameter is TRUE then DBMS_SHARE runs tests to verify that the specified share storage link has the correct privileges. If this parameter is FALSE, then the procedure does not run any checks at creation time. This may lead to errors later, during publication or consumption of the share. Oracle recommends that you specify TRUE for this parameter.

CREATE_SHARE_RECIPIENT Procedure

Create a new share recipient.

Syntax

```
PROCEDURE CREATE_SHARE_RECIPIENT
(
    recipient_name       IN VARCHAR2,
    description          IN VARCHAR2 := NULL,
    recipient_owner      IN VARCHAR2 := NULL,
    email                IN VARCHAR2 := NULL,
    sharing_id           IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
recipient_name	The local name of the share recipient. Some names are not allowed, for example: MY_TENANCY.
description	A description of the recipient.
recipient_owner	The schema that owns the recipient.
email	An email that will be registered for the OAUTH user. You must provide at least one of email or sharing id.
sharing_id	The sharing id of the recipient from GET_SHARING_ID Function. You must provide at least one of email or sharing id.

DROP_CLOUD_STORAGE_LINK Procedure

Drop a cloud storage link.

Syntax

```
PROCEDURE DROP_CLOUD_STORAGE_LINK
(
    storage_link_name    IN VARCHAR2,
    owner                IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
storage_link_name	The name of the cloud storage link to drop.
owner	The owner of the cloud storage link. Leave as NULL for the current user.
auto_commit	If TRUE, the code automatically commits after dropping the link. The default is TRUE.

DROP_RECIPIENT Procedure

Drop a recipient. All access to the recipient will be revoked.

Syntax

```
PROCEDURE DROP_RECIPIENT
(
    recipient_name       IN VARCHAR2,
    owner                IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
recipient_name	The name of the share recipient.
owner	The schema that defines the recipient.

DROP_SHARE Procedure

Drop a share and all of its contents. Future access to the share by consumers will end.

Syntax

```
PROCEDURE DROP_SHARE
(
  share_name           IN VARCHAR2,
  share_owner          IN VARCHAR2 := NULL,
  destroy_objects      IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
share_name	The name of the share to drop.
share_owner	The owner of the share to drop.
destroy_objects	If TRUE, delete all objects created on behalf of the share. The default is TRUE.

DROP_SHARE_LINK_VIEW Procedure

Drop a view that was created by the `CREATE_SHARE_LINK_VIEW` procedure.

See CREATE_SHARE_LINK_VIEW Procedure for further information.

Syntax

```
PROCEDURE DROP_SHARE_LINK_VIEW
(
    view_name            IN VARCHAR2,
    view_owner           IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
`view_name`	The name of the new view.
`view_owner`	The view owner. The default is the current schema.

DROP_SHARE_VERSION Procedure

Drop a single share version. Note that you cannot drop the current version.

Syntax

```
PROCEDURE DROP_SHARE_VERSION
(
    share_name           IN VARCHAR2,
    share_version        IN NUMBER,
    destroy_objects      IN BOOLEAN := TRUE,
    force_drop           IN BOOLEAN := FALSE,
    share_owner          IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
`share_name`	The name of the share.
`share_version`	The version to drop. You can not drop the current version.
`destroy_objects`	Destroy any associated object in cloud storage, if applicable.
`force_drop`	Drop the share version even if there is an outstanding PAR file on the version.
`share_owner`	The owner of the share.

DROP_SHARE_VERSIONS Procedure

Drop a range of share versions. Note that you cannot drop the current version using this procedure.

Syntax

```
PROCEDURE DROP_SHARE_VERSIONS
(
    share_name           IN VARCHAR2,
    from_share_version   IN NUMBER,
    to_share_version     IN NUMBER,
    destroy_objects      IN BOOLEAN := TRUE,
    force_drop           IN BOOLEAN := FALSE,
    share_owner          IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
share_name	The name of the share.
from_share_version	The lowest version to drop.
to_share_version	The highest version to drop.
destroy_objects	Destroy any associated object in cloud storage, if applicable.
force_drop	Drop the share version even if there is an outstanding PAR file on the version.
share_owner	The owner of the share.

DROP_UNUSED_SHARE_VERSIONS Procedure

Drop any share version that is not currently in use.

Syntax

```
PROCEDURE DROP_UNUSED_SHARE_VERSIONS
(
    share_name           IN VARCHAR2,
    destroy_objects      IN BOOLEAN := TRUE,
    share_owner          IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
share_name	The name of the share.
destroy_objects	Destroy any associated object in cloud storage, if applicable.
share_owner	The owner of the share.

ENABLE_SCHEMA Procedure

Enable or disable a schema for sharing. This procedure must be run by the ADMIN user.

Users can consume delta shares without being enabled with this procedure, but they cannot create or publish shares. Sharing is disabled by default for all schemas, including ADMIN.

Syntax

```
PROCEDURE ENABLE_SCHEMA
(
    schema_name           IN VARCHAR2,
    enabled               IN BOOLEAN := TRUE,
    privileges            IN PLS_INTEGER := NULL
);
```

Parameters

Parameter	Description
schema_name	The schema to enable or disable.
enable	TRUE to enable, FALSE to disable.
privileges	The privileges argument has bitmap values. If you leave the argument as NULL, it defaults to PRIV_CREATE_SHARE + PRIV_CREATE_RECIPIENT + PRIV_CONSUME_ORACLE_SHARE. Bitmap values are as follows: • PRIV_CREATE_SHARE Allow users to create an publish shares in their own schema. PRIV_CREATE_SHARE CONSTANT PLS_INTEGER := 1; • PRIV_CREATE_RECIPIENT Allow users to create share recipients in their own schema. PRIV_CREATE_RECIPIENT CONSTANT PLS_INTEGER := 2; • PRIV_CONSUME_ORACLE_SHARE Allow users to consume Oracle-to-Oracle live shares. PRIV_CONSUME_ORACLE_SHARE CONSTANT PLS_INTEGER := 4; • PRIV_ORDS_ACL Grant an ACL to the user on the local ORDS endpoint. This is required for the user to generate bearer tokens on locally created shares. PRIV_ORDS_ACL CONSTANT PLS_INTEGER := 8;

GET_ACTIVATION_LINK Function

Generate the link that gets put into emails to the authorized recipient. This activation link leads to the download page, where the recipient clicks a button to get the delta profile.

Syntax

```
FUNCTION GET_ACTIVATION_LINK
(
  recipient_name       IN VARCHAR2,
  recipient_owner      IN VARCHAR2 := NULL,
  expiration           IN PLS_INTEGER := 259200,
  invalidate_previous  IN BOOLEAN := TRUE
)
RETURN VARCHAR2;
```

Parameters

Parameter	Description
recipient_name	The local name of the recipient.
recipient_owner	The schema that owns the recipient.
expiration	Number of seconds before the activation link expires.
invalidate_previous	If TRUE, which is the default, a previously generated activation link is made invalid. If FALSE, a previously generated activation link remains valid.

Example: Print activation link to the screen

```
SQL> exec dbms_share.create_share_recipient('new_recipient',
email=>'anyone@example.com')

PL/SQL procedure successfully completed.

SQL> column PROFILE format A200
SQL> variable sprof varchar2(32767)
SQL> declare
  2    profile sys.json_object_t;
  3  begin
  4    dbms_share.populate_share_profile('NEW_RECIPIENT', profile);
  5    :sprof := profile.to_string;
  6  end;
  7  /
PL/SQL procedure successfully completed.

SQL> exec
dbms_output.put_line(dbms_share.get_activation_link('NEW_RECIPIENT'))
http://.../ords/_adpshr/delta-sharing/download?key=43BA....YXJlX3Rlc3Q=

PL/SQL procedure successfully completed.
```

GET_PUBLISHED_IDENTITY Function

Get data about the current user that was set by `SET_PUBLISHED_IDENTITY`.

Syntax

```
FUNCTION GET_PUBLISHED_IDENTITY
  RETURN CLOB;
```

Example

```
SQL> declare
  2    id_json json_object_t := json_object_t();
  3  begin
  4    id_json.put('name', 'Demo Publisher');
  5    id_json.put('description', 'Documentation Share Provider');
  6    id_json.put('contact', 'null@example.com');
  7    dbms_share.set_published_identity(id_json);
  8  end;
  9  /

PL/SQL procedure successfully completed.

SQL> select json_query(dbms_share.get_published_identity, '$' pretty)
"Published Identity"
  2  from dual;

Published Identity-
--------------------------------------------------------------------------------
-
{
  "name" : "Demo Publisher",
  "description" : "Documentation Share Provider",
  "contact" : "null@example.com"
}
```

GET_RECIPIENT_PROPERTY Function

Return the value of a property for a recipient.

Syntax

```
FUNCTION GET_RECIPIENT_PROPERTY
(
  recipient_name       IN VARCHAR2,
  recipient_property   IN VARCHAR2,
  recipient_owner      IN VARCHAR2 := NULL
)RETURN VARCHAR2;
```

Parameters

Parameter	Description
recipient_name	The name of the recipient.
recipient_property	The property to get. These properties include: • PROP_SHARE_DESC • PROP_SHARE_PUBLIC_DESC • PROP_SHARE_VERSION_ACCESS • PROP_SHARE_JOB_NAME • PROP_SHARE_SPLIT_SIZE • PROP_SHARE_LOG_LEVEL • PROP_SHARE_JOB_DOP • PROP_SHARE_JOB_CLASS • PROP_SHARE_JOB_PRIORITY • PROP_SHARE_VERSION_ACCESS For information on constants used for this parameter, see descriptions for **Share Properties** in DBMS_SHARE Constants.
recipient_owner	The owner of the recipient. Defaults to current user.

GET_SHARE_PROPERTY Function

Get the property value of an existing share.

Syntax

```
FUNCTION GET_SHARE_PROPERTY
(
  share_name       IN VARCHAR2,
  share_property   IN VARCHAR2,
  share_owner      IN VARCHAR2 := NULL
)
RETURN VARCHAR2
```

Parameters

Parameter	Description
share_name	The name of the share.
share_property	The property value to get. For information on constants used for this parameter, see descriptions for **Share Properties** in DBMS_SHARE Constants.
share_owner	The owner of the share. Defaults to current user.

GET_SHARE_TABLE_PROPERTY Function

Get the property value of an existing share table.

Syntax

```
FUNCTION GET_SHARE_TABLE_PROPERTY
(
  share_name           IN VARCHAR2,
```

```
  share_table_name     IN VARCHAR2,
  share_table_property IN VARCHAR2,
  share_schema_name    IN VARCHAR2 := NULL,
  share_owner          IN VARCHAR2 := NULL
)RETURN VARCHAR2;
```

Parameters

Parameter	Description
share_name	The name of the share.
share_table_name	The name of the share table.
share_table_property	The share table property to update. For information on constants used for this parameter, see descriptions for **Share Table Properties** in DBMS_SHARE Constants.
share_schema_name	The name of the share schema. Defaults to uppercase of current user.
share_owner	The owner of the share.

GRANT_TO_RECIPIENT Procedure

Grant access on a share to a specific recipient. The share and recipient must both belong to the same schema.

Syntax

```
PROCEDURE GRANT_TO_RECIPIENT
(
    share_name           IN VARCHAR2,
    recipient_name       IN VARCHAR2,
    owner                IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
share_name	The name of the share to grant.
recipient_name	The name of the recipient.
owner	The owner of both the share and recipient.
auto_commit	The auto_commit parameter is ignored. This procedure will always commit.

POPULATE_SHARE_PROFILE Procedure

Generate a delta profile for a recipient. You could print this to the screen or upload it somewhere. For example, to an object bucket using DBMS_CLOUD.EXPORT_DATA.

Syntax

```
PROCEDURE POPULATE_SHARE_PROFILE
(
    recipient_name       IN VARCHAR2,
```

```
    share_profile        IN OUT NOCOPY SYS.JSON_OBJECT_T,
    recipient_owner      IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
recipient_name	The local name of the recipient.
share_profile	The share profile, without bearer token.
recipient_owner	The schema that owns the recipient.

Example: Print the profile to the screen.

```
SQL> EXEC DBMS_SHARE.CREATE_SHARE_RECIPIENT('new_recipient',
email=>'anyone@example.com')

PL/SQL procedure successfully completed.
SQL> column PROFILE format A200
SQL> variable sprof varchar2(32767)
SQL> declare
  2    profile sys.json_object_t;
  3  begin
  4    dbms_share.populate_share_profile('NEW_RECIPIENT', profile);
  5    :sprof := profile.to_string;
  6  end;
  7  /

PL/SQL procedure successfully completed.

SQL> select json_query(:sprof, '$' pretty) "PROFILE" from dual;
PROFILE--------------------------------------------------------------------------
-----------------------------------------------
{
  "shareCredentialsVersion" : 1,
  "endpoint" : "https://.../ords/share_test/_delta_sharing/",
  "bearerToken" : "mc7puvhqCpU6xjTOjRdl_w",
  "tokenEndpoint" : "https://.../ords/share_test/oauth/token",
  "clientID" : "VXGQ_44s6qJ-K4WHUNM2yQ..",
  "clientSecret" : "y9ddppgwEmZl7adDHFQndw.."
}
```

PUBLISH_SHARE Procedure

Publish a share and return immediately.

The publication will continue in the background. You can check on the status of the job by querying the `USER_SHARE_JOBS` view. See USER_SHARE_JOBS View for further information.

Syntax

```
PROCEDURE PUBLISH_SHARE
(
    share_name           IN VARCHAR2,
```

```
    share_owner           IN VARCHAR2 := NULL,
    drop_prior_versions   IN BOOLEAN := FALSE,
    share_job_dop         IN NUMBER := NULL,
    share_job_priority    IN NUMBER := NULL,
    job_class             IN VARCHAR2 := 'DEFAULT_JOB_CLASS',
    force_job_class       IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
share_name	The name of the share to publish.
share_owner	The share owner, which must be the current user or NULL.
drop_prior_versions	Set to TRUE if you want to drop all prior versions of the share. Note that versions are only dropped if there are no outstanding Pre-Authenticated Requests (PARs).
share_job_dop	Specify the maximum number of dbms_scheduler jobs that will be used to publish the share. Leave as NULL to use the system default number.
share_job_priority	Specify a relative priority of this share publication compared to others. If two shares are being published at the same time, then the one with the highest priority is processed first even if it was started later.
job_class	The scheduler job class, from all_scheduler_job_classes, that are used to publish the share.
force_job_class	Use the specifiedjob_class even if the admin has defined a different default job class.

PUBLISH_SHARE_WAIT Procedure

Publish a share and wait until the background job is complete. The publication continues even if the call is interrupted.

Syntax

```
PROCEDURE PUBLISH_SHARE_WAIT
(
       share_name           IN VARCHAR2,
       share_owner          IN VARCHAR2 := NULL,
       drop_prior_versions  IN BOOLEAN := FALSE,
       share_job_dop        IN NUMBER := NULL,
       share_job_priority   IN NUMBER := NULL,
       job_class            IN VARCHAR2 := 'DEFAULT_JOB_CLASS',
       force_job_class      IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
share_name	The name of the share to publish.
share_owner	The share owner, which must be the current user or NULL.
drop_prior_versions	Set to TRUE if you want to drop all prior versions of the share. Note that versions are only dropped if there are no outstanding Pre-Authenticated Requests (PARs).

Parameter	Description
share_job_dop	Specify the maximum number of dbms_scheduler jobs that will be used to publish the share. Leave as NULL to use the system default number.
share_job_priority	Specify a relative priority of this share publication compared to others. If two shares are being published at the same time, then the one with the highest priority is processed first even if it was started later.
job_class	The scheduler job class, from all_scheduler_job_classes, that are used to publish the share.
force_job_class	Use the specifiedjob_class even if the admin has defined a different default job class.

PURGE_DETACHED_FILES Procedure

Delete or forget parquet files that have become detached from their shares.

Syntax

```
PROCEDURE PURGE_DETACHED_FILES
(
    file_pattern          IN VARCHAR2 := '%',
    credential_name       IN VARCHAR2 := NULL,
    purge_mode            IN PLS_INTEGER := PURGE_DROP,
    owner_id              IN NUMBER := SYS_CONTEXT('USERENV',
'CURRENT_USERID')
);
```

A version of PURGE_DETACHED_FILES that returns the ID of the purge job, if any.

```
PROCEDURE PURGE_DETACHED_FILES
(
    purge_job_id          IN OUT NOCOPY NUMBER,
    file_pattern          IN VARCHAR2 := '%',
    credential_name       IN VARCHAR2 := NULL,
    purge_mode            IN PLS_INTEGER := PURGE_DROP,
    owner_id              IN NUMBER := SYS_CONTEXT('USERENV',
'CURRENT_USERID')
);
```

Parameters

Parameter	Description
purge_job_id	The purge job ID.
file_pattern	An optional LIKE pattern for the files that are to be purged.
credential_name	An optional credential to be used to delete the files.

Parameter	Description
purge_mode	Specifies how the files are purged. Purge mode values include: • PURGE_DROP Attempt to drop the files, using the specified credential. If the file cannot be dropped, then the file will continue to be listed in the *_SHARE_DETACHED_FILES views. PURGE_DROP CONSTANT PLS_INTEGER := 1; • PURGE_DROP_FORCE Attempt to drop the files, using the specified credential. The file will be removed from the *_SHARE_DETACHED_FILES views even if the attempt to drop the file fails again. PURGE_DROP_FORCE CONSTANT PLS_INTEGER := 2; • PURGE_FORGET Remove the files *_SHARE_DETACHED_FILES views without attempting to drop them. PURGE_FORGET CONSTANT PLS_INTEGER := 3;
owner_id	The owner ID whose files are to be purged.

REMOVE_FROM_SHARE Procedure

Remove a table or view from a share.

Syntax

```
PROCEDURE REMOVE_FROM_SHARE
(
    share_name           IN VARCHAR2,
    share_table_name     IN VARCHAR2,
    share_schema_name    IN VARCHAR2 := NULL,
    share_owner          IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
share_name	The name of an existing share to which the object is revoked.
share_table_name	The name of the share table to revoke. This must match the externally visible name, so the input will be uppercased.
share_schema_name	The name of the share schema. Defaults to uppercase of current user.
share_owner	The owner of the share.
auto_commit	If TRUE, this procedure call commits changes that are not visible externally until the commit takes place. The default value is FALSE, which means that the user must COMMIT after running this call in order to make the change visible.

RENAME_RECIPIENT Procedure

Rename a recipient. This procedure only changes the local name of the recipient. The external definition of the recipient, for example the name of the OAUTH user or sharing id, is not changed.

Syntax

```
PROCEDURE RENAME_RECIPIENT
(
    old_recipient_name   IN VARCHAR2,
    new_recipient_name   IN VARCHAR2,
    owner                IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
old_recipient_name	The current name of the share recipient.
new_recipient_name	The new name of the share recipient.
owner	The schema that defines the recipient.
auto_commit	If TRUE, the changes are automatically committed. Changes are not visible externally until the commit takes place. The default is TRUE.

RENAME_SHARE Procedure

Rename a share. Care should be take with this procedure since the change effects any existing consumers whose access is based on the previous name. Consumers are not notified directly or updated.

Syntax

```
PROCEDURE RENAME_SHARE
(
    old_share_name       IN VARCHAR2,
    new_share_name       IN VARCHAR2,
    share_owner          IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
old_share_name	The current name of the share.
new_share_name	The new name of the share.
share_owner	The owner of the share.
auto_commit	If TRUE, the changes are automatically committed. Changes are not visible externally until the commit takes place. The default is TRUE.

RENAME_SHARE_LINK Procedure

Rename a registered share link.

Syntax

```
PROCEDURE RENAME_SHARE_LINK
(
    old_name             IN VARCHAR2,
    new_name             IN VARCHAR2,
    link_owner           IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
old_name	The current name of the share link.
new_name	The new name of the link.
link_owner	The owner of the share link. Defaults to current schema.

RENAME_SHARE_SCHEMA Procedure

Rename a share schema.

Syntax

```
PROCEDURE RENAME_SHARE_SCHEMA
(
    share_name           IN VARCHAR2,
    old_schema_name      IN VARCHAR2,
    new_schema_name      IN VARCHAR2,
    share_owner          IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
share_name	The name of the share.
old_schema_name	The old name of the schema.
new_schema_name	The new name of the schema.
share_owner	The owner of the share. Defaults to the current schema.
auto_commit	If TRUE, the changes are automatically committed. Changes are not visible externally until the commit takes place. The default is FALSE.

RENAME_SHARE_TABLE Procedure

Rename a share table.

Syntax

```
PROCEDURE RENAME_SHARE_TABLE
(
    share_name           IN VARCHAR2,
    share_schema_name    IN VARCHAR2,
    old_share_table_name IN VARCHAR2,
    new_share_table_name IN VARCHAR2,
    share_owner          IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
share_name	The name of the share.
share_schema_name	The name of the share schema.
old_share_table_name	The old name of the share table.
new_share_table_name	The new name of the share table.
share_owner	The owner of the share.
auto_commit	If TRUE, the changes are automatically committed. Changes are not visible externally until the commit takes place. The default is FALSE.

REVOKE_FROM_RECIPIENT Procedure

Revoke access on a share from a specific recipient.

Syntax

```
PROCEDURE REVOKE_FROM_RECIPIENT
(
    share_name           IN VARCHAR2,
    recipient_name       IN VARCHAR2,
    owner                IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
share_name	The name of the share to revoke.
recipient_name	The name of the recipient.
owner	The owner of the share and recipient.
auto_commit	If TRUE, the changes are automatically committed. Changes are not visible externally until the commit takes place. The default is FALSE.

SET_CURRENT_SHARE_VERSION Procedure

Change the current version of a share.

Syntax

```
PROCEDURE SET_CURRENT_SHARE_VERSION
(
    share_name          IN VARCHAR2,
    share_version       IN NUMBER,
    share_owner         IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
share_name	The name of the share.
share_version	The new version or NULL. The version must exist and must be valid. If the share_version is NULL, then no version will be marked as CURRENT and the share will be "unpublished".
share_owner	The owner of the share. Defaults to the current schema.

SET_PUBLISHED_IDENTITY Procedure

Set data about the current user that will be supplied to recipients of published ORACLE shares.

Syntax

```
PROCEDURE SET_PUBLISHED_IDENTITY
(
    metadata              IN SYS.JSON_OBJECT_T := NULL
);
```

Parameters

Parameter	Description
metadata	If the provider identity has already been set, then only the items that the caller wants to update need to be included in the JSON. Supplying a NULL value for an item causes that item to be removed from the stored identity. However, "name", "description" and "contact" cannot be removed in this way. If the metadata argument is NULL, the existing provider identity is deleted. This can only happen if the current user has no published shares. If the provider identity has not yet been set, the JSON must contain at least: • name (<=128 bytes) • description (<=4000 bytes) • contact (<=4000 bytes) values Additional items may be included at the caller's discretion.

Example: Include additional items in the JSON metadata

In addition to the required "name", "description", and "contact", this example includes additional item "schedule".

```
{
  "name" : "A sample share provider",
  "description" : "Test of share provider metadata",
  "contact" : "provider1@example.com".
  "schedule" : "New data provided on alternate rainy Fridays"
}
```

Example: Update "description" and remove "schedule"

To update "description" and remove "schedule", the following JSON can be used:

```
{
  "description" : "The Share Provider You Can Trust!(tm)",
  "schedule" : null
}
```

SET_RECIPIENT_LOG_LEVEL Procedure

Change the log level for an existing share recipient.

Syntax

```
PROCEDURE SET_RECIPIENT_LOG_LEVEL
(
  recipient_name       IN VARCHAR2,
  log_level            IN PLS_INTEGER,
  recipient_owner      IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
recipient_name	The local name of the share recipient.
log_level	Event logging level. For information on constants used for this parameter, see descriptions for **Log Level** in DBMS_SHARE Constants.
recipient_owner	The schema that owns the recipient.

SET_SHARE_LOG_LEVEL Procedure

Change the log level for an existing share.

Syntax

```
PROCEDURE SET_SHARE_LOG_LEVEL
(
  share_name           IN VARCHAR2,
  log_level            IN PLS_INTEGER,
```

```
  share_owner           IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
share_name	The name of the share.
log_level	Event logging level. For information on constants used for this parameter, see descriptions for **Log Level** in DBMS_SHARE Constants.
share_owner	The owner of the share.

SET_STORAGE_CREDENTIAL Procedure

Set the credential name used by the current user when it attempts to access the given storage.

Syntax

```
PROCEDURE SET_STORAGE_CREDENTIAL
(
    storage_link_name    IN VARCHAR2,
    credential_name      IN VARCHAR2,
    owner                IN VARCHAR2 := NULL,
    check_if_exists      IN BOOLEAN := TRUE,
    auto_commit          IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
storage_link_name	The name of a cloud storage link previously created using CREATE_CLOUD_STORAGE_LINK Procedure.
credential_name	The name of a local credential that gives access to the storage. The credentials used for share storage must be able to read, write, delete, and manage pre-authenticated requests. See Using Pre-Authenticated Requests
owner	The owner of the cloud storage link. Leave as NULL for the current user.
check_if_exists	If check_if_exists is TRUE, then the function will also confirm that the credential exists for the current user.
auto_commit	The default is TRUE. If TRUE, this transaction is committed. If FALSE, the user must commit the transaction. Changes are not visible until the commit takes place.

STOP_JOB Procedure

Attempt to stop a running share job. The procedure should return quickly, but it may take some time for the associated job to stop.

Syntax

```
PROCEDURE STOP_JOB
(
  share_job_id          IN NUMBER,
```

```
  share_job_owner       IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
share_job_id	The ID of the share job.
share_job_owner	The owner of the job. Defaults to the current schema.

UNPUBLISH_SHARE Procedure

Unpublish a share.

Syntax

```
PROCEDURE UNPUBLISH_SHARE
(
    share_name            IN VARCHAR2,
    out_share_job_id      IN OUT NOCOPY NUMBER,
    share_owner           IN VARCHAR2 := NULL,
    drop_all_versions     IN BOOLEAN := FALSE,
    restart_versions      IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
share_name	The name of the share.
out_share_job_id	The ID of any share job that needs to be run to process this command.
share_owner	The owner of the share. Defaults to the current schema.
drop_all_versions	If set to TRUE, all existing versions along with all associated storage is dropped. If drop_all_versions is FALSE, then all existing versions continue to exist, but the share is not visible to recipients. A subsequent call to PUBLISH_SHARE or SET_CURRENT_SHARE_VERSION makes them visible again.
restart_versions	Restart version numbering. If FALSE, then the next published version number will be the same as it would have been if no versions had been dropped. If TRUE, then the next published version will be set to one more than the highest existing version. When used in conjunction with drop_all_versions, this has the effect of resetting the share to its original state. Note that this may confuse any existing delta clients, so it should be used with care.

UPDATE_DEFAULT_RECIPIENT_PROPERTY Procedure

Update the default recipient property values. This procedure requires the user to have admin privileges.

Syntax

```
PROCEDURE UPDATE_DEFAULT_RECIPIENT_PROPERTY
(
  recipient_property   IN VARCHAR2,
  new_value_vc         IN VARCHAR2
);
```

Parameters

Parameter	Description
recipient_property	The property to update. For information on constants used for this parameter, see descriptions for **Share Recipient Properties** in DBMS_SHARE Constants.
new_value_vc	The new property value.

UPDATE_DEFAULT_SHARE_PROPERTY Procedure

Update the default share property values.

Syntax

```
PROCEDURE UPDATE_DEFAULT_SHARE_PROPERTY
(
    share_property       IN VARCHAR2,
    new_value            IN VARCHAR2
);
```

Parameters

Parameter	Description
share_property	The property to update. For information on constants used for this parameter, see descriptions for **Share Properties** in DBMS_SHARE Constants. These properties can be read using the ALL_SHARE_DEFAULT_SETTINGS View.
new_value	The new property value.

UPDATE_RECIPIENT_PROPERTY Procedure

Update a property of an existing recipient.

Syntax

```
PROCEDURE UPDATE_RECIPIENT_PROPERTY
(
```

```
    recipient_name       IN VARCHAR2,
    recipient_property   IN VARCHAR2,
    new_value            IN VARCHAR2,
    recipient_owner      IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
recipient_name	The name of the recipient.
recipient_property	The property to update. These properties include: • PROP_RECIPIENT_EMAIL • PROP_RECIPIENT_DESCRIPTION • PROP_RECIPIENT_LOG_LEVEL • PROP_RECIPIENT_SHARING_ID • PROP_RECIPIENT_PROFILE_URL • PROP_RECIPIENT_PAR_TYPE • PROP_RECIPIENT_MIN_PAR_LIFETIME • PROP_RECIPIENT_PAR_LIFETIME • PROP_RECIPIENT_TOKEN_LIFETIME For information on constants used for this parameter, see descriptions for **Share Recipient Recipient Properties** in DBMS_SHARE Constants.
new_value	The new property value.
recipient_owner	The owner of the recipient. Defaults to the current schema.

UPDATE_SHARE_JOB_PROPERTY Procedure

Modify properties of a running share job. The procedure should return quickly, but it may take some time for the changes to take effect.

Syntax

```
PROCEDURE UPDATE_SHARE_JOB_PROPERTY
(
    share_job_id         IN NUMBER,
    share_property       IN VARCHAR2,
    new_value            IN VARCHAR2,
    share_job_owner      IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
share_job_id	The ID of the share job.
share_property	The property to update. For information on constants used for this parameter, see descriptions for **Share Job Properties** in DBMS_SHARE Constants.
new_value	The new property value.
share_job_owner	The owner of the job. Defaults to the current schema.

UPDATE_SHARE_PROPERTY Procedure

Update a property of an existing share.

Syntax

```
PROCEDURE UPDATE_SHARE_PROPERTY
(
    share_name           IN VARCHAR2,
    share_property       IN VARCHAR2,
    new_value            IN VARCHAR2,
    share_owner          IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
share_name	The name of the share.
share_property	The property to update. For information on constants used for this parameter, see descriptions for **Share Properties** in DBMS_SHARE Constants.
new_value	The new property value.
share_owner	The owner of the share. Defaults to the current schema.
Auto_commit	If TRUE (the default), the changes are automatically committed. If FALSE, the user must commit the changes. Changes are visible externally after the commit takes place.

UPDATE_SHARE_TABLE_PROPERTY Procedure

Update the property value of an existing share table.

Syntax

```
PROCEDURE UPDATE_SHARE_TABLE_PROPERTY
(
    share_name           IN VARCHAR2,
    share_table_name     IN VARCHAR2,
    share_table_property IN VARCHAR2,
    new_value            IN VARCHAR2,
    share_schema_name    IN VARCHAR2 := NULL,
    share_owner          IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
share_name	The name of the share.
share_table_name	The name of the share table.

Parameter	Description
share_table_property	The property to update. These properties include: • PROP_SHARE_TABLE_SPLIT_METHOD • PROP_SHARE_TABLE_SPLIT_COLUMNS • PROP_SHARE_TABLE_ORDER_COLUMNS • PROP_SHARE_TABLE_SHARE_COLUMNS • PROP_SHARE_TABLE_SPLIT_SIZE • PROP_SHARE_TABLE_GATHER_STATS • PROP_SHARE_TABLE_SPLIT_ROWS • PROP_SHARE_TABLE_FLASHBACK
new_value	The new property value.
share_schema_name	The name of the share schema (defaults to uppercase of current user).
share_owner	The owner of the share. Defaults to the current schema.
Auto_commit	If TRUE (the default), the changes are automatically committed. If FALSE, the user must commit the changes. Changes are visible externally after the commit takes place.

VALIDATE_CREDENTIAL Function

Validate a credential name, converting it to canonical form first if required.

The procedure raises an exception if the name is not a valid Oracle identifier. The credential_name is returned without double quotes, as it would appear in the CREDENTIAL_NAME column of the USER_CREDENTIALS view.

Syntax

```
FUNCTION VALIDATE_CREDENTIAL
(
        credential_name      IN VARCHAR2,
        check_if_exists      IN BOOLEAN := TRUE
)
RETURN VARCHAR2;
```

Parameters

Parameter	Description
credential_name	The name of the credential to validate in standard database form, with double quotes if the name is not a simple identifier.
check_if_exists	If TRUE, then the function also confirms that the credential exists for the current user.

VALIDATE_SHARE_STORAGE Procedure

Check to see if the given storage is suitable for versioned shares.

Syntax

The procedure syntax including the `validation_results` output parameter.

```
 PROCEDURE VALIDATE_SHARE_STORAGE
(
    storage_link_name    IN VARCHAR2,
    validation_results   IN OUT NOCOPY VARCHAR2,
    run_storage_tests    IN BOOLEAN := TRUE,
    storage_link_owner   IN VARCHAR2 := NULL
);
```

The procedure syntax not including the `validation_results` output parameter.

```
PROCEDURE VALIDATE_SHARE_STORAGE
(
    storage_link_name    IN VARCHAR2,
    run_storage_tests    IN BOOLEAN := TRUE,
    storage_link_owner   IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
`storage_link_name`	The cloud storage link name.
`validation_results`	(Optional input and output) Validation result details returned in JSON form. The `validation_results` include the results for each separate test.
`run_storage_tests`	Run tests to validate the storage. If TRUE (the default), the procedure tests READ, WRITE, DELETE, and PREAUTHENTICATED REQUESTS.
`storage_link_owner`	The cloud storage link owner.

Example: Validation results

```
{
  "READ":"PASSSED",
  "WRITE":"PASSSED",
  "CREATE_PAR":"PASSSED",
  "DELETE_PAR":"PASSSED",
  "DELETE":"PASSSED"
}
```

WAIT_FOR_JOB Procedure

This procedure waits until the specified share job is complete.

Syntax

```
PROCEDURE WAIT_FOR_JOB
(
    share_job_id          IN NUMBER,
    completed             IN OUT NOCOPY BOOLEAN,
    maximum_wait          IN NUMBER := NULL
);
```

Parameters

Parameter	Description
share_job_id	The ID of the share job.
completed	Job completion indicator.
maximum_wait	The maximum wait period, in seconds. A NULL value implies no limit.

Summary of Share Consumer Subprograms

This table lists the DBMS_SHARE package procedures and functions used to consume shares.

Subprograms	Description
ASSERT_SHARING_ID Procedure	Run basic validation checks against a sharing id and return one in canonical form.
CREATE_CREDENTIALS Procedure and Function	Create a credential containing the bearer token from a delta profile.
CREATE_OR_REPLACE_SHARE_LINK Procedure	Subscribe to share from a registered share provider.
CREATE_OR_REPLACE_ORACLE_SHARE_PROVIDER Procedure	Subscribe to an Oracle share provider, with a local name.
CREATE_ORACLE_SHARE_PROVIDER Procedure	Subscribe to an Oracle share provider, with a local name.
CREATE_SHARE_LINK Procedure	Subscribe to share from a registered share provider.
CREATE_SHARE_LINK_VIEW Procedure	Create or replace a named view that gives access to a remote shared table.
CREATE_SHARE_PROVIDER Procedure	Subscribe to a delta share provider.
DISCOVER_AVAILABLE_SHARES Function	Return one SHARE_AVAILABLE_SHARES_ROW for each available table from the subscribed share providers.
DISCOVER_AVAILABLE_TABLES Function	Return one SHARE_AVAILABLE_TABLES_ROW for each available table from the subscribed share providers or from an explicit delta endpoint.
DROP_SHARE_LINK Procedure	Drop a share link created by the CREATE_SHARE_LINK procedure.
DROP_SHARE_PROVIDER Procedure	Drop a subscription to a share provider.

Subprograms	Description
ENABLE_DELTA_ENDPOINT Procedure	Create necessary ACLs that allow the specified user to connect to a delta endpoint.
FLUSH_SHARE_LINK_CACHE Procedure	Flush the cache of shares for a given share link.
FLUSH_SHARE_PROVIDER_CACHE Procedure	Flush the cache of shares for a given share provider.
GENERATE_SHARE_LINK_SELECT Procedure and Function	Generate a SELECT statement that returns data from a shared table.
GET_ORACLE_SHARE_LINK_INFO Function	Retrieve the cloud link name and namespace for an Oracle-to-Oracle share.
GET_SHARE_LINK_INFO Procedure	Get the endpoint(s), share type and share name along with any additional JSON metadata for a share link.
GET_SHARE_PROVIDER_CREDENTIAL Procedure	Get the credential name to be used by the current user when it attempts to access the given delta share provider.
GET_SHARE_PROVIDER_INFO Procedure	Get the endpoint string(s) and share type along with any additional JSON metadata for a share provider.
GET_SHARING_ID Function	Return an identifier that can be used as the `sharing_id` in the `CREATE_SHARE_RECIPIENT` procedure.
OPEN_SHARE_LINK_CURSOR Procedure	Open a cursor that returns data from a shared table.
REFRESH_BEARER_TOKEN_CREDENTIAL Procedure	Update one or more credentials created by `CREATE_BEARER_TOKEN_CREDENTIAL` or `CREATE_CREDENTIALS`.
RENAME_CLOUD_STORAGE_LINK Procedure	Rename a registered cloud storage link.
RENAME_SHARE_LINK Procedure	Rename a registered share link.
RENAME_SHARE_PROVIDER Procedure	Rename a registered share provider.
REMOVE_SHARE_SCHEMA Procedure	Remove a schema and all its contents from a share.
SET_SHARE_LINK_METADATA Procedure	Set the additional JSON metadata for the share link.
SET_SHARE_PROVIDER_CREDENTIAL Procedure	Set the credential name to access the given share provider.
SET_SHARE_PROVIDER_METADATA Procedure	Set additional JSON metadata for the share provider.
UPDATE_BEARER_TOKEN_CREDENTIAL Procedure	Modify an attribute of a credential created by `CREATE_CREDENTIALS` or `CREATE_BEARER_TOKEN_CREDENTIAL`.

- ASSERT_SHARING_ID Procedure
  Run basic validation checks against a sharing id and return one in canonical form. An exception is raised if the id is obviously invalid.
- CREATE_CREDENTIALS Procedure and Function
  Create a credential containing the bearer token from a delta sharing profile. The standard type, version 1, specifies an endpoint and a single long term bearer token.
- CREATE_OR_REPLACE_SHARE_LINK Procedure
  Subscribe to share from a registered share provider.
- CREATE_OR_REPLACE_ORACLE_SHARE_PROVIDER Procedure
  Subscribe to an Oracle share provider, with a local name.

- CREATE_ORACLE_SHARE_PROVIDER Procedure
  Subscribe to an Oracle share provider, with a local name.
- CREATE_SHARE_LINK Procedure
  Subscribe to share from a registered share provider. The available share names can be found by calling `DISCOVER_AVAILABLE_SHARES`.
- CREATE_SHARE_LINK_VIEW Procedure
  Create or replace a named view that gives access to a remote shared table.
- CREATE_SHARE_PROVIDER Procedure
  Subscribe to a delta share provider.
- DISCOVER_AVAILABLE_SHARES Function
  Return one `SHARE_AVAILABLE_SHARES_ROW` for each available table from the subscribed share providers.
- DISCOVER_AVAILABLE_TABLES Function
  Return one `SHARE_AVAILABLE_TABLES_ROW` for each available table from the subscribed share providers.
- DROP_SHARE_LINK Procedure
  Drop a share link created by the `CREATE_SHARE_LINK` procedure.
- DROP_SHARE_PROVIDER Procedure
  Drop a subscription to a share provider.
- ENABLE_DELTA_ENDPOINT Procedure
  Create necessary ACLs that allow the specified user to connect to a delta endpoint. Admin privileges are required for this procedure.
- FLUSH_SHARE_LINK_CACHE Procedure
  Flush the cache of shares for a given share link. The list of shares for the remote endpoints is fetched instead of relying on cached values.
- FLUSH_SHARE_PROVIDER_CACHE Procedure
  Flush the cache of shares for a given share provider. The list of shares for the remote endpoints is fetched instead of relying on cached values.
- GENERATE_SHARE_LINK_SELECT Procedure and Function
  Generate a SELECT statement that returns data from a shared table.
- GET_ORACLE_SHARE_LINK_INFO Function
  Retrieve the cloud link name and namespace for an Oracle-to-Oracle share.
- GET_SHARE_LINK_INFO Procedure
  Get the endpoint(s), share type and share name along with any additional JSON metadata for a share link.
- GET_SHARE_PROVIDER_CREDENTIAL Procedure
  Get the credential name to be used by the current user when it attempts to access the given delta share provider.
- GET_SHARE_PROVIDER_INFO Procedure
  Get the endpoint string(s) and share type along with any additional JSON metadata for a share provider. For ORACLE share providers, the Oracle provider ID is returned in the endpoint argument.
- GET_SHARING_ID Function
  Return an identifier that can be used as the `sharing_id` in the `CREATE_SHARE_RECIPIENT` procedure. This function can be used to share data between two users, the "provider" and the "recipient", in different databases.

- OPEN_SHARE_LINK_CURSOR Procedure
  Open a cursor that returns data from a shared table.
- REFRESH_BEARER_TOKEN_CREDENTIAL Procedure
  Update one or more credentials created by `CREATE_BEARER_TOKEN_CREDENTIAL` or `CREATE_CREDENTIALS` by calling the registered token endpoints and fetching new bearer tokens. Note this procedure is called automatically by a scheduler job, `ADP$BEARER_REFRESH_JOB`, that runs every 50 minutes.
- RENAME_CLOUD_STORAGE_LINK Procedure
  Rename a registered cloud storage link.
- RENAME_SHARE_PROVIDER Procedure
  Rename a registered share provider.
- REMOVE_SHARE_SCHEMA Procedure
  Remove a schema and all its contents from a share.
- SET_SHARE_LINK_METADATA Procedure
  Set the additional JSON metadata for the share link.
- SET_SHARE_PROVIDER_CREDENTIAL Procedure
  Set the credential name to be used by the current user when it attempts to access the given share provider.
- SET_SHARE_PROVIDER_METADATA Procedure
  Set additional JSON metadata for the share provider.
- UPDATE_BEARER_TOKEN_CREDENTIAL Procedure
  Modify an attribute of a credential created by `CREATE_CREDENTIALS` or `CREATE_BEARER_TOKEN_CREDENTIAL`.

ASSERT_SHARING_ID Procedure

Run basic validation checks against a sharing id and return one in canonical form. An exception is raised if the id is obviously invalid.

Syntax

```
PROCEDURE ASSERT_SHARING_ID
(
    sharing_id              IN OUT NOCOPY VARCHAR2,
    out_sharing_id_type     IN OUT NOCOPY VARCHAR2
);
```

Parameters

Parameter	Description
`sharing_id`	The id to check.
`out_sharing_id_type`	The type of the id, if valid. For example, `TENANCY` or `DATABASE`.

CREATE_CREDENTIALS Procedure and Function

Create a credential containing the bearer token from a delta sharing profile. The standard type, version 1, specifies an endpoint and a single long term bearer token.

Syntax

```
PROCEDURE CREATE_CREDENTIALS
(
    credential_base_name IN VARCHAR2,
    delta_profile        IN CLOB,
    out_credential_name  IN OUT NOCOPY VARCHAR2
);
```

Below is the functional version of the `create_credentials` that returns the name of the new credentials in JSON form.

```
FUNCTION CREATE_CREDENTIALS
(
   credential_base_name IN VARCHAR2,
   delta_profile        IN CLOB
)
RETURN CLOB;
```

Parameters

Parameter	Description
`credential_base_name`	The base name of the credential(s) to create.

`delta_profile`	The delta sharing profile, in JSON format, obtained from the share provider.
	
	`{`
	`  "shareCredentialsVersion": 1,`
	`  "endpoint": "https://<endpoint>",`
	`  "bearerToken": "<token>",`
	`  "expirationTime": "...",`
	`}`
	
	The profile may also, optionally, include a `tokenEndpoint` property along with a `clientID` and `clientSecret`.
	
	`{`
	`  "shareCredentialsVersion": 1,`
	`  "endpoint": "https://<endpoint>",`
	`  "bearerToken": "<token>",`
	`  "expirationTime": "...",`
	`  "tokenEndpoint": "https://<token endpoint>",`
	`  "clientID": "<client id>",`
	`  "clientSecret": "<client secret>"`
	`}`
	
	See Profile File Format and Bearer Token for further information.

`out_credential_name`	The name of the newly created bearer token credential.

CREATE_OR_REPLACE_SHARE_LINK Procedure

Subscribe to share from a registered share provider.

Syntax

```
PROCEDURE CREATE_OR_REPLACE_SHARE_LINK
(
    share_link_name        IN VARCHAR2,
    share_provider         IN VARCHAR2,
    share_name             IN VARCHAR2,
    provider_owner         IN VARCHAR2 := NULL,
    link_owner             IN VARCHAR2 := NULL,
    use_default_credential IN BOOLEAN := TRUE,
    metadata               IN SYS.JSON_OBJECT_T := NULL,
    auto_commit            IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
share_link_name	The name of the share link that will be created. The available share names can be found by calling DISCOVER_AVAILABLE_SHARES Function.
share_provider	The name of the registered share provider.
share_name	The name of the share from the share provider.
provider_owner	The owner of the share provider. Defaults to the current schema.
link_owner	The owner of the share link. Defaults to the current schema.
use_default_credential	If TRUE, use the same credentials as the share provider.
metadata	Optional metadata to associate with the share link.
auto_commit	If TRUE (the default), this procedure call commits changes that are not visible externally until the commit takes place. If FALSE, the user must COMMIT after running this call in order to make the change visible.

CREATE_OR_REPLACE_ORACLE_SHARE_PROVIDER Procedure

Subscribe to an Oracle share provider, with a local name.

It will then appear in ALL_SHARE_PROVIDERS View with `RECIPIENT_TYPE = 'ORACLE'`.

> **Note:**
>
> Use the `SET_STORAGE_CREDENTIAL` procedure to add a credential to the storage link. See SET_STORAGE_CREDENTIAL Procedure.

Syntax

```
PROCEDURE CREATE_OR_REPLACE_CLOUD_STORAGE_LINK
(
    storage_link_name    IN VARCHAR2,
```

```
    uri                 IN VARCHAR2,
    owner               IN VARCHAR2 := NULL,
    metadata            IN SYS.JSON_OBJECT_T := NULL,
    auto_commit         IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
storage_link_name	The name of the cloud storage link. The name of the link should follow standard Oracle naming conventions. See Database Object Names and Qualifiers
uri	The URI of the storage bucket. The URI should be of the form https://objectstorage.region.oraclecloud.com/n/namespace-string/b/bucket/o
owner	The owner of the storage link. Defaults to the current schema.
metadata	An optional JSON metadata document containing additional information.
auto_commit	If TRUE, the changes automatically commit after creating the link. The default is TRUE.

CREATE_ORACLE_SHARE_PROVIDER Procedure

Subscribe to an Oracle share provider, with a local name.

It will then appear in ALL_SHARE_PROVIDERS View with RECIPIENT_TYPE = 'ORACLE'.

Syntax

```
PROCEDURE CREATE_ORACLE_SHARE_PROVIDER
(
    oracle_provider_id   IN VARCHAR2,
    provider_name        IN VARCHAR2,
    owner                IN VARCHAR2 := NULL,
    metadata             IN SYS.JSON_OBJECT_T := NULL,
    auto_commit          IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
oracle_provider_id	The provider ID obtained from the ALL_AVAILABLE_ORACLE_SHARE_PROVIDERS view. See ALL_AVAILABLE_ORACLE_SHARE_PROVIDERS View.
provider_name	A local name for the provider
owner	The owner of the new share provider. Leave as NULL for the current user.
metadata	Optional JSON metadata to associate with the provider.
auto_commit	If TRUE, the changes automatically commit after creating the link. The default is TRUE.

CREATE_SHARE_LINK Procedure

Subscribe to share from a registered share provider. The available share names can be found by calling `DISCOVER_AVAILABLE_SHARES`.

Syntax

```
PROCEDURE CREATE_SHARE_LINK
(
    share_link_name      IN VARCHAR2,
    share_provider       IN VARCHAR2,
    share_name           IN VARCHAR2,
    provider_owner       IN VARCHAR2 := NULL,
    link_owner           IN VARCHAR2 := NULL,
    use_default_credential IN BOOLEAN := TRUE,
    metadata             IN SYS.JSON_OBJECT_T := NULL,
    auto_commit          IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
`share_link_name`	The name of the share link to create. This should follow standard Oracle naming conventions and does not need to be the same as the `share_name` parameter.
`share_provider`	The name of the share provider, listed in `ALL_SHARE_PROVIDERS`, that shared the data.
`share_name`	The name of the share, as defined by the share provider.
`provider_owner`	The schema that subscribed the share provider, as listed in `ALL_SHARE_PROVIDER`. Leave as null to default to the current user, which is typical.
`link_owner`	The owner of the new share link. Leave as null to default to the current user, which is typical.
`use_default_credential`	Set to TRUE to use the same credential for both the share link and the share provider.
`metadata`	Optional JSON metadata to associated with the share link.
`auto_commit`	If TRUE, the changes automatically commit after creating the link. The default is TRUE.

CREATE_SHARE_LINK_VIEW Procedure

Create or replace a named view that gives access to a remote shared table.

Syntax

```
PROCEDURE CREATE_SHARE_LINK_VIEW
(
    view_name            IN VARCHAR2,
    share_link_name      IN VARCHAR2,
    share_schema_name    IN VARCHAR2,
    share_table_name     IN VARCHAR2,
    view_owner           IN VARCHAR2 := NULL,
```

```
    share_link_owner     IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
view_name	The name of the new view.
share_link_name	The name of the share link.
share_schema_name	The name of the shared schema.
share_table_name	The name of the shared table.
view_owner	The view owner. Defaults to the current schema.
share_link_owner	The link owner. Defaults to the current schema.

CREATE_SHARE_PROVIDER Procedure

Subscribe to a delta share provider.

Syntax

```
PROCEDURE CREATE_SHARE_PROVIDER
(
  provider_name         IN VARCHAR2,
  endpoint              IN VARCHAR2,
  token_endpoint        IN VARCHAR2 := NULL,
  share_type            IN VARCHAR2 := 'DELTA',
  owner                 IN VARCHAR2 := NULL,
  metadata              IN SYS.JSON_OBJECT_T := NULL,
  auto_commit           IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
provider_name	The local name of this share provider.
endpoint	The delta endpoint, from the delta sharing profile.
token_endpoint	This parameter is ignored.
share_type	The type of share provider. Leave this as DELTA.
owner	The owner of the share provider. Defaults to the current schema.
metadata	Optional JSON metadata to associate with the share provider.
auto_commit	If TRUE (the default), this procedure call commits changes that are not visible externally until the commit takes place. If FALSE, the user must COMMIT after running this call in order to make the change visible.

DISCOVER_AVAILABLE_SHARES Function

Return one SHARE_AVAILABLE_SHARES_ROW for each available table from the subscribed share providers.

Syntax

```
FUNCTION DISCOVER_AVAILABLE_SHARES
(
    share_provider       IN VARCHAR2,
    owner                IN VARCHAR2 := NULL
) RETURN share_available_shares_tbl PIPELINED;
```

Parameters

Parameter	Description
share_provider	The name of the share provider.
owner	The owner of the share provider. Defaults to the current schema.

Example: Discover a list of shares available from a given provider

```
SQL> select available_share_name
  2    from dbms_share.discover_available_shares('share_prov')
  3   order by available_share_name;

AVAILABLE_SHARE_NAME
--------------------------------------------------------------------------------
--
BURLINGTON_EXPEDITION_2022

EGYPT_EXPEDITION_2022
```

DISCOVER_AVAILABLE_TABLES Function

Return one `SHARE_AVAILABLE_TABLES_ROW` for each available table from the subscribed share providers.

Syntax

```
FUNCTION DISCOVER_AVAILABLE_TABLES
(
  share_provider       IN VARCHAR2 := NULL,
  share_name           IN VARCHAR2 := NULL,
  owner                IN VARCHAR2 := NULL,
  endpoint             IN VARCHAR2 := NULL,
  credential_name      IN VARCHAR2 := NULL
) RETURN share_available_tables_tbl PIPELINED;
```

Parameters

Parameter	Description
share_provider	An optional share provider name. If NULL, search all subscribed share providers.
share_name	An optional share name. If NULL, search all discovered shares.
owner	The owner of the share provider. Defaults to the current schema.

Parameter	Description
endpoint	An optional delta endpoint.
credential_name	An optional bearer token credential to access the endpoint.

Example: List shares available from all subscribed share providers

```
SQL> select * from dbms_share.discover_available_tables()
  2  order by share_name, schema_name, table_name;

 PROVIDER_NAME              PROVIDER_OWNER  SHARE_NAME
------------------------- --------------- ------------------------------
SCHEMA_NAME               TABLE_NAME
------------------------- -------------------------
My Test Oracle Provider   ADP_SHARE_TEST  BURLINGTON_EXPEDITION_2022
SH                        COUNTRIES

My Test Oracle Provider   ADP_SHARE_TEST  BURLINGTON_EXPEDITION_2022
SH                        SH_COUNTRIES

My Test Oracle Provider   ADP_SHARE_TEST  EGYPT_EXPEDITION_2022
SHARED_SCHEMA             SHARED_VIEW_1

My Test Oracle Provider   ADP_SHARE_TEST  EGYPT_EXPEDITION_2022
SHARED_SCHEMA             SHARED_VIEW_2
```

Example: List tables available from an unsubscribed endpoint

```
SQL> exec dbms_cloud.create_credential('MY_CRED', 'BEARER_TOKEN', '123456')
PL/SQL procedure successfully completed.
SQL> column share_name format a13
SQL> column table_name format a20
SQL> column schema_name format a10
SQL> select share_name, schema_name, table_name
2   from dbms_share.discover_available_tables(
3     endpoint=>'https://my_endpoint',
4     credential_name=>'MY_CRED')
5   order by 1, 2, 3;

SHARE_NAME SCHEMA_NAM TABLE_NAME
------------ ---------- --------------------
DELTA_SHARING DEFAULT BOSTON-HOUSING
DELTA_SHARING DEFAULT COVID_19_NYT
DELTA_SHARING DEFAULT FLIGHT-ASA_2008
DELTA_SHARING DEFAULT LENDING_CLUB
DELTA_SHARING DEFAULT NYCTAXI_2019
DELTA_SHARING DEFAULT NYCTAXI_2019_PART
DELTA_SHARING DEFAULT OWID-COVID-DATA

7 rows selected.
```

DROP_SHARE_LINK Procedure

Drop a share link created by the `CREATE_SHARE_LINK` procedure.

See CREATE_SHARE_LINK Procedure for further information.

Syntax

```
PROCEDURE DROP_SHARE_LINK
(
    link_name            IN VARCHAR2,
    link_owner           IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
`link_name`	The name of the share link to drop.
`link_owner`	The owner of the share link to drop. Leave as null for the current schema.

DROP_SHARE_PROVIDER Procedure

Drop a subscription to a share provider.

Syntax

```
PROCEDURE DROP_SHARE_PROVIDER
(
    provider_name        IN VARCHAR2,
    owner                IN VARCHAR2 := NULL,
    drop_credentials     IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
`provider_name`	The name of the share provider to drop.
`owner`	The owner of the share provider to drop. Defaults to the current schema.
`drop_credentials`	If TRUE, any credentials associated with the provider are dropped. If FALSE, credentials are not dropped.

ENABLE_DELTA_ENDPOINT Procedure

Create necessary ACLs that allow the specified user to connect to a delta endpoint. Admin privileges are required for this procedure.

Syntax

```
PROCEDURE ENABLE_DELTA_ENDPOINT
(
    schema_name          IN VARCHAR2,
```

```
    delta_profile         IN CLOB,
    enabled               IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
schema_name	The schema to enable or disable.
delta_profile	The delta profile. Only the endpoint and tokenEndpoint are required.
enabled	TRUE to enable and FALSE to disable.

FLUSH_SHARE_LINK_CACHE Procedure

Flush the cache of shares for a given share link. The list of shares for the remote endpoints is fetched instead of relying on cached values.

Syntax

```
PROCEDURE FLUSH_SHARE_LINK_CACHE
(
    link_name             IN VARCHAR2,
    owner                 IN VARCHAR2 := NULL,
    auto_commit           IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
link_name	The name of the share link.
owner	The owner of the share link. Defaults to the current schema.
auto_commit	If TRUE, the changes are automatically committed. The default is TRUE.

FLUSH_SHARE_PROVIDER_CACHE Procedure

Flush the cache of shares for a given share provider. The list of shares for the remote endpoints is fetched instead of relying on cached values.

Syntax

```
PROCEDURE FLUSH_SHARE_PROVIDER_CACHE
(
  provider_name         IN VARCHAR2,
  owner                 IN VARCHAR2 := NULL,
  auto_commit           IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
provider_name	The name of the share provider.

Parameter	Description
owner	The owner of the share provider. Defaults to the current schema.
auto_commit	If TRUE, the changes are automatically committed. The default is TRUE.

GENERATE_SHARE_LINK_SELECT Procedure and Function

Generate a SELECT statement that returns data from a shared table.

Syntax

Procedure version of GENERATE_SHARE_LINK_SELECT.

```
PROCEDURE GENERATE_SHARE_LINK_SELECT
(
    share_link_name      IN VARCHAR2,
    share_schema_name    IN VARCHAR2,
    share_table_name     IN VARCHAR2,
    stmt                 IN OUT NOCOPY CLOB,
    share_link_owner     IN VARCHAR2 := NULL
);
```

Function version of GENERATE_SHARE_LINK_SELECT.

```
 FUNCTION GENERATE_SHARE_LINK_SELECT
(
    share_link_name      IN VARCHAR2,
    share_schema_name    IN VARCHAR2,
    share_table_name     IN VARCHAR2,
    share_link_owner     IN VARCHAR2 := NULL
)
RETURN CLOB;
```

Parameters

Parameter	Description
share_link_name	The name of the share link.
share_schema_name	The name of the shared schema.
share_table_name	The name of the shared table.
stmt	The generated select statement.
share_link_owner	The link owner. Defaults to the current schema.

GET_ORACLE_SHARE_LINK_INFO Function

Retrieve the cloud link name and namespace for an Oracle-to-Oracle share.

Syntax

```
FUNCTION GET_ORACLE_SHARE_LINK_INFO
(
  oracle_provider_id   IN VARCHAR2,
```

```
  share_name           IN VARCHAR2,
  share_schema_name    IN VARCHAR2,
  share_table_name     IN VARCHAR2
)
RETURN CLOB;
```

Parameters

Parameter	Description
oracle_provider_id	The Oracle Provider ID from ALL_AVAILABLE_ORACLE_SHARE_PROVIDERS.
share_name	The name of a share from ALL_AVAILABLE_ORACLE_SHARE_PROVIDERS.SHARES.
share_schema_name	The name of a share schema from ALL_AVAILABLE_ORACLE_SHARE_PROVIDERS.SHARES.
share_table_name	The name of a table from ALL_AVAILABLE_ORACLE_SHARE_PROVIDERS.SHARES.

Return

The return value is a JSON object containing three properties: schema, table, and dblink. The caller can use these three properties to fetch data using a query of the following form:

```
SELECT *
FROM <schema>.<table>@<dblink>
```

GET_SHARE_LINK_INFO Procedure

Get the endpoint(s), share type and share name along with any additional JSON metadata for a share link.

Syntax

```
PROCEDURE GET_SHARE_LINK_INFO
(
    link_name            IN VARCHAR2,
    endpoint             IN OUT NOCOPY VARCHAR2,
    share_type           IN OUT NOCOPY VARCHAR2,
    share_name           IN OUT NOCOPY VARCHAR2,
    token_endpoint       IN OUT NOCOPY VARCHAR2,
    metadata             IN OUT NOCOPY BLOB,
    link_owner           IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
link_name	The name of a share link (previously created by CREATE_SHARE_LINK).
endpoint	OUT: The endpoint, if any, associated with the share link.
share_type	OUT: The type of share link (for example, DELTA).
share_name	OUT: The name of the linked share.

Parameter	Description
token_endpoint	This parameter is no longer used.
metadata	OUT: Optional metadata associated with the share link.
link_owner	The owner of the share link. Defaults to the current schema.

GET_SHARE_PROVIDER_CREDENTIAL Procedure

Get the credential name to be used by the current user when it attempts to access the given delta share provider.

Syntax

```
PROCEDURE GET_SHARE_PROVIDER_CREDENTIAL
(
    provider_name        IN VARCHAR2,
    share_credential     IN OUT NOCOPY VARCHAR2,
    get_token_credential IN OUT NOCOPY VARCHAR2,
    owner                IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
provider_name	The name of the share provider.
share_credential	OUT: The name of the credential associated with the provider. The credential name is returned without double quotes, as it would appear in the CREDENTIAL_NAME column of the USER_CREDENTIALS view. See ALL_CREDENTIALS View.
get_token_credential	This parameter is not used.
owner	The owner is the name of the schema where the share provider was registered, not the owner of the credential. Defaults to the current schema.

GET_SHARE_PROVIDER_INFO Procedure

Get the endpoint string(s) and share type along with any additional JSON metadata for a share provider. For ORACLE share providers, the Oracle provider ID is returned in the endpoint argument.

Syntax

```
PROCEDURE GET_SHARE_PROVIDER_INFO
(
    provider_name        IN VARCHAR2,
    endpoint             IN OUT NOCOPY VARCHAR2,
    share_type           IN OUT NOCOPY VARCHAR2,
    token_endpoint       IN OUT NOCOPY VARCHAR2,
    metadata             IN OUT NOCOPY BLOB,
    owner                IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
provider_name	The name of the share provider.
endpoint	The delta endpoint.
share_type	The share type: DELTA or ORACLE.
token_endpoint	This parameter is not used.
metadata	The optional metadata that was associated with the share provider.
owner	The owner of the share provider. Defaults to the current schema.

GET_SHARING_ID Function

Return an identifier that can be used as the sharing_id in the CREATE_SHARE_RECIPIENT procedure. This function can be used to share data between two users, the "provider" and the "recipient", in different databases.

See CREATE_SHARE_RECIPIENT Procedure for further information.

Syntax

```
FUNCTION GET_SHARING_ID
(
    sharing_id_type      IN VARCHAR2 := SHARING_ID_TYPE_DATABASE
)
  RETURN VARCHAR2;
```

Parameters

Parameter	Description
sharing_id_type	The type of sharing ID.

Usage

The flow is as follows:

1. The recipient calls DBMS_SHARE.GET_SHARING_ID to get a unique identifier.
2. The recipient sends this identifier (e.g. via email) to the provider.
3. The provider calls DBMS_SHARE.CREATE_SHARE_RECIPIENT, passing in the identifier as sharing_id.
4. The provider calls DBMS_SHARE.GRANT_TO_RECIPIENT to give the recipient access to shared data.

The sharing_id_type parameter is used to specify which database users can access the share following the above sequence.

- DATABASE The share will be visible to any admin user in the database where GET_SHARING_ID was called.
- COMPARTMENT The share will be visible to any admin user in any database in the same compartment where GET_SHARING_ID was called.

- TENANCY The share will be visible to any admin user in any database in the same tenancy where `GET_SHARING_ID` was called.
- REGION The share will be visible to any admin user in any database in the same region where `GET_SHARING_ID` was called.

OPEN_SHARE_LINK_CURSOR Procedure

Open a cursor that returns data from a shared table.

Syntax

```
PROCEDURE OPEN_SHARE_LINK_CURSOR
(
    share_link_name      IN VARCHAR2,
    share_schema_name    IN VARCHAR2,
    share_table_name     IN VARCHAR2,
    table_cursor         IN OUT NOCOPY SYS_REFCURSOR,
    share_link_owner     IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
`share_link_name`	The name of the share link.
`share_schema_name`	The name of the shared schema.
`share_table_name`	The name of the shared table.
`table_cursor`	The cursor.
`share_link_owner`	The link owner. Defaults to current schema.

REFRESH_BEARER_TOKEN_CREDENTIAL Procedure

Update one or more credentials created by `CREATE_BEARER_TOKEN_CREDENTIAL` or `CREATE_CREDENTIALS` by calling the registered token endpoints and fetching new bearer tokens. Note this procedure is called automatically by a scheduler job, `ADP$BEARER_REFRESH_JOB`, that runs every 50 minutes.

See CREATE_BEARER_TOKEN_CREDENTIAL Procedure or CREATE_CREDENTIALS Procedure and Function for further information.

Syntax

```
PROCEDURE REFRESH_BEARER_TOKEN_CREDENTIAL
(
    credential_name           IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to refresh.

RENAME_CLOUD_STORAGE_LINK Procedure

Rename a registered cloud storage link.

Syntax

```
PROCEDURE RENAME_CLOUD_STORAGE_LINK
(
    old_name             IN VARCHAR2,
    new_name             IN VARCHAR2,
    owner                IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
old_name	The current name of the cloud storage link.
new_name	The new name of the cloud storage link.
owner	The owner of the cloud storage link. Defaults to the current schema.
auto_commit	If TRUE, the changes are automatically committed. The default is TRUE.

RENAME_SHARE_PROVIDER Procedure

Rename a registered share provider.

Syntax

```
PROCEDURE RENAME_SHARE_PROVIDER
(
  old_name             IN VARCHAR2,
  new_name             IN VARCHAR2,
  owner                IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
old_name	The current name of the share provider.
new_name	The new name of the share provider.
owner	The owner of the share provider. Defaults to the current schema.

REMOVE_SHARE_SCHEMA Procedure

Remove a schema and all its contents from a share.

Syntax

```
PROCEDURE REMOVE_SHARE_SCHEMA
(
```

```
    share_name           IN VARCHAR2,
    schema_name          IN VARCHAR2,
    share_owner          IN VARCHAR2 := NULL,
    auto_commit          IN BOOLEAN := FALSE
);
```

Parameters

Parameter	Description
share_name	The name of the share.
schema_name	The name of the schema to remove.
share_owner	The owner of the share.
auto_commit	If TRUE, the changes are automatically committed. The default is FALSE.

SET_SHARE_LINK_METADATA Procedure

Set the additional JSON metadata for the share link.

Syntax

```
PROCEDURE SET_SHARE_LINK_METADATA
(
    link_name            IN VARCHAR2,
    metadata             IN SYS.JSON_OBJECT_T,
    replace_existing     IN BOOLEAN := FALSE,
    link_owner           IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
link_name	The name of the share link.
metadata	The new metadata.
replace_existing	If TRUE, then all existing metadata is replaced by the new version. If FALSE, then the new value is merged with any existing metadata.
link_owner	The owner of the share link. Defaults to the current schema.

SET_SHARE_PROVIDER_CREDENTIAL Procedure

Set the credential name to be used by the current user when it attempts to access the given share provider.

Syntax

```
PROCEDURE SET_SHARE_PROVIDER_CREDENTIAL
(
    provider_name        IN VARCHAR2,
    share_credential     IN VARCHAR2,
    get_token_credential IN VARCHAR2 := NULL,
    owner                IN VARCHAR2 := NULL,
```

```
    check_if_exists      IN BOOLEAN := TRUE
);
```

Parameters

Parameter	Description
provider_name	The name of the share provider.
share_credential	The bearer token credential.
get_token_credential	This argument is ignored.
owner	The owner of the share provider. Defaults to the current schema.
check_if_exists	If TRUE (default), then validate that the credential exists.

SET_SHARE_PROVIDER_METADATA Procedure

Set additional JSON metadata for the share provider.

Syntax

```
PROCEDURE SET_SHARE_PROVIDER_METADATA
(
    provider_name        IN VARCHAR2,
    metadata             IN SYS.JSON_OBJECT_T,
    replace_existing     IN BOOLEAN := FALSE,
    owner                IN VARCHAR2 := NULL
);
```

Parameters

Parameter	Description
provider_name	The name of the share provider.
metadata	The new metadata.
replace_existing	If TRUE, then all existing metadata is replaced by the new version. If FALSE, the new value is merged with any existing metadata.
owner	The owner of the share provider. Defaults to the current schema.

UPDATE_BEARER_TOKEN_CREDENTIAL Procedure

Modify an attribute of a credential created by `CREATE_CREDENTIALS` or `CREATE_BEARER_TOKEN_CREDENTIAL`.

See CREATE_BEARER_TOKEN_CREDENTIAL Procedure or CREATE_CREDENTIALS Procedure and Function for further information.

Syntax

```
PROCEDURE UPDATE_BEARER_TOKEN_CREDENTIAL
(
     credential_name           IN VARCHAR2,
     attribute                 IN VARCHAR2,
     new_value                 IN VARCHAR2
);
```

Parameters

Parameter	Description
credential_name	The name of the credential to update.
attribute	The attribute to update. One of 'BEARER_TOKEN', 'CLIENT_ID', 'CLIENT_SECRET', 'TOKEN_REFRESH_RATE'. The token endpoint can not be changed.
new_value	The new value.

Example: Update the CLIENT_ID of a credential

```
SQL> BEGIN
  2    dbms_share.create_bearer_token_credential(
  3      credential_name=>'MY_RENEWABLE_CREDENTIAL',
  4      token_endpoint=>'https://myserver/ords/share_provider/oauth/token',
  5      client_id=>'VXGQ_44s6qJ-K4WHUNM2yQ..',
  6      client_secret=>'y9ddppgwEmZl7adDHFQndw..');
  7  END;
  8  /
PL/SQL procedure successfully completed.
SQL> select credential_name, username from user_credentials where
credential_name LIKE 'MY_RENEWABLE_CREDENTIAL%';
CREDENTIAL_NAME
----------------------------------------
USERNAME
------------------------------------
MY_RENEWABLE_CREDENTIAL
BEARER_TOKEN
MY_RENEWABLE_CREDENTIAL$TOKEN_REFRESH_CRED
ABCDEF
```

Summary of Share Producer Views

This table lists the share producer views for the DBMS_SHARE package.

View	Description
ALL_OBJECT_SHAREABILITY View	This view gives information about the shareability, or otherwise, of tables and views visible to the user.
ALL_SHAREABLE_OBJECTS View	This view lists all of the tables or views that can be added to a share.
ALL_SHARES View	This view lists all share created using CREATE_SHARE.
ALL_SHARE_DEFAULT_SETTINGS View	A view containing the default settings for shares and recipients.
ALL_SHARE_EVENTS View	This view lists all log events associated with shares.
ALL_SHARE_FILES View	A view that contains a list of all the parquet files generated by shares.
ALL_SHARE_RECIPIENTS View	A view containing all share recipients created using CREATE_SHARE_RECIPIENT.
ALL_SHARE_RECIPIENT_EVENTS View	This view contains records of endpoint request by delta share consumers.

View	Description
ALL_SHARE_RECIPIENT_GRANTS View	This view contains one row for each share/recipient combination as specified by calls to GRANT_TO_RECIPIENT.
ALL_SHARE_SCHEMAS View	This view lists all the share schemas that were added to shares using ADD_TO_SHARE.
ALL_SHARE_TABLES View	This view lists all tables or views that were added to share using ADD_TO_SHARE.
ALL_SHARE_VERSIONS View	A view listing the different versions of shares.
DBA_SHARE_DETACHED_FILES View	This view contains a list of parquet files that we generated by DBMS_SHARE but that have become detached in some way.
DBA_SHARE_EVENTS View	This view contains records of endpoint request by delta share consumers.
DBA_SHARE_FILES View	A view that contains a list of all the parquet files generated by shares.
DBA_SHARE_JOB_SEGMENTS View	This view contains a list of parquet files that we generated by DBMS_SHARE but that have become detached in some way.
DBA_SHARE_JOBS View	List share jobs associated with the current user.
DBA_SHARE_RECIPIENT_EVENTS View	This view contains records of endpoint request by delta share consumers.
DBA_SHARE_RECIPIENT_GRANTS View	This view contains one row for each share/recipient combination as specified by calls to GRANT_TO_RECIPIENT.
DBA_SHARE_RECIPIENTS View	A view containing all share recipients created using CREATE_SHARE_RECIPIENT.
DBA_SHARE_SCHEMAS View	This view lists all the share schemas that were added to shares using ADD_TO_SHARE.
DBA_SHARE_TABLES View	This view lists all tables or views that were added to share using ADD_TO_SHARE.
DBA_SHARE_VERSIONS View	A view listing the different versions of shares.
DBA_SHARES View	This view lists all share created using DBMS_SHARE.CREATE_SHARE.
USER_SHARE_DETACHED_FILES View	This view contains a list of parquet files that we generated by DBMS_SHARE but that have become detached in some way.
USER_SHARE_EVENTS View	This view contains records of endpoint request by delta share consumers.
USER_SHARE_FILES View	A view that contains a list of all the parquet files generated by shares.
USER_SHARE_JOBS View	List share jobs associated with the current user.
USER_SHARE_JOB_SEGMENTS View	List segments (tables, table partitions, or table sub-partitions) that are being actively processed by running share jobs.
USER_SHARE_RECIPIENT_EVENTS View	This view contains records of endpoint request by delta share consumers.
USER_SHARE_RECIPIENT_GRANTS View	This view contains one row for each share/recipient combination as specified by calls to GRANT_TO_RECIPIENT.
USER_SHARE_RECIPIENTS View	A view containing all share recipients created using CREATE_SHARE_RECIPIENT.

View	Description
USER_SHARE_SCHEMAS View	This view lists all the share schemas that were added to shares using ADD_TO_SHARE.
USER_SHARE_TABLES View	This view lists all tables or views that were added to share using ADD_TO_SHARE.
USER_SHARE_VERSIONS View	A view listing the different versions of shares.
USER_SHAREABLE_OBJECTS View	This view lists all of the tables or views that can be added to a share.
USER_SHARES View	This view lists all share created using DBMS_SHARE.CREATE_SHARE.

- ALL_OBJECT_SHAREABILITY View
  A view containing all share links that were created using CREATE_SHARE_LINK.
- ALL_SHAREABLE_OBJECTS View
  This view lists all of the tables or views that can be added to a share. Objects that are not shareable may be listed in ALL_OBJECT_SHAREABILITY along with a reason explaining why they are excluded.
- ALL_SHARES View
  This view lists all share created using DBMS_SHARE.CREATE_SHARE.
- ALL_SHARE_DEFAULT_SETTINGS View
  A view containing the default settings for shares and recipients.
- ALL_SHARE_EVENTS View
  This view lists all log events associated with shares.
- ALL_SHARE_FILES View
  A view that contains a list of all the parquet files generated by shares.
- ALL_SHARE_RECIPIENTS View
  A view containing all share recipients created using CREATE_SHARE_RECIPIENT.
- ALL_SHARE_RECIPIENT_EVENTS View
  This view contains records of endpoint request by delta share consumers.
- ALL_SHARE_RECIPIENT_GRANTS View
  This view contains one row for each share/recipient combination as specified by calls to GRANT_TO_RECIPIENT.
- ALL_SHARE_SCHEMAS View
  This view lists all the share schemas that were added to shares using ADD_TO_SHARE.
- ALL_SHARE_TABLES View
  This view lists all tables or views that were added to share using ADD_TO_SHARE.
- ALL_SHARE_VERSIONS View
  A view listing the different versions of shares. For VERSIONED shares, each row represents a particular set of parquet files. For LIVE shares, each row represents a different list of shared objects.
- DBA_SHARE_DETACHED_FILES View
  This view contains a list of parquet files that were generated by DBMS_SHARE but that have become detached in some way.
- DBA_SHARE_EVENTS View
  This view lists all log events associated with shares. Its columns are the same as those in the ALL_SHARE_EVENTS view.

- DBA_SHARE_FILES View
  A view that contains a list of all the parquet files generated by shares. Its columns are the same as those in the ALL_SHARE_FILES view.
- DBA_SHARE_JOB_SEGMENTS View
  List segments (tables, table partitions, or table sub-partitions) that are being actively processed by running share jobs. Its columns are the same as those in the USER_SHARE_JOB_SEGMENTS view.
- DBA_SHARE_JOBS View
  List share jobs associated with the current user. Its columns are the same as those in the USER_SHARE_JOBS view with the addition of an OWNER column.
- DBA_SHARE_RECIPIENT_EVENTS View
  This view contains records of endpoint request by delta share consumers. Its columns are the same as those in the ALL_SHARE_RECIPIENT_EVENTS view.
- DBA_SHARE_RECIPIENT_GRANTS View
  This view contains one row for each share/recipient combination as specified by calls to GRANT_TO_RECIPIENT. Its columns are the same as those in the ALL_SHARE_RECIPIENT_GRANTS view.
- DBA_SHARE_RECIPIENTS View
  A view containing all share recipients created using CREATE_SHARE_RECIPIENT. Its columns are the same as those in the ALL_SHARE_RECIPIENTS view.
- DBA_SHARE_SCHEMAS View
  This view lists all the share schemas that were added to shares using ADD_TO_SHARE. Its columns are the same as those in the ALL_SHARE_SCHEMAS view.
- DBA_SHARE_TABLES View
  This view lists all tables or views that were added to share using ADD_TO_SHARE. Its columns are the same as those in the ALL_SHARE_TABLES view.
- DBA_SHARE_VERSIONS View
  A view listing the different versions of shares. For VERSIONED shares, each row represents a particular set of parquet files. For LIVE shares, each row represents a different list of shared objects. Its columns are the same as those in the ALL_SHARE_VERSIONS view.
- DBA_SHARES View
  This view lists all share created using DBMS_SHARE.CREATE_SHARE. Its columns are the same as those in the ALL_SHARES view.
- USER_SHARE_DETACHED_FILES View
  This view contains a list of parquet files that were generated by DBMS_SHARE but that have become detached in some way.
- USER_SHARE_EVENTS View
  This view lists all log events associated with shares. Its columns are the same as those in the ALL_SHARE_EVENTS view.
- USER_SHARE_FILES View
  A view that contains a list of all the parquet files generated by shares. Its columns are the same as those in the ALL_SHARE_FILES view.
- USER_SHARE_JOBS View
  List share jobs associated with the current user.
- USER_SHARE_JOB_SEGMENTS View
  List segments (tables, table partitions, or table sub-partitions) that are being actively processed by running share jobs.

- USER_SHARE_RECIPIENT_EVENTS View
  This view contains records of endpoint request by delta share consumers. Its columns are the same as those in the ALL_SHARE_RECIPIENT_EVENTS view.
- USER_SHARE_RECIPIENT_GRANTS View
  This view contains one row for each share/recipient combination as specified by calls to GRANT_TO_RECIPIENT. Its columns are the same as those in the ALL_SHARE_RECIPIENT_GRANTS view.
- USER_SHARE_RECIPIENTS View
  A view containing all share recipients created using CREATE_SHARE_RECIPIENT. Its columns are the same as those in the ALL_SHARE_RECIPIENTS view.
- USER_SHARE_SCHEMAS View
  This view lists all the share schemas that were added to shares using ADD_TO_SHARE. Its columns are the same as those in the ALL_SHARE_SCHEMAS view.
- USER_SHARE_TABLES View
  This view lists all tables or views that were added to share using ADD_TO_SHARE. Its columns are the same as those in the ALL_SHARE_SCHEMAS view.
- USER_SHARE_VERSIONS View
  A view listing the different versions of shares. For VERSIONED shares, each row represents a particular set of parquet files. For LIVE shares, each row represents a different list of shared objects. Its columns are the same as those in the ALL_SHARE_VERSIONS view.
- USER_SHAREABLE_OBJECTS View
  This view lists all of the tables or views that can be added to a share. Objects that are not shareable may be listed in ALL_OBJECT_SHAREABILITY along with a reason explaining why they are excluded. Its columns are the same as those in the ALL_SHAREABLE_OBJECTS view.
- USER_SHARES View
  This view lists all share created using DBMS_SHARE.CREATE_SHARE.

ALL_OBJECT_SHAREABILITY View

A view containing all share links that were created using CREATE_SHARE_LINK.

See CREATE_SHARE_LINK Procedure for further information.

Column	Datatype	Description
OWNER	VARCHAR2	The owner of the object.
OBJECT_NAME	VARCHAR2	The name of the object.
OBJECT_TYPE	VARCHAR2	The type of the object, TABLE or VIEW.
NUM_ROWS	NUMBER	The number of rows, if this is a TABLE and if the statistics are available.
PRIV_CODE	VARCHAR2	A non NULL value, if you do not have the required privileges to share this object. • NO_GRANT_READ_PRIV: You have READ privilege, but not READ WITH GRANT OPTION. • PRIV_ERROR: This is an Oracle-maintained object or is otherwise unsupported

Column	Datatype	Description
SUPPORT_CODE	VARCHAR2	A non NULL value, if this object cannot be shared. • INVALID: The object is INVALID (e.g. a badly defined VIEW). • SHARDED: The table is sharded. • NESTED: This is a nested table. • EXTERNAL_PARTITIONED: This is an partitioned, external table. • EXTERNAL: This is a non-partitioned external table. • INDEX_ORGANIZED_TABLE: This is an index organized table. • TRACKING_MV: This is a tracking MV created by DBMS_SHARE. • NO_SHAREABLE_COLUMNS: None of the columns in the table or view can be shared.
SHARE_METADATA	BLOB	A JSON document that gives details of which columns are shareable and how they would be represented using parquet.

ALL_SHAREABLE_OBJECTS View

This view lists all of the tables or views that can be added to a share. Objects that are not shareable may be listed in ALL_OBJECT_SHAREABILITY along with a reason explaining why they are excluded.

Column	Datatype	Description
OWNER	VARCHAR2	The owner of the object.
OBJECT_NAME	VARCHAR2	The name of the object.
OBJECT_TYPE	VARCHAR2	The type of the object, TABLE or VIEW.
NUM_ROWS	NUMBER	The number of rows, if this is a TABLE and if the statistics are available.
SHARE_METADATA	BLOB	A JSON document that gives details of which columns are shareable and how they would be represented using parquet.
NUM_COLUMNS	VARCHAR2	The number of shareable columns in the object.

ALL_SHARES View

This view lists all share created using DBMS_SHARE.CREATE_SHARE.

See CREATE_SHARE Procedure for further information.

Column	Datatype	Description
OWNER	VARCHAR2	The owner of the share.
SHARE_NAME	VARCHAR2	The name of the share.
SHARE_ID	NUMBER	A numeric ID for this share.
METADATA_PATH	VARCHAR2	The lineage metadata path for this share.
METADATA	BLOB	A JSON document containing additional share metadata.
DESCRIPTION	CLOB	A local description of the share.

Column	Datatype	Description
SHARE_TYPE	VARCHAR2	The type is either VERSIONED or LIVE.
PUBLIC_DESCRIPTION	CLOB	An externally visible description of the share.
NUM_TABLES	NUMBER	The number of tables in the share.
NUM_RECIPIENTS	NUMBER	The number of recipients who have been granted access to the share.
NUM_ORACLE_RECIPIENTS	NUMBER	The number of Oracle recipients who have been granted access to the share.
STORAGE_FOLDER	VARCHAR2	The base URL for any generated parquet files.
ORACLE_SHARE_ID	VARCHAR2	A globally unique UUID for the share.
LAST_EXPORT_TIME	TIMESTAMP(9) WITH TIME ZONE	(VERSIONED ONLY) The time when the currently published version was generated.
LAST_NOTIFICATION	TIMESTAMP(9) WITH TIME ZONE	The time the last email notification was sent about this share..
CURRENT_VERSION	NUMBER	The currently published version number.
CREATED	TIMESTAMP(9) WITH TIME ZONE	The date this share was created.
UPDATED	TIMESTAMP(9) WITH TIME ZONE	The date this share was last modified.

ALL_SHARE_DEFAULT_SETTINGS View

A view containing the default settings for shares and recipients.

These can be modified (by ADMIN) using `UPDATE_DEFAULT_SHARE_PROPERTY` and `UPDATE_DEFAULT_RECIPIENT_PROPERTY`. Note that there is no DBA or USER version of this view.

Column	Datatype	Description
SETTING	VARCHAR2	The setting name: • JOB_CLASS • JOB_DOP • MAX_PAR_LIFETIME • MAX_TOKEN_LIFETIME • MIN_PAR_LIFETIME • PAR_LIFETIME • SPLIT_SIZE • TOKEN_LIFETIME
SETTING_VALUE	VARCHAR2	The current setting value.

ALL_SHARE_EVENTS View

This view lists all log events associated with shares.

Entries can be removed by deleting the associated share or by calling the CLEAR_SHARE_EVENTS Procedure.

Column	Datatype	Description
OWNER	VARCHAR2	The owner of the share.

Column	Datatype	Description
SHARE_NAME	VARCHAR2	The name of the share.
SHARE_ID	NUMBER	A numeric ID for the share.
STATUS	VARCHAR2	An event status, such as INFO or ERROR.
DETAILS	CLOB	Additional data for the event, typically a JSON document.
TIME	TIMESTAMP(6) WITH TIME ZONE	The time of the event.
LOG_LEVEL	NUMBER	The detail level for the event: 1-3
SHARE_JOB_ID	NUMBER	The ID of the share job (from USER_SHARE_JOBS View) that created this event.
SCHEDULER_JOB_NAME	VARCHAR2	The name of the dbms_scheduler job that created this event.
ACTION	VARCHAR2	A code for the event activity.
SHARE_VERSION	NUMBER	The share version number associated with this event, if relevant.
OBJECT_NAME	VARCHAR2	The name of the table or view being processed, if relevant.
OBJECT_OWNER	VARCHAR2	The owner of the table or view name being processed, if relevant.
PARTITION_NAME	VARCHAR2	The partition of the table being processed, if relevant.
SPLIT_ORDER	NUMBER	The split number, if a single partition is broken into splits.
SQL_STATEMENT	CLOB	A SQL statement that was executed as part of the event.

ALL_SHARE_FILES View

A view that contains a list of all the parquet files generated by shares.

Column	Datatype	Description
OWNER	VARCHAR2	The owner of the share.
SHARE_NAME	VARCHAR2	The name of the share.
SHARE_ID	NUMBER	A numeric ID for the share.
SHARE_TABLE_NAME	VARCHAR2	The share table associated with the file.
SHARE_SCHEMA_NAME	VARCHAR2	The share schema associated with the file.
SHARE_TABLE_ID	NUMBER	The numeric ID of the share table (ALL_SHARE_TABLES).
SEGMENT_NAME	VARCHAR2	The associated segment name (e.g. a partition), if appropriate.
INITIAL_SHARE_VERSION	NUMBER	The lowest share version number that requires this file.
EXPIRED_SHARE_VERSION	NUMBER	The share version number, if any, where this file was removed.
FLE_URI	VARCHAR2	The full URI for the file.
FILE_NAME	VARCHAR2	The name of the file within the cloud storage bucket.
BYTES	NUMBER	The number of bytes in the file.
SPLIT_ORDER	NUMBER	The split number within the segment.
FILE_STATS	BLOB	Delta statistics (min/max) for columns in the file.

ALL_SHARE_RECIPIENTS View

A view containing all share recipients created using `CREATE_SHARE_RECIPIENT`.

See CREATE_SHARE_RECIPIENT Procedure for further information.

Name	Datatype	Description
OWNER	VARCHAR2	The owner of the recipient object.
RECIPIENT_NAME	VARCHAR2	The name of the recipient.
RECIPIENT_ID	NUMBER	A numeric ID for the recipient
METADATA_PATH	VARCHAR2	The lineage path for the recipient.
RECIPIENT_TYPE	VARCHAR2	The type of recipient • DELTA_SHARING: recipient defined by an email • ORACLE: defined by an Oracle sharing ID • ORACLE_DELTA: defined by an email and a sharing ID
INFO	BLOB	Not currently used.
METADATA	BLOB	JSON metadata associated with this recipient.
DESCRIPTION	CLOB	A local description of the recipient.
RECIPIENT_SHARING_ID	VARCHAR2	(ORACLE) An optional sharing ID for the recipient.
MIN_PAR_INTERVAL	INTERVAL DAY(3) TO SECOND(0)	(DELTA) The shortest lifetime of pre-authenticated requests that will be sent to the consumer.
MAX_PAR_INTERVAL	INTERVAL DAY(3) TO SECOND(0)	(DELTA) The longest lifetime of pre-authenticated requests that will be sent to the consumer.
LOG_LEVEL	NUMBER	The recipient event log level: 0 - 3
CREATED	TIMESTAMP(6) WITH TIME ZONE	The date this share recipient was created.
UPDATED	TIMESTAMP(6) WITH TIME ZONE	The date this share recipient was last modified.

ALL_SHARE_RECIPIENT_EVENTS View

This view contains records of endpoint request by delta share consumers.

Name	Type	Description
OWNER	VARCHAR2	The owner of the recipient.
RECIPIENT_NAME	VARCHAR2	The name of the recipient.
RECIPIENT_ID	NUMBER	The numeric ID of the recipient.
SHARE_ID	NUMBER	The ID of the share being accessed.
STATUS	VARCHAR2	A status code, such as INFO or ERROR.
ENDPOINT	VARCHAR2	The delta endpoint being accessed.
REMOTE_ADDRESS	VARCHAR2	The external address that called the endpoint.
HTTP_USER_AGENT	VARCHAR2	The requesting user-agent, from the HTTP request.
HTTP_REFERER	VARCHAR2	The referer from the HTTP request.
REQUEST	CLOB	The request body. This is only logged if the recipient event level is high.
ERROR_MESSAGE	VARCHAR2	Any error message, if the request failed.

Name	Type	Description
ERROR_TRACE	VARCHAR2	Any error trace, if the request failed.
ELAPSED	INTERVAL DAY(9) TO SECOND(9)	The elapsed time taken to process the request.
CPU_TIME	NUMBER	The CPU time take to process the request
DETAILS	CLOB	The response details. This is only logged if the recipient event level is high.
TIME	TIMESTAMP(6) WITH TIME ZONE	The time the event was recorded.
LOG_LEVEL	NUMBER	The detail level of this event: 1-3

ALL_SHARE_RECIPIENT_GRANTS View

This view contains one row for each share/recipient combination as specified by calls to GRANT_TO_RECIPIENT.

See GRANT_TO_RECIPIENT Procedure for further information.

Name	Datatype	Description
OWNER	VARCHAR2	The owner of the share and recipient.
RECIPIENT_NAME	VARCHAR2	The name of the recipient.
RECIPIENT_ID	NUMBER	The numeric ID of the recipient.
SHARE_NAME	VARCHAR2	The name of the share.
SHARE_ID	NUMBER	The numeric ID of the share.
ORDER_NUM	NUMBER	The grant order.
CREATED	TIMESTAMP(6) WITH TIME ZONE	The time when the grant was made.
UPDATED	TIMESTAMP(6) WITH TIME ZONE	The last time when this grant was updated.

ALL_SHARE_SCHEMAS View

This view lists all the share schemas that were added to shares using ADD_TO_SHARE.

See ADD_TO_SHARE Procedure for further information.

Name	Datatype	Description
OWNER	VARCHAR2	The owner of the share.
SHARE_NAME	VARCHAR2	The name of the share.
SHARE_ID	NUMBER	The numeric ID for this share.
SCHEMA_NAME	VARCHAR2	The name of the share schema, as seen by the share consumers.
SCHEMA_ID	NUMBER	The numeric ID of the share schema.
METADATA_PATH	NUMBER	The lineage path for this share schema.
CREATED	TIMESTAMP(6) WITH TIME ZONE	The date this share schema was created.
UPDATED	TIMESTAMP(6) WITH TIME ZONE	The date this share schema was last modified.

ALL_SHARE_TABLES View

This view lists all tables or views that were added to share using `ADD_TO_SHARE`.

See ADD_TO_SHARE Procedure for further information.

Name	Datatype	Description
OWNER	VARCHAR2	The owner of the share.
SHARE_NAME	VARCHAR2	The name of the share.
SHARE_ID	NUMBER	A numeric ID for the share.
SHARE_SCHEMA_NAME	VARCHAR2	The name of the share schema, as seen by the share consumers.
SHARE_SCHEMA_ID	NUMBER	A numeric ID for the share schema.
SHARE_TABLE_NAME	VARCHAR2	The name of the share schema, as seen by the share consumers.
SHARE_TABLE_ID	NUMBER	A numeric ID for the share table.
METADATA_PATH	VARCHAR2	The lineage path for the share table.
TABLE_NAME	VARCHAR2	The local table or view being shared.
TABLE_OWNER	VARCHAR2	The owner of the local table or view being shared.
OBJECT_TYPE	VARCHAR2	The type of object being shared: TABLE or VIEW.
CREATED	TIMESTAMP(6) WITH TIME ZONE	The date this share table was created.
UPDATED	TIMESTAMP(6) WITH TIME ZONE	The date this share table was last modified.
STATUS	VARCHAR2	The STATUS of the shared object, from `ALL_OBJECTS`.
PRIV_CODE	VARCHAR2	See `ALL_OBJECT_SHAREABILITY.PRIV_CODE`.

ALL_SHARE_VERSIONS View

A view listing the different versions of shares. For VERSIONED shares, each row represents a particular set of parquet files. For LIVE shares, each row represents a different list of shared objects.

Name	Datatype	Description
OWNER	VARCHAR2	The owner of the share.
SHARE_NAME	VARCHAR2	The name of the share.
SHARE_ID	NUMBER	A numeric ID for the share.
SHARE_VERSION	NUMBER	The version of this share.
STATUS	VARCHAR2	The status of this version. • CURRENT • RETIRED • FAILED • ROLLED BACK • STOPPED • PENDING • EXPORTING
EXPORT_TIME	TIMESTAMP(9)	The time when this version was created.
LAST_UPDATE	TIMESTAMP(9)	The last time this version was modified.

Name	Datatype	Description
PROMISED_TO	TIMESTAMP(9)	The latest expiry time for any pre-authenticated request on a parquet file associated with this version.
EXPORT_SCN	NUMBER	The System Change Number current when this version was created.
NUM_FILES	NUMBER	The number of parquet files associated with this version.
NUM_NEW_FILES	NUMBER	The number of new parquet files created for this version.
NUM_PENDING_FILES	NUMBER	The number of parquet files that should have been created, but were not for some reason.
NUM_NEW_PENDING_FILES	NUMBER	The number of pending files that are new as of this version.
ERROR_MESSAGE	VARCHAR2	An error message in the case where the version failed.
TOTAL_FILE_SIZE	NUMBER	The total size of all parquet files associated with this version.

DBA_SHARE_DETACHED_FILES View

This view contains a list of parquet files that were generated by DBMS_SHARE but that have become detached in some way.

This could happen, for example, if a share or share version is dropped with the destroy_objects argument set to FALSE. It can also happen if a user with shares is dropped.

Name	Datatype	Description
OWNER	VARCHAR2	The name of the user who generated the file. This may be NULL if the user has been dropped from the database.
OWNER_ID	NUMBER	The USER_ID of the user who generated the file. This will remain valid and non-NULL even if the user was dropped.
FILE_URI	VARCHAR2	The URL of the generated parquet file.

See Also:

"USER_SHARE_DETACHED_FILES View"

DBA_SHARE_EVENTS View

This view lists all log events associated with shares. Its columns are the same as those in the ALL_SHARE_EVENTS view.

See Also:

"ALL_SHARE_EVENTS View"

DBA_SHARE_FILES View

A view that contains a list of all the parquet files generated by shares. Its columns are the same as those in the ALL_SHARE_FILES view.

See Also:

"ALL_SHARE_FILES View"

DBA_SHARE_JOB_SEGMENTS View

List segments (tables, table partitions, or table sub-partitions) that are being actively processed by running share jobs. Its columns are the same as those in the `USER_SHARE_JOB_SEGMENTS` view.

See Also:

"USER_SHARE_JOB_SEGMENTS View"

DBA_SHARE_JOBS View

List share jobs associated with the current user. Its columns are the same as those in the `USER_SHARE_JOBS` view with the addition of an `OWNER` column.

See Also:

"USER_SHARE_JOBS View"

DBA_SHARE_RECIPIENT_EVENTS View

This view contains records of endpoint request by delta share consumers. Its columns are the same as those in the `ALL_SHARE_RECIPIENT_EVENTS` view.

See Also:

"ALL_SHARE_RECIPIENT_EVENTS View"

DBA_SHARE_RECIPIENT_GRANTS View

This view contains one row for each share/recipient combination as specified by calls to `GRANT_TO_RECIPIENT`. Its columns are the same as those in the `ALL_SHARE_RECIPIENT_GRANTS` view.

See Also:

"ALL_SHARE_RECIPIENT_GRANTS View"

DBA_SHARE_RECIPIENTS View

A view containing all share recipients created using `CREATE_SHARE_RECIPIENT`. Its columns are the same as those in the `ALL_SHARE_RECIPIENTS` view.

See Also:

" ALL_SHARE_RECIPIENTS View"

DBA_SHARE_SCHEMAS View

This view lists all the share schemas that were added to shares using ADD_TO_SHARE. Its columns are the same as those in the `ALL_SHARE_SCHEMAS` view.

See Also:

"ALL_SHARE_SCHEMAS View"

DBA_SHARE_TABLES View

This view lists all tables or views that were added to share using `ADD_TO_SHARE`. Its columns are the same as those in the `ALL_SHARE_TABLES` view.

See Also:

"ALL_SHARE_TABLES View"

DBA_SHARE_VERSIONS View

A view listing the different versions of shares. For VERSIONED shares, each row represents a particular set of parquet files. For LIVE shares, each row represents a different list of shared objects. Its columns are the same as those in the `ALL_SHARE_VERSIONS` view.

See Also:

"ALL_SHARE_VERSIONS View"

DBA_SHARES View

This view lists all share created using `DBMS_SHARE.CREATE_SHARE`. Its columns are the same as those in the `ALL_SHARES` view.

See Also:

"ALL_SHARES View"

USER_SHARE_DETACHED_FILES View

This view contains a list of parquet files that were generated by `DBMS_SHARE` but that have become detached in some way.

This could happen, for example, if a share or share version is dropped with the `destroy_objects` argument set to FALSE. It can also happen if a user with shares is dropped. In that case the files would show up in `DBA_SHARE_DETACHED_FILES View`.

Name	Datatype	Description
`FILE_URI`	`VARCHAR2`	The URL of the generated parquet file.

See Also:

"DBA_SHARE_DETACHED_FILES View"

USER_SHARE_EVENTS View

This view lists all log events associated with shares. Its columns are the same as those in the `ALL_SHARE_EVENTS` view.

See Also:

"ALL_SHARE_EVENTS View"

USER_SHARE_FILES View

A view that contains a list of all the parquet files generated by shares. Its columns are the same as those in the `ALL_SHARE_FILES` view.

See Also:

"ALL_SHARE_FILES View"

USER_SHARE_JOBS View

List share jobs associated with the current user.

Share jobs are created whenever the database needs to run share processes in the background. The PUBLISH_SHARE Procedure initiates a share job.

Column	Datatype	Description
`JOB_ID`	`NUMBER`	A numeric ID for the job.
`JOB_NAME`	`VARCHAR2`	The name of the share job.
`SHARE_ID`	`NUMBER`	A numeric ID for the share associated with this job, if relevant.
`PARALLELISM`	`NUMBER`	The number of `DBMS_SCHEDULER` jobs used to run this share job.
`SHARE_NAME`	`VARCHAR2`	The name of the share associated with this job, if relevant.
`SHARE_VERSION`	`NUMBER`	The share version number associated with this job, if relevant.
`STATUS`	`VARCHAR2`	The status of this job: • PENDING • STOPPING • RUNNING • WAITING_FOR_ODI • DELETING • FAILED • GENERATING_PARS • COMPLETED • STOPPED • ERROR

USER_SHARE_JOB_SEGMENTS View

List segments (tables, table partitions, or table sub-partitions) that are being actively processed by running share jobs.

Name	Datatype	Description
`JOB_ID`	`NUMBER`	A numeric ID for the job from `USER_SHARE_JOBS`.
`JOB_NAME`	`VARCHAR2`	The name of the share job from `USER_SHARE_JOBS`.
`SHARE_ID`	`NUMBER`	A numeric ID for the share associated with this job, if relevant
`PARALLELISM`	`NUMBER`	The number of DBMS_SCHEDULER jobs used to run this share job.

Name	Datatype	Description
SHARE_NAME	VARCHAR2	The name of the share associated with this job, if relevant.
SHARE_VERSION	NUMBER	The share version number associated with this job, if relevant.
STATUS	VARCHAR2	The status of this job: • PENDING • STOPPING • RUNNING • WAITING_FOR_ODI • DELETING • FAILED • GENERATING_PARS • COMPLETED • STOPPED • ERROR
OBJECT_NAME	VARCHAR2	The name of the object that is being processed.
OBJECT_OWNER	VARCHAR2	The owner of the object that is being processed.
OBJECT_TYPE	VARCHAR2	The type of object (TABLE or VIEW) that is being processed.
SHARE_TABLE_NAME	VARCHAR2	The name of the object as it appears in the share.
SHARE_SCHEMA_NAME	VARCHAR2	The name of the object's schema as it appears in the share.
PARTITION_NAME	VARCHAR2	The name of the active partition or sub-partition, if appropriate.
SEGMENT_TYPE	VARCHAR2	The type of segment: TABLE, TABLE PARTITION, or TABLE SUBPARTITION.
BYTES	VARCHAR2	The size of the segment in bytes.

See Also:

"DBA_SHARE_JOB_SEGMENTS View"

USER_SHARE_RECIPIENT_EVENTS View

This view contains records of endpoint request by delta share consumers. Its columns are the same as those in the ALL_SHARE_RECIPIENT_EVENTS view.

See Also:

"ALL_SHARE_RECIPIENT_EVENTS View"

USER_SHARE_RECIPIENT_GRANTS View

This view contains one row for each share/recipient combination as specified by calls to GRANT_TO_RECIPIENT. Its columns are the same as those in the ALL_SHARE_RECIPIENT_GRANTS view.

See Also:

"ALL_SHARE_RECIPIENT_GRANTS View"

USER_SHARE_RECIPIENTS View

A view containing all share recipients created using `CREATE_SHARE_RECIPIENT`. Its columns are the same as those in the `ALL_SHARE_RECIPIENTS` view.

See Also:

" ALL_SHARE_RECIPIENTS View"

USER_SHARE_SCHEMAS View

This view lists all the share schemas that were added to shares using `ADD_TO_SHARE`. Its columns are the same as those in the `ALL_SHARE_SCHEMAS` view.

See Also:

"ALL_SHARE_SCHEMAS View"

USER_SHARE_TABLES View

This view lists all tables or views that were added to share using `ADD_TO_SHARE`. Its columns are the same as those in the `ALL_SHARE_SCHEMAS` view.

See Also:

"ALL_SHARE_TABLES View"

USER_SHARE_VERSIONS View

A view listing the different versions of shares. For VERSIONED shares, each row represents a particular set of parquet files. For LIVE shares, each row represents a different list of shared objects. Its columns are the same as those in the `ALL_SHARE_VERSIONS` view.

See Also:

"ALL_SHARE_VERSIONS View"

USER_SHAREABLE_OBJECTS View

This view lists all of the tables or views that can be added to a share. Objects that are not shareable may be listed in `ALL_OBJECT_SHAREABILITY` along with a reason explaining why they are excluded. Its columns are the same as those in the `ALL_SHAREABLE_OBJECTS` view.

See Also:

"ALL_SHAREABLE_OBJECTS View"

USER_SHARES View

This view lists all share created using `DBMS_SHARE.CREATE_SHARE`.

See Also:

"ALL_SHARES View"

Summary of Share Consumer Views

This table lists the DBMS_SHARE package views.

View	Description
ALL_AVAILABLE_ORACLE_SHARE_PROVIDERS View	This view lists all available Oracle share providers.
ALL_SHARE_CACHE_JOB_INFO View	This view contains information on the most recent Oracle Live share cache population job in the current POD.
ALL_SHARE_LINKS View	A view containing all share links that were created using CREATE_SHARE_LINK.
ALL_SHARE_LINK_VIEWS View	A view that contains a list of all the views created to access the shared data using CREATE_SHARE_LINK_VIEW.
ALL_SHARE_PROVIDERS View	A view that contains one row for each share provider subscription, created by CREATE_SHARE_PROVIDER.
DBA_SHARE_LINK_VIEWS View	A view that contains a list of all the views created to access the shared data using CREATE_SHARE_LINK_VIEW.
DBA_SHARE_LINKS View	A view containing all share links that were created using CREATE_SHARE_LINK.
USER_SHARE_LINKS_VIEW View	A view that contains a list of all the views created to access the shared data using CREATE_SHARE_LINK_VIEW.
USER_SHARE_LINKS View	A view containing all share links that were created using CREATE_SHARE_LINK.
USER_SHARE_PROVIDERS View	A view that contains one row for each share provider subscription, created by CREATE_SHARE_PROVIDER.

- ALL_AVAILABLE_ORACLE_SHARE_PROVIDERS View
  This view lists all available Oracle share providers.
- ALL_SHARE_CACHE_JOB_INFO View
  This view contains information on the most recent Oracle Live share cache population job in the database.
- ALL_SHARE_LINK_VIEWS View
  A view that contains a list of all the views created to access the shared data using CREATE_SHARE_LINK_VIEW.
- ALL_SHARE_LINKS View
  A view containing all share links that were created using CREATE_SHARE_LINK.
- ALL_SHARE_PROVIDERS View
  A view that contains one row for each share provider subscription, created by CREATE_SHARE_PROVIDER.
- DBA_SHARE_LINK_VIEWS View
  A view that contains a list of all the views created to access the shared data using CREATE_SHARE_LINK_VIEW. Its columns are the same as those in the ALL_SHARE_LINK_VIEWS view.

- DBA_SHARE_LINKS View
  A view containing all share links that were created using `CREATE_SHARE_LINK`. Its columns are the same as those in the `ALL_SHARE_LINKS` view.
- USER_SHARE_LINKS_VIEW View
  A view that contains a list of all the views created to access the shared data using `CREATE_SHARE_LINK_VIEW`. Its columns are the same as those in the `ALL_SHARE_LINK_VIEWS` view.
- USER_SHARE_LINKS View
  A view containing all share links that were created using `CREATE_SHARE_LINK`. Its columns are the same as those in the `ALL_SHARE_LINKS` view.
- USER_SHARE_PROVIDERS View
  A view that contains one row for each share provider subscription, created by `CREATE_SHARE_PROVIDER`. Its columns are the same as those in the `ALL_SHARE_PROVIDERS` view.

ALL_AVAILABLE_ORACLE_SHARE_PROVIDERS View

This view lists all available Oracle share providers.

Column	Datatype	Description
ORACLE_PROVIDER_ID	VARCHAR2	A UUID for the Oracle provider.
PROVIDER_NAME	VARCHAR2	A name, as specified by the provider. Note that this is not unique.
DESCRIPTION	VARCHAR2	A description, as specified by the provider.
CONTACT	VARCHAR2	A contact address, such as an email, for the provider.
METADATA	CLOB	Additional JSON metadata, as specified by the provider.
SHARES	CLOB	A JSON representation of the list of shares available from this provider.
CREATED	TIMESTAMP(6)	The time when the share provider was first registered.
UPDATED	TIMESTAMP(6)	The time when the share provider was last updated.

ALL_SHARE_CACHE_JOB_INFO View

This view contains information on the most recent Oracle Live share cache population job in the database.

Names	Datatype	Description
LAST_RUN_DATE	TIMESTAMP(6) WITH TIME ZONE	The start time of the most recent cache job execution.
NEXT_RUN_DATE	TIMESTAMP(6) WITH TIME ZONE	The scheduled start time of the next cache job execution.
RUN_STATUS	NUMBER	The status of the most recent run (0 = success). A non zero value represents the numeric code of the exception, as reported by the SQL CODE function.
MESSAGE_TEXT	VARCHAR2(4000)	A text indicating a warning or error condition encountered by the most recent run. NULL in most cases; indicates a warning if `RUN_STATUS` is 0, an error otherwise.
REPEAT_INTERVAL	VARCHAR2(4000)	The `DBMS_SCHEDULER` repeat interval for the cache job.

ALL_SHARE_LINK_VIEWS View

A view that contains a list of all the views created to access the shared data using `CREATE_SHARE_LINK_VIEW`.

See CREATE_SHARE_LINK_VIEW Procedure for further information.

Names	Datatype	Description
LINK_OWNER	VARCHAR2	The owner of the associated share link.
LINK_NAME	VARCHAR2	The name of the associated share link.
SHARE_SCHEMA_NAME	VARCHAR2	The name of the share schema, as supplied by the share provider.
SHARE_TABLE_NAME	VARCHAR2	The name of the share table, as supplied by the share provider.
VIEW_OWNER	VARCHAR2	The owner of the local view.
VIEW_NAME	VARCHAR2	The name of the local view.

ALL_SHARE_LINKS View

A view containing all share links that were created using `CREATE_SHARE_LINK`.

See CREATE_SHARE_LINK Procedure for further information.

Column	Datatype	Description
OWNER	VARCHAR2	The owner of the share link.
LINK_NAME	VARCHAR2	The name of the share link.
LINK_ID	NUMBER	A numeric ID for the share link.
SHARE_TYPE	VARCHAR2	The type of share provider: DELTA or ORACLE.
SHARE_NAME	VARCHAR2	The name of the share.
SHARE_PROVIDER_NAME	VARCHAR2	The name of the share provider.
SHARE_PROVIDER_OWNER	VARCHAR2	The owner of the share provider.
SHARE_PROVIDER_ID	NUMBER	A numeric ID for the provider.
METADATA_PATH	VARCHAR2	The lineage path of the share link.
SHARE_CREDENTIAL_NAME	VARCHAR2	(DELTA) The name of the credential used to access the endpoints.
METADATA	BLOB	Additional metadata, supplied by the user.
ORACLE_SHARE_PROVIDER_ID	VARCHAR2	(ORACLE) A globally unique GUID for the Oracle share provider.
CREATED	TIMESTAMP(6) WITH TIME ZONE	The date this share link was created.
UPDATED	TIMESTAMP(6) WITH TIME ZONE	The date this share link was last modified.

ALL_SHARE_PROVIDERS View

A view that contains one row for each share provider subscription, created by `CREATE_SHARE_PROVIDER`.

See CREATE_SHARE_PROVIDER Procedure for further information.

Column	Datatype	Description
OWNER	VARCHAR2	The user who subscribed to the share provider.
PROVIDER_NAME	VARCHAR2	The local name given to the share provider.
PROVIDER_ID	VARCHAR2	A numeric ID for the provider.
ENDPOINT	VARCHAR2	(DELTA) The delta endpoint for the provider.
SHARE_TYPE	VARCHAR2	The type of share provider: DELTA or ORACLE.
METADATA_PATH	VARCHAR2	The lineage path for the share provider.
SHARE_CREDENTIAL_NAME	VARCHAR2	(DELTA) The name of the credential used to access the delta endpoints.
METADATA	BLOB	Additional metadata, provided by the user.
ORACLE_PROVIDER_ID	VARCHAR2	(ORACLE) A globally unique GUID for the Oracle share provider.
CREATED	TIMESTAMP(6) WITH TIME ZONE	The date this share provider was created.
UPDATED	TIMESTAMP(6) WITH TIME ZONE	The date this share provider was last modified.

DBA_SHARE_LINK_VIEWS View

A view that contains a list of all the views created to access the shared data using CREATE_SHARE_LINK_VIEW. Its columns are the same as those in the ALL_SHARE_LINK_VIEWS view.

See Also:

"ALL_SHARE_LINK_VIEWS View"

DBA_SHARE_LINKS View

A view containing all share links that were created using CREATE_SHARE_LINK. Its columns are the same as those in the ALL_SHARE_LINKS view.

See Also:

"ALL_SHARE_LINKS View"

USER_SHARE_LINKS_VIEW View

A view that contains a list of all the views created to access the shared data using CREATE_SHARE_LINK_VIEW. Its columns are the same as those in the ALL_SHARE_LINK_VIEWS view.

See Also:

"ALL_SHARE_LINK_VIEWS View"

USER_SHARE_LINKS View

A view containing all share links that were created using `CREATE_SHARE_LINK`. Its columns are the same as those in the `ALL_SHARE_LINKS` view.

See Also:

"ALL_SHARE_LINKS View"

USER_SHARE_PROVIDERS View

A view that contains one row for each share provider subscription, created by `CREATE_SHARE_PROVIDER`. Its columns are the same as those in the `ALL_SHARE_PROVIDERS` view.

See Also:

"ALL_SHARE_PROVIDERS View"

DBMS_SHARE Constants

These constants are used by the `DBMS_SHARE` package.

Detached Files

Constants used by PURGE_DETACHED_FILES Procedure.

Name	Type	Value	Description
`PURGE_DROP`	`PLS_INTEGER`	1	Attempt to drop the files, using the specified credential. If the file cannot be dropped, then the file continues to be listed in the `*_SHARE_DETACHED_FILES` views.
`PURGE_DROP_FORCE`	`PLS_INTEGER`	2	Attempt to drop the files, using the specified credential. The file is removed from the `*_SHARE_DETACHED_FILES` views, even if the attempt to drop the file fails again.
`PURGE_FORGET`	`PLS_INTEGER`	3	Remove the files `*_SHARE_DETACHED_FILES` views without attempting to drop them.

Log Level

Constants used for setting the level of information collected in the log. These levels control the number of events that get logged into `ALL_SHARE_EVENTS` and `ALL_SHARE_RECIPIENTS`.

See SET_SHARE_LOG_LEVEL Procedure and SET_RECIPIENT_LOG_LEVEL Procedure.

Name	Type	Value	Description
`LOG_LEVEL_ERRORS_ONLY`	`PLS_INTEGER`	0	Only log errors.

Name	Type	Value	Description
LOG_LEVEL_BASIC	PLS_INTEGER	1	Log errors and basic information.
LOG_LEVEL_DETAIL	PLS_INTEGER	2	Log errors and additional details.
LOG_LEVEL_DEBUG	PLS_INTEGER	3	Log debug level of information.

Share Job Properties

Properties used in UPDATE_SHARE_JOB_PROPERTY Procedure.

Name	Type	Value	Description
PROP_SHARE_JOB_DOP	VARCHAR2(7)	'JOB_DOP'	The JOB_DOP property determines how many DBMS_SCHEDULER jobs are used to publish the share. This should be a number between 1 and 5.
PROP_SHARE_JOB_CLASS	VARCHAR2(9)	'JOB_CLASS'	The JOB_CLASS property determines the scheduler job class that is used to published the share. See ALL_SCHEDULER_JOB_CLASSES for a list of valid values. The default value is DEFAULT_JOB_CLASS.
PROP_SHARE_JOB_PRIORITY	VARCHAR2(12)	'JOB_PRIORITY'	The JOB_PRIORITY property determines the relative priority when two or more shares from the same user are being published at the same time. The value should be a number, with 0 as the default. Shares with a higher priority will be processed before shares with a lower priority. Shares with the same priority are processed on a first come, first serve basis. Standard values for job priority: SHARE_PRIORITY_LOW CONSTANT NUMBER := 1; SHARE_PRIORITY_DEFAULT CONSTANT NUMBER := 2; SHARE_PRIORITY_HIGH CONSTANT NUMBER := 3;

Share Properties

Constants used to indicate the properties of a share.

See UPDATE_SHARE_PROPERTY Procedure, UPDATE_DEFAULT_SHARE_PROPERTY Procedure and GET_SHARE_PROPERTY Function.

Name	Type	Value	Description
PROP_SHARE_DESC	VARCHAR2(11)	'DESCRIPTION'	A locally visible description of the share.
PROP_SHARE_PUBLIC_DESC	VARCHAR2(18)	'PUBLIC_DESCRIPTION'	An externally visible description of the share.
PROP_SHARE_SPLIT_SIZE	VARCHAR2(10)	'SPLIT_SIZE'	The SPLIT_SIZE property determine how large the generated parquet files will be. The algorithm works as follows: 1. The SQL Optimizer estimates the size in bytes of a given segment (for example, a partition of a table or the results of a view). 2. The number of bytes is divided by the SPLIT_SIZE and rounded up to produce the "number of splits". 3. The data in the segment is then chunked into this "number of splits" using some method (for example ROWID, index columns, specified columns, etc.). 4. Each chunk of data is then converted into a parquet file. Note that the parquet file will generally be smaller than the SPLIT_SIZE due to the compression. In particular, SPLIT_SIZE determines the amount of data before compression.
PROP_SHARE_LOG_LEVEL	VARCHAR2(9)	'LOG_LEVEL'	The LOG_LEVEL property determines the amount of information that will be logged in the ALL_SHARE_EVENTS log.
PROP_SHARE_VERSION_ACCESS	VARCHAR2(14)	'VERSION_ACCESS'	The versions of a published share a recipient can see.

Share Recipient PAR Type

These constants are the valid values for the property `PROP_RECIPIENT_PAR_TYPE` in UPDATE_RECIPIENT_PROPERTY Procedure and GET_RECIPIENT_PROPERTY.

Name	Type	Value	Description
PAR_TYPE_FOLDER	PLS_INTEGER	1	PARs gives access to the entire folder.
PAR_TYPE_FILE	PLS_INTEGER	2	PARs gives access to one file at a time.

Share Recipient Properties

These constants are used in GET_SHARE_PROPERTY Function, UPDATE_DEFAULT_SHARE_PROPERTY Procedure, and UPDATE_SHARE_PROPERTY Procedure.

Name	Type	Value	Description
PROP_RECIPIENT_PAR_LIFETIME	VARCHAR2(12)	'PAR_LIFETIME'	The lifetime of Pre-authenticated Request URLs sent to the recipient through the delta sharing API. The default is three hours: '00 03:00:00'
PROP_RECIPIENT_MIN_PAR_LIFETIME	VARCHAR2(16)	'MIN_PAR_LIFETIME'	The minimum guaranteed lifetime of a Pre-authenticated Request URLs sent to the recipient through the delta sharing API. If there is an existing PAR for the same parquet file, it is reused only if the remaining life exceeds this minimum value. The default is 2 1/2 hours: '00 02:30:00'
PROP_RECIPIENT_MAX_PAR_LIFETIME	VARCHAR2(16)	'MAX_PAR_LIFETIME'	An administrator setting that defines the maximum allowed par lifetime for any recipient. The default is 1 day: '01 00:00:00'
PROP_RECIPIENT_TOKEN_LIFETIME	VARCHAR2(14)	'TOKEN_LIFETIME'	A string, in INTERVAL DAY TO SECOND format, representing the lifetime of a delta sharing bearer token. The default is one hour: '01 00:00:00'.
PROP_RECIPIENT_MAX_TOKEN_LIFETIME	VARCHAR2(18)	'MAX_TOKEN_LIFETIME'	An administrator setting that defines the maximum allowed bearer token lifetime for any recipient. The default is 90 days: '90 00:00:00'
PROP_RECIPIENT_EMAIL	VARCHAR2(5)	'EMAIL'	The email of the recipient. This is only required for delta sharing recipients.
PROP_RECIPIENT_DESCRIPTION	VARCHAR2(11)	'DESCRIPTION'	A textual description of the recipient.

Name	Type	Value	Description
PROP_RECIPIENT_LOG_LEVEL	VARCHAR2(9)	'LOG_LEVEL'	The logging level for the recipient. This controls what gets logged in USER_SHARE_RECIPIENT_EVENTS. The value should be one of the LOG_LEVEL_* constants.
PROP_RECIPIENT_SHARING_ID	VARCHAR2(10)	'SHARING_ID'	The sharing ID of the recipient. This is only required for Autonomous Database recipients.
PROP_RECIPIENT_PAR_TYPE	VARCHAR2(8)	'PAR_TYPE'	The type of pre-authenticated request to create. This should be one of PAR_TYPE_FOLDER (the default) or PAR_TYPE_FILE.
PROP_RECIPIENT_VERSION_ACCESS	VARCHAR2(14)	'VERSION_ACCESS'	Specifies what versions of published shares a recipient can see. One of VERSION_ACCESS_CURRENT or VERSION_ACCESS_ANY.

Share Table Properties

Constants used to indicate share table properties. These are used by GET_SHARE_TABLE_PROPERTY Function, and UPDATE_SHARE_TABLE_PROPERTY Procedure.

Name	Type	Value	Description
PROP_SHARE_TABLE_SPLIT_METHOD	VARCHAR2(12)	'SPLIT_METHOD'	Specifies how a segment should be split into different files.
SPLIT_METHOD_AUTO	VARCHAR2(4)	'AUTO'	Autonomous Database determines the way in which segments are split.
SPLIT_METHOD_RANGE	VARCHAR2(5)	'RANGE'	Split segments based on the value ranges. The exact ranges are determined by analyzing the data histograms. This method requires one or more split_columns to be specified.
SPLIT_METHOD_ROWID	VARCHAR2(5)	'ROWID'	Split segments based on ROWID.
SPLIT_METHOD_HASH	VARCHAR2(4)	'HASH'	Split segments based on HASH values. This method requires one or more split_columns to be specified.

Name	Type	Value	Description
SPLIT_METHOD_VALUE	VARCHAR2(5)	'VALUE'	Split segments based on distinct values. This method requires one or more split_columns to be specified.
PROP_SHARE_TABLE_SPLIT_COLUMNS	VARCHAR2(13)	'SPLIT_COLUMNS'	Specifies what columns are used for splitting. These are required for RANGE, VALUE, AND HASH methods. The value should be a comma delimited set of shared columns (for example, 'state,city' or '"STATE","CITY"').
PROP_SHARE_TABLE_ORDER_COLUMNS	VARCHAR2(13)	'ORDER_COLUMNS'	Specifies what columns are used for ordering when gathering parquet. The value should be a comma delimited set of shared columns (for example, 'state,city' or '"STATE","CITY"').
PROP_SHARE_TABLE_SHARE_COLUMNS	VARCHAR2(13)	'SHARE_COLUMNS'	Specifies what columns are shared. The value is a comma delimited set of shared columns. For example, 'state,city' or '"STATE","CITY"'.
PROP_SHARE_TABLE_SPLIT_SIZE	VARCHAR2(10)	'SPLIT_SIZE'	Override share level split_size for a specific table. The value is a number.
PROP_SHARE_TABLE_GATHER_STATS	VARCHAR2(12)	'GATHER_STATS'	If Autonomous Database will gather statistics, the value of 'GATHER_STATS' is 'YES'. Otherwise the value is 'NO'.

Name	Type	Value	Description
PROP_SHARE_TABLE_SPLIT_ROWS	VARCHAR2(10)	'SPLIT_ROWS'	The SPLIT_ROWS property is an alternative way to specify the amount of data to be stored in each parquet file. 1. Autonomous Database calculates the number of rows in a given segment (for example, a partition of a table or the results of a view). 2. The number of rows is divided by the SPLIT_ROWS and rounded up to produce the "number of splits". 3. The data in the segment is then chunked into this number of splits using some method (for example, ROWID, index columns, specified columns, etc.) 4. Each chunk of data is then converted into a parquet file. It is recommended that you use the SPLIT_SIZE property to control the number of splits since this reflects the amount of data in each row. A row with 900 columns of VARCHAR2(4000), for example, is much larger than a row with a single column of type NUMBER(1). Only use SPLIT_ROWS if you have accounted for the average amount of data in each row.

Name	Type	Value	Description
PROP_SHARE_TABLE_FLASHBACK	VARCHAR2(9)	'FLASHBACK'	The FLASHBACK property determines if the table will be published using flashback queries to ensure read consistency between the different export files. The value should be YES, NO, or AUTO. The AUTO setting will use flashback if it is available. The YES setting will cause the publication to fail if flashback is not possible on the table or view. The NO setting will not use flashback, which means that parquet files could represent different snapshots of the data.

Share Types

Constants used during share creation to identify the type of share.

See CREATE_SHARE Procedure.

Name	Type	Value	Description
SHARE_TYPE_VERSIONED	DBMS_ID	'VERSIONED'	Share is used for sharing versioned data.
SHARE_TYPE_LIVE	DBMS_ID	'LIVE'	Share is used for sharing live data.

Sharing ID Type

Used in ASSERT_SHARING_ID and GET_SHARING_ID.

Name	Type	Value	Description
SHARING_ID_TYPE_TENANCY	VARCHAR2(7)	'TENANCY'	The sharing ID represents an OCI Tenancy.
SHARING_ID_TYPE_COMPARTMENT	VARCHAR2(11)	'COMPARTMENT'	The sharing ID represents an OCI Compartment.
SHARING_ID_TYPE_DATABASE	VARCHAR2(8)	'DATABASE'	The sharing ID represents an OCI Autonomous Database.
SHARING_ID_TYPE_REGION	VARCHAR2(6)	'REGION'	The sharing ID represents an OCI Region.

Version Access

Possible values for the VERSION_ACCESS share property. This is used to implement delta "time travel". These are the valid values associated with PROP_SHARE_VERSION_ACCESS and PROP_RECIPIENT_VERSION_ACCESS.

These can be used to enable the "version" property in the delta sharing query endpoint, which allows recipients to select specific versions of the data instead of always receiving the CURRENT version. You need to enable this on both the share and the recipient.

For example:

```
UPDATE_SHARE_PROPERTY(
          share_name => '...',
          share_property => DBMS_SHARE.PROP_SHARE_VERSION_ACCESS,
          new_value => DBMS_SHARE.VERSION_ACCESS_ANY);

UPDATE_SHARE_PROPERTY(
          share_name => '...',
          share_property => DBMS_SHARE.PROP_RECIPIENT_VERSION_ACCESS,
          new_value => DBMS_SHARE.VERSION_ACCESS_ANY);
```

Name	Type	Value	Description
VERSION_ACCESS_CURRENT	PLS_INTEGER	1	A recipient can see only the CURRENT version. (Default)
VERSION_ACCESS_ANY	PLS_INTEGER	2	A recipient can choose any CURRENT or RETIRED version.

CS_RESOURCE_MANAGER Package

The `CS_RESOURCE_MANAGER` package provides an interface to list and update consumer group parameters, and to revert parameters to default values.

- LIST_CURRENT_RULES Function
  This function lists the parameter values for each consumer group.
- LIST_DEFAULT_RULES Function
  This function returns the default values for all consumer groups.
- REVERT_TO_DEFAULT_VALUES Procedure
  This procedure reverts the specified resource manager's plan properties to default values.
- UPDATE_PLAN_DIRECTIVE Procedure
  Use this procedure to update the resource plan for a specified consumer group.

LIST_CURRENT_RULES Function

This function lists the parameter values for each consumer group.

Syntax

```
CS_RESOURCE_MANAGER.LIST_CURRENT_RULES
   RETURN TABLE;
```

Example

```
SELECT * FROM CS_RESOURCE_MANAGER.LIST_CURRENT_RULES();

CONSUMER_GROUP ELAPSED_TIME_LIMIT IO_MEGABYTES_LIMIT SHARES CONCURRENCY_LIMIT
DEGREE_OF_PARALLELISM
```

```
------------- ----------------- ----------------- ------ ----------------
--------------------
HIGH                                                    4
3                    3
MEDIUM                                                  2
2                    9
LOW                                                     1
900                    1
```

LIST_DEFAULT_RULES Function

This function returns the default values for all consumer groups.

Syntax

```
CS_RESOURCE_MANAGER.LIST_DEFAULT_RULES
  RETURN TABLE;
```

Usage Note

- By default the parallel degree policy value is `MANUAL` for the `TPURGENT` consumer group. The `CS_RESOURCE_MANAGER.LIST_DEFAULT_RULES` function shows no value for the default value for the `DEGREE_OF_PARALLELISM` for the `TPURGENT` consumer group.

Example

```
SELECT * FROM CS_RESOURCE_MANAGER.LIST_DEFAULT_RULES();
CONSUMER_GROUP ELAPSED_TIME_LIMIT IO_MEGABYTES_LIMIT SHARES CONCURRENCY_LIMIT
DEGREE_OF_PARALLELISM
------------- ----------------- ----------------- ------ ----------------
--------------------
HIGH                           0                 0      4
3                    1
MEDIUM                         0                 0      2
1                    1
LOW                            0                 0      1
300                    1
TP                             0                 0      8
300                    1
TPURGENT                       0                 0     12
300
```

REVERT_TO_DEFAULT_VALUES Procedure

This procedure reverts the specified resource manager's plan properties to default values.

Syntax

```
CS_RESOURCE_MANAGER.REVERT_TO_DEFAULT_VALUES(
   consumer_group         IN VARCHAR2,
   shares                 IN BOOLEAN   DEFAULT FALSE,
   concurrency_limit      IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Parameter	Description
consumer_group	Specifies the consumer group to revert. Depending on the workload, valid values are: HIGH, MEDIUM, LOW, TP, or TPURGENT.
shares	When the value is TRUE, revert shares for the service to the default value.
concurrency_limit	When the value is TRUE, revert the concurrency_limit for the service to the default value. When you revert the concurrency_limit, both the concurrency_limit and the degree_of_parallelism values are set to their default values.

Usage Note

- When the workload type is Data Warehouse, the valid values for consumer_group are HIGH, MEDIUM, or LOW.

Examples

```
BEGIN
   CS_RESOURCE_MANAGER.REVERT_TO_DEFAULT_VALUES(
      consumer_group => 'MEDIUM',
      concurrency_limit => TRUE);
END;
/

BEGIN
   CS_RESOURCE_MANAGER.REVERT_TO_DEFAULT_VALUES(
      consumer_group => 'HIGH',
      shares => TRUE);
END;
/
```

UPDATE_PLAN_DIRECTIVE Procedure

Use this procedure to update the resource plan for a specified consumer group.

Syntax

```
CS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE(
   consumer_group         IN VARCHAR2,
   io_megabytes_limit     IN NUMBER   DEFAULT NULL,
   elapsed_time_limit     IN NUMBER   DEFAULT NULL,
   shares                 IN NUMBER   DEFAULT NULL,
   concurrency_limit      IN NUMBER   DEFAULT NULL);
```

Parameters

Parameter	Description
consumer_group	Specifies the consumer group to update. Depending on the workload, valid values are: HIGH, MEDIUM, LOW, TP, or TPURGENT.
io_megabytes_limit	Specifies the maximum megabytes of I/O that a SQL operation can issue. Specify a NULL value to clear the limit.
elapsed_time_limit	Specifies the maximum time in seconds that a SQL operation can run. Specify a NULL value to clear the limit.
shares	Specifies the shares value. A higher number of shares, relative to other consumer groups, increases the consumer group's CPU and I/O priority.
concurrency_limit	Specifies the maximum number of concurrent SQL statements that can be executed. This parameter is only valid with the MEDIUM consumer group.

Usage Notes

- When a SQL statement in the specified service runs more than the specified runtime limit (elapsed_time_limit) or does more I/O than the specified amount (io_megabytes_limit), then the SQL statement will be terminated.
- When the workload type is Data Warehouse, the valid values for consumer_group are HIGH, MEDIUM, or LOW.
- When the concurrency_limit parameter is specified, the only valid value for consumer_group is MEDIUM.

Examples

```
BEGIN
   CS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE(
      consumer_group => 'HIGH',
      shares => 8);
   CS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE(
      consumer_group => 'MEDIUM',
      shares => 2);
   CS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE(
      consumer_group => 'LOW',
      shares => 1);
END;
/

BEGIN
   CS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE(
      consumer_group => 'HIGH',
      io_megabytes_limit => null,
      elapsed_time_limit => null);
END;
/

BEGIN
```

```
   CS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE(
     consumer_group => 'MEDIUM',
     concurrency_limit => 2);
END;
/
```

CS_SESSION Package

The `CS_SESSION` package provides an interface to switch the database service and consumer group of the existing session.

When a connection is established with an Autonomous Database, that session is assigned a consumer group. For example, a session could be created using a connection to the LOW service of an Autonomous Database. You might want to switch the consumer group, for example from LOW to HIGH. The `CS_SESSION` package provides an API for switching. See Database Service Names for Autonomous Database for more information.

The consumer groups determine concurrency and degree of parallelism (DOP). For example, statements on a connection established to the LOW database service run serially. Statements on a connection established to the HIGH database service run in parallel. If you have a workload that requires serial statement processing with switching to a HIGH consumer group for a few statements, the `CS_SESSION` package enables you to switch.

- SWITCH_SERVICE Procedure
  This procedure switches the database service and consumer group of the current session.

SWITCH_SERVICE Procedure

This procedure switches the database service and consumer group of the current session.

Syntax

```
CS_SESSION.SWITCH_SERVICE(service_name IN varchar2);
```

Parameters

Parameter	Description
`service_name`	Specifies the consumer group to update. Depending on the workload, valid values are: `HIGH`, `MEDIUM`, `LOW`, `TP`, or `TPURGENT`.

Usage Notes

When called, the procedure switches the session to the specified service and the related consumer group. If the specified service does not exist in that database, an error message is provided. For example, if you specify 'TP' as the service name on a data warehouse workload, the error indicates it's not a valid service name. No error is reported if the current service and the specified service are identical.

The procedure does not reset session attributes. Anything the user set for their session before calling this procedure will continue as-is. For example, if a session parameter was modified and then later the session switched to a different service, the parameter value will stay the same.

Example

```
BEGIN
  CS_SESSION.SWITCH_SERVICE('HIGH');
END;
/
```

Security and Access

The `ADMIN` user is granted `EXECUTE` privilege on `CS_SESSION` with `GRANT OPTION`. The privilege is also granted to `DWROLE` without the `GRANT OPTION`.

Additional Security Considerations

If a user is granted `EXECUTE` privileges on this procedure and you do not want that user to switch to a specific service, you can use a `AFTER SET CONTAINER` trigger to block the operation. This is achieved by creating an `AFTER SET CONTAINER` trigger.

```
CREATE OR REPLACE TRIGGER SESS_SWITCH
AFTER SET CONTAINER ON DATABASE
BEGIN
IF SYS_CONTEXT('USERENV','SESSION_USER') = 'USER' and
   SYS_CONTEXT('USERENV','SERVICE_NAME') =
'serviceexample_low.adwc.oraclecloud.com'
THEN
    NULL;
ELSE
    RAISE_APPLICATION_ERROR(-20001, 'Denied!  You are not allowed to switch
service in the database');
END IF;
END;
/
```

Error Messages

The following table describes exceptions for `CS_SESSION`

Error	Message	Cause
20001	Invalid service name. Valid values are HIGH, MEDIUM, LOW.	For a data warehouse workload, a value other than 'HIGH', 'MEDIUM', 'LOW' was specified.
20001	Invalid service name. Valid values are HIGH, MEDIUM, LOW, TP, TPURGENT.	For a transaction processing workload, a value other than 'HIGH', 'MEDIUM', 'LOW', 'TP', 'TPURGENT' was specified.
20002	Service switch failed.	Failed to switch to the new service.

Autonomous Database Views

Autonomous Database provides several views that are not available in Oracle Database 19c. This topic lists the Autonomous Database specific views.

- Track Table and Partition Scan Access with Autonomous Database Views
  Oracle Autonomous Database tracks the scan count for tables and partitions. Use the table access stats data dictionary and dynamic views to retrieve scan count information.
- Track Oracle Cloud Infrastructure Resources, Cost and Usage Reports with Autonomous Database Views
  Oracle Autonomous Database tracks the Oracle Cloud Infrastructure resources, cost and usage reports. You can access these reports using the OCI views.
- Pipeline Views
  Lists details for the `DBMS_CLOUD_PIPELINE` views.
- DBMS_CLOUD_AI Views
  The `DBMS_CLOUD_AI` package uses the following views.
- DBMS_CLOUD_FUNCTION Views
  The `DBMS_CLOUD_FUNCTION` package uses the following views.
- DBMS_CLOUD_LINK Views
  The `DBMS_CLOUD_LINK` package uses the following views.
- DBMS_DATA_ACCESS Views
  Describes the Autonomous Database dynamic performance views you can use with the `DBMS_DATA_ACCESS` package to monitor Table Hyperlink URL usage.
- DBA_PROXY_SQL Views
  Describes the Autonomous Database `DBA_PROXY_SQL` views.
- Lockdown Errors View
  Lists details for the `DBA_LOCKDOWN_ERRORS` view.
- Oracle Cloud Infrastructure Logging Interface Views
  The Oracle Cloud Infrastructure (OCI) logging interface views enable authorized users to access log data through a set of views.
- Real Application Testing Capture Replay Views
  Oracle Real Application Testing capture replay views.
- Stripe Views on Autonomous Database
  Stripe is an online payment processing and credit card processing platform for businesses. Users can query views created on top of Stripe APIs using the DBMS_CLOUD package to get Stripe information such as invoices, subscriptions, and customers.
- Track DBMS_CLOUD Load Operations
  `DBMS_CLOUD` tracks details for load operations for each instance and for users.

Track Table and Partition Scan Access with Autonomous Database Views

Oracle Autonomous Database tracks the scan count for tables and partitions. Use the table access stats data dictionary and dynamic views to retrieve scan count information.

- GV$TABLE_ACCESS_STATS and V$TABLE_ACCESS_STATS Views
  The `GV$TABLE_ACCESS_STATS` and `V$TABLE_ACCESS_STATS` views list the scan count for tables and partitions. The scan data collection begins at instance startup time.
- ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS Views
  The `ALL_TABLE_ACCESS_STATS` and `DBA_TABLE_ACCESS_STATS` views list the scan count for tables and partitions. The scan data collection begins at instance startup time.
- USER_TABLE_ACCESS_STATS View
  The `USER_TABLE_ACCESS_STATS` view lists the scan count for the user's tables and partitions. The scan data collection begins at instance startup time.

GV$TABLE_ACCESS_STATS and V$TABLE_ACCESS_STATS Views

The `GV$TABLE_ACCESS_STATS` and `V$TABLE_ACCESS_STATS` views list the scan count for tables and partitions. The scan data collection begins at instance startup time.

Column	Datatype	Description
`READ_COUNT`	`NUMBER`	Aggregated scan count since instance startup
`OBJECT_ID`	`NUMBER`	Object ID of the table or partition
`INST_ID`	`NUMBER`	Instance number where table/partition was scanned This column (`INST_ID`) is only shown in `GV$TABLE_ACCESS_STATS`
`CON_ID`	`NUMBER`	Container ID of the database

ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS Views

The `ALL_TABLE_ACCESS_STATS` and `DBA_TABLE_ACCESS_STATS` views list the scan count for tables and partitions. The scan data collection begins at instance startup time.

> **Note:**
>
> The `ALL_TABLE_ACCESS_STATS` and `DBA_TABLE_ACCESS_STATS` views do not list scan count information for Oracle-maintained schemas.

Column	Datatype	Description
`TABLE_OWNER`	`VARCAR2(128)`	Owner of the table
`TABLE_NAME`	`VARCAR2(128)`	Name of the table
`PARTITION_NAME`	`VARCAR2(128)`	Name of the partition A `NULL` value specifies a non-partitioned table
`INSTANCE_ID`	`NUMBER`	Instance number where table or partition was scanned
`READ_COUNT`	`NUMBER`	Aggregated scan count since instance startup

USER_TABLE_ACCESS_STATS View

The `USER_TABLE_ACCESS_STATS` view lists the scan count for the user's tables and partitions. The scan data collection begins at instance startup time.

Column	Datatype	Description
`TABLE_NAME`	`VARCAR2(128)`	Name of the table
`PARTITION_NAME`	`VARCAR2(128)`	Name of the partition A `NULL` value specifies a non-partitioned table
`INSTANCE_ID`	`NUMBER`	Instance number where table/partition was scanned
`READ_COUNT`	`NUMBER`	Aggregated scan count since instance startup

Track Oracle Cloud Infrastructure Resources, Cost and Usage Reports with Autonomous Database Views

Oracle Autonomous Database tracks the Oracle Cloud Infrastructure resources, cost and usage reports. You can access these reports using the OCI views.

- Prerequisite Steps to Use OCI Resource Views
  Describes the prerequisite steps you must perform to use OCI resource views on Autonomous Database.
- OCI_AUTONOMOUS_DATABASES View
  `OCI_AUTONOMOUS_DATABASES` describes all the Oracle Cloud Infrastructure Autonomous Databases in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_BUDGET_ALERT_RULES View
  `OCI_BUDGET_ALERT_RULES` describes all the Oracle Cloud Infrastructure budget alert rules in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_BUDGET_SUMMARY View
  `OCI_BUDGET_SUMMARY` describes all the Oracle Cloud Infrastructure budget summaries in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_COST_DATA View
  `OCI_COST_DATA` describes all the Oracle Cloud Infrastructure cost data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_OBJECTSTORAGE_BUCKETS View
  `OCI_OBJECTSTORAGE_BUCKETS` describes all the Oracle Cloud Infrastructure object storage buckets in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_USAGE_DATA View
  `OCI_USAGE_DATA` describes all the Oracle Cloud Infrastructure usage data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

Prerequisite Steps to Use OCI Resource Views

Describes the prerequisite steps you must perform to use OCI resource views on Autonomous Database.

> **Note:**
>
> Only ADMIN user has access to the OCI resource views by default. To access these views as another user, the ADMIN must grant READ privileges.

To query an OCI resource view, do the following:

1. Create a dynamic group that includes your Autonomous Database instance and define the required policies to access a view.

For example, the Autonomous Database instance is specified in the `resource.id` parameter with an OCID:

```
resource.id = '<your_Autonomous_Database_instance_OCID>'
```

Each view shows the details for the policy that you must define to query the view.

See Perform Prerequisites to Use Resource Principal with Autonomous Database for details on creating a dynamic group and defining policies.

For example, to access all of the views, define the following policy:

```
Define tenancy usage-report as
ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhq
kggq
Endorse dynamic-group <group-name> to read objects in tenancy usage-report
Allow dynamic-group <group-name> to read buckets in tenancy
Allow dynamic-group <group-name> to read autonomous-database in tenancy
Allow dynamic-group <group-name> to read usage-budgets in tenancy
```

> **Note:**
>
> Do not replace the OCID in this policy with another OCID. This `usage-report` OCID provides the Oracle Cloud Infrastructure usage data for your tenancy.

2. Verify that resource principal is enabled for the ADMIN user on the Autonomous Database instance.

```
SELECT owner, credential_name FROM dba_credentials
   WHERE credential_name = 'OCI$RESOURCE_PRINCIPAL' AND owner = 'ADMIN';

OWNER CREDENTIAL_NAME
----- --------------------
ADMIN OCI$RESOURCE_PRINCIPAL
```

If the resource principal is not enabled, then enable the resource principal:

```
EXEC DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL();
```

See Use Resource Principal to Access Oracle Cloud Infrastructure Resources for more information.

3. Run a query on an OCI resource view.

For example:

```
SELECT NAME, APPROXIMATESIZE FROM OCI_OBJECTSTORAGE_BUCKETS;
SELECT * FROM OCI_USAGE_DATA;
```

OCI_AUTONOMOUS_DATABASES View

`OCI_AUTONOMOUS_DATABASES` describes all the Oracle Cloud Infrastructure Autonomous Databases in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read autonomous-database in tenancy
```

This policy lets you list all Autonomous Databases in your tenancy. Optionally you can restrict it to list Autonomous Databases in a given compartment:

```
Allow dynamic-group <group-name> to read autonomous-database in compartment
<compartment-name>
```

Column	Datatype	Description
DISPLAYNAME	VARCHAR2	The user friendly name for the Autonomous Database
REGION	VARCHAR2	Region Name
COMPARTMENTID	VARCHAR2	The OCID of the compartment
ID	VARCHAR2	The OCID of the Autonomous Database
DBNAME	VARCHAR2	The database name
LIFECYCLESTATE	VARCHAR2	The current state of the Autonomous Database
TIMECREATED	VARCHAR2	The date and time the Autonomous Database was created
DATASTORAGESIZEINTBS	VARCHAR2	The quantity of data in the database in terabytes
LICENSEMODEL	VARCHAR2	The Oracle license model that applies to the Autonomous Database
SERVICECONSOLEURL	VARCHAR2	The URL of the Service Console for the Autonomous Database
APEXDETAILS	CLOB	Information about Oracle APEX Application Development
AREPRIMARYWHITELISTEDIPSUSED	VARCHAR2	Primary White Listed IPs
AUTONOMOUSCONTAINERDATABASEID	VARCHAR2	The Autonomous Container Database OCID
AUTONOMOUSMAINTENANCESCHEDULETYPE	VARCHAR2	Maintenance Schedule Type
AVAILABLEUPGRADEVERSIONS	VARCHAR2	List of Oracle Database versions available for a database upgrade
BACKUPCONFIG	CLOB	Autonomous Database Backup Config
CONNECTIONSTRINGS	CLOB	Autonomous Database Connection Strings
CONNECTIONURLS	CLOB	Autonomous Database Connection URLs
CPUCORECOUNT	NUMBER	The number of OCPU cores to be made available to the database
CUSTOMERCONTACTS	CLOB	The Customer Contacts
DATASAFESTATUS	VARCHAR2	Status of the Data Safe registration for this Autonomous Database
DATASTORAGESIZEINGBS	NUMBER	The quantity of data in the database in gigabytes

Column	Datatype	Description
DBVERSION	VARCHAR2	The Oracle Database version for the Autonomous Database
DATAGUARDREGIONTYPE	VARCHAR2	The Autonomous Data Guard region type of the Autonomous Database
DBWORKLOAD	VARCHAR2	The Autonomous Database workload type
DEFINEDTAGS	CLOB	Defined tags for the resource
FAILEDDATARECOVERYINSECONDS	NUMBER	Indicates the number of seconds of data loss for an Autonomous Data Guard failover
FREEFORMTAGS	CLOB	Free form tags for the resource
INFRASTRUCTURETYPE	VARCHAR2	The infrastructure type this resource belongs to
ISACCESSCONTROLENABLED	VARCHAR2	Indicates if the database level access control is enabled
ISAUTOSCALINGENABLED	VARCHAR2	Indicates if auto scaling is enabled for the Autonomous Database
ISDATAGUARDENABLED	VARCHAR2	Indicates whether the Autonomous Database has a local Autonomous Data Guard enabled
ISDEDICATED	VARCHAR2	True if the database uses dedicated Exadata infrastructure
ISFREETIER	VARCHAR2	Indicates if this is an Always Free resource
ISMTLSCONNECTIONREQUIRED	VARCHAR2	Indicates whether the Autonomous Database requires mTLS connections
ISPREVIEW	VARCHAR2	Indicates if the Autonomous Database version is a preview version
ISREFRESHABLECLONE	VARCHAR2	Indicates whether the Autonomous Database is a refreshable clone
KEYHISTORYENTRY	CLOB	Key History Entry
KEYSTOREID	VARCHAR2	The OCID of the key store
KEYSTOREWALLETNAME	VARCHAR2	The wallet name for Oracle Cloud Infrastructure Vault
KMSKEYID	VARCHAR2	The OCID of the key container that is used as the master encryption key
KMSKEYLIFECYCLEDETAILS	VARCHAR2	Customer managed key lifecycle details
LIFECYCLEDETAILS	VARCHAR2	Information about the current lifecycle state
NSGIDS	CLOB	A list of the OCIDs of the network security groups NSGs
OCPUCOUNT	NUMBER	The number of OCPU cores to be made available to the database
OPENMODE	VARCHAR2	The Autonomous Database open mode
OPERATIONSINSIGHTSSTATUS	VARCHAR2	Status of OCI Ops Insights for this Autonomous Database
PEERDBIDS	VARCHAR2	The list of OCIDs of standby databases located in Autonomous Data Guard
PERMISSIONLEVEL	CLOB	The Autonomous Database permission level
PRIVATEENDPOINT	VARCHAR2	The private endpoint for the resource
PRIVATEENDPOINTIP	VARCHAR2	The private endpoint IP address for the resource
PRIVATEENDPOINTLABEL	VARCHAR2	The private endpoint label for the resource
REFRESHABLEMODE	VARCHAR2	The refresh mode of the clone
REFRESHABLESTATUS	VARCHAR2	The refresh status of the clone
ROLE	VARCHAR2	The Autonomous Data Guard role
SOURCEID	VARCHAR2	The OCID of the source Autonomous Database that was cloned

Column	Datatype	Description
SQLWEBDEVELOPERURL	VARCHAR2	The Database Actions (SQL Developer Web) URL for the Autonomous Database
STANDBYDB	CLOB	Autonomous Database Standby Summary
STANDBYWHITELISTEDIPS	CLOB	The client IP access control list
SUBNETID	VARCHAR2	The OCID of the subnet the resource is associated with
SUPPORTEDREGIONSTOCLONETO	CLOB	The list of regions that support the creation of Autonomous Data Guard
SYSTEMTAGS	CLOB	System tags for this resource
TIMEDATAGUARDROLECHANGED	VARCHAR2	The date and time the Autonomous Data Guard role was switched
TIMEDELETIONOFFREEAUTONOMOUSDATABASE	NUMBER	Time deletion of Free Autonomous Database
TIMELOCALDATAGUARDENABLED	VARCHAR2	The date and time that Autonomous Data Guard was enabled for the Autonomous Database
TIMEMAINTENANCEBEGIN	VARCHAR2	The date and time when maintenance will begin
TIMEMAINTENANCEEND	VARCHAR2	The date and time when maintenance will end
TIMEOFLASTFAILOVER	VARCHAR2	The timestamp of the last failover operation
TIMEOFLASTREFRESH	VARCHAR2	The date and time of the last refresh
TIMEOFLASTREFRESHPOINT	VARCHAR2	The refresh point timestamp
TIMEOFLASTSWITCHOVER	VARCHAR2	The timestamp of the last switchover operation for the Autonomous Database
TIMEOFNEXTREFRESH	VARCHAR2	The date and time of next refresh
TIMERECLAMATIONOFFREEAUTONOMOUSDATABASE	VARCHAR2	The date and time the Always Free database
USEDDATASTORAGESIZEINTBS	NUMBER	The amount of storage that has been used in terabytes
VAULTID	VARCHAR2	The OCID of the Oracle Cloud Infrastructure Vault
WHITELISTEDIPS	CLOB	The client IP access control list

OCI_BUDGET_ALERT_RULES View

`OCI_BUDGET_ALERT_RULES` describes all the Oracle Cloud Infrastructure budget alert rules in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

Queries against this view return results only if you have budgets and budget alerts created in your tenancy.

See Budgets Overview for more information.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read usage-budgets in tenancy
```

This policy lets you list budget summary and budget alerts in your tenancy (if you created a budget and a budget alert). Optionally you can restrict the result returned by querying the view to a given compartment:

```
Allow dynamic-group <group-name> to read usage-budgets in compartment <compartment-name>
```

Column	Datatype	Description
BUDGETID	VARCHAR2	The OCID of the budget
REGION	VARCHAR2	Region name
COMPARTMENTID	VARCHAR2	The compartment ID in which the bucket is authorized
DEFINEDTAGS	CLOB	Defined tags for the resource
DESCRIPTION	VARCHAR2	The description of the alert rule
DISPLAYNAME	VARCHAR2	The name of the alert rule
FREEFORMTAGS	CLOB	Free-form tags for the resource
ID	VARCHAR2	The OCID of the alert rule
LIFECYCLESTATE	VARCHAR2	The current state of the alert rule
MESSAGE	VARCHAR2	The custom message that will be sent when the alert is triggered
RECIPIENTS	VARCHAR2	The audience that receives the alert when it triggers
THRESHOLD	NUMBER	The threshold for triggering the alert
THRESHOLDTYPE	VARCHAR2	The type of threshold
TIMECREATED	VARCHAR2	The time when the budget was created
TIMEUPDATED	VARCHAR2	The time when the budget was updated
TYPE	VARCHAR2	ACTUAL or FORECAST types of alert triggers
VERSION	NUMBER	The version of the alert rule

OCI_BUDGET_SUMMARY View

OCI_BUDGET_SUMMARY describes all the Oracle Cloud Infrastructure budget summaries in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

Queries against this view return results only if you have budgets created in your tenancy.

See Budgets Overview for more information.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read usage-budgets in tenancy
```

This policy lets you list budget summary and budget alerts in your tenancy (if you created a budget and a budget alert). Optionally you can restrict the result returned by querying the view to a given compartment:

```
Allow dynamic-group <group-name> to read usage-budgets in compartment <compartment-name>
```

Column	Datatype	Description
REGION	VARCHAR2	Region name
COMPARTMENTID	VARCHAR2	The OCID of the compartment
AMOUNT	NUMBER	The amount of the budget, expressed in the currency of a rate card
DEFINEDTAGS	CLOB	Defined tags for the resource
FREEFORMTAGS	CLOB	Free-form tags for the resource
DISPLAYNAME	VARCHAR2	The display name of the budget

Column	Datatype	Description
LIFECYCLESTATE	VARCHAR2	The current state of the budget
ACTUALSPEND	NUMBER	The actual spend in currency for the current budget cycle
ALERTRULECOUNT	NUMBER	The total number of alert rules in the budget
BUDGETPROCESSINGPERIODSTARTOFFSET	NUMBER	The number of days offset from the first day of the month, at which the budget processing period starts
DESCRIPTION	VARCHAR2	The description of the budget
FORECASTEDSPEND	NUMBER	The forecasted spend in currency by the end of the current budget cycle
ID	VARCHAR2	The OCID of the budget
RESETPERIOD	VARCHAR2	The reset period for the budget
TARGETS	CLOB	The list of targets on which the budget is applied
TARGETCOMPARTMENTID	VARCHAR2	Target compartment OCID
TARGETTYPE	VARCHAR2	The type of target on which the budget is applied
TIMECREATED	VARCHAR2	The time the budget was created
TIMESPENDCOMPUTED	VARCHAR2	The time the budget spend was last computed
TIMEUPDATED	VARCHAR2	The time the budget was updated
VERSION	VARCHAR2	The version of the budget

OCI_COST_DATA View

`OCI_COST_DATA` describes all the Oracle Cloud Infrastructure cost data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Define tenancy usage-report as
ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhqkggq
Endorse dynamic-group <group-name> to read objects in tenancy usage-report
```

> **Note:**
>
> Do not replace the OCID in this policy with another OCID. This `usage-report` OCID provides the Oracle Cloud Infrastructure usage data for your tenancy.

Column	Datatype	Description
REFERENCE_NUMBER	VARCHAR2	Reference Number/Line identifier used for debugging and corrections
TENANT_ID	VARCHAR2	The identifier (OCID) for the Oracle Cloud Infrastructure tenant
INTERVAL_USAGE_START	TIMESTAMP	The start time of the usage interval for the resource in UTC
INTERVAL_USAGE_END	TIMESTAMP	The end time of the usage interval for the resource in UTC
SERVICE_NAME	VARCHAR2	The service that the resource is in
COMPARTMENT_ID	VARCHAR2	The ID of the compartment that contains the resource

Column	Datatype	Description
COMPARTMENT_NAME	VARCHAR2	The name of the compartment that contains the resource
REGION	VARCHAR2	The region that contains the resource
AVAILABILITY_DOMAIN	VARCHAR2	The availability domain that contains the resource
RESOURCE_ID	VARCHAR2	The identifier for the resource
BILLED_QUANTITY	VARCHAR2	The quantity of the resource that has been billed over the usage interval
BILLED_QUANTITY_OVERAGE	VARCHAR2	The usage quantity for which you were billed
SUBSCRIPTION_ID	VARCHAR2	A unique identifier associated with your commitment or subscription
PRODUCT_SKU	VARCHAR2	The Part Number for the resource in the line
PRODUCT_DESCRIPTION	VARCHAR2	The product description for the resource in the line
UNIT_PRICE	VARCHAR2	The cost billed to you for each unit of the resource used
UNIT_PRICE_OVERAGE	VARCHAR2	The cost per unit of usage for overage usage of a resource
MY_COST	VARCHAR2	The cost charged for this line of usage
MY_COST_OVERAGE	VARCHAR2	The cost billed for overage usage of a resource
CURRENCY_CODE	VARCHAR2	The currency code for your tenancy
BILLING_UNIT_READABLE	VARCHAR2	The unit measure associated with the usage/ billedQuantity in the line
SKU_UNIT_DESCRIPTION	VARCHAR2	The unit used for measuring billed quantity
OVERAGE_FLAG	CHAR	Flag used for overage usage
IS_CORRECTION	VARCHAR2	Used if the current line is a correction
BACK_REFERENCE_NUMBER	VARCHAR2	Data amendments and corrections reference
CREATED_BY	VARCHAR2	The user who created the service
CREATED_ON	TIMESTAMP	The time when the service was created
FREE_TIER_RETAINED	VARCHAR2	Is the service retained on free tier

OCI_OBJECTSTORAGE_BUCKETS View

OCI_OBJECTSTORAGE_BUCKETS describes all the Oracle Cloud Infrastructure object storage buckets in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read buckets in tenancy
```

This policy lets you list object storage buckets in your tenancy. Optionally you can restrict the result returned by querying this view to a given compartment:

```
Allow dynamic-group <group-name> to read buckets in compartment <compartment-name>
```

Column	Datatype	Description
REGION	VARCHAR2	Region name
COMPARTMENTID	VARCHAR2	The compartment ID in which the bucket is authorized

Column	Datatype	Description
NAMESPACE	VARCHAR2	The Object Storage namespace in which the bucket resides
APPROXIMATECOUNT	NUMBER	The approximate number of objects in the bucket
APPROXIMATESIZE	NUMBER	The approximate total size in bytes of all objects in the bucket
AUTOTIERING	VARCHAR2	The auto tiering status on the bucket
CREATEDBY	VARCHAR2	The OCID of the user who created the bucket
DEFINEDTAGS	CLOB	Defined tags for the resource
FREEFORMTAGS	CLOB	Free-form tags for the resource
ETAG	VARCHAR2	The entity tag (ETag) for the bucket
ID	VARCHAR2	The OCID of the bucket
ISREADONLY	VARCHAR2	Whether or not this bucket is read only
KMSKEYID	VARCHAR2	The OCID of a master encryption key
METADATA	VARCHAR2	Arbitrary string keys and values for user-defined metadata
NAME	VARCHAR2	The name of the bucket
OBJECTEVENTSENABLED	VARCHAR2	Whether or not events are emitted for object state changes in this bucket
OBJECTLIFECYCLEPOLICYETAG	VARCHAR2	The entity tag (ETag) for the live object lifecycle policy on the bucket
PUBLICACCESSTYPE	VARCHAR2	The type of public access enabled on this bucket
REPLICATIONENABLED	VARCHAR2	Whether or not this bucket is a replication source
STORAGETIER	VARCHAR2	The storage tier type assigned to the bucket
TIMECREATED	VARCHAR2	The date and time the bucket was created
VERSIONING	VARCHAR2	The versioning status on the bucket

OCI_USAGE_DATA View

`OCI_USAGE_DATA` describes all the Oracle Cloud Infrastructure usage data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

> **Note:**
>
> You can use OCI usage reports and `OCI_USAGE_DATA` view for information on cost and usage *before* January 31st, 2025. The OCI cost and usage reports are deprecated. You can continue to access your existing usage report CSV files until July 31, 2025. See Cost and Usage Reports for more information.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Define tenancy usage-report as
ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhqkggq
Endorse dynamic-group <group-name> to read objects in tenancy usage-report
```

> **Note:**
>
> Do not replace the OCID in this policy with another OCID. This `usage-report` OCID provides the Oracle Cloud Infrastructure cost and usage data for your tenancy.

Column	Datatype	Description
REFERENCE_NUMBER	VARCHAR2	Reference Number/Line identifier used for debugging and corrections
TENANT_ID	VARCHAR2	The identifier (OCID) for the Oracle Cloud Infrastructure tenant
INTERVAL_USAGE_START	TIMESTAMP	The start time of the usage interval for the resource in UTC
INTERVAL_USAGE_END	TIMESTAMP	The end time of the usage interval for the resource in UTC
SERVICE_NAME	VARCHAR2	The service that the resource is in
RESOURCE_NAME	VARCHAR2	The resource name used by the metering system
COMPARTMENT_ID	VARCHAR2	The ID of the compartment that contains the resource
COMPARTMENT_NAME	VARCHAR2	The name of the compartment that contains the resource
REGION	VARCHAR2	The region that contains the resource
AVAILABILITY_DOMAIN	VARCHAR2	The availability domain that contains the resource
RESOURCE_ID	VARCHAR2	The identifier for the resource
CONSUMED_QUANTITY	VARCHAR2	The quantity of the resource that has been consumed over the usage interval
BILLED_QUANTITY	VARCHAR2	The quantity of the resource that has been billed over the usage interval
CONSUMED_QUANTITY_UNITS	VARCHAR2	The unit for the consumed quantity and billed quantity
CONSUMED_QUANTITY_MEASURE	VARCHAR2	The measure for the consumed quantity and billed quantity
IS_CORRECTION	VARCHAR2	Used if the current line is a correction
BACK_REFERENCE_NUMBER	VARCHAR2	Data amendments and corrections reference
CREATED_BY	VARCHAR2	The user who created the service
CREATED_ON	TIMESTAMP	The time when the service was created
FREE_TIER_RETAINED	VARCHAR2	Is the service retained on free tier

Pipeline Views

Lists details for the `DBMS_CLOUD_PIPELINE` views.

- DBA_CLOUD_PIPELINES View
  `DBA_CLOUD_PIPELINES` displays the list of pipelines created in the database. The view contains one row for each pipeline.
- USER_CLOUD_PIPELINES View
  `USER_CLOUD_PIPELINES` displays the list of pipelines created in the database for the user. The view contains one row for each pipeline.
- DBA_CLOUD_PIPELINE_HISTORY View
  `DBA_CLOUD_PIPELINE_HISTORY` lists the pipeline scheduled jobs in the database. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.

- USER_CLOUD_PIPELINE_HISTORY View
  `USER_CLOUD_PIPELINE_HISTORY` lists the pipeline scheduled jobs in the database for the user. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.
- DBA_CLOUD_PIPELINE_ATTRIBUTES View
  `DBA_CLOUD_PIPELINE_ATTRIBUTES` lists the attributes of a pipelines in the database. Attributes control the configuration and behavior of the pipeline jobs.
- USER_CLOUD_PIPELINE_ATTRIBUTES View
  `USER_CLOUD_PIPELINE_ATTRIBUTES` lists the attributes of a pipelines in the database for the user. Attributes control the configuration and behavior of the pipeline.

DBA_CLOUD_PIPELINES View

`DBA_CLOUD_PIPELINES` displays the list of pipelines created in the database. The view contains one row for each pipeline.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the pipeline
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: `LOAD` or `EXPORT`
STATUS	VARCHAR2(7)	NOT NULL	Current status of pipeline: `STARTED` or `STOPPED`
DESCRIPTION	VARCHAR2(4000)		User specified description for the pipeline.
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation time for the pipeline.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline.
LAST_EXECUTION	TIMESTAMP(6) WITH TIME ZONE		Last successful execution time of pipeline job.
OPERATION_ID	NUMBER		Is the Operation ID for use with pipeline logs. See Monitor and Troubleshoot Pipelines for information on the `USER_LOAD_OPERATIONS` view for more information on data load operations.
STATUS_TABLE	VARCHAR2(128)		Status Table for pipeline progress. This is applicable for Load Pipelines.
ORACLE_MAINTAINED	CHAR(1)	NOT NULL	Indicates whether pipeline is Oracle maintained (`Y`) or not (`N`).

USER_CLOUD_PIPELINES View

`USER_CLOUD_PIPELINES` displays the list of pipelines created in the database for the user. The view contains one row for each pipeline.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: `LOAD` or `EXPORT`

Column	Datatype	NULL	Description
STATUS	VARCHAR2(7)	NOT NULL	Current status of pipeline: STARTED or STOPPED
DESCRIPTION	VARCHAR2(4000)		User specified description for the pipeline.
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation time for the pipeline.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline.
LAST_EXECUTION	TIMESTAMP(6) WITH TIME ZONE		Last successful execution time of pipeline job.
OPERATION_ID	NUMBER		Is the Operation ID for use with pipeline logs. See Monitor and Troubleshoot Pipelines for information on the USER_LOAD_OPERATIONS view for more information on data load operations.
STATUS_TABLE	VARCHAR2(128)		Status Table for pipeline progress. This is applicable for Load Pipelines.
ORACLE_MAINTAINED	CHAR(1)	NOT NULL	Indicates whether pipeline is Oracle maintained (Y) or not (N).

DBA_CLOUD_PIPELINE_HISTORY View

DBA_CLOUD_PIPELINE_HISTORY lists the pipeline scheduled jobs in the database. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the pipeline.
PIPELINE_TYPE	VARCHAR2(7)		Type of pipeline: LOAD or EXPORT
JOB_ID	NUMBER	NOT NULL	Unique ID for the pipeline job execution.
JOB_NAME	VARCHAR2(1044)		Unique job name for the pipeline execution.
STATUS	VARCHAR2(30)		Status of the pipeline job.
START_DATE	TIMESTAMP(9) WITH TIME ZONE		Start time of the pipeline job execution.
END_DATE	TIMESTAMP(9) WITH TIME ZON		End time of the pipeline job execution.
INSTANCE_ID	NUMBER		Instance ID where the pipeline job ran.
SESSION_ID	VARCHAR2(128)		Session ID for the job session.
ERROR_NUMBER	NUMBER		Error number in the job (if encountered).
ERROR_MESSAGE	VARCHAR2(4000)		Error message in the job (if encountered).
CPU_USED	INTERVAL DAY(3) TO SECOND(2)		Number of CPU used by the pipeline job run.
JOB_OUTPUT	CLOB		Debug output of the pipeline job run.

USER_CLOUD_PIPELINE_HISTORY View

USER_CLOUD_PIPELINE_HISTORY lists the pipeline scheduled jobs in the database for the user. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.

Column	Data Type	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline
PIPELINE_TYPE	VARCHAR2(7)		Type of pipeline: LOAD or EXPORT
JOB_ID	NUMBER	NOT NULL	Unique ID for the pipeline job execution.
JOB_NAME	VARCHAR2(1044)		Unique job name for the pipeline execution.
STATUS	VARCHAR2(30)		Status of the pipeline job.
START_DATE	TIMESTAMP(9) WITH TIME ZONE		Start time of the pipeline job execution.
END_DATE	TIMESTAMP(9) WITH TIME ZON		End time of the pipeline job execution.
INSTANCE_ID	NUMBER		Instance ID where the pipeline job ran.
SESSION_ID	VARCHAR2(128)		Session ID for the job session.
ERROR_NUMBER	NUMBER		Error number in the job (if encountered).
ERROR_MESSAGE	VARCHAR2(4000)		Error message in the job (if encountered).
CPU_USED	INTERVAL DAY(3) TO SECOND(2)		Number of CPU used by the pipeline job run.
JOB_OUTPUT	CLOB		Debug output of the pipeline job run.

DBA_CLOUD_PIPELINE_ATTRIBUTES View

DBA_CLOUD_PIPELINE_ATTRIBUTES lists the attributes of a pipelines in the database. Attributes control the configuration and behavior of the pipeline jobs.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the pipeline
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: LOAD or EXPORT
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline attribute.
ATTRIBUTE_VALUE	CLOB		Value of the pipeline attribute.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline attribute.

USER_CLOUD_PIPELINE_ATTRIBUTES View

USER_CLOUD_PIPELINE_ATTRIBUTES lists the attributes of a pipelines in the database for the user. Attributes control the configuration and behavior of the pipeline.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.

Column	Datatype	NULL	Description
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: LOAD or EXPORT
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline attribute.
ATTRIBUTE_VALUE	CLOB		Value of the pipeline attribute.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline attribute.

DBMS_CLOUD_AI Views

The DBMS_CLOUD_AI package uses the following views.

- DBA_CLOUD_AI_PROFILES View
- USER_CLOUD_AI_PROFILES View
- DBA_CLOUD_AI_PROFILE_ATTRIBUTES View
- USER_CLOUD_AI_PROFILE_ATTRIBUTES View
- DBA_CLOUD_VECTOR _INDEXES View
- USER_CLOUD_VECTOR _INDEXES View
- DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES View
- USER_CLOUD_VECTOR_INDEX_ATTRIBUTES View

> **See Also:**
>
> Use Select AI for Natural Language Interaction with your Database

DBA_CLOUD_AI_PROFILES View

The list of profiles created in the current database can be obtained by querying DBA_CLOUD_AI_PROFILES. The view displays the details of AI profiles in the database.

Only the ADMIN user is privileged to access DBA_CLOUD_AI_PROFILES. You cannot grant access to other users.

Column	Datatype	NULL	Description
PROFILE_ID	NUMBER	NOT NULL	Unique number assigned to the AI profile
PROFILE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the AI profile
STATUS	VARCHAR2(7)	NOT NULL	Current status of AI profile - ENABLED or DISABLED
DESCRIPTION	VARCHAR2(4000)	NOT NULL	User specified description for the AI profile
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation time for the AI profile.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the AI profile

USER_CLOUD_AI_PROFILES View

The list of profiles created in the current database can be obtained by querying `USER_CLOUD_AI_PROFILES`. The view displays the details of AI profiles in your schema.

Only the user is privileged to access `USER_CLOUD_AI_PROFILES`. You cannot grant access to other users.

Column	Datatype	NULL	Description
PROFILE_ID	NUMBER	NOT NULL	Unique number assigned to the AI profile
PROFILE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile
STATUS	VARCHAR2(7)	NOT NULL	Current status of AI profile - ENABLED or DISABLED
DESCRIPTION	VARCHAR2(4000)	-	User specified description for the AI profile
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation time for the AI profile
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the AI profile

The following example displays a sample output from `USER_CLOUD_AI_PROFILE` view:

```
select PROFILE_NAME, STATUS from USER_CLOUD_AI_PROFILES;

PROFILE_NAME    STATUS
-------------    ---------
OPENAI         ENABLED
GENAI         ENABLED
```

DBA_CLOUD_AI_PROFILE_ATTRIBUTES View

Attributes of AI profile manage the configuration and behavior of the AI profile. The view displays details of all AI profiles in the database.

Only the ADMIN user is privileged to access `DBA_CLOUD_AI_PROFILE_ATTRIBUTES`. You cannot grant access to other users.

Column	Datatype	NULL	Description
PROFILE_ID	NUMBER	NOT NULL	Unique number assigned to the AI profile
PROFILE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the AI profile
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile attribute
ATTRIBUTE_VALUE	CLOB	-	Value of the AI profile attribute
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time of the AI profile attribute

USER_CLOUD_AI_PROFILE_ATTRIBUTES View

Attributes of AI profile manage the configuration and behavior of the AI profile. The view displays details of AI profiles in your schema.

Only the user is privileged to access USER_CLOUD_AI_PROFILE_ATTRIBUTES. You cannot grant access to other users.

Column	Datatype	NULL	Description
PROFILE_ID	NUMBER	NOT NULL	Unique number assigned to the AI profile
PROFILE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile attribute
ATTRIBUTE_VALUE	CLOB	-	Value of the AI profile attribute
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time of the AI profile attribute

The following is an example of a sample output from querying USER_CLOUD_AI_PROFILE_ATTRIBUTES:

```
PROFILE_ID    PROFILE_NAME    ATTRIBUTE_NAME        ATTRIBUTE_VALUE

DBA_CLOUD_VECTOR _INDEXES View

You can obtain a list of vector indexes created in the current database by querying DBA_CLOUD_VECTOR_INDEXES. The view displays the details of all available vector indexes in the entire database.

Only the administrator is privileged to access DBA_CLOUD_VECTOR_INDEXES. You cannot grant access to other users.

Column	Datatype	NULL	Description
INDEX_ID	NUMBER	NOT NULL	Unique number assigned to the index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the index
STATUS	VARCHAR2(7)	-	Current status of index: ENABLED or DISABLED
DESCRIPTION	CLOB	-	User specified description for the index

Column	Datatype	NULL	Description
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation date and time of the index
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the index

USER_CLOUD_VECTOR _INDEXES View

You can obtain a list of vector indexes you created in the current database by querying USER_CLOUD_VECTOR_INDEXES. The view displays the details of all vector indexes that you created in your schema or a PDB.

You have the privilege to access USER_CLOUD_VECTOR_INDEXES. You cannot grant access to other users.

Column	Datatype	NULL	Description
INDEX_ID	NUMBER	NOT NULL	Unique number assigned to the index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the index
STATUS	VARCHAR2(7)	-	Current status of index: ENABLED or DISABLED
DESCRIPTION	VARCHAR2(4000)	-	User specified description for the index
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation date and time of the index
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the index

DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES View

Query the DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES view to display details about the attributes of vector indexes across the entire database. Attributes of the view manage the configuration and behavior of the vector index.

Only the administrator is privileged to access DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES. You cannot grant access to other users.

Column	Datatype	NULL	Description
INDEX_ID	NUMBER	NOT NULL	Unique number assigned to the vector index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the vector index
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index attribute
ATTRIBUTE_VALUE	CLOB	-	Value for the vector index attribute_name
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the vector index

USER_CLOUD_VECTOR_INDEX_ATTRIBUTES View

Query the USER_CLOUD_VECTOR_INDEX_ATTRIBUTES view to display details about the attributes of vector indexes that you created in your schema or PDB. Attributes of the view manage the configuration and behavior of the vector index.

You have the privilege to access USER_CLOUD_VECTOR_INDEX_ATTRIBUTES. You cannot grant access to other users.

Column	Datatype	NULL	Description
INDEX_ID	NUMBER	NOT NULL	Unique number assigned to the vector index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index attribute
ATTRIBUTE_VALUE	CLOB	-	Value for the vector index attribute_name
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the vector index

DBMS_CLOUD_FUNCTION Views

The DBMS_CLOUD_FUNCTION package uses the following views.

- DBA_CLOUD_FUNCTION View
  The DBA_CLOUD_FUNCTION view lists all the functions created in your Autonomous Database.
- DBA_CLOUD_FUNCTION_CATALOG View
  The DBA_CLOUD_FUNCTION_CATALOG view lists all the catalogs created in an Autonomous Database instance.
- USER_CLOUD_FUNCTION View
  The USER_CLOUD_FUNCTION view lists all the functions created by the user.
- USER_CLOUD_FUNCTION_CATALOG View
  The USER_CLOUD_FUNCTION_CATALOG view lists all the catalogs created by the user.
- USER_CLOUD_FUNCTION_ERRORS View
  The USER_CLOUD_FUNCTION_ERRORS view lists the errors generated during the connection validation to the remote library location.

DBA_CLOUD_FUNCTION View

The DBA_CLOUD_FUNCTION view lists all the functions created in your Autonomous Database.

Column	Datatype	Description
OWNER	VARCHAR2(128)	Owner of the catalog
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
APPLICATION_ID	VARCHAR2(2000)	OCI Application ID or Azure Application ID
CLOUD_FUNCTION_NAME	VARCHAR2(128)	Remote cloud function name
FUNCTION_NAME	VARCHAR2(128)	Function Name
FUNCTION_ID	VARCHAR2(2000)	OCI Function ID or AWS Function ARN or Azure Function ID or GCP Function ID
API_TYPE	VARCHAR2(128)	API type (Function or procedure)

DBA_CLOUD_FUNCTION_CATALOG View

The DBA_CLOUD_FUNCTION_CATALOG view lists all the catalogs created in an Autonomous Database instance.

Column	Datatype	Description
OWNER	VARCHAR2(128)	Owner of the catalog
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
CLOUD_PROVIDER	VARCHAR2(128)	OCI or AWS or Azure or GCP

USER_CLOUD_FUNCTION View

The USER_CLOUD_FUNCTION view lists all the functions created by the user.

Column	Datatype	Description
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
APPLICATION_NAME	VARCHAR2(128)	OCI Application Name
APPLICATION_ID	VARCHAR2(2000)	OCI Application ID or Azure Application ID
CLOUD_FUNCTION_NAME	VARCHAR2(128)	Remote cloud function name
FUNCTION_NAME	VARCHAR2(128)	Function Name
FUNCTION_ID	VARCHAR2(2000)	OCI Function ID or AWS Function ARN or Azure Function ID or GCP Function ID
API_TYPE	VARCHAR2(128)	API type (Function or procedure)

USER_CLOUD_FUNCTION_CATALOG View

The USER_CLOUD_FUNCTION_CATALOG view lists all the catalogs created by the user.

Column	Datatype	Description
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
CLOUD_PROVIDER	VARCHAR2(128)	OCI or AWS or Azure or GCP

USER_CLOUD_FUNCTION_ERRORS View

The USER_CLOUD_FUNCTION_ERRORS view lists the errors generated during the connection validation to the remote library location.

Column	Datatype	Description
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
CREATE_TIMESTAMP	TIMESTAMP	Timestamp when error was generated
log_error_msg	CLOB	The error message

DBMS_CLOUD_LINK Views

The DBMS_CLOUD_LINK package uses the following views.

- DBA_CLOUD_LINK_ACCESS and ALL_CLOUD_LINK_ACCESS Views
- DBA_CLOUD_LINK_AUTHORIZATIONS View
- DBA_CLOUD_LINK_PRIVS and USER_CLOUD_LINK_PRIVS Views

DBA_CLOUD_LINK_ACCESS and ALL_CLOUD_LINK_ACCESS Views

Displays details of the registered data sets an Autonomous Database instance is allowed to access.

Only the ADMIN user and users with the `PDB_DBA` role are privileged to access `DBA_CLOUD_LINK_ACCESS`. You cannot grant access to other users.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set.
NAME	VARCHAR2(128)	NOT NULL	Name of registered data set.
CREATED	TIMESTAMP(6)	NOT NULL	Time/Date when the data set was created.
LAST_MODIFIED	TIMESTAMP(6)	NOT NULL	Time when metadata of data set was last modified
AUTHORIZATION_REQUIRED	VARCHAR2(1)	NOT NULL	Data set requires additional authorization. Possible values are: "T" or "F".
DATA_SET_OWNER	VARCHAR2(128)	NULL	Data set owner.

DBA_CLOUD_LINK_AUTHORIZATIONS View

Displays details of which databases are authorized to access data sets. This applies to data sets that require additional authorization.

Only the ADMIN user and users with the `PDB_DBA` role are privileged to access `DBA_CLOUD_LINK_AUTHORIZATIONS`. You cannot grant access to other users.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set.
NAME	VARCHAR2(128)	NOT NULL	Name of registered data set.
CLOUD_LINK_DATABASE_ID	VARCHAR2(40)	NOT NULL	Database ID of database that has been authorized for access.

DBA_CLOUD_LINK_PRIVS and USER_CLOUD_LINK_PRIVS Views

Displays details of the Cloud Link specific privileges, `REGISTER`, `READ`, `AUTHORIZE`, granted to specific users or to the current user.
`USER_CLOUD_LINK_PRIVS` columns are the same as those in `DBA_CLOUD_LINK_PRIVS`. (except for `GRANTEE`).

Only the ADMIN user and users with the `PDB_DBA` role are privileged to read from `DBA_CLOUD_LINK_PRIVS`. You cannot grant access to other users.

The privilege to read from `USER_CLOUD_LINK_PRIVS` view is granted to the ADMIN user, to the `PDB_DBA` role, and to the role `DWROLE`.

Column	Datatype	NULL	Description
GRANTEE	VARCHAR2(128)	NOT NULL	Name of user to whom privilege is granted. This column is not available in USER_CLOUD_LINK_PRIVS.
PRIVILEGE	VARCHAR2(9)	NOT NULL	Privilege, one of: REGISTER, READ, AUTHORIZE, granted to user.
SCOPE	VARCHAR2(14)	NOT NULL	Scope of the privilege.

DBA_CLOUD_LINK_REGISTRATIONS and ALL_CLOUD_LINK_REGISTRATIONS Views

Displays details of all the data set registrations on an Autonomous Database instance.

Only the ADMIN user and users with the PDB_DBA role are privileged to access DBA_CLOUD_LINK_REGISTRATIONS. You cannot grant access to other users.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set.
NAME	VARCHAR2(128)	NOT NULL	Name of registered data set.
ID	RAW(16)	NOT NULL	Unique ID of registered data set.
OWNER	VARCHAR2(128)	NOT NULL	Owner of object (table or view owner).
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of object.
SCOPE	CLOB	NOT NULL	JSON document with details of who is allowed to access the registered data set.
DESCRIPTION	CLOB	NOT NULL	Description of registered data set.
CREATED	TIMESTAMP(6)	NOT NULL	Time/Date when the data set was created.
LAST_MODIFIED	TIMESTAMP(6)	NOT NULL	Time when metadata of data set was last modified
AUTHORIZATION_REQUIRED	VARCHAR2(1)	NOT NULL	Data set requires additional authorization. Possible values are: "T" or "F".
DATA_SET_OWNER	VARCHAR2(128)	NULL	Data set owner.

DBA_CLOUD_LINK_SERVICE_MAPPINGS View

Displays details of all service mappings for Cloud Links consumer databases. Each service mapping consists of a Cloud Link database ID and a database service.

Only the ADMIN user and users with the PDB_DBA role are privileged to access DBA_CLOUD_LINK_SERVICE_MAPPINGS. You cannot grant access to other users.

Column	Datatype	NULL	Description
CLOUD_LINK_DATABASE_ID	VARCHAR2(40)	NOT NULL	Database Identifier of consumer database or "ANY".
SERVICE_NAME	VARCHAR2(10)	NULL	Database service name (HIGH, MEDIUM, or LOW).

V$CLOUD_LINK_ACCESS_STATS and GV$CLOUD_LINK_ACCESS_STATS Views

Displays access to each registered data set owned by an Autonomous Database instance.

`V$CLOUD_LINK_ACCESS_STATS` tracks the elapsed time, DB CPU time, the number of rows retrieved, the number of executions, and the unique database identifier of the database accessing a registered data set.

In addition to the `V$CLOUD_LINK_ACCESS_STATS` information, the `GV$CLOUD_LINK_ACCESS_STATS` view contains an extra column named `INST_ID` of data type `NUMBER`. The `INST_ID` column displays the instance from which the associated `V$` view information was obtained. The `INST_ID` column can be used as a filter to retrieve `V$CLOUD_LINK_ACCESS_STATS` information from a subset of available instances.

The unique database identifier does not disclose the OCIDs (Tenancy, Compartment, Database). This information can be used for auditing an Autonomous Database.

Column	Datatype	NULL	Description
INST_ID	NUMBER	NOT NULL	Instance ID
OWNER	VARCHAR2(128)	NOT NULL	Owner of object(table or view owner)
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of object
DATA_SET_NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set
DATA_SET_NAME	VARCHAR2(128)	NOT NULL	Name of registered data set
SQL_ID	VARCHAR2(13)	NOT NULL	SQL ID of local SQL accessing a registered data set
LAST_ACTIVE_TIME	DATE	NOT NULL	Time when local SQL was last active
CLOUD_LINK_DATABASE_ID	VARCHAR2(512)	NOT NULL	Database identifier of database accessing a registered data set
ELAPSED_TIME	NUMBER	NOT NULL	Elapsed time (in microseconds) of local SQL
CPU_TIME	NUMBER	NOT NULL	CPU time (in microseconds) of local SQL
USER_IO_WAIT_TIME	NUMBER	NOT NULL	User I/O Wait time (in microseconds) of local SQL
EXECUTIONS	NUMBER	NOT NULL	Number of executions of local SQL
FETCHES	NUMBER	NOT NULL	Number of fetches of local SQL
ROWS_PROCESSED	NUMBER	NOT NULL	Number of rows retrieved by local SQL
CON_ID	NUMBER	NOT NULL	Container ID

DBMS_DATA_ACCESS Views

Describes the Autonomous Database dynamic performance views you can use with the `DBMS_DATA_ACCESS` package to monitor Table Hyperlink URL usage.

- V$DATA_ACCESS_URL_STATS and GV$DATA_ACCESS_URL_STATS Views

V$DATA_ACCESS_URL_STATS and GV$DATA_ACCESS_URL_STATS Views

Displays access to each Table Hyperlink owned by an Autonomous Database instance.

When a Table Hyperlink is accessed, CPU time, User I/O wait time, are updated in the V$DATA_ACCESS_URL_STATS view.

The GV$DATA_ACCESS_URL_STATS view contains the additional column named INST_ID of data type NUMBER. The INST_ID column displays the instance from which the associated V$ view information was obtained. The INST_ID column can be used as a filter to retrieve V$DATA_ACCESS_URL_STATS information from a subset of available instances.

Column	Datatype	NULL	Description
INST_ID	NUMBER	NOT NULL	Instance ID
SQL_ID	VARCHAR2(13)	NOT NULL	SQL ID of SQL accessing data when a Table Hyperlink is accessed
PRE_AUTH_URL_ID	VARCHAR2(128)	NOT NULL	Table Hyperlink identifier
ELAPSED_TIME	NUMBER	NOT NULL	Elapsed time (in microseconds) of local SQL
CPU_TIME	NUMBER	NOT NULL	CPU time (in microseconds) of local SQL
USER_IO_WAIT_TIME	NUMBER	NOT NULL	User I/O Wait time (in microseconds) of local SQL
EXECUTIONS	NUMBER	NOT NULL	Number of executions of local SQL
FETCHES	NUMBER	NOT NULL	Number of fetches of local SQL
ROWS_PROCESSED	NUMBER	NOT NULL	Number of rows retrieved by local SQL
USER_ID	VARCHAR2(128)		Application User ID defined for Table Hyperlink
CON_ID	NUMBER	NOT NULL	Container ID

DBA_PROXY_SQL Views

Describes the Autonomous Database DBA_PROXY_SQL views.

- DBA_PROXY_SQL_ACTIONS View
- DBA_PROXY_SQL_MODULES View

DBA_PROXY_SQL_ACTIONS View

Displays the action names for which query offload is configured. You must query this view from a session that is not enabled for query offload on an Autonomous Database instance.

Column	Datatype	NULL	Description
ACTION_NAME	VARCHAR2(4000)		List of actions

DBA_PROXY_SQL_MODULES View

Displays the module names for which query offload is configured. You must query this view from a session that is not enabled for query offload on an Autonomous Database instance.

Column	Datatype	NULL	Description
MODULE_NAME	VARCHAR2(4000)		List of modules

Lockdown Errors View

Lists details for the DBA_LOCKDOWN_ERRORS view.

- DBA_LOCKDOWN_ERRORS View
  The DBA_LOCKDOWN_ERRORS view provides information about SQL statements where lockdown profile errors were generated.

DBA_LOCKDOWN_ERRORS View

The DBA_LOCKDOWN_ERRORS view provides information about SQL statements where lockdown profile errors were generated.

Column	Datatype	NULL	Description
LAST_OCCURRENCE	TIMESTAMP(6)		Timestamp of latest execution failure.
OCCURRENCE_COUNT	NUMBER		Total occurrences of execution failure.
ERROR_NUM	NUMBER		Error number
ERROR_MSG	VARCHAR2(4000)		Error message
RULE_TYPE	VARCHAR2(128)		Lockdown Profile Rule type: STATEMENT, OPTIONS, FEATURE, EXECUTION
SQL_TEXT	CLOB		SQL text
SQL_ID	VARCHAR2(13)		SQL_ID of statement that hit lockdown error.
SESSION_ID	NUMBER		Session identifier.
SESSION_SERIAL	NUMBER		Session serial number.
SCHEMA	VARCHAR2(128)		User's current schema.
MODULE	VARCHAR2(64)		Name of the currently executing module.
ACTION	VARCHAR2(64)		Name of the currently executing action
CLIENT_ID	VARCHAR2(64)		Client identifier of the session.
USER#	NUMBER	NOT NULL	ID number of the user.
USERNAME	VARCHAR2(128)	NOT NULL	Name of the user.
LUSER#	NUMBER	NOT NULL	ID number of the Logon user
LUSERNAME	VARCHAR2(128)	NOT NULL	Name of the logon user.

Oracle Cloud Infrastructure Logging Interface Views

The Oracle Cloud Infrastructure (OCI) logging interface views enable authorized users to access log data through a set of views.

Oracle Cloud Infrastructure (OCI) logging is the central logging solution for OCI services, including VCN flow logs, load balancer logs, object storage logs, and others within the added capability to include custom logs. The logs are not stored in Autonomous Database. Instead, the logs are dynamically retrieved based on various predicates provided by the user, including date range, log group, log name, and others.

- Oracle Cloud Infrastructure Logging Interface Overview
- OCI_LOG_LIST View
- OCI_LOG_DATA View

- OCI_VCN_FLOWLOGS View
- OCI_LBLOG_ACCESS View
- OCI_LBLOG_ERRORS View
- Oracle Cloud Infrastructure Logging Interface Overview
  Providing access to the log data inside an Autonomous Database in relational format provides a useful access method, along with the ability to get the logging data in relational or JSON format and enrich the analytics by joining with other data they may have in the Autonomous Database.
- OCI_LOG_LIST View
  Displays a list of all logs in the tenant. The view does not show log data, but provides the metadata about the logs in a tenancy. This metadata is used to properly specify parameter values for other logging view. If there is no logs under a log group, that log group will not be included in this view.
- OCI_LOG_DATA View
  The common view that provides access to all log types supported by the OCI Logging Service. The log content is in the `DATA` column.
- OCI_VCN_FLOWLOGS View
  View that provides details about traffic that passes through the user's VCN. This log enables users to audit traffic and troubleshoot security lists. Each flow log record reflects logged traffic in one direction of a connection between two endpoints. For example, a single TCP connection, you may have two records in the capture window: one for ingress traffic, and one for egress traffic.
- OCI_LBLOG_ACCESS View
  View that provides load balancer access logs capturing detailed information about requests sent to a load balancer. Each entry contains the time the request was received, client, intermediate HTTP proxy IP addresses, and times used by at the load balancer and backend to process the request.
- OCI_LBLOG_ERRORS View
  View that provides load balancer error logs capturing detailed information about requests related to troubleshooting and monitoring. Each entry contains information such as the time the request was received, error type, and additional details of the specific error.

Oracle Cloud Infrastructure Logging Interface Overview

Providing access to the log data inside an Autonomous Database in relational format provides a useful access method, along with the ability to get the logging data in relational or JSON format and enrich the analytics by joining with other data they may have in the Autonomous Database.

Oracle logging service provides access to logs from Oracle Cloud Infrastructure (OCI) resources. These logs include critical diagnostic information that describes how resources are performing and being accessed. There are varying log types for each Oracle service. To learn more about the logging service and supported OCI services, see Oracle Cloud Infrastructure Logging Overview.

Through the Oracle Cloud Infrastructure Logging Interface, log data can now be accessed through an Autonomous Database in relational format. Users can query different log data in OCI across all compartments and regions. The implemented OCI views use the `OCI$RESOURCE_PRINCIPAL` credential.

To use these views, the following steps need to be done.

1. An Administrator enables use of the `OCI$RESOURCE_PRINCIPAL` credential in the database.

2. Users create a new dynamic group for the OCI$RESOURCE_PRINCIPAL credential.

To learn more about enabling the credential, setting up a dynamic group, and creating policy statements, see Use Resource Principal to Access Oracle Cloud Infrastructure Resources.

As an Administrator, enable the resource principal.

```
EXEC DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL();
```

The dynamic group must have the following rules that include the resource ID of the instance.

```
resource.id = '<resource.id>'
```

There are two policy statements required to access logging views.

```
-- For OCI Logging Views
Allow dynamic-group <group-name> to use logging-family in tenancy
Allow dynamic-group <group-name> to use compartments in tenancy
```

All the views have mandatory and optional predicate values (column names).

Predicate values are as follows:

> **Note:**
>
> OCI_LOG_LIST view does not have mandatory columns. If the REGION value is not provided, the view returns data for the home region.

- REGION (Mandatory)
- COMPARTMENT_ID (Mandatory)
- LOG_GROUP_ID (Mandatory)
- LOG_ID (Optional) - If the value is provided, query results will use the LOG_IDvalue. If no value provided, the value will be returned from the server.
- START_TIME (Optional) - If no value provided, return values are for past 5 minutes in GMT.
- END_TIME (Optional) - If no value provided, return values are for past 5 minutes in GMT.
- SEARCH_CRITERIA (Optional) - If no value provided, null will be returned.

Since there can be different log types within a single log group, it's recommended to specify LOG_ID in a predicate when using OCI_VCN_FLOWLOGS, OCI_LBLOG_ACCESS, and OCI_LBLOG_ERRORS views.

Notes and Restrictions:

- The common view OCI_LOG_DATA supports all log types, so COMPARTMENT_ID, LOG_GROUP_ID, and REGION are sufficient. Likewise, if a user uses the LOG_ID of a load balancer with the OCI_VCN_FLOWLOGS view, it will either not return correct data or any data at all.
- For the OCI_LOG_LIST view, the select * from OCI_LOG_LIST will shows data only for the home region. If you need data for another region, you will have to use a REGION equality predicate in the WHERE clause.

- If the OCI_LOG_DATA, OCI_VCN_FLOWLOGS, OCI_LBLOG_ACCESS, and OCI_LBLOG_ERRORS, the select * from <view> gives an ORA-20000: compartment_id,log_group_id and region are mandatory predicates, please provide valid values for them as equality predicate in the WHERE clause. provide the required predicate values.
- The framework supports querying up to past 7 days (from current time) log data to query from the supported views. Any values for the predicates START_TIME and END_TIME predicates outside this range will result in ORA-20000: start_time and end_time should be from current_timestamp to current_timestamp-7.
- If you do not provide the listed mandatory predicates, you will see an ORA-20000: compartment_id,log_group_id and region are mandatory predicates, please provide valid values for them as equality predicate in the WHERE clause. Other columns can be used as predicates of any type (=, IN). The mandatory predicates can be only used once in a query, and they cannot be used multiple times with AND or NOT.
- Values for START_TIME and END_TIME have to be given in DD-MM-YY HH24:MI:SS format. If not provided in this format, the query will not return any data.

OCI_LOG_LIST View

Displays a list of all logs in the tenant. The view does not show log data, but provides the metadata about the logs in a tenancy. This metadata is used to properly specify parameter values for other logging view. If there is no logs under a log group, that log group will not be included in this view.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
COMPARTMENT_ID	VARCHAR2	Compartment OCID
LOG_GROUP_ID	VARCHAR2	LOG_GROUP OCID
LOG_GROUP_NAME	VARCHAR2	Log group name.
LOG_ID	VARCHAR2	LOG OCID
LOG_NAME	VARCHAR2	Log name
LOG_SERVICE	VARCHAR2	Log service

OCI_LOG_DATA View

The common view that provides access to all log types supported by the OCI Logging Service. The log content is in the DATA column.

Column	Datatype	Description
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID for each log entry
SOURCE	VARCHAR2	Resource name that generated the log message
SPEC_VERSION	NUMBER	Version of the CloudEvents specification this log message uses
LOG_TIME	TIMESTAMP	Log message generation time
TYPE	VARCHAR2	Log message type

Column	Datatype	Description
COMPARTMENT_ID	VARCHAR2	Compartment OCID
INGESTED_TIME	TIMESTAMP	Log message ingest time
LOG_GROUP_ID	VARCHAR2	Log group OCID
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID of log object owner
DATA	CLOB	Log message
ORACLE_DETAILS	CLOB	Oracle-specific metadata

OCI_VCN_FLOWLOGS View

View that provides details about traffic that passes through the user's VCN. This log enables users to audit traffic and troubleshoot security lists. Each flow log record reflects logged traffic in one direction of a connection between two endpoints. For example, a single TCP connection, you may have two records in the capture window: one for ingress traffic, and one for egress traffic.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID unique to each log entry
ACTION	VARCHAR2	Possible values of **ACCEPT** or **REJECT**
FLOW_ID	VARCHAR2	Hash of key fields (source and destination addresses, ports, and protocol)
STATUS	VARCHAR2	Possible values of **OK**, **NODATA**, or **SKIPDATA**
END_TIME	TIMESTAMP	Capture window end time
PACKETS	NUMBER	Number of packets recorded in capture window
VERSION	VARCHAR2	Flow log record schema number
BYTES_OUT	NUMBER	Number of bytes recorded in capture window
PROTOCOL	NUMBER	IANA protocol number
START_TIME	TIMESTAMP	Capture window start time
SOURCE_PORT	NUMBER	Source IANA port number
PROTOCOL_NAME	VARCHAR2	IANA protocol name
SOURCE_ADDRESS	VARCHAR2	IP address of the source in IPv4 or IPv6 notation
DESTINATION_PORT	NUMBER	Destination IANA port number
DESTINATION_ADDRESS	VARCHAR2	IP address of the destination in IPv4 or IPv6 notation
TIME	TIMESTAMP	Same as START_TIME
TYPE	VARCHAR2	Log category
LOG_ID	VARCHAR2	Log OCID

Column	Datatype	Description
TENANT_ID	VARCHAR2	Tenant OCID
VNIC_OCID	VARCHAR2	VNIC OCID
LOG_GROUP_ID	VARCHAR2	Log group OCID
INGESTED_TIME	TIMESTAMP	Time log ingested by OCI Logging
COMPARTMENT_ID	VARCHAR2	Log group compartment OCID
VNIC_SUBNET_OCID	VARCHAR2	VNIC subnet OCID
VNIC_COMPARTMENT_ID	VARCHAR2	VNIC compartment OCID
SOURCE	VARCHAR2	Resource name that generated log message
SPEC_VERSION	NUMBER	Version of the CloudEvents specification this log message uses

OCI_LBLOG_ACCESS View

View that provides load balancer access logs capturing detailed information about requests sent to a load balancer. Each entry contains the time the request was received, client, intermediate HTTP proxy IP addresses, and times used by at the load balancer and backend to process the request.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID unique to each log entry
BACKEND_ADDRESS	VARCHAR2	IP address and port number of the backend server which processed the client request
BACKEND_CONNECT_TIME	NUMBER	Time spent (in seconds, with millisecond precision) to establish backend server connection
BACKEND_PROCESSING_TIME	NUMBER	Total time taken (in seconds, with millisecond precision) from the load balancer establishing a connection to a backend until it completes
BACKEND_STATUS_CODE	NUMBER	Status code of the response from the target
CLIENT_ADDRESS	VARCHAR2	IP address and port number of the requesting client
FORWARDED_FOR_ADDRESS	VARCHAR2	IP address of the client and http proxies between client and load balancer
HOST	VARCHAR2	Domain name which resolves to IP address assigned to the load balancer
LB_STATUS_CODE	NUMBER	Load balancer status code
LISTENER_NAME	VARCHAR2	Listener which received the incoming traffic request on the load balancer's IP address
RECEIVED_BYTES	NUMBER	Total size of the request (in bytes) received from the client
REQUEST	VARCHAR2	Request line received from the client

Column	Datatype	Description
REQUEST_PROCESSING_TIME	NUMBER	Total time taken (in seconds, with millisecond precision) from the load balancer receiving the request from the client until load balancer completes sending response to the client.
ROUTING_RULES_ENGINE_ERRORS	NUMBER	Routing rule engine error during policy evaluation of the request with a 0 (no error) or 1 (error). If an error occurred, requests are forwarded to the default backend attached to the listener.
ROUTING_RULES_MATCHED_RULE	VARCHAR2	Routing policy rule name, which was matched for this specific request
ROUTING_RULES_RULE_HITS	NUMBER	Number of routing rules evaluated to true for the request
ROUTING_RULES_RULE_MISSES	NUMBER	Number of routing rules evaluated to false for the request
SENT_BYTES	NUMBER	Total size of the request (in bytes) sent to the client
SSL_CIPHER	VARCHAR2	Negotiated SSL cipher between the client and the load balancer
SSL_PROTOCOL	VARCHAR2	Negotiated SSL protocol between the client and the load balancer
TIMESTAMP	TIMESTAMP	Log entry generation time
USER_AGENT	VARCHAR2	User agent used to send the request to the load balancer
TIME	TIMESTAMP	Log entry generation time
TYPE	VARCHAR2	Log category
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID
LOG_GROUP_ID	VARCHAR2	Log group OCID
RESOURCE_ID	VARCHAR2	Resource OCID
INGESTED_TIME	TIMESTAMP	Time log ingested by OCI Logging
COMPARTMENT_ID	VARCHAR2	Log group compartment OCID
SOURCE	VARCHAR2	Resource name that generated log message
SUBJECT	VARCHAR2	Subject of the log
SPEC_VERSION	NUMBER	Version of the `CloudEvents` specification this log message uses

OCI_LBLOG_ERRORS View

View that provides load balancer error logs capturing detailed information about requests related to troubleshooting and monitoring. Each entry contains information such as the time the request was received, error type, and additional details of the specific error.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID unique to each log entry
ERROR_LOG_TYPE	VARCHAR2	Log type
ERROR_LOG_ERROR_DETAILS	VARCHAR2	Detailed description of the error message
DATA_TIMESTAMP	TIMESTAMP	Log entry generation time
TIME	TIMESTAMP	Log entry generation time
TYPE	VARCHAR2	Log category
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID
LOG_GROUP_ID	VARCHAR2	Log group OCID
RESOURCE_ID	VARCHAR2	Resource OCID
INGESTED_TIME	TIMESTAMP	Time log ingested by OCI Logging
COMPARTMENT_ID	VARCHAR2	Log group compartment OCID
SOURCE	VARCHAR2	Resource name that generated log message
SUBJECT	VARCHAR2	Subject of the log
SPEC_VERSION	NUMBER	Version of the CloudEvents specification this log message uses

Real Application Testing Capture Replay Views

Oracle Real Application Testing capture replay views.

- DBA_CAPTURE_REPLAY_HISTORY View
  The DBA_CAPTURE_REPLAY_HISTORY view provides historical information for all your workload captures and replays.
- DBA_CAPTURE_REPLAY_STATUS View
  The DBA_CAPTURE_REPLAY_STATUS view provides the most recent status for your workload. The values in the view are updated when you execute FINISH_WORKLOAD_CAPTURE, CANCEL_WORKLOAD_CAPTURE or REPLAY_WORKLOAD.

DBA_CAPTURE_REPLAY_HISTORY View

The DBA_CAPTURE_REPLAY_HISTORY view provides historical information for all your workload captures and replays.

Column	Datatype	Description
NAME	VARCHAR2(32)	Name of the workload capture or replay
UNIQUE_NAME	VARCHAR2(64)	Internal unique name for capture or replay
STATUS	VARCHAR2(8)	Workload capture or replay status
DATABASE_NAME	VARCHAR2(128)	Name of the database
DATABASE_GUID	RAW(16)	Unique id of the database
TYPE	VARCHAR2(10)	Type (capture or replay)

Column	Datatype	Description
START_TIME	DATE	Start time of the workload capture or replay.
END_TIME	DATE	End time of the workload capture or replay.
REPORT_URL	VARCHAR2(1000)	PAR URL path for capture or replay report.

DBA_CAPTURE_REPLAY_STATUS View

The DBA_CAPTURE_REPLAY_STATUS view provides the most recent status for your workload. The values in the view are updated when you execute FINISH_WORKLOAD_CAPTURE, CANCEL_WORKLOAD_CAPTURE or REPLAY_WORKLOAD.

Column	Datatype	Description
STATE	VARCHAR2(32)	Provides the current status for a workload capture or replay. For a workload capture, status value could be one of these: • CAPTURE *capture_name* STARTED • FINISHING CAPTURE • UPLOADING CAPTURE FILES • CANCELING CAPTURE • CANCEL CAPTURE *capture_name* COMPLETED • FINISH CAPTURE *capture_name* COMPLETED For a workload replay, status value could be one of these: • DOWNLOADING CAPTURE FILES • PROCESSING CAPTURE • INITIALIZING REPLAY • PREPARING REPLAY • STARTING REPLAY • UPLOADING REPLAY FILES • REPLAY *replay_name* COMPLETED
PROGRESS	VARCHAR2(8)	Percentage completed for download or upload.

Stripe Views on Autonomous Database

Stripe is an online payment processing and credit card processing platform for businesses. Users can query views created on top of Stripe APIs using the DBMS_CLOUD package to get Stripe information such as invoices, subscriptions, and customers.

For more information on Stripe, see the Stripe website.

- Prerequisites to Use Stripe Views
  To use Stripe with Autonomous Database, set Network ACL for accessing Stripe and create a credential that allows access to Stripe.
- STRIPE_ACCOUNTS View
  STRIPE_ACCOUNTS lists the Stripe account information for the authenticated caller.
- STRIPE_COUPONS View
  STRIPE_COUPONS lists the coupons issued in the Stripe account.

- STRIPE_CUSTOMERS View
  STRIPE_CUSTOMERS lists the customers defined in the Stripe account.
- STRIPE_INVOICES View
  STRIPE_INVOICES lists the invoices defined in the Stripe account.
- STRIPE_PLANS View
  STRIPE_PLANS lists the pricing plans defined in the Stripe account.
- STRIPE_PRODUCTS View
  STRIPE_PRODUCTS lists the query information about products defined in the Stripe account.
- STRIPE_SUBSCRIPTIONS View
  STRIPE_SUBSCRIPTIONS lists the subscriptions managed in the Stripe account.

Prerequisites to Use Stripe Views

To use Stripe with Autonomous Database, set Network ACL for accessing Stripe and create a credential that allows access to Stripe.

To use Stripe API:

1. Use the `DBMS_NETWORK_ACL_ADMIN` package to set Network ACL for accessing Stripe.

```
BEGIN
    DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE(
         host => 'stripe.com',
         ace  => xs$ace_type(privilege_list => xs$name_list('http'),
                             principal_name => 'FOO',
                             principal_type => xs_acl.ptype_db)
   );
END;
/
```

2. Only an ADMIN has access to the Stripe Views. A user must be granted READ access to use them.

   For Example:

```
GRANT READ on STRIPE_COUPONS to TYLER;
```

3. Create a Credential for Stripe APIs. There are two ways to perform this task:
   - (Option 1: Create a credential object with the name `STRIPE$CRED`.) The username is `STRIPE_TOKEN` and the password is the Stripe API token. This token can be found in the Stripe Developers Dashboard. See Stripe API keys for additional information.

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(
        credential_name => 'STRIPE$CRED',
        username        => 'STRIPE_TOKEN',
        password        => 'bearer_token' );
END;
/
```

   - (Option 2: Create a credential object with a user defined name.) The username is `STRIPE_TOKEN` and the password is the Stripe API token. This token can be found in the Stripe Developers Dashboard. Before selecting from the Stripe Views, the Session

parameter `DEFAULT_CREDENTIAL` should be set using the owner and credential object name. See Stripe API keys for additional information.

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(
        credential_name => 'MY_STRIPE_CRED',
        username        => 'STRIPE_TOKEN',
        password        => 'bearer_token');
END;
/
ALTER SESSION SET default_credential = 'MY_SCHEMA.MY_STRIPE_CRED';
```

4. Test by querying a Stripe View:

```
SELECT name, percent_off, duration, times_redeemed FROM STRIPE_COUPONS;

NAME              PERCENT_OFF DURATION        TIMES_REDEEMED
--------------- ------------- --------------- --------------
Promotion Feb           10.00 once                         0
Seasonal disc            5.00 once                         0

```

STRIPE_ACCOUNTS View

STRIPE_ACCOUNTS lists the Stripe account information for the authenticated caller.

See Account for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object.
OBJECT	VARCHAR2(4000)	String representing the objects type.
BUSINESS_TYPE	VARCHAR2(4000)	The business type.
BUSINESS_PROFILE	CLOB	Business information about the account.
CAPABILITIES	CLOB	A hash containing the set of capabilities that was requested for this account and their associated states.
CHARGES_ENABLED	VARCHAR2(4000)	Whether the account can create live charges.
COMPANY	CLOB	Information about the company or business.
CONTROLLER	CLOB	The controller of the account.
COUNTRY	VARCHAR2(4000)	The account country.
CREATED	VARCHAR2(4000)	Time at which the account was connected.
DEFAULT_CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code representing the default currency for the account.
DETAILS_SUBMITTED	VARCHAR2(4000)	Whether account details have been submitted.
EMAIL	VARCHAR2(4000)	An email address associated with the account.
EXTERNAL_ACCOUNTS	CLOB	External accounts currently attached to this account.
FUTURE_REQUIREMENTS	VARCHAR2(4000)	Information about the upcoming new requirements.
INDIVIDUAL	CLOB	Information about the person represented by the account.

Column	Datatype	Description
METADATA	VARCHAR2(4000)	Set of key-value pairs that you can attach to an object.
PAYOUTS_ENABLED	VARCHAR2(4000)	Whether Stripe can send payouts to this account.
REQUIREMENTS	CLOB	Information about the requirements for the account.
SETTINGS	CLOB	Options for customizing how the account functions within Stripe.
TOS_ACCEPTANCE	CLOB	Details on the acceptance of the Stripe Services Agreement.
TYPE	VARCHAR2(4000)	The Stripe account type.

STRIPE_COUPONS View

STRIPE_COUPONS lists the coupons issued in the Stripe account.

See Discounts for subscriptions for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object.
OBJECT	VARCHAR2(4000)	String representing the object type.
AMOUNT_OFF	NUMBER	Amount that will be taken off the subtotal of any invoices for this customer.
CREATED	VARCHAR2(4000)	Time at which the object was created.
CURRENCY	VARCHAR2(4000)	If amount_off has been set, the three-letter ISO code for the currency of the amount to take off.
DURATION	VARCHAR2(4000)	Describes how long a customer who applies this coupon will get the discount.
DURATION_IN_MONTHS	NUMBER	If duration is repeating, the number of months the coupon applies.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.
MAX_REDEMPTIONS	NUMBER	Maximum number of times this coupon can be redeemed, in total, across all customers, before it is no longer valid.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NAME	VARCHAR2(4000)	Name of the coupon displayed to customers on for instance invoices or receipts.

Column	Datatype	Description
PERCENT_OFF	NUMBER	Percent that will be taken off the subtotal of any invoices for this customer for the duration of the coupon.
REDEEM_BY	VARCHAR2(4000)	Date after which the coupon can no longer be redeemed.
TIMES_REDEEMED	NUMBER	Number of times this coupon has been applied to a customer.
VALID	VARCHAR2(4000)	Taking account of the above properties, whether this coupon can still be applied to a customer.

STRIPE_CUSTOMERS View

STRIPE_CUSTOMERS lists the customers defined in the Stripe account.

See Customers for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the customer.
OBJECT	VARCHAR2(4000)	String representing the object type.
ADDRESS	CLOB	The customers address.
BALANCE	NUMBER	Current balance, if any, being stored on the customer.
CREATED	VARCHAR2(4000)	Time at which the object was created.
CURRENCY	VARCHAR2(4000)	Three-letter ISO code for the currency the customer can be charged in for recurring billing purposes.
DEFAULT_SOURCE	VARCHAR2(4000)	ID of the default payment source for the customer.
DELETED	VARCHAR2(4000)	True if the customer is marked as deleted.
DELINQUENT	VARCHAR2(4000)	When the customers latest invoice is billed by charging automatically, delinquent is true if the invoices latest charge failed.
DESCRIPTION	VARCHAR2(4000)	An arbitrary string attached to the object.
DISCOUNT	CLOB	Describes the current discount active on the customer, if there is one.
EMAIL	VARCHAR2(4000)	The customer email address.
INVOICE_PREFIX	VARCHAR2(4000)	The prefix for the customer used to generate unique invoice numbers.
INVOICE_SETTINGS	CLOB	The customer default invoice settings.

Column	Datatype	Description
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or then value false if the object exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NAME	VARCHAR2(4000)	The customer full name or business name.
NEXT_INVOICE_SEQUENCE	NUMBER	The suffix of the customers next invoice number.
PHONE	VARCHAR2(4000)	The customers phone number.
PREFERRED_LOCALES	CLOB	The customers preferred locales, ordered by preference.
SHIPPING	CLOB	Mailing and shipping address for the customer.
TAX_EXEMPT	VARCHAR2(4000)	Describes the customers tax exemption status.
TAX_IDS	CLOB	The customer tax IDs.
TEST_CLOCK	CLOB	ID of the test clock this customer belongs to.

STRIPE_INVOICES View

STRIPE_INVOICES lists the invoices defined in the Stripe account.

See Invoicing for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object
OBJECT	VARCHAR2(4000)	String representing the objects type.
ACCOUNT_COUNTRY	VARCHAR2(4000)	The country of the business associated with this invoice.
ACCOUNT_NAME	VARCHAR2(4000)	The public name of the business associated with this invoice.
ACCOUNT_TAX_IDS	CLOB	The account tax IDs associated with the invoice.
AMOUNT_DUE	NUMBER	Final amount due at this time for this invoice.
AMOUNT_PAID	NUMBER	The amount, in cents, that was paid.
AMOUNT_REMAINING	NUMBER	The difference between amount_due and amount_paid, in cents.
AMOUNT_SHIPPING	NUMBER	This is the sum of all the shipping amounts.
APPLICATION	VARCHAR2(4000)	ID of the Connect Application that created the invoice.

Column	Datatype	Description
APPLICATION_FEE_AMOUNT	NUMBER	The fee in cents that will be applied to the invoice and transferred to the application owners Stripe account when the invoice is paid.
ATTEMPT_COUNT	NUMBER	Number of payment attempts made for this invoice, from the perspective of the payment retry schedule.
ATTEMPTED	VARCHAR2(4000)	Whether an attempt has been made to pay the invoice.
AUTO_ADVANCE	VARCHAR2(4000)	Controls whether Stripe will perform automatic collection of the invoice.
AUTOMATIC_TAX	CLOB	Settings and latest results for automatic tax lookup for this invoice.
BILLING_REASON	VARCHAR2(4000)	Indicates the reason why the invoice was created.
CHARGE	CLOB	ID of the latest charge generated for this invoice, if any.
COLLECTION_METHOD	VARCHAR2(4000)	Either charge_automatically, or send_invoice.
CREATED	VARCHAR2(4000)	Time at which the object was created.
CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code, in lowercase.
CUSTOM_FIELDS	CLOB	Custom fields displayed on the invoice.
CUSTOMER	VARCHAR2(4000)	The ID of the customer who will be billed.
CUSTOMER_ADDRESS	CLOB	The customers address.
CUSTOMER_EMAIL	VARCHAR2(4000)	The customers email.
CUSTOMER_NAME	VARCHAR2(4000)	The customers name.
CUSTOMER_PHONE	VARCHAR2(4000)	The customers phone number.
CUSTOMER_SHIPPING	CLOB	The customers shipping information.
CUSTOMER_TAX_EXEMPT	VARCHAR2(4000)	The customers tax exempt status.
CUSTOMER_TAX_IDS	CLOB	The customers tax IDs.
DEFAULT_PAYMENT_METHOD	VARCHAR2(4000)	ID of the default payment method for the invoice.
DEFAULT_SOURCE	VARCHAR2(4000)	ID of the default payment source for the invoice.
DEFAULT_TAX_RATES	CLOB	The tax rates applied to this invoice, if any.
DESCRIPTION	VARCHAR2(4000)	An arbitrary string attached to the object.
DISCOUNT	CLOB	Describes the current discount applied to this invoice, if there is one.

Column	Datatype	Description
DISCOUNTS	CLOB	The discounts applied to the invoice.
DUE_DATE	VARCHAR2(4000)	The date on which payment for this invoice is due.
ENDING_BALANCE	NUMBER	Ending customer balance after the invoice is finalized.
FOOTER	VARCHAR2(4000)	Footer displayed on the invoice.
FROM_INVOICE	VARCHAR2(4000)	Details of the invoice that was cloned.
HOSTED_INVOICE_URL	VARCHAR2(4000)	The URL for the hosted invoice page.
INVOICE_PDF	VARCHAR2(4000)	The link to download the PDF for the invoice.
LAST_FINALIZATION_ERROR	CLOB	The error encountered during the previous attempt to finalize the invoice.
LATEST_REVISION	VARCHAR2(4000)	The ID of the most recent non-draft revision of this invoice.
LINES	CLOB	The individual line items that make up the invoice.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NEXT_PAYMENT_ATTEMPT	VARCHAR2(4000)	The time at which payment will next be attempted.
NUMBER_	VARCHAR2(4000)	A unique, identifying string that appears on emails sent to the customer for this invoice.
ON_BEHALF_OF	VARCHAR2(4000)	The account (if any) for which the funds of the invoice payment are intended.
PAID	VARCHAR2(4000)	Whether payment was successfully collected for this invoice.
PAID_OUT_OF_BAND	VARCHAR2(4000)	Returns true if the invoice was manually marked paid, returns false if the invoice hasn't been paid yet or was paid on Stripe.
PAYMENT_INTENT	CLOB	The PaymentIntent associated with this invoice.
PAYMENT_SETTINGS	CLOB	Configuration settings for the PaymentIntent that is generated when the invoice is finalized.
PERIOD_END	VARCHAR2(4000)	End of the usage period during which invoice items were added to this invoice.
PERIOD_START	VARCHAR2(4000)	Start of the usage period during which invoice items were added to this invoice.

Column	Datatype	Description
POST_PAYMENT_CREDIT_NOTES_AMOUNT	NUMBER	Total amount of all post-payment credit notes issued for this invoice.
PRE_PAYMENT_CREDIT_NOTES_AMOUNT	NUMBER	Total amount of all pre-payment credit notes issued for this invoice.
QUOTE	VARCHAR2(4000)	The quote this invoice was generated from.
RECEIPT_NUMBER	VARCHAR2(4000)	This is the transaction number that appears on email receipts sent for this invoice.
RENDERING_OPTIONS	CLOB	Options for invoice PDF rendering.
SHIPPING_COST	CLOB	The details of the cost of shipping, including the ShippingRate applied on the invoice.
SHIPPING_DETAILS	CLOB	Shipping details for the invoice.
STARTING_BALANCE	NUMBER	Starting customer balance before the invoice is finalized.
STATEMENT_DESCRIPTOR	VARCHAR2(4000)	Extra information about an invoice for the customers credit card statement.
STATUS	VARCHAR2(4000)	The status of the invoice, one of draft, open, paid, uncollectible, or void.
STATUS_TRANSITIONS	CLOB	The timestamps at which the invoice status was updated.
SUBSCRIPTION	VARCHAR2(4000)	The subscription that this invoice was prepared for, if any.
SUBTOTAL	NUMBER	Total of all subscriptions, invoice items, and prorations on the invoice before any invoice level discount or exclusive tax is applied.
SUBTOTAL_EXCLUDING_TAX	NUMBER	The integer amount in cents representing the subtotal of the invoice before any invoice level discount or tax is applied.
TAX	NUMBER	The amount of tax on this invoice.
THRESHOLD_REASON	CLOB	If billing_reason is set to subscription_threshold this returns more information on which threshold rules triggered the invoice.
TEST_CLOCK	VARCHAR2(4000)	ID of the test clock this invoice belongs to.
TOTAL	NUMBER	Total after discounts and taxes.
TOTAL_DISCOUNT_AMOUNTS	CLOB	The aggregate amounts calculated per discount across all line items.

Column	Datatype	Description
TOTAL_EXCLUDING_TAX	NUMBER	The integer amount in cents representing the total amount of the invoice including all discounts but excluding all tax.
TOTAL_TAX_AMOUNTS	CLOB	The aggregate amounts calculated per tax rate for all line items.
TRANSFER_DATA	CLOB	The account (if any) the payment will be attributed to for tax reporting, and where funds from the payment will be transferred to for the invoice.
WEBHOOKS_DELIVERED_AT	VARCHAR2(4000)	This field tracks the time when webhooks for this invoice were successfully delivered.

STRIPE_PLANS View

STRIPE_PLANS lists the pricing plans defined in the Stripe account.

See Plans for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the plan.
OBJECT	VARCHAR2(4000)	String representing the object type.
ACTIVE	VARCHAR2(4000)	Whether the plan is currently available for purchase.
AGGREGATE_USAGE	VARCHAR2(4000)	Specifies a usage aggregation strategy for plans of usage_type=metered.
AMOUNT	NUMBER	The unit amount in cents to be charged, represented as a whole integer.
AMOUNT_DECIMAL	VARCHAR2(4000)	The unit amount in cents to be charged, represented as a decimal string with at most 12 decimal places.
BILLING_SCHEME	VARCHAR2(4000)	Describes how to compute the price per period.
CREATED	VARCHAR2(4000)	Time at which the plan was created.
CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code, in lowercase.
DELETED	VARCHAR2(4000)	True if the plan is marked as deleted.
INTERVAL	VARCHAR2(4000)	The frequency at which a subscription is billed.
INTERVAL_COUNT	NUMBER	The number of intervals between subscription billings.

Column	Datatype	Description
LIVEMODE	VARCHAR2(4000)	Has the value true if the plan exists in live mode or the value false if the plan exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an plan.
NICKNAME	VARCHAR2(4000)	A brief description of the plan, hidden from customers.
PRODUCT	VARCHAR2(4000)	ID of the product whose pricing this plan determines.
TIERS	CLOB	Each element represents a pricing tier.
TIERS_MODE	VARCHAR2(4000)	Defines if the tiering price should be graduated or volume based.
TRANSFORM_USAGE	CLOB	Apply a transformation to the reported usage or set quantity before computing the amount billed.
TRIAL_PERIOD_DAYS	NUMBER	Default number of trial days when subscribing a customer to this plan using trial_from_plan=true.
USAGE_TYPE	VARCHAR2(4000)	Configures how the quantity per period should be determined.

STRIPE_PRODUCTS View

STRIPE_PRODUCTS lists the query information about products defined in the Stripe account.

See Manage products and prices for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object.
OBJECT	VARCHAR2(4000)	String representing the object type.
ACTIVE	VARCHAR2(4000)	Whether the product is currently available for purchase.
CREATED	VARCHAR2(4000)	Time at which the object was created.
DEFAULT_PRICE	VARCHAR2(4000)	The ID of the Price object that is the default price for this product.
DESCRIPTION	VARCHAR2(4000)	The product description, meant to be displayable to the customer.
IMAGES	CLOB	A list of up to 8 URLs of images for this product, meant to be displayable to the customer.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.

Column	Datatype	Description
NAME	VARCHAR2(4000)	The product name, meant to be displayable to the customer.
PACKAGE_DIMENSIONS	CLOB	The dimensions of this product for shipping purposes.
SHIPPABLE	VARCHAR2(4000)	Whether this product is shipped.
STATEMENT_DESCRIPTOR	VARCHAR2(4000)	Extra information about a product which will appear on your customers credit card statement.
TAX_CODE	VARCHAR2(4000)	A tax code ID.
UNIT_LABEL	VARCHAR2(4000)	A label that represents units of this product.
UPDATED	VARCHAR2(4000)	Time at which the object was last updated.
URL	VARCHAR2(4000)	A URL of a publicly-accessible webpage for this product.

STRIPE_SUBSCRIPTIONS View

STRIPE_SUBSCRIPTIONS lists the subscriptions managed in the Stripe account.

See Subscriptions for additional information.

Column	Datatype	Subscription
ID	VARCHAR2(4000)	Unique identifier for the object.
OBJECT	VARCHAR2(4000)	String representing the object type.
APPLICATION	VARCHAR2(4000)	ID of the Connect Application that created the subscription.
APPLICATION_FEE_PERCENT	NUMBER	A non-negative decimal between 0 and 100, with at most two decimal places.
AUTOMATIC_TAX	CLOB	Automatic tax settings for this subscription.
BILLING_CYCLE_ANCHOR	VARCHAR2(4000)	Determines the date of the first full invoice, and, for plans with month or year intervals, the day of the month for subsequent invoices.
BILLING_THRESHOLDS	CLOB	Define thresholds at which an invoice will be sent, and the subscription advanced to a new billing period.
CANCEL_AT	VARCHAR2(4000)	A date in the future at which the subscription will automatically get canceled.
CANCEL_AT_PERIOD_END	VARCHAR2(4000)	If the subscription has been canceled with the at_period_end flag set to true, cancel_at_period_end on the subscription will be true.

Column	Datatype	Subscription
CANCELED_AT	VARCHAR2(4000)	If the subscription has been canceled, the date of that cancellation.
COLLECTION_METHOD	VARCHAR2(4000)	Either charge_automatically, or send_invoice.
CREATED	VARCHAR2(4000)	Time at which the object was created.
CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code, in lowercase.
CURRENT_PERIOD_END	VARCHAR2(4000)	End of the current period that the subscription has been invoiced for.
CURRENT_PERIOD_START	VARCHAR2(4000)	Start of the current period that the subscription has been invoiced for.
CUSTOMER	VARCHAR2(4000)	ID of the customer who owns the subscription.
DAYS_UNTIL_DUE	NUMBER	Number of days a customer has to pay invoices generated by this subscription.
DEFAULT_PAYMENT_METHOD	VARCHAR2(4000)	ID of the default payment method for the subscription.
DEFAULT_SOURCE	VARCHAR2(4000)	ID of the default payment source for the subscription.
DEFAULT_TAX_RATES	CLOB	The tax rates that will apply to any subscription item that does not have tax_rates set.
DESCRIPTION	VARCHAR2(4000)	The subscription description, meant to be displayable to the customer.
DISCOUNT	CLOB	Describes the current discount applied to this subscription, if there is one.
ENDED_AT	VARCHAR2(4000)	If the subscription has ended, the date the subscription ended.
ITEMS	CLOB	List of subscription items, each with an attached price.
LATEST_INVOICE	VARCHAR2(4000)	The most recent invoice this subscription has generated.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NEXT_PENDING_INVOICE_ITEM_INVOICE	VARCHAR2(4000)	Specifies the approximate timestamp on which any pending invoice items will be billed acc to the schedule provided at pending_invoice_item_interval.
ON_BEHALF_OF	VARCHAR2(4000)	The account the charge was made on behalf of for charges associated with this subscription.

Column	Datatype	Subscription
PAUSE_COLLECTION	CLOB	If specified, payment collection for this subscription will be paused.
PAYMENT_SETTINGS	VARCHAR2(4000)	Payment settings passed on to invoices created by the subscription.
PENDING_INVOICE_ITEM_INTERVAL	CLOB	Specifies an interval for how often to bill for any pending invoice items.
PENDING_SETUP_INTENT	VARCHAR2(4000)	For collecting user authentication when creating a subscription without immediate payment or updating a subscriptions payment method, allowing you to optimize for off-session payments.
PENDING_UPDATE	CLOB	If specified, pending updates that will be applied to the subscription once the latest_invoice has been paid.
SCHEDULE	CLOB	The schedule attached to the subscription.
START_DATE	VARCHAR2(4000)	Date when the subscription was first created.
STATUS	VARCHAR2(4000)	Possible values are incomplete, incomplete_expired, trialing, active, past_due, canceled, or unpaid.
TEST_CLOCK	VARCHAR2(4000)	ID of the test clock this subscription belongs to.
TRANSFER_DATA	CLOB	The account the subscriptions payments will be attributed to for tax reporting, and where funds from each payment will be transferred to for each of the subscriptions invoices.
TRIAL_END	VARCHAR2(4000)	If the subscription has a trial, the end of that trial.
TRIAL_SETTINGS	VARCHAR2(4000)	Settings related to subscription trials.
TRIAL_START	VARCHAR2(4000)	If the subscription has a trial, the beginning of that trial.

Track DBMS_CLOUD Load Operations

DBMS_CLOUD tracks details for load operations for each instance and for users.

- DBA_LOAD_OPERATIONS and USER_LOAD_OPERATIONS Views
  USER_LOAD_OPERATIONS and DBA_LOAD_OPERATIONS views show the load operations in your schema or for all users. The USER_LOAD_OPERATIONS view does not display the USERNAME column.

DBA_LOAD_OPERATIONS and USER_LOAD_OPERATIONS Views

USER_LOAD_OPERATIONS and DBA_LOAD_OPERATIONS views show the load operations in your schema or for all users. The USER_LOAD_OPERATIONS view does not display the USERNAME column.

Column	Datatype	NULL	Description
ID	NUMBER	NOT NULL	Specifies the operation ID.
TYPE	VARCHAR2(128)	NOT NULL	Shows the operation type.
SID	NUMBER	NOT NULL	Session ID of the session.
SERIAL#	NUMBER	NOT NULL	
USERNAME	VARCHAR2(128)	NOT NULL	User ID of the user performing the operation. The USER_LOAD_OPERATIONS view does not display the USERNAME column.
START_TIME	TIMESTAMP(6) WITH TIME ZONE		Start time of the task.
UPDATE_TIME	TIMESTAMP(6) WITH TIME ZONE		Last update time for the task.
STATUS	VARCHAR2(9)		Status of the operation. Valid values are: COMPLETED, FAILED, PENDING, RUNNING, SKIPPED.
OWNER_NAME	VARCHAR2(128)		Schema that owns the operation.
TABLE_NAME	VARCHAR2(128)		
PARTITION_NAME	VARCHAR2(128)		
SUBPARTITION_NAME	VARCHAR2(128)		
FILE_URI_LIST	VARCHAR2(4000)		This value shows either a comma-delimited list of source file URIs or one or more directories and source files that were specified in the FILE_URI_LIST parameter.
ROWS_LOADED	NUMBER		Number of rows loaded in the load operation.
LOGFILE_TABLE	VARCHAR2(128)		Shows the name of the table you can query to look at the log of a load operation.
BADFILE_TABLE	VARCHAR2(128)		Shows the name of the table you can query to look at the rows that got errors during loading.
STATUS_TABLE	VARCHAR2(128)		Shows the name of the status table for the load operation.
TEMPEXT_TABLE	VARCHAR2(128)		
CREDENTIAL_NAME	VARCHAR2(128)		
EXPIRATION_TIME	TIMESTAMP(9) WITH TIME ZONE		

Autonomous Database for Experienced Oracle Database Users

This appendix provides information on using Autonomous Database for experienced Oracle Database users with Autonomous Database Serverless.

For equivalent information about using Oracle Database features and options with Autonomous Database on dedicated Exadata infrastructure, see Oracle Database Features in Dedicated Autonomous Database Deployments.

- About Autonomous Database for Experienced Oracle Database Users
  Autonomous Database configures and optimizes your database for you. You do not need to perform administration operations for configuring the database. SQL commands used for database administration such as `CREATE TABLESPACE` are not available. Similarly, other administrative interfaces and utilities such as `RMAN` are not available.
- Autonomous Database Views
- Autonomous Database – Oracle Database Features
  Describes Oracle Database features available with Autonomous Database.
- Autonomous Database with Oracle Database 23ai
  When you provision or clone an Autonomous Database instance you can select either of these versions: Oracle Database 19c or Oracle Database 23ai.
- Autonomous Database RMAN Recovery Catalog
  You can use Oracle Autonomous Database as a Recovery Manager (RMAN) recovery catalog. A recovery catalog is a database schema that RMAN uses to store metadata about one or more Oracle databases.
- Notes for Users Migrating from Other Oracle Databases
  Describes information that is useful when you are migrating from other Oracle Databases to Oracle Autonomous Database.
- Database Features Unavailable in Autonomous Database
  Lists the Oracle Database features that are not available in Autonomous Database. Additionally, database features designed for administration are not available.
- Logical Partition Change Tracking and Materialized Views
  Describes information about the Logical Partition Change Tracking (LPCT) metadata framework and Query Rewrite with Logical Partition Change Tracking in Autonomous Database.

About Autonomous Database for Experienced Oracle Database Users

Autonomous Database configures and optimizes your database for you. You do not need to perform administration operations for configuring the database. SQL commands used for database administration such as `CREATE TABLESPACE` are not available. Similarly, other administrative interfaces and utilities such as `RMAN` are not available.

There are differences, depending on your workload: Data Warehouse, Transaction Processing, or JSON Database. See the following section appropriate to your workload:

- Data Warehouse Workload with Autonomous Database
  Autonomous Database configures and optimizes your database for you, based on your workload.
- Transaction Processing and JSON Database Workloads with Autonomous Database
  Autonomous Database configures and optimizes your database for you, based on your workload.

Data Warehouse Workload with Autonomous Database

Autonomous Database configures and optimizes your database for you, based on your workload.

Characteristics of a database with Data Warehouse workload:

- The default data and temporary tablespaces for the database are configured automatically. Adding, removing, or modifying tablespaces is not allowed. Autonomous Database creates one tablespace or multiple tablespaces automatically depending on the storage size.
- The database character set is Unicode `AL32UTF8`. See Choose a Character Set for Autonomous Database for more information.
- Compression is enabled by default. Autonomous Database uses Hybrid Columnar Compression for all tables by default. You can specify different compression methods for your tables using the compression clause in your `CREATE TABLE` or `ALTER TABLE` commands.
- Oracle Database Result Cache is enabled by default for all SQL statements.

Accessing a database:

- You do not have direct access to the database node. You can create and drop directories with `CREATE DIRECTORY` and `DROP DIRECTORY`, as described in Creating and Managing Directories on Autonomous Database.

  You can use `DBMS_CLOUD` procedures such as `DBMS_CLOUD.DELETE_FILE`, `DBMS_CLOUD.GET_OBJECT`, and `DBMS_CLOUD.PUT_OBJECT` with files and objects. You do not have direct access to the local file system.

Parallel Execution with Data Warehouse workload:

- Parallelism is determined by the database service. See See Database Service Names for Autonomous Database for more information. for details for parallelism support for each database service.
- When you want to disable parallel DML operations in your session, use the following SQL command:

  ```
  ALTER SESSION DISABLE PARALLEL DML;
  ```

  See *VLDB and Partitioning Guide* for more information on parallel DML operations.
- Manage DML Performance and Compression for Data Warehouse Workloads
- Create Staging Tables for Data Warehouse Workloads
  Autonomous Database supports staging tables that are optimized for loading data into a data warehouse.

Manage DML Performance and Compression for Data Warehouse Workloads

Autonomous Database with Data Warehouse workloads uses Hybrid Columnar Compression for all tables by default. This gives the best compression ratio and optimal performance for direct-path load operations like the loads done using the `DBMS_CLOUD` package. If you perform DML operations like `UPDATE` and `MERGE` on your tables these may cause the compression ratio for the affected rows to decrease leading to larger table sizes. These operations may also perform slower compared to the same operations on an uncompressed table.

For the best compression ratio and optimal performance Oracle recommends using bulk operations like direct-path loads and `CREATE TABLE AS SELECT` statements. But, if your workload requires frequent DML operations like `UPDATE` and `MERGE` on large parts of a table, you can create those tables as uncompressed tables to achieve better DML performance. For example, the following statement creates the table `SALES` as an uncompressed table:

```
CREATE TABLE sales (
    prod_id             NUMBER          NOT NULL,
    cust_id             NUMBER          NOT NULL,
    time_id             DATE            NOT NULL,
    channel_id          NUMBER          NOT NULL,
    promo_id            NUMBER          NOT NULL,
    quantity_sold       NUMBER(10,2)    NOT NULL,
    amount_sold         NUMBER(10,2)    NOT NULL)
NOCOMPRESS;
```

At any point in time you can use the `ALTER TABLE MOVE` statement to compress these tables without impacting queries accessing them. For example, the following statement compresses the table `SALES` using Hybrid Columnar Compression.

```
ALTER TABLE sales MOVE COLUMN STORE COMPRESS FOR QUERY HIGH;
```

Create Staging Tables for Data Warehouse Workloads

Autonomous Database supports staging tables that are optimized for loading data into a data warehouse.

A staging table is a table with the `STAGING` property set. This applies the following characteristics:

- Any form of compression is explicitly turned off and disallowed on a staging table for any data load. The command `ALTER TABLE COMPRESS` is not allowed.
- Setting the `STAGING` property on an existing table does not impact the storage of existing data but does impact future data loads.
- Autonomous Database uses dynamic sampling for statistics for tables with the staging property set, and does not collect statistics on staging tables.
- Dropping staging tables immediately removes the table, bypassing the recycle bin. Setting the `recyclebin` initialization parameter to the value `ON` does not enable the recycle bin.

The characteristics of Autonomous Database partitioned staging tables includes the above, plus the following:

- Any form of compression is explicitly turned off and disallowed on all of the table's partitions and subpartitions.
- You cannot change the default attributes of the table to use compress with `ALTER TABLE MODIFY DEFAULT ATTRIBUTES`.
- You cannot perform partition maintenance operations that move data and compress the data. For example, the following are not allowed when you try to apply compression: `ALTER TABLE` with `MOVE PARTITION`, `MERGE PARTITIONS`, `SPLIT PARTITION`, or `SPLIT SUBPARTITION`.
- You cannot repartition a table with `ALTER TABLE MODIFY PARTITION` and specify any resulting partition to be compressed.

Define staging tables when you create a table or by altering an existing table as follows:

1. Create a table with the `STAGING` property.

   For example:

   ```
   CREATE TABLE staging_table (col1 number, col2 varchar2(100)) FOR STAGING;

   CREATE TABLE part_staging_table (col1 number, col2 varchar2(100))
       PARTITION BYRANGE (col1)
             (PARTITION p1 VALUESLESS THAN (100),
              PARTITION pmax VALUESLESS THAN (MAXVALUE)) FOR STAGING;
   ```

2. Change an existing table to set the `STAGING` property.

   For example:

   ```
   ALTER TABLE staging_table FOR STAGING;
   ```

3. You can verify the `STAGING` property for a table using one of the following views: `USER_TABLES`, `ALL_TABLES`, or `DBA_TABLES`.

   In these views, the `STAGING` column indicates the staging table property, a value `YES` indicates a `STAGING` table, a value `NO` is shown for all other tables.

You can alter a table to remove the `STAGING` property. For example:

```
ALTER TABLE staging_table NOT FOR STAGING;
```

Note the following for altering a table with `NOT FOR STAGING`:

- After you alter a table with `NOT FOR STAGING`, the compression attribute and existing data are not affected and are kept as uncompressed until you explicitly alter the table and specify compression. You can change the table compression and `ALTER TABLE COMPRESS` is allowed.
- Altering a table with `NOT FOR STAGING` does not trigger statistics collection. After you change the table property with `NOT FOR STAGING`, you can collect statistics, either manually or automatically.
- After you alter a table with `NOT FOR STAGING`, when the recycle bin is enabled dropping the table puts the table in the recycle bin.

Transaction Processing and JSON Database Workloads with Autonomous Database

Autonomous Database configures and optimizes your database for you, based on your workload.

Characteristics of Autonomous Database with Transaction Processing or JSON Database workloads:

- The default data and temporary tablespaces for the database are configured automatically. Adding, removing, or modifying tablespaces is not allowed. Autonomous Database creates one tablespace or multiple tablespaces automatically depending on the storage size.
- The database character set is Unicode `AL32UTF8`. See Choose a Character Set for Autonomous Database for more information.

- Compression is not enabled by default but Autonomous Database honors a compression clause if compression is specified on a table.

Accessing a database:

- You do not have direct access to the database node. You can create and drop directories with `CREATE DIRECTORY` and `DROP DIRECTORY`, as described in Create and Manage Directories.

  You can use `DBMS_CLOUD` procedures such as `DBMS_CLOUD.DELETE_FILE`, `DBMS_CLOUD.GET_OBJECT`, and `DBMS_CLOUD.PUT_OBJECT` with files and objects. You do not have direct access to the local file system.

Parallel Execution with Transaction Processing or JSON Database workloads:

- Parallelism is determined by the database service you use. See Database Service Names for Autonomous Database for details about parallelism support for each database service.
- When you want to run DML operations in parallel and the database service you are using allows this, you can enable parallel DML in your session using the following SQL command:

  ```
  ALTER SESSION ENABLE PARALLEL DML;
  ```

  See *VLDB and Partitioning Guide* for more information on parallel DML operations.
- If you create an index manually and specify the `PARALLEL` clause, the `PARALLEL` attribute remains after the index is created. In this case SQL statements can run in parallel unbeknownst to the end user.

  To specify serial execution, change the `INDEX` parallel clause to `NOPARALLEL` or set the `PARALLEL` degree attribute to 1 to specify serial execution:

  ```
  ALTER INDEX index_name NOPARALLEL;
  ```

  or

  ```
  ALTER INDEX index_name PARALLEL 1;
  ```

Autonomous Database Views

Autonomous Database provides several views that are not available in Oracle Database 19c. This topic lists the Autonomous Database specific views.

- Track Table and Partition Scan Access with Autonomous Database Views
  Oracle Autonomous Database tracks the scan count for tables and partitions. Use the table access stats data dictionary and dynamic views to retrieve scan count information.
- Track Oracle Cloud Infrastructure Resources, Cost and Usage Reports with Autonomous Database Views
  Oracle Autonomous Database tracks the Oracle Cloud Infrastructure resources, cost and usage reports. You can access these reports using the OCI views.
- Pipeline Views
  Lists details for the `DBMS_CLOUD_PIPELINE` views.
- DBMS_CLOUD_AI Views
  The `DBMS_CLOUD_AI` package uses the following views.

- DBMS_CLOUD_FUNCTION Views
  The DBMS_CLOUD_FUNCTION package uses the following views.
- DBMS_CLOUD_LINK Views
  The DBMS_CLOUD_LINK package uses the following views.
- DBMS_DATA_ACCESS Views
  Describes the Autonomous Database dynamic performance views you can use with the DBMS_DATA_ACCESS package to monitor Table Hyperlink URL usage.
- DBA_PROXY_SQL Views
  Describes the Autonomous Database DBA_PROXY_SQL views.
- Lockdown Errors View
  Lists details for the DBA_LOCKDOWN_ERRORS view.
- Oracle Cloud Infrastructure Logging Interface Views
  The Oracle Cloud Infrastructure (OCI) logging interface views enable authorized users to access log data through a set of views.
- Real Application Testing Capture Replay Views
  Oracle Real Application Testing capture replay views.
- Stripe Views on Autonomous Database
  Stripe is an online payment processing and credit card processing platform for businesses. Users can query views created on top of Stripe APIs using the DBMS_CLOUD package to get Stripe information such as invoices, subscriptions, and customers.
- Track DBMS_CLOUD Load Operations
  DBMS_CLOUD tracks details for load operations for each instance and for users.

Track Table and Partition Scan Access with Autonomous Database Views

Oracle Autonomous Database tracks the scan count for tables and partitions. Use the table access stats data dictionary and dynamic views to retrieve scan count information.

- GV$TABLE_ACCESS_STATS and V$TABLE_ACCESS_STATS Views
  The GV$TABLE_ACCESS_STATS and V$TABLE_ACCESS_STATS views list the scan count for tables and partitions. The scan data collection begins at instance startup time.
- ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS Views
  The ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS views list the scan count for tables and partitions. The scan data collection begins at instance startup time.
- USER_TABLE_ACCESS_STATS View
  The USER_TABLE_ACCESS_STATS view lists the scan count for the user's tables and partitions. The scan data collection begins at instance startup time.

GV$TABLE_ACCESS_STATS and V$TABLE_ACCESS_STATS Views

The GV$TABLE_ACCESS_STATS and V$TABLE_ACCESS_STATS views list the scan count for tables and partitions. The scan data collection begins at instance startup time.

Column	Datatype	Description
READ_COUNT	NUMBER	Aggregated scan count since instance startup
OBJECT_ID	NUMBER	Object ID of the table or partition

Column	Datatype	Description
INST_ID	NUMBER	Instance number where table/partition was scanned This column (INST_ID) is only shown in GV$TABLE_ACCESS_STATS
CON_ID	NUMBER	Container ID of the database

ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS Views

The ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS views list the scan count for tables and partitions. The scan data collection begins at instance startup time.

> **Note:**
>
> The ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS views do not list scan count information for Oracle-maintained schemas.

Column	Datatype	Description
TABLE_OWNER	VARCAR2(128)	Owner of the table
TABLE_NAME	VARCAR2(128)	Name of the table
PARTITION_NAME	VARCAR2(128)	Name of the partition A NULL value specifies a non-partitioned table
INSTANCE_ID	NUMBER	Instance number where table or partition was scanned
READ_COUNT	NUMBER	Aggregated scan count since instance startup

USER_TABLE_ACCESS_STATS View

The USER_TABLE_ACCESS_STATS view lists the scan count for the user's tables and partitions. The scan data collection begins at instance startup time.

Column	Datatype	Description
TABLE_NAME	VARCAR2(128)	Name of the table
PARTITION_NAME	VARCAR2(128)	Name of the partition A NULL value specifies a non-partitioned table
INSTANCE_ID	NUMBER	Instance number where table/partition was scanned
READ_COUNT	NUMBER	Aggregated scan count since instance startup

Track Table and Partition Scan Access with Autonomous Database Views

Oracle Autonomous Database tracks the scan count for tables and partitions. Use the table access stats data dictionary and dynamic views to retrieve scan count information.

- GV$TABLE_ACCESS_STATS and V$TABLE_ACCESS_STATS Views
  The GV$TABLE_ACCESS_STATS and V$TABLE_ACCESS_STATS views list the scan count for tables and partitions. The scan data collection begins at instance startup time.
- ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS Views
  The ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS views list the scan count for tables and partitions. The scan data collection begins at instance startup time.
- USER_TABLE_ACCESS_STATS View
  The USER_TABLE_ACCESS_STATS view lists the scan count for the user's tables and partitions. The scan data collection begins at instance startup time.

GV$TABLE_ACCESS_STATS and V$TABLE_ACCESS_STATS Views

The GV$TABLE_ACCESS_STATS and V$TABLE_ACCESS_STATS views list the scan count for tables and partitions. The scan data collection begins at instance startup time.

Column	Datatype	Description
READ_COUNT	NUMBER	Aggregated scan count since instance startup
OBJECT_ID	NUMBER	Object ID of the table or partition
INST_ID	NUMBER	Instance number where table/partition was scanned This column (INST_ID) is only shown in GV$TABLE_ACCESS_STATS
CON_ID	NUMBER	Container ID of the database

ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS Views

The ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS views list the scan count for tables and partitions. The scan data collection begins at instance startup time.

> **Note:**
>
> The ALL_TABLE_ACCESS_STATS and DBA_TABLE_ACCESS_STATS views do not list scan count information for Oracle-maintained schemas.

Column	Datatype	Description
TABLE_OWNER	VARCAR2(128)	Owner of the table
TABLE_NAME	VARCAR2(128)	Name of the table
PARTITION_NAME	VARCAR2(128)	Name of the partition A NULL value specifies a non-partitioned table
INSTANCE_ID	NUMBER	Instance number where table or partition was scanned
READ_COUNT	NUMBER	Aggregated scan count since instance startup

USER_TABLE_ACCESS_STATS View

The USER_TABLE_ACCESS_STATS view lists the scan count for the user's tables and partitions. The scan data collection begins at instance startup time.

Column	Datatype	Description
TABLE_NAME	VARCAR2(128)	Name of the table
PARTITION_NAME	VARCAR2(128)	Name of the partition A NULL value specifies a non-partitioned table
INSTANCE_ID	NUMBER	Instance number where table/partition was scanned
READ_COUNT	NUMBER	Aggregated scan count since instance startup

Track Oracle Cloud Infrastructure Resources, Cost and Usage Reports with Autonomous Database Views

Oracle Autonomous Database tracks the Oracle Cloud Infrastructure resources, cost and usage reports. You can access these reports using the OCI views.

- Prerequisite Steps to Use OCI Resource Views
  Describes the prerequisite steps you must perform to use OCI resource views on Autonomous Database.
- OCI_AUTONOMOUS_DATABASES View
  OCI_AUTONOMOUS_DATABASES describes all the Oracle Cloud Infrastructure Autonomous Databases in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_BUDGET_ALERT_RULES View
  OCI_BUDGET_ALERT_RULES describes all the Oracle Cloud Infrastructure budget alert rules in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_BUDGET_SUMMARY View
  OCI_BUDGET_SUMMARY describes all the Oracle Cloud Infrastructure budget summaries in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_COST_DATA View
  OCI_COST_DATA describes all the Oracle Cloud Infrastructure cost data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_OBJECTSTORAGE_BUCKETS View
  OCI_OBJECTSTORAGE_BUCKETS describes all the Oracle Cloud Infrastructure object storage buckets in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_USAGE_DATA View
  OCI_USAGE_DATA describes all the Oracle Cloud Infrastructure usage data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

Prerequisite Steps to Use OCI Resource Views

Describes the prerequisite steps you must perform to use OCI resource views on Autonomous Database.

> **Note:**
>
> Only ADMIN user has access to the OCI resource views by default. To access these views as another user, the ADMIN must grant READ privileges.

To query an OCI resource view, do the following:

1. Create a dynamic group that includes your Autonomous Database instance and define the required policies to access a view.

   For example, the Autonomous Database instance is specified in the `resource.id` parameter with an OCID:

   ```
   resource.id = '<your_Autonomous_Database_instance_OCID>'
   ```

   Each view shows the details for the policy that you must define to query the view.

   See Perform Prerequisites to Use Resource Principal with Autonomous Database for details on creating a dynamic group and defining policies.

   For example, to access all of the views, define the following policy:

   ```
   Define tenancy usage-report as
   ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhq
   kggq
   Endorse dynamic-group <group-name> to read objects in tenancy usage-report
   Allow dynamic-group <group-name> to read buckets in tenancy
   Allow dynamic-group <group-name> to read autonomous-database in tenancy
   Allow dynamic-group <group-name> to read usage-budgets in tenancy
   ```

   > **Note:**
   >
   > Do not replace the OCID in this policy with another OCID. This `usage-report` OCID provides the Oracle Cloud Infrastructure usage data for your tenancy.

2. Verify that resource principal is enabled for the ADMIN user on the Autonomous Database instance.

   ```
   SELECT owner, credential_name FROM dba_credentials
      WHERE credential_name = 'OCI$RESOURCE_PRINCIPAL' AND owner = 'ADMIN';

   OWNER CREDENTIAL_NAME
   ----- --------------------
   ADMIN OCI$RESOURCE_PRINCIPAL
   ```

If the resource principal is not enabled, then enable the resource principal:

```
EXEC DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL();
```

See Use Resource Principal to Access Oracle Cloud Infrastructure Resources for more information.

3. Run a query on an OCI resource view.

   For example:

```
SELECT NAME, APPROXIMATESIZE FROM OCI_OBJECTSTORAGE_BUCKETS;
SELECT * FROM OCI_USAGE_DATA;
```

OCI_AUTONOMOUS_DATABASES View

`OCI_AUTONOMOUS_DATABASES` describes all the Oracle Cloud Infrastructure Autonomous Databases in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read autonomous-database in tenancy
```

This policy lets you list all Autonomous Databases in your tenancy. Optionally you can restrict it to list Autonomous Databases in a given compartment:

```
Allow dynamic-group <group-name> to read autonomous-database in compartment
<compartment-name>
```

Column	Datatype	Description
DISPLAYNAME	VARCHAR2	The user friendly name for the Autonomous Database
REGION	VARCHAR2	Region Name
COMPARTMENTID	VARCHAR2	The OCID of the compartment
ID	VARCHAR2	The OCID of the Autonomous Database
DBNAME	VARCHAR2	The database name
LIFECYCLESTATE	VARCHAR2	The current state of the Autonomous Database
TIMECREATED	VARCHAR2	The date and time the Autonomous Database was created
DATASTORAGESIZEINTBS	VARCHAR2	The quantity of data in the database in terabytes
LICENSEMODEL	VARCHAR2	The Oracle license model that applies to the Autonomous Database
SERVICECONSOLEURL	VARCHAR2	The URL of the Service Console for the Autonomous Database
APEXDETAILS	CLOB	Information about Oracle APEX Application Development
AREPRIMARYWHITELISTEDIPSUSED	VARCHAR2	Primary White Listed IPs
AUTONOMOUSCONTAINERDATABASEID	VARCHAR2	The Autonomous Container Database OCID
AUTONOMOUSMAINTENANCESCHEDULETYPE	VARCHAR2	Maintenance Schedule Type

Column	Datatype	Description
AVAILABLEUPGRADEVERSIONS	VARCHAR2	List of Oracle Database versions available for a database upgrade
BACKUPCONFIG	CLOB	Autonomous Database Backup Config
CONNECTIONSTRINGS	CLOB	Autonomous Database Connection Strings
CONNECTIONURLS	CLOB	Autonomous Database Connection URLs
CPUCORECOUNT	NUMBER	The number of OCPU cores to be made available to the database
CUSTOMERCONTACTS	CLOB	The Customer Contacts
DATASAFESTATUS	VARCHAR2	Status of the Data Safe registration for this Autonomous Database
DATASTORAGESIZEINGBS	NUMBER	The quantity of data in the database in gigabytes
DBVERSION	VARCHAR2	The Oracle Database version for the Autonomous Database
DATAGUARDREGIONTYPE	VARCHAR2	The Autonomous Data Guard region type of the Autonomous Database
DBWORKLOAD	VARCHAR2	The Autonomous Database workload type
DEFINEDTAGS	CLOB	Defined tags for the resource
FAILEDDATARECOVERYINSECONDS	NUMBER	Indicates the number of seconds of data loss for an Autonomous Data Guard failover
FREEFORMTAGS	CLOB	Free form tags for the resource
INFRASTRUCTURETYPE	VARCHAR2	The infrastructure type this resource belongs to
ISACCESSCONTROLENABLED	VARCHAR2	Indicates if the database level access control is enabled
ISAUTOSCALINGENABLED	VARCHAR2	Indicates if auto scaling is enabled for the Autonomous Database
ISDATAGUARDENABLED	VARCHAR2	Indicates whether the Autonomous Database has a local Autonomous Data Guard enabled
ISDEDICATED	VARCHAR2	True if the database uses dedicated Exadata infrastructure
ISFREETIER	VARCHAR2	Indicates if this is an Always Free resource
ISMTLSCONNECTIONREQUIRED	VARCHAR2	Indicates whether the Autonomous Database requires mTLS connections
ISPREVIEW	VARCHAR2	Indicates if the Autonomous Database version is a preview version
ISREFRESHABLECLONE	VARCHAR2	Indicates whether the Autonomous Database is a refreshable clone
KEYHISTORYENTRY	CLOB	Key History Entry
KEYSTOREID	VARCHAR2	The OCID of the key store
KEYSTOREWALLETNAME	VARCHAR2	The wallet name for Oracle Cloud Infrastructure Vault
KMSKEYID	VARCHAR2	The OCID of the key container that is used as the master encryption key
KMSKEYLIFECYCLEDETAILS	VARCHAR2	Customer managed key lifecycle details
LIFECYCLEDETAILS	VARCHAR2	Information about the current lifecycle state
NSGIDS	CLOB	A list of the OCIDs of the network security groups NSGs
OCPUCOUNT	NUMBER	The number of OCPU cores to be made available to the database
OPENMODE	VARCHAR2	The Autonomous Database open mode
OPERATIONSINSIGHTSSTATUS	VARCHAR2	Status of OCI Ops Insights for this Autonomous Database

Column	Datatype	Description
PEERDBIDS	VARCHAR2	The list of OCIDs of standby databases located in Autonomous Data Guard
PERMISSIONLEVEL	CLOB	The Autonomous Database permission level
PRIVATEENDPOINT	VARCHAR2	The private endpoint for the resource
PRIVATEENDPOINTIP	VARCHAR2	The private endpoint IP address for the resource
PRIVATEENDPOINTLABEL	VARCHAR2	The private endpoint label for the resource
REFRESHABLEMODE	VARCHAR2	The refresh mode of the clone
REFRESHABLESTATUS	VARCHAR2	The refresh status of the clone
ROLE	VARCHAR2	The Autonomous Data Guard role
SOURCEID	VARCHAR2	The OCID of the source Autonomous Database that was cloned
SQLWEBDEVELOPERURL	VARCHAR2	The Database Actions (SQL Developer Web) URL for the Autonomous Database
STANDBYDB	CLOB	Autonomous Database Standby Summary
STANDBYWHITELISTEDIPS	CLOB	The client IP access control list
SUBNETID	VARCHAR2	The OCID of the subnet the resource is associated with
SUPPORTEDREGIONSTOCLONETO	CLOB	The list of regions that support the creation of Autonomous Data Guard
SYSTEMTAGS	CLOB	System tags for this resource
TIMEDATAGUARDROLECHANGED	VARCHAR2	The date and time the Autonomous Data Guard role was switched
TIMEDELETIONOFFREEAUTONOMOUSDATABASE	NUMBER	Time deletion of Free Autonomous Database
TIMELOCALDATAGUARDENABLED	VARCHAR2	The date and time that Autonomous Data Guard was enabled for the Autonomous Database
TIMEMAINTENANCEBEGIN	VARCHAR2	The date and time when maintenance will begin
TIMEMAINTENANCEEND	VARCHAR2	The date and time when maintenance will end
TIMEOFLASTFAILOVER	VARCHAR2	The timestamp of the last failover operation
TIMEOFLASTREFRESH	VARCHAR2	The date and time of the last refresh
TIMEOFLASTREFRESHPOINT	VARCHAR2	The refresh point timestamp
TIMEOFLASTSWITCHOVER	VARCHAR2	The timestamp of the last switchover operation for the Autonomous Database
TIMEOFNEXTREFRESH	VARCHAR2	The date and time of next refresh
TIMERECLAMATIONOFFREEAUTONOMOUSDATABASE	VARCHAR2	The date and time the Always Free database
USEDDATASTORAGESIZEINTBS	NUMBER	The amount of storage that has been used in terabytes
VAULTID	VARCHAR2	The OCID of the Oracle Cloud Infrastructure Vault
WHITELISTEDIPS	CLOB	The client IP access control list

OCI_BUDGET_ALERT_RULES View

`OCI_BUDGET_ALERT_RULES` describes all the Oracle Cloud Infrastructure budget alert rules in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

Queries against this view return results only if you have budgets and budget alerts created in your tenancy.

See Budgets Overview for more information.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read usage-budgets in tenancy
```

This policy lets you list budget summary and budget alerts in your tenancy (if you created a budget and a budget alert). Optionally you can restrict the result returned by querying the view to a given compartment:

```
Allow dynamic-group <group-name> to read usage-budgets in compartment <compartment-name>
```

Column	Datatype	Description
BUDGETID	VARCHAR2	The OCID of the budget
REGION	VARCHAR2	Region name
COMPARTMENTID	VARCHAR2	The compartment ID in which the bucket is authorized
DEFINEDTAGS	CLOB	Defined tags for the resource
DESCRIPTION	VARCHAR2	The description of the alert rule
DISPLAYNAME	VARCHAR2	The name of the alert rule
FREEFORMTAGS	CLOB	Free-form tags for the resource
ID	VARCHAR2	The OCID of the alert rule
LIFECYCLESTATE	VARCHAR2	The current state of the alert rule
MESSAGE	VARCHAR2	The custom message that will be sent when the alert is triggered
RECIPIENTS	VARCHAR2	The audience that receives the alert when it triggers
THRESHOLD	NUMBER	The threshold for triggering the alert
THRESHOLDTYPE	VARCHAR2	The type of threshold
TIMECREATED	VARCHAR2	The time when the budget was created
TIMEUPDATED	VARCHAR2	The time when the budget was updated
TYPE	VARCHAR2	ACTUAL or FORECAST types of alert triggers
VERSION	NUMBER	The version of the alert rule

OCI_BUDGET_SUMMARY View

OCI_BUDGET_SUMMARY describes all the Oracle Cloud Infrastructure budget summaries in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

Queries against this view return results only if you have budgets created in your tenancy.

See Budgets Overview for more information.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read usage-budgets in tenancy
```

This policy lets you list budget summary and budget alerts in your tenancy (if you created a budget and a budget alert). Optionally you can restrict the result returned by querying the view to a given compartment:

```
Allow dynamic-group <group-name> to read usage-budgets in compartment <compartment-name>
```

Column	Datatype	Description
REGION	VARCHAR2	Region name
COMPARTMENTID	VARCHAR2	The OCID of the compartment
AMOUNT	NUMBER	The amount of the budget, expressed in the currency of a rate card
DEFINEDTAGS	CLOB	Defined tags for the resource
FREEFORMTAGS	CLOB	Free-form tags for the resource
DISPLAYNAME	VARCHAR2	The display name of the budget
LIFECYCLESTATE	VARCHAR2	The current state of the budget
ACTUALSPEND	NUMBER	The actual spend in currency for the current budget cycle
ALERTRULECOUNT	NUMBER	The total number of alert rules in the budget
BUDGETPROCESSINGPERIODSTARTOFFSET	NUMBER	The number of days offset from the first day of the month, at which the budget processing period starts
DESCRIPTION	VARCHAR2	The description of the budget
FORECASTEDSPEND	NUMBER	The forecasted spend in currency by the end of the current budget cycle
ID	VARCHAR2	The OCID of the budget
RESETPERIOD	VARCHAR2	The reset period for the budget
TARGETS	CLOB	The list of targets on which the budget is applied
TARGETCOMPARTMENTID	VARCHAR2	Target compartment OCID
TARGETTYPE	VARCHAR2	The type of target on which the budget is applied
TIMECREATED	VARCHAR2	The time the budget was created
TIMESPENDCOMPUTED	VARCHAR2	The time the budget spend was last computed
TIMEUPDATED	VARCHAR2	The time the budget was updated
VERSION	VARCHAR2	The version of the budget

OCI_COST_DATA View

`OCI_COST_DATA` describes all the Oracle Cloud Infrastructure cost data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Define tenancy usage-report as
ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhqkggq
Endorse dynamic-group <group-name> to read objects in tenancy usage-report
```

> **Note:**
>
> Do not replace the OCID in this policy with another OCID. This `usage-report` OCID provides the Oracle Cloud Infrastructure usage data for your tenancy.

Column	Datatype	Description
REFERENCE_NUMBER	VARCHAR2	Reference Number/Line identifier used for debugging and corrections

Column	Datatype	Description
TENANT_ID	VARCHAR2	The identifier (OCID) for the Oracle Cloud Infrastructure tenant
INTERVAL_USAGE_START	TIMESTAMP	The start time of the usage interval for the resource in UTC
INTERVAL_USAGE_END	TIMESTAMP	The end time of the usage interval for the resource in UTC
SERVICE_NAME	VARCHAR2	The service that the resource is in
COMPARTMENT_ID	VARCHAR2	The ID of the compartment that contains the resource
COMPARTMENT_NAME	VARCHAR2	The name of the compartment that contains the resource
REGION	VARCHAR2	The region that contains the resource
AVAILABILITY_DOMAIN	VARCHAR2	The availability domain that contains the resource
RESOURCE_ID	VARCHAR2	The identifier for the resource
BILLED_QUANTITY	VARCHAR2	The quantity of the resource that has been billed over the usage interval
BILLED_QUANTITY_OVERAGE	VARCHAR2	The usage quantity for which you were billed
SUBSCRIPTION_ID	VARCHAR2	A unique identifier associated with your commitment or subscription
PRODUCT_SKU	VARCHAR2	The Part Number for the resource in the line
PRODUCT_DESCRIPTION	VARCHAR2	The product description for the resource in the line
UNIT_PRICE	VARCHAR2	The cost billed to you for each unit of the resource used
UNIT_PRICE_OVERAGE	VARCHAR2	The cost per unit of usage for overage usage of a resource
MY_COST	VARCHAR2	The cost charged for this line of usage
MY_COST_OVERAGE	VARCHAR2	The cost billed for overage usage of a resource
CURRENCY_CODE	VARCHAR2	The currency code for your tenancy
BILLING_UNIT_READABLE	VARCHAR2	The unit measure associated with the usage/ billedQuantity in the line
SKU_UNIT_DESCRIPTION	VARCHAR2	The unit used for measuring billed quantity
OVERAGE_FLAG	CHAR	Flag used for overage usage
IS_CORRECTION	VARCHAR2	Used if the current line is a correction
BACK_REFERENCE_NUMBER	VARCHAR2	Data amendments and corrections reference
CREATED_BY	VARCHAR2	The user who created the service
CREATED_ON	TIMESTAMP	The time when the service was created
FREE_TIER_RETAINED	VARCHAR2	Is the service retained on free tier

OCI_OBJECTSTORAGE_BUCKETS View

OCI_OBJECTSTORAGE_BUCKETS describes all the Oracle Cloud Infrastructure object storage buckets in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read buckets in tenancy
```

This policy lets you list object storage buckets in your tenancy. Optionally you can restrict the result returned by querying this view to a given compartment:

```
Allow dynamic-group <group-name> to read buckets in compartment <compartment-name>
```

Column	Datatype	Description
REGION	VARCHAR2	Region name
COMPARTMENTID	VARCHAR2	The compartment ID in which the bucket is authorized
NAMESPACE	VARCHAR2	The Object Storage namespace in which the bucket resides
APPROXIMATECOUNT	NUMBER	The approximate number of objects in the bucket
APPROXIMATESIZE	NUMBER	The approximate total size in bytes of all objects in the bucket
AUTOTIERING	VARCHAR2	The auto tiering status on the bucket
CREATEDBY	VARCHAR2	The OCID of the user who created the bucket
DEFINEDTAGS	CLOB	Defined tags for the resource
FREEFORMTAGS	CLOB	Free-form tags for the resource
ETAG	VARCHAR2	The entity tag (ETag) for the bucket
ID	VARCHAR2	The OCID of the bucket
ISREADONLY	VARCHAR2	Whether or not this bucket is read only
KMSKEYID	VARCHAR2	The OCID of a master encryption key
METADATA	VARCHAR2	Arbitrary string keys and values for user-defined metadata
NAME	VARCHAR2	The name of the bucket
OBJECTEVENTSENABLED	VARCHAR2	Whether or not events are emitted for object state changes in this bucket
OBJECTLIFECYCLEPOLICYETAG	VARCHAR2	The entity tag (ETag) for the live object lifecycle policy on the bucket
PUBLICACCESSTYPE	VARCHAR2	The type of public access enabled on this bucket
REPLICATIONENABLED	VARCHAR2	Whether or not this bucket is a replication source
STORAGETIER	VARCHAR2	The storage tier type assigned to the bucket
TIMECREATED	VARCHAR2	The date and time the bucket was created
VERSIONING	VARCHAR2	The versioning status on the bucket

OCI_USAGE_DATA View

`OCI_USAGE_DATA` describes all the Oracle Cloud Infrastructure usage data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

> **Note:**
>
> You can use OCI usage reports and `OCI_USAGE_DATA` view for information on cost and usage *before* January 31st, 2025. The OCI cost and usage reports are deprecated. You can continue to access your existing usage report CSV files until July 31, 2025. See Cost and Usage Reports for more information.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Define tenancy usage-report as
ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhqkggq
Endorse dynamic-group <group-name> to read objects in tenancy usage-report
```

> **Note:**
>
> Do not replace the OCID in this policy with another OCID. This `usage-report` OCID provides the Oracle Cloud Infrastructure cost and usage data for your tenancy.

Column	Datatype	Description
REFERENCE_NUMBER	VARCHAR2	Reference Number/Line identifier used for debugging and corrections
TENANT_ID	VARCHAR2	The identifier (OCID) for the Oracle Cloud Infrastructure tenant
INTERVAL_USAGE_START	TIMESTAMP	The start time of the usage interval for the resource in UTC
INTERVAL_USAGE_END	TIMESTAMP	The end time of the usage interval for the resource in UTC
SERVICE_NAME	VARCHAR2	The service that the resource is in
RESOURCE_NAME	VARCHAR2	The resource name used by the metering system
COMPARTMENT_ID	VARCHAR2	The ID of the compartment that contains the resource
COMPARTMENT_NAME	VARCHAR2	The name of the compartment that contains the resource
REGION	VARCHAR2	The region that contains the resource
AVAILABILITY_DOMAIN	VARCHAR2	The availability domain that contains the resource
RESOURCE_ID	VARCHAR2	The identifier for the resource
CONSUMED_QUANTITY	VARCHAR2	The quantity of the resource that has been consumed over the usage interval
BILLED_QUANTITY	VARCHAR2	The quantity of the resource that has been billed over the usage interval
CONSUMED_QUANTITY_UNITS	VARCHAR2	The unit for the consumed quantity and billed quantity
CONSUMED_QUANTITY_MEASURE	VARCHAR2	The measure for the consumed quantity and billed quantity
IS_CORRECTION	VARCHAR2	Used if the current line is a correction
BACK_REFERENCE_NUMBER	VARCHAR2	Data amendments and corrections reference
CREATED_BY	VARCHAR2	The user who created the service
CREATED_ON	TIMESTAMP	The time when the service was created
FREE_TIER_RETAINED	VARCHAR2	Is the service retained on free tier

Track Oracle Cloud Infrastructure Resources, Cost and Usage Reports with Autonomous Database Views

Oracle Autonomous Database tracks the Oracle Cloud Infrastructure resources, cost and usage reports. You can access these reports using the OCI views.

- Prerequisite Steps to Use OCI Resource Views
  Describes the prerequisite steps you must perform to use OCI resource views on Autonomous Database.

- OCI_AUTONOMOUS_DATABASES View
  `OCI_AUTONOMOUS_DATABASES` describes all the Oracle Cloud Infrastructure Autonomous Databases in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_BUDGET_ALERT_RULES View
  `OCI_BUDGET_ALERT_RULES` describes all the Oracle Cloud Infrastructure budget alert rules in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_BUDGET_SUMMARY View
  `OCI_BUDGET_SUMMARY` describes all the Oracle Cloud Infrastructure budget summaries in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_COST_DATA View
  `OCI_COST_DATA` describes all the Oracle Cloud Infrastructure cost data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_OBJECTSTORAGE_BUCKETS View
  `OCI_OBJECTSTORAGE_BUCKETS` describes all the Oracle Cloud Infrastructure object storage buckets in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.
- OCI_USAGE_DATA View
  `OCI_USAGE_DATA` describes all the Oracle Cloud Infrastructure usage data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

Prerequisite Steps to Use OCI Resource Views

Describes the prerequisite steps you must perform to use OCI resource views on Autonomous Database.

> **Note:**
>
> Only ADMIN user has access to the OCI resource views by default. To access these views as another user, the ADMIN must grant READ privileges.

To query an OCI resource view, do the following:

1. Create a dynamic group that includes your Autonomous Database instance and define the required policies to access a view.

   For example, the Autonomous Database instance is specified in the `resource.id` parameter with an OCID:

   ```
   resource.id = '<your_Autonomous_Database_instance_OCID>'
   ```

   Each view shows the details for the policy that you must define to query the view.

   See Perform Prerequisites to Use Resource Principal with Autonomous Database for details on creating a dynamic group and defining policies.

   For example, to access all of the views, define the following policy:

   ```
   Define tenancy usage-report as
   ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhq
   ```

```
kggq
Endorse dynamic-group <group-name> to read objects in tenancy usage-report
Allow dynamic-group <group-name> to read buckets in tenancy
Allow dynamic-group <group-name> to read autonomous-database in tenancy
Allow dynamic-group <group-name> to read usage-budgets in tenancy
```

> **Note:**
>
> Do not replace the OCID in this policy with another OCID. This `usage-report` OCID provides the Oracle Cloud Infrastructure usage data for your tenancy.

2. Verify that resource principal is enabled for the ADMIN user on the Autonomous Database instance.

```
SELECT owner, credential_name FROM dba_credentials
   WHERE credential_name = 'OCI$RESOURCE_PRINCIPAL' AND owner = 'ADMIN';

OWNER CREDENTIAL_NAME
----- --------------------
ADMIN OCI$RESOURCE_PRINCIPAL
```

If the resource principal is not enabled, then enable the resource principal:

```
EXEC DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL();
```

See Use Resource Principal to Access Oracle Cloud Infrastructure Resources for more information.

3. Run a query on an OCI resource view.

   For example:

```
SELECT NAME, APPROXIMATESIZE FROM OCI_OBJECTSTORAGE_BUCKETS;
SELECT * FROM OCI_USAGE_DATA;
```

OCI_AUTONOMOUS_DATABASES View

`OCI_AUTONOMOUS_DATABASES` describes all the Oracle Cloud Infrastructure Autonomous Databases in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read autonomous-database in tenancy
```

This policy lets you list all Autonomous Databases in your tenancy. Optionally you can restrict it to list Autonomous Databases in a given compartment:

```
Allow dynamic-group <group-name> to read autonomous-database in compartment
<compartment-name>
```

Column	Datatype	Description
DISPLAYNAME	VARCHAR2	The user friendly name for the Autonomous Database
REGION	VARCHAR2	Region Name
COMPARTMENTID	VARCHAR2	The OCID of the compartment
ID	VARCHAR2	The OCID of the Autonomous Database
DBNAME	VARCHAR2	The database name
LIFECYCLESTATE	VARCHAR2	The current state of the Autonomous Database
TIMECREATED	VARCHAR2	The date and time the Autonomous Database was created
DATASTORAGESIZEINTBS	VARCHAR2	The quantity of data in the database in terabytes
LICENSEMODEL	VARCHAR2	The Oracle license model that applies to the Autonomous Database
SERVICECONSOLEURL	VARCHAR2	The URL of the Service Console for the Autonomous Database
APEXDETAILS	CLOB	Information about Oracle APEX Application Development
AREPRIMARYWHITELISTEDIPSUSED	VARCHAR2	Primary White Listed IPs
AUTONOMOUSCONTAINERDATABASEID	VARCHAR2	The Autonomous Container Database OCID
AUTONOMOUSMAINTENANCESCHEDULETYPE	VARCHAR2	Maintenance Schedule Type
AVAILABLEUPGRADEVERSIONS	VARCHAR2	List of Oracle Database versions available for a database upgrade
BACKUPCONFIG	CLOB	Autonomous Database Backup Config
CONNECTIONSTRINGS	CLOB	Autonomous Database Connection Strings
CONNECTIONURLS	CLOB	Autonomous Database Connection URLs
CPUCORECOUNT	NUMBER	The number of OCPU cores to be made available to the database
CUSTOMERCONTACTS	CLOB	The Customer Contacts
DATASAFESTATUS	VARCHAR2	Status of the Data Safe registration for this Autonomous Database
DATASTORAGESIZEINGBS	NUMBER	The quantity of data in the database in gigabytes
DBVERSION	VARCHAR2	The Oracle Database version for the Autonomous Database
DATAGUARDREGIONTYPE	VARCHAR2	The Autonomous Data Guard region type of the Autonomous Database
DBWORKLOAD	VARCHAR2	The Autonomous Database workload type
DEFINEDTAGS	CLOB	Defined tags for the resource
FAILEDDATARECOVERYINSECONDS	NUMBER	Indicates the number of seconds of data loss for an Autonomous Data Guard failover
FREEFORMTAGS	CLOB	Free form tags for the resource
INFRASTRUCTURETYPE	VARCHAR2	The infrastructure type this resource belongs to
ISACCESSCONTROLENABLED	VARCHAR2	Indicates if the database level access control is enabled
ISAUTOSCALINGENABLED	VARCHAR2	Indicates if auto scaling is enabled for the Autonomous Database
ISDATAGUARDENABLED	VARCHAR2	Indicates whether the Autonomous Database has a local Autonomous Data Guard enabled

Column	Datatype	Description
ISDEDICATED	VARCHAR2	True if the database uses dedicated Exadata infrastructure
ISFREETIER	VARCHAR2	Indicates if this is an Always Free resource
ISMTLSCONNECTIONREQUIRED	VARCHAR2	Indicates whether the Autonomous Database requires mTLS connections
ISPREVIEW	VARCHAR2	Indicates if the Autonomous Database version is a preview version
ISREFRESHABLECLONE	VARCHAR2	Indicates whether the Autonomous Database is a refreshable clone
KEYHISTORYENTRY	CLOB	Key History Entry
KEYSTOREID	VARCHAR2	The OCID of the key store
KEYSTOREWALLETNAME	VARCHAR2	The wallet name for Oracle Cloud Infrastructure Vault
KMSKEYID	VARCHAR2	The OCID of the key container that is used as the master encryption key
KMSKEYLIFECYCLEDETAILS	VARCHAR2	Customer managed key lifecycle details
LIFECYCLEDETAILS	VARCHAR2	Information about the current lifecycle state
NSGIDS	CLOB	A list of the OCIDs of the network security groups NSGs
OCPUCOUNT	NUMBER	The number of OCPU cores to be made available to the database
OPENMODE	VARCHAR2	The Autonomous Database open mode
OPERATIONSINSIGHTSSTATUS	VARCHAR2	Status of OCI Ops Insights for this Autonomous Database
PEERDBIDS	VARCHAR2	The list of OCIDs of standby databases located in Autonomous Data Guard
PERMISSIONLEVEL	CLOB	The Autonomous Database permission level
PRIVATEENDPOINT	VARCHAR2	The private endpoint for the resource
PRIVATEENDPOINTIP	VARCHAR2	The private endpoint IP address for the resource
PRIVATEENDPOINTLABEL	VARCHAR2	The private endpoint label for the resource
REFRESHABLEMODE	VARCHAR2	The refresh mode of the clone
REFRESHABLESTATUS	VARCHAR2	The refresh status of the clone
ROLE	VARCHAR2	The Autonomous Data Guard role
SOURCEID	VARCHAR2	The OCID of the source Autonomous Database that was cloned
SQLWEBDEVELOPERURL	VARCHAR2	The Database Actions (SQL Developer Web) URL for the Autonomous Database
STANDBYDB	CLOB	Autonomous Database Standby Summary
STANDBYWHITELISTEDIPS	CLOB	The client IP access control list
SUBNETID	VARCHAR2	The OCID of the subnet the resource is associated with
SUPPORTEDREGIONSTOCLONETO	CLOB	The list of regions that support the creation of Autonomous Data Guard
SYSTEMTAGS	CLOB	System tags for this resource
TIMEDATAGUARDROLECHANGED	VARCHAR2	The date and time the Autonomous Data Guard role was switched
TIMEDELETIONOFFREEAUTONOMOUSDATABASE	NUMBER	Time deletion of Free Autonomous Database
TIMELOCALDATAGUARDENABLED	VARCHAR2	The date and time that Autonomous Data Guard was enabled for the Autonomous Database

Column	Datatype	Description
TIMEMAINTENANCEBEGIN	VARCHAR2	The date and time when maintenance will begin
TIMEMAINTENANCEEND	VARCHAR2	The date and time when maintenance will end
TIMEOFLASTFAILOVER	VARCHAR2	The timestamp of the last failover operation
TIMEOFLASTREFRESH	VARCHAR2	The date and time of the last refresh
TIMEOFLASTREFRESHPOINT	VARCHAR2	The refresh point timestamp
TIMEOFLASTSWITCHOVER	VARCHAR2	The timestamp of the last switchover operation for the Autonomous Database
TIMEOFNEXTREFRESH	VARCHAR2	The date and time of next refresh
TIMERECLAMATIONOFFREEAUTONOMOUSDATABASE	VARCHAR2	The date and time the Always Free database
USEDDATASTORAGESIZEINTBS	NUMBER	The amount of storage that has been used in terabytes
VAULTID	VARCHAR2	The OCID of the Oracle Cloud Infrastructure Vault
WHITELISTEDIPS	CLOB	The client IP access control list

OCI_BUDGET_ALERT_RULES View

OCI_BUDGET_ALERT_RULES describes all the Oracle Cloud Infrastructure budget alert rules in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

Queries against this view return results only if you have budgets and budget alerts created in your tenancy.

See Budgets Overview for more information.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read usage-budgets in tenancy
```

This policy lets you list budget summary and budget alerts in your tenancy (if you created a budget and a budget alert). Optionally you can restrict the result returned by querying the view to a given compartment:

```
Allow dynamic-group <group-name> to read usage-budgets in compartment <compartment-name>
```

Column	Datatype	Description
BUDGETID	VARCHAR2	The OCID of the budget
REGION	VARCHAR2	Region name
COMPARTMENTID	VARCHAR2	The compartment ID in which the bucket is authorized
DEFINEDTAGS	CLOB	Defined tags for the resource
DESCRIPTION	VARCHAR2	The description of the alert rule
DISPLAYNAME	VARCHAR2	The name of the alert rule
FREEFORMTAGS	CLOB	Free-form tags for the resource
ID	VARCHAR2	The OCID of the alert rule
LIFECYCLESTATE	VARCHAR2	The current state of the alert rule
MESSAGE	VARCHAR2	The custom message that will be sent when the alert is triggered

Column	Datatype	Description
RECIPIENTS	VARCHAR2	The audience that receives the alert when it triggers
THRESHOLD	NUMBER	The threshold for triggering the alert
THRESHOLDTYPE	VARCHAR2	The type of threshold
TIMECREATED	VARCHAR2	The time when the budget was created
TIMEUPDATED	VARCHAR2	The time when the budget was updated
TYPE	VARCHAR2	ACTUAL or FORECAST types of alert triggers
VERSION	NUMBER	The version of the alert rule

OCI_BUDGET_SUMMARY View

OCI_BUDGET_SUMMARY describes all the Oracle Cloud Infrastructure budget summaries in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

Queries against this view return results only if you have budgets created in your tenancy.

See Budgets Overview for more information.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read usage-budgets in tenancy
```

This policy lets you list budget summary and budget alerts in your tenancy (if you created a budget and a budget alert). Optionally you can restrict the result returned by querying the view to a given compartment:

```
Allow dynamic-group <group-name> to read usage-budgets in compartment <compartment-name>
```

Column	Datatype	Description
REGION	VARCHAR2	Region name
COMPARTMENTID	VARCHAR2	The OCID of the compartment
AMOUNT	NUMBER	The amount of the budget, expressed in the currency of a rate card
DEFINEDTAGS	CLOB	Defined tags for the resource
FREEFORMTAGS	CLOB	Free-form tags for the resource
DISPLAYNAME	VARCHAR2	The display name of the budget
LIFECYCLESTATE	VARCHAR2	The current state of the budget
ACTUALSPEND	NUMBER	The actual spend in currency for the current budget cycle
ALERTRULECOUNT	NUMBER	The total number of alert rules in the budget
BUDGETPROCESSINGPERIODSTARTOFFSET	NUMBER	The number of days offset from the first day of the month, at which the budget processing period starts
DESCRIPTION	VARCHAR2	The description of the budget
FORECASTEDSPEND	NUMBER	The forecasted spend in currency by the end of the current budget cycle
ID	VARCHAR2	The OCID of the budget
RESETPERIOD	VARCHAR2	The reset period for the budget
TARGETS	CLOB	The list of targets on which the budget is applied

Column	Datatype	Description
TARGETCOMPARTMENTID	VARCHAR2	Target compartment OCID
TARGETTYPE	VARCHAR2	The type of target on which the budget is applied
TIMECREATED	VARCHAR2	The time the budget was created
TIMESPENDCOMPUTED	VARCHAR2	The time the budget spend was last computed
TIMEUPDATED	VARCHAR2	The time the budget was updated
VERSION	VARCHAR2	The version of the budget

OCI_COST_DATA View

OCI_COST_DATA describes all the Oracle Cloud Infrastructure cost data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Define tenancy usage-report as
ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhqkggq
Endorse dynamic-group <group-name> to read objects in tenancy usage-report
```

> **Note:**
>
> Do not replace the OCID in this policy with another OCID. This usage-report OCID provides the Oracle Cloud Infrastructure usage data for your tenancy.

Column	Datatype	Description
REFERENCE_NUMBER	VARCHAR2	Reference Number/Line identifier used for debugging and corrections
TENANT_ID	VARCHAR2	The identifier (OCID) for the Oracle Cloud Infrastructure tenant
INTERVAL_USAGE_START	TIMESTAMP	The start time of the usage interval for the resource in UTC
INTERVAL_USAGE_END	TIMESTAMP	The end time of the usage interval for the resource in UTC
SERVICE_NAME	VARCHAR2	The service that the resource is in
COMPARTMENT_ID	VARCHAR2	The ID of the compartment that contains the resource
COMPARTMENT_NAME	VARCHAR2	The name of the compartment that contains the resource
REGION	VARCHAR2	The region that contains the resource
AVAILABILITY_DOMAIN	VARCHAR2	The availability domain that contains the resource
RESOURCE_ID	VARCHAR2	The identifier for the resource
BILLED_QUANTITY	VARCHAR2	The quantity of the resource that has been billed over the usage interval
BILLED_QUANTITY_OVERAGE	VARCHAR2	The usage quantity for which you were billed
SUBSCRIPTION_ID	VARCHAR2	A unique identifier associated with your commitment or subscription
PRODUCT_SKU	VARCHAR2	The Part Number for the resource in the line
PRODUCT_DESCRIPTION	VARCHAR2	The product description for the resource in the line

Column	Datatype	Description
UNIT_PRICE	VARCHAR2	The cost billed to you for each unit of the resource used
UNIT_PRICE_OVERAGE	VARCHAR2	The cost per unit of usage for overage usage of a resource
MY_COST	VARCHAR2	The cost charged for this line of usage
MY_COST_OVERAGE	VARCHAR2	The cost billed for overage usage of a resource
CURRENCY_CODE	VARCHAR2	The currency code for your tenancy
BILLING_UNIT_READABLE	VARCHAR2	The unit measure associated with the usage/ billedQuantity in the line
SKU_UNIT_DESCRIPTION	VARCHAR2	The unit used for measuring billed quantity
OVERAGE_FLAG	CHAR	Flag used for overage usage
IS_CORRECTION	VARCHAR2	Used if the current line is a correction
BACK_REFERENCE_NUMBER	VARCHAR2	Data amendments and corrections reference
CREATED_BY	VARCHAR2	The user who created the service
CREATED_ON	TIMESTAMP	The time when the service was created
FREE_TIER_RETAINED	VARCHAR2	Is the service retained on free tier

OCI_OBJECTSTORAGE_BUCKETS View

OCI_OBJECTSTORAGE_BUCKETS describes all the Oracle Cloud Infrastructure object storage buckets in the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Allow dynamic-group <group-name> to read buckets in tenancy
```

This policy lets you list object storage buckets in your tenancy. Optionally you can restrict the result returned by querying this view to a given compartment:

```
Allow dynamic-group <group-name> to read buckets in compartment <compartment-name>
```

Column	Datatype	Description
REGION	VARCHAR2	Region name
COMPARTMENTID	VARCHAR2	The compartment ID in which the bucket is authorized
NAMESPACE	VARCHAR2	The Object Storage namespace in which the bucket resides
APPROXIMATECOUNT	NUMBER	The approximate number of objects in the bucket
APPROXIMATESIZE	NUMBER	The approximate total size in bytes of all objects in the bucket
AUTOTIERING	VARCHAR2	The auto tiering status on the bucket
CREATEDBY	VARCHAR2	The OCID of the user who created the bucket
DEFINEDTAGS	CLOB	Defined tags for the resource
FREEFORMTAGS	CLOB	Free-form tags for the resource
ETAG	VARCHAR2	The entity tag (ETag) for the bucket
ID	VARCHAR2	The OCID of the bucket
ISREADONLY	VARCHAR2	Whether or not this bucket is read only

Column	Datatype	Description
KMSKEYID	VARCHAR2	The OCID of a master encryption key
METADATA	VARCHAR2	Arbitrary string keys and values for user-defined metadata
NAME	VARCHAR2	The name of the bucket
OBJECTEVENTSENABLED	VARCHAR2	Whether or not events are emitted for object state changes in this bucket
OBJECTLIFECYCLEPOLICYETAG	VARCHAR2	The entity tag (ETag) for the live object lifecycle policy on the bucket
PUBLICACCESSTYPE	VARCHAR2	The type of public access enabled on this bucket
REPLICATIONENABLED	VARCHAR2	Whether or not this bucket is a replication source
STORAGETIER	VARCHAR2	The storage tier type assigned to the bucket
TIMECREATED	VARCHAR2	The date and time the bucket was created
VERSIONING	VARCHAR2	The versioning status on the bucket

OCI_USAGE_DATA View

OCI_USAGE_DATA describes all the Oracle Cloud Infrastructure usage data for the Oracle Cloud Infrastructure tenancy obtained from the current Autonomous Database instance.

> **Note:**
>
> You can use OCI usage reports and OCI_USAGE_DATA view for information on cost and usage *before* January 31st, 2025. The OCI cost and usage reports are deprecated. You can continue to access your existing usage report CSV files until July 31, 2025. See Cost and Usage Reports for more information.

To query this view you need a dynamic group that includes your Autonomous Database instance and the following policy defined on that dynamic group:

```
Define tenancy usage-report as
ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhqkggq
Endorse dynamic-group <group-name> to read objects in tenancy usage-report
```

> **Note:**
>
> Do not replace the OCID in this policy with another OCID. This usage-report OCID provides the Oracle Cloud Infrastructure cost and usage data for your tenancy.

Column	Datatype	Description
REFERENCE_NUMBER	VARCHAR2	Reference Number/Line identifier used for debugging and corrections
TENANT_ID	VARCHAR2	The identifier (OCID) for the Oracle Cloud Infrastructure tenant
INTERVAL_USAGE_START	TIMESTAMP	The start time of the usage interval for the resource in UTC

Column	Datatype	Description
INTERVAL_USAGE_END	TIMESTAMP	The end time of the usage interval for the resource in UTC
SERVICE_NAME	VARCHAR2	The service that the resource is in
RESOURCE_NAME	VARCHAR2	The resource name used by the metering system
COMPARTMENT_ID	VARCHAR2	The ID of the compartment that contains the resource
COMPARTMENT_NAME	VARCHAR2	The name of the compartment that contains the resource
REGION	VARCHAR2	The region that contains the resource
AVAILABILITY_DOMAIN	VARCHAR2	The availability domain that contains the resource
RESOURCE_ID	VARCHAR2	The identifier for the resource
CONSUMED_QUANTITY	VARCHAR2	The quantity of the resource that has been consumed over the usage interval
BILLED_QUANTITY	VARCHAR2	The quantity of the resource that has been billed over the usage interval
CONSUMED_QUANTITY_UNITS	VARCHAR2	The unit for the consumed quantity and billed quantity
CONSUMED_QUANTITY_MEASURE	VARCHAR2	The measure for the consumed quantity and billed quantity
IS_CORRECTION	VARCHAR2	Used if the current line is a correction
BACK_REFERENCE_NUMBER	VARCHAR2	Data amendments and corrections reference
CREATED_BY	VARCHAR2	The user who created the service
CREATED_ON	TIMESTAMP	The time when the service was created
FREE_TIER_RETAINED	VARCHAR2	Is the service retained on free tier

Pipeline Views

Lists details for the DBMS_CLOUD_PIPELINE views.

- DBA_CLOUD_PIPELINES View
  DBA_CLOUD_PIPELINES displays the list of pipelines created in the database. The view contains one row for each pipeline.
- USER_CLOUD_PIPELINES View
  USER_CLOUD_PIPELINES displays the list of pipelines created in the database for the user. The view contains one row for each pipeline.
- DBA_CLOUD_PIPELINE_HISTORY View
  DBA_CLOUD_PIPELINE_HISTORY lists the pipeline scheduled jobs in the database. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.
- USER_CLOUD_PIPELINE_HISTORY View
  USER_CLOUD_PIPELINE_HISTORY lists the pipeline scheduled jobs in the database for the user. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.
- DBA_CLOUD_PIPELINE_ATTRIBUTES View
  DBA_CLOUD_PIPELINE_ATTRIBUTES lists the attributes of a pipelines in the database. Attributes control the configuration and behavior of the pipeline jobs.
- USER_CLOUD_PIPELINE_ATTRIBUTES View
  USER_CLOUD_PIPELINE_ATTRIBUTES lists the attributes of a pipelines in the database for the user. Attributes control the configuration and behavior of the pipeline.

DBA_CLOUD_PIPELINES View

DBA_CLOUD_PIPELINES displays the list of pipelines created in the database. The view contains one row for each pipeline.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the pipeline
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: LOAD or EXPORT
STATUS	VARCHAR2(7)	NOT NULL	Current status of pipeline: STARTED or STOPPED
DESCRIPTION	VARCHAR2(4000)		User specified description for the pipeline.
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation time for the pipeline.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline.
LAST_EXECUTION	TIMESTAMP(6) WITH TIME ZONE		Last successful execution time of pipeline job.
OPERATION_ID	NUMBER		Is the Operation ID for use with pipeline logs. See Monitor and Troubleshoot Pipelines for information on the USER_LOAD_OPERATIONS view for more information on data load operations.
STATUS_TABLE	VARCHAR2(128)		Status Table for pipeline progress. This is applicable for Load Pipelines.
ORACLE_MAINTAINED	CHAR(1)	NOT NULL	Indicates whether pipeline is Oracle maintained (Y) or not (N).

USER_CLOUD_PIPELINES View

USER_CLOUD_PIPELINES displays the list of pipelines created in the database for the user. The view contains one row for each pipeline.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: LOAD or EXPORT
STATUS	VARCHAR2(7)	NOT NULL	Current status of pipeline: STARTED or STOPPED
DESCRIPTION	VARCHAR2(4000)		User specified description for the pipeline.
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation time for the pipeline.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline.
LAST_EXECUTION	TIMESTAMP(6) WITH TIME ZONE		Last successful execution time of pipeline job.

Column	Datatype	NULL	Description
OPERATION_ID	NUMBER		Is the Operation ID for use with pipeline logs. See Monitor and Troubleshoot Pipelines for information on the USER_LOAD_OPERATIONS view for more information on data load operations.
STATUS_TABLE	VARCHAR2(128)		Status Table for pipeline progress. This is applicable for Load Pipelines.
ORACLE_MAINTAINED	CHAR(1)	NOT NULL	Indicates whether pipeline is Oracle maintained (Y) or not (N).

DBA_CLOUD_PIPELINE_HISTORY View

DBA_CLOUD_PIPELINE_HISTORY lists the pipeline scheduled jobs in the database. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the pipeline.
PIPELINE_TYPE	VARCHAR2(7)		Type of pipeline: LOAD or EXPORT
JOB_ID	NUMBER	NOT NULL	Unique ID for the pipeline job execution.
JOB_NAME	VARCHAR2(1044)		Unique job name for the pipeline execution.
STATUS	VARCHAR2(30)		Status of the pipeline job.
START_DATE	TIMESTAMP(9) WITH TIME ZONE		Start time of the pipeline job execution.
END_DATE	TIMESTAMP(9) WITH TIME ZON		End time of the pipeline job execution.
INSTANCE_ID	NUMBER		Instance ID where the pipeline job ran.
SESSION_ID	VARCHAR2(128)		Session ID for the job session.
ERROR_NUMBER	NUMBER		Error number in the job (if encountered).
ERROR_MESSAGE	VARCHAR2(4000)		Error message in the job (if encountered).
CPU_USED	INTERVAL DAY(3) TO SECOND(2)		Number of CPU used by the pipeline job run.
JOB_OUTPUT	CLOB		Debug output of the pipeline job run.

USER_CLOUD_PIPELINE_HISTORY View

USER_CLOUD_PIPELINE_HISTORY lists the pipeline scheduled jobs in the database for the user. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.

Column	Data Type	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline
PIPELINE_TYPE	VARCHAR2(7)		Type of pipeline: LOAD or EXPORT
JOB_ID	NUMBER	NOT NULL	Unique ID for the pipeline job execution.
JOB_NAME	VARCHAR2(1044)		Unique job name for the pipeline execution.

Column	Data Type	NULL	Description
STATUS	VARCHAR2(30)		Status of the pipeline job.
START_DATE	TIMESTAMP(9) WITH TIME ZONE		Start time of the pipeline job execution.
END_DATE	TIMESTAMP(9) WITH TIME ZON		End time of the pipeline job execution.
INSTANCE_ID	NUMBER		Instance ID where the pipeline job ran.
SESSION_ID	VARCHAR2(128)		Session ID for the job session.
ERROR_NUMBER	NUMBER		Error number in the job (if encountered).
ERROR_MESSAGE	VARCHAR2(4000)		Error message in the job (if encountered).
CPU_USED	INTERVAL DAY(3) TO SECOND(2)		Number of CPU used by the pipeline job run.
JOB_OUTPUT	CLOB		Debug output of the pipeline job run.

DBA_CLOUD_PIPELINE_ATTRIBUTES View

DBA_CLOUD_PIPELINE_ATTRIBUTES lists the attributes of a pipelines in the database. Attributes control the configuration and behavior of the pipeline jobs.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the pipeline
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: LOAD or EXPORT
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline attribute.
ATTRIBUTE_VALUE	CLOB		Value of the pipeline attribute.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline attribute.

USER_CLOUD_PIPELINE_ATTRIBUTES View

USER_CLOUD_PIPELINE_ATTRIBUTES lists the attributes of a pipelines in the database for the user. Attributes control the configuration and behavior of the pipeline.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: LOAD or EXPORT
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline attribute.
ATTRIBUTE_VALUE	CLOB		Value of the pipeline attribute.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline attribute.

Pipeline Views

Lists details for the DBMS_CLOUD_PIPELINE views.

- DBA_CLOUD_PIPELINES View
  DBA_CLOUD_PIPELINES displays the list of pipelines created in the database. The view contains one row for each pipeline.
- USER_CLOUD_PIPELINES View
  USER_CLOUD_PIPELINES displays the list of pipelines created in the database for the user. The view contains one row for each pipeline.
- DBA_CLOUD_PIPELINE_HISTORY View
  DBA_CLOUD_PIPELINE_HISTORY lists the pipeline scheduled jobs in the database. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.
- USER_CLOUD_PIPELINE_HISTORY View
  USER_CLOUD_PIPELINE_HISTORY lists the pipeline scheduled jobs in the database for the user. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.
- DBA_CLOUD_PIPELINE_ATTRIBUTES View
  DBA_CLOUD_PIPELINE_ATTRIBUTES lists the attributes of a pipelines in the database. Attributes control the configuration and behavior of the pipeline jobs.
- USER_CLOUD_PIPELINE_ATTRIBUTES View
  USER_CLOUD_PIPELINE_ATTRIBUTES lists the attributes of a pipelines in the database for the user. Attributes control the configuration and behavior of the pipeline.

DBA_CLOUD_PIPELINES View

DBA_CLOUD_PIPELINES displays the list of pipelines created in the database. The view contains one row for each pipeline.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the pipeline
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: LOAD or EXPORT
STATUS	VARCHAR2(7)	NOT NULL	Current status of pipeline: STARTED or STOPPED
DESCRIPTION	VARCHAR2(4000)		User specified description for the pipeline.
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation time for the pipeline.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline.
LAST_EXECUTION	TIMESTAMP(6) WITH TIME ZONE		Last successful execution time of pipeline job.
OPERATION_ID	NUMBER		Is the Operation ID for use with pipeline logs. See Monitor and Troubleshoot Pipelines for information on the USER_LOAD_OPERATIONS view for more information on data load operations.
STATUS_TABLE	VARCHAR2(128)		Status Table for pipeline progress. This is applicable for Load Pipelines.
ORACLE_MAINTAINED	CHAR(1)	NOT NULL	Indicates whether pipeline is Oracle maintained (Y) or not (N).

USER_CLOUD_PIPELINES View

USER_CLOUD_PIPELINES displays the list of pipelines created in the database for the user. The view contains one row for each pipeline.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: LOAD or EXPORT
STATUS	VARCHAR2(7)	NOT NULL	Current status of pipeline: STARTED or STOPPED
DESCRIPTION	VARCHAR2(4000)		User specified description for the pipeline.
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation time for the pipeline.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline.
LAST_EXECUTION	TIMESTAMP(6) WITH TIME ZONE		Last successful execution time of pipeline job.
OPERATION_ID	NUMBER		Is the Operation ID for use with pipeline logs. See Monitor and Troubleshoot Pipelines for information on the USER_LOAD_OPERATIONS view for more information on data load operations.
STATUS_TABLE	VARCHAR2(128)		Status Table for pipeline progress. This is applicable for Load Pipelines.
ORACLE_MAINTAINED	CHAR(1)	NOT NULL	Indicates whether pipeline is Oracle maintained (Y) or not (N).

DBA_CLOUD_PIPELINE_HISTORY View

DBA_CLOUD_PIPELINE_HISTORY lists the pipeline scheduled jobs in the database. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the pipeline.
PIPELINE_TYPE	VARCHAR2(7)		Type of pipeline: LOAD or EXPORT
JOB_ID	NUMBER	NOT NULL	Unique ID for the pipeline job execution.
JOB_NAME	VARCHAR2(1044)		Unique job name for the pipeline execution.
STATUS	VARCHAR2(30)		Status of the pipeline job.
START_DATE	TIMESTAMP(9) WITH TIME ZONE		Start time of the pipeline job execution.
END_DATE	TIMESTAMP(9) WITH TIME ZON		End time of the pipeline job execution.
INSTANCE_ID	NUMBER		Instance ID where the pipeline job ran.
SESSION_ID	VARCHAR2(128)		Session ID for the job session.
ERROR_NUMBER	NUMBER		Error number in the job (if encountered).

Column	Datatype	NULL	Description
ERROR_MESSAGE	VARCHAR2(4000)		Error message in the job (if encountered).
CPU_USED	INTERVAL DAY(3) TO SECOND(2)		Number of CPU used by the pipeline job run.
JOB_OUTPUT	CLOB		Debug output of the pipeline job run.

USER_CLOUD_PIPELINE_HISTORY View

USER_CLOUD_PIPELINE_HISTORY lists the pipeline scheduled jobs in the database for the user. Use this view to monitor the health of the pipeline and detect failures in pipeline job runs.

Column	Data Type	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline
PIPELINE_TYPE	VARCHAR2(7)		Type of pipeline: LOAD or EXPORT
JOB_ID	NUMBER	NOT NULL	Unique ID for the pipeline job execution.
JOB_NAME	VARCHAR2(1044)		Unique job name for the pipeline execution.
STATUS	VARCHAR2(30)		Status of the pipeline job.
START_DATE	TIMESTAMP(9) WITH TIME ZONE		Start time of the pipeline job execution.
END_DATE	TIMESTAMP(9) WITH TIME ZON		End time of the pipeline job execution.
INSTANCE_ID	NUMBER		Instance ID where the pipeline job ran.
SESSION_ID	VARCHAR2(128)		Session ID for the job session.
ERROR_NUMBER	NUMBER		Error number in the job (if encountered).
ERROR_MESSAGE	VARCHAR2(4000)		Error message in the job (if encountered).
CPU_USED	INTERVAL DAY(3) TO SECOND(2)		Number of CPU used by the pipeline job run.
JOB_OUTPUT	CLOB		Debug output of the pipeline job run.

DBA_CLOUD_PIPELINE_ATTRIBUTES View

DBA_CLOUD_PIPELINE_ATTRIBUTES lists the attributes of a pipelines in the database. Attributes control the configuration and behavior of the pipeline jobs.

Column	Datatype	NULL	Description
PIPELINE_ID	NUMBER	NOT NULL	Unique number assigned to the pipeline.
PIPELINE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline.
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the pipeline
PIPELINE_TYPE	VARCHAR2(7)	NOT NULL	Type of pipeline: LOAD or EXPORT
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the pipeline attribute.
ATTRIBUTE_VALUE	CLOB		Value of the pipeline attribute.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the pipeline attribute.

USER_CLOUD_PIPELINE_ATTRIBUTES View

`USER_CLOUD_PIPELINE_ATTRIBUTES` lists the attributes of a pipelines in the database for the user. Attributes control the configuration and behavior of the pipeline.

Column	Datatype	NULL	Description
`PIPELINE_ID`	`NUMBER`	`NOT NULL`	Unique number assigned to the pipeline.
`PIPELINE_NAME`	`VARCHAR2(128)`	`NOT NULL`	Name of the pipeline.
`PIPELINE_TYPE`	`VARCHAR2(7)`	`NOT NULL`	Type of pipeline: `LOAD` or `EXPORT`
`ATTRIBUTE_NAME`	`VARCHAR2(128)`	`NOT NULL`	Name of the pipeline attribute.
`ATTRIBUTE_VALUE`	`CLOB`		Value of the pipeline attribute.
`LAST_MODIFIED`	`TIMESTAMP(6) WITH TIME ZONE`	`NOT NULL`	Last modification time for the pipeline attribute.

DBMS_CLOUD_AI Views

The `DBMS_CLOUD_AI` package uses the following views.

- DBA_CLOUD_AI_PROFILES View
- USER_CLOUD_AI_PROFILES View
- DBA_CLOUD_AI_PROFILE_ATTRIBUTES View
- USER_CLOUD_AI_PROFILE_ATTRIBUTES View
- DBA_CLOUD_VECTOR _INDEXES View
- USER_CLOUD_VECTOR _INDEXES View
- DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES View
- USER_CLOUD_VECTOR_INDEX_ATTRIBUTES View

> **See Also:**

> Use Select AI for Natural Language Interaction with your Database

DBA_CLOUD_AI_PROFILES View

The list of profiles created in the current database can be obtained by querying `DBA_CLOUD_AI_PROFILES`. The view displays the details of AI profiles in the database.

Only the ADMIN user is privileged to access `DBA_CLOUD_AI_PROFILES`. You cannot grant access to other users.

Column	Datatype	NULL	Description
`PROFILE_ID`	`NUMBER`	`NOT NULL`	Unique number assigned to the AI profile
`PROFILE_NAME`	`VARCHAR2(128)`	`NOT NULL`	Name of the AI profile
`OWNER`	`VARCHAR2(128)`	`NOT NULL`	Owner schema of the AI profile
`STATUS`	`VARCHAR2(7)`	`NOT NULL`	Current status of AI profile - `ENABLED` or `DISABLED`

Column	Datatype	NULL	Description
DESCRIPTION	VARCHAR2(4000)	NOT NULL	User specified description for the AI profile
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation time for the AI profile.
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the AI profile

USER_CLOUD_AI_PROFILES View

The list of profiles created in the current database can be obtained by querying USER_CLOUD_AI_PROFILES. The view displays the details of AI profiles in your schema.

Only the user is privileged to access USER_CLOUD_AI_PROFILES. You cannot grant access to other users.

Column	Datatype	NULL	Description
PROFILE_ID	NUMBER	NOT NULL	Unique number assigned to the AI profile
PROFILE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile
STATUS	VARCHAR2(7)	NOT NULL	Current status of AI profile - ENABLED or DISABLED
DESCRIPTION	VARCHAR2(4000)	-	User specified description for the AI profile
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation time for the AI profile
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time for the AI profile

The following example displays a sample output from USER_CLOUD_AI_PROFILE view:

```
select PROFILE_NAME, STATUS from USER_CLOUD_AI_PROFILES;

PROFILE_NAME    STATUS
-------------    ---------
OPENAI         ENABLED
GENAI         ENABLED
```

DBA_CLOUD_AI_PROFILE_ATTRIBUTES View

Attributes of AI profile manage the configuration and behavior of the AI profile. The view displays details of all AI profiles in the database.

Only the ADMIN user is privileged to access DBA_CLOUD_AI_PROFILE_ATTRIBUTES. You cannot grant access to other users.

Column	Datatype	NULL	Description
PROFILE_ID	NUMBER	NOT NULL	Unique number assigned to the AI profile
PROFILE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the AI profile
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile attribute
ATTRIBUTE_VALUE	CLOB	-	Value of the AI profile attribute

Column	Datatype	NULL	Description
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time of the AI profile attribute

USER_CLOUD_AI_PROFILE_ATTRIBUTES View

Attributes of AI profile manage the configuration and behavior of the AI profile. The view displays details of AI profiles in your schema.

Only the user is privileged to access `USER_CLOUD_AI_PROFILE_ATTRIBUTES`. You cannot grant access to other users.

Column	Datatype	NULL	Description
PROFILE_ID	NUMBER	NOT NULL	Unique number assigned to the AI profile
PROFILE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the AI profile attribute
ATTRIBUTE_VALUE	CLOB	-	Value of the AI profile attribute
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification time of the AI profile attribute

The following is an example of a sample output from querying `USER_CLOUD_AI_PROFILE_ATTRIBUTES`:

```
PROFILE_ID    PROFILE_NAME    ATTRIBUTE_NAME        ATTRIBUTE_VALUE
LAST_MODIFIED

DBA_CLOUD_VECTOR _INDEXES View

You can obtain a list of vector indexes created in the current database by querying `DBA_CLOUD_VECTOR_INDEXES`. The view displays the details of all available vector indexes in the entire database.

Only the administrator is privileged to access `DBA_CLOUD_VECTOR_INDEXES`. You cannot grant access to other users.

Column	Datatype	NULL	Description
INDEX_ID	NUMBER	NOT NULL	Unique number assigned to the index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the index
STATUS	VARCHAR2(7)	-	Current status of index: ENABLED or DISABLED
DESCRIPTION	CLOB	-	User specified description for the index
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation date and time of the index
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the index

USER_CLOUD_VECTOR _INDEXES View

You can obtain a list of vector indexes you created in the current database by querying USER_CLOUD_VECTOR_INDEXES. The view displays the details of all vector indexes that you created in your schema or a PDB.

You have the privilege to access USER_CLOUD_VECTOR_INDEXES. You cannot grant access to other users.

Column	Datatype	NULL	Description
INDEX_ID	NUMBER	NOT NULL	Unique number assigned to the index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the index
STATUS	VARCHAR2(7)	-	Current status of index: ENABLED or DISABLED
DESCRIPTION	VARCHAR2(4000)	-	User specified description for the index
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation date and time of the index
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the index

DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES View

Query the DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES view to display details about the attributes of vector indexes across the entire database. Attributes of the view manage the configuration and behavior of the vector index.

Only the administrator is privileged to access DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES. You cannot grant access to other users.

Column	Datatype	NULL	Description
INDEX_ID	NUMBER	NOT NULL	Unique number assigned to the vector index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the vector index
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index attribute
ATTRIBUTE_VALUE	CLOB	-	Value for the vector index attribute_name
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the vector index

USER_CLOUD_VECTOR_INDEX_ATTRIBUTES View

Query the `USER_CLOUD_VECTOR_INDEX_ATTRIBUTES` view to display details about the attributes of vector indexes that you created in your schema or PDB. Attributes of the view manage the configuration and behavior of the vector index.

You have the privilege to access `USER_CLOUD_VECTOR_INDEX_ATTRIBUTES`. You cannot grant access to other users.

Column	Datatype	NULL	Description
INDEX_ID	NUMBER	NOT NULL	Unique number assigned to the vector index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index attribute
ATTRIBUTE_VALUE	CLOB	-	Value for the vector index `attribute_name`
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the vector index

DBMS_CLOUD_AI Views

The `DBMS_CLOUD_AI` package uses the following views.

- DBA_CLOUD_AI_PROFILES View
- USER_CLOUD_AI_PROFILES View
- DBA_CLOUD_AI_PROFILE_ATTRIBUTES View
- USER_CLOUD_AI_PROFILE_ATTRIBUTES View
- DBA_CLOUD_VECTOR _INDEXES View
- USER_CLOUD_VECTOR _INDEXES View
- DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES View
- USER_CLOUD_VECTOR_INDEX_ATTRIBUTES View

STATUS	VARCHAR2(7)	-	Current status of index: ENABLED or DISABLED
DESCRIPTION	VARCHAR2(4000)	-	User specified description for the index
CREATED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Creation date and time of the index
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the index

DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES View

Query the DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES view to display details about the attributes of vector indexes across the entire database. Attributes of the view manage the configuration and behavior of the vector index.

Only the administrator is privileged to access DBA_CLOUD_VECTOR_INDEX_ATTRIBUTES. You cannot grant access to other users.

Column	Datatype	NULL	Description
INDEX_ID	NUMBER	NOT NULL	Unique number assigned to the vector index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index
OWNER	VARCHAR2(128)	NOT NULL	Owner schema of the vector index
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index attribute
ATTRIBUTE_VALUE	CLOB	-	Value for the vector index attribute_name

Column	Datatype	NULL	Description
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the vector index

USER_CLOUD_VECTOR_INDEX_ATTRIBUTES View

Query the USER_CLOUD_VECTOR_INDEX_ATTRIBUTES view to display details about the attributes of vector indexes that you created in your schema or PDB. Attributes of the view manage the configuration and behavior of the vector index.

You have the privilege to access USER_CLOUD_VECTOR_INDEX_ATTRIBUTES. You cannot grant access to other users.

Column	Datatype	NULL	Description
INDEX_ID	NUMBER	NOT NULL	Unique number assigned to the vector index
INDEX_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index
ATTRIBUTE_NAME	VARCHAR2(128)	NOT NULL	Name of the vector index attribute
ATTRIBUTE_VALUE	CLOB	-	Value for the vector index attribute_name
LAST_MODIFIED	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Last modification date and time of the vector index

DBMS_CLOUD_FUNCTION Views

The DBMS_CLOUD_FUNCTION package uses the following views.

- DBA_CLOUD_FUNCTION View
  The DBA_CLOUD_FUNCTION view lists all the functions created in your Autonomous Database.
- DBA_CLOUD_FUNCTION_CATALOG View
  The DBA_CLOUD_FUNCTION_CATALOG view lists all the catalogs created in an Autonomous Database instance.
- USER_CLOUD_FUNCTION View
  The USER_CLOUD_FUNCTION view lists all the functions created by the user.
- USER_CLOUD_FUNCTION_CATALOG View
  The USER_CLOUD_FUNCTION_CATALOG view lists all the catalogs created by the user.
- USER_CLOUD_FUNCTION_ERRORS View
  The USER_CLOUD_FUNCTION_ERRORS view lists the errors generated during the connection validation to the remote library location.

DBA_CLOUD_FUNCTION View

The DBA_CLOUD_FUNCTION view lists all the functions created in your Autonomous Database.

Column	Datatype	Description
OWNER	VARCHAR2(128)	Owner of the catalog
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
APPLICATION_ID	VARCHAR2(2000)	OCI Application ID or Azure Application ID

Column	Datatype	Description
CLOUD_FUNCTION_NAME	VARCHAR2(128)	Remote cloud function name
FUNCTION_NAME	VARCHAR2(128)	Function Name
FUNCTION_ID	VARCHAR2(2000)	OCI Function ID or AWS Function ARN or Azure Function ID or GCP Function ID
API_TYPE	VARCHAR2(128)	API type (Function or procedure)

DBA_CLOUD_FUNCTION_CATALOG View

The DBA_CLOUD_FUNCTION_CATALOG view lists all the catalogs created in an Autonomous Database instance.

Column	Datatype	Description
OWNER	VARCHAR2(128)	Owner of the catalog
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
CLOUD_PROVIDER	VARCHAR2(128)	OCI or AWS or Azure or GCP

USER_CLOUD_FUNCTION View

The USER_CLOUD_FUNCTION view lists all the functions created by the user.

Column	Datatype	Description
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
APPLICATION_NAME	VARCHAR2(128)	OCI Application Name
APPLICATION_ID	VARCHAR2(2000)	OCI Application ID or Azure Application ID
CLOUD_FUNCTION_NAME	VARCHAR2(128)	Remote cloud function name
FUNCTION_NAME	VARCHAR2(128)	Function Name
FUNCTION_ID	VARCHAR2(2000)	OCI Function ID or AWS Function ARN or Azure Function ID or GCP Function ID
API_TYPE	VARCHAR2(128)	API type (Function or procedure)

USER_CLOUD_FUNCTION_CATALOG View

The USER_CLOUD_FUNCTION_CATALOG view lists all the catalogs created by the user.

Column	Datatype	Description
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
CLOUD_PROVIDER	VARCHAR2(128)	OCI or AWS or Azure or GCP

USER_CLOUD_FUNCTION_ERRORS View

The USER_CLOUD_FUNCTION_ERRORS view lists the errors generated during the connection validation to the remote library location.

Column	Datatype	Description
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
CREATE_TIMESTAMP	TIMESTAMP	Timestamp when error was generated
log_error_msg	CLOB	The error message

DBMS_CLOUD_FUNCTION Views

The DBMS_CLOUD_FUNCTION package uses the following views.

- DBA_CLOUD_FUNCTION View
  The DBA_CLOUD_FUNCTION view lists all the functions created in your Autonomous Database.
- DBA_CLOUD_FUNCTION_CATALOG View
  The DBA_CLOUD_FUNCTION_CATALOG view lists all the catalogs created in an Autonomous Database instance.
- USER_CLOUD_FUNCTION View
  The USER_CLOUD_FUNCTION view lists all the functions created by the user.
- USER_CLOUD_FUNCTION_CATALOG View
  The USER_CLOUD_FUNCTION_CATALOG view lists all the catalogs created by the user.
- USER_CLOUD_FUNCTION_ERRORS View
  The USER_CLOUD_FUNCTION_ERRORS view lists the errors generated during the connection validation to the remote library location.

DBA_CLOUD_FUNCTION View

The DBA_CLOUD_FUNCTION view lists all the functions created in your Autonomous Database.

Column	Datatype	Description
OWNER	VARCHAR2(128)	Owner of the catalog
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
APPLICATION_ID	VARCHAR2(2000)	OCI Application ID or Azure Application ID
CLOUD_FUNCTION_NAME	VARCHAR2(128)	Remote cloud function name
FUNCTION_NAME	VARCHAR2(128)	Function Name
FUNCTION_ID	VARCHAR2(2000)	OCI Function ID or AWS Function ARN or Azure Function ID or GCP Function ID
API_TYPE	VARCHAR2(128)	API type (Function or procedure)

DBA_CLOUD_FUNCTION_CATALOG View

The DBA_CLOUD_FUNCTION_CATALOG view lists all the catalogs created in an Autonomous Database instance.

Column	Datatype	Description
OWNER	VARCHAR2(128)	Owner of the catalog
CATALOG_NAME	VARCHAR2(128)	Name of the catalog
CLOUD_PROVIDER	VARCHAR2(128)	OCI or AWS or Azure or GCP

USER_CLOUD_FUNCTION View

The `USER_CLOUD_FUNCTION` view lists all the functions created by the user.

Column	Datatype	Description
`CATALOG_NAME`	`VARCHAR2(128)`	Name of the catalog
`APPLICATION_NAME`	`VARCHAR2(128)`	OCI Application Name
`APPLICATION_ID`	`VARCHAR2(2000)`	OCI Application ID or Azure Application ID
`CLOUD_FUNCTION_NAME`	`VARCHAR2(128)`	Remote cloud function name
`FUNCTION_NAME`	`VARCHAR2(128)`	Function Name
`FUNCTION_ID`	`VARCHAR2(2000)`	OCI Function ID or AWS Function ARN or Azure Function ID or GCP Function ID
`API_TYPE`	`VARCHAR2(128)`	API type (Function or procedure)

USER_CLOUD_FUNCTION_CATALOG View

The `USER_CLOUD_FUNCTION_CATALOG` view lists all the catalogs created by the user.

Column	Datatype	Description
`CATALOG_NAME`	`VARCHAR2(128)`	Name of the catalog
`CLOUD_PROVIDER`	`VARCHAR2(128)`	OCI or AWS or Azure or GCP

USER_CLOUD_FUNCTION_ERRORS View

The `USER_CLOUD_FUNCTION_ERRORS` view lists the errors generated during the connection validation to the remote library location.

Column	Datatype	Description
`CATALOG_NAME`	`VARCHAR2(128)`	Name of the catalog
`CREATE_TIMESTAMP`	`TIMESTAMP`	Timestamp when error was generated
`log_error_msg`	`CLOB`	The error message

DBMS_CLOUD_LINK Views

The `DBMS_CLOUD_LINK` package uses the following views.

- DBA_CLOUD_LINK_ACCESS and ALL_CLOUD_LINK_ACCESS Views
- DBA_CLOUD_LINK_AUTHORIZATIONS View
- DBA_CLOUD_LINK_PRIVS and USER_CLOUD_LINK_PRIVS Views
- DBA_CLOUD_LINK_REGISTRATIONS and ALL_CLOUD_LINK_REGISTRATIONS Views
- DBA_CLOUD_LINK_SERVICE_MAPPINGS View
- V$CLOUD_LINK_ACCESS_STATS and GV$CLOUD_LINK_ACCESS_STATS Views

DBA_CLOUD_LINK_ACCESS and ALL_CLOUD_LINK_ACCESS Views

Displays details of the registered data sets an Autonomous Database instance is allowed to access.

Only the ADMIN user and users with the `PDB_DBA` role are privileged to access `DBA_CLOUD_LINK_ACCESS`. You cannot grant access to other users.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set.
NAME	VARCHAR2(128)	NOT NULL	Name of registered data set.
CREATED	TIMESTAMP(6)	NOT NULL	Time/Date when the data set was created.
LAST_MODIFIED	TIMESTAMP(6)	NOT NULL	Time when metadata of data set was last modified
AUTHORIZATION_REQUIRED	VARCHAR2(1)	NOT NULL	Data set requires additional authorization. Possible values are: "T" or "F".
DATA_SET_OWNER	VARCHAR2(128)	NULL	Data set owner.

DBA_CLOUD_LINK_AUTHORIZATIONS View

Displays details of which databases are authorized to access data sets. This applies to data sets that require additional authorization.

Only the ADMIN user and users with the `PDB_DBA` role are privileged to access `DBA_CLOUD_LINK_AUTHORIZATIONS`. You cannot grant access to other users.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set.
NAME	VARCHAR2(128)	NOT NULL	Name of registered data set.
CLOUD_LINK_DATABASE_ID	VARCHAR2(40)	NOT NULL	Database ID of database that has been authorized for access.

DBA_CLOUD_LINK_PRIVS and USER_CLOUD_LINK_PRIVS Views

Displays details of the Cloud Link specific privileges, `REGISTER`, `READ`, `AUTHORIZE`, granted to specific users or to the current user.
`USER_CLOUD_LINK_PRIVS` columns are the same as those in `DBA_CLOUD_LINK_PRIVS`. (except for `GRANTEE`).

Only the ADMIN user and users with the `PDB_DBA` role are privileged to read from `DBA_CLOUD_LINK_PRIVS`. You cannot grant access to other users.

The privilege to read from `USER_CLOUD_LINK_PRIVS` view is granted to the ADMIN user, to the `PDB_DBA` role, and to the role `DWROLE`.

Column	Datatype	NULL	Description
GRANTEE	VARCHAR2(128)	NOT NULL	Name of user to whom privilege is granted. This column is not available in `USER_CLOUD_LINK_PRIVS`.

Column	Datatype	NULL	Description
PRIVILEGE	VARCHAR2(9)	NOT NULL	Privilege, one of: REGISTER, READ, AUTHORIZE, granted to user.
SCOPE	VARCHAR2(14)	NOT NULL	Scope of the privilege.

DBA_CLOUD_LINK_REGISTRATIONS and ALL_CLOUD_LINK_REGISTRATIONS Views

Displays details of all the data set registrations on an Autonomous Database instance.

Only the ADMIN user and users with the PDB_DBA role are privileged to access DBA_CLOUD_LINK_REGISTRATIONS. You cannot grant access to other users.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set.
NAME	VARCHAR2(128)	NOT NULL	Name of registered data set.
ID	RAW(16)	NOT NULL	Unique ID of registered data set.
OWNER	VARCHAR2(128)	NOT NULL	Owner of object (table or view owner).
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of object.
SCOPE	CLOB	NOT NULL	JSON document with details of who is allowed to access the registered data set.
DESCRIPTION	CLOB	NOT NULL	Description of registered data set.
CREATED	TIMESTAMP(6)	NOT NULL	Time/Date when the data set was created.
LAST_MODIFIED	TIMESTAMP(6)	NOT NULL	Time when metadata of data set was last modified
AUTHORIZATION_REQUIRED	VARCHAR2(1)	NOT NULL	Data set requires additional authorization. Possible values are: "T" or "F".
DATA_SET_OWNER	VARCHAR2(128)	NULL	Data set owner.

DBA_CLOUD_LINK_SERVICE_MAPPINGS View

Displays details of all service mappings for Cloud Links consumer databases. Each service mapping consists of a Cloud Link database ID and a database service.

Only the ADMIN user and users with the PDB_DBA role are privileged to access DBA_CLOUD_LINK_SERVICE_MAPPINGS. You cannot grant access to other users.

Column	Datatype	NULL	Description
CLOUD_LINK_DATABASE_ID	VARCHAR2(40)	NOT NULL	Database Identifier of consumer database or "ANY".
SERVICE_NAME	VARCHAR2(10)	NULL	Database service name (HIGH, MEDIUM, or LOW).

V$CLOUD_LINK_ACCESS_STATS and GV$CLOUD_LINK_ACCESS_STATS Views

Displays access to each registered data set owned by an Autonomous Database instance.

V$CLOUD_LINK_ACCESS_STATS tracks the elapsed time, DB CPU time, the number of rows retrieved, the number of executions, and the unique database identifier of the database accessing a registered data set.

In addition to the V$CLOUD_LINK_ACCESS_STATS information, the GV$CLOUD_LINK_ACCESS_STATS view contains an extra column named INST_ID of data type NUMBER. The INST_ID column displays the instance from which the associated V$ view information was obtained. The INST_ID column can be used as a filter to retrieve V$CLOUD_LINK_ACCESS_STATS information from a subset of available instances.

The unique database identifier does not disclose the OCIDs (Tenancy, Compartment, Database). This information can be used for auditing an Autonomous Database.

Column	Datatype	NULL	Description
INST_ID	NUMBER	NOT NULL	Instance ID
OWNER	VARCHAR2(128)	NOT NULL	Owner of object(table or view owner)
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of object
DATA_SET_NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set
DATA_SET_NAME	VARCHAR2(128)	NOT NULL	Name of registered data set
SQL_ID	VARCHAR2(13)	NOT NULL	SQL ID of local SQL accessing a registered data set
LAST_ACTIVE_TIME	DATE	NOT NULL	Time when local SQL was last active
CLOUD_LINK_DATABASE_ID	VARCHAR2(512)	NOT NULL	Database identifier of database accessing a registered data set
ELAPSED_TIME	NUMBER	NOT NULL	Elapsed time (in microseconds) of local SQL
CPU_TIME	NUMBER	NOT NULL	CPU time (in microseconds) of local SQL
USER_IO_WAIT_TIME	NUMBER	NOT NULL	User I/O Wait time (in microseconds) of local SQL
EXECUTIONS	NUMBER	NOT NULL	Number of executions of local SQL
FETCHES	NUMBER	NOT NULL	Number of fetches of local SQL
ROWS_PROCESSED	NUMBER	NOT NULL	Number of rows retrieved by local SQL
CON_ID	NUMBER	NOT NULL	Container ID

DBMS_CLOUD_LINK Views

The DBMS_CLOUD_LINK package uses the following views.

- DBA_CLOUD_LINK_ACCESS and ALL_CLOUD_LINK_ACCESS Views
- DBA_CLOUD_LINK_AUTHORIZATIONS View
- DBA_CLOUD_LINK_PRIVS and USER_CLOUD_LINK_PRIVS Views
- DBA_CLOUD_LINK_REGISTRATIONS and ALL_CLOUD_LINK_REGISTRATIONS Views
- DBA_CLOUD_LINK_SERVICE_MAPPINGS View
- V$CLOUD_LINK_ACCESS_STATS and GV$CLOUD_LINK_ACCESS_STATS Views

DBA_CLOUD_LINK_ACCESS and ALL_CLOUD_LINK_ACCESS Views

Displays details of the registered data sets an Autonomous Database instance is allowed to access.

Only the ADMIN user and users with the PDB_DBA role are privileged to access DBA_CLOUD_LINK_ACCESS. You cannot grant access to other users.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set.
NAME	VARCHAR2(128)	NOT NULL	Name of registered data set.
CREATED	TIMESTAMP(6)	NOT NULL	Time/Date when the data set was created.
LAST_MODIFIED	TIMESTAMP(6)	NOT NULL	Time when metadata of data set was last modified
AUTHORIZATION_REQUIRED	VARCHAR2(1)	NOT NULL	Data set requires additional authorization. Possible values are: "T" or "F".
DATA_SET_OWNER	VARCHAR2(128)	NULL	Data set owner.

DBA_CLOUD_LINK_AUTHORIZATIONS View

Displays details of which databases are authorized to access data sets. This applies to data sets that require additional authorization.

Only the ADMIN user and users with the PDB_DBA role are privileged to access DBA_CLOUD_LINK_AUTHORIZATIONS. You cannot grant access to other users.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set.
NAME	VARCHAR2(128)	NOT NULL	Name of registered data set.
CLOUD_LINK_DATABASE_ID	VARCHAR2(40)	NOT NULL	Database ID of database that has been authorized for access.

DBA_CLOUD_LINK_PRIVS and USER_CLOUD_LINK_PRIVS Views

Displays details of the Cloud Link specific privileges, REGISTER, READ, AUTHORIZE, granted to specific users or to the current user.
USER_CLOUD_LINK_PRIVS columns are the same as those in DBA_CLOUD_LINK_PRIVS. (except for GRANTEE).

Only the ADMIN user and users with the PDB_DBA role are privileged to read from DBA_CLOUD_LINK_PRIVS. You cannot grant access to other users.

The privilege to read from USER_CLOUD_LINK_PRIVS view is granted to the ADMIN user, to the PDB_DBA role, and to the role DWROLE.

Column	Datatype	NULL	Description
GRANTEE	VARCHAR2(128)	NOT NULL	Name of user to whom privilege is granted. This column is not available in USER_CLOUD_LINK_PRIVS.
PRIVILEGE	VARCHAR2(9)	NOT NULL	Privilege, one of: REGISTER, READ, AUTHORIZE, granted to user.
SCOPE	VARCHAR2(14)	NOT NULL	Scope of the privilege.

DBA_CLOUD_LINK_REGISTRATIONS and ALL_CLOUD_LINK_REGISTRATIONS Views

Displays details of all the data set registrations on an Autonomous Database instance.

Only the ADMIN user and users with the PDB_DBA role are privileged to access DBA_CLOUD_LINK_REGISTRATIONS. You cannot grant access to other users.

Column	Datatype	NULL	Description
NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set.
NAME	VARCHAR2(128)	NOT NULL	Name of registered data set.
ID	RAW(16)	NOT NULL	Unique ID of registered data set.
OWNER	VARCHAR2(128)	NOT NULL	Owner of object (table or view owner).
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of object.
SCOPE	CLOB	NOT NULL	JSON document with details of who is allowed to access the registered data set.
DESCRIPTION	CLOB	NOT NULL	Description of registered data set.
CREATED	TIMESTAMP(6)	NOT NULL	Time/Date when the data set was created.
LAST_MODIFIED	TIMESTAMP(6)	NOT NULL	Time when metadata of data set was last modified
AUTHORIZATION_REQUIRED	VARCHAR2(1)	NOT NULL	Data set requires additional authorization. Possible values are: "T" or "F".
DATA_SET_OWNER	VARCHAR2(128)	NULL	Data set owner.

DBA_CLOUD_LINK_SERVICE_MAPPINGS View

Displays details of all service mappings for Cloud Links consumer databases. Each service mapping consists of a Cloud Link database ID and a database service.

Only the ADMIN user and users with the PDB_DBA role are privileged to access DBA_CLOUD_LINK_SERVICE_MAPPINGS. You cannot grant access to other users.

Column	Datatype	NULL	Description
CLOUD_LINK_DATABASE_ID	VARCHAR2(40)	NOT NULL	Database Identifier of consumer database or "ANY".
SERVICE_NAME	VARCHAR2(10)	NULL	Database service name (HIGH, MEDIUM, or LOW).

V$CLOUD_LINK_ACCESS_STATS and GV$CLOUD_LINK_ACCESS_STATS Views

Displays access to each registered data set owned by an Autonomous Database instance.

V$CLOUD_LINK_ACCESS_STATS tracks the elapsed time, DB CPU time, the number of rows retrieved, the number of executions, and the unique database identifier of the database accessing a registered data set.

In addition to the V$CLOUD_LINK_ACCESS_STATS information, the GV$CLOUD_LINK_ACCESS_STATS view contains an extra column named INST_ID of data type NUMBER. The INST_ID column displays the instance from which the associated V$ view information was obtained. The INST_ID column can be used as a filter to retrieve V$CLOUD_LINK_ACCESS_STATS information from a subset of available instances.

The unique database identifier does not disclose the OCIDs (Tenancy, Compartment, Database). This information can be used for auditing an Autonomous Database.

Column	Datatype	NULL	Description
INST_ID	NUMBER	NOT NULL	Instance ID
OWNER	VARCHAR2(128)	NOT NULL	Owner of object(table or view owner)

Column	Datatype	NULL	Description
OBJECT_NAME	VARCHAR2(128)	NOT NULL	Name of object
DATA_SET_NAMESPACE	VARCHAR2(128)	NOT NULL	Namespace of registered data set
DATA_SET_NAME	VARCHAR2(128)	NOT NULL	Name of registered data set
SQL_ID	VARCHAR2(13)	NOT NULL	SQL ID of local SQL accessing a registered data set
LAST_ACTIVE_TIME	DATE	NOT NULL	Time when local SQL was last active
CLOUD_LINK_DATABASE_ID	VARCHAR2(512)	NOT NULL	Database identifier of database accessing a registered data set
ELAPSED_TIME	NUMBER	NOT NULL	Elapsed time (in microseconds) of local SQL
CPU_TIME	NUMBER	NOT NULL	CPU time (in microseconds) of local SQL
USER_IO_WAIT_TIME	NUMBER	NOT NULL	User I/O Wait time (in microseconds) of local SQL
EXECUTIONS	NUMBER	NOT NULL	Number of executions of local SQL
FETCHES	NUMBER	NOT NULL	Number of fetches of local SQL
ROWS_PROCESSED	NUMBER	NOT NULL	Number of rows retrieved by local SQL
CON_ID	NUMBER	NOT NULL	Container ID

DBMS_DATA_ACCESS Views

Describes the Autonomous Database dynamic performance views you can use with the `DBMS_DATA_ACCESS` package to monitor Table Hyperlink URL usage.

- V$DATA_ACCESS_URL_STATS and GV$DATA_ACCESS_URL_STATS Views

V$DATA_ACCESS_URL_STATS and GV$DATA_ACCESS_URL_STATS Views

Displays access to each Table Hyperlink owned by an Autonomous Database instance.

When a Table Hyperlink is accessed, CPU time, User I/O wait time, are updated in the `V$DATA_ACCESS_URL_STATS` view.

The `GV$DATA_ACCESS_URL_STATS` view contains the additional column named `INST_ID` of data type `NUMBER`. The `INST_ID` column displays the instance from which the associated `V$` view information was obtained. The `INST_ID` column can be used as a filter to retrieve `V$DATA_ACCESS_URL_STATS` information from a subset of available instances.

Column	Datatype	NULL	Description
INST_ID	NUMBER	NOT NULL	Instance ID
SQL_ID	VARCHAR2(13)	NOT NULL	SQL ID of SQL accessing data when a Table Hyperlink is accessed
PRE_AUTH_URL_ID	VARCHAR2(128)	NOT NULL	Table Hyperlink identifier
ELAPSED_TIME	NUMBER	NOT NULL	Elapsed time (in microseconds) of local SQL
CPU_TIME	NUMBER	NOT NULL	CPU time (in microseconds) of local SQL
USER_IO_WAIT_TIME	NUMBER	NOT NULL	User I/O Wait time (in microseconds) of local SQL
EXECUTIONS	NUMBER	NOT NULL	Number of executions of local SQL

Column	Datatype	NULL	Description
FETCHES	NUMBER	NOT NULL	Number of fetches of local SQL
ROWS_PROCESSED	NUMBER	NOT NULL	Number of rows retrieved by local SQL
USER_ID	VARCHAR2(128)		Application User ID defined for Table Hyperlink
CON_ID	NUMBER	NOT NULL	Container ID

DBMS_DATA_ACCESS Views

Describes the Autonomous Database dynamic performance views you can use with the DBMS_DATA_ACCESS package to monitor Table Hyperlink URL usage.

- V$DATA_ACCESS_URL_STATS and GV$DATA_ACCESS_URL_STATS Views

V$DATA_ACCESS_URL_STATS and GV$DATA_ACCESS_URL_STATS Views

Displays access to each Table Hyperlink owned by an Autonomous Database instance.

When a Table Hyperlink is accessed, CPU time, User I/O wait time, are updated in the V$DATA_ACCESS_URL_STATS view.

The GV$DATA_ACCESS_URL_STATS view contains the additional column named INST_ID of data type NUMBER. The INST_ID column displays the instance from which the associated V$ view information was obtained. The INST_ID column can be used as a filter to retrieve V$DATA_ACCESS_URL_STATS information from a subset of available instances.

Column	Datatype	NULL	Description
INST_ID	NUMBER	NOT NULL	Instance ID
SQL_ID	VARCHAR2(13)	NOT NULL	SQL ID of SQL accessing data when a Table Hyperlink is accessed
PRE_AUTH_URL_ID	VARCHAR2(128)	NOT NULL	Table Hyperlink identifier
ELAPSED_TIME	NUMBER	NOT NULL	Elapsed time (in microseconds) of local SQL
CPU_TIME	NUMBER	NOT NULL	CPU time (in microseconds) of local SQL
USER_IO_WAIT_TIME	NUMBER	NOT NULL	User I/O Wait time (in microseconds) of local SQL
EXECUTIONS	NUMBER	NOT NULL	Number of executions of local SQL
FETCHES	NUMBER	NOT NULL	Number of fetches of local SQL
ROWS_PROCESSED	NUMBER	NOT NULL	Number of rows retrieved by local SQL
USER_ID	VARCHAR2(128)		Application User ID defined for Table Hyperlink
CON_ID	NUMBER	NOT NULL	Container ID

DBA_PROXY_SQL Views

Describes the Autonomous Database DBA_PROXY_SQL views.

- DBA_PROXY_SQL_ACTIONS View
- DBA_PROXY_SQL_MODULES View

DBA_PROXY_SQL_ACTIONS View

Displays the action names for which query offload is configured. You must query this view from a session that is not enabled for query offload on an Autonomous Database instance.

Column	Datatype	NULL	Description
ACTION_NAME	VARCHAR2(4000)		List of actions

DBA_PROXY_SQL_MODULES View

Displays the module names for which query offload is configured. You must query this view from a session that is not enabled for query offload on an Autonomous Database instance.

Column	Datatype	NULL	Description
MODULE_NAME	VARCHAR2(4000)		List of modules

DBA_PROXY_SQL Views

Describes the Autonomous Database DBA_PROXY_SQL views.

- DBA_PROXY_SQL_ACTIONS View
- DBA_PROXY_SQL_MODULES View

DBA_PROXY_SQL_ACTIONS View

Displays the action names for which query offload is configured. You must query this view from a session that is not enabled for query offload on an Autonomous Database instance.

Column	Datatype	NULL	Description
ACTION_NAME	VARCHAR2(4000)		List of actions

DBA_PROXY_SQL_MODULES View

Displays the module names for which query offload is configured. You must query this view from a session that is not enabled for query offload on an Autonomous Database instance.

Column	Datatype	NULL	Description
MODULE_NAME	VARCHAR2(4000)		List of modules

Lockdown Errors View

Lists details for the DBA_LOCKDOWN_ERRORS view.

- DBA_LOCKDOWN_ERRORS View
  The DBA_LOCKDOWN_ERRORS view provides information about SQL statements where lockdown profile errors were generated.

DBA_LOCKDOWN_ERRORS View

The DBA_LOCKDOWN_ERRORS view provides information about SQL statements where lockdown profile errors were generated.

Column	Datatype	NULL	Description
LAST_OCCURRENCE	TIMESTAMP(6)		Timestamp of latest execution failure.
OCCURRENCE_COUNT	NUMBER		Total occurrences of execution failure.
ERROR_NUM	NUMBER		Error number
ERROR_MSG	VARCHAR2(4000)		Error message
RULE_TYPE	VARCHAR2(128)		Lockdown Profile Rule type: STATEMENT, OPTIONS, FEATURE, EXECUTION
SQL_TEXT	CLOB		SQL text
SQL_ID	VARCHAR2(13)		SQL_ID of statement that hit lockdown error.
SESSION_ID	NUMBER		Session identifier.
SESSION_SERIAL	NUMBER		Session serial number.
SCHEMA	VARCHAR2(128)		User's current schema.
MODULE	VARCHAR2(64)		Name of the currently executing module.
ACTION	VARCHAR2(64)		Name of the currently executing action
CLIENT_ID	VARCHAR2(64)		Client identifier of the session.
USER#	NUMBER	NOT NULL	ID number of the user.
USERNAME	VARCHAR2(128)	NOT NULL	Name of the user.
LUSER#	NUMBER	NOT NULL	ID number of the Logon user
LUSERNAME	VARCHAR2(128)	NOT NULL	Name of the logon user.

Lockdown Errors View

Lists details for the DBA_LOCKDOWN_ERRORS view.

- DBA_LOCKDOWN_ERRORS View
  The DBA_LOCKDOWN_ERRORS view provides information about SQL statements where lockdown profile errors were generated.

DBA_LOCKDOWN_ERRORS View

The DBA_LOCKDOWN_ERRORS view provides information about SQL statements where lockdown profile errors were generated.

Column	Datatype	NULL	Description
LAST_OCCURRENCE	TIMESTAMP(6)		Timestamp of latest execution failure.
OCCURRENCE_COUNT	NUMBER		Total occurrences of execution failure.
ERROR_NUM	NUMBER		Error number
ERROR_MSG	VARCHAR2(4000)		Error message
RULE_TYPE	VARCHAR2(128)		Lockdown Profile Rule type: STATEMENT, OPTIONS, FEATURE, EXECUTION
SQL_TEXT	CLOB		SQL text

Column	Datatype	NULL	Description
SQL_ID	VARCHAR2(13)		SQL_ID of statement that hit lockdown error.
SESSION_ID	NUMBER		Session identifier.
SESSION_SERIAL	NUMBER		Session serial number.
SCHEMA	VARCHAR2(128)		User's current schema.
MODULE	VARCHAR2(64)		Name of the currently executing module.
ACTION	VARCHAR2(64)		Name of the currently executing action
CLIENT_ID	VARCHAR2(64)		Client identifier of the session.
USER#	NUMBER	NOT NULL	ID number of the user.
USERNAME	VARCHAR2(128)	NOT NULL	Name of the user.
LUSER#	NUMBER	NOT NULL	ID number of the Logon user
LUSERNAME	VARCHAR2(128)	NOT NULL	Name of the logon user.

Oracle Cloud Infrastructure Logging Interface Views

The Oracle Cloud Infrastructure (OCI) logging interface views enable authorized users to access log data through a set of views.

Oracle Cloud Infrastructure (OCI) logging is the central logging solution for OCI services, including VCN flow logs, load balancer logs, object storage logs, and others within the added capability to include custom logs. The logs are not stored in Autonomous Database. Instead, the logs are dynamically retrieved based on various predicates provided by the user, including date range, log group, log name, and others.

- Oracle Cloud Infrastructure Logging Interface Overview
- OCI_LOG_LIST View
- OCI_LOG_DATA View
- OCI_VCN_FLOWLOGS View
- OCI_LBLOG_ACCESS View
- OCI_LBLOG_ERRORS View

- Oracle Cloud Infrastructure Logging Interface Overview
  Providing access to the log data inside an Autonomous Database in relational format provides a useful access method, along with the ability to get the logging data in relational or JSON format and enrich the analytics by joining with other data they may have in the Autonomous Database.
- OCI_LOG_LIST View
  Displays a list of all logs in the tenant. The view does not show log data, but provides the metadata about the logs in a tenancy. This metadata is used to properly specify parameter values for other logging view. If there is no logs under a log group, that log group will not be included in this view.
- OCI_LOG_DATA View
  The common view that provides access to all log types supported by the OCI Logging Service. The log content is in the `DATA` column.
- OCI_VCN_FLOWLOGS View
  View that provides details about traffic that passes through the user's VCN. This log enables users to audit traffic and troubleshoot security lists. Each flow log record reflects logged traffic in one direction of a connection between two endpoints. For example, a

single TCP connection, you may have two records in the capture window: one for ingress traffic, and one for egress traffic.

- OCI_LBLOG_ACCESS View
  View that provides load balancer access logs capturing detailed information about requests sent to a load balancer. Each entry contains the time the request was received, client, intermediate HTTP proxy IP addresses, and times used by at the load balancer and backend to process the request.
- OCI_LBLOG_ERRORS View
  View that provides load balancer error logs capturing detailed information about requests related to troubleshooting and monitoring. Each entry contains information such as the time the request was received, error type, and additional details of the specific error.

Oracle Cloud Infrastructure Logging Interface Overview

Providing access to the log data inside an Autonomous Database in relational format provides a useful access method, along with the ability to get the logging data in relational or JSON format and enrich the analytics by joining with other data they may have in the Autonomous Database.

Oracle logging service provides access to logs from Oracle Cloud Infrastructure (OCI) resources. These logs include critical diagnostic information that describes how resources are performing and being accessed. There are varying log types for each Oracle service. To learn more about the logging service and supported OCI services, see Oracle Cloud Infrastructure Logging Overview.

Through the Oracle Cloud Infrastructure Logging Interface, log data can now be accessed through an Autonomous Database in relational format. Users can query different log data in OCI across all compartments and regions. The implemented OCI views use the `OCI$RESOURCE_PRINCIPAL` credential.

To use these views, the following steps need to be done.

1. An Administrator enables use of the `OCI$RESOURCE_PRINCIPAL` credential in the database.
2. Users create a new dynamic group for the `OCI$RESOURCE_PRINCIPAL` credential.

To learn more about enabling the credential, setting up a dynamic group, and creating policy statements, see Use Resource Principal to Access Oracle Cloud Infrastructure Resources.

As an Administrator, enable the resource principal.

```
EXEC DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL();
```

The dynamic group must have the following rules that include the resource ID of the instance.

```
resource.id = '<resource.id>'
```

There are two policy statements required to access logging views.

```
-- For OCI Logging Views
Allow dynamic-group <group-name> to use logging-family in tenancy
Allow dynamic-group <group-name> to use compartments in tenancy
```

All the views have mandatory and optional predicate values (column names).

Predicate values are as follows:

> **Note:**
>
> OCI_LOG_LIST view does not have mandatory columns. If the REGION value is not provided, the view returns data for the home region.

- REGION (Mandatory)
- COMPARTMENT_ID (Mandatory)
- LOG_GROUP_ID (Mandatory)
- LOG_ID (Optional) - If the value is provided, query results will use the LOG_IDvalue. If no value provided, the value will be returned from the server.
- START_TIME (Optional) - If no value provided, return values are for past 5 minutes in GMT.
- END_TIME (Optional) - If no value provided, return values are for past 5 minutes in GMT.
- SEARCH_CRITERIA (Optional) - If no value provided, null will be returned.

Since there can be different log types within a single log group, it's recommended to specify LOG_ID in a predicate when using OCI_VCN_FLOWLOGS, OCI_LBLOG_ACCESS, and OCI_LBLOG_ERRORS views.

Notes and Restrictions:

- The common view OCI_LOG_DATA supports all log types, so COMPARTMENT_ID, LOG_GROUP_ID, and REGION are sufficient. Likewise, if a user uses the LOG_ID of a load balancer with the OCI_VCN_FLOWLOGS view, it will either not return correct data or any data at all.
- For the OCI_LOG_LIST view, the `select * from OCI_LOG_LIST` will shows data only for the home region. If you need data for another region, you will have to use a REGION equality predicate in the WHERE clause.
- If the OCI_LOG_DATA, OCI_VCN_FLOWLOGS, OCI_LBLOG_ACCESS, and OCI_LBLOG_ERRORS, the `select * from <view>` gives an `ORA-20000: compartment_id,log_group_id and region are mandatory predicates, please provide valid values for them as equality predicate in the WHERE clause.` provide the required predicate values.
- The framework supports querying up to past 7 days (from current time) log data to query from the supported views. Any values for the predicates START_TIME and END_TIME predicates outside this range will result in `ORA-20000: start_time and end_time should be from current_timestamp to current_timestamp-7.`
- If you do not provide the listed mandatory predicates, you will see an `ORA-20000: compartment_id,log_group_id and region are mandatory predicates, please provide valid values for them as equality predicate in the WHERE clause`. Other columns can be used as predicates of any type (=, IN). The mandatory predicates can be only used once in a query, and they cannot be used multiple times with AND or NOT.
- Values for START_TIME and END_TIME have to be given in `DD-MM-YY HH24:MI:SS` format. If not provided in this format, the query will not return any data.

OCI_LOG_LIST View

Displays a list of all logs in the tenant. The view does not show log data, but provides the metadata about the logs in a tenancy. This metadata is used to properly specify parameter

values for other logging view. If there is no logs under a log group, that log group will not be included in this view.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
COMPARTMENT_ID	VARCHAR2	Compartment OCID
LOG_GROUP_ID	VARCHAR2	LOG_GROUP OCID
LOG_GROUP_NAME	VARCHAR2	Log group name.
LOG_ID	VARCHAR2	LOG OCID
LOG_NAME	VARCHAR2	Log name
LOG_SERVICE	VARCHAR2	Log service

OCI_LOG_DATA View

The common view that provides access to all log types supported by the OCI Logging Service. The log content is in the DATA column.

Column	Datatype	Description
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID for each log entry
SOURCE	VARCHAR2	Resource name that generated the log message
SPEC_VERSION	NUMBER	Version of the CloudEvents specification this log message uses
LOG_TIME	TIMESTAMP	Log message generation time
TYPE	VARCHAR2	Log message type
COMPARTMENT_ID	VARCHAR2	Compartment OCID
INGESTED_TIME	TIMESTAMP	Log message ingest time
LOG_GROUP_ID	VARCHAR2	Log group OCID
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID of log object owner
DATA	CLOB	Log message
ORACLE_DETAILS	CLOB	Oracle-specific metadata

OCI_VCN_FLOWLOGS View

View that provides details about traffic that passes through the user's VCN. This log enables users to audit traffic and troubleshoot security lists. Each flow log record reflects logged traffic in one direction of a connection between two endpoints. For example, a single TCP connection, you may have two records in the capture window: one for ingress traffic, and one for egress traffic.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field

Column	Datatype	Description
ID	VARCHAR2	A random UUID unique to each log entry
ACTION	VARCHAR2	Possible values of **ACCEPT** or **REJECT**
FLOW_ID	VARCHAR2	Hash of key fields (source and destination addresses, ports, and protocol)
STATUS	VARCHAR2	Possible values of **OK**, **NODATA**, or **SKIPDATA**
END_TIME	TIMESTAMP	Capture window end time
PACKETS	NUMBER	Number of packets recorded in capture window
VERSION	VARCHAR2	Flow log record schema number
BYTES_OUT	NUMBER	Number of bytes recorded in capture window
PROTOCOL	NUMBER	IANA protocol number
START_TIME	TIMESTAMP	Capture window start time
SOURCE_PORT	NUMBER	Source IANA port number
PROTOCOL_NAME	VARCHAR2	IANA protocol name
SOURCE_ADDRESS	VARCHAR2	IP address of the source in IPv4 or IPv6 notation
DESTINATION_PORT	NUMBER	Destination IANA port number
DESTINATION_ADDRESS	VARCHAR2	IP address of the destination in IPv4 or IPv6 notation
TIME	TIMESTAMP	Same as START_TIME
TYPE	VARCHAR2	Log category
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID
VNIC_OCID	VARCHAR2	VNIC OCID
LOG_GROUP_ID	VARCHAR2	Log group OCID
INGESTED_TIME	TIMESTAMP	Time log ingested by OCI Logging
COMPARTMENT_ID	VARCHAR2	Log group compartment OCID
VNIC_SUBNET_OCID	VARCHAR2	VNIC subnet OCID
VNIC_COMPARTMENT_ID	VARCHAR2	VNIC compartment OCID
SOURCE	VARCHAR2	Resource name that generated log message
SPEC_VERSION	NUMBER	Version of the CloudEvents specification this log message uses

OCI_LBLOG_ACCESS View

View that provides load balancer access logs capturing detailed information about requests sent to a load balancer. Each entry contains the time the request was received, client, intermediate HTTP proxy IP addresses, and times used by at the load balancer and backend to process the request.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID unique to each log entry
BACKEND_ADDRESS	VARCHAR2	IP address and port number of the backend server which processed the client request
BACKEND_CONNECT_TIME	NUMBER	Time spent (in seconds, with millisecond precision) to establish backend server connection
BACKEND_PROCESSING_TIME	NUMBER	Total time taken (in seconds, with millisecond precision) from the load balancer establishing a connection to a backend until it completes
BACKEND_STATUS_CODE	NUMBER	Status code of the response from the target
CLIENT_ADDRESS	VARCHAR2	IP address and port number of the requesting client
FORWARDED_FOR_ADDRESS	VARCHAR2	IP address of the client and http proxies between client and load balancer
HOST	VARCHAR2	Domain name which resolves to IP address assigned to the load balancer
LB_STATUS_CODE	NUMBER	Load balancer status code
LISTENER_NAME	VARCHAR2	Listener which received the incoming traffic request on the load balancer's IP address
RECEIVED_BYTES	NUMBER	Total size of the request (in bytes) received from the client
REQUEST	VARCHAR2	Request line received from the client
REQUEST_PROCESSING_TIME	NUMBER	Total time taken (in seconds, with millisecond precision) from the load balancer receiving the request from the client until load balancer completes sending response to the client.
ROUTING_RULES_ENGINE_ERRORS	NUMBER	Routing rule engine error during policy evaluation of the request with a 0 (no error) or 1 (error). If an error occurred, requests are forwarded to the default backend attached to the listener.
ROUTING_RULES_MATCHED_RULE	VARCHAR2	Routing policy rule name, which was matched for this specific request
ROUTING_RULES_RULE_HITS	NUMBER	Number of routing rules evaluated to true for the request
ROUTING_RULES_RULE_MISSES	NUMBER	Number of routing rules evaluated to false for the request
SENT_BYTES	NUMBER	Total size of the request (in bytes) sent to the client
SSL_CIPHER	VARCHAR2	Negotiated SSL cipher between the client and the load balancer
SSL_PROTOCOL	VARCHAR2	Negotiated SSL protocol between the client and the load balancer
TIMESTAMP	TIMESTAMP	Log entry generation time

Column	Datatype	Description
USER_AGENT	VARCHAR2	User agent used to send the request to the load balancer
TIME	TIMESTAMP	Log entry generation time
TYPE	VARCHAR2	Log category
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID
LOG_GROUP_ID	VARCHAR2	Log group OCID
RESOURCE_ID	VARCHAR2	Resource OCID
INGESTED_TIME	TIMESTAMP	Time log ingested by OCI Logging
COMPARTMENT_ID	VARCHAR2	Log group compartment OCID
SOURCE	VARCHAR2	Resource name that generated log message
SUBJECT	VARCHAR2	Subject of the log
SPEC_VERSION	NUMBER	Version of the `CloudEvents` specification this log message uses

OCI_LBLOG_ERRORS View

View that provides load balancer error logs capturing detailed information about requests related to troubleshooting and monitoring. Each entry contains information such as the time the request was received, error type, and additional details of the specific error.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID unique to each log entry
ERROR_LOG_TYPE	VARCHAR2	Log type
ERROR_LOG_ERROR_DETAILS	VARCHAR2	Detailed description of the error message
DATA_TIMESTAMP	TIMESTAMP	Log entry generation time
TIME	TIMESTAMP	Log entry generation time
TYPE	VARCHAR2	Log category
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID
LOG_GROUP_ID	VARCHAR2	Log group OCID
RESOURCE_ID	VARCHAR2	Resource OCID
INGESTED_TIME	TIMESTAMP	Time log ingested by OCI Logging
COMPARTMENT_ID	VARCHAR2	Log group compartment OCID
SOURCE	VARCHAR2	Resource name that generated log message
SUBJECT	VARCHAR2	Subject of the log
SPEC_VERSION	NUMBER	Version of the `CloudEvents` specification this log message uses

Oracle Cloud Infrastructure Logging Interface Views

The Oracle Cloud Infrastructure (OCI) logging interface views enable authorized users to access log data through a set of views.

Oracle Cloud Infrastructure (OCI) logging is the central logging solution for OCI services, including VCN flow logs, load balancer logs, object storage logs, and others within the added capability to include custom logs. The logs are not stored in Autonomous Database. Instead, the logs are dynamically retrieved based on various predicates provided by the user, including date range, log group, log name, and others.

- Oracle Cloud Infrastructure Logging Interface Overview
- OCI_LOG_LIST View
- OCI_LOG_DATA View
- OCI_VCN_FLOWLOGS View
- OCI_LBLOG_ACCESS View
- OCI_LBLOG_ERRORS View

- Oracle Cloud Infrastructure Logging Interface Overview
  Providing access to the log data inside an Autonomous Database in relational format provides a useful access method, along with the ability to get the logging data in relational or JSON format and enrich the analytics by joining with other data they may have in the Autonomous Database.
- OCI_LOG_LIST View
  Displays a list of all logs in the tenant. The view does not show log data, but provides the metadata about the logs in a tenancy. This metadata is used to properly specify parameter values for other logging view. If there is no logs under a log group, that log group will not be included in this view.
- OCI_LOG_DATA View
  The common view that provides access to all log types supported by the OCI Logging Service. The log content is in the `DATA` column.
- OCI_VCN_FLOWLOGS View
  View that provides details about traffic that passes through the user's VCN. This log enables users to audit traffic and troubleshoot security lists. Each flow log record reflects logged traffic in one direction of a connection between two endpoints. For example, a single TCP connection, you may have two records in the capture window: one for ingress traffic, and one for egress traffic.
- OCI_LBLOG_ACCESS View
  View that provides load balancer access logs capturing detailed information about requests sent to a load balancer. Each entry contains the time the request was received, client, intermediate HTTP proxy IP addresses, and times used by at the load balancer and backend to process the request.
- OCI_LBLOG_ERRORS View
  View that provides load balancer error logs capturing detailed information about requests related to troubleshooting and monitoring. Each entry contains information such as the time the request was received, error type, and additional details of the specific error.

Oracle Cloud Infrastructure Logging Interface Overview

Providing access to the log data inside an Autonomous Database in relational format provides a useful access method, along with the ability to get the logging data in relational or JSON

format and enrich the analytics by joining with other data they may have in the Autonomous Database.

Oracle logging service provides access to logs from Oracle Cloud Infrastructure (OCI) resources. These logs include critical diagnostic information that describes how resources are performing and being accessed. There are varying log types for each Oracle service. To learn more about the logging service and supported OCI services, see Oracle Cloud Infrastructure Logging Overview.

Through the Oracle Cloud Infrastructure Logging Interface, log data can now be accessed through an Autonomous Database in relational format. Users can query different log data in OCI across all compartments and regions. The implemented OCI views use the `OCI$RESOURCE_PRINCIPAL` credential.

To use these views, the following steps need to be done.

1. An Administrator enables use of the `OCI$RESOURCE_PRINCIPAL` credential in the database.
2. Users create a new dynamic group for the `OCI$RESOURCE_PRINCIPAL` credential.

To learn more about enabling the credential, setting up a dynamic group, and creating policy statements, see Use Resource Principal to Access Oracle Cloud Infrastructure Resources.

As an Administrator, enable the resource principal.

```
EXEC DBMS_CLOUD_ADMIN.ENABLE_RESOURCE_PRINCIPAL();
```

The dynamic group must have the following rules that include the resource ID of the instance.

```
resource.id = '<resource.id>'
```

There are two policy statements required to access logging views.

```
-- For OCI Logging Views
Allow dynamic-group <group-name> to use logging-family in tenancy
Allow dynamic-group <group-name> to use compartments in tenancy
```

All the views have mandatory and optional predicate values (column names).

Predicate values are as follows:

> **Note:**
>
> `OCI_LOG_LIST` view does not have mandatory columns. If the `REGION` value is not provided, the view returns data for the home region.

- `REGION` (Mandatory)
- `COMPARTMENT_ID` (Mandatory)
- `LOG_GROUP_ID` (Mandatory)
- `LOG_ID` (Optional) - If the value is provided, query results will use the `LOG_ID`value. If no value provided, the value will be returned from the server.
- `START_TIME` (Optional) - If no value provided, return values are for past 5 minutes in GMT.

- END_TIME (Optional) - If no value provided, return values are for past 5 minutes in GMT.
- SEARCH_CRITERIA (Optional) - If no value provided, null will be returned.

Since there can be different log types within a single log group, it's recommended to specify LOG_ID in a predicate when using OCI_VCN_FLOWLOGS, OCI_LBLOG_ACCESS, and OCI_LBLOG_ERRORS views.

Notes and Restrictions:

- The common view OCI_LOG_DATA supports all log types, so COMPARTMENT_ID, LOG_GROUP_ID, and REGION are sufficient. Likewise, if a user uses the LOG_ID of a load balancer with the OCI_VCN_FLOWLOGS view, it will either not return correct data or any data at all.
- For the OCI_LOG_LIST view, the select * from OCI_LOG_LIST will shows data only for the home region. If you need data for another region, you will have to use a REGION equality predicate in the WHERE clause.
- If the OCI_LOG_DATA, OCI_VCN_FLOWLOGS, OCI_LBLOG_ACCESS, and OCI_LBLOG_ERRORS, the select * from <view> gives an ORA-20000: compartment_id,log_group_id and region are mandatory predicates, please provide valid values for them as equality predicate in the WHERE clause. provide the required predicate values.
- The framework supports querying up to past 7 days (from current time) log data to query from the supported views. Any values for the predicates START_TIME and END_TIME predicates outside this range will result in ORA-20000: start_time and end_time should be from current_timestamp to current_timestamp-7.
- If you do not provide the listed mandatory predicates, you will see an ORA-20000: compartment_id,log_group_id and region are mandatory predicates, please provide valid values for them as equality predicate in the WHERE clause. Other columns can be used as predicates of any type (=, IN). The mandatory predicates can be only used once in a query, and they cannot be used multiple times with AND or NOT.
- Values for START_TIME and END_TIME have to be given in DD-MM-YY HH24:MI:SS format. If not provided in this format, the query will not return any data.

OCI_LOG_LIST View

Displays a list of all logs in the tenant. The view does not show log data, but provides the metadata about the logs in a tenancy. This metadata is used to properly specify parameter values for other logging view. If there is no logs under a log group, that log group will not be included in this view.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
COMPARTMENT_ID	VARCHAR2	Compartment OCID
LOG_GROUP_ID	VARCHAR2	LOG_GROUP OCID
LOG_GROUP_NAME	VARCHAR2	Log group name.
LOG_ID	VARCHAR2	LOG OCID
LOG_NAME	VARCHAR2	Log name
LOG_SERVICE	VARCHAR2	Log service

OCI_LOG_DATA View

The common view that provides access to all log types supported by the OCI Logging Service. The log content is in the `DATA` column.

Column	Datatype	Description
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID for each log entry
SOURCE	VARCHAR2	Resource name that generated the log message
SPEC_VERSION	NUMBER	Version of the `CloudEvents` specification this log message uses
LOG_TIME	TIMESTAMP	Log message generation time
TYPE	VARCHAR2	Log message type
COMPARTMENT_ID	VARCHAR2	Compartment OCID
INGESTED_TIME	TIMESTAMP	Log message ingest time
LOG_GROUP_ID	VARCHAR2	Log group OCID
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID of log object owner
DATA	CLOB	Log message
ORACLE_DETAILS	CLOB	Oracle-specific metadata

OCI_VCN_FLOWLOGS View

View that provides details about traffic that passes through the user's VCN. This log enables users to audit traffic and troubleshoot security lists. Each flow log record reflects logged traffic in one direction of a connection between two endpoints. For example, a single TCP connection, you may have two records in the capture window: one for ingress traffic, and one for egress traffic.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID unique to each log entry
ACTION	VARCHAR2	Possible values of **ACCEPT** or **REJECT**
FLOW_ID	VARCHAR2	Hash of key fields (source and destination addresses, ports, and protocol)
STATUS	VARCHAR2	Possible values of **OK**, **NODATA**, or **SKIPDATA**
END_TIME	TIMESTAMP	Capture window end time
PACKETS	NUMBER	Number of packets recorded in capture window
VERSION	VARCHAR2	Flow log record schema number
BYTES_OUT	NUMBER	Number of bytes recorded in capture window
PROTOCOL	NUMBER	IANA protocol number

Column	Datatype	Description
START_TIME	TIMESTAMP	Capture window start time
SOURCE_PORT	NUMBER	Source IANA port number
PROTOCOL_NAME	VARCHAR2	IANA protocol name
SOURCE_ADDRESS	VARCHAR2	IP address of the source in IPv4 or IPv6 notation
DESTINATION_PORT	NUMBER	Destination IANA port number
DESTINATION_ADDRESS	VARCHAR2	IP address of the destination in IPv4 or IPv6 notation
TIME	TIMESTAMP	Same as START_TIME
TYPE	VARCHAR2	Log category
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID
VNIC_OCID	VARCHAR2	VNIC OCID
LOG_GROUP_ID	VARCHAR2	Log group OCID
INGESTED_TIME	TIMESTAMP	Time log ingested by OCI Logging
COMPARTMENT_ID	VARCHAR2	Log group compartment OCID
VNIC_SUBNET_OCID	VARCHAR2	VNIC subnet OCID
VNIC_COMPARTMENT_ID	VARCHAR2	VNIC compartment OCID
SOURCE	VARCHAR2	Resource name that generated log message
SPEC_VERSION	NUMBER	Version of the CloudEvents specification this log message uses

OCI_LBLOG_ACCESS View

View that provides load balancer access logs capturing detailed information about requests sent to a load balancer. Each entry contains the time the request was received, client, intermediate HTTP proxy IP addresses, and times used by at the load balancer and backend to process the request.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID unique to each log entry
BACKEND_ADDRESS	VARCHAR2	IP address and port number of the backend server which processed the client request
BACKEND_CONNECT_TIME	NUMBER	Time spent (in seconds, with millisecond precision) to establish backend server connection
BACKEND_PROCESSING_TIME	NUMBER	Total time taken (in seconds, with millisecond precision) from the load balancer establishing a connection to a backend until it completes
BACKEND_STATUS_CODE	NUMBER	Status code of the response from the target

Column	Datatype	Description
CLIENT_ADDRESS	VARCHAR2	IP address and port number of the requesting client
FORWARDED_FOR_ADDRESS	VARCHAR2	IP address of the client and http proxies between client and load balancer
HOST	VARCHAR2	Domain name which resolves to IP address assigned to the load balancer
LB_STATUS_CODE	NUMBER	Load balancer status code
LISTENER_NAME	VARCHAR2	Listener which received the incoming traffic request on the load balancer's IP address
RECEIVED_BYTES	NUMBER	Total size of the request (in bytes) received from the client
REQUEST	VARCHAR2	Request line received from the client
REQUEST_PROCESSING_TIME	NUMBER	Total time taken (in seconds, with millisecond precision) from the load balancer receiving the request from the client until load balancer completes sending response to the client.
ROUTING_RULES_ENGINE_ERRORS	NUMBER	Routing rule engine error during policy evaluation of the request with a 0 (no error) or 1 (error). If an error occurred, requests are forwarded to the default backend attached to the listener.
ROUTING_RULES_MATCHED_RULE	VARCHAR2	Routing policy rule name, which was matched for this specific request
ROUTING_RULES_RULE_HITS	NUMBER	Number of routing rules evaluated to true for the request
ROUTING_RULES_RULE_MISSES	NUMBER	Number of routing rules evaluated to false for the request
SENT_BYTES	NUMBER	Total size of the request (in bytes) sent to the client
SSL_CIPHER	VARCHAR2	Negotiated SSL cipher between the client and the load balancer
SSL_PROTOCOL	VARCHAR2	Negotiated SSL protocol between the client and the load balancer
TIMESTAMP	TIMESTAMP	Log entry generation time
USER_AGENT	VARCHAR2	User agent used to send the request to the load balancer
TIME	TIMESTAMP	Log entry generation time
TYPE	VARCHAR2	Log category
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID
LOG_GROUP_ID	VARCHAR2	Log group OCID
RESOURCE_ID	VARCHAR2	Resource OCID
INGESTED_TIME	TIMESTAMP	Time log ingested by OCI Logging
COMPARTMENT_ID	VARCHAR2	Log group compartment OCID
SOURCE	VARCHAR2	Resource name that generated log message

Column	Datatype	Description
SUBJECT	VARCHAR2	Subject of the log
SPEC_VERSION	NUMBER	Version of the CloudEvents specification this log message uses

OCI_LBLOG_ERRORS View

View that provides load balancer error logs capturing detailed information about requests related to troubleshooting and monitoring. Each entry contains information such as the time the request was received, error type, and additional details of the specific error.

Column	Datatype	Description
REGION	VARCHAR2	OCI region name
DATE_TIME	TIMESTAMP	Same as the oracle.ingestedtime field
ID	VARCHAR2	A random UUID unique to each log entry
ERROR_LOG_TYPE	VARCHAR2	Log type
ERROR_LOG_ERROR_DETAILS	VARCHAR2	Detailed description of the error message
DATA_TIMESTAMP	TIMESTAMP	Log entry generation time
TIME	TIMESTAMP	Log entry generation time
TYPE	VARCHAR2	Log category
LOG_ID	VARCHAR2	Log OCID
TENANT_ID	VARCHAR2	Tenant OCID
LOG_GROUP_ID	VARCHAR2	Log group OCID
RESOURCE_ID	VARCHAR2	Resource OCID
INGESTED_TIME	TIMESTAMP	Time log ingested by OCI Logging
COMPARTMENT_ID	VARCHAR2	Log group compartment OCID
SOURCE	VARCHAR2	Resource name that generated log message
SUBJECT	VARCHAR2	Subject of the log
SPEC_VERSION	NUMBER	Version of the CloudEvents specification this log message uses

Real Application Testing Capture Replay Views

Oracle Real Application Testing capture replay views.

- DBA_CAPTURE_REPLAY_HISTORY View
  The DBA_CAPTURE_REPLAY_HISTORY view provides historical information for all your workload captures and replays.
- DBA_CAPTURE_REPLAY_STATUS View
  The DBA_CAPTURE_REPLAY_STATUS view provides the most recent status for your workload. The values in the view are updated when you execute FINISH_WORKLOAD_CAPTURE, CANCEL_WORKLOAD_CAPTURE or REPLAY_WORKLOAD.

DBA_CAPTURE_REPLAY_HISTORY View

The `DBA_CAPTURE_REPLAY_HISTORY` view provides historical information for all your workload captures and replays.

Column	Datatype	Description
`NAME`	`VARCHAR2(32)`	Name of the workload capture or replay
`UNIQUE_NAME`	`VARCHAR2(64)`	Internal unique name for capture or replay
`STATUS`	`VARCHAR2(8)`	Workload capture or replay status
`DATABASE_NAME`	`VARCHAR2(128)`	Name of the database
`DATABASE_GUID`	`RAW(16)`	Unique id of the database
`TYPE`	`VARCHAR2(10)`	Type (capture or replay)
`START_TIME`	`DATE`	Start time of the workload capture or replay.
`END_TIME`	`DATE`	End time of the workload capture or replay.
`REPORT_URL`	`VARCHAR2(1000)`	PAR URL path for capture or replay report.

DBA_CAPTURE_REPLAY_STATUS View

The `DBA_CAPTURE_REPLAY_STATUS` view provides the most recent status for your workload. The values in the view are updated when you execute `FINISH_WORKLOAD_CAPTURE`, `CANCEL_WORKLOAD_CAPTURE` or `REPLAY_WORKLOAD`.

Column	Datatype	Description
`STATE`	`VARCHAR2(32)`	Provides the current status for a workload capture or replay. For a workload capture, status value could be one of these: • CAPTURE *capture_name* STARTED • FINISHING CAPTURE • UPLOADING CAPTURE FILES • CANCELING CAPTURE • CANCEL CAPTURE *capture_name* COMPLETED • FINISH CAPTURE *capture_name* COMPLETED For a workload replay, status value could be one of these: • DOWNLOADING CAPTURE FILES • PROCESSING CAPTURE • INITIALIZING REPLAY • PREPARING REPLAY • STARTING REPLAY • UPLOADING REPLAY FILES • REPLAY *replay_name* COMPLETED
`PROGRESS`	`VARCHAR2(8)`	Percentage completed for download or upload.

Real Application Testing Capture Replay Views

Oracle Real Application Testing capture replay views.

- DBA_CAPTURE_REPLAY_HISTORY View
  The DBA_CAPTURE_REPLAY_HISTORY view provides historical information for all your workload captures and replays.
- DBA_CAPTURE_REPLAY_STATUS View
  The DBA_CAPTURE_REPLAY_STATUS view provides the most recent status for your workload. The values in the view are updated when you execute FINISH_WORKLOAD_CAPTURE, CANCEL_WORKLOAD_CAPTURE or REPLAY_WORKLOAD.

DBA_CAPTURE_REPLAY_HISTORY View

The DBA_CAPTURE_REPLAY_HISTORY view provides historical information for all your workload captures and replays.

Column	Datatype	Description
NAME	VARCHAR2(32)	Name of the workload capture or replay
UNIQUE_NAME	VARCHAR2(64)	Internal unique name for capture or replay
STATUS	VARCHAR2(8)	Workload capture or replay status
DATABASE_NAME	VARCHAR2(128)	Name of the database
DATABASE_GUID	RAW(16)	Unique id of the database
TYPE	VARCHAR2(10)	Type (capture or replay)
START_TIME	DATE	Start time of the workload capture or replay.
END_TIME	DATE	End time of the workload capture or replay.
REPORT_URL	VARCHAR2(1000)	PAR URL path for capture or replay report.

DBA_CAPTURE_REPLAY_STATUS View

The DBA_CAPTURE_REPLAY_STATUS view provides the most recent status for your workload. The values in the view are updated when you execute FINISH_WORKLOAD_CAPTURE, CANCEL_WORKLOAD_CAPTURE or REPLAY_WORKLOAD.

Column	Datatype	Description
STATE	VARCHAR2(32)	Provides the current status for a workload capture or replay. For a workload capture, status value could be one of these: • CAPTURE *capture_name* STARTED • FINISHING CAPTURE • UPLOADING CAPTURE FILES • CANCELING CAPTURE • CANCEL CAPTURE *capture_name* COMPLETED • FINISH CAPTURE *capture_name* COMPLETED For a workload replay, status value could be one of these: • DOWNLOADING CAPTURE FILES • PROCESSING CAPTURE • INITIALIZING REPLAY • PREPARING REPLAY • STARTING REPLAY • UPLOADING REPLAY FILES • REPLAY *replay_name* COMPLETED
PROGRESS	VARCHAR2(8)	Percentage completed for download or upload.

Stripe Views on Autonomous Database

Stripe is an online payment processing and credit card processing platform for businesses. Users can query views created on top of Stripe APIs using the DBMS_CLOUD package to get Stripe information such as invoices, subscriptions, and customers.

For more information on Stripe, see the Stripe website.

- Prerequisites to Use Stripe Views
  To use Stripe with Autonomous Database, set Network ACL for accessing Stripe and create a credential that allows access to Stripe.
- STRIPE_ACCOUNTS View
  STRIPE_ACCOUNTS lists the Stripe account information for the authenticated caller.
- STRIPE_COUPONS View
  STRIPE_COUPONS lists the coupons issued in the Stripe account.
- STRIPE_CUSTOMERS View
  STRIPE_CUSTOMERS lists the customers defined in the Stripe account.
- STRIPE_INVOICES View
  STRIPE_INVOICES lists the invoices defined in the Stripe account.
- STRIPE_PLANS View
  STRIPE_PLANS lists the pricing plans defined in the Stripe account.
- STRIPE_PRODUCTS View
  STRIPE_PRODUCTS lists the query information about products defined in the Stripe account.
- STRIPE_SUBSCRIPTIONS View
  STRIPE_SUBSCRIPTIONS lists the subscriptions managed in the Stripe account.

Prerequisites to Use Stripe Views

To use Stripe with Autonomous Database, set Network ACL for accessing Stripe and create a credential that allows access to Stripe.

To use Stripe API:

1. Use the `DBMS_NETWORK_ACL_ADMIN` package to set Network ACL for accessing Stripe.

```
BEGIN
    DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE(
         host => 'stripe.com',
         ace  => xs$ace_type(privilege_list => xs$name_list('http'),
                             principal_name => 'FOO',
                             principal_type => xs_acl.ptype_db)
   );
END;
/
```

2. Only an ADMIN has access to the Stripe Views. A user must be granted READ access to use them.

   For Example:

```
GRANT READ on STRIPE_COUPONS to TYLER;
```

3. Create a Credential for Stripe APIs. There are two ways to perform this task:

   - (Option 1: Create a credential object with the name `STRIPE$CRED`.) The username is `STRIPE_TOKEN` and the password is the Stripe API token. This token can be found in the Stripe Developers Dashboard. See Stripe API keys for additional information.

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(
        credential_name => 'STRIPE$CRED',
        username        => 'STRIPE_TOKEN',
        password        => 'bearer_token' );
END;
/
```

   - (Option 2: Create a credential object with a user defined name.) The username is `STRIPE_TOKEN` and the password is the Stripe API token. This token can be found in the Stripe Developers Dashboard. Before selecting from the Stripe Views, the Session parameter `DEFAULT_CREDENTIAL` should be set using the owner and credential object name. See Stripe API keys for additional information.

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(
        credential_name => 'MY_STRIPE_CRED',
        username        => 'STRIPE_TOKEN',
        password        => 'bearer_token');
END;
/
ALTER SESSION SET default_credential = 'MY_SCHEMA.MY_STRIPE_CRED';
```

4. Test by querying a Stripe View:

```
SELECT name, percent_off, duration, times_redeemed FROM STRIPE_COUPONS;

NAME              PERCENT_OFF DURATION        TIMES_REDEEMED
--------------- ------------- --------------- --------------
Promotion Feb           10.00 once                         0
Seasonal disc            5.00 once                         0
Firstpurchase            5.00 forever                      1
```

STRIPE_ACCOUNTS View

STRIPE_ACCOUNTS lists the Stripe account information for the authenticated caller.

See Account for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object.
OBJECT	VARCHAR2(4000)	String representing the objects type.
BUSINESS_TYPE	VARCHAR2(4000)	The business type.
BUSINESS_PROFILE	CLOB	Business information about the account.
CAPABILITIES	CLOB	A hash containing the set of capabilities that was requested for this account and their associated states.
CHARGES_ENABLED	VARCHAR2(4000)	Whether the account can create live charges.
COMPANY	CLOB	Information about the company or business.
CONTROLLER	CLOB	The controller of the account.
COUNTRY	VARCHAR2(4000)	The account country.
CREATED	VARCHAR2(4000)	Time at which the account was connected.
DEFAULT_CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code representing the default currency for the account.
DETAILS_SUBMITTED	VARCHAR2(4000)	Whether account details have been submitted.
EMAIL	VARCHAR2(4000)	An email address associated with the account.
EXTERNAL_ACCOUNTS	CLOB	External accounts currently attached to this account.
FUTURE_REQUIREMENTS	VARCHAR2(4000)	Information about the upcoming new requirements.
INDIVIDUAL	CLOB	Information about the person represented by the account.
METADATA	VARCHAR2(4000)	Set of key-value pairs that you can attach to an object.
PAYOUTS_ENABLED	VARCHAR2(4000)	Whether Stripe can send payouts to this account.
REQUIREMENTS	CLOB	Information about the requirements for the account.
SETTINGS	CLOB	Options for customizing how the account functions within Stripe.
TOS_ACCEPTANCE	CLOB	Details on the acceptance of the Stripe Services Agreement.
TYPE	VARCHAR2(4000)	The Stripe account type.

STRIPE_COUPONS View

STRIPE_COUPONS lists the coupons issued in the Stripe account.

See Discounts for subscriptions for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object.
OBJECT	VARCHAR2(4000)	String representing the object type.
AMOUNT_OFF	NUMBER	Amount that will be taken off the subtotal of any invoices for this customer.
CREATED	VARCHAR2(4000)	Time at which the object was created.
CURRENCY	VARCHAR2(4000)	If amount_off has been set, the three-letter ISO code for the currency of the amount to take off.
DURATION	VARCHAR2(4000)	Describes how long a customer who applies this coupon will get the discount.
DURATION_IN_MONTHS	NUMBER	If duration is repeating, the number of months the coupon applies.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.
MAX_REDEMPTIONS	NUMBER	Maximum number of times this coupon can be redeemed, in total, across all customers, before it is no longer valid.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NAME	VARCHAR2(4000)	Name of the coupon displayed to customers on for instance invoices or receipts.
PERCENT_OFF	NUMBER	Percent that will be taken off the subtotal of any invoices for this customer for the duration of the coupon.
REDEEM_BY	VARCHAR2(4000)	Date after which the coupon can no longer be redeemed.
TIMES_REDEEMED	NUMBER	Number of times this coupon has been applied to a customer.
VALID	VARCHAR2(4000)	Taking account of the above properties, whether this coupon can still be applied to a customer.

STRIPE_CUSTOMERS View

STRIPE_CUSTOMERS lists the customers defined in the Stripe account.

See Customers for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the customer.
OBJECT	VARCHAR2(4000)	String representing the object type.
ADDRESS	CLOB	The customers address.
BALANCE	NUMBER	Current balance, if any, being stored on the customer.
CREATED	VARCHAR2(4000)	Time at which the object was created.
CURRENCY	VARCHAR2(4000)	Three-letter ISO code for the currency the customer can be charged in for recurring billing purposes.
DEFAULT_SOURCE	VARCHAR2(4000)	ID of the default payment source for the customer.
DELETED	VARCHAR2(4000)	True if the customer is marked as deleted.
DELINQUENT	VARCHAR2(4000)	When the customers latest invoice is billed by charging automatically, delinquent is true if the invoices latest charge failed.
DESCRIPTION	VARCHAR2(4000)	An arbitrary string attached to the object.
DISCOUNT	CLOB	Describes the current discount active on the customer, if there is one.
EMAIL	VARCHAR2(4000)	The customer email address.
INVOICE_PREFIX	VARCHAR2(4000)	The prefix for the customer used to generate unique invoice numbers.
INVOICE_SETTINGS	CLOB	The customer default invoice settings.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or then value false if the object exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NAME	VARCHAR2(4000)	The customer full name or business name.
NEXT_INVOICE_SEQUENCE	NUMBER	The suffix of the customers next invoice number.
PHONE	VARCHAR2(4000)	The customers phone number.
PREFERRED_LOCALES	CLOB	The customers preferred locales, ordered by preference.
SHIPPING	CLOB	Mailing and shipping address for the customer.
TAX_EXEMPT	VARCHAR2(4000)	Describes the customers tax exemption status.
TAX_IDS	CLOB	The customer tax IDs.
TEST_CLOCK	CLOB	ID of the test clock this customer belongs to.

STRIPE_INVOICES View

STRIPE_INVOICES lists the invoices defined in the Stripe account.

See Invoicing for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object
OBJECT	VARCHAR2(4000)	String representing the objects type.
ACCOUNT_COUNTRY	VARCHAR2(4000)	The country of the business associated with this invoice.
ACCOUNT_NAME	VARCHAR2(4000)	The public name of the business associated with this invoice.
ACCOUNT_TAX_IDS	CLOB	The account tax IDs associated with the invoice.
AMOUNT_DUE	NUMBER	Final amount due at this time for this invoice.
AMOUNT_PAID	NUMBER	The amount, in cents, that was paid.
AMOUNT_REMAINING	NUMBER	The difference between amount_due and amount_paid, in cents.
AMOUNT_SHIPPING	NUMBER	This is the sum of all the shipping amounts.
APPLICATION	VARCHAR2(4000)	ID of the Connect Application that created the invoice.
APPLICATION_FEE_AMOUNT	NUMBER	The fee in cents that will be applied to the invoice and transferred to the application owners Stripe account when the invoice is paid.
ATTEMPT_COUNT	NUMBER	Number of payment attempts made for this invoice, from the perspective of the payment retry schedule.
ATTEMPTED	VARCHAR2(4000)	Whether an attempt has been made to pay the invoice.
AUTO_ADVANCE	VARCHAR2(4000)	Controls whether Stripe will perform automatic collection of the invoice.
AUTOMATIC_TAX	CLOB	Settings and latest results for automatic tax lookup for this invoice.
BILLING_REASON	VARCHAR2(4000)	Indicates the reason why the invoice was created.
CHARGE	CLOB	ID of the latest charge generated for this invoice, if any.
COLLECTION_METHOD	VARCHAR2(4000)	Either charge_automatically, or send_invoice.
CREATED	VARCHAR2(4000)	Time at which the object was created.

Column	Datatype	Description
CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code, in lowercase.
CUSTOM_FIELDS	CLOB	Custom fields displayed on the invoice.
CUSTOMER	VARCHAR2(4000)	The ID of the customer who will be billed.
CUSTOMER_ADDRESS	CLOB	The customers address.
CUSTOMER_EMAIL	VARCHAR2(4000)	The customers email.
CUSTOMER_NAME	VARCHAR2(4000)	The customers name.
CUSTOMER_PHONE	VARCHAR2(4000)	The customers phone number.
CUSTOMER_SHIPPING	CLOB	The customers shipping information.
CUSTOMER_TAX_EXEMPT	VARCHAR2(4000)	The customers tax exempt status.
CUSTOMER_TAX_IDS	CLOB	The customers tax IDs.
DEFAULT_PAYMENT_METHOD	VARCHAR2(4000)	ID of the default payment method for the invoice.
DEFAULT_SOURCE	VARCHAR2(4000)	ID of the default payment source for the invoice.
DEFAULT_TAX_RATES	CLOB	The tax rates applied to this invoice, if any.
DESCRIPTION	VARCHAR2(4000)	An arbitrary string attached to the object.
DISCOUNT	CLOB	Describes the current discount applied to this invoice, if there is one.
DISCOUNTS	CLOB	The discounts applied to the invoice.
DUE_DATE	VARCHAR2(4000)	The date on which payment for this invoice is due.
ENDING_BALANCE	NUMBER	Ending customer balance after the invoice is finalized.
FOOTER	VARCHAR2(4000)	Footer displayed on the invoice.
FROM_INVOICE	VARCHAR2(4000)	Details of the invoice that was cloned.
HOSTED_INVOICE_URL	VARCHAR2(4000)	The URL for the hosted invoice page.
INVOICE_PDF	VARCHAR2(4000)	The link to download the PDF for the invoice.
LAST_FINALIZATION_ERROR	CLOB	The error encountered during the previous attempt to finalize the invoice.
LATEST_REVISION	VARCHAR2(4000)	The ID of the most recent non-draft revision of this invoice.
LINES	CLOB	The individual line items that make up the invoice.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.

Column	Datatype	Description
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NEXT_PAYMENT_ATTEMPT	VARCHAR2(4000)	The time at which payment will next be attempted.
NUMBER_	VARCHAR2(4000)	A unique, identifying string that appears on emails sent to the customer for this invoice.
ON_BEHALF_OF	VARCHAR2(4000)	The account (if any) for which the funds of the invoice payment are intended.
PAID	VARCHAR2(4000)	Whether payment was successfully collected for this invoice.
PAID_OUT_OF_BAND	VARCHAR2(4000)	Returns true if the invoice was manually marked paid, returns false if the invoice hasn't been paid yet or was paid on Stripe.
PAYMENT_INTENT	CLOB	The PaymentIntent associated with this invoice.
PAYMENT_SETTINGS	CLOB	Configuration settings for the PaymentIntent that is generated when the invoice is finalized.
PERIOD_END	VARCHAR2(4000)	End of the usage period during which invoice items were added to this invoice.
PERIOD_START	VARCHAR2(4000)	Start of the usage period during which invoice items were added to this invoice.
POST_PAYMENT_CREDIT_NOTES_AMOUNT	NUMBER	Total amount of all post-payment credit notes issued for this invoice.
PRE_PAYMENT_CREDIT_NOTES_AMOUNT	NUMBER	Total amount of all pre-payment credit notes issued for this invoice.
QUOTE	VARCHAR2(4000)	The quote this invoice was generated from.
RECEIPT_NUMBER	VARCHAR2(4000)	This is the transaction number that appears on email receipts sent for this invoice.
RENDERING_OPTIONS	CLOB	Options for invoice PDF rendering.
SHIPPING_COST	CLOB	The details of the cost of shipping, including the ShippingRate applied on the invoice.
SHIPPING_DETAILS	CLOB	Shipping details for the invoice.
STARTING_BALANCE	NUMBER	Starting customer balance before the invoice is finalized.
STATEMENT_DESCRIPTOR	VARCHAR2(4000)	Extra information about an invoice for the customers credit card statement.

Column	Datatype	Description
STATUS	VARCHAR2(4000)	The status of the invoice, one of draft, open, paid, uncollectible, or void.
STATUS_TRANSITIONS	CLOB	The timestamps at which the invoice status was updated.
SUBSCRIPTION	VARCHAR2(4000)	The subscription that this invoice was prepared for, if any.
SUBTOTAL	NUMBER	Total of all subscriptions, invoice items, and prorations on the invoice before any invoice level discount or exclusive tax is applied.
SUBTOTAL_EXCLUDING_TAX	NUMBER	The integer amount in cents representing the subtotal of the invoice before any invoice level discount or tax is applied.
TAX	NUMBER	The amount of tax on this invoice.
THRESHOLD_REASON	CLOB	If billing_reason is set to subscription_threshold this returns more information on which threshold rules triggered the invoice.
TEST_CLOCK	VARCHAR2(4000)	ID of the test clock this invoice belongs to.
TOTAL	NUMBER	Total after discounts and taxes.
TOTAL_DISCOUNT_AMOUNTS	CLOB	The aggregate amounts calculated per discount across all line items.
TOTAL_EXCLUDING_TAX	NUMBER	The integer amount in cents representing the total amount of the invoice including all discounts but excluding all tax.
TOTAL_TAX_AMOUNTS	CLOB	The aggregate amounts calculated per tax rate for all line items.
TRANSFER_DATA	CLOB	The account (if any) the payment will be attributed to for tax reporting, and where funds from the payment will be transferred to for the invoice.
WEBHOOKS_DELIVERED_AT	VARCHAR2(4000)	This field tracks the time when webhooks for this invoice were successfully delivered.

STRIPE_PLANS View

STRIPE_PLANS lists the pricing plans defined in the Stripe account.

See Plans for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the plan.

Column	Datatype	Description
OBJECT	VARCHAR2(4000)	String representing the object type.
ACTIVE	VARCHAR2(4000)	Whether the plan is currently available for purchase.
AGGREGATE_USAGE	VARCHAR2(4000)	Specifies a usage aggregation strategy for plans of usage_type=metered.
AMOUNT	NUMBER	The unit amount in cents to be charged, represented as a whole integer.
AMOUNT_DECIMAL	VARCHAR2(4000)	The unit amount in cents to be charged, represented as a decimal string with at most 12 decimal places.
BILLING_SCHEME	VARCHAR2(4000)	Describes how to compute the price per period.
CREATED	VARCHAR2(4000)	Time at which the plan was created.
CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code, in lowercase.
DELETED	VARCHAR2(4000)	True if the plan is marked as deleted.
INTERVAL	VARCHAR2(4000)	The frequency at which a subscription is billed.
INTERVAL_COUNT	NUMBER	The number of intervals between subscription billings.
LIVEMODE	VARCHAR2(4000)	Has the value true if the plan exists in live mode or the value false if the plan exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an plan.
NICKNAME	VARCHAR2(4000)	A brief description of the plan, hidden from customers.
PRODUCT	VARCHAR2(4000)	ID of the product whose pricing this plan determines.
TIERS	CLOB	Each element represents a pricing tier.
TIERS_MODE	VARCHAR2(4000)	Defines if the tiering price should be graduated or volume based.
TRANSFORM_USAGE	CLOB	Apply a transformation to the reported usage or set quantity before computing the amount billed.
TRIAL_PERIOD_DAYS	NUMBER	Default number of trial days when subscribing a customer to this plan using trial_from_plan=true.
USAGE_TYPE	VARCHAR2(4000)	Configures how the quantity per period should be determined.

STRIPE_PRODUCTS View

STRIPE_PRODUCTS lists the query information about products defined in the Stripe account.

See Manage products and prices for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object.
OBJECT	VARCHAR2(4000)	String representing the object type.
ACTIVE	VARCHAR2(4000)	Whether the product is currently available for purchase.
CREATED	VARCHAR2(4000)	Time at which the object was created.
DEFAULT_PRICE	VARCHAR2(4000)	The ID of the Price object that is the default price for this product.
DESCRIPTION	VARCHAR2(4000)	The product description, meant to be displayable to the customer.
IMAGES	CLOB	A list of up to 8 URLs of images for this product, meant to be displayable to the customer.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NAME	VARCHAR2(4000)	The product name, meant to be displayable to the customer.
PACKAGE_DIMENSIONS	CLOB	The dimensions of this product for shipping purposes.
SHIPPABLE	VARCHAR2(4000)	Whether this product is shipped.
STATEMENT_DESCRIPTOR	VARCHAR2(4000)	Extra information about a product which will appear on your customers credit card statement.
TAX_CODE	VARCHAR2(4000)	A tax code ID.
UNIT_LABEL	VARCHAR2(4000)	A label that represents units of this product.
UPDATED	VARCHAR2(4000)	Time at which the object was last updated.
URL	VARCHAR2(4000)	A URL of a publicly-accessible webpage for this product.

STRIPE_SUBSCRIPTIONS View

STRIPE_SUBSCRIPTIONS lists the subscriptions managed in the Stripe account.

See Subscriptions for additional information.

Column	Datatype	Subscription
ID	VARCHAR2(4000)	Unique identifier for the object.

Column	Datatype	Subscription
OBJECT	VARCHAR2(4000)	String representing the object type.
APPLICATION	VARCHAR2(4000)	ID of the Connect Application that created the subscription.
APPLICATION_FEE_PERCENT	NUMBER	A non-negative decimal between 0 and 100, with at most two decimal places.
AUTOMATIC_TAX	CLOB	Automatic tax settings for this subscription.
BILLING_CYCLE_ANCHOR	VARCHAR2(4000)	Determines the date of the first full invoice, and, for plans with month or year intervals, the day of the month for subsequent invoices.
BILLING_THRESHOLDS	CLOB	Define thresholds at which an invoice will be sent, and the subscription advanced to a new billing period.
CANCEL_AT	VARCHAR2(4000)	A date in the future at which the subscription will automatically get canceled.
CANCEL_AT_PERIOD_END	VARCHAR2(4000)	If the subscription has been canceled with the at_period_end flag set to true, cancel_at_period_end on the subscription will be true.
CANCELED_AT	VARCHAR2(4000)	If the subscription has been canceled, the date of that cancellation.
COLLECTION_METHOD	VARCHAR2(4000)	Either charge_automatically, or send_invoice.
CREATED	VARCHAR2(4000)	Time at which the object was created.
CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code, in lowercase.
CURRENT_PERIOD_END	VARCHAR2(4000)	End of the current period that the subscription has been invoiced for.
CURRENT_PERIOD_START	VARCHAR2(4000)	Start of the current period that the subscription has been invoiced for.
CUSTOMER	VARCHAR2(4000)	ID of the customer who owns the subscription.
DAYS_UNTIL_DUE	NUMBER	Number of days a customer has to pay invoices generated by this subscription.
DEFAULT_PAYMENT_METHOD	VARCHAR2(4000)	ID of the default payment method for the subscription.
DEFAULT_SOURCE	VARCHAR2(4000)	ID of the default payment source for the subscription.
DEFAULT_TAX_RATES	CLOB	The tax rates that will apply to any subscription item that does not have tax_rates set.

Column	Datatype	Subscription
DESCRIPTION	VARCHAR2(4000)	The subscription description, meant to be displayable to the customer.
DISCOUNT	CLOB	Describes the current discount applied to this subscription, if there is one.
ENDED_AT	VARCHAR2(4000)	If the subscription has ended, the date the subscription ended.
ITEMS	CLOB	List of subscription items, each with an attached price.
LATEST_INVOICE	VARCHAR2(4000)	The most recent invoice this subscription has generated.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NEXT_PENDING_INVOICE_ITEM_INVOICE	VARCHAR2(4000)	Specifies the approximate timestamp on which any pending invoice items will be billed acc to the schedule provided at pending_invoice_item_interval.
ON_BEHALF_OF	VARCHAR2(4000)	The account the charge was made on behalf of for charges associated with this subscription.
PAUSE_COLLECTION	CLOB	If specified, payment collection for this subscription will be paused.
PAYMENT_SETTINGS	VARCHAR2(4000)	Payment settings passed on to invoices created by the subscription.
PENDING_INVOICE_ITEM_INTERVAL	CLOB	Specifies an interval for how often to bill for any pending invoice items.
PENDING_SETUP_INTENT	VARCHAR2(4000)	For collecting user authentication when creating a subscription without immediate payment or updating a subscriptions payment method, allowing you to optimize for off-session payments.
PENDING_UPDATE	CLOB	If specified, pending updates that will be applied to the subscription once the latest_invoice has been paid.
SCHEDULE	CLOB	The schedule attached to the subscription.
START_DATE	VARCHAR2(4000)	Date when the subscription was first created.
STATUS	VARCHAR2(4000)	Possible values are incomplete, incomplete_expired, trialing, active, past_due, canceled, or unpaid.

Column	Datatype	Subscription
TEST_CLOCK	VARCHAR2(4000)	ID of the test clock this subscription belongs to.
TRANSFER_DATA	CLOB	The account the subscriptions payments will be attributed to for tax reporting, and where funds from each payment will be transferred to for each of the subscriptions invoices.
TRIAL_END	VARCHAR2(4000)	If the subscription has a trial, the end of that trial.
TRIAL_SETTINGS	VARCHAR2(4000)	Settings related to subscription trials.
TRIAL_START	VARCHAR2(4000)	If the subscription has a trial, the beginning of that trial.

Stripe Views on Autonomous Database

Stripe is an online payment processing and credit card processing platform for businesses. Users can query views created on top of Stripe APIs using the DBMS_CLOUD package to get Stripe information such as invoices, subscriptions, and customers.

For more information on Stripe, see the Stripe website.

- Prerequisites to Use Stripe Views
  To use Stripe with Autonomous Database, set Network ACL for accessing Stripe and create a credential that allows access to Stripe.
- STRIPE_ACCOUNTS View
  STRIPE_ACCOUNTS lists the Stripe account information for the authenticated caller.
- STRIPE_COUPONS View
  STRIPE_COUPONS lists the coupons issued in the Stripe account.
- STRIPE_CUSTOMERS View
  STRIPE_CUSTOMERS lists the customers defined in the Stripe account.
- STRIPE_INVOICES View
  STRIPE_INVOICES lists the invoices defined in the Stripe account.
- STRIPE_PLANS View
  STRIPE_PLANS lists the pricing plans defined in the Stripe account.
- STRIPE_PRODUCTS View
  STRIPE_PRODUCTS lists the query information about products defined in the Stripe account.
- STRIPE_SUBSCRIPTIONS View
  STRIPE_SUBSCRIPTIONS lists the subscriptions managed in the Stripe account.

Prerequisites to Use Stripe Views

To use Stripe with Autonomous Database, set Network ACL for accessing Stripe and create a credential that allows access to Stripe.

To use Stripe API:

1. Use the `DBMS_NETWORK_ACL_ADMIN` package to set Network ACL for accessing Stripe.

```
BEGIN
    DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE(
         host => 'stripe.com',
         ace  => xs$ace_type(privilege_list => xs$name_list('http'),
                             principal_name => 'FOO',
                             principal_type => xs_acl.ptype_db)
   );
END;
/
```

2. Only an ADMIN has access to the Stripe Views. A user must be granted READ access to use them.

   For Example:

```
GRANT READ on STRIPE_COUPONS to TYLER;
```

3. Create a Credential for Stripe APIs. There are two ways to perform this task:

   - (Option 1: Create a credential object with the name `STRIPE$CRED`.) The username is `STRIPE_TOKEN` and the password is the Stripe API token. This token can be found in the Stripe Developers Dashboard. See Stripe API keys for additional information.

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(
        credential_name => 'STRIPE$CRED',
        username        => 'STRIPE_TOKEN',
        password        => 'bearer_token' );
END;
/
```

   - (Option 2: Create a credential object with a user defined name.) The username is `STRIPE_TOKEN` and the password is the Stripe API token. This token can be found in the Stripe Developers Dashboard. Before selecting from the Stripe Views, the Session parameter `DEFAULT_CREDENTIAL` should be set using the owner and credential object name. See Stripe API keys for additional information.

```
BEGIN
    DBMS_CLOUD.CREATE_CREDENTIAL(
        credential_name => 'MY_STRIPE_CRED',
        username        => 'STRIPE_TOKEN',
        password        => 'bearer_token');
END;
/
ALTER SESSION SET default_credential = 'MY_SCHEMA.MY_STRIPE_CRED';
```

4. Test by querying a Stripe View:

```
SELECT name, percent_off, duration, times_redeemed FROM STRIPE_COUPONS;

NAME              PERCENT_OFF DURATION        TIMES_REDEEMED
--------------- ------------- --------------- --------------
Promotion Feb           10.00 once                         0
```

```
Seasonal disc           5.00 once                    0
Firstpurchase           5.00 forever                 1
```

STRIPE_ACCOUNTS View

STRIPE_ACCOUNTS lists the Stripe account information for the authenticated caller.

See Account for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object.
OBJECT	VARCHAR2(4000)	String representing the objects type.
BUSINESS_TYPE	VARCHAR2(4000)	The business type.
BUSINESS_PROFILE	CLOB	Business information about the account.
CAPABILITIES	CLOB	A hash containing the set of capabilities that was requested for this account and their associated states.
CHARGES_ENABLED	VARCHAR2(4000)	Whether the account can create live charges.
COMPANY	CLOB	Information about the company or business.
CONTROLLER	CLOB	The controller of the account.
COUNTRY	VARCHAR2(4000)	The account country.
CREATED	VARCHAR2(4000)	Time at which the account was connected.
DEFAULT_CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code representing the default currency for the account.
DETAILS_SUBMITTED	VARCHAR2(4000)	Whether account details have been submitted.
EMAIL	VARCHAR2(4000)	An email address associated with the account.
EXTERNAL_ACCOUNTS	CLOB	External accounts currently attached to this account.
FUTURE_REQUIREMENTS	VARCHAR2(4000)	Information about the upcoming new requirements.
INDIVIDUAL	CLOB	Information about the person represented by the account.
METADATA	VARCHAR2(4000)	Set of key-value pairs that you can attach to an object.
PAYOUTS_ENABLED	VARCHAR2(4000)	Whether Stripe can send payouts to this account.
REQUIREMENTS	CLOB	Information about the requirements for the account.
SETTINGS	CLOB	Options for customizing how the account functions within Stripe.
TOS_ACCEPTANCE	CLOB	Details on the acceptance of the Stripe Services Agreement.
TYPE	VARCHAR2(4000)	The Stripe account type.

STRIPE_COUPONS View

STRIPE_COUPONS lists the coupons issued in the Stripe account.

See Discounts for subscriptions for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object.

Column	Datatype	Description
OBJECT	VARCHAR2(4000)	String representing the object type.
AMOUNT_OFF	NUMBER	Amount that will be taken off the subtotal of any invoices for this customer.
CREATED	VARCHAR2(4000)	Time at which the object was created.
CURRENCY	VARCHAR2(4000)	If amount_off has been set, the three-letter ISO code for the currency of the amount to take off.
DURATION	VARCHAR2(4000)	Describes how long a customer who applies this coupon will get the discount.
DURATION_IN_MONTHS	NUMBER	If duration is repeating, the number of months the coupon applies.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.
MAX_REDEMPTIONS	NUMBER	Maximum number of times this coupon can be redeemed, in total, across all customers, before it is no longer valid.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NAME	VARCHAR2(4000)	Name of the coupon displayed to customers on for instance invoices or receipts.
PERCENT_OFF	NUMBER	Percent that will be taken off the subtotal of any invoices for this customer for the duration of the coupon.
REDEEM_BY	VARCHAR2(4000)	Date after which the coupon can no longer be redeemed.
TIMES_REDEEMED	NUMBER	Number of times this coupon has been applied to a customer.
VALID	VARCHAR2(4000)	Taking account of the above properties, whether this coupon can still be applied to a customer.

STRIPE_CUSTOMERS View

STRIPE_CUSTOMERS lists the customers defined in the Stripe account.

See Customers for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the customer.
OBJECT	VARCHAR2(4000)	String representing the object type.

Column	Datatype	Description
ADDRESS	CLOB	The customers address.
BALANCE	NUMBER	Current balance, if any, being stored on the customer.
CREATED	VARCHAR2(4000)	Time at which the object was created.
CURRENCY	VARCHAR2(4000)	Three-letter ISO code for the currency the customer can be charged in for recurring billing purposes.
DEFAULT_SOURCE	VARCHAR2(4000)	ID of the default payment source for the customer.
DELETED	VARCHAR2(4000)	True if the customer is marked as deleted.
DELINQUENT	VARCHAR2(4000)	When the customers latest invoice is billed by charging automatically, delinquent is true if the invoices latest charge failed.
DESCRIPTION	VARCHAR2(4000)	An arbitrary string attached to the object.
DISCOUNT	CLOB	Describes the current discount active on the customer, if there is one.
EMAIL	VARCHAR2(4000)	The customer email address.
INVOICE_PREFIX	VARCHAR2(4000)	The prefix for the customer used to generate unique invoice numbers.
INVOICE_SETTINGS	CLOB	The customer default invoice settings.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or then value false if the object exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NAME	VARCHAR2(4000)	The customer full name or business name.
NEXT_INVOICE_SEQUENCE	NUMBER	The suffix of the customers next invoice number.
PHONE	VARCHAR2(4000)	The customers phone number.
PREFERRED_LOCALES	CLOB	The customers preferred locales, ordered by preference.
SHIPPING	CLOB	Mailing and shipping address for the customer.
TAX_EXEMPT	VARCHAR2(4000)	Describes the customers tax exemption status.
TAX_IDS	CLOB	The customer tax IDs.
TEST_CLOCK	CLOB	ID of the test clock this customer belongs to.

STRIPE_INVOICES View

STRIPE_INVOICES lists the invoices defined in the Stripe account.

See Invoicing for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object
OBJECT	VARCHAR2(4000)	String representing the objects type.
ACCOUNT_COUNTRY	VARCHAR2(4000)	The country of the business associated with this invoice.
ACCOUNT_NAME	VARCHAR2(4000)	The public name of the business associated with this invoice.
ACCOUNT_TAX_IDS	CLOB	The account tax IDs associated with the invoice.
AMOUNT_DUE	NUMBER	Final amount due at this time for this invoice.
AMOUNT_PAID	NUMBER	The amount, in cents, that was paid.
AMOUNT_REMAINING	NUMBER	The difference between amount_due and amount_paid, in cents.
AMOUNT_SHIPPING	NUMBER	This is the sum of all the shipping amounts.
APPLICATION	VARCHAR2(4000)	ID of the Connect Application that created the invoice.
APPLICATION_FEE_AMOUNT	NUMBER	The fee in cents that will be applied to the invoice and transferred to the application owners Stripe account when the invoice is paid.
ATTEMPT_COUNT	NUMBER	Number of payment attempts made for this invoice, from the perspective of the payment retry schedule.
ATTEMPTED	VARCHAR2(4000)	Whether an attempt has been made to pay the invoice.
AUTO_ADVANCE	VARCHAR2(4000)	Controls whether Stripe will perform automatic collection of the invoice.
AUTOMATIC_TAX	CLOB	Settings and latest results for automatic tax lookup for this invoice.
BILLING_REASON	VARCHAR2(4000)	Indicates the reason why the invoice was created.
CHARGE	CLOB	ID of the latest charge generated for this invoice, if any.
COLLECTION_METHOD	VARCHAR2(4000)	Either charge_automatically, or send_invoice.
CREATED	VARCHAR2(4000)	Time at which the object was created.

Column	Datatype	Description
CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code, in lowercase.
CUSTOM_FIELDS	CLOB	Custom fields displayed on the invoice.
CUSTOMER	VARCHAR2(4000)	The ID of the customer who will be billed.
CUSTOMER_ADDRESS	CLOB	The customers address.
CUSTOMER_EMAIL	VARCHAR2(4000)	The customers email.
CUSTOMER_NAME	VARCHAR2(4000)	The customers name.
CUSTOMER_PHONE	VARCHAR2(4000)	The customers phone number.
CUSTOMER_SHIPPING	CLOB	The customers shipping information.
CUSTOMER_TAX_EXEMPT	VARCHAR2(4000)	The customers tax exempt status.
CUSTOMER_TAX_IDS	CLOB	The customers tax IDs.
DEFAULT_PAYMENT_METHOD	VARCHAR2(4000)	ID of the default payment method for the invoice.
DEFAULT_SOURCE	VARCHAR2(4000)	ID of the default payment source for the invoice.
DEFAULT_TAX_RATES	CLOB	The tax rates applied to this invoice, if any.
DESCRIPTION	VARCHAR2(4000)	An arbitrary string attached to the object.
DISCOUNT	CLOB	Describes the current discount applied to this invoice, if there is one.
DISCOUNTS	CLOB	The discounts applied to the invoice.
DUE_DATE	VARCHAR2(4000)	The date on which payment for this invoice is due.
ENDING_BALANCE	NUMBER	Ending customer balance after the invoice is finalized.
FOOTER	VARCHAR2(4000)	Footer displayed on the invoice.
FROM_INVOICE	VARCHAR2(4000)	Details of the invoice that was cloned.
HOSTED_INVOICE_URL	VARCHAR2(4000)	The URL for the hosted invoice page.
INVOICE_PDF	VARCHAR2(4000)	The link to download the PDF for the invoice.
LAST_FINALIZATION_ERROR	CLOB	The error encountered during the previous attempt to finalize the invoice.
LATEST_REVISION	VARCHAR2(4000)	The ID of the most recent non-draft revision of this invoice.
LINES	CLOB	The individual line items that make up the invoice.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.

Column	Datatype	Description
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NEXT_PAYMENT_ATTEMPT	VARCHAR2(4000)	The time at which payment will next be attempted.
NUMBER_	VARCHAR2(4000)	A unique, identifying string that appears on emails sent to the customer for this invoice.
ON_BEHALF_OF	VARCHAR2(4000)	The account (if any) for which the funds of the invoice payment are intended.
PAID	VARCHAR2(4000)	Whether payment was successfully collected for this invoice.
PAID_OUT_OF_BAND	VARCHAR2(4000)	Returns true if the invoice was manually marked paid, returns false if the invoice hasn't been paid yet or was paid on Stripe.
PAYMENT_INTENT	CLOB	The PaymentIntent associated with this invoice.
PAYMENT_SETTINGS	CLOB	Configuration settings for the PaymentIntent that is generated when the invoice is finalized.
PERIOD_END	VARCHAR2(4000)	End of the usage period during which invoice items were added to this invoice.
PERIOD_START	VARCHAR2(4000)	Start of the usage period during which invoice items were added to this invoice.
POST_PAYMENT_CREDIT_NOTES_AMOUNT	NUMBER	Total amount of all post-payment credit notes issued for this invoice.
PRE_PAYMENT_CREDIT_NOTES_AMOUNT	NUMBER	Total amount of all pre-payment credit notes issued for this invoice.
QUOTE	VARCHAR2(4000)	The quote this invoice was generated from.
RECEIPT_NUMBER	VARCHAR2(4000)	This is the transaction number that appears on email receipts sent for this invoice.
RENDERING_OPTIONS	CLOB	Options for invoice PDF rendering.
SHIPPING_COST	CLOB	The details of the cost of shipping, including the ShippingRate applied on the invoice.
SHIPPING_DETAILS	CLOB	Shipping details for the invoice.
STARTING_BALANCE	NUMBER	Starting customer balance before the invoice is finalized.
STATEMENT_DESCRIPTOR	VARCHAR2(4000)	Extra information about an invoice for the customers credit card statement.

Column	Datatype	Description
STATUS	VARCHAR2(4000)	The status of the invoice, one of draft, open, paid, uncollectible, or void.
STATUS_TRANSITIONS	CLOB	The timestamps at which the invoice status was updated.
SUBSCRIPTION	VARCHAR2(4000)	The subscription that this invoice was prepared for, if any.
SUBTOTAL	NUMBER	Total of all subscriptions, invoice items, and prorations on the invoice before any invoice level discount or exclusive tax is applied.
SUBTOTAL_EXCLUDING_TAX	NUMBER	The integer amount in cents representing the subtotal of the invoice before any invoice level discount or tax is applied.
TAX	NUMBER	The amount of tax on this invoice.
THRESHOLD_REASON	CLOB	If billing_reason is set to subscription_threshold this returns more information on which threshold rules triggered the invoice.
TEST_CLOCK	VARCHAR2(4000)	ID of the test clock this invoice belongs to.
TOTAL	NUMBER	Total after discounts and taxes.
TOTAL_DISCOUNT_AMOUNTS	CLOB	The aggregate amounts calculated per discount across all line items.
TOTAL_EXCLUDING_TAX	NUMBER	The integer amount in cents representing the total amount of the invoice including all discounts but excluding all tax.
TOTAL_TAX_AMOUNTS	CLOB	The aggregate amounts calculated per tax rate for all line items.
TRANSFER_DATA	CLOB	The account (if any) the payment will be attributed to for tax reporting, and where funds from the payment will be transferred to for the invoice.
WEBHOOKS_DELIVERED_AT	VARCHAR2(4000)	This field tracks the time when webhooks for this invoice were successfully delivered.

STRIPE_PLANS View

STRIPE_PLANS lists the pricing plans defined in the Stripe account.

See Plans for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the plan.

Column	Datatype	Description
OBJECT	VARCHAR2(4000)	String representing the object type.
ACTIVE	VARCHAR2(4000)	Whether the plan is currently available for purchase.
AGGREGATE_USAGE	VARCHAR2(4000)	Specifies a usage aggregation strategy for plans of usage_type=metered.
AMOUNT	NUMBER	The unit amount in cents to be charged, represented as a whole integer.
AMOUNT_DECIMAL	VARCHAR2(4000)	The unit amount in cents to be charged, represented as a decimal string with at most 12 decimal places.
BILLING_SCHEME	VARCHAR2(4000)	Describes how to compute the price per period.
CREATED	VARCHAR2(4000)	Time at which the plan was created.
CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code, in lowercase.
DELETED	VARCHAR2(4000)	True if the plan is marked as deleted.
INTERVAL	VARCHAR2(4000)	The frequency at which a subscription is billed.
INTERVAL_COUNT	NUMBER	The number of intervals between subscription billings.
LIVEMODE	VARCHAR2(4000)	Has the value true if the plan exists in live mode or the value false if the plan exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an plan.
NICKNAME	VARCHAR2(4000)	A brief description of the plan, hidden from customers.
PRODUCT	VARCHAR2(4000)	ID of the product whose pricing this plan determines.
TIERS	CLOB	Each element represents a pricing tier.
TIERS_MODE	VARCHAR2(4000)	Defines if the tiering price should be graduated or volume based.
TRANSFORM_USAGE	CLOB	Apply a transformation to the reported usage or set quantity before computing the amount billed.
TRIAL_PERIOD_DAYS	NUMBER	Default number of trial days when subscribing a customer to this plan using trial_from_plan=true.
USAGE_TYPE	VARCHAR2(4000)	Configures how the quantity per period should be determined.

STRIPE_PRODUCTS View

STRIPE_PRODUCTS lists the query information about products defined in the Stripe account.

See Manage products and prices for additional information.

Column	Datatype	Description
ID	VARCHAR2(4000)	Unique identifier for the object.
OBJECT	VARCHAR2(4000)	String representing the object type.
ACTIVE	VARCHAR2(4000)	Whether the product is currently available for purchase.
CREATED	VARCHAR2(4000)	Time at which the object was created.
DEFAULT_PRICE	VARCHAR2(4000)	The ID of the Price object that is the default price for this product.
DESCRIPTION	VARCHAR2(4000)	The product description, meant to be displayable to the customer.
IMAGES	CLOB	A list of up to 8 URLs of images for this product, meant to be displayable to the customer.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NAME	VARCHAR2(4000)	The product name, meant to be displayable to the customer.
PACKAGE_DIMENSIONS	CLOB	The dimensions of this product for shipping purposes.
SHIPPABLE	VARCHAR2(4000)	Whether this product is shipped.
STATEMENT_DESCRIPTOR	VARCHAR2(4000)	Extra information about a product which will appear on your customers credit card statement.
TAX_CODE	VARCHAR2(4000)	A tax code ID.
UNIT_LABEL	VARCHAR2(4000)	A label that represents units of this product.
UPDATED	VARCHAR2(4000)	Time at which the object was last updated.
URL	VARCHAR2(4000)	A URL of a publicly-accessible webpage for this product.

STRIPE_SUBSCRIPTIONS View

STRIPE_SUBSCRIPTIONS lists the subscriptions managed in the Stripe account.

See Subscriptions for additional information.

Column	Datatype	Subscription
ID	VARCHAR2(4000)	Unique identifier for the object.

Column	Datatype	Subscription
OBJECT	VARCHAR2(4000)	String representing the object type.
APPLICATION	VARCHAR2(4000)	ID of the Connect Application that created the subscription.
APPLICATION_FEE_PERCENT	NUMBER	A non-negative decimal between 0 and 100, with at most two decimal places.
AUTOMATIC_TAX	CLOB	Automatic tax settings for this subscription.
BILLING_CYCLE_ANCHOR	VARCHAR2(4000)	Determines the date of the first full invoice, and, for plans with month or year intervals, the day of the month for subsequent invoices.
BILLING_THRESHOLDS	CLOB	Define thresholds at which an invoice will be sent, and the subscription advanced to a new billing period.
CANCEL_AT	VARCHAR2(4000)	A date in the future at which the subscription will automatically get canceled.
CANCEL_AT_PERIOD_END	VARCHAR2(4000)	If the subscription has been canceled with the at_period_end flag set to true, cancel_at_period_end on the subscription will be true.
CANCELED_AT	VARCHAR2(4000)	If the subscription has been canceled, the date of that cancellation.
COLLECTION_METHOD	VARCHAR2(4000)	Either charge_automatically, or send_invoice.
CREATED	VARCHAR2(4000)	Time at which the object was created.
CURRENCY	VARCHAR2(4000)	Three-letter ISO currency code, in lowercase.
CURRENT_PERIOD_END	VARCHAR2(4000)	End of the current period that the subscription has been invoiced for.
CURRENT_PERIOD_START	VARCHAR2(4000)	Start of the current period that the subscription has been invoiced for.
CUSTOMER	VARCHAR2(4000)	ID of the customer who owns the subscription.
DAYS_UNTIL_DUE	NUMBER	Number of days a customer has to pay invoices generated by this subscription.
DEFAULT_PAYMENT_METHOD	VARCHAR2(4000)	ID of the default payment method for the subscription.
DEFAULT_SOURCE	VARCHAR2(4000)	ID of the default payment source for the subscription.
DEFAULT_TAX_RATES	CLOB	The tax rates that will apply to any subscription item that does not have tax_rates set.

Column	Datatype	Subscription
DESCRIPTION	VARCHAR2(4000)	The subscription description, meant to be displayable to the customer.
DISCOUNT	CLOB	Describes the current discount applied to this subscription, if there is one.
ENDED_AT	VARCHAR2(4000)	If the subscription has ended, the date the subscription ended.
ITEMS	CLOB	List of subscription items, each with an attached price.
LATEST_INVOICE	VARCHAR2(4000)	The most recent invoice this subscription has generated.
LIVEMODE	VARCHAR2(4000)	Has the value true if the object exists in live mode or the value false if the object exists in test mode.
METADATA	CLOB	Set of key-value pairs that you can attach to an object.
NEXT_PENDING_INVOICE_ITEM_INVOICE	VARCHAR2(4000)	Specifies the approximate timestamp on which any pending invoice items will be billed acc to the schedule provided at pending_invoice_item_interval.
ON_BEHALF_OF	VARCHAR2(4000)	The account the charge was made on behalf of for charges associated with this subscription.
PAUSE_COLLECTION	CLOB	If specified, payment collection for this subscription will be paused.
PAYMENT_SETTINGS	VARCHAR2(4000)	Payment settings passed on to invoices created by the subscription.
PENDING_INVOICE_ITEM_INTERVAL	CLOB	Specifies an interval for how often to bill for any pending invoice items.
PENDING_SETUP_INTENT	VARCHAR2(4000)	For collecting user authentication when creating a subscription without immediate payment or updating a subscriptions payment method, allowing you to optimize for off-session payments.
PENDING_UPDATE	CLOB	If specified, pending updates that will be applied to the subscription once the latest_invoice has been paid.
SCHEDULE	CLOB	The schedule attached to the subscription.
START_DATE	VARCHAR2(4000)	Date when the subscription was first created.
STATUS	VARCHAR2(4000)	Possible values are incomplete, incomplete_expired, trialing, active, past_due, canceled, or unpaid.

Column	Datatype	Subscription
TEST_CLOCK	VARCHAR2(4000)	ID of the test clock this subscription belongs to.
TRANSFER_DATA	CLOB	The account the subscriptions payments will be attributed to for tax reporting, and where funds from each payment will be transferred to for each of the subscriptions invoices.
TRIAL_END	VARCHAR2(4000)	If the subscription has a trial, the end of that trial.
TRIAL_SETTINGS	VARCHAR2(4000)	Settings related to subscription trials.
TRIAL_START	VARCHAR2(4000)	If the subscription has a trial, the beginning of that trial.

Track DBMS_CLOUD Load Operations

DBMS_CLOUD tracks details for load operations for each instance and for users.

- DBA_LOAD_OPERATIONS and USER_LOAD_OPERATIONS Views
  USER_LOAD_OPERATIONS and DBA_LOAD_OPERATIONS views show the load operations in your schema or for all users. The USER_LOAD_OPERATIONS view does not display the USERNAME column.

DBA_LOAD_OPERATIONS and USER_LOAD_OPERATIONS Views

USER_LOAD_OPERATIONS and DBA_LOAD_OPERATIONS views show the load operations in your schema or for all users. The USER_LOAD_OPERATIONS view does not display the USERNAME column.

Column	Datatype	NULL	Description
ID	NUMBER	NOT NULL	Specifies the operation ID.
TYPE	VARCHAR2(128)	NOT NULL	Shows the operation type.
SID	NUMBER	NOT NULL	Session ID of the session.
SERIAL#	NUMBER	NOT NULL	
USERNAME	VARCHAR2(128)	NOT NULL	User ID of the user performing the operation. The USER_LOAD_OPERATIONS view does not display the USERNAME column.
START_TIME	TIMESTAMP(6) WITH TIME ZONE		Start time of the task.
UPDATE_TIME	TIMESTAMP(6) WITH TIME ZONE		Last update time for the task.
STATUS	VARCHAR2(9)		Status of the operation. Valid values are: COMPLETED, FAILED, PENDING, RUNNING, SKIPPED.
OWNER_NAME	VARCHAR2(128)		Schema that owns the operation.
TABLE_NAME	VARCHAR2(128)		
PARTITION_NAME	VARCHAR2(128)		

Column	Datatype	NULL	Description
SUBPARTITION_NAME	VARCHAR2(128)		
FILE_URI_LIST	VARCHAR2(4000)		This value shows either a comma-delimited list of source file URIs or one or more directories and source files that were specified in the FILE_URI_LIST parameter.
ROWS_LOADED	NUMBER		Number of rows loaded in the load operation.
LOGFILE_TABLE	VARCHAR2(128)		Shows the name of the table you can query to look at the log of a load operation.
BADFILE_TABLE	VARCHAR2(128)		Shows the name of the table you can query to look at the rows that got errors during loading.
STATUS_TABLE	VARCHAR2(128)		Shows the name of the status table for the load operation.
TEMPEXT_TABLE	VARCHAR2(128)		
CREDENTIAL_NAME	VARCHAR2(128)		
EXPIRATION_TIME	TIMESTAMP(9) WITH TIME ZONE		

Track DBMS_CLOUD Load Operations

DBMS_CLOUD tracks details for load operations for each instance and for users.

- DBA_LOAD_OPERATIONS and USER_LOAD_OPERATIONS Views
  USER_LOAD_OPERATIONS and DBA_LOAD_OPERATIONS views show the load operations in your schema or for all users. The USER_LOAD_OPERATIONS view does not display the USERNAME column.

DBA_LOAD_OPERATIONS and USER_LOAD_OPERATIONS Views

USER_LOAD_OPERATIONS and DBA_LOAD_OPERATIONS views show the load operations in your schema or for all users. The USER_LOAD_OPERATIONS view does not display the USERNAME column.

Column	Datatype	NULL	Description
ID	NUMBER	NOT NULL	Specifies the operation ID.
TYPE	VARCHAR2(128)	NOT NULL	Shows the operation type.
SID	NUMBER	NOT NULL	Session ID of the session.
SERIAL#	NUMBER	NOT NULL	
USERNAME	VARCHAR2(128)	NOT NULL	User ID of the user performing the operation. The USER_LOAD_OPERATIONS view does not display the USERNAME column.
START_TIME	TIMESTAMP(6) WITH TIME ZONE		Start time of the task.
UPDATE_TIME	TIMESTAMP(6) WITH TIME ZONE		Last update time for the task.

Column	Datatype	NULL	Description
STATUS	VARCHAR2(9)		Status of the operation. Valid values are: COMPLETED, FAILED, PENDING, RUNNING, SKIPPED.
OWNER_NAME	VARCHAR2(128)		Schema that owns the operation.
TABLE_NAME	VARCHAR2(128)		
PARTITION_NAME	VARCHAR2(128)		
SUBPARTITION_NAME	VARCHAR2(128)		
FILE_URI_LIST	VARCHAR2(4000)		This value shows either a comma-delimited list of source file URIs or one or more directories and source files that were specified in the FILE_URI_LIST parameter.
ROWS_LOADED	NUMBER		Number of rows loaded in the load operation.
LOGFILE_TABLE	VARCHAR2(128)		Shows the name of the table you can query to look at the log of a load operation.
BADFILE_TABLE	VARCHAR2(128)		Shows the name of the table you can query to look at the rows that got errors during loading.
STATUS_TABLE	VARCHAR2(128)		Shows the name of the status table for the load operation.
TEMPEXT_TABLE	VARCHAR2(128)		
CREDENTIAL_NAME	VARCHAR2(128)		
EXPIRATION_TIME	TIMESTAMP(9) WITH TIME ZONE		

Autonomous Database – Oracle Database Features

Describes Oracle Database features available with Autonomous Database.

Autonomous Database includes features that:

- Automate index management tasks, such as creating, rebuilding, and dropping indexes based on changes in the application workload.

  See Manage Automatic Indexing on Autonomous Database for more information.

  > **Note:**
  >
  > There are restrictions for Automatic Indexing when you use JSON data with Autonomous Database. See SODA Notes for more information.

- Gather real-time statistics automatically while a conventional DML workload is running. Because statistics can go stale between stats gathering jobs, online statistics gathering for conventional DML helps the optimizer generate more optimal plans. Online statistics aim to reduce the possibility of the optimizer being misled by stale statistics.

  See Real-Time Statistics for more information.

- Gather statistics automatically on a more frequent basis. High-Frequency Automatic Optimizer Statistics Collection complements the standard statistics collection job. By default, the collection occurs every 15 minutes, meaning that statistics have less time in

which to be stale. High-Frequency Automatic Optimizer Statistics Collection is enabled by default.

See Configuring High-Frequency Automatic Optimizer Statistics Collection for more information.

- Quarantine execution plans for SQL statements, for example, statements that are terminated by the Resource Manager for consuming excessive system resources in an Oracle Database. Automatic SQL Quarantine based on Resource Manager consumption limit violations is disabled by default but any manually quarantined SQL statement will be honored.

  See Quarantine for Execution Plans for SQL Statements Consuming Excessive System Resources for more information.

- Automatically assess the opportunity for SQL plan changes to improve the performance for known statements.

  See Managing the SPM Evolve Advisor Task for more information.

- Apache ORC format is supported in Autonomous Database for loading and querying data in object store.

  See Create Credentials and Load Data Pump Dump Files into an Existing Table and Query External Data with ORC, Parquet, or Avro Source Files for more information.

- Complex types are supported in Autonomous Database for ORC, Avro, and Parquet structured files.

  See DBMS_CLOUD Package Avro, ORC, and Parquet Complex Types for more information.

Autonomous Database with Oracle Database 23ai

When you provision or clone an Autonomous Database instance you can select either of these versions: Oracle Database 19c or Oracle Database 23ai.

See Provision an Autonomous Database Instance and Clone an Autonomous Database Instance for information on provisioning and cloning Autonomous Database.

Topics

- Autonomous Database with Oracle Database 23ai Features
  Autonomous Database with Oracle Database 23ai offers many new innovative autonomous features and provides developer-oriented functionality.
- Autonomous Database with Oracle Database 23ai Notes
  If you are using Autonomous Database with Oracle Database 23ai, the following regions support Oracle Database 23ai.

Autonomous Database with Oracle Database 23ai Features

Autonomous Database with Oracle Database 23ai offers many new innovative autonomous features and provides developer-oriented functionality.

If you use Autonomous Database with Oracle Database 23ai, then many of the concepts and features of this service are further documented here:

- Oracle Database 23ai
- *Oracle Database New Features*

Autonomous Database with Oracle Database 23ai Notes

If you are using Autonomous Database with Oracle Database 23ai, the following regions support Oracle Database 23ai.

- Autonomous Database with Oracle Database 23ai in the Paid tier is available in all commercial public cloud regions.

  See Provision an Autonomous Database Instance for more information.

- Always Free Autonomous Database with Oracle Database 23ai is available in all commercial public cloud regions *except* the following regions: Colombia Central: Bogota (BOG), Saudi Arabia Central (RUH), Singapore West: Singapore (XSP)
  See Provision an Autonomous Database Instance for more information.

See Database Features Unavailable in Autonomous Database for information on Oracle Database features not available on Autonomous Database.

Autonomous Database RMAN Recovery Catalog

You can use Oracle Autonomous Database as a Recovery Manager (RMAN) recovery catalog. A recovery catalog is a database schema that RMAN uses to store metadata about one or more Oracle databases.

- Use Autonomous Database as an RMAN Recovery Catalog
  Recovery Manager (RMAN) recovery catalog is preinstalled in Autonomous Database in schema `RMAN$CATALOG`. The preinstalled catalog version is based on the latest version of Oracle Database and is compatible with all supported Oracle database versions.

Use Autonomous Database as an RMAN Recovery Catalog

Recovery Manager (RMAN) recovery catalog is preinstalled in Autonomous Database in schema `RMAN$CATALOG`. The preinstalled catalog version is based on the latest version of Oracle Database and is compatible with all supported Oracle database versions.

The recovery catalog contains metadata about RMAN operations for each registered target database. When RMAN is connected to a recovery catalog, RMAN obtains its metadata exclusively from the catalog.

> **Note:**
>
> Autonomous Database is not supported as an RMAN target database. An RMAN target database is an Oracle Database to which RMAN is connected with the `TARGET` keyword. A target database is a database on which RMAN is performing backup and recovery operations. See Backup and Restore Autonomous Database Instances for information on Autonomous Database backup and recovery operations.

Access to RMAN Recovery Catalog

Access to the recovery catalog is provided through predefined user `RMAN$CATALOG` with the appropriate access to the recovery catalog only. The `RMAN$CATALOG` user is locked by default.

You can either proxy to the predefined user `RMAN$CATALOG` through the ADMIN user or explicitly unlock the preinstalled schema:

- ADMIN user proxy into `RMAN$CATALOG` using ADMIN user's password:

  ```
  connect admin[rman$catalog]/password@connect_string
  ```

- ADMIN user can set a password for `RMAN$CATALOG`. Then the `RMAN$CATALOG` user can directly connect:

  ```
  connect admin/password@connect_string
  alter user rman$catalog identified by password account unlock;
  connect rman$catalog/password@connect_string
  ```

Use the RMAN Recovery Catalog

You can use the RMAN recovery catalog by connecting RMAN to the preinstalled recovery catalog. Registering a target database in the recovery catalog maintains the database's records in the recovery catalog. For example, to register a target database:

```
RMAN> connect catalog rman$catalog/password@connect_string;

connected to recovery catalog database
recovery catalog schema version 21.01.00.00. is newer than RMAN version

RMAN> register database;
database registered in recovery catalog
starting full resync of recovery catalog
```

To use your Autonomous Database as a recovery catalog, it is recommended to connect with the `LOW` service.

See Registering a Database in the Recovery Catalog for more details about using the RMAN recovery catalog.

Notes for Users Migrating from Other Oracle Databases

Describes information that is useful when you are migrating from other Oracle Databases to Oracle Autonomous Database.

- Initialization Parameters
  Autonomous Database configures database initialization parameters automatically when you provision a database. You do not need to set any initialization parameters to start using your service. But, you can modify some parameters if you need to.
- SQL Commands
  Autonomous Database allows most of the SQL commands available in Oracle Database. To ensure the security and the performance of Autonomous Database, some SQL commands are restricted.
- Data Types
  Autonomous Database allows most of the data types available in Oracle Database. To ensure the security and the performance of Autonomous Database, some data types are restricted.
- PL/SQL Package Notes for Autonomous Database
  Notes for Oracle Database PL/SQL packages in Autonomous Database.

- ADMIN User Roles and Privileges
  In Autonomous Database the predefined administrative user is ADMIN and this account has privileges to manage users and to manage the database.
- Oracle XML DB
  Describes Autonomous Database support for Oracle XML DB features. To ensure the security and the performance of your Autonomous Database, some Oracle XML DB features are restricted.
- Oracle Text
  Describes Autonomous Database support for Oracle Text features. To ensure the security and the performance of your Autonomous Database, some Oracle Text features are restricted.
- Oracle Flashback
  Oracle Flashback Technology is a group of Oracle Database features that let you view past states of database objects or to return database objects to a previous state without using point-in-time media recovery.
- Oracle Database Real Application Security
  Oracle Database Real Application Security is a database authorization model that: supports declarative security policies, enables end-to-end security for multitier applications, provides an integrated solution to secure database and application resources, and advances the security architecture of Oracle Database to meet existing and emerging demands of applications developed for the Internet.
- Oracle LogMiner
  Describes restrictions for Oracle LogMiner on Autonomous Database.
- Choose a Character Set for Autonomous Database
- Query the Alert Log
  You can query the database alert log using `V$DIAG_ALERT_EXT` to search for log data.

Initialization Parameters

Autonomous Database configures database initialization parameters automatically when you provision a database. You do not need to set any initialization parameters to start using your service. But, you can modify some parameters if you need to.

Modifiable Initialization Parameters

The following table shows the initialization parameters that are only modifiable with `ALTER SESSION`.

Only Modifiable with ALTER SESSION	More Information
CONSTRAINTS	
CONTAINER	
CURRENT_SCHEMA	
CURSOR_INVALIDATION	CURSOR_INVALIDATION
DEFAULT_COLLATION	
DEFAULT_CREDENTIAL	
EDITION	
ISOLATION_LEVEL	
JSON_BEHAVIOR	This parameter is only applicable with Oracle Database 23ai. See JSON_BEHAVIOR for more information.

Only Modifiable with ALTER SESSION	More Information
JSON_EXPRESSION_CHECK	JSON_EXPRESSION_CHECK
OPTIMIZER_SESSION_TYPE	OPTIMIZER_SESSION_TYPE
OPTIMIZER_USE_INVISIBLE_INDEXES	OPTIMIZER_USE_INVISIBLE_INDEXES
READ_ONLY	
SQL_TRACE	See Perform SQL Tracing on Autonomous Database for details
SQL_TRANSLATION_PROFILE	
SQL_TRANSPILER	This parameter is only applicable with Oracle Database 23ai. See SQL_TRANSPILER for more information.
STATISTICS_LEVEL	STATISTICS_LEVEL
TIME_ZONE	For more information on TIME_ZONE, see *Oracle Database SQL Language Reference*.
XML_PARAMS	This parameter is only applicable with Oracle Database 23ai. See XML_PARAMS for more information.

The following table shows the initialization parameters that are only modifiable with ALTER SYSTEM.

Only Modifiable with ALTER SYSTEM	More Information
BLANK_TRIMMING	BLANK_TRIMMING
FIXED_DATE	FIXED_DATE
JOB_QUEUE_PROCESSES	JOB_QUEUE_PROCESSES
LOCKDOWN_ERRORS	See LOCKDOWN_ERRORS for details
MAX_IDLE_BLOCKER_TIME	MAX_IDLE_BLOCKER_TIME With a value higher than 5, the parameter acts as if it was set to 5
MAX_IDLE_TIME	MAX_IDLE_TIME By default MAX_IDLE_TIME is set 1440. Setting the MAX_IDLE_TIME value to 0 or to a value higher than 1440, the parameter acts as if it was set to 1440.
SESSION_EXIT_ON_PACKAGE_STATE_ERROR	SESSION_EXIT_ON_PACKAGE_STATE_ERROR

The following table shows the initialization parameters that are modifiable with either ALTER SESSION or ALTER SYSTEM.

Modifiable with ALTER SESSION or ALTER SYSTEM	More Information
APPROX_FOR_AGGREGATION	APPROX_FOR_AGGREGATION
APPROX_FOR_COUNT_DISTINCT	APPROX_FOR_COUNT_DISTINCT
APPROX_FOR_PERCENTILE	APPROX_FOR_PERCENTILE
CLIENT_PREFETCH_ROWS	See CLIENT_PREFETCH_ROWS
CONTAINER_DATA	CONTAINER_DATA
CURSOR_SHARING	CURSOR_SHARING
DDL_LOCK_TIMEOUT	DDL_LOCK_TIMEOUT

Modifiable with ALTER SESSION or ALTER SYSTEM	More Information
GROUP_BY_POSITION	
GROUP_BY_POSITION_ENABLED	This parameter is only applicable with Oracle Database 23ai. See GROUP_BY_POSITION_ENABLED for more information
HEAT_MAP	HEAT_MAP
IGNORE_SESSION_SET_PARAM_ERRORS	IGNORE_SESSION_SET_PARAM_ERRORS
LDAP_DIRECTORY_ACCESS	LDAP_DIRECTORY_ACCESS
LOAD_WITHOUT_COMPILE	
MAX_STRING_SIZE	See Data Types for details
NLS_CALENDAR	NLS_CALENDAR
NLS_COMP	NLS_COMP
NLS_CURRENCY	NLS_CURRENCY
NLS_DATE_FORMAT	NLS_DATE_FORMAT
NLS_DATE_LANGUAGE	NLS_DATE_LANGUAGE
NLS_DUAL_CURRENCY	NLS_DUAL_CURRENCY
NLS_ISO_CURRENCY	NLS_ISO_CURRENCY
NLS_LANGUAGE	NLS_LANGUAGE
NLS_LENGTH_SEMANTICS	NLS_LENGTH_SEMANTICS
NLS_NCHAR_CONV_EXCP	NLS_NCHAR_CONV_EXCP
NLS_NUMERIC_CHARACTERS	NLS_NUMERIC_CHARACTERS
NLS_SORT	NLS_SORT
NLS_TERRITORY	NLS_TERRITORY
NLS_TIME_FORMAT	
NLS_TIME_TZ_FORMAT	
NLS_TIMESTAMP_FORMAT	NLS_TIMESTAMP_FORMAT
NLS_TIMESTAMP_TZ_FORMAT	NLS_TIMESTAMP_TZ_FORMAT
OPTIMIZER_CAPTURE_SQL_QUARANTINE	OPTIMIZER_CAPTURE_SQL_QUARANTINE
OPTIMIZER_IGNORE_HINTS	For more information on OPTIMIZER_IGNORE_HINTS, see Manage Optimizer Statistics on Autonomous Database.
OPTIMIZER_IGNORE_PARALLEL_HINTS	For more information on OPTIMIZER_IGNORE_PARALLEL_HINTS, see Manage Optimizer Statistics on Autonomous Database.
OPTIMIZER_MODE	OPTIMIZER_MODE
OPTIMIZER_REAL_TIME_STATISTICS	OPTIMIZER_REAL_TIME_STATISTICS
OPTIMIZER_USE_SQL_QUARANTINE	OPTIMIZER_USE_SQL_QUARANTINE
PLSCOPE_SETTINGS	PLSCOPE_SETTINGS
PLSQL_CCFLAGS	PLSQL_CCFLAGS
PLSQL_DEBUG	PLSQL_DEBUG
PLSQL_IMPLICIT_CONVERSION_BOOL	This parameter is only applicable with Oracle Database 23ai. See PLSQL_IMPLICIT_CONVERSION_BOOL
PLSQL_OPTIMIZE_LEVEL	PLSQL_OPTIMIZE_LEVEL
PLSQL_WARNINGS	PLSQL_WARNINGS

Modifiable with ALTER SESSION or ALTER SYSTEM	More Information
QUERY_REWRITE_INTEGRITY	QUERY_REWRITE_INTEGRITY
RECYCLEBIN	RECYCLEBIN
REMOTE_DEPENDENCIES_MODE	REMOTE_DEPENDENCIES_MODE
RESULT_CACHE_INTEGRITY	See RESULT_CACHE_INTEGRITY
RESULT_CACHE_MODE	See RESULT_CACHE_MODE
SKIP_UNUSABLE_INEDEXES	SKIP_UNUSABLE_INDEXES
SQL_HISTORY_ENABLED	This parameter is available starting with Oracle Database 23ai. See SQL_HISTORY_ENABLED for more information.
SYSDATE_AT_DBTIMEZONE	See SYSDATE_AT_DBTIMEZONE Select a Time Zone for SYSDATE on Autonomous Database
XML_CLIENT_SIDE_DECODING	See XML_CLIENT_SIDE_DECODING

For more information on initialization parameters see *Oracle Database Reference*.

- SESSION_EXIT_ON_PACKAGE_STATE_ERROR
  SESSION_EXIT_ON_PACKAGE_STATE_ERROR enables or disables special handling for stateful PL/SQL packages running in a session.
- SYSDATE_AT_DBTIMEZONE Select a Time Zone for SYSDATE on Autonomous Database
- CLIENT_PREFETCH_ROWS
- JOB_QUEUE_PROCESSES
- LOCKDOWN_ERRORS
  Set the LOCKDOWN_ERRORS parameter to control whether Autonomous Database lockdown profile errors are raised or ignored.
- RESULT_CACHE_INTEGRITY
  Set the RESULT_CACHE_INTEGRITY parameter to specify whether the result cache considers queries using possibly non-deterministic constructs as candidates for result caching.
- RESULT_CACHE_MODE
  Set the RESULT_CACHE_MODE parameter to specify which queries are eligible to store result sets in the result cache. Only query execution plans with the result cache operator will attempt to read from or write to the result cache.

SESSION_EXIT_ON_PACKAGE_STATE_ERROR

SESSION_EXIT_ON_PACKAGE_STATE_ERROR enables or disables special handling for stateful PL/SQL packages running in a session.

Property	Description
Parameter type	Boolean
Default Value	FALSE
Modifiable	ALTER SYSTEM
Range of values	TRUE | FALSE

SESSION_EXIT_ON_PACKAGE_STATE_ERROR specifies the handling for a stateful PL/SQL package running in a session. When such a package undergoes modification, such as during planned

maintenance for Oracle-supplied objects, the sessions that have an active instantiation of the package receive the following error when they attempt to run the package:

```
ORA-4068 existing state of package has been discarded
```

However, the application code that receives the `ORA-4068` error may not be equipped to handle this error with its retry logic.

Setting `SESSION_EXIT_ON_PACKAGE_STATE_ERROR` to `TRUE` provides different handling for this case. When `SESSION_EXIT_ON_PACKAGE_STATE_ERROR` is `TRUE`, instead of just raising the `ORA-4068` error when the package state is discarded, the session immediately exits. This can be advantageous because many applications are able to handle session termination by automatically and transparently re-establishing the connection.

SYSDATE_AT_DBTIMEZONE Select a Time Zone for SYSDATE on Autonomous Database

`SYSDATE_AT_DBTIMEZONE` enables special handling in a session for the date and time value returned in calls to `SYSDATE` and `SYSTIMESTAMP`.

Depending on the value of `SYSDATE_AT_DBTIMEZONE`, you see either the date and time based on the default Autonomous Database time zone, Coordinated Universal Time (UTC), or based on the time zone that you set in your database.

Property	Description
Parameter type	Boolean
Default Value	`FALSE`
Modifiable	`ALTER SESSION`, `ALTER SYSTEM`
Range of values	`TRUE` | `FALSE`

Default Autonomous Database Time Zone

The default Autonomous Database time zone is Coordinated Universal Time (UTC) and by default calls to `SYSDATE` and `SYSTIMESTAMP` return the date and time in UTC.

In order to change database time zone, you can run the following statement.

This example sets the database time zone to `UTC-5`.

```
ALTER DATABASE SET TIME_ZONE='-05:00';
```

This example sets the database time zone for the US east coast: `America/New_York` and the time is automatically adjusted at DST switches:

```
ALTER DATABASE SET TIME_ZONE='America/New_York';
```

> **Note:**
>
> You must restart the Autonomous Database instance for the change to take effect.

After you set the database time zone, by default `SYSDATE` and `SYSTIMESTAMP` continue to return date and time in UTC (`SYSDATE_AT_DBTIMEZONE` is `FALSE` by default). If you set

SYSDATE_AT_DBTIMEZONE to TRUE in a session, SYSDATE and SYSTIMESTAMP return the database time zone.

See *Setting the Database Time Zone* in Oracle Database 19c or Oracle Database 23ai for more information on using the SET TIME_ZONE clause with ALTER DATABASE.

Using SYSDATE_AT_DBTIMEZONE in a Session

When SYSDATE_AT_DBTIMEZONE is FALSE in a session, calls to SYSDATE and SYSTIMESTAMP return values based on the default Autonomous Database time zone, Coordinated Universal Time (UTC).

When SYSDATE_AT_DBTIMEZONE is TRUE in a session, calls to SYSDATE or SYSTIMESTAMP return the date and time based on the database time zone.

> **Note:**
>
> Setting SYSDATE_AT_DBTIMEZONE to TRUE only affects the use of SYSDATE and SYSTIMESTAMP as operators in application SQL (for example, in queries, DML, and CTAS operations). When using this parameter, it is recommended that your client/session timezone matches your database timezone.

Example

The following example returns dates and times for two different time zones, based on the SYSDATE_AT_DBTIMEZONE parameter value:

```
SQL> SELECT DBTIMEZONE FROM DUAL;

DBTIMEZONE
_____________
-05:00

SQL> ALTER SESSION SET SYSDATE_AT_DBTIMEZONE=FALSE;

Session altered.

SQL> SELECT SYSTIMESTAMP FROM DUAL;

SYSTIMESTAMP
_____________________________________
27-JAN-22 06.59.45.708082000 PM GMT

SQL> ALTER SESSION SET SYSDATE_AT_DBTIMEZONE=TRUE;

Session altered.

SQL> SELECT SYSTIMESTAMP FROM DUAL;

SYSTIMESTAMP
_____________________________________
27-JAN-22 02.14.47.578946000 PM -05:00
```

> **Note:**
>
> When a `SYSDATE` or `SYSTIMESTAMP` query is executed in SQL Worksheet of Database Actions, the time and date value that is returned is in UTC (when `SYSDATE_AT_DBTIMEZONE` parameter is set to `TRUE` or `FALSE`). To obtain the database time zone when working in Database Actions, use `TO_CHAR()` as follows:
>
> ```
> SQL> SELECT TO_CHAR(SYSTIMESTAMP,'YYYY-MM-DD"T"HH24:MI:SS TZH":"TZM')
> FROM DUAL;
>
> TO_CHAR(SYSTIMESTAMP,'YYYY-MM-DD"T"HH24:MI:SSTZH":"TZM')
> ____________________________________________________________
> 2022-01-27T14:15:00 -05:00
> ```

CLIENT_PREFETCH_ROWS

Set the `CLIENT_PREFETCH_ROWS` parameter to enable clients to reduce the number of roundtrips required while fetching rows of a query result set.

`CLIENT_PREFETCH_ROWS` specifies the number of rows to be prefetched by the Oracle client driver, without making any changes to the client application. The client driver buffers the prefetched rows after each successful query execution and for each subsequent fetch request sent to the database.

This parameter applies only to clients that use Oracle Call Interface (OCI) to connect to the database.

This parameter applies only with Oracle Instant Client/Oracle Database Client 19.17 (or later) and 21.8 (or later), for all platforms.

Property	Description
Parameter type	Integer
Syntax	`CLIENT_PREFETCH_ROWS = integer`
Default Value	`0` (Only client-side settings apply)
Modifiable	`ALTER SYSTEM`, `ALTER SESSION`
Range of values	`0` to `UB4MAXVAL` (`4294967295`)
Basic	No

The `CLIENT_PREFETCH_ROWS` parameter can be set with `ALTER SESSION` or `ALTER SYSTEM`. If the parameter value changes using `ALTER SESSION`, the new value becomes effective for that specific session on subsequent resultset fetches. If the parameter value changes using `ALTER SYSTEM`, the new value takes effect for the statements that run on connections created after the `ALTER SYSTEM` command.

For example, if `CLIENT_PREFETCH_ROWS` is set to 100 and a client application asks to fetch 10 rows, a total of 110 rows are returned to the client driver. The first 10 rows out of the 110 rows are given to the application, and the client driver internally buffers the remaining 100 rows. The next 10 row fetches from the client application, each with 10 rows per fetch iteration can be fulfilled from the 100 rows that are internally buffered by the client driver. This process reduces the number of required network roundtrips to and from the database. In this example, on the

11th fetch, a new network roundtrip is incurred and the database returns the next batch of 110 rows, as long as the result set is not exhausted, and the cycle repeats.

Notes for setting `CLIENT_PREFETCH_ROWS`:

- When `CLIENT_PREFETCH_ROWS` is set to a non-zero value, its value takes precedence over the default `OCI_ATTR_PREFETCH_ROWS` value for prefetch row count.
- If the `OCI_ATTR_PREFETCH_ROWS` value is set to a non-default value, then the `CLIENT_PREFETCH_ROWS` value is ignored for the prefetch row count.
- Using `CLIENT_PREFETCH_ROWS` with `OCIAttrSet()`:

  `OCI_ATTR_PREFETCH_ROWS` sets the number of top-level rows to be prefetched. The default value is 1 row. However, if `CLIENT_PREFETCH_ROWS` is set, the number of top-level rows to be prefetched is determined by the following precedence:

  1. If you set the `OCI_ATTR_PREFETCH_ROWS` attribute using `OCIAttrSet()` function or `oraaccess.xml` as the value '1', then the database initialization parameter `CLIENT_PREFETCH_ROWS` value takes precedence and determines the number of top-level rows to be prefetched.
  2. If you set the `OCI_ATTR_PREFETCH_ROWS` attribute using `OCIAttrSet()` function or `oraaccess.xml` as the value '*x*' other than 1, then '*x*' number of top-level rows will be prefetched, and the database initialization parameter `CLIENT_PREFETCH_ROWS` is ignored.
  3. If you do not set an `OCI_ATTR_PREFETCH_ROWS` value using `OCIAttrSet()` or `oraaccess.xml`, then the database initialization parameter `CLIENT_PREFETCH_ROWS` value takes precedence and determines the number of top-level rows to be prefetched.
- Using `CLIENT_PREFETCH_ROWS` with `OCIAttrGet()`:

  The function `OCIAttrGet()` returns the effective prefetch row value set from `OCI_ATTR_PREFETCH_ROWS`, `oraaccess.xml` and the database initialization parameter `CLIENT_PREFETCH_ROWS`. If the `OCI_ATTR_PREFETCH_MEMORY` value is set, the value returned by `OCIAttrGet()` might not be the final prefetch rows value and may be restricted to the maximum number of rows allowed by the memory value specified by the `OCI_ATTR_PREFETCH_MEMORY` attribute.

See Also:

- *Oracle Call Interface Developer's Guide* for more information about fetching results and setting the prefetch count.
- OCIAttrSet()
- OCI_ATTR_PREFETCH_ROWS

JOB_QUEUE_PROCESSES

Set the `JOB_QUEUE_PROCESSES` parameter to specify the maximum number of job workers that can be created to run Oracle Scheduler (`DBMS_SCHEDULER`) jobs.

Setting the value to 0 disables non-Oracle supplied Scheduler jobs.

Property	Description
Parameter type	Integer
Syntax	`JOB_QUEUE_PROCESSES = integer`
Default Value	The default value depends on the **ECPU count** (**OCPU count** if your database uses OCPUs) and the setting for **ECPU auto scaling** (**OCPU auto scaling** if your database uses OCPUs). See the following table for details.
Modifiable	`ALTER SYSTEM`
Range of values	Minimum value: `0` Maximum value depends on the **ECPU count** (**OCPU count** if your database uses OCPUs) and the setting for **ECPU auto scaling** (**OCPU auto scaling** if your database uses OCPUs), as shown in the following table.

The default and maximum values for `JOB_QUEUE_PROCESSES` differ depending on the compute model you use. See Compute Models in Autonomous Database for more information.

Compute Model	Default and Maximum Value with Auto Scaling Disabled	Default and Maximum Value with Auto Scaling Enabled
ECPU	7.5 x ECPU count	22.5 x ECPU count
OCPU	30 x OCPU count	90 x OCPU count

Oracle Scheduler job coordinator and job workers are controlled by the `JOB_QUEUE_PROCESSES` parameter. The actual number of job workers created for Oracle Scheduler jobs is auto-tuned by the Scheduler depending on several factors, including available resources, Resource Manager settings, and currently running jobs.

The default value for `JOB_QUEUE_PROCESSES` provides a compromise between quality of service for applications and reasonable use of system resources. However, it is possible that the default value does not suit every environment.

Setting the value of `JOB_QUEUE_PROCESSES` to 0 disables non-Oracle supplied Scheduler jobs. When `JOB_QUEUE_PROCESSES` is set to `0` this does not disable any internal jobs for Oracle-supplied users (service related jobs run by Oracle-supplied users continue to be scheduled).

Oracle-supplied users are users marked as `ORACLE_MAINTAINED` with value `Y`. Non Oracle-supplied users are users marked as `ORACLE_MAINTAINED` with value `N`.

See ALL_USERS for more information.

LOCKDOWN_ERRORS

Set the `LOCKDOWN_ERRORS` parameter to control whether Autonomous Database lockdown profile errors are raised or ignored.

Autonomous Database uses lockdown profiles to restrict certain database functionality and features. By default the database raises an error whenever you attempt to run a SQL command that is restricted by the Autonomous Database lockdown profile. The `LOCKDOWN_ERRORS` parameter allows you to suppress lockdown profile errors. Additionally, when `LOCKDOWN_ERRORS` is set to the value `IGNORE`, upon ignoring an error the database logs the details regarding the SQL statement, user, and timestamp for the command.

> **Note:**
>
> Carefully evaluate your existing scripts before you set the value of this parameter to `IGNORE`. When you set the value to `IGNORE`, any existing scripts you use will no longer raise lockdown errors.

You can use `DBA_LOCKDOWN_ERRORS` view to obtain information on lockdown profile errors. See Lockdown Errors View for more information.

Property	Description
Parameter type	String
Syntax	`LOCKDOWN_ERRORS = IGNORE | RAISE`
Default Value	The default value is `RAISE`.
Modifiable	`ALTER SYSTEM`
Valid values	`RAISE`: Raise lockdown profile errors. `IGNORE`: Suppress lockdown profile errors.

RESULT_CACHE_INTEGRITY

Set the `RESULT_CACHE_INTEGRITY` parameter to specify whether the result cache considers queries using possibly non-deterministic constructs as candidates for result caching.

Property	Description
Parameter type	String
Syntax	`RESULT_CACHE_INTEGRITY = { ENFORCED | TRUSTED }`
Default Value	For Autonomous Database the default value is: `ENFORCED`
Modifiable	`ALTER SYSTEM`

Values

- `ENFORCED`: Irrespective of the setting of `RESULT_CACHE_MODE` or specified hints, only deterministic constructs are eligible for result caching. For example, queries using PL/SQL functions that are not declared as deterministic are never cached (unless the functions are declared as deterministic the query results with such functions will not be cached).
- `TRUSTED`: The database honors the setting of `RESULT_CACHE_MODE` and specified hints and will consider queries using possibly non-deterministic constructs as candidates for result caching. For example, queries using PL/SQL functions that are not declared as deterministic can be cached. Note, however, that results that are known to be non-deterministic are not cached (for example `SYSDATE` or constructs involving `SYSDATE`).

RESULT_CACHE_MODE

Set the `RESULT_CACHE_MODE` parameter to specify which queries are eligible to store result sets in the result cache. Only query execution plans with the result cache operator will attempt to read from or write to the result cache.

Property	Description
Parameter type	String

Property	Description
Syntax	`RESULT_CACHE_MODE = { MANUAL | MANUAL_TEMP | FORCE | FORCE_TEMP }`
Default Value	For Autonomous Database with workload type set to Data Warehouse: `FORCE` For workload types Transaction Processing, JSON, or APEX: `MANUAL`
Modifiable	`ALTER SESSION`, `ALTER SYSTEM`

See RESULT_CACHE_MODE for more information.

- Using SQL Result Cache Hints
  Use result cache hints at the application level to control caching behavior. The SQL result cache hints take precedence over the result cache mode and result cache table annotations.

Using SQL Result Cache Hints

Use result cache hints at the application level to control caching behavior. The SQL result cache hints take precedence over the result cache mode and result cache table annotations.

You can use SQL result cache hints in the following ways:

- Using the `RESULT_CACHE` Hint
- Using the `NO_RESULT_CACHE` Hint
- Using the `RESULT_CACHE` Hint in Views

Using the `RESULT_CACHE` Hint

When the result cache mode is `MANUAL`, the `/*+ RESULT_CACHE */` hint instructs the database to cache the results of a query block and to use the cached results in future executions.

See Using the RESULT_CACHE Hint and RESULT_CACHE Hint for more information.

Using the `NO_RESULT_CACHE` Hint

The `/*+ NO_RESULT_CACHE */` hint instructs the database not to cache the results in either the server or client result caches.

See Using the NO_RESULT_CACHE Hint and RESULT_CACHE Hint for more information.

Using the `RESULT_CACHE` Hint in Views

The `RESULT_CACHE` hint applies only to the query block in which the hint is specified. If the hint is specified only in a view, then only these results are cached.

See Using the RESULT_CACHE Hint in Views and RESULT_CACHE Hint for more information.

SQL Commands

Autonomous Database allows most of the SQL commands available in Oracle Database. To ensure the security and the performance of Autonomous Database, some SQL commands are restricted.

This section provides a list of SQL command limitations that are required to protect security and for the performance integrity of Autonomous Databases. Most of the standard SQL and PL/SQL syntax and constructs available with Oracle Database work in Autonomous Databases.

> **Note:**
>
> If you try to use a restricted SQL command the system reports:
>
> `ORA-01031: insufficient privileges`
>
> This error indicates that you are not allowed to run the SQL command in Autonomous Database.

The following SQL statements are not available in Autonomous Database:

- `ADMINISTER KEY MANAGEMENT`: By default Autonomous Database uses Oracle-managed encryption keys. Using Oracle-managed keys, Autonomous Database creates and manages the encryption keys that protect your data and Oracle handles rotation of the TDE master key.

  If you want customer-managed keys, a master encryption key in the Oracle Cloud Infrastructure Vault is used to generate the TDE master key on Autonomous Database. See Managing Encryption Keys on Autonomous Database for more information.
- `CREATE TABLESPACE`, `ALTER TABLESPACE`, and `DROP TABLESPACE`: Autonomous Database automatically configures default data and temporary tablespaces for the database. Adding, removing, or modifying tablespaces is not allowed. Autonomous Database creates one tablespace or multiple tablespaces automatically depending on the storage size.
- `CREATE DATABASE LINK`

  Use `DBMS_CLOUD_ADMIN.CREATE_DATABASE_LINK` to create database links in Autonomous Database. See Use Database Links with Autonomous Database for more information.
- `CREATE LIBRARY`
- `DROP DATABASE LINK`

  Use `DBMS_CLOUD_ADMIN.DROP_DATABASE_LINK` to drop database links in Autonomous Database. See Use Database Links with Autonomous Database for more information.

Roles and Views Restrictions for Data Dictionary

Granting `SELECT ANY DICTIONARY` does not provide access to the `SYS`/`SYSTEM` schemas. You can grant `SELECT_CATALOG_ROLE` to allow `SELECT` privileges on all data dictionary views, if needed.

SQL Statements with Restrictions in Autonomous Database

The following DDL statements are available in Autonomous Database with some restrictions:

SQL Command	Restrictions

`ALTER PLUGGABLE DATABASE` and `ALTER DATABASE`	Only the following clauses are allowed:
	`DEFAULT EDITION`
	`SET TIME_ZONE`
	`SET CMU_WALLET`

`ALTER PROFILE`	Using `ALTER PROFILE`, there are restrictions for a user defined `PASSWORD_VERIFY_FUNCTION`. See Manage Password Complexity on Autonomous Database for more information. Using `ALTER PROFILE`, the optional `CONTAINER` clause is ignored if specified. See Create Users on Autonomous Database for information on the password parameter values defined in the default profile.

`ALTER SESSION`	Only the following clauses are allowed:
	`ADVISE COMMIT`, `ADVISE ROLLBACK`, `ADVISE NOTHING`
	`CLOSE DATABASE LINK`
	`ENABLE COMMIT IN PROCEDURE`, `DISABLE COMMIT IN PROCEDURE`
	`ENABLE PARALLEL` <`QUERY`|`DDL`|`DML`>, `DISABLE PARALLEL` <`QUERY`|`DDL`|`DML`>, `FORCE PARALLEL` <`QUERY`|`DDL`|`DML`>
	`ENABLE RESUMABLE`, `DISABLE RESUMABLE`
	`SET CONSTRAINTS`
	`SET CURRENT_SCHEMA`
	`SET DEFAULT_COLLATION`
	`SET EDITION`
	`SET ISOLATION_LEVEL`
	`SET OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES`
	`SET ROW ARCHIVAL VISIBILITY`
	`SET STATISTICS_LEVEL`
	`SET TIME_ZONE`

`ALTER SYSTEM`	`ALTER SYSTEM` is not allowed except `ALTER SYSTEM SET` and `ALTER SYSTEM KILL SESSION` `SET` can only be used to set parameters listed in Initialization Parameters.
`ALTER USER`	The following clause is ignored: `DEFAULT TABLESPACE` The `IDENTIFIED` with the `EXTERNALLY` clause is not supported. The `IDENTIFIED BY VALUES` clause is not allowed.
`ALTER TABLE`	For restrictions, see `ALTER TABLE` Restrictions.
`CREATE PROFILE`	`PASSWORD_VERIFY_FUNCTION` See Manage Password Complexity on Autonomous Database for more information. Using `ALTER PROFILE`, the optional `CONTAINER` clause is ignored if specified. See Create Users on Autonomous Database for information on the password parameter values defined in the default profile.

SQL Command	Restrictions
`CREATE TABLE`	For restrictions, see `CREATE TABLE` Restrictions.
`CREATE OR REPLACE TRIGGER`	The `AFTER STARTUP` and `BEFORE SHUTDOWN` events are not supported with `CREATE OR REPLACE TRIGGER`.
`CREATE USER`	The following clause is ignored: • `DEFAULT TABLESPACE` `IDENTIFIED` with the `EXTERNALLY` clause is not supported. The `IDENTIFIED BY VALUES` clause is not allowed.

CREATE TABLE Restrictions

`XMLType` tables using XML schema-based storage are not allowed. See Oracle XML DB for more information.

The clauses not in this list are allowed.

Clause	Comment
`cluster`	Ignored
`ilm_clause`	Ignored
`inmemory_table_clause`	Ignored
`LOB_storage_clause`	The `LOB_compression_clause` is recognized. Other `LOB_storage_clause` parameters are ignored. See LOB_compression_clause for more information.
`logging_clause`	Ignored
`organization external`	Ignored
`organization index`	Creates a regular table with a primary key. Using the `organization index` clause does not create an index-organized table. You should test and verify the performance of the generated table for your application.
`physical_properties`	Ignored

> **Note:**
>
> For more information on CREATE TABLE, see *Database SQL Language Reference*.

ALTER TABLE Restrictions

The clauses not in this list are allowed.

Clause	Comment
`allocate_extent_clause`	Ignored
`alter_iot_clauses`	Ignored
`deallocate_unused_clause`	Ignored
`ilm_clause`	Ignored
`inmemory_table_clause`	Ignored

Clause	Comment
logging_clause	Ignored
modify_LOB_storage_clause	Ignored
physical_attributes_clause	Ignored
shrink_clause	Ignored

> **Note:**
>
> For more information on ALTER TABLE, see *Database SQL Language Reference*.

Data Types

Autonomous Database allows most of the data types available in Oracle Database. To ensure the security and the performance of Autonomous Database, some data types are restricted.

The following data types are not supported or have limited support in Autonomous Database:

- Large Object (LOB) data types: only SecureFiles LOB storage is supported. BasicFiles LOBs are automatically converted to SecureFiles LOBs.
- Media types are not supported (Oracle Multimedia is desupported)

Checking and Setting MAX_STRING_SIZE

By default Autonomous Database uses extended data types and the value of `MAX_STRING_SIZE` is set to the value `EXTENDED`. With this setting you can specify a maximum size of 32767 bytes for the `VARCHAR2`, `NVARCHAR2`, and `RAW` data types. The default, `EXTENDED`, is the recommended setting and allows Autonomous Database to take full advantage of database capabilities.

Use `DBMS_MAX_STRING_SIZE` subprograms to check usage of extended data types and to change the database to revert to the older style `STANDARD`, supporting a maximum size of 4000 bytes for `VARCHAR2`, `NVARCHAR2`, and `RAW` data types.

> **Note:**
>
> Using `DBMS_MAX_STRING_SIZE.MODIFY_MAX_STRING_SIZE` is a one-way change that cannot be reverted. After a database is switched back to the `STANDARD` style of supporting a maximum length of 4000 bytes for the `VARCHAR2`, `NVARCHAR2`, and `RAW` data types, you cannot re-enable `EXTENDED` data types.
>
> The ADMIN user is granted `EXECUTE` privilege `WITH GRANT OPTION` clause on `DBMS_MAX_STRING_SIZE`. Oracle recommends that you do not `GRANT EXECUTE` on this package to other users.

1. Check whether your environment can be reverted to the old style, `STANDARD` behavior:

```
SELECT * FROM
TABLE(DBMS_MAX_STRING_SIZE.CHECK_MAX_STRING_SIZE('STANDARD'));
```

See CHECK_MAX_STRING_SIZE Function for more information.

2. Check and correct all reported violations from Step 1, if applicable.
3. After fixing any reported violations found in Step 1, if you want to revert to a maximum length of 4000 bytes for `VARCHAR2`, `NVARCHAR2`, and `RAW` data types, use `DBMS_MAX_STRING_SIZE.MODIFY_MAX_STRING_SIZE` as follows:

   ```
   EXEC DBMS_MAX_STRING_SIZE.MODIFY_MAX_STRING_SIZE('STANDARD');
   ```

   See MODIFY_MAX_STRING_SIZE Procedure for more information.

See MAX_STRING_SIZE for more information.

See Extended Data Types for details on extended data types.

For a list of Oracle data types see *Oracle Database SQL Language Reference*.

PL/SQL Package Notes for Autonomous Database

Notes for Oracle Database PL/SQL packages in Autonomous Database.

Unavailable PL/SQL Packages

- `DBMS_DEBUG_JDWP`
- `DBMS_DEBUG_JDWP_CUSTOM`

DBMS_LDAP PL/SQL Package Notes

Provides notes for the `DBMS_LDAP` package:

- Specifying an IP address in the host name is not allowed.
- The only allowed port is 636.
- The `SSLWRL` and `SSLWALLETPASSWD` arguments to the `OPEN_SSL` procedure are ignored. The default value for the `SSLWRL` property is set to the wallet that is used by `UTL_HTTP` and `DBMS_CLOUD` for making outbound web requests on Autonomous Database.
- The `DBMS_LDAP.SIMPLE_BIND_S` and `DBMS_LDAP.BIND_S` subprograms perform authentication to the directory server.

  The `DBMS_LDAP.SIMPLE_BIND_S` and `DBMS_LDAP.BIND_S` subprograms are modified to accept credential objects as an argument.

  Following are the usage notes and examples of these modified subprograms:

  – The modified `SIMPLE_BIND_S` and `BIND_S` subprograms enable you to pass credential objects to set directory server authentication. Credential objects are schema objects, hence they can be accessed only by privileged users and enable you to configure schema-level privileges to access control the credentials. Passing scheduler credentials is an appropriate and secure way to store and manage username/password/keys for authentication.

  – The modified `SIMPLE_BIND_S` and `BIND_S` subprograms are a secure and convenient alternative to previously existed `SIMPLE_BIND_S` and `BIND_S` subprogram.

    See FUNCTION simple_bind_s and FUNCTION bind_s for more information.

  – The `CREDENTIAL` argument of the `SIMPLE_BIND_S` and `BIND_S` functions is used to perform credential based authentication to the directory server.

- For example:
  - Create a credential object:

```
BEGIN DBMS_CLOUD.CREATE_CREDENTIAL (
    credential_name => 'LDAP_CRED',
    username        => 'web_app_user',
    password        => 'password' );
END;
```

    This creates a credential object which creates a stored username/password pair.

    See CREATE_CREDENTIAL Procedure for more information.

    See Specifying Scheduler Job Credentials for more information.

  - Invoke `DBMS_LDAP.SIMPLE_BIND_S`:

```
DECLARE
      l_mail_conn DBMS_LDAP.INIT;
    BEGIN
      l_ldap_conn   := DBMS_LDAP.INIT('ldap.example.com', 636);
      l_auth_result := DBMS_LDAP.SIMPLE_BIND_S(l_ldap_conn,
'LDAP_CRED');
      ...
END;
```

    The code in this example first invokes the `DBMS_LDAP.INIT` function which initializes a session with an LDAP server and establishes a connection with the LDAP server `ldap.example.com` at port number `636`. The value `l_ldap_conn` in the `SIMPLE_BIND_S` function is the LDAP session handle and `LDAP_CRED` is the credentials name.

  - The `function bind_s` performs complex authentication to the directory server. For example:

```
DECLARE
      l_mail_conn DBMS_LDAP.INIT;
    BEGIN
      l_ldap_conn   := DBMS_LDAP.INIT('ldap.example.com', 636);
      l_auth_result := DBMS_LDAP.BIND_S(l_ldap_conn, 'LDAP_CRED',
METH => DBMS_LDAP.AUTH_SIMPLE);
      ...
END;
```

    The code in this example first invokes the `DBMS_LDAP.INIT` function which initializes a session with an LDAP server and establishes a connection with the LDAP server `ldap.example.com` at port number `636`. The value `l_ldap_conn` in the `BIND_S` function is the LDAP session handle and `LDAP_CRED` is the credentials name. `METH` is the authentication method. The only valid value is `DBMS_LDAP_UTL.AUTH_SIMPLE`.

- The `EXECUTE` privileges on `DBMS_CLOUD` or `DWROLE` is required to create scheduler credentials.
- The passed credential must be present in the current schema or have a synonym pointing to a credential in the schema and be in the enabled state.

  - A public or private synonym that points to a credential in a different user schema can be supplied as a value for the `CREDENTIAL` parameter provided you have the `EXECUTE` privilege on the base credential object pointed to by the synonym. See Overview of Synonyms for more information.

- SSL/TLS is enforced for all communication happening between LDAP server and Autonomous Database.
- When your Autonomous Database instance is configured with a private endpoint, set the `ROUTE_OUTBOUND_CONNECTIONS` database parameter to '`PRIVATE_ENDPOINT`' to specify that all outgoing LDAP connections are subject to the Autonomous Database instance private endpoint VCN's egress rules. See Enhanced Security for Outbound Connections with Private Endpoints for more information.
- To use `DBMS_LDAP` for a connection on a private endpoint, use `DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE` and specify the `private_target` parameter with value `TRUE`.

> **Note:**
>
> If you set `ROUTE_OUTBOUND_CONNECTIONS` to `PRIVATE_ENDPOINT`, setting the `private_target` parameter to `TRUE` is not required in this API. See Enhanced Security for Outbound Connections with Private Endpoints for more information.

- **`DBMS_LDAP` Error**

Error Message	Potential Cause
`ORA-31400: Missing or invalid scheduler credential`	Passed credentials are NULL or invalid.

See DBMS_LDAP in *PL/SQL Packages and Types Reference* for more information.

DBMS_NETWORK_ACL_ADMIN PL/SQL Package Notes

Provides notes for the `DBMS_NETWORK_ACL_ADMIN` package:

- Granting ACL privileges on IP addresses is not allowed.
- The `HTTP_PROXY` ACL is allowed on private endpoints.

See DBMS_NETWORK_ACL_ADMIN in *PL/SQL Packages and Types Reference* for more information.

UTL_HTTP PL/SQL Package Notes

Provides notes for the `UTL_HTTP` package:

- Connections through IP addresses are not allowed.
- Only `HTTPS` is allowed when the Autonomous Database instance is on a public endpoint. When the Autonomous Database instance is on a private endpoint, both `HTTPS` and `HTTP_PROXY` connections are allowed (`HTTP` connections are disallowed for both public endpoints and private endpoints).
- The `UTL_HTTP.set_proxy` API is allowed when the Autonomous Database instance is on a private endpoint.

- When the Autonomous Database instance is on a private endpoint and you use `HTTP_PROXY` or the `UTL_HTTP.SET_PROXY` API:
  - `DBMS_CLOUD` requests do not honor the proxy server you set with `UTL_HTTP.SET_PROXY`. This includes `DBMS_CLOUD.SEND_REQUEST` and all object storage access for `DBMS_CLOUD` external tables that you define with `DBMS_CLOUD.CREATE_EXTERNAL_TABLE`, `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE`, or `DBMS_CLOUD.CREATE_HYBRID_PART_TABLE`.
  - `APEX_WEB_SERVICE` requests do not honor the proxy server you set with `UTL_HTTP.SET_PROXY`.
- All web services must be secured. The only allowed port is 443 when the Autonomous Database instance is on a public endpoint. When the Autonomous Database instance is on a private endpoint this restriction does not apply.

  Your Autonomous Database instance is preconfigured with an Oracle Wallet that contains more than 90 of the most commonly trusted root and intermediate SSL certificates. The Oracle Wallet is centrally managed. You can configure `UTL_HTTP` to use a wallet for a site that is protected using self-signed SSL certificates. See Use a Customer-Managed Wallet for External Calls with UTL_HTTP for more information.
- The `SET_AUTHENTICATION_FROM_WALLET` procedure is disallowed.
- The `WALLET_PATH` and `WALLET_PASSWORD` arguments for the `CREATE_REQUEST_CONTEXT`, `REQUEST`, and `REQUEST_PIECES` procedures are ignored.
- The `CREDENTIAL` argument of the `SET_CREDENTIAL` procedure is used to pass the credential object as an input to the procedure. See Specifying Scheduler Job Credentials and CREATE_CREDENTIAL Procedure for more information.
- The `EXECUTE` privileges on `DBMS_CLOUD` or `DWROLE` is required to create credential objects.
- The passed credentials must be present in the current user schema and be in the enabled state.
- A public or private synonym that points to a credential in a different user schema can be supplied as a value for the `CREDENTIAL` parameter provided you have the `EXECUTE` privilege on the base credential object pointed to by the synonym. See Overview of Synonyms for more information.
- Oracle Wallet configuration cannot be altered. All arguments for `SET_WALLET` procedure are ignored.
- When your Autonomous Database instance is configured with a private endpoint, set the `ROUTE_OUTBOUND_CONNECTIONS` database parameter to '`PRIVATE_ENDPOINT`' to specify that all outgoing `UTL_HTTP` connections are subject to the Autonomous Database instance private endpoint VCN's egress rules. See Enhanced Security for Outbound Connections with Private Endpoints for more information.
- **`UTL_HTTP` Errors**

  The following table shows error messages and possible causes for these error messages when using `UTL_HTTP`:

Error Message	Potential Cause
`ORA-12545: Connect failed because target host or object does not exist`	Target host or object does not exist or it is private.

Error Message	Potential Cause
`ORA-24247: network access denied by access control list (ACL)`	Access control list (ACL) for the specified host could not be found.
`ORA-29024: Certificate validation failure`	Certificate of the host does not exist or is not among the supported certificates.
`ORA-29261: Bad argument`	Passed credentials are invalid or disabled or the user does not have sufficient privileges on the credential.

See UTL_HTTP in *PL/SQL Packages and Types Reference* for more information.

UTL_INADDR PL/SQL Package Notes

Provides notes for the `UTL_INADDR` package:

- The `UTL_INADDR` package is available for use on an Autonomous Database instance with a private endpoint (PE).
- The **`GET_HOST_ADDRESS`** function is available.
- The **`GET_HOST_NAME`** function is not available.

See UTL_INADDR in *PL/SQL Packages and Types Reference* for more information.

UTL_SMTP PL/SQL Package Notes

Provides notes for the `UTL_SMTP` package:

- Public SMTP endpoints can be used as long as routing is done through customer reverse connection endpoint (RCE).
- Mail with an IP address in the host name is not allowed.
- The only allowed ports are 25 and 587.
- The `CREDENTIAL` argument of the `SET_CREDENTIAL` function is used to pass the scheduler credentials object as an input to the function. See Specifying Scheduler Job Credentials and CREATE_CREDENTIAL Procedure for more information.
- The `EXECUTE` privileges on `DBMS_CLOUD` or `DWROLE` is required to create credential objects.
- The `CREDENTIAL` argument of the `SET_CREDENTIAL` procedure is used to pass the credential objects object as an input to the procedure. See Specifying Scheduler Job Credentials for more information.
- The passed credentials must be present in the current user schema and be in the enabled state.
- A public or private synonym that points to a credential in a different user schema can be supplied as a value for the `CREDENTIAL` parameter provided you have the `EXECUTE` privilege on the base credential object pointed to by the synonym. See Overview of Synonyms for more information.
- When your Autonomous Database instance is configured with a private endpoint, set the `ROUTE_OUTBOUND_CONNECTIONS` database parameter to '`PRIVATE_ENDPOINT`' to specify that all outgoing `UTL_SMTP` connections are subject to the Autonomous Database instance private endpoint VCN's egress rules. See Enhanced Security for Outbound Connections with Private Endpoints for more information.
- **`UTL_SMTP` Error**

Error Message	Potential Cause
`ORA-29261: Bad argument`	Passed credentials are invalid or disabled or the user does not have sufficient privileges on the credential.

See UTL_SMTP in *PL/SQL Packages and Types Reference* for more information.

UTL_TCP PL/SQL Package Notes

Provides notes for the `UTL_TCP` package:

- The IP address is not allowed in the host name.
- The only allowed ports are: 443 (HTTP) 25 and 587 (SMTP).
- For port 443, only HTTPS URLs are allowed.
- The `WALLET_PATH` and `WALLET_PASSWORD` arguments for the `OPEN_CONNECTION` procedure are ignored. The default value for the `WALLET_PATH` and `WALLET_PASSWORD` property are set to the wallet that is used by `UTL_HTTP` and `DBMS_CLOUD` for making outbound web requests on Autonomous Database.
- SSL/TLS is enforced for all communication happening over TCP/IP connections.
- When your Autonomous Database instance is configured with a private endpoint, set the `ROUTE_OUTBOUND_CONNECTIONS` database parameter to '`PRIVATE_ENDPOINT`' to specify that all outgoing `UTL_TCP` connections are subject to the Autonomous Database instance private endpoint VCN's egress rules. See Enhanced Security for Outbound Connections with Private Endpoints for more information.

See UTL_TCP in *PL/SQL Packages and Types Reference* for more information.

ADMIN User Roles and Privileges

In Autonomous Database the predefined administrative user is ADMIN and this account has privileges to manage users and to manage the database.

It is recommended to use the ADMIN user to create accounts and grant privileges for users to connect to the database. See Manage Users for more information.

To maintain security, the privilege SYSDBA is not granted to the ADMIN user; a limited number of system privileges are granted to ADMIN. The following query shows privileges that are granted to SYS that are not granted to the ADMIN user:

```
SELECT privilege FROM dba_sys_privs WHERE grantee='SYS' MINUS
    SELECT privilege FROM dba_sys_privs WHERE grantee = 'ADMIN' ORDER BY 1;
```

ADMIN User GRANT ANY Restrictions

The `GRANT ANY PRIVILEGE` system privilege is not available for the ADMIN user. Instead use `GRANT ANY OBJECT PRIVILEGE`, `GRANT ANY SCHEMA PRIVILEGE`, or `GRANT ANY ROLE`.

System Privilege	Description
`GRANT ANY OBJECT PRIVILEGE`	This allows granting object privileges on objects including those owned by SYS with a few exceptions. In Autonomous Database, `GRANT ANY OBJECT PRIVILEGE` can only be exercised against customer created user schemas and can't be exercised against Oracle maintained schema such as SYSTEM or SYS, and many others, to ensure security. `ORA-1031/942` errors indicate that a privilege cannot be granted by ADMIN.
`GRANT ANY PRIVILEGE`	This allows granting of all system privileges excluding administrative privileges such as SYSDBA. The ADMIN user does not have SYSDBA privileges (instead a list of system privileges is granted). Use the following query to list the ADMIN privileges: `SELECT privilege FROM dba_sys_privs WHERE grantee = 'ADMIN' ORDER BY 1;`
`GRANT ANY ROLE`	This allows granting of roles to users and user roles. In Autonomous Database, `GRANT ANY ROLE` can only be exercised against customer created roles. The privileges that are NOT granted with `WITH ADMIN OPTION` to ADMIN user, such as `DBA`, `EXP_FULL_DATABASE`, and others can't be granted by the ADMIN user. `ORA-1031` errors indicate that a rol cannot be granted by ADMIN.

Roles and Views Restrictions for Data Dictionary

Granting `SELECT ANY DICTIONARY` does not provide access to the `SYS`/`SYSTEM` schemas. You can grant `SELECT_CATALOG_ROLE` to allow `SELECT` privileges on all data dictionary views, if needed.

Oracle XML DB

Describes Autonomous Database support for Oracle XML DB features. To ensure the security and the performance of your Autonomous Database, some Oracle XML DB features are restricted.

The following is supported, in addition to the features listed:

- Full support for XMLQuery, XMLTable, and other SQL/XML standard functions
- Indexing schema including functional indexes using SQL/XML expressions, Structured XMLIndex and XQuery Full Text Index

> **Note:**
>
> If you migrate tables containing `XMLType` columns to Autonomous Database using Oracle Data Pump, you need to convert to Non-Schema Binary XML prior to using Oracle Data Pump Export (expdp).

Area	XML DB Feature	Supported in Autonomous Database	More Information
Repository	XML DB Protocol	No	Repository Access Using Protocols

Area	XML DB Feature	Supported in Autonomous Database	More Information
Repository	XML DB Resources	No	Oracle XML DB Repository Resources
Repository	XML DB ACLs	No	Repository Access Control
Storage	XML Schema Registration	No [1]	XML Schema Registration with Oracle XML DB
Storage	CLOB	No	Deprecated
Storage	Object Relational	No	XML Schema and Object-Relational XMLType
Storage	Binary XML	Yes (Non schema-based only)	XMLType Storage Models
Index	Structured XML Index	Yes	XMLIndex Structured Component
Index	XQuery Full Text Index	Yes	Indexing XML Data for Full-Text Queries
Index	Unstructured XMLIndex	No	XMLIndex Unstructured Component
Packages	XML DOM package	Yes	PL/SQL DOM API for XMLType (DBMS_XMLDOM)
Packages	XML Parser Package	Yes	PL/SQL Parser API for XMLType (DBMS_XMLPARSER)
Packages	XSL Processor (DBMS_XSLPROCESSOR)	Yes	PL/SQL XSLT Processor for XMLType (DBMS_XSLPROCESSOR)

[1] While you cannot do XML schema registration, runtime validation of XML documents is available through DBMS_XMLSCHEMA_UTIL.

For details on Oracle XML DB, see Oracle XML DB Developer's Guide.

Oracle Text

Describes Autonomous Database support for Oracle Text features. To ensure the security and the performance of your Autonomous Database, some Oracle Text features are restricted.

Oracle Text Feature	Supported in Autonomous Database	More Information
All logging, and APIs which perform logging such as `ctx_report.query_log_summary`	Not Supported	QUERY_LOG_SUMMARY
File Datastore	Not Supported (see replacement `DIRECTORY_DATASTORE`)	Datastore Types
URL Datastore	Not Supported (see replacement `NETWORK_DATASTORE`)	Datastore Types
`CREATE INDEX` with `BIG_IO` option	Supported if you grant the privilege to create a trigger to the user (`GRANT CREATE TRIGGER`).	Improved Response Time Using the BIG_IO Option of CONTEXT Index

Oracle Text Feature	Supported in Autonomous Database	More Information
`OPTIMIZE_INDEX` in rebuild mode	Supported if you grant the privilege to create a trigger to the user (`GRANT CREATE TRIGGER`).	OPTIMIZE_INDEX

For details on Oracle Text, see Oracle Text Application Developer's Guide.

Oracle Flashback

Oracle Flashback Technology is a group of Oracle Database features that let you view past states of database objects or to return database objects to a previous state without using point-in-time media recovery.

To restore and recover your database to a point in time, see Restore and Recover your Autonomous Database.

Oracle Flashback Feature	Supported in Autonomous Database
`DBMS_FLASHBACK`	Yes except the procedure: `DBMS_FLASHBACK.TRANSACTION_BACKOUT`
Flashback Data Archive	Yes
Flashback Drop	Yes
Flashback Query	Yes
Flashback Table	Yes
Flashback Transaction	No
Flashback Transaction Query	Yes
Flashback Version Query	Yes

See Track Table Changes with Flashback Time Travel for information on using Flashback features.

Oracle Database Real Application Security

Oracle Database Real Application Security is a database authorization model that: supports declarative security policies, enables end-to-end security for multitier applications, provides an integrated solution to secure database and application resources, and advances the security architecture of Oracle Database to meet existing and emerging demands of applications developed for the Internet.

See Introducing Oracle Database Real Application Security more information.

Real Application Security works the same on Autonomous Database as on an on-premises Oracle Database except you need to perform the following ADMIN tasks before using Real Application Security on Autonomous Database:

- To create Real Application Security users/roles, you need the `PROVISION` system privilege. As the ADMIN user run the following command to grant this privilege to a database user:

  ```
  SQL> EXEC
  XS_ADMIN_CLOUD_UTIL.GRANT_SYSTEM_PRIVILEGE('PROVISION','DB_USER');
  ```

  In this example, *`DB_USER`* is a database user.

  Running this command on Autonomous Database replaces the following on-premise database command (note the `_CLOUD_` is not in the following package name):

  ```
  SQL> EXEC SYS.XS_ADMIN_UTIL.GRANT_SYSTEM_PRIVILEGE('PROVISION', 'DB_USER',
  XS_ADMIN_UTIL.PTYPE_XS);
  ```

  See General Procedures for Creating Application User Accounts for more information.

- To create Real Application Security data controls, you need the `ADMIN_ANY_SEC_POLICY` privilege. As the ADMIN user run the following command to grant this privilege:

  ```
  EXEC
  XS_ADMIN_CLOUD_UTIL.GRANT_SYSTEM_PRIVILEGE('ADMIN_ANY_SEC_POLICY','DB_USER'
  );
  ```

  In this example, *`DB_USER`* is a database user.

  Running this command on Autonomous Database replaces the following on-premise database command (note the `_CLOUD_` is not in the following package name):

  ```
  SQL> EXEC
  SYS.XS_ADMIN_UTIL.GRANT_SYSTEM_PRIVILEGE('ADMIN_ANY_SEC_POLICY','DB_USER');
  ```

  See Creating Roles and Application Users for more information.

Oracle LogMiner

Describes restrictions for Oracle LogMiner on Autonomous Database.

Archived Log Retention Maximum is 48 Hours

Autonomous Database archived log files are kept for up to 48 hours. LogMiner can only access up to 48 hours of archived log files.

If you attempt to mine log files older than 48 hours, LogMiner reports `ORA-1285: "error reading file"`.

Choose a Character Set for Autonomous Database

The Autonomous Database default database character set is Unicode AL32UTF8 and the default national character set is AL16UTF16. When you provision a database, depending on the workload type, you can select a database character set and a national character set.

> **Note:**
>
> Oracle recommends using the default Unicode database character set (AL32UTF8) for its universality and compatibility with contemporary and future technologies and language requirements.

If you are using an on-premises database with a non-Unicode character set, migrating to the default Unicode character set can be a convoluted process requiring complex data analysis. Thus, Autonomous Database lets you choose a character set when you provision an Autonomous Database instance.

1. Create an Autonomous Database following the provisioning steps.

   See Provision an Autonomous Database Instance for more information.

2. On the **Create Autonomous Database** page expand **Show Advanced Options**.
3. In the advanced options area, select the **Management** tab.

   - In the **Character Set** field, use the selector to choose a character set.
   - In the **National Character Set** field, use the selector to choose a national character set.

   To make selecting a value easier, when you type in the text area this filters the list. For example, if you type JA you see only the options containing JA, including: JA16EUC, JA16EUCTILDE, JA16SJIS, JA16JA16SJISTILDE, and JA16VMS.

4. Click **Create Autonomous Database** to provision the Autonomous Database.

See the following for more information:

- Choosing an Oracle Database Character Set

- Character Set Migration
- Support Note 788156.1
- Notes for Character Set Selection
  Provides notes and limitations for selecting a character set and a national character set on Autonomous Database.

Notes for Character Set Selection

Provides notes and limitations for selecting a character set and a national character set on Autonomous Database.

- When you provision an Autonomous Database instance you can only select a character set for **Data Warehouse**, **Transaction Processing**, or **APEX** workload types.

  The **JSON Database** workload type only supports the default character set and you cannot select a different character set.
- Always Free Autonomous Database does not support character set selection.
- You cannot select a different character set when you clone an instance. A cloned Autonomous Database instance has the same character set as the source database.
- You cannot change the character set of an existing Autonomous Database instance.
- APEX developer and administration pages are supported in English only when the database character set is different from the default (AL32UTF8).

  Translation of user applications into other languages or setting an application's primary language to a value other than English is not supported. If you use APEX in a language other than English, you may experience issues such as illegible, garbage text. You can, however, use your APEX applications to process non-English user data, as long as the languages of the data are supported by the selected database character set.

  If you need full globalization support in APEX, migrate your applications and data to AL32UTF8, the universal Unicode character set, which is the default and recommended character set for Autonomous Database.

  When you choose a character set other than the default Unicode character set (AL32UTF8) on Autonomous Database, the APEX language selector only shows languages that are supported in that database character set. For example, if you choose the database character set WE8ISO8859P1 (ISO 8859-1 West European), the language selector does not show Japanese or Korean.
- While you are provisioning an instance the **Character Set** selector on the **Management** tab lists the supported character set names. If you want to see a list of supported database character sets before you provision a database, refer to the following:
  - See Table A-4 in Recommended Database Character Sets
  - See Table A-6 in Other Character Sets

Query the Alert Log

You can query the database alert log using `V$DIAG_ALERT_EXT` to search for log data.

`V$DIAG_ALERT_EXT` shows the contents of the XML-based alert log in the Automatic Diagnostic Repository (ADR). For example, if you want to search for `ORA` errors or client connection tracing, you can query `V$DIAG_ALERT_EXT`. Also you can query `V$DIAG_ALERT_EXT` if you want to pull the data from these logs to another analytic solution for tracing `ORA` errors, such as `ORA-600` or `ORA-7445`.

Database Features Unavailable in Autonomous Database

Lists the Oracle Database features that are not available in Autonomous Database. Additionally, database features designed for administration are not available.

List of Unavailable Oracle Features

- Oracle Real Application Security Administration Console (RASADM)
- Oracle Industry Data Models
- Oracle Database Lifecycle Management Pack
- Oracle Data Masking and Subsetting Pack

> **Note:**
>
> Oracle Data Safe, available with Autonomous Database provides Data Masking. See Use Oracle Data Safe with Autonomous Database for more information.

- Oracle Cloud Management Pack for Oracle Database
- Oracle Multimedia: Not available in Autonomous Database and deprecated in Oracle Database 18c.
- Oracle Sharding
- Oracle XStream
- Custom locale objects, including: language, territory, character set, and collation (linguistic sort) are not supported. Custom locale definitions created using Oracle Locale Builder cannot be deployed on Autonomous Database. See Customizing Locale Data for more information.
- Original export/import methods are not supported in Autonomous Database. See Migrate Oracle Databases to Autonomous Database for information on recommended migration methods.
- Oracle True Cache
- Raft Replication in Oracle Globally Distributed Database

Logical Partition Change Tracking and Materialized Views

Describes information about the Logical Partition Change Tracking (LPCT) metadata framework and Query Rewrite with Logical Partition Change Tracking in Autonomous Database.

- About Logical Partition Change Tracking
- Using Logical Partition Change Tracking
  Logical Partition Change Tracking (LPCT) logically partitions a table using a specified key column and method.
- Example: Logical Partition Change Tracking
  Shows the steps to use Logical Partition Change Tracking (LPCT) using a Materialized View that contains joins and aggregates.

About Logical Partition Change Tracking

Logical Partition Change Tracking (LPCT) tracks the staleness of materialized views.

Logical Partition Change Tracking enables you to create logical partitions on base tables. It evaluates the staleness of the base tables for individual logical partitions without using a materialized view log or requiring any of the tables used in the materialized view to be partitioned.

When one or more dependent base tables of a materialized view are updated, a materialized view becomes `STALE` and cannot be used for query rewrite under the default enforced integrity mode.

Logical Partition Change Tracking (LPCT) provides the capability to leverage the user-supplied logical partitioning information of base tables of a materialized view for a more fine-grained, partition-level tracking of stale data for both refresh and rewrite purposes. While classical Partitioning Change Tracking (PCT) relies on the physical partitioning of tables, LPCT has no dependency on tables being physically partitioned; LPCT can be used with both partitioned and nonpartitioned tables.

Logical Partition Change Tracking mechanism makes use of the `FRESH` subsets (partitions) of materialized views despite other subsets being `STALE`. Faster response times can be achieved for user queries because pre-computed results in materialized views are used more often. Other than increasing the usability of materialized views, PCT and LPCT also allows incremental refreshing of the materialized views without the need of materialized view logs; refresh can be both `ON DEMAND` or `ON COMMIT`.

Similar to Partitioning Change Tracking (PCT), Logical Partition Change Tracking (LPCT) is associated with a base table and can accurately identify the rows in a Materialized View affected by data changes on the base table, according to the logical partition boundaries defined.

See Advanced Materialized Views Advanced Materialized Views for more information.

Using Logical Partition Change Tracking

Logical Partition Change Tracking (LPCT) logically partitions a table using a specified key column and method.

Logical Partition Change Tracking creation syntax is analogous to physical partitions. Unlike physical partitions, which must be created as part of table creation, LPCT can be freely specified independent of the table creation and its shape, allowing more flexibility to address your requirements. LPCT creation is metadata only.

- Creating Logical Partitions - BNF
  Describes the syntax to create BNF logical partitions.
- Choosing the Logical Partition Key Column
  The logical partitioning key is specified to define the boundaries of each logical partition.
- Freshness of Materialized Views Using Logical Partition Change Tracking
  The Logical Partition Change Tracking (LPCT) staleness tracking mechanism automatically records and consolidates the change statistics internally based on the specified logical partition key and partitioning method during each data change.

- Rewrite with Materialized Views Using Logical Partition Change Tracking
  Using Logical Partition Change Tracking (LPCT), Oracle knows that a materialized view is `STALE` with respect to some logical partitions of the base table, but `FRESH` with respect to other portions.
- Refresh of Materialized Views Using Logical Partition Change Tracking
  Logical Partition Change Tracking (LPCT) refresh can be implemented using the finer-grained data staleness to incrementally refresh `STALE` subsets of a materialized view, eliminating costly complete refresh or log-based fast refresh.
- Logical Partition Change Tracking – Data Dictionary Views
  Describes the data dictionary views to find information about logical partitions.

Creating Logical Partitions - BNF

Describes the syntax to create BNF logical partitions.

Following is the syntax to create BNF logical partitions:

```
CREATE LOGICAL PARTITION TRACKING ON table_name
    PARTITION BY RANGE (partition_key)
    INTERVAL (interval_clause)
    (partition_specification);
```

- Only `RANGE` and `INTERVAL` logical partitioning methods are supported.
- Only a single logical partition key column is supported.
- The partition key column can be of these data types:
  - `NUMBER`
  - `DATE`
  - `CHAR`
  - `VARCHAR`
  - `VARCHAR2`
  - `TIMESTAMP`
  - `TIMESTAMP WITH TIME ZONE`

Choosing the Logical Partition Key Column

The logical partitioning key is specified to define the boundaries of each logical partition.

The logical partition key is not physical, this means that table rows belonging to a key range are not segregated into a separate physical partition. The table can be non-partitioned or partitioned on a key that is different from the logical partition key. The logical partition key can be chosen freely, and partition boundaries can be made flexible.

To choose a Logical Partition Change Tracking (LPCT) key column, you can consider a clustered column, that is, a column where data is close to sorted by column value, that are frequently referenced in the query filter predicates. For a clustered column, less logical partitions are likely to be affected during data loads, this means that less `STALE` logical partitions need to be refreshed and more `FRESH` logical partitions are ready to be used for rewrites. If a table is already partitioned, it is recommended to create a LPCT using a different column other than the partition key column. LPCT offers similar benefits as Partitioning Change

Tracking (PCT), and the combined benefits are not maximized if data tracking is done on the same column.

Freshness of Materialized Views Using Logical Partition Change Tracking

The Logical Partition Change Tracking (LPCT) staleness tracking mechanism automatically records and consolidates the change statistics internally based on the specified logical partition key and partitioning method during each data change.

Adjacent change data is grouped into a “logical” partition. Unlike with Partitioning Change Tracking (PCT), which is tied to physical partition bounds the LPCT scheme offers flexibility in managing and grouping the data changes resulting from DMLs applied to the base table.

During conventional DMLs and Direct-loads, LPCT adopts the same algorithm that PCT uses to track staleness. During Query rewrites, LPCT adopts the same algorithm that PCT uses to calculate rewrite containment.

When a table is logically partitioned using key ranges, a materialized view defined on the table is eligible to use LPCT for staleness tracking, refresh and query rewrite, provided that the materialized view contains the logical partition key.

> **Note:**
>
> All types of Materialized Views are supported for LPCT.

Rewrite with Materialized Views Using Logical Partition Change Tracking

Using Logical Partition Change Tracking (LPCT), Oracle knows that a materialized view is `STALE` with respect to some logical partitions of the base table, but `FRESH` with respect to other portions.

Having the finer-grained data staleness information of the base tables, the associated materialized view would be used more frequently due to LPCT rewrite.

Oracle transparently identifies and makes use of the `FRESH` subset of materialized views for query rewrite to answer complicated queries of base tables when `QUERY_REWRITE_INTEGRITY = ENFORCED |TRUSTED`.

If the materialized view rows are partially `FRESH` with respect to those logical partitions, a partial rewrite might take place to answer the query partially using materialized view, that is, `FRESH` logical partitions, and partially using the base table, that is, the `STALE` logical partitions.

Refresh of Materialized Views Using Logical Partition Change Tracking

Logical Partition Change Tracking (LPCT) refresh can be implemented using the finer-grained data staleness to incrementally refresh `STALE` subsets of a materialized view, eliminating costly complete refresh or log-based fast refresh.

If LPCT refresh is specified, the `STALE` logical partitions are identified and targeted refresh operations will be performed to those logical partitions only.

To invoke refresh using logical partition change tracking you specify `'L'` or `'l'` (“logical”) as refresh method.

For example: `execute DBMS_MVIEW.REFRESH(<materialized_view_name>,'L');`

If `REFRESH FORCE` is specified, a `FAST` refresh is chosen and performed if possible, or else it performs a `COMPLETE` refresh. During materialized view `FORCE` refresh, LPCT refresh has the same priority as Partitioning Change Tracking (PCT) refresh.

Logical Partition Change Tracking – Data Dictionary Views

Describes the data dictionary views to find information about logical partitions.

Query the following data dictionary views to retrieve information about logical partitions.

- `ALL_MVIEW_DETAIL_LOGICAL_PARTITION`: This view displays the freshness information of the materialized views, with respect to an LPCT detail logical partition, accessible to the current user. See ALL_MVIEW_DETAIL_PARTITION for more information.
- `DBA_MVIEW_DETAIL_ LOGICAL_PARTITION`: displays freshness information for all materialized views in the database, with respect to a LPCT detail logical partition. See DBA_MVIEW_DETAIL_PARTITION for more information.
- `USER_MVIEW_DETAIL_ LOGICAL_PARTITION`: displays freshness information for all materialized views, with respect to a LPCT detail logical partition, owned by the current user. See USER_MVIEW_DETAIL_PARTITION for more information.

Example: Logical Partition Change Tracking

Shows the steps to use Logical Partition Change Tracking (LPCT) using a Materialized View that contains joins and aggregates.

1. Create base tables with logical change partitions.
   a. Create `MYSALES` table.

```
CREATE TABLE mysales ( time_id DATE, prod_id NUMBER, cust_id NUMBER,
channel_id CHAR(1), promo_id NUMBER(6), quantity_sold
      NUMBER(3), amount_sold NUMBER(10,2))
      PARTITION BY LIST (prod_id)
      (PARTITION p1 VALUES (1,2,3),
      PARTITION p2 VALUES (4,5,6),
      PARTITION p3 VALUES (7,8,9),
      PARTITION p4 VALUES(DEFAULT));
```

   This creates the `MYSALES` table.

   b. Insert records into the `MYSALES` table.

```
INSERT INTO mysales (time_id, prod_id, cust_id, amount_sold) VALUES
(TO_DATE('2007-06-05','yyyy-mm-dd'), 1, 2088, 189.98);
INSERT INTO mysales (time_id, prod_id, cust_id, amount_sold) VALUES
(TO_DATE('2007-07-05','yyyy-mm-dd'), 2, 1354, 12.99);
INSERT INTO mysales (time_id, prod_id, cust_id, amount_sold) VALUES
(TO_DATE('2007-09-05','yyyy-mm-dd'), 5, 2088, 189.98);
INSERT INTO mysales (time_id, prod_id, cust_id, amount_sold) VALUES
(TO_DATE('2007-10-05','yyyy-mm-dd'), 18, 2088, 42);
COMMIT;
```

   This populates the `MYSALES` table.

c. Create logical partition tracking for the `MYSALES` table.

```
CREATE LOGICAL PARTITION TRACKING ON mysales
  PARTITION BY RANGE (time_id)
  INTERVAL(NUMTOYMINTERVAL(2, 'YEAR'))
  (
   PARTITION p0 VALUES LESS THAN (TO_DATE('7-15-2005', 'MM-DD-YYYY')),
   PARTITION p1 VALUES LESS THAN (TO_DATE('7-15-2007', 'MM-DD-YYYY'))
  );
```

This creates a logical partition tracking for the `MYSALES` table using the `TIME_ID` as key.

d. Create `MYCUSTOMERS` table.

```
CREATE TABLE mycustomers (cust_id NUMBER, age NUMBER, gender CHAR(1),
address VARCHAR(100));
```

This creates the `MYCUSTOMERS` table.

e. Insert records into the `MYCUSTOMERS` table.

```
INSERT INTO mycustomers(cust_id, age, gender) VALUES (2088, 35, 'F');
INSERT INTO mycustomers(cust_id, age, gender) VALUES (1234, 54, 'M');
INSERT INTO mycustomers(cust_id, age, gender) VALUES (1354, 17, 'F');
INSERT INTO mycustomers(cust_id, age, gender) VALUES (6666, 15, 'F');
COMMIT;
```

This populates the `MYCUSTOMERS` table.

f. Create logical partition tracking for the `MYCUSTOMERS` table.

```
CREATE LOGICAL PARTITION TRACKING ON mycustomers
 PARTITION BY RANGE (age) INTERVAL (20.5)
 (PARTITION m0 values less than (20));
```

This creates a logical partition tracking for the `MYSALES` table using the `AGE` as key.

2. Create a materialized view on top of tables with logical partition change tracking.

a. Create materialized view on `MYSALES` and `MYCUSTOMERS` tables.

```
CREATE MATERIALIZED VIEW sales_age_time
 REFRESH FAST
 ENABLE QUERY REWRITE
 AS SELECT SUM(s.amount_sold) amount_total, c.age, s.time_id
 FROM mysales s, mycustomers c
 WHERE s.cust_id = c.cust_id
 GROUP BY c.age, s.time_id;
```

This creates the `SALES_AGE_TIME` materialized view.

b. Query the `DBA_MVIEW_DETAIL_LOGICAL_PARTITION` data dictionary view.

```
SELECT mview_name, DETAILOBJ_NAME, DETAIL_LOGICAL_PARTITION_NAME
LPARTNAME,
```

```
DETAIL_LOGICAL_PARTITION_NUMBER LPART#, FRESHNESS
FROM DBA_MVIEW_DETAIL_LOGICAL_PARTITION
WHERE mview_name = 'SALES_AGE_TIME'
ORDER BY 1,2,3;
```

It shows the following output.

```
MVIEW_NAME        DETAILOBJ_NAME     LPARTNAME      LPART#
FRESHNESS
---------------   ---------------    ----------     ----------
---------
SALES_AGE_TIME    MYCUSTOMERS        M0             0           FRESH
SALES_AGE_TIME    MYSALES            P0             0           FRESH
SALES_AGE_TIME    MYSALES            P1             1           FRESH
```

c. Use `EXPLAIN_MVIEW` to assess the logical partition related refresh and rewrite capabilities.

```
EXECUTE DBMS_MVIEW.EXPLAIN_MVIEW ('sales_age_time');

SELECT CAPABILITY_NAME, RELATED_TEXT, POSSIBLE
FROM MV_CAPABILITIES_TABLE
WHERE MVNAME = 'SALES_AGE_TIME' AND CAPABILITY_NAME LIKE '%LPT%'
ORDER BY 1, 2;
```

It shows the following output.

```
CAPABILITY_NAME              RELATED_TEXT                POSSIBLE
--------------------------   -------------------------
---------------
LPT                                                       Y
LPT_TABLE                    MYCUSTOMERS                  Y
LPT_TABLE                    MYSALES                      Y
LPT_TABLE_REWRITE            MYCUSTOMERS                  Y
LPT_TABLE_REWRITE            MYSALES                      Y
REWRITE_LPT                                               Y
REFRESH_FAST_LPT                                          Y
```

3. Observe the impact of DMLs on your materialized view.

a. Introduce a new logical partition on the `MYSALES` table.

```
INSERT INTO mysales (time_id, prod_id, cust_id, amount_sold) VALUES
      (TO_DATE('2019-02-05','yyyy-mm-dd'), 99, 2108, 33);
```

This introduces a new partition (partition #6) on the `MYSALES` table.

b. Introduce a new logical partition on the `MYSALES` table.

```
INSERT INTO mysales (time_id, prod_id, cust_id, amount_sold) VALUES
(TO_DATE('2019-02-05','yyyy-mm-dd'), 99, 2108, 33);
```

This introduces a new partition (partition #6) on the `MYSALES` table.

c. Introduce a new logical partition on the `MYCUSTOMERS` table.

```
INSERT INTO mycustomers(cust_id, age, gender) VALUES (1399, 80, 'F');
```

This introduces a new partition (partition #3) on the `MYCUSTOMERS` table.

d. Introduce a new logical partition on the `MYSALES` table.

```
INSERT INTO mysales (time_id, prod_id, cust_id, amount_sold) VALUES
(TO_DATE('2019-02-09','yyyy-mm-dd'), 99, 1997, 79.9);
```

This introduces a new partition (partition #7) on the `MYSALES` table.

e. Introduce a new logical partition on the `MYSALES` table.

```
INSERT INTO mysales (time_id, prod_id, cust_id, amount_sold) VALUES
(TO_DATE('2010-02-09','yyyy-mm-dd'), 110, 1997, 108.98);
COMMIT;
```

This introduces a new partition (partition #2) on the `MYSALES` table.

f. Query the `DBA_MVIEW_DETAIL_LOGICAL_PARTITION` data dictionary view.

```
SELECT mview_name, DETAILOBJ_NAME, DETAIL_LOGICAL_PARTITION_NAME
LPARTNAME,
 DETAIL_LOGICAL_PARTITION_NUMBER LPART#, FRESHNESS
 FROM DBA_MVIEW_DETAIL_LOGICAL_PARTITION
 WHERE mview_name = 'SALES_AGE_TIME'
 ORDER BY 1,2,3;
```

Now, it shows the following output.

```
MVIEW_NAME        DETAILOBJ_NAME     LPARTNAME      LPART#
FRESHNESS
---------------   ---------------    ----------     ----------
---------
SALES_AGE_TIME    MYCUSTOMERS        M0             0             FRESH
SALES_AGE_TIME    MYCUSTOMERS        SYS_88904P3    3             STALE
SALES_AGE_TIME    MYSALES            P1             0             FRESH
SALES_AGE_TIME    MYSALES            P1             1             FRESH
SALES_AGE_TIME    MYSALES            SYS_88899P3    2             STALE
SALES_AGE_TIME    MYSALES            SYS_88899P7    6             STALE
```

g. Perform LPCT rewrite on subset of lpart #1 on the `MYSALES` and lpart #0 on the `MYCUSTOMERS` tables.

```
DELETE FROM rewrite_table;
DECLARE
 stmt varchar2(2000) := q'#select sum(s.amount_sold) amount_total,
 c.age, s.time_id
 FROM mysales s, mycustomers c
```

```
 WHERE s.cust_id = c.cust_id
 AND s.time_id < TO_DATE ('07-07-2007', 'MM-DD-YYYY')
 AND c.age < 18
 GROUP BY c.age, s.time_id#';
BEGIN
 dbms_mview.explain_rewrite (stmt,'sales_age_time');
END;
/
SELECT mv_name, sequence, pass, message FROM rewrite_table;
```

h. Query `REWRITE_TABLE` to verify the rewrites.

```
SELECT mv_name, sequence, pass, message FROM rewrite_table;
```

i. Execute the following query.

```
SELECT SUM(s.amount_sold) amount_total,
 c.age, s.time_id
 FROM mysales s, mycustomers c
 WHERE s.cust_id = c.cust_id
 AND s.time_id < TO_DATE ('07-07-2007', 'MM-DD-YYYY')
 AND c.age < 18
 GROUP BY c.age, s.time_id;
```

j. View the explain plan for the above query to verify the rewrites.

```
SELECT * FROM TABLE(dbms_xplan.display_cursor);

PLAN_TABLE_OUTPUT
_____________________________________________________
SQL_ID  ampuzk8tbp6df, child number 0
-------------------------------------
SELECT SUM(s.amount_sold) amount_total,
c.age, s.time_id
FROM mysales s, mycustomers c
WHERE s.cust_id = c.cust_id
AND s.time_id < TO_DATE ('07-07-2007', 'MM-DD-YYYY')
AND c.age < 18
GROUP BY c.age, s.time_id;

Plan hash
        value: 3902795718

-------------------------------------------------------------------------
-----------------------
        | Id  | Operation                    | Name           | Rows  |
Bytes | Cost
        (%CPU)| Time

|-------------------------------------------------------------------------
-----------------------
        |   0 | SELECT STATEMENT             |                |
          |       |     2 (100)|
        ||*  1 |  MAT_VIEW
```

```
        REWRITE ACCESS FULL| SALES_AGE_TIME |     1 |    35 |
          2   (0)| 00:00:01

|-------------------------------------------------------------------------
------------------------
        Predicate Information (identified by operation id):
        ---------------------------------------------------
        1 - filter(("SALES_AGE_TIME"."TIME_ID"<TO_DATE('2007-07-07
00:00:00', 'syyyy-mm-dd hh24:mi:ss') AND "SALES_AGE_TIME"."AGE"<18))
Note
-----
   - dynamic statistics used: dynamic sampling (level=2)
26 rows selected.
```

4. Leverage LPCT for incremental refresh.
   a. Execute the following code to perform LPCT refresh.

```
EXECUTE DBMS_MVIEW.REFRESH('SALES_AGE_TIME', 'L');
```

   b. Verify the refresh using the following query.

```
SELECT mview_name, DETAILOBJ_NAME, DETAIL_LOGICAL_PARTITION_NAME
LPARTNAME, DETAIL_LOGICAL_PARTITION_NUMBER LPART#, FRESHNESS
 FROM DBA_MVIEW_DETAIL_LOGICAL_PARTITION
 WHERE mview_name = 'SALES_AGE_TIME'
 ORDER BY 1,2,3;
```

Migrating MySQL and Third-Party Databases to Autonomous Database

Migration is the process of copying the schema objects and data from a source MySQL or a third-party (non-Oracle) database, such as Amazon Redshift, Microsoft SQL Server, Sybase Adaptive Server, IBM DB2 (UDB), or Teradata, to Autonomous Database.

Using Oracle SQL Developer Migration Wizard you can perform migration in an efficient and largely automated way.

- Migrating Amazon Redshift to Autonomous Database
  The SQL Developer Amazon Redshift Migration Assistant, available with SQL Developer 18.3 and later versions provides a framework for easy migration of Amazon Redshift environments on a per-schema basis.
- Migrating MySQL to Autonomous Database
  Migration is the process of copying the schema objects and data from a source MySQL to Autonomous Database. Using Oracle SQL Developer Migration Wizard you can perform migration in an efficient and largely automated way.
- Migrating Microsoft SQL Server or Sybase Adaptive Server to Autonomous Database
  Migration is the process of copying the schema objects and data from a source Microsoft SQL Server or Sybase Adaptive Server to Autonomous Database. Using Oracle SQL Developer Migration Wizard you can perform migration in an efficient and largely automated way.

- Migrating IBM DB2 (UDB) Database to Autonomous Database
  Migration is the process of copying the schema objects and data from a source IBM DB2 (UDB) database to Autonomous Database. Using Oracle SQL Developer Migration Wizard you can perform migration in an efficient and largely automated way.
- Migrating Teradata Database to Autonomous Database
  Migration is the process of copying the schema objects and data from a source Teradata database to Autonomous Database. Using Oracle SQL Developer Migration Wizard you can perform migration in an efficient and largely automated way.

Migrating Amazon Redshift to Autonomous Database

The SQL Developer Amazon Redshift Migration Assistant, available with SQL Developer 18.3 and later versions provides a framework for easy migration of Amazon Redshift environments on a per-schema basis.

This section describes the steps and the workflow for both an online migration of Amazon Redshift and for the generation of scripts for a scheduled, manual migration that you run at a later time.

- Autonomous Database Redshift Migration Overview
  Using SQL Developer you can migrate database files from Amazon Redshift to Autonomous Database.
- Connect to Amazon Redshift
  Using SQL Developer you can migrate database Schemas and Tables from Amazon Redshift to Autonomous Database. To extract metadata and data from Amazon Redshift for a migration, you need to connect to Amazon Redshift with SQL Developer.
- Connect to Autonomous Database
  Using SQL Developer you create a connection to Autonomous Database
- Start the Cloud Migration Wizard
  Invoke the Cloud Migration Wizard from the Tools menu of SQL Developer to initiate your Amazon Redshift migration to Autonomous Database.
- Review and Finish the Amazon Redshift Migration
  The summary shows a summary of the information that you have specified.
- Use Generated Amazon Redshift Migration Scripts
  When you choose to generate migration scripts a new subdirectory is created in the local directory specified in the migration Wizard. You can run these scripts in real time or use them for programmatic processing.
- Perform Post Migration Tasks
  After successful migration of your Redshift environment you should consider the following post-migration tasks:

Autonomous Database Redshift Migration Overview

Using SQL Developer you can migrate database files from Amazon Redshift to Autonomous Database.

- **Capture:** Captures Metadata schemas and tables from source database and stores in Migration Repository.
- **Convert:** Redshift Datatypes are mapped to Oracle Datatypes. Redshift Object names are converted to Oracle names based on Oracle Naming Convention. The Column Defaults that use Redshift functions are replaced by their Oracle equivalents.
- **Generate:** Generate schemas and DDLs based on the converted metadata.

- **Deploy:** Deploy the generated schemas and DDLs.
- **Copy Data:** Unload data from Redshift tables to Amazon Storage S3 then copy data from Amazon Storage to Autonomous Database tables(in schemas) that were Deployed earlier.

Connect to Amazon Redshift

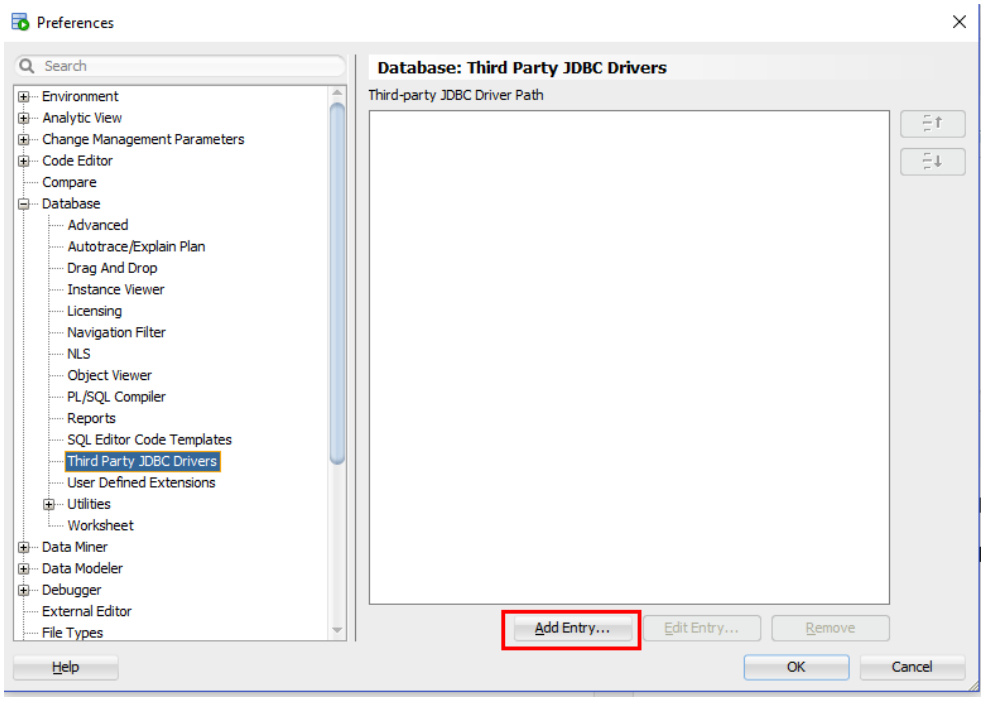
Using SQL Developer you can migrate database Schemas and Tables from Amazon Redshift to Autonomous Database. To extract metadata and data from Amazon Redshift for a migration, you need to connect to Amazon Redshift with SQL Developer.

Download Amazon Redshift JDBC Driver and Add the Third Party Driver

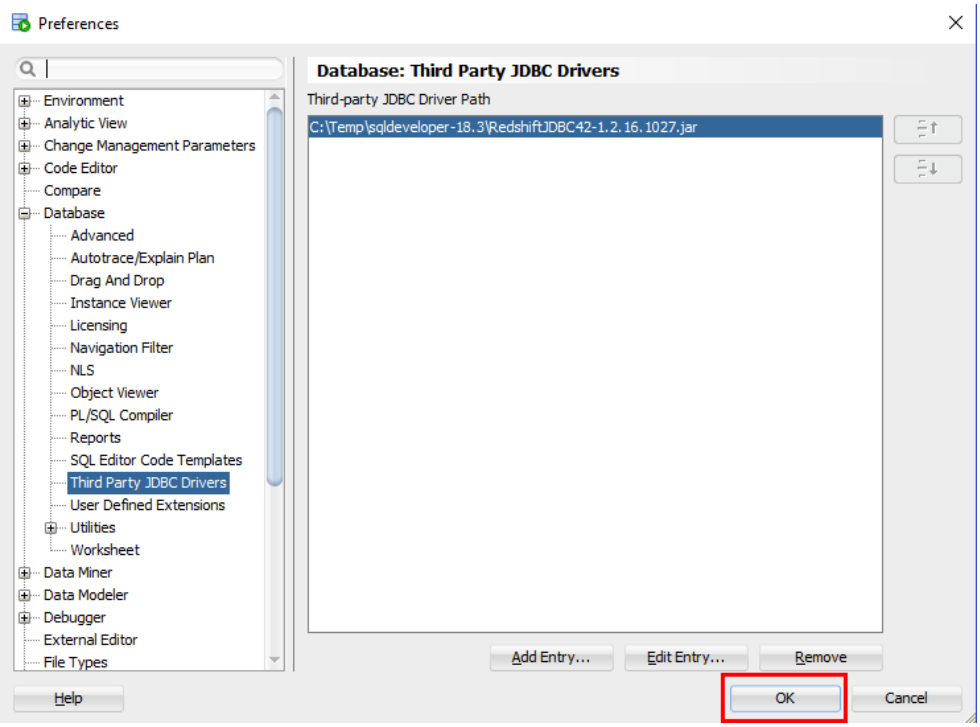
1. Download an Amazon Redshift JDBC driver to access Amazon Redshift. Consult the Amazon Redshift documentation for the location of the most recent JDBC driver. For more information, see Configure a JDBC Connection.

> **Note:**
>
> Use the Amazon Redshift JDBC Driver JDBC 4.2–compatible driver.

2. Store the Amazon Redshift JDBC driver in a local directory where SQL Developer can access the Amazon Redshift JDBC driver.
3. Add the Amazon Redshift JDBC driver as third party to SQL Developer before making a connection. Within SQL Developer, go to **Tools > Preferences > Database > Third Party JDBC Drivers** (for Mac, this is **Oracle SQL Developer > Preferences Database > Third Party JDBC Drivers**).
4. Click **Add Entry** and select the path to the Amazon Redshift JDBC Driver that you download.



5. Click **OK** to add the Amazon Redshift JDBC driver that you download.

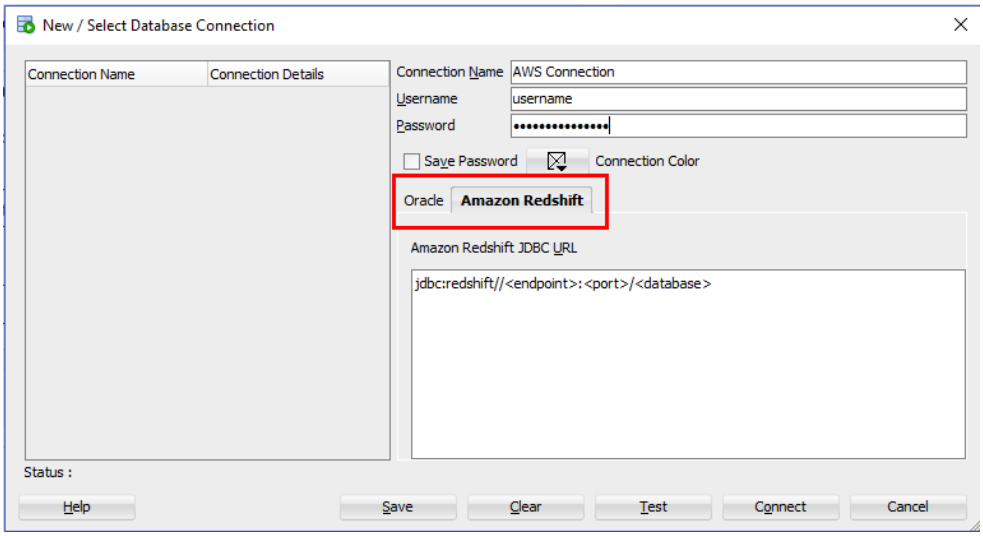


Add Connection to Amazon Redshift Database

Connect to the Amazon Redshift database.

1. In the Connections panel, right-click **Connections** and select **New Connection...**.
2. Select the **Amazon Redshift** tab and enter the connection information for Amazon Redshift.

   If you are planning to migrate multiple schemas it is recommended to connect with the Master username to your Amazon Redshift system.



- For more details for configuring a JDBC Connection and obtaining the Amazon Redshift JDBC URL, see AWS: Configure a JDBC Connection.
- For more details for configuring security options for the connection (in case of "Amazon [500150] connection error"), see AWS: Configure Security options for Connection (in case of "Amazon [500150] connection error").
- If you deployed your Amazon Redshift environment within a Virtual Private Cloud (VPC) you have to ensure that your cluster is accessible from the Internet. See http://docs.aws.amazon.com/redshift/latest/gsg/rs-gsg-authorize-cluster-access.html for details of how to enable public Internet access.
- If your Amazon Redshift client connection to the database appears to hang or times out when running long queries, see http://docs.aws.amazon.com/redshift/latest/mgmt/connecting-firewall-guidance.html for possible solutions to address this issue.

Test the connection before you save it.

Additional Information for Amazon Authentication and Access Control

- AWS: Security
- AWS: Managing Cluster Security Groups Using the Console

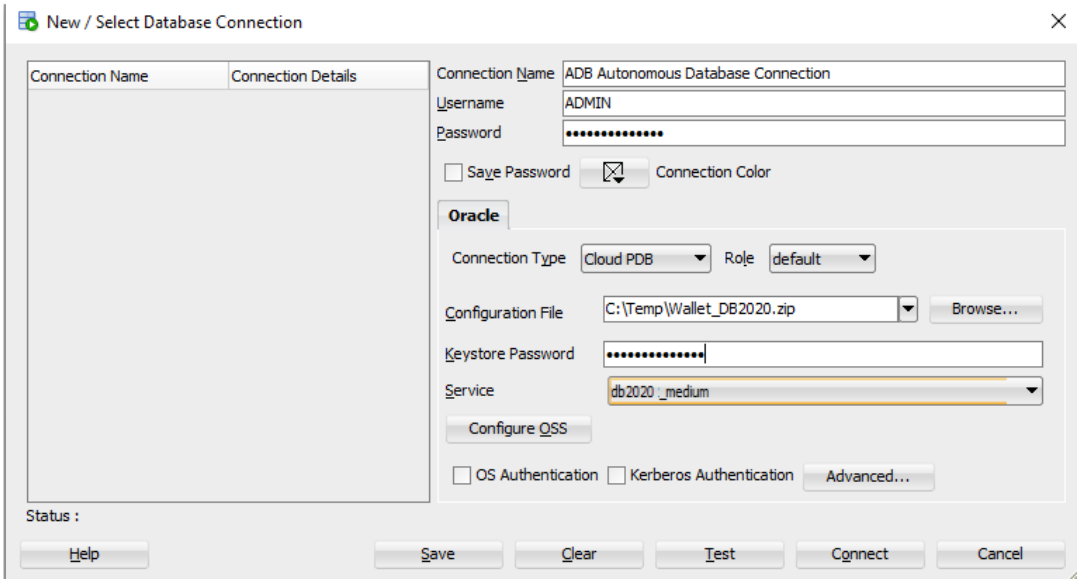
Connect to Autonomous Database

Using SQL Developer you create a connection to Autonomous Database

Obtain the client credentials wallet zip file. For more information, see Download Client Credentials (Wallets).

1. In the Connections panel, right-click **Connections** and select **New Connection...**.
2. Select the **Oracle** tab and enter the connection information for Autonomous Database.
3. For the AWS Redshift Migration connection, select the **_low** connection to your database.

   For more information, see See Database Service Names for Autonomous Database for more information..
4. Add a connection to Autonomous Database.



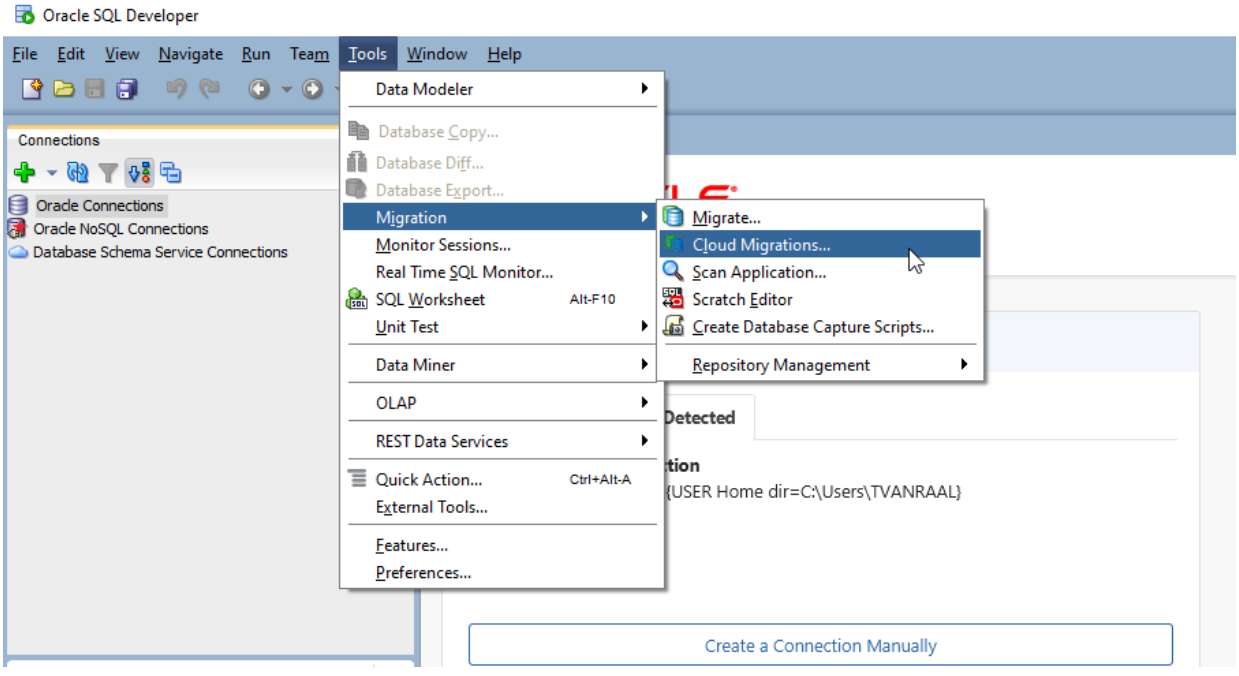
See Connect Oracle SQL Developer with a Wallet (mTLS) for more information.

Test the connection before you save it.

Start the Cloud Migration Wizard

Invoke the Cloud Migration Wizard from the Tools menu of SQL Developer to initiate your Amazon Redshift migration to Autonomous Database.

The Cloud Migration wizard starts when you click Cloud Migrations from **Migration** in the **Tools** menu. The Cloud Migrations wizard enables you to migrate schemas, objects (tables), and data from an Amazon Redshift database to Autonomous Database.



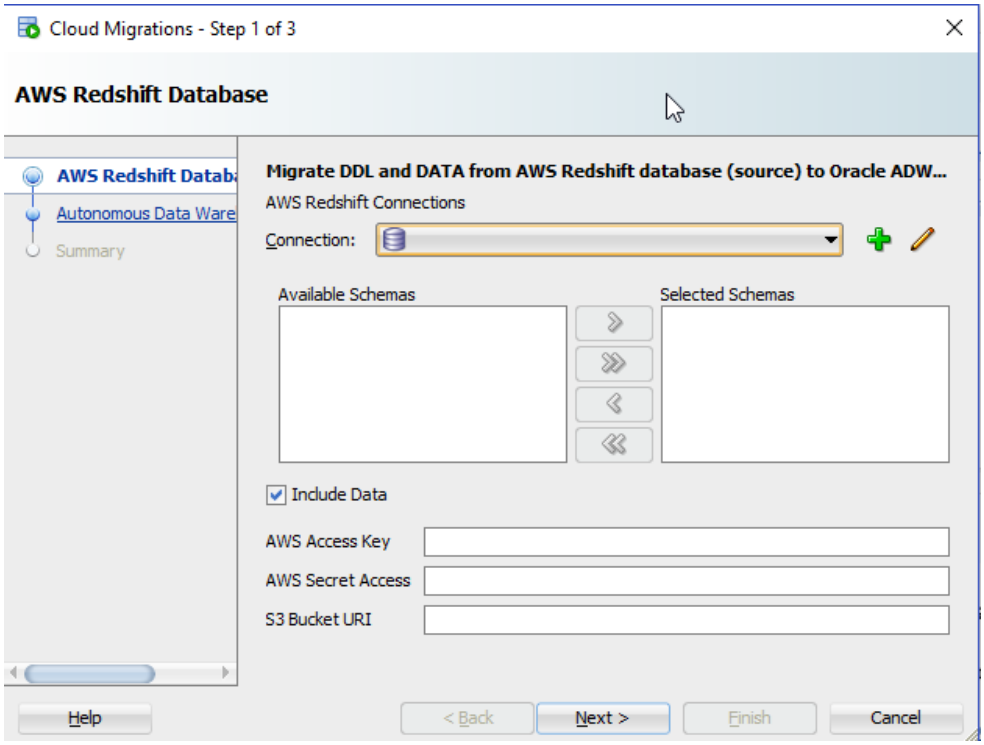
The Cloud Migration Wizard is an easy set of steps. The Cloud Migration Wizard guides you to:

- Identify the schemas in your Amazon Redshift database that you want to migrate.
- Identify the target Autonomous Database.
- Define whether you want to migrate the metadata (DDL), the data, or both.
- Choose to migrate your system online, to generate scripts, or both.

Identify the Amazon Redshift Database

Identify the schemas in the Amazon Redshift database to migrate. All objects, mainly tables, in the schema will be migrated. Migration to Autonomous Database is on a per-schema basis. Schemas cannot be renamed as part of the migration.

1. In the AWS Redshift Migration, specify the Connection.



- **Connection:** Name of the Redshift database connection.
- **Available Schemas:** Schemas available for the specific connection.
- **Selected Schemas:** Click the Add icon to select the schemas you want to migrate from **Available Schemas**.
- **Include Data:** DDL and DATA migrates the selected schemas and data.

When you migrate data, you have to provide the AWS access key, AWS Secret Access Key, and an existing S3 bucket URI where the Redshift data will be unloaded and staged. The security credentials require certain privileges to store data in S3. It is recommended to create new, separate access keys for the migration. The same access key is used later on to load the data into the Autonomous Database using secure REST requests.

- **AWS Access Key:** For more information on access keys, see AWS Identity and Access Management.

- **AWS Secret Access:** For more information on access keys, see AWS Identity and Access Management.
- **S3 Bucket URI:** For information on common S3 ServiceException errors, see S3ServiceException Errors.

  For more information an S3 buckets, see Creating and Configuring an S3 Bucket.

Amazon S3 Bucket URI Format

For the source files that reside in Amazon S3, see the following for a description of the URI format for accessing your files: Accessing a Bucket For example the following refers to the file folder 'folder_name' in the adwc bucket in the us-west-2 region.

```
https://s3-us-west-2.amazonaws.com/adwc/folder_name
```

S3 Bucket Configuration Example 1

If you provide the following S3 Bucket URI :

```
https://s3-us-west-2.amazonaws.com/my_bucket
```

The wizard verifies the entire path including *my_bucket*. An attempt is made to write a test file, if it is not accessible there is a prompt. In case, `my_bucket` does not exist, there is an error reported:

```
Validation Failed
```

Then the code generation creates the following path for the `DBMS_CLOUD.COPY_DATA` function:

```
file_uri_list => "https://s3-us-west-2.amazonaws.com/my_bucket/
oracle_schema_name/oracle_table_name/*.gz"
```

The migration assistant creates these folders: *oracle_schema_name*/*oracle_table_name* inside the bucket: *my_bucket*.

S3 Bucket Example 2

If you provide the following S3 Bucket URI :

```
https://s3-us-west-2.amazonaws.com/my_bucket/another_folder
```

The wizard verifies the entire path including *my_bucket*. An attempt is made to write a test file, if it is not accessible there is a prompt. In case, `my_bucket` does not exist, there is an error reported:

```
Validation Failed
```

In this case the *another_folder* does not have to exist. The migration creates the *another_folder* bucket inside *my_bucket*.

Then the code generation creates the following path for the `DBMS_CLOUD.COPY_DATA` function:

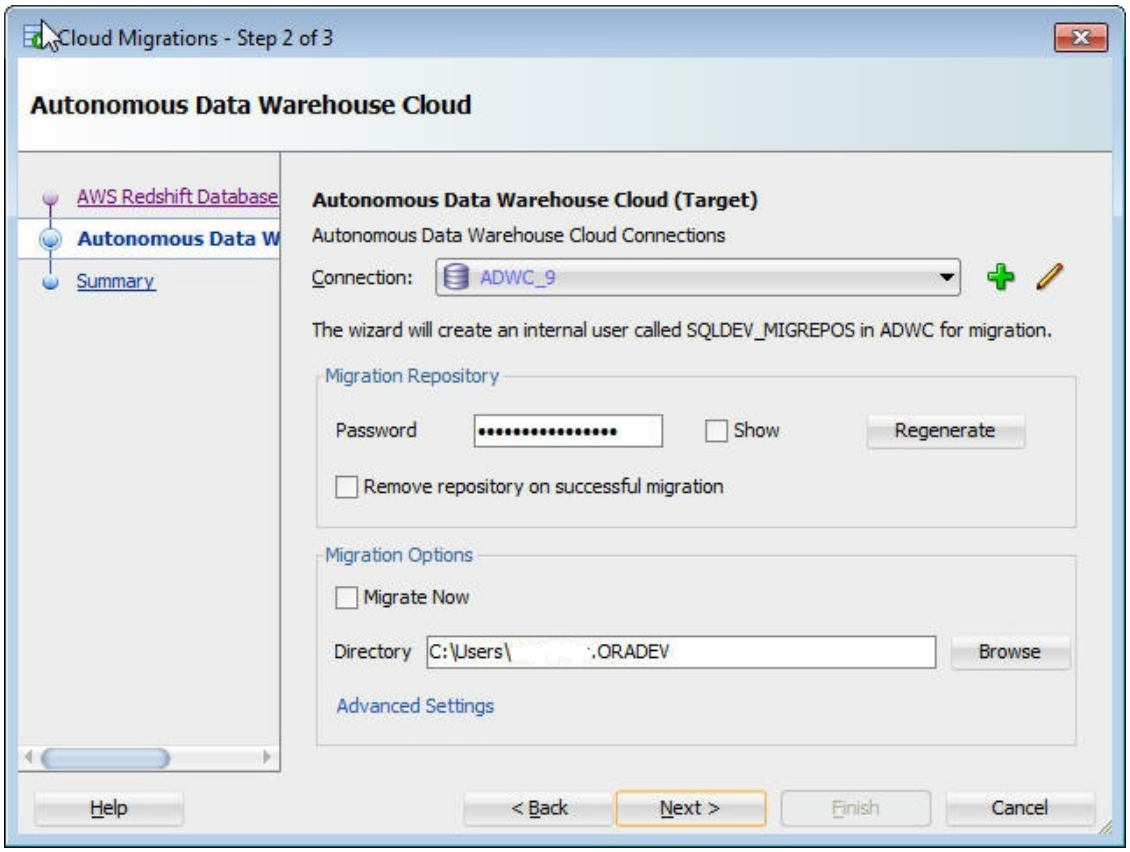
```
file_uri_list => 'https://s3-us-west-2.amazonaws.com/my_bucket/another_folder/
oracle_schema_name/oracle_table_name/*.gz
```

Step 2 of 3: Autonomous Data Warehouse Cloud

First create a connection for your target Autonomous Database See Connect to Autonomous Database. The user for this connection must have the administrative privileges; the connection is used throughout the migration to create schemas and objects.

> **Note:**
>
> Use the ADMIN user or a user with admin role.

The Amazon Redshift Migration Assistant allows you to do an online migration right away, to generate all scripts necessary for a migration, or both. If you chose to store the scripts in a local directory you have to specify the local directory (the directory must be writable by the user).



- **Connection:** Name of the Autonomous Data Warehouse Cloud connection. Create a connection for the Autonomous Database if required. The user must have administrative privileges since this connection is used throughout the migration to create schemas and objects.

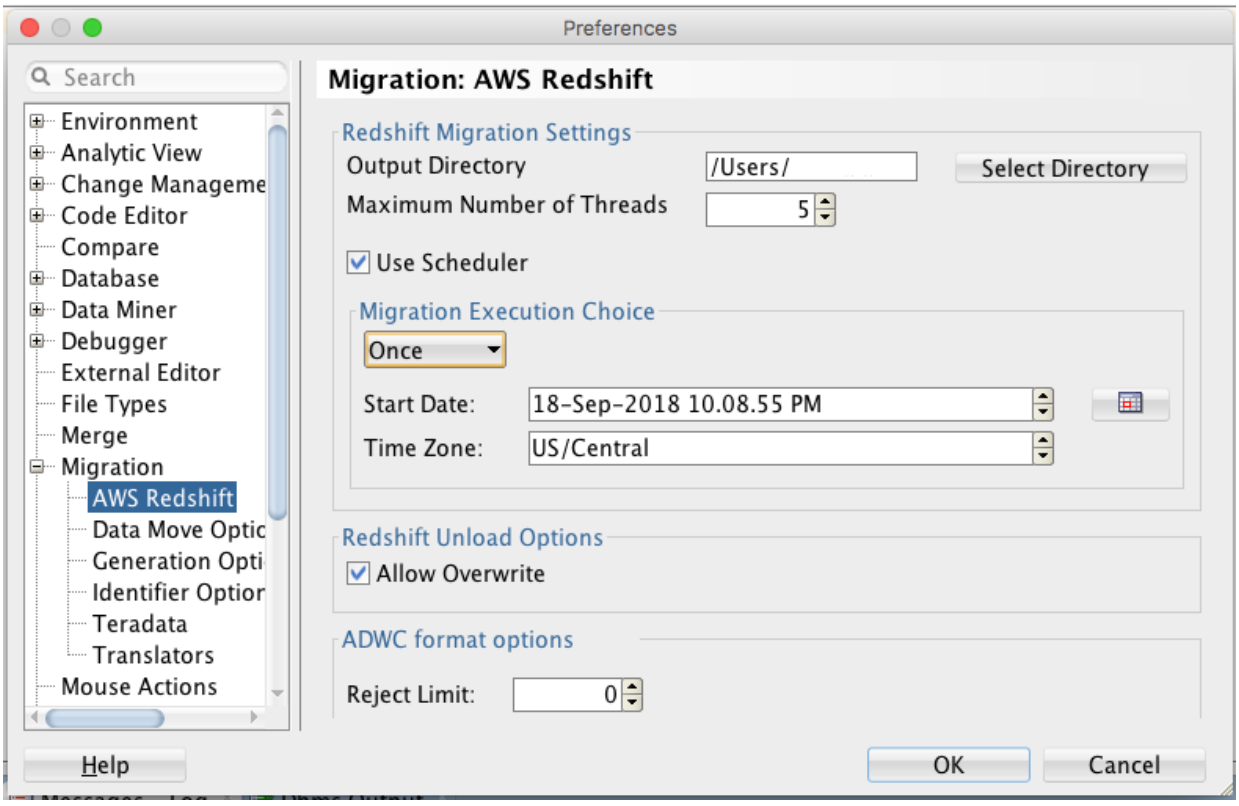
- **Migration Repository Password:** Password for the migration repository that is installed in the Autonomous Database as part of the schema migration. Either use the pre-filled password or enter a new password.
- **Remove repository on successful migration:** Select this option to remove the repository after the migration is completed. The repository is not required after migration.
- **Migrate Now:** Select this option to perform an online migration immediately.

> **Note:**
>
> – If **Include Data** from Step 1 and **Migrate Now** are both unselected, you are opting for just generation of all required SQL Scripts for manual migration.
>
> – If **Include Data** from Step 1 is unchecked and **Migrate Now** is selected, then all selected schemas and their tables will be deployed in Autonomous Database but data will not be loaded into tables.
>
> – If **Include Data** from Step 1 and **Migrate Now** are both selected, then all selected schemas and their tables will be deployed in Autonomous Database and data will be loaded into tables.

- **Directory:** Specify the director to store the generated scripts necessary for the migration; this saves the scripts in a local directory.

Advanced Settings (Optional)

The default settings should work unless you want to control the format options when Unloading to S3 storage or Copying from S3 storage to Autonomous Database. For more information on Format Options, see DBMS_CLOUD Package Format Options. To use advanced options, click **Advanced Settings**.



Output Directory: Enter the path or click Select Directory to select the directory or folder for the migration.

Maximum Number of Threads: Enter the number of parallel threads to enable when loading data to tables in Autonomous Database.

Use Scheduler: Select this option to enable the scheduler for migration. You can schedule jobs for data load migration operations from the AWS S3 bucket to Autonomous Database. You have the option to run the scheduled jobs immediately or at a future date and time. To monitor the data load scheduled jobs, use the Scheduler node in the Connections navigator.

Migration Execution Choice:

- **Immediate** runs the scheduler as soon as the Redshift migration is triggered.
- **Once** runs the scheduler on a future date. You specify the **Start Date** and **Time Zone**. By default, the Start Date displays the current date and time of the local system. To change the start date, use the calendar icon to double-click and select the date or use the spinner to highlight the date and then click the field to set it.

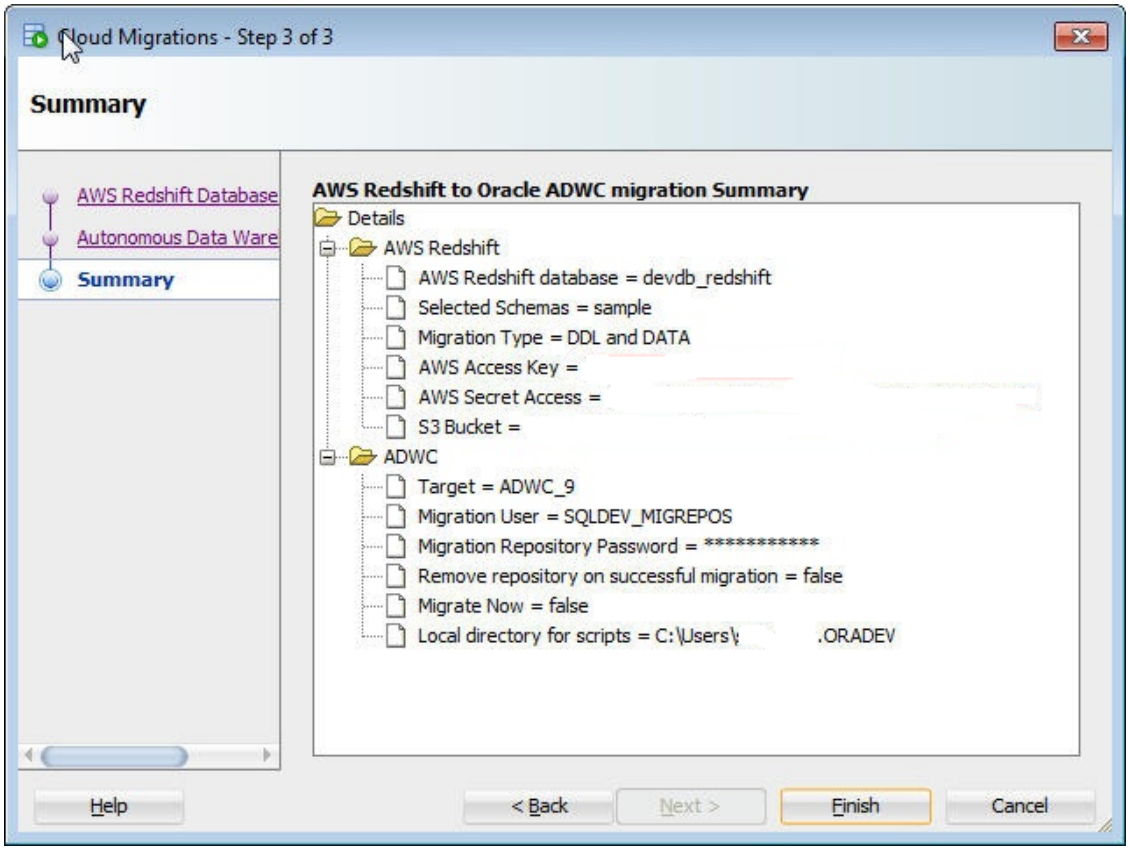
Redshift Unload Options: Allow Overwrite: If this option is enabled, the unload process will overwrite existing files, including the manifest file (lists the data files that are created by the unload process). By default, unload fails if there are files that can be overwritten.

ADWC format options: Reject Limit: Enter the number of rows to reject when loading data to tables in Autonomous Database. The migration operation will error out after the specified number of rows are rejected. The default is 0.

Review and Finish the Amazon Redshift Migration

The summary shows a summary of the information that you have specified.

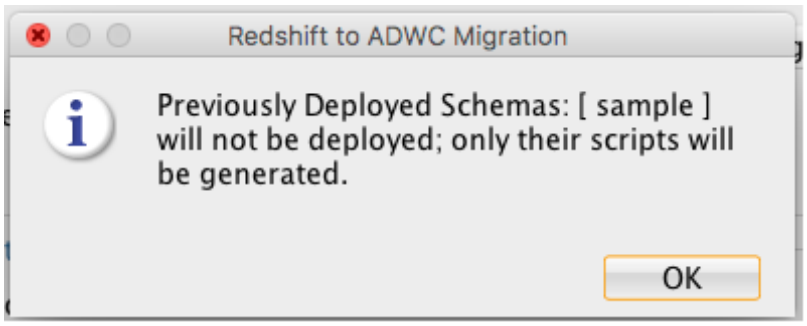
To change any information, press **Back** as needed.



If you have chosen an immediate migration, then the dialog of the migration wizard stays open until the migration is finished. If you select generate scripts, the migration process generates the necessary scripts in the specified local directory, and does not run the scripts.

To perform the migration, click **Finish**

If the selected schema name in AWS Redshift already exists in Autonomous Database, the migration process excludes deploying these selected schemas and displays a dialog:



Summary: What The Migration Assistant Creates

- Creates a new Autonomous Database user using the *schema_name* from Redshift.
- Creates a new bucket on S3 based on the *schema name*.
- Creates sub-folders on S3 for each table.

Use Generated Amazon Redshift Migration Scripts

When you choose to generate migration scripts a new subdirectory is created in the local directory specified in the migration Wizard. You can run these scripts in real time or use them for programmatic processing.

The directory contains the following scripts:

- `redshift_s3unload.sql`
- `adwc_ddl.sql`
- `adwc_dataload.sql`
- `adwc_dataload_scheduler.sql`

These scripts contain all necessary commands to migrate your Amazon Redshift system to Autonomous Database. You can run these scripts in real time or use them for programmatic processing.

Unload Your Amazon Redshift Data into S3

The first step of a successful migration is to unload your Amazon Redshift data into Amazon S3, which acts as a staging area. Script **redshift_s3unload.sql** has all the Amazon Redshift unload commands to unload the data using the access credentials and the S3 bucket that were specified in the Migration Wizard workflow.

Connect to your Amazon Redshift environment to run this script.

Create Your Data Warehouse Objects

To prepare your Autonomous Database create your empty data warehouse schema prior to loading data. The Amazon Redshift Migration Assistant converted all Amazon Redshift schema structures into Oracle structures in script **adwc_ddl.sql**.

The script must be executed while you are connected to your Autonomous Database as privileged user; for example, ADMIN.

By default, the schema created for the migration has the same name as the schema in Amazon Redshift. You must change the password to the valid password for the specified user either in the script or after the script runs. If you want to change the schema name then change the schema name and all references to the name.

Load Your Amazon Redshift Data into Your Oracle Autonomous Database

The script **adwc_dataload.sql** contains all the load commands necessary to load your unloaded Amazon Redshift data straight from S3 into your Autonomous Database.

Execute the script while connected to your Autonomous Database as a privileged user; for example ADMIN.

If you want to change the target schema name when you create your data warehouse objects then you must adjust the target schema names in this script accordingly.

Use of JOB SCHEDULER

SQL Developer provides a graphical interface for using the DBMS_SCHEDULER PL/SQL package to work with Oracle Scheduler objects. To use the SQL Developer scheduling features, please refer 'Scheduling Jobs Using SQL Developer' topic of SQL Developer User Guide and **Oracle Database Administrator's Guide** to understand the concepts and essential tasks for job scheduling.

The Scheduler node for a connection appears in the Connections navigator and in the DBA navigator. Use ADWC 'admin' user to navigate which displays Scheduler objects owned by the 'admin' monitoring status of data load jobs.

Under ADWC 'admin' Connection → Scheduler → Jobs, you will see AWS Redshift to ADWC data load jobs are created with name <schema_name>_<table_name>.

To see the status of completion of each data load, please expand each scheduled job and check the status.

Also for more detailed information about data load operation see table `MD_REPORT` in `SQLDEV_MIGREPOS` schema that stores information about table columns: and

```
 OPERATION_ID, LOGFILE_TABLE, BADFILE_TABLE, SOURCE_SCHEMA_NAME,
TARGET_SCHEMA_NAME, SOURCE_TABLE_NAME,
```

and

```
 TARGET_TABLE_NAME, SOURCE_TABLE_ROWS, TARGET_TABLE_ROWS_LOADED, ERROR
MESSAGE,
```

and

```
STATUS (COMPLETED or FAILED)
```

Redshift Migration Log and Report Files

After Redshift Migration, you will find three files:

- `MigrationResults.log` : Log file of Redshift migration
- `readme.txt` : file explains how to use the Generated Amazon Redshift Migration Scripts.
- `redshift_migration_reportxxx.txt` : Contains information about Migration, here is sample:

```
_____________________________________________________________
OPERATION ID : 8566
LOGFILE TABLE : COPY$8566_LOG
BADFILE TABLE : COPY$8566_BAD
SOURCE SCHEMA : sample
TARGET SCHEMA : SAMPLE
SOURCE TABLE : listing
TARGET TABLE : LISTING
SOURCE TABLE ROWS : 192497
TABLE ROWS LOADED : 192497
ERROR MESSAGE : null
STATUS : COMPLETED
```

```
START TIME : 2018-09-27 17:25:18.662075
END TIME : 2018-09-27 17:25:25.012695
_____________________________________________________________
```

Perform Post Migration Tasks

After successful migration of your Redshift environment you should consider the following post-migration tasks:

- Drop schema `SQLDEV_MIGREPOS`
- Drop the Amazon S3 bucket used for staging
- Harden the Amazon account used for accessing S3
- Drop the database credential used for data loading from S3
- Harden your accounts in your Autonomous Database

1. Drop schema `SQLDEV_MIGREPOS`

   As part of the schema migration the Migration Assistant installs a minimal migration repository in the target Autonomous Database. After the migration this account is no longer needed and can be dropped or alternatively locked.

2. Drop the Amazon S3 Bucket Used for Staging

   Unless you desire to use the unloaded Redshift data otherwise you can drop the bucket containing the unloaded data.

3. Harden the Amazon Account Used for Accessing S3

   You should inactivate the security access key used for S3 access unless needed for other purposes.

4. Drop the database credential used for data loading from S3

   The Amazon security credentials to access S3 are stored encrypted as database credential `REDSHIFT_DWCS_CREDS` in your Autonomous Database in the privileged user schema that was used for the migration. Oracle recommends you drop this credential after successful migration unless needed for other purposes. For more information, see DROP_CREDENTIAL Procedure.

5. Harden your Accounts in Your Autonomous Database

   For the new schema created as part of the migration with the Migration Assistant, ensure to change the passwords of these accounts or lock and expire them if they’re solely used for data storage.

Migrating MySQL to Autonomous Database

Migration is the process of copying the schema objects and data from a source MySQL to Autonomous Database. Using Oracle SQL Developer Migration Wizard you can perform migration in an efficient and largely automated way.

See SQL Developer: Migrating Third-Party Databases and Before Migrating From MySQL for more information.

Migrating Microsoft SQL Server or Sybase Adaptive Server to Autonomous Database

Migration is the process of copying the schema objects and data from a source Microsoft SQL Server or Sybase Adaptive Server to Autonomous Database. Using Oracle SQL Developer Migration Wizard you can perform migration in an efficient and largely automated way.

See SQL Developer: Migrating Third-Party Databases and Before Migrating From Microsoft SQL Server or Sybase Adaptive Server for more information.

Migrating IBM DB2 (UDB) Database to Autonomous Database

Migration is the process of copying the schema objects and data from a source IBM DB2 (UDB) database to Autonomous Database. Using Oracle SQL Developer Migration Wizard you can perform migration in an efficient and largely automated way.

See SQL Developer: Migrating Third-Party Databases and Before Migrating From IBM DB2 for more information.

Migrating Teradata Database to Autonomous Database

Migration is the process of copying the schema objects and data from a source Teradata database to Autonomous Database. Using Oracle SQL Developer Migration Wizard you can perform migration in an efficient and largely automated way.

See SQL Developer: Migrating Third-Party Databases and Before Migrating From Teradata for more information.

SODA Collection Metadata

It describes SODA Collection metadata on the database.

- SODA Collection Metadata on Autonomous Database
  Describes default and customized collection metadata on Autonomous Database.

SODA Collection Metadata on Autonomous Database

Describes default and customized collection metadata on Autonomous Database.

- SODA Default Collection Metadata on Autonomous Database
  Describes the default collection metadata on Autonomous Database, that is the metadata for a collection that is added when custom metadata is not supplied.
- SODA Customized Collection Metadata on Autonomous Database
  Describes SODA collection custom metadata on Autonomous Database.

SODA Default Collection Metadata on Autonomous Database

Describes the default collection metadata on Autonomous Database, that is the metadata for a collection that is added when custom metadata is not supplied.

Each SODA implementation provides a way to create a default collection when you supply a collection name. For example, in SODA for Java you use the `createCollection` method and supply just a collection name parameter:

```
db.admin().createCollection("myCol");
```

This creates a collection with default collection metadata. When you create a default collection on your database, the collection metadata includes the following information (regardless of which SODA implementation you use to create the default collection):

```
{
   "keyColumn" :
   {
      "name" : "ID",
      "sqlType" : "VARCHAR2",
      "maxLength" : 255,
      "assignmentMethod" : "UUID"
   },

   "contentColumn" :
   {
      "name" : "JSON_DOCUMENT",
      "sqlType" : "BLOB",
      "jsonFormat" : "OSON"
   },
   "versionColumn" :
   {
     "name" : "VERSION",
     "method" : "UUID"
   },

   "lastModifiedColumn" :
   {
     "name" : "LAST_MODIFIED"
   },

   "creationTimeColumn" :
   {
      "name" : "CREATED_ON"
   },

   "readOnly" : false
}
```

> **Note:**
>
> Using Always Free Autonomous Database with Oracle Database 23ai, the default metadata changes as follows.

```
{
   "keyColumn" :
   {
      "name" : "ID",
      "sqlType" : "VARCHAR2",
      "maxLength" : 255,
      "assignmentMethod" : "UUID"
   },

   "contentColumn" :
   {
      "name" : "JSON_DOCUMENT",
      "sqlType" : "JSON",
   },
   "versionColumn" :
   {
     "name" : "VERSION",
     "method" : "UUID"
   },

   "lastModifiedColumn" :
   {
     "name" : "LAST_MODIFIED"
   },

   "creationTimeColumn" :
   {
      "name" : "CREATED_ON"
   },

   "readOnly" : false
}
```

SODA Customized Collection Metadata on Autonomous Database

Describes SODA collection custom metadata on Autonomous Database.

Each SODA implementation provides a way to customize the collection metadata during collection creation. For example, in SODA for Java, you can use the following command:

```
OracleDocument metadata = db.createDocumentFromString("metadata_string");
OracleCollection col = db.admin().createCollection("myCustomColl", metadata);
```

In this example, for *metadata_string* you can use the default metadata as the starting point, and customize the following:

- Change `keyColumn.assignmentMethod` to `CLIENT`: Change the value of the `assignmentMethod` under `keyColumn` in the metadata to `CLIENT` (instead of `UUID`).

Valid values for `keyColumn.assignmentMethod` on Autonomous Database:

  - **UUID** (default): Keys are generated by SODA, based on the `UUID`.
  - **CLIENT**: Keys are assigned by the client application.

- Provide a `mediaTypeColumn name` value: A media type column is needed if the collection is to be heterogeneous, that is, it can store documents other than JavaScript Object Notation (JSON). See Media Type Column Name for details.

The following example specifies client-assigned keys and a custom media type column. The `mediaTypeColumn name` is specified with the value *YOUR_MEDIA_TYPE_COLUMN_NAME*. Otherwise, the default settings are used.

```
{
   "keyColumn" :
   {
      "name" : "ID",
      "sqlType" : "VARCHAR2",
      "maxLength" : 255,
      "assignmentMethod" : "CLIENT"
   },

   "contentColumn" :
   {
      "name" : "JSON_DOCUMENT",
      "sqlType" : "BLOB"
   },

   "versionColumn" :
   {
     "name" : "VERSION",
     "method" : "UUID"
   },

   "lastModifiedColumn" :
   {
     "name" : "LAST_MODIFIED"
   },

   "creationTimeColumn" :
   {
      "name" : "CREATED_ON"
   },

   "mediaTypeColumn" :
   {
      "name" : "YOUR_MEDIA_TYPE_COLUMN_NAME"
   },

   "readOnly" : false
}
```

Cloud Support and Identity Information

This lists the procedure to file a service request using Oracle Cloud Support.

- Obtain Tenancy Details
  When you file a service request or when you need Autonomous Database tenancy details for other reasons you can obtain these details for your instance. Tenancy details for an instance are available on the Oracle Cloud Infrastructure Console or you can obtain these details by querying the database.

Obtain Tenancy Details

When you file a service request or when you need Autonomous Database tenancy details for other reasons you can obtain these details for your instance. Tenancy details for an instance are available on the Oracle Cloud Infrastructure Console or you can obtain these details by querying the database.

If you need to file a service request use Oracle Cloud Support or contact your support representative. When you contact support, provide the first five items so that support can identify your instance.

- Database Name
- Region
- Tenancy OCID
- Database OCID
- Compartment OCID
- Outbound IP Address
- Availability Domain

If you are connected to the database you can obtain tenancy details by querying the `CLOUD_IDENTITY` column of the `V$PDBS` view.

For example, running the following provides the cloud identity information for an instance:

```
SELECT cloud_identity FROM v$pdbs;

CLOUD_IDENTITY
------------------------------------------------------------------
{
  "DATABASE_NAME" : "DBxxxxxxxxxxx",
  "REGION" : "us-phoenix-1",
  "TENANT_OCID" : "OCID1.TENANCY.REGION1..ID1",
  "DATABASE_OCID" : "OCID1.AUTONOMOUSDATABASE.OC1.IAD.ID2",
  "COMPARTMENT_OCID" : "ocid1.tenancy.region1..ID3"
  "PUBLIC_DOMAIN_NAME" : "adb.us-ashburn-1.oraclecloud.com",
  "TENANT_ACCOUNT_NAME" : "test_example",
  "AUTOSCALABLE_STORAGE" : false,
  "BASE_SIZE" : 1099511627776,
  "INFRASTRUCTURE" : "Serverless",
  "SERVICE" : "ADW",
  "APPLICATIONS" :
  [
    "GRAPH",
    "ODI",
    "ORDS",
    "DATABASEACTIONS",
    "OMLMOD",
    "APEX",
```

```
    "OML"
  ],
  "OUTBOUND_IP_ADDRESS" :
  [
       "192.0.2.254"
  ]
  "AVAILABILITY_DOMAIN" : "SoSC:region-1-AD-1"
  "COMPUTE_MODEL" : "ECPU",
  "COMPUTE_COUNT" : 2,
  "COMPUTE_AUTOSCALING" : true,
  "AUTONOMOUS_DATA_GUARD" :
  [
    {
      "STANDBY_TYPE" : "local",
      "AVAILABILITY_DOMAIN" : "SoSC:region-AD-2"
    },
    {
      "STANDBY_TYPE" : "cross-region",
      "AVAILABILITY_DOMAIN" : "SoSC:region-AD-1"
    }
  ]
}
```

If your Autonomous Database instance was created before the tenancy details feature was added and has not been restarted, then this query does not return tenancy details. In this case, as a one-time operation, restart your instance and run the query again. You can restart your instance from the Oracle Cloud Infrastructure console or using the restart API.

Topics

- Database Name
- Region
- Tenancy OCID
- Database OCID
- Compartment OCID
- Outbound IP Address
- Public Domain Name
- Tenant Account Name
- Autoscalable Storage
- Base Size
- Infrastructure
- Service
- Applications
- Availability Domain
- Compute Model
- Compute Count
- Compute Auto Scaling

- Cloud Identity Information for Autonomous Data Guard
- Public IP Address Ranges for Autonomous Database

Database Name

You set the database name when you provision a database or when you rename a database.

The Oracle Cloud Infrastructure Console shows the database name on the Autonomous Database Details page under General Information in the **Database Name** field.

Region

The Oracle Cloud Infrastructure Console shows the region on the console, in the Regions area.

Tenancy OCID

The tenancy details page shows the tenancy OCID.

See Managing the Tenancy for information on accessing the Tenancy Details page.

See Resource Identifiers for information on Oracle Cloud Identifiers.

Database OCID

The Oracle Cloud Infrastructure Console shows the database OCID on the Autonomous Database Details page under General Information in the **OCID** field.

See Resource Identifiers for information on Oracle Cloud Identifiers.

Compartment OCID

See Managing Compartments for more information on compartments.

See Resource Identifiers for information on Oracle Cloud Identifiers.

Outbound IP Address

The `OUTBOUND_IP_ADDRESS` is the outbound IP address of your Autonomous Database instance. You can use the `OUTBOUND_IP_ADDRESS` when you create a database link to another Autonomous Database instance that uses ACLs to restrict access. In this case, you need to allow the specified outbound IP address to connect to the target Autonomous Database and then create the database link.

The `OUTBOUND_IP_ADDRESS` shows the outbound IP address in the following cases:

- When your Autonomous Database instance uses a Public Endpoint.
- When your Autonomous Database instance uses a Private Endpoint and the database property `ROUTE_OUTBOUND_CONNECTIONS` is set to `''` (the default value).

> **Note:**
>
> When your Autonomous Database instance uses a Private Endpoint and you set the database property `ROUTE_OUTBOUND_CONNECTIONS` to `'PRIVATE_ENDPOINT'`, outbound connections go through the private endpoint. See Enhanced Security for Outbound Connections with Private Endpoints for more information.

See Create Database Links from Autonomous Database to a Publicly Accessible Autonomous Database with a Wallet (mTLS) for information on creating database links.

See Configuring Network Access with Access Control Rules (ACLs) for information on configuring access control rules.

Public Domain Name

The `PUBLIC_DOMAIN_NAME` shows the public domain name for your Autonomous Database instance.

Tenant Account Name

The `TENANT_ACCOUNT_NAME` field specifies the tenant account name for your Autonomous Database instance.

See Tenancy Management for more information.

Autoscalable Storage

The `AUTOSCALABLE_STORAGE` field specifies if storage auto scaling is enabled. Possible values are `true` or `false`.

See Storage Auto Scaling for more information.

Base Size

The `BASE_SIZE` show's the Autonomous Database instance base storage size.

See Provision an Autonomous Database Instance for more information.

Infrastructure

The `INFRASTRUCTURE` field shows the deployment type.

See Provision an Autonomous Database Instance for more information.

Service

The `SERVICE` field shows the Autonomous Database instance workload type.

See About Autonomous Database Workload Types and Provision an Autonomous Database Instance for more information.

Applications

The `APPLICATIONS` field shows the tools that are enabled on the Autonomous Database instance.

See Manage Autonomous Database Built-in Tools for more information.

Availability Domain

You can view the Availability Domain of your Autonomous Database instance.

This is useful when you need to deploy your Application Servers when your Autonomous Database instance resides in a multi-Availability Domain region. In order to reduce latency as much as possible you would want to deploy your Application Server and database in the same Availability Domain.

See Regions and Availability Domains for more information on Availability Domains.

Compute Model

The `COMPUTE_MODEL` shows the Autonomous Database instance compute model. Valid values are `ECPU` or `OCPU`.

See Compute Models in Autonomous Database for more information.

Compute Count

The `COMPUTE_COUNT` shows the Autonomous Database instance **ECPU count** (**OCPU count** if your database uses OCPUs).

See Provision an Autonomous Database Instance for more information.

Compute Auto Scaling

The `COMPUTE_AUTOSCALING` field specifies if the Autonomous Database instance has compute auto scaling enabled. Valid values are `true` or `false`.

See Compute Auto Scaling for more information.

Cloud Identity Information for Autonomous Data Guard

The `AUTONOMOUS_DATA_GUARD` field shows the available Autonomous Data Guard disaster recovery standby databases, information for each standby includes the `STANDBY_TYPE`, either `local` or `cross-region`, and the `AVAILABILITY_DOMAIN`.

See Use Standby Databases with Autonomous Data Guard for Disaster Recovery for more information.

Public IP Address Ranges for Autonomous Database

Oracle Cloud Infrastructure provides information about public IP address ranges for Autonomous Databases that are deployed in Oracle Cloud Infrastructure.

See IP Address Ranges for more information.
