  - The text description for this option varies depending on the gradient mode you select. Click this box to select a secondary color to merge with the primary color. The fill colors then merge using the method defined in the Gradient Mode menu.

- **Transparency (%)**
  - Select a percentage to define how intense the fill colors are. A setting of 100% is completely transparent, which prevents the fill colors from displaying. A setting of 0% has no transparency, resulting in intense background colors. The selected percentage is immediately reflected in the Preview area, so you can easily scroll through the transparency percentages to find a value that best suits your needs.

- **Preview**
  - This area provides a sample of how the fill colors you select will appear on the text field's background.
Click the **Borders** tab to define the borders for the text field.

Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

- **Change Colors**

**How You Change Fonts and Colors**

Certain items you edit in explorers include options to change font attributes or add colors.

The methods to define fonts and colors are generally the same, regardless of the item you’re editing or the explorer you’re using.

**Change Font Attributes from the Font Tab**

When customizing text elements in Analytics, you can specify font attributes to change the display of the text. Font attributes can be selected from the ribbons in certain editors, such as the chart styles editor, or from a Font tab on a window in other areas.
The same options are available from the ribbon or the tab. Some editors give you access to font attributes from both the ribbon and the tab, allowing you to change font attributes from either location. This procedure describes the options available on the Font tab. However, you can also set these options from the ribbons of most editors in Analytics, such as the Chart Styles editor.

1. Click the **Font** tab.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Font</td>
<td>Click this drop-down menu to select a font.</td>
</tr>
<tr>
<td>Style</td>
<td>Select the check boxes for the style attributes you want. You can select multiple attributes to apply to the font: Regular, Bold, Italic, Underline, Strikethrough, and All Caps.</td>
</tr>
<tr>
<td>Size</td>
<td>Click this drop-down menu to select the point size of the font.</td>
</tr>
<tr>
<td>Color</td>
<td>Click the color box to select a color for the font. See <em>Change Colors</em>.</td>
</tr>
<tr>
<td>Preview</td>
<td>Click this button to preview the font using the options you select. This button isn't available on all Font tabs.</td>
</tr>
</tbody>
</table>

3. Click **OK**.

### Change Colors

You can select colors for many objects in Analytics, such as text labels and report backgrounds.

When selecting colors from a tabbed window, the Color window displays. When selecting colors from a **ribbon**, the color menu is displayed. Both give you the same options, though they present them in slightly different ways. This procedure explains how to select colors and define custom colors using both the color menu and Color window.

1. To select a color using the menu, click the color you want to use.
   The color is applied to the object you’re editing.
2. To select a color using the window:
   a. Click the color you want.
   b. Click **OK**.
   The color is applied to the object you’re editing.
3. To define a custom color from the window:
   a. Click **Define Custom Colors**.
      The window expands to show custom color options.
   b. Click anywhere in the color palette or enter the HSL (hue, saturation, luminance) or RGB (red, green, blue) components in the appropriate text boxes to define your custom color.
      The HSL color model defines the hue, saturation, and luminance of the color.
      - **Hue**—The hue is the pigment of the color and has a value between 0 to 359 degrees.
- Saturation—The saturation is measured as a percent from 0 to 100 and specifies the vividness of a color.
- Lumination—Lumination is the amount of white in the color and is a value from 0 to 100 percent.

The RGB color model defines the amount of red, green, and blue light the color contains. RGB values can be between 0 and 255. For example, when all components are set to 255, the color is white, and when all are set to 0, the color is black.

c. Click Add to Custom Colors. The color is added to your custom colors.
d. Click OK to apply the color you selected or created to the component you’re defining.

4. To view additional standard colors or to create a custom color from the color menu, click More Colors.
   a. To choose a standard color from the window, click the color you want and click OK to apply the color to the object you’re editing.
   b. To define a custom color, click the Custom tab.
      Custom colors are defined on the Custom tab in the same way they’re defined on the Color window.
   c. Click OK to apply the custom color to the object you’re editing.

Creating Basic Custom Reports

Overview of Creating Basic Custom Reports

You can create new reports using the Analytics explorer. While this can be a complex process, learning how to create a basic report will help you understand the tools you need to create more complex reports.

When creating reports, you can use advanced features such as multiple output levels, linked reports, calculations, data exceptions, variables, computed fields, and custom scripts. These reports can take time to plan or may require input from several people. However, you can quickly create reports that fulfill most of your reporting needs.

Related Topics
- Overview of Custom Reports

How to Plan a Basic Custom Report

No matter how simple or complex a custom report is, there are certain guidelines to follow to help you create the report you want.

Since each custom report you create can output different data and include different components, you may want to design your report before you start to create it. This helps determine what steps you need to take to create the report you want. We recommend considering the following questions before you create your report.

- What audience will view or use the report? This determines which report layout you use since some layouts include charts, titles, and other information. See Apply a Layout to a Dashboard and Apply a Layout to an Output Level.
- What information do you want the report to return? This determines the fields to include in the report’s output. See Overview of Report Output Columns.
• What fields do you want to be able to search on when running the report, and what information should be excluded? This determines the report’s fixed and runtime selectable filters. See Overview of Report Filters.
• Do you want to be able to drill down on any fields to view additional information? This determines if multiple output levels or linked reports need to be configured. See Overview of Report Output Levels and Overview of Linked Reports.
• How do you want the information that’s returned to be ordered? This determines the sorting options that you apply to the report. See How You Change Report Sort Order.
• Who should have access to run or edit the report? This determines if the report should be made public and what permissions are applied to the report. See Set Report Permissions.

Tip: If an existing report is similar to a report you want to create, you can copy the existing report and then edit the copy to create your new report. To view descriptions of existing reports, you can generate a catalog of reports. See Create a List of Reports. For information about finding reports, see Search for Analytics Items. For information about viewing the contents of a report, see View a Report Definition.

Overview of Creating Custom Reports

After you understand what your report should contain, you create it on the report designer. The procedures listed here demonstrate the basic steps that are required to create most reports. While the sample report might not be useful to your organization, knowing how to create a report such as this will help you create reports your organization needs.

In this sample report, you will see the number of unresolved and updated incidents in each incident queue. You will also be able to drill down on the information in the first level to open a second output level to view details about the incidents in each queue.

To create the report, you will follow a number of basic steps.

1. Open the report designer. See Open the Report Designer.
2. Add columns to the report. See Add Output Columns to a Report.
3. Add another output level to the report. See Add a Second Output Level to a Report.
4. Add filters to the report. See Add a Search Filter to a Report.
5. Save the report. See Save a Custom Report.

Open the Report Designer

The report designer gives you access to all the tools you need to create basic or more complex reports.

1. Do one of the following:
   o Click Analytics on the navigation pane, double-click Reports Explorer, and then click New Report.
   o If your navigation set is configured to add new reports from the file menu, click File and then select Report. See Asset Workspaces.
2. Select the type of report you want to build: Grid report, Standard report, or Standard report with Chart. Since the sample report will primarily be used internally by staff members to work with records, select Grid report.
Note: Grid reports are most commonly used on the Service Console to list records that staff members can open for editing. The other report types are generally used to present summaries of data inside or outside of your organization. If you decide you want a different report type after you start creating a report, you can change it from the Report Layouts button on the Home tab.

After selecting the report type, the report design center opens where you create your report. The report designer consists of the ribbon, the design surface, where report content is located, and the data dictionary, where you can select from the database’s tables and fields.

• Creating a Custom Report (video)

Add Output Columns to a Report
In this procedure, we will add two columns to the report’s first output level, displaying incident queues and the number of incidents in each queue.

1. Expand the All Tables tree on the data dictionary and then select Incidents.
2. Select Queue (queue_id) on the right side of the data dictionary and drag it to the design surface. The field is added to the report as a column and is automatically named Queue, but you can right-click the column to change the name and customize other options.
3. On the data dictionary, scroll down to the Functions tree and expand it.
4. Select Aggregate Functions and then drag count(expr) onto the design surface. The Column Definition window opens where you select the field you want counted.

We will edit the column’s expression to specify what records we want counted. In this example, we want to count the incidents in each queue.

5. On the left side of the window, expand Current Dataset > Incidents.
6. Scroll down to Incident ID (i_id) and drag it to the text between the parentheses on the right side of the window. After you do this, the column’s expression will be count(incidents.i_id).
We want to count the records using this field since it’s a unique identifier for incidents as no two incidents share the same ID number.

7. To change the name of the column you're adding, enter the name you want in the Heading field. For our example, you can enter Number of Incidents.

8. Click OK.

The new column automatically displays a count of all incidents in each incident queue.

The first output level of the sample report now has two columns displaying incident queues and the number of incidents in each queue. For more information about adding output columns to reports and the types of columns you can add, see Overview of Report Output Columns.

Add a Second Output Level to a Report

Now we will add a second output level to the report that you can drill down into to view details about the incidents in the queues.

For an overview of output levels, see Overview of Report Output Levels. Alternatively, if you already have a report that returns the information you want to see in the drill-down level, you can link the reports together instead of adding another output level. See Overview of Linked Reports.

1. Click the Level tab and then click Add Drilldown.

You can enter a different name for the new output level in the Name field, add notes about the level in the Description field, and change other options that are described in Overview of Report Output Levels.

As you review the options in the Drilldown Settings area of the window, notice that the drill-down filter is automatically set to incidents.queue_id. When you use the report and click a drill-down link on the first level of the report, the second output level knows to display only information related to the queue in the row you clicked. For more complex reports, the drill-down filter can be changed, but it’s not necessary to do so here.

The link you click when using the report is also automatically set to incidents.queue_id. However, for our sample report, we will make the incident count column the link we click to drill down.

The Level Settings window opens, displaying information about the new output level.

2. Click the Link drop-down menu and select count(incidents.i_id).

3. Click OK.

Tip: If your report has multiple output levels, you can click the Level drop-down menu at the top of the design surface and select the level you want.

You can now drag fields from the data dictionary onto the design surface to add columns to the second level of the report. Since this output level is intended to display details about the incidents, you could add fields from the incidents
table such as Reference #, Subject, Assigned Account, and Date Created. You can also add fields from the contacts table to view information about the contacts who submitted the incidents. See Add Output Columns to a Report.

Related Topics
- Creating a Custom Report (video)

Add a Search Filter to a Report

Next, we will add a fixed filter to return only unresolved and updated incidents in the report.

Fixed filters prevent reports from querying more information than you need in the report. You could also add runtime selectable filters to the report to return only incidents created in a certain time period, assigned to particular staff accounts, or that match other criteria you specify. Unlike fixed filters, runtime selectable filters let you select the values you want when you run the report.

1. Click the Home tab and then click Add Filter. The Add Filter window opens.
2. If you want to specify a name for the filter, enter a name in the Name field. This name is used only on the report designer. If you do not specify a name, the filter's database field is used instead.
3. Clear the Make this Filter Selectable at Run Time check box.
   
   Note: If we were creating a runtime selectable filter, we would leave this check box selected and enter a filter name in the Label this Filter field that staff members see when running the report. We could also select the Required check box for runtime selectable filters to force the report’s users to specify a filter value before they can run the report.
4. In the Definition section, right-click in the Expression field and select Incidents > Status status_id. This is the database field we are using to filter the report’s output by.
5. Click the Operator drop-down menu and select In List.
6. Choose the items you want to include in the search.
   When you use the In List operator, all items are selected by default. Clear the check box next to each item you do not want to include in the initial search or clear the Select All check box and select the check box next to each item you want to include. For our example, select Unresolved and Updated. The report will include only incidents with one of these statuses. Since the filter is selectable at runtime, you can change the search options when you run the report.
   To prevent menu options that are irrelevant to the report's audience from being available in searches, click Customize and clear the check boxes next to the options you do not want to display.
7. Click OK.

Save a Custom Report

The final step in creating the report is to save it to a location where the report’s audience can access it. After you save the report, your staff members can open it, assuming they have permission to do so.

1. Click the arrow next to Save on the Quick Access toolbar and select Save and Close. The Save As window opens where you specify the name of the report and where you want it saved.
2. Select the Public Reports folder or a custom subfolder beneath it. Reports that are saved in the My Reports folder are accessible only by you.
   a. To create a custom subfolder, right-click Public Reports, select New Folder, and enter the name you want for the folder.
3. Enter the name for the report in the Name field. The name can be up to eighty characters long.
4. Click OK.

Your staff members can now access the report from the Reports explorer or you can add the report to their navigation sets. You can edit the report whenever you want to add more columns, filters, or output levels. You can also add advanced functionality such as column calculations, variables, inline editing, and other options. If you want to show the information in the report to a wider audience, you can also change the report’s layout and add charts, text fields, and images.

If you encounter problems when you try to run a custom report, you can examine it using the report analyzer. This will help you determine the cause of the problem, such as the report querying tables that it does not need, or lacking filters to reduce the amount of data being read.

Custom Reports

Overview of Custom Reports

Creating custom reports gives you the flexibility to output the information you need in the format you want.

Custom reports can be simple, pulling data from one table and returning data from the same table, or they can be complex, pulling data from several tables, filtering it, and returning tabular and chart information in multiple output levels or linked reports.

When creating a custom report, you can select the database fields you want, add calculations and functions to the fields, and create fixed and runtime selectable filters to find the exact records you want. You can also add charts and text to your report, and specify the display and data options used when your report is opened. This ensures the information presented in your report is clear and accessible to your audience.

Overview of the Report Designer

You create and edit custom reports from the report designer.

All the tools you need to create a report are available from one location. You can also access optional items, such as chart styles and color schemes you have configured in the other Analytics explorers, from the report designer to enhance your reports.
You can customize reports based on your organization's needs using the report designer's ribbon, data dictionary, and design surface components.

Open the Report Designer
Use the report designer to create and edit custom reports.

In most cases, you will open the report designer from the Reports explorer. However, if you want to create a new report and your navigation set is configured to add reports from the file menu, you can click File and select Report.

Note: If your site has an Agent Browser UI associated with it, a message displays stating that not all Analytics features are supported by the interface. Click OK to continue.

After you open the report designer, you can increase the amount of space on the design surface by hiding the data dictionary or elements on the design surface. When you need an item that's hidden, you can display it again.

1. Click Analytics on the navigation pane.
2. Double-click Reports Explorer.
3. To edit an existing custom report, right-click the report and select Edit. The report designer opens.
4. To create a report, click the New Report button.
   A window opens where you select the report's initial layout.
5. Click the name of the layout you want to use for the report.
   Options include Grid Report, Standard Report, and Standard Report with Chart.
   When you select a layout, the report designer opens with the selected layout.
6. To create a copy of a report from another interface by importing a report definition, click Import Existing Report Definition. See Import a Report from an XML File.

Import a Report from an XML File
Using existing report definitions allows you to create duplicates of complex custom reports from other interfaces without manually re-creating the reports.

If you have multiple interfaces, you can use report definitions saved in XML files to create reports on other interfaces. If you have previously exported segments, you can also import these to create custom reports. Since reports aren't shared...
between interfaces, you must export a report from one interface and import it into another to have the same report available in multiple interfaces.

**Note:** When you import a report definition to create a report on a different B2C Service site, items in the report definition that do not exist in the database where you import the report, such as custom fields, will display in the new report but will not display data. You must edit the new report to modify or delete items that do not correspond to existing fields in the database.

When you import a report, the permissions from the imported report aren’t changed. However, the owner of the report is changed to the staff member who imports the report.

1. Click **New Report** on the Report explorer’s ribbon to select the report layout.
2. Click **Import Existing Report Definition**.
3. Select the XML file containing the report definition.
4. Click **Open**.

   The imported report opens on the report designer where you can modify it.

   If you import a report that includes custom object record commands into a site that has custom objects with different names or ID numbers, a window opens where you can match the custom objects referred to in the imported report to the custom objects on the site.

   If the XML file you import contains a custom script, a dialog displays where you can choose to import the script or not. See *Create a Custom Script in a Report*.

5. Save the new report.

**Overview of Report Designer Views**

There are four different ways to view a report as you edit it in the report designer.

Each view presents your report in a different way and gives you access to different ribbon tabs.

- **Report View**—This view shows you the report just as your staff members will see it when they open it. The report presents real data and is particularly useful when you want to preview a report you’re editing. This view does not let you add column calculations, adjust column formatting options, or use action links.

- **Layout View**—This view is similar to the report view and is also useful for previewing reports. However, unlike the report view, this view lets you select individual columns in the report and apply formatting options to the columns. For example, if you want to add *conditional formatting* to a column to highlight data that meets certain criteria in the column, you could select the layout view, select the column, and configure conditional formatting for the column.

**Note:** When you select the report or layout view, a message appears if your report queries too much data. While you can save the report, we recommend that you add fixed filters or reduce the number of tables in the report to ensure that the report runs efficiently. In addition, any custom scripts added to the report are checked for PHP errors when you select these views. If any problems are found, a message displays providing information about the error. The report can be saved, but the custom script will be disabled when users run the report. See *Create a Custom Script in a Report*. 
• **Design View**—This is the default view when you open the report designer. This view gives you access to the tools you need to create and edit your report on the design surface.

• **Data Set View**—This view shows your report in a textual design space. You can add columns, filters, and variables using this view, just as you can when using the design view, but you cannot add graphic elements, such as charts, images, or text fields. The data set view is particularly helpful if you want to view text descriptions of your report’s contents, and access different report components to edit them. In addition, you can define the filter label that displays in the Quick Search by selecting the filter you want to display and moving it to the top of the list.

**Related Topics**

• Specify Report Views

**Specify Report Views**

When you open the report designer, you can choose to use one of four views to look at your report.

1. Edit a report.
   By default, the report opens in the design view.
2. Click the arrow on the **Views** button on the Home tab and select the view you want.
   The report display is updated to use the view you select.

---

**Overview of Report Designer Components**

The majority of the tasks you perform when creating or editing a custom report are done through the ribbon, design surface, and data dictionary components of the report designer.

These components provide access to the data, report sections, parameters, and other items you use to create and edit custom reports.

The ribbon is shown at the top of the content pane and gives you access to the tools you need to create and edit reports. The design surface is shown in the middle of the content pane and shows the data area and other fields. The data dictionary is shown at the bottom of the content pane and gives you access to the fields in the database that you can use in your custom reports.

**Report Designer Ribbon**

The report designer ribbon includes eight tabs from which you can access options to create or edit a report.

The ribbon tabs vary depending on which view you use and the object selected on the design surface. For example, when editing a report using the design view, you can select the Home, Display, Insert, Level, and Page Setup tabs to add filters and report levels, insert charts, and modify the report display. The Design, Format, and Options tabs are displayed when you select objects on the report, giving you options to edit the selected object. The data set view gives you similar options, though the Insert tab isn’t available. Fewer tabs are available when using the report and layout views.

**Tip:** You can minimize the ribbon when editing a report by double-clicking the active tab. Click the tab to temporarily display the buttons on the tab or double-click the tab again to maximize the ribbon.
Each tab on the ribbon has one or more groups containing buttons you can use to modify the report or items on the report. Some groups have icons to the right of their names that you can click to open a window. For example, the Page Setup tab has Print, Background, and Display groups. You can click the small icon shown on the Background group to open the Display Options window.

Windows give you access to the same features you can access from the ribbon. However, the windows group the options differently, and sometimes contain additional options not available from the ribbon.

When explaining features that can be accessed from a window or the ribbon, we describe the feature using the window, but remember that the buttons on the ribbon provide shortcuts to most of the same features available on windows.

Report Designer Home Tab
The report designer’s Home tab gives you access to options that impact the entire report.

From the Home tab, you can select report layouts, view or export a definition of the report, schedule the report to be sent out in an email, adjust permissions, view an audit log, and enable inline editing for the report. You can also sort the data in the report or view it differently using rollups or slicing. Buttons on the tab’s Data Set group give you access to the report’s tables, filters, variables, and columns.

</table>
Report Designer Display Tab

The Display tab on the report designer ribbon provides several ways to view a report.

The Display tab is similar to the Display tab available when viewing a report. Each gives you options to apply report styles, add report sections, page the report, fix column headers, and display data using cross tabs. The report designer’s Display tab also includes a Show/Hide group that lets you add rulers, lines, and headings to help you identify sections and fields shown on the design surface.

For descriptions of the buttons on the tab’s Format, Sections, and Options groups, see Report Display Tab.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Rulers</td>
<td>Click this button to display horizontal and vertical rulers when designing the report to provide a perspective on the report’s size.</td>
</tr>
<tr>
<td>Show Rule Lines</td>
<td>Click this button to display horizontal lines separating the report sections displayed on the design surface.</td>
</tr>
<tr>
<td>Show Field Outlines</td>
<td>Click this button to display borders around the fields you add to the report.</td>
</tr>
<tr>
<td>Show Section Headers</td>
<td>Click this button to display a heading above each report section.</td>
</tr>
<tr>
<td>Show Grid</td>
<td>Click this button to display a grid in the report’s header and footer sections to help you align items you add to the sections. You can also select the grid size you want to use.</td>
</tr>
</tbody>
</table>

Report Designer Insert Tab

The Insert tab allows you to add columns, charts, and data exceptions to your report.

You can also add standard text fields or custom text fields created from the Text Fields explorer and images added in the Images explorer. See Create a Text Field and Images Explorer.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column</td>
<td>Click this button to open the Column Definition window to add a column to the report. See Add a Column to a Report. You can also add columns by dragging them from the data dictionary onto the design surface.</td>
</tr>
<tr>
<td>Text</td>
<td>Click this button to insert a text field into a report section that accepts text fields. See Add a Text Field to a Header or Footer.</td>
</tr>
<tr>
<td>Image</td>
<td>Click this button to add an image to your report. See Add an Image to a Report Section.</td>
</tr>
<tr>
<td>Chart</td>
<td>The buttons in this group let you select a chart to add to the Charts section of your report. You can select different chart types and subtypes. See How to Add and Edit Charts.</td>
</tr>
</tbody>
</table>
### Exception

Click this button to add data exceptions to the report. See [Create a Data Exception](#).

---

**Report Designer Level Tab**

The report designer’s Level tab gives you access to options you can apply to report levels.

You can also create reports with drill-down levels from this tab. If your report already has multiple output levels, you can select the level you want to edit from the Level drop-down menu located on the design surface.

You can apply level filters and group filters from this tab and add custom scripts to the report level you’re viewing. You can also click Edit to add output descriptions to the report level.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Level</td>
<td>The buttons in this group let you edit the report level that's currently selected on the Level drop-down menu at the top of the design surface. You can also delete the selected level, or add custom scripts or drill-down levels to the level.</td>
</tr>
<tr>
<td>Edit</td>
<td>Click this button to open the Level Settings window where you can configure all level options for the selected level. See <a href="#">Overview of Report Output Levels</a>.</td>
</tr>
<tr>
<td>Delete</td>
<td>Click this button to delete the selected level. This option isn’t available for the top level of a report. When you delete a level, all the columns and other items added to the level are also deleted.</td>
</tr>
<tr>
<td>Add Drilldown</td>
<td>Click this button to add a drill-down level to the selected level. See <a href="#">Overview of Report Output Levels</a>.</td>
</tr>
<tr>
<td>Custom Scripts</td>
<td>Click this button to add a custom script to the selected level. See <a href="#">Create a Custom Script in a Report</a>.</td>
</tr>
<tr>
<td>Drilldown Settings</td>
<td>The options in this group let you select the drill-down filter and link for the level. See <a href="#">Configure Recursive Drill-Down Levels</a>.</td>
</tr>
<tr>
<td>Drilldown Filter</td>
<td>Click this drop-down menu to select the output column or columns to use as the filter for the new level. The drill-down filter determines the data set displayed in the drill-down level.</td>
</tr>
<tr>
<td>Drilldown Link</td>
<td>Click this drop-down menu to select the output column you click to open the drill-down level. You can also select Entire Row to open the drill-down level by clicking anywhere on a row in the parent output level. If you want to drill down into another report level instead of opening a specific record when a value from the record is double-clicked on a report, select Entire Row as the drill-down link. When configuring record commands for the report, select None from the Default Record drop-down menu. See <a href="#">Change Record Command Actions</a>.</td>
</tr>
<tr>
<td>Open in Window</td>
<td>Click this drop-down menu to specify how you want to open the drill-down output level. To replace the current output level, select None. To open the output level in a new window, select the location on the screen where you want the window to open by default. You can choose Top, Bottom, Left, or Right.</td>
</tr>
<tr>
<td>Grouping</td>
<td>The buttons in this group let you configure result grouping for the drill-down level.</td>
</tr>
<tr>
<td>Group Results</td>
<td>Select this check box to group data on the selected level. See <a href="#">Group Data in an Output Level</a>.</td>
</tr>
<tr>
<td>Change Group Order</td>
<td>Click this button to change the order of the grouped output columns. See <a href="#">Change Data Grouping Order</a>.</td>
</tr>
</tbody>
</table>
### Group/Button Description

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters</td>
<td>The buttons in this group let you manage level and group filters, and add record limits to the selected level.</td>
</tr>
<tr>
<td>Level Filters</td>
<td>Click this button to view, add, edit, or delete level filters. See <em>Create a Level Filter</em>.</td>
</tr>
<tr>
<td>Group Filters</td>
<td>Click this button to view, add, edit, or delete group filters. See <em>Create a Group Filter</em>.</td>
</tr>
<tr>
<td>Add Level Filter</td>
<td>Click this button to add a level filter. See <em>Create a Level Filter</em>.</td>
</tr>
<tr>
<td>Add Group Filter</td>
<td>Click this button to add a group filter. See <em>Create a Group Filter</em>.</td>
</tr>
<tr>
<td>Record Limit</td>
<td>Click this button to limit the number of records that can be returned on the selected level. See <em>Set Record Row Limits and Page Breaks</em>.</td>
</tr>
</tbody>
</table>

### Report Designer Page Setup Tab

The buttons on the Page Setup tab let you change printing options for the report. You can also change the report’s background, margins, and width.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Print</td>
<td>The buttons in this group let you configure the report for printing and add the Page Header and Page Footer sections. See <em>Print a Report</em>.</td>
</tr>
<tr>
<td></td>
<td>This button group displays only if your profile includes the Print/Export/Forward Reports permission. See <em>Analytics Permissions</em>.</td>
</tr>
<tr>
<td>Print Margin</td>
<td>Click this button to select the size of the margins used when printing the report. Options include Normal, Narrow, Medium, and Wide.</td>
</tr>
<tr>
<td>Size</td>
<td>Click this button to select the size of the paper used when printing the report. Options include Letter, Legal, Executive, A3, A4, and A5.</td>
</tr>
<tr>
<td>Portrait/Landscape</td>
<td>Click these buttons to print the report in portrait or landscape mode.</td>
</tr>
<tr>
<td>Page Header/Page Footer</td>
<td>Select these check boxes to include a page header and page footer when printing the report.</td>
</tr>
<tr>
<td>Print to Fit</td>
<td>Select this check box to scale the report to your printer’s default page width and send the report to the printer.</td>
</tr>
<tr>
<td>Background</td>
<td>The buttons in this group let you add a background color to the report. You can select the background color and add a gradient color to blend into the primary color. You can also choose how intense the colors should be with the Transparency setting.</td>
</tr>
<tr>
<td>Display</td>
<td>The buttons in this group let you add margins to the report and set the report’s width.</td>
</tr>
<tr>
<td>Margin</td>
<td>Click this button to select the width of the margins around the report. Options include None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.</td>
</tr>
<tr>
<td>Width</td>
<td>Click this button to select the width of the entire report. Options include Best Fit and Fit to Window. When using Best Fit, all content in the report is examined to calculate column width before the report displays. To reduce the report load time, you can enable Improve Display Performance. See <em>Change Data Display Options</em>.</td>
</tr>
</tbody>
</table>
Report Designer Design Tab

Use the Design tab to configure and add columns and data types to your custom report.

The report designer’s Design tab is available when you click a column, text field, exception, or chart. This tab also displays when you select a filter, variable, or table when using the data set view.

**Note:** The Design tab is renamed to Text Field when a text field is selected.

Different buttons are shown on the tab depending on the item you select. For example, when working with a column, buttons are available to add calculations, configure data rollups, and add comparison values. When working with text fields, you can change fonts, margins, and borders.

The options you can select for columns, text fields, data exceptions, charts, tables, and filters or variables are described in the following tables.

**Note:** The groups and buttons available on this tab depend on the type of object you select. In addition, when editing a column, the options on the tab depend on the type of data the column returns.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Edit</strong></td>
<td>Click this button to open the Column Definition window, from which you can edit the column’s definition. See <em>Change Trend Options</em>.</td>
</tr>
<tr>
<td><strong>Arrange</strong></td>
<td>The buttons in this group let you hide, remove, and order the position of the selected column.</td>
</tr>
<tr>
<td><strong>Hide</strong></td>
<td>Click this button to hide the selected column. To show hidden columns, right-click the header for a visible column, select Insert Hidden Column, and select the column you want to show. The column will be displayed in the column’s default location.</td>
</tr>
<tr>
<td><strong>Move Left/Move Right</strong></td>
<td>Click these buttons to move the selected column one column to the left or right.</td>
</tr>
<tr>
<td><strong>Delete</strong></td>
<td>Click this button to remove the selected item from the report.</td>
</tr>
<tr>
<td><strong>Insert Before/Insert After</strong></td>
<td>Click these buttons to open the Column Definition window, from which you can create a new column inserted before or after the selected column.</td>
</tr>
<tr>
<td><strong>Sort</strong></td>
<td>Click this button and select Sort Ascending or Sort Descending to sort the data in the report by the values in the selected column. See <em>How You Change Report Sort Order</em>. Columns with a text area data type cannot be sorted.</td>
</tr>
<tr>
<td><strong>Calculations</strong></td>
<td>The buttons in this group let you add calculations to the selected column. You can hover over each button to view a description of the calculation. You can also choose to show multiple calculations on a single row or on separate rows. See <em>Add Calculations to a Report Column</em>.</td>
</tr>
<tr>
<td><strong>Calculation buttons</strong></td>
<td>Click the button for the calculation that you want to add to the selected column.</td>
</tr>
<tr>
<td><strong>Options</strong></td>
<td>Click this button and select Display Calculations on Single Row to show all the selected calculations on one row beneath the column. Select Display Calculations on Separate Rows to show each calculation on a separate row below the column.</td>
</tr>
<tr>
<td><strong>Report Linking</strong></td>
<td>Click this button to add, edit, and remove links to other reports. You can add conditional or unconditional links to columns. See <em>Overview of Linked Reports</em>.</td>
</tr>
<tr>
<td>Group/Button</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>Rollup</td>
<td>The buttons in this group let you group the information in the report by the selected column. You can also change the ordering if your report has multiple rolled-up columns. See Define Rollups.</td>
</tr>
<tr>
<td>Rollup</td>
<td>Click this button to roll up the report’s data by the selected column. Click the button again to remove the rollup.</td>
</tr>
<tr>
<td>Move Up/Move Down</td>
<td>If your report’s data is rolled up by more than one column, click these buttons to move the selected column up or down one rollup level.</td>
</tr>
<tr>
<td>Options</td>
<td>Click this button to select rollup options. Available options include: • Display Group Counts • Display Rollup Headings • Display Column Headings • Repeat Column Headings</td>
</tr>
<tr>
<td>Insert Column</td>
<td>Click this button in the Computed group to add a computed column to the report. The types of computed columns available depend on the values in the selected column. You can also add computed columns from the data dictionary. See Computed Fields for information about computed columns.</td>
</tr>
<tr>
<td>Trend Options</td>
<td>The buttons in this group let you edit trend options for the selected trend column. See Change Trend Options.</td>
</tr>
<tr>
<td>Perform Forecast</td>
<td>Select this check box to enable forecasting in the trend value column.</td>
</tr>
<tr>
<td>Forecast Units</td>
<td>Enter the number of time units to forecast forward. For example, if the trended column groups data by week, trending forward three units displays data trended three weeks in the future.</td>
</tr>
<tr>
<td>% Change</td>
<td>The buttons in this group let you edit comparison percentage and trend percentage column options for the selected comparison percentage or trend percentage column. See Add a Comparison Percentage Column to a Report and Add a Trend Percentage Column to a Report.</td>
</tr>
<tr>
<td>Comparison Direction</td>
<td>Click this button and select how the percentage value shown in the comparison or trend percentage column should be derived. The value can be derived from the difference between the value in the original column being compared/trended versus the value in the comparison or trend column. The value can also be derived from the difference between the value in the comparison or trend column versus the value in the original column being compared/trended.</td>
</tr>
<tr>
<td>Show Icon</td>
<td>Select this check box to display icons next to the percentage values returned in the column. The icons indicate if there’s a positive change, negative change, or no change.</td>
</tr>
<tr>
<td>Icon Colors</td>
<td>Click this button to change the colors used for the icons that indicate a positive change, negative change, or no change.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit</td>
<td>Click this button to open the Edit Text Field window, from which you can edit the selected text field. See Create a Text Field.</td>
</tr>
<tr>

</tr>
<tr>
<td>Show Criteria</td>
<td>Select this check box to display the exception criteria. For example, if the data exception marks opportunities that are still active, the criteria would display opportunities.status_id = Active.</td>
</tr>
<tr>
<td>% Meeting Criteria</td>
<td>Select this check box to show the percentage of data in the report that meets the specified exception criteria. This information displays at the bottom of the report in the Data Exceptions report section.</td>
</tr>
<tr>
<td>% Not Meeting Criteria</td>
<td>Select this check box to show the percentage of data in the report that does not meet the specified exception criteria. This information displays at the bottom of the report in the Data Exceptions report section.</td>
</tr>
</tbody>
</table>
### Group/Button | Description
--- | ---
**Graphical Display** | The options in this group let you configure the graphical display for the selected data exception. See *Order Data Exceptions*.
Show Notifications | Click this button to show the selected exception in charts shown on the same report output level as the data exception.
Show Criteria | Select this check box to display the exception criteria in the chart. For example, if the data exception marks opportunities that are still active, the criteria would display opportunities.status_id = Active.
% Meeting Criteria | Select these check boxes to display data on the chart showing the percentage of data that meets or that does not meet the specified exception criteria.
% Not Meeting Criteria |  
Color | Click this button to select a color to use for the indicator on the chart that shows the amount of data meeting the exception criteria.

### Group/Button | Description
--- | ---
Define Data Source | Click this button to open the Chart Wizard where you can select data options for your chart. See *Add or Edit a Chart with the Chart Wizard*.
Arrange | The buttons in this group let you position the selected chart on the design surface and remove it from the report.
Delete | Click this button to remove the selected chart from the report.
Bring to Front/Send to Back | Click these buttons to place the selected chart on top of or beneath overlapping charts.
Type | Click this button to change the type and subtype of the selected report. If the data options in the new chart type differ from those in the old chart type, the Chart Wizard opens, allowing you to select new data options. See *Add or Edit a Chart with the Chart Wizard* for descriptions of the available chart types.
Chart Style | Click this button to select a chart style for the selected chart. See *Chart Styles Explorer*.
Labels | Click in the text fields in this group to type text for the chart’s title, category, and value labels.
3D Settings | Click the buttons in this group to specify angle and depth settings for a three-dimensional chart. See *Chart Styles Explorer*. The buttons in this group are active only if a three-dimensional chart is selected.
Settings | Click the buttons in this group to modify settings specific to charts that include bars, lines, or gauges. See *Chart Styles Explorer*. The buttons in this group are active only if a chart with bar, line, or gauge properties is selected.
Colors | Click the button in this group to select a color scheme for the chart. See *Chart Styles Explorer*.

### Group/Button | Description
--- | ---
Tables | Click this button to open the Data Set window, where you can edit the tables used in the report. See *Overview of Table Relationships in Reports*.
Outer Join | Click these buttons to join the selected table with the parent table using an outer or an inner join. See *Overview of Table Joins*.
### Group/Button | Description
--- | ---
Inner Join | 
Join Condition Menu | Select the fields used to link the selected table with the parent table from this drop-down menu.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>

<td>Click this button to open the Add Filter or Add Variable window to add a new filter or variable. See Overview of Report Filters and Add Report Variables. The type of filter you select determines whether you add a report, level, or group filter.</td>
</tr>
<tr>
<td>Delete</td>
<td>Click this button to remove the selected item from the report.</td>
</tr>
<tr>
<td>Move Up/Move Down</td>
<td>Click these buttons to move the selected runtime selectable filter or variable up or down in the list of filters or variables on the data set view.</td>
</tr>
<tr>
<td>Insert Before/ Insert After</td>
<td>Click these buttons to open the Add Filter window to add a new filter or variable before or after the selected filter or variable.</td>
</tr>
<tr>
<td>Filter/Variable Options</td>
<td>The check boxes in this group let you modify options for the selected filter or variable.</td>
</tr>
<tr>
<td>Display in Docked Filters</td>
<td>Select this check box to display the selected variable or runtime selectable filter on the docked filters section of the report. See Add Variables or Runtime Filters to Docked Filters.</td>
</tr>
<tr>
<td>Display in Search Criteria</td>
<td>Select this check box to include descriptions of the selected variable or filter in the search criteria description. See Overview of Search Criteria Descriptions.</td>
</tr>
<tr>
<td>Runtime Selectable</td>
<td>Select this check box to make the selected filter available on the Search window when the report is run. See Create a Fixed or Runtime Selectable Filter.</td>
</tr>
<tr>
<td>Required</td>
<td>Select this check box to make the selected runtime selectable filter required. Staff members must specify values for required filters when they run the report.</td>
</tr>
</tbody>
</table>

**Report Designer Layout Tab**

The report designer’s Layout tab is available when you click a chart.

The buttons on this tab let you apply chart style options to individual charts in your report. This allows you to create a custom look for a chart without creating or modifying a chart style. This tab is identical to the Layout tab on the Chart Styles designer. See Chart Styles Explorer for information about options available on this tab.
Report Designer Format Tab

The report designer Format tab provides access to general display options, such as fonts, margins, borders, and width.

The report designer's Format tab is available when you click a column, data exception, or chart. Some buttons on the tab vary depending on the type of item you select. For example, when working with a column, you can apply conditional formatting to flag data in the column that meets certain criteria.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
</table>
| Font                          | The buttons in this group let you change the font style, size, and color. You can also select font attributes, such as bold and italic, and change the text’s alignment. In addition, you can also add a background color.  
This group does not display when editing a chart. |
| Margin                        | Click this button to select the width of the margins around the selected column. Options include None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.  
This button displays when editing a column. |
| Border                        | The buttons in this group let you add borders to the column and change the borders’ display options. You can identify which borders you want and choose the borders’ color, size, and style.  
This group does not display when editing a chart. |
| Display                       | The buttons in this group let you apply conditional formatting to the column, change the column’s width, freeze the column, and hide repeating values in the column. You can also select other display options for the column.  
This group displays when editing a column. |
| Conditional Formatting        | Click this button to apply conditional formatting to the column's data.                                                                          |
| Width                         | Click this button to select a width for the column. Select Best Fit to automatically set the width based on the amount of space needed to display the column's contents. Best Fit also takes into account the width needed by other columns in the report. Select Percentage to specify a percentage of the total report width for the column. |
| Freeze Column                 | Click this button to fix the selected column in place so it does not move when you horizontally scroll the report. This can be helpful if you want to continue to view the first column in the report while scrolling the report to see the columns on the right of the report.  
When you fix a column, all columns to the left of the column are also fixed. You can still scroll the columns to the right of the fixed column. |
| Hide Repeating                | Click this button to hide consecutive repeating values in the column. For example, if the name of a staff member is shown in the column in five consecutive rows, you can hide repeating values to show the name in only the first column.  
You can also hide repeating values on the Column Format window. This window has an option to exclude hidden repeating values from consideration in column calculations and column auto-filter options. When you hide repeating values from the ribbon, they're still included in column calculations and auto-filtering. |
### Group/Button | Description
--- | ---
Options | Click this button to select display options for the column.
Number | The options in this group let you display numeric values as a gauge and select numeric formats. This group displays when selecting a column containing numeric values.
Date | The options in this group let you select a date format for the column and view the format. This group displays when selecting a column containing date/time data.
Image | The options in this group let you configure the image used to indicate columns that meet data exception criteria. These options are also available when creating data exceptions. See Create a Data Exception. This group displays when editing a data exception.
Current Selection | The options in this group let you select the area of the chart you want to edit and reset the style options. This group displays when editing a chart.
Area Menu | Select the area of the chart you want to edit from this drop-down menu. You can also select the area by clicking it on the chart on the design surface.
Reset to Match Style | Click this button to reset customized display and formatting of the selected chart area to match the default settings specified in the chart style that's applied to the chart.
Format | The buttons in this group let you select border, background, and font characteristics for the selected chart area. These same options are available when creating chart styles. See Create or Edit a Chart Style. This group displays when editing a chart.

</tr>
<tr>
<td><strong>Add Column</strong></td>
<td>Click this button to add a new output column to the report. This button is shown when a column is selected on the report.</td>
</tr>
</tbody>
</table>

### Report Design Surface

The design surface displays all of the sections you add to your custom report from the report designer ribbon.

Only report sections displayed on the design surface are included in a report when it runs. After you add a section to the design surface, you can add, edit, and remove content in the section or modify the display of the section itself. For example, you can drag database fields to the data area, insert charts into the Charts section, and edit the report’s title in the report header. When working on the report designer, you can add rulers, lines, and headings to help you identify...
sections and fields shown on the design surface. These options are accessed from the Show/Hide group on the Display tab.

**Overview of the Data Dictionary**

You can use the data dictionary to access all the tables in the database and view details about each tables’ columns. The data dictionary is shown on the report designer when you use the design or data set views, and lists the standard tables and fields from the database that can be used in custom reports. Functions, variables, computed fields, and tables created for custom objects can also be selected from the data dictionary. Any item listed in the data dictionary can be dragged to the Data Area section to add the field as an output column, dragged to Docked Filters to create a filter based off the field, or dragged to the Data Exceptions section to create an exception based on the field.

You can view detailed information about the tables and fields shown in the data dictionary and customize the data dictionary to show only the fields and tables you regularly use. You can also reposition the data dictionary if you want a different location for it.

**View Database Information on the Report Designer**

Before you add database fields to a report from the data dictionary, you may need to view information about the field’s contents.

When you create or edit a report, the data dictionary shown on the report designer gives you access to information about the tables and fields in the database.

**Tip:** If you want access to the data dictionary without opening the report designer, you can also open it from Configuration > Database > Data Dictionary.

1. Open a report on the report designer.
2. To view a brief description of a table or field, hover over the name of the object in the data dictionary.
3. To view a detailed description of a table or field, right-click the name of the object in the data dictionary and select View Data Definition.
4. To view the entire data dictionary that describes all the standard tables and fields in the database, right-click any table name and select View Full Data Dictionary.

The data dictionary opens in a separate window.

**Customize the Data Dictionary**

You can hide available tables and fields in the data dictionary that you do not use in your reports.

This is helpful if you use only certain tables and fields in your reports and want to simplify the data dictionary to make it easier to select the tables and fields you use.

**Note:** Tables and fields created for custom objects can be viewed only in the All Tables list in the report designer’s data dictionary. This prevents customizing the data dictionary to display only custom object tables. See Overview of Custom Objects.

1. Click Customize at the top of the data dictionary.
   The Customize Data Dictionary window opens.
2. Expand the modules, tables, and fields that you want to see.
3. Clear the check boxes for those tables, fields, or modules, such as Feedback or Sales, that you do not want to see in the data dictionary.
4. To group the database tables by the module they’re most frequently used with, select the Show Modules check box.
5. To sort the lists of tables displayed in the data dictionary by their database names instead of the tables’ aliases, select the Sort by System Name check box.

6. Click OK.

Move the Data Dictionary

By default, the data dictionary is located at the bottom of the report or dashboard designer, but you can reposition it on the content pane.

The following procedure is the same as that used to move the report explorer on the dashboard designer.

1. Click the data dictionary’s title bar and drag it.
   
   When you drag the data dictionary, positioning images appear. Hovering over the various images highlights portions of the report designer.

2. Drop the data dictionary when the section where you want it is highlighted.

The designer displays the data dictionary in the new location.

Since the location of the data dictionary is stored in your personal settings, it stays where you placed it until you move it again.

Overview of Report Sections

Every report consists of items added to the report and configured using the ribbon, design surface, and data dictionary.

Reports can have one or more output levels that contain report sections, and each section can contain text fields, images, charts, and output columns. The data shown in charts and output columns in each output level is impacted by the filters, variables, and comparison date offsets you add to the report.

- **Output levels**—Each report has at least one output level, and each output level contains one or more report sections and can have unique filters, variables, and comparison date offsets. If your report has drill-down levels, a separate output level is added for each drill-down level. The output level you’re currently viewing on the design surface is shown in the Level drop-down menu at the top of the design surface. If your report has multiple output levels, you select the level you want to view from the drop-down menu. See Drilling Down in Reports and Overview of Report Output Levels.

- **Output columns**—The output columns you add to the report levels’ data sections determine the information your staff members can see about the records returned in the report. There are different types of output columns, including database fields, functions, and computed fields. You can apply formatting to the columns in your report and also add calculations to tally data shown in each column. Columns can be added from the Column Definition window or by dragging fields from the data dictionary. See Overview of Report Output Columns.

- **Charts**—Charts offer a graphical display of the data returned in your report. You can add multiple charts to the charts report section in each output level. Different types of charts are available so you can present the data in different ways, and you can modify the display for each chart, selecting different colors, fonts, scales, and other attributes. See How to Add and Edit Charts.

- **Text fields and images**—You can add text fields and images to your report to enhance the report’s appearance and to clarify the report’s purpose. See Add an Image to a Report Section.

- **Data exceptions**—Data exceptions let you highlight data displayed in charts and output columns that meet certain requirements. Each output level can have multiple exceptions to highlight data for different reasons. For example, in an incidents report, you could display unresolved incidents in red text and overdue incidents in bold.
text. The exceptions’ criteria and percentage of data meeting or not meeting the exceptions can be shown in the report level’s charts and exceptions report section. See Create a Data Exception.

Tip: If you want to highlight data in a single column, you can apply conditional formatting to the column instead of using data exceptions. See How You Edit Column Formatting.

- **Report output level content**—Each output level on a report can have different headers, footers, descriptions, charts, data exceptions, and tabular data. See Overview of Content on Report Output Levels.
- **Search parameters**—You can add search parameters to your report to define the data shown in the report’s columns, charts, and exceptions. See Overview of Search Parameters.

**Overview of Content on Report Output Levels**

Each output level of a report can have different content. This includes docked filters, headers, footers, descriptions, charts, tabular data, and data exceptions.

Some areas of report output levels contain text fields, such as the report title, and others are designed to display non-tabular data, such as charts. The content you should include in each output level is primarily determined by the audience and the purpose of the output level. For example, a custom report that only you will use may not need a report header, report footer, or similar report sections. However, these are useful if the report will be sent to other staff members. If you add an area to an output level that does not have content in it, that part of the output level does not display when the report is run.

**Note:** When creating a report, you can select a layout to have the appropriate output level areas automatically included in the report. See Display Data Using Record or Tabular Layouts.

<table>
<thead>
<tr>
<th>Report Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Docked Filters</td>
<td>This is used to display runtime selectable filters at the top of the report for easy changes to the report search parameters. This is added to or removed from the design surface by selecting or clearing the Docked Filters check box on the Display tab.</td>
</tr>
<tr>
<td>Page Header</td>
<td>This is displayed only on printed reports. By default, the page header contains the Current Date text field, which is a variable that outputs the date when the report is run. This is added to or removed from the design surface by selecting or clearing the Page Header check box on the Page Setup tab.</td>
</tr>
<tr>
<td>Report Header</td>
<td>This contains text fields that display at the top of each page of the report. By default, the report header contains the Title and Sub Title text fields. This is added to or removed from the design surface by selecting or clearing the Report Header check box on the Display tab.</td>
</tr>
<tr>
<td>Output Descriptions</td>
<td>This contains text that you can modify to provide general information about the report. Output descriptions can display inline, as text on a separate tab, or by rolling over the columns in the report. See Display Output Descriptions. This is shown on the design surface by selecting Display Descriptions Inline from the Output Descriptions button on the Display tab.</td>
</tr>
</tbody>
</table>
### Overview of Search Parameters

You can add search parameters to your report to define the data shown in the report’s columns, charts, and exceptions.

Search parameters include filters, variables, and comparison date offsets. These are shown on the report’s Search window when staff members run the report, allowing them to modify the data that’s returned, or you can hide filters so their values cannot be changed by staff members.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filters</td>
<td>Filters limit the data returned in your report by selecting a subset of information from the database. Different types of filters are available, and each serves a different purpose.</td>
</tr>
</tbody>
</table>
### Parameter  | Description
--- | ---
Report Filters  | Report filters limit the data accessible to any of the report’s output levels and can be fixed or runtime selectable. Fixed filters cannot be changed when the report is run, but runtime selectable filters can be changed by staff members. Runtime selectable filters can also be required if you want to force staff members to select filter values. See Create a Fixed or Runtime Selectable Filter.

Level Filters  | Level filters are similar to report filters and can be fixed or runtime selectable. However, unlike report filters, level filters limit the data accessible at individual output levels rather than the entire report. See Create a Level Filter.

Group Filters  | Group filters can be fixed or runtime selectable and are applied to data that’s grouped to prevent information about certain groups from being returned. For example, a report that shows the number of unresolved incidents for each staff member could have a group filter to display information only for staff members with more than ten unresolved incidents. See Create a Group Filter.

Variables  | Variables can be used to return different data, or the same data in different formats, in one column. For example, you could create a single report that displays the number of incidents by staff member, group, queue, or status. You select the information you want when you run the report. See Variables.

Comparison Date Offset  | Staff members can select comparison date offsets when they run a report with comparison columns. Comparison columns are used to display related information from different time periods. For example, comparison columns can be used to see how many opportunities were created in two different quarters. See Add a Comparison Percentage Column to a Report and Add a Comparison Value Column to a Report.

---

### Apply a Layout to an Output Level

You can apply a predefined layout to quickly modify the report's display to make it appropriate for the report’s audience.

For example, the Grid layout can be applied to operational reports that are used by staff members who work with incidents, contacts, or other types of records. This layout is ideal for such reports since it does not include titles, headers, or other report sections that aren’t needed when working with records. If your report is to be emailed or printed, you could use the Standard Report layout, which includes titles, headers, and other report sections that help explain the report’s context and purpose. The other layouts available are Standard Report with Chart and Chart Report.

Layouts can be selected on the Getting Started window when creating reports or from the report designer’s ribbon. Layouts selected from the Getting Started window are applied to all the output levels added to the report, and layouts selected from the ribbon are applied to individual output levels. See Open the Report Designer for more information about adding layouts from the Getting Started window.

1. If your report includes more than one output level, select the output level the layout should be applied to from the Level drop-down menu at the top of the design surface.
2. Click the Home tab.
3. Click Report Layouts to open the report layouts menu.
4. Click one of the layouts to apply it to the current output level.

<table>
<thead>
<tr>
<th>Layout</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grid Report</td>
<td>Select this layout for an output level with the Docked Filters, Page Header, Data Area, and Page Footer report sections.</td>
</tr>
<tr>
<td>Standard Report</td>
<td>Select this layout for an output level with the Docked Filters, Page Header, Report Header, Data Area, Report Footer, and Page Footer report sections.</td>
</tr>
<tr>
<td>Layout</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Standard Report with Chart</td>
<td>Select this layout for an output level with the Docked Filters, Page Header, Report Header, Charts, Data Area, and Page Footer report sections.</td>
</tr>
<tr>
<td>Chart</td>
<td>Select this layout for an output level with the Page Header, Charts, and Page Footer report sections. This layout isn't available on the Getting Started window. When a report output level includes a chart but not tabular data, you can add data for the chart directly from the Chart Wizard. See Add or Edit a Chart with the Chart Wizard.</td>
</tr>
</tbody>
</table>

Display and Hide a Report Section
You can choose which sections are displayed on a report.

While layouts automatically add certain report sections to the design surface, you may want to customize the sections displayed after the layout is applied. Manually adding report sections to the design surface is simple using the ribbon. You can add different sections to each output level in a report. For example, the primary output level in your report might include a header and chart, and the other output levels in the report might include only the data area section.

1. If your report includes more than one output level, select the level you want from the Level drop-down menu at the top of the design surface.
2. Click the Display tab.
3. Select the check box next to the section you want to display from the tab’s Section group.
   The design surface changes to include the report section you select.
4. To display the Page Header or Page Footer section when the report is printed, click the Page Setup tab and select the Page Header or Page Footer check box on the tab’s Print group.
5. To remove a report section from the design surface, clear the section’s check box.
   The design surface changes to remove the report section.

Resize a Report Section
You can resize a report section to allow more room for images or text fields, or to reduce the size of the section to allow more room for other sections.

1. Move your cursor over the section border that you want to move on the design surface.
   The cursor changes to display directional arrows when it is over a border.
2. Drag the border to the position you want.

Change the Display of a Report Section
Sections that are included in a report can be customized, allowing you to further tailor your report to your audience.

The available style options for each section vary. You can change the fill colors and borders of all the sections, and you can also change the margins in the output descriptions, search criteria descriptions, data area, and data exceptions sections.

Section styles can also be changed by applying report styles with the Auto Format feature. If the style selected using auto format is applied after you manually modify a section style, your edits to the section style are overwritten. Editing a section style after an auto-format style is applied overwrites the auto-format style. See Apply a Style to a Report for more information about the Auto Format feature.
Tip: The following procedure describes editing section styles from the Edit Style window. However, you can also adjust style options by selecting the report section and using the buttons on the Options tab.

1. Right-click the section on the design surface that you want to edit and select Edit Style.

   **Note:** The Edit Style window for some report sections includes an Options tab that allows you to set layout options.

2. Click the **Margins** tab to modify the amount of space surrounding the contents in the section.

3. Enter the number of pixels between the text and the left, right, top, and bottom margins.

4. If you’re editing a style for a report section, such as the report header, enter the number of pixels you want between the section’s content in the **Spacing** field.

5. Click the **Fill** tab to modify the background fill colors for the selected section.

   When editing styles for report sections that do not have margins, the Fill tab is the active tab when you edit the style.

6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Color/Top Color/Left Color</td>
<td>The text description for this option varies depending on the gradient mode you select. Click this box to select a primary color as the background.</td>
</tr>
<tr>
<td>No Fill</td>
<td>Select this check box to clear any fill colors previously selected. If this box is selected, the other options on the Fill window are disabled except for the Color option. Selecting a color automatically clears the No Fill check box and enables the other options.</td>
</tr>
<tr>
<td>Gradient Mode</td>
<td>Select the positioning of the primary and secondary colors for the background from the Gradient Mode drop-down menu. Using gradient coloring lets you merge two colors. The following options are available.</td>
</tr>
<tr>
<td></td>
<td><strong>None</strong>—Select this option to use only the primary color as the fill color. If you select None, the Gradient Color field is disabled.</td>
</tr>
<tr>
<td></td>
<td><strong>Top to Bottom</strong>—Select this option to merge the colors from the top of the background to the bottom.</td>
</tr>
<tr>
<td></td>
<td><strong>Left to Right</strong>—Select this option to merge the colors from the left of the background to the right.</td>
</tr>
<tr>
<td>Gradient Color/Bottom Color/Right Color</td>
<td>The text description for this option varies depending on the gradient mode you select. Click this box to select a secondary color to merge with the primary color. When you do so, the fill colors merge using the method defined in the Gradient Mode menu.</td>
</tr>
<tr>
<td>Transparency(%)</td>
<td>Select a percentage to define how intense the fill colors are. A setting of 100% is completely transparent, which prevents the fill colors from displaying. A setting of 0% has no transparency, resulting in intense background colors. The selected percentage is immediately reflected in the Preview field, so you can scroll through the transparency percentages to find a value that best suits your needs.</td>
</tr>

Enable Automatic Layout of a Report Section
Applying an automatic layout to a report section lets you quickly arrange the section’s contents for better viewing.

When applying an automatic layout, the report section’s charts, images, and text fields are placed in an invisible table structure, with the items placed in rows and columns. You can adjust the sizing of the rows and columns to arrange the images and text fields exactly like you want them.

1. Add the report section you want to the report output level.
2. To add the report header or footer sections, click the **Display** tab and select the **Report Header** or **Report Footer** check box.
3. To add the page header or footer sections, click the **Page Setup** tab and select the **Page Header** or **Page Footer** check box.
4. Click the report section on the design surface to select it.
5. Click the **Options** tab and click **Automatic**.
6. To prevent the section’s height from being automatically adjusted to fit the items you add to the section, click **Auto Height**.

   **Tip:** When Auto Height is disabled, you can manually change the height of the section by dragging the section’s horizontal borders up or down, just as you would if the section had a manual layout.

### Change the Layout of a Report Section
Section layout properties determine how the charts, images, and text fields you add are positioned on the section.

A manual layout lets you manually position items you add. If the section has an automatic layout, the item is positioned automatically, and the section’s height is adjusted to best fit the item. You can also set table layout options to change how the items in the section are sized. By default, report sections have manual layout enabled.

1. Add images and text fields to the report section.
2. Click the report section on the design surface and then click the **Options** tab.
3. If the section has a manual layout, click **Automatic** to change to an automatic layout.
4. Click **Table Layout**.
5. To give each column in the section’s table the same amount of width, select **Size All Columns Equally**.
6. To give each row in the section’s table the same amount of height, select **Size All Rows Equally**.
7. To size each column to best show the column’s contents, select **Auto Size All Columns**.
8. To size each row to best show the row’s contents, select **Auto Size All Rows**.
9. To manually configure the table’s layout, select **More Options**.
10. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show</td>
<td>Click this drop-down menu and then select whether you want to configure rows or columns.</td>
</tr>
<tr>
<td>Size Type</td>
<td>Specify how the size of the report section is determined in this section.</td>
</tr>
<tr>
<td>Absolute</td>
<td>Select this option to specify a certain size for the selected row or column in pixels.</td>
</tr>
<tr>
<td>Percentage</td>
<td>Select this option to specify a certain percentage of the total available space in the section to allocate to the selected row or column.</td>
</tr>
<tr>
<td>Best Fit</td>
<td>Select this option to have the size of the selected row or column automatically adjusted to best fit the row’s or column’s contents.</td>
</tr>
</tbody>
</table>

11. Click **OK**.
How to Add Images, Text Fields, and Descriptions

Add an Image to a Report Section

When presenting a report, you may want the report to include images, such as a logo, to enhance the report’s appearance or to customize it for your audience.

You can add images you have created in the Images explorer to the Page Header, Report Header, Report Footer, and Page Footer sections. Images can act as backgrounds or header images in these sections. You can also use images as links to open URLs that you specify. See Images Explorer.

1. Click Analytics on the navigation pane.
2. Double-click Reports Explorer.
3. Right-click the report you want to add the image to and select Edit.
4. Click the Insert tab on the report designer’s ribbon.
5. Click Image to open the list of images available in the Images explorer.
6. Click the image you want to add.
   The images list closes.
7. Hover over the report section where you want to add the image.
   The image name displays when the cursor is over a section that can accept an image.
8. Click to place the image in the report section you select.
9. To move an image you have added to a report section, drag the image to the position where you want to place it in the section.

   Note: To move an image from one report section to another, both sections must have Automatic layout enabled. See Enable Automatic Layout of a Report Section.

10. To resize an image you have added to a report section, click the image to activate it, and then drag one of the handles displayed on the image’s borders. The image is resized as you drag the handle.
11. To define how the image should move in relation to the report section’s border, you can specify an anchor style for the image. See Specify an Anchor Style for an Image.

Use a Filter or Variable in the URL Field

You can associate a filter or variable you create in a report to open a different web page depending on the value selected for the filter or variable.

When you view a report and click an image that’s configured as a link, the web page the URL points to opens on the workstation’s default browser.

1. Click Analytics on the navigation pane.
2. Double-click Reports Explorer.
3. Right-click the report you want to add the image to and select Edit.
4. Add an image to the report.
   See Add an Image to a Report Section.
5. Create the filter or variable you will use to populate the image’s URL field.
   For example, you could create a variable named $webpages with a User Defined List type and add menu values such as www.google.com and www.yahoo.com. See Overview of Report Filters or Variables.
6. Right-click the image on the report designer and select Edit Image Field. The Edit Image Field window opens.
7. Enter the name of the filter or variable you created in the URL field. Surround the name in curly brackets.
For example, if the variable’s name is $webpages, enter `{$webpages}` in the URL field. (Filter names do not begin with the dollar sign.)

8. Click **OK**.
9. Click **Save**.

After you open the report, click the report’s **Search** button and enter the URL you want in the filter or variable you created. When you click the image, the web page you selected opens in your workstation’s default browser.

### Associate a URL with an Image

You can associate URLs with images to use the images as links.

When you view a report and click an image that’s configured as a link, the web page the URL points to opens on the workstation’s default browser.

1. Click **Analytics** on the navigation pane.
2. Double-click **Reports Explorer**.
3. Right-click the report you want to add the image to and select **Edit**.
4. Add an image to the report. See *Add an Image to a Report Section*.
5. Right-click the image and select **Edit Image Field**.
   - The **Edit Image Field** window opens.
6. Enter the URL you want the image to link to in the **URL** field.
7. Click **OK** to close the window.
8. Click **Save**.

When you run the report and click the image, the web page the image links to opens in a web browser.

### Add a Text Field to a Header or Footer

You can add text to a report’s header and footer sections. This can be custom text you have created, or standard text that you can modify when editing the report.

Custom text fields, created in the **Text Fields** explorer, and standard text fields, such as Title, can be added to the **Page Header**, **Report Header**, **Report Footer**, and **Page Footer** report sections.

You can also insert values from a report’s filters and variables into the text fields on the report. See *Create a Text Field* for information about creating and editing custom text fields in the **Text Fields** explorer.

1. Click **Analytics** on the navigation pane.
2. Double-click **Reports Explorer**.
3. Right-click the report you want to add the text field to and select **Edit**.
4. Click the **Insert** tab on the report designer’s ribbon.
5. Click **Text Field** to open the list of text fields.
   - The window displays standard text fields, such as Title, and custom text fields you can add using the **Text Fields** explorer. The text fields’ default fonts, colors, and other attributes are reflected in the display.
6. Click the text field you want to add to the report.
   - The text fields list closes, and the cursor displays with a small version of the text field when you hover over report sections that accept text fields.
7. Click the report section where you want to add the text field.
   - The text field is added to your report.
8. To move the text field, drag it to the position you want.
   - To move a text field from one report section to another, both sections must have Automatic layout enabled. See *Enable Automatic Layout of a Report Section*.
9. To resize a text field in a report section, click the text field to activate it and then drag one of the handles displayed on the text field’s borders.
The text field is resized as you drag the handle.

10. Click **Save**.

**Edit a Text Field in a Report**

After adding a text field to a report section, you can edit it to change the fonts, colors, text, and other attributes.

You can have one generic text field that can be added to several reports, which can then be modified in each report.

**Note:** Certain standard text fields, such as Record Count or Rows per Page, include values that are dynamically updated when the report is run. You can edit these fields, but you cannot edit their dynamic value placeholders.

1. Right-click the text field in the report section on the design surface and select **Edit Text Field**.

   **Tip:** If you know the specific options you want, it can be faster to select them from the ribbon. Opening the window gives you an overview of all the available options.

   The **Edit Text Field** window opens.

2. Edit the text field on the Edit Text Field window.

3. Click **OK**.

**Related Topics**

- Create a Text Field

**Display a Filter Value in a Text Field**

You can insert the values currently selected in a report’s filters and variables into text fields on the report. For example, a text field can display the value selected in a filter that filters on the staff member assigned to a group of incidents.

The following procedure describes how to use a value from a filter in a text field, but a similar process is used to display the value from a variable.

1. Click **Analytics** on the navigation pane.
2. Double-click **Reports Explorer**.
3. Right-click the report you want to add the text field to and select **Edit**.
4. Create a filter that includes the values you want to display in the text field.
   
   For example, you can add a filter to an incidents report that filters on the staff accounts that incidents are assigned to. See **Overview of Report Filters**.
5. Add a text field to your report.
   
   See **Add a Text Field to a Header or Footer**.
6. Right-click the text field and select **Edit Text Field**.
   
   The **Edit Text Field** window opens.
7. Enter the text you want to display in the **Text** field on the window’s Text tab. Enter the name of the filter with braces around it where you want the filter value to display in the field. `{filter_name}`
   
   For example, if the report has a filter named Assigned that filters on the staff member assigned to incidents, you can enter **Assigned to {Assigned}** in the window’s Text field.
8. Click **OK**.
9. Click **Save**.

When the report runs, the text field will display the static text entered in the field along with the filter or variable value that’s currently selected. For example, if the filter value is currently Tina Smith, the text field will read Assigned to Tina Smith.
Specify an Anchor Style for an Image

You can change the default anchor style of an image in a report so that it moves with the bottom or right side of the report section when the section’s borders are changed.

By default, when a report section is resized, images and text fields in the section maintain the same distance between the top and left side of the report section.

1. Right-click an image on the design surface and select Edit Image Field. See Add an Image to a Report Section.
2. Click the Anchor Style drop-down menu to display the anchor style options. The image’s current anchor style displays when you click the drop-down menu.
3. To clear an anchor, click the gray bar indicating an active anchor.
4. To add an anchor, click the appropriate clear bar. For example, to anchor an image to the bottom and right side of the report section, clear the gray bars at the top and left side, and click the clear bars at the bottom and right side of the anchor style selection control.
5. Click OK.

Related Topics
- Specify an Anchor Style for a Text Field

Specify an Anchor Style for a Text Field

You can change the default anchor style of a text field in a report so that it moves with the bottom or right side of the report section when the section’s borders are changed.

By default, when a report section is resized, images and text fields in the section maintain the same distance between the top and left side of the report section.

1. Click a text field on the design surface to select it. See Add a Text Field to a Header or Footer.
2. Click Anchor on the Text Field tab to view anchor style options. The text field’s current anchor style displays. The gray bars that are displayed show you which sides of the report section the text field is anchored to.
3. To clear an anchor, click the gray bar indicating an active anchor.
4. To add an anchor, click the appropriate clear bar. For example, to anchor a text field to the bottom and right side of the report section, clear the gray bars at the top and left side, and click the clear bars at the bottom and right side of the anchor style selection control.

Display Output Descriptions

The Output Descriptions report section displays text you enter to describe output levels and columns in the output level.

The output descriptions you add can be displayed inline, on a separate tab in the report, or when rolling over the columns in the report that have definitions defined. You can select the placement of the output descriptions from the ribbon.

1. Click the Display tab.
2. Click Output Descriptions and select the display option you want from the list.
## Option Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do Not Display Descriptions</td>
<td>Select this option to remove output descriptions from the report.</td>
</tr>
<tr>
<td>Display Descriptions on Column Rollover</td>
<td>Select this option to show the output descriptions when rolling over the report columns that have definitions defined.</td>
</tr>
<tr>
<td>Display Descriptions Inline</td>
<td>Select this option to show the output descriptions in the output level, below the page header and report header sections.</td>
</tr>
<tr>
<td>Display Descriptions on Separate Tab</td>
<td>Select this option to show the output descriptions on a separate Description tab. The tab is automatically added to the report when you choose this option.</td>
</tr>
</tbody>
</table>

### Add Text to Output Descriptions

You can add text to the output descriptions section of a report to help describe what the report output means.

1. Open the report you want to edit.
2. To add a description to an output level, select the output level you want from the **Level** drop-down menu at the top of the design surface.
   a. Click the **Level** tab, then click **Edit** to open the **Level Settings** window.
   b. Enter the text you want to describe the output level in the **Description** field.
   c. Click **OK**.
3. To add an output description to a column, click the column on the design surface to select it.
   a. Click the **Design** tab.
   b. Click **Edit** to open the **Column Definition** window.
   c. Enter the text you want to describe the column in the **Description** field.
   d. Click **OK**.

### Overview of Search Criteria Descriptions

Search criteria descriptions provide additional information about the data displayed in a report.

By default, the Search Criteria Descriptions report section includes information about the filters in your report, along with descriptions of the report’s variables, record limits, and comparison date offsets. However, you may not want to display descriptions of all report components, so you can specify which descriptions you want to display. Search criteria descriptions can be displayed *inline* or on a tab in the report. You select where to place the descriptions from the Search Criteria button on the Display tab.
Related Topics

• Add Search Criteria Descriptions

Overview of Report Output Columns

The output columns you add to a report display tabular information about your data.

Output columns are added to the data area of each output level. After an output column is added to the output level, you can move the column, change the column headers, add notes to the column, change the column’s display, and add
calculations to tally the values shown in the column. You can also create data exceptions to highlight data returned in the columns. For example, if you want to highlight all incidents in a report that are unresolved and overdue, you could create data exceptions to display these records in bold red text.

Output columns can be any of these.

- Fields from the database
  - Functions
  - Variables
  - Computed fields

All of these items can be added from the ribbon or by dragging the field from the data dictionary to the design surface.

**Database Fields**

Generally, most of the columns added to reports are fields from the database, which contain the data you see throughout B2C Service.

Fields from tables that are created for *custom objects* are also available (see *Overview of Custom Objects*). The database fields that can be used in reports are listed in the report designer’s data dictionary.

**Tip:** To view descriptions of the tables and fields in the data dictionary, right-click the table or field and select View Data Definition. A new window opens with a description of the table or field.

**Related Topics**
- Database Field Suffixes

**Database Field Suffixes**

By adding a suffix to a database field, you can change the value that’s returned in a report.

When certain database fields are used in report columns, the output is automatically modified to display the data in an easily readable format. For example, the `incidents.assgn_acct_id` field stores the ID numbers of the agents who have incidents assigned to them. Since report users generally prefer to see agent names instead of ID numbers, the names are returned instead of the ID numbers.

However, there are occasions when you may want the report to return the agents' ID numbers instead of their names. In such cases, the suffix `.id` can be added to `incidents.assgn_acct_id`, changing the column's expression to `incidents.assgn_acct_id.id`. This suffix prevents the name associated with the record from being returned automatically and forces the report to instead return the ID number from the database field.

There are several suffixes that can be added to name lookup fields, such as `incidents.assgn_acct_id`, or currency fields, such as `opportunities.mgr_value`. Other types of database fields do not accept suffixes. Each suffix has a different purpose.

<table>
<thead>
<tr>
<th>Suffix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name lookup field suffixes</td>
<td>These suffixes can be used with database fields that trigger an automatic name lookup when used in reports.</td>
</tr>
<tr>
<td>.id</td>
<td>This suffix prevents Analytics from performing a name lookup and returns the ID number stored in the field. For example, <code>answers.assgn_acct_id.id</code> would return the account ID number of the staff member an answer is assigned to.</td>
</tr>
</tbody>
</table>
### Suffixes

<table>
<thead>
<tr>
<th>Suffix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.desc</td>
<td>This suffix can be used only with name lookup fields that have a description field. The suffix returns the text from the field's description rather than the field's ID number or name. For example, <code>incidents.prod_lvl1_id.desc</code> would return the text description of the parent product an incident is associated with.</td>
</tr>
<tr>
<td>.name</td>
<td>This suffix returns the name that's associated with the database field. For example, <code>answers.map_cat_lvl1_id.name</code> would return the name of the parent category an answer is associated with. This suffix is rarely used since the name lookup is usually performed by default.</td>
</tr>
</tbody>
</table>

#### Currency field suffixes

<table>
<thead>
<tr>
<th>Suffix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.curr_id</td>
<td>This suffix returns the type of currency the value was stored in, rather than the currency value. For example, <code>opportunities.mgr_value.curr_id</code> could return USD, GBP, or another currency type.</td>
</tr>
<tr>
<td>.rate_id</td>
<td>This suffix returns the exchange rate that's used to calculate the field's currency value when returning the value in a different currency format. For example, <code>opportunities.rep_value.rate_id</code> could return 1.45000 or another exchange rate.</td>
</tr>
<tr>
<td>.native</td>
<td>This suffix returns the field's value in its original currency instead of the currency determined by staff account or interface settings. For example, <code>opportunities.mgr_value.native</code> used in a report on a British interface would return the manager forecast value in USD if that value was originally entered on a U.S. interface.</td>
</tr>
</tbody>
</table>

### Related Topics
- Database Fields

### Variables

You can create variables to use in report output columns, filters, images, text fields, and data exceptions.

Using a variable in an output column lets you return different data, or data in different formats, in the same column. For example, you could create a single report that displays the number of incidents by staff member, group, queue, or status. You select which of the four variable values to use in the report from the Search window or from a menu at the top of the report if the variable is docked.

Using a variable in a filter lets you combine the functionality of filters with the flexibility of variables. For example, you could create a variable that groups records together in time periods, and then create a filter with an expression of `date_format(opportunities.created, $date_group)`, where `$date_group` is the variable to filter on opportunities created during a particular year. To use the filter, you would simply enter the year you want to report on. Without such a filter, the report would need to include a filter using the `between` operator that requires entering both a start time and an end time.

Using a variable in a data exception lets you use a single exception to flag different data. This eliminates the need to create multiple exceptions to flag data in different columns. For example, you could use a variable in an exception to flag incidents that were created more than one day ago or to flag incidents that were updated more than one day ago. The information you want to flag is selected on the Search window when you run the report. See [Create a Data Exception](#).
Using a variable in an image lets you dynamically generate links to web pages and change the displayed image when you select different variable values. See Add an Image to a Report Section. Using a variable in a text field lets you display the variable's current value in the text field. See Display a Filter Value in a Text Field.

Add Report Variables
Before you can use variables in report output columns, filters, or data exceptions, the variables first need to be created.

There are several types of variables you can use, including predefined lists, user-defined lists, ad hoc values, and replacement values. Each of these serves a unique function.

1. Click the Home tab.
2. Click Add Variable.
   The Add Variable window opens.
3. Enter a name for the variable in the Name field.
   Variable names are always preceded by the dollar sign.
   The options on the Add Variable window change depending on the variable type that's selected.
4. Enter an optional prompt in the Prompt field.
   The Prompt field isn't available when using a Replacement Value variable type, as this type isn't displayed when running a report.
   This text displays on the Search window when running the report. If this field is left empty, the variable's name is displayed instead.
5. Select the variable type from the Type drop-down menu.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Predefined List variables</td>
<td>Select this type to use values from an existing menu or predefined list in the variable. When selecting this option, all menu fields from the tables used in the report are available, along with three predefined lists.</td>
</tr>
<tr>
<td></td>
<td>o Group Date—This list contains date/time formats, such as Month, Week, and Day of Month.</td>
</tr>
<tr>
<td></td>
<td>o Yes/No—This list contains Yes and No options.</td>
</tr>
<tr>
<td></td>
<td>o Currency Formats—This list contains currency formats, such as USD and CAN, that are defined on your site.</td>
</tr>
<tr>
<td>User Defined List</td>
<td>Select this type to compile your own list of menu items to use for the variable. For example, if you wanted the variable to return either incidents' statuses or assigned staff accounts, you could create a variable value for <code>incidents.status</code> and another for <code>incidents.assign_acct_id</code>.</td>
</tr>
<tr>
<td></td>
<td>When you select this type, you must select a data type for the variable. See step 7 in this procedure for a description of the available data types.</td>
</tr>
<tr>
<td>Ad Hoc Value</td>
<td>Select this type to allow staff members to enter their own value for the parameter at runtime, without having to select from a list. For example, an individual using the report types the exact expression or string to use as the variable value.</td>
</tr>
<tr>
<td></td>
<td>When you select this type, you must select a data type for the variable. See step 7 in this procedure for a description of the available data types.</td>
</tr>
</tbody>
</table>
6. If using a predefined list variable type, select the list to use from the **List Name** drop-down menu.

7. If using a user-defined list or ad hoc value variable type, select the data type to use from the **Data Type** drop-down menu.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Select this option to add a variable that uses a string field.</td>
</tr>
<tr>
<td>Integer</td>
<td>Select this option to add a variable that uses an integer field.</td>
</tr>
<tr>
<td>Float</td>
<td>Select this option to add a variable that uses a numeric field that can contain decimal points.</td>
</tr>
<tr>
<td>Date and Time</td>
<td>Select this option to add a variable that uses a date and time field.</td>
</tr>
<tr>
<td>Currency</td>
<td>Select this option to add a variable that uses a currency field.</td>
</tr>
<tr>
<td>Expression</td>
<td>Select this option to add a variable that uses a database field (for example, <code>incidents.status</code>). This data type isn't available for ad hoc values.</td>
</tr>
</tbody>
</table>

8. If using a user-defined list variable type, create the list items you want to include.
   a. Click **Add Item**. The **Edit Variable List Item** window opens.
   b. Enter a name for the list item in the **Name** field.
   c. Enter a value for the list item in the **Value** field.
      The format of the Value field changes depending on the data type selected for the user-defined list. For example, the Value field for a Date and Time list item displays a calendar, whereas the Value field for an expression list item displays a text box and includes an Advanced option you can click to open the data dictionary to help you build the expression.
   d. Click **OK**.
   e. Add the other list items you want to be able to select for the variable.

9. If using a predefined list or user-defined list variable type, enter a default value for the variable in the **Default** field.

10. If using an ad hoc value variable type, enter a default value for the variable in the **Default** field.

11. Do one of the following:
    o If using a replacement variable type, enter the expression you want the variable to replace.
— Click **Use Data Dictionary** to open the data dictionary to create the expression from database fields and functions.

12. Click **OK**.

- Variables
- How to Use Variables in Columns

How to Use Variables in Columns
You can use variables you have created in the output columns you add to a report.

After you create a variable in a report, it’s added to the variables list in the report designer’s data dictionary. You can then create output columns that use the variable in the same manner as you would any other output column, creating the column’s expression out of database fields, **functions**, **computed fields**, and **variables** listed in the data dictionary. In some cases, the variable will be the only item in the column’s expression. In other cases, the variable will be combined with functions or database fields to form the column’s expression.

When a predefined list, user-defined list, or ad hoc value variable is included in a report’s output columns, a menu listing the variable’s options displays on the report’s **Search** window. The variable menu can also display at the top of the report in the docked filters section for easy access by individuals using the report.

Related Topics
- Add a Column to a Report

Computed Fields
You can create computed fields and use them in your reports.

Computed fields aren’t actual fields in the database, but are calculated from the columns in your output level. Before the output level has columns added, computed fields aren’t available. After you add columns to the output level, the data dictionary’s **Computed Fields** tree includes the columns you added. If you click a column in the tree, the available computed fields for that column appear in computed fields in the data dictionary. You can then drag the computed field you want to the design surface, just as you would with a standard database field.

**Tip:** You can also add computed fields by clicking a column on the design surface to select it, clicking the Design tab, clicking the arrow on the **Insert Column** button, and selecting the computed field you want to add.

Most database fields have only a comparison value computed field available. Additional calculations are available for integer fields, which store numbers. The moving average, moving total, percentage of average, percentage of total, running average, and running total columns are all available to use in output levels and in rollups, if rollups exist in the report. When computed fields are added to rollups, the values are reset at the beginning of each rollup section.

The Comparison Value and Comparison Percentage Value computed fields are described in **Add a Comparison Value Column to a Report**. The Trend Value and Trend Percentage Value computed fields are described in **Add a Trend Percentage Column to a Report** and **Add a Trend Value Column to a Report**.

- Change the Number of Data Points

Moving Average

This column outputs a centered moving average.

Centered averages calculate the average for a value in a column by averaging that value, along with a number of values in the column prior to and preceding that value. For example, if a report outputs the number of incidents per month, a centered average for March that uses three data points would use the number of incidents from February, March, and April to derive the average.

Tip: Moving averages work best using odd numbers of data points, but can use an even number, though the internal calculation to derive the value will differ somewhat.

For an odd number of data points, the centered average at \( i \) for a given data point, \( d_i \), and number of data points, \( N \), is:

\[
\frac{(d_i-(N-1)/2 + d_i-(N-1)/2 + 1 + \ldots + d_i + \ldots + d_i + (N-1)/2 -1 + d_i + (N-1)/2)/N}{N}.
\]

For an even number of data points, the centered average at \( i \) for a given data point, \( d_i \), and number of data points, \( N \), is:

\[
\frac{(d_i-N/2 + 2*d_i-N/2 +1 + \ldots + 2*d_i + \ldots + 2*d_i + N/2 -1 + d_i + N/2)/2N}{2N}.
\]

When you add a report moving average column to a report, the calculation automatically uses three data points. However, the number of data points can be changed. See Change the Number of Data Points.

Related Topics
- Computed Fields

Moving Total

A report moving total column outputs a running total of the values in the specified column.

The totals are calculated for the current row, and a number of preceding rows determined by the number of data points you select. By default, the report moving total calculation uses three data points. For example, if you had a column with four rows, with values of 10, 20, 30, and 40, respectively, and used three data points, the corresponding values in the report moving total column would be NULL, NULL, 60, and 90.

Related Topics
- Computed Fields
Change the Number of Data Points

The report moving average and report moving total computed fields use data points in their calculations. The method to select the number of data points to use is identical for either computed field.

1. Add a report moving average or report moving total column to the output level.
2. Right-click the column on the design surface and select **Edit Moving Calculations Options**.
3. Enter the number of data points you want to use in the calculation.
4. Click **OK**.

**Tip:** You can also change the number of data points by selecting the moving calculations column, clicking the **Design** tab, and entering the number of data points in the **Number of Data Points** drop-down menu.

**Related Topics**
- Computed Fields

Percentage of Average

A report percentage of average column calculates the average of the values in the specified column, and then returns the percentage of that total of the value in the current row.

For example, if you had a column with three rows whose values were 10, 20, and 30, the average of the values in the column would be 20. The values returned in the report percentage of average column would be derived by dividing the value in each row by the average value of the column, and multiplying the result by 100. In this example, the values returned would be 50%, 100%, and 150%, respectively.

**Related Topics**
- Computed Fields

Percentage of Total

A report percentage of total column calculates the total of the values in the specified column, and then returns the percentage of that total of the value in the current row.

For example, if you had a column with three rows whose values were 10, 20, and 30, the total of the values in the column would be 60. The values returned in the report percentage of total column would be derived by dividing the value in each row by the total value of the column, and multiplying the result by 100. In this example, the values returned would be 16.6%, 33.3%, and 50%, respectively.

**Related Topics**
- Computed Fields

Running Average

A report running average column averages the values in a specified column for all the column's rows, up to and including the value in the current row.

For example, if you had a column with three rows, with values of 10, 20, and 30, respectively, the corresponding values in the report running average column would be 10, 15, and 20.

**Related Topics**
- Computed Fields
Running Total
A report running total column totals the values in a specified column for all the column’s rows, up to and including the value in the current row.

For example, if you had a column with three rows, with values of 10, 20, and 30, respectively, the corresponding values in the report running total column would be 10, 30, and 60.

Related Topics
• Computed Fields

Functions for Reports
Functions let you apply standard mathematical functions to the data from your database, and output the modified data in report columns.

For example, using the `count()` function, you can output the number of contacts associated with an organization. The column’s expression in this example would be `count(contacts.c_id)`. You can also combine different functions and database fields in the same column’s expression.

**Note:** There’s a limit of 3,500 characters in the column expression field. You can use replacement variables to create expressions that require more characters. See Add Report Variables.

When you drag a function from the data dictionary to the design surface, the Column Definition window opens. This lets you enter the variables used in the function’s expression. You can either enter the variables in the Expression field or, if the variable is an item listed in the Available Columns/Functions field, you can drag the item into the function’s expression.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Aggregate Functions</strong></td>
<td>Select from the following to use an aggregate function in the expression.</td>
</tr>
<tr>
<td></td>
<td>Aggregate functions can be used only when defining output.</td>
</tr>
<tr>
<td><code>avg(expr)</code></td>
<td>This function computes an average value for the data set <code>expr</code>.</td>
</tr>
<tr>
<td><code>count(expr)</code></td>
<td>This function returns the number of rows included in the data set <code>expr</code>.</td>
</tr>
<tr>
<td><code>first(expr, sort column1[, sort column2][,...])</code></td>
<td>This function returns the first value of data set <code>expr</code> based on the order of the specified sort columns. For example, the expression <code>first(threads.note, threads.entered, threads.seq)</code> returns the first thread note in the data set based on time entered and thread sequence.</td>
</tr>
<tr>
<td>`group_concat(expr, separator[, sort column 1, ASC</td>
<td>DESC][, sort column 2, ASC</td>
</tr>
<tr>
<td><code>last(expr, sort column1[, sort column2][,...])</code></td>
<td>This function returns the last value of data set <code>expr</code> based on the order of the specified sort columns. For example, the expression <code>last(threads.note, threads.entered, threads.seq)</code> returns the last thread note in the data set based on time entered and thread sequence.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>

<td>This function returns the smallest numerical value, the first string in alphabetical order, or the earliest date in the data set <code>expr</code>.</td>
</tr>
<tr>
<td><code>sum(expr)</code></td>
<td>This function returns the sum of the values in the data set <code>expr</code>.</td>
</tr>
<tr>
<td><code>sum_distinct(expr, reference)</code></td>
<td>This function returns the sum of distinct values in an expression for a particular record (reference) rather than for all records of the same type in a table. For example, if you want to calculate the sum of all quotas for a particular sales person, you could add a function of <code>sum_distinct(sa_period2accts.quota, sa_period2accts.acct_id)</code>.</td>
</tr>
<tr>
<td><code>stddev(expr)</code></td>
<td>This function returns the standard deviation of <code>expr</code>. For example, the expression <code>stddev(answers.solved_count)</code> returns the standard deviation of all the values in the <code>solved_count</code> column of the <code>answers</code> table.</td>
</tr>
</tbody>
</table>

### String Functions

Select from the following to use a string function in the expression:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>concat(str1, str2)</code></td>
<td>This function combines input character strings from multiple expressions into a single output string. Two or more expressions can be appended with this function. For example, the expression <code>concat('www.', 'global', '.com')</code> returns the value <code>www.global.com</code>.</td>
</tr>
<tr>
<td><code>instr(str, substr)</code></td>
<td>This function returns the numeric position (in characters) of the initial occurrence of string <code>substr</code> in string <code>str</code>. For example, the expression <code>instr('globalcellphones.com', 'cell')</code> returns the value <code>7</code>.</td>
</tr>
<tr>
<td><code>length(str)</code></td>
<td>This function returns the length (in characters) of the string. For example, the expression <code>length('cell phones')</code> returns the value <code>10</code>.</td>
</tr>
<tr>
<td><code>lower(str)</code></td>
<td>This function returns string <code>str</code> in all lowercase characters. For example, the expression <code>lower('Global.COM')</code> returns the value <code>global.com</code>.</td>
</tr>
<tr>
<td><code>ltrim(str)</code></td>
<td>This function returns the string <code>str</code> without leading spaces. For example, the expression <code>ltrim('Cell phone')</code> returns the value <code>Cell phone</code>.</td>
</tr>
<tr>
<td><code>lpad(str1, X, str2)</code></td>
<td>This function returns <code>str1</code> padded on the left with <code>str2</code> until <code>str1</code> is <code>X</code> characters long. For example, the expression <code>lpad('phone', 10, '0')</code> returns the value <code>@@@@@phone</code>.</td>
</tr>
<tr>
<td><code>rpad(str1, X, str2)</code></td>
<td>This function returns <code>str1</code> padded on the right with <code>str2</code> until <code>str1</code> is <code>X</code> characters long. For example, the expression <code>rpad('phone', 10, '0')</code> returns the value <code>phone@@@@</code>.</td>
</tr>
<tr>
<td><code>rtrim(str)</code></td>
<td>This function returns the string <code>str</code> without trailing spaces. For example, the expression <code>rtrim('agarfield@global.com ')</code> returns the value <code>agarfield@global.com</code>.</td>
</tr>
<tr>
<td><code>substr(str, start_pos, [length])</code></td>
<td>This function returns a portion of the string <code>str</code> starting at the character defined by <code>start_pos</code> (an integer) and ending at the character defined by <code>length</code> (an integer). If <code>length</code> isn't indicated, it returns the remainder of the string.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>to_char(expr)</td>
<td>This function converts the numeric expr to a character string.</td>
</tr>
<tr>
<td>to_number(str)</td>
<td>This function converts the character string str to a numeric. If the str isn't numeric, this function returns zero. If str is a combination of numbers and other characters and begins with a number, this function returns only the initial numeric portion. For example, to_number('123ABC') returns 123.</td>
</tr>
<tr>
<td>upper(str)</td>
<td>This function returns string str in all uppercase characters. For example, the expression upper('global.COM') returns the value GLOBAL.COM.</td>
</tr>
</tbody>
</table>

**Date Functions**

Select from the following to use a date function in the expression.

See Reference Information for a list of the date/time format tokens you can use in date functions. Most of the date functions allow you to combine the supported format tokens in any combination you want.

Date functions do not support dates earlier than January 1, 1970.

<table>
<thead>
<tr>
<th>date_add(date, units, interval, round)</th>
<th>This function returns the value of date plus a specified amount of time where date is a date/time type column or a literal string in the format YYYY-MM-DD or YYYY-MM-DD HH:MI:SS. The amount of time to add is specified by units and interval. Units is an integer or expression referring to an integer database field specifying the number of intervals to add or subtract. Interval can be SECONDS, MINUTES, HOURS, DAYS, WEEKS (Sunday through Saturday), IWEEKS (Monday through Sunday), MONTHS, QUARTERS, or YEARS. To round the result to the beginning of the specified interval, set the round argument to 1. If you set round to 0, the result will not be rounded. For example, the expression date_add('2013-11-25 22:35:00', 48, HOURS, 1) returns the value 2013-11-27 22:00:00.</th>
</tr>
</thead>
<tbody>
<tr>
<td>to_date(str, format)</td>
<td>This function converts the value entered in str that's in the format specified in format to a date or date/time value. For example, the expression to_date('20140215', 'YYYYMMDD') returns a value of 02/15/2014. Unlike other date functions, to_date supports only the following date formats.</td>
</tr>
<tr>
<td>DD MM YYYY HH:MI:SS</td>
<td></td>
</tr>
<tr>
<td>DD MM YYYY HH:MI:SS AM</td>
<td></td>
</tr>
<tr>
<td>DD MON YY</td>
<td></td>
</tr>
<tr>
<td>DD MON YYYY</td>
<td></td>
</tr>
<tr>
<td>DD-MM-YY</td>
<td></td>
</tr>
<tr>
<td>DD-MM-YYYY</td>
<td></td>
</tr>
<tr>
<td>DD.MM.YY</td>
<td></td>
</tr>
<tr>
<td>DD.MM.YYYY</td>
<td></td>
</tr>
<tr>
<td>DD/MM/YY</td>
<td></td>
</tr>
<tr>
<td>DD/MM/YYYY</td>
<td></td>
</tr>
<tr>
<td>DD/MM/YYYY HH:MI:SS AM</td>
<td></td>
</tr>
<tr>
<td>MM-DD-YY</td>
<td></td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>date_format(date, format)</td>
<td>This function converts date from a date/time data type to a string and reformats it to match the format specified by format. Date can be a date/time type column or a literal string in the format YYYY-MM-DD or YYYY-MM-DD HH:MI:SS. For example, the expression date_format('2013-11-25 22:25:00', 'DAY, MONTH DD, YYYY, HH12:MI PM') returns the value Tuesday, November 25, 2013 10:25 PM.</td>
</tr>
<tr>
<td>date_diff(date, date)</td>
<td>This function returns the number of seconds occurring between two dates. For example, the expression date_diff('2014-07-26 22:25:00', '2014-07-25 10:30:00') returns the value 129300. Another example is date_diff(sysdate(),incidents.updated). This expression returns the number of seconds between the current time and the time that incidents were last updated. To change the format of the output, use the time_format function. For example, time_format(date_diff('2014-07-26 22:25:00', '2014-07-25 10:30:00'), 'HH24h MIm SSs') returns the value 35h 55m 00s.</td>
</tr>
<tr>
<td>rel_date_diff(date2, date1, rr_id)</td>
<td>This function returns the number of seconds between two dates, taking holidays and the work hours specified in response requirements into account. The value for rr_id is the response requirement ID that you want to use. We recommend using the value from the incidents.rr_id field. For example, if a site's response requirements are configured with work hours from 9 A.M. to 5 P.M., the expression rel_date_diff('2014-07-26 22:25:00', '2014-07-25 10:30:00') returns the value 52200. Another example is rel_date_diff(sysdate(),incidents.rel_due,incidents.rr_id). This expression returns the number of seconds between the current time and incidents' due dates, excluding holidays and taking the work hours configured in the response requirements associated with the incidents into account. This function isn't available for use in variables, filters, or exceptions. In addition, it cannot be nested in other expressions.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>date_trunc(date, units)</code></td>
<td>This function truncates <code>date</code> to the unit specified by <code>units</code>, with <code>units</code> being a time interval of SECONDS, MINUTES, HOURS, DAYS, WEEKS (Sunday through Saturday), IWEEKS (Monday through Sunday), MONTHS, QUARTERS, or YEARS. For example, the expression <code>date_trunc(‘2013-11-25 22:25:10’, ‘HOURS’)</code> returns the value <code>2013-11-25 22:00:00</code>.</td>
</tr>
<tr>
<td><code>sysdate()</code></td>
<td>This function returns the current system date in the format YYYY-MM-DD HhMmSS.</td>
</tr>
<tr>
<td><code>time_format(seconds, format)</code></td>
<td>This function converts <code>seconds</code> to the specified time format. For example, the expression <code>time_format(86610,’HH24 MI SS’)</code> returns the value <code>24 03 30</code>.</td>
</tr>
<tr>
<td><code>date_group(expr, format)</code></td>
<td>This function lets you group records together according to a date range that you specify, and include rows for date ranges that have no associated records. If you do not want to return rows for date ranges with no records, you could use <code>date_format</code> instead. For example, if you have incidents created in January and March, but none in February, and create a report with the expression for column A set to <code>date_group(incidents.created, ‘YYYY-MM’)</code>, and the expression for Column B set to <code>count(*)</code>, the report would output: 2014-01 10 2014-02 0 2014-03 15 If you changed Column A's expression to <code>date_format(incidents.created, ‘YYYY-MM’)</code> to use the <code>date_format</code> function instead of <code>date_group</code>, the output would be similar, but would not include a row for February. When this function is used in a column, the report designer automatically groups the data in the output level, and sets the output level's group and sort order options. At least one date filter is required to use this function.</td>
</tr>
<tr>
<td><strong>Logical Functions</strong></td>
<td>Select from the following to use a logical function in the expression.</td>
</tr>
<tr>
<td><code>if(expression, then result, else result)</code></td>
<td>This function returns the then result if the expression is true and returns the else result if the expression is false. For example, the expression <code>if(incident.c$field=1, ‘Yes’, ‘No’)</code> returns Yes for incidents where the value of <code>c$field</code> is 1. If the value isn't 1, No is returned. You can use IS NULL and IS NOT NULL as part of the expression. For example, you could use the expression <code>if(incident.c$field IS NOT NULL, ‘Yes’, ‘No’)</code>.</td>
</tr>
<tr>
<td><code>decode(test expression, test value 1, result 1, [next test value, next result]...[,default])</code></td>
<td>This function compares <code>test expression</code> to each <code>test value</code> in order and returns <code>result</code> for the first <code>test value</code> that <code>expression</code> matches. If <code>expression</code> does not match any <code>test value</code>, <code>default</code> is returned. If <code>default</code> is undefined, NULL is returned. The <code>decode</code> function can perform table lookups, allowing you to use text strings as test values rather than requiring coded values (for example, you can use <code>Review</code> as a test value for the expression <code>faqs.status</code> even though the table contains code value in the <code>status</code> column).</td>
</tr>
<tr>
<td><code>nvl(expr1, expr2)</code></td>
<td>If the value <code>expr1</code> is null, this function returns the value <code>expr2</code>. However, if the value <code>expr1</code> isn't null, then the value <code>expr1</code> is returned. The value of <code>expr2</code> must match the data type of <code>expr1</code>.</td>
</tr>
<tr>
<td><strong>Math Functions</strong></td>
<td>Select from the following to use a math function in the expression.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>bitand(X, Y)</code></td>
<td>This function returns the bitwise AND of two integers, X and Y.</td>
</tr>
<tr>
<td><code>ceiling(X)</code></td>
<td>This function returns the smallest integer value greater than or equal to X.</td>
</tr>
<tr>
<td><code>floor(X)</code></td>
<td>This function returns the largest integer less than or equal to X.</td>
</tr>
<tr>
<td><code>power(X, Y)</code></td>
<td>This function returns the value of X to the power of Y. For example, <code>power(2, 3)</code> would return 8.</td>
</tr>
<tr>
<td><code>rand()</code></td>
<td>This function generates a random number between 0 and 1. This output can be used to produce a random sampling of data. For example, add a column with an expression of <code>rand()</code> to an incidents report and sort on the column. The report will show information for incidents meeting your search criteria, sorted randomly.</td>
</tr>
<tr>
<td><code>round(X, D)</code></td>
<td>This function returns the value X rounded to the nearest number with D decimals. For example, <code>round(5.55555, 2)</code> returns the value 5.56.</td>
</tr>
<tr>
<td><code>truncate(X, D)</code></td>
<td>This function returns the value X truncated to the D decimal places. For example, the expression <code>truncate(5.55555, 2)</code> returns the value 5.55.</td>
</tr>
</tbody>
</table>

### Currency Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cvt_currency(expr, str)</code></td>
<td>This function converts the currency value <code>expr</code> to the specified currency <code>str</code>. For example, the expression <code>cvt_currency(opportunities.rep_value, 'USD')</code> returns the <code>rep_value</code> in U.S. dollars when “USD” is stored as the abbreviation for U.S. dollars in the <code>currencies</code> table.</td>
</tr>
<tr>
<td><code>make_currency(expr, str)</code></td>
<td>This function converts an integer or decimal number to the specified currency <code>str</code>. For example, the expression <code>make_currency(100.00, 'USD')</code> returns the <code>expr</code> in U.S. dollars. You can also replace <code>str</code> with the value <code>dflt</code> to convert the expression to the user's currency.</td>
</tr>
<tr>
<td><code>to_currency(expr, str)</code></td>
<td>This function converts an integer <code>expr</code> to a value in <code>str</code> currency. The numeric value is converted to an amount in the user’s default currency. The conversion rate used for this function is the exchange rate defined in the <code>exchange_rates</code> table. For example, for a user with a default currency of USD, <code>to_currency(sa_products.c$price, 'EUR')</code> returns an amount in USD that’s equal to the number in the <code>sa_products.c$price</code> custom field converted to Euros.</td>
</tr>
</tbody>
</table>

### How You Use Report Columns

**View the Column Right-Click Menu**

Numerous options that let you change a column’s display, positioning, and other options are available on the column’s right-click menu.

The right-click menu is available for columns when you’re viewing a report, or when you’re editing a report on the report designer. The options in this menu give you a large amount of control over how your columns display and function, so it’s important you understand the options available on the menu.

1. Open the report.
2. Right-click the header of the column you want to modify.
The right-click menu opens.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit Definition</td>
<td>Select this option to open the <strong>Column Definition</strong> window where you can edit the column heading, descriptions, and expression. See <em>Add a Column to a Report</em>. This option displays only when editing a report on the report designer.</td>
</tr>
<tr>
<td>Edit Format</td>
<td>Select this option to open the <strong>Column Format</strong> window where you can change the column format, alignment, width, and styles. See <em>How You Edit Column Formatting</em>.</td>
</tr>
<tr>
<td>Edit Calculations</td>
<td>Select this option to open the <strong>Calculations</strong> window where you can select calculations on the column values to display beneath the column. Refer to <em>Add Calculations to a Report Column</em>.</td>
</tr>
<tr>
<td>Sort Ascending</td>
<td>Select these options to sort the values in the column in ascending or descending order. See <em>How You Change Report Sort Order</em>.</td>
</tr>
<tr>
<td>Sort Descending</td>
<td></td>
</tr>
<tr>
<td>Move Column Left</td>
<td>Select one of these options to move the column left or right. You can also move columns by dragging them on the design surface. These options display only when editing a report on the report designer.</td>
</tr>
<tr>
<td>Move Column Right</td>
<td></td>
</tr>
<tr>
<td>Insert New Column Before</td>
<td>Select one of these options to add a new column before or after the column you have selected. When you select this option, the <strong>Column Definition</strong> window opens so you can create the new column. These options display only when editing a report on the report designer.</td>
</tr>
<tr>
<td>Insert New Column After</td>
<td></td>
</tr>
<tr>
<td>Delete Column</td>
<td>Select this option to delete the column from the report. You can also delete a column by selecting the column and pressing Delete. This option displays only when editing a report on the report designer.</td>
</tr>
<tr>
<td>Freeze Column</td>
<td>Click this button to fix the selected column in place so it does not move when you horizontally scroll the report. This can be helpful if you want to continue to view the first column in the report while scrolling the report to see the columns on the right of the report. When you fix a column, all columns to the left of the column are also fixed. You can still scroll the columns to the right of the fixed column.</td>
</tr>
<tr>
<td>Hide Column</td>
<td>Select this option to prevent the column from displaying in the report output. The column is only hidden, so you can display the column when running the report if you need to see it. For information about showing and hiding columns, see <em>Hide or Show a Column Using Right-Click Options</em>.</td>
</tr>
<tr>
<td>Insert Hidden Column</td>
<td>Select this option to view a list of any hidden or rolled-up columns in the report. Click the hidden or rolled-up column you want to display. This option displays only when the report has hidden columns.</td>
</tr>
</tbody>
</table>
Add a Column to a Report
You can add a report column from either the data dictionary or the **Column Definition** window.

The procedures to add report columns are the same whether you’re adding standard or custom fields from the database, functions, variables, or computed fields. If your column returns information directly from the database, and does not require a complicated expression, you can add the column using the data dictionary. If your column’s expression is complicated, perhaps using several functions, it can be easier to add the column from the **Column Definition** window.

**Note:** Each output level can have a maximum of 100 output columns. In addition, the number of tables used in a report is limited to 20.

1. **To add a column from the data dictionary:**
   a. Select the field, *function*, *variable*, or *computed field* you want from the data dictionary.
      **Note:** If the data dictionary isn't shown on the design surface, click the **Home** tab and click **Data Dictionary** to display it.
   b. Drag the field you selected to the data area on the design surface.

   When you drag an item from the data dictionary to the data area, you can place it in any position. If other columns are in the data area when you drag a field, arrows appear between column headers indicating where the field will be placed. When the field is in the desired location, drop it onto the data area.

2. **To add a column from the **Column Definition** window:**
   a. Click the **Home** tab and click **Add Column**.
      The **Column Definition** window opens.
   b. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heading*</td>
<td>Enter a heading for the column. This heading displays in the report output.</td>
</tr>
<tr>
<td>Use predefined heading when available</td>
<td>Select this check box to use the default heading for the column. This is the name of the field as it appears in the data dictionary.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an optional description for the column. Text that you enter in this field displays in the report when you include the Output Descriptions report section. See <em>Display Output Descriptions</em>.</td>
</tr>
<tr>
<td>Available Columns/Functions</td>
<td>This area displays the data dictionary, which lists the available fields, functions, and parameters you can add as columns to the report. To add an item, expand the tree, select the item, and drag it to the <strong>Expression</strong> section. This option does not display when defining columns for <em>computed fields</em>.</td>
</tr>
<tr>
<td>Expression</td>
<td>This area displays the field, function, or parameter you have defined as a column. If you know the specific field or function you want to add, you can</td>
</tr>
</tbody>
</table>
Also enter it in this field to add it as an output column without dragging it from the Available Columns/Functions field. You can also manually edit the expression shown in this section. The Expression area does not display when defining columns for computed fields.

The maximum number of characters allowed in the expression field is 3,500. You can use replacement variables to create expressions that require more characters. See Add Report Variables.

c. Click OK to add the output column.

The column is added as the last column on the report level. See How You Edit Column Formatting for information about how to reposition the column.

After you add columns to the data area, the report designer displays the columns on the design surface. Four rows of sample text display beneath each column to give you an idea of what the report output will look like.

Related Topics
• Creating a Custom Report (video)

Remove a Column from a Report
If you decide you no longer need a column in the report, you can remove it when working on the report designer.

1. Select the column you want to remove from the report.
2. Do one of the following:
   o Click Delete on the Design tab.
   o Press Delete on your keyboard.

If the column you delete uses a table that's no longer needed in the report, you should remove the table from the report to help the report run efficiently.

Related Topics
• Change Table Joins and Linked Fields

Move a Column in a Report
You can move columns when viewing or editing a report.

1. To move a column when viewing a report, click the header of the column you want to move and drag it to the new position in the report.
2. To move a column when editing a report on the report designer, do one of the following.
   o Drag the column to the new position in the report.
   o Click Move Left or Move Right on the Home tab.

After moving the column, it displays in the new position on the report.
Add Calculations to a Report Column
You can add rows to the bottom of a column to display calculations performed on the column's data. You can also perform calculations on data rollups.

The Calculations window displays all the calculations that can be performed on the data in the column. If the report does not have rollup columns, the Rollup Calculations section does not appear. Also, columns that do not contain numeric values have only the Minimum, Maximum, and Median calculations available.

You can also add calculations from a selected column’s Design tab.

1. Right-click the column and select Edit Calculations.
   The Calculations window opens.
2. If you select a rollup column, select the options you want for the column.
   a. Select the Total check box to display the total value of the output column for all records.
   b. Select the Minimum or Maximum check boxes to display the minimum or maximum values of the output column for all records.
   c. Select the Weighted Average check box to display the weighted average of the column for all records.
   d. Select the Average check box to display the average value of the output column for all records.
   e. Select the Median check box to display the median (middle) value of the output column for all records.
   f. Select the Standard Deviation check box to display the standard deviation of the column for all records.

   Standard deviation is the square root of the variance. It projects how various values in a set of values deviate from the mean for that set.
3. Select calculations for columns.
   a. Select the Total check box to display the total value of the output column for all records.
   b. Select the Minimum or Maximum check boxes to display the minimum or maximum values of the output column for all records.
   c. Select the Weighted Average check box to display the weighted average of the column for all records.
   d. Select the Average check box to display the average value of the output column for all records.
   e. Select the Median check box to display the median (middle) value of the output column for all records.
   f. Select the Standard Deviation check box to display the standard deviation of the column for all records.

   Standard deviation is the square root of the variance. It projects how various values in a set of values deviate from the mean for that set.
   g. Click the Weighted Column drop-down menu and select the column to use in conjunction with the current column to derive the weighted average.

   This drop-down menu is activated when the Weighted Average report or rollup calculation is selected, and displays only numeric columns you can use with weighted averages.

   For example, if you have a report with column X showing the number of incidents solved by a group, and column Y showing the average amount of time spent solving the incidents, a weighted average calculation can determine the average amount of time spent solving each incident regardless of how many incidents each group solved.

   That is, if group A solves 30 incidents and averages 30 minutes per incident, and group B solves 10 incidents averaging 110 minutes per incident, a normal average would calculate 70 minutes per incident, which would not reflect the different number of incidents for each group. A weighted average would show a more accurate average of 50 minutes per incident, since it takes the number of incidents solved by each group into account.

   The calculation used to determine weighted averages is \( \frac{(x1*y1)+(x2*y2))}{(x1+x2)} \) or, in this example, \( \frac{(30*30 + 10*110)}{(30 + 10)} = 50 \).
4. Click OK.

**Related Topics**
- Define Rollups

**Add a Comparison Value Column to a Report**

You can view the same data for two different time periods side-by-side in a report by adding a comparison value computed field.

You can specify the time periods used, and change them while running the report to view the data for different time periods. For example, you could have a report that shows the number of incidents created in the current week and the number of incidents created in the previous week. You could then run the report again to compare numbers of incidents created in the current month and previous month.

After you add a comparison value column to a report, the Comparison button on the Home tab becomes active and you can select the comparison time period. The comparison time period is relative to the time specified in a required date filter you must add to the report.

1. Add an output column that returns values you want to compare. For example, if you want to compare the number of incidents created from one week to the next, you could add a column for count to return a count of incidents.
2. Expand the Computed Fields tree in the data dictionary.

**Tip:** You can also add comparison columns by clicking the column you want to compare on the design surface, clicking the Design tab, clicking the arrow on the Insert Column button, and then selecting the column you want to add.

3. Click the column you want to compare.
4. From the right side of the data dictionary, drag **Comparison Value** (column name) and drop it on the design surface.
5. Click the **Home** tab.
6. Click **Comparison** and select **Edit Comparison Date Offset**.
7. Do one of the following:
   - Enter the relative value you want to use for the default comparison date offset. For example, entering **-1 Weeks Exactly** returns values in the comparison value column that are derived from data that’s exactly one week earlier than the data returned in the column that’s being compared.
   - Click the **Calendar** to specify relative date and time values. See **Filter Date Ranges**.

When you run the report, the default comparison date offset can be changed on the Search window. This lets you to run the report several times to compare different time periods.

8. Click OK.
9. Add a **fixed** or **runtime selectable** date filter to the report. This date filter is used to filter the data returned in the column being compared and determines the time period that the comparison column’s relative comparison date offset is based on.

**Related Topics**
- Add a Comparison Percentage Column to a Report
- Change Column Comparison Options

**Add a Comparison Percentage Column to a Report**

After adding a comparison value column to a report for a numeric field, you can then add a Comparison Percentage computed field column to the report.
Before adding a comparison percentage column, you must first add a comparison value column to the report. See Add a Comparison Value Column to a Report.

This column returns the percentage difference between the comparison value column and the column being compared. For example, if a value in the compared column is 10, and the corresponding comparison value is 15, the percentage difference would be 50%.

1. Expand the Computed Fields tree in the data dictionary.

   **Tip:** You can also add comparison percentage columns by clicking the comparison column you added on the design surface, clicking the Design tab, clicking the arrow on the Insert Column button, and then selecting Comparison % Change.

2. Click the comparison value column you added.

3. From the right side of the data dictionary, drag the Comparison Percentage column name and drop it on the design surface.

4. To set options for the column, right-click the column on the design surface and select Edit Comparison Percentage Options.

   **Tip:** You can also adjust options by selecting the column and using the buttons on the Design tab’s % Change group.

5. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

</tr>
</tbody>
</table>

6. **Click OK.**

Change Column Comparison Options
You can modify the comparison value columns that you have added to a report.

When using comparison values in a report, the comparison and compared values do not necessarily display on the same row as the corresponding values in the other column. This is because a value isn’t automatically returned in a comparison column if there are no records to return.
For example, if a report outputs numbers of incidents assigned to two staff members during the current week and previous week, but the top staff member listed in the report had no incidents assigned in the previous week, there will not be an entry for that staff member in the comparison value column. This results in the comparison value for the second staff member displaying on the first row of the report.

To prevent this, you can set comparison options to have the report output a zero for any rows that lack a value in a column. This results in the corresponding values lining up with one another.

1. Add a comparison value column to a report.
2. Click the Home tab.
3. Click Comparison and select Edit Comparison Match Columns.
4. Select the column(s) that define the corresponding values.
5. Move the selected column to the Comparison Match Columns panel by dragging the field or clicking the right arrow.
6. Click OK.

Related Topics
- Add a Comparison Value Column to a Report

Add a Trend Value Column to a Report
Trend value computed fields are similar to comparison value computed fields. However, where comparison value columns return data from previous time periods, trend value columns return forecasts of data in future time periods, calculated from current data.

Trend values are best used when trending a column that groups data together by a time period, such as a column that shows the number of incidents created in the same week.

Tip: You can also add trend value columns by clicking the column you want to trend on the design surface, clicking the Design tab, clicking the arrow on the Insert Column button, and then selecting Trend Value.

1. Add a numeric output column that returns values you want to trend.
   For example, if you want to forecast the number of incidents that will be created in future weeks, you could add a column for count(incidents.i_id) to return a count of incidents.
2. Expand the Computed Fields tree in the data dictionary.
3. Click the column you want to trend.
4. From the right side of the data dictionary, drag the Trend Value column name and drop it on the design surface.

Add a Trend Percentage Column to a Report
After adding a trend value column to a report, you can then add a Trend Percentage computed field column to the report.

Before adding a trend percentage column, you must first add a trend value column to the report. See Add a Trend Value Column to a Report.

You can add a Trend Percentage column, either from the data dictionary or the Design tab's Insert Column button. Trend Percentage columns return the percentage difference between the trend value column and the column being trended.
For example, if a value in the trended column is 10, and the corresponding trend value is 15, the percentage difference would be 50%.

1. Expand the **Computed Fields** tree in the data dictionary.
2. Click the trend value column you previously added to the report.
3. From the right side of the data dictionary, drag the Trend Percentage column name and drop it on the design surface.
4. To set options for the column, right-click the column on the design surface and select **Edit Trend Percentage Options**.

   **Tip:** You can also edit trend percentage options from the % Change group on the Design tab.

5. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comparison Direction</td>
<td>Select whether the trend value or the trended column is used as the initial column to derive the trend percentage.</td>
</tr>
<tr>
<td>Trend Data to Report Data</td>
<td>Select this option to use the trend value column as the initial column to derive the trending percentage. If the value in the trend value column is greater than the corresponding value in the trended column, a positive percentage is returned.</td>
</tr>
<tr>
<td>Report Data to Trend Data</td>
<td>Select this option to use the trended column as the initial column to derive the trending percentage. If the value in the trended column is greater than the corresponding value in the trend value column, a positive percentage is returned.</td>
</tr>
<tr>
<td>Display Change Icon</td>
<td>Select this check box to display icons next to the percentage values returned in the column. The icons indicate show you if there's a positive change, negative change, or no change. To change the colors used for the icons, click the icon to open the Color window. See Change Colors.</td>
</tr>
</tbody>
</table>

6. Click **OK**.

Change Trend Options

Change trend options to specify the number of time units that are forecast forward for a trend value or trend percentage column.

When using forecasting, you can select the time period that you want to use. For example, if the trended column groups data by week, trending forward three units shows data trended three weeks in the future.

   **Tip:** You can also edit trend options from the Trend Options group on the Design tab after selecting the column on the design surface.

   1. Right-click the trend value column on the design surface and select **Edit Trend Options**.
   2. Select the **Perform Forecast** check box to enable forecasting.
   3. Enter the number of units.
   4. Click **OK**.

How You Edit Column Formatting

You can change formatting options for your report columns to change how they look, or to change how their data is presented.

When you edit a report or view an existing report, you can change the formatting for the report’s columns. Most of these options are the same for all columns and let you adjust column fonts, width, alignment, and similar properties. Other formatting options that impact how data displays vary depending on the type of information the column returns. For instance, a column that displays numbers will have different data options than a column that displays text.

When viewing reports you select format options from the Column Format window. When using the report designer, you can select from options in the Column Format window, or use buttons on the Format tab. The tab includes the most commonly used options available in the window.

If you change column format options when viewing a report, those changes are lost when you close the report. To save formatting changes on a custom report, you must edit it on the report designer.

Edit Column Alignment Options

Change the way text is displayed in a report column.

1. Right-click the header of the column you want to modify and select **Edit Format**.
   The Column Format window opens.
2. Click the **Alignment** tab.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Header</strong></td>
<td>The fields in this section determine the alignment for the column's header.</td>
</tr>
<tr>
<td>Text Alignment</td>
<td>Click this drop-down menu to select the column header’s horizontal alignment. Options include Left, Center, and Right.</td>
</tr>
<tr>
<td>Line Alignment</td>
<td>Click this drop-down menu to select the column header’s vertical alignment. Options include Bottom, Center, and Top.</td>
</tr>
<tr>
<td>Wrap Text</td>
<td>Select this check box to allow the column header's text to wrap to a new line if it exceeds the width of the column.</td>
</tr>
<tr>
<td><strong>Data</strong></td>
<td>The fields in this section determine the alignment for the column's data.</td>
</tr>
<tr>
<td>Text Alignment</td>
<td>Click this drop-down menu to select the horizontal alignment for the column's data. Options include Left, Center, and Right.</td>
</tr>
<tr>
<td>Line Alignment</td>
<td>Click this drop-down menu to select the vertical alignment for the column's data. Options include Bottom, Center, and Top.</td>
</tr>
<tr>
<td>Wrap Text</td>
<td>Select this check box to allow the column’s data to wrap to a new line if it exceeds the width of the column.</td>
</tr>
<tr>
<td>Limit Wrapped Text to x Rows</td>
<td>If the Wrap Text check box is selected, enter the maximum number of wrapped rows that should be shown in the report output. You can enter a value between 1 and 100.</td>
</tr>
<tr>
<td>Repeating Values</td>
<td>The fields in this section let you hide repeating values in the column.</td>
</tr>
</tbody>
</table>
Edit Column Width Options
Change the width of a column in a report.

1. Right-click the header of the column you want to modify and select **Edit Format**. The **Column Format** window opens.
2. Click the **Width** tab.
3. Select the width setting you want.
   - **Best Fit**—Select this option to automatically size the column width to best fit in the report.
   - **Specific Width**—Select this option to define a width for the column. Enter the width of the column and select the unit to use from the drop-down menu. You can choose Percentage (of the total width of the report), Pixel, Inch, Cm (centimeter), Mm (millimeter), Pica, Point, Em, and Ex.

Edit Column Style Options
Change the format of text that appears in a report column.

1. Right-click the header of the column you want to modify and select **Edit Format**. The **Column Format** window opens.
2. Click the **Styles** tab.
   - Text styles control the font, color, margins, background colors, and borders for text fields. The current setting for each text field's style is shown next to the name of the text field.
3. Enter field information.
between the two styles you have defined. If you add a third data style, it is used in every third row.
- Click **Remove** to remove the new data style. Remove appears next to new data styles you add. You cannot remove the original data style.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rollup Totals</td>
<td>Click <strong>Edit</strong> to define the style for the rollup totals if shown in the report's output.</td>
</tr>
<tr>
<td>Report Totals</td>
<td>Click <strong>Edit</strong> to define the style for the report totals headers if shown in the report's output.</td>
</tr>
<tr>
<td>Apply Styles to All Columns</td>
<td>Click this text to apply the styles you defined on this tab to all the columns currently in your report.</td>
</tr>
</tbody>
</table>

**Edit Conditional Format Options**

You can change how values display in a column based on conditions you specify.

Conditional formatting flags information in output columns without creating a data exception. For example, you could add formatting to a column in an incidents report to display the column's output in red text if an incident's status is Unresolved. Multiple format options can be used to flag output using images, background colors, and fonts.

Conditional formatting isn't available for columns that return hierarchical values.

1. Right-click the header of the column you want to modify and select **Edit Format**.
   
   The **Column Format** window opens.
2. Click the **Conditional** tab.
3. Click **Add**. The **Conditional Format** window opens.
   
   The options shown on the Condition tab depend on the type of data output in the column the condition is added to. For example, a column that outputs dates has operators and values that are unique to date fields.
4. Select the operator and value(s) you want flagged.
5. Click the **Format** tab to define how the flagged data is displayed.
6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Click this drop-down menu to select the type of formatting you want to use to indicate column output that meets the selected condition(s).</td>
</tr>
<tr>
<td>Image and Text</td>
<td>Select this option to show images next to the column output that meets the selected condition(s) and display the output with different font options.</td>
</tr>
<tr>
<td>Image Only</td>
<td>Select this option to show an image next to the column output that meets the selected condition(s).</td>
</tr>
<tr>
<td>Text Only</td>
<td>Select this option to use different font options for column output that meets the selected condition(s).</td>
</tr>
<tr>
<td>Image</td>
<td>Click this drop-down menu to select the image to display. Options include Circle, Square, Flag, Check, Up Arrow, Down Arrow, and Custom. Select Custom to select the image from the Images explorer. This drop-down menu is disabled if Text Only is the selected display option.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Change Color | Click this text to change the color of the selected image. The color of custom images cannot be changed.
Preview | This field displays a preview of the selected image, text, or both, depending on the selected display option.
Change Style | Click this text to select font attributes for conditional column text.

7. Click OK.
8. If multiple conditional formats are applied to the column, define the order in which the formats should be applied.

Multiple conditional formats can be applied to the same column to indicate different values. For example, different incident statuses can have different font colors or images. When a column has multiple formats, the order of the conditions is important since this determines which condition is applied first. If a row in a report meets both the first and second conditions in a column, only the first condition is applied to the value.

a. Select the conditional format to move from the Conditional Formats list.
b. Click the **Move Up** or **Move Down** arrows to move the conditional format up or down in the list.

Edit Data Type Column Format Options
The options for editing a report column vary depending on the column data type.

1. Right-click the header of the column you want to modify and select **Edit Format**.
2. To define options for a text column, enter the field information described here.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Text Length** | Define limits to the length of text strings appearing in the column. 
| Do not limit text length | Select this option to allow an unlimited length of text strings in the column. The column is automatically resized to fit the length of the output text. 
This option is not available for menu type fields.
| Limit text to x characters | Select this option to limit the text string length to a certain number of characters and then enter the number of characters. Text strings that exceed this value are truncated.
| **Text Options** | Define options to determine how column contents are displayed.
| Display “more” link when text width exceeds cell width | Select this check box to display a link in a row whose text exceeds the allowed width of the column. When a link is displayed, you can click the link or hover over it to open a window with the full text.
### Field Description

<td>Select this option to display a blank for NULL values.</td>
</tr>
<tr>
<td>Display as 0</td>
<td>Select this option to display No Value for NULL values.</td>
</tr>
</tbody>
</table>

#### Add URL Links to a Column

You can define report column cells as URL links.

When you click a URL link in a report, your web browser launches and the website the URL points to opens. You can customize the URL and add variables to the link, using the values in any of the report’s columns. For example, you could direct a URL to open an answer on the *customer portal*, or you could direct the URL to a page designed by your organization.

1. Right-click the header of the column you want to modify and select **Edit Format**.
   - The **Column Format** window opens.
2. Click the **URL** tab.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>Select this option to clear URL options.</td>
</tr>
</tbody>
</table>

---

808
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Cell Value as Link</td>
<td>Select this option to enable URL options for the column. This lets you link to a website using either the value displayed in the field or a custom URL.</td>
</tr>
<tr>
<td>Display Cell Value as Image</td>
<td>Select this option to enable image options for the column. This lets you store images on a separate server and display the images in the column. Since you can point to external locations for the image files, you do not need to upload the images. Instead, you specify the URL where the image you want to display is stored. See Display External Images in a Report Column.</td>
</tr>
<tr>
<td>Use Cell Value as URL</td>
<td>Select this option to use the value in the field as the URL link. Use this only if the value in the field is a valid URL.</td>
</tr>

Add Gauge Charts to a Column

You can display numeric or currency values in a column as gauge charts. Several types of gauges are available.

1. Right-click the header of the column you want to modify and select **Edit Format**.
   The **Column Format** window opens.
2. Click the **Gauge** tab.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inline Gauge Type</td>
<td>Click this drop-down menu to select the type of gauge you want to use. Options include None, Linear Gauge, Circular Gauge, Progress Bar, LED, and Status Gauge.</td>
</tr>
<tr>
<td>Display Numeric Value</td>
<td>Select this check box to display numeric values on the gauge.</td>
</tr>
<tr>
<td>Orientation</td>
<td>This option displays only when Status Gauge is selected. You can choose Linear Gauge to display the information using a linear line. You can also choose Horizontal to display the information using a horizontal line.</td>
</tr>
<tr>
<td>Show Reference Marks</td>
<td>This option displays only when Status Gauge is selected. Select this check box to display lines on the status gauge where your gauge color ranges are configured. For instance, if you configure ranges of 0%-50% and 51%-100%, a line will display at the midpoint of the gauge between the two ranges.</td>
</tr>
<tr>
<td>Size</td>
<td>Define the size of the gauge in this section.</td>
</tr>
<tr>
<td>Best Fit</td>
<td>Select this option to allow the width of the gauge to be automatically sized to the best fit for the report.</td>
</tr>
<tr>
<td>Specific Width</td>
<td>Select this option to define a width for the gauge. Enter the width of the gauge and select the unit to use from the drop-down menu. You can choose Percentage (of the total width of the column), Pixel, Inch, Cm (centimeter), Mm (millimeter), Pica, Point, Em, and Ex.</td>
</tr>
<tr>
<td>Bar Size</td>
<td>Define the bar size of the gauge in this section. This section is available only for the Status Gauge type.</td>
</tr>
<tr>
<td>Best Fit</td>
<td>Select this option to allow the width of the gauge's bar to be automatically sized to the best fit for the report.</td>
</tr>
<tr>
<td>Specific Width</td>
<td>Select this option to define a width for the gauge's bar. Enter the width you want for the bar size and select the unit to use from the drop-down menu. You can choose You can choose Percentage (of the total width of the column), Pixel, Inch, Cm (centimeter), Mm (millimeter), Pica, Point, Em, and Ex.</td>
</tr>
<tr>
<td>Scales</td>
<td>Define the scale ranges used for the gauge in this section.</td>
</tr>
<tr>
<td>Scale Start/Scale End</td>
<td>Enter the starting value (lowest value) and ending (highest value) for the gauge's scale in these fields. These options are enabled only when defining a custom scale.</td>
</tr>
</tbody>
</table>
Display External Images in a Report Column

If you store images on a separate server, you can display those images in report columns.

Since you can point to external locations for the image files, you do not need to upload the images using the Images explorer. For instance, you can create a text system attribute for the Accounts standard object to store the URLs to photos of your staff members. You can then display the photos in reports that include the system attribute field.

There are some considerations when configuring column image options.

- Column format image options can only be configured using the report designer. They cannot be configured when viewing a report.
- Some restrictions exist on the external images you can display in reports. Each image file must be smaller than 500K in size, and a maximum of 100 unique images can be displayed each time the report is generated. (If you generate the same report multiple times using different search criteria, different images can be displayed.) In addition, to ensure reports run successfully, retrieval of the images times out after 10 seconds.
- External images will display in exported, published, and printed reports. However, they do not display in scheduled reports.
• The image file formats you can use in reports are BMP, EXIF, GIF, JPEG, PNG, and TIFF. If an unsupported file type is encountered when the report runs, the column output displays Invalid Image.

1. Open the report you want to add the image to on the report designer.
2. Right-click the column on the report where you want the image displayed and select Edit Format. The Column Format window opens.
3. Click the URL tab, and then select Display Cell Value as Image.
4. To specify a custom size for the images, select the Scale All Images to the Following Size check box and select width and height values between 1 and 500 pixels.
   By default, images are sized to 100x100 pixels.
5. In the text box, enter the URL of the image file.
6. Click OK.
7. Click Save.

Create a Data Exception
You can create data exceptions to highlight data displayed in columns or charts that meets certain criteria.

Exceptions can be created to flag data that matches expressions built from standard and custom database fields, functions, and variables. For example, you could create an exception to flag incidents with a response time greater than twenty-four hours. Incidents that match the exception could be shown on the report with custom colors, fonts, and markers. Information about the percentage of data meeting the exception can also be displayed.

Tip: Each report level can have a maximum of thirty-two data exceptions.

After you define your exceptions, you can schedule the report to send alerts whenever the criteria of a data exception is met. See How You Schedule Reports.

1. Click Exception on the Insert tab.
   The Exception Editor opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the data exception.</td>
</tr>
<tr>
<td>Display Reference</td>
<td>Click this drop-down menu to select how the data is highlighted. Options are Entire Row or specific columns from the report.</td>
</tr>
<tr>
<td>Expression*</td>
<td>Right-click in this field to select the database column used to except data in the report.</td>
</tr>
<tr>
<td>Use Data Dictionary</td>
<td>Click this text to open the Edit Expression window where you can select functions, variables, and database fields.</td>
</tr>
</tbody>
</table>

<tr>
<td>Operator</td>
<td>Click this drop-down menu to select the operator to use in the exception criteria. This drop-down menu is activated when a database column is selected. See Overview of Filter Operators for a description of operators.</td>
</tr>
<tr>
<td>Value</td>
<td>Specify the second part of the expression in this field. The options available depend on the selected value type, the type of database field the exception is based on, and the operator that's used. You can type in a value, select items from a drop-down menu, or select dates from calendars.</td>
</tr>
</tbody>
</table>

3. To define how the data exception displays in the report’s tabular output, click the Tabular Display tab.

4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Tabular Notification</td>
<td>Select this check box to display the data exception in the report’s tabular output. If this option is cleared, the other options on the Tabular Display tab are unavailable.</td>
</tr>
<tr>
<td>Use Default Display Options</td>
<td>Select this option to display the exception using the color, font, and marking method defined in the style that is being used for the report. See Styles Explorer for information about creating styles and Apply a Style to a Report for information about applying styles to reports.</td>
</tr>
<tr>
<td>Use Custom Display Options</td>
<td>Select this option to define a custom color, font, and data marking method for the exception.</td>
</tr>
<tr>
<td>Data Marking</td>
<td>Click this drop-down menu to select a data marking to mark the data that meets your exception criteria. You can choose None, Circle, Square, Flag, Check, Up Arrow, Down Arrow, or Custom. Select Custom to open the Select Image window and select images you have added in the Images explorer. See Images Explorer. Select None to prevent a graphic from indicating the data exception. The text style you define for the marker will still be applied to the data exception. This allows you to change the color or font of tabular data that meets the exception without adding a graphic. The data marking symbol displays in the window’s Preview field so you can view the symbol as you define it.</td>
</tr>
<tr>
<td>Hide Cell Values</td>
<td>Select this check box to hide the value in the column that's used as the display reference.</td>

- Order Data Exceptions

**Order Data Exceptions**
When you have more than one data exception based on the same database field in a report output level, the ordering of the exceptions can impact which exception the data matches.

When you have multiple data exceptions, you may want the most restrictive exception listed first, since the data is checked against the first exception before other exceptions in the list are matched. For example, you could create exceptions in a report that show the number of open incidents each of your contacts have. You could create an exception to indicate contacts with five or more incidents and another exception to indicate contacts with ten or more incidents. If the first exception is `count(incidents.i_id) > 5`, and the second is `count(incidents.i_id) > 10`, then your data would match only the first exception even if a row had an incident count greater than ten. This occurs because the first exception has precedence over the second exception. To correct this, you would reorder the data exceptions.

1. Select the data exception you want to move on the design surface.
2. Click the Design tab.
3. Click Move Up or Move Down to move the exception to the position you want.

   **Tip:** You can also reorder exceptions by dragging them in the exceptions report section on the design surface.

- Create a Data Exception

**Set Record Row Limits and Page Breaks**
You can limit the number of rows returned on each page or on the entire output of a report.
Reports can return large amounts of data, especially if they lack fixed filters or required runtime selectable filters. It can be difficult to print or view a report with thousands of rows, and finding specific records in such a report can be challenging. For these reasons, you might want to limit the number of rows a report can return on a page or in total.

You can set limits for each output level in the report.

1. Select the level you want to add the record limit to from the Level drop-down menu at the top of the design surface.
2. Click the Level tab.
3. Click the Record Limit button.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limit To</td>
<td>Select this check box to limit the records returned on the output level.</td>
</tr>
<tr>
<td>Rows</td>
<td>Enter the maximum number of rows you want returned. The VRL_HARD configuration setting sets a hard limit on the number of rows that can be returned in a report. Values entered in this field that exceed the VRL_HARD limit are ignored. See Analytics Configuration Settings for information about this and other configuration settings that can impact reports.</td>
</tr>
<tr>
<td>Per Page</td>
<td>Select this check box to apply the record limit to each page of the report. If this check box isn't selected, the row limit you enter restricts the total number of rows returned in the selected output level.</td>
</tr>
</tbody>
</table>

5. Click OK.

Overview of Table Relationships in Reports

You can link tables in different reports so that they function like a single report.

When you use fields from different database tables in a report’s columns or filters, the fields’ tables are automatically added to the report, and the tables are joined by their fields that are linked together in the database. Tables such as incidents and contacts are tied together with a single field in each table, specifically the incidents.c_id and contacts.c_id fields. Since there is only one way to link these tables together, Analytics links them in the report automatically using a table join. By joining the tables, information from both tables can be displayed together.

Note: When viewing a report, you can see the report’s tables in the report definition. See View a Report Definition. When editing a report, you can see and manage the report’s tables by clicking the Tables button on the Home tab of the report designer’s ribbon. See How to Change Table Relationships.

Some reports you create may need to reference numerous tables with different relationships. For example, you may need to use fields from tables that aren’t linked together in the database, or you may need to use fields from tables that can be linked together in more than one way. In these instances, you will need to select the fields you want to use to join the tables.

In addition, if you require a high degree of control over the tables used in a complex report, you can manually add them to the report instead of having the tables added automatically. See Add Tables to a Report Manually.
**Note:** In general, we recommend using as few tables as possible in a single report to help the report run efficiently. If you need to reference numerous tables in a report to return a wide array of information, you can instead create multiple reports, each with a minimum of tables that are focused on one area of the information you’re interested in. You can then link the tables together so they function like a single report. See *Overview of Linked Reports*.

**How to Change Table Relationships**

If you create a report that returns data from multiple tables and find that the data you want isn’t being returned, you may need to change the relationships of the report’s tables.

You can change the order of the tables, the join types connecting the tables, and the specific fields that are linked together in the tables, as long as the fields are linked in the database. You can also delete tables that are no longer needed in the report.

- Change Table Joins and Linked Fields

**Change Table Joins and Linked Fields**

You can edit your report’s data set to change the tables’ join types. In addition, if the tables can be linked by more than one field, you can select a new field to link to.

1. Click the **Home** tab.
2. Click **Tables** to open the **Data Set** window.
   When you open the **Data Set** window, you see the tables in your report and their relationships. When two tables are inner joined, two overlapping circles with their intersection highlighted display next to the secondary table. When two tables are outer joined, two overlapping circles with one circle highlighted display next to the secondary table.
3. Click the table that’s joined to the primary table.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>This field displays the database name of the table you have selected.</td>
</tr>
<tr>
<td>Delete Table</td>
<td>Click this text to remove the table you have selected from the report. If</td>
</tr>
<tr>
<td></td>
<td>the table acts as a parent to other tables in the report, the child tables</td>
</tr>
<tr>
<td></td>
<td>are also removed. Columns aren’t automatically removed from the report when</td>
</tr>
<tr>
<td></td>
<td>their associated tables are deleted. These need to be manually removed before</td>
</tr>
<tr>
<td></td>
<td>the report can be saved.</td>
</tr>
<tr>

<tr>
<td></td>
<td>alias of “contacts,” and the second instance could have an alias of “contacts2”</td>
</tr>
<tr>
<td></td>
<td>to distinguish it from the first instance.</td>
</tr>
<tr>
<td>Join To</td>
<td>This field displays the table the selected table is joined to.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Join Condition | If the table join can link to more than one field in the joined tables, click this drop-down menu to select the fields you want to use to join the tables.

Join Type | Select the **Inner** option to use an *inner join* or the **Outer** option to use an *outer join*.

To change the join type, you can also right-click the joined table in the data set tree and select **Toggle Join Type**.

Join Filters | You can add, delete, or view join filters in this section.

Join filters apply only to outer joins and aren’t available if the **Inner** join type option is selected.

---

**Related Topics**

- How to Create Join Filters

**Change Table Ordering**

When using outer joins to combine tables, the ordering of tables can affect what data the report can return.

If multiple tables are used in the report, you may also need to change which secondary tables are directly linked to the primary table or change the relationships between secondary tables in the data set.

1. Open the Data Set window.
2. To select a different table in the data set as the primary table, right-click the table and select **Set as Root**.
   
   When you set a new table as the root, or primary table, the relationship between the table and the old primary table is broken, resulting in the data set having two primary tables.
3. To move a table beneath another to make it a secondary table, drag the table onto the primary table.
   
   The tables are automatically joined and the new table relationship is displayed on the Data Set window.

**Related Topics**
- Overview of Table Joins

**Add Tables to a Report Manually**

If you require a high degree of control over the tables used in a complex report, you can manually add them to the report instead of having the tables added automatically.

To ensure report queries are efficient, manually adding tables to a report should be performed only by individuals with a thorough understanding of SQL queries.

1. Delete all columns and filters from an existing report, or start with a report with no columns.
2. Click **Tables** on the Home tab.
   
   The Data Set window opens.
3. Click **Select Table**.
A list of all tables displays.

4. Select the table you want from the list.

5. Click OK to add the table to the report.

6. To join additional tables to the table you added, right-click the table you added, select Join To, and select the table to join.

7. Repeat step 6 for each table you want to add.

Overview of Table Joins

Analytics uses inner and outer table joins. The join type that's used to link the tables in your report impacts what records the report can return.

Generally, you do not need to specify which fields are used to join tables together in reports since the tables that are commonly used in reports are often joined automatically. However, some tables can be joined through more than one field and other tables do not have linked fields in the database and cannot directly join together. If you encounter one of these situations when adding a field to a report, you need to specify how the tables are joined. You may also need to change the join type to allow the report to access the appropriate records in the tables.

Note: The relationships between custom object tables and other tables are defined when the custom object is created. See Overview of Custom Objects.

Inner Joins

When tables are linked with an inner join, only records in the tables that share common data can be returned. For example, when the contacts table and the incidents table are linked with an inner join, only contacts that have incidents associated with them can be returned by the report. Information about a contact who has never submitted an incident cannot be returned.

Inner joins are used when tables are automatically joined together since they meet the requirements of most reports and are easier to process in database queries than outer joins.

Outer Joins

When tables are linked with an outer join, all rows from the first table added to the report (referred to as the primary table) can be returned in the report, regardless of their relationship to rows in the secondary table. Information in the secondary table that's related to information in the primary table can also be returned. For example, if accounts is the primary table and incidents is the secondary table in a report, it can return information about all staff accounts, whether or not they have incidents assigned to them. The report can also return information about incidents that are assigned to staff members, but cannot return information about incidents that aren't assigned.

Since outer joins allow all data from the primary table to be returned, but only some from the secondary table, the ordering of the tables is important when using outer joins. If your report does not return the information you want from two tables that are outer joined, you may need to change which table is the primary and which is the secondary. See Change Table Ordering.

Tip: When using outer joins, it can be helpful to add a field from the table you are most interested in first. If your report's purpose is primarily to output information about contacts, a field from the contacts table should be added as a column before fields from other tables.

Outer joins aren't automatically used in reports since inner joins meet the requirements of most reports and are easier to process in database queries than outer joins. Outer joins are also referred to as left joins by those familiar with database queries.

  • How to Change Table Relationships

How to Specify Joins for Tables with Multiple Relationships
You can specify the fields you want to use to join tables when the tables share more than one relationship.

Some tables are linked together in the database using more than one field. For example, incidents can link to accounts through three fields in the incidents table. When joining these tables, the link between the tables isn’t automatically created, so you must define which field should be used to tie the tables together in the report. You’ll do this on the Select Join window, which automatically opens when you add fields from tables such as this to the same report.

The Select Join window also appears if your report already has multiple tables and you add a field from another table that can be related to more than one of the tables already in the report. In this case, you must define which table the new table should be joined to, since different data can be returned by joining different tables. By default, the new table is joined to the primary table in the report using an inner join.

An example that illustrates both cases is if your report includes the incidents and contacts tables, and you then add a field from the accounts table. The accounts table can link to the incidents table through three incident fields and can link to the contacts table through one contact field. In this instance, you would be asked if the accounts table should link to incidents or contacts. If you select the incidents table, you will be asked which field in the table should be used as the link.

Specify Fields to Link Tables
In a report, you can link tables together in the database using more than one field.

1. Add a column or filter to the report from a table that can be linked in more than one way to the other tables in the report.
   The Select Join window opens.
2. To accept the default table relationship that’s displayed, click OK.
3. To define which tables should be linked, select the option next to the table that the new table should join to.
   a. If the new table can link to the selected table by more than one field, select the correct field from the drop-down menu that displays next to the table’s option.
      The field you join the new table to should be associated with the information you want to output in the report. For example, if you’re joining the accounts table to the incidents table, select the incidents.created_by => accounts.acct_id option to output information about the staff member who originally created the incident. If you instead want to output information about the staff member the incident is assigned to, select the incidents.assign_acct_id => accounts.acct_id option.
4. To prevent the Select Join window from displaying again when editing the current report, select the Do Not Show This Dialog Again check box. If you then add another field that requires defining a table relationship, you need to define the relationship from the Data Set window. See Change Table Joins and Linked Fields.
5. If you do not want to define a table relationship, click Cancel.
   If you click the Cancel button, the field you added is still added to the report output, and the new table is added to the report as another primary table. However, there will not be a relationship between this table and the other tables in the report until you manually define the relationship from the Data Set window. You will not be able to save the report until you define this relationship. See How to Change Table Relationships.
6. Click OK.

Define Intermediate Table Joins
Tables that aren’t directly linked together in the database can still be joined by going through intermediate tables that are common to both.
If you attempt to use fields from two tables related to different areas of the application, it may not be possible to join them using an intermediate table. In these instances, both tables will be considered primary tables in the report and you will need to manually edit the table relationships before you can save the report. However, if you encounter this scenario, we recommend reconsidering the report’s design since a single report isn't intended to report on unrelated information.

1. Add a column or filter to the report that requires an intermediate table join.
   The **Select Intermediate Table and Join** window opens.
2. In the **Join From** column, select the option next to the table you want to join the new table to.
3. In the **Intermediate Table** column, select the option next to the table you want to use as the intermediate table to join the new table with the table selected in the **Join From** column.
4. In the **First Join** column, click the drop-down menu and select the fields you want to join from the intermediate table and the table selected in the **Join From** column.
5. In the **Second Join** column, click the drop-down menu and select the fields you want to join from the intermediate table and the new table you’re adding.
   The join tree you define displays on the window.
6. To prevent the **Select Intermediate Table and Join** windows from displaying again when editing the current report, select the **Do Not Show This Dialog Again** check box.
   If you then add another field that requires defining an intermediate table relationship, you need to define the relationship from the Data Set window.
7. Click **OK**.

### How to Add and Edit Charts

You can add charts to your reports to provide the audience with graphical representations of the report’s data.

Using charts, you can clearly compare data or highlight trends or patterns in the data. For example, a pie chart could show comparisons in the number of incidents assigned to staff accounts in the previous week, or you could use a bar chart to show incident activity over a period of time.

You can manually add charts to reports, or you can use a chart table layout to automatically add generic charts with preconfigured positions. You edit charts with the Chart Wizard, to select the chart type, the data used in the chart, labels for the chart, and other settings. In addition, you can change the appearance of charts, including fonts, colors, and other attributes.

| **Note:** Each report level can have a maximum of twenty charts. |

### Add a Chart Manually

When you manually add a chart to a report, you can define all the chart elements, determine how the chart should be sized, and where it should be located in the report.

This procedure describes adding charts using the buttons on the Insert tab. You can also add charts by selecting the Charts report section, clicking the Options tab, and clicking Add Chart to open the Chart Wizard. See **Add or Edit a Chart with the Chart Wizard**.

1. Open the report you want to edit.
2. If your report has multiple output levels, select the level you want to add the chart to from the **Level** drop-down menu at the top of the design surface.

3. Click the **Insert** tab.
   Buttons for the types of charts you can add to the report are displayed on the tab’s **Chart** group.

4. Click the button for the chart type you want to add and select the chart subtype you want to add to your report.

5. Click the Charts report section to add the chart to the report.
   The Chart Wizard opens.

6. Configure the chart and select a chart style with the Chart Wizard.
   **Note:** If you have applied a report style to the report, the chart style that’s associated with the report style is used by default. You can select a different chart style on the Chart Wizard or by clicking the Chart Style button on the Design tab. See *Apply a Style to a Report*.

7. Apply any custom style attributes you want for the chart from the ribbon’s Design, Layout, and Format tabs.
   For information about the options available on these tabs, see *Create or Edit a Chart Style*.

8. To enable automatic positioning and sizing for your chart, edit style options for the chart’s report section.
   See *Chart Placement and Sizing*.

9. Repeat all steps to add additional charts to your report.

### Add a Chart Using Chart Layouts

If you do not want to manually place charts in your report, you can add them using chart table layouts.

When you use a layout, charts are automatically added to your report and are given optimal placement. In addition, the charts are automatically sized in your report.

1. If the Charts report section isn’t displayed on the report level, click the Display tab and select the **Charts** check box.

2. Click the Charts report section on the design surface to select it.

3. Click **Automatic** on the Options tab to apply automatic formatting to the report section. See *Change the Display of a Report Section*.

4. Click **Layouts** to view chart section layouts.

5. Click one of the table layouts to apply it to the current output level. The table layout you select determines how many blank charts are added to your report and how arranged.

6. Do one of the following:
   - Right-click a blank chart on the design surface and select **Edit Chart** to configure the chart with the Chart Wizard. See *Add or Edit a Chart with the Chart Wizard*.
   - Select a chart on the design surface, click the Design tab, click **Type**, and select the chart type and subtype you want to use.
     The wizard opens automatically if the new chart type requires different source data than the previous chart type.

7. To change data options for a chart type that does not require different source data, click **Define Data Source** to manually open the Chart Wizard.

---

- Chart Placement and Sizing

### Add or Edit a Chart with the Chart Wizard

You can use the Chart Wizard to create and customize charts for a report.
The Chart Wizard displays a series of windows for customizing charts. The first window displays the list of available chart types and subtypes. Each successive window contains additional options for customizing your chart. The available options on each succeeding window depend on the chart type and subtype selected.

1. Add or edit a chart to open the Chart Wizard.
2. Click the **Chart Type** drop-down menu to select the chart type you want to use.

<table>
<thead>
<tr>
<th>Chart Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertical Bar</td>
<td>Vertical bar charts display data as a series of vertical bars. Subtype options can display the chart with single or stacked bars and as two- or three-dimensional.</td>
</tr>
<tr>
<td>Horizontal Bar</td>
<td>Horizontal bar charts display data as a series of horizontal bars. Subtype options can display the chart with single or stacked bars and as two- or three-dimensional.</td>
</tr>
<tr>
<td>Pie</td>
<td>Pie charts display data as a percentage of a whole. Subtype options can display two- or three-dimensional pie charts or doughnut charts.</td>
</tr>
<tr>
<td>Line</td>
<td>Line charts display data as a series of points connected by a line. Subtype options can display the chart as two- or three-dimensional.</td>
</tr>
<tr>
<td>Line/Bar Combo</td>
<td>Line/bar combo charts display both a line chart and a vertical bar chart. Subtype options can display the chart with single or stacked bars and as two- or three-dimensional.</td>
</tr>
<tr>
<td>Area</td>
<td>Area charts display data as areas on an x- and y-axis. Subtype options can display the chart as two- or three-dimensional.</td>
</tr>
<tr>
<td>X–Y</td>
<td>X-Y charts display data as a series of plotted points. Subtype options can display the plotted points as points, lines, or bubbles and as two- or three-dimensional.</td>
</tr>
<tr>
<td>Radar</td>
<td>Radar charts display data in a radar format. Numeric values are plotted at markers on the perimeter.</td>
</tr>
<tr>
<td>Stock</td>
<td>Stock charts display the minimum and maximum values for data. Subtype options can display the chart using squares or lines to represent the high and low points of each plot.</td>
</tr>
<tr>
<td>Pareto</td>
<td>Pareto charts display data in descending order with an ascending plot line for cumulative percentage. Subtype options can display the chart as two- or three-dimensional.</td>
</tr>
<tr>
<td>Gauge</td>
<td>Gauge charts display a numeric value as a percentage of a whole. Subtype options can display the chart as a gradation bar or a simple color meter.</td>
</tr>
<tr>
<td>Funnel</td>
<td>Funnel charts display data as areas shown in ascending or descending order. Subtype options can display two- or three-dimensional funnel or pyramid charts.</td>
</tr>
<tr>
<td>Gantt</td>
<td>Gantt charts display time lines for completion of scheduled tasks. Subtype options can display the chart as two- or three-dimensional.</td>
</tr>
</tbody>
</table>

3. Select one of the chart subtypes from the Chart Subtype section.
4. Click **Next** to open the Source Data window.

The source data options let you specify the data to display in the chart. For example, if creating a vertical bar chart, you can specify a column to use as the chart’s category value, displaying on the x-axis, and the column to use as the chart’s series value, displaying on the y-axis. The wizard also displays a sample chart to help you identify chart elements.

5. Enter field information.

<table>
<thead>
<tr>

### Chart Placement and Sizing

The Charts report section can be configured to use automatic or manual section layouts.

Each type of layout for the report section affects the display of data in your charts. When the Charts section has a manual layout, you can select a chart on the report section and drag it to reposition it. You can also select a chart and drag the handles on the chart's outline to resize the chart. When you specify a specific chart size using a manual layout, the data displayed on the chart is adjusted to fit the chart. A large chart displaying a small amount of data may appear too large. Also, a small chart displaying a large amount of data can be difficult to read since the data is compressed to fit the chart.

However, when using an automatic section layout, charts you add are automatically sized to best display the data initially presented in the charts. In addition, when you adjust the report's search parameters, the charts are automatically resized to ensure that all the data is clearly displayed. For example, if your chart shows incidents created...
over a date interval, and the report’s interval is adjusted to a longer period, the chart automatically expands to clearly display all the additional intervals shown in the report.

## Overview of Report Filters

You add filters to a report to limit the data the report returns.

If filters were not used, a report that included information from a table would return all the records in that table every time you run the report. Some filters set hard limits on what the report can return, and other filters can be selected when you run the report so you can look at different records. Filters also help improve report performance by preventing the report from examining data you do not want included in the report.

You can restrict the data returned in a report using the following filters.

- **Report fixed filters**—Fixed filters restrict the data the report can access. Fixed filters cannot be changed or edited when the report is run. See [Create a Fixed or Runtime Selectable Filter](#).
- **Report runtime selectable filters**—Runtime filter values can be changed from their default values when running a report. This lets you run the report to view data about records that share the values selected in the filter and then immediately run the report again with different values selected in the filter. See [Create a Fixed or Runtime Selectable Filter](#).
- **Level filters**—Level filters are fixed or runtime selectable filters that limit data at the individual output levels. Level filters can restrict data from appearing in one level, while allowing it to be returned in other levels in the same report. See [Create a Level Filter](#).
- **Group filters**—Group filters are applied to an output level’s grouped data to filter out certain groups from displaying in the report level’s output. See [Create a Group Filter](#).
- **Join filters**—Join filters restrict data returned in the secondary table of outer table joins. See [How to Create Join Filters](#).

**Tip:** Each report can have up to 100 report filters and each output level in a report can have 100 level filters and one hundred group filters.

### Create a Fixed or Runtime Selectable Filter

Report filters limit the data that can be returned in any level of a report.

Report filters can be fixed or runtime selectable. These filters are similar in that both restrict the data that’s returned in the report according to what the filter allows and are created in the same way. However, runtime filters can be changed when the report is run, whereas fixed filters cannot.

Runtime filters values can be changed by anyone viewing the report, either from the Search window or from docked filters, to return different data each time someone runs the report. Fixed filter values cannot be changed when the report is run, which allows you to restrict the data that report users can view.

Most reports used on workspaces automatically attempt to filter on the record shown in the workspace to display only information that’s related to the record. For this reason, when creating reports for use on workspaces, we recommend...
including a filter based on the unique identifier for the primary type of record shown in the workspace. For example, a report used on an incident workspace could filter on the incident ID field (incidents.i_id).

1. Open the report you want to edit.
2. Click the Home tab.
3. Click Add Filter.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the filter in this field. The name identifies the filter on the report designer but does not display when the report is run. Entering a value for this field is optional. If a name isn’t entered, the name defaults to the name of the filter’s database field.</td>
</tr>
<tr>
<td>Make This Filter Selectable at runtime</td>
<td>Select this check box to make the field a runtime selectable filter. If this check box is cleared, the filter becomes a fixed filter.</td>
</tr>
<tr>
<td>Label This Filter</td>
<td>Enter a label for the filter in this text field. This label displays on the Search window when the report is run.</td>
</tr>
<tr>
<td>Required</td>
<td>Select this check box to require the report’s user to enter a value for the filter when running the report. If this option is selected, the Search window opens automatically when the report is opened and the filter’s value must be specified before results are returned.</td>
</tr>
<tr>
<td>Expression*</td>
<td>Enter the expression you want to use for the filter in this field. You can right-click to select from a list of database tables, fields, and functions, or you can enter the expression. A menu displays when you start entering text that lists the database tables that begin with the letters you enter. You can either continue typing the expression or select a table and field from the list. For descriptions of the types of columns and functions you can use in the expression, see Add a Column to a Report. The maximum number of characters allowed in the expression field is 3,500. You can use replacement variables to create expressions that require more characters. See Add Report Variables.</td>
</tr>
<tr>
<td>Use Data Dictionary</td>
<td>Click this text to open a window containing the data dictionary tree where you can select fields, functions, and variables for the expression.</td>
</tr>
<tr>
<td>Operator</td>
<td>Select the operator to use with the expression. The available operators vary depending on the type of field used in the expression. See Overview of Filter Operators for descriptions of operators.</td>
</tr>
</tbody>
</table>
### Change Menu Filter Options

You can hide selected report runtime filter menu options.

In some instances, you may have runtime filters that display a large number of menu options. If the staff members using the report do not need to see all the menu options, you can hide the ones that are irrelevant to them to make it easier to navigate the menu list. For example, if an incidents report includes a filter on the assigned group, and some staff members don’t need to see incidents assigned to particular groups, you can hide those groups in the filter.

**Tip:** If you need a report to display different menu options to different audiences, create a copy of the original report for each audience and choose the menu options you want in each of the new reports. You can then specify which profiles have permission to open each report. See [Copy Analytics Content](#) and [Set Report Permissions](#).

1. Open the report on the report designer.
2. Click **Filters** on the **Home** tab.
   - The Edit Logical Expression window opens.
3. Select the filter you want to customize, and select **Edit Filter**.
   - The **Edit Filter** window opens, displaying the filter details.
4. Click **Customize**.
   - The **Customize Filter Values** window opens.
5. Clear the check boxes next to the menu options you do not want to display.
6. Click **OK**.
7. Click **OK** to close the Edit Filter window.
8. Click **OK** to close the Edit Logical Expression window.
9. Click **Save**.

### Create a Level Filter

Level filters are similar to the filters that are applied to the main report.

While report filters are applied to the report as a whole, restricting the data that's returned at any level in the report, level filters are applied to individual output levels and only restrict the data returned at the level where they're created.
If the report has multiple output levels, the other levels aren't subject to the level filters applied to other levels in the report.

1. Open the report you want to edit.
2. Select the level you want to add the filter to from the Level drop-down menu at the top of the design surface.
3. Click the Level tab.
4. Click Add Level Filter.
   The Add Filter window opens.
5. Enter field information described in Create a Fixed or Runtime Selectable Filter.
6. Click OK.
7. Click Save.

### Create a Group Filter

Group filters can be used in output levels with grouped data to prevent rows with a certain number of grouped items from displaying.

For example, an output level that returns rows showing the number of unresolved incidents for each staff member could have a group filter to display only rows for staff members with more than ten unresolved incidents. Group filters can be fixed or runtime selectable.

1. Open the report you want to edit.
2. Select the level you want to add the filter to from the Level drop-down menu at the top of the design surface.
3. Click the Level tab.
4. Click Add Group Filter.
   The Add Filter window opens.
5. Enter field information described in Create a Fixed or Runtime Selectable Filter.

   **Note:** The filter options for group filters are identical to those for filters applied to the overall report. However, you generally want group filters to filter on the results in the output level's aggregate column. For example, if the aggregate column in your report counts the number of unresolved incidents a staff member has with count (incidents.i_id), then the group filter's expression could be count (incidents.i_id) > 10, to return rows for staff members with more than ten incidents.

6. Click OK.
7. Click Save.

### Overview of Filter Operators

The operator you select when creating filters greatly impacts the data that's returned, so you should understand the functionality of each operator.

The types of operators available for a filter depend on the data type of the filter's expression.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>equals</td>
<td>The expression matches the value exactly, including case. When using this operator with menu fields, you can quickly locate the menu item you want by entering the first few characters of the item's name. Menu items that do not start with the text you type are removed from the list.</td>
</tr>
<tr>
<td>not equals (exclude No Value)</td>
<td>The expression does not match the value exactly, including case. This operator excludes any values of No Value (Null). For example, a report with a filter of field X not equals (exclude No Value) Y cannot return any records with a value of Y or No Value in field X.</td>
</tr>
<tr>
<td>Operator</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>not equals (include No Value)</td>
<td>The expression does not exactly match the value, or is No Value (Null). For example, a report with a filter of field ( X ) not equals (include No Value) ( Y ) cannot return records with a value of ( Y ), but does return records with a value of No Value.</td>
</tr>
<tr>
<td>not equals (include No Value)</td>
<td>When using this operator with menu fields, you can quickly locate the menu item you want by entering the first few characters of the item’s name. Menu items that do not start with the text you type are removed from the list.</td>
</tr>
<tr>
<td>less than</td>
<td>The expression is less than the value.</td>
</tr>
<tr>
<td>less than or equals</td>
<td>The expression is less than or equal to the value.</td>
</tr>
<tr>
<td>greater than</td>
<td>The expression is greater than the value.</td>
</tr>
<tr>
<td>greater than or equals</td>
<td>The expression is greater than or equal to the value.</td>
</tr>
<tr>
<td>between</td>
<td>The expression is between two specified values. The between operator is available to use with date, currency, and numeric (integer and float) expressions.</td>
</tr>
<tr>
<td>between</td>
<td>When using this operator with a date expression, records matching the beginning value’s date and time are returned, but those matching the ending value’s date and time aren’t. This prevents records from being displayed twice on a report that’s run once to view records created between 9:00 AM and 10:00 AM, and run again to view records created between 10:00 AM and 11:00 AM, for example.</td>
</tr>
<tr>
<td>like</td>
<td>The expression matches any part of the value. When using the Like operator, you should use the % wildcard symbol to offset your value. For example, if you were looking for all fields that contain “all,” you should type %all% in the field.</td>
</tr>
<tr>
<td>not like</td>
<td>The expression does not match any part of the value. Wildcard characters are supported.</td>
</tr>
<tr>
<td>not like or null</td>
<td>The expression does not match any part of the value, or is a null value.</td>
</tr>
<tr>
<td>not like or null</td>
<td>This operator isn’t available in runtime selectable filters.</td>
</tr>
<tr>
<td>in list</td>
<td>The expression values you want to search for are specified by selecting check boxes in a menu. The selected options are displayed in a separate Selected Items list to assist you when selecting from menus with a large number of options.</td>
</tr>
<tr>
<td>in list</td>
<td>When using this operator with menu fields, you can quickly locate the menu item you want by entering the first few letters of the value you want in the filter’s Search Text field. To view the menu options you have selected from a long menu list, click the splitter bar to the right of the list.</td>
</tr>
<tr>
<td>in list</td>
<td>When using this operator with integer fields, the numbers in the Value field must be comma-separated. When using this operator with text fields, the text strings in the Value field must be comma-separated and each text string must be offset by single quotes (for example, ‘red’, ‘green’, ‘orange’). Spaces between entries are ignored.</td>
</tr>
<tr>
<td>Operator</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>not in list</td>
<td>The expression values you do not want to search for are specified by selecting check boxes in a menu. The selected options are displayed in a separate Selected Items list to assist you when selecting from menus with a large number of options. This operator is available only with menu field expressions. When using this operator with menu fields, you can quickly locate the menu item you want by entering the first few letters of the value you want in the filter’s Search Text field. To view the menu options you have selected from a long menu list, click the splitter bar to the right of the list. When using this operator with integer fields, the numbers in the Value field must be comma-separated. When using this operator with text fields, the text strings in the Value field must be comma-separated and each text string must be offset by single quotes (for example, ‘red’, ‘green’, ‘orange’). Spaces between entries are ignored.</td>
</tr>
<tr>
<td>is null</td>
<td>The expression has a null value. This operator isn’t available in runtime selectable filters.</td>
</tr>
<tr>
<td>is not null</td>
<td>The expression does not have a null value. This operator isn’t available in runtime selectable filters.</td>
</tr>
<tr>
<td>Complex Expression</td>
<td>The expression matches any part of the value. This operator allows wildcard searching using an asterisk (*) at the end of a word or partial word and a tilde (~) before a word to perform a similar phrases search on that word only. See Search for a Record from a Report.</td>
</tr>
<tr>
<td>Not Complex Expression</td>
<td>The expression does not match the complex expression in the value. The Not Complex Expression operator is available only with text field expressions.</td>
</tr>
</tbody>
</table>

**Edit a Logical Expression**

You can modify the logical expressions that join filters in a report.

When you add multiple fixed or runtime filters at the same level in a report, the filters are automatically joined together with a logical expression. This defines how the filters should work together to return data. By default, the logical expression uses Boolean AND logic rather than OR logic. If you have a filter of `incidents.status_id = Solved` and a filter of `incidents.queue_id = Queue A`, the logical expression is `incidents.status_id = Solved AND incidents.queue_id = Queue A`. This expression would result in the report returning only solved incidents that are in Queue A.

If the default logical expression does not suit your needs, you can modify the expression from the Edit Logical Expression window. You can also delete, edit, and add filters from this window if you decide your existing filters need to be changed while editing the logical expression. Report filters, level filters, and group filters are joined with separate logical expressions, though each expression is edited in the same manner.

1. Open the report you want to edit.
2. Open the Edit Logical Expression window for the report filters, level filters, or group filters, depending on the type of filters you want to change the expression for.
   - To open the Edit Logical Expression window for report filters, click Filters on the ribbon’s Home tab.
   - To open the Edit Logical Expression window for level filters or group filters, select the report level you want from the Level drop-down menu at the top of the design surface. Click the Level tab and then click the Level Filters or Group Filters button.
When you add filters, they're automatically joined with AND logic and display in an AND tree. Runtime selectable filters are displayed in the tree along with fixed filters, which have an icon displaying a lock.

3. To add a filter joined with OR logic to the logical expression.
   a. Click **Add OR Node**.
      The node is added to the logical expression.
   b. Click the filter that should be joined with OR logic and drag it to the new OR node.

When you add nodes to the expression, the nodes are displayed in a tree structure, with filters displayed either in an AND node or an OR node. Filters in the same AND node are joined to each other using AND logic. Filters in the same OR node are joined to each other using OR logic.

4. To negate a filter, select the filter and click **Negate Filter**. To negate a node in the expression, select the node and click **Negate Expression**.
   A negated filter or node displays on the **Edit Logical Expression** window with an exclamation mark. Negated filters and nodes add NOT logic to the filter. For example, if your filter is `incidents.status_id=Solved` and you negate the filter, the filter becomes `incidents.status_id NOT=Solved`.

5. To add a new filter, select the node you want to add the filter to and click **Add Filter**. See **Create a Fixed or Runtime Selectable Filter**.

6. To edit a filter, select the filter you want to edit and click **Edit Filter**. See **Create a Fixed or Runtime Selectable Filter** for information about editing filters.

7. To delete a filter, select the filter you want to remove and click **Delete Filter**.

   **Note:** If the filter you delete uses a table that is no longer needed in the report, you should remove the table from the report to help the report run efficiently. See **Change Table Joins and Linked Fields**.

8. To display the filters’ field definitions rather than their names, click **Display Filter Descriptions**.
   The **Edit Logical Expression** window is updated to display the filters’ definitions. To display the filters’ names again, click **Display Filter Names**.

9. To view a text definition of the current filters’ logical expression, click **View Text Definition**.

10. Click **OK**.

11. Click **OK**.

12. Click **Save**.

**Combine Runtime Selectable Filters**

When your report includes multiple runtime selectable filters that expect the same type of search input, you can combine the filters to display a single search field on the report’s Search window or docked filters.

This lets report users enter one search value to search by two or more filters simultaneously. For example, you could have one search field to search by contacts’ first names, last names, and organizations’ names.

The combined filters can be joined using AND or OR logical expressions. Using AND logic, the search value you enter must match values in all the combined fields to return results. Using OR logic, the search value you enter needs to match a value in only one of the combined fields. By default, filters are joined using AND logic. See **Edit a Logical Expression**.

Runtime selectable filters that have the same data type, operator, and search options, such as items in a menu field, can be combined. You can combine multiple report filters and multiple level filters, though you cannot combine report filters with level filters.

1. Create a runtime selectable filter. See **Create a Fixed or Runtime Selectable Filter**.

2. Create a second runtime selectable filter.
This filter must have the same name as the other filter you are combining. In addition, the two filters must use the same operator and must be of the same data type. For example, you can combine two integer fields, but you cannot combine an integer field with a menu field.

Add Variables or Runtime Filters to Docked Filters

Variables and runtime filters can be added to docked filters to make them easier to access when viewing reports.

Report users can change variable and filter values using the Search window. However, they can also be added to an output level’s docked filters.

1. Open the report you want to edit.
2. Click the Home tab.
3. Click the arrow on the Views button and select Data Set View.
   Using the data set view, you can see every filter and variable in your report, and you can select them on the design surface for editing.
4. Click a filter or variable on the design surface.
5. Click the Design tab.
6. Select the Display in Docked Filters check box.
   You can double-click docked filters and variables shown on the design surface to open them for editing.
7. Click Save.

When you run your report or view it using a different view, the filters and variables you selected in the Docked Filters report section display at the top of the report.

Overview of the Search Window

The Search window you use to search for information in a report or dashboard displays the filters and variables you specify. You can place these where you want, and size the window to suit your needs.

By default, the controls for the filters and variables have fixed sizes and are grouped by the type of input field they use. For instance, filters for text fields are grouped together as are filters for menu fields. The contents of each group are further arranged according to the operators used by each field in the group. The controls on a dashboard’s Search window are also grouped by the items common to all reports on the dashboard, and those that are specific to individual reports. See How You Search Dashboard Reports.

If the default layout of your report’s Search window does not meet your needs, you can size and organize the window’s contents to ensure that they display as you want them to. For example, you can place the filters you regularly use before the filters with default values you seldom change. In addition, you can manage whitespace on the window by stacking smaller filters and wrapping date range filters.

When you customize a Search window layout from the report or dashboard designer, the layout you save is used as the default layout for all users of the report or dashboard. However, they can also customize the layout and then save it to their local workstation so they see the same layout when they next open the report or dashboard.

Note: If you define a custom layout for a report that is later modified on the report designer, any changes made to the report will not overwrite the layout you define. If new filters are added to the report, they will display last in the user’s customized layout, and any filters deleted from the report will disappear from the layout.

You can customize the Search window you use to search for information in a report or dashboard.

1. Open the search designer.
   - To open the search designer when viewing a report or dashboard, open the Search window and click the gear icon next to Settings in the lower left of the window. See How You Search in Reports and How You Search Dashboard Reports.

   Or

   Click Settings and select Enter Search Design Mode.

   - To open the search designer when editing a report, add the filters you want to the report, click the arrow on the Home tab's Filters button, and select Search Designer.

   Or

   Click the arrow on the Home tab's Filters button to open the Edit Logical Expression window and click Search Designer.

   - To open the search designer when editing a dashboard, click Parameters Values and click the gear icon next to Settings. Dashboard filters are grouped by filters common to multiple reports and filters unique to individual reports. When configuring the search layout for a dashboard, you cannot move filters between the groups.

2. To move a filter, hover over it. The active filter is outlined and the cursor displays as positioning arrows. Drag the filter to the position you want. Blue indicators display, showing you where the filter will be placed.

3. To resize a filter, hover over a border of the filter and then drag the border until the filter is sized as you want.

4. To stack two or more filters together so you can move or resize them together, drag one of the filters immediately below another. An icon displays at the bottom of the stack, as shown in the following figure.

   ![Filter Stack Icon](image)

   To move the stacked filters as a group, click the icon and then drag the filters where you want.

5. To save the layout you configured when editing a report or dashboard, click Set as Default Layout for All Users.

   The search designer closes. After you save the report or dashboard, the layout is saved to the report’s or dashboard's definition.

6. To save the layout you configured for a report or dashboard you’re viewing, click Set as Default Layout.

   The search designer closes and the layout you configured is saved to your workstation.

How to Create Join Filters
Join filters filter data in tables that are joined to the primary table with an outer join.

Join filters are fixed and cannot be changed when the report is run. Join filters are similar to report filters in that they set restrictions on the records that can be returned by the report, but they apply to the table join instead of the data returned by the query on the database. Join filters limit the data contained in the secondary table of the table join.
Without join filters, there would be no way to add a report filter to limit returned data from the secondary table, while not preventing data from the primary table from being returned.

**Note:** From an SQL perspective, join filters are a condition of the ON clause, whereas report filters are a condition of the WHERE clause.

For instance, suppose you want your report to return a list of organizations and the number of incidents they have opened before January 1st. You also want to return any organizations even if they have not submitted any incidents, so you need to join the `incidents` table to the `organizations` table with an outer join. Using an inner join would prevent organizations that have no associated incidents from being returned in the report. You would then add a join filter of `incidents.created < January 1st`. If you also wanted incidents created after March 1st, you would add an OR join filter of `incidents.created > March 1st` to the first filter. The resulting join filters definition would be `incidents.created < January 1st OR incidents.created > March 1st`.

The method of adding join filters is similar to that for adding report filters. However, unlike report filters, join filters allow you to use either a constant value, as report filters do, or an expression you create from the database fields and the functions. See [Functions for Reports](#) for function descriptions.

**Related Topics**
- Create a Join Filter

**Create a Join Filter**

You can create join filters to filter data in tables that are joined to the primary table with an outer join. Tables joined with an inner join do not have the Join Filters option.

1. Click the **Home** tab while editing a report that has multiple tables.
2. Click **Tables**.
3. Select the table you want to add a join filter to.
4. Click **Join Filters**.
   - The **Data Set** window displays the Join Filters section.
5. Click **Add Filter**.
   - The **Add Filter** window opens.
6. Do one of the following:
   - Enter the expression for the join filter.
   - Click **Use Data Dictionary** to open the data dictionary where you can define the filter’s expression.
7. To use an expression filter value, select the **Expression** option.
   - The Add Filter window then displays a Value field.
8. Do one of the following.
   - Enter the expression in the **Value** field.
   - Click **Use Data Dictionary** to open the Edit Expression window, from which you can create the value's expression using database fields, functions, and variables listed in the data dictionary.

**Note:** Currency fields aren't available for use in join filters.

9. Click **OK**.

After you add a join filter, the **Data Set** window is updated to display the filter, along with additional actions that are identical to those used when creating logical expressions for report, group, and level filters. These actions let you edit your filter, create additional filters, add OR logic to the join filters, negate filters, view a text definition of the join filters’ logical expression, and switch between the filters’ descriptions and names. See [Edit a Logical Expression](#).
Overview of Report Output Levels

After you configure the primary output level in your report, you can add output levels, also referred to as drill-down levels, that contain details about records in the first level.

Report users access these secondary levels by clicking on records in the first level that act as links. This is configured in the report designer by grouping data in the primary output level, then creating a drill-down level with more information about the group’s data. You can have up to fifty drill-down levels in your report which can be linked to from the same output level or from sub-levels of the primary output level. See Drilling Down in Reports.

For example, you could create a report listing all unresolved incidents in your knowledge base grouped by the queue they are associated with. The report’s first output level could display every queue and the number of unresolved incidents in the queue. You could then create a second output level to display incident details when drilling down on a queue’s name, or on the number of unresolved incidents in the queue.

Each output level you add to a report can have its own headers, footers, charts, data exceptions, custom scripts, and other standard elements. These are configured in the same way as those on the primary output level.

You can also create drill-down functionality in reports by linking reports together. This method is used when the separate levels contain disparate information pulled from different database tables. See Overview of Linked Reports.

Group Data in an Output Level

Grouping data in an output level allows you to combine records with similar data into one row.

Output levels with grouped data often have other output levels added to them. This lets you drill down into another output level to view details about the grouped records. When you group data, you can order the grouped columns to best suit your needs when you create drill-down output levels.

When you add an aggregate column to an output level, grouping is automatically enabled in the output level. For example, if you were to add a column with an expression of count(incidents.i_id) to an output level to see how many incidents a contact has, the output level would automatically be grouped since you’re using a function to group records together in the column.

1. Open the report you want to edit.
2. Select the output level you want to edit from the Level drop-down menu at the top of the design surface.
3. Click the Level tab.
4. Click Edit.
   - The Level Settings window opens.
5. Select the Group Results check box.
6. Click OK.
7. Click Save.

Change Data Grouping Order

When data is grouped in a level, it’s automatically grouped in the order in which the columns are listed in the output level. This impacts the ordering of filters on drill-down levels that you add to a report. You can manually change group ordering if you need to.
The ordering of grouped data doesn’t affect the rows displayed in the grouped output level. It instead affects the ordering of the drill-down filters of the output level that you drill down into. This ordering is important since it impacts what records you can see when drilling down into the level.

You want the list of fields to start with a field that stores values that multiple records can share so the records can be grouped together by the field’s value. For instance, grouping records by incident status works well since multiple incidents have the same status. You would not want a unique field that stores unique values listed first in the drill-down filters. For instance, grouping by incident reference number does not work since the reference number is different for every incident.

For example, if you have a report with columns for **Reference #**, **Subject**, and **Status Type**, in that order, the output level’s data are also grouped in that order. If you then add a drill-down level, the fields in the drill-down menu’s Filter menu would be listed in this order.

- incidents.ref_no
- incidents.ref_no, incidents.subject
- incidents.ref_no, incidents.subject, incidents.status_id

Since **incidents.ref_no** is the first ordering field for a drill-down level, the drill-down level would return only information related to the incident you drilled down on. If you wanted to drill down on all incidents grouped by a different field, such as the incidents’ status, you would need to reorder the grouping so **incidents.status_id** is grouped first.

1. Select the **Group Results** check box on the Level Settings window. See *Group Data in an Output Level*.
2. Click **Change Group Order**.
   - The **Define Group Order** window opens and is populated with the columns included in the output level.
3. Select the field in the list that you want to move.
4. To move the field higher in the list, click the up arrow.
5. To move the field lower in the list, click the down arrow.
6. Click **OK**.

Create an Additional Output Level

You can add a drill-down output level in a report to display only the content you want.

After you configure your primary output level, adding a drill-down output level is simple, requiring only that you identify the column to filter on and the column(s) to link from in the parent output level. By default, the new output level displays the same report sections shown on the parent level, such as the charts and data area sections, though you can select the sections to display on the new level from the ribbon. You can add content such as text fields, charts, and columns to the new output level just as you did in the primary output level.

1. Open the report you want to edit.
2. Select the parent level you want to add the new output level to from the **Level** drop-down menu at the top of the design surface.
3. Click the **Level** tab.
4. Click **Add Drilldown** to open the **Level Settings** window with drill-down options.
5. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the new level in this text box.</td>
</tr>
</tbody>
</table>

ORACLE
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>To add an optional description for the output level, enter the description you want in this text box. The description displays in the level's Output Descriptions section. See Remove Search Criteria Descriptions.</td>
</tr>
<tr>
<td>Group Results</td>
<td>This check box isn't used when initially creating new output levels. See Group Data in an Output Level.</td>
</tr>
<tr>
<td>Drill-Down Settings</td>
<td>This section defines the data and the link in the parent output level you use to open the drill-down output level.</td>
</tr>
<tr>
<td>Filter</td>
<td>Click this drop-down menu to select the output column or columns to use as the filter for the new level. The drill-down filter determines the data set displayed in the drill-down level.</td>
</tr>
<tr>
<td>Link</td>
<td>Click this drop-down menu to select the output column that you click to open the drill-down level. You can also select Entire Row to open the drill-down level by clicking anywhere on a row in the parent output level. If you want to drill down into another report level instead of opening a specific record when a value from the record is double-clicked on a report, select Entire Row as the drill-down link. When configuring record commands for the report, select None from the Default Record drop-down menu. See Change Record Command Actions.</td>
</tr>
<tr>
<td>Display Report Level in Split Window</td>
<td>Select this check box to open the drill-down output level in a split window on the content pane. This results in the parent output level remaining visible on the other part of the content pane.</td>
</tr>
<tr>
<td>Window Location</td>
<td>When you select the Display Report Level in Split Window check box, you can then select the position where the split window should open. Click this drop-down menu to select Top, Bottom, Left, or Right.</td>
</tr>
<tr>
<td>Custom Script</td>
<td>This section allows you to create, edit, and remove custom scripts to modify the output level's output. See Create a Custom Script in a Report.</td>
</tr>
<tr>
<td>Add</td>
<td>Click this text to add a custom script to the output level.</td>
</tr>
<tr>
<td>Edit</td>
<td>Click this text to edit an existing custom script. This option is available only when a custom script has been added to the output level.</td>
</tr>
<tr>
<td>Remove</td>
<td>Click this text to delete an existing custom script.</td>
</tr>
</tbody>
</table>
6. Click **OK**.
7. Click **Save**.

**Configure Recursive Drill-Down Levels**

You can drill down recursively on hierarchical items (for example, accounts, products, and categories) in a report.

Recursive drill-down allows you to start at specified levels of a hierarchy and become more specific at each lower level as you drill down into it. This feature enables automatic links for hierarchical items so you can access additional levels of detail when viewing a report.

You can enable recursive drill-down only for a level that has a hierarchical output column. If an output level has a hierarchical output column and you do not enable recursive drill-down for the level, then only data for the output column’s first level can be displayed. A level can have both regular and recursive drill-down enabled, but the drill-down links cannot be the same.

1. Create a report output column from a hierarchical item (for example, `accounts.hierarchy` or `incidents.prod_hierarchy`).
2. Click the **Level** tab and click **Edit**.
   The **Level Settings** window opens with recursive drill-down options.
   The recursive drill-down feature is automatically enabled. To disable the feature, clear the **Enable Recursive Drilldown** check box.
3. Click the **Starting Level** drop-down menu and select the starting point for the drill-down level.
   For example, starting level 1 would be the top product in your list of products. Starting level 3 would be three subproducts down from the parent product.
4. Click the **Link** drop-down menu and select the output column you want as the drill-down link in the report.
   By default, this is the hierarchical item.
5. Click **OK**.

**Create a Custom Script in a Report**

You can add custom PHP scripts to your output levels to further manipulate the data in your report. For example, custom scripts can remove unwanted data, create links to web pages, and convert rows of data into tables.

The Create/Edit Custom Scripts Analytics profile permission must be enabled to access custom scripts.

When a report with a custom script runs, the report first runs on the server, then the script is applied to the report’s output. It is important to consider this ordering when creating custom scripts since this may cause the script to not function as you expect. For instance, when you view a report with a script that hides certain rows, the total number of records and pages on the report may be greater than what you see on the report, since these totals are generated when the report first runs.

PHP scripting language must be used when defining a custom script. PHP is a free, open-source scripting language and interpreter, similar in many ways to JavaScript and Microsoft’s VBScript. Like other scripting languages, PHP allows server-side scripting to be embedded inside client scripting. We recommend creating custom scripts only if you’re
familiar with the PHP language and programming concepts. For documentation and information, see *PHP: Hypertext Preprocessor*.

**Note:** Custom scripts cannot include direct SQL statements.

1. Open the report you want to edit.
2. Select the output level you want to add the custom script to from the **Level** drop-down menu at the top of the report designer.
3. Click the **Level** tab.
4. Click **Custom Scripts**. The Custom Script editor opens.
   - If the output level already has a custom script, the editor displays the custom script for editing.
5. From the Initialization tab, enter the script executed before the report is processed.
   - This script is executed when the report starts to process.
   - **Note:** If the report is to be scheduled (see *How You Schedule Reports*), add `putenv('TEMPORARY_RNW_CONF_DIRECTORY');` to the Initialization pane to ensure the custom script runs correctly when recipients open the report.
6. Click the **Headers** tab.
7. Enter the script that runs during the start process.
   - This script is called once while passing the column headings. The `$headers` parameter is an array that contains the column headers for the report. For example:
     ```php
     Array
     (0 => Account ID
     [1] => Full Name)
     ```
8. Click the **Process** tab.
9. Enter the script that runs while the report is generating.
   - This script is called with each row passing the row data. The `$rows` parameter is a nested array, allowing you to return a “table” of data rather than just a row. Initially, the `$rows` parameter contains only data in the first row of the table (`$rows[0] [0]`). Each data cell contains a `val` variable that holds the value of the data cell. It can also contain a `URL` variable that contains a link for the data cell.
10. Click the **Finish** tab.
11. Enter the script that runs during the exit process.
   - This script is called after the rows have been processed. The Finish script returns data in the `$exit_obj` variable, which is added to the report after each row of the Process script.
12. Click **OK** to apply your custom script to your output level.
13. To remove a custom script, click the **Level** tab, click **Edit**, and click **Remove**. Click **Yes** to the removal confirmation.
14. To check the custom script for PHP errors, click the **Home** tab, click **Views**, and select either **Report View** or **Layout View**.
   - If errors are found in the PHP code, a message displays. You can save the report if the message shows an error, but the custom script will be disabled when you run the report. When the problem is corrected and the report is saved again, the custom script will be enabled.
15. Click **Save**.

After adding a custom script to an output level, we recommend previewing the report using the Report View and Layout View options on the Home tab’s Views button. When you do so, the custom script is checked for errors and a message displays if any are found. When troubleshooting reports, we also recommend that you check if any of the report’s output levels have custom scripts since these can modify the reports’ appearance and functionality.

Overview of Linked Reports

You can use conditional and unconditional links to link reports together.

Before you create report links, you should be familiar with the variables and runtime selectable filters in the reports or dashboards you’re linking to since you define the values you want to use for these every time you create a report link. In addition, you should know whether you want to use unconditional or conditional links.

- **Unconditional links**—You can use an unconditional link to open a specific report or dashboard when you drill down on any value in the parent report’s linked column. The content in the linked report or dashboard vary depending on the report’s variables and filters and the value you drill down on, but the same report or dashboard is linked to regardless of the value selected in the parent report’s column. This functionality is similar to drilling down on a value in a column to open another report level.

- **Conditional links**—You can use conditional links to open different reports or dashboards depending on the value you drill down on in the parent report’s linked column. For example, if a column in your parent report lists contacts’ SLAs (service level agreements), you could add a conditional link for each unique SLA listed in the column. When you click one of the SLAs in the column, a report that shows information specific to that SLA would open. Just as with unconditional links, the content in the linked reports or dashboards can vary depending on the values you specify for the linked reports’ variables and filters.

You create links using the Report Linking wizard or the Conditional Report Linking wizard. The wizards are similar, though the Conditional Report Linking wizard includes an additional step. In addition, the ordering of conditional links is important.

Just as you can drill down into different levels within a report (see Overview of Report Output Levels), you can also drill down into separate reports or dashboards using report linking. This helps avoid database query limitations since linked reports run independently of one another. Using linked reports is also beneficial when you need to create multiple reports with identical drill-down levels, since you can create a single report and link to it from multiple reports instead of re-creating identical levels in multiple reports. See How to Use Linked Reports.

Additionally, if you have very complex reports that attempt to display columns with summaries of data from several tables, you may want to use inline aggregate reporting for more efficient database queries. See Inline Aggregate Reporting.

How to Use Linked Reports

While report links are easy to use, there are some items you’ll want to consider before adding them to reports.

When a report link is created, it’s applied to a specific column in the parent report. When you click the link in the column, the linked report opens on a new tab, an existing tab, or on the same tab as the parent report in a split window, depending on how the report link is configured. You close a linked report or dashboard by closing the tab or clicking the Top Level link in the report.

Since report links are specific to columns, you can have several links to reports and dashboards in the same report. Your report can also include drill-down links to other levels in the same report. Report links can be added to any of the output levels in the parent report, allowing you to link to a large number of reports and dashboards from one report.
While report links are easy to use, there are some considerations before adding them to reports.

- Report links function normally when added to workspaces, but the links are unavailable if the reports are used in workspace relationship items. See *Overview of Workspace and Script Elements* for information about using reports in workspaces.

- Just as with drill-down links to other report levels, report links are unavailable when a report is forwarded, exported, published, or sent as a scheduled report. See *How You Distribute Reports and Dashboards*.

- Report links are unavailable when the columns in are rolled up. See *Define Rollups*.

- While you can create links to dashboards, you cannot link to a dashboard from a report that is being viewed in a dashboard. Links to dashboards are unavailable when the reports in are viewed in a dashboard.

- You can create links to public or private reports and dashboards. Staff members with permission to view the parent report can view any reports or dashboards linked to from the parent report, whether public or private. Because of this, you should be familiar with the content of the report or dashboard you’re linking to so staff members won’t be able to access sensitive information.

- You can’t create report links from columns that display values from hierarchical fields, such as the *incidents product hierarchy* field. In addition, columns can be associated with a report link or with a drill-down level in the report, but not both.

- If a report or dashboard is deleted, any links to that report or dashboard are automatically disabled, but the reports containing the links continue to function normally.

Create an Unconditional Report Link

Create an unconditional link to open a specific report or dashboard when you drill down on any value in a parent report’s linked column.

1. Open the report you want to create the link from on the report designer.
2. If your report has multiple output levels, select the report level where you want to create the link.
3. Select the column where you want the link to display.
   It does not need to be the column with the data used to filter shown on the linked report.
4. Click **Report Linking** on the Design tab and select **Add Report Link**.
   The **Report Linking** wizard opens. The first page of the wizard shows you the reports and dashboards you have access to, excluding published reports. You can create links to any of the reports or dashboards shown on the page, including those that are private.
5. Select the report or dashboard you want to link to and click **Next**.
   After you select the report or dashboard you want to link to, you select the values you want to use for the report’s or dashboard’s variables and runtime selectable filters, as shown here.
The values you specify are applied to the linked report or dashboard when it opens. Required variables and filters are indicated with a red flag and you must set a value for these. You can also choose to define values for items that aren’t required.

The values you specify determine the information shown in the linked report when it opens. You generally want to use a value that corresponds to the value clicked in the parent report to display data related to the value in the parent report.

6. Select the type of value you want to use for the linked report’s or dashboard’s variables and filters from the **Use** drop-down menu.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Column Value</td>
<td>Select this option to use the values in the parent report’s selected column to populate the linked report’s variable or filter. When you click the link on a row in the parent report, the column’s value from the selected row is used as the linked report’s variable or filter value. This option is available only when the parent report includes a column with the same data type, such as text, integer, or menu, as the linked report’s variable or filter.</td>
</tr>
<tr>
<td>Parent Filter Value</td>
<td>Select this option to populate the linked report’s variable or filter with the current value from one of the parent report’s filters. This option is available only when the parent report has filters with the same data type and operator as the linked report’s variable or filter.</td>
</tr>
<tr>
<td>Parent Variable Value</td>
<td>Select this option to populate the linked report’s filter with the current value from one of the parent report’s variables. This option is available only when the parent report has variables with the same data type and operator as the linked report’s variable or filter.</td>
</tr>
</tbody>
</table>
7. From the **Value** drop-down menu, select the parent report’s column, variable, or filter you want to use to populate the variable or filter in the linked report or dashboard. If you choose a custom value, enter the custom value you want in the **Value** field.

**Note:** When you select values for the linked report’s variables and filters, the logical expression displayed at the bottom of the window is updated to reflect the values you select. This is the expression that is passed to the linked report or dashboard when you click the link. This information is displayed for reference and cannot be edited.

8. Click **Next**.
   The wizard presents options for specifying where you want the linked report to open.

9. Select the option you want to use to display the linked report or dashboard.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replace Report in the Same Window</td>
<td>Select this option to close the parent report and display the linked report instead.</td>
</tr>
<tr>
<td>Display Report in a Separate Tab</td>
<td>Select this option to open the linked report on a separate tab on the content pane.</td>
</tr>
<tr>
<td>Use Existing Tab</td>
<td>Select this option to open the linked report on an existing tab each time you click the link. The tab is created the first time you click the link. When you open the report again from the same link, the report displays on the same tab.</td>
</tr>
<tr>
<td>Create a New Tab</td>
<td>Select this option to open the linked report on a new tab each time you click the link.</td>
</tr>
<tr>
<td>Display Report in a Split Window</td>
<td>Select this option to open the linked report in a split window. The parent report remains open on one half of the window, and the linked report displays above or below the parent report, or to the left or right of the parent report.</td>
</tr>
<tr>
<td>Top/Bottom</td>
<td>Select these options to display the linked report above or below the parent report.</td>
</tr>
<tr>
<td>Left/Right</td>
<td>Select these options to display the linked report to the left or right of the parent report.</td>
</tr>
</tbody>
</table>
10. Click **Finish**.
11. Click **Save**.

- Overview of Linked Reports
- How to Use Linked Reports
- Create a Conditional Report Link

**Create a Conditional Report Link**

Use conditional links to open different reports or dashboards depending on the value you drill down on in the parent report's linked column.

1. Open the report that you want to create the link from on the report designer.
2. If your report has multiple output levels, select the report level where you want to create the link.
3. Select the column in the parent report where you want the link to display.
   It does not need to be the column with the data used to create the link's condition.
   The Conditional Report Linking wizard opens. On this page of the wizard, you specify the condition(s) that must be met for the link to be triggered. The link you create is activated only when a value in the parent report meets the condition(s) you specify. You can add other conditional links to the same column to open different reports or dashboards when selecting other rows in the report.
5. Click the **Column** drop-down menu and select the column in the parent report that you want to use to create the link's condition.
   The column you select does not need to be the same column the link is displayed on. For example, you can use the values in a hidden column to create the link's condition, but display the link on another column in the report.
6. Click the **Operator** drop-down menu and select the operator you want to use for the link.
   The operators displayed depend on the column's data type.
7. Enter the value you want to use for the conditional link.
8. Click **Next**.
   The remaining pages of the Conditional Report Linking wizard are identical to those on the **Report Linking** wizard.
9. To add other conditional links, repeat steps 2 through 8.
10. Click **Save**.

- Create an Unconditional Report Link

**Reorder a Conditional Link**

If you create several conditional links on the same column, you can reorder them to ensure that links with conditions that might overlap are triggered in the order you want.

You must create a conditional report link before you can reorder a conditional link. See **Create a Conditional Report Link**.

While ordering is irrelevant for conditional links with exclusive conditions, it can affect which linked report or dashboard opens if you have multiple links that could match a particular column value.

1. Select the report column that's associated with the link and click **Report Linking** on the Design tab.
   The Manage Conditional Report Links window opens displaying all the conditional links that are associated
   with the selected column. From this window you can add, remove, edit, and reorder conditional links.

3. Select the link you want to move and click the up or down arrow to move it to the position you want.
   Conditional links are examined starting with the link at the top of the list. The first link that matches the column
   value is triggered and any other links that could match the column value are ignored.

4. Click OK.

Edit a Report Link
After you create conditional or unconditional report links, you can edit them.

You must create a conditional report link or an unconditional report link to edit a report link. See Create a Conditional
Report Link and Create an Unconditional Report Link.

You can use the standard Linked Reports and Reports with Disabled Links reports to list reports that contain links to
reports and dashboards.

1. Open the report that includes the link on the report design center.
2. Select the report column that's associated with the link and click Report Linking on the Design tab.
   Links window opens.
   a. Click Edit next to the link you want to edit.
   b. Click OK.

5. Click Save.

Remove a Report Link
After you create conditional or unconditional report links, you can remove them.

You must create a conditional report link or an unconditional report link to edit a report link. See Create a Conditional
Report Link and Create an Unconditional Report Link.

You can use the standard Linked Reports and Reports with Disabled Links reports to list reports that contain links to
reports and dashboards.

1. Open the report that includes the link on the report design center.
2. Select the report column that's associated with the link and click Report Linking on the Design tab.
3. To remove an unconditional report link, select Remove Report Link.
   The unconditional link is deleted.
4. To remove all conditional links from the column, select Clear All Conditional Report Links.
   All conditional links are deleted.
5. To remove only some of the conditional links on the column, select Manage Conditional Report Links.
   a. Click Delete next to the link you want to remove, and click Yes to confirm the deletion.
   b. Click OK.

6. Click Save.

Inline Aggregate Reporting
Inline aggregate reporting lets you insert columns in custom reports to show aggregate information that could not
normally be displayed due to restraints on database query size.

The aggregate data you want displayed in a column is compiled in a separate report and then pulled into a column in
the primary report. This breaks the database query that would normally be required to return the data in a single report
into multiple queries from multiple reports.
**Note:** You can pull data from several reports into columns in a single parent report. However, the parent report cannot have more than 500 cells displaying inline aggregate data.

Using this feature helps avoid query limitations when running reports that include summaries of data from tables containing large amounts of data, such as transactions or incident performance, particularly when joins do not exist between all the tables you need to include in a report.

**CAUTION:** Using inline aggregate reporting is not recommended for most reports where normal *inner* or *outer joins* are used, since it will result in less efficient reports that may not run successfully. Use inline aggregate reporting only when the query required to return aggregate data in a column results in a Cartesian join between tables. This is when data is pulled from all rows in the tables required by the query, resulting in a large number of rows being accessed. If you’re unfamiliar with Cartesian joins, or have questions about whether using this feature will help a report run more efficiently, please submit a service request.

**Related Topics**
- Configure Inline Aggregate Reporting

**Configure Inline Aggregate Reporting**

Inline aggregate reporting lets you insert columns in custom reports to show aggregate information that could not normally be displayed due to restraints on database query size.

1. Create a column in a report to collect the aggregate data.
   a. Click Analytics on the navigation pane.
   b. Double-click Reports Explorer.
   c. Do one of the following:
      - Click New Report and select a report format to create a new report.
      - Right-click an existing report and select Edit.
   d. Click Add Column on the Home tab.
      The Column Definition window opens. See Add a Column to a Report.
   e. Configure the column to display the aggregate data you want.
      See Functions for Reports for a list of aggregate functions you can use in reports.
   f. Add a runtime selectable filter or a variable to the report.
      Inline aggregate reporting requires that the report you link to includes at least one variable or runtime selectable filter. See Add Report Variables or Create a Fixed or Runtime Selectable Filter.
   g. Click Save.

2. Create a new report or edit a report that will link to the column created in the previous step.
   o Click New Report and select a report format to create a new report, or
   o Right-click an existing report and select Edit.

3. Click Inline Aggregate on the Insert tab. The Inline Aggregate Wizard opens.
   a. Enter a column header for the new column.
   b. Enter an optional column description.
   c. Click Next.
   d. Select the report containing the aggregate column you want to link to and click Next.
   e. Select the values you want to use for the linked aggregate report’s variables and runtime selectable filters.
The values you specify determine what data is shown in the aggregate column. Required variables and filters are indicated with a red flag and you must set a value for these. You must also map at least one indexed filter in the report containing the aggregate column to a column in the parent report.

f. Select the values you want to use for the linked aggregate report’s variables and filters from the **Use** drop-down menu.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Column Value</td>
<td>Select this option to use the values in a column in the parent report to populate the linked aggregate report’s variable or filter. This option is available only when the parent report includes a column with the same data type, such as text, integer, or menu, as the linked aggregate report’s variable or filter.</td>
</tr>
<tr>
<td>Parent Filter Value</td>
<td>Select this option to populate the aggregate report’s variable or filter with the current value from one of the parent report’s filters. This option is available only when the parent report has filters with the same data type and operator as the linked aggregate report’s variable or filter.</td>
</tr>
<tr>
<td>Parent Variable Value</td>
<td>Select this option to populate the linked aggregate report’s filter with the current value from one of the parent report’s variables. This option is available only when the parent report has variables with the same data type and operator as the linked aggregate report’s variable or filter.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Select this option to use the default variable or filter value specified in the linked aggregate report for the variable or filter value.</td>
</tr>
<tr>
<td>Custom Value</td>
<td>Select this option to specify a custom value for the variable or filter. The values you can enter depend on the data type and available options. For instance, if a filter uses a text field, you can enter the text you want to use for the filter’s value. If a filter uses a menu field containing staff accounts, you select the staff accounts you want from a menu.</td>
</tr>
</tbody>
</table>

4. Click **Finish**.
5. Click **Save**.

**How to Enable Editing Records on Reports**

When the rows in a report display information from unique records, such as incident reference numbers, contacts’ names, or organizations’ names, you can perform actions on the records directly from the report.
There are two methods to edit records directly from a report.

- **Inline editing**—Using inline editing, you can double-click or right-click an individual field on a record shown on a report to make changes to the field. For instance, you can double-click the name of a staff member an incident is assigned to and then select a different staff member from a menu that displays to assign it to someone else. When you enable inline editing on a report, you can choose which fields can be edited inline.

- **Record commands**—By adding command links or buttons to a report, you can edit, delete, copy, or perform other actions on individual records shown on the report. Record commands are shown on reports as buttons on the ribbon, as links in the report rows, or as record commands when you right-click a record. When you enable record commands on a report, you can choose the default action that should be performed when you double-click a record on the report. You can also select which commands should be available as buttons, links, and right-click menu commands.

**Note:** To edit records shown on reports, staff members’ profiles must include permissions to modify the appropriate record types.

**Related Topics**
- Analytics Permissions

**Overview of Using Record Commands on Reports**

The record commands displayed on a report let you perform actions such as opening, printing, and deleting records the report displays.

Record commands can be displayed as links in a column, as buttons on the report’s Home tab, or as options displayed when right-clicking a row. Using record commands, you can perform actions on the record types that are displayed in the report, but you can also perform actions on other record types that are related to the information displayed in the report. For example, if the report displays information about incidents, the report’s record commands can be configured to perform actions on the contacts that are associated with the incidents.

**Note:** Record command options aren’t applied when viewing reports in workspaces.

You can select from standard record commands, such as the edit or delete command. In addition, if your site has add-ins that perform actions on records, you can add these as commands to a report as well.

**Related Topics**
- Overview of Add-Ins

**Add Record Command Links to a Report**

You can select the record command links that you want to display in a report.

The links’ record commands must be enabled for the report on the Customize Record Commands window.

When you add record command links, they’re displayed in a column that’s automatically added to your report. You can select the links you want to display. Not all the record commands you specify for the report are available as links.

When using the report, you can hide or display links that are enabled for the report from the Links button on the Display tab of the report.

1. Open the report you want to edit.
2. If your report has more than one output level, click the Level drop-down menu on the design surface and select the level you want to add links to.

3. Click the Display tab.

4. Click Links and select the link you want to add to the report.

If the link you want to add to the report isn't displayed on the Links button, verify that the associated record command for the link is enabled and that the record type you want the links to apply to is selected as the default record. See Change Record Command Actions.

When you add the first record command link to your report, the Action column is added to the report.

5. Click Save.

Specify the Record Commands to Display on a Report

By default, every record command available for your report is enabled, with the exception of the Incident > Fill Inbox command, but you can remove record commands you do not want staff members to access.

The Records button is disabled on reports that do not have rows that display or are associated with unique records.

Record command buttons and right-click menu options are added automatically depending on which record commands are enabled for the report. The enabled record commands also determine which record command links are available, but these need to be added to the report manually. See Adding record command links.

1. Open the report you want to edit.

2. Click the Home tab and click Records.

The Customize Record Commands window opens.

3. To remove a record command from the current report level, expand the record commands list to find the command you want to disable and clear the check box next to the command.

4. To restore the default record commands for all levels in the report, click Reset All.

5. Click OK to save your changes.

6. Click Save.

Change Record Command Actions

You can further customize the record commands in your report by selecting the record type that actions are performed on when you click record command links or double-click the report’s rows.

The record type you select is also used as the default record type for record command buttons and right-click menu options, though you can select any of the record types when using buttons or the right-click menu.

You can also choose the actions you want to perform when you double-click the report’s rows. For example, you can choose to open a record, assign a record, or perform other actions when you double-click the row.

1. Open the report you want to edit.

2. Click Records on the Home tab.

The Customize Record Commands window opens.

3. To select the report level you want to configure, click the Level drop-down menu and select the report level you want.

The options available on the Default Record and Default Action drop-down menus depend on the information displayed in the report level you select.

4. Click the Default Record drop-down menu and select the record type you want the record command actions to apply to.

The record type you select determines which links are available on the Links button located on the Display tab of the report designer, since different actions can be performed on different record types. See Add Record Command Links to a Report.

5. To drill down into another report level instead of opening a record when a row in the report is double-clicked, select None from the Default Record drop-down menu.
The additional report level must be configured with a drill-down link of Entire Row. See Create an Additional Output Level.

6. Click the Default Action drop-down menu and select the action you want performed when you double-click a row in the report.
7. To restore the default record command settings for all the levels in the report, click Reset All near the top of the window.
8. Click OK.
9. Click Save.

Enable Inline Editing

When a report displays unique records, such as incidents or opportunities, the Inline Editing feature lets you edit the values in columns shown on the report without opening the records.

You can configure inline editing in reports only if your profile includes the Modify Inline Report Editing permission on the Analytics tab.

Individual values can be edited directly from the report, or groups of records can be selected to edit values in multiple records. For example, if a report shows the staff member an incident is assigned to, you can change the assigned staff member from the report without opening the record, or you can reassign several incidents shown on the report to a selected staff member.

By default, inline editing is enabled for all editable columns in the report. Only certain columns, such as those containing unique values, can be edited inline. Custom objects, other than menu-only objects, included in your report can also be edited inline.

1. Open the report you want to edit.
2. Click Inline Editing on the Home tab and select Allow Inline Editing.
3. To specify the columns you want inline editing enabled for, click Inline Editing again and select Choose Editable Columns.
   The Editing Options window opens.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow Inline Editing</td>
<td>Select this check box to enable editing from the report.</td>
</tr>
<tr>
<td>Automatically Save Inline Edit Changes</td>
<td>Select this check box to enable the Auto Save feature by default.</td>
</tr>
<tr>
<td>Select Columns You Wish to Make Available for Editing</td>
<td>Select the check boxes next to the report’s columns that you want to make available for editing.</td>
</tr>
<tr>
<td></td>
<td>Reports with multiple output levels show all output levels in an expandable tree. Only columns that return unique, editable values from database fields are available for editing. For example, a column that returns the staff account an incident is assigned to is available for inline editing, but a column that returns incident creation dates or a count of incidents isn't.</td>
</tr>
</tbody>
</table>

5. Click OK.
6. Click Save.
Set Report Permissions

Report permissions let you specify which profiles can open or edit a report.

You can select Open and Edit permissions for each profile defined in your system. If staff members can’t perform certain actions on a report, they may lack permission to edit the report.

**Note:** Permissions applied to private reports are irrelevant until the report is made public.

1. Open the report you want to edit.
2. Click the **Home** tab.
3. Click **Permissions**.
   - The **Permissions** window opens.
4. Select the check boxes next to the profile names to allow staff members assigned to the profiles to open or edit the report.
5. Click **OK** to save the permissions.
6. Click **Save**.

Change Report Properties

Report options let you select the time zone that should be used for the report, change the report’s owner, and modify settings that impact how the report functions when it’s opened for viewing.

You can also configure automatic refresh of the data shown in the report, add notes to the report, and change the image displayed for the report in lists.

1. Open the report you want to edit.
2. Click the **Home** tab.
3. Click **Options** and select **More Options**.
   - The **Edit Settings** window opens.
4. Enter field information.
## Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Time Zone**                      | Click this drop-down menu to select the time zone to use with the report. The dates and times shown in the report’s filters, variables, and output columns are adjusted to reflect the time zone you select. The available options include the following:  
  - Same as Interface—The report’s time zone matches the time zone set for the interface. This is the default setting.  
  - Same as Account—The report’s time zone matches that of the staff member who’s running the report. See Add or Edit a Staff Account.  
  A specific time zone you can select from a list of standard time zones.  
  The database query used to return data in the report always uses the time zone of the interface. For example, if you select the GMT time zone for an incidents report and run it on an interface with an EST time zone, the report could return incidents with a created date of April 1st, 2011, but with reference numbers starting with 110331. This indicates that the incidents were actually created on March 31st, 2011, in the EST time zone, but the displayed date and time are adjusted to reflect when the incidents were created in the GMT time zone. In addition, if the report groups incidents by the day they were created, the same number of incidents will display each day regardless of the time zone that’s used since they’re grouped according to the interface’s time zone. |
| **Owner**                          | Click this drop-down menu to select a report owner. The report owner is the only staff member who can view or edit the report, unless the owner grants permissions to other profiles. See Set Report Permissions.  
  Changing the owner of a private report makes the report unavailable to the previous owner. |
| **Open report without prompting for search parameters** | Select this check box to have the report automatically run and return data when you open it from a navigation list. The report uses the default values specified in the report’s filters.  
  This option is referred to as Initial Run on the Reports explorer Find menu. See Search for Analytics Items for information about finding reports. |
| **Refresh report when data shown is changed due to an action initiated from this report** | Select this check box to have the report’s output automatically updated when an edit to a record is initiated from the report. The report refreshes only if a record is modified in such a way that it no longer matches the report’s search criteria. |
| **Open editor when report contains only one row (quick search and editor search reports only)** | Select this check box to automatically open the record for editing when the report returns only one record.  
  This option applies only to Quick Search reports and reports used in workspaces. |
<p>| <strong>Cache the drilldown levels</strong>     | Select this check box to enable caching of data shown in report output levels. When this option is enabled, the data shown in the initial output level when you view a report is |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>stored on your workstation. When you view a second output level and then return to the top level of the report, it loads quickly since the data you're viewing is cached on your workstation. The cache is cleared when you close the report. When this option isn't enabled, the database is queried every time you drill down to an output level or return to a previous level even if you have recently viewed the output level.</td>
</tr>
<tr>
<td>Return to previous level when current level no longer has data</td>
<td>Select this check box to instruct the report to automatically display the previous output level if the current output level no longer displays any records.</td>
</tr>
<tr>
<td>Allow server to change the data source as necessary</td>
<td>Select this check box to allow Analytics to automatically change the data source if necessary to allow the report to run. For example, if a report is configured to run on the operational database but is unable to do so due to data constraints, selecting this check box allows the report to run on the report database (also referred to as the replication database). Clearing this check box forces reports to run on the data source that's selected. This check box is selected by default when you create a report, and is cleared automatically any time the data source is changed on the Edit Settings window.</td>
</tr>
<tr>
<td>Set report to deferred execution</td>
<td>Select this check box to automatically queue the report when it runs. See How to Prevent Automatic Queuing. If this option isn't selected but the report is automatically queued the next time it runs due to meeting queuing criteria, the Set Report to Deferred Execution check box is selected automatically. To prevent the report from being queued when it's next run, edit the report and clear this check box.</td>
</tr>
<tr>
<td>Data Source</td>
<td>Select which database you want the report to run on. You can choose the operational or the report database (also referred to as the replication database). See Overview of Report Databases for more information about data sources. This option is available only if your site has a report database. If your site does not have a report database, contact your Oracle account manager for more information.</td>
</tr>
<tr>
<td>Report Database</td>
<td>Select this option if you want the report to run on your report database. This option is helpful if your report queries a large amount of data since the query size restrictions on report databases are more relaxed than those on operational databases. If you select this option in a report that includes the Fill Inbox record command and a staff member clicks Fill Inbox when using the report, the report will be automatically configured to use the operational database. This ensures that current data is used when incidents are assigned. See Overview of Incidents and Overview of Report Databases.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operational Database</td>
<td>Select this option if you want the report to run on your operational database. This option is helpful if you need the report to return the most current data available. The operational database is selected by default when you create a new report.</td>
</tr>
<tr>
<td>Refresh all split levels simultaneously</td>
<td>Select this check box to automatically refresh all report levels shown in split windows when data in one of the report levels is refreshed. When this option is disabled, only the data shown in the window selected when the refresh occurs is updated.</td>
</tr>
<tr>
<td>Automatically refresh report at a regular interval</td>
<td>Options in this section let you configure automatic refresh of the report’s data to ensure the most recent data is displayed.</td>
</tr>
<tr>
<td>Auto-refresh options visible at runtime</td>
<td>Select this check box to add an arrow on the Home tab’s Refresh button. Clicking the arrow displays options to enable or disable automatic refresh and to change the refresh interval time. When this check box isn’t selected, the report’s data is refreshed only when the button is clicked.</td>
</tr>
<tr>
<td>Auto-refresh enabled by default</td>
<td>Select this check box to enable automatic refresh of the data shown on the report.</td>
</tr>
<tr>
<td>Interval</td>
<td>Enter the number of seconds after which the data shown on the report is automatically refreshed.</td>
</tr>
<tr>
<td>Image</td>
<td>Click Change to select a different image to display next to the report in lists such as navigation lists. The image that’s displayed by default is determined by the layout selected when creating a new report. When selecting an image, you can choose from a list of standard images or from custom images that have been added in the Images explorer. See Images Explorer.</td>
</tr>
<tr>
<td>Notes</td>
<td>Enter any text you want to add as a note to the report. The note displays on the Edit Settings window, but does not display to anyone viewing the report.</td>
</tr>
</tbody>
</table>

5. Click **OK**.
6. Click **Save**.

## View a Report Audit Log

You can open an audit log for a report to see when the report was created, edited, run, and published, and which staff members performed these actions.

Since the audit log is a report, you can perform common report actions on the audit log, such as printing, forwarding, or slicing.
The audit log shows you when the report was edited and generated, but not all actions performed, such as previewing the report, are listed in the audit log. If you need to see every instance of a report or dashboard being generated, printed, exported, and previewed, you can use the Expanded Report Audit Log. See View the Expanded Report Audit Log.

1. Open the report on the report designer.
2. Click Audit Log on the Home tab.
   The Audit Log window opens.
3. To access a list of actions that can be taken on the audit log, click Options.
   See Overview of the Report Ribbon for descriptions of the actions.
4. Click OK.
5. Click X on the top right.

How to Review Report Performance

Using certain standard reports and the report analyzer helps you identify reports that run slowly, or not at all, and determine the cause.

Reports that are configured to examine large amounts of data may be problematic. These reports might use too few filters, include a large number of tables, or might be running on an excessively large database.

Running Large Reports

While you want to avoid running reports that examine large amounts of data, it may occasionally be necessary to do so to meet your business needs. In such cases, you have several options.

- Run the report on the report database instead of the operational database so the report can query more data. See Overview of Report Databases.
- Queue the report to run at a later time. See Overview of Queuing Reports.
- If the report includes multiple output levels, you may be able to use report linking to reduce the number of tables and rows queried by the report. See Overview of Linked Reports.

Identifying Report Run Failures

You can view reports that fail to run and the types of failures they encounter using two standard reports available in the Reports explorer in Public Reports/Common/Site Administration/Reports.

- Report Failure Details—This report lists reports that failed to run, and how often they failed, during a specified date range. The reasons the reports failed to run are also listed. Reasons include Too Much Data, Timed Out, and Unexpected Error. You can drill down on the rows in this report to view more specific information about each failure.
- Summary of Report Failures—This report lists the types of report failures along with the number of times the failure was encountered during a specified date range. You can drill down on the rows in the report to access information in the Report Failure Details report.

Tip: To create custom reports that display or filter on the success of report generation, you can use the Result Code (result_code) field in the Analytics Audit Log (ac_audit_log) table.
Troubleshoot Reports Using the Report Analyzer

If you encounter problems running a report, or want to view potential issues after you create a report, you can run the report analyzer to check the report’s database queries.

This helps you fine-tune custom reports to ensure they run as quickly and efficiently as possible. The report analyzer examines your report and provides suggestions as to how you can improve the report by removing database tables, adding filters, and making other changes. The analyzer also shows you the estimated number of rows the report’s query may need to access so you know if the report can run without encountering row limits.

**Note:** Reports are analyzed using either the report or operational database, depending on which database they’re configured to use. See Overview of Report Databases.

1. Open the report you want to analyze on the report design center.
2. Click Analyze on the Home tab.
   The report’s Search window opens where you can enter the filter and variable values you want the report to use when it’s analyzed.
   If your report lacks required runtime selectable filters or the Open Report Without Prompting for Search Parameters check box is selected on the report’s Edit Settings window, the Report Analyzer window opens instead of the Search window. See How You Search in Reports.
3. If you’re presented with the report’s Search window, enter the search criteria you want to use and click OK.
   The search criteria you specify can change the estimated number of database rows the query must examine.
   The Report Analyzer window is similar to the Report Definition window and includes the same functions at the top of the window (see View a Report Definition for information about the Report Definition window). The report analyzer lists the report’s filters, tables, output levels, and the estimated number of rows the report’s query will examine when it runs. If the analyzer finds potential issues with the report’s query, it lists the issues in the Notes column next to the applicable report component.

<table>
<thead>
<tr>
<th>Report Component</th>
<th>Potential Issue</th>
</tr>
</thead>
</table>
| Filters          | This section lists the expressions used for each report and level filter and identifies whether the filters’ fields are indexed in the database and whether the index is used. Custom fields can be indexed for faster queries, though too many indexes can slow down queries. The following messages can be returned in this section.

The filter contains a custom field that does not have an index. To improve the performance of this query, consider adding an index on the custom field.

The filter contains a reference to a pseudo field, so no index information is available. |
<p>| Tables           | This section lists the tables that are used in the report, along with the types of joins used to link the data in the tables. Four messages can be returned in this section. |</p>
<table>
<thead>
<tr>
<th>Report Component</th>
<th>Potential Issue</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This table is in an <em>outer join</em> but there are one or more filters on fields in this table. Make sure this is by design. If not, consider changing the join type to <em>inner</em> or changing these filters to join filters to prevent an implicit inner join.</td>
</tr>
<tr>
<td></td>
<td>This table isn’t used in the report. Consider removing the table from the data set. If you need to filter out rows in the parent table that do not have rows in this table, consider adding a not null filter on the join field in the parent table.</td>
</tr>
<tr>
<td></td>
<td>This table isn’t used in all report levels. To improve performance, consider using report linking instead of drill-downs. With report linking, you can specify the table set for each level.</td>
</tr>
<tr>
<td></td>
<td>The data set contains the Incident Performance (<em>inc_performance</em>) and the Transactions (<em>transactions</em>) tables, but there are no filters that provide additional joins between the two tables. To increase performance, consider adding a filter that provides an additional join between the two tables.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Levels</th>
<th>This section lists the output levels (also called drill-down levels) that are used in the report. One message can be returned in this section.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Levels</td>
<td>This level contains one or more columns with a <em>sum_distinct</em> expression. <em>Sum_distinct</em> expressions have a negative impact on performance. If possible, consider a different approach that does not involve using a <em>sum_distinct</em> expression. You may be able to remove the <em>sum_distinct</em> expression by converting any drill-down levels to linked reports.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Rows</th>
<th>This section lists the estimated number of rows that will be examined by the query. Messages display if the number of rows exceeds the threshold values for the operational and report databases (also referred to as replication databases). Three messages can be returned in this section. The messages vary depending on whether your site has a report database in addition to the operational database and the Data Source options specified on the report’s Edit Settings window.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows</td>
<td>The estimated number of analyzed rows for this query is (x). This value exceeds the threshold of 2,000,000 for the operational database. Consider using the report database for this report. Otherwise, it’s likely this will occur automatically.</td>
</tr>
<tr>
<td>-----</td>
<td>----------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rows</td>
<td>The estimated number of analyzed rows for this query is (x). This value exceeds the threshold of 2,000,000 for the operational database. Since you have specified the operational database for this report, it’s unlikely the report will execute. Consider using the report database for this report.</td>
</tr>
<tr>
<td>-----</td>
<td>----------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rows</td>
<td>The estimated number of analyzed rows for this query is (x). This value exceeds the threshold of 5,000,000 for the report database. Consider adding or refining filters to reduce the number of analyzed rows to below this threshold. Otherwise, it’s unlikely the report will execute.</td>
</tr>

- How to Review Report Performance

Using Reports

Overview of Managing Reports on the Reports Explorer

The Reports explorer lets you manage standard and custom reports. From here, you can organize, locate, and view reports.

When viewing a report, you can print, forward, and export the report. If the report allows inline editing, you can also edit data shown on the report directly from the report.

You can adjust the report’s display options to better suit your needs, and alter data characteristics to sort, filter, and output the data in different formats.

How You View Reports

B2C Service includes numerous standard reports you can use to track activity in any Service application.

You can view a detailed description of any report by viewing the report’s definition. If one of the standard reports does not meet your needs, you can create a custom report to return the specific information you want. Custom and standard reports are opened in the same manner.

You can also use the options on the report’s ribbon to search for information, change the report’s display, share the report with others, and perform other actions. Some reports also include multiple output levels or link to other reports or dashboards that you open to view additional information.

Open a Report from the Reports Explorer

You can open reports using the Reports explorer.
Staff members with the appropriate permissions can open standard and custom reports from the navigation pane or from the Reports explorer. You can double-click a report in a navigation list or double-click the Reports explorer to select a specific report to open.

1. Click **Analytics** on the navigation pane.
2. Double-click **Reports Explorer**.
   The explorer opens on the content pane with the folders tree on the left and a detailed list of the selected folder’s contents on the right.
3. In the list on the right, right-click the report you want to open and select **Open**.

When you open a report, the Search window may be displayed where you can specify the search parameters you want to use for the report. The window displays if the report has required runtime selectable filters or is configured to display the Search window. For information about using the Search window, see [How You Search in Reports](#).

In addition, when you attempt to open reports that examine a large amount of data or that may take a long time to run, you may be presented with an option to queue the report. See [Overview of Queuing Reports](#).

This table describes the standard sections you will see when you view reports. Reports may not include all sections.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Docked Filters</td>
<td>Docked runtime filters defined in the report display above the report output, allowing you to quickly select different filter values. For information about adding docked runtime filters, see <a href="#">Add Variables or Runtime Filters to Docked Filters</a>. You can dock output variables in reports in the same manner as runtime filters.</td>
</tr>
<tr>
<td>Report Header</td>
<td>Text added to this area displays near the top of each page in the report. See <a href="#">Add a Text Field to a Header or Footer</a>.</td>
</tr>
<tr>
<td>Output Descriptions</td>
<td>Report output descriptions let the report’s creator relay information, such as the report’s intended purpose, to those who view the report. Output descriptions can be displayed <em>inline</em>, on a separate tab, or on column rollover.</td>
</tr>
<tr>
<td>Search Criteria Descriptions</td>
<td>Descriptions of the filters in the report can be displayed to describe the report’s filters and values. See <a href="#">Overview of Search Criteria Descriptions</a>.</td>
</tr>
<tr>
<td>Charts</td>
<td>Any charts defined in the report display above the tabular report output. See <a href="#">How to Add and Edit Charts</a>. When viewing a chart in a report, you can right-click the chart to switch to a two- or three-dimensional view. When viewing a three-dimensional chart, you can right-click the chart, select Rotate, and drag the chart to change the viewing angle.</td>
</tr>
<tr>
<td>Data Area</td>
<td>This area contains the tabular report output.</td>
</tr>
</tbody>
</table>
### Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report Footer</td>
<td>Text added to this area displays near the bottom of each page in the report. See Add a Text Field to a Header or Footer.</td>
</tr>
<tr>
<td>Data Exceptions</td>
<td>Records matching data exceptions defined in the report are flagged, and a summary of the data exception can be displayed in the report output. See Create a Data Exception.</td>
</tr>
</tbody>
</table>

4. If output or search criteria descriptions are displayed as a tab in the report, click the **Descriptions** tab to view the descriptions. Descriptions can also be displayed as inline text in the report header, or by rolling over the column names in the report.

### View Data Using the Report or Layout View

When you open a report, you can choose to view it using a layout or report mode.

The report view is used by default and lets you look at the report’s data, print the report, and work with the report’s records if you have permissions to do so. However, you cannot add column calculations or change column formatting using this view.

Most staff members use the report view when they look at a report. You can also look at the report using the layout view, which lets you apply formatting options and calculations to individual columns in the report. For example, if you wanted to add conditional formatting to a column to highlight data that met certain criteria in the column, you could change to the layout view, select the column, and configure conditional formatting for the column. Or, to display a calculation at the bottom of a particular column, such as the total of the values shown in a currency column, you could select the column and then select the calculation you want from the report’s Design tab. When using the layout view, you can also change the width of individual columns, and move columns in a report if you want them displayed in a different order.

1. Open a report.
   - By default, the report opens in the report view.
2. Click the **Display** tab.
3. Click the arrow on the **Views** button and select **Layout View** to change the view.
4. To return to the report view, click the arrow on the **Views** button and select **Report View**.

### View a Report Definition

If you want to see descriptions of a report’s output columns, search criteria, and other components, you can view the report definition.

This can be helpful if you want to see exactly how the report was created or determine if the report meets your needs. You can print a report’s definition, and you can export the output to a file for later viewing.

1. From the Reports explorer, do one of the following:
   - Select a report and click **View Definition**.
   - Open a report, click the Home tab, click **Definition**, and select **View**.

   The **Report Definition** window opens.
2. To save the output from the report definition to a file for later viewing, click **Export** and select the file type.
You can select HTML, PDF, Excel, Image, and Delimited file types. See Export Report and Dashboard Data for a description of these file types. You can also choose to export the definition to an XML file which you can use to create duplicate reports on other interfaces. See Export a Report Definition to an XML File.

3. To print the page, perform these steps.
   a. To preview the page layout page before printing it, click Print Preview. See Preview a Report.
   b. To configure the page layout, click Page Setup. See Report Designer Page Setup Tab.
   c. Click Print.
      Your computer’s Print window opens where you can select the destination printer.

4. Click X on the top right to close the Report Definition window.

Export a Report Definition to an XML File

You can save a report definition as an XML file for later viewing.

If you have multiple interfaces, you can import the XML file to copy a custom report from one interface to another. This lets you create duplicates of complex custom reports on other interfaces without manually re-creating the reports.

The following procedure explains how to export report definitions to XML files, which you can later import. See Import a Report from an XML File.

1. To export a report definition from the Report Definition window:
   a. Click the window’s Export button.
   b. Select Report Definition.
      The Save As window opens.

2. To export a report definition while you’re viewing or editing it:
   a. Click the Home tab.
   b. Click Definition.
   c. Select Export.
      The Save As window opens.

3. Select a location for the file and enter a file name.

4. Click Save.

The report definition is saved as an XML file.

Overview of the Report Ribbon

When viewing a report, you can move between the Home, Display, and Page Setup tabs on the ribbon to access buttons that modify the report’s display, search for data, and edit records.

The buttons on the report ribbon vary depending on the report view you use. When looking at a report using the layout view, you can also access Design and Format tabs to adjust formatting and display options. The buttons you see on some of the tabs vary depending on the report’s configuration and on what’s selected on the report.

Tip: You can minimize the ribbon when viewing a report by double-clicking the active tab. Click the tab to temporarily display the buttons on the tab, or double-click the tab again to maximize the ribbon.
Each tab on the ribbon has one or more groups containing buttons you can use to modify the report or items on the report. Some groups have a button to the right of their name that you can click to open windows. For example, you can click the Background group's button on the Page Setup tab to open the Display Options window.

Windows give you access to the same features you can access from the ribbon, though the windows group the options differently, and sometimes contain options not available from the ribbon. When explaining features that can be accessed from a window or the ribbon, we describe the feature using the window. However, the ribbon’s buttons provide shortcuts to most of the same features available on windows.

Report Home Tab

The buttons on the Home tab let you search for records in the report, refresh the report, and modify records displayed in the report.

Buttons to modify records are shown on the tab only when the current report level displays individual records. These options vary depending on the type of records shown in the report and are disabled if the staff member viewing the report lacks permissions to perform the action.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
</table>
| Record                | The buttons in this group let you work with the specific records returned in the report. The available buttons vary depending on the type of records returned in the report and permissions in your profile.  
When editing custom reports, you can choose the buttons you want to display on this group. See Change Record Command Actions.  
The buttons in this group are displayed only if the report level you view returns unique records that can be edited such as incidents, answers, contacts, or organizations. |
<p>| Open                  | Click this button to open the selected record. To open a record that's associated with the selected record, click the arrow on the button and select the type of record you want to open. For example, you could open the contact record for the customer who submitted the selected incident. |
| New                   | Click this button to create a record of the same type as the record selected on the report. To create a record of a different type, click the arrow on the button and select the type of record you want to create. |
| Print                 | Click this button and select the record you want to print. You can print the selected record or another record associated with the selected record. For example, to print the contact record of the customer who submitted the selected record, click the Print button and choose Contact. |
| Copy                  | Click this button and select the record you want to copy. You can copy the selected record or another record associated with the selected record. |
| Assign                | Click this button and select the record you want to assign to another staff member. You can assign the selected record or another record associated with the selected record. |
| Delete                | Click this button and select the record you want to delete. You can delete the selected record or another record associated with the selected record. |
| Preview Answer        | Click this button to view the selected answer as it will display on your site's customer portal. This button is displayed only when viewing a report that lists answers. |</p>

<td>The buttons in this group let you add margins and set the width. Click the arrow on the Display group to open the Display window.</td>
</tr>
<tr>
<td>Margin</td>
<td>Click this button to define the amount of white space around the printed output. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.</td>
</tr>
<tr>
<td>Width</td>
<td>Click this button to select the width of the entire printed output. The available options are Best Fit and fit to Window.</td>
</tr>
</tbody>
</table>

Report Design Tab
When viewing a report in the layout view, you can select a column and select options on the Design tab to change how the data in the column is presented. For example, you can add calculations to the column or roll up the column’s data.
Note: This tab displays only when editing reports or viewing them using the layout view. See View Data Using the Report or Layout View.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arrange</td>
<td>The buttons in this group let you move and hide the selected column. To show hidden columns, right-click the header of a visible column, select Insert Hidden Column, and select the column you want to show.</td>
</tr>
<tr>
<td>Sort</td>
<td>Click this button and select Sort Ascending or Sort Descending to sort the data in the report by the values in the selected column. See How You Change Report Sort Order.</td>
</tr>
<tr>
<td>Calculations</td>
<td>The buttons in this group let you add calculations to the selected column. You can hover over each button to view a description of the calculation. You can also choose to show multiple calculations on a single row or on separate rows. See Add Calculations to a Report Column.</td>
</tr>
<tr>
<td>Rollup</td>
<td>The buttons in this group let you group the information in the report by the selected column. You can also change the ordering if your report has multiple rolled-up columns. See Define Rollups.</td>
</tr>
<tr>
<td>Slice</td>
<td>The buttons in this group let you slice the data in the report by the selected column. You can also change the slice level if your report's data is sliced by more than one column. You can choose to display slice columns as a tree or as links. See How You Slice Report Data.</td>
</tr>
</tbody>
</table>

Report Format Tab

Buttons on the Format tab let you change the formatting of your report.

When viewing a report in the layout view, you can select a column and select options on the Format tab to change how the data in the column is displayed. For example, you can change the fonts, hide repeating lines of data, and replace numeric data with gauges.

Note: This tab displays only when editing reports or viewing them using the layout view. See View Data Using the Report or Layout View.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Font</td>
<td>The buttons in this group let you change the font style, size, and color. You can also select font attributes, such as bold and italic, and change the text's alignment. In addition, you can add a background color.</td>
</tr>
<tr>
<td>Margin</td>
<td>Click this button to select the width of the margins around the selected column. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.</td>
</tr>
<tr>
<td>Border</td>
<td>The buttons in this group let you add borders to the column and change the borders' display options. You can identify which borders you want and choose the borders' color, size, and style.</td>
</tr>
</tbody>
</table>
### Group/Button | Description
---|---
Display | The buttons in this group let you apply conditional formatting to the column, change the column’s width, freeze the column, and hide repeating values in the column. You can also select other display options for the column.
Conditional Formatting | Click this button to apply conditional formatting to the column’s data.
Width | Click this button to select a width for the column. Select Best Fit to automatically set the width based on the amount of space needed to display the column’s contents. Best Fit also takes into account the width needed by other columns in the report. Select Percentage to specify a percentage of the total report width for the column.
When using Best Fit, all content in the report is examined to calculate column width before the report displays. To reduce the report load time, enable Improve Display Performance. See [Change Data Display Options](#).
Freeze Column | Click this button to fix the selected column in place so it does not move when you horizontally scroll the report. This can be helpful if you want to continue to view the first column in the report while scrolling the report to see the columns on the right of the report.
When you fix a column, all columns to the left of the column are also fixed. You can still scroll the columns to the right of the fixed column.
Hide Repeating | Click this button to hide consecutive repeating values in the column. For example, if the name of a staff member is shown in the column in five consecutive rows, you can hide repeating values to show the name in only the first column.
If the Exclude Hidden Values from Calculations check box is selected on the Column Format window’s Alignment tab, any calculations on a column with the Hide Repeating option enabled do not include values in hidden rows.
Options | Click this button to select display options for the column.
Number | The options in this group let you display numeric values as a gauge and select numeric formats. This group displays when selecting a column containing numeric values.
Date | The options in this group let you select a date format for the column and view the format. This group displays when selecting a column containing date/time data.

### Drilling Down in Reports

The drill-down feature lets you click data in a report to open another report, dashboard, or output level to view information related to that shown in the first report or output level.

For instance, the first level of the standard Incidents by Category report displays category names and the number of incidents in each category grouped by date range. By clicking a category name in the report’s chart or tabular data, you can drill down on the category to open a new output level in the report showing the number of incidents in each
subcategory. You can then drill down on each subcategory to open an additional level showing details about the incidents in the subcategory.

By default, output levels opened from drill-down links replace the parent output level on the content pane. You navigate back to other output levels, including the report’s top level, by clicking the level you want at the top of the report. Drill-down levels, reports, and dashboards opened from drill-down links can also be configured to display separately from the parent report. See Overview of Report Output Levels.

**Tip:** Usually, when drilling down into another output level in a report, the database is queried to ensure the most current data is displayed even if you have already viewed the output level. However, this can take extra time and may be unnecessary when viewing reports with data that does not change frequently. To more quickly load report output levels you have already viewed, you can cache the data shown in each level. See Change Report Properties.

Most reports with drill-downs open another output level in the same report. However, you can also link reports together to open another report when you click a drill-down link. See Overview of Linked Reports.

### View Your Database Data Dictionary

You can use the data dictionary to view information about the tables and fields in your site’s database.

The information returned in reports and dashboards is stored in your site’s database, allowing you to see vital information about your customers, staff members, and interfaces. Using the data dictionary, you can view details about all the tables and fields in the database, such as field names, descriptions, and database types. You can add the Data Dictionary component to any navigation list. See Change Your Navigation Pane Settings.

**Note:** Not all the information in the database is accessible to Analytics.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Data Dictionary**.
   
   The content pane displays a list of all the tables in the database.
3. Click a table to view the table information.
   
   The details that display depend on the table you have selected.

<table>

**How You Search in Reports**

You can search for specific records in reports from the Search window.

You search for specific records in reports from the Search window. You can open the Search window from the report’s Home tab. This window also opens automatically when the report includes required runtime filters or when the Open Report Without Prompting for Search Parameters report option isn’t selected. See Change Report Properties.

The options available when searching for information consist of the runtime filters, output variables, sorting options, and other search parameters added when the reports are created or edited. You can modify the layout of these options on the window and save the layout for later use (see Overview of the Search Window). The search parameters are
specific to each report, though many reports share similar filters and output variables. While most search parameters need little or no explanation, some are unique and require additional explanation.

After you perform a search, you may find that the data does not include information from the current day. Certain database tables contain cached data that's updated nightly. See *How You Use Cached Data in Reports*.

**Note:** Reports are intended to output only the information you need to view or access for a specific purpose. We recommend that you configure custom reports to include fixed filters or required runtime selectable filters to limit the data they can return. See *Overview of Report Filters*.

After generating the report using the search criteria you want, you can quickly locate specific content displayed in the report using the Find feature. See *Find Content in a Report*.

**Search for Records in a Report**

Search parameters let you search for records in a report.

1. Open the report you want to search in.
2. Click the **Home** tab.
3. Click **Search**. The **Search** window opens.
4. To change the layout of the Search window, including the sizes and ordering of filters and variables, you need to switch to Search Design Mode.
   a. Click the **Gear** icon next to Settings, or click **Settings** and select **Enter Search Design Mode**.
   b. Edit the layout as described in *Overview of the Search Window*.
   c. Click **Set as Default Layout** to exit Search Design mode and save the layout to your computer.
      When you view the Search window when you next open the same report from your computer, the window uses the layout you saved.
   d. To restore the default layout, click **Settings** and select **Restore Default Layout**.
5. To resize the Search window, drag the borders.
   The window size is saved to your **personal settings** so it will open with the size you specify the next time you open the window when running the same report.
6. Select the filters, sort options, and record limit for the report.

**Note:** Search options often include date range filters and date grouping output variables. See *Filter Date Ranges* and *Date Grouping Output Variables*.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filters</td>
<td>This section displays the report’s runtime selectable filters. The methods used to set the filter values vary depending on the filters’ data types and operators. For example, the values might be multi-selected from menu lists, specified in date fields, or entered in a text field. Text area fields aren't available for use in report filters. See <em>Create a Fixed or Runtime Selectable Filter</em>.</td>
</tr>
</tbody>
</table>

875
This section also lists output variables that have been added to the report. Output variables can have the same types of selection methods as runtime selectable filters. See Variables.

If the filter or variable displays a menu list, you can select all options in the list by selecting the Select All check box, or you can clear all options in the list by clearing the Select All check box. To quickly locate specific values in menu lists, enter the first few letters of the value you want in the filter’s Search Text field. To view the menu options you have selected from a long menu list, click the splitter bar to the right of the list.

Limit and Order
Options in this section let you limit the number of rows returned in the report and select how the report output should be sorted.

Limit To
Select this check box to limit the number of rows returned on each page of the report’s output level or on the entire output level. Limiting the total number of records returned on the output levels prevents reports from returning more records than can be easily viewed or printed.

The VRL_HARD configuration setting sets a hard limit on the number of rows that can be returned in a report. Values entered in the Limit To field that exceed this are ignored. See Analytics Configuration Settings for information about VRL_HARD and other configuration settings that can impact reports.

Rows
Enter the number of rows that should be returned.

Per Page
Select this check box to change the number entered in the Rows text box from a hard limit on the total number of rows returned in the report to a limit on the number of rows returned on each page of the report.

Order By
Click the current sort order fields to open the Sort window where you can select different sort options. The report’s default sort order is displayed with the primary sort field listed first, followed by any subsequent sort fields. The direction each sort field is ordered in is also indicated (Asc for ascending order and Desc for descending order). See How You Change Report Sort Order.

7. To save the filter values you select to the local settings on your workstation, click Settings and select Save as Default Values. These saved values are used as the defaults when you run the report again when you’re logged in with the same staff account.

The default values are overwritten if you select different values and click this button again. If the report is later edited to change filters, the default filter values stored in your local settings are ignored.

8. To restore the search values to the report’s default search values, click Settings and select Restore Default Values. This deletes saved search values from personal settings.

This option is disabled if the report’s current search parameters were not populated from your personal settings. See Change Your Personal Settings.
9. To reset the search parameters’ values to the default values that were populated when the report was opened, click Settings and select Reset Values.

10. To quit without saving your changes, click Cancel.

11. Click Search to search the report with the search parameters you selected.

Overview of Unique Search Parameters

Unique search parameters are used in filters for returning specific data to the report.

While most of the filters and variables you see on the Search window are self-explanatory, these search parameters may require more information to use correctly.

- Filter Date Ranges
- Date Grouping Output Variables
- First Contact Resolution Rate
- Incident Performance Intervals
- Add the Incident Summary Thread Filter to a Report

Filter Date Ranges

You can use runtime filters to select a date range.

Most standard reports include runtime filters created from date/time fields that let you select a time and date range on which to filter the report’s data. (Date ranges between January 1, 1901 and January 17, 2038 are supported.) Which records are included in the time period depend on the type of report. For example, the Incident Activity report includes the Date Created runtime filter, which you can use to display incidents created during a particular date range.

You have several options when selecting a date range. For example, you can select whether you want to use exact dates, a period of time relative to today’s date, or even the current time. When the Relative check box is cleared, you can type in a specific date and time, or click the calendar next to the date and time to view a calendar and select a specific date. By selecting the Relative check box, you can define relative times to search on, such as the previous three months, instead of absolute times.

**Note:** The Time Zone report option can be used to change the time zone reflected in the dates and times shown in a report’s filters and output columns. By default, the time zone of the interface is used. See Change Report Properties.

Define a Relative Date Range in a Filter

You can specify a relative date range in date or date/time filters. For example, a relative range could be from six months ago to three months ago, or a week ago to the current time.

1. Select the Relative check box on the Search window to switch from a specific date to a relative date.
2. Click the Calendar icon to display the relative options.
3. Enter field information.
## Date Grouping Output Variables

While most options on the Search window are runtime selectable filters, which limit the returned data, date grouping options are output variables that group the report’s data by the time period in which a specified event occurred.

Date grouping output variables can be added to custom reports and are frequently used in standard reports. For example, the Agent Activity standard report displays incidents that were assigned to staff members within a certain time range. The default time range is Year/Month/Day, so a row is displayed for each day in the selected date range listing the number of incidents assigned to the agent per day. However, you can select from the options on the Date Grouping menu to group the data by a different time period, such as week or quarter.

Note: When date groupings are shown in the report’s output, they display as the number associated with the time period. Selecting Year/Week, for instance, displays the year followed by the number of the week (2019/23). However, the display format of grouped date columns can be changed by editing the Group Date Format configuration settings located on the Configuration Settings editor in the Group Date Format folder (RightNow Common/General AnalyticsOptions/Group Date Format). See Overview of Site Configuration and Analytics Configuration Settings for descriptions of the configuration settings that impact reports.

### First Contact Resolution Rate

The First Contact Resolution Rate (FCRR) is used in several standard Service reports and can be included in custom reports. This calculation can be used to search by or display the percentage of incidents that were resolved after only one response.

To use the FCRR correctly, it's important to understand how the result is derived. The FCRR is calculated by taking the number of incidents solved after one response by the agent and dividing this number by the number of incidents that were solved after one or more responses. To ensure your agents’ performance is reflected in the FCRR, some incidents

<table>

<tr>
<td>Offset By</td>
<td>Enter the number of time units to use in this field. Values can be positive or negative. For example, use negative values to report on a date range of 6 months ago to 1 month ago.</td>
</tr>
<tr>
<td>Time Units</td>
<td>Select the time unit to use from this drop-down menu. The available options are Minutes, Hours, Days, Weeks, Months, Quarters, and Years.</td>
</tr>
<tr>
<td>Exactly</td>
<td>Select this option to use the exact time period entered. For example, if you run a report at noon on a Wednesday that returns records created from exactly one week ago to the current day, the report returns records created between noon on Wednesday of the previous week and the current day.</td>
</tr>
<tr>
<td>Rounded to Beginning of Time Period</td>
<td>Select this option to round the selected time period to the beginning of the time period. For example, if you run a report on a Wednesday that returns records created from one week ago rounded to the current day, the report returns records created between 12:01 A.M. on Sunday of the previous week and the current day.</td>
</tr>
</tbody>
</table>

4. Click **OK**.
and responses aren’t included in the calculation. Incidents solved without a response being sent aren’t included, and responses automatically appended by rules aren’t included. If an incident is responded to by a staff member and is then reassigned, only the responses sent by the agent who solved the incident are included.

Incident Performance Intervals
Incident performance intervals are used as runtime selectable filters in several standard Analytics reports.

Incident performance intervals can be added as filters or output columns to custom reports, using the Incident Performance (`inc_performance`) table. See Create a Fixed or Runtime Selectable Filter and Add a Column to a Report. Incident performance intervals help you track the length of time between events that occur in the life of an incident. For example, the Create to Initial Response interval tracks the time between the incident’s creation and when the first incident response was sent. There are several types of intervals, some of which can overlap others.

**Note:** The content in the Incident Performance (`inc_performance`) table is updated nightly by the Agedatabase utility. See How You Use Cached Data in Reports.

Some intervals can occur more than one time in the life of an incident. For instance, the Assign to Response interval records the time between an incident being assigned to an agent and the agent sending a response to the incident. If the incident is assigned to and responded to by several agents, several instances of this interval are recorded for the incident.

The following incident performance intervals are available for use in reports:

- **Create to Initial Response**—Measures the interval between the creation of the incident and the first incident response being sent from an agent.
- **Status Change to Response**—Measures the interval between an incident’s `status type` being changed from Waiting or Solved and being set to Unresolved.
- **Assign to Response**—Measures the interval between an incident being assigned to an agent and the first response following the assignment.
- **Create to Final Resolved**—Measures the interval between the creation of the incident and the last time the incident was set to the Solved status type.
- **Last Assigned to Final Resolve**—Measures the interval between the last time the incident was assigned and the last time the incident was set to the Solved status type.
- **Create to Initial Assigned**—Measures the interval between the creation of the incident and the first time the incident was assigned to an agent.
- **Create to Initial Resolved**—Measures the interval between the creation of the incident and the first time the incident was set to the Solved status type.
- **Assigned to Reassigned**—Measures the interval between the incident being assigned to an agent and the incident being assigned to a different agent or to no agent.
- **Status Change to Reassigned**—Measures the interval between the incident being changed from a Waiting or Solved status type to Unresolved and the incident being reassigned to another agent.
- **Queued to De-queued**—Measures the interval between the time an incident enters a `queue` to the time the incident is moved to no queue or a different queue. If the incident’s queue does not change, the interval ends when the incident is set to the Solved status type.
- **Queued to Initial Assigned**—Measures the interval between an incident being placed in a queue and the incident being assigned to an agent for the first time.
- **Queued to Initial Response**—Measures the interval between an incident being placed in a queue and being responded to for the first time.
• **Queued to Initial Resolved**—Measures the interval between an incident being placed in a queue and being set to the Solved status type for the first time.

• **Backlog**—Measures the interval between an incident being created, or being changed from the Waiting or Solved status type to the Unresolved status type, or being added to a queue, to the incident being edited (with the edit saved).

• **Incident Edit**—Measures the interval between an incident being edited and the edit being saved.

• **Servicing**—Measures the interval between an incident being created, added to a queue, or changed from the Waiting or Solved status type to the Unresolved status type, to the incident being set to the Waiting or Solved status type or being added to a different queue.

• **Initial Response to Initial Resolved**—Measures the interval between the incident first being responded to and first being set to the Solved status type.

• **Queue Initial Response to Initial Resolved**—Measures the interval between the time an incident that's assigned to a queue is responded to and the time the incident is set to the Solved status type, while in the same queue.

• **Final Waiting to Final Resolved**—Measures the interval between the last time an incident is set to the Waiting status type and the last time the incident is set to the Solved status type.

Add the Incident Summary Thread Filter to a Report

By adding the Incidents.Summary/Thread filter to a report, you can use one filter to search incidents by reference numbers, subject lines, and thread entries.

If this incidents field is not available when you create the filter, *Submit a Service Request* to have the option enabled on your site.

If an incidents report includes the Incidents.Summary/Thread (search_thread) search filter, you can search for incidents by their reference numbers, by text in subject lines, or by text anywhere in the incident threads. The search includes an implied wildcard (*), so you can enter partial values in the search field, and any records matching the partial value will be returned.

This procedure assumes that you're familiar with creating and editing reports, and adding report filters.

1. Open the report you want to edit.
2. If the Home tab is not active, click it to make it the active tab.
3. Click **Add Filter**.
   The Add Filter window opens.
4. Do one of the following:
   - Type *incidents.search_thread* in the Expression field.
   - Click **Use Data Dictionary**, expand the Incidents tree, double-click the Summary/Thread(search_thread) field, and then click **OK**.
5. Verify that Equals is selected in the Operator drop-down menu.
   We recommend using only the Equals operator with the *incidents.search_thread filter*. This ensures that the values you enter in the filter include the implied wildcard.
6. If you want a default search value for the filter, type it in the Value field.
7. Enter values for the other fields on the Add Filter window, as described in *Create a Fixed or Runtime Selectable Filter*.
8. Click **OK**.

When you use the report, the filter will be available on the Search window. You can also add the filter to the docked filters area at the top of the report.

Find Content in a Report

You can search for specific text, numeric values, or special characters in the content displayed in a report using the Find feature.

When using the Find feature, cells on the report page currently being viewed that contain what you searched for are highlighted. Content on other pages or drill-down levels in the report must be searched separately.

1. Open the report you want to find content in.
2. Click the Home tab.
3. Click Find.
   The Find window opens.
4. Enter the search value you want to find in the report in the Find Text field.
5. To highlight cells in the report only if the content matches the case you use in the search value, select Match Case.
6. To highlight cells in the report only if the cell content exactly matches the search value you enter in the Find Text field, select Match Entire Cell Contents.
7. Do one of the following:
   - Click Find Next to close the Find window and highlight the first cell in the report that matches the search value you entered.
   - Click Find All to close the Find window and highlight all the cells in the report that match the search value you entered.
8. To find the next instance of the search value without opening the Find window, click Find on the Home tab.
9. To clear the search value you entered without opening the Find window, click Clear on the Home tab.

How You Use Cached Data in Reports

Before you analyze data returned in reports, you should understand how using cached data can affect your reports.

Some standard reports return data compiled during previous time periods, and you can create custom reports that use data from tables that store this cached information. Reports that use cached data can query a large amount of information in a short amount of time since cached data is stored in only a few database tables. Reports that use cached data are often designed to compare data from one time period to another, such as comparing sales figures from one quarter to another.

Agedatabase Utility Data Caching

Most cached data is compiled by the Agedatabase utility. This utility runs nightly to cache data to prepare for the following day’s reporting needs. Understanding which reports use cached data will help you accurately interpret your reports’ results.

Cached data remains constant throughout the day and isn’t updated until the next day, after Agedatabase has compiled the information. For this reason, reports using cached data do not include data for the current day.

If you view the report definition for the report you want to run and see that the report includes a database table that stores cached data, you know the report uses cached information and may not include data from the current day.
Dataminer Utility Data Caching

Some cached data is compiled by the Dataminer utility instead of the Agedatabase utility.

By default, the Dataminer utility runs every four hours or as specified in the VISIT_MAX_TIME configuration setting (RightNow User Interface/General/Security).

**CAUTION:** We do not recommend changing configuration settings unless necessary. Changes made to configuration settings can greatly impact the performance and functionality of your entire site. Before you change any configuration setting, it is important that your organization understands the impact of changing the setting. See Overview of Site Configuration.

The data in the following fields is compiled by the Dataminer utility.

- Answers.Score (answers.solved_count)
- All fields in Answer Stats (ans_stats) table
- All fields in the Links (links) table
- Stats.# Answers Viewed (stats.ans_viewed)
- Stats.# Answer Searches (stats.searches)
- Stats.Visitor Actions (stats.hits)

Information in reports that use these tables or fields is only as current as the last time the Dataminer utility ran.

Overview of Queuing Reports

Reports can be manually or automatically queued to run at a later time.

Reports, whether opened individually or in dashboards, can take a long time to run if their database queries attempt to query a large amount of information. However, you can queue reports with intense queries so you can continue to work on the administration interface while the reports run in the background. When the queued reports have been run, you can open them and immediately view their data.

You can manually queue reports that you think may take a long while to run or that you want to view at a later time. If the application determines that a report will take an excessive amount of time to run, which can result in unnecessary load on your database, you’re given the option to queue the report using the report’s current search parameters. If you choose not to queue the report, you can select more restrictive search parameters for your report and try to run it again.

**Note:** Reports that attempt to query too many rows in the database will not run. If you queue such a report, the server will still not be able to process it. We recommend using more restrictive filters, removing unnecessary tables, and using inner table joins to allow such reports to run. If you need a report to return a large amount of information, we recommend that you queue it using the Download Queued Report Results as a CSV File option. This lets you send up to 100MB of data to a comma-separated values (CSV) file. You can then open the file using an external application.
If your site is configured to use a report database (also referred to as a replication database) for reporting purposes, queuing works somewhat differently than it does on sites without a report database. See How Queuing Works on the Report Database.

Queue a Report or Dashboard Manually

You can queue reports or dashboards that you think may query or return large amounts of data. This is also helpful if you want to view a number of reports but do not want to wait for each to generate.

For information about viewing reports in the queue and opening queued reports that have processed, see How You View Reports in the Queue.

You can also require dashboards and reports to be queued when they are run by enabling the Set Report to Deferred Execution option. See Change Report Properties.

1. Do one of the following:
   - Select the report or dashboard on the Reports explorer and click the ribbon’s Queue button.
   - Right-click the report or dashboard, either on the Reports explorer or the navigation list, and select Queue.

   The Queue Search Filters window opens where you specify the search parameters you want to use for the queued report.

   The window contains three sections: Filters, which includes Products, Interface, and Date Range selection options; Delivery Options, which includes options to view or download queued-report results; and Limit and Order, which includes queued-report display options.

2. Enter the search parameters you want to use.

   For information about specifying search parameters, see How You Search in Reports.

3. To send the report output to a CSV file instead of to the console, select the Download Queued Report Results as a CSV File option.

   This lets you send up to 100MB of data to a CSV file. Without this option, reports can return up to 10,000 rows of data. After the queued report is generated, you can select a location to save the file to and then open it using an external application. This option isn't available when queueing dashboards.

   In addition, this option isn't available for all reports since not all reports are appropriate for CSV output. The following restrictions apply.

   - The report cannot contain custom scripts.
   - The report cannot contain comparison columns.
   - The report cannot contain date grouping columns.
   - Rows in the report must return unique records, such as information about specific incidents, answers, or contacts.
   - The first column in the report must be sorted in ascending order and must output data stored in a primary key database column. For instance, the first column could output incident ID numbers or contact ID numbers, and be sorted in ascending order. This restriction helps the data queries more quickly process reports since they use primary keys.

4. Click Queue.

   A message displays an approximation of when the report or dashboard will be generated.

   The time displayed is an approximation of how long it will take to process the queued report or dashboard. However, if there are other reports or dashboards in the queue, it can take longer than the displayed time to process your queued report or dashboard.

5. Click OK.
Automatically Queuing Reports

You can choose to queue the report using the search parameters you selected.

When you attempt to open a report, the database query for the report is checked. If the system determines that the query will likely take too long to process, the Unable to Process Report window displays, asking if you want to queue the report. If you want to attempt to run the report using different search parameters, click Cancel. The window will close and the report's Search window will open. If you want to queue the report using the search parameters you selected when you attempted to run the report, click OK. If you do so, a message displays an estimate of how long it should take to process the report, just as if you had manually queued the report.

**Note:** Reports that are displayed on the workspace or previewed on the report designer are never queued. If it's determined such a report will take too long to generate, the report isn't displayed.

How to Prevent Automatic Queuing

You can prevent the automatic queuing of reports.

After a report is automatically queued, it's queued every time it runs thereafter, since it's assumed the report's filters and data set result in long run times.

**Tip:** To view reports that will be automatically queued when they're next run, you can run the Deferred Reports standard report. This report is located in the Reports explorer’s Common > Site Administration > Reports folder.

If you have a report that's set to be queued, you can prevent it from being automatically queued when it's next run. However, you will still be asked to queue the report when you next run it if the report meets queuing criteria. See Change Report Queuing and Data Source Options for information about preventing automatic queuing for a standard report or Change Report Properties for information about changing queuing options for a custom report.

**Tip:** When you change queuing options for a custom report, we recommend that you also review the report’s fixed filters and table joins to determine if the amount of data the report examines can be reduced to allow it to run more quickly.

Why Reports Fail to Queue

It is possible that a report you queue will not run successfully.

There are several reasons why this might happen.

- You already queued the report using the same search parameters and the first queued report has not yet run.
- The original report you queued was deleted after you queued it and before the queued report could be processed.
- The report is deleted from the queue by another staff member before the report can run and you can view it. However, only the staff member who queues the report and staff members with the Analytics Administrator profile permission can remove reports from the queue.
- The queued report processes, but isn't opened within the number of days specified in the PURGE_QUEUED_REPORT_DAYS configuration setting. Queued reports and dashboards that have been run but not opened within this time period are automatically removed. The default value for this configuration setting is seven days.
• You manually queue a report or dashboard that cannot run due to the query surpassing a limit on the number of database rows that can be accessed.

Notifications for queued reports that fail to run include information about the cause of the failure. If the recipient has permission to edit the report that failed, links to the report analyzer are also included. See Troubleshoot Reports Using the Report Analyzer.

How You View Reports in the Queue

Reports placed in the queue are associated with one of the following states: Waiting, Processing, and Complete.

When you queue a report, it’s placed in a queue where it will be processed by the server. If there are other reports in the queue that have not yet been processed, your report will be placed at the end of the queue. You can see the reports that are in the queue using the My Queued Reports and Reports Waiting in Queue standard reports. From the Reports Explorer, open Public Reports > Common > Site Administration > Reports.

• Reports Waiting in Queue—Displays all the reports that are in the queue waiting to be processed, regardless of who queued the report. Staff members with the Analytics Administrator profile permission can remove reports from the queue using this report if necessary.

• My Queued Reports—Displays the reports you have queued and not yet viewed. When you view this report, you will see that queued reports can be in one of three states.
  ◦ Waiting—Reports in this state are waiting to be run on the server. You can remove reports from the queue that are in this state.
  ◦ Processing—Reports in this state are currently being run on the server. You cannot remove reports from the queue that are in this state.
  ◦ Complete—Reports in this state have been run on the server and are ready to view. You can remove reports from the queue that are in this state without viewing them.

How You Open Queued Reports

You can open queued reports from My Queued Reports or from the notifications list.

When the database server has run a queued report and it’s ready to view, you will receive a message in a toast notification and in your list of notifications. See Notifications.

To view the report, click Open on the toast notification or double-click the notification in your notifications list. The report opens on the content pane. You can also open reports you queued from the My Queued Reports standard report.

When you open a queued report that was sent to a CSV file, the Save As window opens where you can select a location to save the CSV file. You can then use an external application to view the contents of the file. See Queue a Dashboard Manually.

Note: After a queued report is processed, you have a default of seven days to view it. Reports older than the time period specified in the PURGE_QUEUED_REPORT_DAYS configuration setting (Agedatabase/Batch Processing/Miscellaneous Purging) are deleted from the list of processed reports by the Agedatabase utility. For information about this and other configuration settings that impact reports, see Analytics Configuration Settings.

How You Use Queued Reports

When you open a report that you queued, it displays and functions just like a report that has not been queued. However, there are some differences to be aware of.

• Docked filters aren’t displayed in queued reports.
• Action links, such as those used to open and delete records, aren’t displayed.
• The ribbon’s Search, Refresh, Reset, Definition, and Links buttons aren’t available.
• If your report includes drill-down levels, these levels are not queued, so are instead run when you open the drill-down levels.

You can view the output from a queued report as many times as you want. However, it’s important to remember that the output is static. If you need current information from the report, you need to run or queue the report again.

Overview of Report Databases

B2C Service sites have a copy of their database, called a report database, available for reporting purposes. (Report databases are also referred to as replication databases.)

Running reports on this database is generally faster than running reports on the operational database where normal activities, such as adding and editing incidents, occur. In addition, since report databases are used only for reporting, they have higher thresholds on the amount of time reports are allowed to run and the number of database rows reports are allowed to query.

Note: Reports that you attempt to run on the report database can still encounter limits on the number of database rows that can be queried, though the row limits are considerably higher than those on the operational database.

A report that does not run successfully on your operational database may run successfully on your report database. However, since the data on report databases is copied from the operational database at fixed times, the data displayed on reports run on report databases may not be as current as the data shown on reports run on operational databases.

How You Specify Which Database Reports Run On

You can specify whether you want a report to always run on the operational database or the report database. The system can also automatically force a report that fails to run on the operational database to instead run on the report database.

By default, reports are configured to run on the operational database. However, they can automatically switch to the report database (also referred to as the replication database) if they cannot run on the operational database. When you attempt to run a report, the system reviews the database query generated by the report. If the query will take longer than 10 seconds to run or will query more than 2,000,000 database rows, the report automatically runs on the report database. Reports run on this database can query up to 5,000,000 rows. The report owner receives a notification if their report is changed to run on the report database.

Note: When reports are run from editors, such as the incidents editor or the Quick Search menu, they run on the operational database regardless of the reports’ configuration. In addition, reports that include the Fill Inbox record command always run on the operational database. See Change Record Command Actions.

After a report is modified, either manually or automatically, to run on the report database, it will continue to do so unless you edit the report and specify that it runs on the operational database. You can also specify that the report always runs on the database you select to avoid the report automatically changing to run on a different database. In addition, you can require that the report is queued or not queued when it’s next run.
Change Report Queuing and Data Source Options

You can change the queuing and data source options for reports and dashboards.

The Administrator Analytics profile permission is required to modify these settings on a standard report or dashboard. See Analytics Permissions.

1. Click Analytics on the navigation pane.
2. Double-click Reports Explorer.
3. Navigate to the report or dashboard you want to modify, right-click the report, and select Edit.
4. Open the Edit Settings window using one of the following options:
   o To open the window for a standard report or dashboard, click More Options.
   o To open the window for a custom report or dashboard, click Options, and then select More Options.

The Edit Settings window opens.

5. To require the report or dashboard to be queued when it’s next run, select Set Report to Deferred Execution. See Automatically Queuing Reports.

If this option isn’t selected but the report or dashboard is automatically queued the next time it’s run due to meeting queuing criteria, the Set Report to Deferred Execution check box is selected automatically. Clear this check box to prevent the report or dashboard from being automatically queued when it’s next run. However, even when this check box is cleared, you will still be asked to queue the report or dashboard when you next run it if it meets queuing criteria.

6. Select the database you want the report to run on.
   a. To run the report or dashboard on the operational database, select Operational Database. This option is helpful if you need the most current data available.
   b. To run the report or dashboard on the report database, select Report Database. This option is helpful if your report queries a large amount of data since the query size restrictions on report databases are more relaxed than those on operational databases.

7. Click OK.
8. Click Save.

How Queuing Works on the Report Database

Report queueing works slightly differently when using the reporting database.

Since sites with report databases (also referred to as replication databases) have additional options available for running reports, queuing works slightly different on those sites. If your site has a report database, you’ll want to consider keep the following in mind when queuing reports.

- Any reports you queue automatically run on the report database unless the report is configured to always run on the operational database. You can select this option when editing the report. See Change Report Properties.
- If a report is set to run on the report database and it’s determined it will take longer than sixty seconds to run the report’s query, you’re given the option to queue the report. If you choose not to queue the report, you can attempt to run it again using different search parameters. See How You Search in Reports.

How You Distribute Reports and Dashboards

You can share reports with others in a number of ways.

After you open a report or dashboard, you can print it, forward it to an email address, publish it to your folder list, or export the data to be used in an external application. You can also schedule reports and dashboards to be published or emailed at specified times, or when specified data conditions are met. If you have another interface and want to create
a copy of your report or dashboard on the other interface, you can also export the definition and import it on the other interface.

In addition, frequently-used reports and dashboards that query large amounts of information can be cached at scheduled times to reduce database load that can adversely impact site performance.

**Note:** Before you can print, export, or forward reports or dashboards, the Print/Export/Forward Reports permission must be enabled in your profile. See *Analytics Permissions*.

**Modifications Made to Distributed Reports**

When reports and dashboards are exported, forwarded, printed, published, or sent at a scheduled time, certain changes are made to ensure that they display correctly.

Reports and dashboards you open outside B2C Service may not display exactly as they do when viewed within the application.

- Drill-down links to other reports, dashboards, or report levels are disabled in distributed reports. See *Overview of Report Output Levels* for information about drilling down into report levels and *Overview of Linked Reports* for information about drilling down into other reports or dashboards.

**Note:** If your report includes multiple output levels, drill down to the information you want to display in the distributed report before you export, forward, or publish it.

- If the report includes the Links column, which contains links to modify the report’s records, the column isn’t shown on the report.
- If the report’s width is set to Fit in Window, the report is shown using the Best Fit width setting. See *Change Page Options* for descriptions of these settings.
- Reports shown in the record layout are by default converted to tabular layout when they’re exported or scheduled in an Excel format. This ensures that the report’s data can be easily read in a column and row format. See *Display Data Using Record or Tabular Layouts* for information about layouts.
- If the report lacks a report header or has a blank header, a header containing the report’s name is added to the report.
- If the width of a report column is set to a percentage of the report’s width, and the report's width isn't fixed, the column’s width setting is changed to Best Fit. See *How You Edit Column Formatting* for information about column width settings.
- Forwarded and scheduled reports sent in an HTML format use a relative layout instead of an absolute layout. This ensures maximum compatibility with various browsers, but may impact the display of images or charts in the email.
- Paging is disabled for published reports. See *Add Page Breaks*.
- The dates and times displayed in scheduled reports are adjusted for the time zone of the interface they’re sent from, but aren’t adjusted for staff members’ time zone settings in their staff accounts. See *Add or Edit a Staff Account* and *How You Schedule Reports*.
- Externally hosted images displayed in columns aren't available in scheduled reports. See *Display External Images in a Report Column*.

**Print a Report**

After you run a report, you can preview it to see how it will look on a printed page and then send it to a printer.
When previewing a report, you can zoom in and out of the displayed page, view multiple pages, and specify how the pages should display in the preview window. Before you print the report, you can specify print options, including paper size, margin width, and page orientation.

1. Open the report you want to print and click the **Page Setup** tab.
2. To automatically scale the report to your printer’s default page width, select **Print to Fit**.
3. Do one of the following:
   - To specify page setup options, such as page margins, click the button to the right of the Print group name to open the Page Setup window where you can set printing options.
   - Select printing options from the Page Setup tab’s Print group. See **Report Page Setup Tab** for option descriptions.

   **Tip:** If you know the specific options you want, it can be faster to select them from the ribbon. Opening the window gives you an overview of all the available options.

4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paper</td>
<td>This section contains options for selecting paper size and source.</td>
</tr>
<tr>
<td>Size</td>
<td>Click the appropriate paper size for the report from this drop-down menu. The available paper sizes depend on your selected printer.</td>
</tr>
<tr>
<td>Source</td>
<td>Click the paper source from this drop-down menu. The available paper sources are dependent on the printer that is currently selected.</td>
</tr>
<tr>
<td>Orientation</td>
<td>Select whether the report should be printed in landscape or portrait mode.</td>
</tr>
<tr>
<td>Margins</td>
<td>Define the Left, Right, Top, and Bottom margins for the report. The measurement units used for the margin size are determined by your workstation’s environment.</td>
</tr>
<tr>
<td>Printer</td>
<td>Click this button to select the printer you want to use.</td>
</tr>
</tbody>
</table>

5. Click **OK**.
6. Click **File**, select **Print**, and then do one of the following to select your printing preference.
   - Select **Print** to open your workstation’s print window where you can define printer settings and send the report to the printer.
   - Select **Quick Print** to send the report directly to your default printer using the printer’s default settings.

**Preview a Report**

You can preview the information on a report before you print it.

1. Open the report you want to preview.
2. Click **File** and select **Print > Print Preview**.
The Print Preview window opens.

3. Select the preview options you want.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Print</td>
<td>Click this button to send the report to the printer.</td>
</tr>
<tr>
<td>Zoom</td>
<td>Click the down arrow to select the desired zoom percentage and preview the report with the selected zoom level. Click the magnifying glass to reset the zoom level to the default percentage.</td>
</tr>
<tr>
<td>Page</td>
<td>Click these buttons to view one, two, three, four, or six pages of the report on the Print Preview window. These options do not modify the final printout.</td>
</tr>
<tr>
<td>Close</td>
<td>Click this button to close the Print Preview window without printing the report.</td>
</tr>
<tr>
<td>Page</td>
<td>Enter the page number you want to view on the Print Preview window, either by entering the page number or by scrolling through the available page numbers with the arrows.</td>
</tr>
</tbody>
</table>

Forward a Report

You can forward reports and dashboards in emails.

After you view a standard or custom report, you can immediately forward the report as an HTML email to one or more recipients. You can also forward dashboards using the same procedure. Certain modifications may be apparent when viewing forwarded reports.

**Note:** You can forward reports as long as the resulting HTML email does not exceed 8 MB.

1. From an open report, click the **Home** tab.
2. Click **Forward**.
   The Forward Report window opens.
3. Do one of the following:
   - Type one or more email addresses in the **To** field. Multiple addresses must be separated by semicolons. You can also enter addresses in the Cc field to send copies of the email to other addresses, or enter addresses in the Bcc field to send copies of the email to other addresses that are hidden from the other email recipients.
   - Click **To**, **Cc**, or **Bcc** to open the Select Names window. From this window you can add recipient addresses by selecting from a list containing staff members, groups, and distribution lists. See **Select a Recipient**.
4. Select a format for the forwarded email. Options include HTML Email or HTML Attachment (Images/Charts stored on the server).
   Not all email clients show HTML emails in the same manner. If email recipients cannot view a forwarded report correctly, select the **HTML Attachment** (Images/Charts stored on the server) format. Email recipients can then save the image or chart to their hard disk and then open it in a browser. The images and charts used in the email are stored on the server for the number of days specified in the KEEP_EMAILED_IMAGES configuration setting. See **Analytics Configuration Settings** for information about this and other configuration settings that impact reports.
5. Enter a subject for the email.
6. Enter any text you want to appear in the email in the **Comment** text box.
7. Click **Send**.

- Modifications Made to Distributed Reports

**How You Publish Reports**
Publishing a report lets you modify the data and display options of an existing report and then save a copy of the report in the reports explorer that other individuals can access.

After a report is published, it cannot be modified and the report data remains unchanged even as the knowledge base is updated. This ensures that your audience is presented with the report as you want them to see it.

**Note:** To open a published report, staff members must have permission to access the report in the reports explorer folder where it's placed. You can change report permissions by editing the published report, or by editing Analytics permissions in the profile. See *Set Report Permissions*.

The published report appears exactly as it appeared when you published it, with the following exceptions.

- Drill-down links are disabled for report levels and linked reports.
- The report’s runtime selectable filters aren’t available.
- Actions that can be taken on individual records in the report are disabled. Therefore, buttons on the Home tab’s Record group aren’t available, inline editing is disabled, and action links aren’t displayed.
- Paging is disabled for published reports. See *Add Page Breaks*.
- The Publish option isn’t available.
- If the report style the report used when it was published is deleted, a default report style is used when rendering the published report.

You can also automatically publish a report at specific times using the Published format when you schedule a report. Published reports created in this manner are saved in a custom reports folder you select on your site where your audience can access them. If you specify an account or email address when you create the report schedule, a notification or email is sent when the published report is created.

**Tip:** You can view the published reports you own using the My Published Reports standard report.

**Publish a Report Manually**
You can manually publish a report and save it.

1. Run the report you want to publish using the same search parameters that you want the published report to use.
2. Click **File > Publish**.
   - The **Publish As** window opens.
3. Select a directory to store the published report and enter the name of the report.
   - The name must be unique.
   - **Tip:** You can right-click non-standard folders and select New Folder to create a new folder.
4. Click **OK**.
Export Report and Dashboard Data

The data shown in reports and dashboards can be exported to several different file formats so you can view the data in third-party applications. The information that's exported and opened in third-party applications is subject to the functionality of those applications.

You can export your data to HTML, PDF (Portable Document Format), Excel, XML (Extensible Markup Language), Image, or Delimited formats. You can also export the report output to the clipboard. When viewing a report, a maximum of 50,000 characters can be displayed in a single field even if the field contains more characters than this. However, up to 300,000 characters in a field can be exported, though character limitations in third-party applications may still be encountered when viewing the exported report.

Tip: If you want to copy the contents from a few cells in your report or dashboard to another application, you do not need to export the data. Instead, you can right-click the cell you want to copy and select Copy Cell to Clipboard. After the data is on your clipboard, you can copy the data to other applications.

1. Run the report or dashboard to display the data you want to export.
2. Click Export on the Home tab. A menu of export options displays.
3. Select the type of export file that you want.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTML</td>
<td>This option exports the data to an HTML-encoded document, which is compatible with exporting images and charts. Reports and dashboards can be exported using absolute or relative HTML layouts. See Export Report and Dashboard Data for descriptions of export options.</td>
</tr>
<tr>
<td>PDF</td>
<td>This option exports the data to a PDF file, which is compatible with exporting images and charts. When you select this option, you can choose to set the file’s page width automatically or use the options on the Page Setup window.</td>
</tr>
<tr>
<td>Excel</td>
<td>This option exports the data to a Microsoft Excel file. When exporting in this format, the version of Microsoft Excel installed on your workstation is automatically checked and the data is exported to an .xls or .xlsx file depending on the version.</td>
</tr>
<tr>
<td>XML</td>
<td>This option exports the data to an XML file.</td>
</tr>
<tr>
<td>Image</td>
<td>This option exports the data to a .jpg image file, which is compatible with exporting images and charts.</td>
</tr>
<tr>
<td>Clipboard</td>
<td>This option exports the data to the workstation’s clipboard. The data can be exported to the clipboard in HTML, Tab Delimited, or Comma Delimited formats. After the data is on the clipboard, it can be copied to other applications.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Delimited | This option exports the data to a character-delimited file. When you select this option, the Delimiter Selection window opens, where you can specify the character you want to use as the delimiter. You can choose Comma, Space, Tab, Pipe, Caret, or a custom delimiter you select. The delimited format is intended for use with tabular data only.

When you select a format (with the exception of the Clipboard format), the **Export Options** window opens where you can specify the file name and save location, whether to include the report or dashboard name, and whether all the data should be returned or only data shown on the current page. The HTML, PDF, and custom delimiter export options include additional export options.

4. Select the options you want applied to the export file.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>This field displays the file name and where it is saved to. When the Export Options window is initially opened, a default directory location and file name is displayed.</td>
</tr>
<tr>
<td>Save to Folder (folder icon)</td>
<td>Click this button to open the Save As window if you want to specify an alternate location or file name.</td>
</tr>
</tbody>
</table>
| Launch Application | Select this check box to automatically launch the application associated with the file type the data is saved to when you close the Export Options window.  
If you're exporting a large amount of data, you may want to clear this check box to prevent the application from attempting to immediately open when you export the data. |
| Append Date/Time to File Name | Select this check box to append a date/time stamp to the file name that shows when the export file is generated. The date/time stamp is appended to the end of the file name before the file name extension. |
| Date/Time Format | Enter the format you want to use for the date/time stamp you append to the export file name. The default format is %Y-%m-%d %H:%M:%S. This creates a date/time stamp with the year listed first, followed by the month, day, hour, minute, and second (such as 2012-02-25 09:43:30). The format you specify is automatically saved to your personal settings so this becomes your default format the next time you export a report or dashboard. See [Reference Information](#). |
| Reset | Click this button to reset the date/time format to the default format (%Y-%m-%d %H.%M.%S). |
| Save the Selected Directory as the Default Directory | Select this check box to make the folder you specify your default export directory. Selecting this check box saves the folder name to your personal settings so future exports are saved to the specified folder. |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add Report Name to Output</strong></td>
<td>Select this check box to include the report's name in the export file.</td>
</tr>
<tr>
<td></td>
<td>This option isn't available when exporting dashboards. Report names display in exported dashboard files if their title bars are enabled in the dashboard's display options. See <em>Edit Dashboard Options</em> for information about including report title bars on a dashboard.</td>
</tr>
<tr>
<td><strong>Data Set</strong></td>
<td>The options in this group let you choose to export all the data returned by the report's current search criteria or only data shown on the report when the Export button is clicked.</td>
</tr>
<tr>
<td></td>
<td>Data Set options display only if the report's output is restricted by record limits, page limits, slicing, or auto-filters when the Export button is clicked. This option isn't available when exporting dashboards, published reports, or queued reports.</td>
</tr>
<tr>
<td><strong>Export Current Page</strong></td>
<td>Select this option to export only the data currently shown on the report.</td>
</tr>
<tr>
<td><strong>Export All Data</strong></td>
<td>Select this option to include all the data from the report, up to 100,000 rows, regardless of the report's current record limits, page limits, slicing, or auto-filters settings.</td>
</tr>
<tr>
<td></td>
<td>This option isn't functional for reports that were queued.</td>
</tr>
<tr>
<td><strong>HTML Options</strong></td>
<td>Select how you want the HTML file to be generated in this section.</td>
</tr>
<tr>
<td></td>
<td>This section displays only when you select HTML format.</td>
</tr>
<tr>
<td><strong>Use Absolute Layout</strong></td>
<td>Select this option to format the export file using absolute layout. The exported report or dashboard will match the display of the original very closely, though discrepancies may be noticed in some reports and dashboards.</td>
</tr>
<tr>
<td></td>
<td>Some browsers do not support printing HTML files that use this layout.</td>
</tr>
<tr>
<td><strong>Use Relative Layout</strong></td>
<td>Select this option to format the export file using relative layout. The exported report or dashboard will be similar to the original, though there may be some discrepancies.</td>
</tr>
<tr>
<td></td>
<td>Most browsers support printing HTML files that use this layout.</td>
</tr>
<tr>
<td><strong>PDF Options</strong></td>
<td>Select how you want to specify the width of the PDF document in this section.</td>
</tr>
<tr>
<td></td>
<td>This section displays only when you select PDF format.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Set Page Width to Best Fit the Report</td>
<td>Select this option to automatically set the width of the PDF file to best fit the width of the report or dashboard. This method displays the report or dashboard in its original width, though the size of fonts may be reduced and the file may use landscape orientation to fit wide reports and dashboards.</td>
</tr>
<tr>
<td>Use Printer Page Setup to Set Page Dimensions</td>
<td>Select this option to open the Page Setup window to manually select margins, paper size, and orientation for the PDF file. Print a Report for information about this window.</td>
</tr>
<tr>
<td>Excel Options</td>
<td>Select how you want to format date/time columns for the Excel file in this section. This section displays only when you select Excel format.</td>
</tr>
<tr>
<td>Convert All Dates into Excel Formatted Dates</td>
<td>Select this check box to convert all the date and time values shown in the report’s columns to Excel’s MM/DD/YYYY HH:MI AM/PM date format. Selecting this option ensures the date columns in the exported data is consistent with Excel’s functionality.</td>
</tr>
<tr>
<td>Include Cell Images</td>
<td>Select this check box to include images that are displayed in the report’s or dashboard’s cells in the exported file. This option is selected by default.</td>
</tr>
<tr>
<td>Custom Delimiter</td>
<td>Enter the custom delimiter you want to use in this field. This option displays only when you select the Delimited &gt; Custom format.</td>
</tr>
</tbody>
</table>

5. Click OK.

If you selected the Launch Application check box, the application associated with the exported file’s file type opens.

How You Schedule Reports

Scheduled reports are a list of reports that are set up to run on a specified schedule.

You can schedule reports to be sent by email to yourself, other staff members, email addresses, or distribution lists. You can also create a schedule to automatically publish a report. When you define a schedule, you define the specific times when you want the report to be sent. You can also specify the values you want for the report’s filters and variables.

Certain modifications may be apparent when viewing reports or dashboards sent in emails. See Modifications Made to Distributed Reports. In addition, if scheduled reports include custom scripts, the scripts must contain initialization information to ensure they run correctly when recipients open the reports. See Create a Custom Script in a Report.

If you need a report sent when certain conditions are met, you can create alerts. Alerts send the scheduled report when criteria you define in data exceptions are met. For example, you can create data exceptions to flag incidents that have
not been responded to in 24 hours, and then create an alert to send the report when the data exceptions are met. See *Add an Alert to a Schedule*.

**Note:** The Create/Edit Schedules Analytics profile permission must be enabled to schedule reports. See *Analytics Permissions*.

## Schedule a Report

You can set up reports to run on a specified schedule.

The Create/Edit Schedules Analytics profile permission must be enabled to create or edit schedules.

1. Open the Scheduling window (for **standard reports**) or Schedules window (for **custom reports**).
   a. To schedule a standard report, right-click the report and select **Edit**. The **Scheduling** window displays on the left side of the content pane, and displays information about any schedules for the report that have been created.
   b. To schedule a custom report, right-click the report and select **Edit**. Click the **Home** tab, and then click **Scheduling**. The **Schedules** window opens, showing schedules that have been created for the report.
2. Click **Add Schedule**.
   The **New Schedule** window opens.
3. Enter a name for the new schedule in the **Name** field.
   The name should clearly identify the purpose of the schedule. When creating a schedule to publish a report, the report that’s created in the destination folder is given the name you specify in the Name field.
4. Specify the email recipient (unless using the **Published** format), using one of the following methods:
   - Enter the email addresses the scheduled report email should be sent to in the **To** field. Separate addresses with semicolons.
   - Click **To**. The **Select Recipients** opens where you can add staff members, groups, and distribution lists to the schedule. See *Select a Recipient*.

   **Note:** Emails sent for scheduled reports automatically hide the other recipients’ email addresses in the email header.
5. Enter a subject for the scheduled report email in the **Subject** field.
6. Enter any text you want to include in the body of the scheduled report email in the **Comment** field.
7. Select the format of the report from the **Format** drop-down menu.

<table>

<tr>
<td>Send Report to Report Queue for Delivery as a CSV File</td>
<td>When you select this option, the report is queued at the scheduled time. However, instead of being sent as an email attachment, the CSV file is accessed in the report queue. You can access the queued report from toast notifications or the My Queued Reports standard report. See How You View Reports in the Queue.</td>
</tr>
</tbody>
</table>

8. To select the folder in the Reports explorer where you want published reports sent, click the **Destination Folder** drop-down menu and select the folder you want as your destination. This drop-down menu is available only when you select the Published format. See How You Publish Reports.

9. From the Run Report As drop-down menu, select the staff account that would be used if the report were run manually. This lets you specify which account should be used in reports that use the "logged in" filter value. Since the time zone used in the report depends on the account that runs the report, this impacts the times shown in the report. For example, if a staff member working in the Pacific time zone runs a report, the times shown in the report are adjusted to display in the Pacific time zone. See Add or Edit a Staff Account.

10. Click the schedule time next to the Recurrence field. The **Schedule Recurrence** window opens. The underlined text displays the report’s current schedule. This is set to Every Day Every Hour by default.

11. Enter field information.

<tr>
<td><strong>Start</strong></td>
<td>Enter the start date of the schedule or click the Calendar button to open a calendar from which you can select the start date. The current day is the default start date.</td>
</tr>
<tr>
<td><strong>End</strong></td>
<td>Enter the end date of the schedule or click the Calendar button to open a calendar from which you can select the end date.</td>
</tr>
</tbody>
</table>

12. Click **OK**.

13. To specify the values you want to use for the report’s filters and variables when the scheduled report is sent, click the underlined text next to Filter Values. The Search window opens where you can select the values for the report’s runtime filters to use when the scheduled report is automatically generated.

   If you do not specify filter values, the report’s default values are used. See **Overview of Report Filters**.

   **Note:** The Ordering feature isn’t available when selecting filter options for scheduled reports.

14. Click **OK**.

15. To edit an existing schedule, click **Edit** next to the name of the schedule on the Scheduling or Schedules windows.

   The **Edit Schedule** window opens. The options in the window are identical to those in the New Schedule window.

16. To delete an existing schedule, click **Delete** next to the name of the schedule on the Scheduling or Schedules windows.

   a. Click **Yes** to confirm the deletion.
Add an Alert to a Schedule

If a report includes data exceptions, you can create an alert to send an email when the data exception criteria is met.

You can also specify how many times in a row the exception must be met before the alert is sent. The report’s data exception is checked at the times specified in the report’s Schedule Recurrence window. For instance, a report’s data exception could be configured to trigger when ten incidents returned in the report meet the criteria you specify, such as the incidents’ response times not being met. You could then configure a schedule for the report to trigger once an hour every work day. After the schedule is created, you could create an alert to be sent if the data exception is met twice in a row. This would result in the report’s data exception being automatically checked once every hour each work day, according to the times specified on the Schedule Recurrence window. If the report’s data exception is met a single time, the alert would not be sent. However, if the data exception was also met when it was next checked, the alert email would be automatically sent.

The Alerts section of the New Schedule window displays email alerts and their attributes, and lets you create new alerts. Alerts are disabled if the report does not include data exceptions, since alerts are based on data exceptions being met. See Create a Data Exception.

1. Open the New Schedule window, as described in Schedule a Report.
2. Do one of the following:
   - Enter the email addresses to send the alert to, separated by semicolons.
   - Click To. The Select Names window opens where you can add staff members, groups, and distribution lists to the alert. See Select a Recipient.
   **Note:** A report schedule needs to be created in order to add an alert. If the report should be sent as a regular scheduled report and as an alert, you must add recipients to both the schedule’s To field and the alert’s To field. However, if the purpose of the schedule is only to send an alert, do not add recipients in the schedule’s To field.
3. Click Add Alert to open the Add Alert window.
4. Enter information for the alert.

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name*</td>
<td>Enter a name for the alert.</td>
</tr>
<tr>
<td>Exception</td>
<td>Click this drop-down menu to select the data exception that’s used to trigger the alert. The options that are listed in the menu are those that have been added to the report.</td>
</tr>
<tr>
<td>Rule</td>
<td>Enter the number of consecutive times the data exception must be met before the alert is triggered.</td>
</tr>
</tbody>
</table>

5. Click OK.
Cache Reports and Dashboards at Scheduled Times

Caching reports and dashboards that require large database queries can significantly improve report performance.

Running reports and dashboards that pull large amounts of information from multiple database tables can strain database resources. If several users need to run such reports and dashboards regularly, the resulting load can adversely impact site performance. Caching these reports and dashboards on a schedule can greatly reduce the load on the database while providing recent data for your reporting needs.

You can specify when you want your reports or dashboards cached. By default, they're cached hourly, though you can set caching intervals as short as fifteen minutes. Cached reports or dashboards are run on the server at the specified caching time. When a user needs to access the report or dashboard, they open it as they normally would. However, the report or dashboard they see is the version that was cached earlier. At the next scheduled caching time, the report or dashboard is run on the server again, replacing the previous version.

1. Click Analytics on the navigation pane.
2. Double-click Reports Explorer.
3. Navigate to the report or dashboard you want to cache, right-click the report or dashboard, and select Edit.
4. Click Caching on the Home tab.
   The Caching Options window opens.
5. Enter field information.

<table>
<thead>

</tr>
</tbody>
</table>

6. Click **OK**.

**How You Change Report Formatting**

When viewing a standard or custom report, you can change the report’s appearance and how data is displayed.

You can change the report’s colors, fonts, and other display options. You can also change formatting options to sort content, hide columns, add page breaks, and filter data to display only a subset of the records the report returns.

You can also change how data displays on the report using **slicing, cross tabs**, and **rollups**. You can also display **guided assistance** response data in a tree format to help you better review the flow of guided assistance responses.

**Note:** Your profile must include the Customize Reports Analytics permission to use these options.

**Related Topics**
- Analytics Permissions

**Apply a Style to a Report**

Styles can be applied to reports to change how the report text and background are displayed.

The fonts, colors, backgrounds, spacing, padding, and borders for the different report areas can all be changed by applying a style. If the style is associated with a chart style, the appearance of charts added to reports can also be modified.

You can use one of the predefined styles, edit an existing style, or create your own style and save it to use immediately or for reports you view in the future. For procedures on editing and creating styles, see **Styles Explorer**.

Styles you create or default styles can be applied to any report you view. The style you apply to the report impacts the report’s appearance when you print it, export it in certain formats, and forward it to others. There are a number of default styles to choose from. When creating a report for use on the Browser User Interface, we recommend using the Web Theme style which is formatted for use with web browsers.

1. From an open report, click the **Display** tab.
2. Click Auto Format. The Auto Format window opens.
3. To prevent the style from being applied to other levels in the report, clear the Apply Style to All Report Levels check box.
4. Click the style you want to use.

The report is updated to use the style you select.

Display Data Using Record or Tabular Layouts

Reports can be displayed using a record or tabular layout.

Most reports use tabular layouts with column headers across the top of the report and data listed in rows beneath the column headers. However, you can use a record layout to reformat the report to remove the column headers and instead display the field names inline with the field’s values from each record returned in the report. An incidents report is displayed here with the record layout.

**Note:** When a report total is included in a report with a record layout, the total is shifted to the left of the column that it totals. In addition, since reports displayed in a record layout do not have columns, some options that apply to columns, such as column width, do not apply.

</tbody>
</table>

---

1. From an open report, click the Display tab.
2. Click Data.
3. To display the report with a record layout, select Display Data in a Record Layout.
4. To display the report with a tabular layout, select Display Data in a Tabular Layout.

How You Change Report Display Options

Report styles let you change the display options for specific areas of a report, such as the title or data areas.

If you want to change the margins, width, background, and borders of the entire report, or change how the report output is displayed, you do so by changing the report's display options. These are modified using buttons on the ribbon or by using the tabs on the Display Options window.

**Related Topics**

- Overview of the Report Ribbon
Change Page Options
The Page Options tab on the Display Options window contains settings which control report width and the margins surrounding the report content.

1. From an open report, click the **Page Setup** tab.
2. Click the button to the right of the Display group name.
   The **Display Options** window opens with the **Page Options** tab selected.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report Width</td>
<td>Define the width of the entire report using the available options.</td>
</tr>
<tr>
<td>Best Fit</td>
<td>Select this option to display the report columns within the width of the window if possible. If data would otherwise be truncated, the width of the report spans beyond the open window and a scroll bar is added to the bottom of the page, allowing you to view the entire width of the report. When using this option, all content in the report is examined to calculate column width before the report displays. To reduce the report load time, select the Improve Display Performance data display option. See <strong>Change Data Display Options</strong>.</td>
</tr>
<tr>
<td>Fit in Window</td>
<td>Select this option to display the report columns within the width of the window. This can result in column names and data being truncated.</td>
</tr>
<tr>
<td>Specific Width</td>
<td>Select this option to manually specify the report width in pixels, inches, or centimeters.</td>
</tr>
<tr>
<td>Margins</td>
<td>Define the left, right, top, and bottom margins for the report.</td>
</tr>
</tbody>
</table>

4. Click **OK**.

Change Data Display Options
You can select data display options to control a number of features that modify how data in your report displays.

For example, you can add or remove row numbers and add links to the report, which allow staff members with appropriate permissions to modify records returned in the report. You can also output report data in a record format.

1. From an open report, click the **Page Setup** tab, and then click the button to the right of the Display group name.
   The **Display Options** window opens.
2. Click the **Data Display Options** tab.
3. To format the report in record layout, select **Display Columns in a Record Layout**. See **Display Data Using Record or Tabular Layouts**.
4. To fix the report’s column headers at the top of the report so they’re always visible when scrolling the report, select **Fix Column Headers**.
5. To add row numbers to each row of the report, select **Display Row Numbers**.
6. To display multiple calculations in the report on separate lines, select **Display Calculations on Separate Rows**. If this check box isn't selected and the report displays more than one calculation, the calculations display on the same line.
7. To reduce processing time when using the Best Fit option to automatically size report columns, select **Improve Display Performance**.

   By default, the Best Fit option examines content in every row and column in the report to calculate column widths. Selecting Improve Display Performance changes the processing to examine only the content initially displayed on the screen and in every 100th row in the report. Since not all content is examined, report load times are reduced, though some items in the report might be truncated.

   The Improve Display Performance option is ignored when using a report with **cross tabs, rollups, conditional formatting**, and **exceptions**, since these require examining all content before the report is displayed.

8. To add a column to your report which displays actions you can take on records in the report, select **Display Links Column** and select the commands you want to include in the column.

   If the rows do not see unique records, such as a specific incident or contact, the Display Links Column check box is disabled.

9. Click **OK**.

### Customize a Report Background

Adding colors or images to a report’s background can make it more suitable for presentations or other formal purposes. You can add colors and images from the Background tab of the Display Options window.

1. From an open report, click the **Page Setup** tab.
2. Click the button to the right of the Background group name.
3. Click the **Background** tab.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fill</td>
<td>This section lets you define the colors to be used for the report’s background.</td>
</tr>
<tr>
<td>Color/Top Color/Left Color</td>
<td>The text description for this option varies depending on the Gradient Mode you select. Click this box to select a primary color as the background. See Change Colors.</td>
</tr>
<tr>
<td>No Fill</td>
<td>Select this check box to clear any fill colors previously selected. If this box is selected, the other options on the Fill window are disabled except Color. Selecting a color automatically clears the No Fill check box, enabling the other options.</td>
</tr>
<tr>
<td>Gradient Mode</td>
<td>Select the positioning of the primary and secondary colors for the background from the Gradient Mode drop-down menu. Using gradient coloring lets you merge two colors. The following options are available.</td>
</tr>
<tr>
<td>Gradient Color/Bottom Color/Right Color</td>
<td>The text description for this option varies depending on the Gradient Mode you select. Click this box to select a secondary color to merge with the primary color. The fill colors then merge using the method defined in the Gradient Mode menu. See Change Colors.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
Transparency(%) | Select a percentage to define how intense the fill colors are. A setting of 100% is completely transparent and prevents the fill colors from displaying. A setting of 0% has no transparency, resulting in intense background colors. The selected percentage is immediately reflected in the Preview field, so you can scroll through the transparency percentages to find a value that best suits your needs.

Preview | This area provides a sample of how the fill colors you select will appear on the report background.

Picture | In addition to adding background colors for a report, you can add a background or watermark image to the report.

Select Image | Click Select Image to select the image to use with the report. Images are added using the Images explorer. See Images Explorer.

Clear Image | Click Clear Image to remove a previously selected image from the report.

Layout | Click this drop-down menu to define the placement of the image on the background. Available options are None, Title, Center, and Stretch.

5. Click **OK**.

Add a Border to a Report
You can also add borders to a report from the Display Options window. Each border can have different colors, styles, and weights applied.

1. From an open report, click the **Page Setup** tab.
2. Click the button to the right of the Display group name.
3. Click the **Borders** tab.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Color</strong></td>
<td>Click this box to select a color for the border. See Change Colors.</td>
</tr>
<tr>
<td><strong>Style</strong></td>
<td>Click this drop-down menu to select one of the following border styles: Solid, Dashed, Dotted, Inset, Outset, Double, Groove, Ridge, or Rounded.</td>
</tr>
<tr>
<td><strong>Weight</strong></td>
<td>Click this drop-down menu to select the width of the border in pixels. You can choose between 1 and 10 pixels.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Preview | This area defines the placement of the borders you define. Click any button to place a border or click the area in the Preview white space where you want the border.

Border buttons | Click one of the border buttons to add the selected border attributes to the top, bottom, left, right, or all sides of the component. You can also add or remove borders from all sides of the component.

5. Click **OK**.

**Show or Hide Report Sections**

Different sections in a report can display large amounts of information you may not need to see. You can select which sections you view in a report, making it easier to see only the information you want to view.

Report sections include **docked filters**, headers, footers, charts, **data exceptions**, and the data area, that shows the tabular data returned by the report. You can hide or display each of these.

1. From an open report, click the **Display** tab.
2. To remove a section from the report, clear its check box in the Sections tab group. The available check boxes are Docked Filters, Charts, Exceptions, Report Header, and Report Footer.
3. To add a section to the report, select the check box next to the section name.

**Note:** If a section is disabled, it cannot be added to the report since it was not included when the report was created.
4. To remove the data section from the report, click **Data** and select **Do Not Display Data**.

**Show or Hide Data Exceptions**

When you run a report that includes multiple data exceptions, you may not want to always display every exception in the report. You can hide any exception included in a report or show hidden exceptions from the Exception Visibility window.

1. From an open report, click the **Display** tab.
2. Click **Exceptions**.
3. To hide an exception, clear the check box next to the exception.
4. To display a hidden exception, select the check box next to the exception.
5. Click **OK** to apply the exception visibility to the report.

**Change Report Magnification**

When viewing a report, you can change the magnification level to better view the content.

The magnification slider always displays on the bottom right of the content pane, but is enabled only when viewing a report. The current magnification level is shown to the left of the slider. You can select levels ranging from 10 to 200 percent.

To use the slider, drag it to the left or right to decrease or increase magnification. You can also click the plus or minus sign on either end of the slider.
Hide or Show Columns Using the Field Chooser

If you don’t want to view all the fields included in a report when you view it, you can hide the fields temporarily. You can also display fields in the report that are hidden.

1. From an open report, click the Display tab.
2. Click Field Chooser to open the Field Chooser window.
3. To hide a column in a report, drag the field from the Show Fields in This Order section to the Available Fields section, or select the field to hide and click the left arrow.
4. To display a column that’s currently hidden, drag the field from the Available Fields section to the Show Fields in This Order section, or select the field to display and click the right arrow.
5. Click OK.

Hide or Show a Column Using Right-Click Options

You can use the right-click menu options to hide or show a column in your report.

1. To hide a column, right-click the column you want to hide and select Hide Column.
2. To show a hidden column, right-click a visible column, select Insert Hidden Column, and select the column you want shown in the report.

The column displays in the report in the column’s last location.

How You Change Report Sort Order

A report’s default sort options are determined by the report’s parameters and output.

After generating a report, you can change your sort options to sort by any column in the report. You can sort columns from the report’s Data tab or, if your report is shown using the report view, by clicking column headers.

Related Topics

- Running a Standard Report (video)

Change Sort Order Using the Ribbon

You can change the order of sorting information in a report.

1. From an open report, click the Home tab.
2. Click Sort. The Sort window opens.
3. Select the primary field you want to sort by from the Sort Items By drop-down menu.
4. To sort by the selected field in ascending order, select Ascending. To sort in descending order, select Descending. For example, to sort a report’s output by date created, with the newest dates at the top of the list, you would sort the output in descending order.
5. To sort menu fields by the sequence of the field’s entries, select Sort by Menu Sequence.

This option is available only when editing a custom report.

By default, when sorting information in a report using a menu field, the information is sorted by the menu field’s entries in alphabetic order. For example, sorting a report by the Incidents Severity field with entries of Severe, Mid-Range, and Unimportant in ascending order lists records with Mid-Range, then Severe, and then Unimportant severities.

However, when editing a custom report and defining the report’s default sort order, you can select the Sort by Menu Sequence check box to sort by the order or the menu field’s entries. Therefore, sorting the Severity field by sequence in ascending order would result in records with Severe, then Mid-Range, and then Unimportant severities. In this example, this sort order would likely be more helpful for those using the report.
6. To sort on additional fields, select the fields to sort on from the **Then By** drop-down menus. When you define multiple sort fields, the records are initially sorted by the first sort field. If any of the records have the same value for the first sort field, those records are then sorted by the subsequent sort fields.

7. To remove all sort options, click **Clear All**.

8. Click **OK**.

The report refreshes using the sort order you defined.

### Change Sort Order Using Column Headers

You can quickly change the sort order using column headers.

1. Click **Views** on the Display tab and verify that your report is shown using the report view.
2. Click the header of the column you want to sort by.
   - The report is sorted by the column you select in ascending order, and an arrow displays on the column's header.
3. To change the direction of the sort, click the column's header again.
4. To add additional levels of sorting to the report, press Shift and click the headers of the columns in the order in which they should be added to the sort.
   - The report is sorted by the selected columns in ascending order, and arrows display on the sort columns' headers.
5. To change a column's sort direction when sorting by multiple columns, press Shift and click the column's header.

### Enable Auto Filters

You can add auto-filtering to report columns, giving you a quick way to filter data on any field included in the report.

When this feature is enabled, a down arrow appears in the specified column headings of a generated report. By clicking the down arrow, you can filter the report by a value in that column. For example, in a column that displays incidents' associated products, you could click the down arrow to select a certain product. Only incidents associated with that product would display in the report.

Auto filtering hides filtered records but does not remove them from the report output. For this reason, total record counts displayed on the report will not change when auto filtering is used.

1. From an open report, click the **Home** tab.
2. Click **Auto Filter** to display arrows next to each column in the report. Click the Auto Filter button again to turn off auto filtering.
3. To filter on a column, click the down arrow located in the column's header to open the drop-down menu for the column.

   **Note:** When data is filtered by a value in a particular column, the down arrow in that column's header changes from blue to red to show that filtering is active.

4. To show only those records that have a specific value for the column, select the value to filter on. Any records that do not have this value are removed from the report output.
5. To remove any filtering on values in the selected column, select **All**.
6. To show only those records with values at the top or bottom ranges of the selected field's values, select **Top 10**. When you select this option, the **Top 10** window opens.
   - a. Select **Top** or **Bottom** from the Show drop-down menu to define whether the records with the highest or lowest field values are displayed.
      - The definition of what a high or low value in a field is depends on the type of field. For example, in date fields, the oldest dates are at the top and the newer dates are at the bottom, whereas values in text fields are in descending alphabetical order.
b. Select the number of records or the percentage of the total number of records returned in the report to include in the filtered data.

c. Select whether the filtered data should include a specific number of items or a percentage of the total number of records.

d. Click **OK**.

7. To create a custom filter on the field, perform the following steps:

   a. Select **Custom**.

      The **Custom Auto Filter** window opens. Only records that match your custom filter display in the report.

   b. Define the custom filter you want to use.

      The filter options vary somewhat depending on the type of field that's being filtered on. For example, date fields include calendar options, whereas text fields do not. However, every window has a drop-down menu from which you can select the operator, and an area to enter the filter value. See **Overview of Report Filters**.

      **Note**: To specify values from menu fields, the value must be entered manually. When using the In List or Not In List operators, the values must be comma-separated. Text values must be enclosed in single quotation marks. For example, to enter multiple names from the Incidents.Assigned field (incidents.assgnacct_id), enter them as ‘Bob Jones’, ‘Sarah Smith’, ‘Tom Payne’.

   c. Click **OK**.

---

### Add Page Breaks

You can add page breaks to your reports to make them easier to use.

If page breaks are added to a report, only the specified number of rows display. A report with page breaks includes controls to navigate to other pages.

**Note**: When page breaks are added to a report, the slicing, cross tab, and rollups options are disabled. In addition, page breaks are disabled in published reports.

Page breaks can be added from the Search window or from the Display tab when viewing a report. The following procedure describes adding page breaks from the Display tab. See **How You Search in Reports** for information about using the Search window.

1. From an open report, click the **Display** tab.

2. Click **Page Report** and select the number of rows per page you want for your report.

3. To specify a different number of rows per page, click **Page Report** and select **More Options**.

   a. Select **Page Report**. If the report is already paged, this check box is automatically selected when you open the window.

   b. Enter the number of rows you want on each page in the **Rows per Page** field.

   c. Click **OK**.

4. To remove paging from the report, click **Page Report** and select **Remove Paging**.

   After you select the number of rows you want, the report displays with a list of page numbers and arrows at the top of the page. Clicking |< or >| takes you to the first or last page of the report. Clicking < or > takes you to the preceding page or the next page of the report. If enough pages are present in the report, you will also see << and >> at the top of the report. Clicking these arrows displays the preceding or next set of page numbers in the report controls.

---

### How You Slice Report Data

Slicing a report allows you to group tabular data sharing common values in fields included in the report.
Slicing a report allows you to group tabular data sharing common values in fields included in the report. You can then select from the slice tree or links and view only the report data that matches the selected field values. For example, in an incidents report, you could slice by the assigned staff member to display incidents assigned to that person. You could then further break down the incidents assigned to the staff member by other fields such as status.

**Note:** When slicing and cross tabs are applied to a report at the same time, the cross tab is applied first, followed by slicing.

An example of an incidents report sliced in this manner is shown in the following figure. The slice options are displayed in a tree format.

![Incidents report sliced by assigned account](image)

The next figure shows a report sliced on assigned account with the slice options displayed as links.

![Incidents report sliced by assigned account](image)

**Tip:** You can hide the slice section in your report by clicking the section’s Auto-Hide button or you can remove slicing from the report by clicking the Close button on the slice section’s header.

**Slice Report Data**

You can configure a report you’re viewing to display the report’s data in slice groups.

1. From an open report, click the **Home** tab.
2. Click **Slice**. The **Slice** window opens.
Tip: When viewing a report using the layout view, you can select a column, click the Design tab, and click Slice to slice the report by the selected column.

3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slice By</td>
<td>Select from the following options to define the slice by column values or buckets.</td>
</tr>
<tr>
<td>Column Values</td>
<td>Select this option to define slicing by specific values in the fields included in the report. For example, if slicing on the incidents' Status Type field, you can slice on Unresolved, Waiting, or Solved.</td>
</tr>
<tr>
<td>Buckets</td>
<td>Select this option to define slicing by groupings of values in the fields included in the report, such as Solved and Waiting incidents. When you select this option, the window changes to let you define the groupings. See Define a Slice Bucket.</td>
</tr>
<tr>
<td>Display Slices</td>
<td>Select from the following options to define how the slice groups selection appears in the report.</td>
</tr>
<tr>
<td>As a Tree</td>
<td>Select this option to display slice groups in a tree that's docked to the report.</td>
</tr>
<tr>
<td>Show Group Counts</td>
<td>Select this check box when displaying slices as a tree to include the number of records in the slice group. The number displays next to each group name in the tree.</td>
</tr>
<tr>
<td>As Links</td>
<td>Select this option to display the slice groups as links above the data. This option is available only when a single report field is included in the slice.</td>
</tr>
<tr>
<td>Slice Items By</td>
<td>Select the fields to slice items by. If more than one field is selected, the first field defines the top slice group, and the subsequent fields selected define subgroups in the top group. If there are multiple slice fields defined, and the first is set to None, the other slice fields are also cleared.</td>
</tr>
<tr>
<td>Ascending/Descending</td>
<td>Select these options to sort the entries in the slice tree or links in ascending or descending order.</td>
</tr>
<tr>
<td>Sort by Menu Sequence</td>
<td>When slicing by a menu field, such as incidents status, select this check box to order the slice groups using the order of the options in the menu field. If this check box isn't selected, the slice groups will be ordered alphabetically. This option can be configured only when editing the report on the report designer. See Open the Report Designer.</td>
</tr>
</tbody>
</table>
### Define a Slice Bucket

Slicing records by buckets lets you define groupings of data to sort on that would not be allowed by slicing on specific values in a field.

For example, slicing incident reports on the date created values may not be effective since the unique values in date/time fields cover a small span of time. Slicing on such a field would result in very granular slices. However, defining a slice bucket on the date created field would allow you to slice the report output by incidents created during a date range, such as the past seven days.

1. From an open report, click the **Home** tab.
2. Click **Slice**.
   - The **Slice** window opens.
3. Select **Buckets** in the Slice By section.
   - The options on the Slice window change to let you create, edit, or delete buckets.
4. Select the field on which to slice from the **Slice Column** drop-down menu.
5. Click **Add Bucket**.
   - The **Slice Bucket** window opens.
6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name*</td>
<td>Enter a name for the new bucket.</td>
</tr>
<tr>
<td>Operator</td>
<td>Click this drop-down menu to select the operator to use. Operator options are the same as those available when defining filter values, described in <em>Overview of Report Filters</em>.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Value | Select the values from this field to add to the bucket. The available values change depending on the field selected. For example, some fields display drop-down menus with various values to select, while other fields display a calendar to select specific dates or date ranges.

To specify values from menu fields, you must manually enter the value. When using the In List or Not In List operators, the values must be comma-separated. Text values must be enclosed in single quotation marks. For example, to enter multiple names from the Incidents.Assigned field (incidents.assgn_acct_id), enter them as 'Bob Jones','Sarah Smith','Tom Payne'.

7. Click **OK** to return to the main Slice window.

**Define a Cross Tab Report**

Cross tabs let you display report output in a table to summarize large amounts of data.

Using a cross tab table, you can select the fields to define the table’s rows, columns, and output fields, essentially grouping the data by both the row and column output. The output fields are a culmination of the row and column data. For example, if you had a report that returned the number of incidents assigned to each agent and the incidents’ statuses, you could designate the assigned account column as a row field, status as a column field, and number of incidents as a data field. The output would be similar to the sample report displayed in the following figure, which shows the number of incidents categorized by assigned staff member and status.

<table>
<thead>
<tr>
<th>Open Incidents</th>
<th>Status - Created</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assigned Account</td>
<td>Solved</td>
</tr>
<tr>
<td>Ed Long</td>
<td>1</td>
</tr>
<tr>
<td>Mary Parker</td>
<td>2</td>
</tr>
<tr>
<td>Jeff Carell</td>
<td>1</td>
</tr>
<tr>
<td>George Smith</td>
<td>0</td>
</tr>
<tr>
<td>John Hudson</td>
<td>0</td>
</tr>
<tr>
<td>No Value</td>
<td>0</td>
</tr>
<tr>
<td>Total</td>
<td>5</td>
</tr>
</tbody>
</table>

After you view your report data using the columns, rows, and output fields you define, you can select different fields to use as the columns, rows, and output fields. This lets you restructure the report to view groupings of different data, such as the number of incidents each staff member has, grouped by category instead of product. Without using cross tabs, the only way to retrieve these different summaries of data would be to use separate reports.

**Note:** When cross tabs and slicing are applied to a report at the same time, the cross tab is applied first, followed by slicing.

1. From an open report, click the **Display** tab.
2. Click **Cross Tab**.
3. Select **Choose Columns**.
   - The **Cross Tab** window opens.
4. Enter field information.
### Using B2C Service

<td>Select this check box to perform cross tab calculations. An additional column displays for each cross tab calculation.</td>
</tr>
<tr>
<td>Clear All</td>
<td>Click this button to clear all fields and reset the cross tab definition.</td>
</tr>
</tbody>
</table>

5. Click **OK**.
6. To remove cross tabs from your report, click **Cross Tab > Reset**.
7. To perform cross tab calculations on the report, click **Cross Tab > Perform Cross Tab Calculations**.
8. To switch between displaying output fields above or below column fields, click **Cross Tab > Display Output Fields > On Top or On Bottom**.

### Define Rollups

You can define rollup levels in a report to group data beneath headings in the report. You can add additional rollup levels to further break down the data under each heading by grouping data under subheadings.

Using rollups, you can group rows in a report that share the same value in the columns you select for the rollup levels. For example, you can use rollups in an incident report to group incidents by their status. You can then add a second rollup level to group incidents with the same status by their assigned staff account.

1. From an open report, click the **Home** tab.
2. Click **Rollups**.
   
   **Tip:** When editing a report on the report designer, you can select a column and click **Rollup** on the Design tab to roll up the report by the selected column.
3. Select **Choose Columns**.
The **Rollups** window opens.

4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rollup Items By</td>
<td>Select output columns from the drop-down menus in this section to use as the primary rollup level. After you select a column, you can select the sort order for the rollup column. Options include Do Not Sort, Sort Ascending, and Sort Descending. You can add additional columns to the primary rollup level in this section by selecting the columns from the other drop-down menus. When multiple columns are used in a rollup level, the data displayed in the same rollup heading has the same values in all the columns selected for the rollup level.</td>
</tr>
<tr>
<td>Show Field in View</td>
<td>Select this check box to display the rollup column you selected as a column in the report. If this check box isn't selected, the column name displays in the rollup heading, but isn't included as a column in the report output.</td>
</tr>
<tr>
<td>Then By</td>
<td>Select output columns from the drop-down menus in this section to use as the secondary rollup level. After you select a column, you can select the sort order for the rollup column. Options include Do Not Sort, Sort Ascending, and Sort Descending. Secondary rollup levels break down the data in the primary rollup level according to the columns selected for the secondary level. After you define a secondary rollup level, an additional Then By field displays, allowing you to define a third rollup level to further break down the data grouped in the secondary rollup level. If records grouped in the secondary rollup have null values for the rolled-up field and if the rolled-up column is formatted to display blanks for records with null values, the header for the secondary rollup level does not display.</td>
</tr>
<tr>
<td>Display Rollup Headings</td>
<td>Select this check box to display the rollup headings and subheadings. If this check box isn't selected, the headings do not display, though the report data is still sorted as if the headings were present.</td>
</tr>
<tr>
<td>Display Rollup Headings Multi-Line</td>
<td>Select this check box to display each rollup column as a separate heading. If this check box isn't selected when using multiple columns in the same rollup level, the columns for the rollup level display in the same heading. This check box is disabled if the Display Rollup Headers option isn't selected. Note: This option isn't currently supported on the Agent Browser User Interface.</td>
</tr>
</tbody>
</table>
5. To remove the rollups you have selected on the Rollups window, click **Clear All**.
6. Click **OK** to generate the report using the rollups settings.
   The report refreshes, displaying the rollup levels you defined.

7. To quickly remove rollups from your report, click the arrow on the **Rollups** button and select **Reset**.
8. To display the number of records in each rollup group, click the arrow on the **Rollups** button and select **Display Group Counts**. Repeat this to hide the headings.
9. To display headings for each rollup group, click the arrow on the **Rollups** button and select **Display Rollup Headings**. Repeat this to hide the column name.
10. To show the name of the rolled-up column in the heading for each rollup group, click the arrow on the **Rollups** button and select **Display Column Headings**. Repeat this to hide the column name.
11. To display repeating column headers, click the arrow on the **Rollups** button and select **Repeat Column Headings**. Repeat this to hide repeating column headings.
12. To collapse all the rollup headings in a report, click the arrow on the **Rollups** button and select **Collapse All**.
   When viewing a report with rollup headings, you can click the minus or plus button next to each heading to collapse or expand the headings to hide or display the rows beneath the headings.

**Display Guided Assistance Information in Tree Format**
Guided assistance allows you to offer help to your customers using questions that then branch to other questions or answers.

Displaying the guided assistance questions and responses in a way that clearly shows the relationships between them can be challenging using the standard formats available for reports. However, you can configure reports that output this information to display the report columns in a tree format to clearly show the branching relationships in the data. See **Overview of Guided Assistance**.
Note: This option is available only when the report displays information from the Guided Assistance Responses (decision_tree_responses) table. This option is disabled when the report is configured to display data using cross tabs. See Define a Cross Tab Report.

The following report is configured to display guided assistance data in a tree format.

1. Open the report that contains the guided assistance information.
2. Click the Display tab and then click Guide.
   The Edit Guide Display Options window opens.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Columns</td>
<td>This section lists the output fields included in the report. Fields from this section can be dragged to the row fields, question fields, and response fields sections, or a field can be moved by selecting it and clicking the right arrow.</td>
</tr>
<tr>
<td>Row Fields</td>
<td>Move fields to this section to define them as rows in the report. Row fields generally do not have a parent/child relationship with other data in the report, but instead show data that applies to the entire guide tree. For example, a row field could display the name of the guided assistance guide that includes the question and response fields.</td>
</tr>
<tr>
<td>Question Fields</td>
<td>Move fields to this section to define them as question fields in the report. These fields generally display information pertaining to the questions, such as the question description or question type.</td>
</tr>
<tr>
<td>Response Fields</td>
<td>Move fields to this section to define them as response fields in the report. These fields generally display information pertaining to the responses, such as the response description or response order.</td>
</tr>
<tr>
<td>Parent Question Field</td>
<td>Click this drop-down menu and select the field you want to use to display the parent question in the tree. Only integer or text type fields can be selected.</td>
</tr>
<tr>
<td>Child Question Field</td>
<td>Click this drop-down menu and select the field you want to use to display the parent question's child questions. Only integer or text type fields can be selected. In addition, the field type must match that of the field selected for the parent question field.</td>
</tr>
</tbody>
</table>
How You Save Report Display Settings

You can choose to save or clear any changes to the report display settings.

After you edit a column or make changes to a report's output options, you can use the Save as Default and Restore options on the Home tab's Default Settings button to preserve the changes or to clear any changes you made.

Save Display and Data Settings for a Report

Using the Save as Default feature, you can save changes to a report's display and data settings to your workstation so the report uses the same settings you have previously defined.

When you change display and data settings or column formatting to modify a report's appearance, those changes are lost when you close the report. However, you can save your preferences for these settings as your default so they're used automatically when you next open the report.

If you save default settings for a report and the report's default settings are later changed, your saved settings are removed. Saved settings are user specific, so you must log in as the same staff account to have your saved settings applied to the report. See Change Your Personal Settings.

1. Open a report and change display and data settings.
2. Click the Home tab.
3. Click Default Settings > Save as Default.

Reset Display and Data Settings

You can remove a report's display and data settings that are stored on your workstation. This restores these settings to the defaults defined in the report.

1. Open a report that has display and data settings stored on your workstation.
2. Click the Home tab.
3. Click Default Settings > Restore.
   A warning message asks if you're certain you want to restore the default settings.
4. Click Yes to delete your personalized report settings from your workstation.

How You Edit Data on a Report

When a report displays unique records, such as incidents or opportunities, the Inline Editing feature lets you edit the values in columns shown on the report without opening the records.

Individual values can be edited directly from the report, or you can edit values in multiple records. For example, if a report shows the staff member an incident is assigned to, you can change the assigned staff member from the report without opening the record, or you can reassign several incidents shown on the report to a selected staff member.
Note: In order for staff members to edit records using inline editing, their profile must include permission to edit the type of records returned in the report. See Analytics Permissions. In addition, inline editing must be enabled for the report and the report must display data that can be edited. See Enable Inline Editing.

When you edit data inline on a report, the changes you make need to be saved to the server. If this done, the information stored in the server’s database will not be updated. You can either manually save the changes or use the Auto Save feature to automatically save each change after it’s made.

Edit an Individual Value Inline

When editing options are enabled in a report, the data shown for a record on the report can be edited directly without opening the record.

Editing options vary depending on the type of field being edited. For example, a text field presents a text box and a menu field presents a drop-down menu.

1. Click the row that displays the information you want to edit.

   **Tip:** You can see which fields can be edited inline by hovering over the fields on the selected row. Fields that can be edited are highlighted in blue.

2. Click the field that you want to change. Editing options specific to the field’s data type display. For example, menu options display for menu fields and date options display for date fields.

3. Enter the new value.

4. Press Enter or click outside the field you’re editing. Changes to some field types are applied automatically when you enter the value.

   **Tip:** You can press Esc to cancel the edit.

5. If inline edits aren’t saved to the server automatically, click Save to save the change to the server. See Save Edits Performed Inline.

Use Slicing to Edit Records

One of the methods you can use to edit fields enabled for inline editing is to drag a record from a report to a slice node that is defined by the same field. By default, you cannot edit any fields using drag-and-drop that aren’t used in the slice tree.

As an example, if a report is sliced by incident status, you can drag an unsolved incident to a slice node grouping solved incidents to change the incident’s status to Solved.

**Note:** You can’t customize slice drag-and-drop options when running a report. The options must be configured when editing the report on the report designer.

By customizing slice drag-and-drop options, you change the drag-and-drop behavior to edit fields in a record that aren’t used in the slice tree. For example, you can associate several tasks with an incident by dragging the tasks from the report output to the slice node that includes the incident you want them associated with.

This feature is also useful when working with custom objects and attributes with record associations. For instance, if you use a custom attribute in incident workspaces to create associations with parent incidents, you can drag incidents listed on a report and drop them on a slice node that contains the parent incident you want them associated with.

1. Open the report you want to edit on the report designer.
2. Click Inline Editing on the Home tab to ensure inline editing is enabled.
3. Click Slice.
The Slice window opens.
4. Click the Slice Items By drop-down menu and select the column you want to use to slice the report output. The column you choose to slice by is used to create groups of records. It does not necessarily store the values that are changed when dropping values from other records. The column that stores the values that are changed will be selected below.
5. Click Drag and Drop Options. The Drag and Drop Options window opens.
6. Select Enable Drag and Drop. This check box is selected by default; however, it's disabled if the slice column is enabled for inline editing.

**Note:** If you select multiple columns to slice by on the Slice window, you can select the On Drop Apply Edit to Only this Column in the Slice Tree check box to prevent values in the dragged records from being changed automatically. This check box is cleared by default, which results in the records dragged to the slice tree having their values changed to match that in the other slice columns. For example, if you have a second slice on Status and drag an unresolved incident to a slice that groups incidents with a Solved status, the incident you drag will have its status set to Solved. This check box has no impact if only one column is used in the slice.

7. Click the Source Column drop-down menu and select the column with the values you want to use in the destination column.
8. Click the Destination Column drop-down menu and select the column you want to populate using the values from the source column.

The options displayed in the drop-down menu depend on the selected source column since the columns must have the same data type (such as text, currency, or integer).
9. Click OK.
10. Click OK to close the Slice window.
11. Click Save.

When you run the report, you will drag records you want to change to the slice tree. Those records will have their record associations changed to match that of the record included in the slice you drag them to.

- How You Edit Data on a Report
- Enable Inline Editing

**How You Edit Values in Multiple Rows**

If your report includes numerous rows with the same value that you want to edit, you can select the rows and change the value using the Edit Selection feature.

You can also use slicing to group the records by the field you want to edit and then drag the records you want to change to the correct slice group.

**Edit Values in Multiple Rows Using the Ribbon**

Multiple records can be selected and edited using the ribbon.

1. From an open report that allows inline editing, press Ctrl while selecting each record.
2. Click the Home tab.
3. Click Edit Selection.
   A menu displays the fields that can be edited in the rows.
4. Select the field that you want to edit.
Editing options specific to the field's data type display.

5. Enter the value you want the selected records to have.
6. Click OK to apply the change to the selected records.
7. If inline edits aren't saved to the server automatically, click Save on the Home tab to save the changes to the server. See Save Edits Performed Inline.

Edit Multiple Values Using Slicing
You can select and edit multiple records using slicing.

1. Slice the report to group the records by the field you want to edit, displaying the slices as a tree rather than links.
   
   For example, if you want to reassign several incidents to a different staff account, slice the report by the report’s Assigned Account column. See How You Slice Report Data.

2. Select the folder in the slice tree that contains the records you want to edit.
3. Press Ctrl while selecting each record you want to edit.
4. Drag the selected rows to the folder on the slice tree that shows the value you want. After you drop the rows on the slice tree, the report is updated to show the new values for the selected rows.
5. If inline edits aren't saved to the server automatically, click Save on the Home tab to save the changes to the server. See Save Edits Performed Inline.

Save Edits Performed Inline
When you edit data inline, the changes need to be saved to the server.

If the Auto Save feature is enabled, each change is saved automatically. However, you can also disable Auto Save if you want to make several changes and then save the changes to the server. See Enable Inline Editing for information about enabling Auto Save.

When data has been edited on a report but the changes have not been saved to the server, a visual indicator displays on the report next to the edited value. After the data is saved to the server, the visual indicator is removed.

1. To save changes automatically, click the Home tab and then click Auto Save. The button is highlighted when Auto Save is enabled.
   
   Any other inline edits made to the report's fields will be saved to the server automatically until the report is closed again.

2. To save changes manually, click the Home tab and then click Save.

Dashboards

Overview of Dashboards
Dashboards are particularly useful for managers who need to view a wide range of data from different reports. Using dashboards eliminates the need to open a large number of reports individually.

When viewing standard or custom reports, you generally open reports one at a time, and search for data in only the report that's active. However, you can view and search for data in several reports simultaneously by adding them to a dashboard. Each report in a dashboard retains the same functionality as if you opened the report separately, allowing you to access and work with a variety of data from one dashboard.
How You Create Dashboards

Dashboards are created and edited on the dashboard designer. You can modify your dashboards by adding images, text, and controls, and changing their appearance.

If you don’t want to create a new dashboard, you can copy an existing custom or standard dashboard in the Reports explorer and then edit the copy using the dashboard designer.

**Note:** Customizations made to report displays in existing dashboards aren’t carried over when copying dashboards. This can result in a copied dashboard displaying somewhat differently than the original.

Open the Dashboard Designer

The dashboard designer provides the tools you need to create and edit dashboards, and lets you access optional items such as text fields and images to enhance your dashboards.

The designer can be opened from the Reports explorer or by right-clicking a dashboard on the navigation pane and selecting Edit Report Definition. The following procedure describes opening the designer from the Reports explorer.

1. If your navigation set is configured to add dashboards from the file menu, do one of the following:
   - Click **File > Dashboard**. See Overview of Navigation Sets.
   - Click **Analytics** on the navigation pane and then double-click **Reports Explorer**.
2. To create a dashboard, click **New Dashboard**.
3. To edit an existing dashboard, right-click the dashboard and select **Edit**.
   
   The dashboard designer opens. The designer consists of the ribbon, the design surface, where the dashboard content is placed, and the reports explorer, which shows reports and other items you can place on the dashboard. For descriptions of the ribbon and main components, see Overview of the Dashboard Designer Ribbon and Overview of Dashboard Designer Components.

Overview of the Dashboard Designer Ribbon

When you open the dashboard designer, the ribbon includes the Home, Display, and Page Setup tabs from which you can access tools to edit the dashboard.

Each tab has one or more groups containing buttons you can use to modify the dashboard or items on the dashboard.

**Note:** To minimize the ribbon when editing a dashboard, double-click a tab. Click the tab to temporarily display the buttons and click the tab again to hide them. To permanently restore the tab buttons, double-click the tab again.

Dashboard Designer Home Tab

The options available on the Home tab let you preview the dashboard you’re editing and configure options that apply to the entire dashboard. For example, you can select a dashboard layout and specify when the dashboard’s contents should be refreshed.

<table>
<thead>

<tr>
<td>Audit Log</td>
<td>Click this button to open the audit log for the dashboard, which shows you when the dashboard was created, edited, run, and <em>published</em>, and which staff members performed these actions. See <em>View the Dashboard Audit Log</em>. The Expanded Report Audit Log is also available. This shows you when reports and dashboards have been generated, printed, exported, and previewed over the previous 30 days. See <em>View the Expanded Report Audit Log</em>.</td>
</tr>
<tr>
<td>References</td>
<td>Click this button to access predefined reports that show you the <em>workspaces, navigation sets</em>, and <em>report links</em> that use the dashboard you're editing. Viewing these items before editing a dashboard ensures that you're aware of other items that might be impacted by changes you make. If you decide the impact would be too great, you can create a copy of the dashboard and edit the copy instead. If you have the Analytics Administrator profile permission, you can access versions of these reports that include search options using the Report Management component. See <em>How to Monitor Report Usage</em>.</td>
</tr>
<tr>
<td>Display</td>
<td>The buttons in this group let you modify how the dashboard is displayed. For example, you can apply a style to all the reports on the dashboard to give them a similar appearance.</td>
</tr>
<tr>
<td>Screen</td>
<td>Click this button to display all the dashboard's reports on the screen when the dashboard is run. Each report can have separate scroll bars to view the report contents.</td>
</tr>
<tr>
<td>Scrollable</td>
<td>Click this button to display all the contents of each report on the dashboard. When this option is selected, each report displays in its preferred size and the height and width of the items in each report are fixed. Separate reports do not have separate scroll bars, but vertical and horizontal scroll bars are added to the dashboard if needed to display the entire dashboard. If the entire size of the dashboard exceeds 32767 x 32767 pixels, the dashboard contents are clipped when using scrolling.</td>
</tr>
<tr>
<td>Display Options</td>
<td>Click this button to change the dashboard's width, add report title bars, and select which report sections you want to display. See <em>Change Dashboard Display Options</em>.</td>
</tr>
</tbody>
</table>
### Dashboard Designer Display Tab

The options available on the dashboard Display tab let you add images and text fields, show the dashboard header and footer, and hide portions of the designer so you can see only the components you need.

<table>
<thead>
<tr>
<th>Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert</td>
<td>The buttons in this group let you add images and text fields to your dashboard. See <a href="#">How You Add Images and Text Fields to Dashboards</a>.</td>
</tr>
<tr>
<td>Sections</td>
<td>The check boxes and button in this group let you show or hide the Dashboard Header and Dashboard Footer sections, and choose how you want to display the dashboard’s description. See <a href="#">How You Add Dashboard Descriptions</a>.</td>
</tr>
<tr>
<td>Show/Hide</td>
<td>The buttons in this group let you show or hide different parts of the dashboard designer. Showing the reports explorer lets you select reports to add to the dashboard. You can also add rulers, rule lines, field outlines, section headers, and a grid to the design surface to help you create your dashboard. See <a href="#">Overview of Dashboard Designer Components</a>.</td>
</tr>
</tbody>
</table>
| Items       | The buttons in this group let you remove a selected report or a report placeholder from the dashboard, and let you show or hide the title of the selected report when the dashboard is generated.  
  
  The Remove button is disabled when the only report on a dashboard is selected. |
| Dashboard Tab | The buttons in this group let you add, delete, rename, and move dashboard tabs. See [How You Add Tabs to Dashboards](#). |

### Dashboard Designer Page Setup Tab

The options on the Page Setup tab let you configure printing options for the dashboard. These options are applied only when printing.

<table>
<thead>
<tr>
<th>Group</th>

</tr>
</thead>
<tbody>
<tr>
<td>Dashboard Tab</td>
<td>The buttons in this group let you add, delete, rename, and move dashboard tabs. See <a href="#">How You Add Tabs to Dashboards</a>.</td>
</tr>
</tbody>
</table>

---

**Group/Button** | **Description**
--- | ---
Auto Format | Click this button to apply a *style* to all the reports in a dashboard. This overrides styles applied to the individual reports. See [Apply a Style to a Dashboard](#). |
Layouts | Click this button to load a predefined dashboard layout. Layouts let you quickly select how many reports are shown on the dashboard and their position. When you select a layout, the design surface is automatically adjusted to conform to the layout you selected. See [Overview of Dashboard Section Layouts](#). |
Parameter Values | Click this button to open the Set Filter Values window where you can specify defaults for searching reports in the dashboard. See [How You Specify Dashboard Search Defaults](#). |
Add Tab | Click this button to add a tab to the dashboard. Tabs let you create multiple pages for the same dashboard, and you can select the reports that display on each tab. |
<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Print</td>
<td>The buttons in this group let you configure the dashboard for printing and add the Page Header and Page Footer sections.</td>
</tr>
<tr>
<td>Print Margin</td>
<td>Click this button to select the size of the margins used when printing the dashboard. The available options are Normal, Narrow, Medium, and Wide.</td>
</tr>
<tr>
<td>Size</td>
<td>Click this button to select the size of the paper used when printing the dashboard. The available options are Letter, Legal, Executive, A3, A4, and A5.</td>
</tr>
<tr>
<td>Portrait/Landscape</td>
<td>Click these buttons to print the dashboard in portrait or landscape mode.</td>
</tr>
<tr>
<td>Page Header/Page Footer</td>
<td>Select these check boxes to include a page header and page footer when printing the dashboard.</td>
</tr>
<tr>
<td>Print to Fit</td>
<td>Select this check box to scale the dashboard to your printer default page width and send the dashboard to the printer.</td>
</tr>
</tbody>
</table>

### Dashboard Designer Text Field Tab

The ribbon’s Text Field tab is shown when you select a text field on the dashboard designer.

You can use the buttons on the tab to edit the text field fonts, margins, and borders.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit</td>
<td>Click this button to open the Edit Text Field window, where you can select fonts, margins, fill colors, and borders for the text. Many of the buttons on the Text Field tab let you customize the same options available on the Edit Text Field window.</td>
</tr>
<tr>
<td>Arrange</td>
<td>The buttons in this group let you position and size the selected text field.</td>
</tr>
<tr>
<td>Anchor</td>
<td>Click this button to define an anchor style for the image or text field. Anchor styles determine how an image or text field moves in relation to the borders of the dashboard section. See <a href="#">Specify an Anchor Style for a Text Field</a> and <a href="#">Specify an Anchor Style for an Image</a>.</td>
</tr>
<tr>
<td>Bring to Front/Send to Back</td>
<td>Click these buttons to place the selected item on top of or beneath other overlapping items.</td>
</tr>
<tr>
<td>Size to Fit</td>
<td>Click this button to automatically shrink or expand the element containing the image or text field to fit the selected item.</td>
</tr>
<tr>
<td></td>
<td>Manually resizing the selected element disables Size to Fit.</td>
</tr>
<tr>
<td>Font</td>
<td>The buttons in this group let you change the font style, size, and color. You can also select font attributes, such as bold and italic, and change the text alignment within the text field. In addition, you can add a background color for the text field.</td>
</tr>
</tbody>
</table>
### Overview of Dashboard Designer Components

The tasks you perform when creating or editing a dashboard are performed using the dashboard designer’s ribbon, design surface, and reports explorer.

These components provide access to the reports, dashboard sections, and other items you use to create and edit dashboards.

<table>
<thead>
<tr>
<th>Dashboard Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page Header</td>
<td>This section accepts images and text fields and is displayed at the top of dashboards when you print them.</td>
</tr>
</tbody>
</table>
### Dashboard Section

<table>
<thead>
<tr>
<th>Dashboard Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dashboard Header</td>
<td>Contains text fields and images that display at the top of the dashboard. By default, the header contains text fields you can modify for the dashboard's title and subtitle.</td>
</tr>
<tr>
<td>Dashboard Description</td>
<td>Contains text that you can modify to provide general information about the dashboard. You can display dashboard descriptions inline to show the description on the dashboard or as text on a separate tab on the dashboard. See <a href="#">How You Add Dashboard Descriptions</a>.</td>
</tr>
<tr>
<td>Dashboard Items</td>
<td>Contains the reports and components you add to the dashboard. If you add tabs to the dashboard, the name of this section changes to Tabs, and a tree is added from which you can add content to each tab. See <a href="#">How You Add Tabs to Dashboards</a>.</td>
</tr>
<tr>
<td>Dashboard Footer</td>
<td>This section contains text fields and images that display at the bottom of the dashboard.</td>
</tr>
<tr>
<td>Page Footer</td>
<td>The page footer is similar to the page header section. The text fields and images added to this section display at the bottom of printed dashboards.</td>
</tr>
</tbody>
</table>

### Dashboard Design Surface

**The design surface displays the dashboard sections you want to include in the dashboard.**

After a dashboard section is displayed on the design surface, you can add, edit, and remove content in the section. For example, you can drag reports to the Dashboard Items section, insert text fields into the Dashboard Header, and change the background of the Dashboard Footer.

You can add rulers, lines, and headings to help you identify sections and fields shown on the design surface. These options are accessed from the Show/Hide group on the Display tab.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Rulers</td>
<td>Click this button to display horizontal and vertical rulers when designing the dashboard to provide a perspective on the size of the dashboard.</td>
</tr>
<tr>
<td>Show Rule Lines</td>
<td>Click this button to display horizontal lines separating the dashboard sections displayed on the design surface.</td>
</tr>
<tr>
<td>Show Field Outlines</td>
<td>Click this button to display borders around the fields you add to the dashboard.</td>
</tr>
<tr>
<td>Show Section Headers</td>
<td>Click this button to display a heading above each dashboard section.</td>
</tr>
<tr>
<td>Show Grid</td>
<td>Click this button to display a grid in the dashboard's header and footer sections to help you align items you add to the sections. You can also click the arrow on the button to select the grid size you want to use.</td>
</tr>
</tbody>
</table>
Dashboard Reports Explorer

The dashboard designer’s reports explorer lists the items that can be added to a dashboard. You add these by dragging them from the reports explorer to the dashboard’s design surface.

The reports explorer on the dashboard designer includes reports, notifications, infolets, and a web browser component that you can place on the dashboard. If your site is configured to use custom add-ins, they’re also available in the Components tree.

You can also hide the reports explorer to add more room to the design surface if you do not need to add reports. To hide the reports explorer, click the Display tab and then click the Reports Explorer button. You can click the button again to show the reports explorer.

**Tip:** You can drag the reports explorer and reposition it on the dashboard designer or open it in a new window just as you can move the data dictionary on the report designer. See *Move the Data Dictionary*.

Apply a Layout to a Dashboard

The use of layouts is optional, but they offer a helpful starting point when creating dashboards.

When creating a dashboard, you can use dashboard layouts to add predefined regions to the design surface. You can then drag reports and other content to the regions.

1. Click the **Home** tab.
2. Click **Layouts** to open the layouts menu.
3. Select the layout you want to apply to the dashboard.
   The design surface is updated to reflect the layout you selected.
4. To modify the spacing of the dashboard layout you selected, hover over the spaces between the report areas until the cursor changes to show direction arrows. You can then drag the borders to the position you want.

Consolidated Dashboard Layout

Unlike the other dashboard layouts that determine where individual reports display on the dashboard, the Consolidated Dashboard layout groups information from all reports on the dashboard into a single report.

Using this layout lets you display data from multiple, unrelated tables in a single report. While you can create reports that pull information from unrelated tables, they may fail to run due to database query limits.

Since consolidated dashboards combine data by matching the columns in the reports you add, all the reports must have the same number of columns and the corresponding columns in each report must have the same data type. For example, if one report has five columns, the other reports you add to the dashboard must also have five columns, all matching the data types of first report’s columns.

How You Place Content on Dashboards

You can add reports and other items to a dashboard by dragging them from the dashboard designer’s reports explorer to the design surface.

You can decide where to place each item and how much content you want on the dashboard. You can also add tabs to the dashboard to place additional reports and other content that may not fit on the dashboard’s main page.

There are five types of items you can add to dashboards from the dashboard designer’s reports explorer.

**Note:** Each dashboard can have a maximum of fifty items placed on it.
• **Reports**—Most items you add to dashboards will likely be reports, though there are considerations to keep in mind before you add them. Private reports on a dashboard can be viewed by staff members with permission to open the dashboard, even if the staff members do not have permission to view the individual reports. This may result in staff members seeing information they should not have access to. If a report used on a dashboard is deleted, the report is automatically removed from the dashboard and a placeholder for the report displays when the dashboard is viewed or edited. If you want to use the same report on a dashboard more than once with different default filter values to show different data, you need to create a copy of the report and add the copy along with the original report since only one set of filter values can be stored for each unique report on a dashboard.

• **Add-ins**—If you have installed add-ins that are designed to be accessible in dashboards, you can access them in the Components > Add-ins folder. You can drag add-ins to the dashboard just as you would drag a report. See *Overview of Add-Ins*.

• **Notifications**—You can drag the Notifications component, located in the Components > Common folder, to the dashboard to let staff members receive notices on the dashboard when particular events happen, such as an incident being assigned. See *Notifications*.

• **Infolets**—Infolets provide brief overviews of data pertaining to service performance, such as incident assignments and incident backlog. Infolets are intended for use by managers who need quick overviews of data without a great deal of detail. To add an infolet to a dashboard, drag the infolet you want from the Public Reports > Service > Infolets report folder to the dashboard. **Note:** The Agent Overview and Service Overview dashboards in the Infolets report folder provide a look at agent performance and the status of your contact center. Reviewing these dashboards will help you gain an understanding of infolets and how you might use them in your custom dashboards. When creating custom infolet dashboards, we recommend using the Infolet auto format style.

• **Web browser**—A web browser can be added to a dashboard as well, allowing staff members to navigate to a web page displayed in the dashboard. To add the browser to a dashboard, drag the Web Browser–Component report from the Public Reports > Common report folder to the dashboard. After the browser is added to the dashboard, you can specify a default URL in the dashboard’s parameters. See *How You Specify Dashboard Search Defaults*.

### How You Place Reports on Dashboards

You can place reports on dashboards using drag and drop from the reports explorer. You can remove reports at any time, and also replace existing reports with others.

If you need to make a change to a report on the dashboard, you can also open the report for editing directly from the dashboard.

**Note:** If your dashboard has only one report, you cannot remove it, but you can replace it with another report.

### Add a Report to a Dashboard

You can quickly add reports to a dashboard.

This procedure describes adding reports to the dashboard, but the same process is used to add any of the other items listed in the dashboard’s reports explorer.

1. In the dashboard designer’s reports explorer, navigate to the report you want to add to the dashboard. You can quickly locate reports by right-clicking a report folder in the reports explorer and selecting *Search*.
2. Select the report and drag it to the dashboard.
3. Drop the report on the design surface where you want the report to display.
When you drag the report to the design surface, positioning images, shown here, appear. Hovering over the various images highlights portions of the design surface. After the section where you want the report is highlighted, drop the report. The design surface refreshes to show the updated dashboard layout.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Entire Area" /></td>
<td>This icon group appears over the predefined dashboard section you’re hovering over when dragging a report. Hovering over the various icons in the group highlights different portions of the dashboard section where you can drop the report. You can hover over the center of the icon group to drop the report in the full dashboard section. You can also place the report in the top, bottom, left, or right portions of the dashboard section by hovering over the individual icons in the group. If you break up a predefined dashboard section when dropping your report onto the dashboard section, the dashboard's layout is split into smaller areas.</td>
</tr>
<tr>
<td><img src="image2.png" alt="Area Buttons" /></td>
<td>Drop a report over one of these icons to place the report in the top, right, bottom, or left areas of the dashboard.</td>
</tr>
</tbody>
</table>

4. To modify the size of the area where you placed the report, hover over the area’s borders until the cursor changes to show direction arrows. You can then drag the borders to the position you want.

5. Repeat these steps to add additional reports to the dashboard.

6. Click **Save**.

Remove a Report from a Dashboard
You may want to remove reports from a dashboard.
Right-click the report on the design surface and select **Remove**.

Or
Click the item on the dashboard, click the **Display** tab, and click **Remove**.

Replace a Report on the Dashboard
You can replace a report with another report from the reports explorer.
Drag the new report you want on the dashboard from the reports explorer and place it on top of an existing report on the dashboard. The existing report is replaced with the new report.

Open a Report for Editing from the Dashboard
Right-click the report on the design surface and select **Edit Report Definition**. The report opens on the report designer where you can edit it.

See **Open the Report Designer** for information about editing reports.
How You Add Tabs to Dashboards

Multiple pages containing reports can be added as tabs to the same dashboard.

When creating a dashboard, you may find that you want more reports than can easily be viewed or that you want to group similar reports together. By adding tabs to the dashboard, you can create multiple pages for the same dashboard, and you can select the reports that display on each tab. Each tab acts as a distinct page of the dashboard. Reports are added to the pages just as they would be if the dashboard had only one page.

Tip: Each dashboard can have a maximum of fifty tabs.

Add a Tab to a Dashboard

You can add additional tabs to the dashboard.

1. Click the Home tab.
2. Click Add Tab.

After you add a tab, the dashboard designer is updated to show the tabs on the design surface. The tab names will likely not be what you want, but you can change them.

Change the Name of a Tab

Tab names can be modified if needed.

1. Do one of the following:
   - Right-click the tab on the design surface and select Rename.
   - Click the tab, click the Display tab, and click the Rename button.
2. Enter the new name for the tab.
3. Click OK.

How You Add Dashboard Descriptions

Dashboard descriptions display information about the dashboard.

If you create a dashboard that will be used by other people, you can add a description to explain the purpose of the dashboard or to relay other information concerning the dashboard. The description text can display inline on the dashboard or as text accessed from a separate tab.

Add a Dashboard Description

You can use the Edit Dashboard Description option to change the dashboard description.

1. Click the Home tab on the dashboard designer’s ribbon.
2. Click Options and select Edit Dashboard Description.
   - The Edit Dashboard Description window opens.
3. Enter the text for the description.
4. Click OK.

Define the Description Location

You can directly display the dashboard description inline or display it on a separate tab.

1. Click the Display tab and then click Dashboard Description.
2. To display the dashboard description on the dashboard, select Display Dashboard Description Inline.
3. To display the dashboard description on a separate Description tab, select Display Dashboard Description on Separate Tab.
How You Add Images and Text Fields to Dashboards

You can add images and text fields to your dashboard’s header and footer sections to clarify the dashboard’s purpose or to make it more presentable to your target audience.

When you place an image or text field on the dashboard, you can either manually position the item or it can be positioned automatically depending on the section’s layout properties. After you add an image or text field to a dashboard section, you can reposition it if needed, and you can edit any text fields you have added directly from the dashboard.

Overview of Dashboard Section Layouts

You can set the layout for dashboard sections to be manual or automatic.

If the section has an automatic layout, the text field or image is positioned automatically, and the dashboard section’s height is adjusted to best fit the image or text field. You can also set table layout options to change how the items in the section are sized. By default, dashboard sections have manual layout enabled.

Enable Automatic Layout of a Dashboard Section

You can use an automatic layout of a dashboard section.

1. Add the dashboard section you want to your dashboard.
   a. To add the dashboard header or footer sections, click the Display tab and select the Dashboard Header or Dashboard Footer check box.
   b. To add the page header or footer sections, click the Page Setup tab and select the Page Header or Page Footer check box.
2. Click the dashboard section you want to modify on the design surface.
3. Click the Options tab and click Automatic.
4. To prevent the section’s height from being automatically adjusted to fit the items you add to the section, click Auto Height to disable the feature.

   Tip: When Auto Height is disabled, you can manually change the height of the dashboard section by dragging the section’s horizontal borders up or down, just as you would if the section had a manual layout.

If a dashboard section has an automatic layout, the images and text fields you add to it are arranged in an invisible table structure with the items placed in rows and columns. You can adjust the sizing of the rows and columns to arrange the images and text fields as you want them.

Change Table Layout Options

You can specify the table layout options for a dashboard section.

1. Add images and text fields to the dashboard section.
2. Select the dashboard section you want to modify on the design surface.
3. If the section has a manual layout, click Automatic on the Options tab to change to an automatic layout.
4. Click Table Layout on the Options tab.
5. To give each column in the section’s table the same amount of width, select Size All Columns Equally.
6. To give each row in the section’s table the same amount of height, select Size All Rows Equally.
7. To size each column to best show the column’s contents, select Auto Size All Columns.
8. To size each row to best show the row’s contents, select Auto Size All Rows.
9. To manually configure the table’s layout, select More Options.
   The Edit Table Layout Properties window opens.
10. Enter field information.
### Add a Text Field to a Dashboard

You can add predefined text fields to your dashboard, or you can add custom text fields you create in the Text Fields explorer. You can also add new text fields you create from the dashboard design center.

The dashboard’s page header, dashboard header, page footer, and dashboard footer sections all accept text fields. See [Create a Text Field](#) for information about creating custom text fields. After you add a text field to a dashboard, you can modify its text, fonts, colors, and borders to tailor the text field to the dashboard’s audience. These edits to the text field are specific to the dashboard and do not affect the original text field. This lets you customize the same text fields for different dashboards.

1. Add the dashboard section to the design surface that you want to add the text field to.
   a. To add the dashboard header or footer sections, click the **Display** tab and select the **Dashboard Header** or **Dashboard Footer** check box.
   b. To add the page header or footer sections, click the **Page Setup** tab and select the **Page Header** or **Page Footer** check box.

2. If you want the text field to be automatically positioned on the dashboard, click the **Options** tab, and click **Automatic**. See [Overview of Dashboard Section Layouts](#).

3. To add a preconfigured text field to the dashboard, click the **Display** tab and then click **Text**. The Insert Text Field window opens.
   - The window displays standard text fields and custom text fields that you have added in the Text Fields explorer. The text fields’ default fonts, colors, and other attributes are reflected in the display.

4. Click the text field you want to add to the dashboard. The Insert Text Field window closes, and the cursor displays the name of the text field you’re adding when you hover over dashboard sections that accept text fields, such as the dashboard header.

5. Click the dashboard section on the design surface where you want to add the text field. The text field is added to your dashboard.

6. To add a new text field that’s not in the Text Fields explorer, click the **Options** tab and click **Add Text Field**. The text field is added to the dashboard section with default text and text attributes which you can then edit. See [Edit a Text Field in a Report](#).

7. Click **Save**.

---

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>

<tr>
<td>Best Fit</td>
<td>Select this option to have the size of the selected row or column automatically adjusted to best fit the row’s or column’s contents.</td>
</tr>
</tbody>
</table>
Edit a Text Field on a Dashboard
After you add a text field to your dashboard, you can edit it to change the fonts, colors, text, and other attributes. These edits apply to the text in the dashboard, but the original text field isn't affected.

**Note:** Certain standard text fields, such as Current Date, include values that are dynamically updated when the report is run. While these fields can be edited, you cannot edit their dynamic value placeholders.

Right-click the text field and select **Edit Text Field**.

Or

Click the text field and then click **Edit** on the Text Field tab.

The **Edit Text Field** window opens. For the procedure to use the options available on this window, see *Edit a Text Field in a Report*.

You can also edit the text field using the buttons in the Font, Margin, and Border groups on the Text Field tab. These buttons provide shortcuts to many of the same options available on the Edit Text Field window.

Add an Image to a Dashboard
You can insert images you have added to your dashboard's page header, dashboard header, dashboard footer, and page footer. Images can act as backgrounds or header images in these sections.

See **Images Explorer** for information about adding images you can use on reports and dashboards.

1. Add the dashboard section to the design surface that you want to add the image to.
   a. To add the dashboard header or footer sections, click the Display tab and select the **Dashboard Header** or **Dashboard Footer** check box.
   b. To add the page header or footer sections, click the Page Setup tab and select the **Page Header** or **Page Footer** check box.
2. If you want the image to be automatically positioned on the dashboard, click the dashboard section, click the Options tab, and click **Automatic**. See *Overview of Dashboard Section Layouts*.
3. Click the **Display** tab.
4. Click **Image** to open the list of images added in the Images explorer.
5. Click the image you want to add.
6. Hover over the section where you want to add the image. The cursor displays the name of the image you selected when it's over a section that can accept an image.
7. Click to place the image in the dashboard section you select.
8. Click **Save**.

How You Move Images and Text Fields in Dashboards
After you add an image or text field to a dashboard section, you can move the field by dragging it to the appropriate place in the section. This may require dragging other text fields in the dashboard section to prevent the fields from overlapping.

If the dashboard section has a manual layout, you can move the item to any location in the section you want. If the dashboard section has an automatic layout, you can still move the item, but blue lines display when you drag the item, showing you where the item can be placed in relation to any other images or text fields in the section.

When you click an image or text field that has been added to a dashboard section, handles appear on the field's borders. To increase or decrease the size of the field, click the appropriate handle and drag it to a new position. When dragging a text field, the font size remains unchanged, but the text field's area is altered. However, when dragging an image, the image itself is resized.
How You Change Dashboard Properties
You can change the dashboard properties if needed.

Many of the buttons on the Home tab let you specify a number of options that impact how the dashboard can be used. For example, you can select who owns the dashboard, specify dashboard permissions, and set the time zone the dashboard uses when it's opened. You can also schedule the dashboard to be sent in an email, view an audit log to see who has viewed or edited the dashboard, and modify how the dashboard’s reports are searched.

Edit Dashboard Options
Dashboard options let you modify numerous aspects of the dashboard that change how the dashboard appears and functions.

You can select the time zone that should be used for the reports in the dashboard, change the dashboard owner, and modify settings that impact how the dashboard functions when it’s opened for viewing. You can also configure automatic refresh of the data shown in the dashboard’s reports, select data source options, add notes to the dashboard, and change the image displayed for the dashboard in report lists. These and other options are described in the following procedure and are also addressed in *Searching dashboard reports*.

1. **Click Options** on the Home tab, and then select **More Options** to open the Edit Settings window.

   **Note:** Most dashboard options can be selected from the Options button without opening the Edit Settings window.

2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Zone</td>
<td>Click this drop-down menu to select the time zone to be used with the dashboard’s reports. The dates and times listed in the report output, filters, and parameters are adjusted according to the time zone that’s specified. The available options are:</td>
</tr>
<tr>

<tr>
<td>Open dashboard without prompting for search parameters</td>
<td>Select this check box to open the dashboard using the default <em>runtime filters</em> for the reports. If this check box isn't selected, the Search window opens for the dashboard’s reports before the dashboard is displayed. Selecting this check box does not prevent the Search window from opening if a report has a required runtime filter. See <em>How You Search Dashboard Reports</em>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Refresh dashboard when data shown is changed due to an action initiated from this dashboard</td>
<td>Select this check box to automatically refresh the dashboard's reports when you initiate an edit from one of the reports in such a way that the reports' contents would change. The dashboard is refreshed only if a record is edited in such a way that the record no longer matches the dashboard reports' search criteria.</td>
</tr>
<tr>
<td>Combine filters on the same field in search dialog</td>
<td>Select this check box to combine filters on the same field used in multiple reports on the dashboard. For example, multiple reports on the same dashboard might all have filters to search by contact email address. If this check box is selected, the dashboard's Search window joins these into one common filter for this field. All the reports that have this filter are filtered on the search value entered for the common filter.</td>
</tr>
<tr>
<td>Combine filters with the same name and type in search dialog</td>
<td>Select this check box to combine filters that have the same name and filter on different fields with the same data type. For example, if there are two filters both named Contact, and one filter searches a text field for first name, and the other searches a text field for last name, these filters can be joined into one common filter. The search value entered for the common filter is checked against both the first name and last name fields.</td>
</tr>
</tbody>
</table>
| Cache the drilldown levels for all reports                          | Select this check box to automatically cache the data in report levels when they're displayed. When you open a dashboard with this option enabled, the data shown on the reports' initial output levels is stored on your workstation. When you drill down on a report to view another output level and then return to the report's top level, it loads quickly since the data you're viewing is cached on your workstation. The cache is cleared when you close the dashboard.  

If this option isn't selected, the database is queried every time you view an output level to ensure the most recent data is displayed even if you have already viewed the level. This default functionality can result in longer page load times than necessary when viewing reports with data that does not change frequently.  

This option is also available for individual reports. When using a dashboard that has this option enabled, the dashboard's setting overrides the settings in the dashboard's report. |
| Undock docked filters                                               | Select this check box to not dock filters on the dashboard that are docked in the dashboard's reports. If this check box isn't selected and a report on the dashboard includes *docked filters*, the filters are displayed in the dashboard's Search window, and are also docked above the reports in the dashboard. |
| Allow server to change the data source as necessary                 | Select this check box to allow the data source to automatically change if necessary to allow the dashboard to run. For example, if a dashboard is configured to run on the operational database but is unable to do so due to data constraints, selecting this check box allows the dashboard to run on the report database (also referred to as the replication database). Clearing this check box forces dashboards to run on the data source that's selected. |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This check box is cleared automatically any time the data source is changed on the Edit Settings window.</td>
<td></td>
</tr>
<tr>
<td>Set report to deferred execution</td>
<td>Select this check box to automatically queue the dashboard when it runs. If the dashboard is automatically queued the next time it runs due to meeting queuing criteria, this option is selected automatically. To prevent the dashboard from being queued when it's next run, edit the dashboard and clear this check box.</td>
</tr>
<tr>
<td>Data Source</td>
<td>Select which database you want the dashboard to run on. You can choose the operational or the report database. See <a href="#">Overview of Report Databases</a> for information about these data sources. This option is available only if your site has a report database. If your site does not have a report database, contact your Oracle account manager for more information.</td>
</tr>
<tr>
<td>Operational Database</td>
<td>Select this option if you want the dashboard to run on your operational database. This option is helpful if you need the dashboard to return the most current data available.</td>
</tr>
<tr>
<td>Report Database</td>
<td>Select this option if you want the dashboard to run on your report database. This option is helpful if your dashboard queries a large amount of data since the query size restrictions on report databases are more relaxed than those on operational databases.</td>
</tr>
<tr>
<td>Refresh current drilldown levels</td>
<td>Select this check box to automatically refresh the data shown on drill-down levels when the dashboard's display is refreshed without returning to the top levels of the dashboard's reports. When this option isn't enabled and the dashboard is refreshed, drill-down levels shown on the dashboard automatically return to the top level of the dashboard's reports.</td>
</tr>
<tr>
<td>Automatically refresh dashboard at a regular interval</td>
<td>Options in this section let you configure automatic refresh of the data shown in the dashboard's reports to ensure the most recent data is displayed.</td>
</tr>
<tr>
<td>Delay non-focused tab report execution</td>
<td>Select this option to prevent reports on dashboard tabs that you're not viewing from loading in the background. Selecting this option can improve dashboard performance by reducing the amount of time it takes for the dashboard to initially load.</td>
</tr>
<tr>
<td>Auto-refresh options visible at runtime</td>
<td>Select this check box to add an arrow on the Home tab's Refresh button. Clicking the arrow displays options to let staff members enable or disable automatic refresh and change the interval time. When this check box isn't selected, the Refresh button refreshes the dashboard's data only when the button is clicked.</td>
</tr>
</tbody>
</table>
### Field Description

**Auto-refresh enabled by default**  
Select this check box to enable automatic refresh of the data shown in the dashboard’s reports.

**Interval**  
Enter the number of seconds after which the data shown on the dashboard is automatically refreshed.

**Image**  
Click Change to select a different image to display next to the dashboard in lists such as navigation lists. When selecting the new image, you can choose from a list of standard images or from custom images that have been added in the Images explorer. See [Images Explorer](#).

**Notes**  
Enter any text you want to add as a note to the dashboard. The note displays on the Edit Settings window, but cannot be seen by individuals viewing the dashboard.

---

3. Click **OK**.

#### How You Schedule Dashboards to be Sent

You can schedule a dashboard to be sent to recipients or to be published in the same manner that reports can be scheduled.

When a scheduled dashboard is sent, the recipients receive an email containing the dashboard in the format you select when creating the schedule.

**Note:** Dashboard schedules cannot have alerts applied as report schedules can, since dashboards do not have data exceptions associated with them. In addition, dashboards cannot be sent to comma-separated values (CSV) files.

To open a dashboard's Schedules window, click the **Scheduling** button on the Properties tab. See [How You Schedule Reports](#).

#### Set Dashboard Permissions

A dashboard’s permissions specify the profiles whose staff accounts can open or edit the dashboard. You can select Open and Edit permissions for each profile defined in your system. Permissions applied to a private dashboard take effect only when the dashboard is made public.

1. Edit a dashboard and click the **Home** tab.
2. Click **Permissions**.
   
The Permissions window opens.
3. To let staff members open the dashboard, select the check box next to their profile name. You can select multiple profiles.
4. To let staff members edit the dashboard, select the check box next to their profile name. You can select multiple profiles.
5. Click **OK**.

---

**ORACLE**
View the Dashboard Audit Log

You can open an audit log for a dashboard to see when the dashboard was created, edited, run, and published, and which staff members performed these actions. Since the audit log is a report, you can perform common report actions on the audit log, such as printing, forwarding, or slicing.

The audit log shows you when the dashboard was edited and generated, but not all actions taken on the dashboard, such as previewing it, are listed in the audit log. If you need to see every instance of a dashboard or report being generated, printed, exported, and previewed, you can use the Expanded Report Audit Log. See View the Expanded Report Audit Log.

1. Edit a dashboard and click the Home tab.
2. Click Audit Log.
3. To access a list of actions that can be taken on the audit log report, click Options. Many of the actions available when viewing other reports are available on the Options button. See Overview of the Report Ribbon for descriptions of these actions.
4. Click OK.

How You Specify Dashboard Search Defaults

You can specify search defaults for the reports in a dashboard.

When opening a dashboard, the dashboard’s reports automatically display with their default filter values, comparison date offsets, and output variables. However, you can select different defaults for the reports when opened from the dashboard by changing the dashboard’s parameter values. If your dashboard includes the Web Browser–Component report, you can also specify a default URL for the web browser displayed in the dashboard.

You also have the option to set limits on the total number of rows returned in each report or the number of rows returned on each page of the reports. In addition, you can enter Search Design Mode to modify the layout of the filters on the dashboard’s Search window. For more information about searching for information in the reports shown in a dashboard, see How You Search Dashboard Reports.

Set Dashboard Search Defaults

You can change the default values set for the report parameters, for example you can specify the total number of rows returned in the reports.

1. Edit a dashboard.
2. Click the Home tab.
3. Click Parameter Values to open the Set Filter Values window.
   - The window displays the runtime selectable filters, comparison periods, and variables that are in the dashboard’s reports. If any of the reports have identical filters, comparison date offsets, or output variables, these are grouped together. You can also set limits on the number of rows returned on each page of the reports or the total number of rows the reports can return.
4. Select the default values you want for the reports’ variables and filters.
5. To set record or page limits on the reports, select options in the Limit section of the Set Filter Values window.
   - Select the Limit To check box.
   - Enter the number of rows to return.
   - Select the Per Page check box to apply the entered row limit to each page of the report.

   **Note:** If the Per Page check box isn’t selected, the row limit you enter restricts the total number of rows returned in the reports.
6. To clear the customized default search parameters specified for the dashboard, click Settings and select Reset Values. When you do so, the dashboard’s default search parameters are reset to use the reports’ default search parameters.

7. To modify the sizes and placement of the filters on the Search window, click Settings and select Enter Search Design Mode. See Overview of the Search Window.

8. Click OK.

How You Customize Your Dashboard Display

You can customize the appearance of your dashboards to make it more usable or presentable to your audience. Numerous options are available to customize dashboard display. These include applying styles, selecting font attributes, modifying sizing options, and adding titles to the dashboard’s reports.

Apply a Style to a Dashboard

Dashboards can have report styles applied to them, just as individual reports can. When you apply a style to a dashboard, all reports on the dashboard use the same style when viewed from the dashboard.

You can create your own styles, or choose from a number of default styles. Two of the default styles are intended for specific purposes, though you can choose whichever style you want.

- **Infolet**—We recommend using this style with dashboards that primarily contain infolets. This style is formatted to provide the most efficient use of space for viewing infolets. For information about infolets, see How You Place Content on Dashboards.
- **Web Theme**—This style is intended for use on the Browser User Interface. This is formatted to provide a consistent look and feel when viewed in a web browser.

1. Click the Home tab.
2. Click Auto Format to open the Auto Format window.
3. To prevent the style from being applied to all levels in the reports shown on the dashboard, clear the Apply Style to All Report Levels check box.
4. Click the style you want to apply to the dashboard.

The report style is automatically applied to all the reports in your dashboard. If you later add a new report to the dashboard, you will need to apply the style to the dashboard again for the style to be applied to the new report. See Apply a Style to a Report for information about applying a style to a report. For procedures on editing and creating styles, see Styles Explorer.

Change Dashboard Display Options

You can adjust the dashboard's display options to add margins and titles to the reports in the dashboard. You can also specify which report sections should display in the dashboard’s reports.

1. Click the Home tab.
2. Click Display Options to open the Display Options window.
3. In the Margins area, enter the number of pixels between the text and the left, right, top, and bottom margins.
4. In the View Mode area, select an option to specify how you want the dashboard’s reports to scroll.
   a. Screen—Select this option to add scroll bars to the individual reports in the dashboard.
   b. Scrollable—Select this option to permit each report to display in its preferred size, with the height and width of the items in each report fixed. When this option is selected, a single set of scroll bars is added to the dashboard so you can view the entire dashboard surface. However, if the entire size of the dashboard exceeds 32767 x 32767 pixels, the dashboard’s reports may be clipped.
5. Click the Titlebars tab.
6. To display a report’s title above the report in the dashboard, select the check box next to the report.
7. Click the Report Sections tab.
B2C Service
Using B2C Service

Chapter 4
Analytics

This tab displays the common report sections included in the dashboard's reports. Sections common to all reports in the dashboard have a black check mark, sections that aren't shared by all reports have a gray check, and sections that aren't in any of the reports have no check.

8. Select the check box next to each report section you want to display on the dashboard. To remove a section you have already selected, clear the check box next to the section.

9. Click OK.

How You Preview Dashboards

The Report view provides a preview of the dashboard.

When creating and editing dashboards on the dashboard designer, you generally use the Design view. This is the default view used to edit the dashboard's properties, and add reports, images, and text fields to the dashboard.

After you modify your dashboard, you can switch to the report view to preview what the dashboard will look like when it's used by staff. When viewing a dashboard using the report view, the dashboard is presented to you just as your staff members see it, though certain items, such as action links displayed in reports, are disabled. When you want to edit the dashboard again, you can switch back to the design view.

Display a Dashboard Using the Report or Design Views

You can choose to view the dashboard in either report or design view.

1. Edit or create a new dashboard. By default, the dashboard is shown in the design view.
2. Click the ribbon’s Home tab.
3. Click the arrow on the Views button and select Report View to change the view.
4. To view the dashboard with the design view, click the arrow on the Views button and select Design View.

How You Use Dashboards

You can open dashboards just as you would open a regular report from the Reports explorer or one of your navigation lists.

Dashboards can also be opened from links you add to reports. When you open a dashboard, it loads with current report data. You can also queue dashboards to view them at a later time.

The dashboard includes options similar to those accessed from the Report tab when viewing a report. The dashboard also includes docked filters that are common to the reports in the dashboard and may include tabs to access reports on other dashboard pages.

Every report in a dashboard is fully functional, so you can access the standard options available when viewing a report. For instance, you can change the report's sort order, modify column formatting options, and search for information in only one of the dashboard's reports. If the report and your permissions allow it, you can access records shown on a report by double-clicking them, or by right-clicking them and selecting from menu options that display. Reports viewed on dashboards also support inline editing, so you can quickly edit records shown on dashboard reports.

Overview of the Dashboard Ribbon

When you open a dashboard, the dashboard’s ribbon includes Home and Page Setup tabs. You can use the options on these tabs to print the dashboard and adjust the dashboard’s display and output.

When you select an individual report on the dashboard, the ribbon is updated to include additional tabs containing options for modifying the selected report. These tabs are displayed next to the dashboard’s Home and Page Setup tabs, and are grouped under a Report heading.
Note: Some ribbon buttons aren't available when you view a published dashboard or a dashboard that’s run after being queued.

Dashboard Tabs
The buttons on the Home and Page Setup dashboard tabs let you open the Search window, refresh the display, select display options, forward the dashboard, configure print options, and perform other actions that impact the entire dashboard.

Permission to export, print, and forward reports must be selected in your profile for the Page Setup tab and the Export and Forward buttons on the Home tab to display. These permissions are described in Analytics Permissions. See Dashboard Designer Page Setup Tab for descriptions of the buttons on the Page Setup tab.

</tr>
</tbody>
</table>

Report Tabs
When you click a report on the dashboard to select it, the ribbon is updated to include the report's Home, Display, and Page Setup tabs.

You can use the buttons on these tabs to perform the same actions you could if viewing the report outside of a dashboard. For example, you can add calculations, select fields to show in the report, sort the report output, and edit records. For descriptions of the buttons on these tabs, see Overview of the Report Ribbon.

Display and Hide Dashboard Reports
When viewing a dashboard, you can use buttons displayed in each report's title bar to minimize, maximize, or close each report. This allows you to simplify the dashboard display when you want to focus on certain reports in the dashboard.

1. Open the dashboard you want to view.
2. Click one of these buttons on the titlebar of the report you want to hide or display.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimize</td>
<td>Click this button to minimize the report. When a report is minimized, the report name and icon display in the lower left corner of the dashboard. To restore the report, right-click the minimized option and select Restore. This button isn't available when the dashboard is displayed with a scrollable view mode.</td>
</tr>
<tr>
<td>Maximize</td>
<td>Click this button to maximize the report. When a report is maximized, the other reports in the dashboard are hidden. This button isn't available when the dashboard is displayed with a scrollable view mode.</td>
</tr>
<tr>
<td>Restore</td>
<td>Click this button in the maximized report’s title bar to return the report to its previous size.</td>
</tr>
<tr>
<td>Close</td>
<td>Click this button to close the report and temporarily remove it from the dashboard. The report displays the next time you load the dashboard. This button isn't available when the dashboard is displayed with a scrollable view mode.</td>
</tr>
</tbody>

- [Change Dashboard Display Options]

How You Search Dashboard Reports
You can search for information shown in dashboard reports.

While searching for information in reports in a dashboard is similar to searching the reports when generated on their own, there are some differences:

- **Docked filters**—When a report that includes docked runtime filters is run outside of a dashboard, the docked filters display at the top of the report. However, when the report is opened in a dashboard, the report’s docked filters are displayed at the top of the dashboard.

  If multiple reports in the same dashboard include docked filters, all the reports’ docked filters are displayed at the top of the dashboard. If two or more reports in the dashboard have the same docked filters, these can be merged so only one docked filter displays. Values you set in the merged filter are applied to all reports with that filter. See [Edit Dashboard Options] for information about combining filters for dashboard reports.

- **Search window**—When reports are displayed together on a dashboard, you can search for information in all the reports simultaneously. Searching for information in a dashboard is similar to searching for information in a report, though a dashboard’s Search window displays filters common to multiple reports, followed by report-specific filters. These common and report-specific filters are separated by headers on the dashboard’s Search window. See [How You Search in Reports].
Search All Reports on a Dashboard
You can perform a search in all reports on a dashboard.

1. Open the dashboard and click the **Home** tab.
2. Click **Search** to open the dashboard’s Search window.
3. Select the filters, variables, and limits you want.
4. Click **OK** to apply the search criteria to all the reports on the dashboard.

**Note:** Certain options you select when creating dashboards impact the behavior of the Search window. For example, if you select the Open Dashboard Without Prompting for Search Parameters option on the Edit Settings window, the Search window automatically opens when you open the dashboard. See *Edit Dashboard Options* for information about these options.

5. To search a specific report on the dashboard without searching the dashboard’s other reports, select the report on the dashboard, click the report’s **Home** tab, and then click **Search**.

Search in a Single Report on a Dashboard
You can search for information in a specific report on a dashboard.

1. Open the dashboard.
2. Select the report on the dashboard you want to search.
   Additional ribbon tabs display when you select a single report on the dashboard.
3. Click the **Home** tab beneath the ribbon’s Report heading.
4. Click **Search**.
   The report’s **Search** window opens. The search you perform from the report’s Search window applies only to the selected report.
5. Enter the search criteria you want in the Search window and click **Search**.

The search returns information in the selected report. The other reports on the dashboard are unchanged.

How You Queue Dashboards
Dashboards can be queued to run at a later time just as reports can.

Dashboards can be manually queued or automatically queued. After a queued dashboard generates, you can view the dashboard using a standard report or a notification just as you can with queued reports. See *Overview of Queuing Reports*.

**Note:** Unlike queued reports, you cannot send queued dashboards to comma-separated values (CSV) files.

Queue a Dashboard Manually
You can queue dashboards containing reports that you think may query or return large amounts of data. This is also helpful if you want to view a number of dashboards but do not want to wait for each to generate.

1. Do one of the following:
   - Select the dashboard on the Reports explorer and click **Queue**.
   - Right-click the dashboard, either on the Reports explorer or the navigation list, and select **Queue**.
   The **Queue Search Filters** window opens where you specify the search parameters you want to use for the queued dashboard.
2. Enter the search parameters you want to use. See *How You Search Dashboard Reports*.
3. Click **Queue**.
A window displays an approximation of when the dashboard will be available to view.

4. Click OK.

Automatically Queue a Dashboard
Dashboards can be forced to be queued automatically if needed.

When you attempt to open a dashboard, the queries that are required to run each of the dashboard’s reports are examined. If the system determines that one or more of the reports will take too long to process, a message displays the reports in the dashboard that are causing the problem and asks if you want to queue the dashboard. If you choose to queue the dashboard, it’s queued to run at a later time using the search parameters you entered and a message shows you the estimated time when the dashboard will be ready for viewing. If you choose not to queue the dashboard, you can try to run it again using more restrictive search parameters.

**Tip:** You can force dashboards to be queued automatically by enabling the Set Report to Deferred Execution option on the Edit Settings window. See *Edit Dashboard Options*.

How You View Queued Dashboards
You can access queued dashboards from the Reports Explorer.

After you queue a dashboard, you can use standard reports located in the Reports Explorer (Public Reports/Common/Site Administration/Reports) to see the dashboard’s status in the queue. After the dashboard runs and is ready to view, you’re notified and you can open it from several locations. Most of the standard options are available on the dashboard’s ribbon, though there are some exceptions.

It is possible that some of the reports in the dashboard will not queue successfully, for the reasons described in *Why Reports Fail to Queue*. If a report in a dashboard can’t be queued, the queued dashboard can’t be processed.

The methods to view and open dashboards that have been queued are identical to those used with queued reports. See *How You View Reports in the Queue*.

Configuration Settings that Impact Reports

Analytics Configuration Settings
A number of configuration settings can impact report performance and output.

The settings you should be aware of are described in the following topics, and are organized by the folders and subfolders where they are located. For information about modifying configuration settings, see *Overview of Site Configuration*.

**CAUTION:** Changes made to site configuration settings can greatly impact the performance and functionality of your entire site. Before you change any site configuration setting, it is important that your organization understands the impact of changing the setting.

Common Configuration Setting for Reports
Only one setting in the Common category impacts reports.
KF_ACTIONABLE_DATA_PURGE_DAYS is located in the **Common/Knowledge Base** folder. This setting allows you to specify the number of days that daily actionable knowledge base reporting statistics are stored in the database. To prevent these statistics from being removed, set this value to 0. The default value for this setting is 45 days.

RightNow Common Configuration Settings for Reports

The configuration settings described here are located in the RightNow Common folder. These settings let you adjust a number of values that impact what information is available in certain reports, the maximum size of generated reports, date and time formats, and other aspects of reporting.

<table>

### RightNow User Interface Configuration Settings for Reports

Several configuration settings that impact Analytics are located in the RightNow User Interface folder.

<table>
<thead>
<tr>
<th>Description</th>
<th>Configuration Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>RightNow User Interface/Misc. Customization/Query</td>
<td></td>
</tr>
<tr>
<td>Specifies the maximum number of rows that can be displayed in a report. Limiting the number of rows prevents inefficient reports from returning more rows than can be quickly processed and displayed. If the number of rows returned in a report exceeds this number, the remaining results aren't displayed.</td>
<td>VRL_HARD</td>
</tr>
<tr>
<td>The default value for this setting is 10000.</td>
<td></td>
</tr>
<tr>
<td>This setting is ignored when sending queued or scheduled reports to comma-separated values (CSV) files. See Overview of Queuing Reports and How You Schedule Reports.</td>
<td></td>
</tr>
<tr>
<td>RightNow User Interface/Support/General</td>
<td></td>
</tr>
<tr>
<td>Specifies the number of days after which solved incidents are no longer fully searchable. Solved incidents whose closed dates are older than the number of days specified only support searching on keywords in the subject. Set this value to 0 or to a value greater than the value in ARCHIVE_INCIDENTS to disable this feature.</td>
<td>PURGE_DELETE_INCIDENT PHRASES</td>
</tr>
<tr>
<td>Sites with less than 1 million rows in the incidents table aren't affected. Default is 366.</td>
<td></td>
</tr>
</tbody>
</table>
Agedatabase Configuration Settings for Reports

The configuration settings described here are located in the Agedatabase folder. These settings let you set the aggressiveness of the utility’s data caching and purging, and specify values used by certain opportunity tracking reports that use cached data.

The Agedatabase utility automatically runs on the server hosting your site. The utility's main function is to perform automatic maintenance on your knowledge base (for example, aging incidents and answers). However, Agedatabase also caches report data into individual report tables to make report generation more efficient, and it purges old information that’s no longer required for reports to help maintain the efficiency of your database.

**CAUTION:** Changes made to configuration settings can greatly impact the performance and functionality of your entire site. Before you change any configuration setting, it is important that your organization understands the impact of changing the setting.

This table describes the Agedatabase configuration settings that impact reporting.

<table>
<thead>
<tr>
<th>Description</th>
<th>Configuration Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agedatabase/Batch Processing/Miscellaneous Purging</td>
<td></td>
</tr>
<tr>
<td>Specifies the number of days after which clickstream session summary statistics are removed from the database. Set this value to 0 to prevent this information being removed from the database. The default value for this setting is 60. The minimum, non-zero value you can enter is 8.</td>
<td>PURGE_CS_SESSION_SUMMARY</td>
</tr>
<tr>
<td>Specifies the number of days after which incident performance statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. The default value for this setting is 0.</td>
<td>PURGE_DELETE_INC_PERFORMANCE</td>
</tr>
<tr>
<td>Specifies the number of days after which keyword search statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. The default value for this setting is 120.</td>
<td>PURGE_DELETE_KEYWORD_SEARCHES</td>
</tr>
<tr>
<td>Specifies the number of days after which queue statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. The default value for this setting is 120.</td>
<td>PURGE_DELETE_QUEUE_STATS</td>
</tr>
</tbody>
</table>
## Configuration Setting

<table>
<thead>
<tr>
<th>Description</th>
<th>Configuration Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the number of days after which session summary statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. The default value for this setting is 0.</td>
<td>PURGE_DELETE_SESSION_SUMMARY</td>
</tr>
<tr>
<td>Specifies the number of days after which Techmail statistics stored in the Techmail Filter Details (tm_filter_details) and Techmail Statistics (tm_stats) tables will be deleted. A value of 0 disables purging of these tables. The default value for this setting is 30.</td>
<td>PURGE_DELETE_TM_STATS</td>
</tr>
<tr>
<td>Specifies the number of days after which login/logout sessions are removed from the user_trans table (relative to the logout time). Set this value to 0 to prevent login/logout sessions from being removed from the database. The default value for this setting is 0.</td>
<td>PURGE_DELETE_USER_TRANS</td>
</tr>
<tr>
<td>Specifies the number of days after which voice statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. The default value for this setting is 90. For sites with multiple interfaces, statistics are removed from all interfaces based on the interfaces' smallest non-zero value for this setting.</td>
<td>PURGE_DELETE_VOICE_STATS</td>
</tr>
<tr>
<td>Specifies the number of days after which guided assistance session data will be deleted. Set this value to 0 to prevent session data from being deleted. The default value for this setting is 30.</td>
<td>PURGE_GUIDE_SESSIONS</td>
</tr>
<tr>
<td>Specifies the number of days after which guided assistance statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. The default value for this setting is 0.</td>
<td>PURGE_GUIDE_STATS</td>
</tr>
<tr>
<td>Specifies the number of days after which files that store the output from queued reports and dashboards are deleted.</td>
<td>PURGE_QUEUED_REPORT_DAYS</td>
</tr>
</tbody>
</table>
### Description

The default value for this setting is 7 days.

### Configuration Setting

Specifies the number of days after which Rule Log entries are deleted. The maximum value for this setting is 180. A value of zero results in the data being deleted after 180 days.

The default value for this setting is 30.

<table>
<thead>
<tr>
<th>Configuration Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>PURGE_RULE_LOG_FREQ</td>
</tr>
</tbody>
</table>

### Agedatabase > Batch Processing > Opportunities

Specifies the day of the week that the opportunities table is cached for the current sales period(s). Values refer to the day of week, with 1 being Sunday, 2 being Monday, and so on. A value of 0 disables opportunity caching.

The default value for this setting is 6 (Friday).

<table>
<thead>
<tr>
<th>Configuration Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPP_SNAPSHOTS_SCHEDULE</td>
</tr>
</tbody>
</table>

### Agedatabase/Batch Processing/Gap Analysis

Specifies how frequently (in days) the Information Gap report is generated.

The default value for this setting is 7.

Specifies the time period reported on in the Information Gap report. The report will analyze incidents created during the specified number of days.

The default value for this setting is 7.

<table>
<thead>
<tr>
<th>Configuration Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>GAP_FREQUENCY</td>
</tr>
<tr>
<td>GAP_TIME_PERIOD</td>
</tr>
</tbody>
</table>

### Agedatabase/Batch Processing/Sales Performance

Specifies the quota attainment threshold as a percentage that a given salesperson should meet to be classified as a “Top Performer.”

The default value for this setting is 95.

Specifies the relative value from 1-10 of money versus opportunity counts in reviewing a salesperson or group’s current performance. A value of 5 means they’re treated equally. A value of 7 means that total monetary value of opportunities is more important than the number of opportunities. A value of 3 means that the number of opportunities is more important than the total value of those opportunities.

</tr>
</tbody>
</table>

### Transactions Database Table

**Overview of the Transactions Database Table**

Many of the standard reports use data from the database’s Transactions table, and the table can be useful when creating custom reports.

The information in this table describes the actions taken on records (such as incidents, answers, and contacts) and items (such as mailings, surveys, and quotes) in your database. For example, when an incident is created and then assigned to a staff member, two entries are added to the transactions table. The first entry describes when the incident...
was created, who created it, and where it was created from. The second entry describes who the incident was assigned to and when it was assigned.

Due to the amount of information stored in the Transactions table, it can be challenging to write custom reports that use information from the table. However, when you understand how to use the data in the table, you can create powerful custom reports to output or filter on almost all actions taken on the records and items in your database.

- **Transactions Database Table Field Descriptions**—Summarizes all the fields in the Transactions table.
- **Transactions Database Table Transaction Types**—Describes the types of transactions and the records and items they can apply to.
- **Transactions Database Table Attribute and Description Fields**—Describes the Transactions table’s attribute 1, attribute 2, attribute 3, and description fields.

**Note:** You can view additional information about the Transactions (transactions) table and information about other database tables in the data dictionary. You can access the data dictionary by clicking **Configuration > Database > Data Dictionary** on the navigation pane.

### Transactions Database Table Field Descriptions

This table describes all the fields in the Transactions table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account ID (acct_id)</td>
<td>The staff member who performed the transaction. This field will be NULL for transactions not initiated by a staff member.</td>
</tr>
<tr>
<td>Attribute 1 (id1)</td>
<td>These fields contain information specific to certain types of transactions taken on certain records and items. The field values will be NULL for many transactions. See <strong>Transactions Database Table Attribute and Description Fields</strong>.</td>
</tr>
<tr>
<td>Attribute 2 (id2)</td>
<td></td>
</tr>
<tr>
<td>Attribute 3 (id3)</td>
<td></td>
</tr>
<tr>
<td>Date Created (created)</td>
<td>The date and time the transaction occurred.</td>
</tr>
<tr>
<td>Date/Time (dttm)</td>
<td>The scheduled date and time for a mailing. This value will be NULL for any other record or transaction type.</td>
</tr>
<tr>
<td>Description (description)</td>
<td>This field contains information specific to certain types of transactions taken on certain types of records and items. This field will be NULL for many transactions. See <strong>Transactions Database Table Attribute and Description Fields</strong>.</td>
</tr>
<tr>
<td>Foreign Key (id)</td>
<td>The unique ID number of the record, such as an incident or contact, that the transaction affected.</td>
</tr>
<tr>
<td>Interface (interface_id)</td>
<td>The interface the transaction was performed in.</td>
</tr>
<tr>
<td>Client IP Address (ip_address)</td>
<td>The IP address where the transaction originated.</td>
</tr>
<tr>
<td>Source (source_lvl1—source_lvl2)</td>
<td>The component where the transaction occurred. Level-1 source codes are the general area of B2C Service, and level-2 sources are the specific component. See the data dictionary for descriptions of the source codes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Source Hierarchy (source_hierarchy)</td>
<td>The level-1 and level-2 sources displayed in a hierarchical menu.</td>
</tr>
<tr>
<td>Table Association (tbl)</td>
<td>The type of record or item the transaction occurred on, such as an incident, quote, or survey. See Transactions Database Table Transaction Types.</td>
</tr>
<tr>
<td>Type (trans_type)</td>
<td>The type of transaction that occurred, such as a record being created or edited. See Transactions Database Table Transaction Types.</td>
</tr>
</tbody>
</table>

**Transactions Database Table Transaction Types**

The types of transactions stored in the Transactions table, and the types of records and items that the transaction types can apply to, are listed in this table.

The numeric code for each type is shown in parentheses after the type name. The numeric code for each table is shown after the table name.

**Note:** Some transaction types listed in the table are intended for use only by Oracle Consulting Services.

Transactions Database Table Attribute and Description Fields

The attribute and description fields in the Transactions table contain information about events that occur on a number of different record types.

The data in the `attribute 1`, `attribute 2`, `attribute 3`, `attribute 4`, and `description` fields vary depending on the transaction type and the type of record or item the transaction is associated with.

**Note:** These fields aren’t populated for all types of transactions or all combinations of transactions and records. For example, the `attribute 1` field contains the IP address of the source of an incident creation, but the value in this field will be NULL for an answer creation or an incident escalation.

This table describes the contents of the `attribute 1` field for each transaction type. Transaction type ID numbers are shown in parentheses.

<table>
<thead>
<tr>
<th>Transaction Type</th>
<th>Attribute 1 Description</th>
</tr>
</thead>
</table>
| Created (2)  
Edited (3) | If the `record type` is an incident, this is the IP address of the incident’s source for both the Created and Edited transaction types.  

| Assigned (4) | This is the assigned group.  

| Status Change (6) | This is the new status.  
To filter reports on incident, answer, or opportunity status changes, we recommend using the Status field (`status_id`) in the Incident Statuses (`inc_statuses`), Answer Statuses (`ans_statuses`), or Opportunity Statuses (`opp_statuses`) tables. The Transactions table can be used for this purpose, but additional steps are required.  

<p>| Response Sent (8) | This is the staff member who sent the response. |</p>
<table>
<thead>
<tr>
<th>Transaction Type</th>
<th>Attribute 1 Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forwarded (14)</td>

## How to View the Database Data Dictionary

### View Your Database Data Dictionary

You can use the data dictionary to view information about the tables and fields in your site's database.

The information returned in reports and dashboards is stored in your site’s database, allowing you to see vital information about your customers, staff members, and interfaces. Using the data dictionary, you can view details about all the tables and fields in the database, such as field names, descriptions, and database types. You can add the Data Dictionary component to any navigation list. See [Change Your Navigation Pane Settings](#).

**Note:** Not all the information in the database is accessible to Analytics.
1. Click **Configuration** on the navigation pane.

2. Expand **Database**, and then double-click **Data Dictionary**.
   The content pane displays a list of all the tables in the database.

3. Click a table to view the table information.
   The details that display depend on the table you have selected.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Label</td>
<td>Lists the descriptive table name used in the data dictionary.</td>
</tr>
<tr>
<td>Table Description</td>
<td>Displays a description of the table.</td>
</tr>
<tr>
<td>Tbl</td>
<td>Displays the table ID number.</td>
</tr>
<tr>
<td>Visibility</td>
<td>Indicates the products and components that use the table, such as Service, Offer Advisor, and Chat.</td>
</tr>
<tr>
<td>Custom Fields</td>
<td>Indicates whether custom fields are allowed in the table.</td>
</tr>
<tr>
<td>Primary Key</td>
<td>Lists the primary key columns. Click a column to view the column information.</td>
</tr>
<tr>
<td>Columns</td>
<td>Lists the columns contained in the table. Click a column to view the column information.</td>
</tr>
<tr>
<td>Indexes</td>
<td>Lists the indexed columns in the table. Click an indexed column to view the column information.</td>
</tr>
</tbody>
</table>

4. To view column details, click a column in the Table Information section. The details that display depend on the column you select.

<table>

5 Service

Incidents

Overview of Incidents

When customers request help through email or the Ask a Question page, Service automatically creates incidents.

Note: B2C Service includes a component known as “Service” where you work with incidents.

Most of the time, these are the incidents you will respond to. At other times, however, you will add incidents. For example, when a customer contacts you by phone, fax, or mail, you will add an incident to create a record of the customer’s question. When you work with customers to solve their support issues, you are instrumental in creating a positive impression of your organization. As an agent, you are often the customer’s first point of contact, and it is important to resolve their concerns quickly and efficiently the first time. Service helps you do this by providing comprehensive, accurate, and up-to-date information about all aspects of the customer’s communication with your organization.

Besides providing you with all-encompassing information just when you need it, Service gives you the tools to craft consistent, accurate answers to customer questions. It also lets you propose incident as answers, present offer to customers, and create opportunity from incidents.

When you edit or add an incident, you start by answering the customer’s question. Service provides help through standard text, suggested answers, and the ability to search the knowledge base. You define specific information about the incident, such as the staff member it is assigned to, the associated products and categories, and the status and disposition of the incident.

Working with incidents also gives you the ability to:

- Add or update contact information
- Track the amount of billable time you spend on the incident
- Add or edit tasks related to the incident
- Attach files to the incident
- View all actions taken on the incident
- Present promotional offers to the customer

You might also want to propose the incident as a permanent answer in the knowledge base. This lets customers to view the answer without being required to submit a service request.

Note: Service automatically handles email between separate B2C Service sites. The site-specific incidents are accurately updated on each site even if unique reference numbers are used for the same incident. See Cross-Site Email Management.

Incident Reports

This topic describes incident reports and what options are available.
When you click the Incidents button on the navigation pane, the navigation list displays all of the reports and items added to this list by your administrator. The Incidents button, plus all the other buttons you have access to, are part of the navigation set defined in your profile.

Incident reports can be placed in other navigation lists, not just the Incidents navigation list. And if you have permission to customize your navigation set, you can add other items, including reports you have permission to access, to your Incidents navigation list or any of your lists.

Double-clicking any incident report displays the report on the content pane. The incident information displayed on the content pane depends on the incident report you opened and which fields were defined when the report was created. The Incidents report, for example, displays the subject, status, the name of the agent it is assigned to, the queue it is assigned to, the date it was last updated, and the associated reference number. The Home tab on the ribbon lets you open, add, print, copy, assign, delete, forward, and propose incidents. In addition, you can send email to the contact associated with an incident, search for an incident, refresh the report, or reset the search criteria. It also provides data analysis options and options for working with the report. Additional tabs on the report ribbon include options for controlling display and page setup.

Besides selecting an incident from a report, you can search for incidents from a report or use Quick Search.

**Tip:** You can right-click any incident and select the same functions that are available on the incident report ribbon.

### Related Topics
- Record Search Options

### Standard Incident Workspace
This topic describes the standard incident workspace used when working on incidents.

Service provides a standard workspace for working with incidents. The workspace defines which fields are available, which buttons are displayed on the ribbon, and how the information is organized on the content pane.

Your organization can use the standard incident workspace, or your administrator might have created one or more customized workspaces. Your profile defines the workspace you see when you work with incidents, whether it is the standard workspace or a customized workspace. If you are using a customized workspace, keep in mind that the workspace your profile uses may display a different combination of fields, or it may display them in a different location on the content pane.

### Incident Workspace Ribbon
This table describes the buttons on the ribbon of the standard incident workspace.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Editor</td>
<td></td>
</tr>
<tr>
<td>Undock</td>
<td>Click this button to undock the incident editor from the console and display it in a separate window.</td>
</tr>
<tr>
<td>Save</td>
<td></td>
</tr>
</tbody>
</table>
Save
Click this button to save the incident you are working on. The incident remains open. When you save an incident, the rules engine evaluates it. If incident rules exist and the incident matches one or more rules, the record may be modified when you save it. For example, a rule can change an incident’s disposition or add suggested answers to the Response field of the Messages tab.

Save and Close
Click this button to save the incident you are working on and close the incident.

Send
Click this button to send the response you are working on to the primary contact and to anyone in the CC and BCC fields if shown.

**Actions**
With the exception of the New button, the buttons in this group are not enabled until after you have saved an incident you are adding.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>Click this button to add an incident.</td>
</tr>
<tr>
<td>Refresh</td>
<td>Click this button to refresh the current set of incident records.</td>
</tr>
<tr>
<td>Forward</td>
<td>Click this button to forward the incident to any email address, staff account, or group.</td>
</tr>
<tr>
<td>Print</td>
<td>Click this button to print the incident.</td>
</tr>
<tr>
<td>Copy</td>
<td>Click this button to copy the incident.</td>
</tr>
<tr>
<td>Delete</td>
<td>Click this button to delete the incident.</td>
</tr>
</tbody>
</table>

**Proofing**
Click this button to check the spelling of any incident fields that have spell checking enabled.

Incident Record Tabs

Using the incident record tabs, you can respond to the customer and add and edit other information relevant to the incident. You can also work on the incident in stages if you choose, letting you save the changes and then return later to complete your work.

The standard workspace for incidents includes these tabs.

- **Messages**—Contains fields that let you add a customer entry, response, or private note to the incident thread and respond to the customer using either HTML or plain text. From this tab, you can also view suggested answers from SmartAssistant, search the knowledge base for public answers, and insert standard text into your response. See Add an Incident.

- **Contacts**—Lists all contacts associated with the incident. The number of contacts associated with the incident displays in parentheses next to the tab name. You can add, open, print, copy, delete, remove, and email contacts from the incident. See Add or Edit Contact Information.

- **Details**—Contains fields for collecting additional information about the incident, which is beneficial for reporting purposes. See Add Incident Information on the Details Tab.

- **Time Billed**—Lists all time billed entries for the incident. From this tab, you can add, open, and delete time billed entries. See Add Time Billed to an Incident.

- **Tasks**—Lists all of the tasks associated with the incident. You can add, open, copy, delete, print, and forward tasks and mark tasks complete. The Tasks tab displays a number in parentheses to show how many tasks are associated with the opportunity. See Add or Edit a Task for an Incident.

- **Organization**—Lists the organization associated with the incident. See Edit an Organization Associated with an Incident.

- **Web Visit**—Lists all actions the customer took before submitting the incident. Also provided are the client IP address, operating system, and browser used by the customer during their visit. See View Web Visit Information for an Incident.

- **Attachments**—Lists all files attached to the incident. For instance, if a customer forwards a document that is associated with the incident, the Attachments tab provides a convenient location where you can store the document for retrieval. You can add, open, download, delete, and view the properties of file attachments from this tab. See Overview of the Attachments Tab.

- **Audit Log**—Contains a permanent list of all actions associated with an incident, including the date of the action, who performed the action, what the action was, and a description of the action. This information is valuable for tracking interactions with customers, especially if more than one staff member works on the same incident. See Audit Logs.

**Note:** If you make changes to fields on any of the incident record tabs or any of the subtabs or windows opened through the record tabs (for example, the contact editing subtab), you must save the incident in order for all changes on the record tabs to take effect. If you close the record without saving changes, those changes are lost.
Incident Creation

This topic describes the process for working on incidents after a customer submits a question.

When a customer submits a question, Service automatically creates an incident that contains the subject, customer’s question, and contact information. You can complete an incident response in a single editing session, or you might find it useful to work on one part of the response and then return later to complete the rest of the incident.

The standard incident *workspace* enables you to move quickly from one section to the next as you work on incidents. You can edit any part of an incident in any order. The majority of incidents are assigned to you or pulled into your *inbox*. When incidents are assigned to you, some information in the record is populated when you open the incident.

Fill Your Inbox

If your profile has incident editing permission and queues assigned to it, you can click the Fill Inbox button on the ribbon of any incidents report displayed on the content pane.

When you click the Incidents navigation button and double-click the default My Inbox report, the incidents that are assigned to you are displayed. As you respond to and solve incidents, their *status* changes to Solved or Waiting. You can continue to refill your inbox to retrieve new unresolved incidents.

1. Click **Fill Inbox**.
   - If your profile has been set to a manual pull policy, the **Manual Queue Pull** window opens and you can click the arrow to select the queue to pull incidents from. If only one queue is configured to pull incidents from, the **Manual Queue Pull** window does not display.
2. If the displayed incidents report does not display incidents by assigned staff member, open the My Inbox report to view incidents that were added when you clicked Fill Inbox.
   - Unresolved incidents in any of the queues designated in your profile are available to be pulled. The order in which you work on incidents is determined by the queue priority and any processes set up by your administrator.

How You Edit Incidents

The fields you see when adding or editing an incident are defined in a workspace that is assigned to your profile.

Some of the fields are required by default, and your administrator may require that other fields also be completed. You must complete any field marked with an asterisk before you can save the incident. Incidents do not have to be completed in any particular order, but you must complete all required fields before you can save an incident.

This list provides the required and optional steps involved when editing an incident.

- Complete the incident fields. See *Edit Key Incident Fields*.
- Compose your response to the customer. See *Incident Thread*.
- To add content to your response, see *Response Options*.
- To add or edit contact information, see *Add or Edit Contact Information*.
- To track the time you spend editing the incident, see *Add Time Billed to an Incident*.
- To add or edit tasks associated with the incident or its contact, see *Add or Edit a Task for an Incident*.
- To add or edit organization information, see *Edit an Organization Associated with an Incident*.
- To present an offer to a customer who is eligible for one, see *Present an Offer*.
- To create an opportunity for the sales department to follow up, see *Create an Opportunity from an Incident*.
• Send a response to the customer. See *How You Send Incident Responses*.

You can save the incident at any stage of the process and either continue editing or close the incident and return later to complete it.

How Incidents are Evaluated by the Rules Engine
When you save an incident, it is evaluated by the rules engine.

Your administrator may have added *business rules* to simplify and automate your work. For example, rules can change incident fields, apply an *SLA instance*, add *suggested answers* to your response, and take many other actions automatically. If you save an incident without closing it and the incident matches one or more rules, it is possible that the incident was automatically modified by the rules engine. If you notice that changes have been made to the incident, you may want to check with your administrator to verify that they are the result of rule actions. See *Overview of Business Rules*.

Before you start editing incidents, you will benefit from understanding what certain field properties mean in order to provide accurate responses to customers. This includes *incident statuses* and *SLAs*, as they play an important role when you interact with customers.

**Incident Statuses**
Incidents can have one of the four default incident statuses, or they may have a custom status defined by your administrator. The default statuses are Unresolved, Solved, Updated, and Waiting.

Depending on how Service is configured in your organization, the status can change automatically when you or the customer make changes to the incident. You can also change an incident’s status manually.

The following example describes how an incident’s status can change automatically.

1. A customer submits a question from the Ask a Question page. The new incident has a status of Unresolved.
2. The customer updates the question before you begin working on the incident. The incident remains unresolved, but the incident status changes to Updated to reflect the customer’s actions and alert you to the change.
3. You edit the incident and send a response to the customer. Your system may be configured in either of the following ways to automatically change the status, or it may be configured so that no status change occurs.
   - The incident’s status changes to Solved.
   - The incident’s status changes to Waiting. The Waiting status signifies that you have sent a response and are waiting for the customer to let you know if this answers the question. If your system has this configuration and the customer does not respond within forty-eight hours (the default time), the system automatically changes the status to Solved and sends an email to the customer.

**SLA Instance Field**
Another incident field you may work with is the SLA Instance field.

An SLA is a service level agreement. SLAs let your organization to assign and track customer service, such as the number of questions a customer can submit through different channels and the duration of support.

Both contacts and organizations can have SLAs, but contacts that are associated with an organization do not have individual SLAs. Instead, their incidents are credited to their organization’s SLA. Only contacts that do not have an organization association can have SLAs.
Your administrator creates an SLA, which is a generic service contract that has not been applied to any specific customer. An SLA instance is a copy of the generic SLA applied to a specific customer. SLA instances can be applied manually by staff members whose profiles grant them permission to work with SLAs or automatically through business rules in Service. (If you have read-only permissions for contacts, organizations, and incidents, you will see View in the SLA Instance field instead of Add or Edit.)

When you work on an incident for a customer who has an SLA, you can credit that incident to the SLA. If the customer does not have an SLA, you must apply an SLA instance before you can credit the incident.

Related Topics
- Examples of Applying Service Level Agreements (SLAs)

Apply an SLA Instance to a Contact or Organization
This procedure describes how to apply an SLA instance when you are working on an incident.

1. From an incidents report, right-click the incident and select Open > Contact or Open > Organization.
2. Click Add (if no SLAs have been applied to the customer) or Edit in the SLA field.
   - The SLA Viewer window opens. Any SLA instances that have already been applied to the customer are displayed under SLA Instances.
   - **Note:** If you select Open > Contact and the contact is associated with an organization, the SLA field contains “See organization for SLA Details.” Return to the incidents report on the content pane, right-click the incident, and select Open > Organization.
3. Click Add SLA Instance
   - The Add New SLA Instance window opens.
4. Click the Name drop-down menu and select an SLA.
5. Select an active date by clicking a day on the current month calendar (or, to change the month, click the right or left arrow in the month heading). The date today is selected by default.
6. Click OK.
   - The Add New SLA Instance window closes and the SLA instance is added.
7. Click OK.

After an SLA instance has been applied to the customer, you can credit incidents submitted by that customer against the SLA instance as long as the incident occurs within the active date period. See Credit an Incident to an SLA Instance.

Credit an Incident to an SLA Instance
After an SLA instance has been applied to the customer, you can credit incidents submitted by that customer against the SLA instance as long as the incident occurs within the active date period.

1. From an incidents report, right-click the incident and select Open > Incident.
2. Click the Details tab.
3. Click the drop-down menu on the SLA Instance field and select an SLA instance.
   - The incident is credited to the SLA instance you select.
   - **Note:** Every time an incident is credited to an SLA instance, the number of available incidents is reduced. When the last incident is credited, the customer’s SLA is disabled.
4. Click Save.

If you have enabled resolution due calculations and the SLA has a response time defined, you will be able to view the resolution due date and time after saving the incident. See Resolution Due Calculations.
Edit Key Incident Fields

After understanding the role of incident statuses and SLAs, you can edit the key incident fields.

This procedure describes the standard incident workspace. Keep in mind that your workspace may contain different fields. Fields marked with an asterisk are required fields and must be completed before you can save the incident.

1. From an incidents report, right-click the incident and select **Open > Incident**.
2. Enter field information.

   **Tip:** Use Find at the bottom of drop-down menus when available to search quickly. Wildcards are supported. You can search strings that include a space by entering %[spacebar][character], which is helpful when searching last names. For example, when using the Find feature in the Assigned field, entering %[space bar]b returns all last names starting with the letter b. There is also an implied wildcard when searching, so entering b in the Find field returns all items containing the letter b.

<table>
<thead>
<tr>

Incident Thread

The incident thread, which displays communication between the customer and agent, is located on the Messages tab. Using the Rich Text Incident Thread control, you can display, edit, and respond to HTML-formatted emails, resulting in richer interactions with your customers.

This image shows the thread control on the standard incident workspace, displayed by clicking File and selecting Incident.

If the customer submitted the question through the customer portal, it also appears as a Customer Entry thread. You can enter the question for the customer if, for example, you are responding to a phone call. This will appear as a Customer Entry as well. Besides adding a Response thread, you can also add a Private Note thread, which can be read by other staff members but not by customers.

When editing an incident, the default is Response (the default channel is Email). To save time and make your responses accurate and consistent, you can add predefined content, including SmartAssistant suggested answers or standard text. You can also search for answers that are related to the customer’s question.

Note: Whenever a valid incident reference number appears in any incident thread (Customer Entry, Response, or Private Note), it is displayed in green text in the thread and is a link that opens the incident in a separate workgroup when you click it. In order for Service to create a clickable link from an incident reference number, the number must use the format #######-#######.

Messages Tab Toolbar

Using the Messages tab toolbar, you can choose the type of thread entry—customer entry, response, or private note—when responding to the customer.

The thread title bars are color coded, making it easy to differentiate between them when adding or editing an incident. On a new incident, the default thread type on the standard incident workspace is Customer Entry (the default channel is Phone).

The Messages tab lets you send the response to the customer when you save it. You can send the incident response to other recipients as well by adding their email addresses to the CC field. Send response functionality also lets you attach files to the incident and select secure email options.

</tbody>
</table>

Note: Your administrator controls the functions available on this toolbar. See Overview of Workspace and Script Elements to view the list of individual functions.
WYSIWYG Toolbar

Using the incident thread toolbar, you can apply HTML formatting to threads while they display in the uncommitted threads panel.

When you save the incident, all uncommitted (unsaved) threads are moved to the committed threads panel, where all HTML formatting is retained. If the EGW_VISUAL_EMAIL configuration setting is disabled, all incoming email will display as plain text even if it was sent as HTML. Depending on your organization’s security requirements, there may be other reasons to disable this configuration setting. See Email Security for more information.

Use the incident thread toolbar to:

- Cut, copy, paste, undo, and redo. If formatted content is copied from an external source and pasted into the uncommitted threads panel, all formatting is retained. To avoid reformatting pasted content, right-click and select Paste as Text or press Ctrl+Shift+V.
- Change font style, size, and attributes (bold, italic, underline, strikethrough, text color, highlight).
  
  **Tip:** To make the font size in the incident and the response the same, see Answer ID 4857.

- When entering a response or customer entry thread, any changes to font style, color, or highlighting take precedence over the styling used on the customer portal. As a result, contacts using the customer portal to review agent responses may see unexpected font and color combinations.
- Left-justify, center, or right-justify text and images on the page.
- Format text in bulleted or numbered lists.
- Insert images by URL and upload images.
- Insert links.
- Increase and decrease indents.
- Apply specialized formatting, including sub and super script.
- View plain text, which removes all HTML formatting.

**Note:** If formatted content is copied from an external source and pasted into the uncommitted threads panel, all formatting is retained. To avoid reformatting pasted content, right-click and select Paste as Text or press Ctrl+Shift+V.

Add a Response to an Incident

Follow this procedure to add a response to an incident.

1. From an incidents report, right-click the incident and select **Open > Incident**.
2. If the Messages tab is not on top, click **Messages**. (On the standard incident workspace, this tab is displayed when an incident is opened.)
3. If the Response option is not selected automatically, click **Add** and select **Response**. The Response title bar displays on the uncommitted threads panel.
Note: You can add multiple threads to the uncommitted threads panel before saving the incident. To edit or delete a thread, click Edit or Delete located on the right side of the title bar.

4. To identify a channel for a response, click the Email drop-down menu in the Response title bar and select one of the following options: Phone, Fax, Post, CSS Web, or Email. (Email is the default channel on the Response title bar.)

5. Enter your response to the customer’s question. See WYSIWYG Toolbar.

When you save the incident, the uncommitted threads panel closes and all uncommitted threads are moved to the committed threads panel. The committed threads panel expands so the incident threads are easier to read. You can right-click in the committed threads panel and choose options for selecting, copying, and finding text. The find feature (which can also be opened by pressing Ctrl+F) can be useful for finding information quickly.

The thread control remains in this state until you add another response, customer entry, or private note. At that point, the uncommitted threads panel displays again.

Add a Customer Entry or Private Note to an Incident

Follow this procedure to add a customer entry or private note to an incident.

1. From an incidents report, right-click the incident and select Open > Incident.

2. To add a customer entry, click Add and select Customer Entry. The Customer Entry title bar displays on the uncommitted threads panel.

   You can add multiple threads to the uncommitted threads panel before saving the incident. To edit or delete a thread, click Edit or Delete located on the right side of the title bar.

   a. To identify a channel for a customer entry, click the Phone drop-down menu in the Customer Entry title bar and select one of the following options: No Channel, Phone, Fax, Post, CSS Web, or Email. (Phone is the default channel on the Customer Entry title bar.)

3. To add a private note, click Add and select Private Note.

   a. To identify a channel for the private note, click the No Channel drop-down menu and select one of the following options: No Channel, Phone, Fax, Post, CSS Web, or Email. (No Channel is the default channel.)

4. Enter the customer entry or note in the uncommitted threads panel. See WYSIWYG Toolbar.

When you save the incident, the uncommitted threads panel closes and all uncommitted threads are moved to the committed threads panel. The committed threads panel expands so the incident threads are easier to read. You can right-click in the committed threads panel and choose options for selecting, copying, and finding text. The find feature (which can also be opened by pressing Ctrl+F) can be useful for finding information quickly.

The thread control remains in this state until you add another response, customer entry, or private note. At that point, the uncommitted threads panel displays again.

Response Options

Service has tools that help you save time, eliminate mistakes, and provide consistent information to customers.

These tools include the ability to attach links to answers in the knowledge base, insert the actual text of answers into the response, search the knowledge base for specific answers to include, and insert standard, predefined text.

- SmartAssistant Suggested Answers
- How You Search the Knowledge Base
- Insert Standard Text from the Standard Text Window
- Insert Standard Text Using a Keyboard Shortcut
- Find Answers Using Guided Assistance
SmartAssistant Suggested Answers

SmartAssistant contains an autotuning feature that reviews the effectiveness of your current configuration and automatically makes adjustments and suggestions to improve results.

A tuned, optimized SmartAssistant can improve incident deflection rates and produce information that can be used to refine the knowledge base and provide guidance to agents. The autotuner enhances the search algorithm by closely tracking answers that have been appended to an incident thread as a link or text, or that an agent has explicitly identified as the answer that best resolved an incident. SmartAssistant will then give greater deference to these answers, as they are known to relate to or resolve issues submitted as incidents.

In addition, the autotuner reviews the many configuration settings that influence SmartAssistant results and recommends changes to ensure that they are fully optimized. And to help you understand the value of these recommendations and help you decide whether to accept them, their projected impact is also presented.

**Note:** You must enable the KF_SA_OPTIMIZATION_ENABLE configuration setting and add the autotuner component to your list of items for the Configuration button. See [Edit a Configuration Setting](#) and [Create a Navigation Set for the Administrator](#).

Add SmartAssistant Suggested Answers

Follow this procedure to add SmartAssistant suggested answers to a response.

1. Click **SmartAssistant** on the Messages tab toolbar.
   A list of possible answers displays with columns for ID, Summary, Weight, Access, and Status. You can sort by any of the columns.
2. To include the text of an answer in the response, click **Add As Text** in the Action column.
   The answer content is added to the response.
   
   **Tip:** You can also enter answer text if you know an answer ID by pressing F9 from the incident response on the Messages tab, entering the Answer ID number in the **Append Answer Text** window that opens, and pressing Enter. You can edit the answer text before sending the response.
3. To add an answer URL link to the response, click **Add As Link** in the Action column.
4. To view a suggested answer, click **View** in the Action column.
   The **View Answer** window opens, displaying the answer as it appears on the customer portal. (You can print the answer from this view by clicking the **File** menu item and selecting **Print**.)
5. Click **Close**.

Mark an Answer as the Best Answer

Mark an answer as the best answer to have SmartAssistant give it greater deference.

1. From the open incident, click **Best Answers**.
   A list of answers that have been added and committed to the incident thread is displayed with columns for ID, Summary, Access Level, Status, and Date Added. You can sort by any of the columns.
2. To choose the best answer (or answers) for the customer’s question, select the **Best Answer** check box.
3. To clear all best answer selections, select the **No Answer Resolved This Incident** check box.
4. Click **Save**.

Review and Accept Autotuner Recommendations

Review and accept SmartAssistant Auto Tuner settings.

1. Click **Configuration** on the navigation pane.
2. Double-click **SA Auto Tuner** component in your configuration list.
The **SA Auto Tuner** dashboard displays information regarding the current SmartAssistant configuration settings, relevance history, and recommendations.

![SA Auto Tuner Dashboard](image)

The dashboard contains the following reports.

- **SA Configuration**—This report contains information about your current SmartAssistant configuration values (in the Current column) and the suggested values for optimizing them (in the Tuned column). The Relevancy row displays the current aggregated relevancy value of SmartAssistant results.

- **SA Relevance History**—This report displays the percentage of answers suggested by SmartAssistant that have been relevant over recent weekly intervals, also indicating when changes were made to SmartAssistant settings. This demonstrates how changes you have applied impact the SmartAssistant effectiveness of your site.

- **Recommendations**—This panel displays the current recommendation of the auto tuner (whether to accept the suggested configuration changes) based on whether sufficient SmartAssistant coverage was available to evaluate and whether the recommendation is made with high, medium, or low confidence.

3. To accept the suggested configuration and update your settings with the recommended values, click **Accept New Configuration**.

### How You Search the Knowledge Base

As you respond to a customer’s question, you might remember answers that address similar issues. Rather than conducting a time-consuming hunt of the knowledge base to find the relevant answers, Service lets you search for specific answers.

Using any of four text searching techniques, you can quickly identify answers to resolve a customer’s question. See *Append Answer Content*.

### Insert Standard Text from the Standard Text Window

When you are busy responding to customer questions, you will appreciate having the routine parts of your job streamlined as much as possible.

For example, you would probably welcome a shortcut as an alternative to entering a standard greeting and closing for every email response you send. Your administrator can create standard text for routine situations so you can insert a text item into a response.

You can insert standard text from the Standard Text window or, if you know the shortcut key for the text item, you can enter it without opening the Standard Text window.

1. In your response, position the cursor where you want to insert the standard text.
2. Click **Standard Text** on the Messages tab toolbar.
   - The **Standard Text** window opens.
3. Do one of the following:
B2C Service
Using B2C Service

Chapter 5
Service

- Double-click the standard text item to automatically insert the text into your response.
- Select the standard text item you want to insert in your response and click **OK**.
- Drag the standard text item from the list into the response.
- Copy the text in the Preview section and paste it into the response.

If an HTML version of the standard text is available, it displays by default in the Preview section of the window. Otherwise, the plain text version displays.

**Tip:** To search for standard text, click **Find in List**.

4. Click **OK**.
5. To add new standard text to the response, repeat these steps.
6. To edit the standard text, make changes as necessary in the response.

**Note:** If the standard text includes one or more variables, the variable displays in your response rather than the value of the variable (the contact's first name in the example). The variable is replaced with the data only when you send your response. Then, when you reopen the incident, the data displays where the variable had been inserted.

**Related Topics**
- Add or Edit Standard Text
- Insert Standard Text Using a Keyboard Shortcut
- Add or Edit a Variable

**Insert Standard Text Using a Keyboard Shortcut**

If you know the shortcut key for standard text you want to insert, you can enter it without opening the Standard Text window.

1. To display the shortcut key for a standard text item, select the standard text in the column that contains the Standard Text options in the **Standard Text** window.
   The shortcut keys are displayed in the Hotkey field in the right column.
2. At the location in the incident response where you want to insert the standard text:
   a. Press F8 to open a Standard Text field.
   b. Enter the shortcut keys in the field.
   c. Press F8 or Enter to insert the text into your response.

**Related Topics**
- Add or Edit Standard Text

**Find Answers Using Guided Assistance**

Guided assistance is a powerful tool designed to step you through a series of questions and direct you to answers and text responses you can offer your customers.

As you work with customers on the phone or respond to incidents, you can quickly find the information that best helps your customers. Guided assistance steers you to the information based on your answers to the questions rather than you having to review SmartAssistant answers or search the knowledge base.

Before you can use guided assistance to work with incidents, your administrator must have enabled the tool on your site, created *guides* for you to use, and added the Guided Assistance control to the incident workspace you use.
Using B2C Service

Chapter 5

Button Description

Expand Navigator Select this check box to open a panel on the left that displays all the branches used in the guide.

Navigate Click this button after selecting a question or response on the left panel. The contents of the question or response are displayed on the right panel.

Search for a Guide Click this button to search for a guide.

Select a Guide Click this button to select a guide.

Add Text to Thread Click this button to add the text of the current question and response to the incident thread.

1. Open the incident for which you want to use guided assistance.
2. To select a guide from a list, click **Guided Assistance** and click **Select**.
   The **Select a Guide** window opens.
3. Select the guide you want from the list.
4. Click **OK**.
   The **Guided Assistance** window opens.
5. To search for a guide, click **Search for a Guide**. The **Search for a Guide** window opens.
   - **Note**: Before searching for a guide, you should fill out the associated incident’s product and category. Only guides that have been associated with an answer can be searched.
   - a. Define search terms by selecting drop-down menu options or entering phrases in a text field.
   - b. Click **Search**.
      A list of guides that match your search criteria displays.
   - c. Select the guide you want to use and click **Select**.
      The window closes and the questions in the guide are displayed.
6. Answer each of the questions that are presented in the guide until you reach an end point, which is in the form of a knowledge base answer or a text explanation.
7. If the results provide answers from the knowledge base, you can add a link to an answer or the text of the answer in the incident thread, or you can view an answer.
   - a. To add a hyperlink to the answer in the incident, click **Add as Link**.
   - b. To add the text of the answer to the incident, click **Add as Text**.
   - c. To view the answer, click **View**.
8. Click **Close**.

**Related Topics**
- Overview of Guided Assistance

**Add or Edit Contact Information**

Because Service creates incidents from customer questions, the contact information is usually present when you respond to an incident. Sometimes, however, you will need to add or edit contact information.

You can add multiple contacts to an incident, but you must designate only one as the primary contact. Secondary contacts do not have to be associated with the same organization as the primary contact.

1. From an open incident, click the **Contacts** tab.
   Information for the primary contact (which includes name, email address, phone, title, and address) displays at the top of the tab, and nested tabs contain additional information.
2. To remove a contact from the incident, select the radio button next to the contact’s name, click **Remove**, and confirm that you want to remove the contact.
   The contact is disassociated from the incident, but the contact’s record remains in the **knowledge base**.

3. To add a contact, do one of the following:
   - To add a new contact to the incident, click **Add New**. A new contact opens on a subtab.
   - To add an existing contact to the incident, click **Add Existing**, search for the contact you want to add, and select it. To edit this contact, right-click it and select **Open**.

   **Note:** Adding a new contact from the Contacts tab does not change the primary contact for the incident. To designate a primary contact, manually select **Primary** next to the contact’s name. However, adding a new contact using Search next to the Contact field of the incident not only replaces the existing primary contact with the new contact, but the existing primary contact is automatically removed from the incident.

4. To edit an existing contact for the incident, right-click the contact and select **Open**.
   The contact opens on a subtab.

5. Add or edit contact information in the First Name and Last Name fields and make a selection in the State field.

6. To add or edit other contact information, make the changes in the fields or on the record tabs.

7. Click **OK**.
   The Contact subtab closes and keeps the contact data in memory. The contact record is not saved in the knowledge base until you save the incident.

8. To add other information to the primary contact record, click the **Contact Fields** subtab.
   a. To add or edit the contact’s login, enter it in the field.
   b. To select or change the contact’s global opt-in choice, email format, or state, click the appropriate drop-down menu and select an option.

9. To view incident information for the primary contact, click the **Incident History** subtab.

10. Click **Save**.

**Related Topics**
- **Overview of Contacts**
- **Edit Key Incident Fields**

**Add Time Billed to an Incident**

This topic describes how you can use the fields available on the Time Billed tab to track your time working on an incident.

Your organization may collect statistics on the amount of time agents spend solving incidents so that management can plan for better use of staff time. These statistics can also identify products or issues that are causing similar customer questions, allowing answers to be added to the **knowledge base** to reduce the amount of time agents must spend on them.

The Time Billed tab is where you enter the amount of time you spend on an incident. It also lets you see details about the amount of time other agents spent on the incident. Depending on how your administrator has configured your application, you may be required to enter time billed every time you edit an incident or before you can set an **incident status** to Solved.

1. From an incidents report, right-click the incident and select **Open > Incident**.
2. Click the **Time Billed** tab. The tab contains the number of time billed entries associated with the incident in parentheses next to the tab name.
3. Click **Add New** to open the **Time Billed** window.
4. Enter field information.
Modify Time Billed Entries
You can edit and delete time billed entries as necessary.

1. To edit a time billed entry, right-click it and select **Open**.
   a. Make your changes.
   b. Click **Save**.
2. To delete a time billed entry, right-click the entry and select **Delete**.
   
   **Note:** Deleting a time billed entry can result in inaccurate statistics in reports.

Add or Edit a Task for an Incident
You can add and edit all tasks associated with an incident by clicking the Tasks tab.

When you add or edit a task, you not only define its name, the staff member it is assigned to, relevant dates, and type of task, but you also associate it with new or existing incidents. The tab contains the number of tasks associated with the incident in parentheses next to the tab name.

1. From an incidents report, right-click the incident and select **Open > Incident**.
2. Click the **Tasks** tab.
3. Do one of the following:
   a. Click **Add New** to open the new task on a subtab. The reference number for the incident appears in the Incident field on the new task editor.
   b. Right-click a task on the **Tasks** tab and select **Open**.
4. Add or change the task name in the **Name** field.
5. Click the **Status** drop-down menu and select a status for the task. The default status is Not Started.
6. To enter additional task information, complete the fields or select menu options.
7. Click **OK**.
8. Click **Save**.

**Related Topics**
- **Overview of Tasks**
Edit an Organization Associated with an Incident

Incidents are associated with contacts. If an incident also has an organization association, it’s because the primary contact is associated with an organization.

The Organization tab lets you view the name and ID of the organization associated with the primary contact, and you can edit the address, login, password, and state for the organization. But if you want to change the organization associated with an incident, you will have to edit the contact record.

1. From an incidents report, right-click the incident and select **Open > Incident**.
2. Click the **Organization** tab.
   - **Note:** The Organization Name and Organization ID fields are read-only.
3. To enter an address, click **Edit** in the lower right corner of the Billing field to display a window for entering the address. Enter information in the Street, City, and Postal Code fields, and make selections on the Country and State/Prov fields drop-down menus. When you select the country, the associated states or provinces appear in the State/Prov menu. Press Enter when you are finished to close the window and display the address you entered.
4. To enter a login or password, enter the information in the appropriate field.
5. To change the **state**, click the drop-down menu and select an option.
6. To view the incident history for the organization, click the **Incident History** tab.
7. To view the contacts, click the **Contacts for Org** tab. You can also open, add, print, copy, assign, delete, and email contacts using the toolbar on this tab.
   - **CAUTION:** There are usually consequences when a contact is deleted. See **Delete a Contact**.
8. Click **Save**.

View Web Visit Information for an Incident

You might find it helpful to know what information contacts viewed on the customer portal before they submitted their question.

On the Web Visit tab of an incident, you can see what questions they viewed and any searches they performed. In addition, the customer’s referring site (the site they were visiting prior to accessing the customer portal), source IP address, operating system, and browser information are provided.

1. From an incidents report, right-click the incident and select **Open > Incident**.
2. Click the **Web Visit** tab.
   - The number of actions are listed in parentheses on the tab.

Incident Attachments Tab

The Attachments tab lets you add files containing information that may not fit neatly into an incident.

For example, you might want to attach a file that contains graphic elements. When you attach a file to an incident or incident response, that file becomes permanently attached to the incident. Likewise, any file the customer attaches when submitting a question also becomes permanently attached to the incident. HTML email updates that are larger than the maximum description size are attached to the incident as an HTML file.

The Attachments tab lists all files attached to the incident and contains the file name, size, dates created and updated, a description, and whether the attachment is private (not visible on the customer portal). You and other staff members can access any attached file from the Attachments tab of the incident, while the customer can access it from the Your Account page on the customer portal.
If a file is attached at the same time an incident thread is added on the Messages tab, an Attachments indicator displays in the title bar of the thread on the Messages tab after the incident is saved. Click the Attachments drop-down menu to display attachments added at the time the thread entry was saved, then click a file name to view the file.

**Note:** The Attachments indicator drop-down menu in a thread title bar indicates which files were sent in your response to the customer and helps you identify the point in the incident thread an attachment was added to the incident. If you attach a file and save the incident when there are no uncommitted threads, the attached file will appear on the Attachments tab but not on the Messages tab.

Files that are permanently attached to an incident are not sent in your response to the customer unless you specifically mark them to be sent with the response. This lets the customer open the file directly from the email client instead of having to log in to view it.

**Present an Offer**

In your role as an agent, your organization may ask you to present special offers to customers because you have a strong understanding of what they need and have earned their trust through your work with them.

When you work with an incident, Service evaluates the customer’s information and purchase history. Based on the results, it looks for offers the customer is eligible for. These offers can include promotions, suggestions, or both. Promotions are special offers made to specific groups of customers (called targets), while suggestions are automatically generated based on customer information. An example of a promotion is free shipping on certain products. An example of a suggestion is offering a headset to someone who has recently purchased a cell phone. When the customer is eligible for an offer, the V button is enabled. After you finish responding to the customer’s question, you can click Offer Advisor to display an Offers window.

The following procedure is a brief overview of presenting an offer to a customer. For the complete procedure, see *How You Present Offers*.

1. From an open incident, click Offer Advisor to open the Offer Advisor window.
2. Select the offer you want to present to the customer.
3. Do one of the following:
   - If you are on a phone call with the customer, read or paraphrase the guide and product information to the customer.
   - Or, if you are responding to an incident, right-click anywhere in the guide text or product information sections and select Copy. Paste the text into the response and modify as necessary before sending.
4. Click Set Response in the Action column for the offer you want to present. The associated drop-down menu in the Response column is activated.
5. Click the drop-down menu and select Yes, Interest, No, or Defer.
6. Click OK.
7. Click Save.
Create an Opportunity from an Incident

During the course of working with customers, you might discover information that makes them potential customers for other services and products your organization offers. In those cases, you can create opportunities and send them to the sales department for evaluation and follow-up.

The workspace you use to create an opportunity from an incident may be different depending on your profile and any custom workspaces defined by your administrator.

1. From an open incident, click New Opportunity.
2. To edit any information for the opportunity, enter the field information described in Edit Key Opportunity Fields.
3. Click Save.

How You Send Incident Responses

When you have completed a response to an incident, you are ready to send your reply to the customer. Several options are available when you send a response, including attaching files to the response, copying other recipients, and selecting encryption options.

The behavior for sending responses depends on the settings your administrator selected when creating the incident workspace for your profile. The standard incident workspace behaves in the following manner when you add a Response type thread entry to the uncommitted threads panel.

- The Send on Save check box is cleared, so you must select it if you want to automatically send your response to the primary contact when you save the incident. For this reason, you might not want to select it until you have finalized your response so you do not send a response each time you save changes while you work on the incident.
- If an uncommitted response thread exists and the Send on Save check box is selected, the Email title bar displays an attachment icon for associating attachments and a CC field for notifying other contacts. BCC and sign/encrypt functionality can be enabled on the Options window (accessed by clicking Options on the thread control, which is typically found on the Messages tab toolbar).
- You can save a draft response to an incident without sending it. Click Options on the thread control and select the Always Show for Responses check box below the Email Message Header heading. You will then be able to set CC, BCC, and attachments for a response, and save that data until you want to send the response. See Attach Files to an Incident Response and Select Additional Recipients for an Incident Response.
- Customer-entered URLs are replaced with [link removed] in response emails. This ensures that customer-entered URLs (IP addresses) are not identified as spam and blocked. This functionality can be overridden by populating the EGW_ALLOWED_DOMAIN_NAMES and EGW_ALLOWED_TOP_LEVEL_DOMAINS configuration settings located in RightNow Common/Service Modules/RightNow Email.
- If a contact is associated with multiple email addresses, service responses are sent to all associated addresses by default. You can limit your responses to be sent to a single email address by enabling the site-wide configuration setting OESVCSendMail_SINGLE_ADDRESS (located in Common/General/Outgoing Email). When enabled, service responses are sent only to the specified email address and agents can select which one of the contact email addresses they want to send the response to. That email address value remains for the life of the incident. However, any new incidents for that contact will default to the primary email address.

Related Topics
- Edit a Configuration Setting

Send a Response to the Primary Contact

Follow this procedure to send a response to the primary incident contact.

1. Do one of the following:
Click Send.

Select the Send on Save check box, and then click Save.

If a customer does not receive your response, a Viewed Bounced Messages button appears on the Response title bar in the committed threads panel. See View a Bounced Message.

Send a Single Response to a Contact Associated with Multiple Addresses

Follow this procedure to send a single response to a contact associated with multiple addresses.

This procedure assumes you have enabled the site-wide configuration setting OE_SVC_SENDMAIL_SINGLE_ADDRESS (Common/General/Outgoing Email). See Edit a Configuration Setting.

1. Select the Send on Save check box.
   The Response title bar expands and displays the primary contact’s email address, an Attach button (paperclip icon), and a CC field.
2. Click the drop-down menu to the right of the primary contact’s email address and select the address to which you want to send the response.

   **Note:** This email address value remains for the life of the incident. However, any new incidents for this contact will default to the primary email address.

3. Click Save.

- Select Additional Recipients for an Incident Response

Attach Files to an Incident Response

Follow this procedure to attach files to an incident response.

1. Click Options and select the Always Show for Response check box below Email Message Header.
   The Response title bar expands and the Attach button displays.
2. Click Attach.
   The Attachments window opens.
3. To send the response with one or more files that have been attached to the incident, select the associated check boxes in the Incident Files section of the Attachments window.
4. To attach additional files to the incident response, click Add Files and select Browse to view the files and folders on your workstation. Or select Search to open the File Search window.
   a. If you selected Browse, select the file and click Open to attach it to the response.
   b. If you selected Search, specify a directory, all or part of a file name, and the type of file. Click Search. Then select one or more of the matching files and click Add Files.
5. Click OK.
6. Click Send.
   The response is sent with attachments to the customer, as well as any other recipients you added to the CC or BCC fields. Attached files sent with the response will appear in the Attachments drop-down menu in the title bar of the response.

   **Note:** All files attached to an incident or incident response are recorded in the knowledge base and audit log. Files attached to an incident using the Attachments tab, rather than with the Attachments button in the response title bar, are stored with the incident, but are not sent with the response unless selected. These files appear in the Attachments drop-down menu in the title bar of the message with the heading “Added to incident, but not sent.” See Incident Attachments Tab.
Select Additional Recipients for an Incident Response

Follow this procedure to select additional recipients for an incident response.

1. Click Options and select the Always Show for Response and Show CC check boxes under Email Message Header.
   The Response title bar expands and the CC field displays. To display the BCC field, you must also select the Show BCC check box on the Options window.
2. Click CC.
   The Select Names window opens.
3. To import your contacts from the default Contacts folder in Outlook, select the Load Outlook Contacts check box. This is useful for displaying contacts that are not included in B2C Service.
4. Select a name from the list.
   Tip: You can enter the first few letters of the name in the field at the top of the Select Names window. The first name in the list that matches the letters you typed is highlighted. Notice that this name may be the contact's first or last name, an email address, or a group or distribution list.
5. Click CC to list the name in the CC field or click BCC to list the name in the BCC field. Names or addresses in the CC field are visible to all recipients of the response. Names in the BCC field are not visible to other recipients.
6. Click OK.
7. Click Send.
   The response is sent to the customer, as well as any other recipients you added to the CC or BCC fields.

Depending on how your administrator configured your application, the incident status may change to Solved when you save the incident. The incident assignment may also change to your name if the incident was previously assigned to another staff member.

Sign and Encrypt an Incident Response

Follow this procedure to sign and encrypt an incident response.

1. Click Options and select the Always Show for Response and Show Sign/Encrypt check boxes below Email Message Header.
   Note: Because different staff members can be working on the same incident, email signatures are appended to the thread you are responding to instead of to the bottom of the email. If your email signature does not populate the thread response, your administrator has not set up email signature information. Contact your administrator for more information.
2. Select the Sign check box.
   You cannot select the Sign check box if the Service mailbox does not have a certificate that allows sending encrypted email.
3. To encrypt your response to the contact, click the Do Not Encrypt drop-down menu and select Encrypt When Possible or Encrypt Always.
   You cannot select an encryption option if the contact you are responding to does not have a certificate that allows receiving encrypted email. If you select Encrypt Always, you can select only addresses that have certificates associated with them.

- How SMIME Security Works
View a Bounced Message

If a customer does not receive your response due to a bounced message, a View Bounced Message button displays on the Response title bar.

The audit log will also contain an entry for the bounced incident response that reads, “From Techmail–Incoming Auto-Reply Message.”

1. Click View Bounced Messages on the Response title bar.
   The Bounced Messages window opens, displaying full text copies of each bounced email.
2. Click OK.

Service Collaboration

Service Collaboration lets agents collaborate with other agents to more quickly resolve customer questions.

From the incident workspace, agents can create conversations containing the details of their findings and post questions to other agents. The ability to collaborate with other agents encourages knowledge sharing among your staff and decreases response time to customers.

| Note: | To enable and configure Service Collaboration, see Answer ID 6902 on our support site. |

After Service Collaboration is enabled, you must:
- Assign staff members permission to use collaboration.
- Create a custom incident workspace to include a collaboration relationship item control.
- Add the My Incident Conversations item to the navigation set of agents with collaboration permission. Adding this item lets agents quick access to all conversations in which they are participating.

Oracle Social Network (OSN) can be integrated with the agent desktop using Service Collaboration. Agents can customize their toast preferences for OSN notifications. For the link to the OSN documentation, see Oracle Social Network.

Configure Collaboration with External Users

This topic describes how to configure a profile for an external user to assist agents in solving customer questions.

Service Collaboration lets agents get assistance from other staff members who are not agent desktop users. These external users, such as engineers, product experts, analysts, and other subject-matter experts (SMEs), can be brought together to answer complex questions or contribute to solving an incident.

You can create a profile specifically for external users. Users with this profile will be able to log in to the collaboration service directly using a web browser or supported mobile device, but will not be able to use the Service Console. You are permitted up to 100 external users for each Service Console license.

1. Create a profile that will be used only for external users.
2. On the Other tab of the Profiles editor, select the External User check box.

| Note: | Collaboration must be enabled for the External User check box to be visible. |
3. Save and close the new profile.
4. Create staff accounts for the external users, and assign the external user profile to them.
5. On the Staff Accounts editor, select Disabled from Assignment/Report Filters from the Disabled drop-down menu for each external user staff account.

Cobrowse with a Customer from an Incident Workspace

This topic describes how to use Co-browse to assist a customer while working on an incident.

With Co-browse, you can guide a customer through a web page using your mouse or other pointing device to demonstrate actions. In effect, you take control of the customer’s web browser to show the customer how to complete an action. Co-browse helps eliminate the confusion that can arise when giving verbal instructions and is effective for assisting customers in filling out forms or completing a sale.

**Note:** Co-browse must be enabled before you can begin a session with a customer. In addition, you can engage in only one co-browse session at a time.

1. While speaking with a customer on the telephone, direct the customer to the location of the co-browse link on your customer portal and instruct the customer to click it. A message notification opens and provides the customer with an access code number.
2. With the customer’s incident open, click the Co-browse tab.
   The co-browse login page displays and your B2C Service login name appears in the Agent Name field.
3. Ask the customer for the secure session ID number and enter it in the Access Code field.
4. Click Connect. The co-browse toolbar displays and the co-browse session begins.

Your viewing and co-browsing options are limited depending on how your company has set up the Co-browse deployment. Privacy settings can differ when you co-browse in Instant Co-browse mode or Advanced Co-browse mode. Your company’s Co-browse administrator configures the privacy settings.

<table>
<thead>

Add an Incident

This procedure describes how to add an incident for a customer using B2C Service.

Incidents are generally submitted by customers from the Ask a Question page or through email. As a result, the majority of your time is probably spent editing incidents. However, Service does not automatically create incidents when customers contact you by phone, mail, or fax, so you may find yourself adding incidents from time to time.

When you add an incident, you create a record of both the customer’s question and your response, which can help your organization track resolution of the incident. You can add incidents to your knowledge base no matter what navigation list is active or what kind of record you are working on.

1. Do one of the following:
   - Click New on the ribbon.
   - If your navigation set is configured to add incidents from the application menu, click File > Incident.

   **Note:** Notice that the Reference # and Organization Name are read-only fields. The reference number is automatically assigned by B2C Service, and the organization name (if the field contains an entry) is the one associated with the primary contact for the incident.

2. Enter the question or issue in the Subject field. Maximum character limit is 240 characters.
3. Complete the incident fields as described in Edit Key Incident Fields.
4. Click the Customer Entry field and enter the customer’s question.
5. Click Add > Response.
6. Enter your response. See Incident Thread and Response Options.
7. To add or edit contact information for the incident, click the Contacts tab and complete the information as described in Add or Edit Contact Information.
8. To enter the time you spend working on the incident, click the Time Billed tab and complete the information as described in Add Time Billed to an Incident.
9. To add or edit task information for the incident, click the Tasks tab and complete the information as described in Add or Edit a Task for an Incident.
10. To add or edit organization information for the incident, click the Organization tab and complete the information as described in Edit an Organization Associated with an Incident.
11. To attach one or more files to the incident, click the Attachments tab. See Overview of the Attachments Tab.
12. To present an offer to the customer, click Offer Advisor. See Present an Offer.
13. To create an opportunity from the incident, click New Service Opportunity. See Create an Opportunity from an Incident.
14. To send a response, see How You Send Incident Responses.
15. Click Save.

**Related Topics**
- Incident Management
- Creating an Incident (video)

**Incident Management**

Besides editing and adding incidents, you may have other incident management duties as well. For example, you might want to propose that incidents be added as answers to the knowledge base, delete incidents, or requeue or reassign incidents.

For other incident management tasks, including forwarding incidents and updating multiple incidents simultaneously, see Overview of Common Functionality.
Propose an Answer from an Incident

You can propose an incident to become a potential answer for your knowledge base.

Sometimes a customer’s question is common enough that you believe other customers should also have access to the answer. If you believe this information belongs in the knowledge base, you can propose the incident as a potential answer that customers can view without needing to submit a service request. This helps the knowledge base stay current with the information customers need.

When you propose an incident as an answer, a copy of the incident is submitted to a knowledge engineer, who determines whether it should become an answer. If it should, the knowledge engineer first defines an answer access level, answer status, language, and visibility, and then publishes the answer.

**Note:** Incident custom fields may or may not be included when you propose an incident as an answer. If you propose an incident from an incidents report, by either right-clicking the incident and selecting Propose or by clicking Propose on the report ribbon, the incident custom fields are not added to the Notes tab on the Propose Incident for Answer window. If, however, you click Propose from an open incident, the custom fields do appear on the Propose Incident for Answer window.

1. Do one of the following:
   - From an incidents report, right-click the incident and select Propose Incident.
   - With the incident open, click Propose.

   The Propose Incident for Answer window opens.

2. Review the proposed answer and make any necessary edits.

3. To add a note to the proposed answer, click the Notes field and enter your comments.

4. To add or remove any products or categories associated with the proposed answer, click the Products and/or Categories tab. Select those you want to associate with the proposed answer, and clear those you do not want to associate with the answer.

   The products and categories associated with the incident are selected by default.

5. To remove any files that are permanently attached to the incident from the proposed answer, click the Files tab. Clear the check box next to any file you do not want to propose with the incident.

   All files permanently attached to the incident are selected to be proposed with the incident by default.

6. Click OK.

   A confirmation message lets you know that an answer was proposed from the incident.

**Related Topics**

- How You Add Answers for Multiple Interfaces

Delete an Incident

If your profile gives you permission to delete incidents, the Delete button is enabled on the ribbon. When you delete an incident, you permanently remove it from the knowledge base.

1. Do one of the following:
   - To delete an incident when the incident is open, press Delete. A message asks you to confirm deletion of the incident.
   - To delete an incident from an incidents report, right-click the incident and select Delete > Incident.

2. Click Yes.
Reassign or Re-Queue an Incident

You might need to assign incidents from your inbox to another staff member or move them back into an incident queue.

These situations commonly require you to move incidents, although your manager may have other guidelines as well.

- **You log out for the day**—To avoid having unresolved incidents sitting in your inbox when you leave for the day, you might want to assign them to another staff member or place them back in a queue.
- **You are assigned an incident you should not have received**—When an incident is incorrectly assigned, you can assign it to another agent or group or move it to the correct queue.

1. From an incidents report, right-click the incident and select **Open > Incident**.
2. Do one of the following:
   - To reassign the incident, click the **Assigned** drop-down menu and select the appropriate group or staff member.
   - To requeue the incident, click the **Details** tab, click the **Queue** drop-down menu, and select the appropriate queue.
3. Click **Save**.

The incident is moved from your inbox to the agent inbox or selected queue.

Archived Incidents

As customers submit incidents and staff members create incidents, which might have attachments and responses, your site's database can grow very large, leading to performance issues.

To avoid these issues, B2C Service archives incidents automatically past a certain period of time after they are solved. Archived incidents can also automatically be purged (deleted permanently).

You can access data lifecycle management on the Agent Browser UI, which provides built-in policies to archive and purge unused or unrequired data automatically and periodically. See **Data Lifecycle Management**.

Open the Archived Incidents Component

There might be times when you need to reference outdated incidents to better serve your customers. In B2C Service, you can search for and view incidents that have been removed from your knowledge base and archived.

Before you can access the Archived Incidents component, the appropriate permissions must be defined in your profile. Customize navigation sets must be enabled, in addition to Incident Read permission. You must then add the Archived Incidents component to a navigation list. Contact your administrator if you are unsure of your permissions or this component's location.

**Note:** Archived incident information is read-only and cannot be updated. In addition, you must perform a search to display and view archived incidents.

1. Click the navigation button that contains the Archived Incidents component.
2. Double-click ** Archived Incidents.**
The Archived Incidents component opens on the content pane. You can search for, view, print, and export incidents. No incidents display until you perform a search. See Perform a Basic Search for an Archived Incident or Perform an Advanced Search for an Archived Incident.

Perform a Basic Search for an Archived Incident
You can search for archived incidents. No incidents display until you perform a search.

1. Click **Search** on the Archived Incidents component.
   The **Search** window opens.
2. Enter search terms.

<table>
<thead>
<tr>
<th>Field/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference Number</td>
<td>Enter the reference number of the incident in this text box.</td>
</tr>
<tr>
<td>Text Search</td>
<td>Enter a word or phrase in this text box to search all archived incident fields. Because archived incidents have been removed from the knowledge base and converted to a text format, you can only search for incidents with a single text search. Searchable incident fields include Subject, Incident thread, Product (including subproducts), Category (including subcategories), contact-related fields, organization-related fields, incident custom fields, and incident custom attributes. A Boolean OR operator is used between words by default. In addition, there is an implicit wildcard at the end of the search string.</td>

**Related Topics**
- Perform an Advanced Search for an Archived Incident

Perform an Advanced Search for an Archived Incident
The Archived Incidents component features advanced searching capabilities for retrieving archived incidents.

You can perform a search based on a range of search fields, including the subject, threads, product, category, disposition, contact data, and organization data associated with the incident. You can also search ranges for incident creation and closed dates. Custom fields of a string or date data type can also be searched using a specially formatted search value.

After you perform a search, the archived incidents that match your search criteria display on the content pane. Search results are limited to 1,000 incidents rendered in groups of 100. Pagination controls appear when search results exceed 100 incidents. Search results list the reference number, subject, creation date, and closed (solved) date for each incident. To view an incident returned in the search results, double-click an archived incident to open it, or select the incident and click **View Incident**.

1. Click **Search** on the **Archived Incidents** component.
   The **Search** window opens.
2. Click the **Advanced Search** link to access advanced searching options.
Note: To return to basic search options, click the Basic Search link in the top left corner of the window and see Perform a Basic Search for an Archived Incident.

3. Enter field information.

|                 | Where:                                                                                   
|                 | o  custom_field_name = name of the custom field or attribute                             |
|                 | o  search_data_type = text, str, or date                                                 |
|                 | o  connector = AND or OR                                                                  |
|                 | o  search_term = data to search for                                                       |
|                 | Examples:                                                                               |
|                 | c$url_custom_str:"help.example.com"                                                      |
|                 | c$RMA_custom_text:RMA12345 AND                                                           |
|                 | CO$VarCharText_custom_str:megabyte                                                        |
|                 | c$date_custom_date:[20130326T11:37:00Z TO NOW]                                            |
| **Note:**       | Use quotation marks when searching for a URL value in a text field. Use YYYYMMDDTHH:MM:SSZ format for date/time values. You can join multiple search strings together using the AND and OR operators. |

4. To clear all field search values, click **Reset**.

5. Click **Search**.

**Note:** Multiple search terms will be joined with AND operators. For example, searching with `14*` in the Ref number field and `Phone` in the Subject field will find only incidents that satisfy both criteria, that is, their reference numbers start with 14 and their subjects include “Phone.”
View an Archived Incident
When you find the archived incident you’re looking for, you can open it to view the incident details. You can also print, export, or delete the incident.

1. From the list of search results, open the archived incident you want to view.
   
   **Note:** B2C Service workspaces do not apply to archived incidents. Therefore, the layout of archived incidents and the location of certain fields are different from the way incidents normally display on the Agent Browser UI. If an incident includes HTML formatting when it's archived, the HTML formatting is retained and displays on the content pane.

2. View the archived incident details.

<table>

Delete an Archived Incident
You can delete a selective archived incident, permanently removing the incident from your organization’s database.

Your profile must have Administration permission before you can delete archived incidents. See Administration Permissions.

There may be times when you want to delete an archived incident prior to the specified purge date defined by your organization. This procedure lets you delete an archived incident, regardless of the period specified for archived incidents to be automatically deleted.

1. Click Search on the Archived Incidents component.
   The Search window opens.
2. Click the Advanced Search link to access advanced searching options.
3. Enter search terms as described in the Archived Incidents Advanced Search Options table.
   
   **Tip:** You can also use Basic Search to search for an archived incident.
4. Click Search.
The search results display on the Archived Incidents component.

5. Select the check box next to the incident(s) you want to permanently delete.
6. Click **Delete**.
7. Click **OK** in response to the confirm delete message.
8. Click **OK** in response to the selected incidents are being deleted message.

**Note:** It may take up to 30 minutes for the deleted incidents to be fully removed from the database. Deleted incidents may continue to display in search results until the delete operation is complete.

### Export Archived Incidents

After performing a search, you can export archived incidents.

1. Select the archived incidents you wish to export. You can export up to 100 incidents at a time.
2. Click **Export**.
3. Select the location where you want to save the export file and enter a name for the file.
4. Click **Save**.

The export file will be saved with a `.zip` extension, and will contain each exported incident as an individual XML file. You can also open the export file, in which case it will be downloaded to a temporary folder first, then opened.

### Incident Thread Management

In addition to the tools you have for answering customer questions and maintaining accurate records of all communications with your customers, you also have tools that can help you protect customer information contained in incident threads and, when necessary, convert information from response threads to note threads.

- **Incident Thread Masking**
- **Edit or Convert a Response Thread**

### Incident Thread Masking

Your customers and agents may occasionally submit incidents containing sensitive customer information, such as credit card and social security numbers in incident threads. Whether the information appears in a customer entry, response, or private note thread, the security of your customers’ personal assets may be compromised.

Incident thread masking can protect this personal data by automatically masking content in incident threads. By default, B2C Service contains three predefined system masks for credit card, social security, and telephone numbers. In addition, if our predefined patterns do not satisfy your organization’s needs, you can define up to five custom masks to hide other personally identifiable information when new thread entries are created. As you configure incident thread masking for your application, you can test each system and custom mask before finally deploying the configurations to your site. To mask customer information in incident threads, incident thread masking must be enabled. Contact your Oracle account manager to enable this feature.

**CAUTION:** Be aware that after incident thread masking is enabled, masking is automatically performed in new thread entries, even if you make no changes to the predefined masks or define custom masks. Masking also occurs in the incident thread data itself, where the masked values are replaced and not recoverable. Note that predefined text, such as standard text, SmartAssistant responses, and variables, is not masked. Do not include confidential information in predefined text. For these reasons, you should use extreme caution when configuring masking for your site, and enable the profile permission for this feature only for trusted administrators.
After incident thread masking is enabled, you must perform the following tasks so you and your staff can configure incident thread masking.

- Add the Incident Thread Masking component to the Configuration button in at least one navigation set. See Create a Navigation Set for the Administrator.
- Assign the Administration permission on the Administration tab of profiles so specific staff members can configure incident thread masking. See Administration Permissions.

Configure Incident Thread Masking

By default, B2C Service contains three predefined system masks for credit card, social security, and telephone numbers. In addition, if our predefined patterns do not satisfy your organization’s needs, you can define up to five custom masks to hide other personally identifiable information when new thread entries are created.

1. Click Configuration on the navigation pane.
2. Double-click Incident Thread Masking in the configuration list.
   The Incident Thread Masking editor opens on the content pane.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Masks</td>
<td>This section contains a list of three predefined system masks, which are enabled by default. In addition, the last four digits of each system mask also display by default. You can edit each system mask to hide the last four digits or disable any system mask you do not need. When incident thread masking is enabled, masking is automatically performed on credit card, social security, and telephone numbers entered in new incident threads with no action required on your part. You can enable or disable these options to suit your business needs.</td>
</tr>
<tr>
<td>Credit Card</td>
<td>Clear the Enabled check box to disable the credit card mask, or clear the Show Last 4 Digits check box to hide the last four digits of credit card numbers. This mask matches major credit card numbers including Visa, MasterCard, Discover, American Express, and Diners Club. Hyphens, periods, and spaces are accepted as dividers between number groups, as in the following examples. The dividers can be at fixed/random intervals. <strong>Note:</strong> Credit cards with 12–19 digits are supported by Incident Thread Masking to include additional credit card types, not just those in the following list.</td>

<td><strong>Custom Masks</strong></td>
</tr>
<tr>
<td></td>
<td>Double-click in the <strong>Value</strong> field next to the first custom mask and enter the <em>regular expression</em> for the pattern you want to mask. This examples can help you configure custom masks for new incident threads.</td>
</tr>
<tr>
<td></td>
<td><strong>Example 1</strong></td>
</tr>
<tr>
<td></td>
<td>Suppose you want to mask all account numbers that match the pattern 123-123456. Enter <code>[0-9]{3}-{0-9}{6}</code>. As a result, all account numbers that match this pattern will display as XXXXXXXXXX in new incident threads. (Notice that all characters are masked, including the hyphen.)</td>
</tr>
<tr>
<td></td>
<td><strong>Example 2</strong></td>
</tr>
<tr>
<td></td>
<td>In this example, we’ll define a mask for Canadian postal codes that match the pattern K8N 5W6. Enter <code>[A-Z]{1}[0-9]{1}[A-Z]{1} [0-9]{1}[A-Z]{1}[0-9]{1}</code>. As a result, all Canadian postal codes that match the pattern K8N 5W6 will display as XXXXXXX. The space is also masked.</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>This read-only field shows the status of changes you make in any custom mask <strong>Value</strong> field. Statuses include Valid, Requires Test, and Error.</td>
</tr>
<tr>
<td></td>
<td>The status of this field may change when you enter sample text in the <strong>Preview Text</strong> field, and click the <strong>Test/Preview</strong> button.</td>
</tr>
<tr>
<td><strong>Preview Text</strong></td>
<td>Click in this field to test your mask patterns. Include samples that both match and closely match the custom pattern you configured.</td>
</tr>
<tr>
<td></td>
<td>For example, to verify that your Canadian postal codes mask is masking only the alphanumeric pattern you configured, enter the following postal code samples.</td>
</tr>
<tr>
<td></td>
<td><strong>K8N 5W6</strong></td>
</tr>
<tr>
<td></td>
<td><strong>4J3 P2P</strong></td>
</tr>
<tr>
<td></td>
<td><strong>V5T 1Y9</strong></td>
</tr>
</tbody>
</table>
### Field/Button | Description
--- | ---
Test/Preview | Click this button to apply the configured system and custom masks to the sample content in the Preview Text field.

**Result Text**

This field displays the masked preview text. Sample text that matches an enabled system or custom mask will display as masked. For example, the Canadian postal code samples in the Preview Text field displays the following Result Text values:

- XXXXXXX
- 4J3 P2P

The masks applied to the first and third text samples because they matched the alphanumeric expression that we configured in our custom masks example. The second text sample did not match the pattern.

Be sure to test a variety of sample values and adjust custom mask values until the Result Text displays text masked as you want. Also be sure to test inexact matches to ensure that masks are not affecting content that should not be masked.

---

4. Click **Save** save your changes to system and custom masks.

**Note:** You must deploy mask configurations before they will be committed to the database and applied to new incident threads.

5. Click **Deploy**

The **Deploy** window opens.

6. Enter the email addresses you want to send notifications to in the **Email Address** field.

Multiple addresses must be separated by commas. The logged-in staff account’s email address is automatically added. Addresses entered in this field receive emails when deployment completes or when an issue preventing deployment is encountered.

7. Click **Deploy** to deploy your changes.

A **Deploy** message displays.

8. Click **Yes** to confirm the deployment.

The Incident Thread Masking editor will be unavailable until the deployment completes.

9. Click **OK** in response to the message that reads, “Deploying has finished.”

---

Testing the accuracy of masking configurations in a test incident thread is an important security procedure. See [Verify Changes to Incident Thread Masking in a Test Incident](#).

---

**Verify Changes to Incident Thread Masking in a Test Incident**

Testing the accuracy of masking configurations in a test incident thread is an important security procedure.

Though securing the customer’s personal assets is the most compelling reason to test with incidents, the integrity of your incident information is also at stake. Because incident thread masks apply globally to all incident threads, we strongly recommended that you test the deployed masking configurations in a series of incident thread entries and
verify that your masks apply to saved incident entries and incident emails the way you intend. This procedure is for testing purposes only.

1. Create a test incident.
2. Associate a test contact with the incident.
3. Add a new customer entry, response, and private note. In each entry, enter text that both matches and closely matches the mask patterns you have deployed. For example, enter 123-45-6789 and 123-45-67890 to test the social security number system mask. Add other examples of text that match and closely match each of the mask patterns you have deployed.
4. Click Save.
5. Verify that only the appropriate patterns were masked in the incident thread and in the email response.

If you need to make further changes to your masks, you can return to the Incident Thread Masking editor.

Edit or Convert a Response Thread

With incident thread correction you can convert a response thread entry into a note thread entry as well as edit or remove text and images. This lets you remove content so it cannot be seen by customers in future responses.

There may be times when a response contains incorrect information or was inadvertently sent to a customer. Thread entries can be edited after they are sent to a customer, letting you to convert a response thread entry into a note thread entry and edit or delete text and images. With incident thread correction, you can view all responses for a particular incident and select only those you want to change. After a response is modified, it cannot be converted back to the original thread.

**Note:** To access the Incident Thread Correction element, you must have Administration permissions set in your profile. Additionally, you must have the Edit/Delete Committed Thread Content permission set in your profile to edit incident thread content and delete images. See Profiles.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Incident Thread Correction**.
   - The Incident Thread Correction tree displays on the content pane.
3. Enter the reference number of the incident containing the thread entry you want to edit and click **Search**.
   - Threads from the incident display on the content pane.
4. Select the **Make Note** check box next to the response you want to convert into a note.
   - After saving your changes, the next time you open the incident, this information displays as a Note thread.
5. To remove inline images from the incident thread, do the following:
   a. Select the **Remove Thread Images** check box.
   b. Remove the `<img>` tag in the Thread column.
      - When you remove an image from a thread and the incident is refreshed, the image is removed from the incident thread. If you do not remove the `<img>` tag in the Thread column, the image is replaced by a black X icon when the incident is refreshed.
6. To edit the incident thread, do one of the following:
   - Right-click in the Thread column and select **Edit Thread**.
   - Double-click in the Thread column.
   - The **Edit Thread** window opens.
      a. To search for a word or phrase in the incident thread, enter it in the text field and click **Find**.
         - The search results are highlighted on the **Edit Thread** window.
      b. Edit the incident thread.
      c. Click X to close the Edit Thread window.
   - Your changes display in the Thread column on the Threads table.
7. Click **Save**.
The changes you made are saved to the incident.

**Related Topics**
- Incident Thread

### Add or Edit an Incident Stopword

Incident stopwords are common words that are excluded from incident indexing and searching.

Service can suggest incident stopwords based on an analysis of incidents. You can then look at the list of suggested stopwords on the Edit Incident Stopword list. Suggested stopwords are commented out unless you decide to include them in the incident stopword list.

**Note:** Incident stopwords can also be managed through the File Manager using the `exclude_incidents.txt` file. See *Manage Files with the File Manager*.

1. Click **Configuration** on the navigation pane.
2. Expand **Service > Knowledge Base**, and then double-click **Incident Stopwords** to review incident stopwords.
   - The Incident Stopwords editor displays on the content pane and suggested stopwords are listed in the Suggested Additions box.
3. Select the stopwords in the Suggested Additions box and click the top double-right arrow to add the words to the Active list.
   - The words you select are highlighted.
4. To add an additional stopword, enter the word in the text box on the Active list and click **Add New**.
5. To remove a stopword from the list, click the word in the Active list and click the double-left arrow.
   - The word is added to the Removals box, where it is highlighted.
6. Click **Save**.

**Note:** Oracle Cloud Operations must run the **Keywordindexer** utility before your changes to the stopwords list are active. To schedule this, **Submit a Service Request**.

### How You Configure Advanced Routing for Incidents

You can route incoming incidents to agents with specific language or product skills. Routing incidents to agents with a specific skill set ensures that customers’ questions are answered accurately and efficiently.

Products and categories selected by the customer and the language of the customer portal page from which the incident was initiated determine which agent skills are required. If your customer is viewing the English version of the customer portal when they initiate the incident, connecting them to an agent fluent in English is going to provide the best experience. If your customer is looking for information about your newest product, connecting them to an agent who is an expert with that product is going to provide the quickest resolution. When an incident is initiated, if there is no agent logged in with the specific skill required by your customer, advanced routing relaxes the skill requirement immediately to prevent the incident from becoming stuck in the queue.

You can also use advanced routing primarily for the queue overflow capabilities without defining skills.

Additionally, you can track the performance of advanced routing of incident sessions using standard reports available in **Public Reports/Service/Advanced Routing**.
Chapter 5

B2C Service

Note: Advanced routing reports and configuration options will not be visible until Smart Interaction Hub is enabled. To enable, contact your Oracle account manager.

You will need to complete the following tasks before you can configure and use advanced routing for incoming incidents.

- Define products and categories you will use for advanced routing. See [Search Optimization Using Products, Categories, and Dispositions](#).
- Add product and category fields to the Live Help page of the customer portal.
- Create an advanced routing incident queue. See [Add or Edit an Incident Queue](#).
- Create and activate a rule to route incidents to the advanced routing incident queue. See [Overview of Business Rules](#).
- Assign advanced routing permissions to a profile. See [Service Permissions](#).

Additionally, if you are using advanced routing with products or categories, you will need to configure skills and staff account skill scores to finish the configuration and begin using advanced routing for incoming incidents. See [Assign the Skill Edit Permission in Profiles, Add Skills](#), and [Assign Skill Scores to a Staff Account](#).

### Assign the Skill Edit Permission in Profiles

Assign the Skill Edit permission in profiles for advanced routing.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Profiles**.
   
   The report opens on the content pane.
3. Double-click the profile you want to edit.
   
   The **Profiles** editor opens.
4. Click **Permissions**.
   
   The Permissions page opens.
5. Select the **Skill Edit** check box in the Administration section on the Administration tab.
6. Click **Save**.

You must add Product Skills and Language Skills to the navigation set. See [Edit a Navigation Set](#).

### Add Skills

Add skills for advanced routing.

1. Click **Configuration** on the navigation pane.
2. Expand **Service**, and then double-click **Language Skills** or **Product Skills**.
   
   The **Skills** editor displays on the content pane.
3. Do one of the following:
   - To add a skill, click **New** to display the editor.
   - To edit a skill, click it in the tree.

   You can delete a skill at any time by selecting the skill entry in the tree and clicking **Delete**. However, when you delete a skill, all instances of the skill will also be deleted.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skill Information</td>
<td>This section defines the name and type of the skill.</td>
</tr>
</tbody>
</table>
Assign Skill Scores to a Staff Account

Assign skill scores to a staff account for advanced routing.

You can assign skills to a staff account at the profile level or at the individual staff account level. Skills assigned at the profile level are inherited by staff accounts assigned to that profile, but skills can be modified and added to individual staff accounts.

1. Click **Configuration** on the navigation pane.
2. Do one of the following:
   - To assign skills to a profile, expand **Staff Management**, double-click **Profiles**, and then double-click the profile you want to edit. The **Profiles** editor opens.
   - To assign skills to a staff account, expand **Staff Management**, double-click one of the staff account reports, and then double-click the individual account you want to edit. The **Account Details** editor opens.
3. Click **Skills**.
   The **Account Skill Scores** window opens.
4. Click the **Product** or **Language** tab.
5. To add a product or language:
   a. Select the product or language from the drop-down menu.
   b. Click the **Add**, indicated by green plus sign.
   c. Assign the skill an account score from the drop-down menu.
6. To modify a skill at the account level that was inherited by a profile, click the blue arrow next to the skill score.

   **Note:** Changing an agent’s inherited skill score to 0 is not the same as assigning an agent to a profile without that skill. When the advanced routing queue has relaxed to a score of 0, the incident will be routed to an agent with a skill score of 0. The incident will only be routed to an agent assigned a profile without the skill if no other agents with that skill are logged in.

7. To delete a skill, click **Delete**, indicated by the red X next to the skill score.
   Skills assigned at the profile level can only be deleted at the profile level.
8. Click **Save**.

## Answers

### Overview of Answers

Customers use your site to find answers to their questions about the services and products your organization provides.

To help your customers in finding the information they are looking for, you can create answers to common questions and post them on your **customer portal**. As a result, you are able to provide a better customer experience because your customers are able to quickly find the answers to their questions.

**Note:** B2C Service includes a component known as “Service” where you work with answers.

Service provides you with the tools for creating and publishing effective answers. You can format answers to include links, tables, graphics, and other features, making your support site more interactive and visually appealing. In addition, Service provides you with a revolutionary method of **knowledge base** management that enables you to overcome the critical problems associated with a manually constructed knowledge base. Maintenance of your knowledge base is minimized because of automated processes that learn from customers using your site, then automatically rank answers and display the most useful answers first.

Although you can add many answers to your knowledge base as your organization provides new products and services, you might also spend a lot of time managing and updating your current answers. You can add information to existing answers, including adding links to other answers, merging similar answers, and adding **conditional sections** within an answer to control visibility of certain information.

When adding and editing answers, the toolbar lets you perform advanced actions on your answers such as inserting hyperlinks, images, and tables. As your knowledge base grows more complex, you can insert links to other answers, associate answers with multiple access levels, insert conditional sections, and merge similar answers.

To learn how to start your knowledge base and keep it organized and up-to-date, see **How to Seed Your Knowledge Base**. To learn more how to work with answers on the Service Console, see **Process of Creating and Updating Answers**.

### How to Seed Your Knowledge Base

Because Service can start with only 15-20 answers, the need for a comprehensive initial knowledge set is eliminated, which significantly speeds and simplifies implementation.

Most organizations can build their initial knowledge base from existing online questions and answers, documents, or customer support interactions. Instead of constructing a complete set of answers up front, you can take advantage of the ongoing questions that your customers submit to capture real-world issues.
As customers submit questions and your organization’s support staff solves these issues, you are supplied with content that is perfectly suited for public answers. Propose Answer lets agents suggest that certain incidents become public answers, letting you seamlessly create public answers from the real issues your customers are facing. This method of organic growth eliminates the need for a complete initial group of answers, significantly reducing your ongoing maintenance tasks, and ensures that your knowledge base contains useful, effective content. Additionally, as you foresee that upcoming events (for example, a product release, seminar, or conference) may increase queries on your site, you can manually add answers to the knowledge base to answer questions before they are even asked.

**Note:** Agents can propose incidents as answers only if they have Propose permission in their profile. See Service Permissions.

**Define a Process for Publishing and Reviewing Answers**

Before you develop your knowledge base, you must have a process for publishing answers.

This process outlines the steps for efficiently capturing incident information and creating answers.

1. **Define a process for proposing new answers**—Typically, to publish an incident as an answer, the incident threads will need to be summarized to cover a broader topic scope. To take advantage of agent expertise, we have found this approach to be successful.
   a. An agent modifies the existing incident and writes the new answer as a Note thread with the public audience in mind, following established standards and guidelines. Two key items to include are the incident reference number and the staff member’s name.
   b. An agent proposes the incident. An answer is created, and the summary and threads from the existing incident are copied to the Question field of the new answer.
   c. You review, edit, and format the proposed answer, and then publish it. This method uses an agent’s knowledge for writing the bulk of the answer, and then you prepare the answer for public viewing.

2. **Define an approval review process for new answers**—After an answer has been proposed for public use, you may want managers or staff members from other areas in your organization to review the information to ensure technical accuracy of the methods and procedures defined in the solution.

3. **Determine the audience of new answers**—Before publishing an answer, determine which interfaces and customers you want to be able to view the answer. You can control this visibility through the visibility of answer statuses, answer access levels, languages, products, categories, and conditional sections. See How to Control Answer Visibility.

4. **Determine the display position of new answers**—You can set the position of a new answer relative to other answers on the Answers page on the customer portal. When adding or editing an answer, you can choose to place new answers at the top, middle, or bottom of the answers list, or fix them at the top, middle, or bottom. If you want to give added visibility to newly published answers, place them at the top and then allow their historical usefulness to dictate their future placement. In this way, your customers are aware of new answers as you publish them.

5. **Notify staff of new answers**—Your administrator can use standard reports to show answer notifications by answer, product, category, or subscribers. Standard reports for answer notifications can be scheduled to be sent to other staff members and are located under Public Reports/Service/Site Reports/Answer Notifications. See How You Distribute Reports and Dashboards.

After following these steps to identify your process for publishing answers to your customers and notifying staff members about new answers, you can begin creating answers.
Best Practices for Creating Effective Answers

Creating useful answers is a straightforward process with a few simple guidelines. Follow these guidelines to enhance the search process for customers by letting them find pertinent information quickly and eliminating the need for multiple searches.

A knowledge base containing well-crafted answers will also optimize the self-learning features of Service that continually index, group, link, and rank the answers in the knowledge base. These self-learning features are the backbone of self-service, enabling you to present the most historically useful answers first, and to suggest answers related to the customer’s current question. In addition, effective answers will make your maintenance tasks easier as information ages and changes.

Use these guidelines to create clear, focused answers.

- **Create one-topic answers**—Think of each public answer in your knowledge base as one topic or the answer to one question. When a customer comes to your site with a question, they want quick resolution. One-topic answers improve searching and grouping, which enable customers to easily find answers. One-topic answers provide brief, pertinent information without clutter. A knowledge base of unique answers also simplifies management and maintenance.

- **Provide adequate detail**—Because Service indexes the text of the Summary, Question, and Answer fields into words and phrases for text searching and answer grouping, answers should contain an adequate amount of text that explains the issue. With limited text, there are very few indexed words for the answer, and the words that are indexed cannot fully represent the context of the answer. As a result, the answer may be difficult to find during text searching. With too much text (over two pages), you run the risk of writing about several topics and covering too broad of a context. The resulting set of indexed words may not span the entire text of the answer. In effect, the answer can be found during dissimilar searches in which that answer is not relevant.

- **Write a concise summary**—The quality of the summary, meaning how closely it summarizes the contents of an answer, is critical to the effectiveness of the answer and affects its display position, how it links to related answers, and how it is grouped with similar answers. On the Answers page, customers will choose to open and read, or skip over an answer based on the summary. Without a concise summary, customers may not open the answer, which directly impacts its display position and how it is linked with other answers. The summary should state what the customer can expect to learn by reading the answer or what question will be answered.

After creating a knowledge base of effective answers, you will want to publish the answers to be accessed by customers. By understanding the factors that determine answer visibility, you can effectively control how and when answers are seen on the customer portal.

How to Control Answer Visibility

Answers can be either public or private, as well as have specific visibility settings for each interface or for contacts based on access levels defined in their service level agreements (SLAs).

When you publish answers, you make them available to the public on your [customer portal](#). Whether answers are visible on your customer portal is determined by what you specify in certain fields. The key fields and functions that determine how and where answers are presented are *Answer Status, Answer Access Level, Language, Products* and *Categories*, and conditional sections.

In order for answers to appear on the customer portal, the Status, Access Level, Language, Product, and Category fields must be set to a visibility that allows access by customers. If even one field does not allow visibility, the answer will not be available on the customer portal. In addition, if you have sections within an answer with restricted visibility, that section must be assigned an access level associated with the answer. The five fields that control answer visibility are described in detail below.

- **Answer status**—The primary factor that determines the visibility of answers is answer status. There can be many custom answer statuses, but all must be either a Public or Private status type, which is determined when
the custom status is created. Answers set to a status that has a Private status type can never be viewed on the customer portal, regardless of their access or language assignment. Public answers may be viewable through the customer portal, depending on the other fields selected. Two of the default answer statuses are Review and Proposed, both of which have a Private status type. When agents propose an incident to become an answer, it is copied and set to the Proposed status with an access level of Everyone. Since the Proposed status is a Private status type, the answer will not be visible to customers. An answer changes to the Review status when its solved count reaches zero, or when the date specified when adding or editing an answer is reached. The Review status will automatically remove the answer from the customer portal. See Add or Edit an Answer Status.

- **Answer access level**—Access levels determine whether customers can view answers on a per-interface basis. If an answer is set to an access level that has customer visibility on one of the interfaces, then that answer is viewable by everyone on that interface, provided the remaining fields also allow visibility. If an access level does not provide visibility to customers for a certain interface, access can still be given to specific contacts by assigning them SLAs that allow privileged access. One of the default access levels for answers is Everyone. This access level allows all customers to have access to the answer on all interfaces. See Add or Edit an Answer Access Level.

- **Language**—Answer visibility is also determined by the language assigned to it. If assigned to a specific language, an answer will only be visible on the interfaces using that language, as long as the answer status and access level also allow visibility.

- **Products and categories**—The visibility settings for the products and categories associated with the answer will also affect the visibility. If the answer is assigned to a product or category that is not visible to customers on a particular interface, the answer will also not be visible to customers, unless it is assigned to another product or category that is visible on the interface. In other words, if you have an answer that is assigned to two products, and one of the products is not visible on the interface, but the other product is, your answer will appear on the interface. However, if the answer is assigned to two products, and neither product is visible on the interface, your answer will not appear on the interface under any circumstances. See Search Optimization Using Products, Categories, and Dispositions.

- **Conditional sections**—Conditional sections help control visibility of certain sections within an answer. If a section of the answer is assigned an access level that is not visible to customers on a particular interface, but the answer is visible, then customers are able to view the answer but not the conditional section. For more information about conditional sections in answers, see Insert a Conditional Section.

### What to Do When Answers Are Not Visible

If an answer (or a section within an answer) you want to be accessed by your customers does not appear on the customer portal, answer these questions to troubleshoot the problem.

**Tip:** You can preview an answer to view it as customers will see it on the customer portal.

- Is your status set to Public, or a custom status with a status type of Public?
- Does the access level have visibility for the desired interface?
- Is your language for the answer appropriate? If you have more than one interface with multiple languages, is the answer set to the same language as the interface you are trying to view it on?
- Are your products and categories visible on the interface? Is your answer assigned to at least one product or category that is visible to customers?
- Are the answer sections within the answer visible as you intended?

If the answer to any of these questions is “no,” make the appropriate changes and use the preview to see if the answer displays. If you are unsure of the answer to any of the above questions, contact your administrator.
Answer Ranking

Through answer click-track analysis and feedback, your answers are automatically organized.

Answer rankings are constantly updated using the solved count value and presented to your customers with the most useful information first. Service uses three techniques to gather useful information about answers.

- **Explicit customer feedback**—By default, the Answers page offers customers a way to rate answers through the “Is this answer helpful?” option. Their responses automatically raise or lower the solved count of answers.

- **Explicit ranking of answers**—You can explicitly rank answers at certain levels in the knowledge base using the Display Position setting. This is often useful when new issues arise.

- **Click-track analysis**—Service analyzes the path each customer takes through the knowledge base. The use and benefits are two-fold:
  - Answer relationships—An affinity map is built that relates answers that customers view to other answers viewed during the same visit. Through the SmartAssistant feature, Service suggests answers to them based on the historical relationships of that answer to other answers in the knowledge base. The suggested answers appear as learned links on the Relationships tab.
  - Implicit ranking—The click-track data is also used for answer ranking. Each time an answer is viewed by a customer or suggested by an agent, its solved count is increased.

Answer Ranking Through Solved Count

Solved count collects information about the usefulness of answers in your knowledge base and uses this data to rank your answers.

Implicit data is compiled by how customers select and view answers. Explicit data is compiled by how customers rate the effectiveness of individual answers. Both long-term and short-term solved counts are used to calculate the score. Solved counts from the customer portal account for 75 percent of an answer score, and agent solved counts contribute 25 percent. Using the solved count values, Service can dynamically rank the answers by their usefulness and present customers with the most effective answers first. By default, the Solved Count feature is enabled.

An answer score value is a calculated value equal to the answer solved count combined with any “fix at” positions specified for the answer in the Display Position drop-down menu when adding or editing an answer. For more information about the options available, see Add Answer Details.

- **Implicit ratings**—Implicit ratings are gathered as customers view answers. If a customer views an answer, the solved count of the first answer is increased, but not as much as the second viewed answer. In other words, the answer that the customer views last receives the largest solved count increase. Previously viewed answers receive a smaller increase in their solved counts. The solved count is also increased when an agent uses a SmartAssistant suggested answer when responding to a customer’s question.

- **Explicit ratings**—Explicit ratings are gathered from the response to the question, “Is this answer helpful?” This question is displayed on the Answers page on the customer portal.
Solved Count Aging

Over time, the solved count of an unused answer will gradually decline or age.

If an answer has not been viewed for thirty days (the default setting), the solved count is automatically reduced. The solved count of unused answers also declines at a constant rate over time. Ultimately, if an answer has not been viewed for an extended period of time, the answer solved count can reach zero.

When you first create an answer, its rank in the knowledge base is low, thereby making it more difficult to access. Generally, you would not want aging to occur on new answers. By default, new answers will not be aged for thirty days. Your administrator can change the setting to specify an alternate aging period. Your administrator can also control the frequency and aggressiveness of aging on answers depending on your organization’s specific needs. Contact your administrator for more information about the Solved Count settings defined in your application.

When an answer solved count reaches zero, this usually means that the answer has not been viewed for a long time, and it is safe to assume that the information may be outdated or not useful. By default, these aged answers are automatically set to the Review status when their solved count reaches zero. This enables you to easily sort the outdated answers and update them. By default, the Review feature is disabled. Contact your administrator to enable this feature.

Now that you have thought about your processes for publishing answers and understand how the knowledge base grows and presents information, you need to know how to keep your knowledge base accurate and up-to-date.

Answer Management

Many of the maintenance tasks related to organizing the answers in your knowledge base are automated in Service. This allows you to focus on improving and maintaining the content of answers.

This list outlines these automated processes and describes the tools designed to aid with answer management.

- **Aging of answers (Solved Count)**—Just as frequently used answers will rise to the top of the knowledge base, lesser-used answers will move to the bottom through aging of the answers solved count. See Solved Count Aging.

- **Answer review and publish feature**—By using the Review feature, you can easily monitor answers without needing to constantly review them. The Review feature will automatically set an answer to the Review status when the solved count reaches zero or on specifically defined dates. You can also manually set a review date, the date that you want the answer to go into review status. In addition, you can set a publish date for a date in the future. In this way, you can schedule an answer to become public automatically without having to publish. See Answer Review.

- **Data mining**—The processes of linking similar answers for the Related Answers feature is triggered automatically and occurs periodically when modifications are made to the knowledge base. These processes implement innovative technologies to cluster and link answers containing similar content.

- **Customer feedback**—Service closes the loop by providing customers with a method to submit comments and suggestions on answers. Any feedback submitted through the question, “Is this answer helpful,” is turned into a Feedback for Answer incident accessible to agents. You can use this feedback to address content holes and improve answers.

- **Customer visit tracking**—Service tracks customer actions as they move through your support site, recording where they went, what they searched for, and the answers they viewed. Using the Web Visit feature, agents can view this click-stream data to respond more appropriately to customer questions. This information can also indicate areas of the knowledge base that need to be tuned. See View Web Visit Information for an Incident.

- **Knowledge base reports**—A series of standard reports record how customers are navigating the knowledge base, including the products and categories they are searching on, the search text they are entering, and the
answers they are viewing. These reports provide a unique and powerful perspective into how the knowledge base is performing, and enable you to pinpoint weak areas and tune the knowledge base content. See Answer Evaluation Using Analytics.

Customer Feedback

Your customers can provide feedback on answers that do not completely solve their issues by answering the question, “Is this answer helpful?”

This feedback can be extremely valuable for understanding customer needs and updating your answers accordingly. When a customer submits comments or suggestions from the feedback form, an unresolved incident is automatically created. In some instances, customer feedback can be incorporated directly into an existing answer. In other cases, new answers might need to be created.

Answer Review

Over time, the content of your answers can become outdated.

Reviewing answers should be a central part of maintaining your knowledge base to ensure that the content is current, relevant, and useful. You might want to review answers at set intervals, such as every six months, or review answers in conjunction with new product releases or upgrades. If you have a group of answers for a particular product or service, you might want to review the answers in bulk. This can help you develop and prepare information in advance.

By using custom fields, custom answer statuses, and answer access levels, you can easily sort and work on answers in different stages of editing. For example, your administrator might have created a private answer status called Manager Review for newly crafted answers that will require manager approval before being published.

When editing an answer, you can set a specific date to review a particular answer. On the review date, the status of the answer will change from Public to Review. Also, by default, if an answer is not viewed by customers, the answer solved count will reduce to zero, and the status of the answer will change to Review.

| Tip: | To maintain information about a particular topic in one answer, use the Notes tab to store upcoming information or material you are currently editing. |

Related Topics

- Solved Count Aging

Content Hole Identification

You should actively investigate material for new answers by reviewing recently submitted incidents.

Agents can become overwhelmed with assistance requests, and despite their best intentions, they might forget or not have enough time to propose new answers. By continually capturing questions submitted by your customers and crafting new answers that solve those questions, you can publish answers for the most relevant and current issues.

As you search the most recently solved incidents, click the Web Visit tab to see if customers searched or viewed any answers before submitting their incident. In this way, you can locate answers that are incomplete or need updating.

| Note: | Before creating a new answer, search for existing answers that cover the topic. You can avoid duplication by updating an existing answer, rather than creating a new one. |

Answer Evaluation Using Analytics

Service has several standard reports that track customer activity and provide data on the effectiveness of your knowledge base.

One of the most useful reports for identifying subject matter holes in your knowledge base is the Information Gaps report located in Public Reports/Service/Knowledge Base Reports. This report creates knowledge clusters from your existing incidents and compares them to your answers, alerting you when incidents are created that are not closely matched to any answer. By browsing the incidents and their cluster topics, you can evaluate the need for additional answers in your knowledge base.

The Analytics tab on the standard answer workspace displays reports about the answer currently being viewed or edited. The reports are located in Public Reports/Service/Site Reports/Actionable Knowledge Foundation. By reviewing the reports on the Analytics tab, you can fine-tune individual answers to make them more relevant for the customer portal and ultimately improve customer satisfaction.

The Analytics tab contains a toolbar for performing actions on the reports. Three tabs are located under the toolbar: the Descriptions tab, which provides descriptions for the reports, and the Summary and Top 10 tabs, which display the reports.

By default, the Summary tab opens and displays these reports.

- **Answer Usage**—This report provides contact usage details on a per-answer basis.
- **Answer Click-Through Rate**—This report provides a list of customer portal pages, and actions and details about the visits for each.
- **Answer Effectiveness**—This report provides details about the actions performed on individual answers that provide an overall assessment of how effective each answer is.
- **Escalation Details Per Answer**—This report provides information about the escalations that occurred after a particular answer was viewed.

The Top 10 tab displays these reports.

- **Top Searches Per Answer**—This report provides the top ten searches that returned an answer that was viewed by a contact.
- **Top Previous Answers by Answer**—This report provides a list of answers viewed during a selected time period, along with the top ten answers that were most often viewed previous to that time period.
- **Answer Referrers**—This report provides the domain names (www.example.com) that visitors arrive from and the number of times (visits) a given answer was viewed by individuals from those domains.
- **Top Next Answers by Answer**—This report provides a list of answers viewed during a selected time period, along with the top ten answers that were most often viewed after that time period.

Answer Link Checking Using Analytics

Maintaining your knowledge base includes making sure that links in answers to other answers and external sites are not broken. Analytics provides reports for checking answer links.

These reports are located in Public Reports\Common\Site Administration\Link Checker.
<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Broken URIs</td>
<td>Use this report to search for broken links to other answers and external references. After searching, click the link in the Usage column to list where the broken links occur.</td>
</tr>
<tr>
<td>Top URIs</td>
<td>Use this report to search for the most commonly used links to other answers and external references. After searching, click the link in the Usage column to list where the links are used.</td>
</tr>
</tbody>
</table>
| URI Sources       | Use this report to search for answers that have links. After searching, double-click an answer to open it to examine the links.   
|                   | You can embed the URI Sources report in the answer workspace. In the answer workspace, the URI Sources report automatically filters by answer ID and show all answers that link to the answer that is currently open. |

**Process of Creating and Updating Answers**

You can improve customer experience by having answers to common questions readily available on your support site.

With Service, you can create answers about your services and products and post them on your site. You can also create public answers from incidents in your *knowledge base*, or agents can propose incidents to become answers.

After an answer is in your knowledge base, you can update it at any time, making sure your knowledge base contains only the most up-to-date information. For example, you can define specific dates to review an answer and change the answer to Private while you update the details. You can format answers with the HTML editor, which lets you create links, tables, and graphics, and use other HTML features without prior HTML knowledge. As a result, your support site is more interactive and visually appealing.

This flowchart shows the process of creating and updating an answer.
Answer Reports

When you click the Answers button on the navigation pane, the navigation list displays all of the reports and items added to this button by your administrator.

The Answers button, plus all the other buttons you have access to, are part of the navigation set defined in your profile. Answer reports can be placed in other navigation lists, not just the Answers navigation list.

**Note:** If you have permission to customize your navigation set, you can add other items, including any reports you have permission to access, to your Answers navigation list or any of your lists.

The answer information displayed on the content pane depends on the answer report you opened and which fields were defined when the report was created. The Answers Default report, for example, displays the answer ID, summary, language, access level, status, assigned, and date the answer was last updated. The ribbon lets you manage answers and provides data analysis options for working with reports. You can right-click any answer and select the same functions that are available on the ribbon.

**Tip:** Besides selecting an answer from a report, you can search for answers from a report or use Quick Search. See Record Search Options.

Answer Workspace

Service provides a standard workspace for working with answers.

The workspace defines which fields are available, what buttons display on the ribbon, and how the information is organized on the content pane. This is an example of the standard answer workspace.
Your organization can use this standard workspace, or your administrator may have created one or more customized workspaces. Your profile defines the workspace you see when you work with answers, whether it is the standard workspace or a customized workspace. The standard workspace is used to describe how you work with answers, but keep in mind that the workspace your profile uses might display a different combination of fields or display them in a different location on the content pane.

Answer Ribbon
A standard ribbon exists for working with answers.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Editor</td>
<td></td>
</tr>

</table>

**Answer Record Tabs**

Record tabs contain fields and options for adding additional information to answers.

The organization of these tabs lets you manage and edit information and quickly move between the tabs as you work with answers. The information you can access on each tab depends on the permissions set in your profile.

**Note:** If you make changes to fields on any of the answer record tabs or any of the windows opened through the record tabs, you must save the answer in order for all changes on the record tabs to take effect. If you close the record without saving changes, those changes are lost.

- **Content tab**—Contains the fields for adding and editing answers, including answer types. The Content tab also contains the HTML editor for answers where you can create HTML answers using basic word processing functions as well as dynamic content, such as adding hyperlinks, images, tables, answer links, and conditional sections. You can also use source mode to enter HTML code directly in the editor. The HTML editor lets you add a special response, which is a short version of the answer that can be used in search results. You can use
the special response to format your answer content based on how and where the answer displays. See Add an Answer.

• **Products/Categories tab**—Lists all products and categories that are associated with the answer. You can select which products and categories are associated with an answer to enhance search results for customers. See Associate Products and Categories to an Answer.

• **Tasks tab**—Lists all tasks associated with the answer. The number of tasks associated with the answer displays in parentheses next to the tab name. For each task, the tab displays the task name, due date, completion date, staff member assigned to the task, and priority. You can open, copy, delete, print, and forward any task and mark tasks complete by clicking a button on the tab toolbar or by right-clicking the task and making your selection. See Add or Edit a Task for an Answer.

• **Details tab**—Contains the fields for answer details, including Display Position, Review On, Notify Subscribers, and Publish On. See Add Answer Details.

• **Attachments tab**—Lists all attachments associated with the answer. The Attachments tab displays the file name, size, date created, date updated, and a description for each attachment. See Overview of the Attachments Tab.

• **Audit Log tab**—Lists all answer actions performed by staff members as well as automatic changes initiated by any business rules that are used. When an action is generated by the system, the Who field contains Administrator. You can also see who worked on the answer, when it was added or updated, the actions taken, and descriptions of the actions. See Audit Logs.

• **Relationships tab**—Contains the fields and tools necessary to manage answer relationships, including sibling answer relationships, manually relating a new or existing answer with a current answer, and viewing, editing, printing, previewing, and promoting related answers. See Answer Relationships.

• **Notes tab**—Contains answer notes that can be sorted by date. Remember that customers never see the answer notes added by staff members. See Add an Answer.

• **Analytics tab**—Contains the Actionable Knowledge Foundation reports, which display information about the answer being viewed or edited. By reviewing these reports, you can learn how your knowledge base is being used and make the necessary adjustments to improve customer satisfaction. See Answer Evaluation Using Analytics.

### Answer Tasks Tab Toolbar

The Tasks tab contains a toolbar for working with the tasks associated with an open answer.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
</table>
| Add    | Click this button to add a new or existing task:  
  • **Add New**—Select this option to add a task.  
  • **Add Existing**—Select this option to search for a task to add to the answer. |
| Open   | Click this button to open or edit the selected task. If you have read-only access to tasks, you can open the selected task but all options to edit the task are disabled. |
| Print  | Click this button to print the selected task. |
### Add an Answer

Key answer fields are used to specify the answer summary, status, language, access level, and the staff member assigned to the answer.

Key answer fields are located at the top of the content pane. Field marked with a red label and an asterisk are required and must be completed before you can save the answer. The key answer fields that display on the content pane vary depending on the permissions set in your profile.

You can create different answer types when adding answers to the knowledge base. Answer types give you more flexibility in providing information to your customers. You can add the following types of answers:

- **HTML**—Answers that appear to customers as standard HTML on the customer portal. When you create an HTML answer, you can use the HTML editor to view answers as customers will see them. See [HTML Editor for Answers](#).

- **URL**—Answers that consist of a link to an external URL. The URL address and the content of the web page are displayed. See [Add a URL Answer](#).

- **File attachment**—Answers that appear as file attachments. File attachment answers link to information contained in another document and appear to customers on the customer portal as file attachments. See [Add a File Attachment Answer](#).

**1. Do one of the following:**

- From an open answer report, click **New**.
- If your navigation set is configured to add answers from the file menu, click **File** and select **Answer**. See [Configure the File Menu](#).

The New Answer editor displays with the Content tab active.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Summary</td>
<td>Enter the subject of the answer in this field.</td>
</tr>
<tr>
<td>*Status</td>
<td>Click this drop-down menu to select an answer status.</td>
</tr>
<tr>
<td>*Language</td>
<td>Click this drop-down menu to select a language.</td>
</tr>
<tr>
<td>Assigned</td>
<td>Click this drop-down menu to select a staff member to assign to the answer. Only staff members who have permission in their profile to create answers are listed. By default, the staff member who created the answer is selected.</td>
</tr>
</tbody>
</table>

**Tip:** Use the Find feature at the bottom of the Assigned drop-down menu to locate staff members quickly. Wildcards are supported when searching staff members and groups. You can search strings that include a space by entering %Space+character, which is helpful when searching last names.

For example, entering %Space+b returns all last names starting with the letter b. There is also an implied wildcard when searching, so entering b in the Find field returns all items containing the letter b.
### Field Actions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Level</td>
<td>Click this drop-down menu to control answer visibility by selecting one or more access levels. See <a href="#">Associate an Answer with Multiple Access Levels</a>.</td>
</tr>
</tbody>
</table>

3. To add a **flag** to the answer, click the area next to the white flag above the answer fields.

4. Select the answer type on the Content tab.

   Options include HTML, URL, and File Attachment. See [HTML Editor for Answers](#), [Add a URL Answer](#), or [Add a File Attachment Answer](#).

   **CAUTION:** When you change the answer type in an existing answer, all answer relationships and certain answer fields are removed. For example, when you change an HTML answer type to a URL answer type, the Question, Answer, *Special Response*, and Attachments tabs are removed and you lose any content that was created on those tabs.

5. To add keywords to associate with the answer, enter the words in the **Keywords** field on the Content tab. Separate keywords by commas and separate any compound words by spaces. For example, phone, call plan, nationwide.

   Keywords are used by the search feature. In addition, associated products and categories and their descriptions are automatically used as keywords for answers.

   **Tip:** Use keywords sparingly. Too many keywords can negatively impact the accuracy of search results. Instead, consider using the *aliases.txt* wordlist file to customize the words used during keyword indexing and text searching. See [Wordlist Files](#).

6. To add notes specific to your answer content, enter your notes in the **Notes** field on the Content tab.

   Keep in mind that this field can be viewed by customers. Use the Notes tab for private notes.

7. To associate products and categories with the answer, click the **Products/Categories** tab.

8. To add tasks to the answer, click the **Tasks** tab.

9. To add information you want to associate with the answer, including setting Publish On and Review On fields, click the **Details** tab.

10. To attach files to the answer, click the **Attachments** tab. Attachments are available only for HTML answer types.

   You can attach as many files as needed to associate with an answer. Attachments appear as clickable links when a customer views an answer. They can also be indexed as searchable text. Therefore, you can choose whether each document is indexed when managing your file attachments.

   a. Click **Add Files** on the Attachments tab toolbar.

   b. To attach files that will be shared with **sibling answers**, click **Add Files** under the Attachments for This Answer and All Sibling Answers section.

      The Attachments for This Answer and All Sibling Answers section displays only if the Siblings Visible property for the File Attachments relationship item on the answer workspace is set to True. See [Sibling Answers](#) and [Options Properties](#).

11. To view the answer audit log, click the **Audit Log** tab.

12. To manage answer relationships, including sibling answers, manually related answers, and learned links, click the **Relationships** tab.

13. To enter private notes about the answer, click the **Notes** tab.

   These notes are not be visible to customers on the customer portal.
a. Click the **Notes** tab.
b. Click **Add**.
c. Enter the notes in the **Answer Note** field.

14. Click **Save**.

Your answer is added to the knowledge base.

If you set the answer status to Public, the **End-User Visibility** window opens and displays all interfaces associated with the answer, along with the answer product and category visibilities. A green check mark signifies that a product or category is visible on a particular interface, whereas a red X signifies that it is not.

- To perform a visibility check when the answer status is changed to Public, select **Only When Status is Changed to Public Type**.
- To perform a visibility check every time the answer is saved, select **On Every Save**.

**HTML Editor for Answers**

You can use the HTML editor for answers to design creative and eye-catching answers. The default answer type is HTML.

The HTML editor's Content tab contains four subtabs (Question, Answer, **Special Response**, and Quick Preview) that you can use to create and preview content for answers. You can design your answer content using design mode or source mode.

In design mode, you can create dynamic, well-formatted answers without previous HTML experience. The HTML editor contains many of the same options available in basic word processing applications so you format your text and add graphics, links, and other common HTML features. You can also add links that reference other answers. In source mode, you can create answers using HTML source code. By default, the source mode editor displays your code in colored text to indicate structure and syntax.

For design mode to be available with the HTML editor, the HTML Design Mode permission must be selected in your profile. For source mode to be available with the HTML editor, the Source Mode permission must be selected in your profile.

Regardless of which mode you use to create answers, you can preview how the content displays to customers on the **customer portal** from the Quick Preview tab.

**Note:** By default, the HTML editor cleans HTML code to meet XHTML compliance specifications. This results in adding XHTML doctype declarations to the resulting HTML code. If this functionality is disabled through the HTML_TIDY_ENFORCE_XHTML configuration setting, the content will not be cleaned upon saving the answer.

Add an HTML Answer in Design Mode

Design mode lets you create dynamic, well-formatted answers without previous HTML experience.

1. Do one of the following:
   - From an open answer report, click New.
   - If your navigation set is configured to add answers from the file menu, click File and select Answer. See Configure the File Menu.

The New Answer editor displays.

By default, the Content tab is active and the HTML answer types is selected.

2. Enter the subject of the answer in the Summary field.
   This field displays as the subject of the answer on the customer portal.

3. Use the HTML editor to add the question portion of the answer. By default, the Question tab is active.
   Options available on the toolbar let you do the following:
   - Cut, copy, and paste.
   - Search for text.
   - Undo and redo changes.
Format text with bullets or numbered lists.
- Adjust indentation.
- Center, left-justify, or right-justify text and images on the page.
- Change the font using the system fonts, including the default font.
- Change the font style, size, and attributes (highlighting, bold, italic, underline).
- Apply specialized formatting, including super and subscripts.

Other options are also accessed through the toolbar.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>

</tbody>
</table>

4. Click the **Answer** tab to create your answer content.
5. To add a short version of your answer, click the **Special Response** tab.
If you do not enter a *special response*, the content you created on the Answer tab is used.

6. Click the **Quick Preview** tab to preview your answer content.
   
   Customer portal *themes* do not display on the Quick Preview tab. You can also preview the answer and select assigned access levels to view answer visibility by clicking Preview on the ribbon.

7. To use the HTML editor in undocked, full-screen mode, click **Full Screen**.
8. To exit full-screen mode, click **Exit Full Screen**.
9. Click **Save**.

- Preview an Answer

### Add an HTML Answer in Source Mode

You can use source mode to create your answers using HTML source code.

Syntax is highlighted in source mode. You can also search and replace code.

1. Do one of the following:
   - Click **New**.
   - If your navigation set is configured to add answers from the *file menu*, click **File** and select **Answer**.

2. From the Content tab of an answer, select **HTML** as the answer type.
   
   HTML is the default answer type for a new answer.

3. On the Question tab, click the **Source** icon on the HTML editor toolbar.
   
   When adding an HTML answer in source mode, most of the HTML editor toolbar icons are disabled.

4. Enter the HTML code to create your question content.

5. Click the **Answer** tab and enter the HTML code to create your answer content.

6. To add a short version of your answer, click the **Special Response** tab and enter the HTML code.
   
   If you do not enter a *special response*, the content you created on the Answer tab is used.

7. Click the **Quick Preview** tab to preview your answer content.
   
   Customer portal *themes* do not display on the Quick Preview tab. You can also preview the answer and select assigned access levels to view answer visibility by clicking Preview on the ribbon after you save your answer.

8. Click **Save**.

**Related Topics**
- Preview an Answer

### Add a URL Answer

When you create a URL answer, an external URL address displays to customers on the customer portal.

When customers click the URL, an external web page opens in a new window. URL answers are also indexed as searchable text on the *customer portal*. You can still define many of the same fields as you would when creating HTML answers. However, certain fields are unavailable when adding a URL answer. The available fields depend on the permissions set in your profile.

1. Do one of the following:
   - Click **New**.
   - If your navigation set is configured to add answers from the *file menu*, click **File** and select **Answer**.

2. Enter a one-line summary in the **Summary** text box.
   
   This field displays as the subject of the answer on the customer portal.
3. Select URL.

   The **Confirm Answer Type Change** window opens.

   **CAUTION:** When you change the *answer type* in an existing answer, all answer relationships and certain
   answer fields are removed. For example, when you change an HTML answer type to a URL answer type, the
   Question, Answer, *Special Response*, and Attachments tabs are removed and you lose any content that was
   created on those tabs.

4. Click **Yes** in response to the Confirm Answer Type Change message.
5. Enter or paste a URL address in the **URL** field.
6. Click **Preview** to display the URL content.
   
   The Preview section displays the link as it will appear in the customer's web browser. It can also display other
   file types or folder content.

   **Note:** URL answers are not flagged as updated on the Answers page when the answer content changes if the
   URL does not change.

7. Click **Save**.

**Add a File Attachment Answer**

You can add file attachment answers to link to information contained in another document.

File attachment answers contain many of the same answer fields as HTML answers. However, certain fields are
unavailable when adding file attachment answers. The available fields depend on the permissions set in your *profile*.

You can attach only one file for each answer. File attachment answers are also indexed as searchable text on the
*customer portal*.

**Note:** File attachment answers appear to customers on the customer portal as file attachments, which is different
than HTML answers that contain file attachments within the answer to provide additional information.

1. Do one of the following:
   - Click **New**.
   - If your navigation set is configured to add answers from the *file menu*, click **File** and select **Answer**.
2. Enter a one-line summary in the **Summary** text box.
   
   This field will display as the subject of the answer on the customer portal.
3. Select **File Attachment**.
   
   The **Confirm Answer Type Change** window opens.
4. Click **Yes**.

   **CAUTION:** When you change the *answer type* in an existing answer, all answer relationships and certain
   answer fields are removed. For example, when you change an HTML answer type to a file attachment answer type,
   the Question, Answer, *Special Response*, and Attachments tabs are removed and you lose any content that was
   created on those tabs.

5. Click **Add File**.
   
   After you attach a file, information about the selected file appears on the Content tab. The Content tab contains
   a paper clip icon when there is a file attached to the file attachment answer.

<table>
<thead>

<td>After a file has been added to the list, the Open, Download, and Delete options are available.</td>
</tr>
</tbody>
</table>

6. To open the attachment, click **Open**.
7. To download the selected file, click **Download**.
   You are prompted to save the file attachment to the location you specify. A **File Download** window opens displaying the download progress.
8. To change the display of the name and description, click **Properties**.
9. To remove this file from the answer, click **Delete**.
10. Click **Save**.

**Related Topics**

### Edit an Answer

You can edit answers, including sibling answers, manually related links, and learned links.

When you edit an answer, you can also change the information in related answers, but keep in mind that editing answers can affect other answers associated with it. You can also edit answer versions and you can edit multiple answers at one time. See **Answer Versioning**.

1. From an answer report, right-click the answer and select **Open**.
2. To change the **answer type**, select the option next to the answer type.
   Options include HTML, URL, and File Attachment.
   
   **CAUTION:** When you change the answer type in an existing answer, all answer relationships and certain answer fields are removed. For example, when you change an HTML answer type to a URL answer type, the Question, Answer, **Special Response**, and Attachments tabs are removed and you lose any content that was created on those tabs.

3. Edit the answer fields.
4. To search the answer for a word or phrase to replace, click **Find Text** on the HTML toolbar.
   The **Find and Replace** window opens. You can search for a word or phrase using case sensitive or whole word only search criteria.
5. Edit the fields on each of the answer record tabs.
6. To notify answer subscribers of the change, click the Details tab.
   a. Click Notify Subscribers.
   b. Select one of the following options:
      - No Change
      - Do Not Notify
      - This Hour
      - End of Today
      - End of this Week
      - End of this Month
7. Click Save.

Associate Products and Categories to an Answer
You can associate products and categories with answers. By associating products and categories with your answers, you
can create rules and facilitate searching.
1. From an answers report, right-click the answer and select Open.
2. Click the Products/Categories tab.
3. Select products and categories to associate with the answer.

   Note: Regardless of whether product linking is enabled and which categories are linked to products, all products and all categories are available on the Products/Categories tab when you add or edit an answer. In addition, product and category values are shared among sibling answers. When a product or category is changed for an answer, it is also changed for that answer’s sibling answers.

4. To associate the answer exclusively with a product or category (without any dependence on subproducts or subcategories), right click the product or category name. The associated check box displays green and any parent products or categories display a gray check mark to signify they are associated with the answer as well.

Add or Edit a Task for an Answer

You can add and edit all tasks associated with an answer by clicking the Answer Tasks tab.

When you add or edit a task, you not only define its name, the staff member it is assigned to, relevant dates, and type of task, but you also associate it with new or existing answers. For more information on working with answer tasks, see Answer Tasks Tab Toolbar.

1. Right-click the answer and select Open.
2. Click the Tasks tab.
3. Do one of the following:
   - Click Add and select Add New to open a new task on a subtab.
   - Click Add and select Add Existing to open an existing task on a subtab.
   - Right-click a task on the Tasks tab and select Open.

4. Enter the task name in the Name field.
5. To enter additional task information, complete the fields or select a menu option.
6. Click OK.

</tbody>
</table>
Insert a Hyperlink

You can create a hyperlink in an answer that will link to a URL.

When customers view an answer on the customer portal that contains a hyperlink, they can click the link and be directed to either an internal or external URL.

1. From an answer report, right-click the answer and select **Open**.
2. Click the **Link** icon on the toolbar.
   - The **Link** window opens.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Link Info</strong></td>
<td>Select this tab to define your URL display and protocol options.</td>
</tr>
<tr>

<tr>
<td></td>
<td>- &lt;other&gt;</td>
</tr>
</tbody>
</table>
*URL* | Enter a valid URL for the page you want to link to. To verify that the URL you typed is accurate, click the **View URL** button (to the right of the Link field). A web browser opens to the URL you specified. If you enter an invalid URL, an error message opens. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CAUTION:</strong></td>
<td>If the link is to a non-HTML page (for example, a file type), a security warning opens. Verify that the link is directed to a trusted source before you click the Yes button to continue.</td>
</tr>
</tbody>
</table>

**Target**

Click the Target tab to define target options.

- **Target**
  - Click the Target tab and then click the Target drop-down menu to select one of these options.
  - `<Frame>`—Enter the target frame name.
  - `<Popup Window>`—Enter the window name, select window features, and enter window size and position attributes.
  - *New Window* (_blank)—The URL opens in a new window.
  - *Topmost Window* (_top)—The URL opens in the top (focus) window.
  - *Same Window* (_self)—The URL opens in the same window.
  - *Parent Window* (_parent)—The URL opens in the same frameset.

**Advanced**

Click the Advanced tab to define options such as ID, language direction and code, and stylesheet usage.

4. Click **OK** to insert the hyperlink at the cursor position.

Add or Remove Hyperlink Underlines

If you want your hyperlink to display an underline, you must add the underline text decoration manually, before you add your hyperlink. If you want to remove the underline from your hyperlink, you must delete the underline text decoration in source mode.

Even though the HTML editor for answers displays an underlined link when you create a hyperlink, the underline does not display on your customer portal page. This is because the standard customer portal theme does not include a hyperlink that displays with the underline text decoration. Instead, the hyperlink displays in plain text. However, when you hover over the link, then an underline displays.

**Tip:** Keep in mind that answer links also display on the customer portal without the underline text decoration. Therefore, if you want your answer links and your hyperlinks to look the same, make sure to apply consistent formatting to both link types.

You can add the text decoration in design mode or source mode. Removal of the text decoration is available only in source mode.

1. From the HTML editor for answers, click the **Answer** tab.
2. To add the underline text decoration to your hyperlink in design mode, enter the text you want to display as the link.
   - a. Select your text and click the **Underline** icon on the toolbar.
   - b. Select your text again and then click the **Link** icon to define your hyperlink options.
3. To add the underline text decoration to your hyperlink in source mode, click the **Source** icon on the toolbar. The editor changes from design mode to source mode.
4. Add `"style="TEXT-DECORATION: underline"` to your hyperlink in the HTML.
5. To remove the underline text decoration from your hyperlink, click the Source icon on the toolbar. The editor changes from design mode to source mode.

6. Delete “style="TEXT-DECORATION: underline" from your hyperlink in the HTML.

Insert an Image
You can insert an image that is accessible through a URL in your HTML.

You can also define the size of the image, its border properties, and alignment.

Note: Copy and paste functionality is not available when inserting images into answers. Therefore, all answer images must be referenced by URL. As a best practice, we advise you to host your files and graphics on your own web servers and link to those files (through a HTTP address) within your answer content. For information about storing images, see Answer ID 4161 on our customer support site.

1. From an answers report, right-click the answer and select Open.
2. Click the Image icon on the toolbar.
   The Image Properties window opens.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*URL</td>
<td>Enter the URL where the image is located.</td>
</tr>
<tr>
<td>Alternative Text</td>
<td>Enter the alternate text for the image.</td>
</tr>
<tr>
<td>Width</td>
<td>Enter the width, in pixels, you want the image to appear.</td>
</tr>
<tr>
<td>Height</td>
<td>Enter the height, in pixels, you want the image to appear.</td>
</tr>
<tr>
<td>Border</td>
<td>Enter the width, in pixels, of the image border.</td>
</tr>
</tbody>
</table>

4. Click OK.

Insert a Table
You can insert a table in your HTML answer and define the number of rows or columns and its border properties, cell padding, and cell spacing.

1. From an answers report, right-click the answer and select Open.
2. Click the Table icon on the toolbar.
   The Table Properties window opens.
3. Enter field information.
### Field Description

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Rows</td>
<td>Enter the number of rows in the table.</td>
</tr>
<tr>
<td>Columns</td>
<td>Enter the number of columns in the table.</td>
</tr>
<tr>
<td>Width</td>
<td>Enter the width of the table in pixels, or append a valid unit.</td>
</tr>
<tr>
<td>Height</td>
<td>Enter the height of each row in pixels, or append a valid unit.</td>
</tr>
<tr>
<td>Headers</td>
<td>Select None, First Row, First Column, or Both.</td>
</tr>
<tr>
<td>Border size</td>
<td>Enter the width, in pixels, of the table border.</td>
</tr>
<tr>
<td>Cell spacing</td>
<td>Enter the spacing, in pixels, of the table cells.</td>
</tr>
<tr>
<td>Cell padding</td>
<td>Enter the padding, in pixels, of the table cells.</td>
</tr>
<tr>
<td>Alignment</td>
<td>Select Left, Center, or Right.</td>
</tr>
<tr>
<td>Caption</td>
<td>Enter the title of the table.</td>
</tr>
<tr>
<td>Summary</td>
<td>Enter information about the table (not displayed).</td>
</tr>
</tbody>
</table>

4. Click the **Advanced** tab to define the language direction and the style and class attributes.
5. Click **OK**.

### Insert an Answer Link

You can create a link in an answer that references an existing answer. Service provides you with the flexibility to easily create links to existing answers by using the answer ID number instead of entering a long URL for the answer.

1. Right-click the answer on the content pane and select **Open**.
2. Click the **Answer Link** icon on the toolbar.
   - The **Answer Link** window opens.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Answer ID</td>
<td>Enter the answer ID of the answer you want to link to.</td>
</tr>
<tr>
<td>Link Text</td>
<td>Enter the text you want to display to customers.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this field is left blank, “Answer Link” displays to customers.</td>
</tr>
<tr>
<td>Title</td>
<td>Enter the text you want to display to customers when they hover over the link title.</td>
</tr>
<tr>
<td>Target</td>
<td>Select the target location where you want the contents of the link to display. Available options include New Window, Same Window, Parent Window, and Browser Window.</td>
</tr>
<tr>
<td>Class</td>
<td>Enter any class name you want to assign to the link text this field. You must define the class in your HTML content by either using the <code>&lt;style&gt;</code> tag to define the class inline,</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Style</td>
<td>Enter any style attributes you want to assign to the link text. Style attributes define how the text appears, such as color and font. For example, color: red; font-weight: bold; font-style: italic.</td>
</tr>
<tr>
<td>Anchor</td>
<td>Enter the anchor to link to a specific location in a long string of text in an answer. This lets the customer to link to the exact location.</td>
</tr>
</tbody>
</table>

4. Click **OK** to insert the answer link at the cursor position in the current answer.

**Related Topics**
- Insert an Anchor
- Referencing an Answer (video)

**Insert an Anchor**
When you insert an answer link, you can also insert an anchor in the answer you are linking to. The answer link will open to a specific location within the answer.

For example, you might have an answer that contains several paragraphs of text, but the first paragraph does not contain information that will answer the customer’s question. Using an anchor, you can quickly link to a specific location.

1. Right-click the answer on the content pane, then select **Open**.
2. Insert the cursor in the exact location of the answer to which you want to link.
3. Click the **Anchor** icon on the toolbar.
   - The **Anchor Properties** window opens.
4. Enter a name for the anchor in the **Anchor Name** field.
5. Click **OK** to add the anchor at the cursor position in the answer.
6. To rename an anchor, double-click the anchor to open the **Anchor Properties** window.
7. To delete an anchor, right-click the anchor and click **Delete**.

**Related Topics**
- Referencing an Answer (video)

**Insert a Variable into an Answer**
Answer variables are predefined shortcuts for entering information into an answer instead of a long string of text.

When an answer is displayed on the **customer portal**, the variable is replaced with whatever value was specified by your administrator.

Variables are also helpful to use for information that may change. When your administrator changes the value of the variable, all answers containing that variable will also change. Contact your administrator for a list of variables defined for your application.
For example, if your administrator added a variable for a support email address at your organization called “contact,” you could insert the variable for the email address in the answer, such as $contact. If the email address changes, all answers containing the contact variable are updated.

1. From an open answer, click the **Question, Answer, or Special Response** tab on the Content tab and place your cursor where you want to insert the variable.
2. Enter a dollar sign $ followed by the variable name.

   **Note:** Because variables are case sensitive, you must enter the variable name exactly as it is defined. See *Add or Edit a Variable*.

The assigned value displays when customers view the answer.

### Associate an Answer with Multiple Access Levels

You can associate multiple access levels with an answer.

If any of the access levels have customer visibility, the answer is visible on the **customer portal**. In addition, you can control the answers returned in a customer's search by assigning them **SLAs** that allow privileged access to specific answers. For example, a customer assigned an SLA with Gold access is able to view all answers with the assigned access levels of Gold, Everyone, or Gold and Everyone.

Access levels are just one way of controlling answer visibility. For information about other ways to control answer visibility, see *How to Control Answer Visibility*.

1. Right-click the answer on the **content pane** and select **Open**.
2. Click **Access Level** and select the check box next to each access level you want to assign to the answer.

3. To view the answer as customers will see it on the customer portal, click the **Quick Preview** tab.
4. Click **Save**.

### Insert a Conditional Section

You can add conditional content, within your answers, that displays only when specific criteria is met. Conditional sections control the visibility of specific sections within your answers. For example, you could show certain content only to customers with the appropriate access levels according to a service level agreement (SLA).

Say you're working on an answer and you want to add information that is not yet approved for public visibility. You can create an **access level** that has no customer portal visibility and use a **conditional section** to limit visibility to certain access levels.

Conditional sections can also be used with **privileged access** levels assigned to specific **SLAs**. In this way, you could show all your content to customers assigned an SLA with a privileged access level. For instance, a customer assigned an SLA with Gold access is able to view conditional sections with access levels of Gold, Everyone, or Gold and Everyone. This gives you flexibility to customize and personalize answers for different types of customers.

**Note:** Conditional sections can also be nested. Although answers let you nest an unlimited number of conditional sections, we recommend limiting nested conditional sections to three.
1. From an answer report, right-click the answer and select **Open**.  
   By default, the Question tab is active.
2. To add your conditional section to the answer, click the **Answer** tab.
3. Click the **Conditional Section** icon on the toolbar.  
   The **Access Level** window opens.
4. Select the access levels you want to assign to the conditional section.
5. Click **OK**.  
   The Conditional Section text box displays on the Answer tab.

![Conditional Section Icon](image)

When conditioning a section of an answer with an access level not associated with the answer, the section will never be visible to customers.

6. Enter the content you want to display in the conditional section text box.
7. Click **Save**.

**Modify Conditional Sections**

You can modify your conditional section content to make text changes, add nested conditional sections, change access levels, and apply style and class attributes.

1. Right-click the answer on the **content pane** and select **Open**.  
   By default, the Question tab is active.
2. Click the **Answer** tab.
3. To edit the text of a conditional section, click the conditional section and enter your text in the text box.
4. To nest a conditional section in the current conditional section, click inside the answer section and then click the **Conditional Section** icon on the toolbar. See **Insert a Conditional Section**.
5. To change the access level of a conditional section, double-click the conditional section to open the **Access Levels** window.
   a. Select the access level or multiple access levels.
   b. Click **OK** to assign the selected access levels and close the Access Levels window.
6. To apply style and class attributes, right-click inside the conditional section text box and select **Edit Div**. The **Create Div Container** window opens with the General tab active.
   a. Define style and stylesheet classes.
   b. Click the **Advanced** tab.
   c. Enter style attributes in the **Style** field.
   d. Click **OK**.
7. Click **Save**.

If the answer contains conditional content and the customer has access to that level of privileged answer, the conditional content is visible on the Answers page. You can see how the answer will appear to customers with different access levels on the customer portal using the Preview functionality.
Append Answer Content

While editing an answer, you can search for other answers in the knowledge base. If answers are returned that match your search criteria, you can append them to the answer you are editing.

The **Search Knowledge Base** window contains the following tab set.

- **Answers**—Contains links to answers in the knowledge base that match your search phrases.
- **Search Priority Words**—Contains links to answers in the knowledge base that correspond to search priority words in Service.

1. Right-click the answer on the *content pane* and select **Open**.
2. Click the **Search** icon on the toolbox.
   
The **Search Knowledge Base** window opens.

3. Enter your search criteria and click **Search**.
4. Click the **Answers** tab.

   - To append an answer link to the answer you are editing, click **Add as Link** next to the answer. The answer title and a link to the answer are appended to the selected field of the answer at the cursor position.
   - To append the answer text to the answer you are editing, click **Add as Text**. The text of the answer is appended to the answer at the cursor position.
   - To view the answer, click **View**.

5. Click the **Search Priority Words** tab.
To append an answer link to the answer you are editing, click Add as Link next to the answer. The answer title and a link to the answer are appended to the selected field of the answer at the cursor position.

To append the answer text to the answer you are editing, click Add as Text. The text of the answer is appended to the answer at the cursor position.

To view the answer, click View.

6. To view the answer as it will appear on the customer portal, close the Search Knowledge Base window and click the Quick Preview tab.

7. Click Save.

Related Topics
- Preview an Answer

Preview an Answer
Before making an answer available to customers, you can preview it on the customer portal to ensure everything is accurate.

You can verify that the answer and answer sections display as you expect them to by viewing the answer with different access levels selected. See How to Control Answer Visibility.

Note: Customer portal themes are not applied when previewing answers on the content pane. This means the way your answer displays in the preview may be different from how it displays on the customer portal. We recommend using the cascading style sheet (CSS) from your customer portal when previewing answers.

1. From an answers report, right-click the answer and select Preview Answer.
2. Select the access levels from the Access Level drop-down menu.
   Only the sections of the answer with the selected access level will display on the Answer Preview window.
3. Click Preview.

Related Topics
- What to Do When Answers Are Not Visible
- Use the End-User Cascading Style Sheet in Answer Previews

Use the End-User Cascading Style Sheet in Answer Previews
You can use the cascading style sheet (CSS) from your customer portal when previewing answers, to get a better idea of how they will look to the end user. To do this, you must modify the standard answer workspace.

The end-user CSS from the customer portal is also applied to the content when editing the Question and Answer content in the HTML editor.

Note: The Service Console uses custom code and settings to render previews. Therefore, the appearance of an answer in a preview will not look exactly as it will on your customer portal.

1. Copy the standard answer workspace, then open the copy for editing.
2. Click the Design tab.
3. On the Content tab in the workspace, click the Answer Type Container control.
4. On the Design tab, select the Apply End User CSS check box.
5. Save the modified workspace.

Edit the profiles of staff members to use the modified workspace. See Add or Edit a Profile.
Validate Links in an Answer
You can check for broken links in HTML and URL answers.

Keep in mind that this procedure applies to hyperlinks and links to other answers. The broken links checker functions on a per-answer basis. When validating an HTML answer, the broken links checker scans text on the Question and Answer tabs. When validating a URL answer, the broken links checker scans the URL field.

1. While editing an answer, click **Check Links**.
   The **Check Links** window opens and link validation begins.

<table>
<thead>
<tr>
<th>Column/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>This column displays the name of the links that have been checked for validity. If a link does not have a name, this column is empty. Because links in URL answers do not have names associated with them, this column is empty for all URL answers.</td>
</tr>
<tr>
<td>Target</td>
<td>This column displays the links that have been checked for validity. Hyperlinks open in a new browser, whereas answer links open on the Answer Preview window.</td>
</tr>
<tr>
<td>Status</td>
<td>This column displays the status of the links. The following statuses display depending on the type of link being validated.</td>
</tr>
<tr>
<td></td>
<td><strong>Valid</strong>—This status is used only for hyperlinks and signifies that the links checker successfully visited the link destination.</td>
</tr>
<tr>
<td></td>
<td><strong>Broken</strong>—This status is used only for hyperlinks and signifies that the links checker attempted to visit the link destination, but was unsuccessful.</td>
</tr>
<tr>
<td></td>
<td><strong>Does Not Exist</strong>—This status is used only for answer links and signifies that the links checker did not find the answer ID in the knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Public Status Type</strong>—This status is used only for answer links and signifies that the answer was found in the knowledge base and is associated with a Public status type.</td>
</tr>
<tr>
<td></td>
<td><strong>Private Status Type</strong>—This status is used only for answer links and signifies that the answer was found in the knowledge base and is associated with a Private status type.</td>
</tr>
<tr>
<td>Action</td>
<td>This column displays the actions that can be performed on the link. Currently, Edit is the only action available.</td>
</tr>
<tr>
<td>Status Bar</td>
<td>The status bar shows the progress of the validation process. It is not an indicator of the validity of the links. Rather, it is an indicator of the number of links being validated by the links checker.</td>
</tr>
<tr>
<td>Revalidate</td>
<td>Click this button to restart the validation process for all links displayed on the <strong>Check Links</strong> window.</td>
</tr>
</tbody>
</table>

2. To edit a link, click **Edit** in the Action column of the link.
   If you are editing a hyperlink, the **Edit Hyperlink** window opens. If you are editing an answer link, the **Edit Answer Link** window opens.
Note: Although you can update fields, such as changing the Target field, you cannot leave a field blank. If a link does not have a name associated with it, the Name field is disabled.

3. Enter your changes in the appropriate fields.
4. Click OK.
   The Edit Hyperlink or Edit Answer Link window closes and all links are automatically revalidated and display on the Check Links window.
5. Click OK.

Edit a Related Answer
You can edit related answers, including sibling, manually related, and learned links.

Editing a related answer affects all answers associated with it.
1. From an answers report, right-click the answer and select Open.
2. Click the Relationships tab.
3. Click Open next to the answer you want to edit.
   The related answer opens in a new window.
4. Enter your changes.
5. Click OK.
6. Click Save.

Merge Similar Answers
You can effectively manage the answers in your knowledge base by merging similar answers or merging the content of one answer with another answer.

In addition, merging answers also merges any conditional sections. Conditional sections display as text in the appropriate fields of the answer.

Answers can be merged with similar answers found in the knowledge base by using Smart Merge. Smart Merge helps you to identify similar answers and merge them. Merging answers provides your customers with more complete information and can help you eliminate duplicate answers.

Note: Smart Merge relies on the configuration settings used for the SmartAssistant feature. Changing these configuration settings may change the weight given to the relevant answers displayed for both Smart Merge and SmartAssistant.

1. Right-click the answer on the content pane and select Open.
2. Click the Smart Merge icon (next to the Search icon) on the toolbar.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Answer</td>
<td>The parent answer is the current answer to which you are merging an answer. The field displays the summary of the open answer.</td>
</tr>
<tr>
<td>Include in Search</td>
<td>Define your search criteria with any of these areas of the answer. All options are selected by default.</td>
</tr>
<tr>
<td>Summary</td>
<td>Select this check box to search the Summary field for answers you can merge.</td>
</tr>
<tr>
<td>Keywords</td>
<td>Select this check box to search the Keywords field for answers you can merge.</td>
</tr>
<tr>
<td>Question</td>
<td>Select this check box to search the Question field for answers you can merge.</td>
</tr>
<tr>
<td>Answer</td>
<td>Select this check box to search the Answer field for answers you can merge.</td>
</tr>
<tr>
<td>All</td>
<td>Select this option to return all answers, regardless of status.</td>
</tr>
<tr>
<td>End-User Visible</td>
<td>Select this option to return only public answers.</td>
</tr>
</tbody>
</table>

4. Click Refresh.
The results display on the Smart Merge window. The matched answers are sorted by relevance.

5. Click Action next to each answer you want to merge, and select from the merge options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Merge</td>
<td>Select this option to merge the answer with the answer you are editing.</td>
</tr>
<tr>
<td>Merge and Make Private</td>
<td>Select this option to merge the answer with the answer you are editing and set the status to Private. A warning prompts you to verify the action.</td>
</tr>
<tr>
<td>Merge and Delete</td>
<td>Select this option to merge the answer with the answer you are editing and then delete the answer after it has been merged.</td>
</tr>
<tr>
<td>CAUTION: Selecting this option permanently deletes the selected answer from the knowledge base. Use caution when selecting this option.</td>
<td></td>
</tr>
<tr>
<td>Show</td>
<td>Select this option to view the answer in a separate window before you merge it with the answer you are editing.</td>
</tr>
<tr>
<td>Cancel</td>
<td>Select this option to cancel the current selection.</td>
</tr>
</tbody>
</table>

Tip: After you select an option, the underlined text next to the answer changes. For example, if you select Merge, the text changes from Action to Merged.

6. Click Close to close the window and return to the answer.
7. To view the merged answer as it displays on the customer portal, click the Quick Preview tab.
8. Click Save.
Delete an Answer

You can delete answers from Service when they become outdated.

Deleting an answer also deletes all associated relationships.

**CAUTION:** Deleting is permanent and cannot be undone.

1. Right-click the answer on the content pane and select **Delete**.
2. Click **Yes** to confirm the deletion.

Answer Versioning

You can create new versions of answers while keeping previous versions for historical purposes.

**Note:** Before you can use answer versioning, you must modify the answer workspace.

Answer versioning lets you do the following:

- Draft new versions of existing answers, including from historical versions.
- Publish new answer versions immediately or at a designated time in the future.
- Compare answer versions.
- Delete answer versions.
- Audit answer versions.

Answer IDs and version IDs are independent from each other. The IDs may or may not have the same numbers when the versions are created.

**Tip:** If you plan to audit answer versions, we recommend creating business rules to prevent answer versions from being deleted.

<td>Static score assigned to the answer. The static score overrides the solved count and is used to determine the answer display position.</td>
</tr>
</tbody>
</table>

Create an Answer Workspace for Answer Versioning
You must modify the standard answer workspace to enable answer versioning.

Answer versioning uses the Answer Versions report located in Public Reports/Service/Views - Service/Editor Reports - Service.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Workspaces. If workflows are enabled, the item is labeled Workspaces/Workflows.
   The Workspaces explorer opens on the content pane.
3. Copy the standard answer workspace and name the copy.
4. Open the new workspace for editing.
5. Add the Draft and Publish buttons to the ribbon.
   a. Click the Home tab, and then click Ribbon.
   b. On the Ribbon Designer, click any of the buttons in the Actions section of the Ribbon Preview.
      The editing window displays the buttons in the Actions group.
   c. Click Add Buttons.
   d. In the Add or Remove Buttons window, select the Draft and Publish check boxes, and then click OK.
   e. Use the arrows to move the Draft and Publish buttons where you want them to be located.
   f. Click OK to close the Ribbon Designer.
6. Add a new tab to the workspace and name the tab Versions.
7. Add the Answer Versions report to the new tab.
   a. Click the Insert Control tab, and then drag and drop a Report control onto the Versions tab.
   b. Click the Design tab, and then click Report on the ribbon.
      The Select Report window opens.
   c. Select the Answer Versions report located in Public Reports/Service/Views - Service/Editor Reports - Service, and then click OK.
      The Answer Versions report is added to the Versions tab.
8. Click the Insert Field tab, and then add the following fields above the report.
   a. Version ID
   b. Parent Version ID
   c. Version State
   d. Draft Date
   e. Draft Note
9. Click **Save**.
10. Edit the profiles of any staff members who need to create answers so they can use the new workspace.

The new answer workspace should resemble this image.

![Image of new answer workspace]

### Create a New Answer Version
You use the modified answer workspace to create a new draft from an answer and then publish it.

This procedure assumes that the answer workspace has been modified to enable answer versioning.

1. Open the answer for which you want to create a new version.
2. Click **Draft**.
   - The **Create Draft** window opens.
3. Enter a note for the draft and click **OK**.
   - The default note reads, Draft created from version id: current_version_number.
   - The new version opens in the HTML editor with - Draft appended to the title.
4. Close the previous version of the answer.
5. Edit the new version and click **Save**.
   - Clicking the Versions tab shows the original answer version in the Live state, while the new version is in the Draft state.
6. To publish the draft immediately, click **Publish**. The **Publish Draft** window opens.
   - Enter a note about the draft.
   - Click **OK**.
   - The default note reads, Publish draft with version Id: new_version_number.
   - The draft is published. The Versions tab shows the original version is now in the Historical state, while the new version is in the Live state.
7. To publish the draft on a future date, click the **Calendar** icon next to the Publish On field.
a. Select a publishing date.
   If a draft is already set to publish, the Publish On window opens with the draft version ID and the scheduled publish date.

b. Click **OK**.
c. Click **Save**. The draft is published on the specified date.

| Note: | If you change your mind about publishing your draft, you can clear the Publish On field. |

### Create a New Answer Version from a Historical Version

You can create a new draft from a historical version of an answer. For example, you might want to revert some of the changes that have been made to the answer. You can also use this procedure to create a draft from another draft.

1. Open the answer for which you want to create a new version.
2. Click the **Versions** tab.
3. Double-click the historical version.
   The historical version opens in the HTML editor, with "- Historical appended to the title.
4. Close the editor for the live version.
5. Click **Draft**.
   The **Create Draft** window opens.
6. Enter a note for the draft and click **OK**.
   The default note reads, Draft created from version id: historical_version_number .
   The new version opens in the HTML editor with "- Draft appended to the title.
7. Close the previous version of the answer.
8. Edit the new version and click **Save**.
   Clicking the Versions tab shows that the original answer version is in the Historical state while the new version is in the Draft state.
9. To publish the draft immediately, click **Publish**. The **Publish Draft** window opens.
   a. Enter a note about publishing the draft.
   b. Click **OK**.
      The default note reads, Publish draft with version Id: new_version_number .
      The draft is published. Clicking the Versions tab shows the original and previously live versions are now in the Historical state, while the new version is in the Live state.
10. To publish the draft on a future date, click the **Calendar** icon next to the Publish On field.
    a. Select a publishing date from the calendar.
       If a draft is already set to publish, the Publish On window lists the draft version ID and the publish date.
    b. Click **OK**.
    c. Click **Save**.
       The draft is published on the specified date. Clicking the Versions tab shows the original answer version is still in the Historical state, while the new version is in the Draft state.

### Compare Answer Versions

You use the answer preview functionality to compare versions. For example, you might want to compare the live version to a historical version.

1. Click the **Versions** tab and select the first version you want to compare.
2. Click **Preview**.
   The answer version displays in the **Answer Preview** window.
3. Click **File > Compare** .
4. Select the answer version to compare to the first version, and then click **Select**.
The two versions are compared side by side in the Answer Preview window.

Delete an Answer Version

You can delete answer versions without deleting the entire answer.

Deleting the live version of an answer causes the answer to be lost temporarily from any report or functionality that relies on it. Publishing a draft version restores that functionality.

However, you cannot delete the live version of an answer from the Service Console without deleting the answer (and all of its other versions).

To identify answers that are missing live versions, run the Answers Missing Live Versions report, located in Public Reports/Service/Views - Service/Editor Reports - Service.

1. On your modified answer workspace, click the Versions tab.
2. Select the row of the answer version you want to delete by clicking in the row.
3. Click Delete on the Versions tab, and then select Answer Version.
   The Answer Version Delete window opens.
4. Click Yes to confirm the deletion.
5. Click Refresh.

All answer versions are deleted.

Audit an Answer Version

Use the Audit Log tab to view events that have occurred for answer versions. The audit log for answer versions is especially useful in regulated industries.

Tip: We recommend creating business rules to prevent answer versions from being deleted if you plan to audit answer versions.
1. From an open answer, click the **Versions** tab, and then open an answer version.
2. Click the **Audit Log** tab.

The following transactions are listed:

- Transactions for the answer.
- Transactions that affect the answer and all sibling answers.
- Transactions for the answer version.

**Related Topics**
- Audit Logs

**Find the Live Answer Version For a Specific Date**

You can use the Answer Version Audit Search report to find which version of an answer was live on a specific date. This report can be especially useful in regulated industries.

This procedure assumes that the Reports Explorer component has been added to the Analytics button of your navigation set. The Answer Version Audit Search report is located in **Public Reports/Service/Search Reports — Service**.

If you plan to audit answer versions, we recommend creating business rules to prevent answers from being deleted.

1. Click **Analytics** on the navigation pane, and then double-click **Reports Explorer**.
2. Expand **Public Reports > Service > Search Reports — Service**, and then double-click **Answer Version Audit Search**.

   You can also add this report to the Answers button of your navigation set.
3. In the Search window, enter the answer ID.
4. Click the **Calendar** icon to enter a search date or timeframe.
   The Relative check box is selected by default with zero (0) months rounded for the date.
5. To designate a specific date, clear the **Relative** check box.
6. Click **Search**.

   The search result displays as shown in this example.

![Answer Version Audit Search Report](image)

You can open the version in the search results of the report.

**Answer Relationships**

Answer relationships give you a way to group similar answers, improving the way you keep track of and update answers in your knowledge base. There are three types of answer relationships, including sibling answers, manually related answers, and automatically learned links.

You can manage the way one answer relates to other answers from the Relationships tab on the answer workspace. The answer relationship types available to you depend on how the answer workspace assigned in your **profile** is customized.
Sibling answers, manually related answers, and automatically learned links display on the Relationships tab. The tab is divided into the following sections.

- **Sibling Answers**—Answers that can share the same product, category, or file attachments.
- **Manually Related Answers**—Two or more answers manually defined by a staff member.
- **Learned Links**—Answers that are automatically related as a result of customer activity.

Manually related and learned links are disabled when the answer type is set to either URL or File Attachment.

Regardless of which types of answer relationships you work with, it is important to note that all relationships between answers are at a peer level and not at a subordinate level. For example, if you have three answers you want to relate (1, 2, and 3), you can relate 2 to 1 and 3 to 2. All three answers are peers, including answers 1 and 3.

### Sibling Answers

Sibling answers are a set of answers that share the same products, categories, or file attachments.

Sibling answers and attachments with access levels that are at or below the contact’s Service Level Agreement (SLA) are visible to the contact.

**Note:** To display file attachments for answer siblings on the Attachments tab, the Siblings Visible property for the File Attachments relationship item on the custom answer workspace must be set to True. See **Options Properties**.

The Sibling Answers section of the Relationships tab consists of a toolbar and a list of sibling answers. The toolbar is located above the sibling answer list.

<table>

- [Report Home Tab](#)

**Move an Answer to a Sibling Set**

You can create answer relationships by making an answer part of a sibling set.

1. From the Relationships tab, click **Add > Add Existing** on the Sibling Answers toolbar. The Answer Search window opens.
2. Search for the answer you want to move to your sibling set and click **Select**. The Move Siblings window opens.
3. Select the sibling set option you want to use.
4. Click **OK**.

**Remove an Answer from a Sibling Set**

You can change answer relationships by removing an answer from a sibling set.

1. In the Sibling Answers section of the Relationships tab, select the answer that you want to remove from the sibling set.
2. Click **Remove**. The Move Answer window opens.
3. Select the appropriate option.
4. Click **OK**.
Manually Related Answers

Manually related answers are two or more answers that may contain related information. Manually relating answers provides customers with additional options for finding accurate information.

The Manually Related Answers section of the Relationships tab consists of a toolbar and a list of manually related answers. The toolbar is located above the manually related answer list.

<table>

Learned Links

Service automatically links answers, known as learned links, based on customer activity. Relationships between answers are established when customers view answers during the same visit.

The Learned Links section on the Relationships tab consists of a toolbar and a list of learned link answers. The toolbar is located above the learned links answer list.

Note: To display learned links on a customer portal page or any page that is external to the customer portal, add the RelatedKnowledgebaseAnswers widget to the page. The number of related answers (learned links) that display depends on how the widget is configured.

### Other Answer Actions

Besides editing and adding answers, you might have other answer management duties, for example, printing an answer, copying an answer, or making the same change to multiple answers.

- **Printing answers**—You can create a printable version of your answers. When using this function, the answer opens in a new window. The print command is then launched through your web browser and you can choose to print the contents of the page. See *Print a Record*.  

---

1061
• **Copying answers**—You can copy an existing answer to make a new answer or sibling answer. When copying an answer, the language and access level are retained, but the status is set to Private to prevent you from accidentally publishing it. See *Copy a Record*.

• **Updating multiple answers**—You can edit more than one answer at the same time and edit various fields such as status, assigned staff member, review and publish on dates, products, categories, and custom fields. This feature saves you time when you want to make the same change to multiple answers. See *How You Update Multiple Records*.

### Content Library

#### Overview of Content Library

You can create standard text and variables to represent words, phrases, and replies that agents use frequently. Your agents can use this content to save time and eliminate errors when responding to customers and creating answers.

Standard text can be inserted in incident responses or in chat sessions, or added as a *business rule* action, making the information your organization presents more consistent. For example, you may want to create standard text for commonly used information about your products and pricing, or to relay standard troubleshooting or contact information to customers.

You can also assign a shortcut key to any standard text. Agents can use shortcut keys to insert standard text when working on incidents or engaged in a chat session.

Variables are shortcuts that can be inserted into incident responses, chat sessions, or in the Question and Answer fields of an answer. For example, instead of agents entering your organization’s support phone number every time, you can add the phone number as a variable. Agents can copy a variable and paste it or enter the variable inline when responding to a customer in a chat session or an incident response. Variables can be *indexed* to make the answer contents more searchable.

You can embed variables as shortcuts in standard text, including variables defined on the Variables editor or system-defined variables. Variables are also helpful to use for information that may change. By updating the value of the variable, you will also update all answers that contain that variable.

You can add folders to organize standard text and variables and organize folders in the tree.

- Add or Edit a Variable
- Insert Standard Text from the Standard Text Window

#### Add or Edit Standard Text

Provide standard text that your agents can use to save time, eliminate errors, and respond with consistent information in incident responses, chat sessions, and answers. You can also organize standard text using folders.

1. Click **Configuration** on the navigation pane.
2. Expand **Service**, and then double-click **Standard Text**.
   
   The Standard Text tree displays on the left side of the *content pane*.
3. Choose one of the following options:
- To add standard text, click **New**.
- To edit standard text, select it in the tree.

  **Tip:** You can search for standard text by expanding the arrow next to Search at the bottom of the tree.

The Standard Text editor displays on the right side of the content pane.

4. **Enter field information.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter the name of the standard text. The item name in the Standard Text tree on the left side of the content pane populates or updates as you type.</td>
</tr>
<tr>
<td><strong>Hotkey</strong></td>
<td>Enter the keyboard shortcut letters, numbers, or both in this field. This lets agents quickly insert standard text by pressing F8 and the shortcut key when working on an incident or during a chat session. To locate a keyboard shortcut, hover over a standard text response in the tree.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Select at least one of the following check boxes for the standard text type.</td>
</tr>
<tr>
<td>Rule Text</td>
<td>Select this check box to include the standard text as a rule action.</td>
</tr>
<tr>
<td>Chat Text</td>
<td>Select this check box to make this text available to agents during a chat session. This check box displays only when Chat is enabled.</td>
</tr>
<tr>
<td>Incident Text</td>
<td>Select this check box to include this text in the Standard Text list when adding or editing an incident.</td>
</tr>
<tr>
<td>Chat URL</td>
<td>Select this check box to make this URL available to agents during a chat session. Agents can send the URL to customers, which opens a browser that displays the URL. This check box displays only when Chat is enabled.</td>
</tr>
<tr>
<td><strong>Value</strong></td>
<td>Select the appropriate option for adding standard text in plain text or HTML format. If both plain text and HTML versions of a standard text entry are available, the HTML version displays, by default, in the Preview section on the Standard Text window.</td>
</tr>
<tr>
<td>Text</td>
<td>Select this option to add the standard text in plain text.</td>
</tr>
<tr>
<td>HTML</td>
<td>Select this option to add standard text in HTML. For information on how HTML fields in standard text display in responses, see <em>Answer ID 1434</em>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>Click this button to select a variable defined on the Variables editor. See <a href="#">Add or Edit a Variable</a>.</td>
</tr>
<tr>
<td>$</td>
<td>Click this button to select from the list of system-defined variables. When the standard text is appended, the variable is replaced with the related data. If you enter the period mark ( . ) immediately after the variable, and then an alphabetic character, the period becomes part of the variable name.</td>
</tr>
<tr>
<td>SmartAssistant Solutions</td>
<td>Select this option to append the SmartAssistant Solutions variable. $solutions populates in the Value text box.</td>
</tr>
<tr>
<td>Response Link</td>
<td>Select this option to append the Response Link variable. $response_link populates in the Value text box.</td>
</tr>
<tr>
<td>Incidents</td>
<td>Click the Incidents drop-down menu and then select one of the variables on the list. For the list of available standard content variables, see <a href="#">Answer ID 6529</a>. Custom fields and attributes defined in your system are also on the list. For a description of the standard content variables on the list, see the Incidents table information in the Data Dictionary (<a href="#">Configuration &gt; Database &gt; Data Dictionary</a>).</td>
</tr>
<tr>
<td>Contacts</td>
<td>Click the Contacts drop-down menu and then select one of the variables on the list. For the list of available standard content variables, see <a href="#">Answer ID 6529</a>. Custom fields and attributes defined in your system are also on the list. For a description of the standard content variables on the list, see the Contacts table information in the Data Dictionary (<a href="#">Configuration &gt; Database &gt; Data Dictionary</a>).</td>
</tr>
<tr>
<td>Orgs</td>
<td>Click the Orgs drop-down menu and then select one of the variables on the list. For the list of available standard content variables, see <a href="#">Answer ID 6529</a>. Custom fields and attributes defined in your system are also on the list. For a description of the standard content variables on the list, see the Organizations table information in the Data Dictionary (<a href="#">Configuration &gt; Database &gt; Data Dictionary</a>).</td>
</tr>
<tr>
<td>Comment</td>
<td>Enter a description or instructions to help your agents who are working on the Agent Browser User Interface understand how to use the standard text.</td>
</tr>
</tbody>

### Add or Edit a Variable
A variable is a predefined shortcut for entering a long string of text when adding an answer, responding to an incident, engaging in a chat session, or creating standard text. You can add or edit variables from the Variables editor.

1. Click **Configuration** on the navigation pane.
2. Expand **Service**, and then double-click **Variables**.
   - The Variables tree displays on the left side of the content pane.
3. Choose one of the following options:
   - To add a variable, click **New**.
   - To edit a variable, select the variable in the tree.
   
   **Tip:** You can search for variables by expanding the arrow next to Search at the bottom of the tree.

   The Variables editor displays on the right side of the content pane.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter the name of the variable. The item name in the Variables tree on the left side of the content pane is populated or revised as you type. Variable names cannot include spaces. We recommend using an underscore character (_)</td>
</tr>
</tbody>
</table>

Service Level Agreements

Overview of Service Level Agreements

Service level agreements (SLA) control the type and amount of support you offer your customers.

Using response requirements, you can track the effectiveness of your customer service and determine whether staff members are meeting defined service goals for initial response and incident resolution times.

You can also meter the service and support your customers receive. For example, you can control how many incidents an organization can submit based on the number of incidents defined in their assigned SLA instance.

Before you create SLAs, you need to add the holidays your organization observes and define default response requirements so you can track staff members’ response and resolution times. Default response requirements are used for SLAs that do not have custom response and resolution requirements. See Add Custom Response Requirements to an SLA.

Add or Edit a Holiday

To ensure your organization meets its service goals, you need to add all holidays observed by your organization.

Holidays work in conjunction with your default response requirements and any custom response requirements defined in individual SLAs. That is, by adding holidays, you can temporarily suspend response requirements for those days when staff members are not available to respond to customer inquiries and answer their questions.
For example, if your organization observes Independence Day, add it as a holiday so the defaults you set for response and resolution times are suspended for that day. Failing to add the holidays your organization observes will present an inaccurate picture of how staff members are meeting their service goals.

1. Click **Configuration** on the *navigation pane*.
2. Expand **Service > Service Level Agreements**, and then double-click **Holidays**.
   The Holidays tree displays on the *content pane*.
3. Choose from the following options:
   - To add a holiday, click **New** to display the editor.
   - To edit a holiday, click it in the tree.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter the name of the holiday.</td>
</tr>
<tr>
<td><strong>Date</strong></td>
<td>Click in this field and enter the month, day, and year. (The current date appears in this field.) Or Click the calendar to select a different day in the month. Use the left and right arrows at the top of the calendar to change the month, and then click a day.</td>
</tr>
<tr>
<td><strong>Interface Visibility</strong></td>
<td>Select the check box next to each interface for which this holiday applies. When you have multiple interfaces for different countries, you can make a holiday active in one interface but not in another. For example, since July 4 is a holiday in the United States but not in Canada, you would select only your U.S. interfaces for this holiday. However, if your support is handled from the United States, you may want to make the holiday an option in both Canadian and U.S. interfaces.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

**Note:** You must add an entry for all holidays that occur yearly. For example, you must add separate entries for July 4, 2020, and July 4, 2021.

### Define Default Response Requirements

Define your response requirements. Response requirements are the maximum times allowed for incident response and resolution during your organization’s operating hours.

For example, you may have a service goal of initially responding to all customer inquiries within one business day (8 work hours) and resolving all incidents within three business days (24 work hours). By defining these default response requirements, you can measure staff member performance in responding to and solving incidents. You can also use the response requirements for those SLAs that do not have customized response requirements.

Because Service supports both default and custom response requirements, you have flexibility in offering different levels of support to customers. For example, if you want your levels of service to be based on how quickly customers receive an initial response and their incidents are solved, you can set up custom response requirements for each SLA.

1. Click **Configuration** on the *navigation pane*.
2. Expand **Service > Service Level Agreements**, and then double-click **Response Requirements**.
The Response Requirements tree displays on the content pane.

3. Click the appropriate interface in the tree to display the editor.

4. Enter field information for the first service interval. Press Tab to move between interval fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Intervals</td>
<td>Use these fields to select the day and time intervals for the default response requirements.</td>
</tr>
<tr>
<td>New</td>
<td>Click this button to add a new row for the default response requirements.</td>
</tr>
<tr>
<td>Delete</td>
<td>Click this button to delete the selected default response requirement.</td>
</tr>
<tr>
<td>Day</td>
<td>Click this drop-down menu to select a day of the week. Press Tab to move between fields.</td>
</tr>
<tr>
<td>*Start Hour</td>
<td>Enter the start hour using a 24-hour clock (for example, if your business day starts at 8:00 A.M., enter 8 in this column).</td>
</tr>
<tr>
<td>*Minute</td>
<td>Enter the start minute from 0 to 59.</td>
</tr>
<tr>
<td>*End Hour</td>
<td>Enter the end hour using a 24-hour clock (for example, if your business day ends at 5:00 P.M., enter 17 in this column). The end hour must be a number greater than the start hour.</td>
</tr>
<tr>
<td>*Minute</td>
<td>Enter the end minute from 0 to 59.</td>
</tr>
<tr>
<td>Response Time (Minutes)</td>
<td>Enter the maximum number of minutes (between 1 and 99999) that staff members have to initially respond to a new incident. For example, if you require staff members to initially respond within 4 hours, enter 240 in this field.</td>
</tr>
<tr>
<td>Resolution Time (Minutes)</td>
<td>Enter the number of minutes (between 1 and 99999) that staff members have to solve incidents assigned to them. For example, if you require that incidents be resolved within 8 hours, enter 480 in this field.</td>
</tr>
<tr>
<td>Holidays Observed</td>
<td>Select the holidays that will suspend the response requirements. Select the Select All check box to select all holidays in the Holidays Observed section.</td>
</tr>
</tbody>
</table>

5. Click the Day drop-down menu to select the day for the next service interval and press Tab.

   **Tip:** You can have the same day of the week listed in two intervals. For example, if your organization has both day and afternoon shifts, you can add separate intervals for each shift.

6. Click Save.

- Add Custom Response Requirements to an SLA
Resolution Due Calculations

For SLAs that have response times defined, you can have resolution due dates and times calculated automatically when an SLA instance is added to an incident.

This saves you from having to perform complex calculations to account for holidays and service hours.

To display resolution due calculations, you must create a custom incident milestones report and add it to a custom incident workspace. This image shows an incident workspace that has been configured to display resolution due calculations.

Related Topics
- Create the Incident Milestones Report

Add the Incident Milestones Report to a Custom Incident Workspace

To display resolution due calculations, you must create a custom incident milestones report and then add it to a custom incident workspace.

1. Copy the standard incident workspace and name it.
2. Open the custom incident workspace.
3. Click the **Details** tab.
4. Add the custom incident milestones report to the Details tab.
5. Click **Save** to save the custom workspace.
6. Edit your staff members’ profiles to use the new Incident Milestones workspace.

After an SLA instance is applied to an incident, you can view the resolution due date and time. See **Credit an Incident to an SLA Instance**.

How You Set Up SLAs

After adding your holidays and defining default response requirements for your staff members, you can configure SLAs for your application.

Begin by deciding what type of SLAs to offer. For example, you could offer certain customers a premium SLA that provides them with unlimited support for a period of time, and offer other customers a standard SLA that limits the
number of incidents they can submit during a specified time period. In addition, you can control whether customers without an SLA can access your support site, or submit incidents through email or the Ask a Question page. You can also add business rules to automatically assign SLAs to specific customers.

Setting up SLAs consists of the following actions.

- Create the SLAs you want to offer. See Create an SLA.
- Set up business rules to automatically assign SLAs to customers. See How You Issue SLAs Automatically. Also, review how staff members can manually assign SLAs when working on incidents and editing organizations and contacts. See How You Issue SLAs Manually.

Create an SLA

SLAs are designed to allow you flexibility in providing support to your customers. When you create an SLA, you can choose the duration of the SLA and limit the SLA based on the number of incidents that can be submitted.

You can also assign custom answer access levels to an SLA so that customers have privileged access to special groups of answers.

1. Click Configuration on the navigation pane.
2. Expand Service > Service Level Agreements, and then double-click Service Level Agreements. The Service Level Agreements tree displays on the content pane.
3. Choose from the following options:
   - To add a service level agreement, click New to display the editor.
   - To edit a service level agreement, click it in the tree.
4. Enter field information.

<table>

| | When using multiple-language interfaces, you must enter the label in the Label field in the language of the interface.

5. Click **Save**.

**Related Topics**
- How You Customize Configuration Settings
- Add or Edit an Answer Access Level
- View Disabled SLA Instances

**Add Custom Response Requirements to an SLA**
You can define custom response requirements for each SLA or use the default response requirements already defined.

1. When adding or editing an SLA, click **Edit** next to the interface in the Interface Label section.
   The **Response Requirements** window displays.
3. Click **Save**.

**How You Issue SLAs Automatically**
After you create SLAs, they can be automatically issued to organizations and contacts with no organization association using business rules.

After an SLA has been automatically applied to an organization or contact, a unique **SLA instance** is associated with the organization or contact. See Examples of Applying Service Level Agreements (SLAs).

**Note**: Contacts associated with an organization cannot be assigned an SLA instance, as the SLA instance is applied to the organization.

**How You Issue SLAs Manually**
Staff members can manually apply SLAs to organizations and contacts when editing incidents associated with an organization or contact.

After a staff member has applied an SLA, a unique **SLA instance** is associated with that organization or contact.

If an organization or contact has more than one active SLA, staff members can select which SLA to apply to an incident. For example, a contact may have two active SLAs, one that allows unlimited incidents and lasts for thirty days, and another that allows ten of each type of incident and lasts for one year. If a new incident is applied to the limited incident SLA, the staff member can re-assign the incident to the unlimited incident SLA to more efficiently use the customer’s entitlements. See **SLA Instance Field**.

**How You Maintain SLAs**
Maintaining your SLAs is an important part of your customer service solution, and Service provides you with tools for evaluating the performance of your SLAs and how they are meeting your customers’ needs.
You can also edit SLAs as necessary.

- **SLA Reporting**
- **Edit an SLA**
- **View Disabled SLA Instances**

**SLA Reporting**
With Analytics, you can track and report on staff members’ performance and service level achievements.

You can see the usage status of SLAs as well as generate specific reports regarding performance and achievement requirements of each SLA. Analytics can assist you in evaluating and monitoring agent performance, SLA usage and performance, and customer support levels. SLA analytics are located in **Public Reports/Service/SLA Reports**.

For statistical information about individual SLAs, see **Create an SLA**.

**Edit an SLA**
Analyzing your SLAs can help you pinpoint the most effective ones and the ones that may need to be changed. You can edit your SLAs at any time.

After an **SLA instance** is applied to an organization or contact, it cannot be changed. When you edit an SLA, the changes will not affect the instances of the SLA that have already been applied to organizations or contacts. Changes will affect only future instances of the SLA applied to a contact or organization. For your reference, a view-only version of the SLA instance is archived. See **View Disabled SLA Instances**.

1. Click **Configuration** on the **navigation pane**.
2. Expand **Service > Service Level Agreements**, and then double-click **Service Level Agreements**.
   - The Service Level Agreements tree displays on the **content pane**.
3. Click the appropriate service level agreement in the tree to display the editor.
4. Edit field information as necessary. See **Create an SLA**.
5. Click **Save**.

The next time you assign this SLA to contacts and organizations, the changes will apply to all instances of the SLA.

**View Disabled SLA Instances**
If an SLA is edited after an instance of the SLA has been assigned to contacts or organizations, the assigned instance is converted to read-only mode to prevent editing.

The read-only version of the **SLA instance** is archived, letting you view the settings for the previous, or “disabled,” instance of the SLA.

1. Click **Configuration** on the **navigation pane**.
2. Expand **Service > Service Level Agreements**, and then double-click **Service Level Agreements**.
   - The Service Level Agreements tree displays on the **content pane**. If a disabled SLA exists, an arrow displays next to the active SLA it is associated with.
3. Click the arrow to view the disabled SLA. Disabled SLAs display in a light gray font.
4. Click the disabled SLA you want to view.
   - The Service Level Agreement editor displays on the content pane and the disabled SLA opens in read-only mode.
Examples of SLAs

These SLA examples show you how to meter service and offer different levels of support to your customers. SLA examples are provided for a 30-day SLA, a grace period SLA, and a premium SLA.

- Add a 30-Day SLA
- Add a Grace Period SLA
- Add a Premium SLA

Add a 30-Day SLA

This example shows you how to add a 30-day SLA that restricts support to 30 days, but lets contacts and organizations submit an unlimited number of incidents during that time period.

Support begins when the SLA is assigned and automatically ends after 30 days. In this example, the default response requirements are used.

1. Click Configuration on the navigation pane.
2. Expand Service > Service Level Agreements, and then double-click Service Level Agreements. The Service Level Agreements tree displays on the content pane.
3. Click New.
4. Enter 30 Days in the Service Level Name field.
5. Select the Active check box.
6. Select the Self-Service check box to allow access to the customer portal.
7. Enter 30 in the Term (Duration) field and select Days from the drop-down menu.
   
   **Note:** Do not enter any number in the Chat Incidents, CSR Incidents, Email Incidents, Self-Service Incidents, and Total Incidents fields. Leaving these fields blank, or null, will let contacts and organizations assigned this SLA submit an unlimited number of each type of incident until the 30-day term has expired.

8. Click Save.

Add a Grace Period SLA

This example shows you how to add a two-incident SLA that could be assigned to contacts or organizations whose SLAs have recently expired.

The duration is defined using the Total Incidents field. The Term (Duration) field is left blank because the defining measure is the number of incidents, not the length of time. In this SLA, the default response requirements are also used.

1. Click Configuration on the navigation pane.
2. Expand Service > Service Level Agreements, and then double-click Service Level Agreements. The Service Level Agreements tree displays on the content pane.
3. Click New.
4. Enter Grace Period in the Name field.
5. Select the Active check box.
6. Select the Self-Service check box to allow access to the customer portal.
7. Enter 2 in the Total Incidents field.

Leaving the Chat Incidents, CSR Incidents, Email Incidents, and Self-Service Incidents fields blank, or null, will let contacts and organizations assigned this SLA submit an unlimited number of incidents. By entering the number 2 in the Total Incidents field, you are letting customers submit 2 of any incident type, but limit the total number of incidents the contact or organization can submit to 2.
The Term (Duration) field is blank because there is no time limit on the SLA. Contacts and organizations may submit the incidents at any time, until they have submitted two incidents, at which time the SLA will expire.

8. Click Save.

**Add a Premium SLA**

This example shows you how to add a type of SLA that could be offered to organizations or contacts who request premium service. It is set up to provide faster incident response and resolution times than standard SLA entitlements.

For example, staff members must initially respond within four hours and resolve incidents within two working days (sixteen hours).

The SLA has a duration of one year and will allow forty total incidents comprised of ten chat incidents and thirty CSR incidents. In this SLA, custom response requirements are used. See *Add Custom Response Requirements to an SLA*.

1. Click **Configuration** on the **navigation pane**.
2. Expand **Service > Service Level Agreements**, and then double-click **Service Level Agreements**. The Service Level Agreements tree displays on the **content pane**.
3. Click **New**.
4. Enter **Premium** in the **Name** field.
5. Select the **Active** check box.
6. Select the **Self-Service** check box to allow access to the **customer portal**.
7. Enter **10** in the **Chat Incidents** field.
8. Enter **30** in the **CSR Incidents** fields.
9. Enter **40** in the **Total Incidents** field.

**Note:** The number in the Total Incidents field must be greater than or equal to the value of any single incident field. For example, if the number of chat incidents equals 10, and all other incidents have a field value of 5, then the total number of incidents permitted must be 10 or more. The number in the Total Incidents field must also be less than or equal to the sum of the values of all of the single incident fields. For example, if the sum of the field values is 50, then Total Incidents cannot be greater than 50.

10. Enter **1** in the **Term (Duration)** field and select **Years** from the drop-down menu.
11. Click **Save**.

**Offer Advisor Administration**

**Overview of Offer Advisor Administration**

With B2C Service Offer Advisor, you can create promotions and define which groups of customers are eligible for each promotion. It provides agents with solid information to successfully present offers to customers and contribute to increased revenue for your organization.

When agents work with your customers, they are in a perfect position to provide information about new and upgraded products and services with Offer Advisor. Product promotions are a natural use of Offer Advisor. But you can also use the feature to provide personalized service notices that enhance your levels of customer support. For example, Offer Advisor can help agents remind customers about soon-to-expire warranties or notify them about product recalls. Besides the promotions that you create, Offer Advisor also automatically generates product suggestions based on a customer’s purchase history.
Offer Advisor provides offers—that is, promotional information and product suggestions—your agents can present to customers who contact your customer support group. With Offer Advisor’s specifically targeted offers, an agent has the ability to cross-sell (by offering products compatible with those the customer has already purchased) or up-sell (by offering a premium version of a product the customer currently owns). You can also use Offer Advisor to offer SLAs and renewals, remind customers about warranties, add customers to a newsletter mailing list, provide information about product recalls, or deliver other messages to your customers. Offer Advisor includes settings that automatically create sales opportunities when a customer expresses interest in a promotion or suggestion.

To learn how agents use Offer Advisor when they work with customers, see How Offer Advisor Works.

For current information about Offer Advisor, see Answer ID 2230.

Offer Advisor Configuration

After enabling and configuring B2C Service Offer Advisor, staff members can use it while assisting customers.

Configuration options will not be visible until Offer Advisor is enabled. Contact your Oracle account manager.

**Note:** Even with Offer Advisor enabled, you must be sure that the Offer Advisor button appears on the ribbon of the workspace that agents use when they work with incidents. By default, it appears on the standard incident workspace. If agents use a custom incident workspace and the Offer Advisor button is not available on the ribbon, they will not be able to tell if a customer is eligible for offers. See Ribbon and Quick Access Toolbar Buttons.

After Offer Advisor is enabled, perform these tasks to configure it.

- **Integrate purchase history data**—Offer Advisor must have a customer’s purchase history before it can generate product suggestions and apply target rules that have conditions based on purchase history. When sales information resides in an external application, you can integrate sales transaction information into your database, including customer information, purchased products, price, and purchase dates. For information about integrating purchase history data, contact your Oracle account manager.

- **Create targets**—Every promotion needs an intended audience, which is its target. You can create unique targets for specific promotions as well as general targets you can use for multiple promotions. See Targets and Target Rules.

- **Add promotions**—After you have enabled Offer Advisor, integrated purchase history day, and created targets, you can create promotions that include dates, products, information for the agent, and targets. See How You Use Customer Promotions.

Customer Promotions

A promotion is a program defined by a staff member, usually from the marketing department, that specifies the effective dates, the product (if applicable to the promotion), the promotion’s priority, and the target eligible for the promotion.

The promotion description contains information for the agent, such as a text guide to help the agent present the promotion to the customer. The promotion also defines which targets are eligible for the offer. Targets are created using Offer Advisor target rules, a unique type of business rule. Customers who meet the conditions specified in a target rule are automatically added to the defined target.

When an agent responds to a customer’s question, Offer Advisor retrieves information about the customer and the incident. Offer Advisor then applies the target rules and evaluates the customer information to determine if the customer belongs to a target. If the customer belongs to one or more targets, Offer Advisor searches for promotions the target is eligible for and displays them to the agent.
The displayed list of available promotions includes the assigned priority ranking and acceptance rate for each promotion. Also shown is the date of the most recent positive response, if any. (Previously refused offers are not displayed to avoid repeating an offer in which the customer has already expressed no interest.)

### How to Use Suggestions to Recommend Products

A suggestion is an automated product recommendation that predicts customer interest based on purchase history (if data is integrated into the Oracle B2C Service application).

Unlike promotions, which are created by marketing personnel, suggestions for recommended products are automatically generated. Offer Advisor uses a predictive model to develop product suggestions based on the customer’s purchase history.

Offer Advisor first identifies groups of customers who have similar purchasing behavior. When a customer submits an incident, Offer Advisor assigns the customer to the best matching group. Then Offer Advisor compares products the customer has already purchased to products purchased by other members of the group. For example, the customer may belong to the group of customers who have purchased cruise vacations. If many members of that group have taken Alaskan cruises, but the customer has not, Offer Advisor may recommend an Alaskan cruise as the customer’s next purchase.

Offer Advisor ranks a product suggestion based on the strength of the recommendation, in other words, the probability that the customer is interested in the offer. Offer Advisor does not generate suggestions when it does not have enough information for the customer or when it predicts a low likelihood of the customer accepting the offer.

### Text Matching

When the Offer Advisor window displays promotions and suggestions, an agent can search for specific terms that best express the customer’s interests.

The search reorders the offers, ranking each according to its match weight.

Match weight depends on where the search term is found in an offer. For example, if the agent-entered search term matches a keyword for the promotion, the offer has a higher match weight than it would if the search term were found in the product description. Match weights are high (best match), medium, or low. The highest weight occurs when the agent-entered search terms match promotion keywords. Medium weights are assigned when the search term matches the promotion or product name or the text in the promotion’s summary field. Low weights result when terms match the promotion guide or product description.

### Targets and Target Rules

Every promotion is associated with at least one target, which is the group of customers to whom you want to present your promotion. You can create a target to use for a single promotion, or you can create general targets to be used with multiple promotions.

Targets are created with target rules, which are one type of business rule. Business rules automate your workflow by establishing a set of conditions and a resulting action. If the conditions are met, the action is taken.

Target rules single purpose is to define targets—groups of customers—that meet the conditions you specify. You add a rule to specify the conditions you want a customer to meet and if the conditions are met, the customer automatically becomes part of the target.

For example, you might want to promote SLAs. Using target rules, you can use product purchase dates to identify customers with expiring warranties who constitute your target. In another example, you might want to promote a premium calling plan for cellular phone customers in a specific region. You can use target rules to specify geographical limits and identify those customers who currently have basic calling plans. In another situation, you might create a
target consisting of all your customers. In that case, you simply name the target and save the rule without setting any conditions.

For information about how agents interact with Offer Advisor, see How Offer Advisor Works.

Related Topics
• Overview of Business Rules

Create a Target Rule
When you define the conditions of a target rule, you can define targets in terms of a large number of attributes, including demographic information you can gather using custom fields.

Because only one state is permitted for target rules, this state—called Targets—is automatically added when you open target rules. You cannot add states or functions in target rules. Regardless of the conditions you select, the default action is always “Contact will match this target.” You cannot add an action for the Else clause of a target rule.

When you define the conditions of a target rule, you can use fields from the incident, contact, and organization tables in the database. This lets you define targets in terms of a large number of attributes, including demographic information you can gather using custom fields. You can also create a target that includes all of your customers by creating a rule that has no conditions. For lists of the fields allowed for incident, contact, and organization objects, see Business Rule Conditions.

You can also select a unique Purchased Products condition for target rules. The Purchased Products condition is actually a combination of three conditions, all of which must be met in order for the Purchased Products condition to be met. These criteria are product, price, and date purchased. In the Purchased Products condition, you can include or restrict products, define the price range, and specify the time frame of purchases.

This procedure creates a target rule with a Purchased Products condition.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click Rules.
The Rules tree and editor display on the content pane.
3. Click Offer Advisor.
The Browse Targets editor opens.
4. Click Edit.
The Target editor opens.
5. Right-click Targets in the tree and select New Rule.
The Targets editor is activated.
6. Enter the name of the target rule in the Rule Name field.
7. To add notes to the rule, enter them in the Notes field.
8. Click Add IF Condition Based On and select Purchased Products.
9. Enter field information.

<table>
<thead>
<tr>

<td>Select this operator if you want the price or purchase date to contain no value.</td>
</tr>
<tr>
<td>Is not null</td>
<td>Select this operator if you want the price or purchase date to contain a value.</td>
</tr>
</tbody>
</table>

11. Click **Save** to save the target rule.

12. Click **Activate** to compile and activate the target rule base. See *Compilation and Activation of Rule Bases* if you need help with this step.

**Note:** If you click Compile instead of Activate, the rule is checked for errors, but not activated. Offer Advisor does not apply this target rule to customer information until it has been activated.

Select the Relative Time Condition for Date Purchased

The Purchased Products condition lets you select a value for the Date Purchased part of the condition. There may be times when you want to set a specific date and time, which you can do by opening the calendar and selecting them. At other times, however, you might want that value to be relative.
If you want a condition “If the purchase date is less than 24 hours from the time the contact was acquired”, for example, you can select a relative time for the rule condition. Relative time calculates the number of minutes or hours from the current time or from a specific event, such as the time the contact or incident was created.

This procedure shows you how to set a relative time condition using the time a contact was acquired, but the procedure is the same for setting other relative time conditions.

1. Click **Configuration** on the *navigation pane*.
2. Expand **Site Configuration**, and then double-click **Rules**.
   The Rules tree and editor display on the *content pane*.
3. Click **Offer Advisor**.
   The Browse Targets editor opens on the content pane.
4. Click **Edit**.
5. Right-click the rule you want to add the relative time condition to and select **Edit**.
   The Target editor is activated.
6. Click **Add IF Condition Based On** and select **Purchased Products**. In this example, assume you want the target group to include those contacts who purchased a product within twenty-four hours of being acquired as a contact.
7. Select the **Relative** check box for **Date Purchased**.
   The calendar drop-down menu is removed and the Relative time field displays.
8. Click the **Relative Time** drop-down menu above the **Relative** check box.
   The **Relative Time** window opens.
9. Complete the fields in the **Relative Time** window.
10. Click the **Directions** drop-down menu and select **+ (Future)**.
11. Enter 24 in the **Offset** field.
12. Click the **Unit** drop-down menu and select **Hours**.
13. Click **Save** to save your settings and close the **Relative Time** window.
14. Click the **Event** drop-down menu to the right of the **Relative** check box and select **Contact.Acquired**.
15. Click the **Select Operator** drop-down menu and select **Less Than**.
16. Click **Save** to save the new relative time condition for the rule.

### How You Use Customer Promotions

Promotions include the product or message you want agents to present to customers who belong to a specific target group. Promotions also define the active dates, the promotion’s priority, URLs to open when customers express interest in or accept a promotion, and scripts and tips for agents.

You may find it helpful to use existing promotions as the basis for new promotions. In those cases, you can save the promotion with a new name and then make any changes. Even if you do not intend to make any changes, you should rename the promotion so it is possible to distinguish between them in reports.

Because every promotion requires at least one target, you must define the promotion’s target before you can complete the promotion. When you add a promotion, you may already have a target you want to present the promotion to, or you may decide to create a target specifically for this promotion. If you begin creating a promotion before defining a target, you can save the promotion and return later to assign a target.

If your promotion applies to a sales product, you must also be sure the product is in the product catalog. For example, you might create promotions that offer a discount on a new model of cell phone or a free warranty with a purchase. In these examples, the sales products are the cell phone and warranty. In another example, you might want to offer free shipping on all purchases or create a promotion that simply makes an announcement to your customers. In those cases, do not specify a sales product when you create the promotion. See *Add or Edit a Sales Product*. 

*ORACLE*
After you know what product and targets are included in your promotion, you can add the remaining details. These include start and end dates, priority, URLs for taking the next action, and information to guide the agent in presenting the promotion to customers.

**Note:** Even though the Promotions editor lets you create a promotion, it does not make other changes that may be necessary to enact the promotion. For example, if you create a promotion that offers an extended service agreement, you must also change the customer’s SLA to reflect acceptance of the promotion.

**Related Topics**
- Targets and Target Rules

**Add or Edit a Promotion**
Follow this procedure to add or edit a promotion.

1. Click **Configuration** on the navigation pane.
2. Expand **Opportunity Tracking**, and then double-click **Promotions**. The Promotions tree displays on the content pane.
3. Do one of the following:
   - To add a promotion, click **New** to display the editor.
   - To edit a promotion, click it in the tree.
4. Enter the name of the promotion in the **Name** field.
5. To define properties, see **Select Details for a Promotion**.
6. To enter a summary, guide, and keywords, see **Provide Promotion Information to Agents**.
7. To specify targets, see **Select Targets for a Promotion**.
8. Click **Save**.

**Select Details for a Promotion**
You can define the start and end dates, the product associated with a promotion, its priority, and the URLs that agents are directed to based on customer response.

1. Click **Configuration** on the navigation pane.
2. Expand **Opportunity Tracking**, and then double-click **Promotions**. The Promotions tree displays on the content pane.
3. Click the promotion in the tree to display the editor.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activated</td>
<td>Select this check box to activate the promotion. To discontinue a promotion during its active period (between the start and end dates), clear the check box.</td>
</tr>
<tr>
<td>Start Date</td>
<td>Click this drop-down menu to open the current month’s calendar and select a start date for the promotion. Use the arrows at the top to change the month, if necessary, and then select the date.</td>
</tr>
<tr>
<td>End Date</td>
<td>Click this drop-down menu to open the current month’s calendar and select an end date for the promotion.</td>

**Provide Promotion Information to Agents**

You can provide information to help agents present promotions to customers. In addition, you can add a summary of the promotion and keywords associated with the promotion.

1. Click **Configuration** on the navigation pane.
2. Expand **Opportunity Tracking**, and then double-click **Promotions**. The Promotions tree displays on the content pane.
3. Click the promotion in the tree to display the editor.
4. Click **Description** to open the **Description** page.
5. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summary</td>
<td>Enter the text the agent will see in the list of promotions displayed on the <strong>Offer Advisor</strong> window.</td>
</tr>
<tr>
<td>Guide</td>
<td>Enter a script, sales tips, or other guidelines to help the agent present the promotion to the customer.</td>
</tr>
<tr>
<td>Keywords</td>
<td>Enter keywords in this field. Offer Advisor compares these keywords, along with other words associated with the promotion, to the search terms the agent enters to find offers matching the customer’s interests.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

**Select Targets for a Promotion**

You can assign one or more of the available targets to the promotion you are adding.

If you want to define a new target for this promotion, see **Targets and Target Rules**. If you define a new target before you finish creating the promotion, you must activate the target rule and reopen the Promotions editor. The new target then appears in the Available Targets list so you can assign it to the promotion.

1. Click **Configuration** on the navigation pane.
2. Expand **Opportunity Tracking**, and then double-click **Promotions**.
3. Click the promotion in the tree to display the editor.
4. Click **Targets** to open the Targets page.
5. Select a target for this promotion in the Available Targets list and click the right arrow.
6. To assign additional targets, repeat the previous step.
7. To remove a target, select it in the Assigned Targets list and click the left arrow.
8. Click **Save**.

**How You Modify Promotions**

You can edit and delete promotions as necessary.

To edit a promotion, click it in the tree. Make your changes and save the promotion. You can also copy a promotion, edit it, and save it with a new name. The default name is Copy of [Promotion Name].

If you want to edit an existing promotion to use as a new promotion, it is good practice to open the promotion and save it with a new name. If you merely edit the properties of a promotion and do not change the name, your historical data regarding the effectiveness of that promotion may become skewed, preventing accurate reporting.

For example, if you create a Holidays 2020 promotion by renaming the Holidays 2020 promotion, you can distinguish statistics from each promotion, even if everything else in the two promotions is identical. If, however, you do not change the name, two years worth of data are combined in one report, making it impossible to distinguish between them.
This practice also allows agents to present the Holidays 2020 promotion to customers who were not interested in the 2019 promotion. If the name does not change, the promotion is not available to customers who said no to the previous year’s promotion.

To delete a promotion, click Delete. A message asks you to confirm the deletion.

**Note:** Deleting a promotion may prevent accurate reporting by causing some reports to be incomplete. It is good practice to delete only old promotions that are no longer required for historical purposes. You can also add a folder for archiving purposes.

---

**Offer Advisor**

**Overview of Offer Advisor**

When working with customers, you are in a unique position to anticipate their needs and provide them with specifically targeted information. B2C Service Offer Advisor identifies current promotions for which customers are eligible, and generates product suggestions based on their purchase histories.

**Note:** B2C Service includes a component known as “Service” where you work with offers, promotions, and related information.

Offer Advisor does more than simply provide you with a list of offers. It also displays guides to help you present the offer or information to the customer. It may contain product information and direct you to URLs to enter information about orders or leads. Offer Advisor can help you deliver high levels of personalized customer service by providing customers with reminders and service opportunities.

Promotions are special offers made to specific groups of customers. Examples of promotions include free shipping for customers who buy certain products, extended warranties for customers whose basic warranty is about to expire, and discounted prices on accessories for products customers have already purchased. A staff member in your organization, usually from the marketing department, defines a promotion.

Suggestions, on the other hand, are generated automatically. These are product recommendations based on customer characteristics and purchase history. Just as SmartAssistant searches the knowledge base and suggests possible answers to a customer’s questions, Offer Advisor searches for customer characteristics and past purchases to suggest possible products they may be interested in. For example, Offer Advisor may suggest a Caribbean cruise to a customer who has previously purchased a Mexican cruise vacation.

**How Offer Advisor Works**

B2C Service Offer Advisor evaluates customer information when you open an incident, and searches for promotions the customer is eligible for and product suggestions that the customer might be interested in.

If it finds promotions, product suggestions, or both, the Offer Advisor button is enabled on the ribbon.

After you solve the incident, click Offer Advisor. The Offer Advisor window displays and contains the promotions and suggestions found during the search.
Promotions Found Section

The Promotions Found section of the Offer Advisor window displays promotions for which the customer is eligible.

The maximum number of displayed promotions has been set by your administrator, so it is possible that the customer is eligible for other lower-ranking promotions that do not appear unless you scroll down.

**Note:** If the customer previously expressed no interest in a promotion, the promotion does not appear on the Offer Advisor window, and you will not be put in the position of presenting a promotion the customer has already rejected. Nor will the product associated with the rejected promotion appear in the Suggestions Found list.

When working with promotions, keep the following points in mind.

- You can revise the order of the promotions using any of the column headings in the Promotions Found section, although the Rank, % Yes, and Match columns are the most useful. The Name column is simply the name assigned to the promotion by the marketing staff member who developed it. The Summary column provides a brief overview of the promotion.
- Promotions are initially ranked by priority, which is the relative importance assigned to it by the staff member who created it. These values appear in the Rank column. Although a rank of 1 indicates the highest priority, multiple promotions that have the same priority are not differentiated by rank in this list, so lower promotions may have the same priority as the first promotion.
- The % Yes column lists the historical response rate, which is the percentage of times customers have accepted this promotion. To rearrange the promotions in order of acceptance, click the column heading.
- You can enter search terms that indicate the customer’s interest. The Match column prioritizes promotions based on how well your search terms match keywords and other text of the promotion or product. To list the promotions in order of match, where a high value indicates a strong match, click the Match column heading. Lower-ranking promotions that did not appear when the list was prioritized by rank may now be displayed based on their match with the search terms you entered. To learn how to search for matches, see [Enter Search Terms](#).
- The column titled Dup? is used to indicate whether the product in the promotion is duplicated in a suggestion. If the same product appears in Promotions Found and Suggestions Found, the Dup? value in the row is Yes and is highlighted.

Suggestions Found Section

The Suggestions Found section of the Offer Advisor window displays recommendations for products that Offer Advisor has determined are a good fit for the customer.

The maximum number of displayed suggestions has been set by your administrator, so it is possible that other lower-ranking suggestions are available even though they may not appear until you scroll down. Just as you can with promotions, you can revise the order of suggestions using the Rank, % Yes, and Match columns.

Guide Section

The Guide section of the Offer Advisor window contains information about a selected promotion. This information was entered for your use by the marketing staff member who created the promotion.

Depending on your organization’s practices, the information may be a script for a phone conversation, text you can enter into an email response, or simply talking points for the promotion. For example, if most of your customer support requests come through phone calls, the marketing staff member may write a general script for you to use when talking with a customer. If your main channel of communication with customers is through email, the guide may contain text you can copy or append to the response.
The Guide section displays “Offer Guide is unavailable” if you have selected a suggestion instead of a promotion or if marketing personnel did not enter information when creating the promotion.

To copy information in the Guide section that you want to paste into the response, right-click in the Guide section and select Copy. To append the information to the response, right-click and select Append To Thread.

Product Details Section

The Product Details section contains information from the Sales Product Catalog about the selected product suggestion or the product for the selected promotion.

Promotions do not require an associated product. If the selected promotion does not involve a product, this section displays “Product Details are unavailable.”

To copy information in the Product Details section that you want to paste into the response, right-click in the Product Details section and select Copy. To append the information to the response, right-click and select Append To Thread.

How You Present Offers

After you have opened the Offer Advisor window, you can review the promotions and suggestions to determine which one to select to present to the customer.

You can revise the order of the lists of promotions and suggestions to help you decide which offer has the highest potential of success. You can select the offer’s rank or its acceptance rate, or you can enter search terms to determine how well the offer matches the customer’s interests and use the match value as your selection criterion.

Tip: You should strongly consider any offer with Yes displayed on a green background in the Dup? column. This indicates a product that appears in both promotions and suggestions.

- How You Select a Promotion or Suggestion
- Enter Search Terms
- Present an Offer

How You Select a Promotion or Suggestion

After you have opened the Offer Advisor window and reviewed the promotions and suggestions, you can select one to present to the customer.

To use rank as the selection criterion, select the promotion or suggestion ranked 1.

To use acceptance rate, click the% Yes column heading to list the promotions in order of acceptance rate.

Enter Search Terms

You can enter search terms to determine how well an offer matches the customer’s interests and use the match value as your selection criterion.

1. Click Search on the bottom of the Offer Advisor window.
   The Offer Advisor Search window opens.
2. Enter the search terms, separated by a space or comma, and click OK.
Note: The search terms you enter are applied only to the promotions and suggestions available to this customer, not to all promotions and suggestions.

The list of offers is automatically ranked according to match value.

Present an Offer

Present an offer you have selected for the customer.

1. Do one of the following:
   - If you are on a phone call with the customer, read or paraphrase the guide and product information to the customer.
   - If you are responding to an incident, right-click in the guide or product information section to copy the text or append it to the response. Modify as necessary before sending the response.

2. Click Set Response in the Action column for the offer you want to present.
   The associated drop-down menu in the Response column is activated.

3. Click the drop-down menu and select an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Select this option if the customer accepts the offer. Depending on how the promotion is defined or how Offer Advisor is configured, this button may take you to a URL for follow-up action (for example, an order form).</td>
</tr>
<tr>
<td>Interest</td>
<td>Select this option if the customer expresses interest in the offer but is not ready to accept it. Depending on how the promotion is defined or how Offer Advisor is configured, this button may take you to a URL for follow-up action.</td>
</tr>
<tr>
<td>No</td>
<td>Select this option to indicate the customer’s lack of interest in the offer. The promotion or suggestion is disabled in the Offer Advisor window, and the response is recorded to prevent the offer from being made to this customer in the future.</td>
</tr>
<tr>
<td>Defer</td>
<td>Select this option when you are sending the offer by email and do not yet know the customer’s response.</td>
</tr>
</tbody>
</table>

4. Click OK to return to the incident.

5. Click Save to save the incident and record the customer’s responses to the offers. If you do not save the responses, the reports generated by managers and marketing staff will not account for these responses, and the historical information with this customer will not be accurate for future interactions.

Note: If you send an email to a customer who replies with an indication of interest, you can reopen the incident, open the Offer Advisor window, select the promotion or suggestion, and select Yes, Interest, or No to document the response appropriately.
6 Customer Portal

Configuring B2C Service for the Customer Portal

Overview of Customer Portal

Your customers use this interface to interact with your customer support. Your customers can use your customer portal to access a variety of self-help tools, including:

- Searching for product and support information
- Reviewing the contents of your knowledge base
- Asking questions of your support staff and your user community
- Chatting with staff
- Managing their account information

Because the Customer Portal is integrated with your B2C Service application, any information customers enter by submitting an incident, updating account information, or providing feedback on an answer is immediately available to your support staff on the B2C Service administration interface.

Some configuration occurs in the B2C Service administration interface, while editing the templates, pages, widgets, and inlays is completed using third-party tools and software.

Here are a few basic points to keep in mind as you begin working with your customer portal.

- The reference implementation is the set of default pages and files that make up the Customer Portal as it exists before you make modification for your specific needs. Edit the default files so they meet your organization’s support goals. You can match the appearance of the rest of your organization’s website. After working with the default pages, you should understand the concepts well enough to create any custom pages you may need.

- You’ll use a text editor such as TextPad, NotePad, Notepad ++, WordPad, or Adobe Dreamweaver to build and modify your customer portal pages. You’ll also need a WebDAV client for downloading and uploading files.

  Note: We recommend using Cyberduck version 4.4. Other versions of Cyberduck may not work as expected, or with mixed results.

- You use configuration settings on the B2C Service administration interface to set up certain functionality for your customer portal, such as SmartAssistant and search options. But you’ll use the Customer Portal Administration site, your text editor, WebDAV, widgets, and inlays to configure the customer portal pages.

B2C Service Elements Used in Customer Portal

Your Customer Portal relies on B2C Service elements to function.
The knowledge base is the term we use to describe how information in the database is presented. This is information staff members see on the agent desktop and customers see on your customer portal. This is some of the information in the knowledge base.

- **Contacts**—Each of your customers has a contact record in the knowledge base that includes basic information, such as name, email address, and phone number. Contact records also include information about any support issues or questions the customer has submitted as well as any other information your organization asks customers to provide.

- **Answers**—Answers are the heart of your knowledge base. Whether your organization calls them FAQs, help topics, or something else, an answer is the information in the knowledge base that provides a solution to a common customer support question. Your customers can search for answers to their questions, and you can create new answers from questions your customers commonly submit.

- **Incidents**—Incidents are created automatically when your customers submit a request for help through the Ask a Question page of your customer portal or when they provide feedback on your site or a specific answer.

- **Reports**—A report is simply a list of records. The application offers a full range of standard reports, and you can also create custom reports. The list of answers that is returned when a customer conducts a search is simply a report that has been filtered on the search terms. Customer Portal reports are listed on the administration interface and can be accessed by clicking the Analytics button and then opening the Reports explorer to find Public Reports/Service/Views–Service/Custom Portal.

- **Configuration settings**—You can accomplish most of the configuration of your customer portal by editing code for the templates, pages, and widgets that make up your site. There are, however, certain properties that are configured through the administration interface using configuration settings that define behavior on your customer portal.

- **Message bases**—A message base is an editable text string that lets you customize headings, labels, buttons, and other text on your customer portal. When you reference a message base by its standard name in a line of code, the page automatically displays the text of the message base.

- **Data dictionary**—The data dictionary lists the available database tables and fields that can be used for many input and output widgets. You can also use the Business Objects link on the Customer Portal Administration site (Framework > Business Objects) to look up field and table names for contacts, answers, and incidents.

### View Your Customer Portal

As you’re working on changes to your customer portal pages, you can use the development area to view them. You can set your site to open the pages that your customers see on your production site or your development pages.

When you open your customer portal, the set of pages that opens depends on which area you’ve selected to view on the Customer Portal Administration site: production, staging, development, or the reference implementation. You might be looking at the development pages you’re working on but haven’t yet staged and promoted. Or you may be viewing the same production pages your customers see.

1. Open your customer portal by doing one of these:
   - Launch a web browser and enter the URL for your site: `https://<your_site>/app`.
   - From the file menu on the Service Console of your B2C Service application, select `Link > <your_site> > End-user`.
2. To view development pages:
   a. Go to `https://<your_site>/ci/admin`.
   b. Select View Development Area on the dashboard.
Overview of WebDAV

The customer portal uses WebDAV to help you manage your website files.

WebDAV offers a familiar file structure, easy uploading and downloading of multiple files, and file security through login access. After you set up a WebDAV connection to upload and download files, you can use any text editor you want to create and edit files for your customer portal, or you can use Adobe Dreamweaver, which uses its own WebDAV protocol for site management and configuration.

**Note:** If you use special characters in any PHP file, you must use a text editor that lets you save the file with UTF-8 encoding without the leading Byte Order Mark (BOM) character.

**Related Topics**
- Enable MOD_CP_DEVELOPMENT_ENABLED

View Customer Portal Files

Administrators can view files stored on the customer portal server from the Customer Portal Administration site or from their local workstation.

1. To view files on your local workstation:
   a. Browse to the local location you specified in your WebDAV setup.
      
      **Note:** We recommend editing downloaded files and then uploading them back to the server.
   b. Click folders to navigate through the site files.
   c. Double-click the filename to open the file for editing.

2. To view files on the customer portal server:
   a. In a web browser, enter `https://<your_site>/dav`.
   b. Click `cp` to display the subfolders.
   c. Click the folders to open them and navigate through the site files.
   d. Double-click the filename to open the file for editing.

Configuring B2C Service for Customer Portal

Administrators should do some basic configuration before working with pages, widgets, and inlays.

Before you get started working with **pages**, **widgets**, and **inlays**, you’ll want to do some basic configuration for the Customer Portal on the **administration interface**.

- Assign appropriate permissions to staff members who will be working with your customer portal.
- Review the **configuration settings** to be sure you don’t need to change any of the defaults.
- Set up additional configuration options for features that are accessed through your customer portal, such as search options, **SmartAssistant**, **related answers** and **web indexing**.
Assign Permissions for Customer Portal

Access to edit and modify your customer portal is given through profile settings.

1. Log in to B2C Service.
2. Double-click Profiles in Configuration > Staff Management.
3. Double-click the profile you want to assign permissions to.
4. Click Permissions.
5. Select the appropriate permission:
   - CP Edit—Lets staff members with this profile edit customer portal pages using WebDAV, but not to stage or promote them. They can also access the Customer Portal Administration site.
   - CP Stage—Lets staff members with this profile copy the development files to the staging area.
   - CP Promote—Lets staff members with this profile promote customer portal pages from the staging area to the production area.
6. Click Save.

Enable MOD_CP_DEVELOPMENT_ENABLED

Before you can make changes to your customer portal development site, you must enable the MOD_CP_DEVELOPMENT_ENABLED configuration setting.

1. Double-click Configuration Settings in Configuration > Site Configuration.
2. Enter MOD_CP_DEVELOPMENT_ENABLED in the Key field.
3. Click Search.
4. Select Yes in the Value field.
5. Click Save.

Register Customer Portal Open Login with Facebook

Registering your open login with Facebook provides the application IDs and secret keys for requesting customer credentials for authentication.

1. Go to Facebook for Developers Quick Starts.
2. Create a Facebook Login account, following the requirements until you see the ID and secret values.
3. From the Service Console, locate the FACEBOOK_OAUTH_APP_ID configuration setting.
4. In the Value field, enter the App ID from the Facebook registration page.
5. Locate the FACEBOOK_OAUTH_APP_SECRET configuration settings.
6. In the Value field, enter the App secret key from the Facebook registration page.
7. Click Save.
8. On the Facebook page, enter your site’s valid domain in the App Domain field.
   
   Note: If the domain is not valid, authentication will fail.
9. Enter your site’s URL in the Website With Facebook Login.
10. Click Save Changes.
Register Customer Portal Open Login with Google

Registering your open login with Google provides values for the GOOGLE_OAUTH configuration settings.

1. Go to the Google API Dashboard.
2. Create a new application, following the Google requirements until you see the ID and secret values.
3. From the Service Console, locate the GOOGLE_OAUTH_APP_ID configuration setting.
4. In the Value field, enter the App ID from the Google page.
5. Locate the GOOGLE_OAUTH_APP_SECRET configuration setting.
6. In the Value field, enter the App secret key from the Google page.
7. Click Save.

Register Customer Portal Open Login with Twitter

Registering your open login with Twitter provides the application IDs and secret keys for requesting customer credentials for authentication.

1. Go to Twitter Developer.
2. Create a new application using the Twitter requirements.
   a. Set the website URL to point to your B2C Service site.
   b. Select Enable Sign in with Twitter.
   c. Set a Callback URL. The format for the Callback URL is <site_url>/ci/openlogin/oauth/callback/twitter/app/home/onfail/app/home/.
   d. Set the Terms of Service URL. The format for the URL is <site_url>/app/home.
   e. Set the Privacy policy URL. The format for the URL is <site_url>/app/home.
   f. Select the Allow this application to be used to sign in with Twitter checkbox.
   g. On the Permissions tab, select Request email address from users.

   You should see a unique App ID and App secret value.
3. From the Service Console, locate the TWITTER_OAUTH_APP_ID configuration setting.
4. In the Value field, enter the App ID from the Twitter Application details page.
5. Locate the TWITTER_OAUTH_APP_SECRET configuration settings.
6. In the Value field, enter the App secret key from the Twitter Application details page.
7. Click Save.

Add Search Priority Words

You can associate answers and documents with specific search terms ensuring the customer sees the information you want them to.

Search priority words let you associate a specific answer or document with specific search terms to ensure that the answer (or document) will always be returned when a customer enters the search term. When you've assigned a search priority word to an answer and the customer enters the search priority word, the answer is displayed in the Recommended Links section on the Answers page.

2. Click New.
3. Type a name in Search Priority Word Name. This is not the search term itself, merely the identifier for it.
4. In **Keywords**, type search terms, separating each one with a comma, semicolon, or line break.
5. Select **Always Show**, if you want the answer to appear in the Recommended Links section of the Answers page.
6. Choose how you want to associate the search priority word.
   - Public Answer
   - WWW Document
7. Enter the answer or document information you want to associate with the search priority words.
   - To associate to an answer, enter the Answer ID for the answer.
   - To associate to a document, enter the title and URL of the document.
8. Click **Save and Close**.

## Add and Remove Answer Stopwords

Incidents and answers are analyzed for suggested words you have indicated should not be searchable. Administrators can modify this list of stopwords.

1. Open **Answer Stopwords** in **Configuration > Service > Knowledge Base**.
2. Do one or more of these actions:
   - Add words from the Suggested Additions list to the Active **stopword** list.
     i. Select the stopwords you want to add to the list.
     ii. Click >>.
   - Add a stopword that is not in the Suggested Additions field.
     i. Enter the word in the field at the top of the Active list on the right.
     ii. Click **Add New**.
   - Remove a stopword.
     i. Click the word in the Active list.
     ii. Click <<.
3. Click **Save**.

Run the Agedatabase utility to push your changes to the stopwords list.

## Edit the Aliases Word List

You can add aliases, or synonyms, to link terms that are specific to your industry or organization to similar search terms your customers use.

1. Double-click **File Manager** in **Configuration > Site Configuration**.
2. In the **Switch To** drop-down menu, select **wordlist files**.
3. Click **Download**.
4. Click **Save**.
5. Select a location for the file.
6. Open the saved file.
7. Enter each alias on a separate line using comma-delimited terms in uppercase text.
   - The search terms in the line can contain spaces, so you can use phrases as synonyms for the search word, for example:
     - GPS,GLOBAL POSITIONING SYSTEM,NAVIGATIONAL SYSTEM
8. Save the edited file.
9. On the File Manager, click **Browse**.
10. Locate the edited file.
11. Click Open.
12. Click Go.
13. Click OK.

Add an Answer Access Level

Administrators can create custom answer access levels to restrict customer access to specified information.

1. Double-click Customizable Menus in Configuration > Application Appearance.
2. Expand the System Menus folder.
3. Click Answer Access Levels.
4. Click New.
5. Enter the name of the answer access level in the Label field.
6. If you do not want the answer access level to be visible on the interface, clear the Visible check box.
7. Click Save.

After you create custom access levels, you must assign the access levels to SLAs and assign SLAs to your customers. By assigning an SLA to a group of customers (either organizations or contacts without an organization association), your customers can view privileged answers from your customer portal pages.

Define Customer Password Requirements

You can set password requirements that can strengthen customer passwords entered on the Log In, Create an Account, and Change Password pages.

1. Double-click Contact Password Configuration in Configuration.
2. Edit the password requirements.
3. Click Save.

Overview of Finding Content on the Customer Portal

You can use Customer Portal standard searching or indexing to return search results to customers.

Search engines find the pages of your website from links from other sites and from links within your site. With the help of sitemaps, search engines can also find and index pages that are not part of your knowledge base, such as web pages, PDFs, and Microsoft Word documents.

| Note: | Content in iFrames is not searched and indexed. |

Indexing and searching of external documents are possible if you store the documents on a web server so they are available through a URL. Typically, this limits files to those within the document root, CGI root, or FTP root directories.

By default, Sitemap is enabled and registered with Yahoo and Google.

The output URLs for your customer portal sitemap are:

- XML—https://<your_site>/ci/sitemap
• HTML—https://<your_site>/ci/sitemap/html

In addition to using Sitemap to provide better spidering of your customer portal pages, Web Indexer can be pointed to a page that uses Sitemap to better index web pages outside of B2C Service. Filters can guide the web spider to follow only those hyperlinks that are within specified domains. During indexing, URLs are normalized to prevent a document from being indexed more than once.

External documents are not re-indexed if they are edited. They will be re-indexed the next time the Keywordindexer utility runs. The keyword indexes for external documents are stored in a file on the web server rather than in a database table.

Configure the Web Indexer

You can enable external document searching in the Configuration Wizard.

2. Follow the prompts in the Configuration Wizard to configure the Web Indexer.
   Note: To index a site using Sitemap, use the Sitemap URL as the root URL.
3. Click Save.

View External Search Logs

You can view a list of external searches on your site using the External Search log.

1. Open Logs in Configuration > Site Configuration.
2. Click External Search Logs.
3. Click Details for the log you want to view.

Turn Off Customer Browser Cookie Use

With the correct permissions, users can modify configuration settings to turn off cookies.

If you disable cookies, visit data is determined by URL parameters. You must define in individual lines of code to prevent new visits from being initiated each time the customer navigates away from a page.

1. Open Configuration Settings in Configuration > Site Configuration.
2. On the Search window, enter CP_COOKIES_ENABLED in Key and click Search.
   The configuration setting is located in the RightNow User Interface/Customer Portal/Login folder.
3. Set the Value field to No.
4. Click Save.

Pass Visit Information in Custom Pages

When your site has disabled cookies, you can pass visit information by modifying the page links.

1. Open the custom web site page.
2. Locate the link and add `#rn:session#` to the end of the page URL.
   
   `https://<your_site>.custhelp.com/<custom_page>.html#rn:session#`

3. Save and publish the page.

### Maintain Visit Data in JavaScript Links

You can use JavaScript to modify cookie header information and pass visit information.

1. Call the output of the `$CI>session>setSessionData($data)` function in your script and append it to the link.
2. If you are using a widget, you can create a variable for the result.
   
   a. Create a variable.
   
   ```javascript
   $data['js']['session'] = /RightNow/Utils/Url::sessionParameter()
   ```

   b. Reference the variable in the logic file.
      
      ```javascript
      link + data.js.session
      ```

### Maintain Visit Data in PHP Links

You can use php pages, templates, and widgets to modify cookie header information to pass visit data.

1. Add `/RightNow/Utils/Url::sessionParameter()` to the end of the link.
   
   ```php
   link .= /RightNow/Utils/Url::sessionParameter()
   ```

### Accessibility in Customer Portal

Several customer portal pages include a tag that is made visible to screen readers to meet accessibility requirements.

An off-screen `<h1>` tag is visible to screen readers using the `rn_ScreenReaderOnly` CSS class. This tag provides accessible navigation using shortcut keys for customers who use screen readers. The content is not visible to sighted users unless styles are disabled.

Customer portal widgets are designed to comply with Oracle's Accessibility Program. When you create custom widgets, you are responsible for ensuring that your changes do not impact accessibility.

**Note:** If you choose to use an empty string for a label, some widgets will not include the asterisk that indicates the input field is required, even if you set the required attribute to true.

</table>

### Customer Portal File Naming Conventions

Customer portal files follow a standard naming convention.

**File naming conventions**

- Use upper or lowercase alphanumeric characters and the underscore symbol.
- Must begin with a letter or an underscore.
- Paths are not case-sensitive. A mix of upper and lowercase characters is allowed but ignored.

**Note:** The native WebDAV client in an English version of Windows does not handle file names that contain multi-byte characters.

**CSS and JavaScript files**

To avoid naming conflicts with any custom files you create, these files are namespaced with an `rn_` prefix.

### Customer Portal Folder Structure

The Customer Portal incorporates an intuitive, easy-to-navigate file structure that lets you clearly identify the files you can edit.

<table>
<thead>
<tr>
<th>Folder and file location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/core/</td>
<td>You cannot add or remove files in this folder. You cannot edit the names of the folders or files.</td>
</tr>
<tr>
<td>Folder and file location</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>/core/assets/</td>
<td>Contains all web assets used by the Customer Portal Administration site.</td>
</tr>
<tr>
<td>/core/assets/debug-js/</td>
<td>Contains all JavaScript debug assets used by the Customer Portal Administration site.</td>
</tr>
<tr>
<td>/core/assets/default</td>
<td>Contains the CSS, images, and themes for the pages, templates, and widgets in the reference implementation.</td>
</tr>
<tr>
<td>/core/assets/ejs/</td>
<td>Contains the CSS, images, and themes for the pages, templates, and widgets in the reference implementation.</td>
</tr>
<tr>
<td>/core/assets/images/</td>
<td>Contains the CSS, images, and themes for the pages, templates, and widgets in the reference implementation.</td>
</tr>
<tr>
<td>/core/assets/thirdParty/</td>
<td>Contains the CSS, images, and themes for the pages, templates, and widgets in the reference implementation.</td>
</tr>
<tr>
<td>/core/framework/</td>
<td>The core of the Customer Portal code base. Contains all view files for the standard pages, templates, and view partials. It also contains files and information about version changes, controllers, libraries, models, and utilities.</td>
</tr>
<tr>
<td>/core/widgets/</td>
<td>Contains the files for all standard widgets, including controllers, views, CSS, images, logic, and YAML information files. You can use these files to view the code for the standard widgets.</td>
</tr>
<tr>
<td>/customer/</td>
<td>Contains all the Customer Portal files you can modify. Even if you don’t stage and promote these pages, changes you make may affect the look and function of your production pages.</td>
</tr>
<tr>
<td>/customer/assets/</td>
<td>Contains the assets you can add, edit, and delete. Assets include all files for your customer portal that are not pages, templates, or widgets, including CSS, JavaScript, images, video, and other rich web media. You can add, remove, edit, and execute files and add subfolders to this folder.</td>
</tr>
<tr>
<td>/customer/assets/css/</td>
<td>Contains the assets you can add, edit, and delete.</td>
</tr>
<tr>
<td>/customer/assets/images/</td>
<td>Contains the image you can add, edit, and delete.</td>
</tr>
<tr>
<td>/customer/assets/themes/</td>
<td>These files are used strictly by the development files. When you stage the development pages, these files are copied to a time-stamped folder in the staging directory and called from that folder. The themes you develop are kept in this isolated sandbox. The themes are applied to your production site only when you promote the staged files into production.</td>
</tr>
<tr>
<td>/customer/assets/feedback/</td>
<td>These files are used strictly by the development files.</td>
</tr>
<tr>
<td>/customer/assets/other/</td>
<td>Contains text files.</td>
</tr>
<tr>
<td>/customer/assets/default/</td>
<td>Contains default versions of the asset files provided in the reference implementation.</td>
</tr>
<tr>
<td>/customer/development/</td>
<td>This is your working folder. It contains all templates and pages to create and update your customer portal.</td>
</tr>
<tr>
<td>/customer/development/config/</td>
<td>Contains files to define model extensions, hooks that extend functionality, mappings to convert page names from previous frameworks to the current one, and search source model extensions. You can edit these files, but you cannot delete them.</td>
</tr>
<tr>
<td>/customer/development/hook.php</td>
<td>Lets you define a PHP array of functions that is executed before and after the API calls of your choice.</td>
</tr>
<tr>
<td>/customer/development/mapping.php</td>
<td>Redirects page requests and defines parameter mapping when you are migrating from Customer Portal Framework Version 1 (Classic or November 07 end-user interface).</td>
</tr>
<tr>
<td>Folder and file location</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>/customer/development/controllers/</td>
<td>Contains a customer controller file, <strong>AjaxCustom.php</strong>, which provides sample code that you can edit. You cannot delete or rename this file. You can create and add additional controller files to this folder.</td>
</tr>
<tr>
<td>/customer/development/errors/</td>
<td>Contains two PHP scripts (<strong>error_general.php</strong> and <strong>error_php.php</strong>) used to display customized error pages. Besides customizing the appearance of these pages, you can also use information provided by the customer portal to provide more specific information to customer than the standard 404 error page. You can edit these files, but you cannot add any files to this folder.</td>
</tr>
<tr>
<td>/customer/development/helpers</td>
<td>Contains the <strong>sample_helper.php</strong> file and can be used for storing PHP utility function files.</td>
</tr>
<tr>
<td>/customer/development/javascript</td>
<td>Contains a single javascript file, <strong>autoload.js</strong>, which you can edit. You cannot delete or rename this file. In the reference implementation, the file contains no code. When you add content to it, it will automatically load on every page.</td>
</tr>
<tr>
<td>/customer/development/libraries/</td>
<td>Contains <strong>sample.php</strong> file and can be used for storing singleton PHP class files.</td>
</tr>
<tr>
<td>/customer/development/views/</td>
<td>Includes all display files that do not contain logic.</td>
</tr>
<tr>
<td>/customer/development/views/admin/</td>
<td>Pages are used to display answer previews on the Service Console.</td>
</tr>
<tr>
<td>/customer/development/views/pages/</td>
<td>Contains all customer portal pages.</td>
</tr>
<tr>
<td>/customer/development/views/templates/</td>
<td>Includes the <strong>standard.php</strong>—used for the reference implementation pages—and the <strong>agent.php</strong>—for previewing a guide on the B2C Service administration interface.</td>
</tr>
<tr>
<td>/customer/development/views/partials/</td>
<td>Contains custom view partials.</td>
</tr>
<tr>
<td>/customer/development/widgets/</td>
<td>A folder for your custom widgets.</td>
</tr>
<tr>
<td>/customer/error/</td>
<td>This folder can contain only the reference implementation error pages listed in this table.</td>
</tr>
<tr>
<td>/customer/error/splash.php</td>
<td>You can display this page when your site is being upgraded.</td>
</tr>
<tr>
<td>/customer/error/error404.html</td>
<td>Static HTML page displayed when an HTTP 404 Not found error code is returned.</td>
</tr>
<tr>
<td>/customer/error/error413.html</td>
<td>Static HTML page displayed when an HTTP 413 Request entity too large error code is returned.</td>
</tr>
<tr>
<td>/customer/error/error500.html</td>
<td>Static HTML page displayed when an HTTP 500 Internal server error code is returned.</td>
</tr>
<tr>
<td>/generated/</td>
<td>Mirrors the structure of the <strong>development</strong> folder. You cannot add, edit, or delete the files in this folder.</td>
</tr>
<tr>
<td>/generated/production/</td>
<td>Contains the staged files that have been promoted into production. These files are visible to your customers.</td>
</tr>
</tbody>
</table>
### Customer Portal Reports

<td>Reference implementation</td>
<td>Default, read-only files that make up the original customer portal reference implementation.</td>
</tr>
</tbody>
</table>
Customer Portal Template and Page Set

Overview of the Standard Page Set

You can configure the standard page set included in the reference implementation.

The standard page set contains a set of standard pages that lets your customers:

- Search for information in your knowledge base and from your community.
- View answers and community discussions.
- Submit questions to your support staff and community.
- Comment, rate, and flag community discussion content.
- Update their contact and community profile information.
- Moderate community discussions and users (for those with moderation permissions).

**Note:** The reference implementation contains pages that you might not use, such as the mobile page set, basic page set, community pages, and chat pages. Even if you do not use these features, the pages remain available on your customer portal and it is possible that your customers may stumble upon them. You should remove any pages that you do not use in your site.

Overview of the Customer Portal Standard Template

The reference implementation standard Customer Portal pages are built on a standard template. You can customize these files for your organization’s needs and business practices.

The template for the reference implementation of the Customer Portal includes a set of widgets that are contained in the header and footer to control navigation, search, login, product or category selection, and page set selection functionality and the Oracle logo.

**CAUTION:** The behavior of the reference implementation may not correspond to the descriptions in this section if you have changed the default configuration settings.

These widgets are not rendered on a page, but provide specific functionality.

- BrowserSearchPlugin—This widget outputs a link to a browser search engine plug-in. The link is automatically detected by web browsers, and the widget tells the browser what information to send to the search engine so the site can be searched directly from the browser’s search bar.
- ClickjackPrevention—This widget prevents pages from loading in an iFrame or frameset, which prevents your customers from clicking a concealed link.
- CapabilityDetector—This widget detects capabilities of your customers' browsers. When a customer with no or limited JavaScript capabilities tries to access a standard or mobile page, a link to the basic page set appears, advising them to switch to the basic format for a better experience. When a customer with JavaScript capabilities accesses the basic page set, a notice appears to encourage them to switch to the standard page set.
Edit Customer Portal Files

With the right permissions, users can edit customer portal files to customize their site.

You must enable the MOD_CP_DEVELOPMENT_ENABLED configuration setting before you can make changes to your development site, which means it must be enabled in order to make changes to the customer portal. If you do not enable this setting, your customer portal will use the out-of-the-box reference implementation, and it cannot be edited.

1. Download the file to a local network location where you can access and open the file.
2. Edit the file as described in the procedure for that file, and then save the file.
   We're assuming that you're working with the templates and pages in your development folder.
3. Upload the file to the server.
4. View and verify your changes on your development site.

How Customer Portal Handles Question Marks in a URL

The Customer Portal does not use query string parameters within URLs.

When question marks are encountered in a URL, the content in the query string is ignored and the page is rendered as if the content is not in the URL. Product and category values in the search URL use subproduct and subcategory IDs.

For example, when product 130 is the parent of 138 and 138 is the parent of 131 (130 > 138 > 131), if all the products are visible by the end-user, the value is reduced to 131.

Although they are not used in the URLs, you can still access the values stored in the query string. The PHP superglobal \$_GET array is populated with any query string key/value pairs that are found.

iFrame Security Issues

Because using iFrames is not a best practice, the reference implementation includes a removable widget that prevents your customer portal from being presented in an iFrame.

The use of iFrames can pose several issues. Search engine optimization (SEO) is problematic because content in iFrames is not indexed by web crawlers. As a result, search engines will not display your knowledge base content to customers who are searching for specific information. Security is also a concern in iFrames because clickjacking—that is, misleading your customers into clicking a concealed link—is possible.

An additional consideration against the use of iFrames is the inability to set cookies in Internet Explorer 11. Although your customers can unblock third-party cookies, requiring them to do so is not an optimal customer experience.
Customer Portal Framework Versioning

The Customer Portal uses versions that apply a varying degree of change to the framework.

The Customer Portal version is independent of the B2C Service release version, allowing you to upgrade to newer versions of B2C Service while leaving your customer portal site untouched. This gives you control to migrate to a new Customer Portal framework when it's convenient for your schedule. Each area of your customer portal can use a different version of framework.

The Customer Portal uses three levels of versions: major, minor, and nano. Each version level implies a varying degree of change to the framework. The version numbering scheme follows a pattern such as 3.1.4.

- **Major**—A major version change usually involves a fundamental change in a core component of the Customer Portal and will require work on your part to migrate from one version to the next. Major version changes are indicated by a change to the first digit of the version number (for example, the “3” in 3.1.4). You have complete freedom to decide whether you want to migrate to the new major version or remain on your current version.

- **Minor**—A minor change is not backward compatible. These changes may or may not affect you, depending on the area and extent of the change and how it impacts your customizations. You have the choice of opting in to the change rather than risking the possibility of breaking any of your custom code through an automatic update. Minor version changes are indicated by the second digit in the version number, for example, the “1” in 3.1.4.

- **Nano**—Nano changes are fully backward compatible. Theses changes will be applied automatically to your customer portal code with no impact to your site. Your site will always have the most current nano version of the framework being used by your customer portal, giving you the benefit of enhancements and bug fixes without having to do any work to consume them. Nano changes are indicated by the third digit of the version number, that is, the “4” in 3.1.4.

Dependency checks are run when you select a version update to ensure that your B2C Service application supports the selected customer portal framework. Dependency checks also let you know if any of your current widgets must be migrated in order to function on the newer framework.

Overview of Message Bases in Customer Portal

Many widgets and page headings use message bases, which are unique text strings that support internationalization.

You can identify message bases in Customer Portal code because they use an `rn:msg#...#` tag. The label between the `#` symbols points to the specific message base to be used. When you reference a message base in the code, the page automatically displays whatever text is associated with the message base. Message base labels appear in uppercase text with the words separated by an underscore character.
For example, the code that generates the label on the Support Home tab is \#rn:msg:SUPPORT_HOME_TAB_HDG\#. You can change the default label in one of three ways.

- Change the value of the message base—Every place that calls or uses the message base will use the value you defined.
- Reference a different message base—if another message base uses the language you want, reference that message base instead of the one that appears in the default code.
- Enter whatever message you want—if you want the change to appear only once and internationalization is not a concern, you can simply enter whatever message you want into the page or widget code.

Change a Message Base Value

This example shows how a user with the appropriate permissions can modify the value of SUPPORT_HOME_TAB_HDG.

1. Double-click Message Bases in Configuration > Site Configuration.
2. In the Search window Key field, enter SUPPORT_HOME_TAB_HDG.
3. Click Search.
4. Enter the new label in the Text field.
5. Click Save.

Reference a Different Message Base

This example shows how you can reference the SUPPORT_HELP_HDG message base.

Locate the message base you want to use as a replacement. Message bases are listed in Configuration > Site Configuration > Message Bases. For this example we are using SUPPORT_HELP_HDG.

2. Locate the following line of code:
   \(<li><rn:widget path="navigation/NavigationTab" label_tab="\#rn:msg:SUPPORT_HOME_TAB_HDG\#" link="/app/\#rn:config:CP_HOME_URL\#" pages="home"/></li>\>
3. Edit the code to reflect the name of the message base you want to use.
   This code replaces the SUPPORT_HOME_TAB_HDG message base with the SUPPORT_HELP_HDG message base:
   \(<li><rn:widget path="navigation/NavigationTab" label_tab="\#rn:msg:SUPPORT_HELP_HDG\#" link="/app/\#rn:config:CP_HOME_URL\#" pages="home"/></li>\>
4. Save the file.

Use Custom Text Instead of Message Bases

This example shows how to change the default message base label to a custom value.

2. Locate this code.
   \(<li><rn:widget path="navigation/NavigationTab" label_tab="\#rn:msg:SUPPORT_HOME_TAB_HDG\#" link="/app/\#rn:config:CP_HOME_URL\#" pages="home"/></li>\>
Your custom value doesn't need to include `#rn:msg:`.

```html
<li><rn:widget path="navigation/NavigationTab" label_tab="Customer Care"
  link="/app/#rn:config:CP_HOME_URL#" pages="home"/></li>
```

4. Save the file.

## Add Navigation Tabs

You can add new navigation tabs to the standard.php template file.

1. Open `/views/templates/standard.php`
   a. Copy the code lines for an existing navigation tab and paste it where you want the tab to appear in the navigation.
      ```html
      <li><rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:SUPPORT_HOME_TAB_HDG#"
        link="/app/#rn:config:CP_HOME_URL#" pages="home"/></li>
      ```
   b. Edit the `label_tab` attribute to name the tab and the `link` attribute to specify the page you want to open when the tab is clicked.
      ```html
      <li><rn:widget path="navigation/NavigationTab" label_tab="Chat" link="/app/chat/chat_launch/>
      ```
   2. Save the file.

## Change Navigation Tab Labels

You can change the labels for the two existing tabs, Support Home and Ask a Question, on the standard template.

1. Open `/views/templates/standard.php`
   a. To change the Support Home tab label, enter the new label name over the content between the quotation marks for the `label_tab` attribute.
      ```html
      <li><rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:SUPPORT_HOME_TAB_HDG#"
        link="/app/#rn:config:CP_HOME_URL#" pages="home"/></li>
      ```
   b. To change the Ask a Question tab label, enter the new label name over the content between the quotation marks for the `label_tab` attribute.
      ```html
      <li><rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:ASK_QUESTION_HDG#"
        link="/app/ask" pages="ask, ask_confirm"/></li>
      ```
   2. Save the file.

## Add a Drop-down Menu to a Navigation Tab

This example creates a new Answers tab with a submenu to demonstrate how you can create a drop-down menu for navigation tabs on the standard.php template file.

1. Open `/views/templates/standard.php`
   a. Add the `subpages` attribute, `subpages="#rn:msg:ANSWERS_HDG#`, to the `NavigationTab` widget you want to modify. List the page titles and paths in the attribute. WebSearch Indexing > /app/answers/web_list.
      ```html
      <rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:ANSWERS_HDG#"
        link="/app/answers/list" subpages="#rn:msg:ANSWERS_HDG#" pages="answers/list, answers/detail"/>
      ```
   2. Save the file.
Configure the SimpleSearch Widget

You can add simple search functionality to any Customer Portal page.

The SimpleSearch widget is displayed conditionally and does not appear on pages that already contain a search field, such as Support Home, any of the search results pages, and the Public Profile page.

1. Open one of these files and locate the SimpleSearch widget code.

   ◦ /views/templates/standard.php
     <rn:condition hide_on_pages="home, public_profile, results, answers/list, social/questions/list">
       <div class="rn_SearchBar">
         <rn:widget path="search/SimpleSearch" icon_path="" report_page_url="/app/results"/>
       </div>
     </rn:condition>

   ◦ /views/templates/mobile.php
     <rn:condition hide_on_pages="home, results, answers/list, social/questions/list, account/profile, utils/create_account, utils/account_assistance, utils/login_form">
       <div class="rn_SearchBar">
         <rn:widget path="search/SimpleSearch" report_page_url="/app/results"/>
       </div>
     </rn:condition>

2. Edit the code to configure the SimpleSearch widget:

   ◦ To remove the SimpleSearch widget from every page, remove the code you located.
   ◦ To display the SimpleSearch widget on every page, remove the opening condition statement
     <rn:condition ...> and the closing condition statement </rn:condition> lines.
   ◦ To change the widget's labels, add the label attribute using the form label="Your Custom Label Name".
   ◦ To set the focus to the search field when a page opens, add the initial_focus attribute to the widget and
     set the value to true.
     <rn:widget path="search/SimpleSearch" icon_path="" report_page_url="/app/results"
               initial_focus="true"/>
   ◦ To open a page other than the default results page, change the report_page_url to a different page.
     <rn:widget path="search/SimpleSearch" icon_path="" report_page_url="/app/social/questions/list"/>

3. Save the file.

Overview of the AccountDropdown Widget

The AccountDropdown widget displays various account and login options, depending on the customer's status.

Customers who already have an account with your organization can log in to their account by clicking the Log In or Sign up button, which is generated with the AccountDropdown widget. They can also log in using the open login options available through social media accounts, such as Facebook, Twitter, Yahoo, and Google. Customers who do not have an account can click the Create an Account link to enter information and set up an account.
Note: Customers must have their browsers set to accept cookies or they will not be able to log in to the customer portal.

The AccountDropdown widget contains these three widgets.

- LogoutLink—Creates the Logout option on the drop-down menu.
- UserInfoDialog—Opens the dialog that asks customers who have a user name but not a community display name to enter a display name.
- LoginDialog—Opens the login window.

When a widget contains other widgets, you can use the attributes of the contained widgets in the widget definition. So, for example, although the AccountDropdown widget does not include a redirect_url attribute to indicate the page users should be redirected to when they log out, the LogoutLink widget does include that attribute. As a result, you can assign the attribute to the AccountDropdown widget too.

Configure the AccountDropdown Widget

Configure the AccountDropdown widget to modify what account details users can access.

1. Open one of these files and locate the AccountDropdown widget code.

   - /views/templates/standard.php
   - /views/templates/mobile.php

   There are four instances of the AccountDropdown widget on the template page.

   - For users who are not logged in.
     <rn:widget path="login/AccountDropdown" subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > account/overview" />

   - For logged-in users who do not have a community profile.
     <rn:widget path="login/AccountDropdown" subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > account/overview,
     #rn:msg:SUPPORT_HISTORY_LBL# > account/questions/list, #rn:msg:ACCOUNT_SETTINGS_LBL# > account/profile" />

   - For logged-in users with a community profile.
     <rn:widget path="login/AccountDropdown" subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > account/overview,
     #rn:msg:SUPPORT_HISTORY_LBL# > account/questions/list, #rn:msg:ACCOUNT_SETTINGS_LBL# > account/profile,
     #rn:msg:PUBLIC_PROFILE_LBL# > #rn:config:CP_PUBLIC_PROFILE_URL#/user/
     #rn:profile:socialUserID#/" />

   - For logged-in users with a community profile who have moderator permissions.
     <rn:widget path="login/AccountDropdown" subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > account/overview,
     #rn:msg:SUPPORT_HISTORY_LBL# > account/questions/list, #rn:msg:ACCOUNT_SETTINGS_LBL# > account/profile,
     #rn:msg:PUBLIC_PROFILE_LBL# > #rn:config:CP_PUBLIC_PROFILE_URL#/user/
     #rn:profile:socialUserID#, #rn:msg:MODERATION_LBL# > social/moderate/overview" />

2. Edit the code to configure the AccountDropdown Widget.

   - To change the widget's labels, add the label attribute using the form label="Your Custom Label Name".
To automatically open a request for a community user display name for users who do not have one, add the `display_on_page_load` attribute to the last instance of the AccountDropdown widget and set it to true.

To set the focus to the search field when a page opens, add the `initial_focus` attribute to the widget and set the value to true.

To remove the open login providers from the LoginDialog widget that opens when the Log In or Sign Up button is selected, add the `open_login_providers` attribute to the AccountDropdown menu and set it to a null value.

To display only a select number of open login providers, add the `open_login_providers` attribute to the AccountDropdown widget and specify the providers you want.

To remove the password field, add the `disable_password` attribute to the AccountDropdown widget and set its value to true.

3. Save the file.

### Configure the Template Footer

You can customize the footer in the template to add site navigation links, a copyright statement, contact information, and other elements.

2. Locate the footer code.

```php
<div id="rn_Footer" role="contentinfo">
  <div id="rn_RightNowCredit">
    <div class="rn_FloatRight">
      <rn:widget path="utils/RightNowLogo"/>
    </div>
  </div>
</div>
```

3. Edit the code to customize the footer.

   - To display a list of categories instead of the default list of products, add the `data_type` attribute to the ProductCategoryList widget and set it to “categories,” and change the `label_title` attribute to “Categories.”

     ```php
     <rn:widget path="search/ProductCategoryList" report_page_url="/app/products/detail" data_type="categories" label_title="Categories"/>
     ```

   - To change the default number of products or categories that are displayed, add the `maximum_top_levels` attribute to the ProductCategoryList widget and set it to the number you want.

     ```php
     <rn:widget path="search/ProductCategoryList" report_page_url="/app/products/detail" maximum_top_levels="10"/>
     ```

   - To display a specific list of products or categories, add the `only_display` attribute to the ProductCategoryList widget and use the ID numbers, separated by commas, of the products or categories you want to list.

     ```php
     <rn:widget path="search/ProductCategoryList" report_page_url="/app/products/detail"/>
     ```

   - To display an additional level of the product or category hierarchy, add the `levels` attribute to the ProductCategoryList widget and set it to 2.

     ```php
     <rn:widget path="search/ProductCategoryList" report_page_url="/app/products/detail" levels="2"/>
     ```

   - To add a copyright statement to the footer, add `<p>&copy Copyright 2015 Global Wireless</p>` immediately after the line for the OracleLogo widget.

4. Save the file.
Defining Themes

Themes are created from CSS files. Themes may also include graphics, JavaScript, flash animations, and other types of files.

All reference implementation theme files are called from the /euf/assets/themes/standard and /euf/assets/themes/mobile folders. Copies of theme files used in the reference implementation are also stored in /cp/customer/assets/themes/standard and /cp/customer/assets/themes/mobile.

When you create custom themes, you must place them in the /cp/customer/assets/themes subfolder. The CSS used for the theme must also be placed in the custom theme folder. If you try to stage development files containing theme paths not associated with /cp/customer/assets/themes, you will see a warning in the deployment log.

Although all other files in the /cp/customer/assets/ folder are shared between the production and development sites, the files in the /themes/ subfolder of /cp/customer/assets/ are used strictly by the development files. When you stage the development pages, these files are copied to a time-stamped folder in the staging directory and called from that folder. This keeps the themes you develop in an isolated sandbox that cannot be accessed by production files. The themes are applied to your production site only when you promote the staged files into production. Any CSS files that are referenced by a theme but not located in the /themes/ folder will be copied into a special directory in the production copy of the theme when the staged files are promoted into production.

Read-only copies of the reference implementation asset files are available in the /cp/core/assets/default/themes/standard and /cp/core/assets/default/themes/mobile folders. By selecting Reference Implementation on the View Site menu at the upper right of the Customer Portal Administration site, you can see exactly how the Customer Portal appears using the default CSS files. You can also copy the files in this folder if you want to overwrite the changes you've made and restore the reference implementation CSS.

RN Theme Tag

You can define multiple themes and write logic to select a theme at runtime based on any combination of database variables, web visit variables, URL attributes, or other elements.

The RN Theme tag is used on a page or template to define what theme should be used. If a page uses a template and also defines a theme, the page theme takes precedence. Pages can specify more than one theme. If this is the case, the page uses the first theme unless the page code indicates otherwise.

Theme tags have two attributes: the location of the theme directory and one or more CSS files to be included on the page. The reference implementation template, standard.php, uses the default theme, site.css, located in the /euf/assets/themes/standard folder, as shown in this code.

```
<rn:theme path="/euf/assets/themes/standard" css="site.css"/>
```

You can copy the reference implementation CSS file and modify it to create a variety of themes that can be applied to pages using the RN Theme tag.
Note: Rather than specifying a specific YUI version number, you can substitute the value \{YUI\} at the beginning of the file name to use the current YUI version, as shown in the preceding reference implementation template code.

Related Topics
- Overview of Widget CSS Files

Create a Theme

By copying the reference implementation CSS files, you can create your own theme.

1. Create a folder in /cp/customer/assets/themes.
2. Copy the files in /cp/customer/assets/themes/standard and paste them into the folder you created in.
3. In a text editor, open site.css from your new custom folder.
4. To customize your new theme, edit the CSS file.
   a. Make edits to modify the text, colors, or other aspect of your custom theme.
   b. To add images, place the image files in /cp/customer/assets/themes/[your_custom_folder]/images.
5. Save the file.

If you want to modify the widget presentation CSS to match the changes you made, make your changes to the corresponding CSS file in /cp/customer/assets/themes/[your_custom_folder]/widgetCss.

Related Topics
- Creating Custom Themes (video)

Apply a Theme

You can apply your own theme to a page or template.

1. Open the page or template file you want to apply a custom theme to.
2. Locate <rn:theme path="/euf/assets/themes/standard" css="site.css,".
3. Edit the path attribute for the RN Theme tag to specify the new theme. If you want to specify a different CSS file for the theme to use, change the css attribute as well.
   <rn:theme path="/euf/assets/themes/custom_01" css="site_01.css,"
4. Save the file.

Customer Portal Page Meta Tags

You can control Customer Portal functionality through page tags and page meta tags instead of writing PHP code.

You can use page meta tags on any Customer Portal page by adding the attribute name to the <rn:meta> tag.
<table>
<thead>
<tr>
<th>Meta Tag</th>
<th>Attribute Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Session ID Required</td>
<td>account_session_required</td>
<td>Allows the page to be accessed only by logged-in staff accounts. This tag can also be used to create a custom tab with a browser on an agent desktop workspace. This meta tag is used on the guided assistance page so guides can be previewed by staff members who are designing guides on the administration interface.</td>
</tr>
<tr>
<td>Answer Details</td>
<td>answer_details</td>
<td>Defines the page as an Answer Details page, displaying it only if customers have the required permissions.</td>
</tr>
<tr>
<td>Clickstream Tag</td>
<td>clickstream</td>
<td>Defines the type of page for clickstream and page statistics collection.</td>
</tr>
<tr>
<td>Force HTTPS</td>
<td>force_https</td>
<td>Forces the page to use HTTPS when CP_FORCE_PASSWORDS_OVER_HTTPS is enabled.</td>
</tr>
<tr>
<td>Include Chat</td>
<td>include_chat</td>
<td>Indicates whether the page contains a Chat application. Defines whether the page includes all required Chat JavaScript files.</td>
</tr>
<tr>
<td>JavaScript Module</td>
<td>javascript_module</td>
<td>Defines the JavaScript module that should be loaded on the page.</td>
</tr>
<tr>
<td>Login Required</td>
<td>login_required</td>
<td>Specifies whether customers must be logged in to view the page.</td>
</tr>
<tr>
<td>Page Title</td>
<td>title</td>
<td>Defines the title that appears on the page.</td>
</tr>
<tr>
<td>Redirect If Logged In</td>
<td>redirect_if_logged_in</td>
<td>Specifies the page where customers will be redirected if they are already logged in.</td>
</tr>
<tr>
<td>SLA Failed Page</td>
<td>sla_failed_page</td>
<td>Indicates where customers are redirected if they do not have the kind of SLA specified in the SLA Required Type page meta tag.</td>
</tr>
<tr>
<td>SLA Required Type</td>
<td>sla_required_type</td>
<td>Defines the type of SLA a customer must have to view the page.</td>
</tr>
<tr>
<td>Social Moderator Required</td>
<td>social_moderator_required</td>
<td>Indicates a page that can be accessed only by a community user with discussion moderation permissions.</td>
</tr>
</tbody>
</table>
Add Page Meta Tags

This example demonstrates using a page tag on the standard template with a chat application to display an error message to customers who do not have a chat SLA.

1. Open a template file and locate the `<rn:meta>` tag.
   - `/views/templates/standard.php`
   - `/views/templates/mobile.php`
2. Edit the `<rn:meta>` tag to include the `sla_failed_page` attribute.
   ```xml
   <rn:meta title="Gold Service Chat Customers" template="standard.php" clickstream="chat_request" include_chat="true" sla_required_type="chat" sla_failed_page="/app/error/error_id/2" />
   ```
3. Save the file.

Related Topics
- Customer Portal Page Meta Tags

Require Login on Customer Portal Pages

You can require your customers to log in before they can access any or all of your customer portal pages.

By setting the `login_required` attribute on the template to true, all pages that use the template will also require login. However, you don’t want to require customers to log in before they click the Log In or Sign Up link. To prevent requiring login when it doesn’t make sense, the default pages for logging in, resetting passwords, and creating accounts, as well as the error pages have the login_required page meta tag set to false, which overrides the template setting.

By default, the Account Overview page, accessed by clicking the Your Account tab, requires login, but you may also want to require customers to log in before they can view answers in your knowledge base. Or you may decide to require login for your entire customer portal page set.

Note: If you want to keep the answers in your knowledge base from being available to the general public, you must require login on both the answers list and answer details pages. If both pages do not have the same login requirement, a warning will appear when you stage and promote your customer portal. The most secure way to do this is to require login on all pages of your customer portal by requiring login on the template.

1. Open `/views/templates/standard.php`
2. Locate the `<rn:page_content/>
   <rn:meta login_required="true"/>`
3. Save the file.

Require an SLA on the Ask a Question Page

You can require that your customers have an SLA before they can access any or all of your customer portal pages.

1. Open one of the Ask a Question page files and locate the `<rn:meta>` tag:
   - `/views/pages/ask.php`
     `<rn:meta title="#rn:msg:ASK_QUESTION_HDG#" template="standard.php" clickstream="incident_create"/>
   - `/views/pages/mobile/ask.php`
     `<rn:meta title="#rn:msg:ASK_QUESTION_HDG#" template="mobile.php" clickstream="incident_create"/>

2. Edit the code to change the `login_required` page meta tag to "true" and add the `sla_required_type` and `sla_failed_page` meta tags.
   `<rn:meta title="#rn:msg:ASK_QUESTION_HDG#" template="standard.php" clickstream="incident_create" login_required="true" sla_required_type="incident" sla_failed_page="/app/error/error_id/2" />`

3. Save the file.

Content Placement on Customer Portal Pages

You'll use page tags to position information on a page.

These tags control the placement of content on Customer Portal pages.

- **Page Title**—Place this tag where you want the page title to appear when the page and template are merged.
  `<title>
   <rn:page_title/>
  </title>`

- **Head Content**—Place this tag between the opening and closing head tags where the page's head content will be inserted. This content is a combination of widget CSS files, page CSS files, no-cache meta tags, and any other content added to the head by widgets (using the `$this->addHeadContent` function). When the page is rendered, global CSS is loaded first, followed by any other page/widget level CSS. As a result, the correct CSS hierarchy is preserved.
  `<head>
   <rn:head_content/>
  </head>`

- **Page Content**—Place this tag where you want the page's content to be inserted when the page and template are merged.
  `<div>
   <rn:page_content/>
  </div>`

When you use page tags, do not try to comment them out with HTML commands. Comments do not stop widgets from rendering and may cause rendering problems. They may also stop other tags from being converted. If you want to test a page without a page tag, remove it instead of commenting it out.
Display Database Content on Customer Portal Pages

This example uses the Answer Details page to demonstrate how to use page tags to output answer information from the database.

Locate the names of the fields you wish to use in Business Objects on the Customer Portal Administration site. Make note of how to label them in the code.

The `<rn:field>` tag has two attributes.

- **highlight**—Highlights content that matches the keyword parameter in the URL.
- **name**—Identifies the business object type and field to be displayed.

Pound tags (`#rn:`) are also included in page tags and let you display or output language codes, message base labels, visit parameters, configuration setting values, session parameters, community tokens, URL parameters and parameter values, and widget attribute PHP code.

1. Open the Answer Details page (`/views/pages/answer/detail.php`).
2. Locate this code:

```html
<div class="rn_PageTitle rn_RecordDetail">
    <rn:widget path="navigation/ProductCategoryBreadcrumb"/>
    <h1 class="rn_Summary" itemprop="name">
        <rn:field name="Answer.Summary" highlight="true"/>
    </h1>
    <div class="rn_RecordInfo rn_AnswerInfo">
        #rn:msg:PUBLISHED_LBL#
        <span itemprop="dateCreated">#rn:field name="Answer.CreatedTime" #</span>
        | #rn:msg:UPDATED_LBL#
        <span itemprop="dateModified">#rn:field name="Answer.UpdatedTime" #</span>
    </div>
    <rn:field name="Answer.Question" highlight="true"/>
</div>
```

3. Notice the `<rn:field>` tags used to display the answer summary, the created and updated dates, and the answer description.
4. Add other database fields using the same format.
5. Save the file.

How You Apply Common Attributes to Multiple Widgets

Page tags let you create a set of widget attributes that can be referenced by multiple widgets.

You can use the `<rn:container>` tag in one of two ways.

- As a wrapper around a group of widgets—the tag defines the values for one or more widget attributes that all of the enclosed widgets share.
- As a widget attribute that references the attribute-value definitions of the container—you assign the container an ID value and then define attributes within the container. All widgets that reference the container ID then inherit the other attributes defined in the container.
Related Topics
- Use the rn:container Tag as a Wrapper
- Use the rn:container Tag as a Widget Attribute

Use the rn:container Tag as a Wrapper

This example uses the Answers page to demonstrate using the container tag as a wrapper around a group of widgets to applying common attributes to multiple widgets.

Each of the widgets that requires a report use report ID 176 because they are all enclosed within the `<rn:container report_id="176">` tag.

1. Open the Answers page (`/views/pages/answers/list.php`).
2. Locate the `rn_SearchControls` tag.
3. Replace that tag with this code:
   ```html
   <rn:container report_id="176">
   <div class="rn_Hero">
   <div class="rn_HeroInner">
   <div class="rn_SearchControls">
   <h1 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_CMD#</h1>
   <form onsubmit="return false;">
   <div class="rn_SearchInput">
   <rn:widget path="search/KeywordText" label_text="#rn:msg:FIND_THE_ANSWER_TO_YOUR_QUESTION_CMD#" initial_focus="true"/>
   </div>
   <rn:widget path="search/SearchButton" force_page_flip="true"/>
   </form>
   <div class="rn_SearchFilters">
   <rn:widget path="search/ProductCategorySearchFilter"/>
   </div>
   </div>
   </div>
   </rn:container>
   ```
4. Note the code identifying the report: `<rn:container report_id="176">`. You can change the report id to require all widgets in the tag to use a different report.
5. Save the file.

Use the rn:container Tag as a Widget Attribute

This example demonstrates how you could use code to define the container.

When a container is defined this way, any widget on the page can then use the `rn_container_id` attribute as a shortcut for assigning all the attributes defined in the container to the widget that calls the container in its code. If the widget code specifically defines an attribute that is defined in the container, the value for the attribute in the widget code overrides the value in the container.

1. Open the page you want to add the widget attribute to.
2. Add this code to the page: `<rn:container rn_container_id="1" report_id="196" per_page=2/>`. 
Although the value for the \texttt{rn\_container\_id} is an integer in this example, it can be any string.

\textbf{Note:} The prefix \texttt{rnc\_} is reserved by Customer Portal and cannot be used in string values.

3. Add this code to the page.

\begin{verbatim}
<rn:widget path="reports/Multiline" label_text="" initial_focus="true" rn_container_id="1"/>
<rn:widget path="reports/Paginator" icon_path="images/icons/search.png" rn_container_id="1"/>
\end{verbatim}

Each of these widgets uses a \texttt{report\_id} value of 196 and a \texttt{per\_page} value of 2 because those are the values assigned to the attributes in the container definition.

4. Save the file.

The Page Condition Tag

Page condition tags let you hide or display content based on whether set conditions are met.

The code structure for the RN Condition page tags looks like this.

\begin{verbatim}
<rn:condition attribute="value">
  [Content here is displayed only if the specified condition is met]
</rn:condition>
\end{verbatim}

These situations can control whether information is displayed or not.

- The customer’s login status
- The customer is logged in with pass-through authentication
- The specific page where content is placed
- The number of answers viewed by a customer
- The number of searches performed by a customer
- The amount of time that has elapsed since an incident was solved
- The customer’s SLA
- The language of the interface
- The value of a configuration setting
- The value of a URL parameter
- Chat availability
- The customer’s community user status

The conditional page tag also includes an RN Condition Else tag to provide if/then logic for displaying or hiding content.

\textbf{Note:} You should consider the usability issues of conditionally hiding and exposing page navigation before implementing page conditions. Particularly for customers using screen readers, the presence of a new navigation tab may not be evident when the conditions that trigger its appearance have occurred.

Logged In Condition

If the customer is logged in, the content within the condition tags is displayed on the page.
The standard template uses the Logged In page condition tag to display the Welcome Back message and customer’s name in the upper right corner of the page.

**Note:** Although you can use the Logged In page condition tag to show or hide the entire contents of a page, it might be more efficient to use the Login Required page meta tag instead.

### External Login Used Condition

When customers log in to your customer portal using pass-through authentication (PTA), the input fields on the Account Settings page are set to read-only by default.

If you want to let PTA customers change just one or two fields, you can **add an attribute to the widget code for the individual input fields**.

However, if you have a block of input fields that you want to let customers edit, you can enclose them in condition tags rather than editing each widget’s code separately. Use `<rn:condition external_login_used="true">` before the first input widget in the block of input fields, and add the closing condition tag (`</rn:condition>`) after the last widget.

### Hide or Show on Pages Conditions

The Hide on Pages tag lets you specify the pages on which the content between the tags is hidden. The Show on Pages tag lets you specify the pages where the content appears.

The **reference implementation** template uses these tags to prevent the SimpleSearch widget from appearing on pages that already have a search field, namely the Home page, Search Results pages, and the Public Profile page.

### Answers, Questions, and Content Viewed Conditions

You might want to use these tags to require your customers to first view existing answers or community discussions instead of automatically submitting a question to your support team.

The Answers Viewed tag lets you hide content until the customer has viewed the number of answers you specify. The Questions Viewed tag hides content until the specified number of community discussions has been viewed. The Content Viewed condition allows a value that adds the number of answers and questions viewed.

### Searches Done Condition

The Searches Done condition tag hides content until the customer meets the search requirements.

This page condition tag hides content until the customer has conducted the specified number of searches. If you want to use this for displaying the Ask a Question tab, it’s better to **Display the Ask a Question Page Based on User Actions.**
Note: The RN Condition tag identifies a search only when a page is turned or refreshed. For example, assume a customer conducts one search and reviews the list but does not click an answer or otherwise leave or refresh the Answers List page. When the second search is made, the link you are hiding will not be displayed until another page is opened or the current page is refreshed.

Incident Reopen Deadline Hours Condition

You can define content visibility based on incident closure.

This page condition tag lets you define how many hours after an incident is closed that the content within the tags remains visible. For example, the default Question Details page (the page that customers access by clicking one of their questions on the Support History page) hides the section of the page that lets the customer update the question after one week (168 hours). After that time has elapsed, the content is hidden and the Condition Else tag is used to display a message that the question can no longer be updated.

Hide Popular Published Answers for Customers without an SLA

Use the page condition tag to hide content unless the customer has the specified SLA.

2. Find <div class="rn_PopularKB">
3. Add <rn:condition sla="incident" > on a separate line immediately above <div class="rn_PopularKB">
4. Find <div class="rn_PopularSocial">
5. Add </rn:condition> on a separate line immediately above <div class="rn_PopularSocial">
6. Save the file.

Language In Condition

You can display content based on the language defined in the page's content-language meta tag.

The default Account Settings page on an English-language page displays the address fields in this order: Street, City, Country, State/Province, and Postal Code. On pages that use Japanese, Korean, and Chinese languages, the order is Postal Code, Country, State/Province, City, and Street. The use of this condition is demonstrated in this code from the profile.php page.

```
    <rn:widget path="input/FormInput" name="Contact.Address.PostalCode" label_input="#rn:msg:POSTAL_CODE_LBL#" />
    <rn:widget path="input/FormInput" name="Contact.Address.Country" />
    <rn:widget path="input/FormInput" name="Contact.Address.StateOrProvince" label_input="#rn:msg:STATE_PROV_LBL#" />
    <rn:widget path="input/FormInput" name="Contact.Address.City" />
    <rn:widget path="input/FormInput" name="Contact.Address.Street" />
</rn:condition_else>
```

Config Setting Check Condition

You may want to display content based on the value of a configuration setting that was defined on the administration interface.

The attribute for the Config Setting Check condition is more complex than most other conditions. The format is:

\{CONFIG_BASE:CONFIG_SLOT\} (OPERATOR) \{VALUE\}

The attribute includes these elements.

- **CONFIG_BASE**—One of these configuration settings found on the Configuration Settings editor.
  - Common
  - RNW (RightNow Common folder)
  - RNW_UI (RightNow User Interface folder)
  - RNL (Chat folder)
  - MA (Outreach and Feedback)

  **Note:** The CONFIG_BASE element is not case sensitive.

- **CONFIG_SLOT**—The name of the configuration setting as it appears in the Configuration Settings editor. These names are case sensitive.

  - **OPERATOR**—The logical operator. Acceptable values are == (equals), != (not equal), > (greater than), < (less than), >= (greater than or equal to), and <= (less than or equal to).
  - **VALUE**—The value to compare the parameter to. Values include true, false, null, an integer, or a quoted string.

For example, to set a condition that Chat is enabled, the attribute looks like this.

<rn:condition config_check="MOD_CHAT_ENABLED == true">
• OPERATOR—The logical operator. Acceptable values are == (equals), != (not equal), > (greater than), < (less than), >= (greater than or equal to), and <= (less than or equal to).

• VALUE—The value to compare the parameter to. Values include true, false, null, an integer, or a quoted string.

For example, use this attribute to set a condition if the keyword parameter is “roaming.”

"<rn:condition url_parameter_check="kw == 'roaming'">"

Display Alternate Content when Chat is Unavailable

Use the Chat Available tag to determine whether the current time is within the chat operating hours and not a holiday.

2. Locate this code.
   
   
   
   
   <rn:condition>
   <rn:widget path="chat/ChatStatus"/>
   <rn:widget path="chat/ChatHours"/>
   
3. Add this code directly above the code you found in the previous step.
   
   <rn:condition_else/>
   [Content to be displayed when chat hours are not available]
   
4. Remove the chat availability status text by deleting <rn:widget path="chat/ChatStatus"/>
   
5. Save the file.
   
   <rn:condition_else/>
   [Content to be displayed when chat hours are not available]
   </rn:condition>
   <rn:widget path="chat/ChatHours"/>

Community User Statuses

The community user statuses are used to control the content seen by discussion moderators and user moderators.

You may have content on your template or pages that you want to display to some community users but not others. For example, the AccountDropdown widget’s menu options are conditional. Customers who are not community members do not have the Public Profile option, while community users who are not moderators do not have the Moderation option. Four status conditions exist.

• is_active_social_user—Community user with active status.
• is_social_moderator—Content moderator.
• is_social_user—Community user with archived or deleted status.
• is_social_user_moderator—Content and user moderator.

Using the Else Condition

The conditional page tag includes an RN Condition Else to provide if/then logic for displaying or hiding content.

The RN Condition Else tag has no attributes and requires no closing tag. The code will follow this structure.

<n:condition attribute="value"/>
Standard Page Files

Each standard customer portal page has a title that appears in your browser when the page is displayed, and each page is also defined by its page name.

<table>
<thead>
<tr>
<th>Page File Name</th>
<th>Page Title and Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>account/change_password</td>
<td>Change Your Password page—Allows customers to change their password.</td>
</tr>
<tr>
<td>account/overview</td>
<td>Account Overview page—Provides an overview of account information, where customers can view the questions they have submitted, the notifications they have subscribed to, and their service contracts. The Account Overview page also lets customers link to their account settings.</td>
</tr>
<tr>
<td>account/profile</td>
<td>Account Settings page—Allows customers to change their user name and enter contact information.</td>
</tr>
<tr>
<td>account/profile_picture</td>
<td>Update Your Profile Picture page—Lets community users update their profile picture with a default picture or the user's Gravatar or Facebook profile picture.</td>
</tr>
<tr>
<td>account/reset_password</td>
<td>Reset Your Password page—Contains a form where customers can reset their password. The page is accessed only through an email link sent to their primary email address when they request account assistance to reset their password. The link expires after a specified period of time (24 hours by default). If customers do not have a complete contact record, they are taken to the Profile page when they are finished on this page so they can finish setting up an account.</td>
</tr>
<tr>
<td>account/setup_password</td>
<td>Finish Account Creation page—Displays a page with a link to the Account Assistance page. This page is displayed when customers click an email link to reset their password and the link has already expired or when a customer wants to create an account using an email address that is already in the knowledge base.</td>
</tr>
<tr>
<td>account/notif/list</td>
<td>Notifications page—Displays all answers customers have subscribed to as well as product/category notifications they have subscribed to. The page allows customers to delete and renew notifications and add product/category notifications.</td>
</tr>
<tr>
<td>account/notif/unsubscribe</td>
<td>Your Notification Requests: Unsubscribe Results page—Displays a message to customers who have clicked an email link to unsubscribe to an answer notification. This page can be accessed only through the email link.</td>
</tr>
<tr>
<td>account/questions/detail</td>
<td>Question Details page—Displays the details of a specific question submitted by a customer and allows the question to be updated. This page also contains a print button.</td>
</tr>
<tr>
<td>account/questions/list</td>
<td>Support History page—Displays all questions submitted by a customer, including the subject, reference number, status, and date created. Selecting an incident in the list opens the details of the customer's question.</td>
</tr>
<tr>
<td>agent/guided_assistant</td>
<td>Guided Assistant page—Displays a guide on the guided assistance designer of the administration interface as it will appear on the customer portal.</td>
</tr>
<tr>
<td>agent/polling_preview</td>
<td>Polling Preview page—Displays a preview of the polling widget to the staff member creating a survey to show how it will appear on the customer portal.</td>
</tr>
<tr>
<td>answers/detail</td>
<td>Answer Details page—Displays details about a specific answer and includes options for sharing, printing, emailing, and subscribing to the answer. The default page also lets customers submit answer feedback and view related and previously viewed answers.</td>

<tr>
<td>results</td>
<td>Search Results page—Displays the published answers and community discussions that match the entered search term.</td>
</tr>
<tr>
<td>social/ask</td>
<td>Community Ask a Question page—Lets customers submit a question to the community.</td>
</tr>
</tbody>
</table>
### Error 404 Page

The CP_404_URL configuration setting has a default value of error404, which is the page that opens if customers try to access a nonexistent page.

The Error 404 page content is loaded without modifying the URL, so any incorrect characters in the URL can be replaced instead of requiring the entire URL to be re-entered. You can also add conditions, widgets, or other customer portal elements to the page to help the customer.

If the value for CP_404_URL is blank, the browser’s generic error page opens instead.

### Error Codes and Messages

Depending on the parameter passed in the error page URL, various error messages are displayed to the customer.
<table>
<thead>
<tr>

### Customer Portal Widgets

**Customer Portal Widgets**

A widget is an element of the Customer Portal that performs a specific function.

The Customer Portal contains more than one hundred widgets in its standard widget collection. Here are a few examples of standard widget functionality:

- An information field for input of customer information
- A button that launches a search or submits customer information
• A report that returns all answers containing a customer’s search terms
• A dialog for customer feedback
• A topics tree for browsing specific topics
• A link to let customers share their desktop with an agent on the phone
• An offer to chat with an agent

You can configure the functionality of standard widgets by editing their attributes to achieve different results. A standard widget on one page may function differently than the same widget on a different page, depending on the attribute settings.

You can also create custom widgets by extending the functionality of a standard widget, or you can create custom widgets from scratch.

By their nature, widgets are highly diverse elements, and we don’t go into all the details of each one. For widget-specific information, visit https://<your_site>/ci/admin/docs/widgets/standard. You can select a folder and widget to see its definition, preview, description, default code, attributes, and other configuration information.

**Widget Accessibility**

The Customer Portal widgets have been designed to comply with Oracle Accessibility Guidelines.

When you create custom widgets, you are responsible for ensuring that your changes do not impact accessibility. Labels require particular attention. Input labels support accessibility by providing content for screen readers, and they should be used. However, if you choose to use an empty string for a label, some widgets will not include the asterisk that indicates the input field is required, even if you set the required attribute to true.

**Related Topics**

• Oracle's Accessibility Program

**Widget Files and Code**

A widget is a collection of files that work together to provide a specific functionality.

Widgets communicate with the Oracle database and the server through AJAX requests. They also communicate with other widgets through events. When you add a widget to a page or a template, you add code resembling this example.

```html
<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" validate_on_blur="true" initial_focus="true" label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
```

The widget code contains these elements.

• `rn:widget`—Identifies the object as a widget to be rendered on the page. The `rn:` prefix identifies the widget as a standard Customer Portal element.
• `path`—Locates the widget in the file structure by specifying the folder and widget name.
• `attributes`—Defines widget parameters that control appearance and function.

Widget files are stored in widget group subfolders (/chat/, /discussion/, /feedback/, /input/, etc.) in the /cp/core/widgets/standard folder. Each widget has its own subfolder containing all the files for that widget.
A widget may contain some or all of these files:

- **info.yml**—Provides information about a widget's dependencies, requirements, attributes, and URL parameters. Every widget has a YAML file.
- **controller.php**—Constructs the widget and calls the data it needs. The originating release is identified in the first line of code.
- **view.php**—Contains the HTML required to display the widget. The originating release is identified in the first line of code.
- ***.html.php**—Defines a view partial, which is a subset of the widget’s view and is called from the **view.php** file.
- **logic.js**—Contains the display logic and events the widget subscribes to or fires. This file also contains logic for updating the widget’s HTML when new information is received from an event.
- ***.ejs**—Embedded JavaScript template files that combine variables and the template to produce HTML.
- **base.css**—Provides the non-editable CSS for a widget.
- **presentation.css**—Controls the stylistic elements that determine how the widget displays on a page. The presentation CSS files are located in the `/cp/core/assets/default/themes/standard/widgetCss` or `/cp/core/assets/default/themes/mobile/widgetCss` folder and include the widget name.
- **preview/preview.png**—Displays an example of what the widget will look like when it is added to a page.

**Overview of the YAML File**

This topic uses the **info.yml** file for the KeywordText widget to describe the parts of an YAML file.

Every widget has an information file written in YAML format, which contains no executable code.

```yaml
version: "1.1.1"
requires:
  framework: ["3.3"]
  jsModule: [standard, mobile]
attributes:
  report_id:
    name: rn:msg:REPORT_LBL
    type: STRING
    description: rn:msg:ID_RPT_DISP_DATA_SEARCH_RESULTS_MSG
    default: rn:def:CP_NOV09_ANSWERS_DEFAULT
  source_id:
    name: rn:msg:SOURCE_ID_LBL
    type: STRING
    description: rn:msg:NAMED_SRC_WIDGET_FIRE_SRCH_EVENTS_LBL
  label_text:
    name: rn:msg:NAMED_SRC_WIDGET_FIRE_SRCH_EVENTS_LBL
    type: STRING
    description: rn:msg:STRING_LABEL_DISP_WARN_MODIFICATION_LVL
    default: rn:msg:SEARCH_BY_KEYWORD_CMD
  initial_focus:
    name: rn:msg:INITIAL_FOCUS_LBL
    type: BOOLEAN
    description: rn:msg:SET_TRUE_FIELD_FOCUSED_PAGE_LOADED_MSG
  label_placeholder:
    name: rn:msg:PLACEHOLDER_LABEL_LBL
    type: STRING
    description: rn:msg:PLACEHOLDER_NOTE_INPUT_SPACERS_SUPP_IE9_LBL
    default: rn:msg:ASK_A_QUESTION_ELLIPSIS_MSG
info:
  category: 0758
```

1135
- Report Search
  description: rn:msg:WIDGET_DISP_INPUT_TXTBOX_ALLOWS_MSG
  urlParameters:
  kw:
    name: rn:msg:KEYWORD_LBL
    description: rn:msg:SETS_TXT_KEYWORD_BOX_URL_PARAM_VAL_LBL
    example: kw/roam

This file includes these elements:

- **version**—Defines the widget’s version number. Custom widgets must have a major and minor version specified, while standard widgets also include a nano version.

- **requires**—Defines the required framework version number, the required JavaScript module, and any YUI modules that need to be loaded for widget functionality. The Customer Portal Framework Version 3.3 uses the YUI 3.17 library. Several standard YUI modules are available on every page, and any module is available to widgets that declare dependency on that module.

- **attributes**—Defines the widget’s attributes and their values. Note that if a custom widget inherits attributes of a standard widget when it is created, only the inherited attributes that have been removed or edited are listed in info.yml. The others are implied because the custom widget was created by extending the standard widget.

- **extends**—Identifies the standard widget that was used as the parent widget if this widget was created by extending another.

- **info**—Provides a description of the widget’s functionality and an array of URL parameters the widget gets information from, including name, description, an example, and whether the parameter is required. The Widget Info page, accessed at [https://<your_site>/ci/admin/docs/widgets/info](https://<your_site>/ci/admin/docs/widgets/info), is an additional source of information about the info.yml file when you’re on the Customer Portal Administration site.

### Overview of the Controller File

The controller file renders and previews the widget.

The functions within the file construct the widget and get the data the widget needs. The get data function of controller.php instantiates the widget.

The controller files of standard widgets have been intentionally written to omit the closing PHP tag (?>). Additionally, code has been added to automatically remove the closing PHP tag from the end of widget controllers during the staging operation. If you add a closing tag to a widget controller file, the widget will display and work properly on the development site, but parsing errors might occur on the staging site.

### Overview of the View File

The view file contains blocks of code that indicate the elements of the code that you can edit.

In the view.php file, every block has a unique ID that describes its context. Although standard widgets don’t actually use the block tags, the tags identify where you can edit the code. They serve as customization hook points where you can add custom code to the standard widget to create a custom widget. Not every element of every widget is exposed as a block if modifying the element would cause problems with the standard code.

Only the code within blocks can be edited. If you add code outside of block tags, your code will be ignored. If you don’t specify the ID of a standard block or if the ID you specify doesn’t exist in the standard widget’s view, your code will also be ignored.
When a standard widget undergoes a nano change, the change is automatically applied to the widget in your customer portal files so that you can take advantage of the bug fix or enhanced functionality. Additionally, any custom widgets that were created by extending that standard widget will also be updated. This benefit of automatic updating of custom code is possible whenever you extend a standard widget’s view instead of overriding it when you create a custom widget.

View Partials and the View File

View partials are sections of code that can be used multiple places within a widget or shared across multiple widgets.

Many widget view.php files include duplicate sections of code that are used throughout the widget. Other widgets share sections of code, and each widget calls out the same code section.

The cp/core/framework/views/Partials folder contains these view partial files that can minimize code duplication by letting you reuse common view elements, such as the red asterisk and screen reader label to indicate a field is required.

If a widget is within a view partial, the widget is rendered in the view.

Multiple View Partials

Rather than a single large view file, some widgets have partial view files that are smaller subsets of the view.

The view.php is the main widget view, but it renders the partial view files, which also appear in the widget’s folder. For example, the AnswerFeedback widget was split into three view partials. These view partials use the *.html.php naming convention.

The view.php file for the AnswerFeedbackWidget contained 79 lines of code in Framework Version 3.2.1, while the same file in Version 3.3.1 contains only 18 lines, including three lines that call the widget’s view partials to render the various feedback options: Yes/No buttons, up to five stars, and a numerical ranking scale.

When you extend a standard widget and choose to extend its view, the extended widget contains the standard widget’s view.php file and all of its view partial files. When you do not change the standard widget’s view (both View questions are answered No) or when you override the view instead of extending it (by answering Yes to “Does this widget modify the parent widget’s view?” and selecting the Override option), the standard widget’s view partials are not included in the view of the extended widget.

The view partials within a single widget have all the functionality of regular views. They can reference other widgets with the $this context, and they can use <rn:block> and #rn:# tags.

Multiple Widgets Sharing View Partials

This topic uses the SiteFeedback widget to demonstrate how you can use view partials across multiple widgets.
Unlike view partials within a single widget, which have the same functionality as regular view files, view partials that are shared among several widgets have limited functionality. They cannot render widgets or use \texttt{rn}: tags. Nor can they use the $\texttt{this}$ context to access widget properties.

For example, the SiteFeedback widget contains this code.

```php
<label for="rn_<?=\$this->instanceID?>_FeedbackTextarea">
    <?= $this->data['attrs']['label_comment_box'] ?>
    <?= $this->render('Partials.Forms.RequiredLabel') ?>
</label>
```

It calls the view partial \texttt{RequiredLabel.html.php} in the /\texttt{cp/core/framework/views/Partials/Forms} folder, which contains this code:

```php
<span class="rn_Required">$requiredLabel ?:/RightNow/Utils/Config::getMessage(FIELD_REQUIRED_MARK_LBL) ?</span>
<span class="rn_ScreenReaderOnly"> $screenReaderLabel ?:/RightNow/Utils/Config::getMessage(REQUIRED_LBL) ?</span></code>

Instead of duplicating the same HTML across different widgets to create the red asterisk and screen reader label to indicate a required field, this single shared view partial can be reused by any widget that needs it by simply calling:

```php
$this->render('Partials.Forms.RequiredLabel')
```

If you want to override contents of a standard view partial, you must register a custom view in /\texttt{cp/customer/development/config/extensions.yml} by adding this text to the file.

```
partialViewExtensions: - Partials.Forms.RequiredLabel
```

Then whenever the Required.Label view partial is called, the custom file located in /\texttt{cp/customer/development/views/Partials} will be used instead of the standard one in the \texttt{core} folder.

### Custom View Partial

A custom view partial lets you set different functionality in standard view partials.

For example, if you want to use two blue asterisks instead of a single red one to indicate a required field, you can create a custom view partial file with the same name as the standard.

Using the \texttt{RequiredLabel} view partial as an example, you would create the new view file, name it \texttt{RequiredLabel.html.php}, and place it in /\texttt{cp/customer/development/views/Partials/}.

After creating the custom view and placing it in the /\texttt{cp/customer/development/views/Partials} folder, you must register the view. You do that by adding this text to the /\texttt{cp/customer/development/config/extensions.yml} file.

```
viewPartialExtensions: 
    - Partials.Forms.RequiredLabel
```

Now, calling the RequiredLabel view partial will call the custom view from your development site instead of the standard view partial.

To create a new view partial that can be shared among widgets, create the file and add it to /\texttt{cp/customer/development/views/Partials}. If your new file is named \texttt{mySharedPartial.html.php}, for example, you would add this code to the custom widget’s \texttt{view.php} file.

```php
<?$this->render('Partials.MySharedPartial') ?>
```
Because you are not overriding a standard view partial, you do not have to register your custom view partials in the `extensions.yml` file as you do when you want to replace a standard view partial.

**Overview of the Logic File**

The logic file contains the display logic and events for the widget.

The widget may subscribe to or fire custom events to and from the event controller. This file also calls any JavaScript templates the widget might use. The logic.js file is optional.

**Overview of Widget CSS Files**

Some widgets have a base CSS file, others have a presentation CSS file, and many standard widgets have both.

The base CSS file for a widget controls its functionality, while the presentation CSS controls the appearance of a widget. By having separate presentation files, you can control the appearance of one widget without impacting the appearance of any other widgets.

You cannot edit the base CSS files for standard widgets. These CSS files are stored in folders with other files that make up each widget.

Widgets with a corresponding CSS file in the `/cp/customer/assets/themes/standard/widgetCcss` folder use that CSS file to control the presentation of the widget when it is rendered on a page. This file contains the rules for adding stylistic elements to the widget. The file name is `[WidgetName].css`, for example, `AdvancedSearchDialog.css`. The changes you make to presentation CSS files are sandboxed in the `/themes/` folder, so you can view them on your development site. You must stage and promote your customer portal before you can see those changes on your production site.

All widget styling must exist in one of the CSS files. Widget code cannot contain any inline CSS rules.

You should follow these best practices when editing widget CSS files:

- Use as few classes as possible
- Use the top-level widget CSS class attribute to style elements within the widget
- Create styling rules only if a site CSS rule must be overridden

Follow these guidelines when editing the base CSS files found in `/cp/customer/development/widgets//custom/[customWidget]/base.css`:

- Add rules that structure the widget or make it function correctly
- Start rules with the class name in the top-level `<div>` element in the view
- Avoid generic functionality rules
- Avoid styling rules

Follow these guidelines when creating and editing presentation CSS files found in `/cp/customer/assets/themes/standard/widgetCcss/[widgetName.css]`:

- Name the CSS file the same as the widget
- Start rules with the class name in the top-level `<div>` element in the view
Standard and Custom Widget Folders

All standard and custom widgets that are part of the Customer Portal reference implementation are stored together.

All of the standard widgets are stored in the /cp/core/widgets/standard folder, and all custom widgets that you create should be stored in the /cp/customer/development/widgets/custom folder.

The page code of the standard reference implementation files defines widgets without specifying whether they are in the standard or custom folder. Because the reference implementation uses only standard widgets, they are all stored in the standard folder.

When you modify page code to add or edit a widget, you do not have to specify a folder for the widget path. If you explicitly indicate either the standard or custom widget folder, the code will call the widget from that folder. If you do not specify a folder, the custom widget folder is searched first. If no widget with that name exists in the custom folder, the standard folder is searched.

Because the custom folder is searched before the standard folder, you can replace a standard widget with a custom one that uses the same name without having to find and replace all calls to the new widget in all customer portal pages. When you give a custom widget the same name as a standard widget, the custom path must be the same as the standard path. For example, if you create a custom AdvancedSearchDialog widget, you must create a subfolder called search under the custom widget folder and place the widget in that subfolder so the relative path for the custom widget is the same as that of the standard widget. In other words, the path for the standard widget is standard/search/AdvancedSearchDialog. Therefore, the path for the custom widget must be custom/search/AdvancedSearchDialog.

Overview of Widget Controllers

A deployment failure will occur if two different widgets on the same page use the same widget folder name.

When two different widgets on the same page use the same widget folder name and cause a deployment failure, the widgets have the same class name in the controller. If you copy a widget and use the same widget name for the custom widget.

For example, you create a custom input widget, name it FormInput, and put it in the widgets/custom/input folder, the custom widget uses the custom controller. However, because it has the same name as the standard widget's controller, a failure occurs if both widgets are placed on the same page. The error message lists the two widgets using different controllers that have the same class name and identifies the page where they are found. This lets you correct the problem by copying the view.php files of the custom widget to the appropriate folders.

Widget AJAX Requests

When widgets require data, they make an AJAX request to the server.

You define where a widget’s request goes by setting a value for a specifically named AJAX endpoint attribute. For example, the ConditionalChatLink widget has an attribute called get_chat_info_ajax that lets you define where the request for chat availability will be sent. The default value is /ci/ajax_Request/getChatQueueAndInformation. All
requests are sent to /ci/ajaxRequest/, which loads the ajaxRequest controller so it can execute the specified function, which is `getChatQueueAndInformation` in this example.

**Overview of YUI Usage**

The Customer Portal uses YUI 3.17.

While the Customer Portal uses YUI 3.17, you can substitute the value `{YUI}` at the beginning of a file name to use the most current YUI version. These default YUI modules are included on each page, so you don’t need to call them out specifically in the widget code.

- anim-base
- anim-easing
- escape
- event-base
- history
- node-core
- node-event-delegate
- node-screen
- node-style

You can also use these YUI requirements in jsModule.

- `yui: [panel, autocomplete, autocomplete-highlighters]`
- `yui: standard: [overlay]`

**How You Find Widgets**

There are a variety of ways to browse and search for customer portal widgets.

You can open the Widgets page of the Customer Portal Administration site by entering `http://<your_site>/ci/admin/docs/widgets`. You must log in with your user name and password, so make sure your profile includes the CP Edit permission.

You can also access this page from anywhere on the Customer Portal Administration site (`http://<your_site>/ci/admin`) by clicking the Widgets tab.

You can quickly navigate among the different widget folders. After you click Browse Widgets, select Standard Widgets, and select a folder, you can click the drop-down menu associated with the folder level and select a different folder.

Or, if you know the widget’s name, you can enter the first few letters or any part of the name in the Search Widgets field to display a menu of widgets that match your entry.

**Display Widget Versions**

Widget versions are displayed in the widget information found on the administration site.
Every customer portal widget has a version number, letting you incorporate only that widget without requiring you to use an entire widget set or a new framework version.

1. Log into your Customer Portal Administration site.
2. Click **Widgets**.
3. Select **Widget Versions**.
4. To filter the list of widgets, click **View Options**.
5. To display standard widgets only, select **View Options > Widgets > Standard**.
6. To display custom widgets only, select **View Options > Widgets > Custom**.
7. To filter the list of widgets by widget status, click **View Options** and select one of the widget status filters.
   - To display all widgets that are currently activated on your customer portal, select **Active**.
   - To display all widgets that have been deactivated, select **Inactive**.
   - To select all widgets being used in their most current version, select **Up To Date**.
   - To select all widgets for which newer versions are available, select **Out Of Date**.
8. To search for widgets in a specific category, click **View Options** and select a category.
9. To search for a specific widget, enter the first few letters of the widget name in the Search field.
10. To update all widgets to their most recent version for the Customer Portal framework being used by your site, click **Update All**.
11. To see all recent version changes, click **Recent Changes**.

If you migrate versions for multiple widgets on your development site and then decide to stage and promote your customer portal, you are required to deploy every migrated widget during the process. In other words, you cannot selectively deploy widget versions during the staging and promoting processes.

Additionally, if you migrate a widget when a newer version is available because you want to use it on a page, the new version will be used for every instance of that widget on your customer portal.

## Select a Widget

Widget information is defined in detail when you select the widget on the Customer Portal Administration site.

1. In a web browser, enter `https://<your_site>/ci/admin`.
2. Click **Widgets**.
3. Find and select a widget.
   - Select **Browse Widgets**, select **Standard Widgets** or **Custom Widgets**, select the widget folder, and then select the widget name.
   - Select **Widget Versions** and select the widget you want to open from the list.
   - Enter the widget name in **Search Widgets**.

Three tabs appear on the widget information page: **Available Versions**, **Widget Usage**, and **Recent Version Changes**. These elements appear on the page regardless of the selected tab.

- **Preview**—The preview shows you an example of what the widget looks like on a page. If the widget is larger than the preview window and the display provides only a partial view, you can click the preview window to display an expanded view of the widget.
- **Widget history timeline**—A timeline at the top of the page shows the available versions of the widget and the version currently in use. If the widget version is 1.0, the message says, “This is the newest version.”
Overview of the Available Versions Tab

There are a number of attributes on the Available Versions tab of the Widget Information page.

These elements appear on the Available Versions tab.

- **Staging/Production/Development**—When multiple versions of the widget exist, the areas using each version are noted.
- **Framework requirements (dependency information)**—The page includes the framework version that must be installed to support the widget version.
- **Widget version information**—Each version of the widget is listed on the page, with the newest listed first. The version section describes the changes that were made from the previous version. The changes are categorized as likely impact, possible impact, or no impact to custom code, determined by hovering over the bullet for each change. Changes are also classified as new features, removal of functionality, API changes that impact the widget, or bug fixes.
- **Documentation**—Clicking Documentation opens a page of information specific to the widget, including description, default code, attributes by category (such as labels, image paths, and AJAX endpoints), the controller class, path information, and URL parameters. (If the page describes a custom widget that was extended from another widget, it will also list the parent widget.)
- **Dependencies**—When a standard or custom widget has dependencies, the Dependencies button appears on the widget information page next to the Documentation button. Clicking the Dependencies button opens a window that displays the dependencies to other widgets.
  - A widget contains other widgets (for example, AdvancedSearchDialog contains KeywordText and other widgets)
  - A widget is extended from another widget (for example, ChatAttachFileButton extends from FileAttachmentUpload)
  - A widget is the parent of a widget (FileAttachmentUpload is the parent of ChatAttachFileButton)
- **Deactivate this widget**—When you click this button, the widget is no longer available for use on your site. Then, when you filter on only the Active widgets, your list displays only the activated widgets. (Even deactivated widgets will appear in the list of widgets if you do not select the Active filter.) For example, if you do not use B2C Chat, you may want to deactivate each of the chat widgets. When you click the button for a widget that is currently in use on your site, you are asked to verify that you want to deactivate the widget and offered a chance to see where it is being used. (Even though you are not using Chat, the reference implementation includes Chat pages that use the chat widgets so you will see the message.)

Widgets are not actually removed from the code when you deactivate them, but they are made unavailable for use. After you have deactivated a widget, it does not appear in the list of widgets when you use the Active filter. It does appear in the list when no filter is used, but it is grayed out to indicate that it is deactivated. If you click a deactivated widget, you can reactivate it. An Activate This Version button appears, and you can select the version you want from the drop-down menu.

After selecting the version and clicking the button, the widget is activated once again.

**Note:** When new widgets are added in future releases, they are not automatically activated. You’ll need to specify which version of the widget you want when you start using it. This prevents the possibility of using a widget that was activated earlier but hadn’t been used yet if a newer version becomes available before you decide to use it on your customer portal.
Delete this widget—This button appears only for custom widgets. When you click the button, a confirmation message appears. If the widget is being used on your customer portal, a Display Containing Views button appears on the confirmation message. Click the button to display a list of pages and widgets that use the widget you want to delete.

When you click Delete in the confirmation message, the widget is deactivated and deleted from the panel that contains a list of all the widgets. All of the widget’s associated files are also deleted from the file structure, so they no longer appear in the WebDAV file structure. The deleted files are listed in the message that tells you the widget was deleted. You cannot reactivate the widget after deleting it.

### Overview of the Widget Usage Tab

Selecting the Widget Usage tab displays the widgets, pages, and templates that use the widget.

Click the link to view the code snippet on the selected widget or page where the widget is used. Select a widget or page from the list to view the snippet of page code where the widget appears, highlighted for easy location.

### Overview of the Recent Version Changes Tab

The Recent Version Changes tab displays a list of recent updates to the widget.

Information includes whether a different version is now being used or if the widget was activated or deactivated. It also includes the staff member who made the change and the date and time the change occurred.

### Widget Attributes

Each widget has properties that are specific to the instance of the widget.

A widget can look or behave one way on one page and differently on another. You might even have two instances of the same widget on one page with different attributes. For example, you could add a second ProductCategoryList widget to the Support Home page to display a list of featured support products in addition to the featured support categories list that appears on the page by default.

When a widget contains other widgets, you can use the attributes of the contained widgets in the widget definition. For example, the DataDisplay widget contains, among other widgets, the FileListDisplay widget. The code for the DataDisplay widget can include attributes of the FileListDisplay widget, even if those attributes are not available on the DataDisplay widget. The attribute value specified in the DataDisplay widget code is passed on to the FileListDisplay widget.

Additionally, you can create an RN Container page tag to define a set of attributes and their values that are common to multiple widgets. Then, instead of having to add every attribute to the code for each of the affected widgets, you can use the container to define the attributes.

If the widget code specifies an attribute that is also defined in the container, the value for the attribute in the widget code overrides its value in the container.

The page for each widget on the administration site lists and explains the attributes of the widget and tells you how to define the attribute in the widget’s code.
Subwidgets and Attributes
Several Customer Portal widgets contain other widgets.

Often a widget that is contained in a parent widget has attributes with the same name as the attributes of another contained widget. The AdvancedSearchDialog widget, for example, contains two instances of the ProductCategorySearchFilter, one for products and one for categories. Because you want to be able to specify unique labels for each, both instances of the ProductCategorySearchFilter widget have their own ID value to let you use the widget's sub_id attribute to accomplish this.

Review the Containing Widgets section of the documentation page for the AdvancedSearchDialog widget at https://<your_site>/ci/admin/versions/manage/#widget=standard%2Fsearch%2FAdvancedSearchDialog&docs=true&version=1.1.

Notice that each of the widgets that are part of the AdvancedSearchDialog widget now contains a sub_id attribute.

Setting a subwidget's attribute requires the format:

sub:{sub_id}:{widget_attribute}="Value being set"

For example, this procedure uses this syntax to set the label_input attribute for the Product field:

sub:prod:label_input="Your Product"

Configure a Widget With a Subwidget
This example uses the AdvancedSearchDialog widget to demonstrate configuring a widget with a subwidget.

1. Open the page containing the AdvancedSearchDialog widget.
2. Locate `<rn:widget path="search/AdvancedSearchDialog" report_page_url="/app/answers/list"/>
3. Edit the code to include the subwidget labels.

```
<rn:widget path="search/AdvancedSearchDialog" report_page_url="/app/answers/list"
    sub:prod:label_input="Your Product" sub:cat:label_input="Your Category" />
```
4. Save the file.

Overview of the FormInput Widget
The CustomAllInput widget contains the FormInput widget. The FormInput widget contains the SelectionInput, DateInput, PasswordInput, DisplayNameInput, and TextInput widgets.

Because there are different types of input widgets in FormInput, each subwidget has its own ID, which you can use to set attributes for all subwidgets of that particular type, similar to the example shown here.

```
<rn:widget path="input/CustomAllInput" hint="hint for every field except date fields"
    sub:date:hint="hint for all date fields"/>
```

If the code sets an attribute based on type (text, selection, date) and that attribute is set to a specific value by default, you can explicitly override the attribute using the subwidget code format:

```
sub:<id>:<attribute_name>="attribute_value"
```

This ensures that the value you specify takes precedence over attributes set in the widget's view. For example:

```
<rn:widget path="input/CustomAllInput" table="Incident" sub:text:required="true"
    sub:input_Incident.CustomFields.c.text1:text:required="false" sub:selection:hint="Hint for selection field"
    sub:input_Incident.CustomFields.c.priority:selection:hint="Hint for Priority field" />
```
Notice that you must include the type after the field name only if the code also has an attribute with sub:subtype:<attribute_name>. That is, you can set specific attributes such as the required or hint value for a specific field using the format below.

```xml
<rn:widget path="input/CustomAllInput" table="Incident"
    sub:input_Incident.CustomFields.c.text1:required="true"
    sub:input_Incident.CustomFields.c.priority:hint="Hint for Priority field" />
```

ChannelAllDisplay and ChannelAllInput Widgets

This example uses subwidgets to define custom labels.

The ChannelAllDisplay and ChannelAllInput widgets work similarly, where you can use subwidgets to define custom labels for each channel.

```xml
<rn:widget path="output/ChannelAllDisplay" sub:display_FACEBOOK:label="Custom Facebook username"
    sub:display_TWITTER:label="Custom Twitter username"
    sub:display_YOUTUBE:label="Custom YouTube username" />
<rn:widget path="input/ChannelAllInput"
    sub:input_FACEBOOK:label_input="Custom Facebook input field"
    sub:input_TWITTER:label_input="Custom Twitter username"
    sub:input_YOUTUBE:label_input="Custom YouTube input field" />
```

Editing Widget Labels

This example uses the RecentlyAnsweredQuestions widget to demonstrate changing widget labels.

2. Locate `<rn:widget path="discussion/RecentlyAnsweredQuestions" show_excerpt="true" maximum_questions="5" />`.
3. Navigate to the widget's Documentation page and determine the attribute names for the labels you want to edit.
4. Edit the code to add the label attributes you want to change.

```xml
<rn:widget path="discussion/RecentlyAnsweredQuestions" show_excerpt="true" maximum_questions="5" label_answer_more_link="Expand Discussion" label_moderator_answer="Staff Best Answer" label_user_answer="Original Poster Best Answer" />
```
5. Save the file.

How You Change Reports in Widgets

You can edit the widgets on a page to change the reports used by that page.

When a page includes search navigation with an answers report, multiple widgets are used to control the functionality. For example, the Published Answers page includes these widgets:

- Elements of the search tool:
  - Search field (KeywordText widget)
  - Search button (SearchButton widget)
  - Search filters (ProductCategorySearchFilter widgets)
- Elements of the returned search results:
  - The report itself (Multiline widget)
  - The display of total number of results (ResultInfo widget)
  - Pagination control (Paginator widget)
Six widgets on the Published Answers page make up the search field and report, and each of these widgets must call the same report in order for the page to display meaningful information. The reference implementation uses a container page tag to define this report ID as 176, which is the Answers–Complex Expression Search Default report.

The same thing is true for any other Customer Portal page that uses the combination of search field and report, whether it is a page of the reference implementation or a custom page that you’ve created. All widgets that make up these elements must call the same report using one of these methods.

- Use the RN Container page tag to identify one or more common attribute values and then embed a group of widgets within the container tags or specify the container as a widget attribute.
- Edit every search and report widget on the page by adding the report_id attribute to the widget code and setting its value to the ID of the report you want to use. This is the attribute format: report_id="194"

The hide_when_no_results Attribute

The hide_when_no_results attribute prevents a widget from displaying if no search results match the entered terms. The widgets that include the hide_when_no_results attribute are Multiline, Grid, MobileMultiline, and ModerationGrid.

To hide the widget, simply add the attribute and set its value to true. Here’s an example of adding the attribute to the Multiline widget.

```xml
<n:widget path="reports/Multiline" hide_when_no_results="true"/>
```

How You Define the Number of Search Results

You can define the number of displayed search results.

The per_page attribute controls how many results are shown on a page. This example code limits them to 5.

```xml
<n:widget path="reports/Multiline" per_page="5"/>
```

If the report definition on the Service Console includes row limits and the report widget defines the per_page attribute, the widget attribute overrides the report definition.

How You Build Widgets

You can create a new widget using the Customer Portal widget builder.

You can create custom widgets to suit your own business needs. Each custom widget can be designed from scratch as a standalone widget, or it can inherit and extend the functionality and attributes of another widget (referred to as the parent widget).

**Note:** You can also create code for a custom widget and add it to your customer portal through WebDAV without using the widget builder. The widget will appear in the list on the Widget Versions page, but you must manually activate it by selecting it and then clicking Activate This Version in the upper right section of the page.

The widget builder generates custom widget code based on your answers to a series of questions about the widget you want to create. The generated code includes placeholders for additional code you’ll add to define the new custom widget. This reduces the amount of code you must write and minimizes the possibility of errors.
When you create a new widget by extending the functionality of an existing standard or custom widget, you can define whether the new widget will have its own controller, view, CSS, and JavaScript files or whether it will extend the corresponding file from the existing widget that the new widget is being extended from.

To define the behavior of a custom widget, you can include or modify attributes for these components.

- **Controller**—Initializes and processes data required for widget output. Controllers can also contain AJAX-handling functions.
- **View**—Displays the PHP output generated by a controller, rendered as HTML. The file contains a top level div to simplify your coding work.
- **CSS**—Defines the style and appearance of the view.
- **JavaScript**—Produces specific behavior and renders dynamic HTML views.
- **YUI**—Defines the YUI modules to be used with the new widget.
- **Additional widget details**—Lets you add a widget definition, specify inherited URL parameters, and define JavaScript framework compatibility.

### Considerations for Extending or Overriding the View

You can extend or override a view from the parent widget when modifying a new widget.

If you indicate that the new widget will modify the view of the parent widget, you'll be asked if you want to extend the view or override it. This is an important question, and you should think carefully before selecting the override option.

We highly recommend that you choose to extend the widget view instead of overriding it. When you extend a standard widget view, any future changes to the standard widget will be automatically applied to the custom widget that was created by extending it. If you choose to override the view instead of extending it, your custom code will not be updated.

**Note:** You can extend widget views past the child level. For example, if you extend the view for widget A to create the view for custom widget B, you can also extend the view of widget B to create the view for widget C. The parent view can be extended in the child view, which can be extended for the grandchild, and then the great-grandchild.

### Create a Widget

You can create custom widgets to control many features on your customer portal.

1. Enter `https://<your_site>/ci/admin` to log in to the Customer Portal Administration site.
2. Click **Create a New Widget**.
3. Click **Create a Brand New Widget From Scratch**.
4. Enter the name (without spaces) of the custom widget in the **What Is Its Name** field.
5. Enter the name of the custom widget's parent folder in the **And Its Parent Folder** field.
6. Click **Continue**.
7. Answer the widget components questions.

<table>
<thead>
<tr>
<th>Question</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Does this widget have a controller?</td>
<td>Select <strong>Yes</strong> if you will create a controller file for the widget.</td>
</tr>
</tbody>
</table>
Question | Description
--- | ---
Will it be doing any AJAX-handling? | Select Yes if the widget’s controller will handle AJAX requests.

Does this widget have a view? | Select Yes if the widget will display HTML from the controller file’s PHP.

Does this widget have JavaScript? | Select Yes if the widget will contain JavaScript. This option is automatically enabled when the AJAX-handling option is enabled.

YUI Modules | Click Add Module and begin typing the name of the YUI module you want to have loaded on the page containing the widget and passed to the widget’s constructor. A list of modules that match the text you enter appears so you can select the one you want. To add more YUI modules, click Add Module and type the name. By default, several YUI modules are already included on each page.

JavaScript templates too? | Select Yes if the widget will display dynamic HTML content rendered by JavaScript.

8. Click Continue.

9. If you answered Yes to the question about AJAX handling, you can define the default_ajax_endpoint attribute by editing the name, selecting AJAX for the type, creating a description, setting a default value, and defining whether the attribute is required.

10. To add another attribute, click Add an Attribute and enter field information:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute name</td>
<td>Enter the name of the attribute in the header field.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of attribute you want to define. Available types include string, Boolean, AJAX endpoint, option, multi-option, file path, and integer.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the attribute. This text describes the attribute when you click Documentation on the custom widget page.</td>
</tr>
<tr>
<td>Options</td>
<td>Click Add Option and enter an option value to add one or more values to an option-type attribute. This field is available only when the attribute Type is set to Option or Multi-option.</td>
</tr>
<tr>
<td>Default value</td>
<td>Enter a default value for the attribute. By default, a Boolean-type attribute is set to true. Select the False check box if you want the value to default to false.</td>
</tr>
<tr>
<td>This attribute is required</td>
<td>Select this check box to make the attribute required.</td>
</tr>
</tbody>
</table>

11. To add more attributes, repeat step 10.

12. Click Continue.

13. To add details to the widget, click Add Additional Details and enter field information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Widget description</td>
<td>Enter a description for the widget that appears in the info.yml file and on the widget’s definition page.</td>
</tr>
</tbody>
</table>
Using B2C Service

Chapter 6

Customer Portal

Create a Widget by Extending the Functionality of a Widget

You can use an existing widget to create a new custom widget.

1. Enter https://<your_site>/ci/admin to log in to the Customer Portal Administration site.
2. Click Create a New Widget.
3. Click Extend the Functionality of an Existing Widget.
4. Enter the name of the widget you want to extend in the Which Widget Shall It Extend From field.
5. Select the widget you want to extend.
6. Enter the name (without spaces) of your new custom widget in the What Is Its Name field.
7. Enter the name of the custom widget's parent folder in the And Its Parent Folder field.
8. Click Continue.
9. To enable specific widget components, select Yes for each correlating question.

<table>
<thead>
<tr>
<th>Question</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Does this widget have a controller of its own?</td>
<td>Select Yes if you will create a controller file for the widget.</td>
</tr>
<tr>
<td>Will it be doing any of its own AJAX-handling?</td>
<td>Select Yes if the widget's controller will handle AJAX requests.</td>
</tr>
<tr>
<td>Does this widget modify the parent widget's view?</td>
<td>Select Yes if the widget will modify or override blocks of content within the view of its parent.</td>
</tr>
<tr>
<td>Extend the view</td>
<td>This is the recommended option. By extending the view of a standard widget, the custom widget you create will be automatically updated when nano changes are made to the standard widget in the future. No effort will be required on your part to consume the new functionality or bug fix.</td>
</tr>
<tr>
<td>Override the view</td>
<td>This option means that you will be required to manually update the custom widget to take advantage of any future changes to the parent widget</td>
</tr>
<tr>
<td>Include the parent widget's CSS?</td>
<td>Select Yes if the widget will include the CSS style attributes defined for its parent.</td>
</tr>
</tbody>
</table>
### Question | Description
---|---
Does this widget have its own JavaScript? | Select **Yes** if the widget will extend the JavaScript functions defined for its parent.

YUI Modules | The Add Module link is active if you enable JavaScript functions. By default, several YUI modules are already included on each page.

JavaScript templates too? | Select **Yes** if the widget will modify blocks of content within the parent’s JavaScript view.

10. Click **Continue**.
11. To edit an inherited attribute, modify the attribute type, description, default value, or whether it is required.
12. To remove an inherited attribute, click **X**.
13. To add an attribute, click **Add an Attribute** and enter the field information:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute name</td>
<td>Enter the name of the attribute in the header field.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of attribute you want to define. Available types include string, Boolean, AJAX endpoint, option, multi-option, file path, and integer.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the attribute. This text describes the attribute when you click Documentation on the custom widget page.</td>
</tr>
<tr>
<td>Options</td>
<td>Click Add Option and enter an option value to add one or more values to an option-type attribute. This field is available only when the attribute Type is set to Option.</td>
</tr>
<tr>
<td>Default value</td>
<td>Enter a default value for the attribute. By default, a Boolean-type attribute is set to true. Select the False check box if you want the value to default to false.</td>
</tr>
<tr>
<td>This attribute is required</td>
<td>Select this check box to make the attribute required.</td>
</tr>
</tbody>
</table>

15. Click **Continue**.
16. To add details to the widget, click **Add Additional Details** and enter field information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Widget description</td>
<td>Enter a description for the widget that appears in the info.yml file and on the widget’s definition page.</td>
</tr>
<tr>
<td>URL Parameters</td>
<td>If the parent widget contains URL parameters, they will be listed in this section as inherited parameters for the new widget.</td>
</tr>
<tr>
<td>Compatibility</td>
<td>If you want the widget to work with a specific Customer Portal JavaScript framework, select Standard or Mobile or both. Or select No Framework JavaScript is Required. This section does not appear if the widget does not have a JavaScript component.</td>
</tr>
</tbody>
</table>

17. Click **Create Widget**.
18. If necessary, edit the generated files.
Widget Builder Files

The Widget Builder generates a number of files.

Each file in the custom widgets folder is used to enable certain functionality within the widget and can vary based on whether the widget is a standalone widget or if it extends the functionality of another widget.

When you create a custom widget using the widget builder, some or all of these files are stored in the parent folder that you defined in the /widgets/custom folder.

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>info.yml</td>
<td>Contains information about the widget, including its version and attribute values. If the widget extends the functionality of another widget, this file also contains the name of that widget and any components that are extended.</td>
</tr>
<tr>
<td>controller.php</td>
<td>Initializes and processes the data required for the widget output. This file can also contain AJAX-handling functions or modify AJAX functionality inherited from the parent, if any exists.</td>
</tr>
<tr>
<td>view.php</td>
<td>Receives the PHP output generated by the controller and renders it as HTML. If the widget extends the functionality of another widget, this file modifies or overrides blocks of content within the view of the parent.</td>
</tr>
<tr>
<td>logic.js</td>
<td>Defines JavaScript functions used by the widget to produce dynamic behavior.</td>
</tr>
<tr>
<td>view.ejs</td>
<td>Defines JavaScript functions used by the widget to render dynamic views.</td>
</tr>
<tr>
<td>&lt;widget_name&gt;.css</td>
<td>Defines the style and appearance of the view.</td>
</tr>
<tr>
<td>base.css</td>
<td>Contains any style information that extends the CSS of the parent widget, if applicable.</td>
</tr>
</tbody>
</table>

Preview a Custom Widget

This procedure demonstrates including a screen capture of a custom widget in the widget definition.

1. Add a new subfolder called CustomWidget/preview to the /cp/customer/development/widget/custom folder, where CustomWidget is the name of the widget you want to add a preview for.
2. Add a .png, .jpg, .jpeg, or .gif file to the subfolder you created and name it preview.
   When you select the widget on your ci/admin/versions/manage page, the associated preview file render.

Input and Output Widgets

Input widgets let customers enter information and output widgets let you display database content.

When you place input widgets on a page, your customers can enter and update information that gets stored in incidents and contact records. Output widgets are used to display information about incidents, contacts, and answers in read-only form.
You can help your customers enter the information you request by defining field lengths, adding hints to input widgets, and displaying the format that should be used. This section also defines how to input and output custom fields, discusses using widget attributes, URLs, and POST parameters to define default values, and describes a page tag that can also be used for outputting field values.

The fields you can use for input and output widgets and the Field page tag are listed on the Business Objects page of the Customer Portal Administration site. The page lists the names for the answer, asset, contact, incident, service product, service category, community question, community question comment, and community user fields as they are defined in the Connect PHP API.

<table>
<thead>
<tr>
<th>Widget</th>
<th>Data Field</th>
<th>Code Sample</th>
</tr>
</thead>
<tbody>
<tr>
<td>FormInput</td>
<td>Incident.Subject</td>
<td><code>&lt;rn:widget path=&quot;input/FormInput&quot; name=&quot;Incident.Subject&quot; required=&quot;true&quot; /&gt;</code></td>
</tr>
<tr>
<td>DataDisplay</td>
<td>Answer.Products</td>
<td><code>&lt;rn:widget path=&quot;output/DataDisplay&quot; name=&quot;Answer.Products&quot; /&gt;</code></td>
</tr>
<tr>
<td>Field page tag</td>
<td>Contact</td>
<td><code>&lt;rn:field name=&quot;Contact.LookupName&quot;/&gt;</code></td>
</tr>
</tbody>
</table>

You will see an error in development mode if your code for an input widget includes a primary sub-object, that is, if you try to use an input widget on a primary object that is the child of another object. For example, this code will display an error message in the development area: `<rn:widget path="input/FormInput" name="Incident.PrimaryContact.Name.First" />`

The exceptions to this limitation include Incident.Product, Incident.Category, and Contact.Address.Country.

When you create a custom object with custom menu attributes, the attributes can be used with FormInput and DataDisplay widgets and the `rn:field` tags for Contact and Incident objects. Custom menu attributes can be used with the DataDisplay widgets for Answer objects. All custom menu attributes appear on the Business Objects page of the Customer Portal Administration site.

### Input Widgets

Input widgets allow customers to enter information.

These widgets are used to enter information for contacts or incidents.

- **ChannelAllInput**—Adds Twitter, YouTube, and Facebook fields where customers can enter their user names for those channels.

  **Note:** You can also define input fields for single channels. Enter `<rn:widget path="input/FormInput" name="Contact.ChannelUsernames.TWITTER.Username" />` to add the Twitter channel. Change the name attribute to `Contact.ChannelUsernames.YOUTUBE.Username` for YouTube and `Contact.ChannelUsernames.FACEBOOK.Username` for Facebook.

- **ContactNamInput**—Adds First Name and Last Name fields.

- **CustomAllInput**—Displays all contact custom fields on customer entry forms. You must specify the data table (Contact or Incident) for the custom fields you want to display. You can also add individual custom fields by deleting this widget and adding only the ones you want using the FormInput widget.

- **DateInput**—Displays a date drop-down menu where customers can enter date information you have requested.

- **DisplayNamInput**—Displays a field for community users to enter their display name.
• EmailCheck—Validates a customer's entered email address against the database and redirects them to the Create an Account page if the entered address is not in the database.
• FileAttachmentUpload—Displays a field and Browse button where customers can enter or select files to attach to an incident.
• FormInput—Displays a field that can be used to input system fields listed under Business Objects on the Customer Portal Administration site. You must add the name attribute to this widget.

  **Note:** The exceptions are Incident.FileAttachments, which is input with the FileAttachmentUpload widget, and Incident.Category and Incident.Product, which are input with the ProductCategoryInput widget.

• FormSubmit—Generates the button on an input form that submits customer entries. On the reference implementation, labels for this button include Submit, Continue, Save Changes, and Create Account.
• PasswordInput—Lets customers set a new password.
• ProductCatalogInput—Displays product menus for customer selection on assets.
• ProductCategoryInput—Displays product and category menus for customer selection on the ask a question pages.
• RichTextInput—Displays a text field that allows HTML formatting tags.
• SelectionInput—Functions like the FormInput widget for menu and yes/no fields.
• SmartAssistantDialog—Displays a list of suggested answers and includes the Finish Submitting Question button for customers to submit the question they entered on the Ask a Question page.
• SocialUserAvatar—Lets community users select an avatar to associate with their display name.
• TextInput—Functions like the FormInput widget for text, text area, and integer fields.

### Output Widgets

There are widgets to display information on customer portal pages.

These widgets display read-only fields on the customer portal.

• ChannelAllDisplay—Displays Twitter, YouTube, and Facebook user names that were entered by customers.

  **Note:** You can also define output fields for single channels. Enter `<rn:widget path="output/FieldDisplay" name="Contact.ChannelUsernames.TWITTER.Username" />` to add the Twitter channel. Change the name attribute to `Contact.ChannelUsernames.YOUTUBE.Username` for YouTube and `Contact.ChannelUsernames.FACEBOOK.Username` for Facebook.

• CustomAllDisplay—Displays the data entered into any of the contact or incident custom fields being displayed on the page. You can also add individual custom fields by deleting this widget and adding only the ones you want using the DataDisplay widget.

• DataDisplay—Displays the label and value of the field defined by the name attribute in the widget code.
• FieldDisplay—Displays the label and value of the field defined by the name attribute in the widget code. This widget cannot display File Attachment, Hiermenu, or Thread data types.
• FileListDisplay—Displays file attachments for an incident or answer.
• IncidentThreadDisplay—Displays all correspondence associated with an incident.
• ProductCatalogDisplay—Displays the product associated with an asset.
• ProductCategoryDisplay—Displays the product or category hierarchy associated with the answer, incident, or contact.
• ProductCategoryImageDisplay—Displays an image for a specified product or category ID.
Text Input Field Lengths

Use the maximum_length and minimum_length attributes to restrict the number of characters entered in a text field.

You can add these attributes to the TextInput and RichTextInput widgets. Many fields have a maximum field size defined in their database definitions. You can view these by clicking the field name on the Business Object page of the Customer Portal Administration site. If you set the maximum_length attribute of a TextInput or FormInput field to a value larger than the database maximum field size, the attribute value will be ignored. Setting the minimum_length attribute to a value greater than 0 automatically makes the field required.

Edit the widget code to add the maximum_length or minimum_length attribute to the widget, as shown in this example.

```xml
<n:widget path="input/FormInput" name="Incident.Subject" required="true" maximum_length="200" />
```

Field Hints

You can add a hint to help customers complete a field.

If the field is created using the CustomAllInput, DateInput, FormInput, ProductCategoryInput, SelectionInput, or TextInput widget, you can use the hint attribute. By default, field hints appears when the cursor is in the input field. To hide the hint, set the hide_hint attribute to true. If you add the hint attribute to a widget that calls a custom field, the customer portal hint overrides any hint that was defined for the field on the administration interface. The hide_hint attribute can be used with CustomAllInput and CustomAllDisplay widgets.

You can also define and display product and category selection hints by using the hint and always_show_hint attributes for the ProductCategoryInput widget.

Edit the widget code to add the hint attribute to the widget, as shown in this example.

```xml
<n:widget path="input/FormInput" name="Contact.Login" required="true" validate_on_blur="true" label_input="#rn:msg:USERNAME_LBL#" hint="Enter a username or just use your email address" />
```

Depending on the length of your hints, you may want to consider editing your page to accommodate them. You can also edit the width of the hint box by changing the max-width definition in the CSS files for the DateInput, SelectionInput, and TextInput widgets.

As an example, the default base.css file for the TextInput widget uses this code:

```css
.rn_TextInput .rn_HintBox {
  border:1px solid #DBDBDB;
  max-width:200px;
  padding:4px 16px 2px;
  word-wrap:break-word;
}
.rn_TextInput .rn_HintBox.rn_AlwaysVisibleHint {
  max-width:300px;
  opacity:1.0;
  z-index:0;
}
```

It’s always good practice to include a hint when you ask customers to enter data into an object with a system attribute. Likewise, you will want to set the always_show_hint attribute to true. This is especially true if your system attribute requires a regular expression with a specified format, such as a product registration number or a catalog number.

Mask Characters

You can use masks to define custom field formats.
Custom fields may have masks that define their format for correct data entry. For example, you might want to ensure that serial numbers have the correct sequence of letters, numbers, and formatting characters. The system phone number and postal code fields can be defined on the Countries editor of the administration interface to use masks as well.

On the reference implementation, the CustomAllInput, FormInput, and TextInput fields have an always_show_mask attribute that displays the expected (and allowable) input format to help the customer enter the value correctly. By default, the attribute is set to true.

To hide the mask, set the attribute to false as shown in this code.

```xml
<rn:widget path="input/CustomAllInput" table="Contact" always_show_mask="false"/>
```

**Note:** If you add a phone number or postal code input field to a page and set the always_show_mask attribute to true, you must also include the Country field on the page. Without a customer selection in the Country field, the phone number and postal codes fields have no way to be associated with the correct mask.

### Field Validation

You can require field validation to verify customer data.

You may want your customers to validate a field entry by re-entering their information. For example, it’s not uncommon to require customers to add their email address a second time as a way of verifying it. Rather than placing a second FormInput widget on the page for the email address confirmation, you can add the require_validation attribute to the first widget. (The require_validation attribute is an attribute of the TextInput widget, which is contained in the FormInput widget.)

This example uses field validation on the Create an Account page.

```xml
<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" validate_on_blur="true" initial_focus="true" label_input="#rn:msg:EMAIL_ADDR_LBL#" require_validation="true" />
```

### Custom Field Options

Contact, incident, and answer custom fields can be input and displayed on the customer portal.

Custom fields are defined on the administration interface and have these options.

- Read-only—meaning they can only be displayed as an output widget.
- Read/Write—meaning they can be used for both input and output fields.
- Required—the field is mandatory on the customer portal.
- Hint—providing additional information to customers who are entering data in the field.
- Default value—automatically populating the field if the data type is integer, menu, text area, text field, yes/no, or opt-in.

These four elements of a custom field—hint, default value, customer portal read-only or read/write visibility, and whether it’s required—that are defined on the administration interface can be modified through attributes of the input widget used to display the custom field.

- Hints—If you define the hint attribute of an input widget for a custom field, the hint attribute definition defined in the widget code will override whatever hint was defined on the administration interface.
- Default value—If you define the default_value attribute of an input widget for a custom field, that attribute value will override whatever value was defined on the administration interface.
• Visibility—Custom fields marked Read can be used with output widgets, but you will get a widget error message on the page if you try to use them with an input widget. Custom fields marked Read/Write can be used for both input and output widgets.

• Required—If you set the required attribute of an input widget for a custom field to false in the widget code when the custom field is marked as required on the administration interface, you cannot override the requirement with Customer Portal code. If the custom field is not defined as required on the administration interface, you can require it on your customer portal if you set the required attribute of the input widget to true. In other words, the required widget attribute can only make a non-required field required, but it cannot make a required field not required.

Input Field Values
Input fields are either blank or populated with a value, depending on how you define the field.

Customers can enter data in blank input fields, and they can override default values in fields that are already populated. (If you don’t want customers to change the value of a field, use one of the read-only output widgets instead of an input widget.)

There are multiple ways the value of an input widget can be set.

• If the input widget is used with a custom field, the field’s default value may be set on the administration interface when the custom field is added.

• The value can be defined using the default_value attribute of the input widget when you add the widget code to a page. In this case, the input field always contains the defined default value when the page opens. If the field is a custom field with a default value that was defined when it was created, the widget’s default_value attribute overrides the value set on the administration interface.

• You can pass the input field’s value in the URL that opens the page. You might want to use this option if you have multiple ways to open a page. Here’s a simple example: Assume your organization sells printers and monitors. You have one web page just for printers and another for monitors, each with a link to the Ask a Question page on your customer portal. You want to populate the Product field to identify whether customers accessed the Ask a Question page from the printer page or the monitor page. You can define the product type in the page’s URL so that the Product field is populated correctly based on which link was clicked to open the page.

  If you pass a field’s value through the page URL when the field’s value was already defined with the input widget’s default_value attribute, the URL value overrides the widget attribute.

  You can also pass the default value of the input field through a POST parameter.

• The customer enters a value for the field. This value overrides any other predefined value.

Populate the Subject Field
This example populates the Subject field on the Ask a Question page.

2. Locate this code. These lines are not sequential.

   ```html
   <rn:widget path="input/FormInput" name="Incident.Subject" required="true" />
   ...
   <rn:widget path="input/FormInput" name="Incident.Subject" required="true" initial_focus="true"/>
   ```

   One FormInput field is defined for the condition when customers are not logged in, and the second is for logged-in customers.

3. Add the default_value attribute to the FormInput widget to define the value in the Subject field.

   ```html
   <rn:widget path="input/FormInput" name="Incident.Subject" required="true" default_value="Product Registration" />
   ```
Populate Default Product and Category Values

This example populates the product and category fields on the Submit a Question page with preset values.

2. Locate this code.
   ```
   <rn:widget path="input/ProductCategoryInput" name="Incident.Product"/>
   ```
3. Add the `default_value` attribute to the ProductCategoryInput widget.
   ```
   <rn:widget path="input/ProductCategoryInput" name="Incident.Product" default_value="21,47"/>
   ```
4. Locate this code.
   ```
   <rn:widget path="input/ProductCategoryInput" name="Incident.Category"/>
   ```
5. Add the `default_value` attribute to the widget.
   ```
   <rn:widget path="input/ProductCategoryInput" name="Incident.Category" default_value="98"/>
   ```
6. Save the file.

Set a Custom Date/Time Value

You can set a value for a custom date or date/time field.

This example assumes you’ve added a custom Answer Needed By field to the Ask a Question page. If you want to set a default value for the field, add this code to the Ask a Question page.

```
<rn:widget path="input/DateInput" name="Incident.CustomFields.c.answer_needed" default_value="1435920435"/>
```

You can use a UNIX date/time stamp converter to generate the value.

You can also enter absolute and relative dates, which the PHP `strtotime()` function will convert to a UNIX time stamp format. Absolute dates must be entered using the English date format of dd/mm/yyyy.

These values for the `default_value` attribute of a DateInput widget are valid, and more examples can be found at Date/Time Function `strtotime`.

- Now
- 18-12-2015
- December 18, 2015
- Tomorrow
- Today + 2 months
- First day of next month
- Next Wed + 4 days

When adding the custom field to the page, use this code if you want the value of the field to be populated automatically, relative to the current date/time.

```
<rn:widget path="input/DateInput" name="Incident.CustomFields.c.answer_needed" default_value="tomorrow"/>
```

**Note:** The standard date/time fields are read-only, so you cannot set values for those.
Set a Yes/No Field

The SelectionInput widget is used to display Yes/No radio buttons for a custom field.

This example assumes you've added a custom field to a page that asks if the person submitting the question is a current customer. It also assumes you want to set the default value of the widget to Yes. To set it to No, set the default_value attribute to 0 or false. Add this code to the page.

```xml
<rn:widget path="input/SelectionInput" name="Contact.CustomFields.c.current_cust" default_value="1"/>
```

Alternatively, you could set the value to true.

```xml
<rn:widget path="input/SelectionInput" name="Contact.CustomFields.c.current_cust" default_value="true"/>
```

If default_value is set to anything other than 1, 0, true, or false, neither selection appears.

Change Radio Buttons to a Check Box

You can change the default radio buttons to check boxes using the display_as_checkbox attribute.

If you'd prefer to display yes/no fields as a single check box instead of as radio buttons, simply add the display_as_checkbox attribute to the SelectionInput widget.

```xml
<rn:widget path="input/SelectionInput" name="Contact.CustomFields.c.current_cust" display_as_checkbox="true" />
```

When this attribute is set to true, the customer’s response is saved as Yes if the check box is selected and No if the check box is not selected.

Set a Menu Option

You can populate menu options on a drop-down menu by modifying the custom field code.

To set a default option in a drop-down menu, you’ll use the FormInput widget and use the ID of the option. This example includes a menu custom field to define the urgency of the incident, and it sets the urgency to Normal.

To find the ID of a custom field option, open the page in source code view, search for the menu custom field, note the <option> tags, and find the value you want to set.

Add this code to the page.

```xml
<rn:widget path="input/FormInput" name="Incident.CustomFields.c.urgency" default_value="1"/>
```

Populate the Subject Field Using a URL

This example defines a default value for an input field in the URL that opens the page containing the field.

Although this example shows you how to populate a field with a URL within your customer portal, you’re more likely to populate an input field value to access the Ask a Question page from an external page. If you define a field’s value in the URL that calls the page and if that default value is also defined in the code for the input widget, the value in the URL overrides the value specified in the widget code.

2. Edit the navigation tab for the Ask a Question page.
   a. Locate this code.
      ```xml
      <li><rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:ASK_QUESTION_HDG#" link="/app/ask" pages="ask, ask_confirm"/></li>
      ```
   b. Edit the link attribute to use the URL to populate the Subject field.
3. Save the file.

### POST Parameters and Populating Fields

You can use POST parameters from forms you create to populate those fields.

Similar to using URL parameters to populate contact and incident input fields, you can also use POST parameters to populate fields. As with URL parameters, the POST parameter must use the Table.Field format, for example, Incident.Subject.

### How You Display Values without Labels

You can output field values without labels or formatting by using the Field page tag.

When you don’t need a label or any special formatting, you can use the `rn:field` page tag to output the value of the field. All you need to do is specify the table and field names, just as you do when defining an output widget.

For example, you can use this code on the `ask_confirm.php` page to display the customer’s incident number.

```html
<a href="/app/#rn:config:CP_INCIDENT_RESPONSE_URL#/i_id/#rn:url_param_value:i_id##rn:session#">#<rn:field name="Incident.ReferenceNumber" /></a>
```

### Allow Edits to Fields After Login

You can change input fields on the Account Settings page so customers can edit them.

2. Locate this code.

```html
<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" validate_on_blur="true" initial_focus="true" label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
```
3. Edit the code to add the `allow_external_login_updates` attribute.

```html
<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" validate_on_blur="true" initial_focus="true" label_input="#rn:msg:EMAIL_ADDR_LBL#" allow_external_login_updates="true" />
```
4. Save the file.

### Add a System Attribute Using the FormInput Widget

This example uses the FormInput widget to add a contact system attribute to the Ask a Question page asking customers if they have used a previous version of the product.

2. Locate `<rn:widget path="input/FileAttachmentUpload"/>`.
3. Add this code after `<rn:widget path="input/FileAttachmentUpload"/>`.

```html
<rn:widget path="input/FormInput" name="Contact.CustomFields.CO.usedpreviousproducts" always_show_hint="true" hint="Have you used a previous version of this product?" />
```
4. Save the file.
Add a System Attribute Using the DataDisplay Widget

This example adds a Product Registration section to the Account Overview page.

2. Add this code where you want it to appear on the page.

```html
<div class="rn_Overview">
    <h2><a class="rn_Questions" href="/app/account/questions/list#rn:session#">
        Product Registration</a></h2>
    <div class="rn_Questions">
        <rn:widget path="output/DataDisplay" name="Contact.CustomFields.CO.product_registration"
            label="Registered Product"/>
        <rn:widget path="output/DataDisplay" name="Contact.CustomFields.c.date_registered"
            label="Date Registered"/>
    </div>
</div>
```

3. Save the file.

Add a System Attribute Using Regular Expressions

This example adds an RMA system attribute to incidents.

For this example, we'll assume that you've added an RMA system attribute to incidents so that you can match the incident with your organization's Return Merchandise Authorization process. We'll also assume that you've defined the format of the RMA system attribute to use the pattern AA-#####, for example, CX-49935.

1. Open the page where you want to add the system attribute.
2. Add the FormInput widget to the code so it appears where you want it to on the page.

```html
<nr:widget path="input/FormInput" name="Incident.CustomFields.CO.RMA" always_show_hint="true"
    hint="Expected Input: AA-##### (for example, CX-49935)" validate_on_blur="true"
    label_input="Returned Merchandise Authorization" />
```

**Note:** If the regular expression (the AA-##### pattern) is not met, the validate_on_blur attribute indicates an error as soon as customers move to a different field. Without this attribute, the error is not pointed out until customers click the Continue button.

3. Add the hint directly to the field name.

```html
<nr:widget path="input/FormInput" name="Incident.CustomFields.CO.RMA" label_name="RMA (expected input: AA-#####)"
    validate_on_blur="true" label_input="RMA (expected input: AA-#####)" />
```

4. Save the page.

Web Form Security

The Customer Portal includes web form security on the FormSubmit widget that automatically requires human validation when abuse is suspected.

Validation is accomplished through the use of a CAPTCHA, a dialog containing distorted words that the customer is asked to type. When the words are typed correctly, a human is assumed to be on the client side. Customers who have correctly entered a CAPTCHA will not be asked for verification again as long as the visit has not ended or does not exceed an hour.

You may also want to require CAPTCHAs to prevent user name enumeration, that is, the automatic harvesting of user names from your database.
By default, a CAPTCHA opens on the customer portal only when the system detects abuse, but you can configure a form to always require human validation. You can also configure a form to open a CAPTCHA wherever you want on the form instead of in a dialog, where it opens by default.

CAPTCHAs are not used with pass-through authentication. Nor are they used on the basic page set. CAPTCHAs require JavaScript to display and the basic page set does not support JavaScript. Therefore, if an abuse situation is detected on your basic page set, customers will see a generic error message rather than a CAPTCHA.

**Require CAPTCHA Validation on Submit**

This example demonstrates setting a CAPTCHA validation for all form submittals.

1. Open the page containing the form where you want a CAPTCHA to always appear.
2. Locate the code for the FormSubmit widget, `<rn:widget path="input/FormSubmit"`.
3. Edit the FormSubmit widget code to add the `challenge_required` attribute.

   ```xml
   <rn:widget path="input/FormSubmit" label_button="#rn:msg:CREATE_ACCT_CMD#" on_success_url="/app/account/overview" error_location="rn_ErrorLocation"
             challenge_required="true" />
   ```

4. Save the page.

If you want to test a CAPTCHA on a page, you can temporarily set the `challenge_required` attribute to true, as shown in this example. When your testing is complete, you can remove the attribute from the widget code so that a CAPTCHA appears only when abuse is detected.

**Open CAPTCHA Within a Form**

This example code lets you open the CAPTCHA within a form.

1. Open the page containing the form where you want the CAPTCHA to appear.
2. Locate the code for the FormSubmit widget, `<rn:widget path="input/FormSubmit"`.
3. Edit the widget code to add the `challenge_location` attribute and set the attribute equal to the div ID for CaptchaArea.

   ```xml
   <rn:widget path="input/FormSubmit" label_button="#rn:msg:CONTINUE_ELLIPSIS_CMD#" on_success_url="/app/ask_confirm" challenge_required = "true"
             challenge_location="captchaArea" error_location="rn_ErrorLocation"/>
   ```

4. Add `<div id="captchaArea" class="rn_CaptchaDialog">` to the page.

   ```xml
   <rn:widget path="input/FormSubmit" label_button="#rn:msg:CONTINUE_ELLIPSIS_CMD#" on_success_url="/app/ask_confirm" challenge_required = "true"
             challenge_location="captchaArea" error_location="rn_ErrorLocation"/>
   ```

5. Save the page.

**Set the Abuse Detection Cookie**

The Abuse Detection Cookie allows you to test your development site.

An abuse scenario is hard to create deliberately for testing purposes, so the Customer Portal includes a cookie that makes your site behave as if it is under abuse when the cookie is set. It works only in development mode for testing purposes.

1. To set the abuse detection cookie,
   - On your Customer Portal Administration site, click **Set Environment > Trigger Abuse Detection**.
   - On your development site, click **the development header > Links and Resources > Toggle Abuse Detection**.
Remove ClickjackPrevention from the Template

If your site runs in frames, you should remove the ClickJackPrevention widget.

Clickjacking is an attack on browser security that can mislead your customers into clicking a concealed link. To prevent clickjacking, you must not allow your site to be put into an iFrame or frameset on another site.

2. Delete this line of code.
   ```html
   <rn:widget path="utils/ClickjackPrevention"/>
   ```
3. Save the page.

Syndicated Widgets

You can use a syndicated widget to access the Oracle knowledge base from another web page outside of your customer portal.

These are the syndicated widgets.

- `ConditionalChatLink`
- `KnowledgeSyndication`
- `PollingSyndication`
- `ProactiveChat`
- `ProactiveSurveyLink`

The syndicated widgets are generated with JavaScript code that can be placed within another web page. You can configure the widgets by modifying the JavaScript or by using the widget definition page to define the configuration options and settings.

The widgets can be completely styled with their CSS files, which are found in the `/cp/customer/assets/css/syndicated_widgets/standard` folder. You can review and modify the settings for a syndicated widget at `https://<your_site>/ci/tags/syndicated_widgets`.

The KnowledgeSyndication Widget

The KnowledgeSyndication widget provides search access to your knowledge base.

This widget acts like the search fields and reports on the Support Home and Published Answers pages of your customer portal, but you can place it on any page of your website, letting your customers search the Oracle knowledge base from any of your organization's website pages.

By default, the KnowledgeSyndication widget displays a search field, a list of answers from the knowledge base, and a link to additional results on the customer portal pages. This widget can be configured to display spelling corrections and suggestions, recommended documents, and other suggested searches. It can open an answer in a page overlay or on a new page. You can also edit labels and configure the number of displayed answers, whether to display a description of each answer and, if so, the length of the description.

If you have enabled web indexing, the KnowledgeSyndication widget will also search external documents.

Add the KnowledgeSyndication Widget to a Page

The widget information page gives you everything you need to add the KnowledgeSyndication widget to any page on your website.
Your profile must have the CP Edit permission enabled and you must log in to the Customer Portal Administration site if you are not already logged in.

1. Enter `https://<your_site>/ci/tags/syndicated_widgets/standard/KnowledgeSyndication` to open the page for the KnowledgeSyndication widget.
2. In the Configure Widget section, modify the widget attributes.
3. To preview your changes, click **Apply**.
4. Open the source code for the web page you want to add the widget to.
5. On the widget page, click the top **Select Text** button to select the code in the first box and copy the code.
6. Paste the code into your web page file just before the closing `<body>` tag.
   
   Even if you plan to use multiple syndicated widgets on the page, you need to paste this code only once.
7. On the widget page, click the second **Select Text** button and copy the code that defines the widget.
8. Paste the copied code just below the code you pasted in step 6.
9. Add `<div id="myDiv"></div>` to the page code where you want the widget to appear.
10. Save the page.

### Configure the KnowledgeSyndication Widget

You can configure all attributes of the KnowledgeSyndication widget.

In order to return external documents from a search, you must enable web indexing.

1. To enable external document searching, select the check box for the `ext_docs` attribute.
2. To open answers in an overlay instead of a separate window, select the check box for the `display_answers_in_overlay` attribute.
3. To define products for a KnowledgeSyndication widget report, enter the product ID in the field for the `p` attribute.
4. To define categories for a KnowledgeSyndication widget report, enter the category ID in the field for the `c` attribute.
5. To retain the product and category search filters, select the check box for the `persist_prodcat` attribute.
6. To use context-sensitive information to determine what answers should be returned, enter comma-separated HTML tags in the field for the `context` attribute.
7. To define the number of characters that will be evaluated for each tag, enter the number in the field for the `payload_size` attribute.
8. To hide answers until a search is performed, select the check box for the `hide_initial_answers` attribute.
9. To set a keyword for a search query, enter the search word in the field for the `q` attribute.

   **Note:** If you’ve entered HTML tags in the context attribute, any values in the `q` attribute will be overridden.

10. To disable spelling corrections and suggestions, clear the check box for the `correction` attribute.
11. To disable answer descriptions in the search results, clear the check box for the `description` attribute.
12. To disable the More Results link, clear the check box for the `navigation` attribute.
13. To disable recommended documents, clear the check box for the `recommended` attribute.
14. To disable suggested searches, clear the check box for the `related` attribute.
15. To disable the keyword search box to prevent customers from entering search terms, clear the check box for the `search_box` attribute.
16. To edit the default spelling suggestion label of “Did You Mean,” enter the new label in the field for the `label_correction` attribute.
17. To edit the label for recommended documents, enter the new label in the field for the `label_documents` attribute.
18. To edit the label for the More Results link, enter the new label in the field for the `label_more_results` attribute.
19. To edit the No Results Found label, enter the new label in the field for the `label_no_results` attribute.
20. To edit the related searches label, enter the new label in the field for the `label_related_searches` attribute.
21. To edit the Search button label, enter the new label in the field for the `label_search_button` attribute.
22. To edit the Created label, enter the new label in the field for the `label_created` attribute.
23. To edit the Updated label, enter the new label in the field for the `label_updated` attribute.

24. To change the target window that defines where linked documents and additional search results open, enter one of the following target values for the HTML anchor `<a>` tag in the field for the widget’s `target` attribute:
   - `_blank`—Opens the link in a new window.
   - `_self`—Opens the link in the current window.
   - `_parent`—Opens the link in the parent frameset.
   - `_top`—Opens the link in the full window.

25. To edit the length of answer descriptions from the default of 100 characters, enter a numerical value in the field for the `truncate_size` attribute.

26. To change the number of displayed answers from the default of ten, enter an integer in the field for the `number_answers` attribute.

27. To edit the div element, enter a new name for the div element in the field for the `div_id` attribute.

28. To edit the instance ID, replace the “0” in “skw_0” in the `instance_id` attribute with another value for each widget you add to the page.

29. Click **Apply**.

How the KnowledgeSyndication Widget Determines Search Results

The KnowledgeSyndication widget can use context-sensitive information on a page to determine what answers to return.

The KnowledgeSyndication widget evaluates a page for context sensitivity when you specify the HTML tags on the page. If you leave the field for this attribute blank, the KnowledgeSyndication widget will not use page content to determine what answers should be returned. You can also define the amount of content you want the widget to evaluate.

When you specify the page tags, the content within those tags is passed to the server for evaluating answers that are relevant to the page content. You might, for example, want to place the KnowledgeSyndication widget on your product pages so the specific product information from each page is used to return product-specific answers to your customers.

If you enter information in the context attribute's field, the keyword for the search query defined in the `q` attribute is overridden. If the HTML tags you define are not found on the page, the widget defaults to the empty string, and top answers will be returned.

You can list any div ID, as well as title, document, and meta tags in the field for the context attribute. If you list a meta tag, only meta elements that are named description and keywords will be evaluated. If you use a document tag, the entire contents of the page will be evaluated.

The `payload_size` attribute of the KnowledgeSyndication widget defines the number of characters for each tag identified in the context attribute that will be sent to the server for evaluation to determine page content and influence context sensitivity of the returned answers. The default value is 150 characters (approximately 25 English words), and the maximum value is 300 characters.

Inlays and Customer Portal

Inlays are the next generation of syndicated widgets.

These are objects that you can place on any web page to invoke specific customer service interactions. They are packaged units of functionality, such as chat interactions, viewing knowledge articles and service request creation. The name Inlays refers to the design of these components and that you can *inlay* them into any web page, including your external web site, seamlessly.
Inlays are single version, so there is no need to migrate or update your current Inlay implementation. The release cycle for Inlays is typically every 2-4 weeks.

For more information, see the inlay documentation at Oracle OIT Registry.

Polling Widgets

Polling widgets let you add a single-question poll from surveys that have been created on the agent desktop.

The Polling widget is located in the standard widgets folder in the surveys subfolder. The PollingSyndication widget can be found on the Customer Portal Administration site by clicking the Widgets tab and selecting Syndicated Widgets.

The available question types include choice, text, and matrix, and you can use any of these question types in your poll, although the choice question type probably offers the most usefulness to your organization. When customers answer a choice question by selecting a menu item, option, check box, or list item, they see a chart displaying the responses to date. (This chart can be a horizontal bar chart, vertical bar chart, or pie chart.) When customers respond to text and matrix questions, they see a thank you message.

If the survey you have associated with the polling widget contains multiple questions, one of the questions will be selected at random to appear to customers for a one-hour time period. Every customer who is offered the poll during that time sees the same question. At the end of an hour, a new question is selected at random.

Customer visits that result from clicking the PollingSyndication widget are tracked as B2C Service Feedback visits, not as Customer Portal visits.

Polling Widget Attributes

These attributes are available for the standard Polling widget and the PollingSyndication widget.

The question, answers, and some styling options are defined on the agent desktop when surveys and associated questions are created. Additional styling and other attributes are defined with customer portal code. If widget styling attributes are different than the styling defined when the survey was created, the widget attributes are used.

- **Chart Style**—Sets the styling for the chart using the YUI Charts Control. You can specify backgrounds, borders, colors, fonts, and many other chart attributes. The default is blank.
- **Chart Type**—Specifies the chart type. Options include none, horizontal bar, vertical bar, pie chart, and simple. The default is a horizontal bar chart.
- **Cookie Duration**—Defines the number of days until the cookie expires. The default is ten days.
- **Instance ID**—Defines the ID for the widget instance. You can specify this value, or it will be selected automatically.
- **Frequency**—Defines what percentage of visitors are offered the poll. This attribute is used only when modal polls are enabled.
- **Modal**—Sets the survey dialog to be modal. This mode requires customer interaction to close the dialog. By default, the modal poll is disabled.
- **Poll Logic**—Prevents the survey dialog from opening unless the evt_showPoll event is fired. This attribute is used only when modal polls are enabled. You must add code to define the condition that triggers the event.
- **Seconds**—Used only with modal polls to specify the time in seconds until the dialog is opened. The default value is 0.
- **Series Style**—Sets the styling for the chart’s bars or pie wedges with the YUI Charts Control.
• Survey ID—Required to identify the polling survey the widget uses.
• Test—Puts the widget in test mode so results are not recorded.

Add the Polling Widget to a Page
You configure the Polling widget by placing widget code on the customer portal page where you want it to appear and then editing its attributes.

1. Open the file for the page where you want to place the Polling widget.
2. Enter the code for the Polling widget in the location where you want the widget to appear on the page.
   This is an example of the most basic widget code. The value of the survey_id attribute is the ID of the survey containing the polling question you want to use.
   \[<rn:widget path="surveys/Polling" survey_id="8" />\]
   Every Polling widget must include a value for the survey_id attribute. If it does not, an error message appears on the customer portal page.
3. Save the file.

Add the PollingSyndication Widget to an External Page
This example describes the process for adding the PollingSyndication widget to an external page.

1. Enter https://<your_site>/ci/tags/syndicated_widgets/standard/PollingSyndication to open the page for the PollingSyndication widget.
2. In the Configure Widget section, edit the widget attributes.
3. To preview your changes, click Apply
4. Continue to configure the widget until you are satisfied with the result.
5. Open the source code for the web page you want to add the widget to.
6. On the widget page, click Select Text and copy the code.
7. Paste the code into your page file just before the closing \</body> tag.
   Even if you plan to use multiple syndicated widgets on the page, you need to paste this code only once.
8. On the widget page, click the second Select Text and copy the code that defines the widget.
9. Paste the copied code just below the code you pasted in previous steps.
10. On the widget page, click the third Select Text, copy the code, and paste it where you want the widget to appear.
11. Save the page.

Add the Survey ID to the Polling Widget
You can specify the survey used by the polling widget.

Every polling widget must be associated with a polling survey that was designed on the Service Console. If the survey ID is missing from the Polling widget code, you will see an error on the page where you are trying to place the widget.

1. Click Surveys.
2. Double-click Surveys Explorer.
3. Click Choose Details.
4. Select ID.
5. Click OK.
6. Add the survey_id attribute to the widget code.
   \[<rn:widget path="surveys/Polling" survey_id="5" />\]

Define the Cookie Duration for the Polling Widget
You can define the life of the cookie or you can prevent a cookie from being set.
After a customer has answered the poll, a cookie is set to prevent the survey from being offered again when the customer visits the page in the future.

When the poll opens in a separate dialog instead of as an element on the page (a modal poll), the survey is not presented again after the customer has responded, even if the randomization process now presents a different question to customers. In the non-modal mode after a customer has answered the poll, subsequent visits to the site, when the cookie is active, will display only the survey results instead of the survey question that appeared on the first visit.

Configure Modal Polls for the Polling Widget
This procedure demonstrates enabling and configuring the polling widget for modal polls.

1. Add the cookie_duration attribute to the widget code.
   `<rn:widget path="surveys/Polling" survey_id="5" cookie_duration="5" />`
2. Set the attribute value for the number of days you want the cookie to remain active.
3. To define the cookie duration for the PollingSyndication widget.
   a. Open the page for the PollingSyndication widget.
   b. Scroll to the Configure Widget section.
   c. In the cookie_duration attribute, enter the number of days you want the cookie to remain active.

Configure Modal Polls for the PollingSyndication Widget
This procedure demonstrates enabling and configuring the PollingSyndication widget for modal polls.

1. With the page for the PollingSyndication widget open, scroll to the Configure Widget section.
2. Select the modal attribute check box.
3. To offer the poll to only a percentage of your customers, find the frequency attribute and enter a percentage value in the field.
4. To trigger the dialog on the event defined in evt_showPoll, select the poll_logic attribute check box.
5. To trigger the dialog after the page has been open a specified number of seconds, find the seconds attribute and enter the number of seconds in the text field.

Use Poll Logic with Widgets
You can use a JavaScript event to display the polling widget when modal polls are enabled.

A JavaScript event, evt_showPoll, lets you use logic to display the polling widget when modal polls are enabled. When the poll_logic attribute is set to true, the polling dialog does not display unless the evt_showPoll event is triggered.

1. Add the poll_logic attribute to the widget code.
   `<rn:widget path="surveys/Polling" survey_id="4" modal="true" poll_logic="true" />`
2. Then add code to trigger the evt_showPoll event. If, for example, you want to trigger the poll after customers click a link on the widget, you could add the following code to the page containing the widget. (Notice that the widget code prevents cookies from being set so the link will remain active.)

```xml
<n:widget path="surveys/Polling" survey_id="4" modal="true" poll_logic="true" cookie_duration="0" />
<script type="text/javascript">
function pollLogic() {
    RightNow.Event.fire('evt_showPoll');
}
</script>
<a href="#" onclick="pollLogic()"><h2>Help us serve you better by taking this poll.</h2></a>
```

3. To add the poll to the PollingSyndication widget, add the logic code to the external page below the code you added for the PollingSyndication widget.

The following example shows the code you might add if you want to display the poll 500 milliseconds after the page opens.

```javascript
var rnTimer;
startCheck();

// check to see when the RightNow javascript is loaded and ready to use
function startCheck()
{
    rnTimer = setInterval(checkLoaded, 500); // this is milliseconds
}

// when loaded fire the poll
function checkLoaded()
{
    {
        clearInterval(rnTimer);
        RightNow.Client.Event.evt_showPoll.fire();
    }
}
</script>
```

### Edit the Chart Type on Polling Widgets

You can change the type of chart the page uses to display the poll results of a choice type question.

1. To display a vertical bar chart, add the chart_type attribute to the widget code and set its value to vertical_bar.

   ```xml
   <n:widget path="surveys/Polling" survey_id="5" chart_type="vertical_bar" />
   ```

2. To display a pie chart, add the chart_type attribute to the widget code and set its value to pie.

   ```xml
   <n:widget path="surveys/Polling" survey_id="5" chart_type="pie" />
   ```

3. To remove the display, add the chart_type attribute to the widget code and set its value to none.

   ```xml
   <n:widget path="surveys/Polling" survey_id="5" chart_type="none" />
   ```

4. To edit the chart type on the PollingSyndicated widget:
   a. Open the page for the PollingSyndication widget.
   b. Scroll to the Configure Widget section of the page.
   c. Find the chart_type attribute.
   d. Select vertical_bar, pie, or simple.

### Instance ID

The instance_id is used as a unique identifier of the polling widget.
Each instance of a polling widget on a customer portal page or an external page must have its own instance ID. You can enter a value for instance_id in the Polling widget code or type a value in the field for the PollingSyndication widget. If you do not enter a value, one will be assigned automatically.

**Set Test Mode for Polling Widgets**
You can test the polling widgets without contaminating your poll results. No statistics are collected in test mode.

1. Add the `test` attribute to the widget code and set it to `true`.
   
   ```xml
   <rn:widget path="surveys/Polling" survey_id="5" test="true" />
   ```

2. To set the test mode for the PollingSyndication widget:
   a. Open the PollingSyndication widget page.
   b. Scroll to the Configure Widget section of the page.
   c. Find the attribute called `test`.
   d. Select the check box.

**Add a Survey Link to a Page**
You can use the SurveyLink widget to add a link to any customer portal page that opens broadcast surveys and website link surveys.

1. Open the customer portal page that you want to add the SurveyLink widget to.
2. Add `<rn:widget path="surveys/SurveyLink" survey_id="11"/>` where you want the widget to display on the page, defining the `survey_id` attribute with the ID value of the survey you want to use.
   a. To use a graphic element instead of the text link to the survey, add the `icon_path` attribute to the widget.
      
      ```xml
      <rn:widget path="surveys/SurveyLink" survey_id="11" icon_path="images/cp_survey_icon.png" />
      ```
   
   If you want to change the graphic label, add the `label_icon_alt` attribute and set the value to whatever you want the screen reader to read.
   
   ```xml
   <rn:widget path="surveys/SurveyLink" survey_id="11" label_icon_alt="Click here to take our survey" />
   ```

   b. To open the survey in a separate window, add the `target` attribute to the widget code and set it to `_blank`.
      
      ```xml
      <rn:widget path="surveys/SurveyLink" survey_id="11" target="_blank" />
      ```

   c. To change “Survey Link” to different text, add the `link_text` attribute to the widget.
      
      ```xml
      <rn:widget path="surveys/SurveyLink" survey_id="11" link_text="Click here to take our survey" />
      ```

3. Save the file.

**Add the ProactiveSurveyLink Widget to a Page**
You can place the ProactiveSurveyLink widget on any customer portal page.

1. Open the customer portal page that you want to add the ProactiveSurveyLink widget to.
2. Add `<rn:widget path="surveys/ProactiveSurveyLink" survey_id="11"/>` to the page.
   a. To change the labels on the Accept and Cancel buttons, add the `label_accept_button` and `label_cancel_button` attributes.
      
      ```xml
      <rn:widget path="surveys/ProactiveSurveyLink" survey_id="11"
      label_accept_button="Yes please" label_cancel_button="No thanks" />
      ```

   b. To open the survey in a separate window instead of on the same page, add the `target` attribute to the widget code and set it to `_blank`.
      
      ```xml
      <rn:widget path="surveys/ProactiveSurveyLink" survey_id="11" target="_blank" />
      ```
c. To set the cookie duration to anything other than the default value of ten days, add the `cookie_duration` attribute and set it to the number of days you want to avoid presenting the survey offer again.

   `<rn:widget path="surveys/ProactiveSurveyLink" survey_id="11" cookie_duration="0"/>`

d. To change the width of the window that opens when the link is clicked from its default value of 300 pixels, add the `dialog_width` attribute and set it to the value you want.

   `<rn:widget path="surveys/ProactiveSurveyLink" survey_id="11" dialog_width="200"/>`

e. To define a percentage of visitors who will be offered the survey (instead of the default value of 100), add the `frequency` attribute and set it the value you choose.

   `<rn:widget path="surveys/ProactiveSurveyLink" survey_id="11" frequency="50"/>`

f. To change the default invitation to participate in the survey, add the `intro_paragraph` attribute with the text of your choice.

   `<rn:widget path="surveys/ProactiveSurveyLink" survey_id="11" intro_paragraph="Complete this survey and be entered in a drawing to win an iPad!"/>`

g. To open the window after a specified number of seconds, add the `seconds` attribute.

   `<rn:widget path="surveys/ProactiveSurveyLink" survey_id="11" seconds="10"/>`

h. To change the survey title from the default “Survey Invitation,” add the `title` attribute.

   `<rn:widget path="surveys/ProactiveSurveyLink" survey_id="11" title="Tell us what you're thinking"/>`

i. To open the widget only when an event is fired, add the `wait_for_event` attribute to the widget and then add the code to fire the event.

   `<rn:widget path="surveys/ProactiveSurveyLink" survey_id="11" wait_for_event="true" cookie_duration="0" />
<script type="text/javascript">
function dialogLogic()
{
    RightNow.Event.fire('evt_showOffer');
}
</script>
<a href="#" onclick="dialogLogic()"><h2>Help us serve you better by taking this survey.</h2></a>`

Note: A JavaScript event, `evt_showOffer`, lets you use logic to display the ProactiveSurveyLink widget. You must add code to fire `evt_showOffer` in order for the widget to open. If you have defined the `seconds` attribute, the widget opens after the event has fired and the number of seconds has elapsed.

3. Save the page.

Add the Syndicated ProactiveSurveyLink Widget to a Page

You can place the syndicated ProactiveSurveyLink widget on an external web page.

1. Enter https://<your_site>/ci/tags/syndicated_widgets/standard/ProactiveSurveyLink to open the page for the syndicated ProactiveSurveyLink widget.
2. Scroll to the Configure Widget section and edit the widget attributes.
3. To preview your changes, click Apply.
4. Open the source code of the external page you want to add the widget to.
5. To ensure the page renders correctly in Internet Explorer 7, add `<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">` to the top of the page before your first HTML tag.
6. On the right side of the widget page, click the top Select Text and copy the code.
7. Paste the code into your page file just before the closing </body> tag. Even if you plan to use multiple syndicated widgets on the page, you need to paste this code only once.
8. Click the second **Select Text** and copy the code that defines the widget.
9. Paste the copied code just below the code you pasted earlier.
10. Click the third **Select Text** button, copy the code, and paste it where you want the widget to appear on the page.
11. Save your web page.

**Configure the Syndicated ProactiveSurveyLink Widget**

You can customize the syndicated ProactiveSurveyLink widget.

1. Open the Syndicated ProactiveSurveyLink Widget page.
   a. Scroll to the Configure Widget section.
   b. In the survey_id attribute field, enter the ID number of the survey you want to use.
2. To set the cookie duration to anything other than the default value of ten days, enter the number of days you want to avoid presenting the survey offer again in the cookie_duration attribute. If you set the value to 0, no cookie is set.
3. To change the width of the window that opens when the link is clicked from its default value of 300 pixels, enter the new value in the dialog_width attribute.
4. To open the widget only when an event is fired, select the **Enabled** check box for the display_logic attribute.
   
   **Note:** A JavaScript event, evt_showLink, lets you use logic to display the syndicated ProactiveSurveyLink widget. You must add code to fire evt_showLink in order for the widget to open. If you have defined the seconds attribute, the widget opens after the event has fired and the number of seconds has elapsed.
5. Add this code just below the widget code on the page where you’re placing the widget.

   ```javascript
   function dialogLogic()
   {
     RightNow.Client.Event.evt_showLink.fire();
   }
   </script>
   <a href=”#” onclick=dialogLogic()”>Help us serve you better by taking this survey.</a>
   ``
6. To change the div_id attribute from its default of myDiv, enter a new name for the div in the field.
7. To define a percentage of visitors who will be offered the survey (instead of the default value of 100), set the percentage value you want in the frequency attribute.
8. To rename the instance_id attribute, replace the “0” in “psl_0” with another value.
9. To change the default invitation to participate in the survey, enter text for the new introduction in the intro_paragraph attribute.
10. To change the labels on the Accept and Cancel buttons, enter new values for the label_accept_button and label_cancel_button attributes.
11. To open the survey link window after a specified number of seconds, enter the value in the seconds attribute.
12. To open the survey in a separate window instead of on the same page, click the drop-down arrow for the target attribute and select “_blank.”
13. To change the survey title from the default “Survey Invitation,” enter the new title in the title attribute.

**Standard Widgets**

There are widgets included in both the standard and mobile customer portal reference implementations.

**Widgets Not Used in Reference Implementation**
<table>
<thead>
<tr>
<th>Widget</th>
<th>Page</th>
<th>Widget functionality on the page</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccountDropdown</td>
<td>templates/standard</td>
<td>Displays a drop-down menu of account options to logged-in users and a login link to users who are not logged in.</td>
</tr>

Widgets Not Used in Reference Implementation
A number of widgets are available for you to use in your Customer Portal site.

These standard widgets are not used in the reference implementation but are available for you to add to your pages.

- chat
  - ChatCoBrowseButton (used in prior Customer Portal frameworks)
  - ChatCobrowsePremium
  - ChatLaunchFormOpen (used in prior Customer Portal frameworks)
  - ProactiveChat
  - ConditionalChatLink (used in the ContactUs widget)

- discussion
  - RecentlyAskedQuestions

- feedback
  - SiteFeedback (used in ContactUs widget)
  - SocialContentFlagging (used in QuestionComments and QuestionDetail widgets)
  - SocialContentRating (used in QuestionComments and QuestionDetail widgets)

- input
  - AssetCheck
  - ChannelAllInput
  - ContactNameInput (used in prior Customer Portal frameworks)
  - DateInput (used in FormInput widget)
  - EmailCheck
  - ProductCatalogInput
SelectionInput (used in FormInput widget)

- knowledgebase
  - SearchSuggestions
  - TopicBrowse
  - TopicWords

- login
  - LoginDialog (used in AccountDropdown and AnswerNotificationIcon widgets)
  - LogoutLink (used in AccountDropdown widget)

- moderation
  - ModerationContentFlagFilter
  - ModerationDateFilter
  - ModerationStatusFilter

- navigation
  - Accordion
  - MobileNavigationMenu

- output
  - ChannelAllDisplay
  - FieldDisplay (used in other input widgets)
  - FileListDisplay (used in /views/admin/answer_full_preview.php for displaying the print version of an answer on the agent desktop)
  - IncidentThreadDisplay (used in the DataDisplay widget)
  - ProductCatalogDisplay
  - ProductCategoryDisplay (used in the ProductCategoryInput and DataDisplay widgets)

- search
  - AdvancedSearchDialog
  - AssetOrgList
  - CombinedSearchResults
  - DisplaySearchFilters
  - FilterDropdown
  - OrgList
  - ProductCatalogSearchFilter
  - SearchTypeList (contained in AdvancedSearchDialog, which is no longer in use on the reference implementation)
Note: You should add the SearchTypeList widget to any page containing a custom report that uses an integer filter. Without the widget, your customers can search only by answer ID. Adding the widget lets your customers select a different search type so they can enter text search terms.

- SortList (contained in AdvancedSearchDialog)
- WebSearchSort (contained in AdvancedSearchDialog)
- WebSearchType (contained in AdvancedSearchDialog)

- searchsource
  - SourceSort

- social
  - AnswerComments
  - CommunityPosts
  - CommunityPostSubmit
  - CommunitySearchResults
  - CommunityUserDisplay

- surveys
  - SurveyLink
  - ProactiveSurveyLink

- utils
  - Blank
  - CoBrowseLink
  - CoBrowsePremium
  - ProgressBar

Set the Maximum Year for Date Drop-Down Menus

You can set date drop-down menu values.

By default, drop-down date menus display the current year as the highest year option.

1. Locate EU_MAX_YEAR in Common/Knowledge Base/Answer Search.
2. Set the maximum year.
   a. To set the maximum value to the current year, clear any existing value so the Value field is blank.
   b. To set a specific year, enter that year in the Value field.
   c. To set an offset (for example, five years from this year), enter the offset value in the Value field. In this example, type +5.
3. Click Save.

Add an Incident Date Field

This example demonstrates adding a custom field, on the Ask a Question page, letting customers tell you how quickly they need an answer to their submitted question.

1. Open Custom Fields in Configuration > Database.
2. Click Incident.
3. Click New.
4. In the Name field, enter Answer Needed By.
5. Click Data Type and select Date Field.
6. In the Column Name field, enter answer_needed.

| Note: | The Column Name cannot contain spaces. |
7. To require customers to complete the field, select Required for Customer Portal.
8. If the Visibility check boxes for End-user Display and Edit are not selected, select both of them.
9. Click Save.

**Determine Unused Widgets**

You can view a list of obsolete custom widgets.

2. Select Widgets Not In Use.
   - Depending on the size of your site, this review can take some time.
3. If the widgets are not actively being worked on, you can remove them from your live site and archive them.

**Logging in to the Customer Portal**

**How Customers Log in to the Customer Portal**

Your customers can log in directly or they can log in through an external site that verifies their identity.

These are the various login methods.

- **Standard login**—Customers use standard login when they log in to your customer portal using the user name and password assigned to them in B2C Service instead of logging in through an external service provider, such as Facebook or PingFederate. Clicking the Log In or Sign Up button (the AccountDropdown widget) in the upper right corner of any customer portal page opens the login window that lets customers log in. Customers who do not yet have an account can click the Create an Account button on the login window to open a form for entering contact information.

- **Open login**—Customers can log in to the customer portal through an external service provider where they already have an account. You can accept verified customer logins from Facebook, Twitter, Google, and Yahoo, and any other open login provider you want to add.

- **Pass-through authentication (PTA)**—You can integrate the customer portal with your organization’s website so your customers can automatically log in to your support site. Although your organization’s web pages may be external to the customer portal, they can pass login parameters through the URL of the customer portal page. As a result, your customers do not have to complete a second login procedure to access your support site. Information sharing between your external site and the customer portal can be used to create and update contact records. To enable pass-through authentication, contact your Oracle account manager.

  - **Encrypted pass-through authentication**—Data encryption transmits customer information even more securely through the customer portal page URL using one of several encryption options. You can configure encrypted PTA so your customers can log in directly to the customer portal as well as log
in with pass-through authentication from your external site. You also have the option of requiring customers to log out through the external site or allowing them to log out from the customer portal. Your Oracle account manager can provide information about encrypted PTA.

- SAML 2.0 open login (single sign-on)—Instead of logging in to the customer portal with their B2C Service user name and password, customers can log in to a third-party identity provider, such as PingFederate or Windows ADFS, which authenticates their identity. Then they select a connection to the customer portal. The identity provider verifies their login, sends an assertion to the customer portal, which verifies the signature and (if successful) logs the customer in.

### Remove the Password Field Using the Configuration Setting

You can turn off the password requirement.

If you remove the Password field using this procedure, customers who already have passwords will still be able to log in with only their user name.

1. Locate EU_CUST_PASSWD_ENABLED under **RightNow User Interface/General**.
2. Click the **Value** drop-down menu and set the value to **No**.
3. Click **Save**.

### Remove the Password Field by Editing Code

You can remove the password requirement from your Customer Portal pages.

If you remove the Password field using this procedure, you will override the value of the EU_CUST_PASSWD_ENABLED configuration setting. Customers who do not have a value in the password field in the database will still be able to log in with only their user name, but customers who have a value in the password field in the database will not be able to log in.

1. Open one of the following files:
   - /views/templates/standard.php
   - /views/templates/mobile.php
2. Locate this text, which should be in the last lines of code for the first AccountDropdown widget.
   ```php
   sub:input_Contact.NewPassword:label_input="#rn:msg:PASSWORD_LBL#" />
   ```
3. Add the `disable_password` attribute to the widget and set the value to true.
   ```php
   disable_password="true"/>
   ```
4. Save the file.

### Change the Password Reference on the Login Page

You can use this process to remove the password label.
Removing the Password field does not automatically change the message bases within the customer portal.

1. Open one of these files:
   - /views/templates/standard.php
   - /views/templates/mobile.php

2. Locate `sub:input:Contact.NewPassword:label_input="#rn:msg:PASSWORD_LBL#" />`, which should be in the last lines of code for the first AccountDropdown widget.

3. Add the `label_assistance` attribute to the widget and set the value to the new message.
   ```html
   label_assistance="Forgot your username?"/>
   ``

4. Save the file.

Remove the Password Link on the Account Overview Page

This example removes the password reference from the Account Overview page.

1. Open `/views/pages/account/overview.php`

2. Delete this code.
   ```html
   <li><a href="/app/account/change_password#rn:session#">#rn:msg:CHANGE_YOUR_PASSWORD_CMD#</a></li>
   ``

3. Save the file.

Remove the Password Link on the Account Settings Page

This process removes password references from the Account Settings page.

If you removed the password by setting the EU_CUST_PASSWD_ENABLED configuration setting to No, this procedure is unnecessary because the page code checks the setting and removes the password link automatically. If you disabled the password by adding the `disable_password` attribute to the AccountDropdown widget on the template, you should perform this procedure.

1. Open one of the Profile page files:
   - /views/pages/account/profile.php
   - /views/pages/mobile/account/profile.php

2. Delete this code.
   ```html
   <rn:condition external_login_used="false">
   <rn:condition config_check="RNW_UI:EU_CUST_PASSWD_ENABLED == true">
   <br/>
   <a href="/app/#rn:config:CP_CHANGE_PASSWORD_URL##rn:session#">#rn:msg:CHANGE_YOUR_PASSWORD_CMD#</a>
   </rn:condition>
   </rn:condition>
   ``

3. Save the file.

Edit Message Bases on the Login Window

Use this process to edit read-only messages set in the system message bases.

1. Open one of these template files:
Edit the Create an Account Form

You cannot add or remove fields on the Create an Account form, but you can change their labels and whether the field is required.

1. Open one of the template files:
   - /views/templates/standard.php
   - /views/templates/mobile.php

2. To edit any of the field labels, edit the `label` attribute of the associated field on the first instance of the AccountDropdown widget and set the value to the new message.
   ```php
   sub:input_Contact/login:label_input="Account Name"
   ```

3. To not require an email address or first name, remove the line of code from the first AccountDropdown widget that contains the required attribute.
   ```php
   sub:input_Contact.Name.First:required="true"
   ```

   **Note:** If you do not require a user name, the customer will see a message that they do not have permission to create a user, so you should not remove the requirement for that field. The Display Name and Last Name fields are required by default. Even if you remove the requirement for the last name or add the required attribute to the display name code and set it to false, those fields will still be required.

4. Save the file.

Edit the Password Label on the Create an Account Form

You can edit the label on the Create an Account form.

If you set a minimum password length that customers must enter, passwords are automatically required.

3. Edit the `label_input` attribute to define password length information.
   
   ```php
   sub:input_Contact.NewPassword:label_input="Password (8 characters minimum)"
   ```

4. Save the file.

## Edit the Create an Account Page

You can edit the Create an Account page to meet the needs of your organization.

1. Open one of the following files:
   - `/views/pages/utils/create_account.php`
   - `/views/pages/mobile/utils/create_account.php`

2. To add a global opt-in field on the Create an Account page, follow these steps.
   a. Locate the following line of code.
      
      ```php
      <rn:widget path="input/CustomAllInput" table="Contact"/>
      ```
   
   b. Add a FormInput widget after the line you located in step A to ask customers if they want to be on your mailing list.
      
      The following sample code adds the widget and also changes the label from the default value of Global Opt-In.
      
      ```php
      <rn:widget path="input/FormInput" name="Contact.MarketingSettings.MarketingOptIn"
                 label_input="Can we add you to our mailing list?"/>
      ```

3. To enable an email confirmation loop, modify the `CP.EmailConfirmationLoop.Enable` setting.
   a. Open the `cp/customer/development/config/siteConfig.json` file.
   b. Set the `CP.EmailConfirmationLoop.Enable` to 1.

4. Save the file.

## Add Fields on the Create an Account Page

You might want to add alternate email address fields and the customer’s mailing address to the page.

1. Open one of these files:
   - `/views/pages/utils/create_account.php`
   - `/views/pages/mobile/utils/create_account.php`

2. To add a contact field, add a line of code that calls the FormInput widget.

   To find the names of all the contact fields you can use for the FormInput widget, click **Framework > Business Objects** on the Customer Portal Administration site.

   ```php
   <rn:widget path="input/FormInput" name="Contact.Emails.ALT1.Address"
              label_input="Alternate Email 1"/>
   <rn:widget path="input/FormInput" name="Contact.Emails.ALT2.Address"
              label_input="Alternate Email 2"/>
   <rn:widget path="input/FormInput" name="Contact.Address.Street"/>
   <rn:widget path="input/FormInput" name="Contact.Address.City"/>
   <rn:widget path="input/FormInput" name="Contact.Address.StateOrProvince"
              label_input="State or Province"/>
   <rn:widget path="input/FormInput" name="Contact.Address.PostalCode"/>
   ```

3. To allow the entry and display of multiple lines in the Street field, add the textarea attribute to the FormInput widget.
4. To add an organization login and password so your customers can be associated with an organization, add this code.

```html
<rn:widget path="input/FormInput" name="Contact.Organization.Login" label_input="Organization Login" />
<rn:widget path="input/FormInput" name="Contact.Organization.NewPassword" label_input="Organization Password" />
```

5. To make the organization login and password required fields, replace the code in the previous step with this code.

```html
<rn:widget path="input/FormInput" name="Contact.Organization.Login" required="true" label_input="Organization Login" />
<rn:widget path="input/FormInput" name="Contact.Organization.NewPassword" required="true" label_input="Organization Password" />
```

6. Save the file.

Remove Fields on the Create an Account Page

Removing the associated widget will remove the field from the page.

1. Open one of the following files:
   - `/views/pages/utils/create_account.php`
   - `/views/pages/mobile/utils/create_account.php`

2. To remove the Email Address field, delete the following line of code.

```html
<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" validate_on_blur="true" initial_focus="true" label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
```

3. To remove the Username field, delete the following line of code.

```html
<rn:widget path="input/FormInput" name="Contact.Login" required="true" validate_on_blur="true" label_input="#rn:msg:USERNAME_LBL#" hint="#rn:msg:TH_PRIVATE_S_LOG_IN_SITE_JUST_WANT_MSG#"/>
```

4. To remove the Display Name field, delete the following line of code.

```html
<rn:widget path="input/DisplayNameInput" label_input="#rn:msg:DISPLAY_NAME_LBL#" hint="#rn:msg:TH_PUBLIC_THATS_DISP_ALONG_COMMENTS_MSG#"/>
```

5. To remove the Password and Verify Password fields, delete the following lines of code.

```html
<rn:condition config_check="EU_CUST_PASSWD_ENABLED == true">
    <rn:widget path="input/FormInput" name="Contact.NewPassword" require_validation="true" label_input="#rn:msg:PASSWORD_LBL#" label_validation="#rn:msg:VERIFY_PASSWD_LBL#"/>
</rn:condition>
```

6. To remove the First Name and Last Name fields, delete the following lines of code.

```html
<rn:condition config_check="intl_nameorder == 1">
    <rn:widget path="input/FormInput" name="Contact.Name.Last" label_input="#rn:msg:LAST_NAME_LBL#" required="true"/>
    <rn:widget path="input/FormInput" name="Contact.Name.First" label_input="#rn:msg:FIRST_NAME_LBL#" required="true"/>
</rn:condition>
```

7. To remove all contact custom fields with end-user visibility, delete the following line of code.
8. Save the file.

Edit the Password Label on the Create an Account Page

You can edit the password label on the Create an Account page.

1. Open one of the Create an Account page files:
   o /views/pages/utils/create_account.php
   o /views/pages/mobile/utils/create_account.php
2. Locate `<rn:widget path="input/FormInput" name="Contact.NewPassword" require_validation="true" label_input="#rn:msg:PASSWORD_LBL#" label_validation="#rn:msg:VERIFY_PASSWDLBL#"/>
3. Edit the label_input attribute of the FormInput widget to define password length information.
   `<rn:widget path="input/FormInput" name="Contact.NewPassword" require_validation="true" label_input="Password (8 characters minimum)" label_validation="#rn:msg:VERIFY_PASSWDLBL#"/>
4. Save the file.

Edit the Password Label on the Change Your Password Page

You can edit the label on the Change Your Password page.

1. Open one of the change password files:
   o /views/pages/account/change_password.php
   o /views/pages/mobile/account/change_password.php
2. Locate `<rn:widget path="input/PasswordInput" name="Contact.NewPassword" require_validation="true" require_current_password="true" label_input="#rn:msg:PASSWORD_LBL#" label_validation="#rn:msg:VERIFY_PASSWDLBL#" initial_focus="true"/>
3. Edit the label_input attribute of the PasswordInput widget to define password length information.
   `<rn:widget path="input/PasswordInput" name="Contact.NewPassword" require_validation="true" require_current_password="true" label_input="Password (8 characters minimum)" label_validation="#rn:msg:VERIFY_PASSWDLBL#" initial_focus="true"/>

   **Note:** Even if you leave the required attribute set to false, setting a minimum password length on the administration interface causes the configuration setting to override the attribute.
4. Save the file.

Prevent User Name Enumeration

This process adds barriers to the Create an Account page, preventing the automated harvesting of user names.

User name enumeration is an automated attempt to retrieve user names in your database for malicious purposes.

2. Locate these lines of code.
   `<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true"/>
validate_on_blur="true"
initial_focus="true" label_input="#rn:msg:EMAIL_ADDR_LBL#/"

<n:widget path="input/FormInput" name="Contact.Login" required="true"
validate_on_blur="true"
label_input="#rn:msg:USERNAME_LBL#" hint="#rn:msg:TH_PRIVATE_S_LOG_IN_SITE_JUST_WANT_MSG#/"

3. Remove the validate_on_blur attribute for both widgets.

4. Locate this line of code.

<n:widget path="input/FormSubmit" label_button="#rn:msg:CREATE_ACCT_CMD#/"
on_success_url="/app/account/overview" error_location="rn_ErrorLocation"/>

5. Edit the code for the Create Account button (the FormSubmit widget) to add the challenge_required attribute.

<n:widget path="input/FormSubmit" label_button="#rn:msg:CREATE_ACCT_CMD#/"
on_success_url="/app/account/overview" error_location="rn_ErrorLocation"
challenge_required="true" />

6. Save the file.

Overview of Open Login

Open login lets your customers log in to the customer portal by logging in through an external service provider where they already have an account.

By using an external service to authenticate customers instead of requiring them to create a separate customer portal account, you offer your customers a faster, more convenient experience. The default login and Create an Account form contain four OpenLogin widgets, each associated with an external service provider: Facebook, Twitter, Google, and Yahoo. When customers click the Create an Account button, the form opens. Instead of completing the contact information fields on the page to create their account, they can click a widget associated with an external provider where they already have an account. After logging in to the external account, an account is created for them automatically in B2C Service.

Note: If you are opening your customer portal pages in iFrames, you should not use open login. Open login directs customers to a third-party site that then redirects them to the customer portal after verification. Because iFrames do not display a URL, customers cannot verify that the third-party login site is legitimate, and security issues are possible. Additionally, some open login providers do not allow their login page to be opened in an iFrame.

Customers who click the Facebook, Twitter, Google, or Yahoo OpenLogin widgets see a message that tells them to log in to the external service and explains that they will then be redirected to your customer portal and logged in. When they click the button above the message, they are taken to the external site to log in (if they are not already logged in). The site asks for permission to send their email address and possibly their name, depending on the site, back to the customer portal. Customers who allow the transfer of information to B2C Service are redirected to the customer portal and logged in automatically.

How Open Login Works

The Customer Portal uses the web industry protocols OAuth and OpenID to let customers log in from their existing accounts on external services.

To allow customers to log in using Facebook, Twitter, and Google, you must define public IDs and private keys for the applications. Additionally, to use Facebook as an open login provider, you must migrate to OAuth 2.0, process a signed_request parameter, and obtain an SSL certificate. The Customer Portal supports OAuth 1.0 – 2.0.
OAuth lets customers grant authorization for your customer portal to access their information from external sites where they have existing accounts.

OpenID lets customers log in to the site, which then confirms their identity to your customer portal, and also lets them specify what customer information can be shared.

**Note:** Customer information includes, at a minimum, an email address, but may contain other information, such as the customer’s full name. The specific information that is shared depends on which external service is providing the customer information.

### Open Login Account Creation

When customers log in to the customer portal using open login, these events occur the first time they log in from the selected service provider.

1. The customer attempts to access a password-protected customer portal page and is directed to the login window. Or, the customer clicks the Sign Up link, opening the Create an Account page.
2. The customer selects one of the open login options.
3. If the customer is not logged in to the external service provider, the third-party login page opens to allow login, and the provider verifies the customer’s identity.
4. The external service lets the customer know that the customer portal is requesting specific account information and asks the customer for permission to share that information.
5. When the customer grants permission for the external site to share information with the customer portal, the site gives the customer’s information to B2C Service.
6. A contact record for the customer is created in the database using the email address and, if available, the customer’s name. The contact record uses the customer’s email address as the login/username with a null password.
7. The customer is logged in to the customer portal.

### Open Login Process

The following events occur when a customers has logged in to the customer portal using one of their external service accounts but try to use open login again.

1. The customer tries to access the customer portal by logging in through an external site.
2. The external site verifies the customer and sends the customer’s information to the customer portal. If the customer previously gave permission for more than one-time use, this step occurs automatically and the customer does not see the provider page, but is logged in to the customer portal and directed to the Support Home page.
3. The customer portal looks up the customer using the account’s user ID (provided by Twitter and Facebook and stored as contact2channel_type.userid) or the OpenID URL (used by Google, Yahoo, and other OpenID providers, stored as openid_account.openid_url).
4. The customer portal then checks the customer’s login, which should still be the email address, as it was when the contact record was created. If the login is blank for any reason (for example, a staff member deleted it), the login field is repopulated with the customer’s email address.
5. The customer’s email address, as received from the external site, is checked against the email address in the database. If the two addresses do not match, the contact record is updated with the email address from the external site. However, the customer’s login, which is the original email address, is not updated.

6. If the customer does not have a first or last name in the database but that information is received from the external service, the first name and last name fields are updated in the database.

The process is slightly different when customers use an open login from a different external site than the one used to create the contact record in B2C Service. If the open login account the customer is using on this visit does not match other open logins associated with the contact record, the account’s OpenID URL is added to the contact record. By default, customers who use external login to access your customer portal, whether through open login or pass-through authentication, cannot edit their account information on the Account Settings (profile.php) page. If you remove the external login condition on the FormSubmit button—which we recommend against doing—you must also add the allow_external_login_updates attribute before the Save Changes button is available to customers.

**Change the Open Login Options**

You can change the open login options or remove them entirely.

2. Locate `sub:input_Contact.NewPassword:label_input="#rn:msg:PASSWORD_LBL#"` />, which should be in the last lines of code for the first instance of the AccountDropdown widget.
3. Add the `open_login_providers` attribute to the widget and set the value to the providers you want to list.
   ```php
   open_login_providers="facebook,google"/>
   ```
4. Save the file.

**Remove the Open Login Options**

Remove the open login options to restrict customers from using another provider to login to your customer portal.

2. Locate this text, which should be in the last lines of code for the first instance of the AccountDropdown widget.
   ```php
   sub:input_Contact.NewPassword:label_input="#rn:msg:PASSWORD_LBL#" />
   ```
3. Add the `open_login_providers` attribute to the widget and set the value to null.
4. Add the `label_open_login_intro` attribute and set its value to null.
   ```php
   open_login_providers="" label_open_login_intro=""/>
   ```
5. Save the file.

**Remove All OpenLogin Widgets**

This example removes all OpenLogin widgets from the default Create an Account page requiring customers to create a new user account.

1. Open a Create an Account page file:
   - `/views/pages/utils/create_account.php`
   - `/views/pages/mobile/utils/create_account.php`
2. Delete the following lines of code.
Remove an OpenLogin Widget

You can remove the OpenLogin widget associated with specific external providers.

1. Open a Create an Account page file:
   - /views/pages/utils/create_account.php
   - /views/pages/mobile/utils/create_account.php

2. Identify the widgets you want to remove.

   The code `<rn:widget path="login/OpenLogin"/>` is for the Facebook widget. All other widgets include the provider’s name in the controller_endpoint, label_service_button, label_process_explanation, and label_login_button attributes.

   For example, here is the widget to log in with a Google account as it appears on the Create an Account page.

   `<rn:widget path="login/OpenLogin"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"/>

3. Delete the lines of code associated with open login providers you want to remove from the page.
4. Save the page.
Change Labels on OpenLogin Widgets

This example demonstrates editing the labels on the Google OpenLogin widget.

1. Open one of these files:
   - /views/templates/standard.php
   - /views/templates/mobile.php

2. Locate `sub:input:_Contact.NewPassword:label_input="rn:msg:PASSWORD_LBL" />`, which should be in the last lines of code for the first instance of the AccountDropdown widget.
   a. To change the label on the login button, add the `label_login_button` attribute to the widget and set the value to the new message.
      ```html
      sub:openlogin_google:label_login_button="Use Google to log in now" />
      ```
   b. To change the label that explains the process to customers, add the `label_process_explanation` attribute and set the value to the new message.
      ```html
      sub:openlogin_google:label_process_explanation="Google will verify you and log you in instantly."
      ```
   c. To change the “What will happen:” label in the explanation area, add the `label_process_header` attribute and set the value to the new message.
      ```html
      sub:openlogin_google:label_process_header="Why it is okay to do this" />
      ```
   d. To edit the email labels that appear when the service provider authenticates the customer but does not provide the customer’s email address, add any of the following widget attributes to the code: `label_email_address`, `label_email_prompt`, `label_email_prompt_cancel_button`, `label_email_prompt_submit_button`, and `label_email_prompt_title`.
      ```html
      sub:openlogin_google:label_email_prompt="We’ll get you started just as soon as you enter your email address." />
      ```
   e. To change the text label, add the `label_service_button` attribute and set the value to the new message.
      ```html
      sub:openlogin_google:label_service_button="Google Login" />
      ```

3. Save the file.

How Contacts are Created in the Database

B2C Service creates contact records with information passed from the external service.

When the customer portal receives the customer’s email address from the external provider, it creates a contact record in the Oracle database. (If the email address is not received, a contact cannot be created and customers see a message that asks them for their email address or lets them know an account was not created.) If the customer’s name has been transferred from the external provider, that information is also added to the contact record. The Login field of the record on the agent desktop (which is the Username field on the customer portal) is populated with the customer’s email address, and the password is null. Customers whose contact records have been disabled on the agent desktop cannot log in through open login.

Customers can continue to log in through open login with a null password, but they cannot log in to the customer portal directly until they set a password using the standard customer portal protocol. Customers who log in through open login can create a password on the customer portal by clicking the Change Your Password link on the Account Settings.
B2C Service
Using B2C Service

Customer Portal

They can then log in to the customer portal using their login and password, or they can continue to log in through open login.

B2C Service keeps track of all open login accounts a customer uses to prevent duplicate contact records. When a customer’s email address is provided from the external service and it matches an email address in the database, the application finds the existing contact and adds a new channel or OpenId for the customer. The database table openid_accounts keeps track of the different OpenID accounts customers use to log in by mapping OpenIDs to contact IDs.

OpenID URLs

Using the openid_placeholder attribute of the OpenLogin widget, you can preset the URL that displays and include the user name.

By default, the WordPress and OpenID widgets use the OpenID protocol and have the openid attribute set to true.

For the WordPress OpenLogin widget, you would edit the widget code to remove the preset_openid_url attribute and include:

```html
openid_placeholder="https://openid.wordpress.com/[username]"
```

However, you might want the increased security by hiding the URL so the customer sees only a user name field to complete. The preset_openid_url attribute defines the URL but does not expose it on the page. The reference implementation uses these attributes to hide the URL and name the default placeholder “Your WordPress username.”

```html
preset_openid_url="https://openid.wordpress.com/[username]"
openid_placeholder="[#rn:msg:YOUR_WORDPRESS_USERNAME_LBL#]"
```

Support Home Page

Remove the Search Field from Home Pages

You can remove the search field from your Customer Portal home pages.

1. Open one of the following files:
   - /views/pages/home.php
   - /views/pages/mobile/home.php
   - /views/pages/social/home.php

2. Delete the following code from the page.

```html
<div class="rn_SearchControls">
  <h1 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_CMD#</h1>
  <form method="get" action="/app/results">
    <rn:container source_id="KFSearch">
      <div class="rn_SearchInput">
        <rn:widget path="searchsource/SourceSearchField" initial_focus="true"/>
      </div>
      <rn:widget path="searchsource/SourceSearchButton" search_results_url="/app/results"/>
    </rn:container>
  </form>
</div>
```
3. Save the file.

Configure the VisualProductCategorySelector Widget

The VisualProductCategorySelector widget displays products (by default) or categories on the Support Home page.

1. Open one of the Home page files:
   - /views/pages/home.php
   - /views/pages/mobile/home.php
3. To display categories instead of products, add the type attribute.
   `<rn:widget path="navigation/VisualProductCategorySelector" type="category"/>`
4. To change the default number of products or categories that are displayed, add the maximum_items attribute.
   `<rn:widget path="navigation/VisualProductCategorySelector" maximum_items="12"/>`
5. To display a specific list of products or categories, add the top_level_items attribute and use the ID numbers, separated by commas, of the products or categories you want to list.
   `<rn:widget path="navigation/VisualProductCategorySelector" top_level_items="12,13,6"/>`
6. Save the file.

Edit the Popular Published Answers Section

The Support Home page contains a list of popular published answers generated by the TopAnswers widget.

1. Open one of the home page files:
   - /views/pages/home.php
   - /views/pages/mobile/home.php
2. To customize the heading, select all code between the `<h2>` and `</h2>` tags and enter a title.
   `<h2>#{rn:msg:POPULAR_PUBLISHED_ANSWERS_LBL#}</h2>`
3. To change the number of displayed answers, edit the limit attribute of the TopAnswers widget to replace 5 with the number of answers you want to display.
   `<rn:widget path="reports/TopAnswers" show_excerpt="true" limit="5"/>`
4. To shorten the length of the displayed answer excerpt from the default (and maximum) value of 256 characters, add the excerpt_max_length attribute and set the value to the length you want.
   `<rn:widget path="reports/TopAnswers" show_excerpt="true" limit="5" excerpt_max_length="100"/>`
5. To remove excerpts of answers, remove the show_excerpt attribute from the TopAnswers widget.
   `<rn:widget path="reports/TopAnswers" limit="5" />`
6. To open URL and file attachment answers in the same tab instead of opening in a new tab, as they do by default, add the url_type_target attribute and set it to "_self."
   `<rn:widget path="reports/TopAnswers" show_excerpt="true" limit="5" url_type_target="_self" />`
7. Save the file.
Edit the Recent Community Discussions Section

The Support Home page displays a list of recent community discussions, generated by the RecentlyAnsweredQuestions widget, that have a best answer selection.

1. Open one of the home page files:
   - /views/pages/home.php
   - /views/pages/mobile/home.php

2. To customize the heading, select all code between the <h2> and </h2> tags and enter a title.
   ```html
   <h2>$rn:msg:RECENT_COMMUNITY_DISCUSSIONS_LBL$</h2>
   ```

3. To display only questions that have a best answer designated by the original author of the question, add the answer_type attribute to the widget and set its value to “author.”
   ```html
   <rn:widget path="discussion/RecentlyAnsweredQuestions" show_excerpt="true" maximum_questions="5" answer_type="author"/>
   ```

4. To display only questions that have a best answer designated by a moderator of the question, add the answer_type attribute to the widget and set its value to “moderator.”
   ```html
   <rn:widget path="discussion/RecentlyAnsweredQuestions" show_excerpt="true" maximum_questions="5" answer_type="moderator"/>
   ```

5. To change the number of displayed questions, edit the maximum_questions attribute of the widget to replace 5 with the number of questions you want to display.
   ```html
   <rn:widget path="discussion/RecentlyAnsweredQuestions" show_excerpt="true" maximum_questions="5"/>
   ```

6. To shorten the length of the displayed question excerpt from the default (and maximum) value of 256 characters, add the excerpt_max_length attribute and set the value to the length you want.
   ```html
   <rn:widget path="discussion/RecentlyAnsweredQuestions" show_excerpt="true" maximum_questions="5" excerpt_max_length="100"/>
   ```

7. To shorten the length of the displayed best answer excerpt from the default value of 150 characters, add the answer_text_length attribute and set the value to the length you want.
   ```html
   <rn:widget path="discussion/RecentlyAnsweredQuestions" show_excerpt="true" maximum_questions="5" answer_text_length="100"/>
   ```

8. To remove excerpts of questions, remove the show_excerpt attribute from the RecentlyAnsweredQuestions widget.
   ```html
   <rn:widget path="discussion/RecentlyAnsweredQuestions" maximum_questions="5"/>
   ```

9. To change the size of avatars from the default value of medium, add the avatar_size attribute to the widget and select one of the following values: none, small, large, or xlarge.
   ```html
   <rn:widget path="discussion/RecentlyAnsweredQuestions" show_excerpt="true" maximum_questions="5" avatar_sizes="small"/>
   ```

10. Save the file.

Add an Unanswered Questions Section

You can display a list of recent community discussions on your Support Home page.

2. Add this code where you want the section to appear.

```html
<div class="rn_PopularSocial">
  <div class="rn_Container">
    <h2>Unanswered Questions</h2>
    <rn:widget path="discussion/RecentlyAskedQuestions" show_excerpt="true" maximum_questions="4"
      questions_with_comments="no_comments"/>
    <span class="rn_DiscussionsLink">
      <a href="/app/social/questions/lists/kw/*#rn:sessions#">#rn:msg:SHOW_MORE_COMMUNITY_DISCUSSIONS_LBL#</a>
    </span>
  </div>
</div>

3. Save the file.

Search Results Pages

Edit the Search Results Page

You can change what information displays related to published answers from the knowledge base and community discussions.

1. Open one of the Search Results page files:
   - /views/pages/results.php
   - /views/pages/mobile/results.php

2. Find the container that includes the SourceResultListing widget.

3. To change the number of displayed answers from the default of five, edit the per_page attribute and set the value to the number of answers you want to display.

```html
<rn:container source_id="KFSearch" per_page="3">
</rn:container>
```

4. To hide the Published Answers section if no search results match, add the hide_when_no_results attribute and set it to true.

```html
<rn:widget path="searchsource/SourceResultListing"
  label_heading="#rn:msg:PUBLISHED_ANSWERS_LBL#" hide_when_no_results="true" />
```

5. To disable search term highlighting in the Published Answers section, add the highlight attribute and set it to false.

```html
<rn:widget path="searchsource/SourceResultListing"
  label_heading="#rn:msg:PUBLISHED_ANSWERS_LBL#" highlight="false" />
```

6. To truncate the length of published answers to something other than the default value of 200 characters, add the truncate_size attribute and set it to the value you want.

```html
<rn:widget path="searchsource/SourceResultListing"
  label_heading="#rn:msg:PUBLISHED_ANSWERS_LBL#" truncate_size="100" />
```

7. To change the number of community discussions from the default of five, change the per_page attribute and set the value to the number of discussions you want to display.

```html
<rn:container source_id="SocialSearch" per_page="8">
<rn:widget path="searchsource/SocialResultListing"
  label_heading="#rn:msg:RESULTS_FROM_THE_COMMUNITY_LBL#" more_link_url="/app/social/questions/list" show_dates="false"/>
```
9. To hide the Results from the Community section if no search results match, add the hide_when_no_results attribute and set it to `true`.

   `<rn:widget path="searchsource/SocialResultListing" label_heading="#rn:msg:RESULTS_FROM_THE_COMMUNITY_LBL#" more_link_url="/app/social/questions/list" hide_when_no_results="true" />

10. To disable search term highlighting in the Results from the Community section, add the highlight attribute and set it to `false`.

   `<rn:widget path="searchsource/SocialResultListing" label_heading="#rn:msg:RESULTS_FROM_THE_COMMUNITY_LBL#" more_link_url="/app/social/questions/list" highlight="false" />

11. To truncate the length of community questions to something other than the default value of 200 characters, add the truncate_size attribute and set it to the value you want.

   `<rn:widget path="searchsource/SocialResultListing" label_heading="#rn:msg:RESULTS_FROM_THE_COMMUNITY_LBL#" more_link_url="/app/social/questions/list" truncate_size="100" />

12. To hide selected metadata, add the show_metadata attribute and remove the comment_count or best_answers options.

   `<rn:widget path="searchsource/SocialResultListing" show_metadata="comment_count" />

13. Save the file.

---

**Edit the Published Answers Page**

You can modify what displays on the Published Answer page.

Your customers access the Published Answers page by clicking the Show More Published Answers link on the Support Home page or on the Results page. They can enter search terms and filter published answers by product and category.

1. Open one of the Answer List page files:
   - `/views/pages/answers/list.php`
   - `/views/pages/mobile/answers/list.php`

2. To change the number of displayed answers from the reference implementation's default value of five answers, follow these steps.
   a. Change the per_page attribute of the container that includes the SourceResultListing widget and set the value to the number of answers you want to display.

   `<rn:container source_id="KFSearch" per_page="8" history_source_id="KFSearch">

   b. Add the per_page attribute to the Multiline widget and set the same value as you defined in the SourceResultListing widget.

   `<rn:widget path="reports/Multiline" show_answer_update_date_field="false" per_page="8" />

3. To truncate the length of published answers to something other than the default value of 200 characters, follow these steps.
   a. Add the truncate_size attribute to the SourceResultListing widget and set it to the value you want.

   `<rn:widget path="searchsource/SourceResultListing" more_link_url="" truncate_size="100" />

   b. Add the truncate_size attribute to the Multiline widget and set it the same value as you defined in the SourceResultListing widget.

   `<rn:widget path="reports/Multiline" show_answer_update_date_field="false" truncate_size="100" />

4. To remove the icon for the RSS feed, delete `<rn:widget path="knowledgebase/RssIcon" />

---

ORACLE
5. Save the file.

### Change the Search Report

You can use any report on the Answers page, as long as it contains the answers.special_settings filter.

The default search report on the Published Answers page is Answers–Complex Expressions Search Default.

1. Open one of these files:
   - `/views/pages/answers/list.php`
   - `/views/pages/mobile/answers/list.php`
2. Locate `<rn:container report_id="176">`.
3. Replace `176` with the report ID of the answers report you want to open when the customer conducts a search.
4. Save the file.

### Check for the answers.special_settings Filter

Answers reports used on the customer portal must contain the answers.special_settings filter.

If you are using a custom answers report, make sure it includes the answers.special_settings filter.

All standard answers reports for the customer portal already include the filter.

1. Double-click **Reports Explorer** in **Analytics**.
2. Locate the custom answers report you want to use on the customer portal, right-click it, and select **Edit**.
3. Click **Filters**.
4. Locate special settings is null in the list of filters on the window.
5. If the special settings filter is not present in the list, add it.
   a. Click **Add Filter**.
   b. Enter **special settings is null** in the Name field.
   c. Enter **answers.special_settings** in the Expression field.
   d. Select **is null** in the Operator drop-down menu.
      
      **Note:** If the “is null” option is not available in the Operator menu, be sure the check box for Make this filter selectable at runtime is cleared.
   
   e. Click **OK**.
6. Click **OK**.
7. Click **Save**.

### Use a Grid Report on the Published Answers Page

You can use a grid report to display search results in tabular form.

By default, the Published Answers page displays search results in a multiline format.

2. Locate this code.
   
   `<rn:widget path="reports/Multiline" show_answer_update_date_field="false" />`
3. Replace the Multiline widget with the Grid widget.
Copy the Standard Answers Report

Users with report editing permissions can use the Standard Answers report to create a custom report and replaces the standard report.

1. Double-click Reports Explorer in Analytics.
2. Click Find.
3. Select ID in Find Using.
4. Select Equal To.
5. Enter 176 in the field.
6. Click Find.
7. Right-click the report and select Copy.
8. Enter a name for the custom report you are going to create in the Name field.
9. Click OK.

Edit a Custom Report

This example edits a custom report to open answers in a separate window.

Users must have report edit permissions.

1. With the Reports explorer open, locate the custom report you want to edit.
2. Right-click the report and select Edit.
3. Right-click the Summary column and select Insert New Column Before.
4. Enter Link Target in the Heading field.
5. Place the cursor in the Expression field to the right of the Available Columns/Functions.
6. Enter if((answers.type = 2 | answers.type = 3), '_blank') in the Expressions field.
7. Click OK.
8. Right-click the Link Target column and select Hide Column.
9. Right-click the Summary column and select Edit Format.
10. Click URL > Advanced URL Definition.
11. Click Target and select Link Target.
12. Click OK.
13. Click Home.
   a. Click Definition.
   b. Select View.
   c. Note the AcId number.
15. Click Save.
Replace the Standard Report

This example replaces the standard report with a custom report that opens URL and file attachment answers in a separate browser window.

2. Locate `<rn:container report_id="176">`.
3. Replace 176 with the ID number for the custom report you created.
4. Save the file.

Edit the Results from the Community Page

Community discussions can be filtered by product, age, and questions that have a best answer.

2. To remove the Filter by Product filter, delete this code.
   ```xml
   <rn:widget path="searchsource/SourceProductCategorySearchFilter" verify_permissions="true"/>
   ```
3. To remove the Filter by Age filter, delete this code.
   ```xml
   <rn:widget path="searchsource/SourceFilter" filter_type="updatedTime"
   ```
4. To remove the Filter by Best Answer filter, delete this code.
   ```xml
   <rn:widget path="searchsource/SourceFilter" filter_type="numberOfBestAnswers"
   label_default="--" labels="#rn:php:/RightNow/Utils/Config::getMessage(YES_LBL) . ',,' . /RightNow/Utils/Config::getMessage(NO_LBL)#" label_input="#rn:msg:FILTER_BY_BEST_ANSWER_LBL#"/>
   ```
5. To change the number of displayed questions from the default of 10, edit the `per_page` attribute in the container that includes the SocialResultListing widget and change its value to the number of questions you want to display.
   ```xml
   <rn:container source_id="SocialSearch" per_page="5" history_source_id="SocialSearch"> ...
   ```
6. To truncate the length of published questions to something other than the default value of 200 characters, add the `truncate_size` attribute to the SocialResultListing widget and set it to the value you want.
   ```xml
   <rn:widget path="searchsource/SocialResultListing" more_link_url="" truncate_size="100" />
   ```
7. To hide selected metadata, add the `show_metadata` attribute and remove the `comment_count` or `best_answers` options.
   ```xml
   <rn:widget path="searchsource/SocialResultListing" show_metadata="comment_count" />
   ```
8. Save the file.
Configure the Contact Us Section

You can configure the contact us section of the Search Results page.

1. Open the Search Results page to configure the sidebar.
2. To remove the Ask a Question link, add the channels attribute to the ContactUs widget and set the value to *community, chat, feedback*.
   
   ```xml
   <rn:widget path="utils/ContactUs" channels="community,chat,feedback" />
   ```

3. To remove the Ask the Community link, add the channels attribute to the ContactUs widget and set the value to *question, chat, feedback*.
   
   ```xml
   <rn:widget path="utils/ContactUs" channels="question,chat,feedback" />
   ```

4. To remove the Live Chat link, add the channels attribute to the ContactUs widget and set the value to *question, community, feedback*.
   
   ```xml
   <rn:widget path="utils/ContactUs" channels="question,community,feedback" />
   ```

5. To remove the Give Feedback link, add the channels attribute to the ContactUs widget and set the value to *question, community, chat*.
   
   ```xml
   <rn:widget path="utils/ContactUs" channels="question,community,chat" />
   ```

6. Save the page.

Configure the Recently Viewed Section

You can configure the recently viewed items available on various pages including the Search Results, the Answer Details, and the Community Results pages.

1. Open the file for the page you want to configure the sidebar.
2. To change the Recently Viewed heading, add the label_heading attribute to the RecentlyViewedContent widget and set the value to the new heading.
   
   ```xml
   <rn:widget path="discussion/RecentlyViewedContent" label_heading="New Label" />
   ```

3. To change the number of recently viewed answers and discussions from the default of 5, add the content_count attribute to the widget and set the new value. (If you do not want to set a limit, set the attribute to 0.)
   
   ```xml
   <rn:widget path="discussion/RecentlyViewedContent" content_count="3" />
   ```

4. To change the number of characters that are displayed for each answer or discussion from the default value of 50 characters, add the truncate_size attribute and set the new value.
   
   ```xml
   <rn:widget path="discussion/RecentlyViewedContent" truncate_size="100" />
   ```

5. To display only discussions, add the content_type attribute and set the value to *questions*.
   
   ```xml
   <rn:widget path="discussion/RecentlyViewedContent" content_type="questions" />
   ```

6. To display only published answers, add the content_type attribute and set the value to *answers*.
   
   ```xml
   <rn:widget path="discussion/RecentlyViewedContent" content_type="answers" />
   ```

7. To remove the Recently Viewed section, delete `<rn:widget path="discussion/RecentlyViewedContent"/>`.
8. Save the page.
Configure SummaryResultListing on the Published Answers Page

The SummaryResultListing widget displays the Community Results section in the sidebar of the Published Answers page to show community discussions related to the search term.

1. Open one of these files and locate the associated code.
   - `/views/pages/answers/list.php`
     ```xml
     <rn:widget path="searchsource/SummaryResultListing" label_heading="#rn:msg:COMMUNITY_RESULTS_LBL#" results_type="SocialQuestions" more_link_url="/app/social/questions/list" per_page="10"/>
     ```
   - `/views/pages/social/questions/list.php`
     ```xml
     <rn:widget path="searchsource/SummaryResultListing" hide_when_no_results="true" label_heading="#rn:msg:PUBLISHED_ANSWERS_LBL#" per_page="10"/>
     ```

2. To change the number of displayed results from the default of 10, change the value of the `per_page` attribute to the value you want.
3. To disable search term highlighting, add the `highlight` attribute and set it to `false`.
4. To change the length of the question title from the default of 35 characters, add the `truncate_size` attribute and set it to the length you want.
5. To hide the heading when there are no related community discussions, add the `hide_when_no_results` attribute and set it to `true`.
6. Save the file.

Configure the Provide Feedback Dialog

The Provide Feedback dialog opens when customers click the Give Feedback sidebar link.

If the customer is not logged in, the dialog contains two required fields: the email address and a feedback field. If the customer is logged in, the incident created by the feedback is automatically associated with the customer and only the Your Feedback field appears on the dialog.

1. Open the Search Results page.
2. To change the Provide Feedback header, add the `label_dialog_title` attribute to the ContactUs widget and set its value to the new header.
   ```xml
   <rn:widget path="utils/ContactUs" label_dialog_title="New Provide Feedback Header Label" />
   ```
3. To change the confirmation message, add `label_feedback_confirmation="New Confirmation Message"` to the widget code.
4. To point your customers to a different feedback page instead of the Provide Feedback window, follow these steps:
   a. Create the page you want to open, name it, and place it in `/cp/customer/development/views/pages` folder or a subfolder.
   b. Add the `feedback_page_url` attribute to the Contact Us widget and set its value to the new page you have created.
   ```xml
   <rn:widget path="utils/ContactUs" feedback_page_url="/app/utils/your_custom_feedback_page" />
   ```
5. Save the page.
Answer and Question Details Pages

Overview of the Answer and Question Details Pages

When customers select an answer on an Answers report, the Answer Details page opens. When customers select a Recent Community discussion on the Support Home page, the Question Details page opens.

The Answer Details and Question Details pages (views/pages/answers/detail.php or views/pages/social/questions/detail.php) display:

- a summary of the answer or question
- the question and answer text
- the dates when the question or answer were published and updated
- any files that are attached to the answer or question
- a feedback section
- links for sharing, printing, emailing, and subscribing

The page sidebar has a section for channels that customers can use to contact your organization, a section for recently viewed content, and a section for related answers from your knowledge base.

The Details pages also contain the GuidedAssistant widget, which walks customers through a series of questions to help them locate information that may provide additional information to answer their questions.

Depending on how an answer was configured, it may or may not be visible to all customers on the Answer Details page. Many factors control answer visibility, including:

- the answer status
- the answer access level
- the answer language
- the associated products and categories
- conditional sections
- the customers’ SLAs

This is also true of answers that have been reached through a guide on your customer portal. For example, if an answer or section of an answer is available only to customers whose SLAs give them permission to view certain answer access levels, that answer will not be visible to customers without that SLA even if they click an answer in a guide.

If you want to keep the answers in your knowledge base from being available to the general public, you must require login on both the Answers and the Answer Details page. If both pages do not have the same login requirement, a warning will appear when you stage and promote your customer portal.

For search engine optimization, the source code for the Answer Details page includes a tag that contains the title of the answer. The title is all lowercase and the words are separated by hyphens. Punctuation in a title is escaped and the title uses a maximum of 80 characters.

The link tag is automatically added to the <head> section of the answer and uses this form.

```
<link rel="canonical" href="http://www.example.com/app/answers/detail/a_id/<answerID>"
```
Edit Date Labels on the Answer Details Page

This example shows how to edit the labels associated with the publication date of the answer and the date it was last updated.

2. Locate this code.

   #rn:msg:PUBLISHED_LBL# <span itemprop="dateCreated"><rn:field name="Answer.CreatedTime" /></span> &nbsp;&nbsp;|&nbsp;&nbsp;&nbsp; #rn:msg:UPDATED_LBL# <span itemprop="dateModified"><rn:field name="Answer.UpdatedTime" /></span>

3. Edit the code to reflect your label changes.

   This answer was first published on <span itemprop="dateCreated"><rn:field name="Answer.CreatedTime" /></span> &nbsp;&nbsp;|&nbsp;&nbsp;&nbsp; This answer was last updated on <span itemprop="dateModified"><rn:field name="Answer.UpdatedTime" /></span>

4. To remove the dates, delete the code you previously located.

   #rn:msg:PUBLISHED_LBL# <span itemprop="dateCreated"><rn:field name="Answer.CreatedTime" /></span> &nbsp;&nbsp;|&nbsp;&nbsp;&nbsp; #rn:msg:UPDATED_LBL# <span itemprop="dateModified"><rn:field name="Answer.UpdatedTime" /></span>

5. Save the file.

Disable Search Term Highlighting

You can turn off the default highlighting of search terms on the Answer Details page.

1. Open one of the answer details files:
   - /views/pages/answers/detail.php
   - /views/pages/mobile/answers/detail.php
2. Locate this code.

   <h1 id="rn_Summary"><rn:field name="Answer.Summary" highlight="true"/></h1>
   ...
   <rn:field name="Answer.Question" highlight="true"/>
   ...
   <rn:field name="Answer.Solution" highlight="true"/>

3. Remove highlight="true" from each line.
4. Save the file.
Modify the File Attachments Display

You can configure the display to sort the attachments, remove file size information, remove thumbnails, and prevent the display of file attachments.

2. Locate <rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
   label="#rn:msg:ATTACHMENTS_LBL#"/>
3. To sort the file attachment list numerically and alphabetically, edit the DataDisplay widget to add the sort_by_filename attribute and set its value to true.
   <rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
   label="#rn:msg:ATTACHMENTS_LBL#" sort_by_filename="true" />
4. To remove the file attachment size information, add the display_file_size attribute and set it to false.
   <rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
   label="#rn:msg:ATTACHMENTS_LBL#" display_file_size="false" />
5. To remove file attachment thumbnail, add the display_thumbnail attribute and set it to false.
   <rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
   label="#rn:msg:ATTACHMENTS_LBL#" display_thumbnail="false" />
6. To prevent displaying answer file attachments on the answer details page, delete this code.
   <div id="rn_FileAttach">
     <rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
     label="#rn:msg:ATTACHMENTS_LBL#" />
   </div>
7. Save the file.

GuidedAssistant Guides

The sets of branching questions used by the GuidedAssistant widget are called guides, and they are created on the administration interface.

The default Answer Details page includes the GuidedAssistant widget, which helps your customers locate solutions to their problems when they answer questions presented to them on the customer portal. Guides can be associated with individual answers so that when your customers select an answer, the GuidedAssistant widget appears on the Answer Details page. (If the selected answer is not associated with a guide, the widget will not appear.) Or you can select one guide you want to always appear on the page regardless of which answer is opened.

If you define a guide ID in the widget code, that guide will be displayed even if another guide is already associated with the selected answer. If the widget code does not specify a guide, the page displays the guide associated with the answer that is selected, if it has one.

You can configure guides to pass parameters to the Ask a Question page. If, for instance, your customer reaches the end of a guide and still doesn’t have the answer to a question, you can ask for product and category information that will be passed in the URL to the Ask a Question page to populate those fields automatically.

Be sure to check your guides as they appear on the Customer Portal. Image type questions can benefit from additional configuration to display effectively. It’s a good idea to leave additional space to the left of the image and include the caption as part of the image rather than separately. Images that are roughly 350 pixels by 200 pixels display optimally.
Open the Same Guide on Every Answer

By defining the guide ID in the widget code, you can override the answer-guide association and specify one guide open on the Answer Details page regardless of the answer.

1. Open one of the following files:
   - /views/pages/answers/detail.php
   - /views/pages/mobile/answers/detail.php
2. Locate the following code.
   `<rn:widget path="knowledgebase/GuidedAssistant" />`
3. Edit the GuidedAssistant widget to add the `static_guide_id` attribute and specify the ID of the guide.
   `<rn:widget path="knowledgebase/GuidedAssistant" static_guide_id="21" />`
4. Save the page.

Open Guides in a Separate Window

You can open guides from the Answer Details page in a separate window.

1. Create a PHP page that contains the GuidedAssistant widget and place it in a `development` folder. In this example, we'll call the page `guide.php` and place it in the `/development/views/pages` folder.
   ```html
   <rn:meta title="Guides" template="standard.php" />
   <div id="rn_PageContent">
     <div class="rn_AnswerDetail">
       <dl class="rn_Overview">
         <rn:widget path="knowledgebase/GuidedAssistant" />
       </dl>
     </div>
   </div>
   ```
3. Locate this code.
   ```html
   <rn:widget path="knowledgebase/GuidedAssistant" />
   ```
4. Edit the GuidedAssistant widget.
   - To add the `popup_window_url` attribute to specify the guide page you just created.
     ```html
     <rn:widget path="knowledgebase/GuidedAssistant" popup_window_url="/app/guide" />
     ```
   - To add the `call_url_new_window` attribute.
     ```html
     <rn:widget path="knowledgebase/GuidedAssistant" call_url_new_window="true" />
     ```
5. Save the file.

Open Answers Inline

You can open answers inline instead of a separate window, which is the default.

2. Locate this code.
Display Only the Current Question

You can configure the GuidedAssistant widget to display only the current question.

2. Locate <rn:widget path="knowledgebase/GuidedAssistant"/>
3. Add the single_question_display attribute and set it to true.
   <rn:widget path="knowledgebase/GuidedAssistant" single_question_display="true"/>
4. Save the file.

Edit Labels on the GuidedAssistant Widget

These attributes can change the labels displayed in your GuidedAssistant widget.

2. Locate <rn:widget path="knowledgebase/GuidedAssistant"/>
3. Edit the GuidedAssistant widget labels.
   - To change the default label "Please consult the following information", edit the label_answer_result attribute.
   - To change the default label "Launch the Troubleshooter", edit the label_popup_launch_button attribute.
     <rn:widget path="knowledgebase/GuidedAssistant" popup_window_url="/app/guide" label_popup_launch_button="Open Help System"/>
   - To change the default label "Go back to previous question", edit the label_question_back attribute.
   - To change the default label "Start over", edit the label_start_over attribute.
   - To change the default label "OK", edit the label_text_response_button attribute.
   - To change the default label "(Null)", edit the label_text_result attribute.
4. Save the file.

Remove the GuidedAssistant Widget

You can remove the GuidedAssistant widget from your site.

2. Delete <rn:widget path="knowledgebase/GuidedAssistant"/>
3. Save the file.
Add Fields on the Answer Details Page

You might want to provide additional information about the answer being viewed on the Answer Details page.

1. Open one of the listed files and find the line of code:
   - `/views/pages/answers/detail.php`
     <rn:field name="Answer.Question" highlight="true"/>
   - `/views/pages/mobile/answers/detail.php`
     <rn:field name="Answer.Solution" highlight="true"/>

2. Add the appropriate code below the previously located code.
   - To add the answer's ID, add `<p>Answer ID <rn:field name="Answer.ID" /></p>`.
   - To add product information for the answer, add `<rn:widget path="output/DataDisplay" name="Answer.Products" />`.
   - To add category information for the answer, add `<rn:widget path="output/DataDisplay" name="Answer.Categories" />`.

3. Save the file.

Change the Answer Feedback Page

You can create an Answer Feedback page where your customers will be redirected when they submit feedback that is below the specified threshold.

For this example, let's assume that your page name is `new_answer_feedback_page.php` and that you have stored it in `views/pages/answers`.

2. Add the `feedback_page_url` attribute to the AnswerFeedback widget and set its value to the new feedback page.
   ```xml
   <rn:widget path="feedback/AnswerFeedback" label_title="#rn:msg:IS_THIS_ANSWER_HELPFUL_LBL#" feedback_page_url="/app/answers/new_answer_feedback_page" />  
   ```
3. Save the file.

Offer Alternate Feedback Options

You can offer your customers more than the default Yes and No options as a response to the answer feedback question.

You can define up to five options, which appear as stars by default, but can also appear as percentage ratings.

2. Add the `options_count` attribute to the AnswerFeedback widget.
   ```xml
   <rn:widget path="feedback/AnswerFeedback" label_title="#rn:msg:IS_THIS_ANSWER_HELPFUL_LBL#" options_count="5" />  
   ```
3. If you want the options to appear in descending order rather than the default ascending order, add the `options_descending` attribute to the code.
   ```xml
   <rn:widget path="feedback/AnswerFeedback" label_title="#rn:msg:IS_THIS_ANSWER_HELPFUL_LBL#" options_count="5" options_descending="true" />  
   ```
4. If you want to explain the rating scale, you can edit the `label_title` attribute as well.

```xml
<rn:widget path="feedback/AnswerFeedback"
label_title="#rn:msg:IS_THIS_ANSWER_HELPFUL_LBL#" options_count="5"
label_title="Rate this answer for helpfulness by selecting between 1 (low) and 5 (high) stars" />
```

5. If you want to display a numerical percentage rating instead of the default stars that are used when more than two responses are offered, add the `use_rank_labels` attribute.

```xml
<rn:widget path="feedback/AnswerFeedback"
label_title="#rn:msg:IS_THIS_ANSWER_HELPFUL_LBL#" options_count="5"
label_title="How useful is this answer?" use_rank_labels="true" />
```

6. Save the file.

### Remove Answer Feedback

You can remove the answer feedback from the Answer Details page.

2. Delete this code.

```xml
<rn:widget path="feedback/AnswerFeedback" label_title="#rn:msg:IS_THIS_ANSWER_HELPFUL_LBL#"/>
```

3. Save the file.

### Change the Rating Threshold

You can let customers provide more detailed feedback.

2. Locate this code.

```xml
<rn:widget path="feedback/AnswerFeedback" label_title="#rn:msg:IS_THIS_ANSWER_HELPFUL_LBL#" />
```

3. Edit the code to add the `dialog_threshold` attribute to the widget.
   a. Let customers provide feedback on the answer, set the threshold to 0.
   b. Offer every customer the ability to provide feedback, regardless of the answer rating, set the threshold to the total number of feedback options (2 for the default Yes/No buttons, 5 for the default multiple feedback options).

```xml
<rn:widget path="feedback/AnswerFeedback"
label_title="#rn:msg:IS_THIS_ANSWER_HELPFUL_LBL#" options_count="5"
dialog_threshold="3" />
```

4. Save the file.

### Remove Links from the Details Pages

You can remove all or some of the links at the bottom of the Answer Details and the Community Question Details pages.

1. Do one of the following.
To edit the answer details page, open /views/pages/answers/detail.php.

To edit the questions detail page, open /views/pages/social/questions/detail.php.

2. To remove the Notify Me link, delete this code.
   <rn:condition logged_in="true">
   <rn:widget path="notifications/AnswerNotificationIcon" />
   </rn:condition>

3. To remove the Email This Page link, delete this code.
   <rn:widget path="utils/EmailAnswerLink" />

4. To remove the Print link, delete this code.
   <rn:widget path="utils/PrintPageLink" />

5. To remove the Share link, delete this code.
   <rn:widget path="utils/SocialBookmarkLink" />

6. Save the file.

If you remove the Notify Me link, you should also remove the Manage Your Notifications link on the sidebar of the Account Overview page.

Edit the List of Social Networking Sites on the Share Link

You can add, remove, or rearrange the options displayed by editing the SocialBookmarkLink widget.

By default, the Share link lets you share answer content with the Facebook, Twitter, LinkedIn, and Reddit social networking sites.

1. Open one of the Details page files:
   ◦ /views/pages/answers/detail.php.
   ◦ /views/pages/social/questions/detail.php.

2. Locate <rn:widget path="utils/SocialBookmarkLink" />.

3. Edit the code to individually list each site as comma-separated values for the sites attribute.

4. To remove one or more of the default links, delete the associated code from the sites attribute.

   This example removes the LinkedIn link.

5. Save the file.

Configure the ContactUs Widget

The ContactUs widget appears on the Answer and Question Details pages and also on the Search Result pages.
This procedure uses the **answers/detail** page, but the steps are the same for the **social/questions/detail** page.

2. To remove the Ask a Question link, add the `channels` attribute to the ContactUs widget and set the value to `community, chat, feedback`.
   ```xml
   <rn:widget path="utils/ContactUs" channels="community,chat,feedback" />
   ``
3. To remove the Ask the Community link, add the `channels` attribute to the ContactUs widget and set the value to `question, chat, feedback`.
   ```xml
   <rn:widget path="utils/ContactUs" channels="question,chat,feedback" />
   ``
4. To remove the Live Chat link, add the `channels` attribute to the ContactUs widget and set the value to `question, community, feedback`.
   ```xml
   <rn:widget path="utils/ContactUs" channels="question, community,feedback" />
   ``
5. To remove the Give Feedback link, add the `channels` attribute to the ContactUs widget and set the value to `question, community, chat`.
   ```xml
   <rn:widget path="utils/ContactUs" channels="question, community,chat" />
   ``
6. Save the page.

### Configure the SiteFeedback Widget

The Provide Feedback dialog is generated by the SiteFeedback widget contained in the ContactUs widget.

If a customer is not logged in, the dialog contains two required fields: the email address and a feedback field. If a customer is logged in, the incident created by the feedback is automatically associated with the customer and only the Your Feedback field appears on the dialog. This procedure uses the **answers/detail** page, but the steps are the same for the **social/questions/detail** page.

2. To open a different customer portal page instead of the Provide Feedback window, follow these steps.
   a. Create the page you want to open, name it, and place it in `/cp/customer/development/views/pages` folder or a subfolder.
   b. Add the `feedback_page_url` attribute to the ContactUs widget, making sure the path begins with `/app`.
      ```xml
      <rn:widget path="feedback/SiteFeedback" />
      ``
   c. Edit the code to add a value for the `feedback_page_url` attribute. The value must begin with `/app`.
      ```xml
      <rn:widget path="utils/ContactUs" feedback_page_url="/app/utils/your_custom_feedback_page" />
      ``
   d. Save `detail.php`.
3. To edit labels on the Provide Feedback dialog, add the appropriate `label` attribute to the ContactUs widget and change its value to the new label.
   - To change the label on the Give Feedback link, add `label_link="New Give Feedback Link Label"`.
   - To change the Provide Feedback header of the window, add `label_dialog_title="New Provide Feedback Header Label"`.
   - To change the Email label, add `label_email_address="New Email Address Label"`.
   - To change the Your Feedback label, add `label_comment_box="New Your Feedback Label"`. 

---

**ORACLE**

1218
To change the Submit button label, add `label_send_button="New Submit Button Label"`.

To change the Cancel button label, add `label_cancel_button="New Cancel Button Label"`.

To change the confirmation message, add `label_feedback_confirmation="New Confirmation Message"`.

4. Save the page.

Configure the Published Answers Section

The related answers feature suggests answers based on the answer relationships generated when staff members manually relate answers or when customers use your site.

2. To change the Published Answers heading, add the `label_title` attribute to the RelatedAnswers widget and set the value to the new heading.
   ```xml
   <rn:widget path="knowledgebase/RelatedAnswers" label_title="New Label" />
   ```
3. To change the number of published answers from the default of 5, add the `limit` attribute to the RelatedAnswers widget and set the new value.

   If you do not want to set a limit, set the attribute to 0.
   ```xml
   <rn:widget path="knowledgebase/RelatedAnswers" limit="3" />
   ```
4. To change the number of characters that are displayed for each answer from the default value of 0 characters (which prevents truncation), add the `truncate_size` attribute and set the new value.
   ```xml
   <rn:widget path="knowledgebase/RelatedAnswers" truncate_size="50" />
   ```
5. To remove the Published Answers section, delete `<rn:widget path="knowledgebase/RelatedAnswers" />`.
6. Save the file.

Configure the RelatedKnowledgebaseAnswers Widget

The sidebar section called Related Answers displays the most popular published answers and is rendered by the RelatedKnowledgebaseAnswers widget.

2. To change the Related Answers heading, add the `label_heading` attribute to the RelatedKnowledgebaseAnswers widget and set the value to the new heading.
   ```xml
   <rn:widget path="discussion/RelatedKnowledgebaseAnswers" limit="4" label_heading="New Label" />
   ```
3. To change the number of published answers from the page default of 4, set the value of the `limit` attribute to the number you want.
4. To change the number of characters that are displayed for each answer from the default value of 50 characters (which prevents truncation), add the `truncate_title_at` attribute and set the new value. Set the value to 0 if you do not want to truncate the answer title.
   ```xml
   <rn:widget path="discussion/RelatedKnowledgebaseAnswers" limit="4" truncate_title_at="100" />
   ```
5. To remove the Related Answers section, delete `<rn:widget path="discussion/RelatedKnowledgebaseAnswers" limit="4"`.
6. Save the file.
Submit a Question Pages

Your customer portal contains a page that lets customers ask questions to your support staff and another that lets them ask questions to the community.

When the Ask a Question tab is clicked, the first page that opens (/views/pages/ask.php) lets your customers submit questions to your support staff, which automatically creates an incident in your database. This page contains a link to another page (/views/pages/social/ask.php) that lets customers pose their question to the community, instead of submitting it to your organization.

The standard workflow for submitting a question to your support staff on the Customer Portal reference implementation was designed for an optimal customer experience. It asks for only an email address, without requiring account creation or login. When customers are already logged in, the email field is hidden and they need only enter information about their question. When customers submit a question, an incident is created in your database so that your support staff can resolve the issue. The created incident is linked automatically to the customer if a contact record exists in the database. If a contact does not already exist, a new contact record is created. The new contact record contains only the email address, so customers will be required to use account assistance if they want to log in to the customer portal in the future. Customers are not logged in to the customer portal after submitting a question, whether their contact record already exists or is created through the question submission.

When customers who are not logged in click the Ask our Community link after clicking the Ask a Question tab, they are taken to the login window to either log in or create an account. Customers who are logged in but who do not have a community display name will be asked to create a display name before submitting questions to the community.

Display the Ask a Question Page Based on User Actions

The RN Condition page tag lets you hide part of the page if the condition specified in the tag is not met.

Before you implement this requirement, you should consider the usability issues of conditionally hiding and exposing page navigation. Particularly for customers using screen readers, the presence of a new navigation tab may not be evident when the conditions that trigger its appearance have occurred.

Among the attributes of the RN Condition page tag are answers_viewed, questions_viewed, content_viewed (combination of answers and questions/discussions), and searches_done.

2. Locate this code.

   <li><rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:ASK_QUESTION_HDG#" link="/app/ask" pages="ask, ask_confirm"></li>

3. To hide the tab based on the number of answers customers view, add the answers_viewed condition above the code for the Ask a Question tab.
   In this example, customers must view three answers before the tab is displayed.
4. To hide the tab based on the number of community discussions (questions) customers view, add the questions_viewed condition above the code for the Ask a Question tab.

5. To hide the tab based on the combination of answers and community discussions customers view, add the content_viewed condition above the code for the Ask a Question tab.

6. To hide the tab based on the number of searches customers perform, add the searches_done attribute to the NavigationTab widget.

   a. If your only criteria for displaying the Ask a Question page is the number of searches your customers perform, you should use the searches_done attribute of the NavigationTab widget instead of the RN Condition searches_done attribute.

      Because the RN Condition tag identifies a search only when a page is turned or refreshed, this is a less ideal option for displaying the Ask a Question page. Assume you set the searches_done attribute for RN Condition to 2. Now assume a customer conducts one search, reviews the list but does not click an answer or otherwise leave or refresh the answers list page, and then conducts a second search. In this case, the Ask a Question tab will not be displayed until another page is opened or the current page is refreshed.

   b. To count searches performed by the customer regardless of whether page turns occur (that is, regardless of whether an answer resulting from a search is viewed), use the searches_done attribute of the NavigationTab widget rather than the searches_done attribute of the RN Condition tag.

7. To use a combination of options for hiding the navigation tab, use the else condition as shown in this example, which hides the tab until either three answers have been viewed or two searches have been conducted.

   8. Add the following code on a separate line below the code for the Ask a Question tab.

9. Save the file.

Remove the Subject Field

The Subject field on the Ask a Question page populates the Subject field of the created incident.

If you remove the Subject field from the Ask A Question page, the incident Subject field contains the first 80 characters of the customer’s question.

  2. Delete the following line of code from the file to remove the Subject field when the customer is not logged in.

 3. Delete the following lines of code from the file to remove the Subject field when the customer is logged in.
Populate the Product Field

You can automatically populate the product field on the Ask a Question page to a default value.

Although the default_value attribute takes precedence over any other method of populating the products and categories for the ProductCategoryInput widget, you can also populate the product and category fields by passing the ID numbers in the URL used to open the page. This lets you populate different products and categories when customers access the Ask a Question page from different external pages. You can also use POST parameters, but the URL parameters will override the POST parameter if both are used.

2. Locate <rn:widget path="input/ProductCategoryInput" name="Incident.Product" />
3. Add the default_value attribute to the ProductCategoryInput widget to specify the product you identified the ID number for.
   <rn:widget path="input/ProductCategoryInput" name="Incident.Product" default_value="421,47" />
4. Save the file.

Configure File Attachments

The standard Ask a Question page lets your customers attach an unlimited number of files to the question they submit, but you can restrict the number or type of file attachments or prevent them from adding attachments.

2. Locate <rn:widget path="input/FileAttachmentUpload" />
3. To restrict the type of attachments, add the valid_file_extensions attribute to the FileAttachmentUpload widget.
   <rn:widget path="input/FileAttachmentUpload" valid_file_extensions="doc,docx,xls,xlsx" />
4. To change the default label that displays if customers try to attach a file type that is not valid, add the label_invalid_extension attribute and define the label.
   <rn:widget path="input/FileAttachmentUpload" valid_file_extensions="doc,docx,xls,xlsx" label_invalid_extension="You may attach only the following file types:%s" />
5. To restrict the number of file attachments, add the max_attachments attribute to the widget.
   <rn:widget path="input/FileAttachmentUpload" max_attachments="5" />
6. To change the default label that displays if customers exceed the allowable number of attachments, add the label_max_attachment_limit attribute and define the label.
   <rn:widget path="input/FileAttachmentUpload" max_attachments="5" label_max_attachment_limit="You may upload only 5 files to your question." />
7. To remove the ability to attach files to a question, delete <rn:widget path="input/FileAttachmentUpload" />
8. To require a minimum number of file attachments, add the min_required_attachments attribute to the FileAttachmentUpload widget.
   <rn:widget path="input/FileAttachmentUpload" min_required_attachments="2" />
9. To change the default label that displays if customers do not attach the minimum number of attachments, add the label_min_required attribute and define the label.

```
<rn:widget path="input/FileAttachmentUpload" min_required_attachments="2"
label_min_required="You must attach at least 2 files before submitting your question."/>
```

10. Save the file.

Define Form Completion Time

By default, a customer’s partially completed form remains valid for 30 minutes, but you can change that value.

1. Locate SUBMIT_TOKEN_EXP configuration setting in RightNow User Interface/General/Security.
2. Click Value and enter the number of minutes at which you want the form to expire.
3. Click Save.

Edit the Standard Confirmation Page

You can edit the standard confirmation page that opens when a customer submits a question on the Ask a Question page, or you can display a different confirmation page.

2. To change the “Your question has been submitted!” heading, locate the following line of code and edit the content between the `<h1>` tags with your new heading.

```
<h1>#rn:msg:YOUR_QUESTION_HAS_BEEN_SUBMITTED_LBL#</h1>
```

3. Save the file.
4. To display a different confirmation page, follow these steps.
   b. Locate `<rn:widget path="input/FormSubmit" label_button="#rn:msg:CONTINUE_ELLIPSIS_CMD#" on_success_url="/app/ask_confirm" error_location="rn_ErrorLocation" />`.
   c. Edit the code to replace "/app/ask_confirm" with the page of your choice.
5. Save the file.

Create an Incident Rule for Incident Receipts

You can set up an incident rule to send an email receipt to your customers when they submit a question on the Ask a Question page.

1. Open Rules in Configuration > Site Configuration.
2. Click Incident.
3. Click Edit.
4. If an initial state does not already exist for the incident rule base, create one.
   a. Right-click States and select New State.
   b. Enter a name, such as Initial State.
   c. Select Initial State.
   d. Click Save.
5. Right-click the initial state and select New Rule.
6. Enter a name for the incident rule in the Rule Name field.
7. Click Add IF Condition Based On.
8. Select Incident > Source.
9. Click the arrow in the Select Operator field and select Equals.
10. Expand the End-User Pages heading in the incident source menu and select Ask a Question.
11. Click Add Action–Then.
12. Select Email > Send Receipt Email.
13. Click Save.
14. Expand the initial state again and determine the location of the incident receipt rule.
15. If the incident receipt rule is not at the top of the list, drag it to the top position.
16. Click Activate.
17. Click OK.
18. Click OK.
19. If incidents are in the Null state or a state that has been removed, you should move them into an active state in the rule base.
20. Click the drop-down arrow to select a state where the incidents should be moved.
21. Click Save.

Configure the Social Ask Page

On the Community Ask a Question page, customers who are logged in but who do not have a community user profile are asked to enter a display name before continuing.

2. To change the “Submit a question to the support community” heading, locate the following line of code and edit the content between the <h1> tags with your new heading.
   
   <h1>#rn:msg.SUBMIT_A_QUESTION_TO_SUPPORT_COMMUNITY_MSG#</h1>
3. To remove the product selector, delete <rn:widget path="input/ProductCategoryInput" name="SocialQuestion.Product" verify_permissions="Create"/>
4. To clear the check box for “Email me when a new comment is posted,” add the subscribe_me_default attribute to the DiscussionAuthorSubscription widget and set its value to false.
   
   <rn:widget path="notifications/DiscussionAuthorSubscription" subscribe_me_default="false"/>
5. To remove the “Email me when a new comment is posted” check box, delete <rn:widget path="notifications/DiscussionAuthorSubscription"/>
6. Save the file.

How SmartAssistant Works

When your customers can't find an answer to their question in your knowledge base, they can submit a question to your support staff.

If you have an incident business rule defined to do so, the SmartAssistant suggested answers feature uses natural language processing to display a list of answers from your knowledge base that may contain the information your customers are seeking. The list of suggested answers and community discussions is presented to customers before they finish submitting their questions. If one of the suggested answers addresses the customer’s concern, they can avoid
submitting an incident. Besides displaying a list of proposed answers to customer questions, SmartAssistant can also display standard text or a single, specific answer.

Customers also see SmartAssistant suggested answers and community discussions when they submit a question to the community. However, incident rules do not apply to community content.

Create an Incident Rule for SmartAssistant
You need to create an incident rule to use SmartAssistant.

1. Double-click Rules in Configuration > Site Configuration.
2. Click Incident.
3. Click Edit.
4. If an initial state does not already exist for the incident rule base, create one.
   a. Right-click States > New State.
   b. Enter a name in the State Name field.
   c. Select Initial State.
   d. Click Save.
5. Right-click the state you want to add the rule to and select New Rule.
6. Enter a name for the incident rule in the Rule Name field.
7. Click Add IF Condition Based On.
8. Select Incident > Source.
9. Click the arrow in the Select Operator field and select Equals.
10. Expand the End-User Pages heading in the incident source menu and select SmartAssistant on Ask a Question.
11. Click Add Action–Then.
12. You can display a list of suggested answers, append standard text, or append the text of a specific answer.
   o To display a list of suggested answers, select Append Thread > Append SmartAssistant Response to Response Field.
   o To display standard text, select Append Thread > Append Response Template to Response Field and add the standard text response in the Then action.
   o To display an answer, select Append Thread > Append Existing Solution (by Answer ID) to Response Field and enter the ID of the answer you want to display.
13. Click Save.
14. Click Activate > OK > OK.
15. If incidents are in the Null state or a state that has been removed, you should move them into an active state in the rule base.
   a. Click the drop-down arrow to select a state where the incidents should be moved.
   b. Click Save.

Configure SmartAssistant
A variety of options exist for configuring SmartAssistant on the administration interface.

You can enable optimization so that the parameters that control SmartAssistant accuracy are analyzed to determine their optimum values.

1. To enable SmartAssistant optimization (which determines the optimum values for the parameters that control accuracy), follow these steps.
   a. Locate KF_SA_OPTIMIZATION_ENABLE in Common/Knowledge Base/Knowledge Foundation.
   b. Click the Value field and select Yes.
   c. Click Save.
2. To configure the number of days optimization data is valid, follow these steps.
a. Locate KF_SA_OPTIMIZATION_DATA_PURGE_DAYS in Common/Knowledge Base/Knowledge Foundation.
   b. Click the Value field and enter the number of days after which the optimization data is removed.
   c. Click Save.

3. To change the ratio of suggested published answers to community discussions from the default of 60 percent answers to 40 percent community results, follow these steps.
   a. Locate SA_RESULTS_COUNT_RATIO in Common/Knowledge Base/SmartAssistant.
   b. Click the Value field and enter the ratio of answers to community results using the format 60A:40S.
   c. Click Save.

4. To define whether product and category filters should be used for SmartAssistant community results, follow these steps.
   a. Locate SA_USE_SOCIAL_PROD_CAT_FILTER in Common/Knowledge Base/SmartAssistant.
   b. Click the Value field and enter 1 for product filter only, 2 for category filter only, and 3 for both product and category filters.
   c. Click Save.

5. To define the number of answers to display as solutions instead of links, follow these steps.
   a. Locate SA_WF_SOLNS_EXPAND_CNT in RightNow User Interface/Support/SmartAssistant.
   b. Click the Value field and enter the number of expanded suggested answers you want to appear on the customer portal.
   c. Click Save.

6. To change the number of answers suggested from the default value of 5, follow these steps.
   a. Locate SA_NL_MAX_SUGGESTIONS under RightNow User Interface/Support/SmartAssistant.
   b. Click the Value field and enter the number of suggested answers you want to appear on the customer portal.
   c. Click Save.

7. To limit suggested answers by category or product, follow these steps.
   a. Navigate to the RightNow User Interface/Support/SmartAssistant configuration settings.
   b. To limit by categories, click the Value field for SA_SUGGEST_LIMIT_CAT_LVL and enter a value to indicate how you want to restrict suggested answers by category sub-levels.
   c. To limit by products, click the Value field for SA_SUGGEST_LIMIT_PROD_LVL and enter a value to indicate how you want to restrict suggested answers by products sub-levels.
   d. Click Save.

Modify SmartAssistant Relevancy

Two configuration settings let you control how an incident's subject and body influence the way answers are returned in SmartAssistant.

The SA_DISPATCH_RATIO configuration setting includes two values to define whether the answers are returned based on the hybrid mode used by the SA_SUBJ_BODY_WEIGHTS configuration setting or on the standard SmartAssistant mode. The default value “100 0” means that they will always be returned by the first mode, while “0 100” means they will always be returned by the standard mode. The two values do not have to add up to 100. Instead they represent the odds that the first or second mode will be chosen. These configuration settings are also used to identify similar answers for the Smart Merge feature in Service.

1. Locate the configuration settings in Common/Knowledge Base/Answer Search.
2. In the SA_SUBJ_BODY_WEIGHTS value field, enter three values, separated by a single space, to indicate how you want to weight an incident's subject, body, and bonus value for the hybrid SmartAssistant mode.
3. In the SA_DISPATCH_RATIO value field, enter two values, separated by a single space, to define the ratio for returning SmartAssistant answers using the mode from SA_SUBJ_BODY_WEIGHTS.
4. Click Save.
Configure the SmartAssistantDialog Widget

You can modify what is displayed when customers submit their question.

1. Open the appropriate ask.php file.
   - Open /views/pages/ask.php.
   - Open /views/pages/social/ask.php.

2. To remove conditions for the SmartAssistant Dialog widget so that it will always propose suggested answers, locate this code and delete all but the <rn:widget path="input/SmartAssistantDialog"/> line.

   ```xml
   <rn:condition content_viewed="2" searches_done="1">
   <rn:condition_else/>
   <rn:widget path="input/SmartAssistantDialog"/>
   </rn:condition>
   ```

3. To change the content viewed or searches done condition, change the code values to the numbers you want.

   ```xml
   <rn:condition content_viewed="2" searches_done="1">
   ```

4. To open the answers that customers click in a separate window, add the display_inline attribute to the SmartAssistantDialog widget and set it to false.

   ```xml
   <rn:widget path="input/SmartAssistantDialog" display_inline="false"/>
   ```

5. To redirect customers to a page other than the default Support Home page when their questions are answered, add the solved_url attribute to the SmartAssistantDialog widget.

   ```xml
   <rn:widget path="input/SmartAssistantDialog" solved_url="/app/answers/list"/>
   ```

6. To remove the SmartAssistantDialog widget and never suggest answers to your customers, delete this code.

   ```xml
   <rn:condition content_viewed="2" searches_done="1">
   <rn:condition_else/>
   <rn:widget path="input/SmartAssistantDialog"/>
   </rn:condition>
   ```

7. Save the file.

Using the Do Not Create Incident Action with SmartAssistant

You might use the business rule action called Do Not Create Incident if your organization has stopped supporting an older product.

Instead of creating an incident for an unsupported product, you might want to direct customers to the Answers page, where they can search the knowledge base for an answer to their question. In this case, the SmartAssistantDialog widget notifies them that their question hasn’t been submitted and then directs them to the Answers page.

Another time you might want to combine a Do Not Create Incident rule with a SmartAssistant rule is when your organization requires additional information before a customer’s question can be submitted. In this case, the rule base performs a basic form validation. It checks to see if the information is complete and, if it isn’t, directs the customer back to the Ask a Question page without creating an incident from the partial question. You might use this when you have a field on the page that you need customers to answer only under certain conditions. For example, assume you have an Urgency field that is not required except when customers select the Troubleshooting category. When customers select Troubleshooting without selecting an Urgency option, you can automatically direct them back to the submit a question form to complete the field before submitting the question.

Prevent Incident Creation Using the SmartAssistant

This example demonstrates how to prevent an incident creation because your organization no longer supports the selected product.
Create the SmartAssistant rule. See Configure the SmartAssistantDialog Widget.

When the question meets the conditions specified in the Do Not Create Incident rule and the customer clicks the Continue button, the SmartAssistantDialog widget appears. Instead of displaying the suggested answers and standard message bases, the widget displays the labels you have designed specifically for this situation. For example, you can tell customers an incident cannot be submitted because your organization no longer offers the selected product. You can then direct them to the Answers page, where they can search the knowledge base for the answer to their question.

1. Create the standard text message you want to display when the SmartAssistant window opens to tell customers their question has not been submitted.
   In this example, you might create standard text for a product end-of-life.
   "Because this product has reached end-of-life for customer support, we can no longer accept questions about it. For help, please see our knowledge base of existing answers, which will open when you click the Close button."

2. Create the Do Not Create Incident rule by following the example in Create an Incident Rule for SmartAssistant.
   IF Incident.Source equals End-User Pages > SmartAssistant on Ask a Question
   AND Incident.Product equals Call Plans > Prepay
   THEN Do Not Create Incident
   AND Append Response Template to Response Field (Select the standard text you created.)
   AND Stop Processing Rules

3. On the Rules editor, drag the Do Not Create Incident rule so it appears above the SmartAssistant rule in the list of rules within the state.
   Note: The rules engine needs to process the Do Not Create Incident rule before it gets to the SmartAssistant rule. Otherwise, customers will see suggested answers first, but will still have the option to submit their question, triggering an error message if Call Plans > Prepay is selected.

4. Click Activate.

Redirect Customers

You can point your customers to specific pages when they attempt to submit questions to your support team.

2. Locate the following lines of code.
   <rn:condition content_viewed="2" searches_done="1">
   <rn:condition_else/>
   <rn:widget path="input/SmartAssistantDialog"/>
   </rn:condition>
3. Delete the three lines with condition tags.
   If you don’t remove the conditional text tags around the widget, the widget won’t appear to customers who have viewed the necessary number of answers or performed searches, even if they select the Call Plans > Prepay product. All they will see is an error message telling them their question cannot be submitted.
4. Edit the SmartAssistantDialog widget code to add the dnc_label_ attributes.
   Your code will resemble the following.
   <rn:widget path="input/SmartAssistantDialog" dnc_label_cancel_button="Close"
   dnc_label_banner="Your question cannot be submitted." dnc_label_dialog_title="This question cannot be submitted." dnc_redirect_url="/app/answers/list" />
5. Save the file.

Require Information on the Ask a Question Page

Your business needs may require you obtain additional information from customers when they use the Ask a Question page.

2. Locate the following lines of code.
   ```xml
   <rn:condition content_viewed="2" searches_done="1">
     <rn:condition_else/>
     <rn:widget path="input/SmartAssistantDialog"/>
   </rn:condition>
   ```
3. Delete the three lines with condition tags.
   If you don’t remove the conditional text tags around the widget, the widget won’t appear to customers who have viewed the necessary number of answers or performed searches, even if they select the Troubleshooting category. All they will see is an error message telling them their question cannot be submitted.
4. Edit the SmartAssistantDialog widget code to add the dnc_label_ attributes.
   Your code will resemble the following.
   ```xml
   <rn:widget path="input/SmartAssistantDialog" dnc_label_cancel_button="Complete Form"
     dnc_label_banner="We need more information before submitting your question."
     dnc_label_dialog_title="More information required" />  
   ```
5. Save the file.

**Account Pages**

### Change the Account Overview Page Headings

This example shows you how to customize the page heading on the Account Overview page.

2. Locate `<h2><a class="rn_Questions" href="/app/account/questions/list#rn:session#">#rn:msg:MY_SUPPORT_QUESTIONS_LBL#</a></h2>`. 
3. Edit the code with your revised heading.
   ```xml
   <h2><a class="rn_Questions" href="/app/account/questions/list#rn:session#">Incidents You Have Submitted</a></h2>
   ```
4. Save the file.

### Display Service Contracts on the Account Overview Page

If your organization uses SLAs and you want them to be visible to your customers, you can add the Service Contracts section to the Account Overview page.

2. Locate this code:
   ```xml
   <a href="/app/social/questions/list/author/#rn:profile:socialUserID#/kw/*#rn:session#">#rn:msg:SEE_ALL_MY_DISCUSSION_QUESTIONS_LBL#</a>
   </rn:container>
   </div>
   ```
3. Add this code just after the code you located in the previous step.
   ```xml
   <h2><class="rn_Contracts">#rn:msg:SERVICE_CONTRACTS_LBL#</strong></h2>
   <div class="rn_Contracts">
     <rn:widget path="reports/Grid" report_id="185" label_caption="#rn:msg:YOUR_SERVICE_CONTRACTS_LBL="/>
   ```
4. Save the file.

Add Login Information to the Account Overview Page

You can add the login statistics reports to the Account Overview page.

2. Locate this code:
   ```php
   <a href="/app/social/questions/list/author/#rn:profile:socialUserID#/kw/*#rn:session#">#rn:msg:SEE_ALL_MY_DISCUSSION_QUESTIONS_LBL#</a>
   </rn:container>
   </div>
   </div>
3. Add the appropriate code just after the code you located in the previous step.
   - To show Contact Login Statistics, add `<rn:widget path="reports/Grid" report_id="10046" label_caption="Previous Logins" date_format="date_time"/>`.
   - To show Unsuccessful Login Attempts by Contact, add `<rn:widget path="reports/Grid" report_id="10047" label_caption="Previous Unsuccessful Login Attempts" date_format="date_time"/>`.
4. Save the file.

Edit the Links Sidebar on the Account Overview Page

The Account Overview page sidebar contains links to the Account Settings, Change Your Password, Notifications, and Public Profile pages.

2. Locate this code.
   ```html
   <div class="rn_SideRail">
   <fieldset>
   <legend>Links</legend>
   <ul>
   <li><a href="/app/account/profile#rn:session#">#rn:msg:UPDATE_YOUR_ACCOUNT_SETTINGS_CMD#</a></li>
   <li><a href="/app/account/change_password#rn:session#">#rn:msg:CHANGE_YOUR_PASSWORD_CMD#</a></li>
   <li><a href="/app/account/notif/list#rn:session#">#rn:msg:MANAGE_YOUR_NOTIFICATIONS_LBL#</a></li>
   <rn:condition is_active_social_user="true">
   <li><a href="/app/public_profile/user/#rn:profile:socialUserID#">#rn:msg:VIEW_YOUR_PUBLIC_PROFILE_LBL#</a></li>
   </rn:condition>
   </ul>
   </fieldset>
   </div>
   ```
3. To remove the links sidebar, delete the code you located.
4. To change the Links heading, locate the following line of code and replace Links with your new heading.
   ```html
   <legend>Links</legend>
   ```
5. To remove the Update Account Settings link, delete this code.
   ```html
   <li><a href="/app/account/profile#rn:session#">#rn:msg:UPDATE_YOUR_ACCOUNT_SETTINGS_CMD#</a></li>
   ```
Remove the Search Field from the Support History Page

You can remove the search field from the support history page.

2. Delete the following lines of code.
   ```html
   <div class="rn_SearchControls">
   <h1 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_CMD#</h1>
   <form onsubmit="return false;" class="translucent">
   <rn:container report_id="196">
   <div class="rn_SearchInput">
   <rn:widget path="search/KeywordText" label_text="#rn:msg:
   SEARCH_YOUR_SUPPORT_HISTORY_CMD#" label_placeholder=
   "#rn:msg:SEARCH_YOUR_SUPPORT_HISTORY_CMD#" initial_focus="true"/>
   </div>
   <rn:widget path="search/SearchButton"/>
   </rn:container>
   </form>
   <div class="rn_SearchFilters">
   <rn:widget path="search/ProductCategorySearchFilter" />  
   </div>
   </div>
   ```
3. Save the file.

Change the Report on the Support History Page

By default, the Support History page uses the Questions report.

1. Open one of these files.
   - /views/pages/account/questions/list.php
   - /views/pages/mobile/account/questions/list.php
2. Locate `<rn:container report_id="196">`.
3. Replace 196 with the ID for the standard or custom report you want to use.
4. Save the file.
Display All Incidents from a Customer’s Organization

The OrgList2 widget lets customers choose which incidents they see.

2. Locate <div class="rn_PageContent rn_Container">.
3. Enter <rn:widget path="search/OrgList" search_on_select="true" /> just above the page container tag.
   <rn:widget path="search/OrgList" search_on_select="true" />
   <div class="rn_PageContent rn_Container">
4. Save the file.

Configure the Account Settings Page

The Account Settings page lets your customers update their account information.

The Public Profile section lets users change their display name and avatar. Any contact custom fields given End-user Read/Write Visibility appear on this page.

2. To edit the title, replace the content between the <h1> tags with the new title.
   <h1>#rn:msg:ACCOUNT_SETTINGS_LBL#</h1>
3. To add a field to the Account Settings page, insert a line of code that calls the FormInput widget in the location on the page where you want the field to appear.
   To add the alternate email address fields to the page, add these lines of code.
   <rn:widget path="input/FormInput" name="Contact.Emails.ALT1.Address" label_input="Alternate Email 1" />
   <rn:widget path="input/FormInput" name="Contact.Emails.ALT2.Address" label_input="Alternate Email 2" />
4. To add a radio button selection that lets customers opt in to communications from your marketing department, add <rn:widget path="input/FormInput" name="Contact.MarketingSettings.MarketingOptIn" label_input="Opt in to marketing communications from us?" /> wherever you want in the block of FormInput widgets on the page.
5. To remove one of the contact fields, locate the line of code that displays the field and delete it.
   To remove the phone field, you would delete <rn:widget path="input/FormInput" name="Contact.Phones.HOME.Number" label_input="#rn:msg:HOME_PHONE_LBL#">.

   Note: The profile.php code contains conditional sections that display the physical address fields in a different sequence if the browser is using an Asian language. If you want to remove any or all of these fields for all languages, be sure to remove them from both conditions.
6. To remove the Public Profile section, delete the code leaving only the closing form and div tags.
   </form>
   </div>
7. Save the file.
Configure the Public Profile Page

The Public Profile page displays the community user’s display name and avatar, recent community activity, a search field, a section that displays the user’s contribution activity, and a print button.

1. Open `views/pages/public_profile`.
2. To change the user’s avatar size from the default of extra large, add the `avatar_size` attribute to the `AvatarDisplay` widget and set its value to small, medium, or large.
   ```
   <rn:widget path="user/AvatarDisplay" avatar_size="medium"/>
   ```
3. To change the avatars used in the Recent Activity section from the default of medium, add the `avatar_size` attribute to the `UserActivity` widget and set its value to none, small, large, or xlarge.
   ```
   <rn:widget path="user/UserActivity" avatar_size="large"/>
   ```
4. To remove the “Member since” information from the header, delete `#rn:msg:MEMBER_SINCE_LBL# <span itemprop="dateCreated"><rn:field name="SocialUser.CreatedTime" /></span>`.
5. To limit the types of user activity displayed on the Public Profile page, add the `type` attribute to the `UserActivity` widget and set the value to a comma-separated list of only the activity types you want to display.
   ```
   <rn:widget path="user/UserActivity" type="bestAnswerGivenToUser,commentRatingGivenToUser,commentRatingGivenToUser,questionRatingGivenToUser"/>
   ```
6. To remove the search field, delete this code.
   ```
   <div class="rn_ProfileSearch">
     <fieldset>
       <legend>#rn:msg:SEARCH_USERS_CONTRIBUTIONS_LBL#</legend>
       <rn:widget path="search/SimpleSearch" icon_path="" report_page_url="/app/social/questions/list" add_params_to_url="author:userFromUrl"/>
     </fieldset>
   </div>
   ```
7. To limit the types of contributions displayed in the User’s Contributions section from the default of questions, comments, and answers, add the `contribution_types` attribute to the `UserContributions` widget and select only the type of contributions you want to display.
   ```
   <rn:widget path="user/UserContributions" contribution_types="comments, answers"/>
   ```
8. To remove the user’s contribution section, delete `<rn:widget path="user/UserContributions"/>`.
9. To remove the option to print the page, delete `<rn:widget path="utils/PrintPageLink"/>`.
10. Save the file.

Modify the Avatar Selection Options

You can modify the order or remove options from the default avatar selections: default, gravatar, and avatar_library.

2. Locate `<rn:widget path="input/SocialUserAvatar" />`.
3. Edit the widget code to add the `avatar_selection_options` attribute.
   - To remove an option, delete the option value from the `avatar_selection_options` list:
     ```
     <rn:widget path="input/SocialUserAvatar"
     avatar_selection_options="default,avatar_library" />
     ```
   - To change the option order, reorder the option values:
     ```
     <rn:widget path="input/SocialUserAvatar"
     ```

Add or Remove Incident Details on the Question Details Page

The Additional Details section on the Question Details page provides additional incident and customer information.

2. Locate `<div class="rn_AdditionalInfo">`.
3. To add an incident detail, add a line of code that adds the DataDisplay widget to the block of DataDisplay code for incident fields.
   For example, you can include the time the incident was closed by adding `<rn:widget path="output/DataDisplay" name="Incident.ClosedTime" label="Closed" />`.
4. To remove one of the incident fields, locate the line of code that displays the field and delete it.
5. Save the file.

Related Topics
- Viewing Response via the Customer Portal (video)

Prevent Customers from Solving Incidents

You can remove the status field from the page, which prevents customers from solving incidents.

When customers select “No, I don’t need this question answered now” from the Do You Want a Response? drop-down menu and then click Submit, the incident’s status is set to Solved automatically.

2. Delete the following line of code.
   `<rn:widget path="input/FormInput" name="Incident.StatusWithTyp.Status" label_input="#rn:msg:DO_YOU_WANT_A_RESPONSE_MSG#"/>
3. Save the file.

Prevent Customers from Updating Solved Incidents

You can change the amount of time until an incident can no longer be updated or you can prevent customers from ever updating a closed incident.

2. Locate this code.
   `<rn:condition incident_reopen_deadline_hours="168">`
3. Edit the code to change the value for the incident_reopen_deadline_hours attribute to 0.
   `<rn:condition incident_reopen_deadline_hours="0">`
4. Save the file.
Remove Notifications from the Notifications Page

The Notifications page displays all answer notifications, product/category answer notifications, discussions, and product discussion notifications the customer is subscribed to.

2. To remove the Answer Notifications section, delete the following lines of code.
   
   ```xml
   <h2>#rn:msg:ANS_NOTIFICATIONS_LBL#</h2>
   <rn:widget path="notifications/AnswerNotificationManager" />
   ```

3. To remove the Product/Category Notifications section, delete the following lines of code.
   
   ```xml
   <h2>#rn:msg:PRODUCTCATEGORY_ANSWER_NOTIFICATIONS_LBL#</h2>
   <rn:widget path="notifications/ProdCatNotificationManager"
   report_page_url="/app/#rn:config:CP_PRODUCTS_DETAIL_URL#" />
   ```

4. To remove the Discussion Notifications section, delete the following lines of code.
   
   ```xml
   <h2>#rn:msg:DISCUSSION_NOTIFICATIONS_LBL#</h2>
   <rn:container report_id="15104">
   <rn:widget path="reports/ResultInfo" static_filter="User=#rn:profile:socialUserID#"/>
   <<rn:widget path="notifications/DiscussionSubscriptionManager"
   static_filter="User=#rn:profile:socialUserID#"/>
   </rn:container>
   ```

5. To remove the Product Discussion Notifications section, delete the following lines of code.
   
   ```xml
   <h2>#rn:msg:PRODUCT_DISCUSSION_NOTIFICATIONS_LBL#</h2>
   <rn:container report_id="15105">
   <rn:widget path="reports/ResultInfo" static_filter="User=#rn:profile:socialUserID#"/>
   <rn:widget path="notifications/DiscussionSubscriptionManager"
   static_filter="User=#rn:profile:socialUserID#" subscription_type="Product"
   label_no_notification="#rn:msg:CURRENTLY_DONT_ANY_DISC_NOTIF_MSG#"/>
   </rn:container>
   ```

6. Save the file.

Remove Notifications from Customer Portal

If you don’t want customers to subscribe to answers, you'll need to remove the Notify Me link from the Answer Details and Community Question Details pages.

1. Remove the Notify Me icon from the Answer Details page.
   b. Delete this code:
      
      ```xml
      <rn:condition logged_in="true">
         <rn:widget path="notifications/AnswerNotificationIcon" />
      </rn:condition>
      ```
   c. Save the file.

2. Remove the Subscribe link from the Community Question Details page.
   b. Delete this code.
      
      ```xml
      <rn:widget path="notifications/DiscussionSubscriptionIcon"/>
      ```
   c. Save the file.
Configure the PasswordInput Widget

The PasswordInput widget lets you define the strength of customer passwords on the administration interface.

2. Locate this code.
   ```xml
   <rn:widget path="input/PasswordInput" name="Contact.NewPassword" require_validation="true"
   require_current_password="true" label_input="#rn:msg:PASSWORD_LBL#"
   label_validation="#rn:msg:VERIFY_PASSWD_LBL#" initial_focus="true"/>
   ```
3. To enable the customer's web browser to auto-complete the password values, add the `disable_password_autocomplete` attribute and set it to `false`.
   ```xml
   <rn:widget path="input/PasswordInput" name="Contact.NewPassword" require_validation="true"
   require_current_password="true" disable_password_autocomplete="false"
   label_input="#rn:msg:PASSWORD_LBL#" label_validation="#rn:msg:VERIFY_PASSWD_LBL#"
   initial_focus="true"/>
   ```
4. To remove the Current Password field from the form so that customers must enter only the new password value, delete the `require_current_password` attribute.
5. To remove the validation requirement that causes the Verify Password field to appear, delete the `require_validation` attribute.
6. Save the file.

Community Home Page

Modify the Community Announcement Text

You can greet the community or your community moderators with a message tailored to your business needs.

1. Open one of these text files:
   - `/assets/others/community-announcement.txt`
   - `/assets/others/moderator-announcement.txt`
2. Modify the text, as needed.
3. Save the file.

Modify Common Widgets Used in the Community Page

You can customize the numerous widgets used in the reference community home page file.

1. To modify the `utils/AnnouncementText` widget, set the required attribute `file_path` to the location in `/assets/` for the file containing your announcement text.
2. To modify the `discussion/ForumList` widget, add or change these attributes and values:
   a. To change the date format, modify the `last_activity_date_format` attribute.
      - `full_textual` (example: January 1, 2000)
      - `short_textual` (example: Jan 1, 2000)
      - `numeric` (example: 1/1/2000)
b. To include a column of information about the forum, add the `show_columns` attribute and the value for the column.
   - `question_count`
   - `comment_count`
   - `last_activity`

   This example code removes the column containing information about the last activity.
   ```xml
   <rn:widget path="discussion/ForumList" show_column="question_count,comment_count"/>
   ```

c. To change the number of forums shown in the list, modify the `max_forum_count` attribute. The `max_forum_count` is set to 10 by default, but can include as many as 40 forums.

d. To change the amount of text shown in the forum description, modify the `maximum_description_length` attribute.

3. To modify the `user/UserList` widget, add or change these attributes and values:

a. To modify the time period considered for displaying users, set the `activity_time_period` attribute.
   - `past_day`
   - `past_week`
   - `past_month`
   - `past_year`
   - `any_time`

   This example code includes only users active in the past week.
   ```xml
   <rn:widget path="user/UserList" activity_time_period="past_week" content_display_type="table_view"
             avatar_size="small"/>
   ```

b. To change the size of the avatar displayed, modify the `avatar_size` attribute.
   - `none`
   - `small`
   - `medium`
   - `large`

c. To set the format the content is displayed in, modify the `content_display_type` attribute.
   - `table_view`
   - `list_view`

d. To set which content is listed in the results, add the `content_type` attribute.
   - `questions`
   - `comments`
   - `best_answers`

   This example code includes a list of users active in the comments.
   ```xml
   <rn:widget path="user/UserList" content_type="comments" content_display_type="table_view"
             avatar_size="small"/>
   ```

e. To set the maximum number of users shown in the list, add the `max_user_count` attribute.

f. To remove the avatar from the list, set the `show_avatar` attribute to false.

4. To modify the `user/RecentlyActiveUsers` widget, add or change these attributes and values:

a. To change the size of the avatar displayed, modify the `avatar_size` attribute.
   - `none`
   - `small`
   - `medium`
   - `large`

b. To set the format the content is displayed in, modify the `content_display_type` attribute.
c. To change the date format, modify the last_active_date_format attribute.
   - full_textual (example January 1, 2000)
   - short_textual (example Jan 1, 2000)
   - numeric (example 1/1/2000)

d. To modify the time period considered for displaying users, set the show_users_active_in attribute.
   - past_day
   - past_week
   - past_month

e. To determine which information shows for each user when the content is rendered as a list, set the
   specify_list_view_metadata attribute with at least one of these values:
   - user_avatar
   - display_name
   - last_active
   - default: user_avatar, display_name, last_active

f. To change the maximum number of users displayed, set the max_user_count attribute.

5. To modify the utils/TwitterPosts widget, add or change these attributes and values:
   a. To set the required attribute fetch_tweets_using, add one of these values:
      - account
      - hashtag
      - search_query
   b. To display a specific number of tweets, add the data_tweet_limit attribute and set the value between 1
      and 20.
   c. To set the Twitter account used to fetch tweets, add a value to the twitter_account attribute.
      Your code will look something like this:
      `<rn:widget path="utils/TwitterPosts" twitter_account="OracleCX"/>

Chatting on the Customer Portal

Overview of Chat on the Customer Portal

When Chat is enabled on your site, the Contact Us sidebar on the Results and Answer and Discussion Details pages
automatically includes a Live Chat link.

Occasionally, your customers may not find the information they are looking for on your support site or need an answer
more quickly than a typical email response.

When a customer clicks a Chat link on your customer portal, the Live Help page opens and displays a small chat request
form. After the request is submitted, the Chat page opens indicating the customer’s position in the queue. After an
agent accepts the chat request, the Chat page provides a place for the customer to post messages to the agent, and
displays a transcript of the chat session.

The Live Help page is where your customers submit a request for a chat session. After the request has been submitted,
the Chat page opens and the customer can begin chatting with an available agent. The Live Help page is opened when
customers click the Live Chat navigation link in the Contact Us sidebar or any other Chat link that may have been added to your customer portal.

The default Live Help page displays the customer’s first and last names and email address if the customer is logged in. If the customer is not yet logged in, the fields are blank waiting for customer input. If you have incident custom fields with chat visibility, those fields are displayed on the default Live Help page as well, with required custom fields noted by a red asterisk. The page also contains a Submit button, a chat status message, and the chat hours listing.

**Change the Live Help Page Message Bases**

You can modify the Live Help page labels and headings.

2. To change the Live Help heading, locate `<h1>$rn:msg:LIVE_HELP_HDG$</h1>` and enter the new heading between the `<h1>` and `</h1>` tags.
3. To change the Chat subheading, locate `<span class="rn_ChatLaunchFormHeader">$rn:msg:CHAT_MEMBER_OUR_SUPPORT_TEAM_LBL$</span>` and replace the message base with your replacement heading.
   `<span class="rn_ChatLaunchFormHeader">Talk to someone on our support team right now!</span>`
4. To change the Chat Support available message, locate `<rn:widget path="chat/ChatStatus"/>` and add the `label_chat_available` attribute to the widget.
   `<rn:widget path="chat/ChatStatus" label_chat_available="Agents are currently available."/>`
5. To remove fields from the Live Help page, locate this code.
   `<rn:widget path="input/FormInput" name="Incident.Subject" initial_focus="true" label_input="#rn:msg:SUBJECT_LBL#"/>`
   `<rn:condition config_check="COMMON:intl_nameorder == 1">`
   `<rn:widget path="input/FormInput" name="Contact.Name.Last" label_input="#rn:msg-LAST_NAME_LBL#" required="true"/>`
   `<rn:widget path="input/FormInput" name="Contact.Name.First" label_input="#rn:msg-FIRST_NAME_LBL#" required="true"/>`
   `<rn:condition_else/>
   `<rn:widget path="input/FormInput" name="Contact.Name.Last" label_input="#rn:msg-LAST_NAME_LBL#" required="true"/>`
   `<rn:widget path="input/FormInput" name="Contact.Name.First" label_input="#rn:msg-FIRST_NAME_LBL#" required="true"/>`
   </rn:condition>
   `<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
   <!-- optional fields -->
   `<rn:widget path="input/CustomAllInput" table="Incident" chat_visible_only="true" always_show_mask="false" chat_visible_only="true" always_show_mask="false"/>`
   a. To remove the Subject field, delete `<rn:widget path="input/FormInput" name="Incident.Subject" initial_focus="true" label_input="#rn:msg:SUBJECT_LBL#"/>`.
   b. To remove the Last Name field and display only the first name, delete `<rn:widget path="input/FormInput" name="Contact.Name.Last" label_input="#rn:msg-LAST_NAME_LBL#" required="true"/>` from both condition cases.
   c. To remove the Email Address field, delete `<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" label_input="#rn:msg:EMAIL_ADDR_LBL#"/>`.
   d. To remove incident custom fields, delete this code.
   <!-- optional fields -->
6. Save the file.

## Change Available Chat Hours

You change chat hours on the administration interface. Those hours are listed on the Live Help page.

1. Double-click **Interfaces** in **Configuration > Site Configuration**.
2. Click the interface you want to edit chat hours for.
3. Click **Chat Hours**.
4. To add a day, click **Add** and select a day.
5. To edit the start hour and minute or the end hour and minute for any day, click in the field and enter the new value.
6. Click **Save**.

## Chat Page

The Chat page opens after customers submit a chat request.

By default, the **chat_landing.php** file for the Chat page contains the include_chat page meta tag, which is set to true. If you create additional pages that contain a chat application, you must include this meta tag and set it true in the page file. When the include_chat tag is set to true, the page includes all the required JavaScript files for Chat.

Although the default Chat page includes multiple widgets, these widgets are necessary to create a usable Chat page.

- ChatServerConnect
- ChatTranscript
- ChatPostMessage

### Configure the ChatServerConnect Widget

You can change labels, icons, and other attributes of the ChatServerConnect widget.

1. Open one of these files:
   - `/views/pages/chat/chat_landing.php`
   - `/views/pages/mobile/chat/chat_landing.php`
2. Locate `<rn:widget path="chat/ChatServerConnect"/>`.
3. To change the loading icon, add the loading_icon_path attribute to the widget.
   ```html
   <rn:widget path="chat/ChatServerConnect" loading_icon_path="images/indicator_2.gif" />  
   ```
4. To edit any of the default labels (shown in quotation marks), add the associated attribute and define it with your new label.
   ```html
   <rn:widget path="chat/ChatServerConnect" label_connecting="Please wait while we establish a connection to the Chat Server." label_connection_fail="There was a problem connecting to the Chat Server." label_connection_success="A connection to the Chat Server has been established successfully." label_prevent_anonymous_chat="One or more required contact fields are missing. Please review all fields and re-submit the chat request." />  
   ```
requests by requiring one or more of the email, first name, and last name fields (the email_required, first_name_required, or last_name_required attributes).

- label_terminate_session— "This action will terminate your current session. Do you want to continue?"

5. Save the file.

Disable New Message Notifications

You can disable the notification customers receive when the chat agent sends a new message and the transcript window does not have focus.

2. Locate <rn:widget path="chat/ChatTranscript" />
3. Add the unread_messages_titlebar_enabled attribute to the widget and set it to false.

4. Save the file.

Replace the ChatTranscript Widget Icons

You can replace the default icons by defining the path and file name for the replacement icon.

All default icons are in the /cp/customer/assets/themes/standard/images folder, but you can reference the path in the widget attribute by entering images/<filename>.

2. Find <rn:widget path="chat/ChatTranscript" />
3. Add the appropriate attributes to the widget.
   - Agent Message Icon—agent_message_icon_path
   - Alert Icon>alert_icon_path
   - End-user Message Icon—enduser_message_icon_path
   - Off the Record Icon—off_the_record_icon_path

4. Save the file.

Edit the Chat Instructions Label

You can change the message that is displayed to the customer.

2. Locate <rn:widget path="chat/ChatPostMessage" />
3. Add the label_send_instructions attribute to the ChatPostMessage widget.

4. Save the file.

Notify Customers of Incoming Messages

You can bring the chat window to the top or flash the task bar button to notify customers that a new response is available.

This functionality is only available for customers using Internet Explorer.

2. Locate <rn:widget path="chat/ChatPostMessage" />

--

ORACLE

1241
3. Add the `focus_on_incoming_messages` attribute to the ChatPostMessage widget.
   ```html
   <rn:widget path="chat/ChatPostMessage" focus_on_incoming_messages="true" />
   ```

4. Save the file.

Add the ChatCobrowsePremium Widget
You can let customers share their desktop with agents who are chatting with them.

**Add the CoBrowsePremium Widget.**

1. Do one of the following:
   - Open `/views/pages/chat/chat_landing.php`.

2. Locate this code.
   ```html
   <div id="rn_InChatButtonContainer">
   <rn:widget path="chat/ChatAttachFileButton"/>
   <rn:widget path="chat/ChatSendButton"/>
   </div>
   ```

3. Add `rn:widget path="chat/ChatCobrowsePremium"`.
   ```html
   <div id="rn_InChatButtonContainer">
   <rn:widget path="chat/ChatAttachFileButton"/>
   <rn:widget path="chat/ChatSendButton"/>
   <rn:widget path="chat/ChatCobrowsePremium"/>
   </div>
   ```

4. Save the file.

Change the Chat Window Size
The size of the Chat window is determined by the ChatLaunchButton widget used on the Live Help page.

2. Locate this code.
   ```html
   <rn:condition config_check="MOD_VA_ENABLED == 0">
   <rn:widget path="chat/ChatLaunchButton" launch_width="390" launch_height="595"
   error_location="rn_ErrorLocation" add_params_to_url="q_id,pac,request_source,p,c,
   survey_send_id,survey_send_delay,survey_comp_id,survey_term_id,chat_data,
   survey_term_auth,survey_comp_auth"/>
   <rn:condition_else/>
   <rn:widget path="chat/ChatLaunchButton" launch_width="390" launch_height="800"
   error_location="rn_ErrorLocation" add_params_to_url="q_id,pac,request_source,p,c,
   survey_send_id,survey_send_delay,survey_comp_id,survey_term_id,chat_data,
   survey_term_auth,survey_comp_auth,survey_send_auth,i_id"/>
   </rn:condition>
   ```

3. Edit the `launch_height` and `launch_width` attributes to both instances of the ChatLaunchButton widget.
   ```html
   <rn:widget path="chat/ChatLaunchButton" launch_width="250" launch_height="250"
   ...
   <rn:condition_else/>
   <rn:widget path="chat/ChatLaunchButton" launch_width="250" launch_height="500"
   ...
   ```

4. Save the file.

Change the Answer Window Size
You can control the size of the window that opens when the Search button is clicked.

2. Locate `rn:widget path="chat/ChatQueueSearch" popup_window="true"`.

3. Add the following attributes and set their percentage value.
   a. `popup_window_height_percent` (default 42 percent).
   b. `popup_window_width_percent` (default 30 percent).

```html
<rn:widget path="chat/ChatQueueSearch" popup_window="true"
          popup_window_height_percent="75"
          popup_window_width_percent="75" />
```

4. Save the file.

### Configure Chatting Off the Record

The default Chat page contains a button that customers can click to send an off-the-record message.

Any information the customer types in the Off the Record Message dialog will not appear on the Messages tab of the incident created from the chat session. Instead, the incident will show “Message Removed.” Text that is submitted off-the-record is displayed with a different color and icon in the chat transcript window.

1. Open the appropriate chat landing file.
   - `/views/pages/chat/chat_landing.php`
   - `/views/pages/mobile/chat/chat_landing.php`

2. To set all chat posts off the record, edit the ChatPostMessage code to add the `all_posts_off_the_record` attribute.

```html
<rn:widget path="chat/ChatPostMessage" all_posts_off_the_record="true" />
```

3. To remove the off-the-record chat option, delete these two lines of code.
   - `<rn:widget path="chat/ChatOffTheRecordDialog"/>
   - `<rn:widget path="chat/ChatOffTheRecordButton"/>

4. Save the file.

### Remove the Search Field from the Chat Page

You can delete the search field from the Chat page.

2. Delete this code.

```html
<div id="rn_ChatQueueSearchContainer">
  <rn:widget path="chat/ChatQueueSearch" popup_window="true" />
</div>
```

3. Save the file.

### Remove Virtual Assistant Widgets

If your customer portal is not integrated with B2C Service Virtual Assistant, you should remove the Virtual Assistant widgets.

The reference implementation default Chat page includes these virtual assistant widgets: VirtualAssistantAvatar, VirtualAssistantBanner, VirtualAssistantSimilarMatches, and VirtualAssistantFeedback.

2. Delete these two sections of code.

```html
<div id="rn_VirtualAssistantContainer">
  <rn:widget path="chat/VirtualAssistantAvatar"/>
  <rn:widget path="chat/VirtualAssistantBanner"/>
</div>

<rn:widget path="chat/VirtualAssistantSimilarMatches"/>
<rn:widget path="chat/VirtualAssistantFeedback"/>
```
3. Save the file.

Add a Chat Link a Customer Portal Page

This example adds a chat link to the Support Home page.

2. Locate `<h2 class="rn_ScreenReaderOnly">#{rn:msg:SEARCH_RESULTS_CMD#}</h2>`.

3. Add `<rn:widget path="chat/ConditionalChatLink" />`.

4. Save the file.

Configure the ConditionalChatLink Widget

There are a number of attributes you can set for the ConditionalChatLink widget.

1. Open the page to edit.
   - Open the page that includes the ContactUs widget where you want to configure conditional chat.
   - Open the page where you've added the ConditionalChatLink widget.

2. To detect an incident ID and pass it through the URL for the chat agent, add the `auto_detect_incident` attribute to the widget and set its value to `true`.

3. To change the Launch page that opens when customers click the chat link, add the `chat_login_page` attribute and set its value to the new page.

4. To hide the chat so it appears on your customer portal only when agents are available, add the `hide_on_unavailable` attribute and set its value to `true`.

5. To consider information entered by customers after they've been pre-routed, enabling routing rules to check the values of customer fields and re-route the request accordingly, add the `ignore_preroute` attribute and set it to `true`.

6. To open the Chat Launch page in a new window, add the `open_in_new_window` attribute, set it to `true`, and then define the size with the `chat_login_page_height` and `chat_login_page_width` attributes.

**Note:** The `ignore_preroute` attribute should be enabled only when necessary for achieving a specific business goal. The agent availability detection and pre-routing functions occur before routing rules are applied. As a result, when the `ignore_preroute` attribute is enabled, customers may be routed to a different queue than the one originally determined by agent availability, even a queue for which no agent is immediately available. This can conflict with the indication of availability expressed by the widget itself, leading to customer confusion.
7. Save the page.

Add the Syndicated ConditionalChatLink Widget

You can add a chat link to an external page using the syndicated ConditionalChatLink widget.

Your profile must have WebDAV permission enabled, and you must log in with your B2C Service user name and password.

1. Enter `https://<your_site>/ci/tags/syndicated_widgets/standard/ConditionalChatLink` to open the page for the syndicated ConditionalChatLink widget.
2. In Configure Widget, modify the widget attributes for your organization’s needs.
3. To preview your changes, click **Apply**.
4. Modify the widget’s appearance by editing its CSS file, which is `/cp/customer/assets/css/syndicated_widgets/standard/ConditionalChatLink.css`.
5. Click **Select Text** and copy the code.
6. Open the source code for the web page you want to add the widget to.
7. Paste the code into your page file just before the closing `</body>` tag. Even if you plan to use multiple syndicated widgets on the page, you need to paste this code only once.
8. In the generated code, click the second **Select Text** button and copy the code that defines the widget.
9. Paste the copied code just before the closing `</body>` tag.
10. Click the third **Select Text** button, copy the code, and paste it in the page code where you want the widget to appear.
11. Save the page.

Configure the Syndicated ConditionalChatLink Widget

There are various options for configuring the syndicated ConditionalChatLink widget.

1. Select one or more options to configure.
   - To direct customers to a page other than the Live Help page, enter the page name in the field for the `chat_login_page` attribute.
   - To specify a product, enter the product ID number in the field for the `p` attribute.
   - To specify a category, enter the category ID number in the field for the `c` attribute.
   - To specify custom fields, enter one or more key-value pairs in the field for the `custom_fields` attribute. The key is the custom field ID and the value is the value of the custom field.
   - To consider customer data when routing to a chat session, select the Enabled check box for the `ignore_preroute` attribute.

Offering Customers a Chat Session

You can offer customers a chat session when it appears they are not finding the information they are looking for.
You can proactively offer a chat session from your customer portal pages as well as from any external page on your website.

These events occur when a customer accepts a chat offer through either the ProactiveChat widget in the /cp/core/widgets/standard/chat folder or the syndicated ProactiveChat widget.

- Before the chat is offered to the customer, the chat session routing rules determine what queue the chat request will be directed to based on products, categories, custom fields, and other rule conditions.

- When the customer accepts the chat request, the Chat page that opens contains any incident custom fields that have chat visibility.

- If the customer changes any of the information on the Chat page, that information is passed to the agent on the chat session workspace. The rules engine does not run again. As a result, the customer may change a field that would have triggered the chat being assigned to a different queue, but because rules are not run on the updated Chat page, the original queue assignment does not change.

We recommend that you do not add any fields to the Chat page that would result in a queue reassignment if the customer edits that field since reassignment does not occur with either the standard or syndicated widget. If you want to display a different page to customers who enter a chat session through a proactive chat offer, you can create a custom Chat Login page. After you create the custom page, change the chat_login_page attribute for the widget to specify the custom page.

If you want to place the ProactiveChat widget on the /answers/list.php page, place it within the container defined by `<rn:condition url_parameter_check="kw != null">`. Then when a search is performed while viewing all published answers, the page is loaded with the ProactiveChat widget in place. Otherwise, it may not appear due to the page refresh that occurs when a search term is entered.

Chat sessions are not offered in these situations.

- If the customer's browser does not accept cookies, no chat is offered during the customer session.

- If the widget looks for a chat queue ten times without finding one, no chat is offered on that page.

- If a chat is offered (whether or not it is accepted), a cookie is set and no more chat offers are made during the current customer session.

- If a chat is offered and the customer refuses, a cookie is set and no more chat offers are made for 30 days.

Reports for ProactiveChat

There are two standard reports available for the ProactiveChat widget.

The standard reports available can be found in the Reports explorer Public Reports/Service/Chat Reports/Proactive Chat.

- Proactive Chat Offer Statistics—Shows the number of site visits, proactive chat invitations, and accepted, declined, refused, and ignored chat invitations.

- Proactive Chat Summary Statistics—Shows the number of chat requests resulting from a proactive chat invitation and the number of chat sessions that were deflected, abandoned, and accepted (with and without agent interaction).

Add the ProactiveChat Widget to a Page

This example adds the ProactiveChat widget to the results page.

Chat must be enabled and agents must be available before a chat will be offered to a customer. The customer’s browser must be configured to accept cookies.
The default code for the ProactiveChat widget will not trigger a chat offer until you add an attribute that defines the trigger for the offer. You must add at least one of the following attributes to the code: `seconds`, `searches`, or `profile_` attributes.

2. Locate `<rn:widget path="reports/Paginator" />`.
3. Add the ProactiveChat widget.
   
   
   ```xml
   <rn:widget path="chat/ProactiveChat" />
   ```

   a. To trigger the chat offer based on the customer’s inactive time on the page, add the `seconds` attribute to the code.
   
   ```xml
   <rn:widget path="chat/ProactiveChat" seconds="60" />
   ```

   b. To trigger the chat offer based on the number of searches the customer conducted, add the `searches` attribute to the code.
   
   ```xml
   <rn:widget path="chat/ProactiveChat" searches="3" />
   ```

4. Save the file.

**Trigger Chat Offers**

When one of the required attributes has been met, an AJAX request is made to the server, which sends back the number of available agents and the minimum wait time.

You must define at least one of these attributes before the chat offer will be triggered: `seconds`, `searches`, and `profile_`

1. To offer chat based on page time, add the `seconds` attribute.

   ```xml
   <rn:widget path="chat/ProactiveChat" seconds="60" />
   ```

2. To offer chat based on number of searches, add the `searches` attribute.

   ```xml
   <rn:widget path="chat/ProactiveChat" searches="3" />
   ```

3. To offer a chat based on customer profile information, define the `profile_item`, `profile_operator`, and `profile_value` attributes.

   ```xml
   <rn:widget path="chat/ProactiveChat" profile_item="org_id"
   profile_operator="equals" profile_value="81945" />
   ```

The following list includes all the profile items you can use as conditions for offering chats to customers.

- `slac`—The number of chat incidents the customer’s SLA allows.
- `slai`—The number of self-service incidents the customer’s SLA allows.
- `web_access`—The customer’s SLA allows self-service.
- `org_id`—The ID of the organization associated with the customer.
- `o_lvlN`—The ID of the organization’s sublevel, if the organization has subsidiaries, where N is the organization level.

Any of the following operators are valid for defining profile items.

- Equals
- Less than or equals
- Greater than or equals
- Not equal
- Less than
4. To offer a chat based on an event, you must use custom code:
   a. Create an event called `evt_customProactiveInitialization`.
   b. Set the `initiate_by_event` attribute of the ProactiveChat widget to true.

If your organization requires SLAs in order for customers to chat with agents, you'll want to verify that the customer has an SLA with available chat incidents before a chat session is offered. The profile attributes of the ProactiveChat widget can do that for you.

Add the `profile_item`, `profile_operator`, and `profile_value` attributes to the code for the ProactiveChat widget.

Your edited code will resemble the following.

```xml
<rn:widget path="chat/ProactiveChat" seconds="30" profile_item="slac"
profile_operator="greater than" profile_value="0" />
```

## Configure the ProactiveChat Widget

A number of attributes are available to customize and configure the ProactiveChat widget.

**Define the `seconds`, `searches`, or `profile_` attributes in order to Trigger Chat Offers.**

1. To edit the chat invitation message, add the `label_chat_question` attribute.

   ```xml
   <rn:widget path="chat/ProactiveChat" seconds="30"
   label_chat_question="Staff members are available now.
   Would you like to chat with someone?" />
   ```

2. To change the Chat Login page, add the `chat_login_page` attribute.

   ```xml
   <rn:widget path="chat/ProactiveChat" seconds="30"
   chat_login_page="/app/chat/alternate_chat_launch_page" />
   ```

3. To change the size of the chat login window, add the `chat_login_page_height` and `chat_login_page_width` attributes.

   ```xml
   <rn:widget path="chat/ProactiveChat" seconds="30"
   chat_login_page_height="500"
   chat_login_page_width="600" />
   ```

4. To open the Chat Login page in the same window, add the `open_in_new_window` attribute.

   ```xml
   <rn:widget path="chat/ProactiveChat" seconds="30"
   open_in_new_window="false" />
   ```

5. To define the maximum wait time, add the `wait_threshold` attribute.

   ```xml
   <rn:widget path="chat/ProactiveChat" seconds="30" wait_threshold="60" />
   ```

6. To define the minimum number of agents, add the `min_agents_avail` attribute.

   ```xml
   <rn:widget path="chat/ProactiveChat" seconds="30" min_agents_avail="2" />
   ```

## Add the Syndicated ProactiveChat Widget to a Web Page

You can place the syndicated ProactiveChat widget on external sites, instead of being restricted to just customer portal pages.

Your profile must have WebDAV permission enabled, and you must log in with your user name and password.

1. Open [https://<your_site>/ci/tags/syndicated_widgets/standard/ProactiveChat](https://<your_site>/ci/tags/syndicated_widgets/standard/ProactiveChat).
2. Scroll down to the Configure Widget section and begin modifying the widget attributes as you choose.
3. To preview your changes, click Apply.
4. Click the top Select Text button and copy the code.
5. Open the web page you want to add the widget to.
6. Paste the code into your page file just before the closing </body> tag. Even if you plan to use multiple syndicated widgets on the page, you need to paste this code only once.

7. In the generated code, click the second Select Text button and copy the code that defines the widget.

8. Paste the copied code just below the code you pasted, earlier.

9. Add <div id="myDiv"></div> to the page code where you want the widget to appear.

10. Save the page.

Related Topics
    • How You Access the Rules Editor from B2C Service
    • Commonly Deployed Rules

Trigger Syndicated Chat Offers

You can define additional conditions that must be met before a chat is offered.

You must set the seconds attribute before a chat offer will be triggered. You could also create custom rules that trigger the chat offer.

The syndicated ProactiveChat widget opens a chat invitation to your customers after they spend a specified amount of time on the page where you placed the widget. The default code for the syndicated ProactiveChat widget will not trigger a chat offer because the default values for the seconds attribute is 0.

1. Open the syndicated ProactiveChat widget page.
2. To trigger chat offers based on page time, enter a value in the field for the seconds attribute.
3. To define the minimum number of agents, enter a value in the field for the min_agents_avail attribute.
4. To define the maximum wait time, enter a value in the field for the wait_threshold attribute.

Configure the Syndicated ProactiveChat Widget

A number of attributes are available to customize and configure the syndicated ProactiveChat widget.

1. Open the Syndicated ProactiveChat Widget page.
2. To define a default product, enter the product ID in the field for the p attribute.
3. To define a default category, enter the category ID in the field for the c attribute.
4. To change the Chat Login page, enter a value in the field for the chat_login_page attribute.
5. To open the Chat Login page in the same window, clear the Enabled check box in the open_in_new_window attribute.
6. To change the size of the chat login window, enter new height and width attribute values.
   a. Enter the new height of the window, in pixels, in the field for the chat_login_page_height attribute.
   b. Enter the new width of the window, in pixels, in the field for the chat_login_page_width attribute.
7. To replace default images, reference new image files in /cp/customer/assets/images/.
   a. To replace the avatar image, enter the image file path in the field for the avatar_image attribute.
   b. To replace the logo image, enter the image file path in the field for the logo_image attribute.
   c. Leave the fields blank if you do not want to display any images.
8. To edit chat invitation messages, edit the label attribute.
   a. To edit the Yes button, enter the new label in the field for the label_accept_button attribute.
   b. To edit the No button, enter the new label in the field for the label_reject_button attribute.
   c. To edit the label for the chat refusal check box, enter the new label in the field for the label_refuse_checkbox attribute.
9. To edit alternative (alt) text for images.
   a. Enter the new label for the avatar image in the field for the label_avatar_image attribute.
   b. Enter text in the corporate logo image field for the label_logo_image attribute.
10. To edit the dialog header and title bar, add your own data.
   a. For the header label, enter the new label in the field for the `label_dialog_header` attribute.
   b. For the title bar, enter the new label in the field for the `label_title` attribute.
11. To edit the chat invitation, enter a new chat invitation message in the field for the `label_question` attribute.
12. To edit the div element, enter a new name for the div element in the field for the `div_id` attribute.
   ```html
   <div id="newDiv"></div>
   ```
13. To edit the instance ID, replace the “0” in “spac_0” in the `instance_id` attribute with another value for each widget you add to the page. If you have more than one syndicated ProactiveChat widget on a page, you must have unique ID values for each of them. The default value is spac_0.
14. To change the dialog to modal, select the **Enabled** check box for the `modal` attribute.

**Custom Rules for Syndicated ProactiveChat**

You can define custom rules that specify other conditions for triggering a chat offer.

You may want to offer a chat to customers who have a certain dollar value or a specific type of product in their shopping cart.

The syndicated ProactiveChat widget includes two JavaScript API functions.

- The `chatAvailability()` function, for checking agent availability
- The `offerChat()` function, for offering a chat invitation

You can call these functions from your web pages on a specific instance of the ProactiveChat widget. This can be done either through an event or with a direct method call. The custom code to trigger a chat offer must appear on the same page where you place the syndicated ProactiveChat widget.

**Expose the API Functions**

You can request agent availability, offer a chat session using the `offerChat()` function, and offer a chat using an event.

1. Open the web page you want to expose the API functions.
2. Add this code for each widget instance.
   ```html
   <script type="text/javascript">
   RightNow.Client.Controller.addComponent({
     modal: true,
     instance_id: "spac_0",
     div_id: "myDiv",
     seconds: 0,
     module: "ProactiveChat",
     type: 2
   },
   "http://[your_site]/ci/wsf/get");
   </script>
   ```

**Use the chatAvailability() Function**

You can use this function to check the queue id that is currently assigned to the chat instance, the number of agents available, and the current wait time.

**Expose the API Functions.**

The `chatAvailability()` function of the syndicated ProactiveChat widget requests agent availability. In this example, the `chatAvail()` function calls the `chatAvailability()` function on the spac_0 instance of the syndicated ProactiveChat widget.
The callback method, chatDataAvail, displays alerts for the queue ID, agent availability, and wait time data of the result argument.

1. On the web page containing the widget, add this code to define a function that calls chatAvailability() and to define a callback method.

```javascript
function chatAvail()
{
    spac_0.chatAvailability(chatDataAvail);
};

function chatDataAvail(result){
    alert("q_id "+result.queueId);
    alert("agent_avail "+result.availableAgentSessions);
    alert("wait_time "+result.expectedWaitSeconds);
};
```

2. Make sure that your code calls the function that makes the call to chatAvailability(), which in the example is the chatAvail() function.

**Use the offerChat() Function**

You can use the offerChat() function to offer a chat session if its Boolean argument is true.

**Expose the API Functions.**

The offerChat() function of the syndicated ProactiveChat widget lets you offer a chat to a user. In this example, the chatAvail() function calls the chatAvailability() function on the spac_0 instance of the syndicated ProactiveChat widget. The callback method, chatDataAvail, examines the result argument to verify that more than one agent is available and, if so, calls the offerChat() function to offer a chat to the user.

1. On the web page containing the widget, add this code to define a function that calls chatAvailability() and to define a callback method that calls the offerChat() function.

```javascript
function chatAvail()
{
    spac_0.chatAvailability(chatDataAvail);
};

function chatDataAvail(result){
    if(result.availableAgentSessions > 0) {
        alert("offering a chat now");
        spac_0.offerChat(check);
    }
}
```

2. On the web page, make sure that your code calls the function that makes the call to chatAvailability(), which in the example is the chatAvail() function.

**Request Chat Availability Using an Event**

You can request chat availability through an event.

The code must first subscribe to the `evt_chatAvailabilityResponse` event and then fire an `evt_chatAvailabilityRequest` event.

1. Add this code to the web page containing the syndicated ProactiveChat widget.

```javascript
function chatAvailEvent(){
    RightNow.Client.Event.evt_chatAvailabilityResponse.unsubscribe(onDataReady);
    RightNow.Client.Event.evt_chatAvailabilityResponse.subscribe(onDataReady);
    RightNow.Client.Event.evt_chatAvailabilityRequest.fire();
};
```

2. Add code to call the function that requests chat availability, which in the example is chatAvailEvent().

**Offer a Chat Using an Event**

You can offer a chat session by firing an `evt_chatOfferRequest` event.
The checkAvailability parameter of the evt_chatOfferRequest event determines whether the request first checks for agent availability. If the argument is set to true, the evt_chatAvailabilityResponse event is first fired, which determines whether agents are available. If the argument is set to false, a chat is offered immediately.

1. Add this code to the web page containing the syndicated ProactiveChat widget.

```javascript
function offerChatEvent()
{
    RightNow.Client.Event.evt_chatOfferRequest.fire({data:{checkAvailability: true}, id: "spac_0"});
}
```

2. Add code to call the function that offers the chat, which in this example is offerChatEvent().

### Community Self Service Overview

#### Overview of Community Self Service

Peer-to-peer support has become an increasingly important part of web self-service customer support. Your customers expect a support site that integrates official company knowledge with solutions from other customers.

**Note:** This section discusses the Community Self Service feature integrated with Customer Portal Framework Version 3.3 in the August 2015 release. If you are looking for information about configuring B2C Service Social Experience communities, go to Communities on the Customer Portal in the May 2015 documentation.

Your customers have always been able to search for an answer in your knowledge base and ask a question of your customer support agents. Community Self Service adds an extra layer of information for your customers. When they seek an answer to their questions, the Customer Portal returns community content in addition to your published answers. When they seek an answer to their questions, the Customer Portal returns community content in addition to your published answers. And when they want to ask a question, they now have the option of asking for help from other customers. Even SmartAssistant returns community discussions as well as published answers.

Gaining crowd knowledge from other users means that your customers have a powerful new self-service channel that can reduce the number of incidents your customer support agents need to resolve.

### Community Self Service Users

There are several different kinds of users in Community Self Service.

Community users have a Public Profile page associated with their account that includes information about their recent public activity within the Community, including their questions, comments, and answer ratings.

The Community feature prevents anonymous interactions. Unless Community users have a contact record in your database, they can read content but they may not comment, flag information, or forward content. To allow Community interaction, contact records must be extended to include a Community user record that includes display name and avatar. Customers who have a contact record but do not yet have a Community record will be prompted to enter a display name prior to interacting on the Community. Customers who do not have a contact record will be prompted to create both a contact record and a Community record.
### User Types and Functionality

<table>
<thead>
<tr>
<th>User Types</th>

### Community Self Service Actions

There are a number of actions available for different users within a discussion.

These actions are available within discussions.

- **Questions/Discussions**—A question in the community is similar to a B2C Service incident or a discussion in a forum. At a minimum, a question has a title and body, and it may have additional custom fields. Questions cannot have image or file attachments.
  - Asking a question/creating a new discussion—Community users can create new questions, which consist of a title and body text. You may want to extend a question with custom attributes.

- **Associating a product or category to questions**—Community users can associate their questions with a product or category.
• Selecting best answers—Moderator or the question’s author can select the comment that best answered the question. Best answers are displayed near the original question so other users can easily find them. By default, the Support Home page displays only the recent community discussions that have a best answer. Child comments can also be marked as the best answer.

• Editing questions—Original authors can edit their own questions, and moderators can edit questions from community users.

• Deleting questions—Original authors can delete their own questions. When comments are associated with a question that is deleted, the comments are also deleted.

• Comments/Replies—Community users can respond to the original question with their feedback. The reply, or comment, is a single field that cannot contain image or file attachments, but it can contain hyperlinks. If the question includes many replies, the question is paginated with newer comments at the end. Community users can edit or delete their own comments. Users can also subscribe to a question or comment in order to be notified when someone has posted new content to the discussion.

• Ratings—Community users can rate replies to questions by upvoting the comments they like. They can also upvote questions to indicate that they also have a question similar to the one posed by the question’s author.

Community Public Profile Page

The Public Profile page allows users to manage their public profile.

This page also allows users to manage what information displays to the community when they post a question or comment and displays information about their recent activity in the community.

Community users can click their display name in the upper right corner of the customer portal window to view their account information, account overview, support history, and account settings.

Community Access Control

Access control defines the circumstances in which different users can perform actions.

Depending on their permissions, community users can perform a wide variety of actions on community content and users. Using access control, you can set up permissions. Although the Community Self Service feature allows countless combinations of its elements to offer you maximum flexibility in assigning permissions, it also includes basic default access control components that should meet most business needs.

For example, you might set permissions so that your community users are restricted to editing and deleting their own content, while moderators are able to edit and delete content from any user, but only for specific products.

Community Moderation

You can assign moderator privileges to your staff and trusted community users.

Moderators can interact with other users and with user-generated content by editing, moving, and removing it. They can manage users who disrupt your community. Moderation privileges are configurable so your organization can have multiple levels of moderation.
Moderators are responsible for managing inappropriate content and users, organizing content and keeping it on track, and keeping a site active. Moderators can use the moderation dashboards to identify flagged content, review, and suspend or restore it. They can suspend disruptive community members or delete their accounts entirely. They can also edit and lock discussions from within the discussion.

Search for Community Discussions

Users can search for specific discussions and filter on product (or category), age, and whether the discussion includes a best answer.

1. On the Community page, to search by general search terms, enter search terms in the Ask a Question field.
2. Apply filters as needed.
   - To filter by product, click Filter by Product and select a product.
   - To filter by age, click the Filter by Age and select one of the options: Last Day, Last Week, Last Month, or Last Year.
   - To filter by discussions that have a best answer, click Filter by Best Answer and select Yes.
3. Click Search.

Ask a Question to the Community

This process outlines the steps community users take to post a question to the community.

By default, you will receive an email whenever a comment is posted to your question.

1. Click Ask a Question.
2. Click Ask Our Community.
3. Enter the subject in the Subject field.
4. Enter more information about your question in the Question field.
5. To select a product, click Product and select the product or subproduct associated with your question.
6. Click Post Your Question.

Overview of Attaching Files in Community Self Service

You can attachment documents, templates, and snippets to incidents, answers, and community questions and comments.

Attachments can contain malicious code (malware) or data. All incoming attachments are put through an Abuse Detection System (ADS) and scanned for malware. Questionable attachments or attachments that fail the scan are rejected.

| CAUTION: | You should always consider the possibility that attackers could evade detection. |

Users can attach files to community questions and comments. Clicking on the file link on the Discussion page will force the user to download the attachment to their local system. The file URL is associated to the current user’s session. This means a user cannot forward the file URL to other users.
Users must have the appropriate read or write permissions in order to view a file attachment or to attach a file. The system generates an error page for users trying to view an attachment without the appropriate permissions. You control these permissions using Access Control.

There is a server-controlled list of allowed file extensions. This list is applied using the widget attribute. Attachments are forced to be downloaded. You cannot choose to have them open into a browser window or tab. For additional security, if the file name contains unreliable characters, the file name is sanitized to a harmless string.

Add Comments to a Discussion

This process outlines the steps community users take to add comments to discussions.

1. Open a discussion.
   - To add a comment to the question, enter your comment in the Add a New Comment field.
   - To reply to another comment, click **Reply** and enter your response in the Reply to this Comment field.

2. Click **Post Comment**.

Flag and Rate Questions and Comments

This process outlines the steps community users take to flag and rate questions and comments.

1. From the community question or comment, select the feedback.
   - To flag a question or comment as inappropriate, click the **Flag** link.
   - To indicate that you have the same question as the one being asked, click the up arrow.
   - To indicate that you agree with a comment that has been made, click the up arrow to the right of the Reply and Share links.

   **Note:** Users cannot upvote their own question or comment.

Share Community Discussions

This process outlines the steps community users take to email a discussion or share a link to a discussion.

1. To email a discussion:
   - Click **Email This Page**.
   - Enter an email address in the Recipient Email field.
   - Click **Send Email**.

2. To share a discussion on social media:
   - Click **Share**.
   - Select the social media site where you want to share the discussion.

3. To share a link to a comment within a discussion:
   - Click **Share**.
Edit Your Community Questions

This process outlines the steps community users take to edit their questions.

1. Click **Edit**.
2. To edit the subject, enter new text or edit existing text in the Subject field.
3. To edit the question, enter new text or edit existing text in the Question Body field.
4. To change the product associated with the question, click the Product drop-down menu and select a different product.
5. Click **Save**.

Delete Your Community Questions

This process outlines the steps community users take to delete their questions.

1. Click **Edit**.
2. Click **Delete This Question**.
3. Click **Yes**.

Edit Your Community Comments

This process outlines the steps community users take to edit their comments.

1. Click **Edit**.
2. To edit the comment, enter new text or edit existing text in the Edit This Comment field.
3. Click **Save**.

Delete Your Community Comments

This process outlines the steps community users take to delete your comments.

1. Click **Edit**.
2. Click **Delete**.
3. Click **Yes**.

Format Questions and Comments

You can enter questions and comments using plain text or formatted text.

1. To mark text as bold, select the text and click **B**.
2. To mark text as italic, select the text and click **I**.
3. To create a bulleted list, select the paragraphs and click the bulleted list icon.
4. To create a hyperlink, select the link text and click the link icon.
   a. Enter the URL where the link should point in the Links To field.
   b. Click **OK**.
5. To view the text as plain-text markdown instead of the default rich text mode, click **Advanced Mode**.

### Select the Best Answer to a Question

This process outlines the steps community users take to identify and select the best answer to their question.

1. Click **Mark as the Best Answer by Author**.
2. To change your selection of the best answer, select a different best answer.
3. To remove your selection of best answer without selecting another best answer, click **Unmark as Best Answer by Author**.

### Search Questions from a User

This process outlines the steps community users take to search for questions by a particular community user.

1. Click the avatar or user name of a community member to go to that member’s public page.
2. Enter a search term in the Search field.
3. To remove the author filter on the Search Results page, click **X**.

### Edit Community Profile

This process outlines the steps community users take to edit their profile.

1. Click the drop-down menu on your display name in the upper right corner and select **Public Profile**.
2. Click **Update**.
3. To change your avatar, follow these steps.
   a. Click **Change Your Profile Picture**.
   b. To use the default picture (the first letter of your user name), click **Apply** next to default picture.
   c. To use your Gravatar profile picture, click **Apply** next to Gravatar.

   **Note:** Gravatar is a Globally Recognized Avatar, an image that appears besides your name on the community as well as other social sites where you post or comment. You can register an account at [Gravatar](https://gravatar.com) and upload an avatar that is associated with your account.

   d. Click **Save Changes**.
4. To change your user name, follow these steps.
   a. Enter the new name in the Display Name field.
   b. Click **Save Changes**.

### Configuring Your Community

### Overview of the Community Access Control

Access Control lets you define each user’s ability to interact with content on your community site.
Access Control lets you define what community users have access to in the community and is configured on the agent desktop of B2C Service. The Access Control home contains two links.

- View Active Access Control—displays the access controls currently available on your production site.
- View Pending Access Control Paths—displays the access control changes that have been made but not yet deployed.

Access control paths offer a top-to-bottom view of the access control elements and show the components that make up role sets.

- roles
- permission sets
- permission set filters
- the user ownership constraint

The reference implementation includes default permission sets, roles, and role sets that should meet most of your access control needs. The Community Self Service feature offers you maximum flexibility in assigning permissions by allowing countless combinations of its components.

Permissions are the most granular element of access control, and each permission allows a user the ability to perform a single activity. More than forty permissions are available to allow users to view, create, edit, move, flag, and rate questions and comments, as well as perform a variety of community moderation activities.

Permission sets are groups of permissions. The reference implementation includes six default permission sets to address basic community user needs.

- view
- author
- flag
- rate
- moderation questions and comments
- select best answers

Other permission sets allow users to create, edit, and moderate user profiles and delete community members.

Permission set filters and user ownership constraints restrict where on the community individual permissions and permission sets apply. The reference implementation includes one default permission set filter, the Default Nowhere Permission Set Filter, which is an empty filter that you can use to create additional filters.

Every user must have at least one role, and several default roles are included in the reference implementation. Roles combine the permissions granted in the permission sets with the product or category filters of the permission set filters.

Because one person can have multiple roles, role sets are a combination of roles. Roles sets can then be assigned to contacts in your knowledge base.

### Community Role Sets

Understanding the role set defaults can help you determine what changes you want to make.

Access control elements are stored in Community (default) and Custom folders. You cannot edit or delete any of the Community access control elements or move them from the Community folder. Although you can create and move
additional custom folders, subfolders, and access control elements, you cannot move any custom element or folder into a Community folder.

The Customer Portal reference implementation includes six default role sets created to address a variety of business needs. All community users automatically have three role sets assigned to their user profile: Everyone, Default Community User, and Default Contact.

When staff members add contacts to your database and when new customers create accounts on the customer portal, they automatically have these permissions. If you have existing customers that were created before you began using the community self service feature, they are prompted to create a user profile (that is, add a display name) before interacting on the community pages. The creation of a user profile then grants them the same default permissions that all community users have.

- By default, all users have these permissions.
  - View all questions and comments as well as the flags and ratings for all.
  - View all community users.
  - Create, flag, and rate questions and comments.
  - Choose the best answer for their own questions.
  - Delete any flags or ratings they have assigned.
  - Edit their own questions and comments.
  - Delete their own questions and comments.
  - Create and edit their own user profile, including display name and avatar.

- Three additional role sets exist.
  - Default Account
  - Community Moderator—In addition to the permissions assigned to everyone, users with the this role set can:
    - Create, flag, and rate questions and comments for other users.
    - Choose the best answer for a question.
    - Delete flags and ratings for questions and comments from other users.
    - Edit questions and comments from other users.
    - Edit status and make rating adjustments for other users’ questions and comments.
    - Delete questions and comments.
    - Lock discussions.
    - Work on the moderator interface.
    - Edit a community user’s display name, avatar, and status.
    - View contact information for a user.
  - Community User Admin—Can view the moderator interface and create and delete community users.

Add Access Control to a Navigation Set

Users need the Access Control item in their navigation set before they can configure access control.

2. Right-click the navigation set you want to edit and select Open.
3. Select **Configuration** in the upper right column of the editor.
4. In the left column, expand **Components > Common** and select **Access Control**.
5. Click **Add**.
6. Click **Save**.

### Add the Access Control Profile Permission

This procedure lets staff members create and modify access controls for your community.

1. Double-click **Profiles** in **Configuration > Staff Management**.
2. Right-click the profile you want to edit and select **Open**.
3. Click **Search**.
4. Select a navigation set containing Access Control permission.
5. Click **Permissions**.
6. Select **Access Control**.
7. Click **Contacts**.
8. Select **Access Control**.
9. Click **Save**.

### Set the Access Control Filter

This process changes the filter from the default of products to categories.

You cannot filter by both products and categories.

1. Double-click **Configuration Settings** in **Configuration > Site Configuration**.
2. Click **(Select All)**.
3. Enter **SSS_PERMISSION_BY_PRODUCTS** in the Key field and click **Search**.
4. Click **Value**, then click the drop-down menu and select **No**.
5. Click **Save**.

### Create a Contact Workspace for Assigning Role Sets

The standard contact workspace does not include the control for assigning role sets to a contact. Therefore, you must first create a custom contact workspace with the control.

1. Double-click **Workspaces/Workflows** in **Configuration > Application Appearance**.
2. Click **Standard**.
3. Right-click **Contact** and select **Copy**.
4. Enter the name for the new workspace in the **Name** field.
5. Click **OK**.
6. Click **Workspaces and Workflows**.
7. Right-click the copied workspace and select **Open**.
8. Right-click the tab on the far right of the tab set and select **Add Tab After**.
9. Name the New Tab.
   a. Click the tab.
   b. Click **Design**.
   c. Click **Text**.
   d. Select New Tab.
Assign Role Sets to a Contact

Staff members whose profiles include a custom contact workspace with the Role Set Views control can assign role sets to existing contacts.

1. Double-click the name of the contact you want to edit in an open contact report.
2. Click **Role Sets View**.
3. Expand the Community and Custom folders.
4. Select any other role sets you want to assign to the user.
5. Click **Save**.

Search an Access Control Report

If the report contains many entries, it may be easier to search than to scroll through the list looking for what you want.

1. Open the report you want to search and click **Search**.
2. Select filters that match your search criteria.
3. To search by name, enter the first few letters of the element’s name followed by an asterisk or percent sign in the Name Like field.
4. Click **Search**.

Reset an Access Control Report

After you’ve search the report using specific filters, you might want to return to the original search criteria.

1. Open the report you want to reset.
2. Click **Reset**.

Refresh an Access Control Report

Sometimes after you’ve added or deleted items, you will need to refresh the report in order to reflect your changes.

1. Open the report you want to refresh.
2. Click **Refresh**.

Permissions

Permissions define which users can interact with community content and user information, what kinds of interactions are allowed, and where they have these permissions. You cannot customize an existing permission or add a new one.
Permissions are defined to allow actions on information in the database, and the default permissions are set. More than forty permissions exist to let community users view, create, edit, move, flag, and rate discussion content and user information. Additional permissions include options for moderators.

The Permissions report, opened by double-clicking Access Control on the navigation pane and clicking Permissions, displays a read-only list of all community permissions.

**Note:** Although the Edit button is active, you cannot edit individual permissions. And although the New button is active when Edit is selected, you cannot create permissions. Instead, the New button opens the Permission Set workspace.

When the Permissions report is open, you can search, reset the search parameters, and refresh the report using the buttons on the top left of the tab. You can sort the report on each of the column headings.

The Permission Data Conditions column lists the possible constraints for each permission. For example, the User Owned constraint on the Edit Community User Avatar means that you can constrain the permission so that community users with that permission can change only their own avatar.

The # Permission Sets link lets you drill down to view which permission sets include the selected permission. Drilling down on the Edit Community User Avatar shows the two permission sets that use the permission.

The Access Control Path link lets you drill down to view all the paths of **Role Set > Role > Permission Set > Permission Set Filters > Constraints** that use that specific permission.

### Overview of Community Permission Sets

The forty-four community permissions can be grouped into any combination of permission sets.

Six default permission sets are included in the reference implementation to address basic community user needs.

- **Default Community User**—Users can create and edit their own community user profile, including display name and avatar.
- **Default Community Viewer**—Users have read-only access to community users, questions, comments, ratings, and flags.
- **Default Community Author**—Users can create, flag, and rate questions and comments. Users also have permission to change the content they have authored. They can edit and delete questions and comments, delete ratings and flags for questions and comments, and select a best answer.
- **Default Community Moderator**—Moderators can choose a best answer, view the moderator-only elements of the user interface, lock questions, and move comments. They can also delete questions and comments, flags, and ratings, as well as edit questions and comments, rating adjustments, and status, and the question interface.
- **Default Community Moderator – Users**—Moderators can edit a community user’s display name, avatar, and status, view the moderator-only elements of the user interface, and view contact details for a community user.
- **Default Community Admin – Users**—Moderators can create and delete community users and view the moderator-only elements of the user interface.

When you click Permission Sets in the ribbon of the Access Control window, the permissions sets report displays in the default View Active mode.
When you click the Edit button in the ribbon, the permission sets report displays these columns.

- Created Time
- Created By
- Deployment Action

You can view the permissions included in the permission set by clicking the #Permissions Assigned link to display the permissions. The Default Community User permission set, for example, contains four permissions. Notice that the drill-down report title includes the Permission Set ID value (1 in this example) instead of the Permission Set name.

Create a Permission Set

In addition to the six default permission sets included in the reference implementation, you can create custom permission sets to more precisely define the exact permissions you want to grant to your community users and moderators.

1. Double-click **Access Control**.
2. Click **Permissions Sets**.
3. Click **Edit**.
4. Click **New**.
5. Select **Permission Set**.
6. Enter the permission set name in the Name field using only letters, numbers, and underscores.
7. Enter a unique descriptive name for the permission set in the **Labels** field.
8. To describe the permission set, enter information in the **Descriptions** field.
9. To store the permission set in an existing subfolder rather than in the default Custom folder, click **Search** in the **Folder** field.
   a. Select the folder name.
   b. Click **OK**.
10. To create a new subfolder for storing the permission set, click **Search** in the **Folder** field.
   a. Right-click **Custom** and select **New Folder**.
   b. Enter the folder name and press Enter.
   c. Select the new folder.
   d. Click **OK**.
11. Click the arrow next to the Community check box to expand the list of permissions.
12. Select the individual permissions you want the new permission set to include.
13. Click **Save**.

**Deploy Access Control Changes**

Copy a Permission Set

It's possible that a default or custom permission set is almost identical to the one you want to create. You can copy the existing permission set so you can edit it and make your changes.

1. Click **Edit**.
2. Click **Permission Sets**.
3. Right-click the permission set you want and select **Copy > Permission Set**.
4. To change the default name of the copied permission set, enter the new name in the Name field.
5. Enter a new name for the permission set in the Labels field.
6. Click **Save**.
Edit a Permission Set
You can edit any permission set in the Custom folder or its subfolders, but you cannot edit the default Community permission sets.

1. Click Edit.
2. Click Permission Sets.
3. Right-click the permission set you want to edit and select Open > Permission Set.
4. To edit the name, enter a new name in the Name field.
5. To edit the label, enter a new label in the Labels field.
6. Expand the Community permissions in the left column.
7. To add a permission, select its check box.
   a. To add a constraint to the selected permission, select the Constrain By check box.
   b. To remove a constraint from a permission, clear the Constrain By check box.
8. To remove a permission, clear its check box.
9. Click Save.

Delete a Permission Set
You can delete any permission set in the Custom folder or its subfolders, but you cannot delete the default Community permission sets. Nor can you delete a permission set that is used in a role.

1. Click Edit.
2. Click Permission Sets.
3. Right-click the permission set you want to delete and select Delete > Permission Set.
4. Click Yes.

View Where Permissions are Used
This process lets you determine where a permission set is in use.

1. Click Used In.
2. Click links to view:
   o the number of permission sets in each role
   o the assigned permission set filters
   o the number of role sets using the permission set
   o the access control path

Create a Permission Set Filter
Permission set filters are used for permissions that have a product or category restraint.

1. Double-click Access Control.
2. Click Permissions Set Filters.
3. Click Edit.
4. Click New.
5. Select Permission Set Filter.
6. Enter the permission set filter name in the Name field using only letters, numbers, and underscores.
7. Enter a descriptive name for the permission set filter in the Labels field. You can use spaces and special characters, but each custom permission set filter must have a unique label.
8. To describe the permission set filter, enter information in the Descriptions field.
9. Select one or more products (or categories) in the left column.
10. Click Save.
Copy a Permission Set Filter

You can copy the default permission set filter or a custom filter to create a new filter.

1. Click **Edit**.
2. Click **Permission Set Filters**.
3. Right-click the filter you want and select **Copy > Permission Set Filter**.
4. To change the default name of the copied permission set filter, enter the new name in the Name field.
5. Enter a new name for the permission set filter in the Labels field.
6. Click **Save**.

Delete a Permission Set Filter

You can delete any permission set filter that is not being used in a role, but you cannot delete the default Nowhere Permission Set filter.

1. Click **Edit**.
2. Click **Permission Set Filters**.
3. Right-click the filter you want to delete and select **Delete > Permission Set Filter**.
4. Click **Yes**.

User-Owned Constraints

Individual permissions and permission sets apply everywhere on the community unless they are constrained. Some permissions have the ability to be constrained by user ownership.

User-owned constraints apply when a permission applies only to the owner of a profile or content. Without a user-owned constraint, for example, any user with the Edit Comment permission could edit any other user’s comments. You want to let users edit their own comments, but it’s unlikely you want them editing the comments of other users. For that reason, the Edit Comment permission is constrained by user ownership by default. However, you may want to let moderators edit comments, so you would clear the Constrain by User Owned check box in a moderator permission set.

Product and Category Constraints

Individual permissions and permission sets apply everywhere on the community unless they are constrained. Some permissions have the ability to be constrained by product/category.

You can also constrain permissions by either product or category. Whichever constraint you select—product or category—applies for all permissions across your site. In other words, you cannot constrain some permission sets by product and others by category. By default, products are used, but you can change the constraint to categories.

Least Restrictive Path Permissioning

A role set with multiple permission sets will use the least restrictive permission set.

When multiple permission sets are used in a role set and a permission in one set is unconstrained while the same permission in another permission set used in that role set is constrained, the user with that role set will have the unconstrained permission. Assume, for example, a role set that contains two roles. Each of the roles has very similar permission sets, except that one permission set lets the user edit only the user-owned questions and comments, while
the other set does not have the user ownership constraint. Users who are assigned to that role set will be able to edit all questions and comments, regardless of who the owner is. The least restrictive permission path takes precedence.

The least restrictive path also applies to permission set filters. Permissioning can get complicated with the combination of permission sets, permission set filters, and user ownership constraints. Every access control report contains a link to let you view the complete access control path from individual permissions to the role set. Clicking Access Control Paths in the Access Control editor's ribbon lets you view every path.

Overview of Community Roles

Roles combine the permissions granted in the permission sets with the product or category filters of the permission set filters.

Every user has at least one role, and several default roles are included in the reference implementation. When you click Roles in access control, the roles report displays. You can drill down on these values in the report.

- The number of permission sets assigned to the role
- The number of permission set filters assigned to the role
- The number of role sets that include the role

You can also click the View link to see the access control path from individual permissions to role sets.

Seven default roles are included in the reference implementation.

- Everyone—This role uses the Default Community Viewer permission set that gives users read-only access to community content.
- Default Contact—This role uses these permission sets.
  - Default Community User—Lets users create and edit their community profile.
  - Default Community Author—Lets users create, flag, and rate questions and comments as well as manage their own content (edit, delete, and select best answer).
- Default Account—Same as Default Contact.
- Default Community User—Same as Default Contact and Default Account.
- Community User Moderator—This role uses the Default Community Moderator Users permission set that lets moderators edit community user profiles and view contact details.
- Community User Administrator—This role uses the Default Community Admin Users permission set that lets moderators create and delete community users.
- Community Content Moderator—This role uses these permission sets.
  - Default Community Moderator—Lets moderators choose a best answers, lock questions, move comments, and edit and delete questions, comments, flags, and ratings.
  - Default Community Author—Lets users create, flag, and rate questions and comments as well as manage their own content (edit, delete, and select best answer).

Edit a Role

You can edit roles to change the associations with permission sets and permission set filters.

1. Click **Edit**.
2. Click **Roles**.
3. Right-click the role you want to edit and select Open > Role.
4. To add a permission set, click Add and select the permission set from the drop-down menu in the Permission Set column.
5. To change a permission set, click the associated Permission Set drop-down menu and select a different permission set for the role.
6. To define a permission set filter, follow these steps:
   a. Clear the Unconstrained check box.
   b. Click Permission Set Filter.
   c. Expand the Community or Custom folder.
   d. Select the permission set filter.
7. Click Save.

Create a Role

In addition to editing default and custom roles, you can also create new roles.

1. Click Edit.
2. Click Roles.
3. Click New and select Role.
4. Enter the role name in the Name field using only letters, numbers, and underscores.
5. Enter a descriptive name for the role in the Labels field.
   You can use spaces and special characters, but each custom role must have a unique label.
6. To describe the role, enter information in the Descriptions field.
7. To add permission sets and permission set filters, complete these steps for each set:
   a. Click Add and select a permission set from the drop-down menu in the Permission Set column.
   b. To define a permission set filter, follow these steps:
      i. Clear the Unconstrained check box.
      ii. Click Permission Set Filter.
      iii. Expand the Community or Custom folder.
      iv. Select the permission set filter.
8. Click Save.

Delete a Role

You can delete any role in the Custom folder or its subfolders, but you cannot delete the default Community roles. Nor can you delete a role that is used in a role set.

1. Click Edit.
2. Click Roles.
3. Right-click the role you want to delete and select Delete > Role.
4. Click Yes.

Create a Role Set

Although you cannot edit or delete the default role sets, you can create custom role sets to address your specific business needs.

1. Double-click Access Control.
2. Click Role Sets.
3. Click Edit.
4. Click New and select Role Set.
5. Enter the role set name in the Name field using only letters, numbers, and underscores.
6. Enter a descriptive name for the role set in the Labels field. You can use spaces and special characters, but each custom role set must have a unique label.
7. To describe the role set, enter information in the Descriptions field.
8. Click the arrows next to the Community and Custom check boxes on the Roles tab to expand the list of roles.
9. Select the roles you want the new role set to include.
10. Click Save.

Copy a Role Set

You can copy a default or custom role set to create a new role set.

1. Click Edit.
2. Click Role Sets.
3. Right-click the role set you want and select Copy > Role Set.
4. To change the default name of the copied role set, enter the new name in the Name field.
5. Enter a new name for the role set in the Labels field.
6. Click Save.

Edit a Role Set

You can edit existing custom role sets.

1. Click Edit.
2. Click Role Sets.
3. Right-click the custom role set you want and select Open > Role Set.
4. To change the name of the role set, enter the new name in the Name field.
5. To change the label of the role set, enter the new label in the Labels field.
6. To select additional roles to include in the role set, select the check box for the role you want to add.
7. To remove roles from the role set, clear the check box for the role you want to remove.
8. Click Save.

Add Role Set Callout to Community Questions

You can configure role set callouts on community questions and comments to highlight community activity. Attribute settings must include the role set ID, a pipe separator, and the text of the callout.

2. Locate <rn:widget path="discussion/QuestionDetail" sub:prodcat:verify_permissions="Create" />.
3. Edit the widget code to add the author_roleset_callout attribute and modify the label. <rn:widget path="discussion/QuestionDetail" sub:prodcat:verify_permissions="Create" author_roleset_callout="5|Posted by Advanced Moderator" />
4. Save the file.

Delete a Role Set

You can delete any role set in the Custom folder or its subfolders, but you cannot delete the default role sets.

1. Click Edit.
2. Click **Role Sets**.
3. Right-click the role set you want to delete and select **Delete > Role Set**.
4. Click **Yes**.

View Users on the Access Control Editor

You can view a list of all active users on the Access Control editor, or you can search for users by role sets. When Users are selected on the ribbon, the Edit button is disabled. When the Edit button is selected, the Users button is disabled.

1. Double-click **Access Control**.
2. Click **Users**.
3. To display only the users who have specific role sets, expand the Community and Custom lists and select the role sets.
4. To display all users, select (Select All) in the Role Sets menu.
5. To view a user’s permissions, click view in the Effective Permissions column.
6. To view a user’s access control paths, click the View link.

View Pending Access Control Changes

The changes you've been making to access control elements are still pending until you deploy them, which pushes them to your production site. Review your changes before deploying them.

1. Double-click **Access Control**.
2. Click **View Pending**.
3. Click **OK**.

Roll Back Pending Access Control Changes

Rolling back is the process of deleting the pending changes. Rolling back does not revert your production site to the previously deployed version.

1. Double-click **Access Control**.
2. Click **Rollback**.
3. Click **Yes**.
4. Click **OK**.

Deploy Access Control Changes

Before you deploy changes, be certain that you want to implement the access control changes. After you deploy, you cannot revert to the previously deployed version. The Rollback operation merely deletes the pending changes.

1. Double-click **Access Control**.
2. Click **Deploy**.
3. Click **Yes**.
4. Click **OK**.
Modify Social Filters to Use Categories

When setting up permissions for your community, you can define filters that are designed to work with either products or categories. The default selection is product.

Review the widget documentation to ensure you’re modifying the appropriate attributes.

2. Locate any lines of code referencing `uicontrol`.
   ```html
   <rn:widget path="input/ProductCategoryInput" name="SocialQuestion.Product" verify_permissions="Create" />
   ```
3. Modify the widget code.
   ```html
   <rn:widget path="input/ProductCategoryInput" name="SocialQuestion.Category" verify_permissions="Create" />
   ```
4. Repeat the above steps on these pages.
   a. `account/notif/list.php`
   b. `social/questions/detail.php`
   c. `products/lists.php`
   d. `moderate/comment.php`
   e. `moderate/question.php`

Modify the Community Question Rating Type to Stars

The available rating types include upvote, star, and updown.

2. Locate `<rn:widget path="discussion/QuestionDetail" sub:prodcat:verify_permissions="Create" />`.
3. Edit the widget code to add the `rating_type` attribute and modify the label.
   ```html
   <rn:widget path="discussion/QuestionDetail" sub:prodcat:verify_permissions="Create" 
   sub:rating:rating_type="star" label_be_first_to_vote="Rate this question" />
   ```
4. Save the file.

Modify the Community Comment Rating Count to Graphical

The default rating count on community questions and comments is numerical. The available rating count types include numerical and graphical.

2. Locate `<rn:widget path="discussion/QuestionComments"/>`.
3. Edit the widget code to add the `rating_count_format` attribute and modify the label.
   ```html
   <rn:widget path="discussion/QuestionComments" sub:rating:rating_type="star" label_be_first_to_vote="Rate this question" sub:commentRating:rating_count_format="graphical"/>
   ```
4. Save the file.
Remove the Best Answer Voting Option

User, moderators, and administrators can select which answer best addresses the posted question. This option is enabled by default.

2. Locate the following line of code.
   `<rn:widget path="discussion/QuestionComments"/>
3. Edit the widget code to add the best_answer_types attribute.
   `<rn:widget path="discussion/QuestionComments" best_answer_types="none"/>
4. Save the file.

Overview of the Customer Portal Avatar Library

You can add images to your avatar library for your users to choose from.

Community users can update their public profile to use an avatar image. By default, the user’s avatar is a square with the initial letter of their user name.

As a community administrator, you can customize the avatar library. You may want to add branded images to personalize your customer’s experience or promote a product release.

Source files for the avatar library are stored in two folders located in assets/images/avatar_library/.
- **display/everyone/**—images that display next to the user’s name in posts and on the Profile page
- **gallery/everyone/**—images (limited to 160 x 160 pixels) that appear on the Gallery page

You can set these attributes for the avatar library.
- file size: default=150k; max=250k
- file type: default=png; other options=gif, jpg, jpeg
- total avatars: default=100; max=500

Create Role Set Avatar Library for Moderators

You can customize the avatar choices available by groups, based on role sets.

1. Identify the Role Set ID.
   a. Click Access Control.
   b. Click Role Sets.
   c. Identify the Role Set ID for Community Moderator Role Set.
2. Create a folder for the moderator role set avatar library.
   a. Open the file location: assets/images/avatar_library/.
   b. Create a new folder named moderators in the display and gallery folders.
   c. Upload images to both moderators folders.
4. Locate this code.
   ```html
   <div class="rn_PageContent rn_Profile rn_Container">
   <rn:widget path="input/SocialUserAvatar" avatar_library_folder_roleset_map="1|everyone|All Users" />
   </div>
   ```
5. After All Users, enter code for the additional folder views in this format: roleset ID|folder|label.
   ```html
   <rn:widget path="input/SocialUserAvatar" avatar_library_folder_roleset_map="1|everyone|All Users;5|moderators|Moderators" />
   ```

Support Use of Facebook Profile Picture

If you've enabled Facebook login support, you can allow Facebook users to use their Facebook profile picture in Customer Portal.

1. Make sure the following widgets are activated: SocialUserAvatar (v.1.2) and OpenLogin (v.1.5).
3. Add Facebook to the avatar_selection_options attribute.
   Your code should resemble the following.
   ```html
   <rn:widget path="input/SocialUserAvatar"
   avatar_selection_options="default,avatar_library,gravatar,facebook" />
   ```

Moderating Community Self Service

Moderators and Community Self Service

Community Self Service tools help moderators identify content that needs their attention and lets them take appropriate action.

Your Community Self Service community will no doubt be a busy place, and you’ll want to be sure it remains useful, well organized, and respectful for your community users. When you assign moderators—either from your organization’s staff or from within your user community or both—you give them permission to interact with user-generated content and with community users.

A moderator’s role primarily includes managing content and users. Your moderators can edit, remove, and delete discussion content. For example, they may mark a comment as the best answer to the question, suspend a comment so it is visible only to moderators, lock a question, change the product associated with the question, or pin a question to the top of the list of discussions. They can also suspend, delete, and restore users as needed.

You can configure different types of moderators with different permissions and roles. For example, you might want to allow trusted members of your community to moderate content but restrict the moderation of users to staff members. The Access Control component contains several default permission sets and roles that should meet your needs. And, if you need more flexibility, you can create your own moderator role set using any combination of the available permissions and filters.
Moderator Accounts

A moderator has the ability to edit, move, suspend, delete, and restore community users and their content.

A moderator’s ability to moderate your community depends ultimately on how you define the moderator’s access controls. You can create a variety of moderator role sets with whatever combination of permissions you choose.

Users with the Community Moderator role set have all the permissions assigned to general community users—creating and editing a user account, adding, editing, and deleting their own discussion content, and viewing, flagging, and rating all community content. Moderators with this role set can also:

- Work on the moderator interface.
- Create, edit, and delete questions, comments, flags, and ratings of other users.
- Change the product associated with the question.
- Edit community users’ display name, avatar, and status and view users’ contact data.
- Choose the best answer for a question.
- Edit status and make rating adjustments for other users’ questions and comments.
- Lock discussions.

Users with the Community User Admin role set can view the moderator interface and create and delete community users.

Some of the questions you might consider as you go about defining moderator roles for your community include:

- Do you want moderators to be able to suspend, restore, and delete users?
- Do you want to let them edit or delete another user’s content?
- Will you restrict them by product or category?
- Do you want moderators who can suspend content to be able to approve it, or do you want a different group of moderators to approve it?

The Moderation Overview Page

The moderation dashboards provides moderators an overview of all community activity and lets them perform multiple actions.

For the best experience, moderation dashboard users should use Chrome, Firefox, or Internet Explorer 10 and above. If your moderate role set does not include permissions for moderating users, you will not see the Moderate Users tab or information about users on the Moderation Overview page.

The logged-in moderator selects Moderation from the drop-down menu that appears when the display name is clicked. This link and menu is generated by the AccountDropdown widget on the standard template.

The Moderation Overview page opens to provide a snapshot of question, comment, and user activity for the past 90 days. The table, generated by the ModerationSummaryTable widget, breaks the totals down into suspended, active, and archived statuses. Moderators can drill into any of the values to see a list of selected items having the particular status. Drilling down on these values opens the same moderation dashboards that are accessed through the Moderate Comments, Moderate Questions, and Moderate Users tabs in the header.
Announcements are displayed at the top of the page and are rendered with the AnnouncementText widget.

The bottom of the Moderation Overview page contains a graph of new questions and comments for each of the last seven days and a similar graph of new users for the last seven days. Both graphs are rendered by the ActivityCharts widget.

**Content Moderation**

Moderators can take a variety of actions on questions and comments in your community.

Moderators can take these actions on discussion content submitted by community users, if you have given them sufficient permissions.

- Editing content—Changing the subject and body of a question and the body of a comment (comments do not have subjects) and changing the product associated with the question.
- Suspending content—Making content not visible to non-moderator community users but visible to community moderators.
- Approving/restoring content—Making content visible to the community again after it has been suspended by a moderator (approving) or set to pending by the system (restoring).
- Deleting content—Removing content from a discussion so the content remains in the database but has its status set to Deleted (soft delete) or deleting content from the database (hard delete).
- Locking discussions—Preventing additional comments from being made and flags or ratings from being set.
- Moving questions—Associating a question with a different product (or category) by editing the question and selecting a new product.
- Resetting flags—Setting the flag count back to zero.

**User Moderation**

Moderators have access to your customer’s community profiles.

Moderators can take these actions on community users, if you have given them sufficient permissions. These actions affect only the customer’s community profile, not their contact record in your database.

- Suspending users—Preventing a user from logging in, creating content, and receiving subscription emails. This user’s active content remains visible. You would expect this user to be restored.
- Archiving users—Same as suspending, except you would not expect to restore these users, for example, staff members who have left your organization.
- Restoring users—Changing the user’s status back to active.
- Deleting users—Removing a user without the possibility of restoring the account.
- Viewing user information—Viewing information from the user’s contact record.
- Changing avatar and display name—Replacing the user’s picture and changing the display name used by the account.
The Comment Moderation Dashboard

The ModerationAction widget lets users with the role set perform a combination of actions from the Comment Moderation dashboard.

None of the moderation action buttons are active until at least one comment is selected. If you do not have permission to perform an action, the associated moderation action button is disabled. No comments from deleted questions appear in the Comment Moderation dashboard.

- Suspend—When you suspend a comment by setting its status to Suspended, only users with permission to view the moderator user interface can view the comment.
- Approve/restore—You can approve a suspended comment to change its status from Suspended to Active, where every user can see it. When comments are approved, the flag count is automatically reset to zero.
- Delete—You can delete a comment to make it invisible to all users, including moderators.
- Reset flags—When you reset a comment's flags, the flag count is set to zero.
- Suspend author—You can suspend the author of a comments.
- Approve/restore author—You can approve one or more suspended authors or restore pending authors.

Filter Community Comments

The Comment Moderation dashboard lets you filter your results.

1. Click **Select Filters**.
2. To filter comments by date, select one of the options in the Updated Date column.
   - If you want to specify a custom date range, select the last option in the list.
   - Enter dates in the From and To fields or use the calendar to select the dates.
3. To filter comments by status, select **Active** or **Suspended** or both in the Status column.
4. To filter comments by products, click **Select a Product** and select a product or subproduct.
5. Click **Apply** to display filtered results.
6. To remove one of the filters you selected, click the **X** next to the filter name.
7. To sort by the number of flags each comment has, click the up or down arrow next to the red flag symbol in the header row.
8. To sort by the date the comment was most recently updated on, click the up or down arrow next to the Updated On column header.

Suspend Community Comments

Only users with moderation permissions can see suspended comments.

1. Do one of the following:
   - Select one or more comments you want to suspend by selecting the check box to the left of each comment.
   - Select all comments on the page by selecting the check box in the heading row.
2. Click **Suspend**.

Approve Community Comments

Users with moderation permissions can administer comments.

1. Select one or more suspended comments you want to approve by selecting the check box to the left of each comment.
2. Click Approve/Restore.

Delete Community Comments
Users with moderation permissions can delete comments.

1. Select one or more comments you want to delete by selecting the check box to the left of each comment.
2. Click Delete.
3. Click Yes.

Reset Community Comment Flags
Users with moderation permissions can administer comments.

1. Select one or more flagged comments you want to suspend by selecting the check box to the left of each comment.
2. Click Reset Flags.

Suspend Community Authors
Users with moderation permissions can administer comments.

1. Select a comment that is authored by the user you want to suspend.
2. Click Suspend Author.

Approve Community Authors
Users with moderation permissions can administer comments.

1. Select a comment that is authored by the suspended user you want to approve.
2. Click Approve/Restore Author.

The Question Moderation Dashboard

The ModerationAction widget lets users assigned to the role set perform a combination of actions from the Question Moderation dashboard.

None of the moderation action buttons are active until at least one question is selected. If you do not have permission to perform an action, the associated moderation action button is disabled.

- Suspend—When you suspend a question by setting its status to Suspended, only users with permission to view the moderator user interface can view the question. Even if users have the question ID to access the question through the URL, they will see a Not Available message.
- Approve/restore—You can approve a suspended question to change its status from Suspended to Active, where every user can see it. When questions are approved, the flag count is automatically reset to zero.
- Move—You can move a question by changing the product it is associated with.
- Delete—You can delete a question to make it invisible to all users, including moderators.
- Reset flags—When you reset a question’s flags, the flag count is set to zero.
- Suspend author—You can suspend the author of a question.
- Approve/restore author—You can approve one or more suspended authors or restore pending authors.

Filter Community Questions
The Question Moderation dashboard lets you filter your results.

1. Click Select Filters.
2. To filter questions by date, select one of the options in the Updated Date column.
   - If you want to specify a custom date range, select the last option in the list.
   - Enter dates in the From and To fields or use the calendar to select the dates.
3. To filter questions by status.
   - Select **Active**.
   - Select **Suspended**.
   - Select both.
4. To filter questions by products, click the **Select a Product** drop-down menu to select a product or subproduct.
5. Click **Apply** to display filtered results.
6. To remove one of the filters you selected, click the **X** next to the filter name.
7. To sort by the number of flags each question has, click the up or down arrow next to the red flag symbol in the header row.
8. To sort by the date the question was most recently updated on, click the up or down arrow next to the Updated On column header.

**Suspend Community Questions**
Users with moderation permissions can suspend questions.

1. Select one or more questions you want to suspend by selecting the check box to the left of each question.
2. Click **Suspend**.

**Approve Community Questions**
Users with moderation permissions can approve questions.

1. Select one or more suspended questions you want to approve by selecting the check box to the left of each question.
2. Click **Approve/Restore**.

**Move Community Questions**
Users with moderation permissions can move questions.

1. Select one or more questions you want to move by selecting the check box to the left of each question.
2. Click **Move**.
3. Click **Product** and select a product.
4. Click **Move**.

**Delete Community Questions**
Users with moderation permissions can delete questions.

1. Select one or more questions you want to delete by selecting the check box to the left of each question.
2. Click **Delete**.
3. Click **Yes**.

**Reset Community Question Flags**
Users with moderation permissions can administer questions.

1. Select one or more flagged questions you want to suspend by selecting the check box to the left of each question.
2. Click **Reset Flags**.
Suspend Community Authors
Users with moderation permissions can administer questions.

1. Select a question that is authored by the user you want to suspend.
2. Click **Suspend Author**.

Approve Community Authors
Users with moderation permissions can administer questions.

1. Select a question that is authored by the suspended user you want to approve.
2. Click **Approve/Restore Author**.

The User Moderation Dashboard

The ModerationAction widget lets users perform a combination of actions from the User Moderation dashboard.

None of the moderation action buttons are active until at least one user is selected. If you do not have permission to perform an action, the associated moderation action button is disabled.

- **Suspend**—When you suspend users, they can no longer log in, create content, or receive subscription emails. Their previously created content is, however, visible to other community users.
- **Approve/restore**—You can approve suspended users to change their status from Suspended to Active, which gives them the normal community permissions of logging in, creating and rating content, and receiving subscription emails.
- **Archive**—You can archive users who are no longer active in your community, for example, employees who have left your organization. Content from archived users remains visible on your community site.
- **Delete**—You can delete users, preventing them from logging in and hiding their previously created content from all users, including moderators. You cannot restore a deleted user.

Filter Community Users
You can sort the results on the User Moderation dashboard.

1. Click **Select Filters** on the User Moderation dashboard.
2. Select any combination of user status: **Active**, **Suspended**, or **Archive**.
3. Click **Apply**.
4. To remove one of the filters you selected, click the X next to the filter name.
5. To sort by the number of total or suspended question or comments a user has submitted, click the up or down arrow next to the appropriate symbol in the header row.
6. To sort by the number of flagged questions or comments a user has, click the up or down arrow next to the appropriate symbol in the header row.
7. To sort by the date when the user’s contact record was created, click the up or down arrow next to the Created On column header.

Suspend Community Users
Users with moderation permissions can suspend users.

1. Select one or more users you want to suspend by selecting the check box to the left of each name.
2. Click **Suspend**.
Archive Community Users

Users with moderation permissions can archive users.

1. Select one or more users you want to archive by selecting the check box to the left of each name.
2. Click Archive.

Approve Suspended or Archived Users

Users with moderation permissions can administer users.

1. Select one or more suspended or archived users you want to approve by selecting the check box to the left of each name.
2. Click Approve/Restore.

Delete Community Users

Users with moderation permissions can delete users.

1. Select one or more users you want to delete by selecting the check box to the left of each name.
2. Click Delete.
3. Click Yes.

Overview of Moderating Inline Discussions

Moderators can administer discussions and users from the community Question Details page and the User Profile page. Depending on the permissions assigned to you in your role sets, you can perform some or all of these actions.

- Edit—Edit the subject and body of questions, change a question’s associated product, and delete a question as well as edit and delete comments.
- Suspend—Change the status of a question or comment so that it cannot be seen by regular community users, only moderators.
- Approve/restore—Change the status of a question or comment from Suspended to Active so every user can see it.
- Lock—Close a question so that no more comments, flags, and ratings can be made.
- Unlock—Open a locked question for comments, flags, and ratings.
- Best answer—Mark a comment so it appears with a “Selected Best by Moderator” tag.
- Suspend author—Suspend the author of a question or comment.
- Approve/restore author—Approve the suspended author of a question or comment.

Edit a Community Question Inline

Users with moderation permissions can administer your community while interacting with it.

1. Click Edit.
2. To edit the subject, enter new text or edit existing text in the Subject field.
3. To edit the question, enter new text or edit existing text in the Question Body field.
4. To change the product associated with the question, click Product and select a different product.
5. To delete the question, click Delete This Question.
6. Click **Save**.

**Suspend a Community Question Inline**
Users with moderation permissions can administer your community while interacting with it.

1. Click **Moderate**.
2. Select **Suspend Question**.

**Approve a Suspended Community Question Inline**
Users with moderation permissions can administer your community while interacting with it.

1. Click **Moderate** at the top right of the question.
2. Select **Approve/Restore Question**.

**Lock a Community Question Inline**
Users with moderation permissions can administer your community while interacting with it.

1. Click **Moderate**.
2. Select **Lock Question**.

**Unlock a Community Question Inline**
Users with moderation permissions can administer your community while interacting with it.

1. Click the Moderate drop-down menu at the top right of the question.
2. Select **Unlock Question**.

**Edit a Community Comment Inline**
Users with moderation permissions can administer your community while interacting with it.

1. Click **Edit**.
2. To edit the comment, enter new text or edit existing text in the Edit This Comment field.
3. To delete the comment, click **Delete**.
4. Click **Save**.

**Suspend a Community Comment Inline**
Users with moderation permissions can administer your community while interacting with it.

1. Click **Moderate**.
2. Select **Suspend Comment**.

**Approve a Suspended Community Comment Inline**
Users with moderation permissions can administer your community while interacting with it.

1. Click **Moderate**.
2. Select **Approve/Restore Comment**.

**Inline User Moderation on the User Profile Page**
When regular community users access another user’s profile page, they can search the user’s contributions.

From the user’s profile page, moderators can suspend, archive, and delete the user, view the user’s contact information, and change the user’s avatar and display name. Moderators can see a user’s first and last names and email address, although this information is not visible to non-moderator users.
You can access a user’s profile page by clicking the user name in any of the dashboards or by clicking the user name (under the avatar) from a question or comment on the Community Questions page.

Customer Portal Administration

Open the Customer Portal Administration Site

Administrators can complete tasks like setting the environment, viewing logs, defining page set mappings, and viewing reference information.

You must have the CP Promote and CP Stage permissions enabled in your profile. Your user name must not contain multi-byte characters.

1. You can access the Administration site through B2C Service or through a web browser.
   - In a web browser, type https://<your_site>/ci/admin.
   - Double-click Customer Portal in Configuration > Site Configuration and select the interface in the Interfaces tree. Then click Administration Interface.
   - Click File and select Links and then click Customer Portal > Site Administration.

2. Enter your user name and password.
3. Click OK.

How Development Changes Can Affect Production

Some files and configurations are shared between the development and production sites.

It’s a good idea to evaluate changes to your customer portal site in development mode before staging and promoting them to production. While the same URL is used to point to pages in both the production and development environments, you can set your pages to development mode on the Customer Portal Administration site dashboard.

When you work on your development pages, your production site remains untouched until you stage the development pages and then promote them to production. However, some changes you make in the development area have the potential to affect your production data. This is because the development site is connected to the production database. If this is a concern, you can request a cloned site by submitting a service request on our support site.

Changes that can unintentionally affect your production site include:

- Editing files (except themes) in the assets folder—The files in the assets folder (CSS files and images, as well as other files used on your customer portal) are shared by the development and production sites. If you edit a file used on your production pages, your edits may be visible to customers even before you stage and promote. You can reduce this risk by creating separate assets/development and assets/production folders. When making changes to pages and widgets, point to the assets in the development subfolder. When you are ready to stage and promote, you can copy the files to the production subfolder and change the references in your pages and widgets to that folder.

Themes are handled differently and are used only by the development files. When you stage the development pages, the theme files are copied to a time-stamped folder in the staging directory and called by the staged pages from that folder. This lets you keep the themes you develop in an isolated sandbox until you promote the staged pages into production and the files are copied into the production folder.
• Editing message bases, configuration settings, custom reports, and other configuration items—You risk changing the look or functionality of your production customer portal if you edit message bases, configuration settings, custom reports, or other configuration items (such as products, categories, and custom fields) used by your production pages.

View the Customer Portal Site in Various Stages of Publication

Administrators can view the site based on whether the files are in development, staging, or production.

1. In a web browser, enter https://<your_site>/ci/admin.
   o To view pages before you've staged and promoted the files, click View Development Area.
   o To view the development pages after you've staged them, but before you promote them to production, click View Staging Area.
   o To view what your customers see, click View Production Area.

Set the Customer Portal Environment

Administrators can select the page set and mode used to view your site.

The Mobile and Basic page sets aren't available by default and must be enabled before they appear in the page set menu.

1. In a web browser, enter https://<your_site>/ci/admin.
2. Click Set Environment.
3. Select a site mode.
   o To view your production environment, select Production.
   o To view your staging environment, select Staging.
   o To view your development environment, select Development.
   o To view the reference implementation, select Reference.
   The page set drop-down menu is active only when the Allow my current browser / user agent to be the deciding factor (useful for testing your user agent configurations) check box is cleared.
   o To display the standard page set, select Standard.
   o To view your mobile pages on your workstation without a mobile device, select Mobile.
   o To display the basic page set, select Basic.
   o To display a custom page set, select the custom page set name.
   o To display the page set based on how the customer portal is accessed, select Allow my current browser / user agent to be the deciding factor (useful for testing your user agent configurations).
5. Click Set viewing mode and view the site.
Navigate the Development Header

The development header provides information about errors and warnings, widget details, and links to additional resources.

You can identify whether you are viewing your site in the development environment by the Customer Portal Development Area header at the top of the page.

1. From the header you can access these details about the page you are on.
   - To expand the header and view your options, click the +.
   - To close the header, click X.
   - Tip: If you've closed the header and want to display it, refresh the page.
   - To view errors and warnings for the page, click the + next to Errors and Warnings.
   - To view a specific error on the page, click the exclamation point.
   - To view a list of widgets used on the page, their version, and whether they are up-to-date, click Show list of widgets on this page under Page Widget Information.
   - To view URL parameters used by the page, their value, whether the parameter is required, and a description, click Show URL parameters used by this page under Page Widget Information.
   - To view the Production Area, the Customer Portal administration page, the reference implementation, or one of the other links provided, click the associated link under Links and Resources.

Page Set Maps

You can automatically direct customers to the correct interface based on page set mappings.

When you let the browser or user agent determine which page set is displayed, customers can be automatically directed to the correct interface based on the browser they are using. If they're using a desktop or laptop computer, for example, you can direct them to your standard customer portal pages. But if they're using a mobile device, you probably want them to be directed to your mobile customer portal interface. And customers using devices that don't support JavaScript can still view your site with the basic page set. Page set mapping also lets you define unique page sets for various user agents.

Page set mappings affect only the development area until you stage and promote the customer portal. To make page set mappings active on your production site, you must stage and promote after saving your changes. The default mappings cannot be edited.

User Agent Mapping

With the appropriate selection, the customer portal can identify the customers’ user agents and direct them to the appropriate page set.

When you click the Set Environment shortcut on the dashboard, the Set Environment page of the Customer Portal Administration site displays your user agent if the page set check box (Allow my current browser/user agent…) is selected. The default page sets are your standard customer portal pages and the mobile page set.
B2C Service includes two default mappings to the mobile page set and one for the basic page set. These mappings are initially disabled, so you must enable at least one of the mobile page sets and the basic page set and then stage and promote your customer portal site before they are available to your customers. Until you do so, your customers will see your standard customer portal pages even when they are using a mobile or basic device. Additionally, these page sets will not appear in the page set menu on the Set Environment page.

Enable Default Page Set Mappings

You must enable the default page set mappings to let customers see those page sets.

1. In a web browser, open https://<your_site>/ci/admin.
2. Click Page Set Mappings and enable the appropriate page sets.
   - To enable one of the mobile page sets, click Enable for one or more of the mobile devices (iPhone and Android).
   - To enable the basic page set, click Enable for the basic page set.

Related Topics

- Add Page Set Mappings

Add Page Set Mappings

You can create unique pages sets and map them to specific user agents to provide customer portal pages that display differently on different browsers.

1. In a web browser, open https://<your_site>/ci/admin.
2. Click Page Set Mappings.
3. Click Add Mapping.
4. Enter a valid Perl-compatible regular expression in the User Agent Regular Expression field or leave the field blank.
5. Enter a description that can be used for reporting purposes in the required Description field.
6. Enter a path in the required Page Set field.
7. Click Save.

Note: If you create a mapping to a page set folder that does not exist, you cannot save the mapping. If the folder is deleted after the mapping is created, customers who try to access it through a browser will see an error message about too many redirects. (The exact message is browser dependent.) The recursive loop error occurs because it fails to find the nonexistent folder results in a redirect to an error page in the same folder, which also cannot be found.

How You Delete and Disable Mappings

You cannot delete the default mappings for the iPhone, Android, and basic page sets, but you can delete any page set mapping you have added if you have not yet saved it.

To delete a mapping, click Delete in the row containing the mapping.
If you have staged and promoted the mappings you have added, you can no longer delete them, even by rolling back the site, but you can disable them by clicking Disable. You can also disable the default mappings. You must stage and promote the customer portal after you disable a mapping so the change will take effect on your production site.

Overview of the Framework Tab

The Framework tab lets you see information about the available frameworks.

When you type `https://<your_site>/ci/admin/docs/framework` into your browser or click the Framework tab from any page of the Customer Portal Administration site, the Framework page opens.

These options are available on the page and also from the drop-down menu that displays when you hover over the Framework tab.

- **Framework Versions**—Click this link to see the frameworks that are available and to set the framework version you want to use for your development pages.
- **Page Tags**—Click this link for a list of tags that control specific sections of the page or that hide or display content conditionally.
- **Page Meta Tags**—Click this link to see the attributes that can be defined for each page. These include, among others, whether login or an SLA is required to view the page, the template used by the page, and the page title.
- **Business Objects**—Click this link to display field information for adding answer, incident, and contact fields to input and output widgets and the Field page tag. The page displays the format to use for display and input widgets as well as the data type for each field.
- **Old Framework Migration**—If you have migrated to Framework Version 3.3 from Framework Version 2, you can revert your development pages to the older framework. Your staging and production environments are not affected, and you can change back to Framework Version 3.3 later if you change your mind.

| Note: | The Old Framework Migration option does not appear if your Customer Portal installation is new with Framework Version 3.3. |

Framework Versions

A list of available framework versions is available on the Framework tab.

When you click the Framework tab and select Framework Versions, you’ll see a list of the available Customer Portal frameworks in the left column.

For instance, the May 2015 release used Framework Version 3.2.6. If you had been using any nano version (3.2.1 through to 3.2.5) of Framework 3.2 and then upgraded to the May 2015 release, your customer portal would have been automatically migrated to 3.2.6 because nano increments are fully backward compatible.

The August 2015 release, however, was a minor release, which required migration to Framework Version 3.3 and probably required editing custom code. As a result, the November 2015 nano upgrade is 3.3.2. If your site uses an earlier framework (3.0, 3.1, or 3.2), you can choose to keep using it upon upgrade to November 2015 until you decide to migrate to the 3.3 version to take advantage of increased functionality, including Community Self Service.

The list of frameworks in the left column shows the version being used by each of the three environments.
When you click a framework, the changes that are included in that version are defined.

You can mouse over the bullet for each change to learn which type of change it is.

- Likely to impact custom code (major version change)
- May impact custom code (minor version change)
- No impact to custom code (nano version change)

Additionally, the changes are divided into these areas.

- New features
- Removal of functionality
- API changes
- Bug fixes

Additional information about the change and what you might need to do to incorporate the change is available by clicking the link at the end of each line.

### Overview of Reverting to an Earlier Framework

You can choose to revert to an earlier framework version.

You can select the version and clicking **Start Using This Version**, to begin using an earlier framework version.

Whenever you revert to an earlier framework, you will likely encounter errors resulting from newer widgets being incompatible with the older framework, which will require additional work on your part to correct the pages that use the new widgets. We do not recommend you revert your customer portal, but we recognize there are times when you may need to do so.

When you click the button, you'll see a list of widgets that are not compatible with the framework version you select.

You have the option of updating both the framework and widgets or only the framework. If you click Update the Framework, the success message instructs you to manually update the outdated widgets to a version that is compatible with the framework. If you do not, errors will appear on your development pages, and you will experience errors when you try to stage and promote your site.

If you select Update Widgets and Framework, all of the widgets that require a version change to be compatible with the older framework are modified. Your site may still contain compatibility errors so be sure to check your development pages carefully before staging and promoting to prevent errors during the deploy process.

### Business Objects Available in a Framework Version

You can see the available business objects on the Framework tab.

When you are adding a field to the attributes of a Field page tag or the FormInput or DataDisplay widgets, you might not know its Connect PHP API field name.

Click the Framework tab and select Business Objects to look up field and table names so you can include them in the widget code. The link displays fields in the Answer, Asset, Contact, Incident, ServiceCategory, ServiceProduct, SocialQuestion, SocialQuestionComment, and SocialUser tables. The page also provides examples to use for display and input.
If you want to see the description of an object, hover over its name. To view complete information about the object, click it to open a window that displays data type, description, and default value for answer business objects, as well as additional information for contact and incident objects. Click Close.

Overview of the Widgets Tab

The widgets tab lets you browse widgets and view their information.

When you type `https://<your_site>/ci/admin/docs/widgets` into your browser or click the Widgets tab from any page of the Customer Portal Administration site, the Widgets page opens.

These options are available on the page and also from the drop-down menu that displays when you hover over the Widgets tab.

- **Browse Widgets**—Click this link to display links to the lists of standard and custom widgets, organized by folders.
- **Widget Versions**—When you click Widget Versions, you can select a widget to open detailed information for that widget, including a preview image, documentation, where the widget is used, and any version changes.
- **Create a New Widget**—Clicking this link opens the widget builder that lets you create a new widget, either from scratch or by extending an existing standard or custom widget.
- **Widget Info**—Specifies the details that should be included in a widget's `info.yml` file.
- **Syndicated Widgets**—Click this link to display and configure the syndicated widgets, ConditionalChatLink, KnowledgeSyndication, ProactiveChat, and ProactiveSurveyLink. These widgets can access the Oracle knowledge base even though they are placed on web pages external to the customer portal.

Widget Builder

The Customer Portal widget builder can create a new widget by extending the functionality and attributes of an existing widget and generating custom code files for the new widget.

The code contains placeholders that you can modify to achieve the behavior you want for the new widget.

When functional changes or bug fixes are added to a standard widget, the widget undergoes a nano versioning change. As you would expect, the standard widget on your customer portal automatically migrates to the new nano version. Additionally, any custom widgets that have been extended from that standard widget are also modified to incorporate the enhancement or fix.

The widget builder generates custom widget code when you answer a series of questions about the widget you want to create. By creating placeholders for additional code you’ll add to further define the custom widget, it reduces the amount of code you must write and minimizes the possibility of errors because it creates the widget's basic code structure.

Overview of the Logs Tab

The Logs section of the Customer Portal Administration site lets you view logs for WebDAV, debugging, and deployment.
The WebDav log shows a transaction history of all changes to files, including file name, staff account, IP address, date, action, and interface name for each change. The debug log shows log files that are generated during development using the logMessage() function, and they contain the time, calling location, and message. The deployment log lists each log by its file name, date and time the log file was created, the type of action, and the staff member who performed the action. Click the log to see a history of the actions performed during the operation.

WebDAV Logs

WebDAV logs show you changes that have been made to the customer portal files.

You can view the logs if you are logged in to the Customer Portal Administration site, by clicking the Logs tab and selecting WebDAV Logs on the Logs Overview page or from a web browser, by entering https://<your_site>/ci/admin/logs/webdav.

The log displays a list of file names, the staff account that took the action, the IP address from which the action was taken, the date and time, what action was taken, and the interface. By default, the log is sorted by date with the most recent action listed first, but you can sort the log by any of these columns. You can also search the log by each of the columns, for example, by account or page name.

Sandboxed Configurations

The Sandboxed Configurations options let you see how the value is set for each site.

Sometimes a configuration setting can have a different value on your development site than on the staging and production sites.

In Framework Version 3.3, CP_CONTACT_LOGIN_REQUIRED is the only setting that can be different in the different areas.

When you change this kind of setting on the administration interface, the changes affect only the development and reference implementation pages of the customer portal, not the staging and production pages. When you stage the development pages, the changed configuration setting value is active in the staging environment. And when the staged pages are promoted, the change affects the production pages used by your customers.

Connect Object Explorer

The Connect Object Explorer uses a ROQL (RightNow Object Query Language) query interface to help you become familiar with Connect more quickly.

You will learn more efficiently because you can explore Connect and the data it exposes from the Customer Portal Administration site instead of logging in to the administration interface in B2C Service.

In addition to the ROQL query interface, the Connect Object Explorer also provides an object and field explorer to view Connect objects and metadata.

When you interact with the Connect Object Explorer, you gain detailed information about all Connect objects, which improves your efficiency and makes it easier to adopt Framework Version 3.3.
Use the Connect Object Explorer

The Connect Object Explorer uses a ROQL (RightNow Object Query Language) query interface to help you become familiar with Connect more quickly.

1. Open https://[your_site]/ci/admin.
2. Click Tools > Connect Object Explorer.
3. Enter a ROQL query in the New Query field.
   ```sql
   select ID, Name.First, Name.Last, Emails.Address FROM Contact LIMIT 10
   ```
4. Click Execute.
   - To sort the results on any column, click the column heading to sort in ascending order.
   - To see additional results, click Previous or Next.
   - To examine the metadata of a record, click its ID (or click the value in the first column if the first column is not ID).
   - To export the data in a comma-separated values (CSV) file, click Export.
   - To clear the query (and any results if the query was executed), click Clear.
   - To view the history of prior queries, click History.
   - To display a list of all Connect primary objects, click Objects.
   - To view metadata for an object, click it to display a table of field names, values, and field types.
   - To adjust settings for the Connect Object Explorer, click Settings.
   - To change the default number of results from 25, enter a new number in the Default Query Limit field.
   - To change the syntax highlighting theme used by the query editor, click Editor Theme and select a new theme from the available options.
   - To clear the query history, click Clear History.
   - To view the supported query options, click Help.

Sample ROQL Queries

These ROQL sample queries can help you understand how to formulate your queries on the Connect Object Explorer.

Standard object name mappings are used to automatically correct issues of character case and singular/plural form inconsistency until you become more familiar with Connect naming. For example, in this list, all of the first four queries automatically appear as desc Incident in the editor when they are executed. The desc, describe, and show queries are not natively supported by ROQL and work only within the Connect Object Explorer.

The editor uses syntax highlighting of ROQL keywords and primary Connect objects, and you can change the theme by clicking the Settings button and making a selection on the Editor Theme drop-down menu.

- desc Incident
- describe Incident
- describe incident
- desc incidents
• show objects
• Show Objects
• Show Tables
• SHOW TABLES
• SHOW OBJECTS
• SELECT * FROM Mailbox
• SELECT ID, LookupName FROM Account LIMIT 10
• SELECT Contact FROM Contact LIMIT 10
• SELECT Incident.PrimaryContact.ParentContact FROM Incident LIMIT 10
• SELECT Contact FROM Contact C WHERE C.Name.First like 'C%' LIMIT 10
• SELECT Contact FROM Contact WHERE CreatedTime > '2011-10-17T16:27:42' LIMIT 10
• SELECT disabled, source FROM Contact WHERE Contact.Name.First like 'C%' AND Contact.Address.City='Bozeman' LIMIT 10
• SELECT LookupName FROM Contact WHERE LookupName LIKE 'A%';
• SELECT ID, Contact.Name.First, Login FROM Contact WHERE Contact.Name.First IS NOT NULL ORDER BY Contact.Name.First ASC LIMIT 5
• SELECT ID, Contact.Name.First, Login FROM Contact WHERE Contact.Name.First IS NOT NULL

Use the DESC or DESCRIBE statement to obtain field and relationship information about standard and custom objects defined in the Connect Common Object Model (CCOM). You must specify the object’s name in the query, for example, DESC Account.

The SHOW OBJECTS statement lists both standard and custom objects defined in CCOM. The SHOW TABLES statement is an alias for SHOW OBJECTS.

The SELECT statement retrieves either rows or objects from one or more standard or custom objects defined in CCOM. The explorer automatically detects the query type and returns either CSV data or an object with fields you can explore.

Use the Code Assistant Tool

The Code Assistant simplifies the migration process between framework versions and provides specific guidance for updating your custom code.

You must enable Framework Version 3 before using the Code Assistant.

The widget migration wizard walks you through the custom code migration process, and the code suggestion feature offers suggestions for improving or migrating custom code that includes YUI 2.

1. Open https://[your_site]/ci/admin.
2. Click Tools > Code Assistant.
3. To migrate to a different framework version than 3.3 (if, for example, you want to use Framework Version 3.0 instead), select the version you want from the development mode drop-down menus.

   Note: We recommend you use the selected options to prevent potential coding errors.

4. Click Next Step.
   o To use the Code Assistant to help you migrate your widgets, click Continue.
To update your custom code to YUI 3, see *Update YUI 2 Code to YUI 3*.

## Migrate Widgets to Framework Version 3

You must edit the files generated by the Code Assistant in order to add the widget’s attributes and make any other changes.

1. Select Widget Migration on the Code Assistant page and click **Continue**.
   - To review the changes the Code Assistant will make to an individual widget, click +.
   - To select individual widgets for conversion, select the check box next to the widgets you want to migrate.
   - To have Code Assistant migrate every listed widget, select **Select All**
2. Click **Confirm Changes > OK**.
   - To return to the Code Assistant starting page (where you select your production and development mode versions), click **Start Over**.
   - To return to the dashboard, click **Home**.

If a widget was successfully migrated, it will be activated automatically and you will be notified. If a widget could not be activated because additional code changes are required, the message will notify you.

Edit the migrated widget files to include their Framework Version 2 features.

## Update YUI 2 Code to YUI 3

You can use these steps to update from YUI 2.

1. On the Code Assistant page, select **YUI 2 to YUI 3 Suggestions** from the options and click **Continue**.
2. Click + next to the file name to display the suggestions for editing the file’s code to work with the YUI 3 framework.
3. Open the file that needs to be updated and follow the instructions from the Code Assistant for editing the file.
   - The lines that need to be edited are noted. For each suggestion, hover over the question mark to see a summary of the change, for example, “YAHOO.util.Event’s functionality was replaced with ‘Y.Event’.” Clicking the question mark takes you to the YUI library for the element, where you can find additional information.
4. To review your work, click **Rescan**.
5. To return to the Code Assistant starting page (where you select your production and development mode versions), click **Start Over**.
6. To return to the dashboard, click **Home**.

## Accessing Customer Portal Backup Directory

When the Code Assistant modifies your customer portal files, it creates backup files with time stamps and stores them for up to six months.

1. Open your Customer Portal Administration site.
2. Click **Tools** and select **Code Assistant**.
3. Click **Code Assistant Backups**.
4. Click + for a backup to open a list of all files in the backup directory.
5. Click an individual file to display the code for that file.
Overview of the Language Tab

The Language tab lets you select a language that persists across all administration pages for all interfaces.

By default, the language on the Customer Portal Administration site is the same as the language for the interface. The Language tab appears on the Customer Portal Administration site when your customer portal has more than one interface and at least two unique languages. The tab has a drop-down menu of the installed languages, which is dynamically generated by querying the SiteInterface object. When you select a language from the menu, a cookie is set and the language on the administration site uses the selected language regardless of the language of the interface.

Restore Pages to the Reference Implementation

There may be times when you want to restore your development pages to the standard page set.

1. Open `/cp/core/framework`.
2. Copy the `views` subfolder and paste it to your desktop.
3. Copy the `views` folder from your desktop and paste it into the `/cp/customer/development` folder, selecting Yes to All when you are asked to confirm the folder replacement.
   - If you have modified other files in different subfolders in `/cp/customer/development`, copy and paste their `/cp/core` equivalent to the appropriate development subfolder.
   - If you have modified CSS or image files in the `assets` folder, you may want to replace them with the equivalent files from the `/cp/core/assets/default` folder.
4. Verify your changes in the development view.
5. Stage and promote your site.

Staging and Promoting the Customer Portal

How You Stage and Promote the Customer Portal

Once you've developed your customer portal pages, you can push them into production where your customers can use them.

One benefit of the staging area is the ability to selectively stage and promote pages, widgets, versions, and page set mappings without being required to implement all changes from the entire development site. When you stage your customer portal, your selections are copied to a staging area and compiled and optimized for performance. The staging environment looks exactly like your production environment will look when you promote the staged files. As a result, you have one more chance to check your site before making it available to your customers.

When your staging environment looks the way you want, you can promote your changes. This process copies the pages from the staging area to the production area, making them publicly visible. Your current production pages are backed up in case you need to restore them. If you change your mind after promoting your staged pages to the production site, you can revert to the most recent set of production pages with a click of a button.
Stage Customer Portal Pages

You stage your customer portal pages to see how your changes will appear on the production site.

1. Double-click **Customer Portal** in **Configuration > Site Configuration**.
2. Select the interface you want to stage from the Interfaces column.
3. Click **Stage**.

   The first window displays a list of files that have been changed in the development area since the last time files were staged. By default, all new and edited files are selected to be copied to the staging area, and any files you have removed from the development pages have the Remove From Staging action.

4. To prevent a file from being copied to the staging environment, click **Action > No Action**.
5. To remove one or more files from the staging environment, click **Action > Remove From Staging**.
6. Click **Next**.
7. To push all framework and widget version changes, including the addition of new widgets, select **Yes**.

   **CAUTION:** If you do not include pushing the version changes, any new widgets will not be available on your staging site.

8. Click **Next**.
9. To copy a page set that you’ve enabled to the staging area, click **Actions > Copy To Staging**.
10. To remove a development page set from the staging area, click **Actions > Remove From Staging**.
11. Click **Next**.
12. To store a comment in the staging log file, enter a note in the field.

   You can enter up to 4,000 characters.
13. To re-initialize the staging environment, select the check box just above the Stage button.

   **CAUTION:** If you select this check box, you will lose any file and page set selections you have made during the staging process. Re-initializing means that all files in the staging area will be deleted and replaced with the complete set of development files. Additionally, all page set mappings, configuration settings, and version changes in the staging area will be deleted and replaced with their corresponding files or settings from the development area.

14. Click **Stage**.

   **Note:** You will see a message if a deploy lock is in place. Clicking No cancels the staging operation and Yes will override the existing lock and continue with the staging operation. Use caution when clicking Yes because you may compromise another staff member’s file promote if you start overwriting files in the staging area.

15. Click **Stage**.

   **Note:** If any widgets have been deleted, the message notifies you that the deleted widget has been deactivated in the staging environment. Also, if any of the widget versions are incompatible with the framework, a staging error occurs and identifies the incompatible widget.

View the Splash Page

The Customer Portal reference implementation includes a splash page that is displayed to let your customers know that your site is undergoing maintenance.

1. In a web browser, enter https://<your_site>/ci/admin.
2. Click **Settings > Preview Error Pages**.
3. Click **/cp/customer/error/splash.html**.

By default, your newly promoted production site is visible to customers immediately upon completion of the promote process. You might want a little more time to complete any manual tasks that may be required before making your changes public on the production site. If so, you can manually turn on the splash page.

**Note:** Your development and staging pages, WebDAV access to your customer portal files, and the Customer Portal Administration site are unaffected by this configuration setting.

### Turn On the Splash Page

You can turn the splash page on and off.

1. Locate **CP_MAINTENANCE_MODE_ENABLED** in **RightNow User Interface/Customer Portal/General**.
2. Click **Value** and select **Yes**.
3. Click **Save**.

### Promote Customer Portal Pages

You can promote stages Customer Portal pages and files to production.

Before you can promote the staging area, the **profile** assigned to you must have the CP Promote permission enabled. You or your **administrator** can enable this permission if necessary.

1. Double-click **Customer Portal** in **Configuration > Site Configuration**.
2. Select the interface you want to promote from the Interfaces column.
3. Click **Promote**.
4. To store a comment in the log file, enter a note in the field.
5. Click **Promote**.
6. Click **Promote**.

**Related Topics**

- Moving Customer Portal Customizations to Production (video)

### Roll Back the Most Recent Promote Process

You can use the Rollback feature to revert to the prior production pages.

Your profile must contain the CP Promote permission.

1. Double-click **Customer Portal** in **Configuration > Site Configuration**.
2. Select the interface you want to roll back from the Interfaces column.
3. Click **Rollback**.
4. To store a comment in the log file, enter a note in the field.
5. Click **Rollback**.
6. Click **Rollback**.
Deployment Logs

The Customer Portal administration interface includes a list of deployment logs.

Deployment logs are sorted in descending order by date and include the type of deployment and the staff member who initiated the deployment.

You can also view deployment logs from the Customer Portal Administration site. Deploy types include Stage, Promote, and Rollback. Other deploy types include Service Packs and Upgrades.

Clicking the link for a log opens it for viewing. After you’ve viewed the log, click Back to Log Listing at the top of the log to return to the list of logs.

Developer Overview

Model-View-Controller Design Pattern

One of the most important aspects of the Customer Portal framework is the Model-View-Controller (MVC) design pattern, which allows the separation of logic and presentation so that each can vary independently.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

The model represents your data structures. Models are PHP classes that are designed to work with information in your B2C Service database. Models encapsulate database API calls.

For example, the Answer model exposes a get() function that populates an Answer object, and the get() function of the Contact model populates a Contact object. These functions are available to any controllers that load the model.

Instead of making direct SQL calls to the database, custom models can make calls to Oracle Connect PHP API and use the data objects from that API. Models can also use the Oracle RightNow Object Query Language (ROQL) to access the database.

Standard models call the native abuse detection methods. However, in some circumstances, such as when your custom code makes direct Connect PHP calls, or when it overrides standard controllers, your custom code must contain abuse detection calls.

The view is the information that is presented to a customer, usually a web page, although it can be a page fragment such as a header or a sidebar. Views are the page, template, and widget content combined with the CSS, images, and other assets that comprise the presentation part of the architecture.

Views are not called directly, but instead must be loaded by a controller. Any YUI components and other scripts are invoked from within the finalized view. The customer’s experience is therefore controlled from the client side by HTML and JavaScript.

The controller is the intermediary between the model, the view, and any other resources needed to process the HTTP request and generate a web page. The controller is responsible for receiving the request, calling the appropriate models,
and passing data to the view. Controllers are PHP classes that are accessible through URI (Uniform Resource Identifier) requests. They call models, libraries, and helpers as required, and pass data to the view for display.

B2C Service provides a set of application controllers that handle the URI requests. Examples include:

- Page—Processes the page requests and loads the appropriate page or template.
- AjaxRequest—Processes all of the AJAX requests made from client-side widget logic files.
- Fattach—Processes any file attachment requests.

The index.php file is called the front controller. It is distinct from the application controllers like Page.php and AjaxRequest.php and is specific to the Oracle web hosting environment.

The front controller receives the request URI, inspects the request, and then determines what modifications are necessary for the query string.

<table>
<thead>
<tr>
<th>When the request URI contains...</th>
<th>The front controller...</th>
</tr>
</thead>
<tbody>
<tr>
<td>/app</td>
<td>Presets the Page controller and the render function (page/render).</td>
</tr>
<tr>
<td>/dav</td>
<td>Presets the WebDAV controller’s index function (webdav/index).</td>
</tr>
<tr>
<td>/ci</td>
<td>Does not preset any controller or function. Instead, the next two URI segments specify what to load and execute. For example, when the front controller sees ci/ajaxRequest/sendForm, it loads the ajaxRequest controller and executes the sendForm() function. URIs containing /ci are used only for standard controllers.</td>
</tr>
<tr>
<td>/cc</td>
<td>Calls a custom controller. The format is: cc/class_name/function_name.</td>
</tr>
</tbody>
</table>

Widgets have their own view and controller files and can also make calls to models.

When a user accesses a customer portal page, the view file for each widget presents the HTML for that widget, and the user can then interact with the widget. If the user clicks a button or link on the widget to submit the page to the server, the submission request goes to the controller. If part of the request requires data, the controller calls a model function to interact with the database and return the data to the controller. The controller then passes any updates back to the view, which refreshes the widget and displays it on the web page.

A model is not always necessary, because data from the database is not required for every widget.

**Client-side Scripting Framework**

The Customer Portal takes advantage of the YUI library, an open source JavaScript and CSS library for building richly interactive web applications using techniques such as DOM scripting, DHTML, and AJAX. Customer Portal Framework Version 3.3 uses YUI Version 3.17.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Some YUI features used by Customer Portal include:

- Yahoo Global Object
- DOM collection
- Event utility
- Utilities, for example, the browser history manager
- Widgets such as auto complete and button control

The entire YUI library set is included with the Customer Portal. Although the reference implementation does not use the entire YUI framework, you can use these additional libraries for your customer portal implementation.

The Customer Portal Framework Version 3.3 has extended the YUI libraries for integration with the server-side scripting framework. This integration of technology makes it easy to create reusable functionality without having to handle variables and visit information. Typically, these libraries are associated with the specific widget functionality you are trying to create. Review the standard widgets located in /cp/core/widgets in the reference implementation for examples of this integration.

### Connect PHP API

The Connect PHP API provides a set of classes you can use to interact with the CCOM.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Queries in a custom model can use three built-in static methods.

- The fetch() method—Returns a single object based on its ID.
- The first() method—Returns the first record that matches a query string.
- The find() method—Returns an array of all matches for that string.

This is an example of a function in a model that includes calls to the Connect PHP API.

```php
<?php
namespace RightNow/Models;
use RightNow/Utils/Url,
...
RightNow/Connect/v1_2 as Connect,
...
public function get($contactID = null){
  static $contactCache = array();
  if($contactID === null){
    if(Framework::isLoggedIn()){
      $contactID = $this->CI->session->
->getProfileData('contactID');
    }
    else{
      return $this->getResponseObject(null, null, "No contact ID specified and no contact is logged in.");
    }
  } else{
    return $this->getResponseObject(null, null, "Invalid Contact ID: $contactID");
  }
  if(!Framework::isValidID($contactID)){
    return $this->getResponseObject(null, null, "Invalid Contact ID: $contactID");
  } if($cachedContact = $contactCache[$contactID]){ return $cachedContact;
} try{
  $contact = Connect/Contact::fetch($contactID);
} catch(Connect/ConnectAPIErrorBase $e){
```
return $this->getResponseObject(null, null, $e->getMessage());
} else {
    $contactCache[$contactID] = $this->getResponseObject($contact);
    return $contactCache[$contactID];
}

Connect Common Object Model

The CCOM defines a set of objects representing entities in the B2C Service knowledge base that can be displayed on the Customer Portal.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

CCOM includes these types of objects:

- Primary object—Primary objects have a unique key and can be created, read, updated, or deleted directly. They can contain either data fields that hold primitive date types or sub-objects. Primary objects represent entities in the knowledge base such as answers, contacts, and incidents.

- Sub-object—Sub-objects may also contain primitive data types or other sub-objects. Sub-objects do not have a separate existence and are manipulated through their parent primary object. An example of a sub-object is PersonName, which is contained in the Contact primary object.

- Array object—An array object is a collection of sub-objects.

Use dot notation to identify objects in CCOM. For example, to access the first name of a contact, use Contact.Name.First.

Oracle RightNow Object Query Language

ROQL provides an alternative to the Connect PHP API for accessing data in the knowledge base.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

A ROQL query is similar to a SQL query, but there are some exceptions, including:

- FROM is followed by the singular name of a B2C Service object.
- You can retrieve either a whole object or individual fields.
- Not all SQL functions are supported.
• Traditional joins and nested queries are not supported.

There are two types of ROQL query. Tabular queries are similar to SQL queries and return rows of comma-separated values.

```php
function lookupByLastName($search_string) {
    initConnectAPI();
    $query = "SELECT Contact.Name.Last, Contact.Name.First FROM Contact WHERE Contact.Name.Last = "\".$search_string.\""
    $roql_result=RNCPHP/ROQL::query($query)->next();
    $row = $roql_result->next();
    $name = $row[firstname]." "$row[lastname];
    echo $name;
}
```

Object queries return complete objects rather than individual field names.

```php
function lookupByLastName($search_string) {
    initConnectAPI();
    $query = "SELECT Contact FROM Contact WHERE Contact.Name.Last = "\".$search_string.\""
    $roql_result=RNCPHP/ROQL::queryObject($query)->next();
    while($contact = $roql_result->next()) {
        $rows[] = array("last" => $contact->Name->Last);
    }
    echo $rows;
}
```

**Namespaces**

Use this example to learn more about namespaces, their aliases, and declarations.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

This example comes from `/cp/core/framework/Models/Contact.php`:

```php
<?php /* Originating Release: August 2014 */
namespace RightNow/Models;
use RightNow/Utils/Url,
    RightNow/Utils/Framework,
    RightNow/Utils/Config,
    RightNow/Api,
    RightNow/Connect/v1_2 as Connect,
    RightNow/Internal/Sql/Contact as Sql,
    RightNow/Utils/Connect as ConnectUtil,
    RightNow/ActionCapture,
    require_once(CORE_FILES . 'compatibility/Internal/Sql/Contact.php');
class Contact extends PrimaryObjectBase {
    ...
}
```

In this example, a namespace declaration (namespace RightNow/Models) shows that the `Contact.php` file belongs in the `RightNow/Models` namespace. In order to reference the class file you must use `RightNow/Models/Contact`. The reference reflects the folder where the example is located. The example also includes a number of namespace aliases.
Here the code uses the `Custom` namespace in `/cp/customer/development/models/custom/Sample.php`:

```php
<?php
namespace Custom\Models;
class Sample extends /RightNow/Models/Base
{
    // ...
}
```

This example contains the namespace declaration, `namespace Custom/Models`, and a reference to the Base class in the `/RightNow/Models` namespace.

Here is an example of how you can use namespace aliases in your custom code.

```php
use RightNow/Connect/v1_2 as Connect;
```

This offers a shorthand way of referencing namespaces within a file. In this case, you can use the alias Connect, like this: `Connect/NamedIDLabel();` instead of `RightNow/Connect/v1_2/NamedIDLabel();` when referencing the namespace.

Keep in mind these requirements for PHP namespaces in your customer portal code.

- When you reference global objects, such as classes, interfaces, functions, or constants, from within a namespaced class, you must prepend the object with a backslash as shown here `throw new \Exception('Invalid state');`.
- When you reference a namespace in a string, you must escape each backslash as shown here `$controller="/RightNow/Controllers/$library";`.
- You must place the `namespace` declaration at the top of the file before any other code, with the exception of a `declare` statement.

### Primary Namespaces

Primary PHP namespaces relate to the Customer Portal file system.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

<table>
<thead>
<tr>
<th>Namespace</th>
<th>Directory</th>
</tr>
</thead>
<tbody>
<tr>

<td><code>/cp/core/framework/Utils</code></td>
</tr>
</tbody>
</table>
### Namespace | Directory
--- | ---
RightNow/Widgets | /cp/core/widgets/standard
Custom/Models | /cp/customer/development/models
Custom/Widgets | /cp/customer/development/widgets/custom

#### Widget Namespaces

Standard widgets are in the RightNow/Widgets namespace.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

This is an example from the DateInput widget in /cp/core/widgets/standard/input/DateInput/controller.php:

```php
<?php /* Originating Release: August 2014 */
namespace RightNow/Widgets;
use RightNow/Utils/Config,
RightNow/Connect/v1_2 as Connect;
class DateInput extends /RightNow/Libraries/Widget/Input {
    . . .
}
```

Custom widget namespaces must start with **Custom/Widgets**, and the remaining namespace segments must reflect the name of the parent directory of the directory that contains the widget files.

This example is from the DateInput widget’s `logic.js` file in /cp/core/widgets/standard/input/DateInput:

```javascript
/* Originating Release: August 2014 */
RightNow.Widgets.DateInput = RightNow.Field.extend({
    overrides: {
        constructor: function() {
            this.parent();
            . . .
        }
    . . .
});
```

In the example, the namespace for the DateInput widget is declared as `RightNow.Widgets.DateInput`, and it extends from `RightNow.Field`.

Custom widget namespaces must use `Custom.Widgets` as the first two namespace segments, and the remaining segment must reflect the widget’s subfolder. For example, a custom widget in /cp/customer/development/widgets/custom/input must declare its namespace as `Custom.Widgets.input`.

#### Library Namespaces

Custom libraries are in the Custom/Libraries namespace.
This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

This example is from the library in `/cp/customer/development/libraries/Sample.php`:

```php
<?php
namespace Custom/Libraries;

class Sample
{
    //...
}
```

Custom libraries are not required to extend from anything. Also they are not allowed to be in a subfolder, which means the namespace does not have to match the file system path required for custom widgets and models. All libraries appear under the `Custom/Libraries` namespace. Additionally, namespace requirements apply only when using the framework functions (for example, using `$this->load->library('Sample')`) to load and instantiate the library. If you include the library manually using include/require, the Customer Portal cannot enforce the naming conventions.

### JavaScript Namespacing

Namespaces prevent naming conflicts in Customer Portal reference implementation code and your custom code.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

All JavaScript code must be namespaced. There must not be any JavaScript variables or functions that are not contained within a namespace.

JavaScript namespaces are designated with dot notation, for example, `RightNow.Widgets` and `Custom.Widgets`. Customer Portal reference implementation code uses the `RightNow.*` namespaces, but the custom code you develop must use `Custom.*` namespaces.

**Note:** If a namespace segment contains only two characters, both need to be capitalized, for example, `Custom.UI`. If the namespace segment has three or more characters, Pascalcase must be used, for example, `Custom.Urn1`.

### Function Namespaces

There are a number of JavaScript namespaces for common functions in the reference implementation.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

These are common functions namespaces:

- `RightNow.Ajax`—Functions that pertain to AJAX requests or AJAX request handling.
- `RightNow.Event`—Event logic for Customer Portal, including the functions used to create, fire, and subscribe to events, as well as process this information.
How to Access Customer Profile Data

You can access a customer’s profile information using JavaScript so you don’t need to gather that information in a widget controller.php file and pass it to JavaScript manually.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

The available profile data includes whether the customer is logged in, email, first name, last name, full name, contact ID, and previously seen email.

These widgets should use RightNow.Profile in the logic.js file for their profile data:

- chat/ChatLaunchButton/controller.php
- notifications/AnswerNotificationIcon/controller.php
- social/CommunityPostDisplay/controller.php

These methods are available:

- RightNow.Profile.isLoggedIn()
- RightNow.Profile.previouslySeeEmail()
- RightNow.Profile.firstName()
- RightNow.Profile.lastName()
- RightNow.Profile.fullName()
- RightNow.Profile.contactID()
- RightNow.Profile.emailAddress()

Note: This API does not automatically add the Japanese name suffix label when retrieving the fullName property. If you need this label, you can manually append the call to:

RightNow.Interface.getMessage("NAME_SUFFIX_LBL");
Creating a Custom Widget

You can plan and create a custom widget.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

1. Determine whether there is an existing standard or custom widget that provides similar functionality to what you want, and make a note of its name and location.
2. If there is an existing widget with similar functionality, you can extend it. Work through the Guidelines for Extending an Existing Widget table to determine the components and functionality you require for the widget and supporting code.
3. If there is no suitable existing widget, work through the Creating a Brand New Widget table to determine the components and functionality you require for the brand new widget.
4. Use the widget builder to create your widget. This creates all the widget files, which include skeleton code you can use as a starting point for customization.
5. Add the custom code you require to the files produced by the widget builder.
6. Customize the CSS file as required.
7. Create any additional code you require to support your custom widget.

**Note:** Remember that you can change the look and feel of a widget simply by modifying the CSS, and this may be all the customization you require.

Guidelines for Extending an Existing Widget

There are many decisions to make when planning your site and whether to use existing widgets.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

### Planning decision

<table>
<thead>
<tr>
<th>Will your custom widget contain other widgets?</th>
<th>Why you might need this...</th>
<th>See related topics</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Your widget may need to contain other widgets within its view, as long as there is PHP logic within the view. You must add this information manually to the info.yml file.</td>
<td>Widget Info Files</td>
</tr>
</tbody>
</table>

| Where will you add your custom widget, that is, on which pages and where on the page? | You must determine which pages require the widget, and where exactly the widget is added on the page. There may be constraints on where you can add the widget. For example, a widget that extends RightNow.Field must be placed inside an HTML <form> element on the page that contains the widget. | |

| Do you need to develop a new custom model? | You might need to create a custom model if you require data from the server that you cannot obtain from existing model function calls. This may be necessary, for example, if you are adding new custom objects. Consider whether adding a hook to an existing custom model would be sufficient for your needs. | Overview of Creating Models Creating a Custom Model |

| Do you need to add any hooks? | You can use hooks, for example, to modify data, perform custom validation, and return customized error messages to display to the user. | Adding Hooks |

| Do you need to develop a new custom controller? | You might need a custom controller if you have multiple widgets making the same AJAX request. You might also need a custom controller if you are creating a new custom model. | Creating Controllers Custom Controllers |

### Creating a Custom Model

You can customize a standard model's functionality by creating a custom model that extends from a standard model.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Customizing a model can be useful for modifying the behavior of all the widgets that make calls to that particular model.

You may find that adding a hook is sufficient for your customization purposes. Hooks provide custom code associated with particular events that let you extend Customer Portal functionality by calling a function in a custom model. You can...
use hooks, for example, to modify data, perform custom validation, and return customized error messages to display to the user.

You might create a brand new custom model if you need to access custom data, for example, a custom object or data that is not kept in the knowledge base. In this case, the custom model extends directly from the Base model.

Performing Other Customizations

You can create other customizations using widgets and models.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

In addition to creating custom widgets and custom models, there are some other types of customization available for the Customer Portal:

- Custom controller—Custom controllers are mostly required to create a new AJAX endpoint, either to pre-process data before it goes to a standard model, or to allow the sending of the data to a custom model.
- Custom libraries—If you use the same custom code in multiple places, you may want to avoid duplication of the code in a number of models or controllers and therefore use custom libraries to organize the code.
- Custom helpers—Although it is unlikely that you will use custom helpers, you can add them to the folder /cp/customer/development/helpers.
- The autoload javascript file—You can put common functions and event declarations in this file so they get loaded on every page.
- Error pages—You can customize error pages that are displayed when your site is undergoing an upgrade.

Abuse Detection in Code

The code in your custom models or custom controllers may be susceptible to abuse, such as SQL injections and other attacks when certain conditions exist.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Standard models and standard controllers call the native abuse detection methods, so if you use standard controllers with standard models, you do not need to customize your code with abuse detection calls. However, if your custom code performs any direct API calls for database updates or back-end actions, for example, to create or update incidents or contacts, log in a user, or perform answer retrieval, it must contain abuse detection code. Customer portal code generally calls check() in most places, including from controllers. However, custom models should call the /RightNow/Libraries/AbuseDetection::isAbuse() function instead of check() to prevent the model from exiting with JavaScript code for invoking a CAPTCHA. The isAbuse() function returns a ResponseObject error that can be handled appropriately.

In models, use isAbuse() to prevent the model call from exiting with JavaScript code. From other sources, including controllers, use check() to ensure that the CAPTCHA is invoked. If your custom models are being called only from custom controllers, the check() needs to be called once in the request, so it can reside only in the controller.

```php
if (AbuseDetection::isAbuse($formToken)) {
    return false;
}
```
OR
if (!AbuseDetection::isAbuse($formToken)) {
    // Code to create an incident
}

If abuse is detected, a CAPTCHA screen is displayed for the user to fill out. Failing to call the check() function can result in Connect PHP calls throwing an exception.

How You Create Abuse Scenarios

The Customer Portal uses web form security on the FormSubmit widget to automatically require human validation through the use of a CAPTCHA when abuse is suspected.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

If your custom code performs database calls, you must call the /RightNow/Libraries/AbuseDetection::isAbuse() function to detect abuse.

An abuse scenario is hard to create deliberately for testing purposes, so the Customer Portal includes a cookie that makes your site behave as if it is under abuse when the cookie is set. It works only in development mode for testing purposes, so it does not affect customers on your production site.

Other Security Features

There are a number of security enhancements available.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

In addition to the abuse detection cookie, these security enhancements are included in the Customer Portal.

- PTA encryption—The encryption scheme for pass-through authentication supports the use of a salt and IV (initialization vector), which allow more secure encryption of PTA strings. Two configuration settings let you specify the salt or IV values to use during decryption: PTA_ENCRYPTION_SALT and PTA_ENCRYPTION_IV.

- File attachment allow list—The Customer Portal hooks pre_attachment_upload and pre_attachment_download let you indicate the mime types you want to support and allowing you to prevent automatic execution of certain types of downloaded files.

- HTTP Strict Transport Security (HSTS) support—If your customer portal uses SSL only (that is, if SEC_END_USER_HTTPS is enabled), your customers will always access the site using HTTPS even if they type http in the browser address bar. This security feature is supported in Google Chrome, Mozilla Firefox 4, and the NoScript Firefox extension.
The Widget Builder

You can create widgets either by extending an existing standard or custom widget, or by writing a new widget.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

You can use the widget builder to create the files you require for a new or extending widget, and then add code as required to complete your custom widgets.

<table>
<thead>
<tr>
<th>File</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>info.yml</td>
<td>Provides information about a widget, its attributes, and its dependencies. See Widget Info Files.</td>
</tr>
<tr>
<td>controller.php</td>
<td>Contains code to coordinate the widget, including calls to models to access the database and code to pass data to the view. A custom widget can have its own controller or simply use the controller of its parent widget. A custom widget controller can include its own AJAX request handling capability or inherit the capability from its parent widget. See The Custom Widget Controller File.</td>
</tr>
<tr>
<td>view.php</td>
<td>Contains the HTML required to display the widget. A custom widget can have its own view, or simply use the view of its parent widget. See The Extended Widget View.</td>
</tr>
<tr>
<td>view.ejs</td>
<td>Contains JavaScript templates used by the widget to render dynamic views. See Embedded JavaScript and Template Files.</td>
</tr>
<tr>
<td>logic.js</td>
<td>Contains display logic, event-handling, and other logic. A custom widget can have its own logic file, or simply use the logic file of its parent widget. A custom widget logic file can override properties and functions of its parent widget. See Extended Widget Logic Files.</td>
</tr>
<tr>
<td>base.css</td>
<td>Contains base CSS to structure the widget. See Extended Widget CSS.</td>
</tr>
<tr>
<td>WidgetName.css</td>
<td>Contains presentation CSS, which controls the appearance of the widget. See Extended Widget CSS.</td>
</tr>
<tr>
<td>preview/preview.png</td>
<td>Displays an example of what the widget will look like when you add it to a page.</td>
</tr>
</tbody>
</table>

While a new custom widget is not required to have its own controller, view, and logic components, your custom widgets will need at least one of these components.

**Widget Info Files**

Every widget must have an info.yml file, written in the YAML format, in its directory. This file specifies all of the widget's important details.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.
When you use the widget builder to create a new widget, an **info.yml** file for the new widget is automatically created. You may need to edit this file as you make further customizations to the widget.

<table>
<thead>
<tr>
<th>Functionality</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>version:</strong></td>
<td>version: &quot;1.0&quot;</td>
</tr>
<tr>
<td>Contains a string consisting of the major and minor version number of the widget. This section is required.</td>
<td></td>
</tr>
<tr>
<td><strong>requires:</strong></td>
<td>requires:</td>
</tr>
<tr>
<td>Lists the Customer Portal framework and technology dependencies for the widget.</td>
<td>framework: &quot;3.0&quot; jsModule: [standard, mobile] yui: [panel, autocomplete, autocomplete-highlighters]</td>
</tr>
<tr>
<td><strong>attributes:</strong></td>
<td>attributes:</td>
</tr>
<tr>
<td>Lists attributes for the widget. Attributes inherited from a parent widget are included only if they have been modified.</td>
<td>label_heading:</td>
</tr>
<tr>
<td></td>
<td>name: Heading label</td>
</tr>
<tr>
<td></td>
<td>description: Label for the heading</td>
</tr>
<tr>
<td></td>
<td>type: string</td>
</tr>
<tr>
<td></td>
<td>default: Welcome back!</td>
</tr>
<tr>
<td></td>
<td>display_option:</td>
</tr>
<tr>
<td></td>
<td>name: Display option</td>
</tr>
<tr>
<td></td>
<td>description: How to display the widget</td>
</tr>
<tr>
<td></td>
<td>options: [subtle, bold, obnoxious]</td>
</tr>
<tr>
<td></td>
<td>default: subtle</td>
</tr>
<tr>
<td><strong>extends:</strong></td>
<td>extends:</td>
</tr>
<tr>
<td>Specifies the parent widget of the custom widget.</td>
<td>widget: &quot;standard/utils/SocialBookmarkLink&quot; components: [php, css] overrideViewAndLogic: true</td>
</tr>
<tr>
<td><strong>info:</strong></td>
<td>info:</td>
</tr>
<tr>
<td>Contains an associative array of information about the widget.</td>
<td>description: Form for submitting complaints and feature requests.</td>
</tr>
<tr>
<td></td>
<td>urlParameters:</td>
</tr>
<tr>
<td></td>
<td>a_id:</td>
</tr>
<tr>
<td></td>
<td>name: Answer ID</td>
</tr>
<tr>
<td></td>
<td>description: ID of the answer to display</td>
</tr>
<tr>
<td></td>
<td>example: a_id/123</td>
</tr>
<tr>
<td><strong>contains:</strong></td>
<td>contains:</td>
</tr>
<tr>
<td>Optional section used when the widget contains one or more other widgets within its view. You must add this section manually because the widget builder does not generate it. The view must contain PHP logic in order for a widget to contain other widgets.</td>
<td>- widget: standard/input/SelectionInput versions: [&quot;1.0&quot;]</td>
</tr>
<tr>
<td></td>
<td>- widget: standard/input/DateInput versions: [&quot;1.0&quot;]</td>
</tr>
<tr>
<td></td>
<td>- widget: standard/input/TextInput versions: [&quot;1.0&quot;, &quot;1.1&quot;]</td>
</tr>
</tbody>
</table>

**Reserved Words**

Certain common fields used in Customer Portal, especially ones you should not alter or directly input, are reserved and not valid.
This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

The getValidationList() function within CleanseData.php contains a list of reserve words that are validated in a specific format.

**How You Extend Existing Widgets**

A widget can extend an existing standard or custom widget. A widget can have only one parent widget.

Instead of copying standard or custom widget code, which is a tedious and error-prone process, use the widget builder to create a custom widget that extends from another widget. You specify these criteria:

- The components (controller, view, JavaScript, and CSS) to extend.
- Whether the controller does any AJAX handling.
- Whether to extend or override the parent widget’s view.
- Whether to include the parent widget’s CSS.
- The YUI modules you want to have loaded on any page that contains the widget and then passed to the widget’s constructor.
- Whether you require a template, which lets you dynamically render content within the parent’s JavaScript view file.
- Any new attributes for the widget.
- Any changes to attributes inherited from the parent widget.
- Additional information including a description, the URL parameters for the widget, and the JavaScript compatibility information.

The widget builder generates custom code with defaults and placeholders that you can then tailor to your requirements.

**Extend an Existing Widget**

You can extend an existing widget using the widget builder.

1. In the widget builder, select **Extend the functionality of an existing widget**.
2. Specify the name of the new widget and the widget it is extending from.
3. Specify the widget components to be used.
4. If the widget has its own controller, specify whether it will do any AJAX handling.
5. If the widget has its own view, specify whether the parent widget’s view is to be extended or overridden and whether the parent widget’s CSS is to be included.
6. If the widget has its own JavaScript, specify the YUI modules to be used with the widget.
7. If the widget has its own JavaScript, specify whether templates are required.
8. Add any new attributes that are required in addition to the attributes inherited from the parent widget.
9. Add additional details as required, including a description of the widget, any URL parameters, and JavaScript framework compatibility.
If the parent widget of your new widget contains URL parameters, they are listed as inherited parameters for the new widget.

The Extended Widget View

When a widget extends another widget, the parent widget’s view.php file is used for rendering. If the new widget has a view.php file of its own, then the blocks that are defined in the new view are added to the parent widget’s view.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

A widget’s view file may contain <rn:block> elements as shown in this example.

```xml
<nrn:block id="postFeedbackInput"/>
```

Every <rn:block> element within a widget has a unique ID that describes its context. These blocks are customization hook points for extending the widget.

For example if the parent view.php file contains:

```xml
<nrn:block id="main"/>
<div><? $this->data['js']['moreresults'] ?></div>
```

and the extending view contains:

```xml
<nrn:block id="ParentWidgetName-main">
<span><? $this->data['js']['results'] ?></span>
</rn:block>
```

the resulting view is:

```xml
<span><? $this->data['js']['results'] ?></span>
<div><? $this->data['js']['moreresults'] ?></div>
```

If the extending widget does not have a view.php file, then the parent widget’s view.php file is used.

In a similar way, blocks of content within the parent JavaScript view file (view.ejs) can be modified.

How You Override Widget View and JavaScript Files

In most cases, extending the parent widget’s view and customizing the new widget’s view with the <rn:block> element is sufficient, and this is the recommended best practice.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

If a custom widget extends a widget’s controller, but has a completely different view and corresponding logic file, you can specify the overrideViewAndLogic value in the custom widget’s info.yml file. This is also an option in the widget builder. The parent widget’s view.php and logic.js files are then ignored, and instead these files from the custom
widget are used. Specifying an override of just the view or just the logic file is not supported, because the DOM and JavaScript are tightly coupled.

This example from the `extends` section of an `info.yml` file demonstrates how the php component of the DataDisplay widget is being used, but the view and logic files are referenced solely from the extending widget.

```yaml
extends:
  widget: standard/output/DataDisplay
  components: php
  overrideViewAndLogic: true
```

When `overrideViewAndLogic` is specified, the component values `view` and `js` must not be present in the components key in `info.yml`, otherwise an error is thrown when attempting to use the widget.

### The Custom Widget Controller File

A custom widget that extends another widget can have its own controller.php file that extends the other widget’s controller, or it may simply use the parent widget’s controller, which will be loaded and ready to use.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

If the new widget does not have its own controller, its view and logic files will use the default properties and data defined in the parent’s controller.

The new widget can override methods (other than private methods) from the parent widget. When you use the widget builder to create a widget that extends from another widget, the `controller.php` file that is generated lists the methods that can be overridden.

An example of a new `controller.php` file is as follows.

```php
<?php
namespace Custom/Widgets/sample;

class MySocialBookmarkLink extends /RightNow/Widgets/SocialBookmarkLink {
  function __construct($attrs) {
    parent::__construct($attrs);
  }
  function getData() {
    // Add preprocessing code here...
    parent::getData();
    // Add postprocessing code here...
  }
}
```

As shown in the example, custom widgets must use the `Custom/Widgets/widgetParentFolder` namespace, for example, `Custom/Widgets/sample` or `Custom/Widgets/feedback`.

The widget’s class name must be the same as the widget’s folder name.

Widgets extending standard widgets must have a constructor and must call the parent’s constructor. The custom extender can add, modify, or remove data before or after the parent widget controller’s `getData()` method is called. However, widget controllers are not required to call the parent’s `getData()` methods.

The widget automatically inherits any AJAX-handling functionality of its parent. However, the extending widget can also have its own AJAX handler.
Custom Controllers

You can create custom controllers that extend from the /RightNow/Controllers/Base class. You cannot extend from any other controller class.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Custom controllers are mostly required to create a new AJAX endpoint, either to pre-process data before it goes to a standard model, or to allow the sending of the data to a custom model.

Extended Widget Logic Files

A custom widget that extends another widget can have its own logic.js file that extends from the parent widget’s logic file, or it can use the parent widget’s logic file, which will be loaded and ready to use.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

If the new custom widget has its own logic.js file, the code must indicate that it is extending from another widget, for example:

```javascript
RightNow.namespace('Custom.Widgets.MySocialBookmarkLink');
Custom.Widgets.MySocialBookmarkLink = RightNow.Widgets.SocialBookmarkLink.extend({
```

The Constructor Function in logic.js Files

You can use the constructor function to extend logic.js files.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

As an example, the SocialBookmarkLink widget extends from RightNow.Widgets.

```javascript
})
RightNow.Widgets.SocialBookmarkLink = RightNow.Widgets.extend({
  constructor: function() {
    // Do things on page load here (constructor)
  },
  sbl: function() {
    }
});
```

The first function defined in the object passed to RightNow.Widgets.extend() is named constructor. This function is run immediately when the widget is instantiated (during onDomReady event). Three parameters are passed to the constructor method.

- The `data` parameter:
  - `attrs`—Widget attributes.
  - `js`—Members set in the widget’s controller.
  - `info`—Name and path, for example.
- The `instanceID` parameter.
The `y` parameter, which is an instance of YUI.

Before the constructor is called, several helpful actions are performed. The RightNow.Widget that all widgets extend from has already called a base function that's called before the extending widget's constructor is called.

This base function performs these actions:

```javascript
function helper(data, instanceID, Y) {
    this.data = data;
    this.instanceID = instanceID;
    this.Y = Y;
    this.baseDomID = "rn_" + this.instanceID;
    this.baseSelector = "#" + this.baseDomID;
    this.getStatic = function() { return _getObject(this.data.info.class_name);};
}
```

This means that every widget that extends from RightNow.Widget does not need to set instance variables to what was passed in, because that action has already been performed. All standard B2C Service widgets use `rn_ + widgetInstanceID` as a convention for IDs in HTML elements, therefore setting the `baseDomID` and `baseSelector` provides helpful instance variables so that you do not need to duplicate `rn_ + this.instanceID + _SomethingElse` multiple times in widget JavaScript code.

You can define all other widget methods or instance variables within the object passed to RightNow.Widgets.extend() using the standard key: value paradigm. When code is executing inside a widget method, it can reference other methods and instance variables as it normally does (for example, `this.someOtherMethod, this.instanceID`).

**Static Properties**

RightNow.Widgets.extend() accepts two parameters, the constructor function and an optional second parameter, which also must be an object. However, with this second parameter, all key-value properties declared are added as static properties of the widget.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

For example:

```javascript
RightNow.Widgets.SocialBookmarkLink = RightNow.Widgets.extend({
    constructor: function(data, instanceID, Y) {
    },
    sbl: function() {
    },
}, /** End of the first parameter **/
{
    aStaticProperty: "sbl",
    aStaticFunction: function() { ... }
});
RightNow.Widgets.SocialBookmarkLink.aStaticProperty; // "sbl"
RightNow.Widgets.SocialBookmarkLink.aStaticFunction();
```

All static properties are then available on the widget's static class, `RightNow.Widgets.WidgetName`.

If a widget extends another widget then any static properties defined for the parent can be overridden by the child.

**Parent Properties in logic.js Files**

An extending widget automatically gains access to all of the properties and methods of the parent widget, and the extending widget can change the behavior of any of these methods.
This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

In the object passed to parent.extend() there is a special key, overrides, which allows the overriding of properties and methods defined in the parent.

```
parent.extend({
    overrides: {
        constructor: function(){{...}},
        aMethod: function(){{...}},
        aProperty: 23
    },
    anotherMethod: function(){...}
})
```

Any property defined in the object denoted by the overrides key overrides the property of the same name in the parent.

Every function defined inside overrides that has a parent function of the same name automatically gets a this.parent() member that allows the function to call the parent function that it is overriding.

Every property that is defined inside overrides is essentially “flattened out”, meaning that other widget methods still reference them normally using this.propertyName. So from the example above, aMethod is able to call anotherMethod as expected using this.anotherMethod(), and anotherMethod is able to call aMethod as expected using this.aMethod().

As an example, in the parent:

```
RightNow.Widgets.SocialBookmarkLink = RightNow.Widgets.extend({
    constructor: function() { ... },
    onClick: function() { ... },
});
```

And in the extending widget:

```
    overrides: {
        constructor: function() {
            this.parent(); // Calls constructor above
            // Do something else...
            this.showDialog();
        },
        onClick: function() {
            this.parent(); // Calls _onClick above
            // Do something else...
            this.hideDialog();
        },
        showDialog: function() {
            // Do something...
            this._onClick();
        },
        hideDialog: function() {
            // Do something...
        }
    }
});
```

If a property is defined within overrides that does not have the same name as any parent property, then the property simply exists as any other widget property.

```
parent.extend({
    overrides: {
        constructor: function() {...}
    // overrides parent's constructor
    doesntExistOnParent: true
```
If a property with the same name as a parent property is specified outside of the overrides structure, the property is still accessible to the rest of the widget itself, as normal, but the property does not override the parent property of the same name.

```javascript
parent = RightNow.Widget.Extend({
    constructor: function() {
        ...
        something.on('click', this.onClick, this);
    },
    onClick: function() {
        alert('parent');
    }
});
child = parent.extend({
    overrides: {
        constructor() {
            ...
            this.parent();
            this.onClick(); // 'child' alerts
        },
        onClick: function() {
            typeof this.parent === 'undefined'; // true
            alert('child');
        }
    }
});
```

In the example, the extending widget accesses its own onClick() method normally, but when the domElement subscribed to in the parent is clicked, the parent's onClick method is still called, because it was not overridden by the extending widget.

Again, to override and call into a parent method, the overriding method must be contained within the overrides structure.

```javascript
child = parent.extend({
    overrides: {
        constructor() {
            ...
            this.parent();
            this.onClick(); // 'child' alert is followed by a 'parent' alert
        },
        onClick: function() {
            typeof this.parent === 'undefined'; // true
            alert('child');
            this.parent();
        }
    }
});
```

**YUI Components**

An instance of YUI is passed as the third parameter to the constructor function in logic.js files, and widgets can use this YUI instance to interact with YUI.
This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

YUI 3 is intended to be used in discrete, compartmentalized, modularized components within applications. This is exactly how widgets can be described, so YUI is ideal to use with them.

```javascript
this.Y.one(this.baseSelector);
this.Y.UA.ie > 9);
```

Including the YUI 3 script tag on a page creates a minimal YUI() function that returns an object with a few functions and properties. YUI 3 expects callers to list out any sub-module dependencies that you intend to use with your code. The code that uses the sub-modules is a callback function that YUI executes when it has created a new YUI instance with all of those modules as part of that instance. It provides that instance as the first parameter to the callback function.

By default, each YUI instance has several components available as first-level modules, including:

- DOM
- Node
- Anim
- Event
- History
- IO

Widgets declare any YUI module dependencies by listing the modules in their `info.yml` file.

```yaml
... requires: ...
  yui: [slider, autocomplete, autocomplete-highlighters]
...
```

Any standard YUI 3 modules are accessible to widgets that declare such module dependencies.

```javascript
RightNow.Widgets.sbl = RightNow.Widgets.extend({
  constructor: function(data, instanceID, Y) {
    Y.Slider(); Y.Plugin.Autocomplete;
  }
});
```

In some cases, a widget might be used in both mobile and desktop environments, but for each of those environments there might be different requirements. Also, as additional JavaScript on a page incurs a greater performance impact on a mobile device, you may decide not to include certain components for mobile (as long as the widget code appropriately handles the omission of certain YUI components). In this case, in the `info.yml` file you can specify YUI requirements for each `jsModule` entry.

```yaml
... requires:
  yui:
    standard: [panel, autocomplete]
    mobile: [overlay]
...
```

In this example, if the widget is used on a page where `standard` is the `jsModule` value (the default), the widget instance receives a YUI instance including the Panel and Autocomplete YUI components. If the same widget is used on a page where `mobile` is the `jsModule` value, then it receives a YUI instance including just the Overlay component. This lets you use the same widget for both environments without having to build an almost identical mobile widget. However,
requiring very different YUI components for standard and mobile environments is not recommended because it can lead to convoluted code and bugs.

A more common scenario is to simply omit certain requirements for a mobile environment from the info.yml file.

```yaml
... requires: yui: standard: [overlay] ...
```

In this case, rather than the widget checking for a particular browser user-agent, it can then simply not provide a feature or provide the feature in a different way. For example in the widget's logic.js:

```javascript
if (this.Y.Overlay) {
    // Do something with an overlay
} else {
    // Do something without an overlay
}
```

Extended Widget CSS

If there is a base.css file within a widget's directory, then it is used. If there is a presentation CSS file with the same name as the widget directory under /cp/customer/assets/themes/standard/widgetCss, then it is used.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

If a widget extends another widget and you want the CSS for the parent widget to also be included, you can specify it as another component in the info.yml file.

```yaml
extends:
    widget: "standard/utils/SocialBookmarkLink"
    versions: "3.1"
    components: ["php", "css"]
```

The resulting CSS included on the page is ordered with the parent CSS first, followed by the extending child CSS.

```html
<style>
/* Parent base.css */
/* Parent presentation CSS (SocialBookmarkLink.css) */
/* MyWidget base.css */
/* MyWidget presentation CSS (MyWidget.css) */
</style>
```

When a widget extends another widget, the names of both widgets are used for the top-most containing element's class name. In this example, MyWidget extends from the SocialBookMarkLink widget.

```html
<div class="rn_SocialBookmarkLink rn_MyWidget" id="...">
    Widget contents
</div>
```

If the parent's CSS is included, the widget automatically inherits all of the default styling. However, you can specify style changes that apply only to the new extending widget without affecting the standard widget.

```css
.rn_SocialBookmarkLink {
    /* Styles written here will affect the standard SocialBookmarkLink widget as well as any widgets that extend from it*/
}
.rn_SocialBookmarkLink.rn_MyWidget {
    /* Styles written here only affect the extending widget */
```
How You Create a Widget from Scratch

You can use the widget builder to create new widgets.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

You specify the components (controller, view, JavaScript) that the new widget has. A new widget must have at least one of the components.

- For the controller, you can specify whether it does any AJAX handling.
- For the JavaScript, you can specify the YUI modules you want to have loaded on the page that contains the widget and then passed to the widget’s constructor.
- For the JavaScript, you can specify whether you require a template, in other words, a view.ejs file.
- You can specify the attributes required for the new widget.
- You can also specify additional information including a description, the URL parameters for the widget, and the JavaScript compatibility information.

The widget builder generates custom code with defaults and placeholders that you can then tailor to your requirements. The widget’s view.php file contains this div tag to simplify your coding work.

```html
<div id="rn_<%= $this->instanceID %>" class="<%= $this->classList %>">
</div>
```

Create a Widget

You can use the widget builder to create a new widget.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

1. In the widget builder, select Create a brand new widget from scratch.
2. Specify the widget components that will be used.
3. If the widget has a controller, specify whether it will do any AJAX handling.
4. If the widget has its own JavaScript, specify the YUI modules to be used with the widget.
5. If the widget has JavaScript, specify whether templates are required.
6. Add attributes as required.
7. Add additional details as required, including a description of the widget, any URL parameters, and JavaScript framework compatibility information.

Files are generated for the new custom widget. You can then add code to the files as required.

Overview of Making AJAX Requests to the Server

Widgets can make their own AJAX requests to the server.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

This is an overview of the process.

1. You specify the location of a handler for an AJAX request (the endpoint URL) through a widget attribute.
2. Before a widget makes a request, the `logic.js` file fires an event, and subscribers to the event can customize the data to be sent in the request.

3. The widget’s `logic.js` file makes the AJAX request and calls a handler method in the widget’s controller, passing the necessary data for the request.

4. The handler method in the controller can access any parameters passed in the request and calls model functions as required to return the output and results.

5. The widget’s `logic.js` file has a callback method for the response from the server.

6. After a widget receives a response, the `logic.js` file fires an event, and subscribers to the event can customize behavior, for example, to modify any of the data in the response.

Widgets and Event Firing

Before a widget makes an AJAX request, it fires an event.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Subscribers to that event can:

- Add, remove, or modify any data to be sent in the request.
- Cancel the AJAX request.

This code from a `logic.js` file shows an example of such an event.

```javascript
var eventObject = new RightNow.Event.EventObject(this, {data: {
  w_id: this.data.info.w_id,
  a_id: this.data.js.answerID,
  rate: this._rate,
  email: this.data.js.email || this._emailField.value,
  message: this._feedbackField.value,
  threshold: this.data.attrs.dialog_threshold,
  options_count: this.data.attrs.options_count,
  submitfeedback: true,
  handler: this.data.ajaxHandlers.submit_rating_ajax
}});
if(RightNow.Event.fire("evt_answerFeedbackRequest", eventObject)) {
  RightNow.Ajax.makeRequest(this.data.attrs.submit_feedback_ajax, eventObject.data, {successHandler: this._onResponseReceived, scope: this, data: eventObject, json: true});
}
```

In this example, all of the data sent to the server is passed in the `evt_answerFeedbackRequest` event. Subscribers to that event can modify any of that data. If a subscriber returns false, then the event is cancelled and the line containing `RightNow.Ajax.makeRequest` is never reached.

How You Make AJAX Requests in the Widget JavaScript

You can make AJAX requests using JavaScript.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Using the AnswerFeedback widget as an example, when customers rate an answer, the AnswerFeedback widget’s `logic.js` file calls one of its JavaScript functions.

```javascript
/**
 * Submit data to the server.
 */
_submitFeedback: function() {
  var eventObject = new RightNow.Event.EventObject(this, {data: {
```
w_id: this.data.info.w_id,
a_id: this.data.js.answerID,
rate: this._rate,
email: this.data.js.email || this._emailField.value,
message: this._feedbackField.value,
threshold: this.data.attrs.dialog_threshold,
options_count: this.data.attrs.options_count,
submitfeedback: true,
});
if(RightNow.Event.fire("evt_answerFeedbackRequest", eventObject)) {
RightNow.Ajax.makeRequest(this.data.attrs.submit_feedback_ajax, eventObject.data, {successHandler:
this._onResponseReceived, scope: this, data: eventObject, json: true});
}
}

In addition to the normal POST variables, there is also the instance number of the current widget (w_id).

The endpoint for the request (the value for the submit_feedback_ajax attribute) is specified by
this.data.attrs.submit_feedback_ajax. When the widget controller calls $this->setAjaxHandler, the attribute value is
changed to attribute value + widget path + name of handler method. So, for our example.

this.data.attrs.submit_feedback_ajax == "/ci/ajax/widget/standard/feedback/AnswerFeedback/
submitAnswerFeedback"

And therefore the request ultimately made is:

POST /ci/ajax/widget/standard/feedback/AnswerFeedback/submitAnswerFeedback
Data: w_id=12&a_id=57&rate=4&email=red@dog.com&threshold=2&options_count=4&submitfeedback=true

The widget path and handler name are appended onto the path on any value specified for AJAX-type attributes. So, if
the widget’s AJAX endpoint is changed, for example:

<rn:widget path="feedback/AnswerFeedback" submit_feedback_ajax="/cc/feedback">

The URL for the request that’s made is:

POST /cc/feedback/standard/feedback/AnswerFeedback/submitAnswerFeedback

As already discussed, before the AJAX request is actually made, a synchronous event is fired, along with the actual
contents of everything to be sent to the server. This means that any subscriber to the event is able to modify what is
sent to the server.

The widget specifies its own callback function for the server response. In the example, _onResponseReceived() specifies
that the results are to be JSON-parsed before the callback method is called.

Everything needed to route the AJAX request to the specific widget instance is in the AJAX request:

• The path to the widget (added implicitly by the framework).
• The name of the widget’s AJAX handling method (added implicitly by the framework).
• The Instance ID of the widget.
• The page containing the widget (captured as the http_referer in the request).

With this information, the proper widget method can be called and instance-specific attributes can also be called, all as
part of handling the AJAX request.

There are a number of ways to customize the AJAX request.

• Changing the endpoint of the request—You can change the attribute value in the widget declaration on the
containing page.
• Changing how the request data is handled on the server—You can extend the widget controller and either change the ajaxHandlers member to a uniquely named method, or modify the incoming and outgoing data by implementing and wrapping the same method as the parent.

• Modifying the data sent in the AJAX request—You can subscribe to the event that is fired before the AJAX request is sent and modify the event object data.

AJAX Requests in the Widget Controller

Any widget can define an AJAX request handler method within its controller file. All standard widgets behave in this manner.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

This can be illustrated using the standard widget AnswerFeedback as an example. AnswerFeedback performs two AJAX requests: one to record the answer rating that the user has given, and one to submit the user’s feedback message. AnswerFeedback has an attribute for each AJAX request, and each attribute specifies the location of the handler function for the AJAX request (the endpoint). Each instance of a widget can specify a unique AJAX endpoint, if required. However, the attributes have a default path for the endpoint (/ci/ajax/widget), as shown in this excerpt from the info.yml file.

```yaml
submit_rating_ajax:
  name: Submit Rating AJAX
  type: ajax
  description: Endpoint to make the answer rating AJAX request to
  default: /ci/ajax/widget

submit_feedback_ajax:
  name: Submit Feedback AJAX
  type: ajax
  description: Endpoint to make the answer feedback AJAX request to
  default: /ci/ajax/widget
```

The default endpoint, ci/ajax/widget, means that the handler function in the widget’s controller is used for the AJAX request.

This code excerpt illustrates the controller.php of AnswerFeedback.

```php
namespace RightNow/Widgets;

class AnswerFeedback extends /RightNow/Libraries/Widget/Base {
  function __construct($attrs) {
    parent::__construct($attrs);
    $this->setAjaxHandlers(array(
      'submit_rating_ajax' => 'submitAnswerRating',
      'submit_feedback_ajax' => array(
        'handler' => 'submitAnswerFeedback',
        'clickstream' => 'submitFeedback',
      )
    ));
  }

  function getData() {
    ...
  }

  static function submitAnswerRating($postData) {
    // record clickstreams interaction
    // echo out response
  }

  function submitAnswerFeedback($postData) {
    // pass thru to incident model
    // echo out response
  }
```
The widget has a setAjaxHandlers() method inherited from the widget Base class. The keys in the array passed to setAjaxHandlers() are the names of the attributes relevant to the AJAX requests, which are used within the widget's JavaScript to make the request.

The values in the array are either:

- The string name of the widget’s method that will handle the AJAX request (submitAnswerRating() in the example), or,
- An array with key values of:
  - handler—The string name of the widget’s method that will handle the AJAX request (submitAnswerFeedback() in the example).
  - clickstream—The clickstream action to insert when this AJAX request occurs and the handler is called.

AJAX handling methods receive a single parameter that is an associative array of the GET/POST variables. The methods can pull out parameters and route them through to models and then output the results.

The AJAX handling methods can be static or non-static. If an AJAX handling method is static, it cannot access any instance properties of the widget. The method is in turn called as part of the AJAX request, therefore the widget is not instantiated and the method is called statically. For example:

```php
AnswerFeedback::submitAnswerRating($_POST);
```

If an AJAX handling method is non-static, then as the widget method is called on the AJAX request, the method is able to access widget attributes that are specific to that instance of the widget.

Widgets and Firing an Event

After a widget receives a response from the server, it immediately fires an event.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Subscribers to that event can:

- Modify any of the data in the response.
- Perform any additional functionality, integration, or business logic based on the response.
- Cancel the event (so that the source widget ignores the server response).

This code shows an example of such an event.

```javascript
_onResponseReceived: function(response, originalEventObj){
  if(RightNow.Event.fire("evt_answerFeedbackResponse", {data: originalEventObj, response: response})) {
    // handle the server response
  }
}
```

Embedded JavaScript and Template Files

You can use embedded JavaScript (EJS) in template files to dynamically render views.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.
This example code is from a **view.ejs** file.

```html
<rn:block id="preList"/>
<ul id="<%= listID %>">
  <% for (var i = 0; i < links.length; i++) { %>
  <rn:block id="listItem">
    <li><a href="<%= links[i].href %>"/><%= links[i].label %></a></li>
  </rn:block>
  <% } %>
</ul>
<rn:block id="postList"/>
```

The highlighted code shows the JavaScript that is dynamically rendered when the widget logic file loads the **view.ejs** file and the view is rendered.

Essentially JavaScript views allow separation of code and HTML for cleaner, dynamic widgets, and this can be particularly important when you have a lot of HTML in the widget.

EJS is well suited for AJAX handlers in widgets. For example, if you have a widget that uses AJAX to fetch data from the server, it can use EJS to dynamically update the UI on the page with the returned data.

As another example of how you can leverage EJS, you can put `<h1><%= text %></h1>` in a **view.ejs** file (or assign it to a variable in JavaScript).

You then use this code in the **logic.js** file to render the view:

```javascript
// using inline template or JS variable this.Y.one('#myTitle').set('innerHTML', new EJS({text: RightNow.Widget[this.data.info.class_name].templates.view}).render(response));
```

### Form Widgets

Form widgets are those standard input widgets (for example, CustomAllInput, FormInput, and TextInput) or custom widgets that extend from RightNow.Field that allow your customers to enter and update form information that gets stored in incidents and contact records.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

The RightNow.Field widget helper provides several useful functions that make processing form requests easier. For example, the this.parentForm() function allows your custom code to subscribe to form field events, to perform validation of form input, check whether the form should be submitted, and perform error handling as required.

### Form Field Events

All standard input widgets extend from RightNow.Field, and as your custom widgets can extend from those standard widgets, they have access to the this.parentForm() function.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Your custom widgets can therefore subscribe to a form’s events.

The events for this.parentForm() are:

- submit—Fired when the submit button on the form is clicked. Subscribing code must perform validation during this event.
If a widget fails validation, it must report the error in the common error <div> element (whose id value is provided in the EventObject passed to submit event subscribers). It must also return false from the subscriber to the submit event (this notifies the parent form that validation failed and the form must therefore not be submitted).

If a widget passes validation, it must return a valid EventObject whose data is the value to be submitted to the server.

- send—Fired just before the form data is sent to the server. If a subscriber needs to cancel the event (and prevent the form from being sent to the server), false must be returned.
- response—Fired as soon as a response is received from the server.

This logic.js file shows how events can be subscribed to.

```javascript
RightNow.Widgets.sbl = RightNow.Field.extend({
  overrides: {
    constructor: function () {
      this.parent();
      ...
      this.parentForm().on("submit", this.validate, this)
      .on("send", this.seeIfFormShouldBeSubmitted, this)
      .on("response", this.lookAtResponse, this);
      },
      ...
  }
});
```

A widget that extends RightNow.Field must be placed inside an HTML <form> element on a containing page, otherwise a JavaScript error is thrown. There is no parent form, therefore placing an input field outside of a form is invalid HTML.

Form widgets must contain only one FormSubmit widget inside the form. This is because the FormSubmit widget extends from RightNow.Form, which is what sets the this.parentForm() for each Form widget.

### Native Form Submissions

There are cases when you may want a form to be submitted natively (using either a POST or GET request) rather than submitted through an AJAX request.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

If a declared HTML <form> element on a page has action and method attributes defined, and if the FormSubmit widget does not have the on_success_url attribute defined (by default, it is not set), then the form’s action and method attributes are honored. When the form passes validation (that is, all submit subscribers return successful EventObjects), the form is submitted natively.

```html
<form action="/cc/myCustomSubmit" method="post">
  <rn:widget path="input/TextInput" name="Incident.Subject"/>
  ...
  <rn:widget path="input/FormSubmit"/>
</form>
```

### Search Widgets

Search widgets are those standard report-filtering or report-displaying widgets and custom widgets that extend from RightNow.SearchFilter or RightNow.ResultsDisplay. Search widgets allow your customers to filter reports generated from their searches or display those reports.
This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

`RightNow.SearchFilter` and `RightNow.ResultsDisplay` provide access to the `this.searchSource()` function, which allows your custom code to subscribe to search events.

**Report-Filtering Widgets**

There are a number of standard report-filtering widgets.

These standard report-filtering widgets extend from `RightNow.SearchFilter`.

- KeywordText
- SearchButton
- SortList
- Paginator
- SearchTypeList
- OrgList
- ProductCategorySearchFilter
- DisplaySearchFilters

These standard report-displaying widgets extend from `RightNow.ResultsDisplay`.

- Multiline
- MobileMultiline
- Grid
- CombinedSearchResults
- CommunitySearchResults

Widgets, including your custom widgets, that extend `SearchFilter` or `ResultsDisplay` inherit `this.searchSource()`, which is the interface to subscribe to events for searching.

- `search`—Fired when the search button is clicked (fired by the `SearchButton` widget: `this.searchSource().fire("search", eo)`).
- `send`—Fired just before performing the search (making the AJAX request or doing the page flip search).

If a subscriber returns false, then any other subscribers are still notified about the event, but the search is cancelled when the event completes.

- `response`—Fired when a response is returned from the server. The event object contains the server’s response.
- `reset`—Fired to indicate that certain filters (that subscribe to this event) must reset their states to their initial state.
- `keywordChanged`—Fired to indicate that the keyword changed.
- `appendFilter`—Fired when the event-firing code adds a filter to the group of the filters sent to the server.
• setInitialfilters—Fired from ResultsDisplay widgets when the page is loaded. The event object sent contains an allFilters-keyed object containing the initial state of all of the search filters on the page.

### How Filter Widgets Respond to Multiple Reports

A single keyword field can be used for multiple reports on the same page. For report-filtering widgets, the report_id attribute accepts a comma-separated string of report IDs.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

These report IDs are the ones that the search filter is applied to when a search is triggered.

```xml
<rn:widget path="search/KeywordText" report_id="176,197"/>
<rn:widget path="search/SearchButton" report_id="176,197"/>
<rn:widget path="reports/Multiline" report_id="176"/>
<rn:widget path="reports/Multiline" report_id="197"/>
```

In this example, the SearchButton widget triggers a search on reports 176 and 197. The KeywordText widget responds to that search event by passing back the user-entered search term. A search is then completed for both reports 176 and 197 using the same keyword.

Report-displaying widgets are limited to a single report_id value.

Using the inherited searchSource() function, widgets with multiple report IDs can respond to search events either for individually reports or multiple reports. For example, for a widget with report_id="176,197":

```javascript
/* When a search is triggered for either report 176 or report 197 then myHandlerFunction is called */
this.searchSource().on("search", this.myHandlerFunction, this);
...  
/* When a response comes back for report 176 then myResponder is called */
this.searchSource(176).on("response", this.myResponder, this);
...  
/* When a response comes back for report 197 then myOtherResponder is called */
this.searchSource(197).on("response", this.myOtherResponder, this);
```

### Additional Search Sources and Report Widgets

You can include additional search sources in report events, allowing you to add to report results.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Search filter and report widgets have a source_id attribute. An example of a default value for the source_id attribute is social for the CommunitySearchResults widget.

Setting source_id to this value means that the widget’s filter values are applied to searches for social. The KeywordText and SearchButton widgets are used to simultaneously search report 176 as well as social results.

```xml
<rn:widget path="search/KeywordText" report_id="176" source_id="social"/>
<rn:widget path="search/SearchButton" report_id="176" source_id="social"/>
<rn:widget path="reports/Multiline" report_id="176" source_id="social"/>
```

By extending from SearchFilter, widgets inherit the searchSource() method. The searchSource() method can be called without any parameters. In this case, the caller gets back a handle to all reports and search sources that the widget has declared in its report_id and source_id attributes. Subscribing to or firing on that handle happens for all of those reports and search sources.
You can use the `searchSource()` function to respond to search events for additional sources. For example, for a widget with the attributes `report_id` with the value 176 and the `source_id` attribute with the value `social`:

```javascript
... /* When a search is triggered for either report 176 or social then myHandlerFunction is called */
this.searchSource().on("search", this.myHandlerFunction, this);
...

... /* When a search is triggered for the social source then myHandlerFunction is called */
this.searchSource(this.data.attrs.source_id).on("search", this.myHandlerFunction, this);
...

... /* When a response comes back for report 176 then myResponder is called */
this.searchSource(176).on("response", this.myResponder, this);
...

... /* When a response comes back for social then myOtherResponder is called */
this.searchSource("social").on("response", this.myOtherResponder, this);
```

In addition to the built-in external search source `social`, you can use any other search services that may be plugged-in. You can set the `source_id` attribute to an arbitrary name or number, and widgets can specify what data is sent to the server and where the data is to be sent.

The `searchSource()` method can also be called with a named subset of reports and search sources. In this case, the caller gets back a handle to all named reports and search sources that the widget has declared in its `report_id` and `source_id` attributes. Subscribing to or firing on that handle happens for only those named reports and search sources. For example:

```javascript
this.searchSource(176).on("search", sbl, this)
this.searchSource("social").on("search", sbl, this)
```

Finally, the `searchSource()` method can be called with a named subset and additionally specify these options.

- `reportIDOrNamedSearchSource`—A report ID or source ID.
- `endpoint`—A string specifying where the AJAX request is handled.
- `filters`—An array specifying what report filter values are to be sent (only applies to non-report search sources).
- `params`—The key-value parameters to be sent to the server in the POST data.

For example, for a widget with `source_id="sbl"`:

```javascript
this.searchSource({
  /* name of the search source */
  "sbl": {
    "endpoint": "/cc/myCustomController/search",
    "filters": [ "keyword", "sort" ]
    "params": {
      "banana": 0
    }
  }
}).on("search", function() {
  return new RightNow.Event.EventObject(this, {data: {
    resource: "123",
    numOfResults: 20
  }});
});
```

The AJAX request when a search is triggered for `source_id="sbl"` (where the user searched on iphone and sort is set to 2) is therefore:

```
POST /ci/myCustomController/search
FORM DATA keyword=iphone&sort=2&banana=0&resource=123&numOfResults=20
```
Overview of Creating Models

You can create custom models that extend directly from the RightNow/Models/Base class. You can also create custom models that extend from and override standard models, which themselves extend from Base.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Customizing models can be useful for modifying the behavior of all the widgets that make calls to a particular model.

In your custom models, you can include Connect PHP API calls as well as ROQL calls.

You must create a custom model when you need to create access to data that is not available through the standard models.

- Account—Retrieves details about agent accounts based on its ID value.
- Answer—Retrieves and manipulates knowledge base answers and also retrieves related and previous answers.
- AsyncBase—Makes asynchronous HTTP requests to external servers when you need to make several external requests simultaneously without blocking execution.
- Base—Serves as the base class for all models and provides a number of boilerplate methods and a built in cache.
- Chat—Initiates chat requests, sends content between the customer and agent, and checks on current chat availability.
- Clickstream—Inserts entries into the clickstream table.
- Contact—Creates and updates contacts and retrieves contact data.
- Country—Returns a country from the Connect PHP API based on its ID value.
- Field—Marshals contact and incident form data and directs it to the correct model to create and update records.
- FileAttachment—Retrieves file attachments from sources such as answers, incidents, and guides.
- GuidedAssistance—Returns a GuidedAssistance object from the database based on the ID value of the guide.
- Incident—Creates and updates incidents and retrieves incident data.
- Notification—Returns an array of specified product, category, and answer notifications associated with the interface and formats the answer summary.
- Polling—Retrieves questions for displaying polling data, submits poll questions, and retrieves poll results.
- PrimaryObjectBase—Serves as the base class for models that are used to retrieve, create, and update objects within the Customer Portal.
- Prodcat—Retrieves product and category information from the database, works with product/category linking, and gets partial hierarchies of the data.
- ProductCatalog—Retrieves product data from the database.
- Report—Retrieves and manipulates analytics reports.
- Social—Interacts with the Social API to create community posts and comments and memcaches the results for performance benefits.
- Survey—Accesses specified surveys.
Model Coding Standards

There are coding standards for custom models.

Apply these standards when preparing custom models.

- File names—File names must be singular and in Pascalcase format.
- Class names—Class names should be the same as the file name.
- Content—All calls to access the database (Connect PHP API and ROQL calls) must be contained within a model and not in any other part of the code.
- Data caching—If applicable, cache the results of database calls within the model. The two functions setCache() and getCache() use keys to store data over the course of a request. Connecting to the database consumes more resources and caching improves performance.

Standard Models

Standard models are contained within the RightNow/Models namespace, and are located in the /cp/core/framework/Models folder.

Standard models include the Answer, Contact, and Incident models that provide access to objects in the knowledge base. All standard models extend from the Base model class.

Overview of the ResponseObject Object

Within a model, the easiest way to create a ResponseObject object is to use the getResponseObject() function, which is defined in the Base model class.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

For consistency, all functions in models should return a /RightNow/Libraries/ResponseObject object (all standard models return this object). This is recommended because it enables the caller to determine how to handle any errors or warnings, rather than requiring the called function to determine how to format and return the errors and warnings.

The only exception to returning the ResponseObject object is when a return type of the method is boolean. So, for example, /RightNow/Models/Answer::exists() just returns true or false.

The ResponseObject object contains five fields.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>mixed</td>
<td>Whatever the function returns.</td>
</tr>
<tr>
<td>errors</td>
<td>ResponseError array</td>
<td></td>
</tr>
<tr>
<td>error</td>
<td>ResponseError</td>
<td>First ResponseError in errors field.</td>
</tr>
</tbody>
</table>
This example, which makes a call to a standard model function to get notifications for a contact, shows how a returned ResponseObject is used.

```php
$notifications = $this->CI->model('Notification')->get('all', $contactID);
if($notifications->error) {
    echo "Error about getting all notifications " . $notifications->error->externalMessage;
    RightNow/Utils/Framework::logMessage("Warning about getting all notifications " . $notifications->error->externalMessage);
    return;
} else if($notifications->warning) {
    // warnings are usually for developer consumption only
    RightNow/Utils/Framework::logMessage("Warning about getting all notifications " . $notifications->warning);
    return;
} // now get the actual list of notification objects
$notifications = $notifications->result;
...
```

This example throws an exception if a contact cannot be retrieved.

```php
if(!$contact = $this->CI->model('Contact')->get($contactID)->return)
    throw new Exception("What happened here?");
```

The getResponseObject() function has four parameters, but only the $return parameter is required.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$return</td>
<td>mixed</td>
<td>Whatever the function returns such as an object, array, Boolean, or string.</td>
</tr>
<tr>
<td>$validationFunction</td>
<td>function</td>
<td>A callable function that takes the return value as its only argument and returns true upon success. If specified as null, no validation is performed. The default value is is_object.</td>
</tr>
<tr>
<td>$errors</td>
<td>mixed</td>
<td>A ResponseError object, ResponseError array, error string, or error string array.</td>
</tr>
<tr>
<td>$warnings</td>
<td>mixed</td>
<td>A warning string or warning string array.</td>
</tr>
</tbody>
</table>

The ResponseError array contains five fields.
Field Name | Type | Description
--- | --- | ---
externalMessage | string | Error message to display to end users and customers.
errorcode | string | An error code that can be used by the caller to determine how to handle the error.
source | string | Defines where the error came from (for example, models/standard/report).
internalMessage | string | Error message for internal use.
extraDetails | mixed | Any extra details to attach to the error (for example, a stack trace).

The constructor of the ResponseError object has the same fields as shown in the above table and in the same order. The only field that is required is externalMessage.

This is an example of using the getResponseObject() function in a standard model.

```php
public function get($countryID)
{
    if(!Framework::isValidID($countryID)){
        return $this->getResponseObject(null, null, "Invalid Country ID: $countryID");
    }
    try{
        $response = Connect/Country::fetch($countryID);
    } catch(Connect/ConnectAPIErrorBase $e) {
        return $this->getResponseObject(null, null, $e->getMessage());
    }
    return $this->getResponseObject($response);
}
```

Extending from the Base Model

You can create a custom model that extends directly from the Base model.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

The custom model must extend from the Base model class and call the parent constructor within its constructor as shown in this example.

```php
<?php
namespace Custom/Models;
class Sample extends /RightNow/Models/Base
{
    function __construct()
    {
        parent::__construct();
    }
    function get($sampleID)
```
This example shows how you might use the custom model in a widget.

```php
$sampleObject = $this->CI->model('custom/Sample')->get($sampleID);
if($sampleObject->error) {
    echo "Error in retrieving sample object " . $sampleObject->error->externalMessage;
    return;
}
echo "Sample Name: " . $sampleObject->result['SampleName'];
```

### Extending from a Standard Model

You can create a custom model that extends a standard model.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

The custom model is then automatically used in place of calls to the parent standard model. All functions of the parent model that are not marked as private can be called from the custom model.

The file `extensions.yml` file is a configuration file where you specify the standard models to override and the custom model that extends each standard model. The file consists of `modelExtensions` entries that name the standard model to override, and the custom model to use as a replacement.

**Note:** Use spaces and not tabs in the `extensions.yml` file.

To override the standard Answer model with a model at `development/models/custom/ExtendedSample.php`:

```yaml
modelExtensions:
    Answer: ExtendedSample
```

To override the standard Contact model with a model at `development/models/custom/contacts/ContactCreation.php`:

```yaml
modelExtensions:
    Contact: contacts/ContactCreation
```

In the custom model, the class declaration must extend from the standard model as shown in this example, otherwise an error is thrown at runtime.

```php
class ExtendedSample extends /RightNow/Models/Contact
```

To call the function from a custom controller:

```php
$this->model('Answer')-&gt;sampleFunction();
```

### Extend a Standard Model

You can extend a standard model.
This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

1. Open /cp/customer/development/config/extensions.yml.
2. Add this code to the page.
   
   ```yaml
   modelExtensions:
   Answer: ExtendedSample
   ```
3. Make sure that the custom model file contains code similar to that used in this example, where the ExtendedSample custom model extends from the Answer standard model.
   
   ```php
   namespace Custom\Models;
   require_once CPCORE . 'Models/Answer.php';

   class ExtendedSample extends \RightNow\Models\Answer
   {
   function __construct()
   {
   parent::__construct();
   }
   }
   ```
4. Add code to override functions from the parent model or add new functions.

   Although this example shows how to extend the Answer model, you must pass in the name of the class you are extending when you extend objects that Customer Portal modifies (Contact, Incident, Asset, SocialQuestion, SocialComment, and SocialUser).

   To extend the SocialQuestion model, your code will look similar to this.
   
   ```php
   namespace Custom\Models;
   require_once CPCORE . 'Models/SocialQuestion.php';
   class CustomSocialQuestion extends \RightNow\Models\SocialQuestion {
   function __construct() {
   parent::__construct('SocialQuestion');
   }
   }
   ```

**Calling Model Functions**

The code to call a model function varies depending on where the model is called from.

To call the sampleFunction() function of the Sample model from a widget or another model:

```php
$this->CI->model('custom/Sample')->sampleFunction();
```

To call the function from a custom controller:

```php
$this->model('custom/Sample')->sampleFunction();
```

To call the function from anywhere else:

```php
$CI = get_instance();
$CI->model('custom/Sample')->sampleFunction();
```

In each case, the model is automatically loaded.
When using the model() function to call a custom model's functions, you must specify the path to the custom model, as shown in this example:

```php
    $sampleData = $this->CI->model('custom/input/SiteInfoCustomObject')-
                    >sampleFunction()->return;
```

However, in calls to standard models, you need to pass only the name of the model:

```php
    $chatHours = $this->CI->model('Chat')->getChatHours()->return;
```

### Creating Controllers

You can create custom controllers that extend from the /RightNow/Controllers/Base class.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

You cannot extend from any other controller class. All functions of the parent controller that are not marked as private can be called from the custom controller and additional code can be added as required.

Functions in custom controllers are called by sending a request to a URL with this format.

```
class_name/function_name
```

For example, to call the myHandler() function in the `MyController.php` controller, the URL is: `/cc/myController/myHandler`

### Controller Coding Standards

Within controllers, group public functions that are callable from URLs at the top of the file.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

All functions that are not intended to be callable with a URL should be labeled as private or protected, and their names should begin with an underscore (_). This is the only location where you can start your function names with a non-alphabetic character. Also, locate these private or protected functions toward the bottom of the file. This organizes the code better and makes it obvious which functions can be called with a URL and which ones cannot. For example:

```php
    function viewPage()
    .......
    private function _addParms()
```

Only define an index() function within your controller when you need to be able to call the controller without defining a method. If you want to require a method to be defined to use the controller, omit the index() function.

### Controller Function Content

For controller functions that interact with models and are called by using AJAX requests, the content of the function should harvest POST variables, call the model, and return JSON encoded data (plain text must not be returned from the server).
This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Any business logic required for the AJAX call should be performed in the model. This allows model functions to be easily reused. For example:

```php
function doSearch()
{
    $searchTerm = $this->input->post('term');
    $this->load->model('custom/Search');
    $results = $this->model('custom/Search')->query($searchTerm);
    echo json_encode($results);
}
```

### Adding Hooks

Hooks are sections of code in custom models that allow you to extend Customer Portal functionality. You specify hooks that you wish to execute before and after important events that occur within Customer Portal.

You can use hooks, for example, to modify data, perform custom validation, and return customized error messages to display to the user.

You define hooks in `/cp/customer/development/config/hooks.php` with `$rnHooks`. You specify the hook location that is, the event associated with the hook, as the array index and set that index to an array of three items:

- **class**—The name of the custom model you wish to use. The class name must match the name of the custom model, including case sensitivity.
- **function**—The name of the function within the class to call.
- **filepath**—The location of the model, which is automatically prefixed with `models/custom/`. The filepath item needs a value only if your model is contained within a subfolder.

For example, assume you want to call the `sendFeedback()` function immediately after an incident is created, and you will use the `Immediateincidentfeedback` model, which you created and placed in `models/custom/Immediateincidentfeedback.php`.

```php
$rnHooks['post_incident_create'] = array('class' => 'Immediateincidentfeedback',
                                          'function' => 'sendFeedback',
                                          'filepath' => '');
```

For a list of events and more examples of hooks, review the comments in the `hooks.php` file.

### Creating Libraries

You can add custom libraries containing sets of utility functions.
This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

A custom library must be a class file and located in the folder `/cp/customer/development/libraries`. This example shows the structure for a `Sample.php` library.

```php
namespace Custom/Libraries;
class Sample
{
    function __construct()
    {
    }
    function sampleFunction()
    {
    }
}
```

### Loading a Library

You can load a library in different ways depending on where it's being called.

To load a library called Sample from a widget or model:

```php
$this->CI->load->library('Sample');
```

To load the library from a custom controller:

```php
$this->load->library('Sample');
```

To load the library from anywhere else, including other libraries:

```php
$CI = get_instance();
$CI->load->library('Sample');
```

### Calling a Library Function

After a library loads, you can call a library function in different ways, depending on where it's being called.

To call the `sampleFunction()` function in the Sample library from a widget or model:

```php
$this->CI->sample->sampleFunction();
```

To call the function from a custom controller:

```php
$this->sample->sampleFunction();
```

To call the function from anywhere else, including other libraries:
$CI = get_instance();
$CI->sample->sampleFunction();

Creating Helpers

You can add custom helpers in the folder /cp/customer/development/helpers.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

You can load a helper in different ways depending on where it's being called. For example, to load a sample_helper.php file containing a helper function from a widget or model:

```php
$this->CI->load->helper('sample')
```

From a custom controller:

```php
$this->load->helper('sample')
```

To load multiple helpers at the same time, you can pass an array that loads each helper file, using the format shown in this example.

```php
$this->load->helper(array ('sample1','sample2','sample3'))
```

After a helper is loaded you can call all functions in the helper by simply using the name of the function, for example, helperFunction().

Loading JavaScript Content on Every Page

The autoload JavaScript file is automatically loaded on every page so you can put common functions and event declarations in a single location.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

You could add code like this to the /cp/customer/development/javascript/autoload.js file to override the default failure handler and not display the error dialog if a particular request fails.

```javascript
RightNow.Event.subscribe("on_before_ajax_request", function(name, data){
    data = data[0];
    if(data.url === '/ci/ajaxRequestMin/getHierValues'){
        data.failureHandler = function(response){};
    }
});
```

This code subscribes to an event that is fired before making an AJAX request. In this case, if the request is made to a specific URL, the failure handler function is set to not do anything, and the request can be modified as required.
Customizing Error Pages

Besides customizing the appearance of error pages, you can also display severity, message, file name, and line number where the error occurred if an error occurs.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

The `/cp/customer/development/errors` folder contains two PHP scripts used to display customized error pages. These are `error_general.php` and `error_php.php`. By customizing these pages, you can provide your customers with more specific information than they will receive from a standard 404 error page delivered by the web server. You can edit these files but you cannot add any files to this folder.

Additionally, the `/cp/customer/error` folder contains these static HTML pages that you can customize to provide additional information when these error types are returned. The default message is “There has been an error with your request.”

- `error404.html`—Displayed when an HTTP 404 Not found error code is returned.
- `error413.html`—Displayed when an HTTP 413 Request entity too large error code is returned.
- `error500.html`—Displayed when an HTTP 500 Internal server error code is returned.

The `splash.html` page is displayed when your site is being upgraded.

Dynamic Forms

A dynamic form is a form with fields that change depending on selections in other fields. These are the general steps for creating a dynamic form.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

The Customer Portal includes a change handler for the Field.js module (used by input widgets) in the Customer Portal JavaScript API. Input widgets subscribe to this change handler, which is called anytime the widget changes. When you want a widget for a dynamic form, you extend the corresponding standard input and override the onChange function. All input widgets have a hide_on_load attribute to let you hide forms that should appear only when the input value of another widget matches the condition you define. The change handler is triggered by changes to any form field. In addition to changing a field’s visibility, you can also change whether it is required based on a previous field. The setConstraints method indicates whether customers must add a value to the field.

1. Create a new widget by extending one of the following standard input widgets (DateInput, FileAttachmentUpload, MobileProductCategoryInput, PasswordInput, ProductCategoryInput, SelectionInput, or TextInput).

   **Note:** This is the widget that triggers the change when its value is changed rather than the widget that changes as a result of a value change. For example, if you want to make the Incident.Product field required when the Incident.Subject field equals “test,” extend the TextInput widget so you can use it with the Incident.Subject field.
2. Edit the widget you created so it subscribes to the change event handler.
3. Use the findField method to retrieve the field that should change (the Incident.Product field in this example).
4. Call the setConstraints method with a JavaScript object (for example, `constraint = {required: true}`) to change the field.

Example: Use the Dynamic Forms

The following procedure describes the necessary steps for using the dynamic forms sample code.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

1. Download and extract the Dynamic Form sample files.
2. Copy the downloaded `dynamic_ask.php` file from the Dynamic Form/customer/development/views/pages folder and paste into your development pages at /cp/customer/development/views/pages.
3. Copy the downloaded input folder from Dynamic Form/customer/development/widgets/custom and paste into your development pages at /cp/customer/development/widgets/custom.
4. Activate the downloaded widget.
   a. Go to the Customer Portal Administration site at https://[your_site]/ci/admin/versions/manage.
   b. Locate the DynamicProductCategoryInput widget.
   c. Select the widget and click Activate this Version.
5. Create a new custom object.
   b. Double-click Object Designer.
   c. Click Import, browse to Dynamic Form/exports/CP CustomObject.zip, and click Open.
   d. Click Next, and then click Next again.
   e. Click Save.
   f. Click Deploy.
6. On the Service Console, click Service and then double-click Products/Categories/Dispositions.
7. Hover over the products and categories for the ID values of the products and categories you want to use in the sample code.
   You will replace the product and category ID values used in the sample code with IDs that are relevant to your customer portal.
8. Edit the `dynamic_ask.php` page to use your organization’s product and category IDs.
   These IDs are referenced in lines 33, 43, and 44.
   When you go to your development site and select various products and categories, you will notice that the displayed fields vary with your selections. Notice that the sample code in the `dynamic_ask.php` page first displays the Category field only for selected products (those products associated with ID 1 and ID 2 in the sample code). Then it displays selected fields based on the category ID. For example, using the code sample, select product ID 2 and category ID 68 will display the custom Serial Number field. The following table shows the dynamic fields that are displayed or required for selected product and category IDs called out in the code sample. You can substitute your product and category IDs to create a similar matrix for testing your custom code.
Install the AdditionalResults Widget

The AdditionalResults sample widget queries a third-party search API when searching the B2C Service knowledge base and appends the results onto the end of report results. It extends from the standard Multiline widget.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

This sample code was tested with Customer Portal framework 3.2. Later framework versions may not function as documented and require modification to the sample code. Additional assistance and examples may be found on the Customer Portal Forum. This code is not certified or supported by Oracle. It is intended for educational or testing purposes only. Use of this sample code implies acceptance of the Oracle Technology Network License Agreement.

Duck Duck Go is the third-party search engine used as the source for search results. Simple phrases and keywords will return results, but Duck Duck Go’s search API does not return results for complex queries or questions.
This sample widget assumes that the default Multiline report (ID 176) is being used.

1. Create a **search** folder in `/cp/customer/development/widgets/custom`.
2. Download and extract the *Additional Results sample files*.
3. Move or copy the `AdditionalResults.css` file from the unzipped *Additional Results/customer/assets/themes/standard/widgetCss* folder into your `/cp/customer/assets/themes/standard/widgetCss` folder.
4. Move or copy the unzipped *Additional Results/customer/development/widgets/custom/search/AdditionalResults* folder into your `/cp/customer/development/widgets/custom/search` folder that you created in step 1.
5. Activate the `AdditionalResults` widget.
   a. Go to `https://<your_site>/ci/admin/versions/manage`.
   b. Locate and select the `AdditionalResults` widget.
   c. Click **Start Using This Version**.
6. Place the widget on a Search Results page and add the `source_id` attribute to widgets that are to trigger and provide filter values for the search.

**Prerequisites**

You must complete the following tasks before you can use the sample code.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

1. Create a menu-only custom object, `TypeOfFeedbackMenu`, with settings as follows:
   - Type—Menu Only Object
   - Package—CO
   - Menu Items—Complaint, Compliment, Suggestion, Question/Concern.
2. Add a custom field, `type`, for Incident, with settings as follows:
   - Name—type
   - Label—Type of feedback
   - Package—CO
   - Data Type—Menu
   - Menu—CO.TypeOfFeedback.
3. Add a custom field, `source`, for Incident, with settings as follows:
   - Name—source
   - Package—CO
   - Label—How did you find this answer?
   - Field Usage—Long text.

**Install the ExtendedAnswerFeedback Widget**

The ExtendedAnswerFeedback sample widget extends the standard AnswerFeedback widget to display and submit custom Incident fields in the feedback form.
This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

This sample code was tested with Customer Portal framework 3.2. Later framework versions may not function as documented and require modification to the sample code. Additional assistance and examples may be found on the Customer Portal Forum. This code is not certified or supported by Oracle. It is intended for educational or testing purposes only. Use of this sample code implies acceptance of the Oracle Technology Network License Agreement.

This sample is one of the possible solutions to this common customization scenario. A different implementation could, for example, send the AJAX request to a custom endpoint that then sends the POST parameters to a custom model that either extends the standard Incident model or re-implements its own feedback creation logic. That implementation is a more classical approach to the problem, but it involves more code.

The approach that this sample takes—allowing the standard controller endpoint and model to process the feedback submittal normally, but using a hook model to add POST parameter values to the incident—is probably not the cleanest approach. However, it has the advantage of leaving the standard controller and Incident model processing intact, so that features like auto abuse-detection and enhancements and bug fixes in future framework updates will continue to happen automatically.

The sample widget requires two Incident custom fields. As the two incident custom fields are editable by the user, they will appear anywhere that the standard CustomAllInput widget is used. When the fields are not null, they will also appear where the standard CustomAllDisplay widget is used, for example, on the questions/detail page.

1. Create a feedback folder in /cp/customer/development/widgets/custom.
2. Download and extract the Extended Answer Feedback sample files.
3. Move or copy the ExtendedAnswerFeedback.css file from the unzipped Extended AnswerFeedback/customer/assets/themes/standard/widgetCss folder into your /cp/customer/assets/themes/standard/widgetCss customer portal file folder.
4. Move or copy the unzipped Extended AnswerFeedback/customer/development/widgets/custom/feedback/ExtendedAnswerFeedback folder into your /cp/customer/development/widgets/custom/feedback folder that you created in step 1.
5. Activate the ExtendedAnswerFeedback widget.
   a. Go to https://<your_site>/ci/admin/versions/manage.
   b. Locate and select the ExtendedAnswerFeedback widget.
   c. Click Start Using This Version.
7. Move or copy the CustomIncidentModel.php file from the unzipped Extended AnswerFeedback/customer/development/models/custom folder into your /cp/customer/development/models/custom folder.
8. Register the hook by adding this code to /cp/customer/development/config/hooks.php.

   $rnHooks['pre_feedback_submit'] = array(
   'class' => 'CustomIncidentModel',
   'function' => 'preFeedbackSubmit',
   );

9. To view the new custom field values on newly-created Answer feedback incidents, add the new Incident.Co.type and Incident.CO.source fields to the Incident workspace that's currently in use.
Install the DisplayChartReport Widget

The DisplayChartReport sample widget is an example of how to use the YUI charting library, a custom widget AJAX endpoint, and a custom report to create a chart display widget for two-dimensional data.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

This sample code was tested with Customer Portal framework 3.2. Later framework versions may not function as documented and require modification to the sample code. Additional assistance and examples may be found on the Customer Portal Forum. This code is not certified or supported by Oracle. It is intended for educational or testing purposes only. Use of this sample code implies acceptance of the Oracle Technology Network License Agreement.

The widget retrieves the data from a report and sends it to the client side to be displayed. When the data arrives at the client side, it is extracted from the data array and transformed into the appropriate format for the YUI charting library. This transformed data can be used to render any two-dimensional YUI chart including bar, column, line, and pie charts. These charts are displayed using Scalable Vector Graphics (SVG) to create a simple interactive chart.

The widget also contains a button to update the displayed results. The button makes an AJAX request to the server to get the modified results (in this case, simple random data), which is then displayed to the user. The widget expects the first two columns of the report data to be the first two dimensions of the rendered chart. If you plan to use the widget as more than a sample, it is worth modifying the controller to more intelligently handle different formats of report data.

1. Create a samples folder in /cp/customer/development/widgets/custom.
2. Download and extract the Display Chart Report sample files.
5. Import the DisplayChartReport,exports/report_def.xml file into the Reports Explorer and note the report ID.
6. In the info.yml file, change the default value for the report_id attribute from -1 to the report ID from step 5.
   a. Go to https://<your_site>/ci/admin/versions/manage.
   b. Locate and select the DisplayChartReport widget.
   c. Click Start Using This Version.
8. Place the widget on a page.
   <rn:widget path="sample/DisplayChartReport"/>

Install the PollingSlider Widget

The custom PollingSlider widget extends the standard Polling widget to create a slider drawer at the bottom of the page that opens a polling survey when it is clicked.
This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

- Create a choice question for the survey you want to add to the page.
- Create a polling survey.
- Determine the survey ID value.

This sample code was tested with Customer Portal framework 3.2. Later framework versions may not function as documented and require modification to the sample code. Additional assistance and examples may be found on the Customer Portal Forum. This code is not certified or supported by Oracle. It is intended for educational or testing purposes only. Use of this sample code implies acceptance of the Oracle Technology Network License Agreement.

1. Create a surveys folder in /cp/customer/development/widgets/custom.
2. Download and extract Polling Slider sample files to a temporary location.
3. Move or copy the PollingSlider.css file from the unzipped Polling Slider/customer/assets/themes/standard/widgetCss folder into your /cp/customer/assets/themes/standard/widgetCss customer portal file folder.
4. Move or copy the unzipped Polling Slider/customer/development/widgets/custom/surveys/PollingSlider folder into your /cp/customer/development/widgets/custom/surveys folder that you created in step 1.
5. Activate the PollingSlider widget.
   a. Go to https://<your_site>/ci/admin/versions/manage.
   b. Locate and select the PollingSlider widget.
   c. Click Start Using This Version.
6. Open the page where you want to add the widget and add this code, substituting the survey ID for “12” in this example:

   `<rn:widget path="surveys/PollingSlider" survey_id="12" />`

   **Note:** It doesn’t matter where you add the code because the widget CSS places it at the bottom of the page automatically. If you want to test the survey on your development page, add cookie_duration="0" to the widget code. This prevents a cookie from being set so you can take the survey repeatedly. (Your customers will not be offered a survey again. Instead, they will simply see the results of the survey until the cookie on their browser expires.)

Example: Model

This sample custom model extends from the standard Answer model.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

This sample code was tested with Customer Portal framework 3.2. Later framework versions may not function as documented and require modification to the sample code. Additional assistance and examples may be found on the Customer Portal Forum. This code is not certified or supported by Oracle. It is intended for educational or testing purposes only. Use of this sample code implies acceptance of the Oracle Technology Network License Agreement.

This model provides a `emailToFriend()` function that overrides the parent function so that the From field is modified with a company email address.
Example: Controller

This sample code illustrates the required structure of a custom controller.

This sample code was tested with Customer Portal framework 3.2. Later framework versions may not function as documented and require modification to the sample code. Additional assistance and examples may be found on the Customer Portal Forum. This code is not certified or supported by Oracle. It is intended for educational or testing purposes only. Use of this sample code implies acceptance of the Oracle Technology Network License Agreement.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

```php
<?php
namespace Custom/Controllers;

class AjaxCustom extends /RightNow/Controllers/Base
{
    // This is the constructor for the custom controller.
    // Do not modify anything within this function.
    function __construct()
    {
        parent::__construct();
    }

    /**
     * Sample function for ajaxCustom controller. This function
     * can be called by sending a request to:
     * /ci/ajaxCustom/ajaxFunctionHandler.
     */
    function ajaxFunctionHandler()
    {
        $postData = $this->input->post('post_data_name');
        //Perform logic on post data here
    }
}
```
Customer Portal Framework

The Customer Portal is a web application framework based on the Model-View-Controller (MVC) design pattern.

This topic is intended for web developers who need to produce custom code for the Customer Portal. You should have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

</tbody>
</table>
Mobile Customer Portal

Overview of Mobile Customer Portal

The mobile reference implementation is designed specifically for mobile devices.

In addition to its streamlined interface and optimized performance, the mobile customer portal includes the ability to direct customers to a predefined page set based on the type of device they use to access your support site.

Using the default mobile reference implementation, customers can view popular answers and featured support categories. They can conduct searches, view lists of answers and individual answers, and provide feedback on an answer. They can also submit questions, update their account information, chat with an agent, and be guided through a series of questions to reach a solution.

The mobile reference implementation was tested on devices using these operating systems.

- Android 1.5+
- iPhone 3.1+

Although not officially supported, other devices that support full-featured browsers (those supporting JavaScript, style sheets, and cookies) are expected to be able to use the mobile reference implementation without customization.

The mobile customer portal pages are automatically included in the Customer Portal reference implementation. This section describes the steps you must take so you can view the mobile pages in development mode and so your customers with mobile devices can view them on your production site.

1. Enable page set mappings. This step is critical for viewing the mobile customer portal.
2. Decide where you want to view the development pages. Your options include viewing them on your regular desktop workstation, mobile devices, and mobile device emulators.
3. Edit the mobile reference implementation to incorporate all the changes you eventually want to include on your production site.
4. Define the user agent mapping so customers who use desktop browsers can view your standard pages and those using mobile devices can view your mobile pages.
5. Stage and promote the customer portal so the mobile development pages you have been working on are promoted to your production site.

Enable Page Set Mappings

After you enable one or more page set mappings on any system and then set the development area for the specific browser or device, you can view the default mobile page set in the development area.

Before you can view the mobile customer portal page set in the development area, you must enable at least one of the default page set mappings.

1. In a web browser, enter https://<your_site>/ci/admin.
2. Click Page Set Mappings.
3. Click Enable in the right column for one or more of the three mobile devices (iPhone, Android, and Palm).
4. To make these pages available on your production site, log in to B2C Service and stage and promote your pages.
Mobile Development Pages

When you begin working on your development pages, you’ll want to test and review your changes before you stage and promote them into production.

You can—and should—review the pages on the actual mobile devices you expect your customers to use to access your support site before you promote the changes. However, you might prefer to do preliminary testing on your desktop browser or a mobile device emulator.

Although you need to enable the page set mappings just once on any browser or device you choose, you must set the development area for each browser or device you test on. For example, assume you want to test your mobile pages on your iPhone and also on an Android emulator. You must select the development area separately for each device. And if you want to also view your mobile pages on your workstation without an emulator, you must set the development area for your browser too.

You can view the mobile development pages:

- On a mobile device.
- On a mobile device emulator.
- On your workstation using one or more browsers.

Note: You may find it easier to verify pages on your desktop browser instead of a mobile device emulator because emulators typically have slower performance. (Google Chrome provides the most representative mobile page set when viewed in a web browser.) Still, before you stage and promote your development pages, you should always preview your pages on the actual kinds of mobile devices you expect your customers to use.

View Development Pages on a Mobile Device or Emulator

You can preview your development pages using a mobile device or mobile device emulator.

You must complete the procedure in Enable Page Set Mappings before you set the development area.

1. On your mobile device or emulator, open https://<your_site>/ci/admin.

   Note: For the best mobile customer portal experience, devices should be configured to load images on web pages. If images are turned off, display issues may occur.

2. On the Quick Shortcuts Dashboard, click View Development Area.

View Mobile Development Pages on a Desktop Workstation

You can preview your development pages on a desktop workstation.

You must complete the procedure in Enable Page Set Mappings before you set the development area.

1. On your workstation browser, open https://<your_site>/ci/admin.
2. On the Quick Shortcuts Dashboard, click Set Environment.
3. In the Production drop-down menu, select Development.
Define User Agent Mapping

You want your customers to be automatically directed to the correct interface based on the browser they are using. User agent mapping lets you control how that occurs. It also lets you define unique page sets for various mobile devices if you want.

1. Access the Customer Portal Administration site.
2. On the Quick Shortcuts Dashboard, click Set Environment.
3. Select Allow my current browser/user agent to be the deciding factor.
4. Click Set Viewing Mode and View the Site.

Mobile Template Configuration

The mobile reference implementation for the Customer Portal includes its own template and a set of pages specific to the mobile customer portal. The template and pages are optimized for mobile devices, and many of the widgets are specially designed for the mobile application.

The file for the mobile reference implementation template is located in the customer portal file structure in /cp/customer/development/views/templates/mobile.php. The template includes a Menu button, a Search field and button, and a page set selector that lets customers display the standard page set on their mobile device if they choose. It also includes a Log In or Sign Up button, an option that takes customers to the top of the page, and another link for the B2C Service website.

Configure the Menu

The Menu button expands and collapses the Support Home and Contact Us options. You can edit the button label and remove or add navigation options.

2. To change the "MENU" heading, follow these steps.
   b. Change #rn:msg:MENU_LBL# to your new label.
   d. To remove the Contact Us option, delete these lines of code.
3. To add options to the Menu button that will take your customers to pages in your customer portal or to external URLs:
   a. Delete the default code for the Support Home and Contact Us options you located in step 2.
   b. Locate `<ul class="rn_NavigationMenu">

c. Modify the code to add navigation options.

   ```html
   <ul class="rn_NavigationMenu">
   <li><a href="/app/#rn:config:CP_HOME_URL##rn:session#">Go to Home page</a></li>
   <li><a href="/app/ask#rn:session#">Ask a question</a></li>
   <li><a href="/app/answers/list#rn:session#">View all answers</a></li>
   <li><a href="/app/account/change_password#rn:session#">Change your password</a></li>
   <li><a href="http://www.oracle.com">Oracle</a></li>
   </ul>
   ```

4. Save the file.

**Configure the Contact Us Menu**

You can configure the Contact Us menu.

2. To remove the Chat option, delete this code.

   ```html
   <li><rn:widget path="navigation/NavigationTab"
   label_tab="#rn:msg:CONTACT_US_LBL#" link="/app/ask"
   subpages="#rn:msg:EMAIL_US_LBL# > /app/ask, #rn:msg:ASK_THE_COMMUNITY_LBL# > /app/social/ask,
   #rn:msg:CALL_US_DIRECTLY_LBL# > javascript:void(0); ">
   </li>
   ```

3. To remove other options from the Contact Us menu, locate this code.

   ```html
   <li><rn:condition config_check="MOD_CHAT_ENABLED == false">
   <rn:widget path="navigation/NavigationTab"
   label_tab="#rn:msg:CONTACT_US_LBL#" link="/app/ask"
   subpages="#rn:msg:EMAIL_US_LBL# > /app/ask,
   #rn:msg:ASK_THE_COMMUNITY_LBL# > /app/social/ask,
   #rn:msg:CALL_US_DIRECTLY_LBL# > javascript:void(0); "/></li>
   ```

   o To remove the Email Us option, delete `#rn:msg:EMAIL_US_LBL# > /app/ask`, from the code for both NavigationTab widgets.
To remove the Ask the Community option, delete #rn:msg:ASK_THE_COMMUNITY_LBL# > /app/social/ask, from the code for both NavigationTab widgets.

To remove the Call Us Directly option, delete #rn:msg:CALL_US_DIRECTLY_LBL# > javascript:void(0) from the code for both NavigationTab widgets.

4. To add options to Contact Us, add code in the location where you want it to appear in the list of options, making sure it precedes the closing "</li>" tags.

This example adds a link for driving directions after the Call Us Directly option. To ensure the option appears in the menu when chat is enabled, as well as when it is disabled, add the code in the widget for each condition.

```html
```

5. Save the file.

Add a URL for the Call Us Directly Option

You can specify a URL to take your customers to a web page containing your organization's contact information.

2. Locate this code.

```html
<nr:condition config_check="MOD_CHAT_ENABLED == false">
</nr:condition>  
<nr:condition_else/>
</nr:condition>
```

3. Replace both instances of `javascript:void(0);` with the URL for your Contact page.

Your edited code will resemble this.

```html
<nr:condition config_check="MOD_CHAT_ENABLED == false">
</nr:condition>  
<nr:condition_else/>
</nr:condition>
```

4. Save the file.

PageSetSelector Widget

If you select the "Allow my current browser/user agent to be the deciding factor" check box on the Set Environment page of the Customer Portal Administration site, the page set is determined by the user agent accessing the pages.

As a result, the mobile page set opens when mobile devices access the customer portal. The PageSetSelector widget lets customers select whether they view the standard reference implementation or the basic page set on their mobile device, instead of viewing the mobile page set.
**Note:** Cookies must be enabled on the customer’s browser to allow this option. If cookies are disabled and the Desktop or Basic option is selected, the mobile page simply refreshes.

### Add a Phone Number to the Contact Us Options

You can add a contact phone number to the options in Contact Us.

2. Locate this code.
   ```xml
   <rn:condition config_check="MOD_CHAT_ENABLED == false">
   <li>
   <rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:CONTACT_US_LBL#" link="/app/ask"
   subpages="#rn:msg:EMAIL_US_LBL# > /app/ask, #rn:msg:ASK_THE_COMMUNITY_LBL# > /app/social/ask,
   #rn:msg:CALL_US_DIRECTLY_LBL# > javascript:void(0); "/"></li>
   <rn:condition_else/>
   <li>
   <rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:CONTACT_US_LBL#" link="/app/ask"
   subpages="#rn:msg:EMAIL_US_LBL# > /app/ask, #rn:msg:ASK_THE_COMMUNITY_LBL# > /app/social/ask,
   #rn:msg:CHAT_LBL# > /app/chat/chat_launch, #rn:msg:CALL_US_DIRECTLY_LBL# > javascript:void(0); "/"></li>
   </rn:condition>
   
   3. Edit the code to replace the Call us directly message base with your phone number. Your edited code will resemble this.
   ```xml
   <rn:condition config_check="MOD_CHAT_ENABLED == false">
   <li>
   <rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:CONTACT_US_LBL#" link="/app/ask"
   subpages="#rn:msg:EMAIL_US_LBL# > /app/ask, #rn:msg:ASK_THE_COMMUNITY_LBL# > /app/social/ask,
   #rn:msg:CALL_US_DIRECTLY_LBL# > (999) 555-1212"></li>
   <rn:condition_else/>
   <li>
   <rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:CONTACT_US_LBL#" link="/app/ask"
   subpages="#rn:msg:EMAIL_US_LBL# > /app/ask, #rn:msg:ASK_THE_COMMUNITY_LBL# > /app/social/ask,
   #rn:msg:CHAT_LBL# > /app/chat/chat_launch, #rn:msg:CALL_US_DIRECTLY_LBL# > (999) 555-1212"></li>
   </rn:condition>
   
   4. Save the file.

### Add an Option to the Account Menu

You can add options to the Account menu.

2. Locate this code.
   ```xml
   <rn:condition is_active_social_user="true">
   <rn:widget path="login/AccountDropdown"
   label_menu_accessibility="#rn:msg:DOUBLE_TAP_TO_OPEN_OR_CLOSE_THE_MENU_LBL#"
   subpages="#rn:msg:SUPPORT_HISTORY_LBL# > account/questions/list, #rn:msg:ACCOUNT_SETTINGS_LBL# > account/profile, #rn:msg:PUBLIC_PROFILE_LBL# > /user/
   #rn:profile:socialUserID"/>
   <rn:condition_else/>
   <rn:widget path="login/AccountDropdown"
   label_menu_accessibility="#rn:msg:DOUBLE_TAP_TO_OPEN_OR_CLOSE_THE_MENU_LBL#"
   subpages="#rn:msg:SUPPORT_HISTORY_LBL# > account/questions/list, #rn:msg:ACCOUNT_SETTINGS_LBL# > account/profile"/>
   </rn:condition>
   
   3. Add a name and page location (for example: `Change your password > account/change_password#rn:session`) to the code where you want the option to appear in the list of options.
a. Choose where you place the option code based on who you want to see the option.
   ◦ If you want the option to be available to everyone, place it in the Account Dropdown widget block of code in the <rn:condition_else/> condition tag.
   ◦ If you want the option to be available to community users, place it in the AccountDropdown widget in the <rn:condition is_active_social_user="true"> Condition tag.
   ◦ If you want the option to be available when customers are logged in, place the new option in the AccountDropdown widget for both conditions.

Because our example is adding a change password option, we'll put it between the options available to logged-in customers: Support History and Account Settings.

```xml
<n:condition is_active_social_user="true">
  <n:widget path="login/AccountDropdown">
    label_menu_accessibility="#n:msg:DOUBLE_TAP_TO_OPEN OR CLOSE THE MENULBL#"
    subpages="#n:msg:SUPPORT_HISTORYLBL# > account/questions/list, Change your password
    > account/change_password#rn:session#, #n:msg:ACCOUNT_SETTINGSLBL# > account/profile,
    #n:msg:PUBLIC_PROFILELBL# > #rn:config:CP_PUBLIC_PROFILE_URL#/user/#rn:profile:socialUserID#"/>
  </n:condition>
</rn:condition>
```

4. Save the file.

---

Remove Default Options from the Account Menu

You can remove options from the Account menu.

2. To remove the Sign Up and Log In options, delete the following lines of code.

```xml
<div class="rn_LoginStatus">
  <n:condition logged_in="false">
    <n:widget path="login/AccountDropdown">
      subpages="#n:msg:ACCOUNT_OVERRIEWLBL# > account/overview
      "
      sub:input_Contact.Emails.PRIMARY.Address:label_input="#n:msg:EMAILADDRLBL#"
      sub:input_Contact.Emails.PRIMARY.Address:required="true"
      sub:input_Contact.Emails.PRIMARY.Address:validate_on_blur="true"
      sub:input_Contact.Login:label_input="#n:msg:USERNAMELBL#"
      sub:input_Contact.Login:required="true"
      sub:input_Contact.Login:validate_on_blur="true"
      sub:input_Contact.Name.First:required="true"
      sub:input_Contact.Name.First:label_input="#n:msg:FIRST_NAMELBL#"
      "
      sub:input_Contact.Name.Last:required="true"
      sub:input_Contact.Name.Last:label_input="#n:msg:LAST_NAMELBL#"
      "
      sub:input_SocialUser.DisplayName:label_input="#n:msg:DISPLAY_NAMELBL#"
      "
      sub:input_Contact.NewPassword:label_input="#n:msg:PASSWORDLBL#"
    </n:condition>
  </n:condition>
</rn:condition>
```

---

Oracle
3. To remove the Support History option, delete the following line of code from both AccountDropdown widgets in the first rn:condition_else.

4. To remove the Account Settings option, delete the following line of code from both AccountDropdown widgets in the first rn:condition_else.

5. Save the file.

Working with OpenLogin Widgets

Four OpenLogin widgets appear on the login window of the standard and mobile reference implementations, and also on the Create an Account form of both page sets.

There’s a separate widget for every open login provider, so you can configure these pages to include only the open login providers you want. Any changes you make on the login window for open login options are applied to the Create an Account form that is opened from the login window, but you can change the Create an Account page options separately.

Note: The code for the default login window includes four OpenLogin widgets, but your page may not display all of these widgets if your site is not configured for their use. The logos appear only if you have defined their respective OAUTH_APP_ID and OAUTH_APP_SECRET on the administration interface.

When customers click one of the open login options, a message explains what will happen. The information is slightly different depending on the external service the customer selects.

Redirect Customers After Login

By default, customers will be redirected to the page they were on when they used open login after they have successfully logged in. You can send them to a different page by defining the redirect_url attribute.

2. Locate the code for the widget you want to edit. This example uses the Google widget.
   ```php
   <rn:widget path="login/OpenLogin"
   controller_endpoint="/ci/openlogin/openid/authorize/google"
   label_service_button="Google"
   label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY_MSG#"
   label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#" />
   ```
3. Add the redirect_url attribute to the widget code setting the value to the page where you want customers to be redirected.
4. Save the file.

Create an Account

The Login page opens when customers click Log In or Sign Up and contains a Create an Account button.

When that button is clicked, a form opens where customers can enter contact information to create their account. (Because they are required to complete the Display Name field on this page, customers who create an account are automatically registered as users for Community Self Service.)

In addition to using this form to let customers create an account, you can direct your customers to the reference implementation Create an Account page. The page is found in the `/views/pages/utils` folder and contains the same fields as the Create an Account form.

Just as the Login page lets your customers use an external service provider to log in to the Customer Portal, so do the Create an Account form and page. You can also add fields to this page (including a global opt-in selection), remove fields, and edit labels and message bases.

Edit the Password Label

You can edit labels associated with most fields in Customer Portal.

3. Edit the `label_input` attribute to define password length information.
   ```php
   sub:input_Contact.NewPassword:label_input="Password (8 characters minimum)"
   ```
4. Save the file.
Providing Guided Assistance to Customers

Guided assistance lets your customers find the most appropriate answers to their questions by leading them through a series of branching questions.

When answers are created on the administration interface for your organization's knowledge base, they can be associated with a specific guide. Then, whenever that answer is opened, customers are asked questions that lead them to the correct answer for their particular situation. It's also possible to specify a single guide that opens every time any answer is viewed.

Creating a guide is done on the administration interface. There are recommended best practices for using guided assistance on the mobile customer portal. Certain practices produce guides that are optimized for use on mobile devices, while others produce a less-than-optimal result. For example, image questions can display poorly if the images aren’t scaled for mobile displays.

- The best question types for mobile guides are Button, Yes/No, Text, and Menu.
- Although the default configuration opens guides in a separate window, a better customer experience will result if you change the Answer Details page so it displays single answers inline on the page.
- Because mobile devices may not be able to open certain file types, avoid using guides that include answers containing file attachments.
- Avoid long menu options to prevent wrapping display problems on a mobile device.
- Avoid the use of wide elements, such as tables, images, and inline web pages, within a question’s content to help prevent a confusing display, particularly since horizontal scrolling is not available on many mobile devices.
- Save answer responses for the last node in a guide to prevent the answer from taking control of the screen, thereby preventing the customer’s return to the guide.
- Avoid list questions to prevent problems that can occur when customers’ previous responses do not display, as sometimes happens on mobile devices.
- Restrict the use of images as much as possible for the best display with the fewest number of alignment issues on the mobile display. Optimal image size is approximately 300 pixels. However, the mobile/site.css file will automatically resize images within answer content.
- Displaying a single question at a time generally results in a better customer experience than appending each new question to the previous ones.

The default Answer Details page for the mobile customer portal includes the GuidedAssistant widget. A Launch the Troubleshooter button appears on the Answer Details page when an answer that is associated with a guide is opened.

When customers click the Launch the Troubleshooter button, the first question appears. Depending on the type of question, customers may select a menu or list option, a button, radio button, or image, or type text in a field.

After customers respond to the first question, they can return to the previous screen and change their answer by clicking the Go Back button. Questions are presented one at a time on the mobile customer portal.

**Note:** Note that clicking the mobile device’s Back button may take customers back to the answer where the guide was launched, it may return them to the device’s home page, or it may exhibit some other behavior. Different mobile devices and operating systems implement the Back button differently.
Customers continue to answer questions that lead them to a solution in the form of a text explanation, an answer from your knowledge base, a URL, or an external event. They may also be led to another guide that asks additional questions until a solution is presented.

### Configuring Guided Assistance

You can use the configuration options to design the GuidedAssistant widget.

- Whether the guide opens in a separate window or inline
- Whether only one question is displayed at a time
- Whether the same guide opens with every answer
- Labels
  - Label when the response is an answer from the knowledge base
  - Launch button label
  - Back button label
  - Start over button
  - Label on the response button that appears with text explanations
  - Label when the response is a text explanation

### Open the Guide Inline

By default, clicking the Launch the Troubleshooter button opens the guide in a separate window that displays the guided assistance page (/views/pages/mobile/utils/guided_assistant.php). We suggest that you set-up the customer portal so guides open inline on the answer details page.

2. Locate the following code.
   ```xml
   <rn:widget path="knowledgebase/GuidedAssistant" popup_window_url="/app/utils/guided_assistant"
     label_text_result="#rn:msg:PLEASE_READ_THIS_RESPONSE_MSG#" />
   ```
3. Edit the GuidedAssistant widget to remove the `popup_window_url` attribute and add the `single_question_display` attribute.
   ```xml
   <rn:widget path="knowledgebase/GuidedAssistant" single_question_display="true" label_text_result="#rn:msg:PLEASE_READ_THIS_RESPONSE_MSG#" />
   ```
4. Save the file.
Display Multiple Questions

When the guide opens on the Guided Assistance page, the GuidedAssistant widget displays one question at a time, with each new question displaying a button that lets customers return to the previous question. The default behavior of the GuidedAssistant widget is to display multiple questions on a page.

2. Locate <rn:widget path="knowledgebase/GuidedAssistant" single_question_display="true"
   label_question_back="#rn:msg:GO_BACK_CMD#" />
3. Delete the single_question_display attribute from the code.
   <rn:widget path="knowledgebase/GuidedAssistant" label_question_back="#rn:msg:GO_BACK_CMD#" />
4. Save the file.

Edit the GuidedAssistant Label

You can edit the page to modify labels.

2. Locate <rn:widget path="knowledgebase/GuidedAssistant" popup_window_url="/app/utils/guided_assistant"
   label_text_result="#rn:msg:PLEASE_READ_THIS_RESPONSE_MSG#" />
3. Add the label_popup_launch_button attribute.
   <rn:widget path="knowledgebase/GuidedAssistant" popup_window_url="/app/utils/guided_assistant"
   label_text_result="#rn:msg:PLEASE_READ_THIS_RESPONSE_MSG#" label_popup_launch_button="Start Here" />
4. Save the file.

Edit Other Labels on the GuidedAssistant Widget

You can edit the page to modify labels.

2. Locate <rn:widget path="knowledgebase/GuidedAssistant" single_question_display="true"
   label_question_back="#rn:msg:GO_BACK_CMD#" />
3. To change the Go Back label that returns customers to the previous question in the guide, edit the
   label_question_back attribute.
   <rn:widget path="knowledgebase/GuidedAssistant" single_question_display="true"
   label_question_back="Previous Question" />
4. To change any of the other labels on the GuidedAssistant widget, add the associated label attribute to the
   widget code and define its value with the text you want.
   - To edit the message displayed when the customer reaches a solution that is an answer from the
     knowledge base, change the text in the label_answer_result attribute.
     <rn:widget path="knowledgebase/GuidedAssistant" single_question_display="true"
     label_question_back="#rn:msg:GO_BACK_CMD#" label_answer_result="This information should answer
     your question."/>
   - To edit the Start Over label when the customer reaches the end of the guide, add the label_start_over
     attribute to the widget code.
To edit the OK button that customers click to enter a text response, add the `label_text_response_button` attribute to the widget code.

To edit the message displayed when the customer reaches a text explanation, add the `label_text_result` attribute.

```html
<n:widget path="knowledgebase/GuidedAssistant" single_question_display="true"
  label_question_back="#rn:msg:GO_BACK_CMD#" label_text_result="The following information answers your question." />
```

5. Save the file.

### Change the Published and Updated Labels

You can edit the page to modify labels.

2. Locate this code.

   ```html
   #rn:msg:PUBLISHED_LBL# <rn:field name="Answer.CreatedTime" /> 
   <br/>
   #rn:msg:UPDATED_LBL# <rn:field name="Answer.UpdatedTime" /> 
   ```

3. To edit the label, modify the text in front of the `<rn:field name=`

   ```html
   This answer was originally published on <rn:field name="Answer.CreatedTime" />
   This answer was last updated on <rn:field name="Answer.UpdatedTime" />
   ```

4. Save the file.

### Remove the Published and Updated Dates

You can edit the page to modify the available fields.

2. Delete the following lines of code.

   ```html
   #rn:msg:PUBLISHED_LBL# <rn:field name="Answer.CreatedTime" /> 
   <br/>
   #rn:msg:UPDATED_LBL# <rn:field name="Answer.UpdatedTime" /> 
   ```

3. Save the file.

### Disable the File Attachments Display

If files are attached to the answer displayed on the Answer Details page, the attachments will be displayed as part of the answer unless you disable their display with this procedure.

2. Delete this code.

   ```html
   <div id="rn_FileAttach">
   <n:widget path="output/DataDisplay" name="Answer.FileAttachments" label="#rn:msg:ATTACHMENTS_LBL#"/>
   </div>
   ```

3. Save the file.

### Remove Related Answers

By default, related answers appear on the answer details page if the answer being displayed is related to any other answers in your knowledge base.

2. Delete the following line of code.

   ```html
   <n:widget path="knowledgebase/RelatedAnswers" /> 
   ```
3. Save the file.

Disabling Answer Feedback

There are a number of attributes that let you modify the button labels.

The default Answer Details page uses the MobileAnswerFeedback widget to let customers provide feedback on the answer they are viewing.

If customers answer Yes, their feedback is recorded and a thank-you message acknowledges the feedback. If they answer No, they have an opportunity to provide additional feedback.

If customers select the link, another window opens where feedback can be entered. If customers are not logged in, the Email field is displayed and is required. If customers are logged in, only the Your Feedback field is displayed.

You can edit all the labels on the MobileAnswerFeedback widget.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>label_cancel_button</td>
<td>Cancel</td>
</tr>
<tr>
<td>label_comment_box</td>
<td>Your Feedback</td>
</tr>
<tr>
<td>label_dialog_prompt</td>
<td>Please tell us how we can make this answer more useful.</td>
</tr>
<tr>
<td>label_dialog_title</td>
<td>Rating submitted</td>
</tr>
<tr>
<td>label_dissatisfied</td>
<td>We're sorry this answer didn't help.</td>
</tr>
<tr>
<td>label_email_address</td>
<td>Email</td>
</tr>
<tr>
<td>label_feedback_submit_success</td>
<td>Thanks for your feedback.</td>
</tr>
<tr>
<td>label_no_button</td>
<td>No</td>
</tr>
<tr>
<td>label_provide_feedback</td>
<td>Would you like to provide feedback so we can make this answer more useful?</td>
</tr>
<tr>
<td>label_satisfied</td>
<td>Thanks for your feedback.</td>
</tr>
<tr>
<td>label_send_button</td>
<td>Submit</td>
</tr>
<tr>
<td>label_title</td>
<td>Is this answer helpful?</td>
</tr>
<tr>
<td>label_yes_button</td>
<td>Yes</td>
</tr>
</tbody>
</table>

If you don’t want to offer your customers the chance to offer answer feedback on the mobile implementation, you can disable the feature.
Disable Answer Feedback
You can edit the page to modify the available fields.

2. Delete `<rn:widget path="feedback/MobileAnswerFeedback" />`.
3. Save the file.

Disabling the Ability to Email the Page
The default Answer Details page lets customers email the displayed answer.

When customers are not logged in, the widget displays fields for the customer’s email address and name. Logged-in customers need to enter only the recipient’s email address, as shown in the overlay on the right.

If you want to remove the ability for customers to email an answer, you can delete the EmailAnswerLink widget from the answer details page.

Remove EmailAnswerLink
You can edit the page to modify the available fields.

2. Delete the following line of code.
   
   `<rn:widget path="utils/EmailAnswerLink" />

3. Save the file.

Logged-in Customers
The differences among the workflows are apparent only when customers are not logged in.

When customers are logged in, the Ask a Question process is the same for all workflows.

- The Ask a Question page opens without an Email Address field because the customer is logged in (and, therefore, the email address is known).
- The customer completes the fields and submits the question.
- B2C Service converts the question into an incident, which is associated with the customer’s contact record.

Email-only Default Workflow
If customers are not logged in when they select Email Us (from either the Contact Us section on the home page or by clicking the Menu button and selecting Contact Us > Email Us), they must enter their email address before submitting their question.

If the email address matches an existing contact record, the resulting incident is associated with that contact record. If the email address does not match an existing contact record, a new record is created for the customer and the incident is associated with that record. The new contact record contains only the email address, so customers will be required to use account assistance if they want to log in to the customer portal in the future. This workflow is implemented by default.
Although the default workflow has been tested for its usability and adopted in the reference implementation, your organization may require more customer information than just an email address. The best way to ensure getting this information is to require customers to create an account before they can ask a question.

Editing the Ask a Question Page for the Email Check Workflow

By editing the Question page, you can verify and modify the workflow.

First, you'll edit the default Ask a Question page to achieve these objectives.

- Display the EmailCheck widget when customers are not logged in so they can enter their email address.
  - If the email address matches an existing contact record, return customers to the Ask a Question page, where the Email Address field is populated.
  - If the submitted email address does not match a contact record in the knowledge base, take customers to the Create Account page. The Email Address field on this page is populated with the submitted information.

- Display the ProgressBar widget so customers who are in this workflow can determine which step of the process they're currently on.

Note: Because the only step for logged-in customers is to complete the Ask a Question fields, the ProgressBar widget is enclosed in conditional tags so it won’t appear to them. The ProgressBar widget includes a current_step attribute that gets set from the EmailCheck widget’s redirect_after_contact_creation attribute.

Here is the code for the revised Ask a Question page (/views/pages/mobile/ask.php). It includes the EmailCheck and ProgressBar widgets and the conditions for displaying them.

```xml
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#" template="mobile.php" clickstream="incident_create"/>

<section id="rn_PageTitle" class="rn_AskQuestion">
  <h1>#rn:msg:ASK_OUR_SUPPORT_TEAM_A_QUESTION_LBL#</h1>
  <rn:condition logged_in="false" url_parameter_check="step != null">
    <rn:condition url_parameter_check="step == null">
      <rn:widget path="utils/ProgressBar"/>
    </rn:condition>
    <rn:condition_else/>
    <rn:widget path="utils/ProgressBar" current_step="#rn:url_param_value:step#"/>
  </rn:condition>
</section>

<section id="rn_PageContent" class="rn_AskQuestion">
  <div class="rn_Padding">
    <!--Logged in or on final step of process-->
    <rn:condition logged_in="true" url_parameter_check="step == 3">
      <form id="rn_QuestionSubmit" onsubmit="return false;">
        <div id="rn_ErrorLocation"></div>
        <fieldset>
          <rn:condition logged_in="false">
            <rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" />
            <rn:widget path="input/FormInput" name="Incident.Subject" required="true" />
          </rn:condition>
          <rn:condition answers_viewed="2" searches_done="1">
            <rn:widget path="input/SmartAssistantDialog" display_answers_inline="true" label_prompt="#rn:msg:FLLOWING_ANS_HELP_IMMEDIATELY_MSG#" accesskeys_enabled="false" label_solved_button="#rn:msg:MY_QUESTION_IS_ANSWERED_MSG#" label_cancel_button="#rn:msg:EDIT_QUESTION_CMD#" />
          </rn:condition>
        </fieldset>
      </form>
    </rn:condition>
  </div>
</section>
```
Edit the Create Account Page

You want customers who access the page from the email check workflow to see a progress bar so they know how far along they are in the process of asking their question.

Although this procedure modifies the default create account page, you may want to create a separate page for this workflow if your default page contains many fields. Because you’ve interrupted a customer who is trying to submit a question, we recommend that you display only the minimum number of fields your organization requires to create an account. Customers can then return quickly to the initial task.

This procedure checks the step parameter you added to the EmailCheck widget on the Ask a Question page. If the step parameter in the URL is not null, the ProgressBar widget appears on the Create Account page.

2. Locate `<h1>`
3. Add this code immediately below the code you located in step 2.

   ```php
   <rn:condition url_parameter_check="step != null">
   <rn:widget path="utils/ProgressBar" current_step="#rn:url_param_value:step#/"/>
   </rn:condition>
   ```
4. Save the file.

Require Login on the Ask a Question Page

Another workflow approach is to simply require customers to log in before they can submit a question.

2. Locate the following line of code at the top of the file.

   ```php
   <rn:meta title="#rn:msg:ASK_QUESTION_HDG#" template="mobile.php" clickstream="incident_create"/>
   ```
3. Edit the code to add the login_required page meta tag.

   ```php
   <rn:meta title="#rn:msg:ASK_QUESTION_HDG#" template="mobile.php" clickstream="incident_create" login_required="true" />
   ```
4. Save the file.
5. Open `views/pages/mobile/ask_confirm.php`. 
6. Locate the following line of code at the top of the file.
   `<rn:meta title="#rn:msg:QUESTION_SUBMITTED_LBL#" template="mobile.php" clickstream="incident_confirm"/>

7. Edit the code to add the login_required page meta tag.
   `<rn:meta title="#rn:msg:QUESTION_SUBMITTED_LBL#" template="mobile.php" clickstream="incident_confirm" login_required="true"/>

8. Save the file.

Add Contact Fields to the Ask a Question Page

You can edit the page to modify the available fields.

2. Locate the lines of code between the `<rn:condition logged_in="false">` condition tags.
   `<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
   `<rn:widget path="input/FormInput" name="Incident.Subject" required="true" />
3. Add this code between the two widgets you located in the previous step.
   `<rn:widget path="input/FormInput" name="Contact.Name.First" required="true" />
   `<rn:widget path="input/FormInput" name="Contact.Name.Last" required="true" />
4. Save the file.

Change the Answers Viewed or Searches Done Condition

The default mobile Ask a Question page uses a condition tag to determine whether the SmartAssistantDialog widget appears when the customer clicks the Continue button or whether the confirmation page is displayed immediately.

2. Locate `<rn:widget path="chat/ChatQueueSearch" popup_window="true"/>`.
3. Edit the code to either delete or change the value of the answers_viewed or searches_done attributes.
   This example code assumes you want to change the number of answers viewed and remove the requirement to perform a search.
   `<rn:condition answers_viewed="3"/>
4. Save the file.

Remove Conditions for SmartAssistantDialog

If you remove the condition tags around the SmartAssistantDialog widget, it will always propose answers to your customers before they can finish submitting their question, regardless of the number of answers they've viewed or searches they've conducted.

You need to have set up a SmartAssistant incident rule in order for the widget to appear.

2. Locate the following lines of code.
   `<rn:condition answers_viewed="2" searches_done="1"/>
   `<rn:condition_else/>
   `<rn:widget path="input/SmartAssistantDialog" accesskeys_enabled="false" display_button_as_link=""/>
3. Delete the two lines of code beginning with `<rn:condition` and the `<rn:condition> line. All that should remain is the code that calls the SmartAssistantDialog widget.
4. Save the file.
Change the Buttons on SmartAssistantDialog

The SmartAssistantDialog widget on the mobile Ask a Question page contains three buttons: My Question is Answered, Finish Submitting Question, and Edit Question. You can edit the labels for the buttons, change their display order on the dialog, or change the buttons to links.

2. Locate `<rn:widget path="input/SmartAssistantDialog" accesskeys_enabled="false" display_button_as_link=""/>

   a. To change the labels on the buttons, add the label_solved_button, label_cancel_button, and label_submit_button attributes.

   ```xml
   <rn:widget path="input/SmartAssistantDialog" accesskeys_enabled="false" display_button_as_link="" label_solved_button="This answered my question" label_cancel_button="Return to my question" label_submit_button="I still need an answer"/>
   ```

   b. To change the buttons’ display order, add the button_ordering attribute. (By default, the display order for buttons is label_solved_button, label_submit_button, label_cancel_button.)

   ```xml
   <rn:widget path="input/SmartAssistantDialog" accesskeys_enabled="false" display_button_as_link="" button_ordering="label_submit_button, label_cancel_button, label_solved_button" />
   ```

   c. To change the buttons to links, edit the display_button_as_link attribute.

   ```xml
   <rn:widget path="input/SmartAssistantDialog" accesskeys_enabled="false" display_button_as_link="label_solved_button, label_submit_button, label_cancel_button" />
   ```

3. Save the file.

Redirect Customers when Questions are Answered

By default, customers who click the My Question is Answered button are redirected to the home page. If you want to direct them to a different page, you can add the solved_url attribute to the SmartAssistantDialog widget.

2. Locate the following lines of code.

   ```xml
   <rn:widget path="input/SmartAssistantDialog" accesskeys_enabled="false" display_button_as_link="" />
   ```

3. Edit the widget code to add the solved_url attribute. Your code will resemble the following.

   ```xml
   <rn:widget path="input/SmartAssistantDialog" accesskeys_enabled="false" display_button_as_link="" solved_url="/app/answers/list" />
   ```

4. Save the file.

Remove SmartAssistantDialog

If you remove the SmartAssistantDialog widget, answers will never be suggested to your customers after they click the Continue button. Instead, the confirmation page will always open.

2. Delete this code.

   ```xml
   <rn:condition answers_viewed="2" searches_done="1">
   <rn:condition_else/>
   <rn:widget path="input/SmartAssistantDialog" accesskeys_enabled="false" display_button_as_link="" />
   </rn:condition>
   ```

3. Save the file.
Require Product and Category Levels

The mobile ask a question page does not require that customers select a minimum number of product or category levels related to their question, but you can edit the page to require them to select one or more levels of products or categories.

If none of your products have end-user visibility specified, the product selection drop-down menu will not appear. Similarly, the category menu will not appear if no categories have end-user visibility. Best practice recommends against requiring product and category selection to prevent form abandonment by your customers.

2. Locate the following lines of code in the file.
   ```html
   <rn:widget path="input/MobileProductCategoryInput" />
   <rn:widget path="input/MobileProductCategoryInput" data_type="Category" />
   ```
3. Add the required_lvl attribute to both MobileProductCategoryInput widgets to specify how many levels you want your customers to select. If you want to require two levels of products and one level of categories, your code will look like the following.
   ```html
   <rn:widget path="input/MobileProductCategoryInput" required_lvl="2" />
   <rn:widget path="input/MobileProductCategoryInput" data_type="Category" required_lvl="1" />
   ```
4. To specify how many levels will be displayed to the customer, add the max_lvl attribute to the MobileProductCategoryInput widgets.
   If the value for required_lvl is greater than the value for max_lvl, the max_lvl value will be set equal to the required_lvl value.
   Your code will resemble the following.
   ```html
   <rn:widget path="input/MobileProductCategoryInput" required_lvl="2" max_lvl="4" />
   <rn:widget path="input/MobileProductCategoryInput" data_type="Category" required_lvl="1" max_lvl="3" />
   ```
5. Save the file.

Populate the Product Field

You can edit the page to modify the available fields.

2. Locate the following line of code.
   ```html
   <rn:widget path="input/MobileProductCategoryInput" />
   ```
3. Add the default_value attribute to the MobileProductCategoryInput widget to specify the product you just identified the ID number for.
   Your code will resemble the following.
   ```html
   <rn:widget path="input/MobileProductCategoryInput" default_value="421,47" />
   ```
4. Save the file.

Attaching Files to Questions

Your customers may want to attach image files to their questions, which they can do from their mobile device.

They can take a photo of a defective product or a screen shot of a program error and send it with their question. Thumbnails appear next to the image name when files have been attached.
**Note:** It’s possible that the image orientation might be different from the original sent by a customer, but staff members working the incident on the Service Console can reorient the image, save it to their desktop, then attach the correct orientation to the incident.

### Requesting a Chat

When customers click the Chat button on the mobile customer portal, the Chat Launch page opens.

If the customer is logged in, the page displays first and last names and email address. If the customer is not logged in, fields for entering that information appear instead.

### Changing the Message Bases

You can edit the page to modify the labels and fields available.

You can change the default “Chat with our support team” and “Chat support is available” message bases on the Mobile Chat Launch page.

### Change the Chat Heading and Labels

You can edit the page to modify the available headings, labels, and fields.

2. To change the heading:
   a. Locate `<h1><rn:msg:CHAT_WITH_OUR_SUPPORT_TEAM_LBL/></h1>`.
   b. Enter the new heading between the `<h1>` and `</h1>` tags.
3. To change the Chat Support Available message:
   a. Locate `<rn:widget path="chat/ChatStatus"/>`.
   b. Add the `label_chat_available` attribute to the code.
      ```html
      <rn:widget path="chat/ChatStatus" label_chat_available="Agents are currently available." />
      ```
4. Save the file.

### Requiring an SLA

You can require that customers have an SLA assigned before accessing certain pages or features of your site.

You can make the Chat Launch page content conditional on the customer having an SLA or you can simply add a meta tag to the page to prevent customers without a chat SLA from requesting a chat. Customers who do not have an SLA will see a Permission Denied message on the page, and customers who are not logged in will be directed to the Login page so their SLAs can be checked.
Remove Fields from the Chat Launch Page

You can edit the page to modify the available fields.

2. Locate the following lines of code.

   ```html
   <fieldset>
   <rn:condition config_check="COMMON:intl_nameorder == 1">
   <rn:widget path="input/FormInput" name="Contact.Name.Last" label_input="#rn:msg:LAST_NAME_LBL#" required="true"/>
   <rn:widget path="input/FormInput" name="Contact.Name.First" label_input="#rn:msg:FIRST_NAME_LBL#" required="true"/>
   </rn:condition_else/>
   <rn:widget path="input/FormInput" name="Contact.Name.First" label_input="#rn:msg:FIRST_NAME_LBL#" required="true"/>
   <rn:widget path="input/FormInput" name="Contact.Name.Last" label_input="#rn:msg:LAST_NAME_LBL#" required="true"/>
   </rn:condition>
   <rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
   </fieldset>
   ```

3. To remove the Last Name field and display only the first name, delete the following line of code from both condition cases.

   ```html
   <rn:widget path="input/FormInput" name="Contact.Name.Last" label_input="#rn:msg:LAST_NAME_LBL#" required="true"/>
   ```

4. To remove the Address field, delete the following line of code.

   ```html
   <rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
   ```

5. Save the file.

Add a Question Field on the Chat Launch Page

You can give your chat agents a better understanding of the chat topic by adding a field on the Chat Launch page for customers to enter their question.

2. Locate `rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" label_input="#rn:msg:EMAIL_ADDR_LBL#"/>

3. Add `rn:widget path="input/FormInput" name="Incident.Subject" label_input="How can we help you today?"` immediately below the code you located in the previous step.

4. Save the file.

Set an SLA Condition for Displaying Page Content

You can edit the page to require an SLA to display the page.

2. Locate the following line of code.
3. Add the following line of code immediately before the code you located in step 2.

   <rn:condition sla="chat" />

4. Add the following code after the last line in the `chat_launch.php` file.

   <rn:condition_else />
   <div id="rn_PageContent" class="rn_AnswerDetail">
   <div class="rn_Padding">
   <h2>#rn:msg:PERMISSION_DENIED_LBL#</h2>
   <p>#rn:msg:CHAT_SLA_REQUIRED_LBL#</p>
   </div>
   </div>
   </rn:condition>

5. Save the file.

---

**Set a Page Meta Tag to Require an SLA**

You can edit the page to require an SLA.

2. Add the `sla_required_type` page meta tag to the first line of the file, which should now read:

   `<rn:meta title="#rn:msg:LIVE_CHAT_LBL#" template="mobile.php" clickstream="chat_request" sla_required_type="chat" />

3. Save the file.

   **Note:** If you require a chat SLA on the chat launch page, you should also require one on the chat page. Edit the `chat_landing.php` file in the same manner by adding `sla_required_type="chat"` to the first line in the file.

---

**Configuring ChatTranscript**

You can edit the widget to modify labels and other display items.

The ChatTranscript widget lets you replace the default icons and labels that appear on the transcript window.

**Note:** Hyperlinks are disabled in the chat transcript to prevent customers from following a link and then being unable to return to the chat session.

---

**Replacing ChatTranscript Widget Icons**

You can replace any of the default icons, which are specified as attributes of the ChatTranscript widget, by defining the path and file name for the replacement icon.

This is the code for the ChatTranscript widget in the `chat_landing.php` file.

   `<rn:widget path="chat/ChatTranscript" mobile_mode="true"/>

---

1376
Setting the `mobile_mode` attribute to true disables the Close button, making customers use the Menu button to navigate away from the chat window.

All default icons are stored in the `/cp/customer/assets/themes/mobile/images` folder. You can reference the path in widget attributes by entering `images/[filename]`.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Attribute</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent Message Icon</td>
<td><code>agent_message_icon_path</code></td>
<td><code>images/chatAgent.png</code></td>
</tr>
<tr>
<td>Alert Icon</td>
<td><code>alert_icon_path</code></td>
<td><code>images/chatAlert.png</code></td>
</tr>
<tr>
<td>End-user Message Icon</td>
<td><code>enduser_message_icon_path</code></td>
<td><code>images/chatEndUserMessage.png</code></td>
</tr>
<tr>
<td>Off the Record Icon</td>
<td><code>off_the_record_icon_path</code></td>
<td><code>images/chatOffTheRecord.png</code></td>
</tr>
</tbody>
</table>

To replace the default Agent Message icon, for example, the code resembles this.

```xml
<rn:widget path="chat/ChatTranscript" agent_message_icon_path="images/chatAgentNew.png"/>
```

**Edit the ChatPostMessage Label**

By default, the ChatPostMessage label on the mobile Chat Page says, “Type your message and send.”

2. Locate `<rn:widget path="chat/ChatPostMessage"
   label_send_instructions="#rn:msg:TYPE_YOUR_MESSAGE_AND_SEND_LBL#" mobile_mode="true"/>`.
3. Edit the label_send_instructions attribute to change the default message base.
   ```xml
   <rn:widget path="chat/ChatPostMessage" label_send_instructions="Your new instructions for sending a message" mobile_mode="true"/>
   ```
4. Save the file.

**Add the Option to Chat Off-the-record**

You can add a button to the Mobile Chat page that lets customers send an off-the-record message during the chat session.

2. Locate `<rn:widget path="chat/ChatEngagementStatus"/>`.
3. Add this code immediately below the line you located in the previous step.
   ```xml
   <rn:widget path="chat/ChatOffTheRecordDialog"/>
   <rn:widget path="chat/ChatOffTheRecordButton" off_the_record_icon_path=""
   label_off_the_record="#rn:msg:SEND_AN_OFF_THE_RECORD_MESSAGE_CMD#"/>
   ```
4. Save the file.
Set all Chat Posts Off-the-record

You can edit the page to change the chat record options.

2. Locate the following line of code.
   ```xml
   <rn:widget path="chat/ChatPostMessage"
   label_send_instructions="#rn:msg:TYPE_YOUR_MESSAGE_AND_SEND_LBL#" mobile_mode="true"/>
   ```
3. Edit the widget to add the `all_posts_off_the_record` attribute, as shown in the following code.
   ```xml
   <rn:widget path="chat/ChatPostMessage"
   label_send_instructions="#rn:msg:TYPE_YOUR_MESSAGE_AND_SEND_LBL#" mobile_mode="true"
   all_posts_off_the_record="true" />
   ```
4. Save the file.

Configuring Other Chat Widgets

You can configure other chat widgets.

Although only three widgets are required for a working chat page, these additional chat widgets provide increased functionality.

- ChatSoundButton
- ChatEngagementStatus
- ChatQueueWaitTime
- ChatCancelButton
- ChatQueueSearch
- ChatPrintButton
- ChatOffTheRecordButton
- ChatDisconnectButton
- ChatAgentStatus
- ChatAttachFileButton
- ChatSendButton
- ChatOffTheRecordDialog
- ChatRequestEmailResponseButton
- ChatCobrowsePremium

These chat widgets are not available on the mobile customer portal.
Edit the Support History Heading

The default heading for the mobile Support History page is Search Your Support History.

3. Edit the code to replace the message base with the new page heading between the <h1> tags.
   <h1>Search your recent questions here</h1>
4. Save the file.

Remove Product and Category Filters

By default, the support history pages lets customers filter their incidents by product and category.

2. Delete the following lines of code.
   <rn:widget path="navigation/Accordion" toggle="rn_Advanced"/>
   <div class="rn_Padding">
     <a class="rn_AlignRight" href="javascript:void(0);" id="rn_Advanced">$rn:msg:PLUS_SEARCH_OPTIONS_LBL$</a>
   </div>
   <rn:widget path="search/MobileProductCategorySearchFilter" filter_type="products"/>
   <rn:widget path="search/MobileProductCategorySearchFilter" filter_type="categories"/>
3. Save the file.

Collapse the Update This Question Section

By default, the Update This Question section is expanded when the mobile Question Details page opens.

2. Locate this code.
   <div class="rn_Module">
     <rn:widget path="navigation/Accordion" toggle="rn_QuestionUpdate"/>
     <h2 id="rn_QuestionUpdate">$rn:msg:UPDATE_THIS_QUESTION_CMD$<span class="rn_Expand"></span></h2>
     <form id="rn_UpdateQuestion" onsubmit="return false;">
       <div id="rn_ErrorLocation"></div>
       <rn:widget path="input/FormInput" name="Incident.StatusWithType.Status" label_input="$rn:msg:DO_YOU_WANT_A_RESPONSE_MSG$"/>
       <rn:widget path="input/FormInput" name="Incident.Threads" label_input="$rn:msg:ADD_ADDTL_INFORMATION_QUESTION_CMD$" initial_focus="true" required="true"/>
       <rn:widget path="input/FileAttachmentUpload" label_input="$rn:msg:ATTACH_ADDTLDOCUMENTSQUESTION_LBL$"/>
       <rn:widget path="input/FormSubmit" label_button="$rn:msg:SUBMIT_CMD$" on_success_url="/app/account/questions/list" error_location="rn_ErrorLocation"/>
     </form>
   </div>
3. Edit the code to add the `<class="rn_Collapsed">` element.

```html
<div class="rn_Module">
  <rn:widget path="navigation/Accordion" toggle="rn_QuestionUpdate"/>
  <h2 id="rn_QuestionUpdate"><span class="rn_Collapsed">#rn:msg:UPDATE_THIS_QUESTION_CMD#</span></h2>
  ...
</div>
```

4. Save the file.

**Expand Communication History When the Page Opens**

You can edit the page to change the displayed communication history.

1. Open `/views/pages/mobile/account/questions/detail.php`
2. Locate this code.

```html
<h2 id="rn_QuestionThread">#rn:msg:COMMUNICATION_HISTORY_LBL#</h2>
<div class="rn_Hidden rn_QuestionThreadContent">
  ...
</div>
```
3. Edit the code to include the `rn_Expanded` class.

```html
<h2 id="rn_QuestionThread" class="rn_Expanded">#rn:msg:COMMUNICATION_HISTORY_LBL#</h2>
<div class="rn_Padding">
  ...
</div>
```
4. Save the file.

**Expand Additional Details When the Page Opens**

You can edit the page to change the display of additional details.

1. Open `/views/pages/mobile/account/questions/detail.php`
2. Locate this code.

```html
<h2 id="rn_QuestionDetails">#rn:msg:ADDITIONAL_DETAILS_LBL#</h2>
<div class="rn_Hidden rn_Padding">
  ...
</div>
```
3. Edit the code to add the `rn_Expanded` class.

```html
<h2 id="rn_QuestionDetails" class="rn_Expanded">#rn:msg:ADDITIONAL_DETAILS_LBL#</h2>
<div class="rn_Padding">
  ...
</div>
```
4. Save the file.

**Edit Labels on the Question Details Page**

You can edit any of the message bases, including field labels, on the Question Details page.

1. Open `/views/pages/mobile/account/questions/detail.php`
2. Locate this code.

```html
<h2 id="rn_QuestionUpdate">#rn:msg:UPDATE_THIS_QUESTION_CMD#</h2>
```
3. Edit the message base to include your customized label.
Edit the Account Settings Page Title

You can edit the page to modify the available labels, titles, headings, and fields.

2. Locate `<h1>`#rn:msg:ACCOUNT_SETTINGS_LBL#</h1>`.
3. Edit the code with your new heading.
   `<h1>Your Current Profile Settings</h1>`
4. Save the file.

Edit Message Bases on the Account Settings Page

You can edit any of the message bases and labels on the Account Settings page.

2. To change the “Change your password” message:
   a. Locate `<a href="/app/account/change_password#rn:session#">#rn:msg:CHG_YOUR_PASSWORD_CMD#</a><br/>
   b. Edit the code with your new message.
   `<a href="/app/account/change_password#rn:session#">Click here to change your password.</a>`
3. To change the label for the Email Address field:
   a. Locate `<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" validate_on_blur="true" label_input="#rn:msg:EMAIL_ADDR_LBL#" />`  
   b. Edit the code with your new message.
   `<rn:widget path="input/FormInput" name="Contact.Emails.PRIMARY.Address" required="true" validate_on_blur="true" label_input="Your primary email address" />`
4. Save the file.

Add or Remove Contact Fields on the Account Settings Page

You can edit the page to modify the available fields and labels.

2. To add one or more contact fields, insert the appropriate code.
   - To add the alternate email address fields to the page, add this code.
     `<rn:widget path="input/FormInput" name="Contact.Emails.ALT1.Address" />
     `<rn:widget path="input/FormInput" name="Contact.Emails.ALT2.Address" />`
   - To add a radio button selection that lets customers opt in to communications from your marketing department, add `<rn:widget path="input/FormInput" name="Contact.MarketingSettings.MarketingOptIn" />` to the block of FormInput widgets on the page.
3. To remove one of the contact fields, locate the line of code that displays the field and delete it.
4. Save the file.

Edit Message Bases on the Change Password Page

You can edit the page to modify the available message bases, labels, and fields.

2. To edit the heading,
   a. Locate <h1>#rn:msg:CHANGE_YOUR_PASSWORD_CMD#</h1>.
   b. Enter the new heading between the <h1> tags.
3. To edit labels for any of the password fields, locate this code:
   ```
   <rn:widget path="input/PasswordInput" name="Contact.NewPassword" require_validation="true"
     require_current_password="true" label_input="#rn:msg:PASSWD_LBL#"
     label_validation="#rn:msg:VERIFY_PASSWD_LBL#" initial_focus="true"/>
   ```
   a. To edit the Current Password label, add the label_current_password attribute and set its value to the label you want.
   b. To edit the Password label, edit the value for the label_input attribute.
   c. To edit the Verify Password label, edit the value for the label_validation attribute.
4. Save the file.

Edit Password Label on the Change Password Page

If you set a minimum password length that customers must enter when they're creating an account or changing their password, passwords are automatically required.

2. Locate
   ```
   <rn:widget path="input/FormInput" name="Contact.NewPassword" require_validation="true"
     label_input="#rn:msg:PASSWD_LBL#" label_validation="#rn:msg:VERIFY_PASSWD_LBL#" initial_focus="true"/>
   ```
3. Edit the label_input attribute of the FormInput widget to define password length information.
   ```
   <rn:widget path="input/FormInput" name="Contact.NewPassword" require_validation="true"
     label_input="Password (8 characters minimum)" label_validation="#rn:msg:VERIFY_PASSWD_LBL#"
     initial_focus="true"/>
   ```
4. Save the file.

Developer Information

The mobile reference implementation offers a JavaScript Module meta tag that enhances performance of the customer portal on mobile devices.

Another difference between the mobile and standard reference implementations is the styling of the development header and the information it contains. In order to automatically display the mobile page set to customers with mobile devices, the customer portal provides user agent mapping so you can define the page sets your customers see based on the browser they are using.

JavaScript Module Meta Tag

To support the higher latency on mobile browsers, a new page meta tag called javascript_module has been added.

If this tag is omitted, the same framework JavaScript as used in the standard reference implementation is loaded. Selecting the mobile option for this tag loads core components, but omits large and unnecessary modules. No deprecated code will be loaded, and the autoload.js file will not be loaded either.
7 Chat Configuration

Overview of Chat

Though self-service and email response management can solve the majority of customer issues, one-on-one interaction remains the best venue and value for certain queries.

With B2C Chat, you can provide access to agents for customer questions and issues that merit human interaction between your supervisors and agents, and agents and customers through real-time chat sessions. You must configure Chat for supervisors, agents, and customers to take advantage of these functions. To get started, become familiar with the following interactions.

- The administrator configures chat for staff and customers.
- The Chat component manages connections, pushes chats to agents, and creates incidents from chats.
- The supervisor manages agents and monitors agents and chats.
- The agent chats with customers, suggests answers, conferences another agent, transfers customers, and cobrowses with customers.
- The customer submits a chat request, searches the knowledge base, reviews suggested answers, and cobrowses with agents.

After you implement Chat for your application, you can measure its effectiveness using powerful analytics. See Real-Time Reports and Chat Audit Report.

How You Configure Chat for Supervisors and Agents

When configuring Chat, it is important that you set certain configuration options before others.

Chat session queues must be added before they will display in profiles, and profiles must be added or updated before they can be assigned to agents. We recommend that you configure Chat options in the following order.

**Note:** Configuration options will not be visible until Chat is enabled. To enable Chat, contact your Oracle account manager.

1. Add chat session queues. See Add or Edit a Chat Session Queue.
2. Add chat agent statuses. See Add or Edit a Chat Agent Status.
3. Add chat reports to navigation sets. See Chat Reporting.
4. Add or update profiles to include Chat permissions. See Add Chat Permissions to a Profile.
5. Add or update staff accounts to use profiles that include Chat permissions. See Add or Edit a Staff Account.

Add or Edit a Chat Session Queue

Chat session queues, when used with profiles and business rules, enable automatic sorting of incoming chats based on contact, organization, product, category, and custom field information.
A wireless communications organization, for example, might have agents that specialize in different types of sales products or services. You could add chat session queues such as cell phones and wireless service. You would then create profiles that let agents access the different queues and assign the appropriate profile to your agents based on their area of expertise.

**Tip:** The following chat configuration settings are not interface specific; the setting in the primary interface takes precedence:

- AVERAGE_WAIT_TIME_SAMPLES
- ESTIMATED_WAIT_TIME_SAMPLES
- IDLE_QUEUE_WAIT_TIME_RESET_SECONDS
- MIN_WAIT_INFO_UPDATE_SECONDS

Setting each configuration setting in additional interfaces to the same value as the primary interface avoids confusion. See *Overview of Multiple Interfaces*.

*Business rules*, which perform actions on incoming chat requests based on specific conditions, can be used to automatically assign incoming chat requests to specified chat session queues. This ensures that chat requests are routed to the appropriate agent based on the agent’s skill set. See *Overview of Business Rules*.

**Note:** If you try to delete a chat session queue that is used in a business rule, a message displays the rules that depend on the queue. Before you can delete the chat session queue, you must first edit the rules so they no longer use the queue.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Customizable Menus**.
   The Customizable Menus tree opens on the content pane.
3. Click the arrow next to the System Menus folder to expand the list.
4. Click **Chat Queues** to display the editor.
   Chat has one default chat session queue named Default Chat Queue. The name of the default queue can be changed, but the queue cannot be deleted. All incoming chat requests are routed to the Default Chat Queue unless new queues are added and *business rules* are implemented to route chats to the new queues.
5. Do one of the following:
   - To add a chat session queue, click **New** to display the editor.
   - To edit a chat session queue, click it in the list.
6. Enter the name of the chat session queue in the **Label** field.
   When using multiple-language interfaces, you must enter the name in the Label field in the language of the interface.
   The same name is added to the Label field in the Interface Visibility section.
7. To designate the queue for use with advanced routing of chat requests, select the **Advanced Routing** check box and enter field information. See *How You Configure Advanced Routing for Chat*.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting Minimum Score</td>
<td>Enter a value from 0 to 5 for each skill. Incoming chats will be first routed to those agents meeting this score.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Lowest Minimum Score</td>
<td>Enter a value from 0 to 5 for each skill. Only agents meeting this minimum skill level can be assigned chats from this queue.</td>
</tr>
<tr>
<td>Relax Score Requirement After</td>
<td>Enter a value in seconds for the queue. The score requirement will be relaxed after the time you specify. Skills are relaxed at the queue level. A value of 0 seconds disables skill relaxation.</td>
</tr>
<tr>
<td>Score Decrement Amount</td>
<td>Enter the score value from 1 to 5 for each skill to be decremented when it meets the relaxation time.</td>
</tr>
<tr>
<td>Overflow Timer</td>
<td>Enter a value in seconds after which the chat will be routed equally to agents assigned the queue as a primary or an overflow. Overflow will be disabled if this field is set to 0, and only agents assigned the queue as a primary will receive chats from this queue.</td>
</tr>
</tbody>
</table>

8. To designate the queue for use with third-party-initiated chat requests, select the **External** check box. The read-only VA Enabled check box is used to designate the queue for use with virtual assistant initiated chat requests.

9. To change the order in which chat session queues display on the editor, select the queue, and click **Move Up** or **Move Down**.

10. Click **Save**.

- How You Configure Virtual Assistant

## Add or Edit a Chat Agent Status

An agent’s status describes his or her availability to chat with customers as well as assist supervisors and other agents with their chats.

Although Chat contains default chat agent statuses, you can create custom agent statuses and associate them with either the Available or Unavailable status type. While working in Chat, agents can change their status as necessary. By default, Chat has five chat agent statuses that are assigned to three chat status types.

- **Available**—The Available status type signifies that the agent is available to chat.
  - Unrestricted—The Unrestricted status indicates that there are no restrictions to an agent’s availability to chat.

- **Unavailable**—The Unavailable status type signifies that the agent is not available to chat.
  - Unqualified—The Unqualified status indicates that the agent did not specify a reason for being unavailable to chat.
  - In Meeting—The In Meeting status indicates that the agent is in a meeting and is not available to chat.
  - On Break—The On Break status indicates that the agent is on a break and is not available to chat.

- **Logged Out**—The Logged Out status type is restricted to the Unspecified chat agent status type and cannot be modified.
  - Unspecified—The Unspecified status indicates that the agent is logged out of Chat. This chat status does not display to staff on the Agent Status drop-down menu.
The default chat agent statuses may be enough for your organization. However, if additional chat agent statuses will help you more accurately determine the status of agents, then you can add them.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree displays on the content pane.
3. Click the arrow next to the System Menus folder to expand the list.
4. Click Chat Agent Statuses to display the editor.
5. Do one of the following:
   ○ To add a chat agent status, click New to display the editor.
   ○ To edit a chat agent status, click it in the list. The In Meeting and On Break default chat agent statuses and custom chat agent statuses can be deleted.
6. Enter the name of the chat agent status in the Label field. The same label is added to the Label field in the Interface Visibility section.
7. Click the Status drop-down menu and select a status type. The options include Available, Unavailable, and Logged Out. After you save a chat agent status, you can change its label but not its status.
8. To change the order in which chat agent statuses display on the editor, select the status and click Move Up or Move Down.
9. Click Save.

When you add a chat agent status, you must assign it to one of the default status types and then make it available through the Chat Agent Statuses section in profiles. See Add Chat Permissions to a Profile.

Chat Reporting

Agents and supervisors use chat reports to view and monitor chat activity.

Chat reports are available in Public Reports/Service/Chat Reports and include real-time reports that are refreshed at a default rate of fifteen seconds or less, and a chat audit report. You can view the reports and, with appropriate permissions, edit them inline or delete selected chats. Reports that can be edited or have chats deleted must include first name, last name, email, IP address, or subject fields.

For editing a chat report inline, the report must have inline editing enabled, automatic saving of inline edits enabled, and your profile must include Edit permission for chats.

For deleting a selected chat, the report must have the delete command enabled and your profile must include Delete permission for chats. You can only delete one chat at a time. When chats are deleted, they will no longer display on the Chat Conversion by Agent report.

</table>
Chat Audit Report
The Chat Audit report is a top-level report that provides a 360-degree view of chat data during a selected time period.

The report includes drill-down links into associated audit detail reports and is available in Public Reports/Service/Chat Reports/Audit Reports.

Tip: To view column definitions in the Chat Audit report, hover over the column headings.

Add a Real-Time Chat Report to a Navigation Set
Add real-time chat reports so staff members can view a dashboard of their chat activity.

Before staff members chat with customers, we recommend that you add the applicable real-time chat reports to their navigation sets so they can view a dashboard of their chat activity. See Real-Time Reports.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Navigation Sets.
   The Navigation Sets explorer opens on the content pane.
3. Double-click the navigation set used by your agents.
   The content pane displays the Navigation Sets editor.
4. On the right side of the content pane, select Communication Center.
   All Communication Center items display in the lower portion.
5. On the left side of the content pane, expand Public Reports/Service/Chat Reports/Real-Time Reports to open the folder with real-time chat reports.
6. To configure the navigation set for agents, drag Chat Agent Home–Real Time from the left column and drop it in the lower portion of the right column.
7. To configure the navigation set for supervisors, drag Chat Supervisor Home–Real Time from the left column and drop it in the lower portion of the right column.
8. Click Save.

The navigation set containing Chat Agent Home or Chat Supervisor Home must be selected in the Interfaces section on the Profile editor. See Add Chat Permissions to a Profile.

- Overview of Navigation Sets

Add Chat Permissions to a Profile
Chat is not fully functional until staff members have been assigned as agents.

After you create or edit a profile containing Chat permissions, you can then assign the profile to individual staff members. This lets you designate which staff members have access to Chat. You can assign Chat permissions to one or more profiles based on your organization's needs.

1. Click Configuration on the navigation pane.
2. Expand **Staff Management**, and then double-click **Profiles**. The report opens on the **content pane**.
3. Double-click the profile you want to edit. The **Profiles** editor opens.
4. Click **Permissions**.
5. Click the **Service** tab and scroll down to Chat permissions.
6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Agent Permissions</td>
<td>Select the <strong>Select All</strong> check box to select all options in the Chat section. If you do not want agents having full chat permissions in their profile, you must clear the check boxes next to the functions you do not want agents to access.</td>
</tr>
<tr>
<td>Chat</td>
<td>Select to let staff members with this profile chat with customers.</td>
</tr>
<tr>
<td>Supervisor</td>
<td>Select to let staff members with this profile have supervisory permissions in Chat.</td>
</tr>
<tr>
<td>Monitor</td>
<td>Select to let supervisors with this profile monitor other agents. This check box cannot be selected unless the Supervisor check box is selected, as monitoring can be performed only by supervisors.</td>
</tr>
<tr>
<td>Conference/Transfer to Other Groups</td>
<td>Select to let staff members conference with agents in other groups and transfer customers to agents in other groups. Agents can always conference with agents in their own group and transfer customers to agents within their own group.</td>
</tr>
<tr>
<td>Pull Chat</td>
<td>Select to let agents pull chats from the wait queue. By default, the chat server automatically pushes chat requests to agents. If the Pull Chat check box is selected, a corresponding pull policy must be selected so that chat requests are offered to agents when they click Request Chat on the Live Media bar.</td>
</tr>
<tr>
<td>Allow Decline</td>
<td>Select to let agents with this profile manually decline chat requests. If Allow Decline is selected, but Auto Decline is not, chats will automatically be assigned to agents if they click X on the top of toast invitations. To decline chats, agents must click Decline on toast invitations.</td>
</tr>
<tr>
<td>Auto Decline</td>
<td>Select to let the system automatically decline chat requests when the toast notification expires. The chat toast expiration timeout can be configured through the CHAT_ALERTFORM_AUTOCLOSE_TIMEOUT configuration setting.</td>
</tr>
<tr>
<td>Set Max Active Chats</td>
<td>Select, and in the associated <strong>Max Active Chats</strong> field enter the maximum number of active chat sessions that a staff member can be engaged in. The value set in this field also determines the value that displays in the Maximum Active Chats field on the Options window. See <strong>Change Your Chat Options</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Set Delay Between Chats</strong></td>
<td>Select, and in the associated <strong>Delay Between Chats</strong> field enter the number of seconds that elapse before a new chat is presented to an agent. The value set in this field determines the value that displays in the Stagger Incoming Chats field on the Options window.</td>
</tr>
<tr>
<td><strong>Edit</strong></td>
<td>Select to let staff members edit existing chats.</td>
</tr>
<tr>
<td><strong>Delete</strong></td>
<td>Select to staff members delete chats.</td>

<tr>
<td><strong>Max Active Chats</strong></td>
<td>Enter the maximum number of active chat sessions that a staff member can be engaged in. The minimum value for this field is 1, the maximum value is 11, and the default value is 3.</td>
</tr>
<tr>
<td><strong>Max Total Chats</strong></td>
<td>Enter the maximum number of total chat sessions, both active sessions and those that are in wrap-up mode, that a staff member can be engaged in. The minimum value for this field is 1, the maximum value is 20, and the default value is 3.</td>
</tr>
<tr>
<td><strong>Delay Between Chats</strong></td>
<td>Enter the number of seconds that elapse before a new chat is presented to an agent.</td>
</tr>
<tr>
<td><strong>Virtual Assistant Profile</strong></td>
<td>This read-only check box is used to designate the profile for use with virtual assistant initiated chat requests.</td>
</tr>
<tr>
<td><strong>Enable Advanced Routing</strong></td>
<td>Select to designate the profile for use with advanced routing.</td>
</tr>
<tr>
<td><strong>Chat Queues</strong></td>
<td>Click to select the chat queue you want to be available for this profile, and click +. After selecting a queue, the queue can be moved up or down in the queue list. If needed, you can then select additional chat queues to associate with this profile. An agent must be assigned to a chat queue to log in to Chat and accept chat requests from customers.</td>
</tr>
<tr>
<td><strong>Pull Policy</strong></td>
<td>Click to select a pull policy that determines the queues that chat requests are retrieved from and their order.</td>
</tr>
<tr>
<td></td>
<td><strong>Strict priority</strong>—Uses the priority ranking of the available queues to determine which queue to pull chats from, starting with the highest ranking queue. Chats are pulled from this queue until the staff member’s active session limit is met or the queue is empty. If the queue is empty before the staff member’s limit is met, then chats are pulled from the queue with the next highest priority ranking.</td>
</tr>
<tr>
<td></td>
<td><strong>First due</strong>—Uses the order that chats were requested to determine which chats are sent to staff members. The first chat requested is the first chat pulled from a queue. Chats are pulled from all the staff member’s available queues in the order the chats were requested until the staff member’s maximum session limit is met or all queues are empty. Queue ranking will not affect the pull order.</td>
</tr>
<tr>
<td><strong>Advanced Routing - Chat Queues</strong></td>
<td>Click to select the advanced routing chat queue you want to be available for this profile, and click +. After selecting a queue, click the drop-down menu to designate it as Primary or Overflow and its order of priority. The queue can be moved up or down in the queue</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>list. If needed, you can then select additional advanced routing chat queues to associate with this profile.</td>
</tr>
<tr>
<td>Chat Agent Statuses</td>
<td>This section contains panels for moving chat agent statuses between the Available and Assigned lists. Chat agent statuses are added through the Chat Agent Statuses editor.</td>
</tr>
<tr>
<td>Available</td>
<td>The Available list displays chat agent statuses that are not available to agents on the Agent Status drop-down menu located on the Live Media bar. Select a status and click <strong>Add</strong> to move the status to the Assigned list.</td>
</tr>
<tr>
<td>Assigned</td>
<td>The Assigned list displays chat agent statuses that are available to agents on the Agent Status drop-down menu located on the Live Media bar. Select a status and click <strong>Remove</strong> to move the status to the Available list. By default, Logged Out–Unspecified is selected so agents are not automatically logged in to Chat when they log in to B2C Service. Select <strong>Available–Unrestricted</strong> to automatically log agents in to Chat (and make them available) when they log in to B2C Service.</td>
</tr>
</tbody>
</table>

7. Click **Save**.

Before agents can use Chat, you must assign a profile containing chat permissions to their staff accounts. See *Add or Edit a Staff Account*.

- Add or Edit a Chat Session Queue
- Add or Edit a Chat Agent Status

**Standard Chat Workspace**

Chat contains a standard chat session workspace that is used by supervisors and agents. The workspace determines what staff members see when they chat with customers or among themselves.

You can use the standard *workspace* or create custom workspaces by copying one to use as a starting point. You assign a workspace in the profile used by agents. If you do not assign a workspace, the system uses the default. The workspace used for chatting on the Agent Browser UI uses a different default standard workspace, the interaction workspace, that may also be customized.

**Chat sessions**—The chat sessions workspace displays when an agent accepts a chat from a customer or when a supervisor monitors a chat. It consists of information about the customer plus Engagement, Incidents, Page Peek, and View Browser History tabs.

- The Engagement tab consists of a Transcript section (where the chat session is recorded to) and a Compose section (where you enter your responses to customers).
• The Incidents tab contains a list of incidents previously submitted by customers, so you can review any correspondence that customers had with other agents prior to the chat session.

• The Page Peek tab is where you view a snapshot of the web page that the customer was viewing when the chat was initiated.

• The Visitor Browser History tab is where you view a list of up to fifteen URLs tracking the pages of your organization’s website that the customer was viewing prior to initiating the chat. The amount of time browser history is retained is configured using the VS_PURGE_NON_PAGELOAD_EVENT_DAYS configuration setting (Agedatabase/Batch Processing/Visitor Service).

**Note:** Engagement Engine must be enabled in order to configure and use page peek and visitor browser history. To enable page peek and visitor browser history, contact your Oracle account manager. We recommend creating a custom chat workspace and removing these tabs if you are not using page peek or visitor browser history.

Additional Chat Configuration Options

Powerful configuration options are available for Chat.

You can set service level requirements to ensure agents respond to customers in a timely manner, for example, or set up *standard text* to increase agent efficiency when responding to contacts. Chat can be integrated with guided assistance so agents can present *guides* to contacts when they are chatting with them. Chat can also be integrated with *Feedback* so that contacts are presented with a *survey* at the conclusion of a chat session.

**Service Level Requirements for Chat**

Chat has configurable service level requirements that let you set realistic service goals for your agents and reasonable expectations for your customers.

You can define the amount of time that elapses before a customer tab changes from green to yellow, indicating to the agent that the customer is waiting for a response. The Chat service level configuration settings are located in *Chat/General/Service Level*. See *How You Customize Configuration Settings* and *Chat with a Customer*.

**Agent and System Service Level Statistics**

From the Chat Agent Home dashboard, agents can view chat statistics, such as the available chat queues, the number of current chat sessions, active chats, waiting customers, average wait time, and average chat duration.
By default, all cumulative statistics are a representation of system activity for the last thirty minutes and are updated each minute. By configuring agent service level statistics, you can configure both the reporting, or “lookback” period, and the frequency of updates to meet your requirements. The agent service level statistics configuration settings are located in Chat/General/Service Level.

See How You Customize Configuration Settings and Chat with a Customer.

Standard Responses and URLs for Chat Sessions

By creating standard responses and URLs for agents to use during chat sessions, your agents can save valuable time by not having to type answers for commonly asked questions or URLs.

A Shortcut field lets agents quickly insert standard text responses and URLs during a chat session. To view the shortcut ID code, agents can hover over the response or URL entry to see the shortcut ID. Entering the shortcut ID in the Shortcut field and pressing Enter automatically sends the response or URL to the customer. For additional information about configuring standard text and URLs, see Add or Edit Standard Text.

**Tip:** If your organization uses variables in standard text, such as contacts.first_name, agents can enter (or copy and paste) the variable inline when responding to a customer. The variable is then replaced with the appropriate data before the response is sent to the customer. For additional information about configuring variables, see Add or Edit a Variable.

- Overview of Content Library

How You Configure Pulling Chats from the Wait Queue

By default, chats are automatically pushed to agents, but this functionality is configurable.

If you select the Pull Chat check box in an agent profile, agents can manually pull chat requests from the wait queue. If the Pull Chat check box is not selected, the Request Chat and Cancel Request buttons are disabled on the Live Media bar and chats are pushed to agents by the system.

**Note:** If the Pull Chat check box is selected, you must also select a pull policy. See Add Chat Permissions to a Profile.

By clicking the Request Chat button, the agent is requesting to pull a chat from the wait queue. If there is a chat in the wait queue, the agent will receive a toast notification that the agent can either accept or decline. If the wait queue is empty, the Request Chat button remains active, letting the chat server know that the agent is attempting to request the next chat that enters the wait queue.

How You Create Incidents from Chat Sessions

Chat sessions can be captured as incidents, letting you track all chat correspondence.

By default, an incident is created when a chat session begins. However, this functionality is configurable so that an incident can be created when a chat session ends or when prompted. In addition, incident fields can be added to the chat session workspace for viewing and editing purposes. By configuring the chat sessions workspace, you can customize this functionality to meet your organization’s needs.
**Note:** To create an incident when a chat session ends or with a prompt, you must copy the standard chat sessions workspace. The copied workspace will contain an Options button on the ribbon, which you can use to customize incident creation and editing. If you do not copy the chat sessions workspace, incident creation is dictated by the default behavior. Contact your Oracle account manager for more information.

The following default actions are performed at the conclusion of the chat session.

- The agent is prompted to enter wrap-up mode or to terminate the session. Wrap-up mode lets agents complete any post-chat tasks before automatically receiving the next chat request.
- If a customer account does not exist for the customer, a new customer account is created and a contact record is added to the knowledge base. If the email address field is not enabled on the Live Help page, the field is set to a generic email address (chat@nodomain.com).
- The Assigned field is set to the agent who participated in the chat session.
- The incident custom fields you have made visible on the Live Help page are updated.
- The chat conversation appears as a chat transcript on the Messages tab of the incident.
- The Subject field is populated with Chat Session.
- The status of the incident is set to Solved.

- Configure Incident Creation and Editing for Chat

Configure Incident Creation and Editing for Chat

By default, an incident is created when a chat session begins. However, you can customize the chat workspace so that an incident is created when a chat session ends or when prompted.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Workspaces**.
   - The Workspaces explorer opens on the content pane.
3. Click the **Standard** folder in the Workspaces tree.
4. Right-click the **Chat Sessions** workspace and select **Copy**.
5. Select the folder you want to add the copied workspace to.
6. Enter a name for the copied workspace in the **Name** field.
7. Click **OK**.
   - The workspace displays on the explorer in the folder that you selected.
8. Double-click the new workspace.
   - The workspace opens on the content pane.
9. Click **Options**.
   - The Chat Options window opens and the Related Incident Options tab displays by default.
10. Select related incident options.

<tr>
<td></td>
<td>chats.last_name and contacts.last_name</td>
</tr>
<tr>
<td></td>
<td>chats.c_id and incidents.c_id</td>
</tr>
<tr>
<td></td>
<td>This feature is disabled by default.</td>
</tr>
</tbody>
</table>

### Wrap-up Behavior

This section contains options for configuring wrap-up mode, which lets agents complete any post-chat tasks before automatically receiving the next chat request.

<table>
<thead>
<tr>
<th>Description</th>
<th>Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select this check box to automatically release a chat after wrap-up mode has ended.</td>
<td>This feature is enabled by default. This feature is not available for the enhanced Service Console.</td>
</tr>
</tbody>
</table>

### Wrap-up time (seconds)

Enter the number of seconds to specify the maximum time allowed for chat sessions to wrap up.

This option is set to 45 seconds by default. If it is set to zero, agents will be prompted when the chat disconnects to terminate or enter wrap-up mode if the Prompt the agent to enter wrap-up mode option is selected.

13. Click **Save**.

After configuring the custom workspace, it must be assigned to one or more profiles. See **Profiles**.
How You Configure the Preliminary Screen Pop

Preliminary screen pop functionality enhances toast notifications that agents view before accepting chats.

The preliminary screen pop displays as a two-column table that lets agents view additional information about chat requests.

The information that displays on the preliminary screen pop table can be specified for the Service Console using the CHAT_ALERTFORM_DISPLAY configuration setting. Note that any changes made will not affect the display on the Agent Browser UI. You can also disable the preliminary screen pop using the CHAT_ALERTFORM_ENABLED configuration setting. Both settings are located in Chat/General/Agent. See How You Customize Configuration Settings.

Related Topics

- Chat with a Customer

Enable Sneak Preview

Sneak Preview lets agents view chat dialog as it is being entered by the customer before the customer sends the message.

Sneak Preview is not enabled by default. Through configuration settings for individual interfaces, you can enable Sneak Preview and specify the time interval sneak preview data is sent to the agent. See How You Customize Configuration Settings. You must be using CP framework version CPv3.5 or later for Sneak Preview.

**Note:** Sneak Preview should only be enabled in accordance with your company's privacy and security requirements.

1. To enable Sneak Preview, set the SNEAK_PREVIEW_ENABLED configuration setting to Yes.
2. Set the SNEAK_PREVIEW_INTERVAL_MS configuration setting to specify the interval in milliseconds that the chat session sends sneak preview data to the agent.
   
   The default value is 3000 milliseconds (3 seconds).

Feedback for Chat

You can gather feedback during or after a chat session.

You have the ability to either send an invitation message to the customer containing a link to the survey during the chat session (website link survey), or have a browser window containing a survey open at the end of the chat session (transactional survey). Customer responses to the surveys are linked back to the chat session to facilitate reporting. See Overview of Surveys.
If you are creating a transactional survey, you must also create a *business rule* to trigger the survey upon completion of the chat session. See *Overview of Business Rules*.

**Guided Assistance for Chat**

Guided assistance guides can be added to custom chat sessions workspaces to assist agents as they chat with customers.

For information about adding the Guided Assistance control to a custom chat sessions workspace, see *How Fields Are Added to Workspaces and Scripts*. For information about how agents use guides while chatting with customers, see *Access Guided Assistance During a Chat Session*.

**Chat Presence Management**

Presence management ensures that chat participants are notified when either the agent or the customer experiences communication difficulties with the chat service.

By default, if the chat service does not receive signals from an agent or customer within two minutes, the chat service begins the process of disconnecting the agent or customer and handling any active chats in which either party is a participant. Presence management is available on a per-site basis. Because agents and customers are recognized by the chat service as existing in an active, absent, or disconnected state, three configuration settings are available for modifying the intervals in which agents and customers are recognized by the chat service. The chat presence management configuration settings are located in *Chat/General/Chat Session*.

**Proactive Chat**

With the proactive chat widget, you can offer a chat invitation to customers while they are using your website.

The proactive chat widget is accessed from the *customer portal*. You can configure the chat widget to select when the chat invitation is displayed to the customer based on the time the customer has spent on the page and the number of searches conducted as well as chat agent availability and estimated wait time. See *Overview of Chat on the Customer Portal*.

**Chat Data Purging**

Because chat data can potentially build up quickly, it can be purged according to configuration settings.

Configuration settings for purging chat data are located in *Agedatabase Utility/Chat Purging*.

**CAUTION:** When chat data is purged, it is permanently deleted from the database. If you need assistance with chat data purging, submit a service request on our *support site*.

**How You Configure Advanced Routing for Chat**

You can route incoming chats to agents with specific language or product skills. Routing chats to agents with a specific skill set ensures that customers’ questions are answered accurately and efficiently.

Products and categories selected by the customer and the language of the customer portal page from which the chat was initiated determine which agent skills are required. If your customer is viewing the English version of the customer portal when they initiate the chat, connecting them to a chat agent fluent in English is going to provide the best experience. If your customer is looking for information about your newest product, connecting them to a chat agent who is an expert with that product is going to provide the quickest resolution. When a chat is initiated, if there is no agent logged in with the specific skill required by your customer, advanced routing relaxes the skill requirement immediately to prevent the chat from becoming stuck in the queue.
You can also use advanced routing primarily for the queue overflow capabilities without defining skills.

You can track the performance of advanced routing of chat sessions using standard reports available in Public Reports/Service/Advanced Routing.

**Note:** Advanced routing reports and configuration options will not be visible until Chat and Smart Interaction Hub are enabled. To enable, contact your Oracle account manager.

You must complete the following tasks before you can configure and use advanced routing for incoming chats.

1. Define products and categories. See Search Optimization Using Products, Categories, and Dispositions.
2. Add product and category fields to the Live Help page of the customer portal.
3. Create an advanced routing chat queue. See Add or Edit a Chat Session Queue.
4. Create and activate a rule to route chats to the advanced routing chat queue. See Overview of Business Rules.
5. Assign advanced routing permissions to a profile. See Add Chat Permissions to a Profile.

Additionally, if you are using advanced routing with products or categories, you must configure skills and staff account skill scores to finish the configuration and begin using advanced routing for incoming chats. See Assign the Skill Edit Permission in Profiles, Add Skills, and Assign Skill Scores to a Staff Account.

### Assign the Skill Edit Permission in Profiles

Assign the Skill Edit permission in profiles for advanced routing.

1. Click Configuration on the navigation pane.
2. Expand Staff Management, and then double-click Profiles.
   - The report opens on the content pane.
3. Double-click the profile you want to edit.
   - The Profiles editor opens.
4. Click Permissions.
   - The Permissions page opens.
5. Select the Skill Edit check box in the Administration section on the Administration tab.
6. Click Save.

You must add Product Skills and Language Skills to the navigation set. See Edit a Navigation Set.

### Add Skills

Add skills for advanced routing.

1. Click Configuration on the navigation pane.
2. Expand Service, and then double-click Language Skills or Product Skills.
   - The Skills editor displays on the content pane.
3. Do one of the following:
   - To add a skill, click New to display the editor.
   - To edit a skill, click it in the list.

   You can delete a skill at any time by selecting the skill entry in the tree and clicking Delete. However, when you delete a skill, all instances of the skill will also be deleted.
4. Enter field information.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Skill Name</td>
<td>Enter the name of the skill.</td>
</tr>
<tr>
<td>Template ID</td>
<td>This read-only field identifies the type of skill.</td>
</tr>
<tr>
<td>Label</td>
<td>Select the interface.</td>
</tr>
<tr>
<td>Characteristics</td>
<td>This section specifies the language, product, or category for the skill.</td>
</tr>
<tr>
<td>Language</td>
<td>Select a language from the drop-down menu.</td>
</tr>
<tr>
<td>Product</td>
<td>Select a product from the drop-down menu.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category from the drop-down menu.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

#### Assign Skill Scores to a Staff Account

Assign skill scores to a staff account for advanced routing.

You can assign skills to a staff account at the profile level or at the individual staff account level. Skills assigned at the profile level are inherited by staff accounts assigned to that profile, but skills can be modified and added to individual staff accounts.

1. Click **Configuration** on the navigation pane.
2. Do one of the following:
   - To assign skills to a profile, expand **Staff Management**, double-click **Profiles**, and then double-click the profile you want to edit. The **Profiles** editor opens.
   - To assign skills to a staff account, expand **Staff Management**, double-click one of the staff account reports, and then double-click the individual account you want to edit. The **Account Details** editor opens.
3. Click **Skills**.
   - The **Account Skill Scores** window opens.
4. Select the **Product** or **Language** tab.
5. To add a product or language:
   - a. Select the product or language from the drop-down menu.
   - b. Click the green + (plus) sign.
   - c. Assign the skill an account score from the drop-down menu.
6. To modify a skill at the account level that was inherited by a profile, click the blue arrow next to the skill score.
   **Note:** Changing an agent’s inherited skill score to 0 is not the same as assigning an agent to a profile without that skill. After the advanced routing queue has relaxed to a score of 0, the chat will be routed to an agent with a skill score of 0. The chat will only be routed to an agent assigned a profile without the skill if no other agents with that skill are logged in.
7. To delete a skill, click the red X next to the skill score.
   - Skills assigned at the profile level can only be deleted at the profile level.
Assign Engagement Engine Rules Permissions in Profiles

Engagement engine rules give you greater control over when, where, and how proactive and reactive chats are provided to your customers.

Engagement engine rules must be enabled. Contact your Oracle account manager.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Profiles**.
   The report opens on the content pane.
3. Double-click the profile you want to edit.
   The Profile editor opens.
4. Click **Permissions**.
   The Permissions page opens.
5. Select **Engagement Engine Rules** on the Administration tab.
6. Click **Save**.
7. Add the Engagement Engine Rules item to your configuration list for the Configuration button.
   See [Create a Navigation Set for the Administrator](#).

Access the Engagement Engine Rules Editor

Engagement engine rules give you greater control over when, where, and how proactive and reactive chats are provided to your customers. A robust set of built-in rule conditions regarding customer behavior and page data determine the initiation of a chat offer.

Engagement engine rules must be enabled. Contact your Oracle account manager.

1. Double-click **Engagement Engine Rules** in the configuration list.
   The Engagement Engine Rules editor login screen opens on the content pane.
2. Enter your user ID, password, and account ID, provided by your Oracle account manager.
3. Click **Log In**.
   The Engagement Engine Rules editor opens on the content pane.
4. For detailed procedures about creating and editing engagement engine rules, click **Help**.

For more information about Engagement Engine, see *Using Oracle Engagement Engine*.

Visitor Browser History

Visitor browser history gives you more information about what your customers were viewing prior to initiating a chat.

A list of up to fifteen URLs tracking the pages of your organization’s website displays on the visitor browser history tab of the chat workspace. Visitor browser history provides agents with valuable information about what customers were viewing before requesting a chat. An agent’s profile must include access to the primary interface for visitor browser history to display.

**Note:** Engagement Engine must be enabled and all pages of your organization’s website that you want to track must contain the engagement engine tag. Contact your Oracle account manager. See *Oracle Engagement Engine Cloud Service* for more information.
How You Configure Chat for Customers

Many options are available for customizing Chat to match your business requirements. Because the chat pages are integrated with the customer portal, they are highly configurable.

| Note: Chat must be enabled in order for your customers to chat with agents. Contact your Oracle account manager. |

See the following configuration topics:

- The Live Help Page
- Chat Page Configuration
- How You Configure Virtual Assistant

The Live Help Page

The Live Help page on the customer portal is your customers’ entry point for submitting chat requests. Within each section you can place incident custom fields to gather additional information before customers can engage in chat. See Overview of Chat on the Customer Portal.

See Set Chat Hours to control when customers can submit chat requests.

Set Chat Hours

You can set chat hours for Chat availability to control when customers can submit chat requests.

The available chat hours you set are displayed on the Live Help page. Outside of those chat hours, customers cannot request assistance. You can also specify more than one set of chat hours per day to allow for multiple time periods in a single day (for example, if you wanted to offer chat during peak traffic times only, such as 8:00 A.M. to 12:00 P.M. and 1:00 P.M. to 5:00 P.M.).

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click Interfaces.
   The Interfaces tree displays on the content pane.
3. Click the interface for which you want to add chat hours.
   The Interfaces editor displays on the content pane.
4. Click Chat Hours.
   The Chat Hours page opens.
   Chat hour intervals will always be entered at the bottom of the list, but when you save your changes, the intervals are arranged in chronological order.
5. Enter field information.

<table>
<thead>
<tr>

<tr>
<td><strong>Day</strong></td>
<td>Click in this field and select the day of the week from the drop-down menu. Use this functionality to specify more than one set of chat hours per day to allow for multiple time periods in a single day.</td>
</tr>
<tr>
<td><strong>Start Hour</strong></td>
<td>Enter the hour of the day that you want the service interval to begin. This field uses the 24-hour clock. For example, enter 8 for 8:00 A.M and enter 17 for 5:00 P.M.</td>
</tr>
<tr>
<td><strong>Minute</strong></td>
<td>Enter the minute of the hour that you want the service interval to begin.</td>
</tr>
<tr>
<td><strong>End Hour</strong></td>
<td>Enter the hour of the day that you want the service interval to end. This field uses the 24-hour clock. For example, enter 8 for 8:00 A.M and enter 17 for 5:00 P.M.</td>
</tr>
<tr>
<td><strong>Minute</strong></td>
<td>Enter the minute of the hour that you want the service interval to end.</td>
</tr>
<tr>
<td><strong>Holidays</strong></td>
<td>Select the holidays that will affect your chat hours. Chat hours will not be available during selected holidays. If you have not defined any holidays, this field is blank.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

The chat hours will now appear on the Live Help page of the customer portal.

**Chat Page Configuration**

Because your organization has its own image and web presence, you may want to customize the Chat page to match the look and feel your customers have come to expect.

The Chat page opens after customers submit chat requests from the Live Help page. From this page, customers can chat with agents, send file attachments, and print chat correspondence. You can customize the look and feel of the Chat page.
To learn more about Chat and how agents interact with customers while chatting, see *Chat for Agents*.

### How You Configure Virtual Assistant

If your site is integrated with Oracle Virtual Assistant (Virtual Assistant), you can route incoming chats to a virtual assistant.

For complete information about Virtual Assistant, see *Using Virtual Assistant*.

Using virtual assistant chats, you can ease the volume of chats requiring an agent. Many customer questions can quickly be answered with existing information in the knowledge base. Agent chats and virtual assistant chats can be initiated, routed, and tracked through the Service Console.

**Note:** The Virtual Assistant component must be enabled in both B2C Service and Virtual Assistant. Contact your Oracle account manager.

After Virtual Assistant is enabled, you need to perform the following steps so incoming chats can be routed to the virtual assistant.

1. Assign the Virtual Assistant Edit permission to your profile—You will need this permission in order to configure the virtual assistant for your application. See *Add Virtual Assistant Edit Permissions to a Profile*.
2. Add the Virtual Assistant editor to a navigation set—All configuration takes place on this editor. See *Add the Virtual Assistant Editor to a Navigation Set*.
3. Create the virtual assistant profile, account, and chat queue—In this step, you will define the virtual assistant name that will display to customers during a chat and the chat queue that will handle incoming chats and escalation. After you fill in this information and save it to the database, the virtual assistant profile is created automatically. See *Create a Virtual Assistant Profile, Account, and Queue* and *Add or Edit a Chat Session Queue*.
4. Create chat rules to route virtual assistant chats and escalate virtual assistant chats to agents when necessary. Upon escalation, you can view a complete transcript of the virtual assistant chat leading to a smooth transition from virtual assistant to agent. See *Route Chats to Virtual Assistant* for steps to create rules.
Add Virtual Assistant Edit Permissions to a Profile
Add Virtual Assistant edit permissions to a profile to configure the Virtual Assistant.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Profiles**.
   The report opens on the content pane.
3. Double-click the profile you want to edit.
   The Profiles editor opens.
4. Click **Permissions**.
5. Select the **Virtual Assistant Edit** check box in the Administration section on the Administration tab.
6. Click **Save**.

Add the Virtual Assistant Editor to a Navigation Set
Add the Virtual Assistant editor to a navigation set for Virtual Assistant configuration.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Navigation Sets**.
   The Navigation Sets explorer opens.
3. Right-click the navigation set you want to edit and select **Open**.
   The navigation set opens on the content pane.
4. Click **Configuration** on the right side of the content pane.
   The folders and configuration items associated with this button display in the lower portion of the right column.
5. Expand the **Components** list and **Common** folder in the left column.
6. Click the **Virtual Assistant Editor** item and then click **Add**.
7. Click **Save**.

Create a Virtual Assistant Profile, Account, and Queue
Define the virtual assistant name that will display to customers during a chat and the chat queue that will handle incoming chats and escalation. After you fill in this information and save it to the database, the virtual assistant profile is created automatically.

You can have only one virtual assistant account and one virtual assistant queue. After they are created, the virtual assistant profile, account, and queue cannot be deleted. However, you can change the names of the virtual assistant account and queue using the Virtual Assistant editor.

1. Click **Configuration** on the navigation pane.
2. Double click **Virtual Assistant Editor** in the list.
3. Enter the name for the virtual assistant in the **Display Name** field.
   This is the account name that will be displayed to customers during a chat.
4. Enter the name for the virtual assistant chat queue in the **Virtual Assistant Queue** field.
   This is the name of the chat queue that you will use to configure rules to handle incoming chats and escalation.
5. Click **Save**.
   The virtual assistant profile (automatically labeled VA_Accounts_Profile), virtual assistant account, and virtual assistant queue are created.

In order to complete the configuration and begin routing incoming chats to the virtual assistant, you must create chat rules. See **Route Chats to Virtual Assistant**.

Route Chats to Virtual Assistant
Create business rules to route chats to the virtual assistant queue and to escalate chats to an agent when certain conditions are met.
You must configure a Virtual Assistant account, profile, and queue before routing chats to Virtual Assistant. See Create a Virtual Assistant Profile, Account, and Queue.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Rules**.
3. Click **Chat**.
4. Click **Edit** to enter the edit mode.
5. Create an Initial State, if one doesn’t exist, and a state named **VA_State**.
   a. Right-click **States**.
   b. Select **New State**.
   c. Enter the name of the state (either **Initial State** or **VA_State**) in the **State Name** field.
   d. Select the **Initial State** check box if this is the Initial State.
   e. Click **Save**.
   The state appears in the Rules tree.
6. Right-click **Initial State**, then select **New Rule**.
   The **Edit Chat Rule** window opens.
7. Enter the name of the rule in the **Rule Name** field.
   For example, name the rule **VA_Rule**.
8. Click **Add IF Condition Based On**, then select the field, operator and value for the condition.
   For example, you may want to route all incidents of a specific type to the virtual assistant queue.
9. Click **Add Action–Then** to choose the action that will be executed if the conditions are met.
   For example, create an Assign Chat Queue action to assign chats to the Virtual Assistant chat queue, and a Transition State and Stop with **VA_State** selected.
10. Click **Save**.
   The rule to route chats to the Virtual Assistant chat queue is saved.
11. Right-click **VA_State**, then select **New Rule**.
    The **Edit Chat Rule** window opens.
12. Enter the name of the rule in the **Rule Name** field.
    For example, name the rule **Escalation**.
13. Click **Add IF Condition Based On**, then select the same condition values you specified for the **VA_Rule**.
14. Click **Add Action–Then** to choose the action that will be executed if the conditions are met.
    For example, create an Assign Chat Queue action to assign chats to the chat queue used to escalate to a live agent, and a Stop Processing Rules action.
15. Click **Save**.
    The rule to escalate chats to a chat queue used by a live agent is saved.
8 Chat

Chat for Agents, Supervisors, and Customers

While self-service and email response management can solve the majority of customer issues, B2C Chat offers the best venue for certain queries, such as helping customers finalize purchases.

- Chat for Agents
- Chat for Supervisors
- Chat for Customers

Chat for Agents

As a chat agent, you can serve customers in real time through typed conversation.

While chatting, you can send predefined responses and URLs to customers, offering a faster response time. When you need assistance with a chat session, you can conference another agent into a chat or transfer a chat to another agent. Both the conference and transfer features can be useful if another agent is more knowledgeable in a particular area.

By default, when you begin chatting with a customer, Chat creates an incident from the chat session, which results in all correspondence being recorded to the knowledge base for resolution and reporting purposes.

Live Media Bar

With the Live Media bar, you can log in, log out, and set your status in Chat.

Chat must be enabled and your profile must include chat permissions to log in as an agent from the Live Media bar. You can request chats and cancel chat requests, manage active chat sessions, and view the status of your connection with the chat server.

The Live Media bar appears on the content pane regardless of which navigation list is selected or what is displayed on the content pane.

**Log in to Chat**

Log in to B2C Chat and view Chat–Real Time reports.

1. Click **Communication Center** on the **navigation pane**.
2. Double-click **Chat Agent Home–Real Time** or **Chat Supervisor Home–Real Time** in the **navigation list**. The dashboard opens on the **content pane**.
The **Chat Agent Home–Real Time** dashboard refreshes every fifteen seconds or less, depending on server load. The following reports display on the **Chat Agent Home** dashboard:

- **Chat Agent Queue Snapshot**—Shows the service statistics for each chat queue that the logged-in agent is assigned to.
- **My Chat Agent Statistics**—Shows chat agents their basic chat statistics, including average response time, engaged time, and chats completed.
- **Current Chat Queue Statistics**—Shows the service statistics for all of the chat queues.

**Note:** If the Chat Agent Home–Real Time or Chat Supervisor Home–Real Time reports do not display in your navigation list, you can add it if you have the correct profile permission. See *How You Customize Navigation and Configuration Lists*.

3. Click **Login Chat** on the Live Media bar.
4. Click **Agent Status** and select **Available**.
   
   Your administrator can configure your profile so that you are automatically logged in and available to chat after logging in to B2C Service.

<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Play Sound</td>
<td>Select to enable sound alerts whenever the chat is updated by the customer.</td>
</tr>
<tr>
<td>Color Window</td>
<td>Select to change colors on the customer tab as time passes to alert you that you need to respond to the customer. This option is selected by default. If this option is not selected, a colored icon will display on the customer tab whenever the customer updates the chat session.</td>
</tr>
<tr>
<td>Incoming Chat Assignment Control</td>
<td>Incoming Chat Assignment Control options apply only to new chat requests.</td>
</tr>
<tr>
<td>Maximum Active Chats</td>
<td>This number represents the maximum number of chat sessions that you can have active at one time. Click the up arrow to increase sessions and click the down arrow to decrease sessions. The maximum number is set by your administrator in your profile.</td>
</tr>
<tr>
<td>Stagger Incoming Chats (Seconds)</td>
<td>This number represents the amount of time that elapses before you are offered another chat. Click the up arrow to increase seconds and click the down arrow to decrease seconds.</td>
</tr>
</tbody>
</table>

3. Click **OK** to save your chat notification settings.

### Chat Sessions Workspace

It is important to familiarize yourself with the chat sessions workspace before chatting with customers.

Your main role is to chat with customers and access tools to answer their questions. This is accomplished through the chat sessions *workspace*.

This image shows the standard chat sessions workspace for an agent after accepting a chat request from a customer. Keep in mind that what you see may be different if your administrator has created a custom chat sessions workspace and assigned it to your *profile*. 
Notice the customer’s name on the content pane tab in the image. Additional tabs will display when you are engaged in multiple chat sessions.

After you accept a chat request, read-only customer fields display at the top of the content pane. See View Incidents Submitted by a Customer. Much of the information listed on the content pane is also provided in the toast invitation you see before accepting the chat request.

Chat Ribbon
While chatting with customers, multiple chat agent tools are available on the chat ribbon.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Undock</td>
<td>Click to undock the chat workspace editor from the console and display it in a separate window.</td>
</tr>
<tr>
<td>Terminate</td>
<td>Click to terminate the chat session.</td>
</tr>
<tr>
<td>Wrap-up</td>
<td>Click to conclude the chat and enter wrap-up mode. Wrap-up mode lets you do any post-chat tasks before automatically receiving the next chat request. Tasks can include creating an incident from the chat, adding the chat to an existing incident, or creating an opportunity from the chat.</td>
</tr>
<tr>
<td>Join</td>
<td>Click to join a chat session while monitoring a chat. This button is disabled until you begin monitoring a chat session.</td>
</tr>
<tr>
<td>Leave</td>
<td>Click to leave a chat session during a conference. For this button to be enabled, you must be the agent who was conferenced into the chat.</td>

**Chat Session Workspace Tabs**

A tab set below the customer’s contact fields contains information about the chat session and the customer’s existing incidents.

- **Engagement**—The Engagement tab is where you chat with customers.
  - The Transcript section contains all chat correspondence between you and the customer. As text is sent from the customer, it appears in the Transcript section with a time stamp. After you send text to the customer from the Compose section, it is added to the Transcript section with a time stamp.
  - The Compose section is where you respond to a customer during a chat session. You can use SmartAssistant to request answers from the knowledge base, manually search for answers in the knowledge base, and send predefined text and URLs to the customer.

- **Incidents**—The Incidents tab is where you view incidents that the customer has submitted prior to requesting the chat.
• **Page Peek**—The Page Peek tab is where you view a snapshot of the web page that the customer was viewing when the chat was initiated.

• **Visitor Browser History**—The Visitor Browser History tab is where you view a list of up to fifteen URLs tracking the pages of your organization’s website that the customer was viewing prior to initiating the chat. The amount of time browser history is retained is configured using the VS_PURGE_NON_PAGELOAD_EVENT_DAYS configuration setting (\texttt{Agedatabase/Batch Processing/Visitor Service}).

**Note:** Engagement Engine must be enabled in order to configure and use page peek and visitor browser history. Contact your Oracle account manager. We recommend creating a custom chat workspace and removing these tabs if you are not using page peek or visitor browser history.

**Related Topics**
- Agent Chat Tools
- Chat with a Customer

**Chat with a Customer**

If you are the agent selected for a chat request, you will receive a toast notification.

Through chat notification settings, you can also enable sound notification.

By default, the toast notification contains customer information, including the customer’s first and last names, email address, and any incident custom fields that have been configured by your administrator.

1. Click **Accept** on the toast invitation to accept the chat request and activate the chat session.
   An automatic greeting is sent to the customer and displays in the Transcript section.

   **Note:** By default, you have fifteen seconds to manually accept or decline an incoming chat request. After fifteen seconds, the toast notification closes and the chat request is returned to the chat queue from which it originated.
The customer tab is gray until the customer asks a question. After the customer asks a question, the customer tab turns green to notify you that it is your turn to respond. By default, the customer tab will change from green to yellow when a customer has been waiting for a response for thirty seconds. When the tab changes to red, it signifies that a customer has been waiting for sixty seconds. After you respond to the customer, the tab color changes back to gray. The timing of the changes in tab color can be configured by your administrator.

**Note:** If Sneak Preview is enabled, you see the customer’s entry in italics as it is being typed, letting you begin composing a response. After the customer sends the message, the customer’s message changes from italicized to regular font. It is a best practice to wait to respond until the customer has sent the message. If you have multiple active chats, you will only see Sneak Preview for the chat in focus.

2. Additional customer tabs display if you are engaged in multiple chat sessions. To manage the individual chat sessions, simply click the appropriate tab when the color changes from gray to green.

   You can also move between active chat sessions using the Active Chats drop-down menu on the Live Media bar. The colors of the selections in the drop-down menu correspond to the colors of the customer tabs.

3. Enter your reply in the message text box in the Compose section.
   a. By default, Render As is selected when responding to customers. To send XML, HTML, or any other type of markup language to the customer without the tags being rendered, select **Leave As Plain** and all of the markup tags will display in the response to the customer.
   b. To copy and paste text, press Ctrl+C and Ctrl+V.
   c. To start a new paragraph, press Shift+Enter.
   d. As you type, an inline spell checker recognizes misspelled words and marks them with a red zigzag underline. Right-click the misspelled word to see a list of substitute words from which you can choose.

   You can also choose to add words to your spell check dictionary. See **Spell Checking**.

4. Click **Send** or press Enter to send your response.

   Your response is added to the Transcript section and the customer’s tab color changes back to gray, signifying it is the customer’s turn to respond.

Email Address Sharing in Chat

Email address sharing lets you associate a single email address with multiple contact records.

By default, email address sharing is disabled, but when it is enabled and a contact submits a chat request, the Email field on the chat sessions workspace displays a yellow icon with a black exclamation point if a duplicate email address is detected by the system. Although contact-matching logic is used to determine which contact to associate the chat session with, you can manually change the contact association by clicking the Contact field and selecting Change. See Email Address Sharing.

Agent Chat Tools

Agent chat tools give you access to customer information, SmartAssistant suggested answers, answers in the knowledge base, and standard text.

In addition, you can transfer chats to other agents, conference other agents into your chat sessions, access guided assistance guides, and co-browse with customers. Agent chat tools are available only when chatting with customers.

View Incidents Submitted by a Customer

You can tailor your assistance to customers if you know what issues they are experiencing. For example, if a customer has an open incident in Service, you can view the contents of the incident while chatting with the customer.

1. While chatting with a customer, click the Incidents tab.

2. Double-click an incident to open it.

3. After reviewing the customer’s current incidents, click the Engagement tab to return to the chat.
Search for a Contact Record

You can access additional information about the customer using the Contact Search feature.

If the customer has a contact record in the knowledge base, for example, you can see any organization association and where the customer is located.

1. Do one of the following:
   - If a contact record exists, the customer's name appears in the Contact field. Click the customer's name and select Open to open the contact record. See Overview of Contacts.
   - If a contact record does not exist for the customer, the Contact field is blank. Click Search to the right of the Contact field to open the Contact Search window. See Record Search Options.

2. After viewing or editing the contact record, click OK to return to the chat session.

Access SmartAssistant Suggested Answers

While chatting with a customer, you can use SmartAssistant to suggest answers for a customer's question.

SmartAssistant searches the knowledge base and returns possible answers related to the chat history text. A new window opens containing links to the suggested answers. If an answer is pertinent, you can add the answer text or the answer link to the Compose section and send it to the customer.

1. Click SmartAssistant on the Compose section.
   - The SmartAssistant window opens.
2. To add the answer link to your response, click Add as Link.
3. To add the answer text to your response, click Add as Text.
4. Click Close.

How You Search the Knowledge Base

As you respond to a customer's question, you might remember answers that address similar issues. Rather than conducting a time-consuming hunt of the knowledge base to find the relevant answers, Service lets you search for specific answers.

Using any of four text searching techniques, you can quickly identify answers to resolve a customer's question. See Append Answer Content.

Insert Standard Text

Frequently used responses and URLs can be prepared in advance so that you can quickly send them to customers.

This tool not only helps you assist customers more quickly, but also eliminates typographical errors. Your administrator can also define shortcut IDs for standard responses and URLs. Then, you can enter an ID in the Shortcut field and press Enter to automatically insert the response or URL in the message text box in the Compose section.

1. Click Standard Text on the Compose section.
   - The Standard Text window opens.
2. Do one of the following:
   - Double-click a standard text item to automatically insert it into the Compose section of the response.
   - Click a standard text item to add it to the Preview section of the Standard Text window and click OK.
   - Drag the standard text item from the left column into the Compose section of the response.
   - Copy the text in the Preview section and paste it into the response.
To search for standard text, click **Find in List** above the left column. If an HTML version of the standard text item is available, it displays by default in the Preview section of the window. Otherwise, the plain text version displays.

**Tip:** If you know the shortcut ID, from the Compose section of the response, you can press F8, enter the keyboard shortcut, and click Enter. The standard text is inserted into the response.

The standard text is now ready to send to the customer.

**Note:** If your organization uses variables in standard text, such as *contacts.first_name*, you can type (or copy and paste) the variable inline when responding to a customer. The variable is then replaced with the appropriate data before you send your response to the customer. If a variable entry does not have a value associated with it, you must enter the value before sending your response to the customer.

3. Click **OK**.

**Transfer a Chat to Another Agent**

When necessary, you can transfer a chat to another agent during a chat session. This feature is helpful when another agent has more experience with a specific topic than you do.

1. At any point during your chat session, click **Transfer**.
   The **Select Names** window opens.

   **Note:** Select **Transfer to Queue** if you are not aware of a specific agent who can accept the transfer. Chat will then route the chat to an agent in the queue.

2. When you see the agent you want to transfer the chat to, select the agent's name and click **Request**.
   The agent receives a toast notification to accept, view, or decline the transfer request.
   - If the agent clicks View, the toast invitation closes, the chat transcript appears on both of your workspaces, the Compose section indicates *In Transfer Consultation*, and a message area is highlighted in blue for private messaging. You and the agent can chat before the other agent accepts or declines the transfer request. The customer cannot view messages sent in the private message area.
     - If the agent clicks Accept, the associated contact and incident are automatically saved, and the chat is transferred to the agent. After the transfer is made, the customer is notified that you left the chat and the new agent's name appears in the chat transcript instead of your name.
     - If the agent declines the conference, the chat stays with you.

**Related Topics**
- Conference Another Agent into Your Chat
Conference Another Agent into Your Chat

Agent conferencing is another way Service helps you provide superior service to your customers.

Conferencing can be useful when you want to include another agent in your chat session to help you solve a customer's problem.

1. At any point during your chat session, click Conference. The Select Names window opens.

2. When you see the agent you want to conference into the chat, select the agent’s name and click Request. The agent receives a toast notification to accept, view or decline the conference request.

   - If the agent clicks View, the chat transcript appears on both of your workspaces, the Compose section indicates In Conference Consultation, and a message area is highlighted in blue for private messaging. You and the agent can chat before the other agent accepts or declines the conference request. The customer cannot view messages sent in the blue private message area.

   - If the agent clicks Accept, the new agent is conferenced into the chat session. The chat transcript appears on both of your workspaces. After the conference starts, you and the customer are notified. Each person can send text and all those in the conference can see the message text and the name of the person who sent it. The Leave button is disabled on your ribbon because you initiated the conference. The agent you conferenced in must click Leave to exit the conference.

   - If the agent clicks Decline, the chat stays with you.

Access Guided Assistance During a Chat Session

The Guided Assistance control can be added to custom chat sessions workspaces so guides are available when you chat with customers.

At any point during a chat session, you can search for a guide or select a guide to resolve difficult questions.

**Note:** Guided assistance must be enabled before you can access guides on the chat sessions workspace. Contact your Oracle account manager.

1. While chatting with a customer, click Search for a Guide or Select a Guide on the Guided Assistance control. The Search for a Guide or the Select a Guide window opens.

2. To insert a question from the guide, click Add to Chat.

   Add to Chat is available for all questions and text explanations in guides.

   - If the Leave as Plain Text option is selected, all HTML tags and other code that is entered in the reply (including the code in guides) will display as unrendered.
The Include Choices check box controls how chat message text is formed from questions when you click Add to Chat. When the Include Choices check box is selected, the chat message text that is added to the Compose section includes both the question and its choices. When it is not selected, it includes only the question.

The Automatically Send check box controls what happens to the chat message text when you click Add to Chat. When this check box is selected, the chat message text is automatically sent to the customer. When it is not selected, it is added to the Compose section of the chat and is not sent to the customer until you click Send.

Cobrowse with a Customer

With Co-browse, you can guide a customer through a web page using your mouse or other pointing device to demonstrate actions.

In effect, you take control of the customer’s web browser to show the customer how to complete an action. Co-browse helps eliminate the confusion that can arise when giving instructions to customers through dialog or text. Co-browse is also effective for assisting customers in filling out forms or completing a sale.

**Note:** Co-browse must be enabled before you can begin a session with a customer. In addition, you can engage in only one co-browse session at a time.

1. While chatting with a customer, click **Screen Sharing**.

   A message informs you that an invitation is being sent to the customer to start a co-browse session. After the customer accepts the co-browse request, the chat transcript is updated with a link so you can view the customer’s desktop. Co-browse is also available for customers using mobile devices.

2. Click the link to view the customer’s desktop.

   Focus shifts from the Engagement tab to the Co-browse tab, where the customer’s desktop displays.
The Co-browse toolbar lets you control the co-browse session. Your viewing and options are limited depending on how your organization has set up the Co-browse deployment. Privacy settings can differ when you co-browse in Instant Co-browse mode or Advanced Co-browse mode. Your organization's administrator configures the privacy settings.

| Annotations | Click to make comments on the customer’s window.  
  o Select one of the displayed suggested colors, or click the last color option to open a color picker where you can select any color.  
  o Select the line width for your annotations.  
  Any comments you make are cleared from the window when you click Annotations again, or when the customer scrolls the page, resizes the browser window, or navigates from the page.  
  **Note:** Comments are only visible to you and the customer. If another agent is joined in the co-browsing session, comments you make are not visible to that agent. |

3. Click **Disconnect** to disconnect from the co-browse session.  
Both you and the customer are notified when the co-browse session has ended. The customer can also disconnect from the co-browse session at any time.  
**Note:** Although co-browse information is not recorded to the chat transcript, it is recorded to the knowledge base and can be viewed using standard co-browse reports. See [Cobrowse Session Reporting](#).

**Related Topics**  
- Configure Cobrowse on a Chat Workspace
Wrap Up and Terminate a Chat Session

Either you or the customer can end the chat session. If the customer ends the session, a message asks if you want to terminate or wrap up the session. Alternatively, you can click the Wrap-up or Terminate buttons to end the session.

By default, an incident is created when a chat session begins and an Incident field displays as a key field containing the incident’s reference number. You can edit the incident while chatting with a customer by right-clicking the reference number and selecting Open.

Your administrator can configure chat to create an incident when you terminate or wrap up a chat automatically, or by prompting you to save the chat as an incident for tracking and reporting purposes. If you choose to create an incident, it is assigned to you with a status and status type set by your administrator. The dialog from the chat session is inserted as a response thread.

1. To enter wrap-up mode, click Wrap-up.
   a. Complete any post-chat tasks such as creating an incident, adding the chat to an existing incident, or creating an opportunity from the chat. You can edit this incident in the same manner as any other incident, including changing the incident subject.

   When you create an incident, the chat transcript is inserted as a response thread on the Messages tab. The party that initially disconnected from the chat (customer or agent) is also identified in the response thread. In the event the chat transcript is converted to an incident and emailed to the customer, private chat messages that took place between you and other agents during the chat are hidden to prevent customers from seeing them.

   b. Click Terminate.

2. To end the session without entering wrap-up mode, click Terminate.

The chat session closes and the chat transcript is inserted as a response thread on the Messages tab of the incident.

Chat for Supervisors

Through real-time reporting, Chat makes it easy to manage a group of agents. It is important to familiarize yourself with the Chat Supervisor Home–Real Time dashboard before monitoring agents.

If you think it is necessary to intervene in a chat session, you can do so at any time by joining the chat and monitoring it.

The following reports display on the Chat Supervisor Home–Real Time dashboard. The Chat Supervisor Home–Real Time dashboard refreshes every fifteen seconds or less, depending on server load.

- **Current Chat Queue Statistics**—Shows the service statistics for each chat queue.
- **Current Chat Agent Statistics**—Shows the service statistics for each chat agent.
- **Chat Supervisor Queue Snapshot**—Shows all current chat engagements, which includes customers who are waiting to chat with agents. You can view all agents and their active chat sessions, the number of customers waiting to chat, the average wait time, and the average time duration of chats. See Monitor a Chat Session.
Monitor a Chat Session

If you notice a chat duration that is unusually long, you can monitor the chat to see if there are any problems. By making sure chats flow through the system without interruption, you increase customer satisfaction.

When you monitor a chat session, the chat automatically opens on the Engagement tab. The look and feel of the Engagement tab is the same for both supervisors and agents.

**Tip:** When monitoring a chat, you might want to disable auto scrolling on the chat sessions workspace so the Transcript window does not automatically scroll to the newest thread every time an agent or customer updates the chat session. For information about the Auto Scroll Control Position property, see *Selected Object Properties*.

1. Click **Login Chat** to log in to Chat.
2. From the Chat Supervisor Queue Snapshot report, select the chat you want to monitor and click **Monitor**, or you can right-click and select **Monitor**.
   
The chat session opens on the Engagements tab and you can view all correspondence between the agent and customer. At this point, the agent does not know the chat is being monitored. The private response Compose field displays.
3. To send a private message to the agent, enter your message in the private response Compose field and click **Send Private Message**.
   
   Your message appears on the chat transcript and is indicated to be a private message. The agent cannot respond to your private message unless you join the chat.
4. To join the chat you are monitoring, click **Join**.
   
   Two Compose fields display, one with a white background for public messages to the agent and customer, and the other with a blue background for private messages to the agent. The agent is notified that you joined the chat.
5. To send a message, enter your message in either the public or private Compose field, and click **Send Public Message** or **Send Private Message**, as appropriate.
   
   Customers don’t see private messages to the agent. Send a public message if you want the customer to see your message to the agent.
6. To leave the chat you are monitoring, click **Leave**.
   
   You are disconnected from the chat and the monitoring session ends. If you were only monitoring and had not joined the chat, the agent is not notified that you left. If you joined the chat, the agent is notified that you left the chat.

Chat for Customers

The Chat page is the customer interface where customers chat with agents.

Because the Chat page is integrated with the customer portal, it can be customized to suit your customers’ needs.

After customers submit a chat from the Live Help page on the customer portal, the Chat page opens. This page displays a wait time and queue position when customers are waiting to chat. In addition, customers can search the knowledge base for answers to their questions while they are waiting to chat with an agent.

This image shows the Chat page after an agent accepts a customer’s request to chat. What your customers see may be different if your administrator has customized this page.

Chat with an Agent

Customers chat with an agent from the Live Help page.

1. From the Live Help page, the customer fills in the required information and clicks **Submit Request**. The Chat page opens. While Chat searches for an available agent, the customer is placed in the wait queue and is provided with the estimated wait time and position in the queue.

   ![Chat Page](image)

   After an agent accepts the chat request, the status section changes from Searching to Connected, and the Chat Dialog section opens with a greeting from the agent.

   ![Chat Dialog](image)

2. The customer enters a question and presses Enter or clicks **Send**. The customer’s question is added to the Chat Dialog section.

3. The agent responds to the customer. The agent’s response is added to the Chat Dialog section.

4. After receiving an answer to the question, the customer clicks **Disconnect** to terminate the chat session. The agent is notified that the customer has disconnected.

5. The customer clicks **Close** to close the Chat page and return to the Live Help page.
Chat Customer Reconnect

In the case of a crashed browser or otherwise improperly terminated chat session, the chat reconnect feature lets customers reconnect to their previous chat session.

When customers are unintentionally disconnected from a chat and attempt to chat again, they receive a message stating that an existing chat session was found and are given the option of resuming that session. Upon reconnecting to the chat session, the Chat page is populated with all chat correspondence that was present before the chat became disconnected, and customers can resume the chat session where they left off without having to wait in a chat queue.
9 Co-browse

Overview of Cobrowse

Co-browsing lets customers share their desktop with agents who are helping them on the telephone or during a chat session.

Staff members can guide customers through web pages using their mouse or other pointing device to demonstrate actions. In effect, they take control of the customer’s browser to show the customer how to complete an action. Co-browse helps eliminate the confusion that can arise when giving instructions to customers through dialog or text. Co-browse is also effective for assisting customers in filling out forms or completing a sale.

Administrators use the administrative console to manage the product and customize the Co-browse user interface. See Admin Console. See Answer ID 5673 on our support site for system requirements.

Admin Console

The Co-browse administrative console is a standalone user interface used to manage B2C Co-browse, to customize the user interface and configure its deployment, to add and edit users, and to access additional Co-browse reports.

With B2C Service, you configure Co-browse on chat and incident workspaces, add a Co-browse widget to the customer portal, and give Co-browse permission to agents working on the agent desktop through their profile.

In addition, the following functionality is available for Configuration Administrators through the Co-browse Admin Console:

- Company set up and remote control options (see Working with Companies)
- User management and permissions (see Permissions and How You Manage Users)
- SiteID management (see SiteIDs)
- Co-browse product UI customization, security masking, and deployment (see Cobrowse UI Configuration, Configuration Files for Privacy and Security, and Configure Your Company Deployment)
- Reporting (see Working with Reports)

See Implementing Standalone Cobrowse for more details on working with the Admin Console.

Configure Cobrowse on an Incident Workspace

Co-browse configuration for incident workspaces consists of creating a custom incident workspace with a tab where agents can co-browse with customers.

You must add the CobrowsePremium widget to the customer portal before agents can co-browse with customers. See Add the CoBrowsePremium Widget.
**Note:** Before you can configure Co-browse, it must be enabled. To enable Co-browse, contact your Oracle account manager.

1. Click **Configuration** on the *navigation pane*.
2. Expand **Application Appearance**, and then double-click **Workspaces**.
   The **Workspaces** explorer displays on the *content pane*.
3. Expand the **Standard** folder, right-click the incident workspace, and select **Copy**.
   The **Copy Incident As** window opens.
4. Enter a name for the copied workspace in the **Name** field and click **OK**.
5. Open the copy of the incident workspace.
6. Right-click next to the Audit Log tab and select **Add Tab**.
7. Click the **Design** tab.
8. In the Label section of the ribbon, click the **Text** drop-down menu and rename the tab **Co-browse**.
9. Click the **Insert Control** tab.
10. In the Relationship Items section, drag the **Co-browse control** onto the Co-browse tab on the workspace.
11. Click **Save**.

Now you need to assign this custom incident workspace to profiles. See **Profiles**. For information about using Co-browse on incident workspaces, see **Cobrowse with a Customer from an Incident Workspace**.

### Add the CoBrowsePremium Widget

Follow this procedure to add the CoBrowsePremium widget to your customer portal pages.

1. Open the **standard.php** file in the **views/templates** folder.
2. Locate the following lines of code.
   ```html
   <div class="rn_Feedback">
   <rn:widget path="feedback/SiteFeedback"/>
   <span>$rn:msg:SITE_USEFUL_MSG$</span>
   </div>
   </rn:condition>
   ```
3. Add the following lines of code immediately after the last line you located in step 2.
   ```html
   <div>
   <rn:widget path="utils/CobrowsePremium" />
   </div>
   ```
4. **Save** **standard.php**.
5. **Promote** the customer portal pages to Production.

To enable mobile compatibility, follow these same steps to modify the **mobile.php** template.

After the widgets have been added to the appropriate pages, the standard and mobile page sets need to be enabled. See **Stage Customer Portal Pages** and **Promote Customer Portal Pages**.

### Configure Cobrowse on a Chat Workspace

Co-browse configuration for B2C Chat consists of creating a custom chat sessions workspace with a tab where agents can co-browse with customers.
You must add the ChatCobrowsePremium widget to the customer portal before agents can co-browse with customers. See Add the ChatCobrowsePremium Widget. In addition, a Co-browse control must be added to the workspace ribbon so staff members can invite customers to co-browse when they are chatting with them.

**Note:** Before you can configure Co-browse, it must be enabled. To enable Co-browse, contact your Oracle account manager.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Workspaces**.
   The Workspaces explorer displays on the content pane.
3. Expand the Standard folder, right-click the chat sessions workspace, and select **Copy**.
   The Copy Chat Sessions As window opens.
4. Enter a name for the copied workspace in the **Name** field and click **OK**.
5. Open the copy of the chat sessions workspace.
6. Right-click next to the Incidents tab and select **Add Tab**.
7. Click the **Design** tab.
8. In the Label section of the ribbon, click the **Text** drop-down menu and rename the tab **Co-browse**.
9. Click the **Insert Control** tab.
10. In the Relationship Items section of the ribbon, drag the Co-browse control onto the Co-browse tab on the workspace.
11. Click the **Home** tab on the ribbon and click **Ribbon**.
   The ribbon designer opens.
12. Click a button in the **Session** group to activate the buttons.
13. Click **Add Buttons** on the ribbon designer toolbar.
   The Add or Remove Buttons window opens.
14. Select **Screen Sharing** and click **OK**.
   The Screen Sharing button displays on the ribbon designer.
15. Click **OK**.
   The ribbon designer closes.
16. Click **Save**.

Now you need to assign this custom chat sessions workspace to profiles. See Profiles. For information about using Co-browse on chat workspaces, see Cobrowse with a Customer.
Add Cobrowse Permissions to a Profile

Co-browse is not fully functional until staff members have been assigned co-browse permissions in their profile.

After you create or edit a profile containing co-browse permissions, you can then assign the profile to individual staff members. This lets you designate which staff members have access to Co-browse. You can assign co-browse permissions to one or more profiles based on your organization’s needs.

1. Click Configuration on the navigation pane.
2. Expand Staff Management, and then double-click Profiles. The report opens on the content pane.
3. Double-click the profile you want to edit. The Profile editor opens.
4. Click Permissions. The Permissions page opens.
5. Click the Service tab.
7. Click Save.

Before agents can use Co-browse, you must assign a profile containing co-browse permissions to their staff account. See Add or Edit a Staff Account.

Cobrowse Session Reporting

The Co-browse Summary report displays co-browse activity from all sources and shows detailed information about each co-browse session such as agent and contact names, when the session started and ended, and what caused the session to end.

With this information, you can spot trends and implement steps to improve customer satisfaction.

The Co-browse Summary report is available in Public Reports/Service/Co-Browse. Before staff members can use the report, it must be added to their navigation sets. See Edit a Navigation Set.

All co-browse data is stored in the cobrowse_sessions table. Although the table is used for the Co-Browse Summary report, it can also be used for custom reports. See Overview of Creating Basic Custom Reports.
10 Outreach and Feedback

Explorers

Overview of Explorers

Explorers are used to access and manage mailings, campaigns, questions, surveys, audiences, and content library items created in Outreach and Feedback.

With these explorers, you can browse, search, and organize items in hierarchical folders on the content pane using functions similar to Windows Explorer. Like Windows Explorer, each B2C Service explorer consists of a set of hierarchical folders and a detailed list of available items. Explorers display items of their associated type. For instance, documents are listed in the Documents explorer.

While each explorer generally resides in its associated navigation list, it is important to remember that explorers can be added to (or removed from) any navigation list, just like a report. For example, the Mailings explorer can be added to the Mailings navigation list or to a different navigation list. If you are unable to locate a specific explorer in any of your navigation lists, contact your administrator.

The following table describes how to open each Outreach and Feedback explorer from its most common location on the navigation pane.

<table>
<thead>
<tr>
<th>Explorer</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outreach Explorers</td>
<td>These explorers are used to manage mailings and campaigns.</td>
</tr>
<tr>
<td>Mailings</td>
<td>Click Mailings on the navigation pane and double-click Mailings Explorer. See Overview of Mailings.</td>
</tr>
<tr>
<td>Campaigns</td>
<td>Click Campaigns on the navigation pane and double-click Campaigns Explorer. See Overview of Campaigns.</td>
</tr>
<tr>
<td>Feedback Explorers</td>
<td>These explorers are used to manage questions and surveys in Feedback.</td>
</tr>
<tr>
<td>Questions</td>

</tr>
<tr>
<td>Content Library Explorers</td>
<td>These explorers are used to manage content library items in both Outreach and Feedback.</td>
</tr>
<tr>
<td>Documents</td>
<td>Click Content Library on the navigation pane and double-click Documents Explorer. See Create a Document.</td>
</tr>
<tr>
<td>Tracked Links</td>
<td>Click Content Library on the navigation pane and double-click Tracked Links Explorer. See Add a Tracked Link.</td>
</tr>
<tr>
<td>File Attachments</td>
<td>Click Content Library on the navigation pane and double-click File Attachments Explorer. See Add a File.</td>
</tr>
<tr>
<td>Templates</td>
<td>Click Content Library on the navigation pane and double-click Templates Explorer. See How Templates Work.</td>
</tr>
<tr>
<td>Snippets</td>
<td>Click Content Library on the navigation pane and double-click Snippets Explorer. See How Snippets Work.</td>
</tr>
</tbody>
</table>

Find a Document

Explorers contain a number of search functions to help you find mailings, campaigns, segments, contact lists, documents, tracked links, files, templates, snippets, surveys, and questions.

The following procedure describes how to search for a document from the Documents explorer, but the steps are the same for searching for other Outreach and Feedback items.

Tip: You can also search for mailings, campaigns, surveys, and documents from anywhere in the product using Quick Search. See Overview of Quick Search.

1. Click Find on the ribbon.
   The left side of the content pane displays a Find menu, hiding the folders tree.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find Using</td>
<td>This drop-down menu contains the names of all the columns in the documents list. Each column is associated with one of three data types that are supported in explorer searches.</td>
</tr>
<tr>
<td></td>
<td>◦ Strings—Search for strings that start with, contain, end with, or match the value you enter in the text box.</td>
</tr>
<tr>
<td></td>
<td>◦ Dates—Search for dates before, on, or after today’s date. You can also click the calendar in the search text box to display the current month calendar and select another day, or click the arrows at the top of the calendar to change months.</td>
</tr>
<tr>
<td></td>
<td>◦ Integers—Search for values that are less than, equal to, or greater than a number. You can also click the up and down arrows in the search text box to increase or decrease the search value.</td>
</tr>
</tbody>
</table>
### Outroch and Feedback

#### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> The data type of the column you select determines the available search criteria. For example, if you select Created (a date data type), you can search for dates before, on, or after a selected date.</td>
<td></td>
</tr>
<tr>
<td>Search text box</td>
<td>Type your search text in this field.</td>
</tr>
<tr>
<td>Case Sensitive</td>
<td>When searching a string column, select this check box to match the case.</td>
</tr>
<tr>
<td>Show Advanced Options</td>
<td>Click this text or the down arrow to display the following advanced search options.</td>
</tr>
<tr>
<td>Search globally, replace results</td>
<td>Select this option to remove the results from the previous search and replace with results from this search. This method is selected by default.</td>
</tr>
<tr>
<td>Search within results, replace results</td>
<td>Select this option to search only the current results and keep only those that match this search.</td>
</tr>
<tr>
<td>Search globally, append to results</td>
<td>Select this option to keep results from the previous search and add results from this search.</td>
</tr>
<tr>
<td>Return Non-matching Items</td>
<td>Select this check box to return all documents that do not match your search criteria.</td>
</tr>
</tbody>
</table>

1. To edit an item, select the item you want to edit and click **Open**. The item opens on the content pane.
2. Edit the necessary fields and click **Save**.

For additional information about explorer search functionality, see the Search On state in Explorer Display States.

---

3. Click **Find**.
   The search results replace the document list in the explorer.
4. To clear the value from the search text box, click **Clear**.
5. To replace the search results with the original documents list, click **Refresh** on the ribbon.
Copy an Item

You can copy items used in documents, mailings, and surveys.

1. Select the item you want to copy and click **Copy**. The Copy As window opens.
2. Select the folder you want to save the item in and enter the name of the item in the **Name** field.
3. Click **OK**.

Delete an Item

You can delete items used in documents, mailings, and surveys. However, make sure the item has no dependencies before you delete it.

**CAUTION:** If you attempt to delete an item that is being used in a document, mailing, survey, or campaign, a *dependency* warning lists each location where the item is used and provides you with an option to cancel the deletion. If you choose to continue deleting the item, all references to the item become invalid and you must manually update each reference appropriately. For example, if you delete a tracked link used in a survey, you must edit the survey and either remove the tracked link or replace it with a valid link.

1. Select the item you want to delete and click **Delete**.

Automatically Generated Folders

The Documents explorer contains a folder for content that is automatically created when a document is saved or copied in a mailing or survey.

The system creates a copy of each document that is inserted in a mailing message or a survey invitation message, and each page that is added to the questionnaire in a survey. Each copy is stored in the corresponding subfolder in the Automatically Generated folder. You can reuse these documents or use them to track the content you have used in previous mailings or surveys. Additionally, automatically generated copies of each message template can be found in the Automatically Generated folder. However, the message template documents are read-only.

The Tracked Links explorer also contains an Automatically Generated folder that contains all *tracked links* that are created when the tracked link converter runs. See **Convert Links to Tracked Links**.

**Note:** If you modify the content in a mailing or survey, those changes are also made to the automatically generated copy and impact all other instances of that copy. For example, if you create a mailing and insert an existing document on the Message tab, a copy of that document is automatically generated and stored in the Automatically Generated folder. Each time you modify the content in that mailing, the copy is also modified, but the original document is not modified. However, if you share a document with a mailing or survey, every time the content is updated, all occurrences of the document are also updated.
<table>
<thead>
<tr>
<th>Folder</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Documents explorer</td>
<td>The Documents explorer contains the following automatically generated folders.</td>
</tr>
<tr>
<td>Mailing Messages</td>
<td>This subfolder contains a copy of every document created on the Message tab in a mailing after the mailing is saved. The new document is named “YYMDDHHHMM &lt;mailing name&gt;” where YYMDDHHHMM is the year, month, day, hour, and minute of the first save, and the mailing name corresponds with the name of the original mailing. If more than one message is used (for example, the same document is reused in multiple mailings), the new document is named “YYMDDHHHMM &lt;mailing name&gt;: &lt;message name&gt;” where “message name” corresponds with the message defined on the Message tab of the mailing. The document name is limited to 80 characters.</td>
</tr>
<tr>
<td>Message Templates</td>
<td>This subfolder contains a copy of every administrator notification, administrator email, and contact email for this interface. The documents are named the same as the corresponding message. These documents are read-only.</td>
</tr>
<tr>
<td>Survey Invitation Messages</td>
<td>This subfolder contains a copy of every document created on the Invitation Message tab in a survey. The new document is named “YYMDDHHHMM &lt;survey name&gt;” where YYMDDHHHMM is the year, month, day, hour, and minute of the save, and the survey name corresponds with the name of the original survey. The document name is limited to 80 characters.</td>
</tr>
<tr>
<td>Survey Pages</td>
<td>A subfolder is created for each survey created in basic mode and is named the same as the corresponding survey. These folders contain a document for each page in the questionnaire. When you add, edit, or delete a page in the questionnaire, the corresponding document is also modified. Documents are read-only if they are created in basic mode but can be edited if they are converted to advanced mode.</td>
</tr>
<tr>
<td>Survey Reminders</td>
<td>This subfolder contains a copy of every document created on the Reminders tab in a survey. The copy is named “YYMDDHHHMM &lt;reminder name&gt;” where YYMDDHHHMM is the year, month, day, hour, and minute of the save, and the name corresponds with the name of the original reminder. The name is limited to 80 characters. You can edit the reminders in this folder as long as they have not been sent.</td>
</tr>
<tr>
<td>Tracked Links explorer</td>
<td>The Automatically Generated folder in this explorer contains all of the tracked links that are created every time the tracked link converter runs. The tracked links are organized in subfolders using the YYYY-MM-DD format, which corresponds to the date the tracked links are generated. See Convert Links to Tracked Links. You can edit or move the tracked links in this folder.</td>
</tr>
</tbody>
</table>
Audiences

Overview of Audiences

B2C Service provides two methods for grouping contacts to create audiences for your broadcast mailings and surveys: contact lists and segments.

Contact lists are static lists comprised only of contacts that have been explicitly selected, changing only when you manually add or remove contacts. Segments are dynamic lists comprised of contacts that match one or more fixed filters that you specify. Because segments are dynamic, their contents change over time as updated contacts fall in and out of alignment with the filters.

When you create a mailing or survey, contact lists and segments can be used alone or included with (or excluded from) other lists and segments to form your audience. You can include and exclude a total of fifty contact lists and segments, each containing a vast number of contacts. This gives you all the flexibility you need to assemble audiences that are specific, optimized, and efficiently maintained.

For information about uploading contacts to your knowledge base, see Add a Contact. For information about adding segments and lists to mailings and surveys, see Define the Broadcast Mailing Audience and Define the Broadcast Survey Audience.

- Define the Transactional Mailing Audience
- Define the Transactional Survey Audience

Add a Contact List

Contact lists are static sets of contacts you can use to define audiences for broadcast mailings and surveys.

Contact lists are static in that you add each contact to a list manually. Otherwise, the list does not change, even when a contact record is modified in the database. Every time a contact list is used, it returns the same set of contacts. You can create as many lists as you want and update them by manually adding or removing contacts as needed. After a contact list is created, you can update your audiences to include or exclude it.

Note: The following procedure assumes that you access the Contact Lists explorer from the Audiences navigation list. However, this explorer may reside in a different navigation list.

1. Click Audiences on the navigation pane.
2. Double-click Contact Lists Explorer.
   The Contact Lists explorer opens on the content pane.
3. Click New.

   Tip: You can also create a contact list from an open contact list by clicking New. Additionally, if your navigation set is configured to add contact lists from the file menu, click File > Audience > Contact List. See Overview of Navigation Sets.
A new contact list opens on the content pane.

4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notes</td>
<td>Enter any notes associated with the contact list in this field.</td>
</tr>
<tr>
<td>Available for Proof</td>
<td>Select this check box to let contacts in the list receive proof requests. See Send a Proof.</td>
</tr>
<tr>
<td>Remove Contacts from Old List</td>
<td>Clear this check box to let contacts stay in contact lists for longer than the time frame set in the database. When this check box is selected, contact list data is removed according to the value of a database variable that is set, by default, to 400 days. To change this value, Submit a Service Request. Also see Answer ID 4802.</td>
</tr>
<tr>
<td>Tip</td>
<td>We recommend leaving this check box selected to ensure your database tables stay at a manageable size.</td>
</tr>
<tr>
<td>Count</td>
<td>This field displays the number of contacts in the contact list the last time it was counted and the date and time the count was performed.</td>
</tr>
<tr>
<td>Details</td>
<td>To view the details of a count, click Details in the Current Count section after the count has been performed. A window opens showing the number of contacts belonging to the contact list, and how many of those contacts have an invalid or duplicate email address or no address. A count must be performed before Details are available.</td>
</tr>
<tr>
<td>Refresh</td>
<td>To calculate the number of contacts currently in the list, click Refresh. The list must be saved before the count is refreshed.</td>
</tr>
</tbody>
</table>

5. To add new and existing contacts to the list on the Contacts tab, see How Contact Lists Work.
6. To view a list of actions taken on the contact list, click the Audit Log tab.
7. To check the spelling of any fields that have spell checking enabled, click Spelling.
8. Click Save. The Save As window opens.
9. Select the folder you want to save the contact list in and enter the name of the contact list in the Name field.
10. Click Save.

How Contact Lists Work

From the Contacts tab of the contact list editor, you can add existing contacts to the list or create new contacts and add them to the list.

You can search your list of contacts, remove contacts from the list, or edit contact records. See Overview of Contacts. Contacts can also be added to lists in large batches using the Data Import Wizard. See How Data Import Works.
Add a Contact to the Contact List
You can add existing contacts to your contact list from the Contacts tab of the contact list editor.

1. On the Contacts tab of a contact list, click Add > Add Existing.
   The Contact Search window opens.
2. To search for an existing contact to add to your contact list, enter the search criteria in one or more fields. You can use any of the following fields to define your search criteria.
   - Contact Last Name
   - Contact First Name
   - Phone
   - Email
   - Postal Code
   - Organization
   - CX State
   Tip: You can use an asterisk (*) as a wildcard in your search term.
3. Click Search.
   A list of contacts that match the search criteria you entered appears in the grid below the search criteria fields.
4. Select a contact and click Select to add the contact to the list.
   Tip: You can select multiple contacts by pressing Ctrl while clicking additional contacts. Selected contacts that are already in the list are not added again.
5. To add a new contact, click Add > Add New. See Create a Contact and Add It to the Contact List.
6. Click Save.

Create a Contact and Add It to the Contact List
You can create new contacts and add them to your contact list.

1. On the Contacts tab of a contact list, click Add > Add New.
   The New Contact window opens.
2. Enter contact field information.
   Names of required fields appear in red text and are flagged with asterisks.
3. Click OK.
   The contact appears on the Contacts tab with the other contacts in the contact list.
   Note: Clicking OK on the child window saves the new contact in memory but it is not added to the knowledge base until you save the contact list (the item from which the contact record was created). See Overview of Contacts.
4. Click Save.
Search the Contact List
You can search the list of contacts using several fields and return the results in the grid. Contacts can then be removed from the contact list or a contact record can be edited.

1. From an open contact list, click **Search List** on the Contacts tab toolbar.
   - The Search window opens.
2. In the Filters section, enter the last name, first name, or email address of the contact you are searching for.
   - Partial values can be used.
3. In the Limit and Order section, enter the maximum number of contact records you want to return.
   a. To return all matching contact records, but limit the number of contact records per page, select the **Per Page** check box.
4. To sort by fields other than last name followed by first name, click the Order By text and select from the available fields.
5. To design your Search window layout and to set, restore, or reset your default filter values, click the **Settings** drop-down menu. See **Modify the Search Window**.
6. Click **Search**.
   - Search results are returned on the Contacts tab.
7. To edit a contact record, click **Open** next to the contact.
8. To remove a contact from the contact list, click **Remove** next to the contact.
   - **Note:** This does not delete the contact from the knowledge base. It only removes the contact from the list.
9. To remove all contacts from the contact list, click **Clear List**.
   a. Click **Yes** to confirm.
10. To clear the search results and view the entire contact list, click **View Entire List**.
11. To refresh the contact list, click **Refresh**.
12. To access report options, such as sorting and exporting, click **Options** next to the contact. See **How You Distribute Reports and Dashboards** and **How You Change Report Formatting**.

Create a Segment
While contact lists are created by manually adding contacts to a static list, segments are dynamic lists of contacts created by defining contact criteria and selecting filters.

When you create a segment, you can filter using any field in the Contacts (contacts) table, including custom fields, and by joining the Contacts table to other tables. For example, some segments might include all contacts who live in Montana, all contacts between the ages of 18 and 24, or all contacts who live in Montana and are between the ages of 18 and 24. You can also filter contacts by whether they have submitted an incident related to a certain product.

After you create a segment, it can be used in mailings and surveys and the group of contacts is constantly adjusted and updated as contact data meets or falls outside of the segment requirements. For example, a segment that selects customers based on their age produces a different result every time it is used for a mailing, assuming that customer contact data changes.

- **Note:** The following procedure assumes that you access the Segments explorer from the Audiences **navigation list**. However, this explorer may reside in a different navigation list.

1. Click **Audiences** on the navigation pane.
2. Double-click **Segments Explorer**.
The Segments explorer opens on the content pane.

3. Click **New** on the ribbon.

   **Tip:** You can also create a segment from an open segment by clicking New. Additionally, if your navigation set is configured to add segments from the file menu, click **File > Audience > Segment**. See **Configure the File Menu**.

   a. To create a segment from scratch, click **New Segment**.
      
      The Segment editor opens on the content pane.
      
      The content pane is divided into sections to group common functions and help make creating the segment easier. At the top is the current count of contacts meeting the segment criteria. The tabs let you define the segment filters and data set, preview a list of contacts belonging to the segment, and view the audit log.

   b. To create a segment by copying an existing segment, click **Choose Existing Segment**.
      
      The **Choose Existing Segment** window opens where you can select the segment you want to use.

   c. To import an XML segment, click **Import Segment**.

4. Enter field information to define the segment filters on the Criteria tab.

5. To preview the contacts belonging to the segment, click the **Preview** tab.

6. To refresh the audience count, click **Refresh** in the Count section.

7. To view the details of an audience count, click **Details** in the Count section after the count has been performed. A window opens showing you the number of contacts belonging to the segment, along with how many of those contacts have an invalid or duplicate email address or no address.

8. To view a list of actions taken on the segment, click the **Audit Log** tab.

9. Click **Save**.

   The Save As window opens.

10. Select the folder you want to save the segment in and enter the name of the segment in the **Name** field.

11. Click **Save**.

### How Segment Filters Work

Filters determine which contacts are returned when the segment is applied to contact data.

You can use expressions and operators to determine a data set, and you can also use SQL-type functions (such as aggregate, string, date, logical, and math functions) to define expressions when creating a filter. From the Criteria tab of the Segment editor, you can define the filters used by your segment and the database tables used to create the filters.

The Data Dictionary section lists the database tables that can be accessed by the segment. You can also join tables to columns in other tables, such as joining the Contacts (contacts) table to the Incidents (incidents) table.

The Fields section shows the fields (database columns) associated with the table selected in the Data Dictionary section. You can drag and drop fields from the Fields section to the Filters section to filter contacts by that field. For example, you could select the Contacts table in the Data Dictionary section and drag and drop the State/Province field from the Fields section to the Filters section to filter contacts by the state in their address. For a description of the available tables and columns, see the **Overview of the Data Dictionary**.

In addition to drag-and-drop functionality, you can click Add Filter in the Actions section to add a filter. After filters are added, you have additional options in the Actions section to edit and delete filters and change the logical expression used for multiple filters.
Add Filters to a Segment

Filters determine which contacts are returned when the segment is applied to contact data.

1. Select a table in the Data Dictionary section.
   The table columns appear in the Fields section.
2. Drag and drop a column name from the Fields section to the center of the Criteria tab.
   
   **Tip:** You can also add a filter by clicking Add Filter in the Actions section or double-clicking a column name in the Fields section.

   The **Edit Filter** window opens.

3. Enter the name of the filter in the **Name** field.
   The name appears in the Filters section of the Criteria tab.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Expression</td>
<td>Enter the expression you want to use to limit the data set in this field. The syntax is &lt;table_name&gt;.&lt;column_name&gt;. As you type an entry in the Expression field, a drop-down menu displays a list of database tables that begin with the letters you type. You can enter the complete expression or select a table and field from the drop-down menu. You can also select a table and column or function by right-clicking in the field.</td>
</tr>
<tr>
<td>Operator</td>
<td>Select the operator to use in comparing the expression to the value. The available operators vary depending on the expression.</td>
</tr>
<tr>
<td>Value Type</td>
<td>Select the type of value to match with the expression from these options.</td>
</tr>
<tr>
<td>Constant</td>
<td>Select this option to type the value to complete the filter or select the value from a drop-down menu (depending on the expression).</td>
</tr>
<tr>
<td>Expression</td>
<td>Select this option to enter an expression to complete the filter, using the syntax &lt;table_name&gt;.&lt;column_name&gt;.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter the value that the expression is compared to. The available options in the Value field change depending on the type of field, the operator you select, and the value type. For example, when the field type is menu, you select it from a drop-down menu, but when the field type is date, you select it from a calendar.</td>
</tr>
</tbody>
</table>

5. To customize the list of values that display in the Value field, click **Customize**.
The Customize link is available only when you select equal or list values from the Operator drop-down menu and when the Value field displays as a drop-down menu.

6. To select an expression or expression value from a list of database fields and functions, click Use Data Dictionary. The Edit Expression window opens.
   a. Enter the expression by dragging and dropping columns and functions from the Available Columns/Functions section to the Expression section.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Dataset</td>
<td>Select a table and column from the tables currently used in the segment. The Contacts table is available by default.</td>
</tr>
<tr>
<td>All Tables</td>
<td>Select a table and column from the available tables.</td>
</tr>
<tr>
<td>Functions</td>
<td>Select a function to filter contacts in the segment.</td>
</tr>
</tbody>
</table>

b. Click OK to save the expression and return to the Edit Filter window.

7. Click OK to save the filter.

   **Note:** If there is an error in the expression, the Expression field changes to orange and an error exclamation point appears. Hover over the exclamation point for more information about the error. You must either correct the error or click Cancel to exit the window.

8. To edit a filter, do one of the following:
   o Select the filter and click Edit Filter in the Actions section.
   o Right-click the filter in the Filters section and select Edit Filter.

9. To display the filter expression in the Filters section instead of the name you defined, click Display Filter Descriptions. To switch back to the filter name, click Display Filter Names.

10. To delete a filter, do one of the following:
    o Select the filter and click Delete Filter in the Actions section.
    o Right-click the filter in the Filters section and select Delete Filter.

11. To define the logical expression used when multiple filters are included in the segment, see Edit a Logical Expression.

12. To define the tables and joins used in the segment, click Edit Data Set in the Advanced Options section. See Edit the Data Set.

13. To apply group filters to the segment, click Edit Group Filters in the Advanced Options section. See Create a Group Filter.

Functions for Segments
Functions let you apply standard mathematical operators to your segment. You can also combine different functions and database fields in an expression.

**Before you begin**—Before you can add a function, you must add a filter. See Add Filters to a Segment.

After you drag a function to the expression on the Edit Expression window, you must enter the variables used in the function. You can either type the variables in the Expression field or, if the variable is an item listed in the Available Columns/Functions field, you can drag the item into the function of the expression.
### Aggregate Functions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>avg</strong>(expr)</td>
<td>This function computes an average value for the data set <em>expr</em>.</td>
</tr>
<tr>
<td><strong>count</strong>(expr)</td>
<td>This function returns the number of rows included in the data set <em>expr</em>.</td>
</tr>
<tr>
<td><strong>first</strong>(expr, sort column1[, sort column2][,...])</td>
<td>This function returns the first value in the data set <em>expr</em> based on the order of the specified sort columns. For example, the expression <code>first(threads.note, threads.entered, threads.seq)</code> returns the first thread note in the data set based on time entered and thread sequence.</td>
</tr>
<tr>
<td><strong>group_concat</strong>(expr, separator[, sort column 1, ASC</td>
<td>DESC][, sort column 2, ASC</td>
</tr>
<tr>
<td><strong>last</strong>(expr, sort column1[, sort column2][,...])</td>
<td>This function returns the last value in the data set <em>expr</em> based on the order of the specified sort columns. For example, the expression <code>last(threads.note, threads.entered, threads.seq)</code> returns the last thread note in the data set based on time entered and thread sequence.</td>
</tr>
<tr>
<td><strong>max</strong>(expr)</td>
<td>This function returns the largest numerical value, the last string in alphabetical order, or the latest date in the data set <em>expr</em>.</td>
</tr>
<tr>
<td><strong>min</strong>(expr)</td>
<td>This function returns the smallest numerical value, the first string in alphabetical order, or the earliest date in the data set <em>expr</em>.</td>
</tr>
<tr>
<td><strong>sum</strong>(expr)</td>
<td>This function returns the sum of the values in the data set <em>expr</em>.</td>
</tr>
<tr>
<td><strong>sum_distinct</strong>(expr, reference)</td>
<td>This function returns the sum of distinct values in an expression for a particular record (reference) rather than for all records of the same type in a table. For example, if you want to calculate the sum of all quotas for a particular sales person, you could add a function of <code>sum_distinct(sa_period2accts.quota, sa_period2accts.acct_id)</code>.</td>
</tr>
<tr>
<td><strong>stddev</strong>(expr)</td>
<td>This function returns the standard deviation of <em>expr</em>. For example, the expression <code>stddev(answers.solved_count)</code> returns the standard deviation of all the values in the <code>solved_count</code> column of the Answers (answers) table.</td>
</tr>
</tbody>
</table>

### String Functions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>concat</strong>(str1,str2)</td>
<td>This function combines input character strings from multiple expressions into a single output string. Two or more expressions can be appended with this function. For example, the expression `concat(‘www.’, ‘global’, ‘.com’) returns the value <a href="http://www.global.com">www.global.com</a>.</td>
</tr>
<tr>
<td><strong>instr</strong>(str, substr)</td>
<td>This function returns the numeric position (in characters) of the initial occurrence of string <em>substr</em> within string <em>str</em>. For example, the expression `instr(‘globalcellphones.com’, ‘cell’) returns the value 7.</td>
</tr>
</tbody>
</table>
### Expression | Description
--- | ---
length(str) | This function returns the length (in characters) of the string. For example, the expression `length('cell phones')` returns the value 10.
lower(str) | This function returns string str in all lowercase characters. For example, the expression `lower('Global.COM')` returns the value `global.com`.
ltrim(str) | This function returns the string str without leading spaces. For example, the expression `ltrim('Cell phone')` returns the value `Cell phone`.
lpad(str1, X, str2) | This function returns `str1` padded on the left with `str2` until `str1` is `X` characters long. For example, the expression `lpad('phone', 10, '@')` returns the value `@@@@@phone`.
rpad(str1, X, str2) | This function returns `str1` padded on the right with `str2` until `str1` is `X` characters long. For example, the expression `rpad('phone', 10, '@')` returns the value `phone@@@@@`.
rtrim(str) | This function returns the string str without trailing spaces. For example, the expression `rtrim('agarfield@global.com ')` returns the value `agarfield@global.com`.
substr(str, start_pos, [length]) | This function returns a portion of the string str starting at the character defined by `start_pos` (an integer) and ending at the character defined by `length` (an integer). If `length` is not indicated, it returns the remainder of the string.
to_char(expr) | This function converts the numeric `expr` to a character string.
to_number(str) | This function converts the character string `str` to a numeric. If the `str` is not numeric, this function returns zero. If `str` is a combination of numbers and other characters and begins with a number, this function returns only the initial numeric portion. For example, `to_number('123ABC')` returns `123`.
upper(str) | This function returns string `str` in all uppercase characters. For example, the expression `upper('global.COM')` returns the value `GLOBAL.COM`.

### Date Functions

Select from the following to use a date function in the expression.

date_add(date, units, interval, round) | This function returns the value of `date` plus a specified amount of time where `date` is a datetime type column or a literal string in the format YYYY-MM-DD or YYYY-MM-DD HH:MI:SS. The amount of time to add is specified by `units` and `interval`, where `units` must be an integer specifying the number of intervals to add, and `interval` can be SECONDS, MINUTES, HOURS, DAYS, WEEKS, MONTHS, or YEARS. To round the result to the beginning of the specified interval, set the `round` argument to 1. Otherwise, set `round` to 0 and the result is not rounded. For example, the expression `date_add('2003-11-25 22:35:00', 48, HOURS, 1)` returns the value `2003-11-27 22:00:00`.
to_date(str, format) | This function converts the string `str` in the format specified by `format` to a date value. For example, the function `to_date('19981231', 'YYYYMMDD')` returns a date of 12/31/1998. Unlike date_format, the to_date function supports only the following date formats.

- DD MM YYYY HH24:MI:SS
- DD MM YYYY HH:MI:SS AM
- DD MON YY

---

1444
<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DD MON YYYY</td>
<td>This function converts date from a datetime data type to a string and reformats date to match the format specified by format, where date is a datetime type column or a literal string in the format YYYY-MM-DD or YYYY-MM-DD HH:MI:SS. For example, the expression <code>date_format('2003-11-25 22:25:00', 'DAY, MONTH DD, YYYY, HH12:MI PM')</code> returns the value <strong>Tuesday, November 25, 2003 10:25 PM</strong>.</td>
</tr>
<tr>
<td>DD-MM-YY</td>
<td></td>

</tr>
<tr>
<td>YYYY-MM-DD HH24:MI:SS</td>
<td></td>
</tr>
<tr>
<td>YYYY-MM-DDTHH24:MI:SS</td>
<td></td>
</tr>
<tr>
<td>YYYY.MM.DD</td>
<td></td>
</tr>
<tr>
<td>YYYY /MM/DD</td>
<td></td>
</tr>
<tr>
<td>YYYYMMDD</td>
<td></td>
</tr>
</tbody>
</table>

**date_format(date, format)**

**date_diff(date, date)**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>This function returns the number of seconds occurring between two dates. For example, the expression <code>date_diff('2009-11-26 22:25:00', '2009-11-25 10:30:00')</code> returns the value <strong>129300</strong>.</td>
<td></td>
</tr>
</tbody>
</table>
### Expression | Description
--- | ---
Another example is `date_diff(sysdate(),incidents.updated)`. This expression returns the number of seconds between the current time and the time that incidents were last updated. | 
**Note:** To change the format of the output, use the `time_format` function. For example, `time_format(date_diff('2009-11-26 22:25:00', '2009-11-25 10:30:00'), 'HH24h MIm SSs')` returns the value 35h 55m 00s.

date_trunc(date, units) | This function truncates `date` to the unit specified by `units`. For example, the expression `date_trunc('2003-11-25 22:25:10', HOURS)` returns the value 2003-11-25 22:00:00.

sysdate() | This function returns the current system date in the format YYYY-MM-DD HH:MI:SS.

time_format (seconds, format) | This function converts `seconds` to the specified time format. For example, the expression `time_format(86610,'HH24 MI SS')` returns the value 24 03 30.

date_group(expr, format) | This function groups records together according to a date range that you specify, and includes rows for date ranges that have no associated records. If you do not want to return rows for date ranges with no records, you could use `date_format` instead.

For example, if you have incidents created in January and March, but none in February, and create a report with the expression for column A set to `date_group(incidents.created, 'YYYY-MM')`, and the expression for Column B set to `count(*)`, the report would output:

2006-01 10
2006-02 0
2006-03 15

If you changed the expression in Column A to `date_format(incidents.created, 'YYYY-MM')` to use the `date_format` function instead of `date_group`, the report would output similar data, but would not return a row for February.

This function can be used only when defining group filters. See Create a Group Filter.

### Logical Functions
Select from the following to use a logical function in the expression.

**if**(expression, then result, else result) | This function returns the then result if expression is true, or returns the else result if expression is false. For example, the expression `if(incident.c$field=1, 'Yes', 'No')` returns Yes for incidents where the value of c$field is 1. Otherwise, No is returned.

You can use `IS NULL` and `IS NOT NULL` as part of the expression. For example, you could use the expression `if(incident.c$field IS NOT NULL, 'Yes', 'No').`

decode(expression, test_value_1, result_1[, test_value_2, result_2][, default]) | This function compares `expression` to each `test value` in order and returns `result` for the first `test value` that `expression` matches. If `expression` does not match any `test value`, `default` is returned. If `default` is undefined, a null value is returned.

The decode function can perform table lookups, letting you use text strings as test values rather than requiring coded values. For example, you can use Review as a test value for the expression `faqs.status` even though the table contains code value in the `status` column.

**nvl**(expr1, expr2) | If the value `expr1` is null, this function returns the value `expr2`. However, if the value `expr1` is not null, then the value `expr1` is returned. The value of `expr2` must match the data type of `expr1`.

### Expression

<table>
<thead>
<tr>
<th>Math Functions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bitand(X, Y)</code></td>
<td>This function returns the bitwise AND of two integers, X and Y.</td>
</tr>
<tr>
<td><code>ceiling(X)</code></td>
<td>This function returns the smallest integer value greater than or equal to X.</td>
</tr>
<tr>
<td><code>floor(X)</code></td>
<td>This function returns the largest integer less than or equal to X.</td>
</tr>
<tr>
<td><code>power(X, Y)</code></td>
<td>This function returns the value of X to the power of Y. For example, <code>power(2, 3)</code> would return 8.</td>
</tr>
<tr>
<td><code>rand()</code></td>
<td>This function returns a random number between 0 and 1, containing up to nine decimal places.</td>
</tr>
<tr>
<td><code>round(X, D)</code></td>
<td>This function returns the value X rounded to the nearest number with D decimals. For example, <code>round(5.55555, 2)</code> returns the value 5.56.</td>
</tr>
<tr>
<td><code>truncate(X, D)</code></td>
<td>This function returns the value X truncated to the D decimal places. For example, the expression <code>truncate(5.55555, 2)</code> returns the value 5.55.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Currency Functions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>to_currency(expr, str)</code></td>
<td>This function converts <code>expr</code> to a value in <code>str</code> currency. The value is returned as an amount in the staff member’s default currency. The conversion rate used for this function is the exchange rate defined in the Exchange Rates (<code>exchange_rates</code>) table. For example, for a staff member with a default currency of USD, <code>to_currency(opportunities.mgr_value, 'EUR')</code> returns an amount in USD that is equal to the number in the <code>mgr_value</code> converted to Euros.</td>
</tr>
</tbody>
</table>

### Filter Operators for Segments

The operator you select when creating filters greatly impacts the data that is returned, so it is important to understand the functionality of each operator.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>equals</td>
<td>The expression matches the value exactly (including case).</td>
</tr>
<tr>
<td>not equals (exclude No Value)</td>
<td>The expression does not match the value exactly (including case), and does not contain a null value.</td>
</tr>
<tr>
<td>less than</td>
<td>The expression is less than the value.</td>
</tr>
<tr>
<td>less than or equals</td>
<td>The expression is less than or equal to the value.</td>
</tr>
<tr>
<td>greater than</td>
<td>The expression is greater than the value.</td>
</tr>
<tr>
<td>greater than or equals</td>
<td>The expression is greater than or equal to the value.</td>
</tr>
</tbody>
</table>
### Operator | Description
--- | ---
**between** | The expression is between two specified values. The between operator is available to use with date, currency, and numeric (integer and float) expressions. When using this operator with a date expression, records matching the date and time of the beginning value are returned, but those matching the date and time of the ending value are not. This prevents records from being displayed twice on a report that is run once to view records created between 9:00 AM and 10:00 AM, and run again to view records created between 10:00 AM and 11:00 AM, for example.

**like** | The expression matches any part of the value. When using this operator, you should use the % wildcard symbol to offset your value. For example, to include values containing “all,” type ‘%all%’ in the Value field.

**not like** | The expression does not match any part of the value. The % character may be used as a wildcard. For example, to exclude values containing “all,” type ‘%all%’ in the Value field.

**in list** | The expression values you want to search for are specified by selecting check boxes in a menu. The selected options are displayed in a separate Selected Items list to assist you when selecting from menus with a large number of options. When using this operator with integer fields, the numbers in the Value field must be comma-separated. When using this operator with text fields, the text strings in the Value field must be comma-separated and each text string must be offset by single quotes. For example, ‘red’, ‘green’, ‘orange’. Spaces between entries are ignored.

**not in list** | The expression values you do not want to search for are specified by selecting check boxes in a menu. The selected options are displayed in a separate Selected Items list to assist you when selecting from menus with a large number of options. This operator is available only with menu field expressions. When using this operator with integer fields, the numbers in the Value field must be comma-separated. When using this operator with text fields, the text strings in the Value field must be comma-separated and each text string must be offset by single quotes. For example, ‘red’, ‘green’, ‘orange’. Spaces between entries are ignored.

**is null** | The expression contains a null value.

**is not null** | The expression does not contain a null value.

**not equals (include No Value)** | The expression does not match the value exactly (including case), or contains a null value.

**not like or null** | The expression does not match any part of the value, or contains a null value.

**Complex Expression** | The expression matches any part of the value. This operator allows wildcard searching using an asterisk (*) at the end of a word or partial word and a tilde (~) before a word to perform a similar phrases search on that word only. See Special Characters Allowed When Searching.

**Not Complex Expression** | The expression does not match the complex expression in the value. The Not Complex Expression operator is available only with text field expressions.
Edit a Logical Expression

When you add multiple filters to a segment, the filters are automatically joined together with a logical expression. This defines how the filters should work together to return data.

By default, the logical expression uses Boolean AND logic. For example, if you have a filter of `contacts.prov_id = MT`, and a filter of `contacts.ma_state = Yes`, the logical expression is `contacts.prov_id = MT` AND `contacts.ma_state = Yes`. This expression would result in the report returning only contacts that are from Montana and are in the Outreach state.

You can edit logical expressions to limit your data set by using different Boolean operators to connect your filters.

- The AND operator retrieves data matching all of the filters.
- The OR operator retrieves data matching any of the filters.
- The NOT operator (represented by an exclamation point) excludes matching data.

When you add nodes to the expression, the nodes are displayed in a tree structure, with filters displayed either under an AND node or an OR node. Filters under the same AND node are joined to each other using AND logic, and filters under the same OR node are joined to each other using OR logic.

NOT logic is achieved by negating a filter, which displays in the Filters section preceded by an exclamation point. For instance, if you negate the filter description `contacts.prov_id = MT`, the description appears as `!contacts.prov_id = MT` (equivalent to `NOT contacts.prov_id = MT`).

1. From an open segment, add more than one filter to the Filters section.
   This image shows an open segment with two filters.

   ![Image showing a segment with two filters]

   The filters you add are automatically joined with AND logic and are displayed in an AND tree.

2. To add a filter joined with OR logic to the logical expression:
   a. Click **Add OR Node** in the Actions section.
      The node is added to the logical expression.
   b. Click the filter that should be joined with OR logic and drag it to the new OR node.

3. To negate a filter, select the filter and click **Negate Filter** in the Actions section.

4. To view a text definition of the logical expression for the current filters, click **View Text Definition**.
   The Text Definition window opens.
5. To display the filter description instead of the filter name, click **Display Filter Descriptions**. The filter description includes the field name, operator, and value. For example, a filter named Contacts in MT could be described as `contacts.prov_id = MT`.

**Edit the Data Set**

The data set consists of the database tables the segment is referencing.

The Contacts *(contacts)* table is automatically added to the data set when you create a segment. When you add fields from different database tables as filters or add more than one table to the data set, the tables that contain the fields are automatically joined together. This lets you use data from tables related to contacts; for example, incidents. Tables can be joined using two methods, or join types:

- **Inner join**—Inner joins select records from the joined tables on the condition that the value in the specified column of the primary table is equal to the value in the specified column of the secondary table. For example, if the Incidents table is joined to the Contacts table with an inner join, contacts without an associated incident are not included.

- **Outer join**—Outer joins select rows from two tables regardless of whether the specified columns contain corresponding values. An outer join returns all rows from the primary table and any rows from the secondary table where the value in the specified column of the primary table is equal to the value in the specified column of the secondary table. For example, if the Incidents table is joined to the Contacts table with an outer join, contacts without an associated incident are included.

**Note:** Tables are automatically added to the data set when you select columns to filter by in the segment.

1. Click **Edit Data Set** in the Advanced Options section. The **Edit Data Set** window opens, listing the tables in your segment and their relationships.
2. To add another table, right-click the table you want to join to, select **Join To**, and select the table and columns you want to join (for example, Incidents > `contact.c_id=incidents.c_id`). Repeat this step for each table you want to add.
3. To edit table join information, click the table that is joined to the parent table. This image shows the table that is joined to the parent table and the available join options which are defined in the Edit Data Set window table.

![Edit Data Set Window](image)

- **Enter field information.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>This field displays the database name of the table you have selected.</td>
</tr>
</tbody>
</table>
## Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete Table</td>
<td>Click Delete Table to remove the table you have selected from the segment. If the table acts as a parent to other tables in the segment, the child tables are also removed.</td>
</tr>
<tr>
<td>Alias</td>
<td>This field displays the alias name of the table you have selected. The alias allows for multiple instances of the same database table to the same segment. For example, the first instance of the Contacts (contacts) table would have an alias of “contacts,” and the second instance would have an alias of “contacts2” to distinguish it from the first instance.</td>
</tr>
<tr>
<td>Join To</td>
<td>This field displays the table that the selected table is joined to.</td>
</tr>
<tr>
<td>Join Condition</td>
<td>If more than one field relationship is available to join the tables, click this drop-down menu to select the fields on which to join.</td>
</tr>
<tr>
<td></td>
<td>If only one field relationship is available, the menu displays only that option.</td>
</tr>
<tr>
<td>Join Type</td>
<td>Select the Inner option to use an inner join and the Outer option to use an outer join.</td>
</tr>
<tr>
<td></td>
<td><strong>Tip:</strong> To change the join type, you can also right-click the joined table in the Data Set tree and select Toggle Join Type.</td>
</tr>
<tr>
<td>Join Filters</td>
<td>If you select the Outer join type, the option to add join filters becomes available.</td>
</tr>
</tbody>
</table>

4. Click **OK**.

**Create Outer Join Filters**

When you create an outer join, you can add join filters to filter the data returned from the secondary table without filtering the data from the primary table.

Join filters are similar to segment filters in that they limit the records that can be returned by the report, but they apply to the table join rather than to the data returned by the query on the database.

1. Select a joined table in the data set tree.
2. Select **Outer** as the join type.
   - The Join Filters heading displays.
3. Expand the Join Filters heading on the Edit Data Set window.
   - The Edit Data Set window displays the Join Filters section.
4. Click **Add Filter**.
   - The **Add Filter** window opens.
5. Enter field information.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the filter. If you leave this field blank, the database name displays.</td>
</tr>
<tr>
<td><strong>Expression</strong></td>
<td>Enter the expression you want to use to limit the data set in this field. The syntax is <code>&lt;table_name&gt;.&lt;column_name&gt;</code>. As you type an entry in the Expression field, a drop-down menu displays a list of database tables that begin with the letters you type. You can enter the complete expression or select a table and field from the drop-down menu. You can also select a table and column or function by right-clicking in the field.</td>
</tr>
<tr>
<td>Tip:</td>
<td>If you drag and drop a column name from the Fields section, the field contains the table and column name.</td>
</tr>
<tr>
<td>Operator</td>
<td>Select the operator to use in comparing the expression to the value. The available operators vary depending on the expression.</td>
</tr>
<tr>
<td>Value Type</td>
<td>Select the type of value to match with the expression from these options.</td>
</tr>
<tr>
<td>Constant</td>
<td>Select this option to enter the value to complete the filter or select the value from a drop-down menu or calendar (depending on the expression).</td>
</tr>
<tr>
<td>Expression</td>
<td>Select this option to enter an expression to complete the filter, using the syntax <code>&lt;table_name&gt;.&lt;column_name&gt;</code>.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter the value that the expression is compared to. The available options in the Value field change depending on the type of field, the operator you select, and the value type. For example, when the field type is menu, you select it from a drop-down menu, but when the field type is date, you select it from a calendar.</td>
</tr>
</tbody>
</table>

6. Click **OK**.

The Edit Data Set window is updated to display the filter, along with additional actions.

The additional actions that become available are identical to those used when creating logical expressions for segment filters. These actions let you edit your filter, create additional filters, add OR logic to the join filters, negate filters, and view a text definition of the join filter logical expression. For procedures on using these actions, see *Edit a Logical Expression*.

**Create a Group Filter**

You can create group filters to specify the filters to use on grouped data.

Group filters are applied to the data after the grouping is completed and must be aggregate functions. For example, if you join the Contacts (contacts) table to the Marketing Activities (ma_trans) table, create a fixed filter for `ma_trans.type` of email Sent, group by `contacts.c_id`, and use the group filter `count(*) > 10`, then only those contacts that have been sent more than ten emails will be selected in the segment.

1. From the Criteria tab, click **Edit Group Filters**.
   The **Edit Groups** window opens.
2. Click **Add Filter**
   The Add Filter window opens.
3. Enter field information on the Add Filter window. See How Segment Filters Work.
4. Click OK to save the group filter.
   The additional actions that become available are identical to those used when creating logical expressions for segment filters. These actions let you edit your filter, create additional filters, add OR logic to the join filters, negate filters, and view a text definition of the join filter logical expression. See Edit a Logical Expression.
5. Click OK.

Preview a Segment
After defining your filters, you may want to see which contacts meet the segment criteria. You can preview the segment to see a list of up to 1,000 contacts.

1. Click the Preview tab.
   The contacts’ first name, last name, and email address display. If any contact fields are used to filter the segment, they are also included as output columns in the list.
2. To change the number of contacts that display per page, click Options > Paging.
   The Report Paging Options window opens.
3. Enter the number of rows you want to display per page and click OK.
4. To edit a contact record, select the contact and click Open. See Edit a Contact.
5. To print a contact record, select the contact and click Print.
6. To access report options, such as sorting and exporting, click Options. See How You Distribute Reports and Dashboards.

Analyze a Segment
The segment analyzer examines your segment and provides suggestions as to how you can improve the segment by removing database tables, adding filters, and making other changes.

The analyzer also shows you the estimated number of rows the segment query may need to access so you know if the segment can run without encountering row limits.

Tip: After you create or edit a segment, we recommend that you run the segment analyzer to check the segment database queries. This lets you fine-tune your segments to ensure they run as quickly and efficiently as possible.

1. Open the segment you want to analyze.
2. Click Analyze on the ribbon Home tab.
   The Segment Analyzer window opens.
   The segment analyzer lists the segment filters, tables, output levels, and the estimated number of rows the segment query examines when it runs. If the analyzer finds potential issues with the segment query, it lists the issues in the Notes column next to the applicable segment component.

   The following table describes the four segment components included on the Segment Analyzer window and lists the messages you may see in the Notes column when potential issues are found.

<table>
<thead>
<tr>
<th>Segment Component</th>
<th>Potential Issue</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filters</td>
<td>This section lists the expressions used for each segment and level filter and identifies whether the filter fields are indexed in the database and whether the index is used. Custom fields can be indexed for faster queries, though too many indexes can slow down queries. Only the following message can be returned in this section.</td>
</tr>
<tr>
<td></td>
<td>- The filter contains a custom field that does not have an index. To improve the performance of this query, consider adding an index on the custom field.</td>
</tr>
</tbody>
</table>
### Segment Component | Potential Issue
--- | ---
**Tables** | This section lists the tables that are used in the segment, along with the types of joins used to link the data in the tables. Two messages can be returned in this section.
  - This table is in an outer join but there are one or more filters on fields in this table. Make sure this is by design. If not, consider changing the join type to inner or changing these filters to join filters to prevent an implicit inner join.
  - This table is not used in the report. Consider removing the table from the data set. If you need to filter out rows in the parent table that do not have rows in this table, consider adding a not null filter on the join field in the parent table.
**Levels** | This section does not apply to segments even though it displays in the report.
**Rows** | This section lists the estimated number of rows that will be examined by the query. Messages are displayed if the number of rows exceeds the threshold values for the operational and report databases. Three messages can be returned in this section. The messages vary depending on whether your site has a report database in addition to the operational database.
  - The estimated number of analyzed rows for this query is X. This value exceeds the threshold of 2,000,000 for the operational database. Consider using the report database for this report. Otherwise, it is likely this will occur automatically.
  - The estimated number of analyzed rows for this query is X. This value exceeds the threshold of 2,000,000 for the operational database. Since you have specified the operational database for this report, it is unlikely the report will execute. Consider using the report database for this report.
  - The estimated number of analyzed rows for this query is X. This value exceeds the threshold of 5,000,000 for the report database. Consider adding or refining filters to reduce the number of analyzed rows to below this threshold. Otherwise, it is unlikely the report will execute.

3. Click **X** on the top right to close the Segment Analyzer window.
4. Click **X** on the top right to close the segment.

### Export a Segment
Exporting and importing segments saves you time by letting you reuse your segments.

There may be situations when you want to use the same segment in multiple interfaces, websites, or custom reports. You can export your segments as XML files and then import the files to use again. See *Import a Report from an XML File*.

1. Open the segment you want to export.
2. Click **Export** on the ribbon Home tab.
3. Save the new XML file.

### Import a Segment
Exporting and importing segments saves you time by letting you reuse your segments.

There may be situations when you want to use the same segment in multiple interfaces, websites, or custom reports. You can export your segments as XML files and then import the files to use again. See *Import a Report from an XML File*.

1. On the Segments explorer, click **New**.
2. Click **Import Segment**.
**Note:** You must have exported an XML segment and saved it to a location where you can access it before it can be imported.

3. Select the XML segment file you want to import and click **Open**.

The segment displays on the Data Dictionary window.

**Example of Creating a Segment**

This procedure uses a real-world scenario to walk you through the creation of a segment.

In the following example, a segment is created to return a data set of contacts who live in the state of Montana and have submitted an incident assigned to a certain product. The example works under the premise that there is a product named Call Plans. For information about creating products, see [Add or Edit a Product](#), [Add a Subproduct](#), and [Edit Visibility Settings for Multiple Products Simultaneously](#).

1. From the Segments explorer, click **New**.
   - A new segment opens on the content pane.
2. Click **New Segment**.
   - The Segment editor opens on the content pane.
3. Click **Contacts** under Current Dataset in the Data Dictionary section on the Criteria tab.
4. In the Fields section, drag State/Province (prov_id) and drop it in the Filters section.
   - The **Edit Filter** window opens with the `contacts.prov_id` field populating the Expression field.
5. Click the **Value** drop-down menu and select **MT**.
6. Click **OK**.
7. Click **Incidents** under All Tables in the Data Dictionary section.
8. In the Fields section, drag Product Hierarchy (prod_hierarchy) and drop it in the Filters section.
   - The **Edit Filter** window opens with the `incidents.prod_hierarchy` field populating the Expression field.
9. Click the **Value** drop-down menu and select **Call Plans**.
10. Click **OK**.

The segments display on the content pane with the criteria you defined.

11. Click **Save**, enter the segment name in the **Name** field of the Save As window, and click **Save**.

The segment can now be used in mailings and surveys to target only those contacts with an address in Montana who have submitted an incident associated with call plans.

**How You Improve Conversion Rates**

A successful broadcast mailing is largely dependant on the quality of your contacts. This topic includes steps you can take to improve your organization’s conversion rates.

A common myth about sending broadcast email is that—like direct mail—the larger your audience, the more likely your mailing is to be successful. In reality, succeeding with broadcast email depends more on the quality of contacts than the quantity. Sending email to people who have no interest in your product or service not only drags down your conversion rates, it can land you on lists that block delivery of future mailings across large swaths of the Internet.

One of the most effective ways to improve conversion rates is to filter your contacts by email viewing history. The system keeps track of each contact’s marketing activity in the Marketing Scorecard (`ma_scorecard`) table. When a contact views a mailing, the `ma_scorecard.last_view` field is updated with the date and time that the message was viewed. Knowing whether a contact recently viewed a message provides a reasonable basis for judging contact quality.

There are several reasons a contact might not view a message. For example, the message may contain an unfamiliar From address or an ambiguous subject line. It may be filtered as spam, bounced or blocked by the recipient’s mail server, or rejected due to the sender’s reputation. Whatever the reason, it is safe to assume that a contact who has not viewed a recent mailing is not likely to view one in the future.
Conversely, a contact who recently viewed a message is more likely to view future messages. Therefore, to optimize your conversion rates and protect your reputation, we recommend that you add the following filter to all segments:

- `ma_scorecard.last_view` greater than -90 Days Exactly (Relative)

This filter limits your segment to a list of contacts who have viewed at least one mailing within the past ninety days.

**Tip:** After you have added this filter to a segment and included the segment in an audience, be sure to perform an audience count. If the segment returns too small an audience, adjust the date value defined by the `ma_scorecard.last_view` filter to be less restrictive. But remember—the longer contacts go without viewing a mailing, the more likely they are to lower your conversion rates.

The contacts in the resulting list will be more likely to view future messages than contacts who are not listed. You can also assume that their email addresses are valid and that they are not marking your messages as spam. Therefore, the quality of these contacts is high.

Another way to improve conversion rates is to track your contacts’ engagement score. Based on historical contact interactions within B2C Service, the system evaluates each contact and assigns a contact engagement score on a scale from 0 to 100. This statistic is based on each contact’s hourly transaction history, such as content viewed, links clicked, web form and survey submittals, marketing emails forwarded, SmartSense ratings, and service transactions. Score value is stored in the `ma_scorecard.score` field, which is available for reports (for example, the Engagement Scorecard report), segments, and campaign decisions.

**Note:** Data older than 400 days is automatically truncated from the following tables: Marketing Activities (`ma_trans`), Bounced Messages (`bounced_msgs`), and Mailing Exclusions.

The Marketing Stats (`ma_stats`) table summarizes records in the Marketing Activities (`ma_trans`) table that share a unique combination of `mailing_id`, `format_id`, `doc_id`, `flow_id`, `flow_web_page_id`, and `type` values. This ensures that summary marketing transaction statistics remain available indefinitely, even after the originating `ma_trans` records have been truncated. All transactions related to unsubscribe, including list-unsubscribe header, feedback loop unsubscribe, and unsubscribe, will remain in the Marketing Activities table.

To ensure optimal conversion rates and protect your reputation, you should adopt a regular contact evaluation process to ensure that all contacts are valid and active.

**Contact Opt-In Management**

Although many of your customers may want to be included in your mailings or survey invitations, it is not uncommon for some to decline. In fact, anti-spam legislation in most countries requires that you provide a way for your contacts to easily opt out of all mailings.

An effective opt-in process can also provide numerous benefits, including the following:

- Affirming contact receptiveness to your messages.
- Targeting the interests of your valued prospects and customers to provide more pertinent information without overwhelming their inboxes.
- Optimizing your contact data to improve conversion rates.
- Protecting your company reputation among ISPs.
To help track your customers’ messaging preferences, B2C Service provides two types of opt-in fields.

- **Global Opt-in**—is a contact database field that describes the willingness of your contacts to receive any form of bulk mailing.
- **Custom opt-in fields**—are contact custom fields of an opt-in data type that can be used to more precisely describe the willingness of contacts to receive bulk mailings about specific topics or products.

Opt-in fields are often made visible on the Account Settings page of the customer portal so that customers can set their own preferences for accepting bulk email. Opt-in fields are also commonly paired with unsubscribe links in mailings and survey invitations to provide contacts with a simplified means of opting out. See *Insert an Unsubscribe Link*.

Contacts that are globally opted in are considered fully active and willing to receive your communications. Alternately, contacts that are globally opted out should be regarded as though they have explicitly stated that they do not want to receive bulk email from your company—they should be excluded from all mailings and surveys. Global exclusions are enabled by default by the Honor Global Opt-in check box on the Audience tab of mailings and surveys. See *Define the Broadcast Mailing Audience*.

Exclusions based on custom opt-in fields are manually enabled by adding a filter to your segments, such as `contacts.<opt-in_field_name> not equals No`, or by adding a special segment to your audience as described in the following procedure.

**Related Topics**
- CAN-SPAM Compliance
- Contact Opt-Out Tracking
- Exclude Contacts Based on a Custom Opt-In Field

**Exclude Contacts Based on a Custom Opt-In Field**

Exclusions based on custom opt-in fields are manually enabled by adding a filter to your segments.

You could add a filter such as `contacts.<opt-in_field_name> not equals No`, or you could add a special segment to your audience as described in the following procedure.

1. Click **Audiences** on the navigation pane.
2. Double-click **Segments Explorer**.
   The Segments explorer opens on the content pane.
3. Click **New** on the ribbon. A new segment opens on the content pane.
   
   **Tip:** You can also exclude a segment based on a custom opt-in field from an open segment by clicking New. Additionally, if your navigation set is configured to add segments from the file menu, click **File > Audience > Segment**. See *Configure the File Menu*.

   a. To create a segment from scratch, click **New Segment**.
   b. To create a segment by copying an existing segment, click **Choose Existing Segment**.
      The **Choose Existing Segment** window opens where you can select the segment you want to use.
   c. To import an XML segment, click **Import Segment**. See *Import a Segment*.
4. Click **Add Filter**. The **Add Filter** window opens.
   a. Enter the opt-in field name in the **Expression** field.
   b. Select **No** from the **Value** field.
   c. Click **OK**.
   d. Click **Save and Close** to save the segment.
5. From the Audience tab of an open mailing, click **Add Segment** in the Excluded section.
6. Select the segment you created and click **OK**.
7. Click Save.

Contact Opt-Out Tracking

B2C Service records transactions for global opt-ins and opt-outs in the contact audit log.

While global opt-outs are generally performed by contacts themselves, there are many methods by which a contact can be opted out.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>

<tr>
<td>Data Import</td>
<td>The contact was opted out when the contact record was uploaded by the Data Import Wizard.</td>
</tr>
<tr>
<td>List-Unsubscribe Header</td>
<td>The contact clicked an opt-out button in the mail client that appeared as a result of the List-Unsubscribe mail header.</td>
</tr>
<tr>
<td>Automatic Feedback Loop</td>
<td>The contact clicked a spam notification feature provided by the contact's email service, which relayed a notification to B2C Service, and the contact was opted-out by the system.</td>
</tr>
</tbody>
</table>

In addition to the audit log, the system provides the following reports to help you identify the methods responsible for opting out contacts.

- **Mailing Opt-Out Details**—Lists all contacts who opted out as a result of a mailing and the opt-out method used.
- **Contact Opt-Out Details**—Lists all contacts currently opted out and (if available) the opt-out method used.
- **Outreach Activity**—Includes information about contacts who opted out using the List-Unsubscribe Header or Automatic Feedback Loop methods.
- **Mailing Response Analysis**—Includes the total number of opt-outs that occurred using the List-Unsubscribe Header or Automatic Feedback Loop methods.

**CAUTION:** Administrators noticing a large number of global opt-outs may be tempted not to include unsubscribe links in mailings. However, you should be aware that in many countries, including the United States, the inclusion of unsubscribe links in marketing email is required by law. See [CAN-SPAM Compliance](https://icompliance.com). If your site is experiencing higher-than-usual opt-out rates, the recommended best practice is to increase the deliverability of your communications.
Content Library

Overview of Content Library

The Content Library is a resource for creating, storing, and organizing custom content such as documents, templates, tracked links, and snippets. When saved, you can access this content whenever you need to include it in a mailing, campaign, web page, or survey.

You can use the content as is, or make minor changes after it has been added. You can also upload file attachments once and include them in your content as many times as you like.

The HTML editor lets you create dynamic documents to send to your customers in mailings, surveys, and notifications. You can add graphics, hyperlinks, tables, and apply text formatting without having any knowledge of HTML. Should you need to modify the source code, the editor provides easy access with a technical interface.

You can also add web forms to documents, templates, and snippets to collect customer data from the web or through email. You can add any database contact field or contact custom field to the web form, enabling you to populate a contact record with data from the submitted form.

- Insert a Web Form

Create a Document

You can create unique documents to use in mailings, campaigns, and surveys. Documents can be designed in either HTML or plain text, and are easily previewed while being created. You can also access tasks and notes associated with the document, and an audit log of actions taken on the document.

After a document is created, it can be served as a web page in a campaign, sent to contacts in a mailing or survey invitation, or used to form a questionnaire in a survey. Documents can contain templates, web forms, snippets, merge fields, merge reports, and conditional sections based on contact filters. However, mailings and surveys using simpler documents send more quickly than those using documents with many merge fields, merge reports, conditional sections, and web forms.

**Note:** The following procedure assumes that you access the Documents explorer from the Content Library navigation list. However, this explorer may reside in a different navigation list.

1. Click **Content Library** on the navigation pane.
2. Double-click **Documents Explorer**.
   - The Documents explorer opens on the content pane.
3. Click **New**.
   - A new document opens on the content pane.
Tip: You can also create a document from an open document by clicking New. Additionally, if your navigation set is configured to add documents from the file menu, click File > Content Library > Document. See Configure the File Menu.

By default, the Summary tab is active when creating a document. From here, you can assign the document to a staff member, as well as manage document notes, tasks, and attachments. See How Documents Work. The Notes, Tasks, Attachments, and Audit Log tabs are available only when the Summary tab is selected.

4. To assign the document to another staff member (by default, the document is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.

Tip: Wildcards are supported when searching staff members. You can search strings that include a space by entering %+Space+character, which is helpful when searching last names. For example, typing %+Space+b returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing b in the Find field returns all items containing the letter b.

a. To search for a staff member, enter the staff member’s name in the Find field.

5. To let staff members to serve this document as a web page, select the Approved for Web check box.

6. To let staff members to use this document in a mailing or survey, select the Approved for Email check box.

7. To create an HTML version of the document, click the HTML tab and see Create an HTML Document.

8. To create a plain-text version of the document, click the Text tab and see Create Text Content in Documents.

9. To spell check the document, click Spelling on the ribbon and see Spell Checking.

10. Click Save.

The Save As window opens.

11. Select the folder you want to save the document in and type the name of the document in the Name field.

12. Click Save.

Create an HTML Document

When you create HTML documents, you have the option of starting with a blank document, copying an existing document, using a template, or uploading your own HTML to the document.

HTML documents can be modified by editing the source code, or using an HTML editor to add images, formatting or insert special links, such as tracked links or links to unsubscribe to mailings. You can also add conditional sections, merge fields, and merge reports to your HTML documents.

1. Click the HTML tab.

2. To create an HTML document from scratch, click Begin with Blank Content.

The HTML editor opens. See How the HTML Editor Works.

a. Select the document you want to copy.

b. Click OK to add the content to your document.

| Note: Changes to the document content do not affect the original document.

4. To create an HTML document by uploading a template, click Pick a Template. The Choose Template window opens.

a. Select the template you want to use.

b. To create a template, click New Template and see How Templates Work.

c. Click OK to use the template in your document.

5. To create an HTML document by uploading an HTML file from your workstation, click Upload HTML Content.

a. Select the HTML file you want to upload.
Create Text Content in Documents

You may want to create a text version of your document if certain customers can receive only plain text emails. When you create text documents, you can start with a blank document, upload the text portion of an existing document, or convert an HTML file.

1. Click the **Text** tab.
2. To create text content from scratch, click **Begin with Blank Content**. The text editor opens. See *How You Create and Edit Text-Only Messages*.
3. To create text content by copying an existing document, click **Copy Existing Document**. The Choose Document window opens.
   a. Select the document you want to copy.
   b. Click **OK** to add the content to your document.
4. To create a text document by converting an HTML page to text, click **Convert HTML Content**. The HTML to Text window opens.
   a. To convert the HTML content to text, select **HTML Part**. This option is not available if no HTML content exists in the document.
   b. To convert an HTML file to text, select **File On Disk** and browse for the file.
   c. Click **OK** to insert the converted HTML in the text part of your document.
5. Click **Save**.

How Documents Work

You can view click-through results for a document and add notes, tasks, and file attachments to your documents. You can also view the audit log to see when a document was created and edited.

The following sections describe how to view click-through results and add notes and tasks.

- **View Click-Through Results**
- **Add a Note to a Document, Mailing, or Survey**
- **Add a Task to a Document**

To add file attachments and view the audit log, see *Overview of the Attachments Tab* and *Audit Logs*.

View Click-Through Results

Documents can be viewed with click-through results for tracked links, web page links, file links, unsubscribe links, and forward to friend links.

Following each link, inline statistics display the number of times the link was clicked, the number of total link clicks in the document, and the percentage of times the link was clicked when compared to total clicks. The links are also color coded so you can immediately see how they are performing. Links that perform well appear in green, underperforming links appear in red, and all other links appear in yellow.

1. From the Documents explorer, do one of the following:
Add a Note to a Document, Mailing, or Survey
You can use notes to provide additional information about the content that can be viewed by staff members as they are working with the document, mailing or survey.

1. On the Summary tab of an open document, mailing, or survey, click the Notes tab.
2. Click Add.
3. Enter the note text in the text field.
4. To sort the notes by ascending or descending date, click the Sort drop-down menu and select the sort option.
5. To edit an existing note, click Edit next to the note.
6. To permanently delete a note, click Delete next to the note.

Add a Task to a Document
From the Summary tab, you can assign new or existing tasks to documents and edit, delete, and forward tasks to other staff members. You can also view each task associated with the document.

1. From your open document, click the Tasks tab.
2. Enter field information.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>Click this button to display a drop-down menu containing the following options.</td>
</tr>
<tr>
<td>Add New</td>
<td>Select this option to add a new task. See Add a Task for the procedure to complete the fields on this window.</td>
</tr>
<tr>

<td>Click this button to select an option for managing the output and display of information on the tab, such as print, forward, or export. See Forward a Report, and Export Report and Dashboard Data. For information about other options, see How You Change Report Formatting.</td>
</tr>
</tbody>
</table>
How Templates Work

Templates are used to standardize the design of the headers and footers of your documents. When you apply a template to a document, the template design appears as part of the document layout.

However, the template design cannot be edited from the document editor—you can edit only the contents of the document, indicated by a red outline. To make changes to the template, you must open it in the template editor. See *Create a Template*.

Templates are sometimes referred to as “living” content. When a template is edited and saved, all documents using the template automatically display the updated content. For instance, if you design a template containing a standard header and apply it to multiple documents, any changes made to that template appear automatically in every document that the template was applied to.

In certain cases, you may be better off using a snippet. Consider the following when deciding whether to use templates.

- Templates are best used for applying a common look and feel to a group of documents that will be published to the web (using the Serve Web Page campaign element, for instance). For documents used in a mailing or survey invitation, it is better to add design elements using snippets.

For example, if a template is applied to a document used by a mailing, and the template is later edited, the mailing is updated in B2C Service to reflect the edits. This occurs even if the mailing has already been sent and the RNM_MOD_SENT_DOCS configuration setting is set to disable the editing of sent documents. If the template is edited after the mailing is sent, and a staff member views the mailing from the mailing editor or the Outreach Activity tab of a recipient’s contact record, the mailing no longer appears as it did when it was sent. This can cause confusion and ambiguity about the effectiveness of the mailing.

- When you insert a snippet, its contents are copied to the layout and can then be edited freely with the rest of the design. You can also edit the snippet at any time without affecting the appearance of layouts to which the snippet was previously applied. See *Create a Snippet*.

- Another alternative to using templates is to store your design in an HTML file outside of B2C Service and then upload it when you create your mailing or survey. See *Upload HTML Content*.

If you need to update a template that has been applied to a document, you can click Info on the Home tab ribbon to display the template ID. You can then search for the template in the Templates explorer by clicking Find on the ribbon and selecting ID from the Find Using drop-down menu. See *Find a Document*.

**Tip:** To see a list of documents that are using a template, you can create a report from the Documents (documents) table that uses the `live_rc_id` filter. For example, using the Documents table, you could add columns, such as Name, Date Created, Date Updated, and Assigned, and then add the `live_rc_id` filter to the report to see which templates are returned in the list. See *Overview of Creating Custom Reports*.

Document templates are not applied when surveys are viewed on mobile devices because templates are not optimized for mobile. However, if you want to create an appropriately sized template to be used for mobile, you could add HTML content with a conditional section for mobile runtime that includes a smaller image. See *How You Customize Surveys for Use on Mobile Devices*. 
Create a Template

Templates are used to standardize the design of the headers and footers of your documents. Templates are sometimes referred to as “living” content. When a template is edited and saved, all documents using the template automatically display the updated content.

1. Click **Content Library** on the navigation pane.
2. Double-click **Templates Explorer**.
   The Templates explorer opens on the content pane.
3. Click **New**.
   A new template opens on the content pane.

   **Tip:** You can also create a template from an open template by clicking New. Additionally, if your navigation set is configured to add templates from the file menu, click **File > Content Library > Template**.

4. To create the template from scratch, click **Begin with Blank Content**.
   The HTML editor opens. In the middle of the HTML editor is a placeholder for document content when the template is used. You can insert HTML above and below the placeholder, including in the header and footer. See **How the HTML Editor Works**.

   **Note:** The template must include the content placeholder.

5. To create a template by copying an existing template, click **Copy Existing Template**.
   The **Choose Template** window opens.
   a. Select the template you want to copy.
   b. Click **OK** to add the content to your template.

   After uploading your HTML, you must insert the placeholder by clicking **Content Placeholder** in the toolbox.

6. To create a template by uploading an HTML file from your workstation, click **Upload HTML Content**.
   a. Browse to the location of the HTML file you want and select it.
   b. Click **Open**.
   The HTML is inserted in your template.

   After uploading your HTML, you must insert the placeholder by clicking **Content Placeholder** in the toolbox.

7. To spell check the template, click **Spelling** on the ribbon.

8. Click **Save**.
   The **Save As** window opens.

9. Select the folder you want to save the template in and type the name of the template in the **Name** field.

10. Click **Save**.

**Related Topics**
- How Templates Work
- Configure the File Menu

How Snippets Work

Snippets are small pieces of commonly used content that can be inserted into the layout of a document, mailing message, survey, or survey invitation.

Creating a snippet is helpful if you want to make certain design elements available to any document, mailing, or survey. Snippets can be accessed easily and reused as many times as needed. When you insert a snippet, its contents are
copied to the layout and can then be edited freely with the rest of the design. Changes made to a snippet in the snippet editor do not alter the appearance of layouts to which the snippet was previously applied.

**Tip:** If you want to apply design elements that can be updated automatically across multiple documents, you might consider using a template instead of a snippet. When a template is edited and saved, all documents using the template automatically display its updated content. However, templates are best used when working with groups of documents that will be published to the web (using the Serve Web Page campaign element, for instance). When designing documents that are used for mailings or survey invitations, it is better to use snippets.

You can also store your design in an HTML file outside of B2C Service and then upload it when you create your mailing or survey. See *Upload HTML Content*.

**Create a Snippet**

Snippets are small pieces of commonly used content that can be inserted into your content.

1. Click **Content Library** on the navigation pane.
2. Double-click **Snippets Explorer**.
   The Snippets explorer opens on the content pane.
3. Click **New**.

   **Tip:** You can also create a snippet from an open snippet by clicking New. Additionally, if your navigation set is configured to add snippets from the file menu, click **File > Content Library > Snippet**. See *Configure the File Menu*.

   A new snippet opens on the content pane.

   By default, the snippet type is HTML. You can also create plain text snippets. See *Create a Text Snippet*.

4. To create an HTML snippet from scratch, click **Begin with Blank Content**.
   The HTML editor opens so you can design the HTML in your snippet. See *How the HTML Editor Works*.
5. To create an HTML snippet by copying an existing snippet, click **Copy Existing Snippet**. The Choose Snippet window opens.
   a. Select the snippet you want to copy.
   b. Click **OK** to add the content to your snippet.
6. To create an HTML snippet by uploading an HTML file from your workstation, click **Upload HTML Content**.
   a. Browse to the location of the HTML file you want and select it.
   b. Click **OK** to insert the HTML into your snippet.
7. To spell check the snippet, click **Spelling** on the ribbon.
8. Click **Save**.
   The **Save As** window opens.
9. Select the folder you want to save the snippet in and enter the name of the snippet in the **Name** field.
10. Click **Save**.

**Related Topics**

- How Snippets Work

**Create a Text Snippet**

You may want to create a text version of your snippet to insert in text documents. Text documents are used if certain customers can receive only plain text emails.

1. From the Snippets explorer, click **New**.
A new snippet opens on the content pane.

**Tip:** You can also create a snippet from an open snippet by clicking New. Additionally, if your navigation set is configured to add snippets from the file menu, click File > Content Library > Snippet. See Configure the File Menu.

2. Click Change in the Current Snippet Type section.
The Snippet Type window opens on the content pane.

**Note:** You can also change to a text snippet while creating an HTML snippet by clicking Switch to Text Mode in the Tasks section of the HTML editor.

3. Select Text Snippet.
4. Click OK.
The snippet type changes to Text.
5. To create a text snippet from scratch, click Begin with Blank Content.
The text editor opens where you can define the plain-text version of your snippet. See How You Create and Edit Text-Only Messages.
6. To create a text snippet by copying an existing snippet, click Copy Existing Snippet. The Choose Snippet window opens.
   a. Select the snippet you want to copy.
   b. Click OK to add the content to your snippet.
7. To create a text snippet by converting an HTML page to text, click Upload HTML Content.
   a. Browse to the HTML file you want to convert and select it.
   b. Click Open to insert the converted HTML in the snippet.
8. Click Save.

**Related Topics**
- How Snippets Work

### Add a Tracked Link

You can add links that are tracked and reported on for statistical purposes.

The number of times a link was clicked through is reported when editing the mailing or survey and through analytics. See View Mailing Results.

After you have added tracked links to your system, they can be inserted in documents, templates, or snippets. See Insert a Tracked Link. Tracked links can also be inserted in several of the standard system-generated contact email messages. See How You Customize Messages. Adding tracked links to your contact emails are especially useful in tracking your customer-facing incident responses. See Incident Response Tracking.

**Note:** Due to the volume of tracked links that accumulate as new content is created, the Agedatabase utility regularly purges the database of orphaned tracked links. That is, links that have been defined but not used in any campaign, document, or mailing. The PURGE_TRACKED_LINK_DAYS configuration setting specifies the number of days after which an orphaned tracked link is removed from the database. The default value is 30 days. To turn off tracked link purging, set the value to 0.

1. Click Content Library on the navigation pane.
2. Double-click Tracked Links Explorer.
The Tracked Links explorer opens on the content pane.

3. Click New.

Tip: You can also create a tracked link from an open tracked link by clicking New. Additionally, if your navigation set is configured to add tracked links from the file menu, click File > Content Library > Tracked Link. See Overview of Navigation Sets.

A new tracked link opens on the content pane.

4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the full URL of the tracked link in this field.</td>
</tr>
<tr>
<td>![Open URL]</td>
<td>Click this icon to open the URL.</td>
</tr>
<tr>
<td>![Merge Field]</td>
<td>Click this icon to add a contact, incident, opportunity, or tracked link merge field to the URL.</td>
</tr>
<tr>
<td>Menu Access Disabled</td>
<td>Select this check box to make the tracked link unavailable. Staff members cannot insert the link in a document.</td>
</tr>
<tr>
<td>Unsubscribe</td>
<td>Select this check box to increment the unsubscribed count when this link is clicked in a mailing or survey. Note: Clicking the link does not change the contact’s opt-in status. Select this check box if you want to manage opt-in information outside of B2C Service.</td>
</tr>
<tr>
<td>Category</td>
<td>Click this drop-down menu and select a category to associate with the link. See Add or Edit a Tracked Link Category.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the tracked link in this field. The description is for internal use only and is not seen by contacts who receive a mailing or survey with the link.</td>
</tr>
</tbody>
</table>

5. To add a merge field to the URL, click the Merge Field icon.
   a. Select the database field you want to merge. Merge fields are populated with data from the contact record, account data or an associated incident, asset, opportunity, organization, or tracked link. You can also use the special fields that are available. The value of this field is appended to the URL as a parameter. For example, if you wanted to pass the login field value from the contact record, specifying http://www.global.example/regform.php?user=$contacts.login would return a URL such as http://www.global.example/regform.php?user=jsmith.
   b. Click OK to append the field to the URL.

6. To spell check the tracked link description, click Spelling on the ribbon.
7. Click **Save**.
   The **Save As** window opens.
8. Select the folder you want to save the tracked link in and enter the name of the tracked link in the **Name** field.
9. Click **Save**.

## Add a File

You can add files to your system that can be viewed by contacts who receive your mailings and surveys. After your files are added, you can use them as many times as you want.

Links to the files can be inserted in documents, templates, and snippets as a link. As a best practice, always include an unsubscribe link to give your contacts the option of opting out of future mailings and surveys. See *Insert an Unsubscribe Link*.

**Note:** Certain practical limitations exist that restrict the size of files that can be uploaded to B2C Service. See *Answer ID 280* on our support site.

1. Click **Content Library** on the navigation pane.
2. Double-click **File Attachments Explorer**.
   The File Attachments explorer opens on the content pane.
3. Click **New**.
   **Tip:** You can also add files from an open file by clicking **New**. Additionally, if your navigation set is configured to add files from the file menu, click **File > Content Library > File**. See *Overview of Navigation Sets*.
   A new file opens on the content pane.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*File</td>
<td>Enter the full path name to the file you want to upload in this field or click Browse to browse for the file.</td>
</tr>
<tr>
<td></td>
<td>Click the text in this field when editing a file to preview the file.</td>
</tr>
<tr>
<td>Menu Access Disabled</td>
<td>Select this check box to make the file unavailable. Staff members cannot select the file to insert in a document.</td>
</tr>
<tr>
<td>End-User Access Disabled</td>
<td>Select this check box to make the file unavailable in mailings and surveys sent to contacts. Contacts will receive a message indicating that access is denied.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the file in this field. The description is for internal use only. It is not seen by contacts who receive a mailing or survey with the file.</td>
</tr>
</tbody>
</table>

5. To spell check the file description, click **Spelling** on the ribbon.
6. Click **Save**.
The Save As window opens.

7. Select the folder you want to save the file in and enter the name of the file in the Name field.
8. Click Save.

How the HTML Editor Works

When creating content for use in mailings, surveys, message templates, or answers, you can add HTML using an HTML editor built into the system.

The HTML editor for answers is different from the HTML editor used for mailings, surveys, and message templates. The information in this section pertains to the HTML editor for mailings, surveys, and message templates. For details about the HTML editor for answers see HTML Editor for Answers.

The HTML editor contains many of the same options available in basic word processing applications and also has specialized operations such as adding web forms, conditional sections, incident threads, merge fields, and merge reports.

You can create content in design or source mode. Using design mode, you can create dynamic, well-formatted content even if you do not have previous HTML experience. You can include special formatting in your text and add graphics, links, and other HTML features. You can also add links to existing content. See How You Add HTML in Design Mode.

Note: For design mode to be available in Outreach and Feedback, the HTML Design Mode permission must be selected for both Outreach and Feedback in your profile. See Outreach Permissions and Feedback Permissions.

Using source mode, you can create content using HTML source code. Regardless of which mode you use to create content, you can preview how it appears to customers from the Preview tab.

The links and dynamic content elements that display on the HTML editor are context-sensitive and depend on what type of content you are creating.

Related Topics

- Add HTML in Source Mode
- Preview Content

How You Add HTML in Design Mode

B2C Service contains an HTML editor for creating dynamic content.

When in design mode, you can use word processing functions to create HTML, as well as dynamic content, such as adding a conditional section or a merge field. You can add several types of links to your content as this image shows.

The links and dynamic content elements that display on the HTML editor are context-sensitive and depend on what type of content you are creating.
Note: For design mode to be available in Outreach and Feedback, the HTML Design Mode permission must be selected for both Outreach and Feedback in your profile. Otherwise, only source mode is available. See Add HTML in Source Mode, Outreach Permissions, and Feedback Permissions.

Links appear as clickable text when the document is used in a message, mailing, or survey or as a web page. When a link is added, you have the option of defining certain attributes depending on the type of link. Links, as well as forms and dynamic content elements, are located in the toolbox.

Tip: You can define style and class properties on most toolbox and tasks elements (or options) by right-clicking the element after you add it to the canvas. Keep in mind that style and class must be defined in a CSS file that is available on your web server, and linked to in the <head> tag of a message, mailing, or survey template. See Edit Style and Class.

Using the toolbar, you can create HTML using many of the same options available in basic word processing applications. Functions include:

- Cut, copy, and paste
- Find and replace text
- Print the document
- Undo and redo changes
- Switch to full screen
- Format text in numbered or bulleted lists
- Adjust indentation
- Center, left-justify, or right-justify text and images on the page
- Insert line breaks
- Change font size and style attributes (such as bold, italic, and underline)
- Apply special text formatting (such as color, highlighting, superscripts, and subscripts)
- Copy text formatting using the style applier

Additional functions are accessed through the Toolbox and Tasks sections. In the Toolbox section, there are HTML, Links, and Dynamic Content sections. When creating documents in Outreach and Feedback, there is also a Forms
section. In the Tasks section, there are Start Over and Content sections. For detailed information about these functions, see the Toolbox Section and Tasks Section tables here: *Links and Dynamic Content Elements*.

**Tip:** You can insert HTML by clicking a button in the Toolbox or Tasks section, or by dragging and dropping the button to a specific location on the canvas.

**Links and Dynamic Content Elements**

You can add several types of links and dynamic content elements to your content. When an element is added, you have the option of defining certain attributes depending on the type of element.

Links appear as clickable text when the content is used in a message, mailing, or survey. The tools displayed on the HTML editor are context sensitive and are the logical tools you would use for the specific content you are creating.

Links and dynamic content elements are found in the Toolbox and Tasks sections of the HTML editor. Within the Toolbox, there are HTML, Links, and Dynamic Content sections. In Outreach and Feedback, there is also a Forms section. Within the Tasks, there are Start Over and Content options.

**Tip:** You can insert HTML by clicking any button in the Toolbox or Tasks section, or by dragging and dropping the button to a specific location on the canvas.

Add HTML in Source Mode

The HTML editor contains an option to create your documents using HTML code. You can enter HTML code directly in the editor to create your content.

The editor displays your code using colored text to indicate structure and syntax. There are additional functions available that you can access through the Toolbox and Tasks sections. The links and dynamic content elements that display on the HTML editor are context-sensitive and depend on what type of content you are creating. When you save, the system automatically validates your code formatting and notifies you about any errors.

**Note:** By default, the editor requires your code to be XHTML compliant before it can be saved. To allow code to be saved without XHTML compliance, disable the HTML_TIDY_ENFORCE_XHTML configuration setting (RightNow User Interface/Misc. Customization/HTML Editor).

1. Click the **Source** tab at the bottom of the HTML editor.

   Source mode automatically places the cursor after the opening `<body>` tag. This image shows the HTML editor in source mode with the HTML tab selected.

   ![HTML editor in source mode](image)

   The Source tab has a toolbar and a section for entering your source code. Using the toolbar, you can create HTML using some of the same options available in basic word processing applications. Functions include:

   - Cut, copy, and paste
   - Find and replace text
   - Print the document
   - Undo and redo changes
   - Switch to full screen
   - Enable or disable syntax highlighting
**Tip:** It’s a good idea to preview your work when using Source mode. When you switch between the Source and Preview tabs, your cursor stays where you left it, making it easy to check your work. See *Preview Content*.

Additional functions are accessed through the Toolbox and Tasks sections. You can insert HTML by clicking a button in the Toolbox or Tasks section, or by dragging and dropping the button to a specific location on the canvas. For detailed information about these functions, see the Toolbox Section and Tasks Section tables in *Links and Dynamic Content Elements*.

### How You Can Use Dynamic Content

In addition to HTML, B2C Service supports the passing of specific JavaScript events to fields within web forms and surveys. This provides increased flexibility in personalizing the appearance and behavior of fields and questions as they are completed.

For example, an “onclick” event can be specified to dynamically enable a phone number field when a customer selects a check box indicating they want to be contacted by phone.

<table>
<thead>
<tr>

How You Create and Edit Text-Only Messages

You can create text-only messages for your customers who can receive only plain text emails.

Unlike the HTML editor, the text editor does not contain text formatting options. It does, however, contain links for additional functions related to B2C Service, such as adding a *merge field*, or *conditional section*. You can also add several types of links to your content. When a link is added, you have the option of defining certain attributes depending on the type of link. Links in plain text cannot be clicked and customers need to copy the URL into their web browser.

Using the toolbar, you can use several of the same options available in basic word processing applications. Functions include:

- Cut, copy, and paste
- Find and replace text
- Print the document
- Undo and redo changes
- Switch to full screen
- Enable or disable syntax highlighting

Additional functions are accessed through the Toolbox and Tasks sections.

</tr>
</tbody>
</table>

**Note:** The CAN-SPAM Act of 2003 requires that commercial email messages contain the sender’s valid physical postal address.

**Preview Content**
You can preview the HTML and text versions of your content. The content displays as customers will see it in their email client or on a web page.

1. Click the **Preview** tab at the bottom of the HTML editor.
2. To see how your dynamic content displays, either by incident or contact, click the **Search** icon next to the Preview Incident or Preview Contact field.

The **Search** window opens where you can search for an incident or a contact to use when the message is previewed on the Preview tab.
Prefill Web Form Fields

Web forms can display with one or more fields prefilled with data, letting you simplify the form completion process for your contacts.

By appending specially formatted parameters to the web page URL, any database or custom contact field that appears on the form can be set with a default value. Field values submitted in a prefilled form overwrite the existing values in the contact record. Prefilled values can be unique to the placement of each link. For example, you can publish links at three different sites to a single web form but configure each link to prefill fields on the form with different values.

To prefill fields in a web form, the document containing the form must first be served in a campaign or advanced survey using a Serve Web Page element. See Edit Serve Web Page Attributes.

1. Open the campaign or survey that serves the document containing the web form.
2. Double-click the Serve Web Page element to open the Serve Web Page window.
3. To prefill the web form with any field information that can be derived from a contact’s B2C Service browser cookie, click the User Identification tab.
   a. Select Other Credentials.
   b. Select the Cookie check box to enable browser cookie identification.
   Note: Prefilled field values override any common values set by the cookie.
   c. Select the Email Click-Through Parameters check box to enable parameters passed in the URL.
4. Click the Web Page tab and click Copy URL.
   a. Click OK to acknowledge that the web page URL has been copied to the clipboard.
5. Click OK to close the window.
6. If you have not already launched the campaign or survey, click Launch on the Home tab.
   a. Click OK to launch and save.
7. Open a new web browser and paste the web page URL into the browser address field.
8. Append parameters to the URL to define which fields you want to prefill. See How You Append Field Parameters.
   a. Submit the URL in your web browser and confirm the fields are prefilled as you want.
9. Copy the updated URL from the browser address field and publish the link to your designated external sources.

How You Append Field Parameters

Every field in a web form is associated with a parameter that can be passed a value in the web page URL, and multiple parameters may be passed at the same time to define multiple field values.

To define a prefilled value for a specific field, append its parameter to the web page URL in the following format:

```
/wf_2_<field_ID>/<prefill value>
```

Each field parameter contains a unique field ID. You can view custom field IDs on the Custom Fields editor by hovering over each field. For example, if a custom field has an ID of 3, the parameter would be:

```
/wf_2_3/<prefill value>
```

Default contact fields also have unique field IDs. For example, if you select the Country field, which has an ID of 100022, the parameter would be:
### Field Name | Field       | Field ID |

</tbody>
</table>

**Note:** For descriptions of these fields, click **Configuration** on the navigation pane, expand **Database**, and then double-click **Data Dictionary**.

The prefill values that can be passed in a parameter depend on the field type. All database contact fields and contact custom fields are one of the following types.

- **Text Field or Text Area**—The value of a text field or text area is expressed in the URL as text. Append the text you want as the value of the field, and the field prefills with that text. For example, to prefill the Postal Code field with the text “59771,” append that value to the field parameter as follows:

  `/wf_2_100024/59771`

- **Integer**—The value of an integer field is expressed in the URL as an integer. Append the integer you want as the value of the field, and the field prefills with that integer. For example, to prefill a custom field (ID 301) with the number “5,” append that value to the field parameter as follows:

  `/wf_2_301/5`

- **Menu**—The value of a menu field item is expressed in the URL as a unique ID number. (Menu item IDs can be obtained by viewing the source code of the form in a web browser.) Append the ID of the menu item to prefill the field with the text of that menu item. For example, to prefill the State/Province field with “MT,” append its menu item ID value to the field parameter as follows:

  `/wf_2_100023/32`

- **Radio or Opt-in**—The value of a radio or opt-in field is expressed in the URL as 0 for a “No” value or 1 for a “Yes” value. Append either 0 or 1 and the No or Yes radio button will be selected. For example, to select the Yes radio button on the Global Opt-in field, append “1” to the field parameter as follows:

  `/wf_2_100025/1`

- **Date or Date/Time**—The value of a date or date/time field is expressed in the URL in a special time format. Append the formatted value to prefill the field with the equivalent date or date/time. Use the following formats to pass values to date and date/time fields:

  `<Year>–<Month>–<Day>T`
  `<Year>–<Month>–<Day>T<hour>:<minute>`

For example, to prefill a custom date field (ID 320) with the date “November 1, 2005,” append “2005-11-01T” to the field parameter as follows:

  `/wf_2_320/2005-11-01T`

Or, to prefill a custom date/time field (ID 320) with the date and time “November 1, 2005, 3:32 PM,” append “2005-11-01T15:32” to the field parameter as follows:

  `/wf_2_320/2005-11-01T15:32`
| Note: | Remember to include the “T” after the date when declaring a value in date or date/time format. |

You can prefill multiple fields on a form at the same time by appending multiple parameters to a single URL, separated by slashes. This image shows a URL that has been modified to prefill three fields: State, Country, and a service provider custom field.

![Image of prefilled form fields](image.png)

To prefill these fields, the following three parameters were added to the end of the URL:

- `/wf_2_100023/32`—The State field is assigned the numeric ID value of 32 for the menu option “Montana.”
- `/wf_2_100022/1`—The Country field is assigned the numeric ID value of 1 for the menu option “U.S.”
- `/wf_2_3/985`—The custom service provider field is assigned the numeric ID value of 985 for the menu option “Technicomm.”

**Web Form and Survey Security**

When customers submit information to websites, it is common to verify the information originates from a human rather than a bot (an automated software program) being run for malicious purposes.

B2C Service provides web form and survey security that automatically requires human validation when abuse is suspected. For example, when a standard action is performed repeatedly in a short amount of time.

Validation is accomplished through the use of a CAPTCHA, a dialog containing distorted words that the customer is asked to type. When the words are typed correctly, a human is assumed to be on the client side. After customers have correctly entered a CAPTCHA, they are not asked for verification again as long as the visit has not ended or does not exceed an hour.

| Note: | Because CAPTCHA runs behind the scenes, it is presented to the customer only when a web form or survey displays and requires the customer to type data and submit it to the system. |
External Suppression List

Overview of the External Suppression List

In addition to the global suppression list applied across all B2C Service sites, you can use the external suppression list to define a site-specific list of email addresses that are excluded from mailings and surveys.

When a mailing or survey is sent or launched, the audience is automatically checked against both the global and external suppression lists and email is not sent to contacts with an email address on either list. This can help you ensure that certain addresses are consistently excluded from marketing and survey communications even if those contacts have not explicitly opted out.

**Note:** The global suppression list supplements your site-specific external suppression list to exclude a list of known SPAM addresses and invalid (or mistyped) domains. Although the external suppression list is honored by default, you can configure individual surveys and mailings to ignore the external suppression list and send to all audience members instead. Keep in mind that the global suppression list is always honored. See Define the Broadcast Mailing Audience and Define the Broadcast Survey Audience.

Create or Edit an External Suppression List

You can create the external suppression list by adding email addresses individually or uploading a list of multiple addresses from a file.

You can also replace the current list with a new list or remove specific email addresses from the suppression list if you decide you now want to send mailings or surveys to those addresses.

**Note:** The list of email addresses you use to append to the existing external suppression list or to replace it must be a .txt document with a separate email address on each line.

The following procedure assumes that the External Suppression List component has been added to your navigation list.

1. Click Configuration on the navigation pane.
2. Expand Outreach, and then double-click External Suppression List.
   
   The External Suppression List editor displays on the content pane.
3. To append a list of addresses to the external suppression list, click Append to List on the ribbon. A window opens to let you browse to the folder that contains the file you want to append.

   **Note:** Practical limitations can cause the upload process to time out after five minutes. If you have difficulty uploading a large file, split the data into multiple files and upload them instead. For more about file size limitations, see Answer ID 280 on our support site.

   a. Select the .txt file you want to append or type its path and name in the **File Name** field.
   b. Click Open.
      
      A message lets you know that the upload was successful.
   c. Click OK.
   d. Click the Search icon to the right of the Search the External Suppression List field.
      
      The email addresses in the file display in the Records Found section.
4. To add an individual email address to the external suppression list, enter the email address in the **Add to the External Suppression List**.
   a. Click the **Add Email** icon to the right of the field.
   b. Click the **Search** icon to the right of the Search the External Suppression List field.
   The new email address displays in the Records Found section.
5. To replace the existing suppression list with a different list, click **Replace List** on the ribbon. A window opens to let you browse to the folder that contains the file you want to replace the list with.
   a. Select the .txt file you want to replace the existing list or type its path and name in the **File Name** field.
   b. Click **Open**. A message asks you to confirm that you want to replace the list.
   c. Click **Yes** to confirm.
   d. Click the **Search** icon to the right of the Search the External Suppression List field.
   The Records Found section now displays only the email addresses in the file you selected.
6. To delete individual email addresses in the external suppression list, search for the addresses you want to delete. See **Search the External Suppression List**.
   a. Select the check box next to each email address you want to delete.
   b. Click **Delete** on the ribbon. A message asks you to confirm that you want to delete the selected addresses.
   c. Click **Yes** to confirm.
   The Records Found section is refreshed to remove the addresses you deleted.
7. To delete all email addresses in the external suppression list, click **Delete All** on the ribbon. A message asks you to confirm.
   a. Click **Yes** to confirm.
   A message lets you know all email addresses were successfully deleted.
   b. Click **OK**.

**Search the External Suppression List**

Before you can remove individual email addresses from the external suppression list, you need to select them, which means you must display them on the editor by searching for them. You might, for example, want to search for and delete all email addresses with a specific domain.

1. Click **Configuration** on the navigation pane.
2. Expand **Outreach**, and then double-click **External Suppression List**.
   The editor displays on the content pane.
3. Select the type of search you want from the **Like** drop-down menu.

<table>
<thead>
<tr>
<th>Search Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Like</td>
<td>The search returns email addresses that contain the search term you enter. For example, typing and returns the following results: <a href="mailto:jim.anderson@example.com">jim.anderson@example.com</a>, <a href="mailto:sandy._johnson@example.net">sandy._johnson@example.net</a>, and <a href="mailto:jsmith@example.net">jsmith@example.net</a>.</td>
</tr>
<tr>
<td>Ends With</td>
<td>The search returns email addresses that end with the search term you enter. Use this option to find all email addresses at a specific domain, such as example.com.</td>
</tr>
<tr>
<td>Exact Match</td>
<td>The search returns email addresses that exactly match the search term you enter.</td>
</tr>
<tr>
<td>Starts With</td>
<td>The search returns email addresses that begin with the search term you enter.</td>
</tr>
</tbody>
</table>

4. Enter your search term in the text field. Leave this field blank to return all email addresses in the list.
5. Click **Search**.
The number of matching records and the returned email addresses display in the Records Found section.

6. To select one or more email addresses to remove from the external suppression list, do one of the following:
   - Select the check box next to each email address.
   - Select the **Select All** check box if you want to remove all of the addresses in the Records Found field.

**Download the External Suppression List**
You can download your external suppression list and save it to a text file on your local workstation.

1. Click **Configuration** on the navigation pane.
2. Expand **Outreach**, and then double-click **External Suppression List**.
The editor displays on the content pane.
3. Click **Download List** on the ribbon.
   A window opens where you can browse to the folder where you want to save the file.
4. Enter the file name in the **File Name** field or select an existing file to overwrite it.
5. Click **Save**.
   A confirmation message lets you know the download was successful and asks if you want to open the file.
6. Click **Yes** or **No** to close the download confirmation.
   If you click Yes, the file opens.

---

**Outreach Mailings**

**Overview of Mailings**

Outreach provides a centralized, intuitive method of sending emails to specific audiences.

You can create messages using text and HTML documents, and choose contact lists and segments to be included in or excluded from the mailing. Mailings can then be sent all at the same time or at different times determined by specific criteria or transactional events.

Outreach also provides extensive tools for proofing and testing mailings. You can send mailings to one or more people for approval and track the status of their review. You can also send mailings to smaller subsets of the defined audience and view analytics regarding how many emails sent to the subset bounced or were opened, clicked though, replied to, or unsubscribed to. This lets you fine-tune the mailing before broadcasting it to the entire audience, and also lets you determine how effective it was after the entire broadcast.

How Mailings Work

You can target and email different groups of your customers. When you create a mailing, you define the content of the message and the group of customers who will receive it.

You can include and exclude a total of fifty contact lists or segments of contacts from your mailing. You can also send test mailings and proofs before committing to a final email.

There are two types of mailings you can create, distinguished by delivery method.

- **Broadcast mailings** are used to send a message to a specified audience at a time you choose.
- **Transactional mailings** are event-triggered, so the email is sent when actions you define occur, such as a campaign action or a rule action.

This flowchart shows how the processes for creating and sending a broadcast mailing are different from a transactional mailing.
Note: The following procedure assumes that you access the Mailings explorer from the Mailings navigation list. However, this explorer may reside in a different navigation list.

1. Click Mailings on the navigation pane and double-click Mailings Explorer.
The Mailings explorer opens on the content pane.

2. **Click New.**

A new mailing opens on the content pane.

**Tip:** You can also create a mailing from an open mailing by clicking New. Additionally, if your navigation set is configured to add mailings from the file menu, click **File > Mailing**. See **Overview of Navigation Sets**.

3. To create a broadcast mailing (the mailing method selected by default), see **Create a Broadcast Mailing**.
4. To change to a transactional mailing, see **Change the Mailing Method**. Then, to create the transactional mailing, see **Create a Transactional Mailing**.

**Mailing Delivery Statuses**

Delivery status indicates the current state of the mailing as it progresses through the distribution process.

Your broadcast and transactional mailings must follow certain steps that are defined by the mailing delivery status.

This table describes the delivery statuses for broadcast and transactional mailings and indicates whether the status is set by a staff member action or updated automatically by the system.

<table>
<thead>
<tr>
<th>Status</th>
<th>Survey Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>Broadcast</td>
<td>This is the preliminary status of a mailing. When a mailing is created, it is automatically set to the Draft status. The status reverts to Draft if a staff member unschedules the mailing.</td>
</tr>
<tr>
<td></td>
<td>Transactional</td>
<td></td>
</tr>
<tr>
<td>Scheduled</td>
<td>Broadcast</td>
<td>This status indicates a mailing is ready to be sent at a scheduled date and time. When a staff member selects the send time, the mailing is automatically set to the Scheduled status.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Launched</td>
<td>Transactional</td>
<td>This status indicates a mailing has been launched and can be included in a rule or campaign. Staff members launch a mailing by clicking the Launch on the Delivery tab.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>A launched mailing cannot be edited. However, you can suspend the mailing message, make edits, and then re-launch it. See <strong>Suspend a Transactional Mailing</strong>.</td>
</tr>
<tr>
<td>Recurrence Scheduled</td>
<td>Broadcast</td>
<td>This status indicates a mailing is scheduled for recurring runs. When a staff member selects a recurrence pattern, the mailing is automatically set to the Recurrence Scheduled status.</td>
</tr>
<tr>
<td>Preparing to Send</td>
<td>Broadcast</td>
<td>This status indicates a mailing is about to be sent. The status changes to Preparing to Send when a staff member clicks Send Now.</td>
</tr>
<tr>
<td>Sending</td>
<td>Broadcast</td>
<td>This status indicates a mailing is currently being sent to customers. The system automatically sets the mailing status to Sending after the mailing is done preparing to send or at the date and time the mailing is scheduled to send.</td>
</tr>
</tbody>
</table>
### Status, Survey Type, Description

<table>
<thead>
<tr>
<th>Status</th>
<th>Survey Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Suspended</td>
<td>Broadcast</td>
<td>This status indicates a mailing is temporarily suspended from the Sending or Scheduled status. Staff members can change the status to Suspended by clicking Suspend on the Delivery tab.</td>
</tr>
<tr>
<td></td>
<td>Transactional</td>
<td></td>
</tr>
<tr>
<td>Suspended by Error</td>
<td>Broadcast</td>
<td>This status indicates a mailing encountered an error and was suspended by the system.</td>
</tr>
<tr>
<td></td>
<td>Transactional</td>
<td></td>
</tr>
<tr>
<td>Canceled</td>
<td>Broadcast</td>
<td>This status indicates the survey was manually canceled. Staff members can cancel a mailing by clicking Cancel Mailing on the Delivery tab.</td>
</tr>
<tr>
<td></td>
<td>Transactional</td>
<td>A canceled mailing can no longer be modified or sent. However, it can be copied to a new mailing, and the copy can be modified and sent.</td>
</tr>
<tr>
<td>Completed</td>
<td>Broadcast</td>
<td>This status indicates a mailing was sent. The system automatically sets a mailing status to Completed from the Sending status.</td>
</tr>
</tbody>

### Mailing Management

When creating or editing a mailing, the Summary tab provides a variety of mailing management functions, including changing the mailing method, adding notes, and adding tasks.

- **Changing the mailing method**—Once you create a mailing, you can change its mailing method type. The mailing methods available are Broadcast and Transactional. Broadcast mailings with recurrence activated are shown as Recurring Broadcast.

- **Adding notes**—You may want to add notes to a mailing that are not sent to audience members. You can use notes to provide additional information about the mailing that can be viewed by staff members as they are working with the mailing.

- **Adding tasks**—You can assign new or existing tasks to mailings and edit, delete, and forward tasks to other staff members. You can also view each task associated with the mailing.

Other common functions available from the Summary tab include the ability to add file attachments or view the audit log to see when the mailings were created and edited and when mailing delivery statuses were changed.

### Change the Mailing Method

After you create a mailing, you can change its mailing method type.

You can switch mailing methods only when the delivery status of the mailing is Draft, Suspended, or Error and no emails have been sent. See *Mailing Delivery Statuses*.

1. On the Summary tab of an open mailing, click **Change** next to Mailing Method.

   The **Select Mailing Method** window opens.
2. Select **Broadcast** or **Transactional**.
3. Click **OK**.

The mailing changes to the method you selected.

**Add a Note to a Document, Mailing, or Survey**

You can use notes to provide additional information about the content that can be viewed by staff members as they are working with the document, mailing, or survey.

1. On the Summary tab of an open document, mailing, or survey, click the **Notes** tab.
2. Click **Add**.
3. Enter the note text in the text field.
4. To sort the notes by ascending or descending date, click the **Sort** drop-down menu and select the sort option.
5. To edit an existing note, click **Edit** next to the note.
6. To permanently delete a note, click **Delete** next to the note.

**Add a Task to a Mailing**

You can assign new or existing tasks to mailings and edit, delete, and forward tasks to other staff members. You can also view each task associated with the mailing.

1. On the Summary tab of an open mailing, click the **Tasks** tab.
2. Enter field information.

<table>

### Create a Broadcast Mailing

You can create a broadcast mailing if you want to email a group of contacts in your knowledge base. Broadcast mailings are sent to an audience you define.

The content of the email can be added as you create the mailing, or by using a previously defined document. See [Create a Document](#). You can also choose to market test your mailing by sending different message content to subsections of your audience.

**Note:** The delivery of broadcast mailings can be impaired by factors beyond the scope of Outreach. Contact your account manager for steps you can take to optimize your message delivery and to improve delivery and participation rates.

1. From the Mailings explorer, click **New**.
   A new broadcast mailing opens on the content pane.
   By default, the Summary tab is active. From here, you can review general information about the mailing in the At a Glance section, as well as manage mailing notes, tasks, and attachments. As you create the mailing, you move through each tab to complete the mailing elements.

   **Note:** You can also add custom tabs to your mailings. Custom tabs give you quick access to elements you frequently use in your mailings. See [Add a Custom Tab to Mailings](#).

2. To assign the mailing to another staff member (by default, the mailing is assigned to the staff member who creates it), click the **Assigned** drop-down menu and select the staff member.

   **Tip:** Wildcards are supported when searching staff members. You can search strings that include a space by entering `%Space+character`, which is helpful when searching last names. For example, entering `%Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so entering `b` in the Find field returns all items containing the letter b.

   a. To search for a staff member, enter the staff member's name in the **Find** field.

3. Click the calendar in the Planned Launch field to select a date for the launch.
   This field is for planning purposes only. The email is not sent on this date.

4. Click the links in the At a Glance section to perform common mailing functions.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailing Method</td>
<td>This field displays the mailing method currently selected for the mailing. Click Change to change the method. See <em>Mailing Management</em>.</td>
</tr>
<tr>
<td>Market Testing</td>
<td>This field displays the market testing mode of the mailing. Click Change to change market testing modes. See <em>Activate Market Testing in Broadcast Mailings</em>.</td>
</tr>
<tr>
<td>Audience Count</td>
<td>This field displays the most recent audience count and the time and date it was performed. Click Refresh to perform an updated count. To view the details of the count, click Details. See <em>View Audience Count Details in Mailings</em>.</td>
</tr>
<tr>
<td>Message</td>
<td>Click Preview to preview the mailing.</td>
</tr>
<tr>
<td>Proofing</td>
<td>This field displays the cumulative number of proofs that have been sent, approved, and rejected. Click Send Proof Message to send a proof. See <em>Send a Proof</em>.</td>
</tr>
<tr>
<td>Delivery Status</td>
<td>This field displays the delivery status of the mailing and the number of emails sent and delivered. See <em>Access Broadcast Mailing Delivery Options</em>.</td>
</tr>
</tbody>
</table>

5. Click the **Audience** tab to define an audience for the mailing.
6. Click the **Message** tab to create the email sent to the mailing audience. See *Create a Message in Broadcast Mailings*.
7. Click the **Proofing** tab to send a proof of the mailing for internal review before sending it to the entire audience.
8. Click the **Delivery** tab to select delivery options.
9. Click the **Results** tab to view the report associated with the mailing. See *View Mailing Results*.

**Note:** If your application is configured with custom tabs for mailings, they display after the Results tab.

10. To spell check the mailing, click **Spelling**.
11. Click **Save**.
    
    The **Save As** window opens.
12. Select the folder you want to save the mailing in and enter the name of the mailing in the **Name** field.
13. Click **Save**.

### Define the Broadcast Mailing Audience

You specify the audience your broadcast mailing will be sent to from the Audience tab.

You can include and exclude a total of fifty contact lists and segments, each containing a vast number of contacts. For example, you could include twenty-two segments of contacts and exclude twenty-eight contact lists for a total of fifty lists. You can also restrict the scope of your audience, set mailing frequency and recency limits, and specify how to handle global opt-in and suppression options. See *Overview of Audiences*.

1. From an open mailing, click the **Audience** tab.
2. To include a list in the audience, click **Add Contact List** in the Included section. The **Select Contact List** window opens.
a. To add a contact list, click **New Contact List** and see **Add a Contact List**.
b. Select the list you want to include in the mailing audience and click **OK**.
   The list is added to the Included grid. Contacts belonging to the list will receive the mailing unless they are in an excluded segment or list.
3. To include a segment in the audience, click **Add Segment** in the Included section. The **Select Segment** window opens.
a. To add a segment, click **New Segment** and see **Create a Segment**.
b. Select the segment you want to include in the mailing audience and click **OK**.
   The segment is added to the Included grid. Contacts belonging to the segment will receive the mailing unless they are in an excluded segment or list.
4. To include a list in the audience, click **Add Contact List** in the Excluded section. The **Select Contact List** window opens.
a. Select the list you want to exclude from the mailing audience and click **OK**.
   The list is added to the Excluded grid. Contacts belonging to the list will not receive the mailing.
5. To exclude a segment from the audience, click **Add Segment** in the Excluded section. The **Select Segment** window opens.
a. Select the segment you want to exclude from the mailing audience and click **OK**.
   The segment is added to the Excluded grid. Contacts belonging to the segment will not receive the mailing.
6. To edit a list or segment that is included in or excluded from the mailing, click **Open** next to the list or segment name. See **How Contact Lists Work**.
7. To remove a list or segment from the Included or Excluded sections, click **Remove** next to the list or segment name.
8. Enter field information to set communication options.

<table>
<thead>
<tr>

<tr>
<td>Limit delivery to a randomly selected subset of the audience</td>
<td>Select this check box to send the mailing to a subset of the audience. Enter a percentage or use the up and down arrows to select a percentage of the audience to send the mailing to.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Allow delivery of messages to multiple contacts sharing the same email address</td>
<td>Select this check box to send messages to multiple contacts sharing the same email address. If this check box is cleared, the message is sent only to the contact most recently updated. This option is available only when email address sharing is enabled. See Email Address Sharing.</td>
</tr>
<tr>
<td></td>
<td><strong>CAUTION:</strong> Because duplicate messages sent to a single address are a common characteristic of spam, you should select this check box only when necessary. When the check box is selected and you attempt to schedule or send a mailing, survey, or proof, and duplicate email addresses exist in your audience, a message warns you that your reputation as a bulk email sender may be adversely affected and impact your ability to send future communications.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Exclude from audience if previously sent</td>
<td>Select this check box to exclude contacts from the audience who were previously sent a message from the same mailing. This option applies only to recurring mailings. Contacts excluded in this manner are also excluded from the audience count. See Add or Edit a Recurring Schedule for a Broadcast Mailing.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
9. To count the number of contacts who will receive the mailing, click **Refresh** in the Current Count section. After the audience has been counted, the last count also displays in this section.

10. To view the details of an audience count, click **Details** in the Current Count section after the count has been performed.
Frequency and Recency Limits

There are several settings that let you limit the number of emails your customers receive through mailings and surveys. Two of the settings limit the frequency and recency of email communication with your customers.

Frequency limits let you control the frequency at which your customers receive email from your organization—in other words, how often an email will be sent to your customers. Recency limits let you define the number of days that pass between the emails that you send. Frequency is set using the Limit Frequency of Communication check box and recency is set using the Limit Recency of Communication check box, both accessed on the Audience tab of your mailing or survey. For specific details about defining these settings, see the Options Section table in the procedure about defining your audience.

- **Frequency and recency settings apply to the sending of email.** These settings are not impacted by survey completion, views, or clicks. Following are two examples that demonstrate this point.
  - A customer received an email 31 days ago that included a transactional survey. However, the customer just submitted the survey yesterday. If recency on the next mailing is set to 30 days, the customer could receive another email from the system.
  - An agent presents a website link survey in a new browser window at the end of a chat. Since website link surveys are not associated with email, recency limits do not apply to this survey.

- **Frequency and recency settings apply to emails sent from both Outreach and Feedback** and cannot be applied to only one product area. For example, suppose you have a rule to send a transactional survey after an incident is solved. Also suppose you add an Outreach broadcast mailing with frequency limited to no more than two messages in the last seven days. Now, one of your customers has two incidents: one solved on Monday and the other solved on Tuesday. If the broadcast mailing is scheduled for future delivery on Thursday, the customer will not receive the Outreach email sent by the mailing because of the two Feedback surveys emailed earlier in the week.

- **The system checks for frequency and recency limits at the time the email is sent.** The system performs frequency and recency checks at the scheduled mailing or survey time. (The system also checks for custom logic such as any segments or business rules at this time.)

View Audience Count Details in Mailings

You can view the audience count to see how the count is calculated. You can see the included and excluded lists and segments, along with the number of invalid emails and opt-outs.

You must count your audience before you can view audience count details.

1. Do one of the following:
   - From the Summary tab, click **Details** next to Audience Count.
   - From the Audience tab, click **Details** next to Current Count.

The Audience Count Details window opens.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Lists the name of each segment or contact list included in or excluded from the mailing.</td>
</tr>
<tr>

<td>Lists the number of contacts in each list or segment who are included in or excluded from the mailing.</td>
</tr>
<tr>
<td>Total Audience Size</td>
<td>Lists the net total number of contacts who will receive the mailing.</td>
</tr>
</tbody>
</table>
Create a Message in Broadcast Mailings

From the Message tab, you can activate market testing, specify the mailbox settings for the mailing, the subject of the email, and any URL parameters you want to attach to links in the message.

In addition, you can create either plain text or HTML messages from scratch, from existing content, or by uploading HTML from another site.

1. From an open mailing, click the Message tab.
2. To activate market testing, click the information bar (above the From address field) and select Change Market Testing Mode. See Activate Market Testing in Broadcast Mailings.
3. To change the mailbox sending the message, or the From and Reply-to addresses, click Edit next to the From address. See Customize the Mailing Message Header.
4. Enter the subject of the message in the Subject field.
   For the best practice on creating effective subject lines, see Ensuring that contacts read your message.
5. To add a merge field to the subject, click the Merge Field icon (to the right of the Subject field) and select the field.
   Merge fields add personalized elements to the subject, such as the contact’s first name.
6. To create an HTML message from scratch, click Begin with Blank Content and see How the HTML Editor Works.
7. To create an HTML message by using an existing document, click Choose Existing Content and see Insert Existing Content.
8. To create an HTML message by uploading your own HTML page, click Upload HTML Content and see Upload HTML Content.
9. To create a text version of the message, click the Text tab.
10. To create a text message from scratch, click Begin with Blank Content and see How the HTML Editor Works.
11. To create a text message by copying an existing document, click Choose Existing Content.
12. To create a text message by converting an HTML page to text, click Convert HTML Content and see Convert HTML Content.

CAUTION: The system automatically creates a document containing the content created on the Message tab and stores it in the Automatically Generated folder in the Documents explorer. When you update the document in the mailing, those changes will also be made to the automatically generated copy. In addition, if you make any changes to the copy in the Automatically Generated folder, those changes will also be made to the text on the Message tab in the mailing. See Automatically Generated Folders.

13. To add URL parameters, enter any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.
14. To add a merge field to the URL parameters, click the **Merge Field** icon to the right of the URL Parameters field and select the field. See *Insert a Merge Field to a URL Parameter*.

Customize the Mailing Message Header

If you want to use a different name and email address for your mailing, such as a branded email address, you can do so by customizing the message header.

By default, Outreach uses the name and email addresses specified in the outgoing email settings of your default Outreach mailbox. By customizing the message header, when a recipient views your mailing, the name and email addresses defined in the customized header are used instead of those specified in the default Outreach mailbox.

**Note:** Be sure to regularly monitor mail received by the email addresses specified in your custom message header. If you want replies to your mailing to be converted to incidents in B2C Service, your mail administrator must configure SMTP forwarding from that mail account to an account configured in B2C Service. See *How Mailboxes Work*.

Also note that when an email message cannot be delivered, it usually results in a “bounce” error notification. Bounce notifications are sent to the Envelope From/Bounce Address defined in the outgoing email settings of your Outreach mailbox even if the message header is customized using the following procedure. See *Email Bounce Handling*.

1. On the Message tab of an open mailing, click **Edit** next to the From field.
   
The **Customize From and Reply-To Headers** window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>Click this drop-down menu and select a mailbox to change the mailbox from the default. See <em>How Email Works in Outreach and Feedback</em>.</td>

Best Practices for Using Branded Email Domains

Using email addresses branded with your company domain name can help recipients recognize your organization as the sender, improving deliverability. However, care must be taken to ensure that bounce notifications are processed correctly. Review these recommended best practices when using branded domains to send mailings.

1. Keep the mailbox configuration provided by Oracle—At the time your site was created, an Oracle representative probably helped configure your Outreach mailbox settings using a mail account with an Oracle domain, such as rnmk.com. These settings should be left as is to ensure bounce errors are processed. See Email Bounce Handling.

2. Customize the message header—When creating the mailing message, add your branded email address by customizing the message header. Customizing the message header does not affect bounce processing, but contact replies to your email will be sent to the branded address.

3. Implement email authentication—Implementing a form of authentication for your branded email accounts can help protect your reputation and secure your mail delivery rates. B2C Service supports two forms of authentication.
   - Sender Policy Framework—Sender Policy Framework (SPF) is an email authentication option that designates permitted senders of email originating from your domain, excluding those with mismatched or incorrectly specified SPF records. See Answer ID 2489 on our support site for information about implementing SPF on your site.
   - DomainKeys/DomainKeys Identified Mail—DomainKeys (DK) and DomainKeys Identified Mail (DKIM) are email authentication options that use cryptographic signatures to designate email as originating from an authorized email delivery provider, excluding messages sent from those with unsigned or incorrectly assigned signatures. See Answer ID 2701 on our support site for information about implementing DK and DKIM on your site.

Insert Existing Content

As an alternative to creating a message from scratch, you can base your message on existing content. You can choose to copy content into your message and customize it, or share the content with other surveys and messages that use the document.

1. From the Message tab of a mailing or the Invitation Message tab of a survey, click Choose Existing Content. The Choose Document window opens.

2. Select the document you want to use and click OK. If it is not already in use by another mailing, campaign, or survey, the content is added to your message. Otherwise, the Content Already in Use window opens.
   a. To share the document with the items indicated in the grid, click Share Content.
      When you share a document, you can edit the content of the document, but all other messages that share it are also modified. Likewise, if another staff member edits the document, your message is also modified.
   b. To create a copy of the document, click Copy Content.
      If you edit the copied content, the original document is not affected. Conversely, if the content of the original document is modified, it does not affect your copy of the message.
CAUTION: The system automatically creates a document containing the copied content and stores it in the Automatically Generated folder in the Documents explorer. When you update the document in the mailing or survey, those changes are also made to the automatically generated copy. In addition, if you make any changes to the copy in the Automatically Generated folder, those changes are also made to the content of the mailing or survey. See Automatically Generated Folders.

Upload HTML Content
You can upload an HTML file into your document, template, snippet, mailing or survey to create your message. The HTML document must be stored in a file accessible through your workstation. You cannot access the HTML of a web page.

1. From the HTML tab of a document, the Message tab of a mailing, the Invitation Message tab of a survey, or from a new template or snippet, click Upload HTML Content.
2. Select the HTML file you want to upload.
3. Click Open.

The HTML is inserted in your message.

Convert HTML Content
When creating a text message, you can take HTML content from the HTML message or from an HTML file and convert it to plain text.

You should finalize your HTML content before converting it to text.

1. From the Message tab of an open mailing or the Invitation Message tab of an open survey, click the Text tab and then click Convert HTML Content.
   The HTML to Text window opens.
2. To convert the HTML message to text, select HTML Part.
3. To convert an HTML file to text, select the File On Disk and browse for the file.
4. Click OK.

The converted HTML is added to the text part of your message.

Activate Market Testing in Broadcast Mailings
When creating a broadcast mailing, you can test different content and designs on a subset of your audience by using market testing.

For broadcast mailings, market testing is available in two modes: even split and random sampling.

- **Even split**—This mode sends your test messages to equal portions of your audience. For example, if you created four messages, each message would be sent to twenty-five percent of your audience. In this way, you can test different content and designs for use in future mailings.

- **Random sampling**—This mode sends test messages to a percentage of the audience you specify. After the test messages are sent, you send a final message to remaining audience members. For example, you could send two messages to five percent of your audience each. After determining the most effective message, you would send a final message to any audience members who had not received a test message.

By default, the Message tab is set up without market testing. This means you create and send only one message with the mailing.

1. On the Message tab of an open mailing, click the information bar (above the From address field) and select Change Market Testing Mode.
   You can also access this window on the Summary tab by clicking Change next to Market Testing.
   The Select Market Testing Mode window opens.
2. To send test messages to equal portions of your audience, select **Even Split**. See [Create Messages in Even Split Mode](#).

3. To send test messages to a percentage of your audience, select **Random Sampling**. See [Create Messages in Random Sampling Mode](#).

4. To disable market testing, select **None**.

   **Note:** If you have created more than one test message, the **Select Message To Keep** window opens asking which message you want to use. You must select a message to keep before you can disable market testing.

5. Click **OK**.

### Create Messages in Even Split Mode

When creating messages in even split mode, you define different message content and proofing options for each version of your message. Your audience is split evenly between the messages. The messages are sent at the same time and share delivery options.

1. From the Select Market Testing Mode window, select **Even Split** and click **OK**.

   The Message tab (mailings) or the Invitation Message tab (surveys) displays in even split mode.

   By default, one test message is sent to 100 percent of the audience. From here, you can add more messages, edit messages, send proofs, or view results. From here, you can also see information about each message.

<table>

</tr>
</tbody>
</table>
2. Click New on the toolbar to add a second test message.  
   The Edit Message window opens.
3. Enter the name of the message in the Name field.
4. Enter the subject of the message in the Subject field on the Content tab. See Create a Message in Broadcast Mailings and Create an Invitation Message in Broadcast Surveys.
5. Define any other content or formatting options you may want to test using either the HTML editor or the text editor on the Content tab. See How the HTML Editor Works and How You Create and Edit Text-Only Messages.
6. To send a proof message, click the Proofing tab on the Edit Message window. See Send a Proof.
7. Click OK to save the message.
6. The new message is added to the Message tab (mailings) or the Invitation Message tab (surveys).
8. To open a message for editing, select the message and click Open.
9. To delete a message, select the message and click Delete.
10. To copy a message to create another test message, select the message and click Copy.
   
   **Note:** A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages is not shared with the original test message or subsequent copies. See Automatically Generated Folders.
11. To send a proof of a message, select the message and click Send Proof.
12. To preview the content of a message, select the message and click Preview.
13. To refresh the message statistics, click Refresh.
14. To add URL parameters, enter any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.
15. To add a merge field to the URL parameters, click the Merge Field icon to the right of the URL Parameters field and select the field. See Insert a Merge Field to a URL Parameter.

### Create Messages in Random Sampling Mode

You should use random sampling mode when you want to send a sample of test messages to your audience before determining the best one to use as a final message.

When creating messages in random sampling mode, you define different message content, designs, delivery, and proofing options for each version of your message. After you evaluate the effectiveness of your test messages, you create a final message and send it.

For the best practice on how to handle scheduling, see Scheduling Mailings and Surveys for Market Testing.

1. From the Select Market Testing Mode window, select Random Sampling and click OK.

   By default, one test message is sent to five percent of the audience, and one final message sent to the remainder of the audience. You can add more messages, edit the messages, send proofs, or view results. From here, you can also see information about each message.

<table>
<thead>
<tr>

<td>This column displays the number of times the mailing was replied to.</td>
</tr>
</tbody>
</table>

2. Click **New** on the toolbar to add a second message. The **Edit Message** window opens.
3. Enter the name of the message in the **Name** field.
4. Enter the number or percentage of recipients you want to receive the message in the **Test Audience** field and select **Percent** or **Recipients** from the drop-down menu.
   The percentage of recipients is based on the number of contacts in the audience at the time the mailing is sent.
5. Enter the subject of the message in the **Subject** field on the Content tab. See Create a Message in Broadcast Mailings.
6. Define any other content or formatting options you may want to test using either the HTML editor or the Text editor on the Content tab. See How the HTML Editor Works and How You Create and Edit Text-Only Messages.
7. To send a proof message, click the **Proofing** tab on the Edit Message window. See Send a Proof.
8. Click the **Delivery** tab on the Edit Message window to define the delivery options for the message. See Access Broadcast Mailing Delivery Options or Access Broadcast Survey Delivery Options.
   **Tip:** When sending multiple test cells, we recommend scheduling them to be sent all at one time rather than a few minutes apart. This minimizes any performance impact on your database by sharing audience segmentation processes across all of the sending cells, instead of performing them multiple times.
9. Click **OK** to save the test message.
   The new message is added to the Message (mailings) or the Invitation Message (surveys) tab.
10. To open a message for editing, select the message and click **Open**.
11. To delete a message, select the message and click **Delete**.
Note: You cannot delete the final message.

12. To copy a message to create a new message, select the message and click Copy.
    A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages is not shared with the original test message or subsequent copies. See Automatically Generated Folders.

13. To send a proof of a message, select the message and click Send Proof.

14. To preview the content of a message, select the message and click Preview.

15. To refresh the message statistics, click Refresh.

16. To add URL parameters, enter any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.

17. To add a merge field to the URL parameters, click the Merge Field icon to the right of the URL Parameters field and select the field. See Insert a Merge Field to a URL Parameter.

18. When you are satisfied with your message, you must copy it as your final message and then define delivery options.
    a. Select the message and click Copy To Final.
       The message you selected is copied to the Final Message section of the Message tab (mailings) or the Invitation Message (surveys) tab.
    b. Click OK.
    c. Select the final message and click Open.
       The Edit Message window opens.
    d. Click the Delivery tab on the Edit Message window to define delivery options.

Send a Proof
An important step in creating a mailing or a survey is ensuring the content is approved by the necessary contacts and staff members and as a final check for any mistakes.

You can send a proof to any combination of staff accounts, staff groups, proof lists, distribution lists, and distribution list available addresses, and then view the results of the proof from the Proofing tab. See Add or Edit a Distribution List.

After a reviewer has approved or rejected the proof, the assigned staff member will receive a Mailing Proof Response Notification or a Survey Proof Response Notification. Both notifications can be customized using message templates found in the Administrator Notifications message type under the Outreach or Feedback category respectively. See How You Customize Messages.

Proof surveys and mailings are subject to the following behaviors and limitations.

- If your message contains conditional sections, all conditional sections display in the proof message. However, reviewers see the conditional sections only if they can be mapped to contact records that allow access to those conditional sections.
- If a form on the proof contains an email address field and a reviewer submits a value for the field in the survey preview, a contact record is created or updated so that advanced survey functions can be tested. For this reason, be sure that your reviewers use only test contact addresses to avoid updating production contacts when testing survey proofs.
- To ensure the proofing process does not impact statistics after the mailing or survey has been sent, Outreach and Feedback does not retain data submitted from proof surveys. If you want to submit test responses without impacting specific statistics, you can copy the mailing or survey and test using the copy instead.

For the best practice about sending proofs, see Send Proofs to Key Staff.

1. From an open mailing or survey, click the Proofing tab.
2. Click **Send Proof Message** to select proof recipients. The Send Proof Message window opens.

   **Tip:** From the Summary tab, clicking Send Proof Message opens the Send Proof Wizard where you can select the survey you want to send for a proof, and then follow the wizard as it steps you through the process of sending your message.

3. To create a proof list, click **New Proof List** and see **Add a Contact List**.
4. Enter an email address or the name of a group or proof list in the **Recipients** field.
5. To select proof recipients from a list, click the **Select Recipients** icon (to the right of the Recipients field). The Select Names window opens.
   a. Select a staff member, address, group, or proof list and click **To**.
   b. To find a specific staff member, address, group, or proof list, enter the name in the **Type Name or Select From List** field.
   c. The first item matching the letters you type is selected in the grid.
   d. Click **OK**.
6. Enter any comments you want to appear in the message in the **Comment** text box.
7. To spell check your comments, click the **Spell Check** icon (to the right of the Comment field).
8. To customize your proof message by contact record, which lets your reviewers see how dynamic content will look for a specific contact, click the **Search** icon next to the Preview Contact field on the bottom of the window. The Contact Search window opens.
   a. Enter your search criteria in one or more of the available fields and click **Search**.
   b. Select a contact and click **Select**.
   c. The Contact Search window closes and the contact name you selected populates the Preview Contact field on the Send Message Proof window.
9. Click **Send Proof Message**.

Accept or Reject a Proof Email
After you send a proof, the recipients can accept or reject the mailing or survey content.

The proof email automatically displays a link to a web page where the tester can accept or reject the content. The word “Proof:” is prepended to the message subject. The assigned staff member receives either a Mailing Proof Response Notification or a Survey Proof Response Notification every time a reviewer submits feedback.

1. In a proof email, click the **Submit Your Feedback** link.
   A new window opens where you can make comments and accept or reject the proof.
2. Enter any comments related to the proof mailing or survey in the **Comments for Mailing Organizer** text box.
3. Do one of the following:
   - To approve the mailing, click **Approve**.
   - To reject the mailing, click **Reject**.

   A message displays confirming your submission.

Proof Results
After you have sent the proof message, you can easily check the proof results from the Proofing tab.

The Proofing Results section lists all message proofs that were previously sent for the selected mailing or survey, grouped by date and time. You can see how many times the proof was viewed, who accepted and rejected the proof, and any comments from the proof testers.
<table>

Access Broadcast Mailing Delivery Options

After you have defined the audience, created a message, and sent a proof mailing, you can send the mailing to your customers.

The Delivery tab lets you choose to send the mailing immediately or schedule its delivery for sometime in the future. In addition, you can control the speed of the delivery and access common administration tasks for the mailing.

1. From an open mailing, click the Delivery tab.

The Delivery tab is divided into sections. The Delivery Status section displays the status of the mailing (see Mailing Delivery Statuses) and contains options for controlling the sending of the mailing. You can perform the following tasks from this section.
   - **Send a mailing**—See Send a Broadcast Mailing.
   - **Schedule a mailing, Reschedule a mailing, and Cancel a mailing schedule**—See Schedule a Broadcast Mailing.
   - **Mailing recurrence**—See Add or Edit a Recurring Schedule for a Broadcast Mailing.
   - **Suspend a mailing**—See Suspend a Broadcast Mailing.
   - **Cancel a mailing**—See Cancel a Broadcast Mailing.

The Delivery Options section lets you set options related to sending the mailing. See Send a Broadcast Mailing.

On the bottom of the tab, delivery information about the mailing is available for you to quickly scan and assess in the Delivery Checklist and Message Send History sections.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery Checklist</td>
<td>This section displays the audience count and proof history and provides a link to preview the survey.</td>
</tr>
<tr>
<td>Audience Count</td>
<td>This field displays the most recent audience count and the time and date it was performed. Click Refresh to perform an updated count. See Define the Broadcast Mailing Audience.</td>
</tr>
<tr>
<td>Message Preview</td>
<td>This section contains a link to preview the message that is sent with the mailing. Click Preview to preview the message.</td>
</tr>
</tbody>
</table>
Send a Broadcast Mailing

Broadcast mailings can be sent immediately from the Delivery tab. The status changes to Preparing to Send and then the mailing is sent to your defined audience. After the mailing finishes sending, the status is Completed.

1. On the Delivery tab of an open mailing, enter field information in the Delivery Options section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limit delivery rate to no more than x messages per hour</td>
<td>Select this check box to control the rate of delivery, and then click the drop-down menu to select the number of emails to send per hour when the Limit Delivery Rate check box is selected.</td>
</tr>
<tr>
<td>CC proof audience on send</td>
<td>Select this check box to copy the sent mailing to your proof message recipients. The phrase “Proof Copy:” is prepended to the message subject.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Proof members may receive two messages if they are also part of the audience.</td>
</tr>
</tbody>
</table>

2. Click **Send Now**.
3. Click **Yes** to confirm that you want to send the mailing.

The delivery status changes to Preparing to Send and you can see the delivery progress of the message along with the audience count.

When the mailing finishes sending, the status changes to Completed and the Delivery Status section displays the number of emails sent and delivered.

Schedule a Broadcast Mailing

You can schedule broadcast mailings to be sent on a specified date and time. This lets you coordinate sending a mailing before the actual send date (for example, to coincide with a product launch). When scheduled, the mailing sends automatically.

1. On the Delivery tab of an open mailing, enter field information in the Delivery Options section.
Using B2C Service

Chapter 10
Outreach and Feedback

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limit delivery rate to no more than x messages per hour</td>
<td>Select this check box to control the rate of delivery, and then click the drop-down menu to select the number of emails to send per hour when the Limit Delivery Rate check box is selected.</td>
</tr>
<tr>
<td>CC proof audience on send</td>
<td>Select this check box to copy the sent mailing to your proof message recipients. The phrase “Proof Copy:” is prepended to the message subject.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Proof members may receive two messages if they are also part of the audience.</td>
</tr>
</tbody>
</table>

2. Click **Schedule**.  
The Confirm Schedule Mailing window opens.
3. Enter the date and time you want to send the mailing in the **Time to Send Mailing** field or click the calendar to open a calendar and select the date.
4. Click **OK**.  
The Delivery Status section displays the time and date the mailing is scheduled to be sent.
5. To reschedule the mailing, click **Reschedule**.
6. To cancel a scheduled mailing, click **Unschedule**.

**Note:** Although you do not have to wait until all the test messages are sent before scheduling a final mailing, all of the test messages must be sent before the final mailing can be sent.

Add or Edit a Recurring Schedule for a Broadcast Mailing

Mailing recurrence lets you send broadcast mailings at regular daily, weekly, monthly, or yearly intervals with a number of flexible options.

- You can schedule mailings to run during a specific date range, or set no end date to allow recurrences to run indefinitely.
- You can schedule mailings to run on specific days of the month or specific months of the year.
- You can send a message to each contact in your audience only once or every time the recurrence is initiated.
- You can select the time of day that you want messages to begin sending.

Before setting a recurring schedule, you must first define the audience and the message subject and content. When recurrence has been set, you can click Suspend to suspend recurrences. This saves the recurrence information so it can be edited or reactivated.

Information about past recurrences—such as the time last run, next scheduled runtime, the time the schedule was last updated, and basic results data—is stored in the knowledge base and tracked in the Recurring Mailings Summary report. Also, each recurrence is tracked in the mailing **audit log** along with a description of how many emails were sent.

1. From an open mailing, click the **Delivery** tab.
2. Click **Recurrence**.
   - The **Confirm Schedule Recurrence** window opens.
3. Enter field information.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Recurrence Pattern</strong></td>
<td>Select the weekly or monthly interval when the mailing should be sent. For example, a mailing could be sent every two weeks on Tuesday, or every month on the 7th and 19th.</td>
</tr>
<tr>
<td>Clear All</td>
<td>Click this text to clear all selected recurrence pattern check boxes.</td>
</tr>
<tr>
<td>Monthly</td>
<td>Select this option to display check boxes for the days of the month. You can then select the days of the month when the mailing should be sent.</td>
</tr>
<tr>
<td>Weekly</td>
<td>Select this option to display check boxes for each day of the week. You can then select the check boxes next to the days when you want the mailing to be sent. When you select this option, a Recur drop-down menu displays where you can specify the frequency of the weekly mailing. For example, if you want to send a mailing every week on the days selected, enter 1 in the field. If you want the mailing to be sent every third week on the days selected, enter 3 in the field. This field accepts values from 1 to 99.</td>
</tr>
<tr>
<td>Schedule Specific Months</td>
<td>Click this header to display check boxes for the months of the year. Select the months during which the mailing should be sent. By default, every month is selected, but if you do not want to send during a specific month, you can clear the check box for that month.</td>
</tr>
<tr>
<td>Clear All</td>
<td>Click this text to clear all check boxes for the selected months.</td>
</tr>
<tr>
<td><strong>Range of Recurrence</strong></td>
<td>Options in this section let you specify a date range for the recurrence and time of day at which the mailing is sent.</td>
</tr>
<tr>
<td>Start</td>
<td>Enter the start and end date of the schedule or click the calendar from which you can select the start and end date. The current day is the default start date.</td>
</tr>
<tr>
<td>End</td>
<td></td>
</tr>
<tr>
<td>Time to Send Mailing</td>
<td>Enter the time of day to begin sending the mailing.</td>
</tr>
</tbody>
</table>

4. Click **OK** to save the recurrence settings and return to the Delivery tab.
5. To suspend the recurrence, click **Suspend**.
   a. Click **OK** to confirm you want to suspend the recurrence.
   After recurrence is suspended, you can click Recurrence again to edit or reactivate it.
6. To exclude contacts from the audience that were included in a previous instance of the recurrence, click the **Audience** tab and select the **Exclude From Audience if Previously Sent** check box.

**Note:** By default, a recurring mailing is sent on every recurrence to every contact who matches your audience, even contacts who previously received an instance of the same message. If you want each contact to receive only one instance of a recurring mailing, you need to exclude contacts from the audience that were previously sent to. This is often helpful when sending a one-time offer. For instance, sending a one-time offer to all contacts who have a birthday in the next month.

**Related Topics**
- **Audit Logs**
Suspend a Broadcast Mailing
You may want to stop sending a mailing while it is sending or preparing to send. You can temporarily stop a mailing from sending by suspending it.

1. From the Delivery tab of an open mailing, click Suspend.
   This button appears only when a mailing is in the process of being sent.
2. Click Yes to confirm suspending the mailing.

The status changes to Suspended and the Delivery Status section displays the number of audience members the mailing was already sent and delivered to.

Cancel a Broadcast Mailing
You can cancel a mailing at any time. When you cancel a mailing, the mailing is saved and you can still view mailing results. However, the mailing can no longer be sent or modified.

A canceled mailing can no longer be modified or sent. However, it can be copied to a new mailing, and the copy can be modified and sent. Instead of canceling your mailing, you may want to consider temporarily suspending it. See Suspend a Broadcast Mailing.

1. From the Delivery tab of an open mailing, click Cancel Mailing.
2. Click Yes to confirm that you want to cancel the mailing.

The delivery status changes to Canceled.

View Mailing Results
One of the most important benefits of sending mailings is the ability to analyze the results. With Outreach, you have direct access to a comprehensive dashboard from the Results tab.

You can get up-to-the-minute statistics of mailing results, including the number of clicks, unsubscribes, forwards, and bounces as well as the number of emails sent and delivered.

Note: The email gateway must be activated in order for the Techmail utility to capture bounce data for analytics. See Email Bounce Handling.

1. From an open mailing, click the Results tab.
   The list of standard reports displays.
2. Select a report from the list.
   Tip: When you select a report, the report description displays in the area below the list to help you understand the purpose of the report.
3. Click Go.
   The report opens on a new tab.
4. To view a definition of the report, including its tables, filters, and column descriptions, click Definition on the ribbon and select View. See View a Report Definition.
5. To view the same report for a different mailing, select the mailing from the Mailing drop-down menu at the top of the open report and then click Search.

Customize the Mailing Report List
The mailing report list provides a set of useful standard reports that display results information about the mailing you are editing. However, you can add or remove reports to customize the list.

1. From the Results tab of an open mailing, click Customize List.
   The Customize Mailing Report List window opens.
2. To add a report to the mailing report list, select a report from the Available Items list and click Add.
You can also double-click reports to add them.

3. To search for a report in the Available Items list, click **Find In List** and enter the name (or part of the name) of the report you are looking for.
4. To remove a report from the mailing report list, select the report in the Selected Items list and click **Remove**.
5. To rearrange the order of the reports you are adding, select a report in the Selected Items list and click the up or down arrow.

**Tip:** You can also drag and drop reports to adjust their position.

6. Click **OK** to close the window and update the list.

Added reports display at the bottom of the list.

---

### Create a Transactional Mailing

Transactional mailings let you send a mailing when an event occurs.

You can send the email as part of a campaign. Transactional mailings can also be sent from a contact, opportunity, or incident rule when a creation or update occurs. For example, when an incident is closed, you can send a mailing to the incident contact to notify them of product updates.

1. From the Mailings explorer, click **New**.
   
   A new broadcast mailing opens on the content pane.

   **Tip:** You can also create a mailing from an open mailing by clicking New. Additionally, if your navigation set is configured to add mailings from the file menu, click **File > Mailing**.

2. Click **Change** in the Mailing Method section of the Summary tab.
   
   The Select Mailing Method window opens.

3. Select **Transactional**.

4. Click **OK**.

   By default, the Summary tab is active. From here, you can review general information about the mailing in the At a Glance section, as well as manage mailing notes, tasks, and attachments. As you create the mailing, you move through each tab to complete the mailing elements.

   **Note:** You can also add custom tabs to your mailings. Custom tabs give you quick access to elements you frequently use in your mailings. See **Add a Custom Tab to Mailings**.

5. To assign the mailing to another staff member (by default, the mailing is assigned to the staff member who creates it), click the **Assigned** drop-down menu and select the staff member.
   
   **a.** To search for a staff member, enter the staff member's name in the **Find** field.

   **Tip:** Wildcards are supported when searching staff members. You can search strings that include a space by entering `%+Space+character`, which is helpful when searching last names. For example, entering `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so entering `b` in the Find field returns all items containing the letter b.

6. Click the links in the At a Glance section to perform common mailing functions.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<tr>
<td>Delivery Status</td>
<td>This field displays the delivery status of the mailing and the number of emails sent and delivered.</td>
</tr>
</tbody>
</table>

7. Click the Audience tab to define an audience for the mailing. See Define the Transactional Mailing Audience.
8. Click the Message tab to create the email sent to the mailing audience. See How Messages Work in Transactional Mailings.
9. Click the Proofing tab to send a proof of the mailing for internal review before sending it to the entire audience. See Send a Proof.
10. Click the Delivery tab to select delivery options. See Access Transactional Delivery Options for Mailings.
11. Click the Results tab to view the report associated with the mailing. See View Mailing Results.
   If your application is configured with custom tabs for mailings, they display after the Results tab.
12. To spell check the mailing, click Spell Check on the ribbon.
13. Click Save.
   The Save As window opens where you can select the folder you want to save the mailing in and enter the name of the mailing in the Name field.
14. Click Save.

**Define the Transactional Mailing Audience**

Even though your rules and campaigns determine which customers receive transaction mailings, you still need to define certain audience elements if you want to exclude certain customers or configure opt-out and external suppression list settings.

You can also restrict the scope of your audience, set mailing frequency and recency limits, and specify how to handle global opt-in and suppression options. See Overview of Audiences.

1. From an open mailing, click the Audience tab.
Note: The audience for a transactional mailing automatically includes all contacts who trigger the associated transactional event. For that reason, you can select only who is excluded from the mailing, not who is included in it. You can exclude a total of fifty contact lists and segments, each containing a vast number of contacts.

2. To exclude a list from the audience, click Add Contact List in the Excluded section. The Select Contact List window opens.
   a. To add a contact list, click New Contact List and see Add a Contact List.
   b. Select the list you want to exclude from the mailing audience and click OK.
      The list is added to the Excluded grid. Contacts belonging to the list do not receive the mailing.

3. To exclude a segment from the audience, click Add Segment in the Excluded section. The Select Segment window opens.
   a. To add a new excluded segment, click New Segment and see Create a Segment.
   b. Select the segment you want to exclude from the mailing audience and click OK.
      The segment is added to the Excluded grid. Contacts belonging to the segment will not receive the mailing.

4. To edit a list or segment that is excluded from the mailing, click Open next to the list or segment name.
5. To remove a list or segment from the Excluded section, click Remove next to the list or segment name.
6. Enter field information to set communication options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Honor global opt-in</td>
<td>Select this check box to send the mailing to contacts who did not explicitly opt out of receiving mailings. Clear this check box to send the mailing to all contacts in the audience, regardless of their opt-in preference.</td>
</tr>
<tr>
<td>Limit frequency of communication</td>
<td>Select this check box to set a mailing frequency limit, and then enter a maximum number of mailings and a number of days in which contacts can receive messages before they are excluded from mailings. When the mailing launches, it is not sent to any contacts who have received the maximum number of mailings within the designated time period. For more information about how this setting works, see Frequency and Recency Limits. The minimum you can enter is 2 in the last 1 day. The maximum number of days you can enter is 90. <strong>Tip:</strong> To ensure contacts receive only 1 email every “x” number of days, use the Limit recency of communication setting described in the next entry.</td>
</tr>
<tr>
<td>Limit recency of communication</td>
<td>Select this check box to set a mailing recency limit. Enter the minimum number of days that should elapse before contacts receive another email. When the mailing launches, it is not sent to any contacts who have received a mailing in the past specified number of days. For more information about how this setting works, see Frequency and Recency Limits. The maximum number of days you can enter is 90. The default value is 1 day.</td>
</tr>
</tbody>
</table>
### How Messages Work in Transactional Mailings

From the Message tab, you can activate market testing and specify the mailbox settings for the mailing, the subject of the email, and any URL parameters you want to attach to links in the message.

In addition, you can create either plain text or HTML messages from scratch, from existing content, or by uploading HTML from another site. Creating a message in transactional mailings follows the same procedure as creating a message in broadcast mailings. See [Create a Message in Broadcast Mailings](#).

### Activate Market Testing in Transactional Mailings

When creating a transactional mailing, you can send a sample of test messages to portions of your audience before determining the best one to use as a final message. You can define different message content, designs, delivery, and proofing options for each version of your message.

For transactional mailings, market testing is available in **audience sampling mode**. If more than one message is created when market testing is used, then contacts who are sent the email through a campaign or rule will receive one of the
test messages. When the mailing is launched through a campaign, market testing rotates between the test messages. After you evaluate the effectiveness of your test messages, you create a final message.

2. Select Audience Sampling.
3. Click OK. The Messages tab displays in audience sampling mode.

From here, you can add more messages, edit the messages, send proofs, or view results. You can also see information about each message.

<table>
<thead>
<tr>
<th>Column</th>

</tr>
<tr>
<td>Opened</td>
<td>This column displays the number of unique email recipients who opened the message.</td>
</tr>
<tr>
<td>Clicked</td>
<td>This column displays the number of unique email recipients who clicked a tracked link.</td>
</tr>
</tbody>
</table>
| Unsubscribed| This column displays the number of email recipients who unsubscribed from mailings.  

**Note:** Unsubscribe sets global opt-in in both Outreach and Feedback. See Insert an Unsubscribe Link.

| Replied     | This column displays the number of times the mailing was replied to.        |

4. Click New on the toolbar to add a second test message. The Edit Message window opens.
5. Enter the name of the message in the Name field.
6. Enter the subject of the message in the Subject field on the Content tab. See How Messages Work in Transactional Mailings.
7. Define any other content or formatting options you may want to test using either the HTML editor or the Text editor on the Content tab. See How the HTML Editor Works and How You Create and Edit Text-Only Messages.
8. To send a proof message, click the Proofing tab on the Edit Message window. See Send a Proof.
9. Click the **Delivery** tab on the Edit Message window to access delivery options. See *Access Transactional Delivery Options for Mailings*.

10. Click **OK**.

   The new test message displays on the Messages tab.

11. To open a message for editing, select the message and click **Open**.

12. To delete a message, select the message and click **Delete**.

13. To copy a message to create another test message, select the message and click **Copy**.

   A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages are not shared with the original test message or subsequent copies. See *Automatically Generated Folders*.

14. To send a proof of a message, select the message and click **Send Proof**.

15. To preview the content of a message, select the message and click **Preview**.

16. To refresh the message statistics, click **Refresh**.

17. To add URL parameters, enter any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the **URL Parameters** field.

18. To add a merge field to the URL parameters, click the **Merge Field** icon to the right of the URL Parameters field and select the field. See *Insert a Merge Field to a URL Parameter*.

**Access Transactional Delivery Options for Mailings**

After you have defined the audience, created a message, and proofed the mailing, you can launch the mailing so it becomes active in rules and campaigns. From the Delivery tab, you can launch, suspend, or cancel the mailing, as well as access common administration tasks and see the send history.

1. From an open mailing, click the **Delivery** tab.

   The Delivery tab is divided into sections. The Delivery Status section displays the status of the mailing (see *Mailing Delivery Statuses*) and contains buttons for controlling the sending of the mailing. You can perform the following tasks from this section.

   - **Launch a mailing**—See *Launch a Transactional Mailing*.
   - **Suspend a mailing**—See *Suspend a Transactional Mailing*.
   - **Cancel a mailing**—See *Cancel a Transactional Mailing*.

On the bottom of the tab, delivery information about the mailing is available for you to quickly scan and assess in the Delivery Checklist and Message Send History sections.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message Preview</td>
<td>Contains a link to preview the message that is sent with the mailing. Click Preview to preview the message.</td>
</tr>
<tr>
<td>Proofing</td>
<td>Displays a summary report of message proofs associated with the mailing. Click Send Proof Message to send the message as a proof. See <em>Send a Proof</em>.</td>
</tr>
<tr>
<td>CAN-SPAM Compliance</td>
<td>Displays the results of the CAN-SPAM compliance test. Click Test CAN-SPAM to test the mailing for compliance with the CAN-SPAM Act. Click Details to view the results of a test. See <em>Check Compliance from the Delivery Tab</em>.</td>
</tr>
</tbody>
</table>
Launch a Transactional Mailing

After you launch a mailing, the status changes to Launched. From the Launched status, you can suspend the mailing or cancel it.

Transactional mailings must be launched before they can be used in rules or campaigns.

**Note:** A launched transactional mailing cannot be edited. However, you can suspend the transactional mailing message, make edits, and then re-launch it. See [Suspend a Transactional Mailing](#).

1. From the Delivery tab of an open mailing, click **Launch**.
2. Click **Yes** to confirmation launch of the mailing.

Delivery status changes to Launched and you can see how many mailings were sent and delivered.

Suspend a Transactional Mailing

You may want to stop sending a mailing after it has already been launched. You can temporarily stop a mailing from sending by suspending it.

1. From the Delivery tab of an open mailing, click **Suspend**.
2. Click **Yes** to confirmation suspending the mailing.

The status changes to Suspended and the Delivery Status section displays the number of audience members the mailing was already sent and delivered to.

Cancel a Transactional Mailing

You can cancel a mailing at any time. When you cancel a mailing, the mailing is saved and you can still view mailing results. However, the mailing cannot be launched again or further modified.

A canceled mailing can no longer be modified or sent. However, it can be copied to a new mailing, and the copy can be modified and sent. Instead of canceling your mailing, you may want to consider temporarily suspending it. See [Suspend a Transactional Mailing](#).

1. From the Delivery tab of an open mailing, click **Cancel Mailing**.
2. Click **Yes** to confirm that you want to cancel the mailing.

The delivery status changes to Canceled.

Add a Custom Tab to Mailings

Custom tabs give you quick access to elements you use frequently in your mailings.

For example, if you use images in your mailings, you could add a tab with a URL link to the place where your images are stored. Likewise, if you use a web-based email deliverability tool (or any other type of web-based program), you could link to those programs.
You can also use merge fields in your custom tab to include attributes of the mailing in query string parameters or URL redirect links. See Insert a Text Merge Field and Edit Redirect to URL Attributes. Custom tabs display after the Results tab on the mailings editor.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click Configuration Settings.
   The Search window opens.
3. Clear the Select All check box under Folders, select the RightNow User Interface check box, and click Search.
   The Configuration Settings editor opens.
4. Double-click the MAILING_EDITOR_TABS setting in RightNow User Interface/Miscellaneous/General to open the setting on the content pane.

   **Tip:** To display configuration settings in alphabetical order, click in the Key column header.

5. To add a URL link to your custom tab, enter the label name and the associated link in the Value field using the following syntax: (tab("<label name>",<URL>))
6. To add a merge field, enter the following sample code in the Value field: (tab("Revenue",http://oracle.com/revenue?report.php?mailing=$mailing.mailing_id))
7. To add more than one custom tab, press Enter to begin a separate line, and repeat steps 5 and 6.
8. Click Save.

Your custom tab displays next to the Results tab on every new and existing mailing after you log out and then log back in.

**CAN-SPAM Compliance**

B2C Service helps you identify CAN-SPAM compliance issues. When creating a mailing or survey with a message, the system automatically checks that the message contains a physical address, an unsubscribe link, and honors global opt-in preferences. Remaining requirements must be manually verified by the mailing or survey designer.

Legal definitions and penalties for spam vary among countries. Therefore, it is important to stay abreast of current and pending legislation in the United States and other countries. There are many sites that you can check to stay current with the laws and to make sure your site is compliant.

The CAN-SPAM Act of 2003 (CAN-SPAM) requires that organizations adhere to certain rules when sending commercial emails. Included in the requirements are the following conditions:

- Email does not contain false or misleading header information.
- Email does not use a deceptive subject line.
- Email contains a way for recipients to opt out of all emails, not just specific types.
- Email does not send to contacts that have previously opted out.
- Email must be identified as an advertisement in the subject line.
- Email includes the sender’s physical mailing address, which must display in ASCII text.
- Email that contains adult content is identified as such in the subject line.
- Email does not send to harvested or generated email addresses.
- Email does not send to domains in the Federal Communications Commission (FCC) wireless domain list.

**Note:** The checklist is used to gauge your compliance with CAN-SPAM. You should use this checklist in conjunction with and not as a replacement for legal counsel.
You can check for CAN-SPAM compliance from the Message tab of a mailing, the Invitation Message tab of a survey, and the Delivery tab of a mailing or survey.

For information about the CAN-SPAM Act, see the Federal Trade Commission (FTC) website.

Related Topics
- Check Compliance from the Invitation Message Tab
- Check Compliance from the Message Tab
- Check Compliance from the Delivery Tab

Check Compliance from the Message Tab
Testing for CAN-SPAM compliance issues can be accessed from both the Message and the Delivery tabs in a mailing.

The system automatically checks that the message contains a physical address and an unsubscribe link, and honors global opt-in preferences. The remaining requirements must be manually verified by the staff member creating the mailing. For best practices related to mailings, see Improving your email marketing.

1. From the Message tab of an open mailing, do one of the following:
   - Click Test CAN-SPAM in the Content section of Tasks on the HTML editor.
   - From the Delivery tab, click Test CAN-SPAM in the Delivery Checklist section.

The CAN-SPAM Compliance Report opens.

The report shows whether each system-verified requirement passed or failed. The manually verified requirements can be selected or cleared based on your manual verifications.

<td>This section lets you preview the following parts of a mailing.</td>
</tr>
</tbody>
</table>
Check Compliance from the Delivery Tab

You can check for CAN-SPAM compliance issues from the Delivery tab of a mailing or survey. You can also test CAN-SPAM compliance from the Message tab of a mailing or the Invitation Message tab of a survey.

The system automatically checks that the message contains a physical address and an unsubscribe link, and honors global opt-in preferences. The remaining requirements must be manually verified by the staff member creating the mailing or survey.

1. Open a mailing or survey and click the Delivery tab.
2. Click Test CAN-SPAM in the Delivery Checklist section.

The CAN-SPAM Compliance Report opens.

The report shows whether each system-verified requirement passed or failed. The manually verified requirements can be selected or cleared based on your manual verifications.

<table>

3. To view a read-only copy of the results from the last time CAN-SPAM compliance was tested, click Details next to CAN-SPAM Compliance on the Delivery tab.

Outreach Campaigns

Overview of Campaigns

Outreach provides a powerful solution for building and managing dynamic, multiple-step marketing campaigns. Using the intuitive campaign designer, you can create your campaign as a flow diagram comprised of a series of conditional elements that can trigger a variety of business processes.

Based on criteria you define, your campaign can send mailings, add contacts to lists, create incidents and opportunities, notify staff, and perform many other useful actions. In addition, you can define a budget and predict your return on investment. After your campaign is launched, you can review its results and compare them against your estimates to evaluate the effectiveness of your design.

When creating and editing a campaign, you perform most tasks using the ribbon, canvas, and campaign components. These tools provide all of the resources you need to design and launch any campaign, simple or complex.
The campaign design ribbon includes three standard tabs (Home, Insert, and View) and two contextual tabs (Element Tools and Path Tools) that become visible when an element or connector is selected. Each tab has one or more groups containing buttons for modifying the campaign or elements on the canvas.

The Home tab gives you access to options that impact the entire campaign. For example, you can manage campaign details, review results, create tasks, select element types, and validate, launch, and suspend the campaign.

<table>

<td>Components can also be accessed from the toolbox.</td>
</tr>
</tbody>
</table>

Campaign Design Ribbon View Tab
The View tab provides access to the component toolbox and options for changing your view of the design canvas.

You can change the view of the design canvas from the View tab, including displaying design grid elements and adjusting the zoom level. These options make it easier to review and edit your flow diagram.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Campaign Components</td>
<td>Click this button to display the toolbox.</td>
</tr>
<tr>
<td>Canvas</td>
<td>The check boxes and drop-down menu in this group let you select canvas options.</td>
</tr>
<tr>
<td>Labels</td>
<td>Select this check box to display labels for elements in the diagram.</td>
</tr>
</tbody>
</table>
### Group/Button | Description
--- | ---
Connectors Labels | Select this check box to display labels for connectors in the diagram. Labels display by default.
Validation Results | Select this check box to display validation icons in the diagram.
Grid | Select this check box to display the canvas grid.
Grid Size | Click this drop-down menu to select the size of the canvas grid.
Zoom | The buttons in this group let you select a zoom level for the canvas.
Zoom | Click this button to access the Zoom Options window. See Set Zoom Options.
100 Percent | Click this button to view the canvas at its normal size.
Fit to Screen | Click this button to adjust the zoom level to show all elements.
Extents | Click this button to show the entire canvas.

### Set Canvas Options
You can set canvas options that are available from the View tab on the campaign design ribbon.

1. To display labels for elements on the canvas, select the Labels check box.
2. To display labels for connectors on the canvas, select the Connector Labels check box.
3. To display validation results on the canvas, select the Validation Results check box. See Campaign Validation.
4. To display the canvas grid, select the Grid check box.
5. To change the size of the canvas grid, click the Grid Size drop-down menu.

### Set Zoom Options
You can set zoom options that are available from the View tab.

1. Click Zoom on the View tab.
   The Zoom Options window opens.
2. To specify a desired zoom level, select an option in the Zoom To section.
   a. To adjust the zoom level to show all components, select Fit to Screen.
   b. To show the entire canvas, select Extents.
3. Enter a zoom percentage in the Percent field. Click the up or down arrow to increase or decrease the value.
   **Tip:** You can also change the magnification of the canvas using the zoom slider located in the bottom right corner of the Service Console.
4. Click OK.

### Campaign and Survey Element Tools Tab
When you select an element on the canvas of a campaign or an advanced survey, the design ribbon displays a contextual tab called the Element Tools tab.
The contextual tabs that display on the ribbon depend on your selection. When you select an element or a connector, the ribbon displays a fourth contextual tab. When an element is selected, the Element Tools tab displays. The Element Tools tab is divided into two sections. On the left are contextual groups and options, meaning they change depending on the element selected. On the right are standard groups and options, meaning they display no matter what element is selected.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>The options in this group let you change the font style, size, and color. You can select font attributes, such as bold and italic, and change the text alignment.</td>
</tr>
<tr>
<td>(Label Position)</td>
<td>Click this icon to select the position of the label relative to the element. The default label position of a new element is Inside.</td>
</tr>
<tr>
<td>Text »</td>
<td>Click this icon to enter the text of the element label. You can also edit the label text inline by clicking the element label.</td>
</tr>
<tr>
<td>Notes</td>
<td>Click this option to enter notes about the element.</td>
</tr>
<tr>
<td>Size</td>
<td>The options in this group let you change the height and width of the element.</td>
</tr>
</tbody>
</table>

### Campaign and Survey Path Tools Tab

When you select a connector on the canvas of a campaign or an advanced survey, the design ribbon displays a contextual tab called the Path Tools tab.

The options on this tab let you format the connector and change the connector type. See *Connectors in Campaigns* and *Connectors in Surveys*.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Click this drop-down to change the type of the selected connector.</td>
</tr>
<tr>
<td></td>
<td>A connector type can be changed only when it is not connected to a standard or event-triggering element.</td>
</tr>
<tr>
<td>Style</td>
<td>The options in this group let you change the line style of the selected connector.</td>
</tr>
<tr>
<td>Straight</td>
<td>Click this option to set the connector line style to straight.</td>
</tr>
<tr>
<td>Square</td>
<td>Click this option to set the connector line style to square.</td>
</tr>
<tr>
<td>Rounded Square</td>
<td>Click this option to set the connector line style to rounded square.</td>
</tr>
<tr>
<td>Curved</td>
<td>Click this option to set the connector line style to curved.</td>
</tr>
</tbody>
</table>
Create a Campaign

Outreach provides an intuitive graphical interface for creating and editing campaigns. When designing a campaign, you can drag components from the toolbox and order them on the canvas. You can select components from either the Home or Insert tab on the ribbon.

You can also define the objectives for the campaign by including a text summary and estimating expenses and return on investment. After the campaign has been launched, you can view its results to assess the effectiveness of your efforts.

**Note:** The following procedure assumes that you access the Campaigns explorer from the Campaigns navigation list. However, this explorer may reside in a different navigation list.

1. Click **Campaigns** on the navigation pane and double-click **Campaigns Explorer**. The Campaigns explorer opens on the content pane.
2. Click **New** to select a starting point for your new campaign.
   a. Click **Blank Campaign** to open a new campaign with a blank design canvas.
   b. To create a new campaign by copying the design of an existing campaign, click **Choose Existing Campaign**. See **Choose an Existing Design**.
   c. To create a new campaign by copying a campaign template, click **Choose a Campaign Template**. See **Apply a Campaign Template**.

   **Tip:** You can also create campaigns from an open campaign by clicking **New**. Additionally, if your navigation set is configured to add campaigns from the file menu, click **File > Campaign**. By default, the design canvas is active when creating a campaign. From here, you can design the campaign flow diagram. See **Create a Campaign Flow Diagram**.

3. To manage campaign details, including assignment, start and end dates, and objectives, click **Details** from the Display group on the ribbon. See **Set Campaign Details**.
4. To view the campaign results, click **Results** from the Display group on the ribbon. See **View Campaign Results**. Note that this report will display no data until the campaign has been launched.
5. To add tasks to the campaign, click **Tasks** from the Display group on the ribbon. See **Add a Task to a Campaign**.
6. Click **Save**. The Save As window opens where you can select the folder you want to save the campaign in and enter the name of the campaign in the Name field.
7. Click **Save**.

- **Configure the File Menu**

Create a Campaign Flow Diagram

The first step in creating a campaign is to design a flow diagram. The flow diagram is a graphical representation of the campaign “flow,” the actions and decisions your campaign will perform, and the order in which it will perform them.
Your flow diagram can be as simple as a single path connecting a few actions, or it can be complex, routing your audience through dozens of actions, paths, and decision points. With its simplified graphical interface, Outreach makes creating a complex workflow as easy as clicking and dragging component elements into a logical order.

Whether your business needs are simple or complex, start by reviewing the elements available in the toolbox and consider how each might help accomplish the key objectives of your campaigns. When you have a clear idea which elements will be useful, you can create the flow diagram by dragging them from the toolbox to the canvas, inserting each element in a logical position, and connecting them to define the sequence of action. After an element has been inserted, you can double-click it to open a window where you can edit its attributes.

**Tip:** When explaining attributes that can be edited on a window or the ribbon, we describe the procedure using the window. However, keep in mind that the ribbon provides easy access to most of the same attributes available on windows, without the need to double-click. Campaign components can also be dragged to your flow diagram from the Elements groups on the Home and Insert tabs.

When a campaign is launched and a contact performs the first action, the decisions and actions in each element are evaluated and executed in the sequence you have specified. For example, when a contact submits a web form, your campaign evaluates the information provided and executes the next action, such as creating a sales lead and sending a follow-up message to the contact.

1. From an open campaign, drag and drop a campaign component element from the toolbox onto the canvas.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td>Execute Object Event Handler</td>
<td>Drag and drop this element to add a contact-related object event handler that will trigger an external event action. See <em>Edit Execute Object Event Handler Attributes</em>.</td>
</tr>
</tbody>
</table>
### Conditional Elements
Conditional elements produce multiple path outcomes based on decisions.

#### Case Statement
Drag and drop this element to add a case statement to the campaign. A case statement is a type of conditional element that lets you add multiple choice decisions. This gives you an easy way to add diverse branching capabilities to your campaigns based on conditions defined in the workflow. Case statements are unique because they have an outgoing path for every condition. As soon as the first choice (condition) is matched, the path for that choice is followed, and no other conditions within the case statement are evaluated. See [Connectors in Campaigns](#). After adding the case statement, double-click it to define its attributes. See [Edit Case Statement Attributes](#).

#### Decision
Drag and drop this element to add a decision point. A decision lets you specify conditions the contact must meet to advance in the workflow. You can create two outgoing paths from a decision: Yes (contact meets the criteria) and No (contact does not meet the criteria). See [Connectors in Campaigns](#). After adding the decision, double-click it to define its attributes. See [Edit Decision Attributes](#).

#### Artifacts
Artifact elements let you make comments about your campaign. They do not affect the outcome of your flow diagram.

#### Comment
Drag and drop this artifact to add comments about your flow diagram or a specific campaign component. A comment artifact does not require a connector, but if your comment is about a specific element, use the Artifact connector type. See [Connectors in Campaigns](#).

2. To connect one element to another, click an anchor on the first element and drag the connector to an anchor on the second element.
   The anchor is highlighted when the connector is able to link to it. The connector arrow will point from the first element to the second. See [Connectors in Campaigns](#).

3. To change the formatting of an element, double-click the element, and then use the options on the Element Tools tab.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>The buttons in this group let you change the font style, size, and color. You can select font attributes, such as bold and italic, and change the text alignment.</td>
</tr>
<tr>
<td><img src="#" alt="Label Position" /></td>
<td>Click this button to select the position of the label relative to the element. The default label position of a new element is Inside.</td>
</tr>
</tbody>
</table>
Section 1

**Group/Button** | **Description**
--- | ---
[Text ▷] | Click this button to type the text of the element label. You can also edit the label text inline by clicking the element label.

Notes | Click this button to type notes about the element.

Size | The buttons in this group let you change the height and width of the element.

**Tip:** To select multiple elements at the same time, press Ctrl and select each component.

4. To cut, copy, or paste one or more components, click the appropriate button on the Clipboard group of the Home tab.

5. To undo an action on the canvas, click **Undo** on the Quick Access toolbar.

6. To redo an action on the canvas, click **Redo** on the Quick Access toolbar.

7. To export an image of the canvas to your workstation, click **File** and select **Export Image**.

**Connectors in Campaigns**

Connectors are components used to link campaign elements and indicate flow direction. Elements can be connected to other elements depending on their type. The type of connector is indicated by its color.

<table>
<thead>
<tr>
<th>Connector</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Green</td>
<td>This type of connector links a decision element to another element. The path is taken if the contact meets the criteria specified in the decision.</td>
</tr>
<tr>
<td>No</td>
<td>Red</td>
<td>This type of connector links a decision element to another element. The path is taken if the contact does not meet the criteria specified in the decision.</td>
</tr>
<tr>
<td>Standard</td>
<td>Gray</td>
<td>This type of connector links one element to another element. The second action is performed immediately after the first.</td>
</tr>
<tr>
<td>Artifact</td>
<td>Black (Dashed)</td>
<td>This type of connector links a comment to an element.</td>
</tr>
<tr>
<td>Submit</td>
<td>Blue</td>
<td>This type of connector submits the element web form fields to the database and then links to another element. A web form can be a document with a web form or survey questions. In order for the submit connector to work, there must be a submit action on the web form that's used in the campaign. See <a href="#">Insert a Survey Results Link</a>.</td>
</tr>
<tr>
<td>Case</td>
<td>Gray</td>
<td>This type of connector links a case statement element to another element. The path is taken if the contact meets the criteria specified in the case statement.</td>
</tr>
</tbody>
</table>
Each element can have a specific number of incoming and outgoing connectors. The following table details the type and number of connectors allowed in each element.

<table>
<thead>
<tr>
<th>Element</th>

### Connect an Element

Connectors are used to link elements and show flow direction. Elements can be connected to other elements depending on their type. The type of connector is indicated by its color.

The anchor is highlighted when the connector is able to link to it. The connector arrow will point from the first element to the second. When you connect your element types this way, the system automatically applies the correct connector type.

1. Click an anchor on the first element and drag the connector to an anchor on the second element.

   **Note:** If you use the wrong connector type, the element anchor will not be highlighted.

Other ways to connect elements include the following:

- Hover over the first element and click a blue arrow to link to an adjoining element.
- Drag one element over another, hover over its blue arrow until it turns dark blue, and then drop to connect the elements. Connecting your elements this way auto-links them with the correct connector type.
- Click an element from the toolbox, and then hover over an element on the canvas and click its blue arrow to drop and auto-link the new element.
- Drag and drop a connector from the toolbox to the canvas, and then drag the ends of the connector to the elements you want to link.

- Connectors in Surveys

**Connect to a Different Element**
You can change the flow of your existing elements by moving a connector to a different element.

1. Click a midpoint on the connector to select it and drag one of its ends to an anchor on a different element. The element will highlight when you can connect to it. Remember, if you try to use the wrong connector type, your element will not be highlighted.

**Edit a Square or Curved Connector**
You can adjust the shape of the connection on square and curved connectors.

These images show the calibration points on square and curved connectors.

1. Click a midpoint on a square or curved connector to select it and drag the calibration points to change the connection shape.

**Delete a Connector**
You can delete connector components.

1. Click a midpoint on the connector to select it and press Delete.

**Edit Serve Web Page Attributes**
After you add a Serve Web Page element to your flow diagram, you can edit its attributes to select a document to serve as a web page through B2C Service.

You can specify the shortcut ID used to generate the URL and choose whether to prefill the web form in the document with contact fields stored in the contact’s cookies or passed as parameters in the URL. You can also customize the title of the page you are editing. The page title displays in the title bar of the web browser when the survey is taken.

**Tip:** Use a submit connector to connect this action to the next action when the web page contains a web form or survey questions. You can also add a back button to a web page that contains a web form. See [Add a Back Button to a Serve Web Page](#).
1. Double-click the **Serve Web Page** element. 
   The **Serve Web Page** window opens.
2. Enter the name of the element in the **Label** field.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| *Documents         | Select the document you want to use as a web page from this list.  
   To search for a document, right-click the list and select Search. Then enter the document name in the Find field. |
| New Document       | Click this text to create a document. See [Create a Document](#). |
| *Shortcut ID       | Enter the shortcut ID that is used to format the URL in this field. The URL for the document will be:  
   `http://<your_domain>/ci/documents/detail/2/<shortcut_ID>`  
   **Note:** This shortcut ID must be unique for all Serve Web Page elements in all surveys and campaigns. |
| (View Web Page)    | Click this icon to open the web page in a browser.  
   The icon is inactive until the campaign is launched. If the shortcut ID is edited after launching, the icon is inactive until the campaign is saved. |
| Copy URL           | Click this icon to copy the web page URL to the clipboard.  
   The URL will not be valid until the campaign is launched. |
| *Friendly Name     | Enter the name of your web page. This name is used when linking to the web form from another document. |
| Title              | Enter the name of the page as you want it to display in the title bar of the web browser when the survey is taken.  
   If you leave this field blank, either the document title or the template title will display in the web browser title bar. If a template has been applied to the document the web page uses, then the template title is used. |

4. Click the **User Identification** tab. 
   You can specify default values for the settings on the User Identification tab by editing optional configuration settings. See [Customize Feedback Configuration Settings](#).
5. Enter field information.

**Note:** Keep in mind that all the settings you define on the User Identification tab determine what data is passed to the survey results. This affects how you can associate your survey results to an incident or to a contact.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identify User By</td>
<td>Select from the following options to prefill a web form (if one is included in your document).</td>
</tr>
<tr>
<td>Login with Password</td>
<td>Select this option to require the contact to log in to the customer portal before viewing the web form.</td>
</tr>
<tr>
<td>Remember Previous Login</td>
<td>Select this check box to identify the contact through the contact’s B2C Service login cookie. If a login cookie does not exist, the contact is redirected to the login page on the customer portal. If this check box is cleared, the contact is always required to log in through the customer portal before viewing the web form.</td>
</tr>
<tr>
<td>Other Credentials</td>
<td>Select this option to identify the contact by a cookie or through URL parameters.</td>
</tr>
<tr>
<td>Cookie</td>
<td>Select this option if you want to use the contact’s browser cookie to prefill the web form. The contact’s record is updated with the form submission.</td>
</tr>
<tr>
<td>Email Click-Through Parameters</td>
<td>Select this option if you want to use parameters passed in the URL to prefill the web form.</td>
</tr>
<tr>
<td>Tip:</td>
<td>If using this option to prefill a web form from a link in a mailing, be sure to use a web page link instead of a tracked link. Because tracked links are used to redirect to external sites, they do not support click-through parameters.</td>
</tr>
<tr>
<td>Do Not Identify</td>
<td>Select this option if you do not want the web form to prefill. This applies only to single page surveys or campaigns with only one Serve Web Page element. For surveys and campaigns with more than one page, after the contact info is added to the first page, the subsequent pages will prefill. Therefore, this option applies only to the first instance of a page in a survey or campaign flow that uses a Submit connector. For example, most surveys use a Submit connector on the first page that flows to the next page with another Submit connector, and so on. In this case, the first page will not prefill since the contact has not been identified. However, after the first page has been submitted, the next page that loads will be associated to that contact. Therefore, any web form fields on that page (as well as on subsequent pages) will prefill even though Do Not Identify is selected.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Note: A contact record is updated through the web form if the email address field is included and can be matched to an existing record. When serving a website link survey, this option is available only if the Allow Anonymous check box is selected on the Summary tab of the survey.

Set Browser Cookie on Submit | Select this check box if you want to set the contact’s browser cookie upon submitting the form. If the contact accesses any form later, the form will be prefilled if the Cookie option is selected for that form.

### Tip:
You can set default values for the user identification fields by editing the configuration settings located in Outreach and Feedback/General/Campaigns. Note that default values specified by these settings impact both new campaigns and new advanced surveys.

6. To add any notes associated with the element, click the **Notes** tab and enter the notes.
7. Click **OK**.

### Edit Broadcast Mailing Attributes

After you add a Broadcast Mailing element to your flow diagram, you can edit its attributes to define which mailing to send.

You can choose to create a mailing or use an existing mailing in your database. See Create a Broadcast Mailing.

### Tip:
Use a submit connector to connect this element to the next element when the mailing contains a web form.

1. Double-click the **Broadcast Mailing** element to open the **Broadcast Mailing** window.
2. Enter the name of the element in the **Label** field.
3. Select the mailing you want to send from the list.
   a. To search for a mailing, right-click the list and select **Search**. Then enter the mailing name in the **Find** field.
4. To create a broadcast mailing, click **New Broadcast Mailing**.
   
   **Note:** When adding a new broadcast mailing to a campaign, you cannot send or schedule the mailing until you save the campaign.

5. To add any notes associated with the element, click the **Notes** tab and enter the notes.
6. Click **OK**.

### Edit Scheduled Entry Point Attributes

After you add a Scheduled Entry Point element to your flow diagram, you can edit its attributes to schedule regular runs of a campaign for a designated segment.

When launched, a scheduled campaign can be edited, suspended, rescheduled, or canceled at any time. Information about past runs—such as the time last run, next scheduled runtime, the time the schedule was last updated, and basic results data—is stored in the knowledge base and tracked in the Recurring Campaigns Summary report. Also, each
recurrence is tracked in the campaign audit log along with a description of how many contacts were processed. See Audit Logs.

1. Double-click the Scheduled Entry Point element to open the Scheduled Entry Point window.

   **Note:** To avoid conflicts, campaigns may contain only one Scheduled Entry Point. Those containing a Scheduled Entry Point cannot contain a broadcast mailing and cannot be selected to run automatically when using the Data Upload Wizard.

2. Enter the name of the entry point in the **Label** field.

3. Enter field information.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Field | Description
---|---
Time to execute campaign | Enter the time of day to begin sending the campaign.

4. Click the **Segment** tab and select the segment you want the campaign to act on.
   a. To exclude contacts from the segment that were included in a previous instance of the recurrence, select **Exclude Previous Match**.
   b. To create a new segment, click **New Segment**.
5. Click the **Properties** tab and enter the shortcut ID of the entry point in the **Shortcut ID** field.
   This value is used to identify the entry point and must be unique for each campaign.
6. Enter the name of the entry point in the **Friendly Name** field.
7. To add any notes associated with the entry point, click the **Notes** tab and enter the notes.
8. Click **OK**.

### Edit Entry Point Attributes

After you add an Entry Point element to your flow diagram, you can edit its attributes to define its name and shortcut.

The shortcut can be passed as a parameter to send contacts through the campaign, beginning at the entry point. The entry point can also be used when contacts are uploaded using the Data Import Wizard. See [Import Data](#).

1. Double-click the **Entry Point** element to open the **Entry Point** window.
2. Enter the name of the entry point in the **Label** field.
3. Enter the shortcut ID of the entry point in the **Shortcut ID** field.
   This value is used to identify the entry point and must be unique for each campaign.
4. Enter the name of the entry point in the **Friendly Name** field.
5. Select **Create Outreach Activity Record** to record a transaction when a contact enters the flow diagram at an entry point.
   This can be used to report on the entry point in outreach activity reports, including on the Outreach Activity tab when editing a contact record.
6. To add any notes associated with the entry point, click the **Notes** tab and enter the notes.
7. Click **OK**.

### Edit Add to List Attributes

After you add an Add to List element to your flow diagram, you can edit its attributes to define which list the contact is added to. You can select from predefined lists in your system or create a list.

1. Double-click the **Add to List** element to open the Add to List window.
   The **Add to List** window opens.
2. Enter the name of the element in the **Label** field.
3. Select a contact list from the List tab.
   a. To search for a contact list, right-click the list and select **Search**.
   b. Enter the list name in the **Find** field.
4. To create a contact list, click **New Contact List** and see [Add a Contact List](#).
5. To add any notes associated with the element, click the **Notes** tab and enter the notes.
6. Click **OK**.
Edit Transactional Mailing Attributes

After you add a Transactional Mailing element to your flow diagram, you can edit its attributes to define which mailing to send to a contact. In addition, you can choose to send the mailing immediately, at an exact time, or at a certain interval.

If the mailing is scheduled to be sent at a certain interval, it is stored until the mailer daemon sends it. By default, the mailer daemon sends scheduled transactional mailings every fifteen minutes. If you want the utility to send mailings more frequently, you must edit the RNMD_EVENT_PROC_INTERVAL configuration setting.

**Note:** The Transactional Mailing element simply schedules a mailing to be sent. It does not pause the processing of the flow until the mailing is sent. Therefore, any elements following this element in the flow continue to be processed immediately, even if the mailing is scheduled to be sent in the future.

This element can be filtered using segments. If you choose to filter a transactional mailing, you can select whether contacts who are in or not in the segment will be sent an email.

1. Double-click the **Transactional Mailing** element.
   - The **Transactional Mailing** window opens.
2. Enter the name of the element in the **Label** field.
3. Select the mailing you want to send.
   a. To search for a mailing, right-click the list and select **Search**. Then enter the mailing name in the **Find** field.

   **Note:** In order to send a transactional mailing, it must be in a launched state. If you select a transactional mailing that has not been launched, it does not send and the system advances to the next element in your flow diagram.

4. To create a transactional mailing, click **New Transactional Mailing**. See *Create a Transactional Mailing*.
5. Click the **Schedule** tab.
6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediately</td>
<td>Select this option to send the email immediately after the action occurs.</td>
</tr>
<tr>
<td>At Exact Time</td>
<td>Select this option and click the calendar (to the right of the date field) to select a specific date and time to send the email. If this option is selected, a clock icon appears on the Transactional Mailing element to indicate that a delivery time for the mailing is scheduled.</td>
</tr>
<tr>
<td>Wait</td>
<td>Select this option to send the mailing a specified amount of time after the action is triggered in the flow. Use the up and down arrows to select the number of units, and click the drop-down menu to select the interval (minutes, hours, days, or weeks). If this option is selected, a clock icon appears on the Transactional Mailing element to indicate that a delivery time for the mailing is scheduled.</td>
</tr>
</tbody>
</table>
7. Click the **Filter** tab to select whether or not contacts should be included in the segment to be filtered from the mailing.

   The default is Send This Mailing Only to People in the Following Segment. If you leave the default, only contacts who meet the criteria in the segment receive the mailing.

8. Select the **Filter this Mailing** check box.

9. Click the drop-down menu and select whether or not customers in the segment will receive the mailing.

10. Select a segment for the mailing.

11. To add a segment, click **New Segment** and see *Create a Segment*.

12. To add any notes associated with the element, click the **Notes** tab and enter the notes.

13. Click **OK**.

**Edit Set Field Attributes**

After you add a Set Field element to your flow diagram, you can edit its attributes to specify the value of contact fields. You can specify a number of different field values, including opt-in status, state, or any contact custom fields defined in your system.

1. Double-click the **Set Field** element.

   The **Set Field** window opens.

2. Enter the name of the element in the **Label** field.

3. Click the **Field** drop-down menu and select the contact field you want to set the value of.

4. To add a new contact custom field, click **Add New Custom Field** and see *Add or Edit a Custom Field*.

5. Enter a value for the contact field you selected.

   **Note:** In addition to setting explicit (absolute) values, you can set null values for text and text area fields as well as relative values for some field types. Relative values are defined by adding or subtracting (or appending or prepending) a value to the previous value of the field. See *Relative Field Values*.

6. To add any notes associated with the element, click the **Notes** tab and enter the notes.

7. Click **OK**.

**Relative Field Values**

In addition to setting absolute field values for date, date/time, integer, text, and text area fields, you can set relative values.

When setting a value for one of these field types, clicking the Value drop-down menu presents additional options for adding or subtracting (or appending or prepending) a value to the previous value of the field. For example, you can increment the value of an integer field by 1 or append text to a contact text field. For date and date/time fields, you can also set a value relative to the time of action, such as adding one day to the current date and time.

Options for setting relative field values vary by field type.

<table>
<thead>
<tr>
<th>Field Type</th>
<th>Value Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Add or subtract a number of days or weeks to or from the previous value or the current date.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Add or subtract a number of minutes, hours, days, or weeks to or from the previous value or the current date and time.</td>
</tr>
<tr>
<td>Integer</td>
<td>Add or subtract an integer value to or from the current value.</td>
</tr>
</tbody>
</table>
Edit Opportunity Attributes

After you add an Opportunity element to your flow diagram, you can edit its attributes to define fields of the opportunity created by this element.

You can specify the opportunity’s name, status, strategy, stage, assigned sales representative, and territory.

1. Double-click the Opportunity element.
   The Opportunity window opens.
2. Enter the name of the element in the Label field.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field Type</th>
<th>Value Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Type</td>
<td>Description</td>
</tr>
<tr>
<td>Text Field</td>
<td>Prepend or append a text value to the current text value.</td>
</tr>
<tr>
<td>Text Area</td>
<td>Prepend or append a text value to the current text value.</td>
</tr>
</tbody>
</table>

**Note:** The resulting value cannot be greater than the maximum value defined for the field or less than the minimum. Therefore, the maximum value you can add or subtract is the maximum value minus the minimum value of the field. For example, if the field maximum is 8 and the field minimum is -8, the maximum value you can add or subtract from the current value is 16.

**Field** | **Description**
---|---
*Name | Enter the name of the opportunity in this field. The contact’s email address is appended to the lead name.
*Status | Click this drop-down menu to assign a status to the opportunity.
Strategy | Click this drop-down menu to assign the opportunity to a strategy.
Stage | Click this drop-down menu to assign the opportunity to a stage. The options in this menu depend on the strategy selected.
Assigned | Click this drop-down menu to assign the opportunity to a sales representative. Use the Find field at the bottom of the Assigned drop-down menu to quickly locate staff members.

**Tip:** Wildcards are supported when searching staff members. You can search strings that include a space by entering %+Space+character, which is helpful when searching last names. For example, entering %+Space+b returns all last names starting with the letter b. There is also an implied wildcard when searching, so entering in the Find field returns all items containing the letter b.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Territory</td>
<td>Click this drop-down menu to assign the opportunity to a territory.</td>
</tr>
<tr>
<td>Summary</td>
<td>Enter a summary of the opportunity in this field.</td>
</tr>
</tbody>
</table>

4. Click **Set Custom Field** to set custom fields for the opportunity. The **Set Custom Field** window opens.

   **Note:** You must define custom fields in the Custom Fields editor before you can set a custom field for an opportunity. See [Add or Edit a Custom Field](#).

   a. Click the **Field** drop-down menu to select the custom field you want to set.
   b. Enter the value of the custom field in the **Value** field.
   c. Click **OK**.

   The custom field and its value appear in the Custom Fields grid.

5. To edit the value of a custom field, click **Edit** next to the custom field.
6. To remove the set value of a custom field, click **Delete** next to the custom field.
7. To add any notes associated with the element, click the **Notes** tab and enter the notes.
8. Click **OK**.

**Related Topics**

- [How You Work with Opportunities](#)

**Edit Notification Attributes**

After you add a Notification element to your flow diagram, you can edit its attributes to define which staff members to notify.

1. Double-click the **Notification** element.
   
   The **Notification** window opens.
2. Enter the name of the element in the **Label** field.
3. Enter the message you want to appear in the subject line of the notification in the **Message** field.
4. Select the check boxes of the staff members you want to notify.
5. To add any notes associated with the element, click the **Notes** tab and enter the notes.
6. Click **OK**.

**Edit Redirect to URL Attributes**

Redirect to URL elements let you define a web page your customers are redirected to when they complete the previous action in the workflow. After adding a Redirect to URL element to your flow diagram, you can edit its attributes to specify the URL you want to send the contact.

1. Double-click the **Redirect to URL** element.
   
   The **Redirect to URL** window opens.
2. Enter the name of the element in the **Label** field.
3. Enter the URL of the website you want to redirect the contact to in the **URL** field.
   
   The protocol must be specified. The following protocols are supported:
   - file://
   - ftp://
   - gopher://
Edit Transactional Survey Attributes

After you add a Transactional Survey element to your flow diagram, you can edit its attributes to define which survey to send to a contact. In addition, you can choose to send the survey immediately, at an exact time, or at a certain interval.

If the survey is scheduled to be sent at a certain interval, the survey is stored until sent by the mailer daemon. By default, the mailer daemon is scheduled to send scheduled transactional surveys every fifteen minutes.

### Note: The Transactional Survey element simply schedules a survey to be sent. It does not pause the processing of the flow until the survey is sent. Therefore, any elements following this element in the flow continue to process immediately, even if the survey is scheduled to be sent in the future.

This element can be filtered using segments. If you choose to filter a transactional survey, you can select whether contacts who are in or not in the segment are sent an email.

1. Double-click the Transactional Survey element.
   The Transactional Survey window opens.
2. Enter the name of the element in the Label field.
3. Select the survey you want to send.
   a. To search for a survey, right-click the list and select Search. Then enter the survey name in the Find field.
   In order to be sent, the transactional survey you select must be in a launched state. If you select a transactional survey that has not been launched, it is not sent and the system advances to the next element in your flow diagram.
4. To create a transactional survey, click New Transactional Survey. See Create a Segment.
5. Click the Schedule tab.
6. Enter field information.

<table>
<thead>
<tr>

Using B2C Service

Chapter 10
Outreach and Feedback

7. Click the **Filter** tab and select **Filter This Survey** to select whether contacts should be included or not included in the segment to be filtered from the survey.

   The default is Send This Survey Only to People in the Following Segment. If you leave the default, only contacts who meet the criteria in the segment receive the survey.

8. To send the survey to all contacts except those who meet the criteria in the segment, click the drop-down menu and select **Send This Mailing to Everyone Not in the Following Segment**.

9. Select a segment for the survey.

10. To add a segment, click **New Segment**.

11. To add any notes associated with the element, click the **Notes** tab and enter the notes.

12. Click **OK**.

**Edit Execute Object Event Handler Attributes**

You can add contact-related object event handlers to your campaign that can be associated with create and update operations on contact objects. Object event handlers are added and managed on the process designer in a virtual container called the process model.

After you add your object event handlers on the process designer and deploy the process model, you can add an Execute Object Event Handler element to your flow diagram and then associate it with one your object event handlers to trigger an action. See *Add an Object Event Handler*.

**Note:** Only synchronous object event handlers are applicable to campaigns and surveys.

1. Double-click the **Execute Object Event Handler** element.

   The **Execute Object Event Handler** window opens.

   Contact objects must be added on the process designer and then the process model must be deployed for objects to display on the List tab.

2. Enter the name of the element in the **Label** field.

3. Select an object event handler from the List tab.

4. To add notes about the object event handler, click the **Notes** tab and enter your notes.

5. Click **OK**.

**Edit Lead Attributes**

After you add a Lead element to your flow diagram, you can edit its attributes to define fields of the lead created by this element.

You can specify the status, strategy, stage, assigned sales representative, and territory of the lead.

1. Double-click the **Lead** element.
The Lead window opens.

2. Enter the name of the element in the **Label** field.
3. Enter field information.

<table>

<tr>
<td>Summary</td>
<td>Enter a summary of the lead in this field.</td>
</tr>
</tbody>
</table>

4. Click **Set Custom Field** to set custom fields for the lead. The **Set Custom Field** window opens. **Note:** You must define custom fields in the Custom Fields editor before you can set a custom field for a lead. See *Add or Edit a Custom Field.*
   a. Click the **Field** drop-down menu to select the custom field you want to set.
   b. Enter the value of the custom field in the **Value** field.
   c. Click **OK.**

   The custom field and its value appear in the Custom Fields grid.

5. To edit the value of a custom field, click **Edit** next to the custom field.
6. To remove the set value of a custom field, click **Delete** next to the custom field.
7. To add any notes associated with the element, click the **Notes** tab and enter the notes.
8. Click OK.

Edit Incident Attributes
After you add an Incident element to your flow diagram, you can edit its attributes to define the subject, status, and other elements of the created incident.

1. Double-click the **Incident** element.
   The **Incident** window opens.
2. Enter the name of the element in the **Label** field.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Subject</td>
<td>Enter the subject of the incident in this text box.</td>
</tr>
<tr>
<td>*Status</td>
<td>Click this drop-down menu to select a status to assign to the incident. The default status is Unresolved.</td>
</tr>
<tr>
<td>Assigned</td>
<td>Click this drop-down menu to select a group or staff member to assign to the incident. Use the Find field at the bottom of the Assigned drop-down menu to quickly locate staff members.</td>
</tr>
<tr>
<td>Tip: Wildcards are supported when searching staff members. You can search strings that include a space by entering <code>%+Space+character</code>, which is helpful when searching last names. For example, entering <code>%+Space+b</code> returns all last names starting with the letter b. There is also an implied wildcard when searching, so entering in the Find field returns all items containing the letter b.</td>
<td></td>
</tr>
<tr>
<td>Product</td>
<td>Click this drop-down menu to select a product for the incident.</td>
</tr>
<tr>
<td>Category</td>
<td>Click this drop-down menu to select a category for the incident.</td>
</tr>
<tr>
<td>Disposition</td>
<td>Click this drop-down menu to select a disposition for the incident.</td>
</tr>
<tr>
<td>Queue</td>
<td>Click this drop-down menu to select a queue for the incident.</td>
</tr>
<tr>
<td>Service Mailbox</td>
<td>Click this drop-down menu to select a mailbox to associate with the incident.</td>
</tr>
<tr>
<td>Customer Entry</td>
<td>Enter a default value for the customer thread in this text box.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Private Note | Click this tab to enter a default value for the notes thread.

4. Click **Set Custom Field** to set custom fields for the incident. The **Set Custom Field** window opens.

**Note:** You must define custom fields in the Custom Fields editor before you can set a custom field for an incident. See *Add or Edit a Custom Field*.

   a. Click the **Field** drop-down menu to select the custom field you want to set.
   b. Enter the value of the custom field in the **Value** field.
   c. Click **OK**.

The custom field and its value appear in the Custom Fields grid.

5. To edit the value of a custom field, click **Edit** next to the custom field.
6. To remove the set value of a custom field, click **Delete** next to the custom field.
7. To add any notes associated with the element, click the **Notes** tab and enter the notes.
8. Click **OK**.

**Related Topics**
- Overview of Incidents

**Add a Comment**

The toolbox also provides a Comment artifact that allows you to enter comments in your diagram without impeding the campaign or survey flow. Comments are added to the canvas in the same way elements are and can be linked to elements using the Artifact connector type.

1. Drag and drop a Comment artifact from the toolbox onto the canvas.
2. Click the artifact to type your comments.
3. To connect the artifact to an element, click an anchor on the artifact and drag to an anchor on the element.

   The anchor is highlighted when the connector is able to link to it.

**Edit Case Statement Attributes**

Case statements help you branch your workflow based on multiple conditions you define. They are unique because you define an outgoing path for each condition. When the first choice (condition) is matched, the path for that choice is followed, and no other conditions within the case statement are evaluated.

After you add a case statement element to your flow diagram, you can edit its attributes to branch your flow to different paths based on whether contacts meet certain conditions. When you edit the case statement, you can define multiple conditions using a contact field in the database, a question, or a score.

Score pertains to the cumulative score from all preceding survey question responses. Score always displays on the Cases tab.

Case statements differ from decisions because they let you add multiple paths to your flow. This image shows a case statement with four choices that lead to three different paths.
1. Double-click the **Case Statement** element. The **Case Statement** window opens.

2. Select a contact field, survey question, or score from the Cases tab.
   **Tip:** Depending on the item you select, choices are either already defined by default or you must define them.

3. If you want to add an “other” path to your case statement, select **Include Option for Other**.

4. To add a choice that is not defined by default, click **Add Choice**. The bottom section of the Case Statement window displays options to define logical expressions for your choices. The Add Choice button does not display if choices have already been defined by default. For example, Contact Type or Global Opt-in under Default Contact Fields have choices defined. Therefore, the Add Choice button does not display when these fields are selected.

5. Click the **Operator** drop-down menu to select the logical symbol that completes your expression.

6. Enter the field value in the **Choice** field.

7. To add another choice that is not defined by default, repeat steps 4 through 6.

8. To delete a choice, select the choice and click **Remove**.

9. To add a choice that is defined by default, select the check boxes next to the choices you want to include in your case statement.
   **Cases with menu, yes/no, and opt-in items present you with default choices defined by the database.**

10. To add any notes associated with the element, click the **Notes** tab and enter the notes.

11. Click **OK**.

**Edit Decision Attributes**

Decision elements let you branch your workflow based on two outgoing paths you define.

After you add a Decision element to your flow diagram, you can edit its attributes to require contacts to meet certain criteria before moving down the Yes path. Contacts who do not meet the criteria are moved down the No path (if one exists). When you edit the decision, you can define conditions based on contact fields or question responses and a logical expression based on the conditions.

When you create decisions in campaigns or advanced questionnaires, you can create branches in your survey based on customer response. For example, you could serve a document with survey questions as a web page, then create a decision based on a response to send them to one of two documents containing additional questions.
Also, when a matrix question is added to an advanced questionnaire, each question from the matrix can be filtered by decision elements. In this way, you can direct the flow based on a specific contact response to an individual question in the matrix.

1. Double-click the Decision element to open the Decision Conditions window.
2. Enter the name of the decision in the Label field.
3. Click Add Condition to create a condition for the Yes path. The Add Condition window opens.
   a. Enter the name of the condition in the Name field.
   b. Click the Source drop-down menu and select a database field or survey question.

   **Note:** When adding a text field to a decision, the Source drop-down menu displays an additional item as “<text field name> SmartSense.” Selecting the Smart Sense item lets you evaluate the customer’s emotional state or attitude based on the words or language the customer used when responding to the question. You can then specify values from Very Happy to Very Angry as criteria for your decision logic.

   c. Click the Operator drop-down menu and select the logical symbol that completes the condition.
   d. Enter the value of the field or click the drop-down menu and select the value in the Value field.
   e. Click OK to add the condition to the decision.

   This expression determines which contacts meet the condition (for example, State/Province=MT or <menu question>==<specified answer>).

   By default, when multiple conditions are added, they are joined by AND. When the AND operator is used, contacts are moved down the Yes path when all the conditions are met. You can further limit your data set by using the Boolean operators OR and NOT. When the OR operator is used, contacts are moved down the Yes path when any of the conditions are met.

4. To add an OR to your expression, click Add OR Node. Conditions attached to the OR node are joined by OR.
5. To edit a condition, select the condition and click Edit Condition.
6. To delete a condition, select the condition and click Remove Condition.

   The Add OR Node, Edit Condition, and Delete Condition options display only after you have added a condition.

7. Click View Text Definition to see your conditions as a logical expression.
8. To add any notes associated with the element, click the Notes tab and enter the notes.
9. Click OK.

**Edit External Event Attributes**

External events have been deprecated and may be permanently removed in a future release. Instead, you can use contact-related object event handlers to trigger actions.

For information about external events or contact-related object event handlers, contact your Oracle account manager. See Edit Execute Object Event Handler Attributes.

**Choose an Existing Design**

When creating a new campaign, there may be times when you want to start with a flow diagram that was previously designed for another campaign.

This can be accomplished by making a copy of an existing campaign to create your new campaign. When you copy a campaign to create your design, you can also choose to copy element attributes from the original or start with empty attributes. You can then make changes and additions to the new campaign without impacting the original.

1. Click New to open the Getting Started section to select a starting point for your campaign.
2. Click Choose Existing Campaign. The Choose Existing Campaign window opens.
3. Select the campaign you want to use.
4. To select how the campaign is inserted, click Show Advanced Options.
   a. To copy the element attributes of the campaign diagram, including labels and other fields, select Full Copy.
   Broadcast mailing IDs and shortcut IDs will not be copied, as these values must be unique.
   b. To copy the campaign diagram without its element attributes, select Empty Copy.
      After copying, you will need to edit each element to enter its attributes.
5. Click OK.
   Tip: Outreach also provides a number of predefined campaign templates that support common business processes. See Apply a Campaign Template.

Campaign Validation
As you create a flow diagram for your campaign, Outreach validates all flow components to ensure all required attributes have been specified. Although validation occurs in real time as you add and update the components, you can also force validation manually by clicking Validate on the Home tab.

You can choose to display validation flags by selecting the Validation Results check box on the View tab. This way, valid components are flagged with a green check mark, while those found to be invalid are flagged with a red exclamation point and a small button you can click to view the validation error. If you attempt to launch a campaign without first addressing its validation errors, the flags automatically display (even if you have not selected the Validation Results option) along with a message summarizing the errors.

Launch or Suspend a Campaign
After you have designed and validated your campaign, you must launch it to make it active. After a campaign has been launched, you can suspend it and relaunch it at a later time.

1. To launch or relaunch the campaign, click Launch on the Home tab.
   a. Click OK to save the campaign in a launched state.
2. To suspend the campaign, click Suspend.
   a. Click OK to save the campaign in a suspended state.
3. Click Save.
   Note: When you suspend a campaign, you do not suspend all of the mailings or surveys that are associated with the campaign. You are simply preventing new contacts from entering the flow. If you want to suspend mailings that are included in the campaign flow, you must do so from the mailings or surveys.

View Campaign Results
The content pane displays a report listing the type of transactions that have occurred over the life of the campaign, sorted by the number of instances.

In addition to the campaign results, Outreach features a variety of reports for viewing detailed campaign performance statistics.

1. Click Results on the Home tab.
A report opens.
Campaign Management

In addition to the flow diagram, campaigns can be further defined by a variety of other configuration options, including campaign objectives, tasks, notes, and file attachments. You can also view an audit log to see when a campaign was created and edited.

This section describes how to create objectives and tasks for your campaign. For information about notes, file attachments, and the audit log, see Overview of Common Functionality.

Set Campaign Details

The campaign details settings let you assign a campaign to a staff member, set start and end dates, and define campaign objectives. After a campaign is launched, this section also displays a report listing opportunities generated by the campaign.

1. Click Details on the Home tab.
   The campaign details display on the content pane.
2. To assign the campaign to another staff member (by default, the campaign is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.
   a. To search for a staff member, enter the staff member’s name in the Find field.
   Tip: Wildcards are supported when searching staff members. You can search strings that include a space by entering %+Space+character, which is helpful when searching last names. For example, entering %+Space+b returns all last names starting with the letter b. There is also an implied wildcard when searching, so entering b in the Find field returns all items containing the letter b.
3. Click the calendar next to the Start Date field to select the date the campaign is scheduled to start.
4. Click the calendar next to the End Date field to select the date the campaign is scheduled to end.
   Note: The Start Date and End Date fields are for planning purposes only. They do not affect campaign launch or suspend dates. See Launch or Suspend a Campaign.
5. Enter a description of your campaign objectives in the Objectives Summary text box.
   You can use the settings in the Objectives section to track key attributes of the campaign, such as its budget, its expected cost, and the number of leads the campaign is expected to generate. When you know the actual cost and sales of your campaign, you can enter those figures as well, and the system uses them to calculate cost per lead, cost per opportunity, net profit, and return on investment (ROI).
6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Budget</td>
<td>Enter the amount budgeted for the campaign, select the currency used, and click the Exchange Rates icon to select the exchange period.</td>
</tr>
</tbody>
</table>
**Field** | **Description** |
--- | --- |
Expected Cost | Enter the expected cost of the campaign, select the currency used, and click the Exchange Rates icon to select the exchange period. When the campaign ends, enter the actual cost of the campaign. |
Actual Cost |  |
Expected Sales | Enter the expected amount of sales resulting from the campaign, select the currency used, and click the Exchange Rates icon to select the exchange period. When the campaign ends, enter the actual amount of sales resulting from the campaign. |
Actual Sales |  |
Expected Leads | Enter the number of leads expected to be generated from the campaign. |
Actual Leads | This field displays the actual number of leads generated from the campaign through the Lead element. |
Expected Opportunities | Enter the number of opportunities expected to be generated from the campaign. |
Actual Opportunities | This field displays the actual number of opportunities generated from the campaign through the Opportunity element. |
Expected Cost Per Lead | These fields display the expected cost per lead, and when the campaign ends, the actual cost per lead. The values are calculated by dividing the expected cost by the expected leads. |
Actual Cost Per Lead |  |
Expected Cost Per Opportunity | These fields display the expected cost per opportunity, and when the campaign ends, the actual cost per opportunity. The values are calculated by dividing the expected cost by the expected opportunities. |
Actual Cost Per Opportunity |  |
Expected Net Profit | These fields display the expected net profit, and when the campaign ends, the actual net profit. The values are calculated by subtracting the expected cost from the expected sales. |
Actual Net Profit |  |
Expected ROI | These fields display the expected return on investment, and when the campaign ends, the actual return on investment. The values are the percentage difference between the expected cost and expected sales. |
Actual ROI |  |
7. To view data associated with campaign objectives, you can view the Opportunities by Stage report located below the objectives section. For information about this report, click the **Options** drop-down menu and select **View Definition**.

8. Click **Save**.

### Add a Task to a Campaign

To manage other work related to a campaign, you can create and assign tasks to yourself and other staff members. You can then track the overall progress of those tasks by viewing their due date and completion percentage.

This section describes the options available for creating and assigning tasks.

1. Click **Tasks** on the Home tab.
   - The Tasks section opens on the content pane.
2. Enter field information.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tasks</td>
<td>Click this button to display a drop-down menu containing the following options.</td>
</tr>
<tr>
<td>Add New</td>
<td>Select this option to add a new task. See <em>Add a Task</em> for the procedure to complete the fields on this window.</td>
</tr>
<tr>
<td>Add Existing</td>
<td>Select this option to add an existing task. After finding and selecting a task, the task is added to the task list for the campaign. See <em>Search for a Task from an Open Record</em>.</td>
</tr>
<tr>

</tr>
<tr>
<td>Print</td>
<td>Click this button to print the selected task.</td>
</tr>
<tr>
<td>Copy</td>
<td>Click this button to copy the selected task.</td>
</tr>
<tr>
<td>Delete</td>
<td>Click this button to permanently delete the selected task.</td>
</tr>
<tr>
<td>Remove</td>
<td>Click this button to remove the selected task from the campaign (without deleting the task).</td>
</tr>
<tr>
<td>Complete</td>
<td>Click this button to mark the selected task completed.</td>
</tr>
<tr>
<td>Forward</td>
<td>Click this button to open the Task Forward window and send the task to specific recipients.</td>
</tr>
<tr>
<td>Options</td>
<td>Click this button to select an option for managing the output and display of information on the tab, such as print, forward, or export. See <em>How You Change Report Formatting</em> for information about other options, such as Auto Filter, Slice, Cross Tab, and Rollups.</td>
</tr>
</tbody>
</table>
Outreach provides several predefined templates as a starting point for creating your campaign flow diagram. When you choose a template, the elements and connectors associated with that template are added to your diagram.

You can add and remove elements to further customize your campaign. You then open each element to assign its attributes and configure it to meet your business needs.

1. From the Template group of the Insert tab, hover over each template button to see a preview on the content pane.
   A tooltip displays a description of the template.
   - **Ad Conversion**—This template updates a contact submitted through a web form to create a lead if the contact is interested in the promotion. See *Ad Conversion*.
   - **Email Promotion**—This template sends a broadcast email and actions are taken based on a contact’s level of interest. See *Email Promotion*.
   - **Event Registration**—This template sends an invitation to an event and uses a web form for registration. See *Event Registration*.
   - **Information Request**—This template is used to gather information about contacts through a questionnaire. See *Information Request*.
   - **Subscription Management**—This template allows contacts to update their subscription preferences. See *Subscription Management*.

2. Click a template button to add the template to the canvas.
   A message opens warning you that selecting a template overwrites the existing content on the canvas.

3. Click **OK**.
   The template is inserted in the diagram.

4. Double-click each element to edit its attributes.

5. Click **Save**.

**Related Topics**
- Create a Campaign Flow Diagram

**Ad Conversion**
The Ad Conversion template uses a web form to determine if a contact is interested in a promotion or product. Based on the web form, the contact record is either updated to set a field, or the contact is converted to a sales lead.
### Component | Description
---|---
Conversion Form | This Serve Web Page element starts the campaign. Double-click the element to select or create a document that uses a web form to determine customer interest.
Interested? | This conditional element determines which path contacts should follow based on their interest. Double-click the element to choose a contact field to base the decision on.
Lead | This element creates a lead from the contact record for contacts who are interested. Double-click the element to set fields associated with the lead.
Update Contact | This element updates the contact record if the customer is not interested. Double-click the element to choose which contact field to update.

### Email Promotion
The Email Promotion template sends a broadcast email and actions are taken based on a contact's level of interest in the promotion. The broadcast email sends a link to a web form.

Based on two levels of interest (ready to buy and interested), the customer is either sent to the purchase page, added as a lead to Opportunity Tracking, or added to a contact list and sent a follow-up email.

### Component | Description
---|---
Promotion | This element sends a broadcast mailing to contacts inviting them to click through to the conversion form. Double-click the element to select or create a mailing that links to the conversion form.
Conversion Form | This element serves a document as a web page. Double-click the element to select or create a document that uses a web form to determine customer interest.
Ready to Buy? | This conditional element determines the path contacts should follow based on whether they are ready to buy the product. Double-click the element to choose a contact field to base the decision on.
E-Commerce | This element serves a document as a web page to contacts who are ready to buy. Double-click the element to select or create a document as a sales form.
Interested? | This conditional element determines the path contacts should follow based on interest. Double-click the element to choose a contact field to base the decision on.
Lead | This element creates a lead from the contact record for contacts who are interested. Double-click the element to set fields associated with the lead.
List | This element adds contacts who are not interested to a contact list. Double-click the element to select or create the list you want to add the contacts to.
Follow-Up | This element sends a transactional mailing to contacts who are not interested as a follow-up. Double-click the element to select or create a mailing and decide when to send it and how to filter it.
Event Registration

The Event Registration template sends an invitation to an event and uses a web form for registration.

When contacts register, they are added to a list and receive emails to thank them, confirm their registration, and remind them of the event. Contacts who do not register are sent a thank you email and an email to follow up.

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invitation</td>
<td>This element sends a broadcast mailing to contacts inviting them to click through to the registration form. Double-click the element to select or create a mailing that links to the registration form.</td>
</tr>
<tr>
<td>Registration Form</td>
<td>This element serves a document as a web page. Double-click the element to select or create a document that uses a web form to register contacts for an event.</td>
</tr>
<tr>
<td>Registered?</td>
<td>This conditional element determines which path contacts should follow based on whether they registered for the event. Double-click the element to choose a contact field to base the decision on.</td>
</tr>
<tr>
<td>Thank You (Yes path)</td>
<td>This element serves a document as a web page to contacts who registered for the event. Double-click the element to select or create a document as a thank-you page.</td>
</tr>
<tr>
<td>Attendee List</td>
<td>This element adds contacts who registered for the event to a contact list. Double-click the element to select or create the list you want to add the contacts to.</td>
</tr>
<tr>
<td>Confirmation</td>
<td>This element sends a transactional mailing to contacts to confirm their registration. Double-click the element to select or create a mailing as a confirmation.</td>
</tr>
<tr>
<td>Reminder</td>
<td>This element sends a transactional mailing to contacts who registered to remind them of the event. Double-click the element to select or create a mailing as a reminder and decide when to send it.</td>
</tr>
<tr>
<td>Thank You (No path)</td>
<td>This element serves a document as a web page to contacts who did not register for the event. Double-click the element to select or create a document as a thank-you page.</td>
</tr>
<tr>
<td>Follow-Up</td>
<td>This element sends a transactional mailing to contacts who did not register as a follow-up. Double-click the element to select or create a mailing and decide when to send it and how to filter it.</td>
</tr>
</tbody>
</table>

Information Request

The Information Request template is used to gather information about contacts through a questionnaire. Contacts are sent a broadcast mailing inviting them to fill out a web form. After submitting the web form, contacts are redirected to a thank you page and then sent a follow-up email.

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect</td>
<td>This element sends a broadcast mailing to contacts inviting them to fill out the web form. Double-click the element to select or create a mailing that links to the questionnaire.</td>
</tr>
</tbody>
</table>
### Subscription Management

The Subscription Management template lets contacts update their subscription preferences. Contacts can update their information through a web form. After submitting the web form, they are redirected to a web page that confirms their submission and then sent a transactional mailing as additional confirmation.

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subscription Form</td>
<td>This element serves a document as a web page. Double-click the element to select or create a document that uses a web form to gather contact information.</td>
</tr>
<tr>
<td>Confirmation (Serve Web Page)</td>
<td>This element serves a document as a web page to contacts who submitted the subscription form. Double-click the element to select or create a document as a confirmation page.</td>
</tr>
<tr>
<td>Confirmation (Transactional Mailing)</td>
<td>This element sends a transactional mailing to contacts who submitted the subscription form. Double-click the element to select or create a mailing and decide when to send it and how to filter it.</td>
</tr>
</tbody>
</table>

**Note:** In addition to using predefined campaign templates, you can reuse flow diagrams from previously created campaigns. See *Choose an Existing Design*. 

### Customize Outreach and Feedback Configuration Settings

Outreach provides many options that can be enabled by editing configuration settings. These settings are used to set cookie expiration times, define default values for Serve Web Page element properties, and specify whether documents can be edited after having been sent in a mailing.

You can also define the subject line of Forward to Friend emails and specify a default URL to load in cases where a blank page would display.

1. Expand **Site Configuration**, and then double-click **Configuration Settings**. The **Search** window opens, where you can filter your search results.
2. Clear the **Select All** check box under **Folders** and then select **Outreach and Feedback**.
3. To search for a specific configuration setting in the Outreach and Feedback folder, enter the setting name in the **Key** field. (The Key field is not case sensitive.)
You can search part of a configuration setting name by appending a wildcard (either an asterisk or a percentage sign) to the end of your search term.

4. Click Search.

   The Configuration Settings editor displays the settings that match your search criteria. To display configuration settings in alphabetical order, click in the Key column header.

5. Expand the folders under Outreach and Feedback/General.

6. Customize the settings in the specific Campaigns and Miscellaneous folders.

   For information about a setting, see the description that appears on the Configuration Settings editor. For complete details about the Configuration Settings editor, including searching, editing, and creating new configuration settings, see Edit a Configuration Setting.

Feedback Questions

Overview of Questions

Before you create surveys in Feedback, you must first create the questions that your respondents will answer. You can choose different question types to gather responses of different qualities, and you can customize display characteristics of each question.

For example, you can provide space for your respondents to enter their answers in their own words, returning data that is often specific and insightful. Alternatively, you can offer respondents a choice of prewritten answers to a question, which provides you with a consistent, easily interpreted data set. You can also score choice questions and use Analytics to evaluate responses as numerical values.

While some types of question may be more useful than others based on your needs, any combination of question types can be added to a survey. By presenting questions that are concise and meaningful, you can ensure that the feedback you receive will be clear and actionable.

Related Topics

• Best Practices for Writing Effective Questions

Best Practices for Writing Effective Questions

When writing a question, it is important to respect your respondents’ time and be clear about the information you are requesting. The following best practices can help you optimize survey completion rates while obtaining the most meaningful respondent feedback.

• Adopt an engaging tone—Speak respectfully to respondents. The more welcoming your language, the more likely your audience is to complete each question.

• Use common words—Choose your words carefully. To ensure comprehension and accuracy, it is best to assume that your respondents are not familiar with industry jargon and complex terminology. (One effective rule of thumb is to write for a sixth-grade reading level.)
• **Keep questions specific and short**—State each question in a way that is meaningful to your respondents and your analysis. Rephrase questions that are vague or verbose. When creating a choice question, clearly define its lowest and highest values. For example, on a scale of 1 to 5, what 1 means and what 5 means.

• **Understand the goal of each question**—Refine your questions to provoke the answers most meaningful to your analysis. A well-framed question increases the significance of your data.

• **Limit the number of questions**—Include only questions that are essential to your goal. If two questions would return similar answers, combine them to eliminate the redundancy. If you must include several questions that are similar in form and content, consider creating a *matrix question* to save space. When creating choice and matrix questions, keep the number of answer selections to a minimum while still accommodating all possible answers.

• **Spell check your questions**—Remember to spell check your questions using the Spelling option available on the ribbon.

### How Questions Work

Feedback provides a flexible set of features for creating questions to add to your surveys.

When you create a survey question, you define the question name, type, and text that respondents see on the surveys. You can also assign a *score* to each question choice. There are three question types.

- **Create a Text Question**
- **Create a Choice Question**
- **Create a Matrix Question**

**Note:** Questions can be edited after they have been created, even if they have been used in a survey. However, if you edit the question text or choices, those changes appear immediately in any survey it has been included in. For this reason, if you want to preserve the integrity of the data returned by the original question, we recommend creating a new question rather than editing the existing question.

### Create a Text Question

Text questions let respondents enter their answer to the question.

You can create text questions when you want your respondents to be able to answer in their own words without having to choose from predefined options. For example, “Do you have any suggestions?” When you create a text question, you define only the question and the available space the respondent has to answer.

1. From the Questions explorer, click **New**.
   A new question opens on the content pane.
   **Tip:** You can also create questions from an open question by clicking New. Additionally, if your navigation set is configured to add questions from the file menu, click **File > Surveys > Question**. See Configure the File Menu.

2. Enter the text of the question in the **Question Text** field. This will be the question you want the respondent to answer. For example, “How can we improve our service?”
3. Select **Text** from the **Question Type** drop-down menu.
4. Enter field information.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</tbody>
</table>
Create a Choice Question

Creating choice questions let you define the available responses for the question, allowing respondents to choose their answer from a menu, radio button, check box, or list. Choice questions may be scored and evaluated in Analytics.

1. From the Questions explorer, click New.

A new question opens on the content pane.

**Tip:** You can also create questions from an open question by clicking the New button. Additionally, if your navigation set is configured to add questions from the file menu, click File > Surveys > Question. See Configure the File Menu.

2. Enter the text of the question in the Question Text field. This will be the question you want the respondent to answer. For example, “Which of the following products did you purchase?”

3. Select Choice from the Question Type drop-down menu.

Choice is the default question type.

4. Click the Display As menu and select one of the following question display types:
   - **Radio**—The choices appear as options following the question. Respondents can select only one of the predefined choices to answer the question.
   - **Checkbox**—The choices appear as check boxes. Respondents can select as many check boxes as you define.
   - **Menu**—The choices appear in a drop-down menu. Respondents click the drop-down menu to select one of the predefined choices to answer the question. Menu is the default for Choice questions.
   - **List**—The choices appear in a list. Respondents can select as many list items as you define to answer the question.

</table>

6. Click **Display Options** on the ribbon to define HTML properties for the question and answer. The **Display Options** window opens.

7. Enter field information.

8. Click **OK**.

9. To preview the question before saving it, click **Preview Question** on the ribbon. The **Question Preview** window opens.
a. Click OK.

10. To spell check your question, click Spelling.

11. Click Save.

The Save As window opens where you can select the folder you want to save the question in and enter the name of the question in the Name field.

12. Click Save.

Create a Matrix Question

In cases where a series of questions can be responded to with the same set of answer choices, matrix questions can help streamline survey appearance by grouping the questions together in a table.

Answer choices are displayed using either radio buttons (to permit only one answer to each question) or check boxes (to allow more than one answer). If you choose radio buttons, you can restrict selections to one choice per row, forcing respondents to rank their answers.

1. From the Questions explorer, click New.

A new question opens on the content pane.

Tip: You can also create questions from an open question by clicking the New button. Additionally, if your navigation set is configured to add questions from the file menu, click File > Surveys > Question. See Configure the File Menu.

2. Select Matrix from the Question Type drop-down menu.

3. Enter the introductory text for the matrix in the Introduction Text field.

   This text summarizes the group of questions in the matrix. For example, “Please rank your service experience in the following areas.”

4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display As</td>
<td>Click this drop-down menu to select how answer choices are displayed. Options include Radio or Checkbox. Radio is the default. The question display type affects which fields display in the Matrix section.</td>

</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remove</td>
<td>Click this button to remove the choice.</td>
</tr>
<tr>
<td></td>
<td>![up_down_arrows] Click the up or down arrow to move the selected choice one position higher or lower in the list.</td>
</tr>
<tr>
<td>Randomize Rows</td>
<td>Select this check box to display the questions in the matrix in a random order. If the check box is not selected, the questions display in the order in which they are listed in the list of questions.</td>
</tr>
</tbody>
</table>
| Forced Ranking         | Select this check box with radio button choices to restrict survey respondents to select only one choice per column. This option is useful when designing a matrix containing rows of items that you want your respondents to rank. Since matrix questions with radio buttons allow only one choice to be selected per row, the additional restriction on columns forces respondents to rank their answers.  
**Note:** When Forced Ranking is selected, the matrix must contain the same number of rows (questions) as it does columns (choices). |

5. Click the **Display Options** button on the ribbon to define HTML properties for the question and answer. The **Display Options** window opens.

6. Enter field information:

<table>
<thead>
<tr>

10. Click **Save**.
    The Save As window opens where you can select the folder you want to save the question in and enter the name of the question in the **Name** field.

11. Click **Save**.

### Best Practices for Using Matrix Questions in Mobile Surveys

When matrix questions display on small mobile devices (400 pixels wide or less), questions and choices automatically reflow to display vertically. Larger mobile devices, such as tablets (or when small devices are viewed in landscape mode), are wide enough to display matrix questions horizontally, as they display on a desktop.

Instead of using matrix questions in your mobile surveys, consider adding a case section with conditional content using runtime variables to the HTML content of your questionnaire. This way, you can show different content for mobile devices from what you show for desktop mode. See *How You Customize Surveys for Use on Mobile Devices*.

Here is an example of how you could use a case section with conditional content for both variables to hide a matrix question that wouldn’t be effective when viewed on a small mobile device.

![Legend for image: 1. Choice style question displays for mobile 2. Matrix style question displays for desktop](image)

You could accomplish the same effect by adding a conditional section for each variable. Either way, the important takeaway is to create content for both variables on a single page. Otherwise, the variable for which no content is defined will display a blank page.

**Tip:** Remember to test and preview your survey in both mobile and desktop modes and on applicable mobile devices and browsers to ensure your conditional sections work the way you intend them to.
Feedback Surveys

Overview of Surveys

Feedback contains flexible tools for creating custom surveys in a variety of formats. Surveys can be sent as mailings, served as web pages, or sent as events triggered by a campaign or business rule.

After you have defined the questions you want to ask, you can easily present them to your audience in surveys. With a wide range of formatting and customization options, including survey reminders, market testing, and full analytics integration for tracking results, surveys provide you with a powerful channel for inviting, gathering, and analyzing customer feedback.

Create a Survey

You can create four types of surveys, distinguished by invitation method. Although available features vary by invitation method, every survey is presented through a web page and can be linked to from outside of B2C Service.

- **Broadcast surveys** are used to send broadcast invitations to specified audiences at a time you choose.
- **Transactional surveys** send invitations triggered by events that you define, such as an incident resolution or a campaign action.
- **Website link surveys** rely on separate invitation delivery mechanisms, such as a link to the survey placed on a web page.
- Polling surveys display as a single question on a customer portal page or any page that is external to the customer portal, such as a “Poll of the Day.” After customers submit their response, they see a poll results chart or a thank-you message.

With the exception of polling surveys, surveys can be added to workspaces, letting your agents complete surveys by proxy (on behalf of contacts) during telephone interactions. See Proxy Surveys. Whatever methods you choose for delivering surveys, the basic steps for creating them are the same.

**Tip:** Keep in mind that if you want to use survey reminders, it is best to add them as a part of your initial survey creation process because reminders are scheduled based on when the initial survey is sent. The survey type (broadcast or transactional) also plays a role. For these reasons, we recommend implementing survey reminders into your strategy from the start. See Add a Survey Reminder.
The following procedure assumes that you access the Surveys explorer from the Surveys navigation list. However, this explorer might reside in another navigation list.

1. Click Surveys on the navigation pane and double-click Surveys Explorer.
2. Click New.
   
   A new survey opens on the content pane.

   **Tip:** You can also create surveys from an open survey by clicking New. Additionally, if your navigation set is configured to add surveys from the file menu, click File > Surveys > Survey.

3. To create a broadcast survey, click Broadcast Survey and see Create a Broadcast Survey.
4. To create a transactional survey, click Transactional Survey and see Create a Transactional Survey.
5. To create a website link survey, click Website Link and see Create a Website Link Survey.
6. To create a polling survey, click Polling Survey and see Create a Polling Survey.
7. Click Save.
   
   The Save As window opens where you can select the folder you want to save the survey in and enter the name of the survey in the Name field.
8. Click Save.

### Survey Delivery Statuses

Your broadcast and transactional surveys must follow certain steps that are defined by the survey delivery status. Delivery status indicates the current state of the survey as it progresses through the distribution process.

This table describes the delivery statuses for broadcast and transactional surveys and indicates whether the status is set by a staff member action or updated automatically by the system.

<table>
<thead>
<tr>
<th>Status</th>
<th>Survey Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>Broadcast</td>
<td>This is the preliminary status of a survey. When a survey is created, it is automatically set to the Draft status. The status reverts to Draft if a staff member unschedules a survey.</td>
</tr>
<tr>
<td></td>
<td>Transactional</td>
<td></td>
</tr>
<tr>
<td>Scheduled</td>
<td>Broadcast</td>
<td>This status indicates a survey is ready to be sent at the scheduled send date and time. When a staff member selects the send time, the survey is automatically set to the Scheduled status.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Launched</td>
<td>Transactional</td>
<td>This status indicates a survey has been launched and can be included in a rule or campaign. Staff members launch a survey by clicking Launch on the Delivery tab.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> By default, a launched survey can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, suspend the survey invitation message, make edits, and then re-launch it. See Launch a Transactional Survey.</td>
</tr>
<tr>
<td>Recurrence Scheduled</td>
<td>Broadcast</td>
<td>This status indicates a survey is scheduled for recurring runs. When a staff member selects a recurrence pattern, the survey is automatically set to the Recurrence Scheduled status.</td>
</tr>
</tbody>
</table>
### Status

<table>
<thead>
<tr>
<th>Status</th>
<th>Survey Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preparing to Send</td>
<td>Broadcast</td>
<td>This status indicates a survey is about to be sent. The status changes to Preparing to Send when a staff member clicks Send Now.</td>
</tr>
<tr>
<td>Sending</td>
<td>Broadcast</td>
<td>This status indicates a survey is currently being sent to customers. The system automatically sets the survey status to Sending after the survey is done preparing to send or at the date and time the survey is scheduled to send.</td>
</tr>
<tr>
<td>Suspended</td>
<td>Broadcast</td>
<td>This status indicates a survey is temporarily suspended from the Sending or Scheduled status. Staff members can change the status to Suspended by clicking Suspend on the Delivery tab.</td>
</tr>
<tr>
<td>Suspended by Error</td>
<td>Broadcast</td>
<td>This status indicates a survey encountered an error and was suspended by the system.</td>
</tr>
<tr>
<td>Expired</td>
<td>Broadcast</td>
<td>This status indicates a survey has expired. Surveys can be set to expire based on date or maximum number of responses. After the first expiration criterion is met, the status is set to Expired and cannot be changed. See <a href="#">Survey Expiration Settings</a>.</td>
</tr>
<tr>
<td>Canceled</td>
<td>Broadcast</td>
<td>This status indicates a survey was manually canceled. Staff members can cancel a survey by clicking Cancel Invitation Message on the Delivery tab.</td>
</tr>
<tr>
<td>Completed</td>
<td>Broadcast</td>
<td>This status indicates a survey was sent. The system automatically sets a survey status to Completed from the Sending status.</td>
</tr>
</tbody>
</table>

**Note:** By default, a canceled survey can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, copy a canceled survey, and then modify and send the copied survey. See [Cancel a Broadcast Survey Invitation Message](#) and [Cancel a Transactional Survey Invitation Message](#).

### Survey Management

When creating or editing a survey, the Summary tab provides a variety of survey management functions.

Most of these functions vary depending on the survey invitation method, but some can be used on any survey, including the following.

- **Changing the survey invitation method**—After you create a survey, you can change its invitation method type. The invitation methods available are Broadcast, Transactional, Website Link, and Polling Survey. Broadcast surveys with an active recurrence are labeled Recurring Broadcast Survey.
• **Deactivating an active survey**—When you change the survey status to Inactive, customers cannot submit responses to the survey and receive a warning message when attempting to access the survey URL.

• **Setting survey expiration**—Customizing the availability of your surveys makes the feedback you receive from your customers more timely and actionable, and therefore, more meaningful for your organization.

• **Adding notes**—You may want to add notes to a survey that are not sent to audience members. You can use notes to provide additional information about the survey that can be viewed by staff members as they are working with the survey.

• **Adding tasks**—You can assign new or existing tasks to surveys and edit, delete, and forward tasks to other staff members. You can also view each task associated with the survey.

Other common functions available from the Summary tab include the ability to add file attachments or view the audit log to see when the surveys and broadcast survey reminders were created and edited and when delivery statuses changed.

### Change the Invitation Method of a Survey
Survey invitation methods include broadcast, transactional, website link, and polling. After you create a survey, you can change its invitation method type.

1. On the Summary tab of an open survey, click **Change** next to Invitation Method. The *Select Invitation Method* window opens.

   **Note:** You can switch invitation methods only when the delivery status of the message is Draft and no rules or campaigns reference the survey. See *Survey Delivery Statuses*.

2. Select **Broadcast Survey**, **Transactional Survey**, **Website Link**, or **Polling Survey**.

3. Click **OK**.

   The survey invitation method changes to the type you select.

### Deactivate a Survey
When you change the survey status to Inactive, customers cannot submit responses to the survey and receive a warning message when attempting to access the survey URL.

1. On the Summary tab of an open survey, click **Deactivate** next to Survey Status. The *Disable Survey* window opens.

2. Click **Yes** to confirm you want to deactivate the survey.

3. To reactivate the survey, click **Activate**. The *Activate Survey* window opens.

4. Click **Yes** to confirm you want to activate the survey.

   The survey status changes to Active.

### Add a Note to a Document, Mailing, or Survey
You can use notes to provide additional information about the content that can be viewed by staff members as they are working with the document, mailing or survey.

1. On the Summary tab of an open document, mailing, or survey, click the **Notes** tab.

2. Click **Add**.

3. Enter the note text in the text field.

4. To sort the notes by ascending or descending date, click the **Sort** drop-down menu and select the sort option.

5. To edit an existing note, click **Edit** next to the note.

6. To permanently delete a note, click **Delete** next to the note.
Add a Task to a Survey

You can assign new or existing tasks to surveys and edit, delete, and forward tasks to other staff members. You can also view each task associated with the survey.

1. On the Summary tab of an open survey, click the Tasks tab.
2. Enter field information.

<table>

</table>
Survey Expiration Settings

Because many surveys are needed for only a limited period of time, you can set an absolute date and time when a survey automatically expires. In addition to an absolute expiration date, broadcast and transactional surveys can be set to expire relative to the date you send the invitation message.

Relative expiration can help you capture feedback in a relevant time frame so that you can make decisions based on your insight. Say you create a recurring survey that filters every day for new customers to gather feedback about why your organization was selected. Also, you want to receive this feedback within 30 days. Since the survey is triggered daily, setting a relative expiration date instead of an absolute date keeps the survey active for all new customers, but also sets an expiration date relative to the contact it is sent to. See Add or Edit a Recurring Broadcast Survey Schedule.

You can also set survey expiration based on the maximum number of survey responses you have received. For instance, suppose you want to offer your customers an incentive for their feedback. You could offer a coupon to the first 1,000 responses you receive. This option is available for all survey types, including survey by proxy.

In addition, you can customize the expiration message, per survey, that recipients receive if they try to take an expired survey. This helps ensure your recipients know the right course of action to take when an expiration message displays.

**Note:** After the first expiration criterion is met, the survey status is set to Expired and the status cannot be changed. Therefore, if you want to make changes to your expiration criteria, you must do it before the first criterion is met.

### Set an Absolute Expiration Date

Automatic survey expiration is useful when a survey is needed for a limited period of time.

If you set both an absolute expiration date and a relative expiration date, the criteria that is met first triggers the survey to expire. For a scenario illustrating when it can be useful to set both, see the example at the end of this procedure.

1. On the Summary tab of an open survey, click **Edit** next to Expiration Date or click the expiration date. The **Survey Expiration** window opens.
2. Select **Time to Expire Survey** and then type the date and time you want the survey to expire or click the calendar to select the date.
3. To expire a survey at the current date and time, click the calendar and then click **Today – [Date]**.
4. To cancel an existing survey expiration date, click the calendar and then click **No Value**.
5. Click **OK**.

The Expiration Date field displays the time and date the survey is scheduled to expire.

In rare cases, you may want to set both an absolute and a relative expiration date. Suppose you set an absolute expiration for the last day of the year, but your survey is either transactional or recurring. In other words, either an event triggers the survey to send or it is scheduled to send daily. You also want your survey to expire 30 days from the send date. By setting both an absolute and a relative expiration, you ensure that you get your response within the 30-day time frame or before the end of the year.

### Set a Relative Expiration Date

Broadcast and transactional surveys can be set to expire relative to the date you send the invitation message.
If you set both an absolute expiration date and a relative expiration date, the criteria that is met first triggers the survey to expire. For a scenario illustrating when it would be useful to set both, see the example at the end of the procedure Set an Absolute Expiration Date.

1. On the Summary tab of an open survey, click Edit next to Expiration Date.
   The Survey Expiration window opens.

2. Select Relative Expiration and then type the number of days you want to set the survey to expire after you send the invitation message. The maximum number of days you can set a survey to expire is 365.

3. Click OK.
   The window closes and the Expiration Date field on the Summary tab displays the number of days after you send the invitation message that the survey is scheduled to expire.

   • If a contact is past the first page of a survey and the survey expires, the survey will be accepted (as long as the contact finishes the survey in that session). This means there is a chance that responses will be logged after the expiration date.

   • For recurring surveys, only an absolute expiration date will expire an entire survey because relative expiration applies only to the contact the survey is sent to. See Add or Edit a Recurring Broadcast Survey Schedule.

Set Expiration Based on Maximum Number of Responses
You can set survey expiration based on the maximum number of survey responses you have received. This option is available for all survey types, including survey by proxy.

If you set both an absolute expiration date and a relative expiration date, the criteria that is met first triggers the survey to expire. For a scenario illustrating when it would be useful to set both, see the example at the end of the procedure Set an Absolute Expiration Date.

1. On the Summary tab of an open survey, click Edit next to Expiration Max Responses.
   The Maximum Responses window opens.

2. Select Limit Responses and enter the maximum number of responses you want to allow.
   The maximum number of survey responses you can define is one million.

3. Click OK.
   The window closes and the Expiration Max Responses field on the Summary tab displays the maximum number of responses defined, the number of responses received, and the number of responses that are still allowed.

4. To update the number of received and remaining responses that display on the Summary tab, click Refresh on the ribbon.

   A response is counted as soon as the answer to the first question is submitted.

Customize the Expiration Message
To help ensure your recipients know the right course of action to take when an expiration message displays, you can customize the expiration message, per survey, that recipients receive if they try to take an expired survey.

1. On the Summary tab of an open survey, click Edit next to Expiration Message.
   The Survey Expiration Message window opens.

2. Enter the message you want recipients to see if they try to take an expired survey in the Expiration Message text box. You can use HTML tags in this text box.

   Note: If you do not define your own survey expiration message, the system default message is used.

3. Click OK.
Survey Reminders

Reminders prompt your audience to take the survey if they have forgotten about it or to finish it if they have already started but have not yet submitted it. This increases your participation rates and, ultimately, gives you more data about your customer experiences.

We recommend implementing survey reminders into your strategy from the start. For detailed information about how to make survey reminders effective, see Best Practices for Creating Effective Survey Reminders.

For broadcast and transactional surveys, you can add up to four automatic reminder messages to create a sense of urgency for customers to complete surveys within a time frame you specify.

The audience for survey reminders can include recipients who have not started the survey, recipients who have started but have not completed the survey, or both. When a reminder is sent to a customer who has started the survey, the survey page that the customer was on is the page that opens (as long as cookies are enabled on the customer’s computer) when the customer comes back to finish the survey.

You can also exclude segments of your audience from your reminders. For example, suppose you have a customer who unsubscribed from your list since the initial invitation message was sent. You could create a segment that uses a custom opt-out field in the filter criteria and then exclude that segment from your audience. See Create a Segment.

- Survey reminders apply global opt-in and external suppression list options to your reminder audience if those options are selected on the Audience tab of your survey. However, even if recency and frequency of communication options are selected for the initial audience, they are not applied to the reminder audience because the scheduling and frequency options you define for each reminder take precedence over any recency and frequency options that may be selected for the initial survey audience.
- The system is designed to prevent duplicates by allowing only one reminder to be sent to the same audience on the same day.

While there are two standard reports that apply to survey reminders (Survey Reminder Statistics and Broadcast Response Timeline), you can use the audit log to track your broadcast survey reminders without needing to run a report. When reminders are sent for broadcast surveys, a new row is added to the audit log, which is available on the survey Summary tab.

**Tip:** Survey reminders can be scheduled to send between 1 and 365 days after your initial invitation message is sent. Since it takes at least one day before your first reminder can be sent, be sure to take this time factor into account when creating survey reminders.

Add a Survey Reminder

Survey reminders increase your participation rates and, ultimately, give you more data about your customer experiences. You can add up to four automatic reminder messages to broadcast and transactional surveys, creating a sense of urgency for customers to complete surveys within a time frame you specify.

Keep in mind that after a reminder is sent, you cannot edit, proof, or delete that reminder. However, for transactional surveys, you can suspend the reminder, make edits, and then re-launch it. See Survey Delivery Statuses.

1. From an open survey, click the Reminders tab.

   You can send up to four reminder messages to your audience. From the toolbar, you can create a reminder, edit, delete, and send proofs of your reminders.
<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>This column displays the name of the survey reminder.</td>
</tr>
<tr>
<td>Subject</td>
<td>This column displays the email subject line for the message that is sent to your audience about the survey reminder.</td>
</tr>
<tr>
<td>Audience</td>
<td>This column displays the recipients who are included in the reminder message audience. Options available include the following:</td>
</tr>
<tr>
<td></td>
<td>Not Started—Sends the invitation message to recipients who have not submitted any pages of the survey.</td>
</tr>
<tr>
<td></td>
<td>In Progress—Sends the invitation message to recipients who have started but have not completed the survey.</td>
</tr>
<tr>
<td></td>
<td>By default, both options are selected.</td>
</tr>
<tr>
<td>Reminder Days</td>
<td>This column displays the number of days after the initial invitation message was sent that the reminder message will be sent.</td>
</tr>
<tr>
<td></td>
<td>The minimum value of this field is 1 day and the maximum value is 365 days.</td>
</tr>
<tr>
<td>Status</td>
<td>This column displays the delivery status of the reminder. See Survey Delivery Statuses.</td>
</tr>
<tr>
<td></td>
<td>This column is available only for broadcast survey reminders.</td>
</tr>
</tbody>
</table>

2. Click New on the toolbar to add your first reminder message.
   The **Survey Reminder** window opens.
3. Enter the name of the reminder message in the **Name** field.
   **Tip:** Be specific when naming your reminder messages to help keep track of the different reminders you create. For example, “1st reminder sent 7 days after invite.”
4. Enter the number of days after the initial invitation message is sent that the reminder message will be sent in the **Reminder Days** field.
   This value must be unique for each reminder that you add in order to prevent duplicates by allowing only one reminder to be sent to the same audience on the same day.
5. Enter the subject your audience will see in the **Subject** field.
6. To insert a merge field into the subject line of your reminder message, click the Merge Field icon (to the right of the Subject field) and select the merge field. For example, you could use the special field, Survey Expiration Date, to let your audience know when the survey expires. See Insert a Text Merge Field.
7. Define your message text and any other content or formatting options for your reminder using either the HTML editor or the Text editor on the Content tab. See How the HTML Editor Works and How You Create and Edit Text-Only Messages.
8. Click the **Audience** tab to define the audience for your reminder. By default, both the Not Started and the In Progress check boxes are selected in the Included section.
a. Clear the **Not Started** check box to send the reminder message only to recipients who have started the survey.
b. Clear the **In Progress** check box to send the reminder message only to recipients who have not started the survey.

9. To exclude a segment from the audience, click **Add Segment** in the Excluded section. The **Select Segment** window opens where you can select segments you want to exclude.

10. To edit a segment that is excluded from the reminder, click **Open** next to the segment name. See *Add Filters to a Segment*.

11. To remove a segment from the Excluded section, click **Remove** next to the segment name.

12. To count the number of contacts who will receive the reminder, click **Refresh** in the Count section.

   **Note:** The Count section is available only for broadcast surveys and data is available only after the survey reminder is sent.

13. Click **OK**.

   The new reminder is added to the Reminders tab.

14. To add another reminder, click **New** on the toolbar and repeat steps 3 to 13.

15. To open a reminder for editing, select the reminder and click **Open**.

16. To delete a reminder, select the reminder and click **Delete**.

17. To copy a message to create another reminder, select the message and click **Copy**. You can then open the copy and make your edits.

   A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a reminder message. Changes made to content in any of the copied reminder messages are not shared with the original reminder message or subsequent copies. See *Automatically Generated Folders*.

18. To send a proof of a reminder message, select the message and click **Send Proof**. See *Send a Proof*.

### Best Practices for Creating Effective Survey Reminders

To be most effective, survey reminders need to be a part of your initial survey creation process because reminders are scheduled based on when the initial survey is sent. The survey type (broadcast or transactional) also plays a role.

- For broadcast surveys (with the exception of recurring broadcast surveys), you cannot add reminders after the broadcast survey is sent.
- For transactional surveys, reminders will apply only to the invitation messages sent after the reminder has been added. For example, if you have a transactional survey that has been triggered to send by an external event and then you decide to add reminders, the reminders will start sending only after your next survey is triggered. For these reasons, we recommend implementing survey reminders into your strategy from the start.

Other best practices for using survey reminders include the following.

- **Add reminders quickly**—An efficient way to add more than one reminder is to simply copy your first reminder, and then open each new reminder to edit the Name, Reminder Days, and Subject fields, as well as any message text you may want to change.

- **Plan message delivery timing**—Since it takes at least one day before your first reminder can be sent, be sure to take this time factor into account when creating survey reminders.

- **Protect your reputation**—Even though you can add four survey reminders to each survey, be careful not to overwhelm your customers with too many reminders. For example, if you’ve sent a survey that expires in seven days, you probably don’t need to send four reminders. Seriously consider the appropriate number of reminders to send for your specific situation. Otherwise, you risk harming your reputation with your customers.

- **Track reminder success**—View the effectiveness of survey reminders using our standard reports. See *View Survey Results*. 

---

**ORACLE**
Survey Reminder Statistics—This report lets you see the total number of email messages that were sent, viewed, and clicked (opened) for both the initial invitation message as well as for all of the reminders. Being able to see both the viewed and clicked statistics lets you evaluate which reminder prompted the customer to open the survey. In other words, which one was most effective. This report also returns the number of emails that bounced.

Broadcast Response Timeline—This report lets you see trends by using a time line to show the peaks and valleys in your survey response numbers. Available only for broadcast survey reminders, responses received from the date the initial invitation message was sent through the date the survey was last submitted display on the report. It also shows both the number of survey invitations and the number of reminders sent. (This report is not available on the Results tab if the broadcast survey is a recurring survey or if it uses market testing.)

Mobile Surveys

Surveys are automatically optimized for readability and touchscreen compatibility making them user-friendly on mobile devices. Landing pages, including Thank You, Forward to Friend, and Unsubscribe, have also been optimized for mobile.

The system detects whether the survey is being taken on a mobile device or a standard web device, such as a desktop or laptop. When a mobile device is detected, the survey is optimized so that taking it from that device is easy. For example, text is larger so it is readable without needing to zoom into the page, and answer choices and buttons are easy to select with the touch of a finger.

Mobile optimization is enabled, by default, on the Survey Options window. See Set Survey Options.

Tip: Because different mobile devices and browsers display surveys in different ways, we recommend testing your surveys on applicable mobile devices and browsers before you launch them.

Preview Your Survey for Mobile

See the way your survey looks on a mobile device as well as a desktop or laptop.

1. From an open survey, click Mobile on the ribbon.
   The Mobile Preview window opens as it would display if viewed from a mobile device.
2. To see how the survey would look on a mobile device without mobile optimization applied, click Switch to Desktop Mode at the bottom of the Mobile Preview window.
3. Click OK.

How You Customize Surveys for Use on Mobile Devices

Case sections and conditional sections using runtime variables can be added to the HTML content of your survey questionnaire if you want to show different content for mobile devices from what you show for desktop mode.

For instance, you might want to use a smaller image at the top of your survey for mobile devices than the one you use for surveys viewed on desktops. In another situation, you could use a case section to hide a lengthy matrix question that might not be effective when viewed on a small mobile device.

This image shows the Conditional Section window with the Runtime Variable option selected.
When using conditional and case sections with runtime variables, it's important to remember the following:

- Mobile conditional sections are honored on a mobile device even if mobile optimization is disabled in your survey.
- When using desktop and mobile runtime variables, we recommend that you create content for both variables on one page. You can do this either with a conditional section for each variable, or by adding content that appears for both variables. Otherwise, the runtime variable for which no content is defined will display a blank page.
- If the mobile user selects the Switch to Desktop Mode link, available on the first survey page, all content that displays will be desktop content, even if a mobile device is being used. (Switch to Desktop Mode is available only on the first page of a survey.)
- Test and preview your survey in both mobile and desktop modes to ensure your conditional sections work the way you intend them to.

- Insert a Conditional Section

Best Practices for Mobile Surveys
Many factors need to be considered when designing surveys for use on mobile devices. Several of these factors are addressed in this topic.

If a survey uses a template, the template is not applied when the survey is viewed on a mobile device because most templates are not optimized for mobile. If you want to create an appropriately sized template to be used for mobile, you could add HTML content with a conditional section for mobile runtime that included a smaller image. See *How You Customize Surveys for Use on Mobile Devices*.

Mobile optimization automatically resizes fonts for a user-friendly mobile experience. Therefore, font size, even if you modify the default setting, is ignored on mobile devices when mobile optimization is enabled.

Keep in mind that certain fonts are not supported or consistently displayed on every mobile device. The list of widely supported fonts for most mobile devices includes the following.

- Arial
- Courier and Courier New
- Georgia (with the exception of Android)
- Helvetica
- Times and Times New Roman
• Trebuchet MS (with the exception of Android)
• Verdana

For basic surveys, class and style button properties are ignored on mobile devices when mobile optimization is enabled. However, you can modify button properties on advanced surveys by using a WebDAV client to access your Customer Portal file structure, and then opening the `/cp/customer/assets/feedback` folder to edit the `mobile.css` file. See [Overview of WebDAV](#) and [Customer Portal Folder Structure](#).

When using case and conditional sections with runtime variables, it’s important to remember the following:

• Mobile conditional sections work when a mobile device is detected even if mobile optimization is disabled on the survey.
• If the mobile user selects the Switch to Desktop Mode link, available on the first survey page, all content that displays will be desktop content, even if a mobile device is being used. (Switch to Desktop Mode is available only on the first page of the survey.)
• When using desktop and mobile runtime variables, we recommend that you create content for both variables on one page. You can do this either with a conditional section for each variable, or by adding content that appears for both variables. Otherwise, the runtime variable for which no content is defined will display a blank page.

Mobile preview is a limited, browser-based preview that gives you a general idea of how your survey might look on a smaller device when you are designing your survey from your desktop. With that in mind, always test your surveys on applicable mobile devices and browsers before you launch them. See [Preview Your Survey for Mobile](#).

Track mobile survey use by analyzing usage trends with our standard reports. In addition, the Mobile Survey Trends Dashboard displays all three mobile survey reports in one place for easy analysis. See [View Survey Results](#).

The three mobile survey reports (Mobile Survey Trend, Mobile Survey Browser Trend, and Mobile Survey Operating System Trend) and the dashboard are located in [Public Reports/Feedback/Survey Responses/Mobile Surveys](#). A fourth report (Standard Versus Mobile Survey Trend), which is not included on the dashboard, is also located in [Public Reports/Feedback/Survey Responses](#).

• **Mobile Survey Trend** shows the number of mobile surveys started and completed over time as well as the completion rate.
• **Mobile Survey Browser Trend** shows the number of mobile surveys submitted per browser over time.
• **Mobile Survey Operating System Trend** shows the number of mobile surveys submitted per operating system over time.
• **Standard Versus Mobile Survey Trend** shows the number of surveys taken on a mobile device versus surveys taken on a standard web device, such as a desktop. If no columns for mobile devices display on the report, either the survey was not enabled for mobile optimization or no mobile devices were used to take the survey.

Because different mobile devices and browsers display surveys in different ways, we recommend testing your surveys on applicable mobile devices and browsers before you launch them.

**Proxy Surveys**

Any broadcast, transactional, or website link survey can be added to a workspace, letting your agents complete surveys on behalf of contacts during telephone interactions. Surveys can be embedded in contact, organization, incident, or opportunity workspaces by inserting a Survey By Proxy control.
Together with the advanced mode features Feedback provides, proxy surveys can be used to initiate more complex processes, such as creating leads and tasks, setting contact field values, sending staff notifications, and triggering external events. This makes proxy surveys useful for meeting a variety of key business needs.

- An incident-based proxy survey can be used by customer support agents to invite feedback about how a support call was handled or assess interest in new service offerings.
- An organization-based or contact-based proxy survey can be used by marketing personnel to prequalify leads and opportunities for the sales team or add contacts to segments based on their explicitly confirmed interests.
- Opportunity-based proxy surveys can be used by sales reps to gather feedback about specific sales interactions or assess how well a product fits a given area of need.

Related Topics
- Add a Control to the Design Space

Create a Broadcast Survey

You can create a broadcast survey if you want to survey a group of contacts in your knowledge base.

You can create a broadcast survey if you want to survey a group of contacts in your knowledge base. Similar to mailings, broadcast surveys are sent at a certain time to an audience you define. A link to the survey is sent by email using your own content or a previously defined document. See Create a Document. Customers can then click the link to complete the survey.

**Note:** The delivery and participation rates of survey invitation emails can be impaired by factors beyond the scope of Feedback.

1. From the Surveys explorer, click **New**.
   A new survey opens on the content pane.
   **Tip:** You can also create surveys from an open survey by clicking New. Additionally, if your navigation set is configured to add surveys from the file menu, click **File > Surveys > Survey**.

2. Click **Broadcast Survey**.
   By default, the Summary tab is active. From here, you can review general information about the survey in the At a Glance section, as well as manage survey notes, tasks, and attachments (see Survey Management). As you create the survey, you move through each tab to complete the survey elements.

3. To assign the survey to another staff member (by default, the survey is assigned to the staff member who creates it), click the **Assigned** drop-down menu and select the staff member.
   a. To search for a staff member, enter the staff member’s name in the **Find** field.
   **Tip:** Wildcards are supported when searching staff members. You can search strings that include a space by entering %+Space+character, which is helpful when searching last names. For example, typing %+Space+b returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing b in the Find field returns all items containing the letter b.

4. To let customers answer the survey anonymously, select the **Allow Anonymous** check box.
   Contact information is not required to answer the survey.
   Selecting Allow Anonymous in your survey does not mean that all responses are anonymous. If a survey invitation is sent to a contact or an B2C Service cookie is detected on the contact’s computer, or the survey
itself contains an email address field, Feedback attempts to use that information to identify the contact. For information about using cookies to identify contacts, see Set Survey Options.

5. To let customers submit the survey more than once, select the Allow Multiple Submissions check box. The Allow Multiple Submissions option is not visible for recurring surveys, which always allow multiple submissions. However, recurring surveys can be configured to exclude contacts from the audience that were included in a previous instance of the recurrence. See Add or Edit a Recurring Broadcast Survey Schedule.

6. Click the text in the At a Glance section to perform common survey functions.

<table>

</table>
Field | Description
---|---
Proofing | This field displays the number of proofs that have been sent, approved, and rejected. Click Send Proof Message to send a proof. See Send a Proof.
Delivery Status | This field displays the delivery status of the survey and the number of emails sent and delivered. See Survey Delivery Statuses.

7. Click the **Questionnaire** tab to add questions and HTML content to the survey. See *Create a Questionnaire in Basic Mode* and *Create a Questionnaire in Advanced Mode*.

8. Click the **Audience** tab to define an audience for the survey. See *Define the Broadcast Survey Audience*.

9. Click the **Invitation Message** tab to create the message sent to the survey audience. See *Create an Invitation Message in Broadcast Surveys*.

10. Click the **Reminders** tab to create automatic email messages that will prompt your customers either to start taking the survey or to finish it if they have already started. See *Survey Reminders*.

11. Click the **Proofing** tab to send a proof of the email for internal review before sending it to the entire audience.

12. Click the **Delivery** tab to select delivery options. See *Access Broadcast Survey Delivery Options*.

13. To view the reports associated with the survey, click the **Results** tab. See *View Survey Results*.

14. To preview the survey as it would be viewed on a standard web device, such as a desktop or a laptop, click **Standard** on the ribbon.

   The survey preview opens in a web browser.

   **Note:** If a survey contains an email address field and you submit a value for the field in the survey preview, the form creates or updates contact records so that advanced survey functions can be tested. For this reason, be sure to use only test contact addresses to avoid updating production contacts when testing survey previews. Also, be careful not to use the preview survey URL in place of the URL of your completed survey (described in step 16). Information submitted on a preview survey is discarded and has no effect on the data collected by the live survey. For identification purposes, each preview survey displays a watermark to ensure it is not confused with a live survey.

15. To preview the survey as it would be viewed from a mobile device, click **Mobile** on the ribbon. See *Mobile Surveys*.

   Mobile preview is a limited, browser-based preview that gives you a general idea of how your survey might look on a smaller device when you are designing your survey from your desktop. With that in mind, always test your surveys on applicable mobile devices and browsers before you launch them.

16. To copy the URL of the survey to your clipboard, click **Survey URL** on the ribbon. The **Survey URL** message opens.

   a. Click **OK** when you are finished viewing the URL.

   A URL is automatically assigned to the survey. This is the URL that your invitation message links to and your customers visit to complete the survey. From this window, you can view the URL and it is automatically copied to your workstation clipboard.

17. Click **Save**.

- Configure the File Menu
Define the Broadcast Survey Audience

Your survey audience can include and exclude a total of fifty contact lists and segments, each containing a vast number of contacts.

For example, you could include twenty-two segments of contacts and exclude twenty-eight contact lists for a total of fifty lists. You can also restrict the scope of your audience, set survey frequency and recency limits, and specify how to handle global opt-in and suppression options. See Overview of Audiences for complete details and procedures about using contact lists and segments in surveys and mailings.

1. From an open survey, click the Audience tab.
2. To include a list in the audience, click Add Contact List in the Included section. The Select Contact List window opens.
   a. To add a contact list, click New Contact List and see Add a Contact List.
   b. Select the list you want to include in the survey audience and click OK.
      The list is added to the Included grid. Contacts belonging to the list receive the survey.
3. To include a segment in the audience, click Add Segment in the Included section. The Select Segment window opens.
   a. To add a segment, click New Segment and see Create a Segment.
   b. Select the segment you want to include in the survey audience and click OK.
      The list is added to the Included grid. Contacts belonging to the list receive the survey.
4. To exclude a list from the audience, click Add Contact List in the Excluded section. The Select Contact List window opens.
   a. Select the list you want to exclude from the survey audience and click OK.
      The list is added to the Excluded grid. Contacts belonging to the list do not receive the survey.
5. To exclude a segment from the audience, click Add Segment in the Excluded section. The Select Segment window opens.
   a. Select the segment you want to exclude from the survey audience and click OK.
      The segment is added to the Excluded grid. Contacts belonging to the segment do not receive the survey.
6. To edit a list or segment that is included in or excluded from the survey, click Open next to the list or segment name. See How Contact Lists Work and How Segment Filters Work.
7. To remove a list or segment from the Included or Excluded sections, click Remove next to the list or segment name.
8. Enter field information about communication options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Honor global opt-in</td>
<td>Select this check box to send the survey to contacts who did not explicitly opt out of receiving surveys or mailings. Clear this check box to send the survey to all contacts in the audience, regardless of their opt-in preference.</td>
</tr>
<tr>
<td>Limit frequency of communication</td>
<td>Select this check box to set a frequency limit, then enter a maximum number of surveys and mailings and a number of days in which contacts can receive messages before they are excluded from surveys. The survey is not sent to any contacts who have received the maximum number of surveys and mailings within the designated time period. For more information about how this setting works, see Frequency and Recency Limits. The minimum you can enter is 2 in the last 1 day. The maximum number of days you can enter is 90.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Tip:</strong> To ensure contacts receive only 1 email every &quot;x&quot; number of days, use the Limit recency of communication setting described next.</td>
<td></td>
</tr>
<tr>
<td>Limit recency of communication</td>
<td>Select this check box to set a recency limit. Enter the minimum number of days that should elapse before contacts receive another email. The survey is not sent to any contacts who have received a survey or mailing email in the past specified number of days. For more information about how this setting works, see Frequency and Recency Limits. The maximum number of days you can enter is 90. The default value is 1 day.</td>
</tr>
<tr>
<td><strong>Tip:</strong> Use this check box to ensure contacts receive only one email every “x” number of days. For instance, if you want your contacts to receive only one email per week, you can select this check box and then set the field to seven.</td>
<td></td>
</tr>
<tr>
<td>Honor external suppression list</td>
<td>Select this check box to exclude contacts in the external suppression list from receiving the survey. Clear this check box to send the survey to all contacts in the audience, even if they are in the external suppression list. See Overview of the External Suppression List for complete details and procedures about the external suppression list.</td>
</tr>
<tr>
<td>Limit delivery to a randomly selected subset of the audience</td>
<td>Select this check box to send the survey to a random subset of the audience. Enter a percentage or use the up and down arrows to select a percentage of the audience to send the survey to.</td>
</tr>
<tr>
<td>Allow delivery of messages to multiple contacts sharing the same email address</td>
<td>Select this check box to send messages to multiple contacts sharing the same email address. If this check box is cleared, the message is sent only to the contact most recently updated. This option is available only when email address sharing is enabled. See Email Address Sharing.</td>
</tr>
<tr>
<td><strong>CAUTION:</strong> Because duplicate messages sent to a single address are a common characteristic of spam, you should select this check box only when necessary. When the check box is selected and you attempt to schedule or send a mailing, survey, or proof, and duplicate email addresses exist in your audience, a message warns you that your reputation as a bulk email sender may be adversely affected and impact your ability to send future communications.</td>
<td></td>
</tr>
<tr>
<td>Exclude from audience if previously sent</td>
<td>Select this check box to exclude contacts from the audience that were previously sent an invitation from the same survey. This option applies only to recurring surveys. Contacts excluded in this manner are also excluded from the audience count. See Add or Edit a Recurring Broadcast Survey Schedule.</td>
</tr>
</tbody>
</table>
9. To count the number of contacts who will receive the survey, click **Refresh** in the Current Count section. After the audience has been counted, the last count also displays in this section.

10. To view the details of an audience count, click **Details** in the Current Count section after the count has been performed.

**View Audience Count Details in Surveys**

You can view the audience count to see how the count is calculated. You can see the included and excluded lists and segments, along with the number of invalid, opt-out and duplicate emails as well as emails that are part of the external or global suppression list.

You must count your audience before you can view audience count details.

1. Do one of the following:
   - From the Summary tab, click **Details** next to Audience Count.
   - From the Audience tab, click **Details** next to Current Count.

   The Audience Count Details window opens.

<table>
<thead>
<tr>

<td>Lists the number of contacts in each list or segment who are included in or excluded from the survey.</td>
</tr>
<tr>
<td>Total Audience Size</td>
<td>Lists the net total number of contacts who receive the survey.</td>
</tr>
</tbody>
</table>

**Note:** Audiences are filtered from invitation emails in the following order.
- Excluded segments and contacts
- Contacts without an email address
- Contacts with an invalid email address
- Contacts who have opted out
- Shared email addresses and duplicate contacts (overlaps in included lists or segments)
- Contacts in the global suppression list
- Contacts in the external suppression list
- Contacts filtered by recency settings
- Contacts filtered by frequency settings

**Create an Invitation Message in Broadcast Surveys**

The invitation message is what your customers receive in the email inviting them to participate in the survey.

From the Invitation Message tab, you can activate market testing, specify the mailbox settings for the message, the subject of the email, and any URL parameters you want to attach to the survey link in the message. In addition, you can create either plain text or HTML messages from scratch, from existing content, or by uploading HTML from another site.
Note: By default, a canceled survey can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, copy a canceled survey and then modify and send the copied survey. See Cancel a Broadcast Survey Invitation Message. Alternatively, you can enable the RNM_MOD_SENT_DOCS configuration setting (Outreach and Feedback/General/Miscellaneous) to allow edits to documents that have been used in sent messages. Just be aware when you enable this setting, you will no longer be able to view the original content sent to your customers, and your reporting will not be as accurate.

1. From an open survey, click the Invitation Message tab.
2. To activate market testing, click the information bar (above the From address field) and select Change Market Testing Mode. See Activate Market Testing in Broadcast Surveys.
3. To change the mailbox sending the message or the From and Reply-To addresses, click Edit next to the From address. See Customize the Survey Invitation Message Header.
4. Enter the subject of the message in the Subject field.
   For the best practice on creating effective subject lines, see Ensuring that contacts read your message.
5. To add a merge field to the subject, click the Merge Field icon (to the right of the Subject field) and select the field. See Insert a Text Merge Field.
6. To create an HTML invitation message from scratch, click Begin with Blank Content and see How the HTML Editor Works.
7. To create an HTML invitation message by copying an existing document, click Choose Existing Content and see Insert Existing Content.
8. To create an HTML invitation message by uploading your own HTML page, click Upload HTML Content and see Upload HTML Content.
9. To create a text version of the invitation message, click the Text tab.
10. To create a text invitation message from scratch, click Begin with Blank Content and see How You Create and Edit Text-Only Messages.
11. To create a text invitation message by copying an existing document, click Choose Existing Content.
12. To create a text invitation message by converting an HTML page to text, click Convert HTML Content and see Convert HTML Content.
   The system automatically creates a document containing the content created on the Invitation Message tab and stores it in the Automatically Generated folder in the Documents explorer. When you update the document in the survey, those changes are also made to the automatically generated copy. In addition, if you make any changes to the copy in the Automatically Generated folder, those changes are also made to the text on the Invitation Message tab in the survey. See Automatically Generated Folders.
13. To add URL parameters, enter any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.
14. To add a merge field to the URL parameters, click the Merge Field icon to the right of the URL Parameters field and select the field. See Insert a Merge Field to a URL Parameter.

Customize the Survey Invitation Message Header
If you want to use a different name and email address for your survey invitation message, such as a branded email address, you can do so by customizing the message header.

By default, Feedback uses the name and email addresses specified in the outgoing email settings of your default Outreach mailbox. By customizing the message header, when a recipient views your invitation message, the name and email addresses defined in the customized header are used instead of those specified in the default Outreach mailbox.

Note: Be sure to regularly monitor mail received by the email addresses specified in your custom message header. If you want replies to your survey invitations to be converted to incidents, your mail administrator must configure SMTP forwarding from that mail account to an account configured in B2C Service. See How Mailboxes Work.
Also note that when an email message cannot be delivered, it usually results in a “bounce” error notification. Bounce notifications are sent to the Envelope From/Bounce Address defined in the outgoing email settings of your Outreach mailbox even if the message header is customized using the following procedure. See Email Bounce Handling.

See also Best Practices for Using Branded Email Domains.

1. From the Invitation Message tab of an open survey, click **Edit** next to the From field. The Customize From and Reply-To Headers window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>Click this drop-down menu and select a mailbox to change the mailbox from the default. See Overview of Email Management for complete details and procedures about email handling.</td>

3. Click **OK**.
B2C Service
Using B2C Service

Chapter 10
Outreach and Feedback

Insert Existing Content
As an alternative to creating a message from scratch, you can base your message on existing content. You can choose to copy content into your message and customize it, or share the content with other surveys and messages that use the document.

1. From the Message tab of a mailing or the Invitation Message tab of a survey, click Choose Existing Content. The Choose Document window opens.
2. Select the document you want to use and click OK. If it is not already in use by another mailing, campaign, or survey, the content is added to your message. Otherwise, the Content Already in Use window opens.
   a. To share the document with the items indicated in the grid, click Share Content.
      When you share a document, you can edit the content of the document, but all other messages that share it are also modified. Likewise, if another staff member edits the document, your message is also modified.
   b. To create a copy of the document, click Copy Content.
      If you edit the copied content, the original document is not affected. Conversely, if the content of the original document is modified, it does not affect your copy of the message.

   CAUTION: The system automatically creates a document containing the copied content and stores it in the Automatically Generated folder in the Documents explorer. When you update the document in the mailing or survey, those changes are also made to the automatically generated copy. In addition, if you make any changes to the copy in the Automatically Generated folder, those changes are also made to the content of the mailing or survey. See Automatically Generated Folders.

Upload HTML Content
You can upload an HTML file into your document, template, snippet, mailing or survey to create your message. The HTML document must be stored in a file accessible through your workstation. You cannot access the HTML of a web page.

1. From the HTML tab of a document, the Message tab of a mailing, the Invitation Message tab of a survey, or from a new template or snippet, click Upload HTML Content.
2. Select the HTML file you want to upload.
3. Click Open.

The HTML is inserted in your message.

Convert HTML Content
When creating a text message, you can take HTML content from the HTML message or from an HTML file and convert it to plain text.

You should finalize your HTML content before converting it to text.

1. From the Message tab of an open mailing or the Invitation Message tab of an open survey, click the Text tab and then click Convert HTML Content.
   The HTML to Text window opens.
2. To convert the HTML message to text, select HTML Part.
3. To convert an HTML file to text, select the File On Disk and browse for the file.
4. Click OK.

The converted HTML is added to the text part of your message.
Activate Market Testing in Broadcast Surveys

When creating a broadcast survey, you can test different content and designs on a subset of your audience by using market testing.

For broadcast surveys, market testing is available in two modes: even split and random sampling.

- **Even split**—This mode sends your test message to equal portions of your audience. For example, if you created four messages, each message would be sent to twenty-five percent of your audience. In this way, you can test different content and designs for use in future messages.

- **Random sampling**—This mode sends test messages to a percentage of the audience you specify. After the test messages are sent, you send a final message to remaining audience members. For example, you could send two messages to five percent of your audience each. After determining the most effective message, you would send a final message to any audience members who had not received a test message.

By default, the Invitation Message tab is set up without market testing. This means you create and send only one invitation message.

1. On the Invitation Message tab of an open survey, click the information bar (above the From address field) and select Change Market Testing Mode.
   
   You can also access this window on the Summary tab by clicking Change next to Market Testing.

   The **Select Market Testing Mode** window opens.

2. To send test messages to equal portions of your audience, select **Even Split**. See Create Messages in Even Split Mode.

3. To send test messages to a percentage of your audience, select **Random Sampling**. See Create Messages in Random Sampling Mode.

4. To disable market testing, select **None**.

   **Note:** If you have created more than one test messages, the Select Message To Keep window opens asking you which message you want to use. You must select a message to keep before you can disable market testing.

5. Click **OK**.

Create Messages in Even Split Mode

When creating messages in even split mode, you define different message content and proofing options for each version of your message. Your audience is split evenly between the messages. The messages are sent at the same time and share delivery options.

1. From the Select Market Testing Mode window, select **Even Split** and click **OK**.
   
   The Message tab (mailings) or the Invitation Message tab (surveys) displays in even split mode.

By default, one test message is sent to 100 percent of the audience. From here, you can add more messages, edit messages, send proofs, or view results. From here, you can also see information about each message.

<table>
<thead>
<tr>
<th>Column</th>

<td>This column displays the percentage of the audience the message will be sent to.</td>
</tr>
<tr>
<td>Sent</td>
<td>This column displays the number of emails sent with the message.</td>
</tr>
<tr>
<td>Delivered</td>
<td>This column displays the number of emails sent with the message that did not bounce.</td>
</tr>
<tr>
<td>Opened</td>
<td>This column displays the number of unique email recipients who opened the message.</td>
</tr>
<tr>
<td>Clicked</td>
<td>This column displays the number of unique email recipients who clicked a tracked link.</td>
</tr>
<tr>
<td>Unsubscribed</td>
<td>This column displays the number of email recipients who unsubscribed from mailings.</td>
</tr>
<tr>
<td>Replied</td>
<td>This column displays the number of times the mailing was replied to.</td>
</tr>
</tbody>
</table>

Unsubscribe sets global opt-in in both Outreach and Feedback. See [Insert an Unsubscribe Link](#).

---

2. Click **New** on the toolbar to add a second test message.

The **Edit Message** window opens.

3. Enter the name of the message in the **Name** field.

4. Enter the subject of the message in the **Subject** field on the Content tab. See [Create a Message in Broadcast Mailings](#) and [Create an Invitation Message in Broadcast Surveys](#).

5. Define any other content or formatting options you may want to test using either the HTML editor or the text editor on the Content tab. See [How the HTML Editor Works](#) and [How You Create and Edit Text-Only Messages](#).

6. To send a proof message, click the **Proofing** tab on the Edit Message window. See [Send a Proof](#).

7. Click **OK** to save the message.

The new message is added to the Message tab (mailings) or the Invitation Message tab (surveys).

8. To open a message for editing, select the message and click **Open**.

9. To delete a message, select the message and click **Delete**.

10. To copy a message to create another test message, select the message and click **Copy**.

**Note:** A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages is not shared with the original test message or subsequent copies. See [Automatically Generated Folders](#).

11. To send a proof of a message, select the message and click **Send Proof**.

12. To preview the content of a message, select the message and click **Preview**.

13. To refresh the message statistics, click **Refresh**.

14. To add URL parameters, enter any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the **URL Parameters** field.

15. To add a merge field to the URL parameters, click the **Merge Field** icon to the right of the URL Parameters field and select the field. See [Insert a Merge Field to a URL Parameter](#).
Create Messages in Random Sampling Mode

You should use random sampling mode when you want to send a sample of test messages to your audience before determining the best one to use as a final message.

When creating messages in random sampling mode, you define different message content, designs, delivery, and proofing options for each version of your message. After you evaluate the effectiveness of your test messages, you create a final message and send it.

For the best practice on how to handle scheduling, see *Scheduling Mailings and Surveys for Market Testing*.

1. From the Select Market Testing Mode window, select **Random Sampling** and click **OK**.

The Message tab (mailings) or Invitation Message tab (surveys) displays in random sampling mode.

By default, one test message is sent to five percent of the audience, and one final message sent to the remainder of the audience. You can add more messages, edit the messages, send proofs, or view results. From here, you can also see information about each message.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>This column displays the name of the message.</td>
</tr>
<tr>
<td>Subject</td>
<td>This column displays the email subject line for the message.</td>
</tr>
<tr>
<td>Status</td>
<td>This column displays the status of the message. See <em>Mailing Delivery Statuses</em> and <em>Survey Delivery Statuses</em>.</td>

<td>This column displays the number of emails sent with the message that did not bounce.</td>
</tr>
<tr>
<td>Opened</td>
<td>This column displays the number of unique email recipients who opened the message.</td>
</tr>
<tr>
<td>Clicked</td>
<td>This column displays the number of unique email recipients who clicked a tracked link.</td>
</tr>
<tr>
<td>Unsubscribed</td>
<td>This column displays the number of email recipients who unsubscribed from mailings. Unsubscribe sets global opt-in in both Outreach and Feedback. See <em>Insert an Unsubscribe Link</em>.</td>
</tr>
<tr>
<td>Replied</td>
<td>This column displays the number of times the mailing was replied to.</td>
</tr>
</tbody>
</table>
2. Click New on the toolbar to add a second message.
   The Edit Message window opens.
3. Enter the name of the message in the Name field.
4. Enter the number or percentage of recipients you want to receive the message in the Test Audience field and select Percent or Recipients from the drop-down menu.
   The percentage of recipients is based on the number of contacts in the audience at the time the mailing is sent.
5. Enter the subject of the message in the Subject field on the Content tab. See Create a Message in Broadcast Mailings.
6. Define any other content or formatting options you may want to test using either the HTML editor or the Text editor on the Content tab. See How the HTML Editor Works and How You Create and Edit Text-Only Messages.
7. To send a proof message, click the Proofing tab on the Edit Message window. See Send a Proof.
8. Click the Delivery tab on the Edit Message window to define the delivery options for the message. See Access Broadcast Mailing Delivery Options or Access Broadcast Survey Delivery Options.

   Tip: When sending multiple test cells, we recommend scheduling them to be sent all at one time rather than a few minutes apart. This minimizes any performance impact on your database by sharing audience segmentation processes across all of the sending cells, instead of performing them multiple times.
9. Click OK to save the test message.
   The new message is added to the Message (mailings) or the Invitation Message (surveys) tab.
10. To open a message for editing, select the message and click Open.
11. To delete a message, select the message and click Delete.
   Note: You cannot delete the final message.
12. To copy a message to create a new message, select the message and click Copy.
   A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages is not shared with the original test message or subsequent copies. See Automatically Generated Folders.
13. To send a proof of a message, select the message and click Send Proof.
14. To preview the content of a message, select the message and click Preview.
15. To refresh the message statistics, click Refresh.
16. To add URL parameters, enter any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.
17. To add a merge field to the URL parameters, click the Merge Field icon to the right of the URL Parameters field and select the field. See Insert a Merge Field to a URL Parameter.
18. When you are satisfied with your message, you must copy it as your final message and then define delivery options.
   a. Select the message and click Copy To Final.
      The message you selected is copied to the Final Message section of the Message tab (mailings) or the Invitation Message (surveys) tab.
   b. Click OK.
   c. Select the final message and click Open.
      The Edit Message window opens.
   d. Click the Delivery tab on the Edit Message window to define delivery options.

Send a Proof
An important step in creating a mailing or a survey is ensuring the content is approved by the necessary contacts and staff members and as a final check for any mistakes.
You can send a proof to any combination of staff accounts, staff groups, proof lists, distribution lists, and distribution list available addresses, and then view the results of the proof from the Proofing tab. See Add or Edit a Distribution List.

After a reviewer has approved or rejected the proof, the assigned staff member will receive a Mailing Proof Response Notification or a Survey Proof Response Notification. Both notifications can be customized using message templates found in the Administrator Notifications message type under the Outreach or Feedback category respectively. See How You Customize Messages.

Proof surveys and mailings are subject to the following behaviors and limitations.

- If your message contains conditional sections, all conditional sections display in the proof message. However, reviewers see the conditional sections only if they can be mapped to contact records that allow access to those conditional sections.
- If a form on the proof contains an email address field and a reviewer submits a value for the field in the survey preview, a contact record is created or updated so that advanced survey functions can be tested. For this reason, be sure that your reviewers use only test contact addresses to avoid updating production contacts when testing survey proofs.
- To ensure the proofing process does not impact statistics after the mailing or survey has been sent, Outreach and Feedback does not retain data submitted from proof surveys. If you want to submit test responses without impacting specific statistics, you can copy the mailing or survey and test using the copy instead.

For the best practice about sending proofs, see Send Proofs to Key Staff.

1. From an open mailing or survey, click the Proofing tab.
2. Click Send Proof Message to select proof recipients.
   The Send Proof Message window opens.

   **Tip:** From the Summary tab, clicking Send Proof Message opens the Send Proof Wizard where you can select the survey you want to send for a proof, and then follow the wizard as it steps you through the process of sending your message.

3. To create a proof list, click New Proof List and see Add a Contact List.
4. Enter an email address or the name of a group or proof list in the Recipients field.
5. To select proof recipients from a list, click the Select Recipients icon (to the right of the Recipients field). The Select Names window opens.
   a. Select a staff member, address, group, or proof list and click To.
   b. To find a specific staff member, address, group, or proof list, enter the name in the Type Name or Select From List field.
      The first item matching the letters you type is selected in the grid.
   c. To import your contacts from the default Contacts folder in Outlook, select Load Outlook Contacts. This is useful for displaying contacts that are not included in B2C Service. See How You Synchronize Contacts.
   d. Click OK.
6. Enter any comments you want to appear in the message in the Comment text box.
7. To spell check your comments, click the Spell Check icon (to the right of the Comment field).
8. To customize your proof message by contact record, which lets your reviewers see how dynamic content will look for a specific contact, click the Search icon next to the Preview Contact field on the bottom of the window.
   The Contact Search window opens.
   a. Enter your search criteria in one or more of the available fields and click Search.
      A list of contacts that match your search criteria displays in the grid below the search criteria fields.
   b. Select a contact and click Select.
      The Contact Search window closes and the contact name you selected populates the Preview Contact field on the Send Message Proof window.
9. Click **Send Proof Message**.

Accept or Reject a Proof Email

After you send a proof, the recipients can accept or reject the mailing or survey content.

The proof email automatically displays a link to a web page where the tester can accept or reject the content. The word “Proof” is prepended to the message subject. The assigned staff member receives either a Mailing Proof Response Notification or a Survey Proof Response Notification every time a reviewer submits feedback.

1. In a proof email, click the **Submit Your Feedback** link.
2. Enter any comments related to the proof mailing or survey in the **Comments for Mailing Organizer** text box.
3. Do one of the following:
   - To approve the mailing, click **Approve**.
   - To reject the mailing, click **Reject**.

A message displays confirming your submission.

Proof Results

After you have sent the proof message, you can easily check the proof results from the Proofing tab.

The Proofing Results section lists all message proofs that were previously sent for the selected mailing or survey, grouped by date and time. You can see how many times the proof was viewed, who accepted and rejected the proof, and any comments from the proof testers.

Access Broadcast Survey Delivery Options

The Delivery tab lets you choose to send the survey immediately or schedule its delivery for sometime in the future. In addition, you can control the speed of the delivery and access common administration tasks for the survey.

You must create a questionnaire before delivering the survey. See **Create a Questionnaire in Basic Mode**.

After you have created the **questionnaire**, defined the audience, created an invitation message, and sent proofs of the survey, you can send the survey to your customers.

1. From an open survey, click the **Delivery** tab.

   The Delivery tab is divided into sections. The Delivery Status section displays the status of the survey (see **Survey Delivery Statuses**) and contains buttons for controlling the sending of the survey. You can perform the following tasks from this section.
○ **Send a survey**—See *Send a Broadcast Survey*.
○ **Schedule a survey, Unschedule a survey, and Reschedule a survey**—See *Schedule a Broadcast Survey*.
○ **Set a recurring survey**—See *Add or Edit a Recurring Broadcast Survey Schedule*.
○ **Suspend a survey**—See *Suspend a Broadcast Survey*.
○ **Cancel a survey**—See *Cancel a Broadcast Survey Invitation Message*.

The Delivery Options section lets you set options related to sending the survey.

On the bottom of the tab, delivery information about the survey is available for you to quickly scan and assess in the Delivery Checklist and Message Send History sections.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>

<tbody>
<tr>
<td><strong>Delivery Checklist</strong></td>
<td>This section displays the audience count and proof history and provides a link to preview the survey.</td>
</tr>
<tr>
<td><strong>Audience Count</strong></td>
<td>After an audience count has been performed, this section displays the most recent count and the time and date it was performed. Click Refresh to perform an updated audience count. See <em>Define the Broadcast Survey Audience</em>.*</td>
</tr>
<tr>
<td><strong>Message Preview</strong></td>
<td>This section contains a link to preview the message that is sent with the survey. Click Preview to preview the message.</td>
</tr>
<tr>
<td><strong>Proofing</strong></td>
<td>This section displays a summary report of message proofs associated with the survey. Click Send Proof Message to send the message as a proof.</td>
</tr>
<tr>
<td><strong>CAN-SPAM Compliance</strong></td>
<td>This section contains a link to test survey compliance with the CAN-SPAM Act of 2003. If you have already tested CAN-SPAM compliance, the test results and a link to the details of the test display. See <em>CAN-SPAM Compliance</em>.*</td>
</tr>
<tr>
<td><strong>Message Send History</strong></td>
<td>This section displays a log of events relating to the delivery status of the survey. If the survey has not been sent, it is noted here.</td>
</tr>
</tbody>
</table>

**Send a Broadcast Survey**

Broadcast surveys can be sent immediately from the Delivery tab. The status changes to Preparing to Send and then the survey is sent to your defined audience. After the survey finishes sending, it is marked Completed.

1. From the Delivery tab of an open survey, enter field information in the Delivery Options section.

<table>
<thead>

<td>Proof members may receive two messages if they are also part of the audience.</td>
</tr>
</tbody>
</table>

2. Click **Send Now**.
A window opens asking you to confirm that you want to send the survey.

3. Click **Yes** to send the survey.
The delivery status on the Delivery tab changes to Preparing to Send and you can see the delivery progress of the survey.

When the survey is finished sending, the status changes to Completed and the Delivery Status section displays the number of emails sent and delivered.

Schedule a Broadcast Survey
You can schedule broadcast surveys to be sent on a specified date and time. This lets you coordinate sending a survey before the actual send date. For example, to send a survey that coincides with a product launch. When scheduled, the survey automatically sends.

1. From the Delivery tab of an open survey, enter field information in the Delivery Options section. See **Send a Broadcast Survey** for field descriptions.

2. Click **Schedule**.
The **Confirm Schedule Invitation Message** window opens.

3. Enter the date and time you want to send the survey or click the calendar (to the right of the Time to Send Invitation Message field) and select the date.

4. Click **OK**.
The Delivery Status section displays the time and date the survey is scheduled to send.

5. To unschedule a survey without canceling it, click **Unschedule**.
This way, the survey can be scheduled later.

6. To reschedule the survey, click **Reschedule**.

7. To cancel a survey schedule, click **Cancel Invitation Message**.
   a. Click **OK** to confirm you want to cancel the invitation message.

   **Tip:** To edit or send a survey that has been canceled, first copy the survey and then edit or send the survey copy. See **Cancel a Broadcast Survey Invitation Message**.

Add or Edit a Recurring Broadcast Survey Schedule
Survey recurrence lets you send broadcast survey invitations at regular daily, weekly, monthly, or yearly intervals with a number of flexible options.

- You can schedule invitations to send during a specific date range, or set no end date to allow recurrences to run indefinitely.
- You can schedule invitations to send on specific days of the month or specific months of the year.
- You can send an invitation to each contact in your audience only once or include all matching contacts every time the recurrence is initiated.
You can select the time of day that you want invitations to begin sending.

Information about past recurrences—such as the time last run, next scheduled runtime, the time the schedule was last updated, and basic results data—is stored in the knowledge base and tracked in the Recurring Surveys Summary report (Public Reports/Feedback/Survey Performance). Also, each recurrence is tracked in the survey audit log along with a description of how many invitations were sent. See Audit Logs.

Before you set a recurring schedule, you must first define the audience and the invitation message subject and content. After recurrence has been set, you can click Suspend to suspend recurrences. This saves the recurrence information so it can be edited or reactivated.

1. From an open survey, click the Delivery tab.
2. Click Recurrence.
3. The Confirm Schedule Recurrence window opens.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recurrence Pattern</td>
<td>Select the weekly or monthly interval when the survey should be sent. For example, a survey could be sent every two weeks on Tuesday, or every month on the 7th and 19th.</td>
</tr>
<tr>
<td>Clear All</td>
<td>Click this text to clear all selected recurrence pattern check boxes.</td>
</tr>
<tr>
<td>Monthly</td>
<td>Select this option to display check boxes for the days of the month. You can then select the days of the month when the survey should be sent.</td>
</tr>
<tr>
<td>Weekly</td>
<td>Select this option to display check boxes for each day of the week. You can then select the check boxes next to the days when you want the survey to be sent. When you select this option, a Recur drop-down menu displays where you can specify the frequency of the weekly survey. For example, if you want to send a survey every week on the days selected, enter 1 in the field. If you want the survey to send every third week on the days selected, enter 3 in the field. This field accepts values from 1 to 99.</td>
</tr>
<tr>
<td>Schedule Specific Months</td>
<td>Click this header to display check boxes for the months of the year. Select the months during which the survey should send. By default, every month is selected, but if you do not want to send during a specific month, you can clear the check box for that month.</td>
</tr>
<tr>
<td>Clear All</td>
<td>Click this text to clear all check boxes for the selected months.</td>
</tr>
<tr>
<td>Range of Recurrence</td>
<td>Options in this section let you specify a date range for the recurrence and time of day at which the survey is sent.</td>
</tr>
<tr>
<td>Start</td>
<td>Enter the start and end dates of the schedule or click the calendars to select the dates. The current day is the default start date.</td>
</tr>
<tr>
<td>End</td>
<td></td>
</tr>
</tbody>
</table>
4. Click **OK** to save the recurrence settings and return to the Delivery tab.

5. To suspend the recurrence, click **Suspend**. The **Confirm Suspend** window opens.
   a. Click **OK** to confirm you want to suspend the recurrence.

   **Note:** After recurrence is suspended, you can click **Recurrence** again to edit or reactivate it.

6. To exclude contacts from the audience that were included in a previous instance of the recurrence, click the **Audience** tab and select **Exclude From Audience if Previously Sent**.

   **Tip:** By default, a recurring survey sends on every recurrence to every contact that matches your audience, even contacts who previously received an instance of the same message. If you want each contact to receive only one instance of a recurring survey, you must exclude contacts from the audience that were previously sent to. This is often helpful when sending a one-time offer. For instance, sending a one-time offer to all contacts who have a birthday in the next month.

### Suspend a Broadcast Survey

You may want to stop sending a survey while it is sending or preparing to send. You can temporarily stop a survey from sending by suspending it.

1. From the Delivery tab of an open survey, click **Suspend**.

   **Note:** This button appears only when a survey is in the process of sending.

   The Confirm Suspend message opens asking you to confirm that you want to suspend the survey.

2. Click **Yes** to confirm suspending the survey.

   The status changes to Suspended and the Delivery Status section displays the number of audience members the survey was already sent and delivered to.

### Cancel a Broadcast Survey Invitation Message

You can cancel a survey invitation message at any time. When you cancel the survey invitation message, the survey is saved and you can still view survey results. However, the invitation message cannot be sent or further modified.

By default, a canceled survey can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, copy a canceled survey and then modify and send the copied survey.

**Tip:** Alternatively, you can enable the RNM_MOD_SENT_DOCS configuration setting (**Outreach and Feedback/General/Miscellaneous**) to allow edits to documents that have been used in sent messages. Just be aware when you enable this setting, you will no longer be able to view the original content sent to your customers, and your reporting will not be as accurate.

1. From the Delivery tab of an open survey, click **Cancel Invitation Message**.

   The **Confirm Cancel Invitation Message** window opens asking you to confirm that you want to cancel the invitation message.

2. Click **Yes** to cancel the survey.

The delivery status changes to Canceled.
**View Survey Results**

In addition to helping you create and send effective surveys, Feedback provides a comprehensive set of reports and monitoring tools to help you process and analyze the results.

The Results tab displays a list of standard reports that present survey response data as well as information about the effectiveness of your survey invitation messages, such as total emails sent and delivered, survey link clicks, unsubscribes, **bounces**, and forwards. You can also track question response rates, survey reminder statistics, mobile survey trends, and trending information based on timeline. Other reports can be added to the list to provide more analytical options for your survey.

**Note:** The email gateway must be activated in order for the *Techmail* utility to capture bounce data for analytics. See *Email Bounce Handling*.

Feedback also features topic monitoring for text responses in the survey. Topic monitoring helps you analyze text responses by grouping them into topics and identifying them by common keywords. See *Topic Monitoring*.

1. From an open survey, click the **Results** tab.
   The list of standard reports display.
2. Select a report from the Results Reports list.
   **Tip:** When you select a report, the report description displays in the area below the list to help you understand the purpose of the report.
3. Click **Go**.
   The report displays on a new tab.
4. To view a definition of the report, including its tables, filters, and column descriptions, click **Definition** on the ribbon and select **View**.
5. To view the same report for a different survey, select the survey from the **Survey Name** drop-down menu and click **Search**.

**Customize the Survey Report List**

The survey reports list provides a set of useful standard reports that display results information about the survey you are editing. However, you can add or remove reports to customize the list.

1. From the Results tab of an open survey, click **Customize List**.
   The **Customize Survey Report List** window opens.
2. To add a report to the survey report list, do one of the following:
   ○ Select a report from the Available Items list and click **Add**.
   ○ Press Ctrl while selecting each report you want to add at the same time. You can also press Shift to select multiple consecutive reports.
3. To search for a report in the Available Items list, click **Find In List** and enter the name (or part of the name) of the report you are looking for.
4. To remove a report from the survey report list, select the report in the Selected Items list and click **Remove**.
5. To rearrange the order of the reports you are adding, select a report in the Selected Items list and click the up or down arrow.
   **Tip:** You can also drag and drop reports to adjust their position.
6. Click **OK** to close the window and update the list.

Added reports display at the bottom of the list.
How You Track Transactional Survey Results by Agent

Tracking which agent was assigned to the incident (or opportunity) at the time the transactional survey was sent is important for gauging agent success rates.

The question_sessions.acct_id field is used to track this information, and is available when reporting on survey results. The account ID value (acct_id) is added directly to the Question Sessions (question_sessions) table. Because system processes can ultimately change the agent assignment at any point in its lifecycle, even after a related transactional survey is sent, this ensures that the agent the survey results are tied to are accurate.

When the survey is sent, the account ID for the related record is encrypted in the URL that is included in the survey invitation message. When the survey is submitted, that account ID value is set in the question_sessions.acct_id field of the Question Sessions table. Since the account ID is included in the URL at the time the survey is sent, even if the agent assigned to the record changes between when the survey is sent and submitted, the account ID value submitted for the survey does not change from the send time value.

Note: This functionality also applies to surveys popped at the end of a chat session. In this case, however, question_sessions.acct_id is based on the final agent assigned at the end of the chat session and is set when the survey is completed.

Related Topics
  • Create a Transactional Survey

Exclude or Include a Survey Response

If you find a survey response that is invalid—for example, a question appears to have been misunderstood or answered incorrectly—you can improve the accuracy of your data by excluding the response from your survey results.

When you exclude a survey response, you exclude all answers submitted by the contact during the entire survey response session. Excluded responses are not actually deleted from the system. Instead, the question_sessions.ac_ignore field is set to Yes, which excludes the response session from any reports that include this filter. For this reason, excluding (or including) a survey response affects its visibility across all reports that filter on the question_sessions.ac_ignore field.

1. From an open survey results report, select the record from which you want to exclude a response and click Response Exclusion on the ribbon.
   The Response Exclusion button is enabled only on reports with response data that list results.
   The Response Exclusion window opens.
2. To exclude the response from survey results, select Exclude Response.
3. Click OK.
4. To see your change reflected on your report, click Refresh.
   Note: When you exclude a survey response you exclude all answers submitted by the contact.
5. To include a previously excluded response back into the survey results, click Search on the ribbon.
   This feature does not work when cross tabbing is used in the report or if the report displays data from multiple responses in a single row.
   a. Clear the No check box, select the Yes check box, and click Search. By changing your search criteria for response exclusions, you’ve changed the data that displays on the report.
      Now, all records that have responses excluded will display.
   b. Click Response Exclusion on the ribbon.
      The Response Exclusion window opens with the Include Response option selected.
c. Click OK.
d. To see the responses added back into your report, click Search on the ribbon and change your Response Exclusion criteria from Yes to No.
e. Click Search.
   All records that are set to “Include Response,” including those that had previously been excluded, now display.

Topic Monitoring

Text responses often provide the most valuable information you receive. However, text responses can be more difficult to analyze than multiple choice questions that can be counted and included in graphs. A useful approach for analyzing text responses is to group responses containing similar content and look for emerging themes.

Since the process of clustering (grouping responses and identifying themes) can be time consuming and tedious, Feedback can automatically perform this task, providing an easy method to spot trends in text responses to your survey questions. Topic monitoring lets you view the distribution of responses across themes and drill down into themes or sub-themes to read individual responses. Themes are accessed through the survey Results tab and the topic monitoring report in Analytics.

Cluster Text Responses

Grouping responses and identifying themes can help you analyze text responses received from customers.

1. In the Topic Monitoring section on the Results tab, click Go.
   The Topic Monitoring Wizard opens.
2. Select a question from the Select a Survey Question drop-down menu.
   The question text appears below the menu.
   
   Note: In order to be clustered, the question you select must have received at least ten responses.
3. Select Cluster Responses.
4. To view recent cluster results without re-clustering, select View Previous Results and see the descriptions in the Topic Monitoring Report table.
5. Click Finish.
   The Topic Monitoring Wizard closes and the Clustering Progress section displays on the Results tab.
   When clustering is complete, the resulting themes display on the Results tab.

<table>
<thead>

</table>
### Field | Description
---|---
Theme Definition | Click Details to view the top keywords for the theme and the theme type.
Change Results Report | Click this text to return to the default Results tab.
Tasks | Use the options in this section to cluster responses, reset clustering, edit themes, and open the Topic Monitoring Wizard.
Cluster Responses | Click this option to recluster the responses using your customized themes.
Reset Clustering | Click this option to recluster the responses without using your customized themes.
Your custom themes are retained. However, they cannot be used during this clustering session.
Edit Themes | Click this option to edit the themes used in clustering. See Edit Themes.
Clustering Wizard | Click this option to open the Topic Monitoring Wizard and cluster responses for a different question.
Question Info | This section displays the name and Question ID of the selected question.

**Edit Themes**

If you want to create your own themes based on specific words, you can customize the keywords that determine the themes used during clustering by editing themes or creating new ones. During the clustering process, the themes you create are emphasized more than automatically generated themes.

1. In the Topic Monitoring section on the Results tab, do one of the following:
   - Click **Go**.
   - Click **Edit Themes** in the Survey Tasks section on the Results tab that displays response themes for a question.

   The **Topic Monitoring Wizard** opens.

   **Note:** Response themes are only displayed after clustering has finished and there are at least ten question responses for the survey.

2. Select a question from the **Select a Survey Question** drop-down menu.
   The question text appears below the menu.
3. Select **Edit Themes/Keywords** and click the **Next**.
   The Edit Themes page opens in the wizard.
The Edit Themes window is divided into two sections: Themes to Include and Previously Suggested Themes. The Themes to Include section displays a list of themes that are used in clustering. You can also add and import themes through this section.

The Previously Suggested Themes section displays a list of themes that were created during the clustering process. Suggested themes change each time responses are clustered. However, you can prevent a suggested theme from being automatically modified by moving it to the Themes to Include section. See Include a Suggested Theme.

4. When you are done editing themes, click Next. The Final Action page opens.

5. To close the Topic Monitoring Wizard and return to the survey without clustering responses, select Resume Survey Editing.

If you select the Resume Survey Editing option, changes made to themes are saved, but responses are not clustered. The next time you cluster responses, your themes are applied.

6. To cluster responses and return to the survey, select Cluster Responses.

7. Click Finish.

Add Custom Themes

When editing themes, you can customize them to fit your unique needs.

1. From the Edit Themes page of the Topic Monitoring Wizard, click Add in the Themes to Include section. The Theme Editor window opens.

2. Enter a name for the theme in the Name field.

3. Enter a keyword that you want associated with this theme in the Keyword field and click Add. The keyword is added to the Keyword list.

   Note: Multiword keywords are not supported by the topic monitor. If multiple words are entered for a single keyword value, only the first word will be used. If the resulting outcome produces too many matches that are irrelevant to your search, try adding other keywords that relate to an appropriate subset of your topic. For example, adding the multiword phrase "customer experience" as a keyword will produce the same effect as adding the single keyword "customer" and the word "experience" will be ignored. For a more accurate result set, add keywords “customer” and “experience” separately.

4. To edit a keyword, click Edit next to the keyword.

5. To remove a keyword from the list, click Remove next to the keyword.

6. To move a keyword up or down in the list, use the up and down arrows to the right of the keyword list. When responses are clustered, the keywords at the top of the list are considered more important than the keywords at the bottom of the list.

7. Click OK.

Import Themes

When editing themes, you can import themes from existing survey questions.

1. From the Edit Themes page of the Topic Monitoring Wizard, click Import in the Themes to Include section. The Import Themes window opens.

   Note: Only questions that have been clustered or have custom themes display in the tree.

2. Select a question from the tree and click OK.

The imported themes are added to the Themes to Include section.

All themes included with the question are imported. You can edit or delete them after the import. Suggested themes are not imported.
Edit a Theme
The following procedure describes the steps pertaining to the Theme Editor window.

1. From the Edit Themes page of the Topic Monitoring Wizard, click Edit next to the theme in the Themes to Include section. The Theme Editor window opens.

2. To edit a keyword, click Edit next to the keyword.

3. To remove a keyword from the list, click Remove next to the keyword.

4. To move a keyword up or down in the list, use the up and down arrows to the right of the keyword list.

   **Note:** When responses are clustered, the keywords at the top of the list are considered more important than the keywords at the bottom of the list.

5. Click OK.

Include a Suggested Theme
The Previously Suggested Themes section displays a list of themes that were created during the clustering process. Suggested themes change each time responses are clustered. However, you can prevent a suggested theme from being automatically modified by moving it to the Themes to Include section.

1. To include a suggested theme, do one of the following:
   - Click Copy next to the suggested theme in the Previously Suggested Themes section. The suggested theme appears in the Themes to Include section.
   - Select a theme and click the left arrow between the Themes to Include and Previously Suggested Themes sections.

2. To view a suggested theme, click View next to the theme in the Previously Suggested Themes section.

   The View Theme window opens.

Add Stopwords
After clustering your text responses, you might find that commonly used words appear as topics. If you want to remove words from the clustering process to prevent them from being used as topics, you can add the words to the stopword list.

You can access the stopword list file (exclude_responses.txt) from the File Manager.

   **Note:** When adding stopwords to the list, you must specify all forms of the word that you want to exclude. For example, if you do not want phone or phones used as topics, you must add them both to the list.

1. Click Configuration on the navigation pane.

2. Expand Site Configuration, and then double-click File Manager.

   The File Manager opens on the content pane.

3. Select Wordlist Files from the Switch To drop-down menu.

   The available wordlist files display.

   a. Select the exclude_responses.txt file.

   The file opens on the content pane where you can make edits.

4. Enter the words you want to add to your stopword list.

   Each word must be typed in upper case and separated by a carriage return.

5. Click Save.

   You may need to scroll to the bottom of the content pane to access the Save button.
Best Practices for Topic Monitoring

Best practices for topic monitoring vary depending on your goals. However, general practices can be applied in all situations to help you find the information you are looking for.

1. **Cluster responses**—Cluster responses before you add stopwords or customize themes.
2. **Review themes**—Review the predefined themes and sub-themes to determine if they are satisfactory. Look for common words that you think might be breaking your themes into smaller, less definitive clusters. Also look for certain words that you think might be useful in creating distinctive, useful themes.
3. **Add stopwords**—If you determine that there are common words that do not contribute to the creation of distinctive clusters, add them to the stopword list.
   
   **Note:** Stopwords you add are applied to all the responses you cluster.
4. **Add custom themes**—If you determine that there are certain words that can help create distinctive, useful themes, add a custom theme containing these keywords.
   
   **Tip:** Custom themes are most helpful in creating distinctive clusters when they use synonyms. For example, a theme containing the word “software” should also contain the words “application” and “program.” If you find that a word is often misspelled, you can include the common misspelling as a keyword.
5. **Cluster responses again**—Cluster the responses again and, if necessary, repeat the previous steps of reviewing themes, adding stopwords, and adding custom themes until you are satisfied with the resulting themes.
   
   **Tip:** If you use these steps and get results that are less satisfactory than the predefined themes, reset clustering by clicking Reset Clustering in the Tasks section of the Results tab. Any custom themes you created are retained, but they are not used in the clustering session.

Create a Transactional Survey

Transactional surveys let you survey customers when an event occurs. When a transactional survey is triggered, the system sends your customer an email message that links to a survey on a web page.

You can send the email as part of a campaign or as a part of a contact, opportunity, incident, or chat rule. For example, when an incident is closed, a rule can send a survey to the primary contact of the incident to find out how satisfied the contact was with your customer service.

**Note:** The survey will only be sent to the contact once per incident regardless of how many times the rule is matched.

- For information about using transactional survey attributes in campaigns, see *Edit Transactional Survey Attributes*.
- For information about tracking transactional survey results by agent, see *How You Track Transactional Survey Results by Agent*.

1. From the Surveys explorer, click **New**.
   
   A new survey opens on the content pane.
   
   **Tip:** You can also create surveys from an open survey by clicking New. Additionally, if your navigation set is configured to add surveys from the file menu, click **File > Surveys > Survey**.
2. Click **Transactional Survey**.
By default, the Summary tab is active. From here, you can review general information about the survey in the At a Glance section, as well as manage survey notes, tasks, and attachments. As you create the survey, you move through each tab to complete the survey elements.

3. To assign the survey to another staff member (by default, the survey is assigned to the staff member who creates it), click the **Assigned** drop-down menu and select the staff member.
   - To search for a staff member, enter the staff member’s name in the **Find** field.

   Wildcards are supported when searching staff members. You can search strings that include a space by entering %+Space+character, which is helpful when searching last names. For example, typing %+Space+b returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing b in the Find field returns all items containing the letter b.

4. To let customers answer the survey anonymously, select **Allow Anonymous**. Contact information is not required.

   **Note:** Selecting Allow Anonymous in your survey does not mean that all responses will be anonymous. If a survey invitation is sent to a contact or an B2C Service cookie is detected on the contact’s computer, or the survey itself contains an email address field, Feedback attempts to use that information to identify the contact.

5. Click the text in the At a Glance section to perform common survey functions.

<td>Rule Visibility</td>
<td>Select which rules the survey can be used in. For example, select the Incidents check box if you want this survey available in an incident rule. You can select from contact, opportunity, incident, and chat rules.</td>
</tr>
</tbody>
</table>

6. Click the **Questionnaire** tab to add questions and HTML content to the survey. See [Create a Questionnaire in Basic Mode](#) and [Create a Questionnaire in Advanced Mode](#).
7. Click the **Audience** tab to define an audience for the survey. See [Define the Transactional Survey Audience](#).
8. Click the **Invitation Message** tab to create the message sent to the survey audience. See [Create an Invitation Message in Broadcast Surveys](#).
9. Click the **Proofing** tab to send a proof of the message for internal review before sending it to the entire audience.
10. Click the **Reminders** tab to create automatic email messages that will prompt your customers either to start taking the survey or to finish it if they have already started. See [Survey Reminders](#).
11. Click the **Delivery** tab to select delivery options. See [Access Transactional Delivery Options for Surveys](#).
12. To view the reports associated with the survey, click the **Results** tab.
13. To preview the survey as it would be viewed on a standard web device, such as a desktop or a laptop, click **Standard** on the ribbon.
   The survey preview opens in a web browser.

   **Note:** If a survey contains an email address field and you submit a value for the field in the survey preview, the form creates or updates contact records so that advanced survey functions can be tested. For this reason, be sure to use only test contact addresses to avoid updating production contacts when testing survey previews. Also, be careful not to use the preview survey URL in place of the URL of your completed survey (described in the following step). Information submitted on a preview survey is discarded and has no effect on the data collected by the live survey. For identification purposes, each preview survey displays a watermark to ensure it is not confused with a live survey.

14. To preview the survey as it would be viewed from a mobile device, click **Mobile** on the ribbon.
   Mobile preview is a limited, browser-based preview that gives you a general idea of how your survey might look on a smaller device when you are designing your survey from your desktop. With that in mind, always test your surveys on applicable mobile devices and browsers before you launch them.
15. To copy the URL of the survey to your clipboard, click **Survey URL** on the ribbon.
The Survey URL message opens. A URL is automatically assigned to the survey. This is the URL that your invitation message links to and your customers visit to complete the survey. From this window, you can view the URL and it is automatically copied to your workstation clipboard.

1. Click OK when you are finished viewing the URL.

16. Click Save.

**Define the Transactional Survey Audience**

Even though your rules and campaigns determine which contacts receive the survey, you still need to define certain audience options if you want to exclude specific contacts or configure opt-out and external suppression list settings. You can also set survey frequency and recency limits to narrow your audience.

See [Overview of Audiences](#) for complete details and procedures about using contact lists and segments in surveys and mailings.

1. In the open survey, click the **Audience** tab.

   **Note:** The audience for a transactional survey automatically includes all contacts who trigger the associated transactional event. For that reason, you can select only who is excluded from the survey, not who is included in it. You can exclude a total of fifty contact lists and segments, each containing a vast number of contacts.

2. To exclude a list from the audience, click **Add Contact List** in the Excluded section. The **Select Contact List** window opens.
   - To add a contact list, click **New Contact List** and see [Add a Contact List](#).
   - Select the list you want to exclude from the survey audience and click OK.
   - The list is added to the Excluded grid. Contacts belonging to the list do not receive the survey.

3. To exclude a segment from the audience, click **Add Segment** in the Excluded section. The **Select Segment** window opens.
   - To add a segment, click **New Segment** and see [Create a Segment](#).
   - Select the segment you want to exclude from the survey audience and click OK.
   - The segment is added to the Excluded grid. Contacts belonging to the segment do not receive the survey.

4. To edit a list or segment that is excluded from the survey, click **Open** next to the list or segment name. See [Add a Contact List](#) and [Create a Segment](#).

5. To remove a list or segment from the Excluded section, click **Remove** next to the list or segment name.

6. Enter field information about communication options.

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td>Honor global opt-in</td>
<td>Select this check box to send the survey to contacts who did not explicitly opt out of receiving surveys and mailings. Clear this check box to send the survey to all contacts in the audience, regardless of their opt-in preference.</td>
</tr>
<tr>
<td>Limit frequency of communication</td>
<td>Select this check box to set a frequency limit and then enter a maximum number of surveys and mailings and a number of days in which contacts can receive messages</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
| | before they are excluded from surveys. When the survey is launched, it is not sent to any contacts who have received the maximum number of surveys and mailings within the designated time period. The minimum you can enter is two in the last one day.
| | The minimum you can enter is 2 in the last 1 day. The maximum number of days you can enter is 90.
| | **Tip:** To ensure contacts receive only 1 email every “x” number of days, use the Limit recency of communication setting described next.
| Limit recency of communication | Select this check box to set a recency limit. Enter the minimum number of days that should elapse before contacts receive another email. When the survey is launched, it is not sent to any contacts who have received a survey or mailing email in the past specified number of days.
| | The maximum number of days you can enter is 90. The default value is 1 day.
| | **Tip:** Use this check box to ensure contacts receive only one email every “x” number of days. For instance, if you want your contacts to receive only one email per week, you can select this check box and then set the field to seven.
| Honor external suppression list | Select this check box to exclude contacts in the external suppression list from receiving the survey. Clear this check box to send the survey to all contacts in the audience, even if they are in the external suppression list. See [Overview of the External Suppression List](#) for complete details and procedures about the external suppression list.
| Limit delivery to a randomly selected subset of the audience | Select this check box to send the survey to a random subset of the audience. Enter a percentage or use the up and down arrows to select a percentage of the audience to send the survey to.
| Allow delivery of messages to multiple contacts sharing the same email address | Select this check box to send messages to multiple contacts sharing the same email address. If this check box is cleared, the message is sent only to the contact most recently updated. This option is available only when email address sharing is enabled. See [Email Address Sharing](#).
| | **CAUTION:** Because duplicate messages sent to a single address are a common characteristic of spam, you should select this check box only when necessary. When the check box is selected and you attempt to schedule or send a mailing, survey, or proof, and duplicate email addresses exist in your audience, a message warns you that your reputation as a bulk email sender may be adversely affected and impact your ability to send future communications.
How Invitation Messages Work in Transactional Surveys

From the Invitation Message tab, you can activate market testing and specify the mailbox settings for the mailing, the subject of the email, and any URL parameters you want to attach to links in the message.

In addition, you can create either plain text or HTML messages from scratch, from existing content, or by uploading HTML from another site. Creating an invitation message follows the same procedure as creating an invitation message in a broadcast survey. See Create an Invitation Message in Broadcast Surveys.

Note: By default, a transactional survey that has been launched or canceled can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, suspend a launched survey invitation message, make edits, and then relaunch it. See Suspend a Transactional Survey. For a canceled survey, you can copy it, and then modify and send the copy. See Cancel a Transactional Survey Invitation Message. Alternatively, you can enable the RNM_MOD_SENT_DOCS configuration setting (Outreach and Feedback/General/Miscellaneous) to allow edits to documents that have been used in sent messages. Just be aware when you enable this setting, you will no longer be able to view the original content sent to your customers, and your reporting will not be as accurate.

Activate Market Testing in Transactional Surveys

When creating a transactional survey, you can send a sample of test messages to portions of your audience before determining the best one to use as a final message. You can define different message content, designs, delivery, and proofing options for each version of your message.

For transactional surveys, market testing is available in audience sampling mode. If more than one message is created when market testing is used, then contacts who sent the email through a campaign or rule will receive one of the test messages. When the survey is launched through a campaign, market testing rotates between the test messages. After you evaluate the effectiveness of your test messages, you create a final message.

   The Select Market Testing Mode window opens.
2. Select Audience Sampling.
3. Click OK.
   The Invitation Message tab displays in audience sampling mode.
   You can add additional messages, edit the messages, send proofs, or view results. From here, you can also see information about each message.

</tbody>
</table>

**Note:** Unsubscribe sets global opt-in in both Outreach and Feedback. See [Insert an Unsubscribe Link](#).

| Replied       | This column displays the number of times the survey message was replied to. |

4. Click **New** on the toolbar to add a second test message.

   The **Edit Message** window opens.

5. Enter the name of the message in the **Name** field.

6. Enter the subject of the message in the **Subject** field on the Content tab. See [How Invitation Messages Work in Transactional Surveys](#).

7. Define any other content or formatting options you may want to test using either the HTML editor or the Text editor on the Content tab. See [How the HTML Editor Works](#) and [How You Create and Edit Text-Only Messages](#).

8. To send a proof, click the **Proofing** tab on the Edit Message window. See [Proof Results](#).

9. Click the **Delivery** tab on the Edit Message window to access delivery options for the test message. See [Access Transactional Delivery Options for Surveys](#).

10. Click **OK**.

    The new message displays on the Invitation Message tab.

11. To open a message for editing, select the message and click **Open**.

12. To delete a message, select the message and click **Delete**.

13. To copy a message to create a new message, select the message and click **Copy**.

    A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages are not shared with the original test message or subsequent copies. See [Automatically Generated Folders](#).

14. To send a proof, select the message and click **Send Proof**.

15. To preview the content of a message, select the message and click **Preview**.

16. To refresh the message statistics, click **Refresh**.

17. To add URL parameters, enter any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the **URL Parameters** field.

18. To add a merge field to the URL parameters, click the **Merge Field** icon to the right of the URL Parameters field and select the field. See [Insert a Merge Field to a URL Parameter](#).

**Access Transactional Delivery Options for Surveys**

After you have created the questionnaire, defined the audience, created an invitation message, and proofed the survey, you can launch the survey so you can send it in rules and campaigns.
You must create a questionnaire before delivering the survey. See *Create a Questionnaire in Basic Mode*.

From the Delivery tab, you can launch, suspend, or cancel surveys as well as access common administration tasks and see the send history.

1. From an open survey, click the **Delivery** tab.

   The Delivery tab is divided into sections. The Delivery Status section displays the status of the survey (see *Survey Delivery Statuses*) and contains buttons for controlling the sending of the survey. You can perform the following tasks from this section.
   - **Launch a survey**—See *Launch a Transactional Survey*.
   - **Suspend a survey**—See *Suspend a Transactional Survey*.
   - **Cancel a survey**—See *Cancel a Transactional Survey Invitation Message*.

On the bottom of the tab, delivery information about the survey is available for you to quickly scan and assess.

<table>
<thead>
<tr>
<th>Section</th>

<td>This section contains a link to test survey compliance with the CAN-SPAM Act of 2003. If you have already tested CAN-SPAM compliance, the test results and a link to the details of the test display. See <em>Check Compliance from the Delivery Tab</em>.</td>
</tr>
<tr>
<td>Message Send History</td>
<td>This section displays a log of events relating to the delivery status of the survey. If the survey has not been sent, it is noted here.</td>
</tr>
</tbody>
</table>

**Launch a Transactional Survey**

After you launch a survey, the status changes to Launched. From the Launched status, you can suspend the survey invitation message or cancel it.

Transactional surveys must be launched before they can be used in rules or campaigns.

**Note:** By default, a launched transactional survey can no longer be edited. This ensures that you can accurately track the content you send your customers. You can, however, suspend the survey invitation message, make edits, and then re-launch it. See *Suspend a Transactional Survey*. Alternatively, you can enable the RNM_MOD_SENT_DOCS configuration setting (**Outreach and Feedback/General/Miscellaneous**) to allow edits to documents that have been used in sent messages. Just be aware when you enable this setting, you will no longer be able to view the original content sent to your customers, and your reporting will not be as accurate.

1. From the Delivery tab of an open survey, click **Launch**.
2. Click Yes to confirm the survey launch.

The delivery status on the Delivery tab changes to Launched and you can see how many surveys were sent and delivered.

Suspend a Transactional Survey

You may want to stop sending a survey after it has already been launched. You can temporarily stop a survey from sending by suspending it.

1. From the Delivery tab of an open survey, click Suspend.

   Note: This button appears only when a survey has been launched.

   The Confirm Suspend message appears asking you to confirm that you want to suspend the survey.

2. Click Yes to confirm suspending the survey.

The status changes to Suspended and the Delivery Status section displays the number of audience members the survey was already sent and delivered to.

Cancel a Transactional Survey Invitation Message

You can cancel a survey invitation message at any time. When you cancel a survey invitation message, the survey is saved and you can still view survey results. However, the survey invitation message cannot be launched again.

By default, a canceled survey can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, copy a canceled survey and then modify and send the copied survey.

Tip: Alternatively, you can enable the RNM_MOD_SENT_DOCS configuration setting (Outreach and Feedback/General/Miscellaneous) to allow edits to documents that have been used in sent messages. Just be aware when you enable this setting, you will no longer be able to view the original content sent to your customers, and your reporting will not be as accurate.

1. From the Delivery tab of an open survey, click Cancel Invitation Message.

   The Confirm Cancel Invitation Message window opens asking you to confirm that you want to cancel the invitation message.

2. Click Yes to cancel the survey.

The delivery status changes to Canceled.

Create a Website Link Survey

You can create website link surveys when you do not need to email a link to the survey or target a specific set of contacts. Website link surveys are published as a web page and can be linked to from any source.

For example, you could create a survey that is linked to from the shopping cart on your website. Because website link surveys are posted as a web page, you do not need to define an audience or invitation message, or send or launch the survey. After you save the survey, it is available on the web and can be linked to from your outside source.

1. From the Surveys explorer, click New.

   A new survey opens on the content pane.

   Tip: You can also create surveys from an open survey by clicking New. Additionally, if your navigation set is configured to add surveys from the file menu, click File > Surveys > Survey. See Configure the File Menu.

2. Click Website Link.
By default, the Summary tab is active when creating a website link survey. From here, you can review general information about the survey in the At a Glance section, as well as manage survey notes, tasks, and attachments (see Survey Management). As you create the survey, you move through each tab to complete the survey elements.

3. To assign the survey to another staff member (by default, the survey is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.
   a. To search for a staff member, enter the staff member’s name in the Find field.
      Wildcards are supported when searching staff members. You can search strings that include a space by entering %Space+character, which is helpful when searching last names. For example, typing %Space returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing b in the Find field returns all items containing the letter b.

4. To remove the ability of customers to answer the survey anonymously, clear the Allow Anonymous check box.

   **Note:** Selecting Allow Anonymous in your survey does not mean that all responses are anonymous. If a survey invitation is sent to a contact or an B2C Service cookie is detected on the contact’s computer, or the survey itself contains an email address field, Feedback attempts to use that information to identify the contact.

5. Click the text in the At a Glance section to perform common survey functions.

<table>

</table>
Field | Description
---|---
Proofing | This field displays the number of proofs that have been sent, approved, and rejected. Click Send Proof Message to send a proof. See *Send a Proof*. 

Rule Visibility | Clear the Chats check box to make this survey unavailable as an action in a chat rule. Rule Visibility only displays if Chat is enabled.

6. Click the **Questionnaire** tab to add questions and HTML content to the survey. See *Create a Questionnaire in Basic Mode*.
7. Click the **Proofing** tab to send a proof of the survey for internal review before sending it to the entire audience. Tip: The email that is sent from the Proofing tab for website link surveys uses the Survey Proof message template. You can customize this message template from the Message Templates editor. For complete details and procedures about customizing templates, see *Overview of Message Templates*.
8. To view the reports associated with the survey, click the **Results** tab. See *View Survey Results*.
9. To preview the survey as it would be viewed on a standard web device, such as a desktop or a laptop, click **Standard** on the ribbon. The survey preview opens in a web browser.
10. To preview the survey as it would be viewed from a mobile device, click **Mobile** on the ribbon. See *Mobile Surveys*. Mobile preview is a limited, browser-based preview that gives you a general idea of how your survey might look on a smaller device when you are designing your survey from your desktop. With that in mind, always test your surveys on applicable mobile devices and browsers before you launch them.
11. To copy the URL of the survey to your clipboard, click **Survey URL** on the ribbon. The Survey URL message opens. The system automatically assigns a URL to the survey. This is the URL that you link to from outside of B2C Service. From this window, you can view the URL and it is automatically copied to your workstation clipboard.
12. Click **Save**.

**Polling Surveys**

Polling surveys display as a question on a customer portal page or any page that is external to the customer portal. Polling surveys offer a unique way to engage your customers by asking them a single question, and then using their responses to gauge your business activities.

After customers submit their response, they see a poll results chart or a thank-you message, depending on the question type used in the polling survey. Question types include **text**, **choice**, and **matrix**. Any of these question types can be used, although the choice question type may be the most useful in a polling survey. It is also the only question type that presents customers with a results chart.

Customers are presented with only a single question. If you activate more than one question in a polling survey, then one active question is randomly selected to display to customers for a one-hour time period. Every customer who is offered the poll during that hour sees the same question. At the end of an hour, a new active question is selected at random.
Since polling surveys allow anonymous responses, if customers are not logged in, they can still respond to the survey. If customers are logged in, their responses to the survey question are associated with their contact record.

Because polling surveys are posted to a customer portal page or an external web page, you do not need to define an audience or invitation message, or send or launch the polling survey.

**Note:** Polling surveys are associated with polling widgets—either a Polling widget or a PollingSyndication widget. Widget attributes and styling options are defined in the customer portal. See [Polling Widgets](#).

### Create a Polling Survey

Polling surveys display as a question on a customer portal page or any page that is external to the customer portal.

1. From the Surveys explorer, click **New**.
   A new survey opens on the content pane.
   
   **Tip:** You can also create surveys from an open survey by clicking **New**. Additionally, if your navigation set is configured to add surveys from the file menu, click **File > Surveys > Survey**.

2. Click **Polling Survey**.
   The Summary tab for a polling survey displays on the content pane.
   By default, the Summary tab is active. From here, you can review general information about the polling survey in the **At a Glance** section, as well as manage polling survey notes, tasks, attachments, and audit log. As you create the polling survey, you move through each tab to complete the polling survey elements.

3. To assign the polling survey to another staff member (by default, the survey is assigned to the staff member who creates it), click the **Assigned** drop-down menu and select the staff member. To search for a staff member, enter the staff member’s name in the **Find** field.
   
   Wildcards are supported when searching staff members. You can search strings that include a space by entering `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the **Find** field returns all items containing the letter b.

4. Click the text in the **At a Glance** section to perform common polling survey functions.

<table>

<td>This field displays the number of responses a survey can accept. If set, this field also displays the number of responses received, as well as the number of surveys that are still allowed. The maximum number of survey responses you can define is one million.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This field works only on sites using Customer Portal Framework Version 3.0 or later.</td>
</tr>
<tr>
<td>Expiration Message</td>
<td>Click <strong>Edit</strong> to customize the survey expiration message. If you do not define your own survey expiration message, the system default message is used. This field works only on sites using Customer Portal Framework Version 3.0 or later.</td>
</tr>
<tr>
<td>Question List</td>
<td>This field displays how many active and inactive questions are in the polling survey. The system supports a maximum of 100 questions. There must be at least one active question in the polling survey.</td>
</tr>
<tr>
<td>Responses</td>
<td>This field displays how many polling surveys were offered to and submitted by customers.</td>
</tr>
</tbody>
</table>

5. Click the **Question List** tab to add questions to the polling survey.
   
   You can either add existing questions or create new questions. Keep in mind, if more than one question is used in a polling survey, one question is randomly selected to display to customers for a one-hour time period. Every customer who is offered the poll during that hour sees the same question. At the end of an hour, a new question is selected at random.

   **Tip:** Since all questions are stored in the same place, questions are shared across the different survey types.

6. Click **Add Question**.
   
   The **Select Question** window opens.

7. To add an existing question, double-click the question you want to add. The question is added to the Active Questions list.

8. To add a new question, click **Add Question**, and then click **New Survey Question**.
   a. To create a text question, see **Create a Text Question**.
   b. To create a choice question, see **Create a Choice Question**.
   c. To create a matrix question, see **Create a Matrix Question**.

   **Note:** Display options which lets you define HTML properties for all question types, may be affected by widget styling attributes defined in the customer portal. (Display options are available on the ribbon of a new question.)

   You can also activate and deactivate questions, open questions for editing, and remove questions from the questions list. Questions with results cannot be removed, but they can be deactivated.

   **Tip:** Questions can be edited after they have been created, even if they have been used in a polling survey. Keep in mind that if you edit a question, those changes appear immediately in any polling survey that uses the question. For this reason, if you want to preserve the integrity of the data returned by the original question, we recommend creating a new question rather than editing the existing question.

9. To define polling survey options, click **Polling Options** on the ribbon. The **Polling Survey Options** window opens.
a. To define the polling survey title that displays on the web page, enter it in the Poll Title field.
b. To let respondents see the polling survey results chart on the web page, select Show Chart.
c. To display the total number of votes on the web page, select Show Total Votes.
d. To display polling survey results to all web page visitors, even if they have not responded to the poll, select Show View Results Link.
e. To define what happens after customers submit a polling survey, click Add Action in the End of Survey Actions section. You can also edit, remove, and reorder actions. End of survey actions are handled the same way as end of survey options in broadcast and transactional surveys.

Note: In order for an end of survey action to work from an external page, the customer portal needs to associate the customer with a contact record. Therefore, the customer must be logged in to the customer portal site, or you must implement open login or pass-through authentication (PTA) functionality. See Set End of Survey Options.

10. To spell check the polling survey, click Spelling.
11. To preview the polling survey, click Preview Survey.

The polling survey preview lets you see specific questions and switch between views.

Tip: Since polling surveys are not accessible through a link, you can’t send a proof of your polling survey to anyone. So previewing and spell checking your polling survey are important steps in your process.

12. Click the Results tab to view the reports associated with the polling survey.
   a. Select a question and click Go.
      The question results display in a web browser.

   Tip: If your polling survey uses a text question, you can use topic monitoring to group the text responses containing similar content so that you can look for emerging themes. See Topic Monitoring.

13. Click Save.

When you save the polling survey, a survey ID is assigned that must be associated to the polling widget in the customer portal. See Add the Polling Widget to a Page.

HTML Properties in Polling Surveys

You can define HTML properties in polling surveys. While the steps for defining HTML properties for a polling survey are the same as all other survey types, there is one exception that you need to be aware of. Style precedence depends on the HTML tags defined in the customer portal.

If the customer portal web designer uses the !Important tag in the widget styling attributes, those styles take precedence over the HTML properties you define in the polling survey by clicking Display Options on the ribbon of the New Question window. For customer portal widget styling attributes, see Polling Widgets.

- To define HTML properties for a text question, see steps 5–7 in Create a Text Question.
- To define HTML properties for a choice question, see steps 6–8 in Create a Choice Question.
- To define HTML properties for a matrix question, see steps 5–7 in Create a Matrix Question.

Create a Questionnaire in Basic Mode

The questionnaire is the main part of broadcast, transactional, and website link surveys. It consists of a set of questions you want your customers to answer.
You must create a questionnaire for these types of surveys. From the Questionnaire tab, you have all the tools you need to create a dynamic HTML survey. You can add your own content, along with new and previously created questions. In your survey, you can add multiple pages to your questionnaire. This can help break up the survey into manageable chunks. Customers see only questions on one page before proceeding to the next page.

You can create the questionnaire in either basic or advanced mode. In basic mode, you can design multi-page questionnaires in a straightforward interface focused mainly on your survey presentation. In advanced mode, you can design a flow diagram to present questionnaires, set criteria for survey branches, and trigger automated actions such as sending notifications, setting fields, and creating opportunities and incidents.

The following procedure describes how you can create a questionnaire in basic mode. See Create a Questionnaire in Advanced Mode for the procedure for creating a questionnaire in advanced mode.

**Note:** Questionnaires do not apply to polling surveys because polling surveys use a list of questions instead of questionnaires. See Polling Surveys.

1. In an open survey, click the Questionnaire tab.
   
   The Questionnaire tab opens on the content pane.

   The Questionnaire tab is divided into sections. The main section shows the page you are editing and displays the current content and questions in the questionnaire. When you create a questionnaire, this section is blank. If there is more than one page in the questionnaire, you can scroll through the pages using the arrows at the top of this section.

   On the right side are options for the tasks you can perform on the questionnaire, such as adding a question. The Page Tasks section contains options for the tasks you can perform on the specific page of the questionnaire you are working on. The Survey Tasks section contains options for the tasks you can perform on the entire survey. You can also right-click in the main section to select from the most common tasks.

2. Enter field information.

<table>
<thead>
<tr>

</tbody>
</table>

## Add a Question to a Survey

Adding questions is the most important part of creating your survey. You can add any questions already in Feedback or create questions as needed.

1. Click **Add a Question** in the Page Tasks section.
The **Select Question** window opens.

**Tip:** You can also add questions by hovering over the Questions tab to the right of the Page Tasks section and then dragging a question from the list to the survey page. To make the Questions section easier to access, you can dock it to the Questionnaire tab by clicking the Auto Hide icon at the top of the Questions section.

2. To add an existing question, select it from the list and click **OK** or double-click the question.

To add multiple questions at the same time, press the Ctrl key while selecting each question you want to add. When you drag multiple questions to the survey page, they are added in the order in which they were selected.

3. To create a new question, click **New Survey Question**.

A window opens where you can create a question. After you save the new question, it appears in the questions list. See **How Questions Work**.

4. To reorder questions on the page, drag each question to its new position.

5. To open a question for editing, click **Open**.

6. To remove a question from the survey page, click **Remove**.

7. To move the question to another page of a multi-page questionnaire, click the arrow next to Remove and select **Move**. The **Move Item** window opens.

   a. Select a destination page from the list.
   
   b. Click the **Before Item** drop-down menu to select the question you want the moved question to come before.
   
   c. Click **OK** to move the question to the specified location.

**Related Topics**

- Best Practices for Writing Effective Questions

**Set the Page Title**

You can change the title of the page you are editing from the default “Page <page number>.” The page title displays in the title bar of the web browser when the survey is taken.

1. In your open questionnaire, click **Set Page Title** in the Page Tasks section.

   The **Set Page Title** window opens.

2. Enter the name of the page in the **Title** field.

   This field must contain a value.

3. Click **OK**.

**Organize Questionnaire Pages**

If you have more than one page in your questionnaire, you can organize the pages by reordering, deleting, or adding pages. You can also edit the page titles to change what displays to customers in the title bar of their web browser.

The system automatically creates a document for each page created in a questionnaire and stores it in the Automatically Generated folder in the Documents explorer. When you update a page in the questionnaire, those changes are also made to the automatically generated copy. See **Automatically Generated Folders**.

1. In your open questionnaire, click **Organize Pages** in the Survey Tasks section.

   The **Organize Pages** window opens and displays a list of the pages in your questionnaire.

2. To add a page, click **Add Page**.

   A page is added to the bottom of the list.

3. To edit a page title, select the page you want to edit and click **Edit Title**. See **Set the Page Title**.

4. To delete a page from the questionnaire, select the page you want to delete and click **Remove**.
The page and all of its contents are deleted.

| CAUTION: Deleting a page cannot be undone. |

5. To move a page up one position, select the page and click Move Up.
6. To move a page down one position, select the page and click Move Down.

| Tip: You can also drag and drop pages to adjust their position. |

7. Click OK.

Apply a Survey Template
You can use a template to add HTML above and below the content and questions in your questionnaire. Templates are created through the Content Library.

1. In your open questionnaire, do one of the following:
   - Click Apply Template in the Survey Tasks section.
   - Click Choose next to Survey Template at the bottom of the content pane.

   The Choose Template window opens.

2. Select the template you want to use and click OK.

   The template is applied to your questionnaire and the name of the template appears in the Survey Template section.

3. To clear a template from your survey, do one of the following:
   - Click Clear Template on the Choose Template window.
   - Click Clear next to Survey Template on the bottom of the content pane.

Related Topics
- How Templates Work

Set Survey Options
Specifying survey options lets you customize your questionnaire. You can set font attributes, choose how to notify customers of their progress through your survey, and specify how you identify customers.

You can also add back buttons to multiple-page surveys and change the default text of the button labels. Any questions that respondents answer are saved, making it easy to review or change answers from a previous page or to come back at a later date to finish a survey.

Additionally, mobile optimization is applied, by default, from your survey options. Mobile optimization makes your surveys user-friendly when taken on mobile devices. See Mobile Surveys.

1. In your open questionnaire, click Survey Options in the Survey Tasks section.

   The Survey Options window opens.

2. Enter field information.

Clear this check box to disable optimization for mobile devices.</td>
</tr>
</tbody>
</table>

3. Click **OK**.

### Set End of Survey Options

You can determine what happens after customers submit a survey. For example, you can add the contact to a list, create an opportunity, or send the customer an email.

A wizard helps step you through the process of the final actions performed after a survey is submitted. In addition, you can specify where customers are routed, such as the default Thank You page or your own website.

**Note:** When a survey is responded to anonymously, survey actions that require contact identification are disregarded. Feedback cannot create an incident or opportunity for an anonymous responder, add them to a list, or send them a transactional mailing or survey.

1. In your open questionnaire, click **End of Survey Options** in the Survey Tasks section.

   Step 1 in a polling survey is slightly different. In your open question list, click **Polling Options** on the ribbon to open the Polling Survey Options window, where the End of Survey Actions section displays. Continue with step 2.

   The **End of Survey Options** window opens.

2. Click **Add Action** to add an action that is performed when the survey is submitted.

   The **Survey Final Action Wizard** opens. See [Add an Action with the Survey Final Action Wizard](#).

3. To edit an action, select the action and click **Edit Action**.

4. To delete an action, select the action and click **Remove**.

5. To move an action up one position, select the action and click **Move Up**.

   The actions execute in the order they are listed.

6. To move an action down one position, select the action and click **Move Down**.

   **Tip:** You can also drag and drop actions to adjust their position.

7. Select the page you want to display after the survey is submitted from the options listed in the Final Page section.
## Option Description

### Redirect to Default Thank You Page
Select this option to use the default final page. Customers are redirected to a B2C Service page that thanks them for their feedback.

You can edit this page through the File Manager using the `cci/top.php`, `head.php`, and `bottom.php` files. See [Manage Files with the File Manager](#).

### Redirect to URL
Select this option and enter a URL to redirect customers to a specific website. See [Edit Redirect to URL Attributes](#).

### Open URL
Click this icon to open the URL.

### Add
Click this icon to add a contact, incident, opportunity, or tracked link **merge field** to the URL. See [Insert a Text Merge Field](#).

### Display Final Page Without Buttons
Select this option to display the final page of the survey without a Submit button.

If you select this option, your survey should have more than one page with no questions on the last page, since answers cannot be submitted.

1. **Click OK.**

### Add an Action with the Survey Final Action Wizard

When setting end of survey options, the Survey Final Action wizard steps you through the process of adding an action to the end of your survey.

You can choose from several actions and also specify whether the action occurs at the end of all survey submissions or just when a survey **score** has been met. See [Set End of Survey Options](#).

1. From the End of Survey Options window, click **Add Action**.

   The **Survey Final Action Wizard** opens.

2. Click **Next**.

3. Select the action you want to perform from the final action type options.

<table>
<thead>
<tr>
<th>Action Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add the Survey Contact to a List</td>
<td>Select this option to add the customer to a contact list after submitting the survey.</td>
</tr>
<tr>
<td>Create an Opportunity</td>
<td>Select this option to create an opportunity in Opportunity Tracking using the customer information.</td>
</tr>
</tbody>
</table>
### Action Type | Description
---|---
Create a Notification | Select this option to send an email to staff members notifying them that the survey has been submitted.
Create an Incident | Select this option to create an incident in Service using the customer information.
Create a Lead | Select this option to create a lead in Opportunity Tracking using the customer information.
Execute Object Event Handler | Select this option to create a contact-related object event handler using customer information.
Send an Email to a Contact | Select this option to send a transactional mailing to the customer.
Set a Field Value | Select this option to set a field in the contact record for the customer.
Execute an External Event | Select this option to execute an external event after the survey is submitted.

4. Click **Next**. The next page that displays depends on the action you selected in the previous step. On this page of the wizard, you can set details for the action.

- **Add the Survey Contact to a List**—See *Edit Add to List Attributes*.
- **Create an Opportunity**—See *Edit Opportunity Attributes*.
- **Create a Notification**—See *Edit Notification Attributes*.
- **Create an Incident**—See *Edit Incident Attributes*.
- **Create a Lead**—See *Edit Lead Attributes*.
- **Execute Object Event Handler**—See *Edit Execute Object Event Handler Attributes*.
- **Send an Email to a Contact**—See *Edit Transactional Mailing Attributes*.
- **Set a Field Value**—See *Edit Set Field Attributes*.
- **Execute an External Event**—See *Edit External Event Attributes*.

5. Click **Next**.

6. Select when the action should be performed.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Every time the survey is completed</td>
<td>Select this option to perform the action every time the survey is submitted.</td>
</tr>
<tr>
<td>When the completed survey score is</td>
<td>Select this option and enter a survey score to send the survey only when the survey is equal to, less than, greater than, or between certain scores. For information about question scores, see <em>Create a Choice Question</em>.</td>
</tr>
</tbody>
</table>
7. Click **Finish** to add the action.
8. Click **OK**.

**Tip:** The actions available in the Survey Final Action Wizard are also available as standards elements when editing in *advanced mode*.

---

### Create a Questionnaire in Advanced Mode

If you want to create more detailed questionnaires, you can do so in advanced mode. Feedback provides an intuitive graphical interface for creating and editing advanced surveys.

For example, to add survey branching, you can use the Decision element or the Case Statement element. See *Edit Decision Attributes* and *Edit Case Statement Attributes*. When creating and editing an advanced survey, you perform most tasks using the ribbon, canvas, and survey components. These resources provide all of the tools and elements you need to design an advanced survey.

1. Click **Switch to Advanced Mode** in the Survey Tasks section.

When you switch to advanced mode, the default questionnaire displays a survey page element, a Submit connector, and a Redirect to URL element that is defined (by default) to display a thank you page when the contact clicks the Submit button. This flow represents the simplest form of an advanced survey that you can send. See *Edit Redirect to URL Attributes*.

### Advanced Mode Survey Ribbon

The advanced mode ribbon features two additional tabs, Designer Home and View, from which you can access options to create or edit an advanced survey. Each tab on the ribbon has one or more groups containing options you can use to modify the survey or elements on the canvas.

**Advanced Survey Designer Home Tab**

The Home tab in advanced surveys gives you access to basic editing functions, survey components, and attributes that impact the entire survey.

From the Advanced Survey Designer Home tab, you can specify certain survey options to customize your questionnaire. You can set the font attributes and choose how to notify customers of their progress through your survey. You can also specify how the system identifies contacts. See *Set Survey Options in Advanced Mode*.

<table>

</table>
Set Canvas Options
The following procedure describes the steps for customizing your canvas options on the View tab in advanced surveys.

1. To display labels for connectors on the canvas, select **Connector Labels** on the View tab.
2. To display validation results on the canvas, select **Validation Results**. See **Survey Validation**.
3. To display the canvas grid, select **Grid**.
4. To change the size of the canvas grid, click the **Grid Size** drop-down menu and select from Small, Medium, or Large.

Set Zoom Options
You can set zoom options that are available from the View tab.

1. Click **Zoom** on the View tab.
   The **Zoom Options** window opens.
2. To specify a desired zoom level, select an option in the **Zoom To** section.
   a. To adjust the zoom level to show all components, select **Fit to Screen**.
   b. To show the entire canvas, select **Extents**.
3. Enter a zoom percentage in the **Percent** field. Click the up or down arrow to increase or decrease the value.
   **Tip:** You can also change the magnification of the canvas using the zoom slider located in the bottom right corner of the Service Console.
4. Click **OK**.

Campaign and Survey Element Tools Tab
When you select an element on the canvas of a campaign or an advanced survey, the design ribbon displays a contextual tab called the Element Tools tab.

The contextual tabs that display on the ribbon depend on your selection. When you select an element or a connector, the ribbon displays a fourth contextual tab. When an element is selected, the Element Tools tab displays. The Element Tools tab is divided into two sections. On the left are contextual groups and options, meaning they change depending on the element selected. On the right are standard groups and options, meaning they display no matter what element is selected.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>The options in this group let you change the font style, size, and color. You can select font attributes, such as bold and italic, and change the text alignment.</td>
</tr>
</tbody>
</table>
| ![Label Position](image)  
(Label Position) | Click this icon to select the position of the label relative to the element. The default label position of a new element is Inside. |
| ![Text](image)  
Text | Click this icon to enter the text of the element label.  
You can also edit the label text inline by clicking the element label. |
| Notes        | Click this option to enter notes about the element. |
| Size         | The options in this group let you change the height and width of the element. |
Campaign and Survey Path Tools Tab

When you select a connector on the canvas of a campaign or an advanced survey, the design ribbon displays a contextual tab called the Path Tools tab.

The options on this tab let you format the connector and change the connector type. See Connectors in Campaigns and Connectors in Surveys.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Click this drop-down to change the type of the selected connector. A connector type can be changed only when it is not connected to a standard or event-triggering element.</td>
</tr>
<tr>
<td>Style</td>
<td>The options in this group let you change the line style of the selected connector.</td>
</tr>
<tr>
<td>Straight</td>
<td>Click this option to set the connector line style to straight.</td>
</tr>
<tr>
<td>Square</td>
<td>Click this option to set the connector line style to square.</td>
</tr>
<tr>
<td>Rounded Square</td>
<td>Click this option to set the connector line style to rounded square.</td>
</tr>
<tr>
<td>Curved</td>
<td>Click this option to set the connector line style to curved.</td>
</tr>
</tbody>
</table>

Design an Advanced Survey Flow Diagram

The first step in creating a survey in advanced mode is to design a flow diagram. The flow diagram is a graphical representation of the survey “flow,” the actions and decisions your survey will perform, and the order in which it will perform them.

Your flow diagram can be as simple as a single path connecting a few actions, or it can be complex, routing your audience through dozens of actions, paths, and decision points. With its simplified graphical interface, Feedback makes creating even a complex workflow as easy as clicking and dragging components into a logical order.

Whether your business needs are simple or complex, you should start by reviewing the elements available in the toolbox and consider how each might help accomplish the key objectives of your survey. When you have a clear idea which elements will be useful, you can create the flow diagram by dragging them from the toolbox to the canvas, inserting each element in a logical position, and connecting them to define the sequence of actions. After an element has been inserted, you can double-click it to open a window where you can edit its attributes.

Tip: When explaining attributes that can be edited on a window or the ribbon, we describe the procedure using the window. However, keep in mind that the ribbon provides easy access to most of the same attributes available on windows, without the need to double-click. Survey elements can also be dragged to your flow diagram from the Elements groups on the Designer Home tab.
When a survey is launched and a contact performs the first action, the decisions and actions in the survey are evaluated and executed in the sequence you have specified. For example, when a contact submits a web form, your campaign evaluates the information provided and executes the next action, such as creating a sales lead and sending a follow-up message to the contact.

**Note:** When a survey is responded to anonymously, survey actions that require contact identification are disregarded. Feedback cannot create an incident or opportunity for an anonymous responder, add them to a list, or send them a transactional mailing or survey.

If you switch to *advanced mode* before adding anything to the questionnaire, the canvas initially displays the components of a basic survey: a blank web form with a submit button that redirects to the Feedback standard Thank You page. These elements serve as the starting point for your design. You can add, edit, or remove elements to customize the questionnaire to fit your needs.

1. Drag and drop a survey element from the toolbox onto the canvas.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Event Triggering Elements</strong></td>
<td>Event-triggering elements serve as starting points for questionnaires.</td>
</tr>
<tr>
<td>Survey Page</td>
<td>Drag and drop this element to add a survey page to the questionnaire. After adding this element, double-click it to add content to the page. See <em>Edit a Survey Page</em>.</td>
</tr>
<tr>
<td>Serve Web Page</td>
<td>Drag and drop this element to serve a web page. After adding this element, double-click it to define its attributes. See <em>Edit Serve Web Page Attributes</em>.</td>
</tr>
<tr>
<td><strong>Conditional Elements</strong></td>
<td>Conditional elements produce multiple path outcomes based on decisions.</td>
</tr>
<tr>
<td>Decision</td>
<td>Drag and drop this element to add a decision point. A decision lets you specify conditions the contact must meet to advance in the workflow. You can create two outgoing paths from a decision: Yes (contact meets the criteria) and No (contact does not meet the criteria). See <em>Connectors in Surveys</em>. After adding the decision, double-click it to define its attributes. See <em>Edit Decision Attributes</em>.</td>
</tr>
<tr>
<td>Case Statement</td>
<td>Drag and drop this element to add a case statement to the survey. A case statement is a type of conditional element that lets you add multiple choice decisions. This give you an easy way to add diverse branching capabilities to your surveys based on conditions defined in the workflow. Case statements are unique because they have an outgoing path for every condition. As soon as the first choice (condition) is matched, the path for that choice is followed, and no other conditions within the case statement are evaluated. See <em>Connectors in Surveys</em>. After adding the case statement, double-click it to define its attributes. See <em>Edit Case Statement Attributes</em>.</td>
</tr>
<tr>
<td><strong>Standard Elements</strong></td>
<td>Standard items perform actions when specified criteria are met.</td>
</tr>
<tr>
<td>Element</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>

</tr>
<tr>
<td>Notification</td>
<td>Drag and drop this element to send a notification to one or more staff members. After adding this element, double-click it to define its attributes. See <a href="#">Edit Notification Attributes</a>.</td>
</tr>
<tr>
<td>Redirect to URL</td>
<td>Drag and drop this element to redirect the contact to a URL. After adding this element, double-click it to define its attributes. See <a href="#">Edit Redirect to URL Attributes</a>.</td>
</tr>
<tr>
<td>Incident</td>
<td>Drag and drop this element to create an incident from the contact record. After adding this element, double-click it to define its attributes. See <a href="#">Edit Incident Attributes</a>.</td>
</tr>
<tr>
<td>Opportunity</td>
<td>Drag and drop this element to create an opportunity from the contact record. After adding this element, double-click it to define its attributes. See <a href="#">Edit Opportunity Attributes</a>.</td>
</tr>
<tr>
<td>Lead</td>
<td>Drag and drop this element to create a lead from the contact record. After adding this element, double-click it to define its attributes. See <a href="#">Edit Lead Attributes</a>.</td>
</tr>
<tr>
<td>Add to List</td>
<td>Drag and drop this element to add the contact to a list. After adding this element, double-click it to define its attributes. See <a href="#">Edit Add to List Attributes</a>.</td>
</tr>
<tr>
<td>Set Field</td>
<td>Drag and drop this element to set a value for one of the fields in the contact record. After adding this element, double-click it to define its attributes. See <a href="#">Edit Set Field Attributes</a>.</td>
</tr>
<tr>
<td>Execute Object Event Handler</td>
<td>Drag and drop this element to add a contact-related object event handler that will trigger an external event action. See <a href="#">Edit Execute Object Event Handler Attributes</a>.</td>
</tr>
<tr>
<td>Transactional Mailing</td>
<td>Drag and drop this element to send a transactional mailing to the contact. After adding this element, double-click it to define its attributes. See <a href="#">Edit Transactional Mailing Attributes</a>.</td>
</tr>
<tr>
<td>Transactional Survey</td>
<td>Drag and drop this element to send a transactional survey to the contact. After adding this element, double-click it to define its attributes. See <a href="#">Edit Transactional Survey Attributes</a>.</td>
</tr>
<tr>
<td>External Event</td>
<td>Drag and drop this element to run an external event. External events are scripts that run outside of B2C Service. After adding this element, double-click it to define its attributes. See <a href="#">Edit External Event Attributes</a>.</td>
</tr>
<tr>
<td>Element</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Artifacts</td>
<td>Artifact elements let you make comments about your survey. They do not affect the outcome of your flow diagram.</td>
</tr>
<tr>
<td>Comment</td>
<td>Drag and drop this artifact to add comments about your flow diagram or a specific survey component. A comment artifact does not require a connector, but if your comment is about a specific element, use the Artifact connector type. See Connectors in Surveys.</td>
</tr>
</tbody>
</table>

2. To edit the attributes of an element on the canvas, double-click the element. See How You Edit Element Attributes.

3. To connect one element to another, click an anchor on the first element and drag the connector to an anchor on the second element. See Connectors in Surveys.

4. To cut, copy, or paste one or more components, click the appropriate option on the Clipboard group of the Designer Home tab.

5. To export an image of the canvas to your workstation, click File > Export Image.

6. To change the formatting of an element, select the element and see the following table. See Campaign and Survey Element Tools Tab.

   **Tip:** To select multiple elements at the same time, press Ctrl and select each element.

Connectors in Surveys

Connectors are components used to link survey elements and indicate flow direction. Elements can be connected to other elements depending on their type. The type of connector is indicated by its color.

Each element can have a specific number of incoming and outgoing connectors. This table lists the number of connectors allowed for each element.

<table>
<thead>
<tr>
<th>Path</th>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
</table>
| Submit | Blue | This type of connector submits the element web form fields to the database and then links to another element. A web form can be a document with a web form or survey questions.  
**Note:** In order for the submit connector to work, there must be a submit action on the web form that's used in the campaign. See Insert a Survey Results Link. |
<p>| Yes | Green | This type of connector links a decision element to another element. The path is taken if the contact meets the criteria specified in the decision. |
| No | Red | This type of connector links a decision element to another element. The path is taken if the contact does not meet the criteria specified in the decision. |
| Standard | Gray | This type of connector links one element to another element. The second action is performed immediately after the first. |</p>
<table>
<thead>
<tr>
<th>Path</th>
<th>Color</th>

</table>
Connect an Element
Connectors are used to link elements and show flow direction. Elements can be connected to other elements depending on their type. The type of connector is indicated by its color.

The anchor is highlighted when the connector is able to link to it. The connector arrow will point from the first element to the second. When you connect your element types this way, the system automatically applies the correct connector type.

1. Click an anchor on the first element and drag the connector to an anchor on the second element.

   | Note: If you use the wrong connector type, the element anchor will not be highlighted.

Other ways to connect elements include the following:

- Hover over the first element and click a blue arrow to link to an adjoining element.
- Drag one element over another, hover over its blue arrow until it turns dark blue, and then drop to connect the elements. Connecting your elements this way auto-links them with the correct connector type.

<table>

</table>
Click an element from the toolbox, and then hover over an element on the canvas and click its blue arrow to drop and auto-link the new element.

Drag and drop a connector from the toolbox to the canvas, and then drag the ends of the connector to the elements you want to link.

**Related Topics**

- Connectors in Campaigns
- Connectors in Surveys

**Connect to a Different Element**

You can change the flow of your existing elements by moving a connector to a different element.

1. Click a midpoint on the connector to select it and drag one of its ends to an anchor on a different element. The element will highlight when you can connect to it. Remember, if you try to use the wrong connector type, your element will not be highlighted.

**Edit a Square or Curved Connector**

You can adjust the shape of the connection on square and curved connectors.

These images show the calibration points on square and curved connectors.

1. Click a midpoint on a square or curved connector to select it and drag the calibration points to change the connection shape.

**Delete a Connector**

You can delete connector components.

1. Click a midpoint on the connector to select it and press Delete.

**How You Edit Element Attributes**

After you have added an element to the canvas, you must edit its attributes to make it functional. For example, if you add a survey page to the canvas, you need to edit it and add the questions that will appear on that page.

The following elements can be added to an advanced survey:

- **Edit a Survey Page**
Edit a Survey Page

After you add a Survey Page element to your flow diagram, you can edit its attributes to add questions and HTML content, set the page title, and define the buttons you want to use on your page.

For multiple-page surveys, you can add next and previous buttons to your pages. Because the next button performs a submit function when it is clicked, after respondents finish a page and perform a submit, answers from that page are saved so they can easily go back and forth between pages. This makes it easy to review or change answers from a previous page or to come back at a later date to finish a survey. You can also customize the appearance of the button text and style attributes to make it more applicable for each survey page.

For best practices about using back and next buttons, see *Standard element placement when using next and back buttons*.

1. Double-click the **Survey Page** element.
2. The New Survey Page window opens.
3. Click an option in the Page Tasks section.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a Question</td>
<td>Click this button to add a question to the questionnaire. See <em>Add a Question to a Survey</em>.</td>
</tr>
<tr>
<td>Add HTML Content</td>
<td>Click this button to add HTML content to the questionnaire. See <em>How the HTML Editor Works</em>.</td>
</tr>
<tr>
<td>Set Page Title</td>
<td>Click this button to change the title of the page from the default “Page &lt;page number&gt;.” See <em>Set the Page Title</em>.</td>
</tr>
</tbody>
</table>
Modify Buttons

After you add a Survey Page element to your flow diagram, you can define the buttons you want to use on your page.

1. Click **Modify Buttons** in the Page Tasks section. The **Set Button Properties** window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Button Alignment</strong></td>
<td>Click this drop-down menu to select left, center, or right alignment. Left is selected by default.</td>
</tr>
<tr>
<td><strong>Show Next Button on Page</strong></td>
<td><strong>CAUTION:</strong> Because the next button performs a submit function for each page, do not remove the next button from survey pages that have questions on them. Otherwise, responders cannot submit their answers. This check box, which is selected by default, displays a next button and performs a submit function when you add subsequent pages to your survey. If you clear this check box, the remaining fields are disabled.</td>
</tr>
<tr>
<td><strong>Text</strong></td>
<td>To change the label of the next button, which is set to Submit by default, enter the name of the label as you want it to display.</td>
</tr>
<tr>
<td><strong>Class</strong></td>
<td>Enter any class name you want to assign to the button. You must define the class in your HTML document by either using the &lt;style&gt; tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the &lt;link&gt; tag.</td>
</tr>
<tr>
<td><strong>Style</strong></td>
<td>Enter any style attributes you want to assign to the button. Style attributes define how the button appears, such as color, font, and alignment (for example, font-family: arial, sans-serif; font-weight: bold; background: #99f00; margin-left: 20px).</td>
</tr>
<tr>
<td><strong>Show Previous Button on Page</strong></td>
<td>Select this check box to display a previous button on your page.</td>
</tr>
<tr>
<td><strong>Text</strong></td>
<td>To change the label of the previous button, which is set to Back by default, enter the name of the label as you want it to display.</td>
</tr>
</tbody>
</table>
Edit Serve Web Page Attributes

After you add a Serve Web Page element to your flow diagram, you can edit its attributes to select a document to serve as a web page through B2C Service.

You can specify the shortcut ID used to generate the URL and choose whether to prefill the web form in the document with contact fields stored in the contact’s cookies or passed as parameters in the URL. You can also customize the title of the page you are editing. The page title displays in the title bar of the web browser when the survey is taken.

**Tip:** Use a submit connector to connect this action to the next action when the web page contains a web form or survey questions. You can also add a back button to a web page that contains a web form. See Add a Back Button to a Serve Web Page.

1. Double-click the **Serve Web Page** element.
   The **Serve Web Page** window opens.
2. Enter the name of the element in the **Label** field.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Documents</td>
<td>Select the document you want to use as a web page from this list. To search for a document, right-click the list and select Search. Then enter the document name in the Find field.</td>
</tr>
<tr>
<td>New Document</td>
<td>Click this text to create a document. See Create a Document.</td>
</tr>
<tr>
<td>*Shortcut ID</td>
<td>Enter the shortcut ID that is used to format the URL in this field. The URL for the document will be: http://&lt;your_domain&gt;/ci/documents/detail/2/&lt;shortcut_ID&gt;</td>
</tr>
</tbody>
</table>

**Note:** This shortcut ID must be unique for all Serve Web Page elements in all surveys and campaigns.
4. Click the **User Identification** tab.

You can specify default values for the settings on the User Identification tab by editing optional configuration settings. See [Customize Feedback Configuration Settings](#).

5. Enter field information.

### Note:
Keep in mind that all the settings you define on the User Identification tab determine what data is passed to the survey results. This affects how you can associate your survey results to an incident or to a contact.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Identify User By</strong></td>
<td>Select from the following options to prefill a web form (if one is included in your document).</td>
</tr>
<tr>
<td>Login with Password</td>
<td>Select this option to require the contact to log in to the <em>customer portal</em> before viewing the web form.</td>
</tr>
<tr>
<td>Remember Previous Login</td>
<td>Select this check box to identify the contact through the contact’s B2C Service login cookie. If a login cookie does not exist, the contact is redirected to the login page on the customer portal. If this check box is cleared, the contact is always required to log in through the customer portal before viewing the web form.</td>
</tr>
<tr>
<td>Other Credentials</td>
<td>Select this option to identify the contact by a cookie or through URL parameters.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cookie</td>
<td>Select this option if you want to use the contact’s browser cookie to prefill the web form. The contact’s record is updated with the form submission.</td>
</tr>
<tr>
<td>Email Click-Through Parameters</td>
<td>Select this option if you want to use parameters passed in the URL to prefill the web form.</td>
</tr>
<tr>
<td></td>
<td><strong>Tip:</strong> If using this option to prefill a web form from a link in a mailing, be sure to use a web page link instead of a tracked link. Because tracked links are used to redirect to external sites, they do not support click-through parameters.</td>
</tr>
<tr>
<td>Do Not Identify</td>
<td>Select this option if you do not want the web form to prefill. This applies only to single page surveys or campaigns with only one Serve Web Page element. For surveys and campaigns with more than one page, after the contact info is added to the first page, the subsequent pages will prefill. Therefore, this option applies only to the first instance of a page in a survey or campaign flow that uses a Submit connector. For example, most surveys use a Submit connector on the first page that flows to the next page with another Submit connector, and so on. In this case, the first page will not prefill since the contact has not been identified. However, after the first page has been submitted, the next page that loads will be associated to that contact. Therefore, any web form fields on that page (as well as on subsequent pages) will prefill even though Do Not Identify is selected. <strong>Note:</strong> A contact record is updated through the web form if the email address field is included and can be matched to an existing record. When serving a website link survey, this option is available only if the Allow Anonymous check box is selected on the Summary tab of the survey.</td>
</tr>
<tr>
<td>Set Browser Cookie on Submit</td>
<td>Select this check box if you want to set the contact’s browser cookie upon submitting the form. If the contact accesses any form later, the form will be prefilled if the Cookie option is selected for that form.</td>
</tr>
</tbody>
</table>

**Tip:** You can set default values for the user identification fields by editing the configuration settings located in Outreach and Feedback/General/Campaigns. Note that default values specified by these settings impact both new campaigns and new advanced surveys.

6. To add any notes associated with the element, click the Notes tab and enter the notes.
7. Click OK.
Add a Back Button to a Serve Web Page

You can add a back button to a web page that contains a web form.

1. From an advanced survey, double-click the **Serve Web Page** element. The **Serve Web Page** window opens.
2. Click **New Document**.
3. From the HTML tab of your document, click **Begin With Blank Content**. The HTML editor opens.
4. Click **Web Form** in the Forms section of the Toolbox. See *Insert a Survey Results Link*.
   
   **Note:** Form fields cannot be added outside of a web form.
5. Click **Submit Button** to add a submit button to your web form. Web forms must contain a submit button.
6. To add a back button to your content, click **Back Button**.
7. To edit the label of the back button, double-click the button and enter the label as you want it to display.

Edit Decision Attributes

Decision elements let you branch your workflow based on two outgoing paths you define.

After you add a Decision element to your flow diagram, you can edit its attributes to require contacts to meet certain criteria before moving down the Yes path. Contacts who do not meet the criteria are moved down the No path (if one exists). When you edit the decision, you can define conditions based on contact fields or question responses and a logical expression based on the conditions.

When you create decisions in campaigns or advanced questionnaires, you can create branches in your survey based on customer response. For example, you could serve a document with survey questions as a web page, then create a decision based on a response to send them to one of two documents containing additional questions.

Also, when a matrix question is added to an advanced questionnaire, each question from the matrix can be filtered by decision elements. In this way, you can direct the flow based on a specific contact response to an individual question in the matrix.

1. Double-click the **Decision** element to open the **Decision Conditions** window.
2. Enter the name of the decision in the **Label** field.
3. Click **Add Condition** to create a condition for the Yes path. The **Add Condition** window opens.
   a. Enter the name of the condition in the **Name** field.
   b. Click the **Source** drop-down menu and select a database field or survey question.

   **Note:** When adding a text field to a decision, the Source drop-down menu displays an additional item as “<text field name> SmartSense.” Selecting the Smart Sense item lets you evaluate the customer’s emotional state or attitude based on the words or language the customer used when responding to the question. You can then specify values from Very Happy to Very Angry as criteria for your decision logic.
   c. Click the **Operator** drop-down menu and select the logical symbol that completes the condition.
   d. Enter the value of the field or click the drop-down menu and select the value in the **Value** field.
   e. Click **OK** to add the condition to the decision.

   This expression determines which contacts meet the condition (for example, State/Province=MT or <menu question>=<specified answer>). By default, when multiple conditions are added, they are joined by AND. When the AND operator is used, contacts are moved down the Yes path when all the conditions are met. You can further limit your data...
set by using the Boolean operators OR and NOT. When the OR operator is used, contacts are moved down the Yes path when any of the conditions are met.

4. To add an OR to your expression, click **Add OR Node**.
   Conditions attached to the OR node are joined by OR.
5. To edit a condition, select the condition and click **Edit Condition**.
6. To delete a condition, select the condition and click **Remove Condition**.
   The Add OR Node, Edit Condition, and Delete Condition options display only after you have added a condition.
7. Click **View Text Definition** to see your conditions as a logical expression.
8. To add any notes associated with the element, click the **Notes** tab and enter the notes.
9. Click **OK**.

**Edit Case Statement Attributes**

Case statements help you branch your workflow based on multiple conditions you define. They are unique because you define an outgoing path for each condition. When the first choice (condition) is matched, the path for that choice is followed, and no other conditions within the case statement are evaluated.

After you add a case statement element to your flow diagram, you can edit its attributes to branch your flow to different paths based on whether contacts meet certain conditions. When you edit the case statement, you can define multiple conditions using a contact field in the database, a question, or a score.

Score pertains to the cumulative score from all preceding survey question responses. Score always displays on the Cases tab.

Case statements differ from decisions because they let you add multiple paths to your flow. This image shows a case statement with four choices that lead to three different paths.

1. Double-click the **Case Statement** element.
   The **Case Statement** window opens.
2. Select a contact field, survey question, or score from the Cases tab.
   **Tip:** Depending on the item you select, choices are either already defined by default or you must define them.
3. If you want to add an “other” path to your case statement, select **Include Option for Other**.
4. To add a choice that is not defined by default, click **Add Choice**.
   The bottom section of the Case Statement window displays options to define logical expressions for your choices.
The Add Choice button does not display if choices have already been defined by default. For example, Contact Type or Global Opt-in under Default Contact Fields have choices defined. Therefore, the Add Choice button does not display when these fields are selected.

5. Click the Operator drop-down menu to select the logical symbol that completes your expression.
6. Enter the field value in the Choice field.
7. To add another choice that is not defined by default, repeat steps 4 through 6.
8. To delete a choice, select the choice and click Remove.
9. To add a choice that is defined by default, select the check boxes next to the choices you want to include in your case statement.
   Cases with menu, yes/no, and opt-in items present you with default choices defined by the database.
10. To add any notes associated with the element, click the Notes tab and enter the notes.
11. Click OK.

Edit Notification Attributes
After you add a Notification element to your flow diagram, you can edit its attributes to define which staff members to notify.

1. Double-click the Notification element.
   The Notification window opens.
2. Enter the name of the element in the Label field.
3. Enter the message you want to appear in the subject line of the notification in the Message field.
4. Select the check boxes of the staff members you want to notify.
5. To add any notes associated with the element, click the Notes tab and enter the notes.
6. Click OK.

Edit Redirect to URL Attributes
Redirect to URL elements let you define a web page your customers are redirected to when they complete the previous action in the workflow. After adding a Redirect to URL element to your flow diagram, you can edit its attributes to specify the URL you want to send the contact.

Note: The Redirect to URL element that displays when you switch to advanced mode is defined, by default, to display a Thank You page when the contact clicks the Submit button on the survey page (which is also defined by default).

1. Double-click the Redirect to URL element.
   The Redirect to URL window opens.
2. Enter the name of the element in the Label field.
3. Enter the URL of the website you want to redirect the contact to in the URL field.
   The protocol must be specified. The following protocols are supported:
   - file://
   - ftp://
   - gopher://
   - http://
   - https://
   - mailto:
   - nntp:
   - news:
4. To open the URL in a browser, click the Open URL icon to the right of the URL field.
5. To add a contact, incident, opportunity, or tracked link field to the URL as a parameter, click the **Merge Field** icon (to the right of the Open URL icon). See *Insert a Text Merge Field*.
6. To add any notes associated with the element, click the **Notes** tab and enter the notes.
7. Click **OK**.

**Edit Incident Attributes**

After you add an Incident element to your flow diagram, you can edit its attributes to define the subject, status, and other elements of the created incident.

1. Double-click the **Incident** element.

   The **Incident** window opens.
2. Enter the name of the element in the **Label** field.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Subject</td>
<td>Enter the subject of the incident in this text box.</td>
</tr>
<tr>
<td>*Status</td>
<td>Click this drop-down menu to select a status to assign to the incident. The default status is Unresolved.</td>
</tr>
<tr>
<td>Assigned</td>
<td>Click this drop-down menu to select a group or staff member to assign to the incident. Use the Find field at the bottom of the Assigned drop-down menu to quickly locate staff members.</td>
</tr>
<tr>
<td><strong>Tip:</strong> Wildcards are supported when searching staff members. You can search strings that include a space by entering <code>%+Space+character</code>, which is helpful when searching last names. For example, entering <code>%+Space+b</code> returns all last names starting with the letter b. There is also an implied wildcard when searching, so entering in the Find field returns all items containing the letter b.</td>
<td></td>
</tr>
<tr>
<td>Product</td>
<td>Click this drop-down menu to select a product for the incident.</td>
</tr>
<tr>
<td>Category</td>
<td>Click this drop-down menu to select a category for the incident.</td>
</tr>
<tr>
<td>Disposition</td>
<td>Click this drop-down menu to select a disposition for the incident.</td>
</tr>
<tr>
<td>Queue</td>
<td>Click this drop-down menu to select a queue for the incident.</td>
</tr>
<tr>
<td>Service Mailbox</td>
<td>Click this drop-down menu to select a mailbox to associate with the incident.</td>
</tr>
<tr>
<td>Customer Entry</td>
<td>Enter a default value for the customer thread in this text box.</td>
</tr>
<tr>
<td>Private Note</td>
<td>Click this tab to enter a default value for the notes thread.</td>
</tr>
</tbody>
</table>
4. Click **Set Custom Field** to set custom fields for the incident. The **Set Custom Field** window opens.

   **Note:** You must define custom fields in the Custom Fields editor before you can set a custom field for an incident. See [Add or Edit a Custom Field](#).

   a. Click the **Field** drop-down menu to select the custom field you want to set.
   b. Enter the value of the custom field in the **Value** field.
   c. Click **OK**.

   The custom field and its value appear in the Custom Fields grid.

5. To edit the value of a custom field, click **Edit** next to the custom field.
6. To remove the set value of a custom field, click **Delete** next to the custom field.
7. To add any notes associated with the element, click the **Notes** tab and enter the notes.
8. Click **OK**.

**Edit Opportunity Attributes**

After you add an Opportunity element to your flow diagram, you can edit its attributes to define fields of the opportunity created by this element.

You can specify the opportunity’s name, status, strategy, stage, assigned sales representative, and territory.

1. Double-click the **Opportunity** element.

   The **Opportunity** window opens.

2. Enter the name of the element in the **Label** field.

3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the opportunity in this field. The contact’s email address is appended to the lead name.</td>
</tr>
<tr>
<td>Status</td>
<td>Click this drop-down menu to assign a status to the opportunity.</td>
</tr>
<tr>
<td>Strategy</td>
<td>Click this drop-down menu to assign the opportunity to a strategy.</td>
</tr>
<tr>
<td>Stage</td>
<td>Click this drop-down menu to assign the opportunity to a stage. The options in this menu depend on the strategy selected.</td>
</tr>
<tr>
<td>Assigned</td>
<td>Click this drop-down menu to assign the opportunity to a sales representative. Use the Find field at the bottom of the Assigned drop-down menu to quickly locate staff members.</td>
</tr>
</tbody>
</table>
Tip: Wildcards are supported when searching staff members. You can search strings that include a space by entering `%+Space+character`, which is helpful when searching last names. For example, entering `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so entering in the Find field returns all items containing the letter b.

### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

<tbody>
<tr>
<td>Territory</td>
<td>Click this drop-down menu to assign the opportunity to a territory.</td>
</tr>
<tr>
<td>Summary</td>
<td>Enter a summary of the opportunity in this field.</td>
</tr>
</tbody>
</table>

4. Click **Set Custom Field** to set custom fields for the opportunity. The **Set Custom Field** window opens.

   **Note:** You must define custom fields in the Custom Fields editor before you can set a custom field for an opportunity. See **Add or Edit a Custom Field**.

   a. Click the **Field** drop-down menu to select the custom field you want to set.
   b. Enter the value of the custom field in the **Value** field.
   c. Click **OK**.

   The custom field and its value appear in the Custom Fields grid.

5. To edit the value of a custom field, click **Edit** next to the custom field.
6. To remove the set value of a custom field, click **Delete** next to the custom field.
7. To add any notes associated with the element, click the **Notes** tab and enter the notes.
8. Click **OK**.

4. Click **Set Custom Field** to set custom fields for the lead. The **Set Custom Field** window opens.

   **Note:** You must define custom fields in the Custom Fields editor before you can set a custom field for a lead. See **Add or Edit a Custom Field**.

   a. Click the **Field** drop-down menu to select the custom field you want to set.
   b. Enter the value of the custom field in the **Value** field.
   c. Click **OK**.

   The custom field and its value appear in the Custom Fields grid.

5. To edit the value of a custom field, click **Edit** next to the custom field.
6. To remove the set value of a custom field, click **Delete** next to the custom field.
7. To add any notes associated with the element, click the **Notes** tab and enter the notes.
8. Click **OK**.

**Related Topics**

- How You Work with Leads
Edit Add to List Attributes
After you add an Add to List element to your flow diagram, you can edit its attributes to define which list the contact is added to. You can select from predefined lists in your system or create a list.

1. Double-click the Add to List element to open the Add to List window.
2. Enter the name of the element in the Label field.
3. Select a contact list from the List tab.
   a. To search for a contact list, right-click the list and select Search.
   b. Enter the list name in the Find field.
4. To create a contact list, click New Contact List and see Add a Contact List.
5. To add any notes associated with the element, click the Notes tab and enter the notes.
6. Click OK.

Edit Set Field Attributes
After you add a Set Field element to your flow diagram, you can edit its attributes to specify the value of contact fields. You can specify a number of different field values, including opt-in status, state, or any contact custom fields defined in your system.

1. Double-click the Set Field element.
2. Enter the name of the element in the Label field.
3. Click the Field drop-down menu and select the contact field you want to set the value of.
4. To add a new contact custom field, click Add New Custom Field and see Add or Edit a Custom Field.
5. Enter a value for the contact field you selected.
6. To add any notes associated with the element, click the Notes tab and enter the notes.
7. Click OK.

Relative Field Values
In addition to setting absolute field values for date, date/time, integer, text, and text area fields, you can set relative values.

When setting a value for one of these field types, clicking the Value drop-down menu presents additional options for adding or subtracting (or appending or prepending) a value to the previous value of the field. For example, you can increment the value of an integer field by 1 or append text to a contact text field. For date and date/time fields, you can also set a value relative to the time of action, such as adding one day to the current date and time.

Options for setting relative field values vary by field type.

<table>
<thead>
<tr>
<th>Field Type</th>
<th>Value Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Add or subtract a number of days or weeks to or from the previous value or the current date.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Add or subtract a number of minutes, hours, days, or weeks to or from the previous value or the current date and time.</td>
</tr>
</tbody>
</table>
**Edit Execute Object Event Handler Attributes**

You can add contact-related object event handlers to your campaign that can be associated with create and update operations on contact objects. Object event handlers are added and managed on the process designer in a virtual container called the process model.

You must add object event handlers from the process designer and then deploy the process model before you can add Execute Object Event Handler elements to your campaign.

After you add your object event handlers on the process designer and deploy the process model, you can add an Execute Object Event Handler element to your flow diagram and then associate it with one of your object event handlers to trigger an action. See Add an Object Event Handler.

**Note:** Only synchronous object event handlers are applicable to campaigns and surveys.

1. Double-click the **Execute Object Event Handler** element.
   - The **Execute Object Event Handler** window opens.
   - Contact objects must be added on the process designer and then the process model must be deployed for objects to display on the List tab.

2. Enter the name of the element in the **Label** field.

3. Select an object event handler from the List tab.

4. To add notes about the object event handler, click the **Notes** tab and enter your notes.

5. Click **OK**.

**Edit Transactional Mailing Attributes**

After you add a Transactional Mailing element to your flow diagram, you can edit its attributes to define which mailing to send to a contact. In addition, you can choose to send the mailing immediately, at an exact time, or at a certain interval.

If the mailing is scheduled to be sent at a certain interval, it is stored until the *mailer daemon* sends it. By default, the mailer daemon sends scheduled transactional mailings every fifteen minutes. If you want the utility to send mailings more frequently, you must edit the RNMD_EVENT_PROC_INTERVAL configuration setting.

**Note:** The Transactional Mailing element simply schedules a mailing to be sent. It does not pause the processing of the flow until the mailing is sent. Therefore, any elements following this element in the flow continue to be processed immediately, even if the mailing is scheduled to be sent in the future.
This element can be filtered using segments. If you choose to filter a transactional mailing, you can select whether contacts who are in or not in the segment will be sent an email.

1. Double-click the **Transactional Mailing** element.
   
   The **Transactional Mailing** window opens.
2. Enter the name of the element in the **Label** field.
3. Select the mailing you want to send.
   
   a. To search for a mailing, right-click the list and select **Search**. Then enter the mailing name in the **Find** field.

   **Note:** In order to send a transactional mailing, it must be in a launched state. If you select a transactional mailing that has not been launched, it does not send and the system advances to the next element in your flow diagram.

4. To create a transactional mailing, click **New Transactional Mailing**. See **Create a Transactional Mailing**.
5. Click the **Schedule** tab.
6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediately</td>
<td>Select this option to send the email immediately after the action occurs.</td>
</tr>
<tr>
<td>At Exact Time</td>
<td>Select this option and click the calendar (to the right of the date field) to select a specific date and time to send the email.</td>
</tr>
<tr>
<td></td>
<td>If this option is selected, a clock icon appears on the Transactional Mailing element to indicate that a delivery time for the mailing is scheduled.</td>
</tr>
<tr>
<td>Wait</td>
<td>Select this option to send the mailing a specified amount of time after the action is triggered in the flow. Use the up and down arrows to select the number of units, and click the drop-down menu to select the interval (minutes, hours, days, or weeks).</td>
</tr>
<tr>
<td></td>
<td>If this option is selected, a clock icon appears on the Transactional Mailing element to indicate that a delivery time for the mailing is scheduled.</td>
</tr>
</tbody>
</table>

7. Click the **Filter** tab to select whether or not contacts should be included in the segment to be filtered from the mailing.

   The default is Send This Mailing Only to People in the Following Segment. If you leave the default, only contacts who meet the criteria in the segment receive the mailing.
8. Select the **Filter this Mailing** check box.
9. Click the drop-down menu and select whether or not customers in the segment will receive the mailing.
10. Select a segment for the mailing.
11. To add a segment, click **New Segment** and see **Create a Segment**.
12. To add any notes associated with the element, click the **Notes** tab and enter the notes.
13. Click **OK**.

**Edit Transactional Survey Attributes**

After you add a Transactional Survey element to your flow diagram, you can edit its attributes to define which survey to send to a contact. In addition, you can choose to send the survey immediately, at an exact time, or at a certain interval.
If the survey is scheduled to be sent at a certain interval, the survey is stored until sent by the *mailer daemon*. By default, the mailer daemon is scheduled to send scheduled transactional surveys every fifteen minutes.

**Note:** The Transactional Survey element simply schedules a survey to be sent. It does not pause the processing of the flow until the survey is sent. Therefore, any elements following this element in the flow continue to process immediately, even if the survey is scheduled to be sent in the future.

This element can be filtered using segments. If you choose to filter a transactional survey, you can select whether contacts who are in or not in the segment are sent an email.

1. Double-click the **Transactional Survey** element. The **Transactional Survey** window opens.
2. Enter the name of the element in the **Label** field.
3. Select the survey you want to send.
   a. To search for a survey, right-click the list and select **Search**. Then enter the survey name in the **Find** field. In order to be sent, the transactional survey you select must be in a launched state. If you select a transactional survey that has not been launched, it is not sent and the system advances to the next element in your flow diagram.
4. To create a transactional survey, click **New Transactional Survey**. See Create a Segment.
5. Click the **Schedule** tab.
6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediately</td>
<td>Select this option to send the survey invitation message immediately after this action occurs.</td>
</tr>
<tr>
<td>At Exact Time</td>
<td>Select this option and click the calendar (to the right of the At Exact Time field) to select a specific date and time to send the invitation message. If this option is selected, a clock icon appears on the Transactional Survey element to indicate that a time has been scheduled for this invitation message.</td>
</tr>
<tr>
<td>Wait</td>
<td>Select this option to send the survey invitation message a specified amount of time after this action is triggered in the flow. Use the up and down arrows to select the number of units, and click the drop-down menu to select the interval (minutes, hours, days, or weeks). If this option is selected, a clock icon appears on the Transactional Survey element to indicate that a time has been scheduled for this invitation message.</td>
</tr>
</tbody>
</table>

7. Click the **Filter** tab and select **Filter This Survey** to select whether contacts should be included or not included in the segment to be filtered from the survey. The default is Send This Survey Only to People in the Following Segment. If you leave the default, only contacts who meet the criteria in the segment receive the survey.
8. To send the survey to all contacts except those who meet the criteria in the segment, click the drop-down menu and select **Send This Mailing to Everyone Not in the Following Segment**.
9. Select a segment for the survey.
10. To add a segment, click **New Segment**.
11. To add any notes associated with the element, click the **Notes** tab and enter the notes.
12. Click **OK**.

**Edit External Event Attributes**

External events have been deprecated and may be permanently removed in a future release. Instead, you can use contact-related object event handlers to trigger actions.

In order to pass contact data to the external event, you must create a template file specifying the data format. For information about external events or contact-related object event handlers, contact your Oracle account manager.

See *Edit Execute Object Event Handler Attributes*.

**Add a Comment**

The toolbox also provides a Comment artifact that allows you to enter comments in your diagram without impeding the campaign or survey flow. Comments are added to the canvas in the same way elements are and can be linked to elements using the Artifact connector type.

1. Drag and drop a Comment artifact from the toolbox onto the canvas.
2. Click the artifact to type your comments.
3. To connect the artifact to an element, click an anchor on the artifact and drag to an anchor on the element. The anchor is highlighted when the connector is able to link to it.

**Survey Validation**

As you create a flow diagram for your survey, Feedback validates all flow components to ensure all required attributes have been specified. Although validation occurs in real time as you add and update the components, you can also force validation manually by clicking Validate on the Designer Home tab.

You can choose to display validation flags by selecting the Validation Results check box on the View tab. This way, valid components are flagged with a green check mark, while those found to be invalid are flagged with a red exclamation point and a small button you can click to view the validation error. If you attempt to send a survey without first addressing its validation errors, the flags automatically display (even if you have not selected the Validation Results option) along with a message summarizing the errors.

**CAN-SPAM Compliance**

B2C Service helps you identify CAN-SPAM compliance issues. When creating a mailing or survey with a message, the system automatically checks that the message contains a physical address, an unsubscribe link, and honors global opt-in preferences. Remaining requirements must be manually verified by the mailing or survey designer.

Legal definitions and penalties for spam vary among countries. Therefore, it is important to stay abreast of current and pending legislation in the United States and other countries. There are many sites that you can check to stay current with the laws and to make sure your site is compliant.
The CAN-SPAM Act of 2003 (CAN-SPAM) requires that organizations adhere to certain rules when sending commercial emails. Included in the requirements are the following conditions:

- Email does not contain false or misleading header information.
- Email does not use a deceptive subject line.
- Email contains a way for recipients to opt out of all emails, not just specific types.
- Email does not send to contacts that have previously opted out.
- Email must be identified as an advertisement in the subject line.
- Email includes the sender’s physical mailing address, which must display in ASCII text.
- Email that contains adult content is identified as such in the subject line.
- Email does not send to harvested or generated email addresses.
- Email does not send to domains in the Federal Communications Commission (FCC) wireless domain list.

**Note:** The checklist is used to gauge your compliance with CAN-SPAM. You should use this checklist in conjunction with and not as a replacement for legal counsel.

You can check for CAN-SPAM compliance from the Message tab of a mailing, the Invitation Message tab of a survey, and the Delivery tab of a mailing or survey.

For information about the CAN-SPAM Act, see the [Federal Trade Commission (FTC) website](http://www.ftc.gov).

- [Check Compliance from the Delivery Tab](#)

### Check Compliance from the Invitation Message Tab

Testing for CAN-SPAM compliance issues can be accessed from both the Invitation Message and the Delivery tabs in a survey.

The system automatically checks that the message contains a physical address and an unsubscribe link, and honors global opt-in preferences. The remaining requirements must be manually verified by the staff member creating the survey. For best practices related to surveys, see *Improving your email marketing*.

1. Open a survey and click the **Invitation Message** tab.
2. Click **Test CAN-SPAM** under the Content section of Tasks on the HTML editor.

   The CAN-SPAM Compliance Report opens.

   The report shows whether each system-verified requirement passed or failed. The manually verified requirements can be selected or cleared based on your manual verifications.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Verified</td>
<td>This section shows whether the following system-verified requirements passed or failed.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Must Include Physical Address</td>
<td>The system automatically verifies that a physical address is included in the message. For this requirement to pass, you must have inserted a physical address clicking Insert Address on the HTML editor. See Insert a Physical Address. If a text address has not been inserted using Insert Address, the requirement fails.</td>
</tr>
<tr>
<td>Must Include a Working Opt-Out Method</td>
<td>The system automatically verifies that a global unsubscribe link is included in the message. The unsubscribe link can be added by clicking Unsubscribe Link in the toolbox of the HTML editor. When Unsubscribe Link is clicked, a window opens for selecting the opt-in field. If Global Opt-In is selected, the requirement passes when CAN-SPAM compliance is checked.</td>
</tr>
<tr>
<td>Must Honor Opt-Out Requests Within 10 Days</td>
<td>The system automatically verifies whether the global opt-in setting is honored by the survey. By default, the Honor Global Opt-In check box is selected on the Audience tab, which prevents messages from sending to contacts who have globally opted out of receiving communications. If this check box is not selected, the requirement fails when compliance is checked. Since contacts are instantly unsubscribed when they globally opt out of surveys, any global opt-out requests are automatically met within 10 days.</td>
</tr>
</tbody>
</table>

**Manually Verified**  
This section lets you select whether the following requirements passed or failed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Has Candid Subject Line</td>
<td>You must manually verify that the message uses a candid subject line. CAN-SPAM compliance requires that the subject line of an email accurately reflects its contents. To pass this requirement, you should ensure that the subject line is not deceptive to the email recipient. You can view the subject line in the Preview section.</td>
</tr>
<tr>
<td>Indicates Any Adult Content in Subject</td>
<td>You must manually verify that the subject identifies adult content in the message. The CAN-SPAM Act requires that a message containing adult content must contain the text “SEXUALLY EXPLICIT” in the subject line of the email. You can view the subject line in the Preview section.</td>
</tr>
<tr>
<td>Indicates Any Advertisement in Subject</td>
<td>You must manually verify that the subject identifies the message as an advertisement, when applicable. The CAN-SPAM Act requires that the message contains clear and conspicuous notice that the message is an advertisement or solicitation. To pass this requirement, you should ensure that the subject line accurately reflects the message content. You can view the subject line in the Preview section.</td>
</tr>
<tr>
<td>Has Accurate From and Reply-To Headers</td>
<td>You must manually verify that the From and Reply-To headers contain accurate information. CAN-SPAM compliance requires that the From and Reply-To headers and routing information, including the originating name and email address, must accurately identify your organization. You can view the From and Reply-To headers and the return path in the Preview section.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
| **Does Not Send to Harvested or Generated Addresses** | You must manually verify that you are not sending the message to harvested or generated addresses. Harvested email addresses are gathered from websites or web services that have published a notice prohibiting the transfer of email addresses for the purpose of sending email. Generated email addresses are formed by using a “dictionary attack,” by combining names, letters, or numbers into multiple permutations.
| **Does Not Send to Domains in FCC Wireless List** | You must manually verify that you are not sending the message to email addresses that contain domains in the FCC wireless list. The CAN-SPAM Act prevents the sending of messages to wireless devices, such as mobile phones. The FCC publishes a *downloadable list of domain names used by wireless service providers*.
| **Overall Compliance** | This section indicates whether the email is entirely CAN-SPAM compliant. If any of the compliance criteria in this table fails, overall compliance fails.
| **Preview** | This section lets you preview the following parts of a message.
| **Preview Message** | Click this text to preview the message.
| **Subject** | Displays the subject of the message.
| **Return-Path** | Displays the mailbox address the message is being sent from.
| **From** | Displays the From address of the message.
| **Reply-To** | Displays the Reply-To address of the message.

3. Select the check box next to the manually verified items that you have verified.
4. Click OK.

**Check Compliance from the Delivery Tab**

You can check for CAN-SPAM compliance issues from the Delivery tab of a mailing or survey. You can also test CAN-SPAM compliance from the Message tab of a mailing or the Invitation Message tab of a survey.

The system automatically checks that the message contains a physical address and an unsubscribe link, and honors global opt-in preferences. The remaining requirements must be manually verified by the staff member creating the mailing or survey.

1. Open a mailing or survey and click the Delivery tab.
2. Click **Test CAN-SPAM** in the Delivery Checklist section.
   The CAN-SPAM Compliance Report opens.
The report shows whether each system-verified requirement passed or failed. The manually verified requirements can be selected or cleared based on your manual verifications.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Verified</td>
<td>This section shows whether the following system-verified requirements passed or failed.</td>
</tr>
<tr>
<td>Must Include Physical Address</td>
<td>The system automatically verifies that a physical address is included in the message. For this requirement to pass, you must have inserted a physical address clicking Insert Address on the HTML editor. See Insert a Physical Address. If a text address has not been inserted using Insert Address, the requirement fails.</td>
</tr>
<tr>
<td>Must Include a Working Opt-Out Method</td>
<td>The system automatically verifies that a global unsubscribe link is included in the message. The unsubscribe link can be added by clicking Unsubscribe Link in the toolbox of the HTML editor. When Unsubscribe Link is clicked, a window opens for selecting the opt-in field. If Global Opt-In is selected, the requirement passes when CAN-SPAM compliance is checked.</td>
</tr>
<tr>
<td>Must Honor Opt-Out Requests Within 10 Days</td>
<td>The system automatically verifies whether the global opt-in setting is honored by the survey. By default, the Honor Global Opt-In check box is selected on the Audience tab, which prevents messages from sending to contacts who have globally opted out of receiving communications. If this check box is not selected, the requirement fails when compliance is checked. Since contacts are instantly unsubscribed when they globally opt out of surveys, any global opt-out requests are automatically met within 10 days.</td>
</tr>
<tr>
<td>Manually Verified</td>
<td>This section lets you select whether the following requirements passed or failed.</td>

3. To view a read-only copy of the results from the last time CAN-SPAM compliance was tested, click **Details** next to CAN-SPAM Compliance on the Delivery tab.

### Survey Session Recovery

When a contact loads a survey in a web browser, a cookie is placed on the contact’s computer and updated to track which survey pages have been submitted.
If a contact attempts to access a survey that the contact has abandoned, the system detects this from information in the survey cookie and then loads the first page in the survey page sequence that has not yet been submitted. This ensures that the contact does not have to answer all questions again from the first page of the survey. This cookie is separate from the session cookie placed when a contact logs in to the customer portal and does not affect login status.

**Note:** By default, the survey cookie does not expire and is cleared only when the survey is completed. Therefore, contacts are not able to start over or access previously submitted pages unless the cookie is first cleared from their browser. You can disable the survey cookie or define an expiration interval by editing the RNM_RESUME_SURVEY_COOKIE_EXP configuration setting (Outreach and Feedback/General/Miscellaneous). However, upon clearing the cookie and reloading the survey, all questions revert to a blank state. At no time can contacts see answers that they previously submitted.

### Customize Feedback Configuration Settings

Feedback provides many options that can be activated by editing configuration settings. These settings are used to set cookie expiration times, define default values for Serve Web Page element properties, and specify whether documents can be edited after having been sent in a survey.

You can also define the subject line of Forward to Friend emails and specify a default URL to load in cases where a blank page would have been displayed.

1. Expand **Site Configuration**, and then double-click **Configuration Settings**. The **Search** window opens, where you can filter your search results.
2. Clear the Select All check box and then select the **Outreach and Feedback** check box.
3. To search for a specific configuration setting in the Outreach and Feedback folder, enter the setting name in the **Key** field.
   
   You can search part of a configuration setting name by appending a wildcard (either an asterisk or a percentage sign) to the end of your search term.
4. Click **Search**.
   
   The Configuration Settings editor displays the settings in the Outreach and Feedback folder that match your search criteria.

   **Tip:** To display configuration settings in alphabetical order, click in the Key column header.

5. Expand the folders under **Outreach and Feedback/General**.
6. Customize the settings under the specific Campaigns and Miscellaneous folders.

   For information about a setting, see the description that appears on the Configuration Settings editor. For complete details about the Configuration Settings editor, including searching, editing, and creating new configuration settings, see **Edit a Configuration Setting**.

Best Practices for Mailings, Surveys, and Campaigns

There are a number of methods or techniques that are generally found to be superior to those achieved by other means or that have become a standard mode of operation. Best practices as they apply to Outreach and Feedback as well as email management are listed here.

- **Best Practices for Sending Email**
- **Best Practices for Using Branded Email Domains**
- **Best Practices for Creating Effective Survey Reminders**
- **Best Practices for Writing Effective Questions**
- **Best Practices for Mobile Surveys**
- **Best Practices for Using Matrix Questions in Mobile Surveys**
- **Best Practices for Topic Monitoring**

Ensuring that contacts read your message

Because most mail clients list new messages by From address and subject, the contents of these fields are critical to having your message read. Refine your message subject to be concise yet informative and make sure it clearly states your purpose and any special conditions of your offer. If it isn’t clear who you are or what you want, your message can be easily passed over.

Improving your email marketing

In addition to anti-spam legislation, many other external factors can negatively impact the efficiency and success of your surveys. As an Outreach and Feedback user, it is important that you follow industry-accepted best practices to protect your reputation, optimize your audience, and produce well-formed content. While these best practices do not guarantee that your emails will always be accepted, they can improve the chances that your messages are delivered to the intended recipients with minimal interference from content monitors and filters. Since these practices are focused on improving the quality of your contact data as well as your messages, your survey conversion rates will most likely improve as well.

Standard element placement when using next and back buttons

When you use next and back buttons with standard elements, we recommend adding those elements to the end rather than to the middle of your flow. For example, suppose you add an Incident element to the second page of a survey, and then you add next and back buttons on subsequent pages. This scenario could cause two incidents to be created if respondents go back to the first page, because when they are ready to move forward, clicking the next button will resubmit the incident. Therefore, to avoid the possibility of triggering duplicate actions, we recommend adding standard elements (such as an Incident element) to the end of your surveys.

Send proofs to key staff

When sending proofs, consider adding key members of your customer support, sales, and marketing teams. Sharing a sample of each mailing or survey can help ensure that all contact “touch points” (groups in your organization that work directly with customers) are aware of the messages being communicated to your customers. Providing a consistent message across all channels is key to providing a world-class customer experience.
Scheduling mailings and surveys for market testing

Market testing your mailings and surveys works best when you schedule the test messages at the same time rather than launching them a few minutes apart. By scheduling test messages at the same time, the database and servers have to process data only once instead of multiple times.
11 Social Experience

Overview of Social Experience

Social Experience is a set of complementary features, each representing a different, powerful way of interacting with customers using social media.

While each component serves a distinct purpose, they can be used together to create a wide-ranging social web presence. By engaging with your customers using leading social channels or providing a targeted social channel of your own, you can foster dynamic customer relationships, deliver powerful support offerings, and build brand loyalty.

To make the most effective use of social media, be sure to review each feature and consider its benefits to your service initiatives. Together, the major components summarized here provide a comprehensive solution for organizations looking to expand and solidify their social media presence.

Communities—the Communities feature of Social Experience is not available to new B2C Service customers beginning with the August 2015 release. If you are an existing customer using Social Experience communities, see Communities in the May 2015 documentation.

Channels—an extensive variety of methods by which your staff can communicate with your customers. Channels refer to all of the available sources such as Service and Outreach mailboxes, chat, and the Ask a Question page, channels support leading social media such as Facebook, Twitter, YouTube, and RSS feeds processed by B2C Service.

Self Service for Facebook—Self Service is a social web solution you can use to embed a set of B2C Service features directly on your organization’s Facebook page. As a result, your organization can deliver a consistent experience to customers and fans on Facebook while maintaining a unified view of customer interactions across channels.

Channels

Overview of Channels

Channels are all of the available sources of social content processed by your site.

In B2C Service, channels are helpful for routing new incidents to the agent desktop using the Incident.Channel field as a rule condition in business rules.

Traditional channels through which incidents are created and responded to. These include CSS Email (email submitted to a Service mailbox), MA Email (email submitted to an Outreach mailbox), Phone, Fax, Post, CSS Web (Ask a Question), MA Web (created by a campaign or advanced survey), Chat, and Email (responses sent to customers by email). Standard channels are most commonly used to reference incident thread sources that are configured in B2C Service and Outreach, such as mailboxes, chat sessions, and campaign flow actions.
You can edit the name of each channel to suit your business needs.

## Grant Channel Account Access to a Staff Account

In order to respond to incidents created through a social channel, agents must first be granted access to a channel account configured for that channel.

While you can grant channel account access to groups and agents through the Channel Accounts editor, you can also provide access to specific agents by editing their staff accounts.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Staff Accounts by Profile**.
3. Double-click the staff account that you want to grant channel account access to.
4. Click **Channels**.
5. Click the channel that you want to provide access for.
6. Click **Add**.
7. Double-click the channel account you want to add.
   
   The **Channel Accounts** window closes and the channel is added to the Channel Accounts section on the Accounts Channel editor.
8. To change the default channel account, select the radio button in the Default column of the desired default channel account.

   **Note:** The default channel account is the channel account that staff members will use when responding to incidents. However, if they have been granted access to more than one channel account, they will have the option to select another channel account at that time.

9. Click **Save**.

## How You Store Social Media User Names

When monitoring certain channel types, B2C Service can store your customers’ social media identifier in their contact records which lets you associate incoming social monitor incidents with contacts based on their social media accounts and helps agents identify where posts originate.

When an incident is created through Facebook, Twitter, or YouTube, B2C Service searches all contacts for an instance of the associated social media identifier. If a matching identifier is located, the incident is automatically associated with the contact. If no matching identifier is found, a new contact containing the identifier is created for the incident.

- When an incident is created through a Facebook channel, B2C Service populates the Channel Usernames field in the contact record with the post author’s Facebook user ID.
- When an incident is created through Twitter or YouTube, the Channel Usernames field is populated with the user name from the channel.
In addition to this automated process, contacts and staff members can be permitted to add and edit user names for each channel type, based on the visibility settings on the Channel Types editor and the configuration of the customer portal and agent workspace. Channel types are not interface specific and cannot be deleted.

- Contacts can add, edit, and view their Facebook, Twitter, and YouTube user names through the ChannelAllInput and ChannelAllDisplay widgets on the customer portal. See Customer Portal Widgets.
- Staff members can add and edit Facebook, Twitter, and YouTube user names for contacts from a custom contact workspace. Before staff members can add and edit social media user names, the Channel Usernames field must be added to the contact workspace. See Overview of Workspaces.

Related Topics
- Edit a Channel Type
- Add or Edit a Social Media User Name for a Contact

Edit a Channel Type
You can permit staff members and contacts to add and edit social media user names based on the channel type visibility settings.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Click the System Menus drop-down arrow, then click Channel Types.
   The Channel Types editor is displayed.
4. To rename a channel type:
   a. Click it in the Label column.
   The Interface Visibility section displays, showing the names of all available interfaces, the languages they are implemented in, and the language-specific label of the channel.
   b. Enter the new name for the channel type. When you move to another field, the Label field in the Interface Visibility section is populated with the name you typed.

   **Note:** When using multiple-language interfaces, enter the label in the Label field in the language of the interface.
5. To remove channel type visibility for staff members and contacts, clear the Contact Visible check box next to the applicable channel type.
   This removes staff member visibility for the channel type in the Channel Usernames field on custom contact workspaces. In addition, visibility is removed from the applicable widget on the customer portal.
6. To change the display sequence of channel types on the custom contact workspace and the customer portal, click the up or down arrow next to the Contact Visible column.
7. Click Save.

Add or Edit a Social Media User Name for a Contact
Agents can add, edit, and remove social media user names for a contact.

- The Channel Usernames field must have been added to the custom contact workspace being used. See Edit a Workspace.
- The Contact Visible check box must be selected for the channel type. See Edit a Channel Type.
1. While editing a contact record, click Add or Edit in the Channel Usernames field.
2. To add a social media user name:
Using B2C Service

Chapter 11
Social Experience

1. Click Add Username.
2. Click Channel Type and select Facebook, Twitter, or YouTube.
3. Enter the contact's user name in the Username column.
4. To edit a social media user name, enter the changes in the Username column.
   **CAUTION:** Changing the social media user name may affect the ability of the system to accurately track open conversations with the user.
5. To remove a social media user name, click Remove in the Action column.
6. Click OK.
7. Click Save.

Self Service for Facebook

Overview of Self Service for Facebook

Self Service is a special Facebook application served by B2C Service that provides your customers with access to features from B2C Service right from your organization’s Facebook page, in both its standard and mobile web interfaces.

**CAUTION:** The Communities feature of Social Experience is not available to new B2C Service customers beginning with the August 2015 release. If you are an existing customer providing access to Social Experience communities directly from your organization’s Facebook page, see Self Service for Facebook in the May 2015 documentation.

Using Self Service for Facebook, customers can:
- Search the B2C Service knowledge base, including results from natural language search using Virtual Assistant, if enabled.
- Submit questions privately to your support team.
- Rate and comment on answers.
- Share service experiences on Facebook.

As needed, your agents can field and respond to Facebook incidents right from their agent desktop. In this way, your customers can receive the same exceptional support they receive from your other service channels without having to leave Facebook. As a result, your organization can deliver a consistent experience to customers and fans on Facebook while maintaining a unified view of customer interactions across all service channels.

Self Service Features in Facebook

The Self Service features in Facebook help customers find the information they need by browsing or searching your knowledge base from the Facebook social networking site.
When connected, the Find Answers tab displayed in Facebook presents the same answers that are visible in the answer search report defined for your customer portal. The report will also include results from your Virtual Assistant, if enabled.

This image shows the Self Service for Facebook application connected to a consumer products support site.

Similar to visiting the customer portal, customers can click an answer to view its contents, including guides, without leaving Facebook. They can also click the Ask a Question tab to submit questions to your B2C Service. Incidents submitted in this manner are processed by your system just like incidents submitted through the customer portal, and can then be accessed by your staff using the agent desktop.

Self Service for Facebook will create or update contact records on your site as needed, regardless of your site pass-through authentication (PTA) settings. When customers attempt to use the Ask a Question feature for the first time, they will be prompted to log in to Facebook (if they haven’t already) and grant application access to basic account information. This data will be used to link their Facebook account to their contact record in B2C Service. Facebook accounts will be associated with existing contacts that share the same email address (whether primary or alternate). In a case where no matching contact is found, a new contact will be created and automatically associated using the email address from the Facebook account. Agent responses to incidents submitted through Facebook are sent by email to that address.

When email address sharing is enabled in B2C Service, Facebook account association is subject to a contact-matching process. See Email Address Sharing.

Customers can also click the Your Support Account tab to view and update incidents from their recent support history.

Incidents created through Self Service for Facebook will be processed through whatever business rules and escalation paths you have configured for your site. If a SmartAssistant rule is active, suggested answers will be displayed when questions are submitted, just as they are in the customer portal. If you want to route these incidents through a distinct set of rule actions, you can do so by using “Incident.Channel equals Facebook” as a business rule condition. See Incident Conditions.
How You Configure Self Service for Facebook

Self Service is a component of your B2C Service application that can be embedded in a Facebook fan page. To enable it on your site, you must configure its settings in both Facebook and B2C Service.

Because Facebook often revises the development environment used to manage applications, the procedures for configuring Self Service are subject to frequent changes. For current procedures, see Answer ID 4193 on our support site.

When working with social media, it is important to consider potential security risks and take the appropriate precautions associated with third-party login information, customer data, and application code. To maintain the integrity and security of your Self Service application, see Overview of Security-Related Configuration Settings.
Opportunity Tracking

Overview of Opportunities

An opportunity is a record in B2C Service Opportunity Tracking (Opportunity Tracking) that contains information about a specific sale or a pending deal.

In essence, opportunities are the building blocks of your sales operation for collecting general sales information, following sales strategy, setting forecast, and preparing and sending quote to customers. The information that is collected during the sales cycle can be processed by B2C Service Analytics (Analytics) to help managers identify trends and forecast sales periods and to help you meet or exceed your quota.

Before you start working on your assigned opportunities, you’ll want to know how to access opportunities and how opportunity information is organized. The topics in this section explain the layout you’ll be working with and show you where the details of each opportunity are located.

Opportunity Reports

Opportunity reports can be placed in the Opportunities navigation list or any other navigation list you have access to.

When you click Opportunities on the navigation pane, the navigation list displays all of the reports and items added to this button by your administrator. The Opportunities button, plus all the other buttons you have access to, are part of the navigation set defined in your profile.

Opportunity reports can also be placed in other navigation lists, not just the Opportunities list. And if you have permission to customize your navigation set, you can add other items, including any reports you have permission to access, to your Opportunities navigation list or any of your lists. Double-clicking any opportunity report displays the list of opportunities in the report on the content pane.

The information displayed on the content pane depends on the opportunities report you select and which fields were defined when the report was created. The Recently Modified Opportunities report, for example, displays the opportunity’s name, forecasted value, and date it was last modified.

Using buttons on the ribbon, you can open, add, copy, delete, print, forward, assign, and reject opportunities and email the contact. You can also search for opportunities, refresh the report, and reset the search criteria. Right-clicking any opportunity displays the same functions as those on the ribbon.

Tip: Besides searching for opportunities from a report, you can also use Quick Search to find a specific opportunity from anywhere in the product.

Standard Workspace for Opportunities

Your B2C Service application contains a standard workspace for working with opportunities, and defines which fields you see and how the information is organized on the content pane.

Your organization may use the standard workspace, or your administrator may have created one or more customized workspaces. Your profile defines the workspace you see when you work with opportunities, whether it is the standard
workspace or a customized workspace. For documentation purposes, we use the standard opportunity workspace to describe how to work with opportunities.

**Opportunity Ribbon**

This table describes the buttons on the ribbon of the standard opportunity workspace.

<table>
<thead>

<td>Click this button to see details about the opportunity, including its ID, when it was created and by whom, and the date it was last updated and by whom. If the opportunity is in a rules state or has an escalation level, that information also appears.</td>
</tr>
</tbody>
</table>
Key Opportunity Fields

When you open an opportunity, you see fields on the top of the content pane and record tabs on the bottom. The opportunity fields store the opportunity’s name, status, strategy, stage, rep forecast, contact association, organization association, manager forecast, and other information that describes the properties of the opportunity.

Some of the opportunity fields are required by default, and your administrator may require that other fields also be completed. You must complete any field marked with an asterisk before you can save the opportunity. See Edit Key Opportunity Fields.

Opportunity Record Tabs

Much of the information about the opportunity is organized in record tabs, which group similar details.

For instance, all of the contacts associated with the opportunity are listed on the Contacts tab and all tasks associated with the opportunity appear on the Tasks tab.

Note: If you make changes on any windows accessed from the opportunity record tabs, you must save the opportunity in order for your changes on the record tabs to take effect. If you close the record without saving changes, your changes are lost.

Opportunities include these record tabs. Click a tab to see what information is listed and what your options are.

- **Details tab**—Contains fields related to opportunity competitor data, completion data, win/loss data, and other general data. Use the fields on this tab to collect additional information about an opportunity, which is beneficial for reporting purposes. See Edit Details Tab Information.

- **Contacts tab**—Lists the contacts associated with the opportunity, including the primary contact and all secondary contacts. From the Contacts tab, you can add a new or existing contact to the opportunity, open a contact for editing, copy a contact, print contact information, remove a contact, send email to the contact, or set the contact’s role in the opportunity. The Contacts tab displays a number in parentheses to show how many contacts are associated with the opportunity. See Add or Edit Contact Information.

- **Notes tab**—Stores internal information about the opportunity. Notes are never sent to customers. You can add, edit, or remove notes that originated by phone, fax, post, web form, or email for any opportunity based on the type of correspondence you had with a contact or organization. And you can view the notes by opportunity, contact, organization, or by any combination of the three. See Add or Edit a Note for an Opportunity.

- **Tasks tab**—Lists all of the tasks associated with an opportunity. You can add, open, copy, delete, print, and forward tasks and mark tasks complete. Tasks can be assigned to an opportunity based on the opportunity’s sales stage, or they can be manually assigned and associated with an opportunity by another staff member. The Tasks tab displays a number in parentheses to show how many tasks are associated with the opportunity. See Add or Edit a Task for an Opportunity.

- **Quotes tab**—Contains all quotes associated with the opportunity. From this tab you can open, create, copy, delete, print, and send quotes to prospective and current customers. (An opportunity can contain multiple quotes, but all of the quotes are directly associated with the opportunity you are currently editing.) The Quotes tab displays a number in parentheses to show how many quotes are associated with the opportunity. See Add a Quote to an Opportunity.

- **Attachments tab**—Lists all files attached to the opportunity. For instance, if a customer forwards you a document that is associated with the opportunity, the Attachments tab provides a convenient location where you can store the document for retrieval. You can add, open, download, delete, and view the properties of file attachments from this tab.
• Audit Log tab—Contains a permanent list of all actions associated with an opportunity, including the date of the action, who performed the action, what the action was, and a description of the action. This information is valuable for tracking interactions with customers, especially if more than one staff member works on the same opportunity.

How You Work with Opportunities

Opportunities are the building blocks of your sales operation for collecting general sales information.

When staff members in your marketing, service, or sales department discover a potential buyer for your organization’s products or services, they can generate a lead (a prequalified opportunity) and assign it to you. Most of the time, you work with these existing opportunities that have been created by someone else. For this reason, we have identified procedures for working with existing opportunities rather than adding new opportunities.

At other times, however, you can add opportunities to the knowledge base. For instance, when an existing customer contacts you by phone, fax, or email, you may want to add an opportunity to create a record of the customer’s inquiry. See Add an Opportunity.

Regardless of how opportunities are assigned to you or where they originate, there are benefits from understanding what certain field properties mean and how they can impact opportunities during the sales cycle. This knowledge can help you effectively move your opportunities toward a sale.

Opportunity Statuses

Opportunity statuses represent the current state of your opportunities.

The seven default opportunity statuses are Lead, Reject, Active, Inactive, Closed, Dead, and Lost. Your administrator can also define additional opportunity statuses to show a more complete representation of the opportunities in your knowledge base.

<table>
<thead>
<tr>
<th>Opportunity Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lead</td>
<td>A lead is a prequalified opportunity that has not been accepted.</td>
</tr>
<tr>
<td>Reject</td>
<td>A rejected lead is a prequalified opportunity that has been rejected.</td>
</tr>
<tr>
<td>Active</td>
<td>An opportunity with the Active status is no longer a lead and is advancing in the system toward a sale.</td>
</tr>
<tr>
<td>Closed</td>
<td>An opportunity with the Closed status resulted in a sale.</td>
</tr>
<tr>
<td>Lost</td>
<td>An opportunity with the Lost status has been lost, for example, to a competitor.</td>
</tr>
<tr>
<td>Inactive</td>
<td>An opportunity with the Inactive status is no longer being pursued but could be activated at a later date.</td>
</tr>
<tr>
<td>Dead</td>
<td>An opportunity with the Dead status is no longer being pursued.</td>
</tr>
</tbody>
</table>

Related Topics

• How You Work with Opportunities
How You Work with Leads

Leads are opportunities that are prequalified by your marketing, service, or sales department and are assigned the Lead status.

Since leads are prequalified versions of opportunities, they appear as opportunities on the content pane. You are assigned leads based on your organization’s processes, but you can also manually create leads and assign them to yourself.

**Note:** A lead assigned to a status that is not Lead or Reject is considered to be an opportunity.

Many of the opportunity fields for leads are populated. For instance, when you receive a lead, it already has an organization or contact association and a description of the product or service the organization or contact is interested in purchasing.

Accept a Lead

Many of the opportunity fields for leads are populated. For instance, when you receive a lead, it already has an organization or contact association and a description of the product or service the organization or contact is interested in purchasing.

1. From an open opportunity, click **Status**.
2. Select **Active** to convert the lead into an active opportunity.
3. Click **Save**.

To represent the movement of leads to opportunities and vice versa, all actions are recorded to the audit log and display on the Audit Log tab.

Reject a Lead

You can reject a lead from an open opportunity.

1. From an open opportunity, click **Reject**.
   
   The Reject Lead window opens. If your profile does not let you reject leads, the Reject button is not active.

2. Click the **Rejection Reason** drop-down menu and select a rejection reason.
3. To provide additional information, enter a comment in the Comments field.
4. Click **OK** to close the Reject Lead window.
5. Click **Save** to reject the lead and save the opportunity.

   Because rejected leads are associated with the Reject status, you must filter on the Reject status when searching for leads that have been rejected. You can convert a rejected lead into an active opportunity by changing its status to Active.

How You Use Sales Strategies

Sales strategies are plans defined by your organization that include associated stages and tasks that should be completed as you work your opportunities.

Your organization may have multiple sales strategies based on your business processes. Strategies ensure that best practices, policies, and procedures are followed during the sales cycle.

When you select a strategy while editing an opportunity, the Stage field populates with the first stage of the strategy. Any tasks associated with the strategy (including those associated with other stages) populate the Tasks tab.
**Note:** If you change a sales strategy for an opportunity, all tasks associated with the previous strategy are deleted from the Tasks tab, and all tasks associated with the new strategy populate the Tasks tab.

**Forecast an Opportunity**

A forecast is a projection of sales revenue for an opportunity that may close in a given sales period.

Each opportunity contains fields for a manager forecast and a sales representative forecast. A manager forecast is a projection of sales revenue for an opportunity from a manager’s point of view, whereas a sales representative forecast is a projection of sales revenue for an opportunity from a sales representative’s point of view. Sales forecasts play an important role in helping management determine realistic sales projections for a sales period.

1. Perform one of these tasks:
   - If you are a manager, click the Manager Forecast field.
   - If you are a sales representative, click the Rep Forecast field.
2. Enter the revenue amount that you forecast to be generated by the sale in the field.
3. Click **Save**.

When a quote is associated with the opportunity and the Forecast check box is selected for the quote, the Rep Forecast field automatically reflects the amount specified in the quote. See [Add a Quote to an Opportunity](#).

**Edit Key Opportunity Fields**

After you understand the role of statuses, strategies, and forecasts, you can complete the opportunity fields to update your opportunities.

Required fields are labeled with an asterisk next to them. Remember that you can’t save an opportunity without completing all of the required fields.

1. From an open opportunity, enter field information.

<table>

<td>You can change the default in <strong>File &gt; Options &gt; Personal Settings</strong>. See Change Your Personal Settings.</td>
</tr>
<tr>
<td>Rep Commit</td>
<td>Click this drop-down menu and select Yes to commit to closing the opportunity in the defined sales period. This drop-down menu is not active until a value is entered in the Rep Forecast field.</td>
</tr>
<tr>
<td>Summary</td>
<td>Enter a summary about the opportunity.</td>
</tr>
<tr>
<td>Contact</td>
<td>Click this button to add a primary contact to the opportunity. If a primary contact is not associated with an opportunity, an organization must be associated. Although many contacts can be associated with an opportunity, only one of them can be designated as the primary contact. <em>CAUTION:</em> If you use the Search button on the Contact field to add a contact to the opportunity when a primary contact for the opportunity already exists, the existing primary contact is removed from the opportunity and replaced with the new primary contact.</td>
</tr>
<tr>
<td>Organization</td>
<td>Click this field to add an organization to the opportunity. If an organization is not associated with an opportunity, a primary contact must be associated. Only one organization can be associated with an opportunity.</td>
</tr>
<tr>
<td>Assigned</td>
<td>Click this drop-down menu to re-assign the opportunity to another sales representative. The list of staff members that displays in the drop-down menu is the same list that displays in the Salesperson field of the contact record. See Add or Edit Contact Information. Also be aware that because of the account hierarchy in Opportunity Tracking, if a manager account is disabled, that manager’s name continues to display as read-only in the Assigned drop-down menu of the opportunity workspace. This allows staff members who reported to that manager to display underneath the former manager until another manager is designated. Refer to Staff Management. <strong>Tip:</strong> Use the Find field at the bottom of the Assigned drop-down menu to quickly locate staff members. Wildcards are supported when searching staff members. You can search strings that include a space by entering $+Space+character$, which is helpful when searching last names. For example, typing $+Space+b$ returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing b in the Find field returns all items containing the letter b.</td>
</tr>
<tr>
<td>Territory</td>
<td>Click this drop-down menu to re-assign the opportunity to another territory.</td>

</tbody>
</table>
Field | Description
--- | ---
**Opportunity Competitors** | Click this drop-down menu and select the competitors that were also pursuing the opportunity.
**Note:** A check box and an option appear next to each competitor in the drop-down menu. You can select multiple check boxes to show that multiple competitors are involved, but you can select only one option to designate the primary competitor.

Other Data | This section contains fields for entering miscellaneous data about the opportunity.
Date of Initial Contact | To change the date that initial contact was made with the customer, enter a date or click the calendar and select a new date from the calendar.
Source | This field displays the source of the opportunity’s creation in B2C Service. This is a read-only field.
Recall | To change the reminder date that you should contact the customer, enter a date or click the calendar and select a new date from the calendar.

2. Click **Save**.

**Contacts Tab Toolbar**

This table describes the Contacts tab toolbar buttons.

| Button | Description |
--- | ---|
Add | Click this button and select one of the following options to add a new or existing contact to the opportunity.
Add New | Select this option to display the New Contact window. After creating and saving the new contact, the contact is added to the contact list for the opportunity.
Add Existing | Select this option to display the Contact Search window. After finding and selecting the existing contact, the contact is added to the contact list for the opportunity. Your administrator can add a secondary report to the Contact Search window. This feature is especially useful for displaying all contacts associated with an organization when you add a contact to an organization’s opportunities.
Open | Click this button to open the selected contact.
Print | Click this button to print the selected contact.
Copy | Click this button to copy the selected contact.
Delete | Click this button to permanently delete the selected contact.
Remove | Click this button to remove the selected contact from the opportunity (without deleting the contact). This does not delete the contact from the knowledge base. It just disassociates the contact from the opportunity.
Email | Click this button to send an email to the selected contact.
Add or Edit Contact Information

The Contacts tab on the opportunities workspace contains a toolbar for working with the contacts associated with the opportunity.

When an opportunity is assigned to you in the form of a lead, the contact information is often present. Sometimes, however, only an organization is associated with the opportunity, so you must add contact information.

1. From an open opportunity, click the **Contacts** tab.
2. Perform one of these tasks:
   - Click **Add > Add New** on the toolbar. The **New Contact** window opens.
   - To edit a contact for the opportunity, right-click the contact and select **Open**. A window containing the contact’s information opens. (The contact edit window contains the same fields as the New Contact window.)
3. Enter field information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>provinces appear in the States/Prov. menu. Close the window to display the address you entered.</td>
<td></td>
</tr>
<tr>
<td>Channel Usernames</td>
<td>Click Add in this field to open the Channel Usernames window where you can add Facebook, Twitter, and YouTube user names for contacts. This field does not display unless your administrator has configured a custom contact workspace for the Channel Usernames field.</td>
</tr>
<tr>
<td>Contact Type</td>
<td>Click this drop-down menu to select the type of contact you are working with.</td>
</tr>
<tr>
<td>State</td>
<td>Click to select one or more of the following: Service, Outreach, or Opportunities. Or, click X to delete.</td>
</tr>
<tr>
<td>Organization</td>
<td>Click the Search icon to open the Organization Search window and search for an organization to associate with the contact.</td>
</tr>
<tr>
<td>Salesperson</td>
<td>Click this drop-down menu and select the salesperson who is associated with the contact. This field defaults to the staff member who created the contact record.</td>
</tr>
<tr>
<td>Title</td>
<td>Enter the contact’s job title in this field.</td>
</tr>
<tr>
<td>Login</td>
<td>Enter a login for the customer to use when logging in to the customer portal. If the customer created an account on the customer portal, this field displays the login selected by the customer. This field applies only to B2C Service.</td>
</tr>
<tr>
<td>SLA</td>
<td>Click this field to add an SLA instance.</td>
</tr>
<tr>
<td>Global Opt-in</td>
<td>Click this drop-down menu and select Yes if the contact wants to receive B2C Service mailings and surveys. Select No if the contact does not want to receive B2C Service mailings and surveys.</td>
</tr>
</tbody>
</table>

4. Click OK to add the new contact record and associate it with the opportunity.

**Add or Edit a Note for an Opportunity**

From the Notes tab, you can add opportunity-related details to an opportunity.

You can also choose the origin of the note you’re adding (phone, fax, post, web form, or email) to accurately document the origin of the note information. And you can edit notes after you add them. Notes are internal and are never sent to customers.

By default, the Notes tab opens with only opportunity notes displayed. If there’s a contact or organization associated with the opportunity, and the Notes tab of the contact or organization record has notes associated with it, those notes can also be displayed.

1. From an open opportunity, click the Notes tab.
2. Perform one of these tasks:
   - To add a note, click Add.
To edit a note, click Edit next to the note header bar.

3. Click the Opportunity Note drop-down menu and select one of the following channels where the opportunity note information originated:
   - **No Channel**—The note information originated as something other than a phone call, fax, postal mail, web form, or email.
   - **Phone**—The note information originated as a phone call.
   - **Fax**—The note information originated as a fax.
   - **Post**—The note information originated as postal mail.
   - **CSS Web**—The note information originated from a web form.
   - **Email**—The note information originated as email.

   If Outlook integration is activated, Outlook email can be appended to opportunities, contacts, organizations, and incidents in the Email format.

4. Click in the text area and type the note.

5. Click **Save**.

### View Contact and Organization Notes While Editing an Opportunity

Use this procedure to view contact and organization notes when editing opportunities.

To edit a contact or organization note, you must edit the contact or organization record.

1. From an open opportunity, click the **Notes** tab.
2. Click the **View** drop-down menu and perform any of these tasks:
   - To view all associated opportunity notes, select **Opportunity Notes**.
   - To view all associated contact notes, select **Contact Notes**.
     - **Note**: A contact must be associated with the opportunity for contact notes to display.
   - To view all associated organization notes, select **Organization Notes**.
     - **Note**: An organization must be associated with the opportunity for organization notes to display.

### Tasks Tab Toolbar

This table describes the Tasks tab toolbar buttons.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>

<tr>
<td>Print</td>
<td>Click this button to print the task.</td>
</tr>
<tr>
<td>Copy</td>
<td>Click this button to copy the task.</td>
</tr>
<tr>
<td>Delete</td>
<td>Click this button to permanently delete the task.</td>
</tr>
<tr>
<td>Remove</td>
<td>Click this button to remove the selected task from the opportunity (without deleting the task).</td>
</tr>
</tbody>
</table>
Add or Edit a Task for an Opportunity

Most tasks are added automatically to the Tasks tab when a sales strategy is selected for the opportunity although you can also manually add tasks.

You can view all tasks associated with an opportunity by clicking the opportunity's Task tab. The Tasks tab contains a toolbar for working with the tasks associated with the opportunity. See Tasks Tab Toolbar.

1. From an open opportunity, click the Tasks tab.
2. Perform one of these tasks:
   o Click Add > Add New. The New Task window opens.
   o Right-click a task on the Tasks tab and select Open.

The New Task window opens with your name displaying in the Assigned field and the opportunity name displaying in the Opportunity field. The Task type field displays Opportunities because the task was created while editing an opportunity.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter the name of the task.</td>
</tr>
<tr>
<td>Assigned</td>
<td>Click this drop-down menu and select a staff account.</td>
</tr>
<tr>
<td>Tip:</td>
<td>To quickly find and select a name in the list of staff members that displays in the drop-down menu, enter the letters of the staff member's name in rapid succession until the name is highlighted, then press Enter.</td>
</tr>
<tr>
<td><strong>Status</strong></td>
<td>Click this drop-down menu and select a status. Options included are Not Started, In Progress, Completed, Waiting, Deferred.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>Enter a value for the percentage of the task that is complete.</td>
</tr>
<tr>
<td>Priority</td>
<td>Click this drop-down menu and select a priority. Options included are Low, Normal, High.</td>
</tr>
<tr>
<td>Due Date</td>
<td>Click this calendar menu and select a due date.</td>
</tr>
<tr>

### Add an Opportunity

This procedure shows you how to add an opportunity.

While most of your opportunities are assigned to you, undoubtedly there are times when you need to add an opportunity to create a record of a customer’s inquiry. When adding an opportunity, all required fields must be filled in before you can save it, including any required fields configured by your administrator. The remaining fields on all tabs can be filled in at a later time.

1. Click **File > Opportunity**.
2. Complete opportunity fields as described in *Edit Key Opportunity Fields*.
3. To add detailed information to the opportunity, click the **Details** tab and complete the information as described in *Edit Details Tab Information*.
4. To add or edit contact information for the opportunity, click the **Contacts** tab and complete the information as described in *Add or Edit Contact Information*.
5. To add or edit note information for the opportunity, click the **Notes** tab and complete the information as described in *Add or Edit a Note for an Opportunity*.
6. To add or edit task information for the opportunity, click the **Tasks** tab and complete the information as described in *Add or Edit a Task for an Opportunity*.
7. To add quote information to the opportunity, click the **Quotes** tab and complete the information as described in *Add a Quote to an Opportunity*.

---

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notes</td>
<td>Enter any notes about the task in this field. You may need to scroll down to see this field.</td>
</tr>
<tr>
<td><em>Opportunity</em></td>
<td>Click <strong>Search</strong> to open the Opportunity Search window, where you can associate an opportunity with the task.</td>
</tr>
<tr>
<td>Organization</td>
<td>Click <strong>Search</strong> to open the Organization Search window, where you can associate an organization with the task.</td>
</tr>
<tr>
<td>Contact</td>
<td>Click <strong>Search</strong> to open the Contact Search window, where you can associate a contact with the task.</td>
</tr>
<tr>
<td>Incident</td>
<td>Click <strong>Search</strong> to open the <strong>Incident Search</strong> window, where you can associate an incident with the task.</td>
</tr>
<tr>
<td>Answer</td>
<td>Click <strong>Search</strong> to open the Answer Search window, where you can associate an answer with the task.</td>
</tr>
<tr>
<td>Campaign</td>
<td>Click <strong>Search</strong> to open the Campaign Search window, where you can associate a campaign with the task.</td>
</tr>
<tr>
<td>Mailing</td>
<td>Click <strong>Search</strong> to open the <strong>Mailing Search</strong> window, where you can associate a mailing with the task.</td>
</tr>
<tr>
<td>Survey</td>
<td>Click <strong>Survey</strong> to open the Survey Search window, where you can associate a survey with the task.</td>
</tr>
<tr>
<td>Document</td>
<td>Click <strong>Search</strong> to open the Document Search window, where you can associate a document with the task.</td>
</tr>
</tbody>
</table>
8. To attach one or more files to the opportunity, click the **Attachments** tab and follow the instructions described in *Browse for a File to Attach to a Record*.

9. To view the audit log for the opportunity, click the **Audit Log** tab and complete the information as described in *Audit Logs*.

10. Click **Save**.

### Close an Opportunity

Your ultimate goal with an opportunity is to close it, since an opportunity with a Closed status signifies an opportunity that has resulted in a sale.

1. From the opportunity, click the **Quotes** tab.

2. If a quote is associated with the opportunity, select the quote that resulted in a sale. If a quote is not associated with the opportunity, skip to step 4.

3. Select **Forecast** under the Forecast column.

   - The Rep Forecast field automatically updates to the value of the quote that was selected.

4. Click the **Status** drop-down menu and select **Closed**.

5. Click the **Stage** drop-down menu and select the appropriate stage.

6. If necessary, edit the **Rep Forecast** field so that it displays the correct value.

7. Click the **Rep Commit** field and select **Yes**.

8. Click the **Tasks** tab and make sure the appropriate tasks are completed.

9. Click the **Details** tab and complete the appropriate fields under Completion Data, Win/Loss Data, and Other Data. See *Edit Details Tab Information*.

10. Click **Save**.

   **Note:** Upon changing the status from Active to Closed and saving the opportunity, the Date Closed field on the Details tab populates with the current date. The opportunity no longer appears in most of your reports unless you filter on the Closed status type when searching.

### Delete an Opportunity

If your profile gives you permission to delete opportunities, the Delete button is available on the ribbon. When you delete an opportunity, you permanently remove it from the knowledge base.

**CAUTION:** Deleting an opportunity is permanent and cannot be undone.

1. From an open opportunity, click **Delete**.

   A message asks you to confirm the deletion.

2. Click **Yes** to delete the opportunity.

   **Note:** Staff members with the Bulk Delete permission enabled can delete up to 1000 opportunity records at a time. See *Administration Permissions* and *Perform Bulk Delete*. Transactions associated with those opportunities are deleted asynchronously. Purging transactions is controlled by data lifecycle management policies. See *Data Lifecycle Management*.
Other Opportunity Actions

Besides editing and adding opportunities, you may have other opportunity management duties as well. You might, for example, want to forward opportunities to others within or outside your organization, copy an opportunity, or make the same change to multiple opportunities.

- **Forwarding opportunities**—You can send a copy of an opportunity to other recipients. For instance, your manager may want to see all opportunities related to a particular inquiry, or you might want another sales representative to review your opportunity data before sending a quote to a customer.

- **Copying opportunities**—There may be times when you need to create an opportunity that is similar to an existing one. Rather than entering all field information from scratch, just copy the existing opportunity and use it as a base for the new one.

- **Updating multiple opportunities**—You can update, forward, and delete multiple opportunities at one time rather than performing the same action on each opportunity individually. This saves time when you have several opportunities that apply to the same sales product or service.

Sales Process

How You Work with Strategies

A strategy is a series of stages that an opportunity moves through in the sales pipeline on its way to becoming a final sale. Each stage of a strategy includes tasks that must be completed before the opportunity can move to the next stage.

You probably want different strategies for different kinds of opportunities. For example, you might have one strategy to sell a high volume of products to government organizations and a different one to sell single products to individual consumers.

When staff members select a strategy for an opportunity they are working on, the first stage of that strategy automatically populates the Stage field. All tasks associated with the strategy (including those associated with other stages) are also added to the opportunity.

Add or Edit a Strategy

Add a strategy for each kind of opportunity your staff members will work on.

1. Click **Configuration** on the navigation pane.
2. Expand **Opportunity Tracking**, and then double-click **Strategies**. The Strategies tree displays on the content pane.
3. Perform one of these tasks:
   - To add a strategy, click **New**. The editor displays on the content pane.
   - To edit a strategy, click it in the tree.
4. Enter field information.
Field | Description
--- | ---
**Strategy Name** | Enter the name of the strategy. The item name in the Strategies tree on the left side of the content pane and the Label field in the Interface Visibility section are populated or revised as you type.

Disabled | Select this check box to prevent sales representatives from selecting or viewing the sales strategy.

Notes | Enter any comments about the sales strategy.

Visible | Clear this check box if you do not want the strategy to be visible on the interface.

5. Because you cannot save the strategy without adding at least one stage to it, click the arrow on the New button and select **Add a New Stage to the Selected Strategy**.

The Stage Details editor displays on the content pane.

6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Stage Name</strong></td>
<td>Enter the name of the stage. The stage details item name in the Strategies tree on the left side of the content pane and the Label field in the Interface Visibility section are populated or revised as you type.</td>
</tr>
</tbody>
</table>

Forecast Percent | To enable this field, select the **Forecast Enabled** check box. The forecast percentage is an estimate of how far an opportunity has progressed in the sales strategy when it is at this stage. For example, you might be only 5% confident that an opportunity will close when it is in an Initial Contact stage, but 100% confident at a Sale Complete stage. Enter a value in the field.

Forecast Enabled | Select this check box to enable forecasts for the stage.

**Note:** You must select this check box to activate the Forecast Percent field.

Status Type | Select a status type from this drop-down menu to associate with the stage.

Notes | Enter any comments about the stage.

7. To add another stage to the strategy, repeat the previous steps.

8. Click **Save**.

**Add or Edit a Stage Task**

Just as strategies contain stages, each stage can contain multiple tasks that are required to complete each stage. After you have added a stage to a strategy, you can then add tasks to the stage.

When staff members select strategies and stages for an opportunity, the opportunity’s **Tasks** tab lists the tasks associated with the selected stage.

1. Click **Configuration**.

2. Expand **Opportunity Tracking**, and then double-click **Strategies**.
The Strategies tree displays on the content pane.

3. Locate the strategy you want and click the arrow to the left of the strategy to expand it, displaying the stages associated with the strategy.

4. Click the stage where you want to add or edit tasks.

   The Stage Details editor displays on the content pane.

5. Perform one of these tasks:
   - To add a task, click the arrow on the New button and select **Add a New Task to the Selected Stage**. The Task Details editor displays on the content pane.
   - To edit a task, click the arrow to the left of the stage to display the tasks associated with it, and click the task you want to edit.

6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Task Name</td>
<td>Enter the name of the task. The task details item name in the Strategies tree and the Label field in the Interface Visibility section are populated or revised as you type.</td>
</tr>
<tr>
<td>Owner</td>
<td>Click the Search icon next to the field to display staff accounts grouped by manager. Select the task owner from the list and click OK to close the window and populate the field.</td>
</tr>
<tr>
<td>Task Interval</td>
<td>Enter the amount of time estimated to complete the task. Select days, hours, or minutes from the drop-down menu and then type a value in the field. This value is used to calculate the task due date. When a strategy is selected for an opportunity, the associated tasks are added to the opportunity, and due dates are calculated by adding the task interval to the current date and time.</td>
</tr>
<tr>
<td>Notes</td>
<td>Enter any comments about the task.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the task.</td>
</tr>
</tbody>
</table>

7. To add another task to the stage, repeat the previous steps.

8. Click **Save**.

   **Note:** When you delete a strategy, the strategy is removed from the Strategy field of all associated opportunities and replaced with No Value. However, tasks that were associated with the strategy (and therefore with opportunities that had the strategy assigned to them) remain associated with the opportunities.

---

**Add or Edit a Sales Period**

A sales quota is defined as a specific number of dollars in sales that staff must produce over a specific time frame, or sales period.

Opportunity Tracking lets you define sales periods on an annual, semi-annual, quarterly, monthly, or weekly basis. You can define each period’s start and end dates, the total revenue goal, head count, goal for the number of closed
opportunities, and quotas for each sales representative. When you define quotas for each salesperson, you can review that information in reports throughout the sales period.

1. Click **Configuration** on the navigation pane.
2. Expand **Opportunity Tracking**, and then double-click **Sales Periods**. The Sales Periods tree displays on the content pane.
3. Perform one of these tasks:
   - To add a sales period, click **New** on the ribbon to display the editor.
   - To edit a sales period, click it in the tree.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Sales Period Name</td>
<td>Enter the name of the sales period.</td>
</tr>
<tr>
<td>*Type</td>
<td>Click this drop-down menu to select a sales period type. Your options include Annual, Monthly, Quarterly, Semi-Annual, and Weekly.</td>
</tr>
<tr>
<td>*Start Date</td>
<td>Click the calendar and select the start date of the sales period. The default is today's date.</td>
</tr>
<tr>
<td>*End Date</td>
<td>Click the calendar and select the end date of the sales period. The default is tomorrow's date.</td>
</tr>
<tr>
<td>Revenue Goal</td>
<td>Enter the revenue goal for the sales period and, if necessary, select a different currency from the drop-down menu. This is the target level of revenue for the sales period displayed in the selected currency, regardless of the local currency of the transactions.</td>
</tr>
<tr>
<td>Headcount</td>
<td>Enter the number of assigned staff persons for the sales period.</td>
</tr>
<tr>
<td>Closed Opportunities Goal</td>
<td>Enter the goal number of closed opportunities for the sales period. This is the number of opportunities targeted to close during the sales period expressed as a positive whole number.</td>
</tr>
<tr>
<td>Notes</td>
<td>Enter any comments about the sales period.</td>
</tr>
<tr>
<td>Quotas</td>
<td>Add sales quotas for each sales representative during the sales period. See <strong>Add or Edit a Sales Quota to Sales Periods</strong>.</td>
</tr>
<tr>
<td>Filter</td>
<td>Select Account, Amount, or Currency from the drop-down menu to filter the staff accounts that display in the Quotas section. See <strong>Add or Edit a Sales Quota to Sales Periods</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

**Note:** Deleting a sales period deletes all quotas associated with it.

**Add or Edit a Sales Quota to Sales Periods**

When you define a sales period, you can also add a sales quota for each staff member. When you add sales quotas, managers can generate reports to track productivity for individual sales representatives or the entire sales team.
**Note:** Sales managers must have Edit Sales Period permission in their profile to edit sales quotas.

1. Click **Configuration** on the navigation pane.
2. Expand **Opportunity Tracking**, and then double-click **Sales Periods**.
   
   The **Sales Periods** tree displays on the content pane.
3. Click the sales period where you want to add or edit sales quotas.
   
   The Quotas section of the editor displays all staff accounts with profiles that have the Appear in Menus permission selected on the Opportunity Tracking tab.
4. Click the **Amount** field for the account whose quota you want to add or edit, and type the value in the field. If necessary, select a different currency from the drop-down menu.
5. Repeat the previous step for each sales quota you want to add or edit.
6. Click **Save**.

---

### Add or Edit a Territory or Subterritory

Opportunity Tracking uses territories and subterritories to define sales regions based on geography. Staff members can be assigned to a territory or subterritory for reporting purposes.

1. Click **Configuration** on the navigation pane.
2. Expand **Opportunity Tracking**, and then double-click **Territories**.
   
   The Territories tree displays on the content pane.
3. Perform one of these tasks:
   - To add a territory, click **New**.
   - To edit a territory, click it in the tree.
   
   To add multiple parent territories in the same session, you must first press Ctrl and click the highlighted territory in the tree before clicking **New**.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Territory Name</td>
<td>Enter the name of the territory. The item name in the Territories tree and the Label field in the Interface Visibility section are populated or revised as you type.</td>
</tr>
<tr>
<td>Disabled</td>
<td>Select this check box to prevent sales representatives from selecting or viewing the territory when adding an opportunity.</td>
</tr>
<tr>
<td>Associated Accounts</td>
<td>This read-only field lists the staff members assigned to the territory in their staff account. This field is blank if you are adding a territory.</td>
</tr>
<tr>
<td>Notes</td>
<td>Enter any comments about the territory.</td>
</tr>
<tr>
<td>Visible</td>
<td>Clear this check box if you do not want the territory to be visible on the interface.</td>
</tr>
</tbody>
</table>

**Note:** If you clear a territory's visibility, you cannot move a visible territory to be subordinate to one that does not have visibility on the interface.
5. Perform one of these tasks:
   - To add a subterritory to a territory, click the territory in the Territories tree, click **New**, and complete the fields.
   - To edit a subterritory, click it in the tree and edit the fields.

6. Click **Save**.

---

**Quote Templates**

**How You Work with Quote Templates**

When you add or edit a quote template, you use Microsoft Word to format the document.

In addition to using standard Word functions, you can insert merge fields into the quote template. The merge fields serve as variables for opportunity data. When a sales representative merges the opportunity data into the quote template, the appropriate fields are completed automatically.

For example, an organization name merge field on the quote template populates the field on the quote. This simplifies the data entry required to generate the quote and ensures accuracy and consistency.

**Note:** Before sales representatives can generate quotes using quote templates, you must add price schedules and sales products to B2C Service. See *Overview of Customizable Menus*.

**Add or Edit a Quote Template**

When you add or edit a quote template, you use Microsoft Word to format the document using the following procedure.

1. Click **Configuration** on the navigation pane.
2. Expand **Opportunity Tracking**, and then double-click **Quote Templates**.
   The Quote Templates tree displays on the content pane.
3. Perform one of these tasks:
   - To add a quote template, click **New** to display the editor.
   - To edit a quote template, click it in the tree.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Name</td>
<td>Enter the name of the quote template. The item name in the Quotes Templates tree and the Label field in the Interface Visibility section are populated or revised as you type. Use a descriptive name that helps sales representatives select the appropriate quote template for generating a quote.</td>
</tr>
<tr>
<td>Disabled</td>
<td>Select this check box to prevent sales representatives from selecting or viewing the quote template.</td>
</tr>
<tr>
<td>Notes</td>
<td>Enter any comments about the quote template.</td>
</tr>
</tbody>
</table>
5. Click **Word Editor**. An instance of Microsoft Word opens in the Quote Templates editor with an Add-Ins tab for merge fields.

6. Click the **Add-Ins** tab to display the Quote Template ribbon.

   **Note:** Because the Add-Ins tab does not exist in Word 2003, the Quote Template toolbar is a standard toolbar instead of a ribbon.

7. Format the Word document based on your organizational policies and standards. If you have an existing Microsoft Word template, you can copy and paste it into the Word document.

8. To insert a merge field, place your cursor in the quote template document where you want to insert the field.

9. Click one of the drop-down menus in the Custom Toolbars section on the Quote Template ribbon and select a merge field to add to the quote template.

   For a complete list of merge fields and their associated descriptions, click **Database**, and then double-click **Data Dictionary**.

<table>
<thead>
<tr>
<th>Drop-Down Menu</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Single Items</strong></td>
<td>Click this drop-down menu to select merge fields that have a one-to-one relationship with opportunities. For example, because an opportunity can be associated with only one organization, organization fields are listed in the Single Items drop-down menu.</td>
</tr>
<tr>
<td><strong>Group Items</strong></td>
<td>Click this drop-down menu to select merge fields that have a many-to-one relationship with opportunities. For example, because a quote can be associated with many sales products, sales product fields are listed in the Group Items drop-down menu. You must create a table with column headers before using merge fields from the Group Items drop-down menu. After the table is created with column headers, a merge field from the Group Items drop-down menu must be inserted into a single cell in the table. Word automatically adds rows to the table based on how many values are in the group. The font of the column headers determines the font of the merge fields in the table.</td>
</tr>
<tr>
<td><strong>Indexed Items</strong></td>
<td>Click this drop-down menu to select merge fields that have a many-to-one relationship with opportunities and are indexed in the database. For example, because an opportunity can be associated with many contacts, contact fields are listed in the Indexed Items drop-down menu. You must replace the “N” with a numeric value. While using a field from the Group Items drop-down menu returns all of the contacts associated with an opportunity, using a field from the Indexed Items drop-down menu returns only the contact you specify according to “N” (the number one is always associated with the primary field in a database table). For example, to return the email address of the primary contact who is associated with an opportunity, contacts.email1 should be added to the quote template.</td>
</tr>
</tbody>
</table>

10. Repeat the previous step until you have added all merge fields to the quote template.
CAUTION: If you close the instance of Microsoft Word by clicking X inside the Quote Template editor, the B2C Service application closes and any unsaved changes are lost. To save your quote template without closing the application, you must click the Save and Close button.

11. Click Save.

Quotes

How You Prepare Quotes

There are considerations when preparing to send a quote to a customer.

Before you can send a quote to a customer, you must add the quote to the opportunity, add sales products to the quote, and merge the opportunity and quote information into a quote template. Only then can you send the quote.

Note: A quote must always be associated with an opportunity. In order to create or edit a quote, you must first open the opportunity that is associated with the quote.

Quotes Toolbar

The Quotes tab on an opportunity workspace contains a toolbar for working with quotes for the opportunity.

This table describes the default buttons on the Quotes toolbar.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add New</td>
<td>Click this button to add a quote to the opportunity. See Add a Quote to an Opportunity.</td>
</tr>
<tr>
<td>Open</td>
<td>Click this button to open the selected quote. See Edit a Quote.</td>
</tr>
<tr>
<td>Print</td>
<td>Click this button to print the selected quote. See Print a Quote.</td>
</tr>
<tr>
<td>Copy</td>
<td>Click this button to copy the selected quote. See Copy a Quote.</td>
</tr>
<tr>
<td>Delete</td>
<td>Click this button to delete the selected quote. See Delete a Quote.</td>
</tr>
<tr>
<td>Send</td>
<td>Click this button to send the selected quote to the customer. See Send a Quote to a Customer.</td>
</tr>
<tr>
<td>Options</td>
<td>Click this drop-down menu to choose report options.</td>
</tr>
</tbody>
</table>

Add a Quote to an Opportunity

Adding a quote to an opportunity is the first step in preparing a quote.
After you add a quote to an opportunity, you complete the quote fields, add sales products to the quote, and merge the quote data into a quote template.

1. While adding or editing an opportunity, click the Quotes tab.
2. Click Add New.
   The New Quote window opens.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Name</td>
<td>Enter the name of the quote in this field.</td>
</tr>
<tr>
<td>Status</td>
<td>Click this drop-down menu to select the status of the quote. Default statuses are Unsent, Sent, Queued, Accepted, and Returned.</td>
</tr>
<tr>
<td>Unsent</td>
<td>Select this status for quotes that have been created but not yet sent. This is the default status for new quotes.</td>
</tr>
<tr>
<td>Sent</td>
<td>This status is automatically selected when a quote is sent to a customer. After a quote is sent to a customer, you cannot edit the quote again unless your profile gives you permission.</td>
</tr>
<tr>
<td>Queued</td>
<td>Select this status if the quote is waiting to be reviewed.</td>
</tr>
<tr>
<td>Accepted</td>
<td>Select this status if the quote has been sent and the customer has accepted it.</td>
</tr>
<tr>
<td>Returned</td>
<td>Select this status if the quote has been returned because it needs to be renegotiated or because it was rejected by the customer.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Click this drop-down menu to select a price schedule to associate with the quote. (Your administrator has added different price schedules based on your organization’s needs.)</td>
</tr>
<tr>
<td>Product list</td>
<td>When you select a price schedule, all sales products that are associated with the schedule appear in the product list below the Schedule field. If the products are organized in folders, click the plus sign next to a folder to expand it and show the products within that folder. You can then double-click or drag and drop products to add them to the quote.</td>
</tr>
<tr>
<td>Sales product grid</td>
<td>After you select a schedule and add one or more sales products from the product list, the sales product grid displays details about the added sales products. See Sales Products and Quotes.</td>
</tr>
<tr>
<td>Adjusted Name</td>
<td>This column displays the product’s name.</td>
</tr>
<tr>
<td>Original Price</td>
<td>This column displays the product’s price as it is defined in the product catalog for the price schedule you selected.</td>
</tr>
</tbody>
</table>

**Note:** Working with sales products in the grid modifies the products only for the quote you are editing and does not change the sales product in the product catalog. If, for example, you discount the product in the sales product grid for a particular quote, the original price is unchanged in the product catalog.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjusted Price</td>
<td>This column displays the adjusted price of the product, which you can edit by selecting a product in the sales product grid and opening it.</td>
</tr>
<tr>
<td>Quantity</td>
<td>This column displays the quantity of the product included in the quote.</td>
</tr>
<tr>
<td>Discount</td>
<td>This column displays the discount percentage applied to the sales product.</td>
</tr>
<tr>
<td>Total</td>
<td>This column displays the total adjusted price for the sales product, taking into account the quantity selected and the discount applied to that specific product.</td>
</tr>
<tr>
<td>Action</td>
<td>After a sales product has been added to the list, choose one of the following actions: Open—Opens the quote product editor and where you can make changes to the product. Delete—Deletes the sales product from the quote.</td>
</tr>
<tr>
<td>Quote Total</td>
<td>This read-only field displays the sum of product totals for all the products in the quote. It includes the discounts applied to the specific products in the quote, but it does not include the discount for the entire quote, which you can enter in the % Discount field.</td>
</tr>
<tr>
<td>% Discount</td>
<td>Enter the percent discount to be applied to the entire quote, or use the arrows to increase or decrease the value.</td>
</tr>
<tr>
<td>Grand Total</td>
<td>This field displays the total price for the quote after the quote discount has been applied.</td>
</tr>
<tr>
<td>Offer Start Date</td>
<td>Click this calendar to select the start date for the quote from the current month's calendar. If necessary, use the arrows at the top of the calendar to move backward or forward by month.</td>
</tr>
<tr>
<td>Offer End Date</td>
<td>Click this calendar to select the end date for the quote.</td>
</tr>
<tr>
<td>Quote Document</td>
<td>If the quote information has not been merged into a quote template yet, Attach Quote is active. Click Attach Quote to merge the quote with a quote template. See Merge Opportunity and Quote Data into a Quote Template. After quote information has been merged into a quote template, this section displays the name of the quote as well as options to edit and delete the quote.</td>
</tr>
<tr>
<td>Notes</td>
<td>Enter a description of the quote in this field.</td>
</tr>
</tbody>
</table>

4. Click **OK** to close the New Quote window and add the quote to the opportunity.
5. Click **Save**.

**Quote Product Editor**

This table describes the fields on the Quote product editor.
### Field | Description
--- | ---
Original ID | This read-only field displays the product ID.
Original Name | This read-only field displays the product name.
Original Price | This read-only field displays the price assigned to the product in the price schedule you selected for the quote.
Original Description | This read-only field displays the product’s description.
Adjusted ID | Enter a product ID in this field if you want to modify the original ID.
Adjusted Name | Enter a product name in this field if you want to change the product’s name in the quote.
Adjusted Price | Enter a price in this field if you want to change the original price of the product for this quote. The value you enter appears in the Adjusted Price column on the sales product grid.
*Quantity | Enter a quantity in this field if you want to change the default value of 1. Changing this field affects the value of the Total column on the sales product grid.
*Discount | Enter a percent discount in this field if you want to change the default value of 0. Changing this field affects the value of the Total column on the sales product grid.
Adjusted Description | Enter a description in this field if you want a description other than the original description.
Notes | Enter any notes about the product quote in this field.

### Sales Products and Quotes

When you add a quote to an opportunity, you must select a price schedule in the Schedule drop-down menu on the New Quote window.

Your administrator added the price schedules, and each price schedule corresponds to a specific set of sales products. When you select a price schedule, the associated products appear in a product list below the Schedule field.

You use the product list to select the products you want to add to the quote. After they appear in the sales product grid on the right, you can adjust quantities and specific discounts for each product for this quote.

**Note:** Editing a product for this quote does not change its price in any other quote, nor does it change the price in the product catalog.

### Add a Sales Product to a Quote

This procedure assumes that you have already added a quote to an opportunity, but have not yet selected a price schedule or added sales products to the quote.

1. While editing an opportunity, click the **Quotes** tab.
2. Right-click the quote you want to open and select **Open**.
   
The quote editor opens.
3. Click the **Schedule** drop-down menu and select a price schedule for the quote.
Note: When you select a price schedule, all sales products associated with the price schedule populate the product list below the Schedule field. You can click the plus sign next to folders to expand them. The sales product grid is located next to the product list.

4. Perform one of these tasks:
   - Double-click a sales product in the product list to move the product to the sales product grid. Information about the sales product appears in the grid.
   - Drag a sales product from the product list to the sales product grid.

5. To edit a selected sales product in the sales product grid, right-click the product and select Open. The quote product editor opens.

6. Perform one of these tasks:
   - Enter field information described in Quote Product Editor.
   - Click OK to save your changes, close the quote product editor, and return to the open quote.

7. Click OK to save your changes to the quote, close the quote, and return to the opportunity.

8. Click Save.
   Now you can merge opportunity and quote data into a quote template to generate a quote you can send to the customer.

Merge Opportunity and Quote Data into a Quote Template

After you have added a quote to the opportunity and then added sales products to the quote, you have defined all the information necessary to generate the quote for the customer.

You can merge the opportunity and quote data with a quote template. When you select a quote template from the available options, Opportunity Tracking generates a quote you can save and send to the customer.

1. While editing an opportunity, click the Quotes tab.

2. Right-click the quote you want to merge into a quote template and select Open.
   The quote editor opens.

3. Click Attach Quote.
   The Select Template window opens, providing a list of available quote templates that have been defined by your administrator.

4. Select a quote template and click OK.
   The opportunity and quote data are merged into the quote template, and the Quote Viewer window opens with the quote displaying as a Word document.

5. To edit the document, make changes using Microsoft Word.

   Note: You can make any changes you need to customize the quote document, but your changes do not modify the quote template.

6. To merge the same opportunity data into a different quote template, click Merge and select a new template from the Select Template window.

7. Enter a name for the quote in the Custom Document Name field to ensure that the name of the quote is unique for the customer receiving it.

8. Click Save to save the quote and return to the quote editor.

9. Click OK to close the window and add your quote to the opportunity.
   A paper clip icon appears on the Quotes tab.

10. If you want to forecast the quote to close within the specified sales period, select the Forecast check box in the Forecast column.
After the Forecast check box is selected, the quote amount appears in the Rep Forecast field of the opportunity. See *Forecast an Opportunity*.

11. Click **Save**.

After saving the opportunity, you can view the quote audit log, which contains all activities related to the quote. See *Quote Audit Log*.

## Send a Quote to a Customer

After you merge all necessary information about the opportunity into the quote template and have reviewed the quote, you are ready to send the quote to your customer.

1. From the Quotes tab of an opportunity, right-click the quote you want to send and select **Send**.
   
The Send Quote window opens.

   **Note:** The Send option is not active unless all opportunity and quote data have been successfully merged into a quote template. See *Merge Opportunity and Quote Data into a Quote Template*.

2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>To</strong></td>
<td>Enter the email address of the contact or staff member you are sending the quote to, or click this button to open the Select Names window.</td>
</tr>
<tr>
<td><strong>Cc</strong></td>
<td>Enter an email address in the Cc field to send the quote to, or click this button to open the Select Names window.</td>
</tr>
<tr>
<td><strong>Bcc</strong></td>
<td>Enter an email address in the Bcc field to send the quote to, or click this button to open the Select Names window.</td>
</tr>
<tr>
<td><strong>Subject</strong></td>
<td>Enter the subject for the quote in this field.</td>
</tr>
<tr>
<td><strong>Comment</strong></td>
<td>Enter any comments in this field.</td>
</tr>
<tr>
<td><strong>Opportunity Files</strong></td>
<td>Any files that are permanently attached to the opportunity are listed in this section. Select the check box next to any file attachments you want to send with the quote.</td>
</tr>
<tr>
<td><strong>Temporary Files</strong></td>
<td>Click <strong>Add Files</strong> to select a file to send with the quote. This action does not permanently attach the file to the opportunity.</td>
</tr>
<tr>
<td><strong>Send as PDF</strong></td>
<td>Select this check box if you want to send the quote as a PDF attachment instead of the default Word attachment. If this check box does not appear, your administrator has not configured Opportunity Tracking to send quotes as PDF documents.</td>
</tr>
</tbody>
</table>

3. Click **Send** to send the quote to the recipients you’ve added to the Send Quote window.

After a quote has been sent to a customer, the details of the quote (From, To, Cc, Bcc, Format, Attachments, Subject, and Comments) are recorded as a note to the opportunity the quote is associated with. In addition, the status of the quote is automatically set to Sent.
How You Manage Quotes

In addition to adding and sending quotes, the toolbar on the Quotes tab lets you open a quote for editing as well as print, copy, and delete a quote.

These options are also available when you right-click a quote. When a quote is open, you can view the audit log that lists all activities related to the quote.

After a quote has been sent, you cannot edit it unless your profile gives you permission to do so. However, you can make a copy of the quote, edit the copy, and then send the copied quote to a customer.

Edit a Quote

You can edit a quote before sending it to the customer. After a quote has been sent, you cannot edit it unless your profile gives you permission to do so.

1. While editing an opportunity, click the Quotes tab.
2. Right-click the quote you want to edit and select Open.
   The quote editor opens.
   | Note: You can edit only one quote at a time.
3. Modify fields as needed. See Add a Quote to an Opportunity for field descriptions.
4. Click OK, and then click Save.

Copy a Quote

After a quote has been sent, you cannot edit it unless your profile gives you permission to do so. However, you can make a copy of the quote, edit the copy, and then send the copied quote to a customer.

1. While editing an opportunity, click the Quotes tab.
2. Right-click the quote you want to copy and select Copy.
   The copied quote appears in the quote list with a name of “Copy of <quote>” and its status is set to Unsent.
3. Right-click the copied quote and select Open to edit as necessary. See Add a Quote to an Opportunity for field descriptions.
4. Click OK to save your changes to the copied quote.
5. Click Save.

Delete a Quote

You can delete a quote from an open opportunity.

1. While editing an opportunity, click the Quotes tab.
2. Right-click the quote you want to delete and select Delete.
   A confirmation message opens.
3. Click Yes to confirm the deletion.
4. Click Save.

Print a Quote

You can print a quote from the Quotes tab when you edit an opportunity.

1. While editing an opportunity, click the Quotes tab.
2. Right-click the quote you want to print and select **Print**.
   The **Print Dialog** window opens.
3. Click **File > Print**
   The **Print** window opens.
4. Click **Print**.

**Quote Audit Log**

All actions related to a quote are recorded to the quote audit log, which is located next to the Attachments tab on the quote editor. Information in the audit log includes when the quote was created and updated, by whom, and the actions taken.

**Note:** Before you can see any recent actions in the audit log, you must save the opportunity the quote is associated with.

This table describes the columns in the quote audit log.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When</td>
<td>This column lists the date and time of the actions.</td>
</tr>
<tr>
<td>Who</td>
<td>This column lists the name of the sales rep who acted on the quote.</td>
</tr>
<tr>
<td>What</td>
<td>This column lists the actions related to the quote.</td>
</tr>
<tr>
<td></td>
<td><strong>Created</strong>—The first time a quote is added to the opportunity and the opportunity is saved.</td>
</tr>
<tr>

</tbody>
</table>
13 Security Practices

Overview of Oracle B2C Service Security and Compliance

An important part of product security is your diligence in configuring B2C Service and your vigilance in its use.

Security is a changing landscape with new attack methods continuously developing, many of which are based on social engineering that takes advantage of user trust. The protection of our customers’ assets is a high priority at Oracle. We strive to make your B2C Service experience secure by holding ourselves to industry-standard security and privacy requirements in our software development practices and operational methods. For added protection, B2C Service can be hosted within our community cloud environments that align with well-known regulatory control frameworks.

See Overview of Deploying B2C Service in a Controlled Environment, and the sections that follow it, for guidance when deploying B2C Service in a regulated environment.

Network and Hosting Infrastructure

Oracle uses “defense in depth” with multiple levels of security crafted to protect everything in the hosted environment from the network infrastructure to the software.

B2C Service sites are hosted in security-hardened pods where each is protected by redundant firewalls and a demilitarized zone architecture. All major services, which include web, database, and mail services, are separately hosted and load balanced. The pods are audited daily, both internally and externally, and every quarterly software release is subjected to a third-party audit. In addition, a dedicated security staff monitors all systems for events that could jeopardize system reliability or data integrity.

How You Develop a Security Plan

When configuring your B2C Service site, your goal is to obtain the maximum effectiveness for your staff and your customers, while ensuring that your site is safe from threats.

Although B2C Service is designed and implemented with the highest levels of security, we recognize that our customers’ needs vary. Therefore, we offer configuration options that let you accept various levels of risk. Your sensitivity to those risks should dictate the configuration and management options you use in your site.

Note: Never assume that your security system is foolproof. New attacks are designed every day, so you should expect that any weakness will eventually be exploited. Ongoing vigilance and process improvement are required to minimize risk.
Common Security Threats

Risks to using a web-facing software product like B2C Service to collect and store data include but are not limited to:

- Data leaks to unauthorized persons.
- Attacks to subvert security measures.
- Vandalism of the host site.
- Attacks against site users.

Security Considerations

To start developing your security plan, we’ve compiled a list of questions and considerations that relate to the use of B2C Service. Your answers should help determine the content of your security plan. Here are some things to consider.

- What type of data will you collect and store?
  - Is personal information such as name, address, telephone number, and email address collected?
  - Is medical or financial information collected and stored?
  - Are there required data security standards or certifications, such as HIPAA or PCI?

- What methods will be used to obtain the data?
  - Does information come over the Internet or a private intranet?
  - Does information come from a voice-based system?

- What is the access method for the data?
  - Are users required to provide credentials, such as a user name and password, or is data openly available?

- What are the risks associated with compromised data?
  - What is the monetary cost?
  - What is the non-monetary cost, such as loss of reputation?
  - Are there legal ramifications?

- Who are your user groups?
- What authentication methods are available and which should be used for each type of user?
- For each type of data, which types of users should have access and how should the authorization be accomplished?
- What communication methods will be used and what efforts should be made to protect communication from being compromised?

While there are many resources available that can help you develop security policies and procedures, keep in mind that you should rely only on those resources that you find reliable and trustworthy. If you want to read more about security, here are some suggestions.

- *Information Security Policy Templates*—for information about security training and security certification
• **OWASP Foundation**—A nonprofit organization focused on improving software security

## Administration Interface Configuration

Properly configuring the administration interface is critical to your site security because staff members can be granted permission to view and modify virtually everything in a B2C Service site, including your site controls and data.

B2C Service uses role-based access control through profile permissions, navigation sets, and workspaces that you define. All staff members are assigned a profile that is associated with a navigation set and one or more workspaces.

- **Navigation sets**—A navigation set is a combination of navigation buttons and their associated navigation lists. Each navigation list contains unique reports and items based on staff member responsibilities, and every profile must include a navigation set that all staff members with that profile use when working in B2C Service. By carefully examining staff member responsibilities before you create navigation sets, you can grant access to functionality to only those individuals who require it.

- **Workspaces**—Workspaces define the appearance of the agent desktop when staff members add, view, and edit records in B2C Service. Each profile has one or more workspaces that can be designed to provide only the functionality that is needed by the staff member. Along with navigation sets, workspaces provide macro-level control over access rights.

- **Profile permissions**—Profiles let you control which areas of B2C Service your staff members can access and what specific actions they can perform in those areas.

**Note:** You must create navigation sets before profiles in order for staff members to have access to reports and other components. In addition, if you use custom workspaces, we recommend creating them before creating profiles so you can assign the workspaces to specific profiles.

## How You Use Role Access to Define Permissions

Setting permissions carefully and thoughtfully greatly enhances the security of your site. This is particularly true regarding administrator permissions, which typically let staff members edit configuration settings and administrative controls.
One method for determining the permissions you grant is to use a role-access method. While no contrived set of roles will represent any organization perfectly, the four job types used here demonstrate a general scenario of how permissions might be set up.

- Administrator—Staff member with access to all functionality.
- Supervisor—Staff member with supervisory responsibilities but no responsibility for configuring your site.
- Staff member—Staff member with access to data but no administrative controls.
- Developer—Staff member with access to development and integration interfaces.

Although this table doesn't contain a complete list of all the permissions available, it does provide a list of those permissions having direct security ramifications.

## Email Security

Although most email sent over networks is not encrypted, we recommend encrypting all data that you deem sensitive. B2C Service is designed to prevent the inadvertent release of information, but there are also a number of configuration settings related to email that you can use to increase your protection.

### Certificates

Secure sockets layer (SSL) protocol provides encryption services for client-server communication security. To accomplish this, digital certificates are used to convey identification information and encryption keys. Since all agent desktop communication is over SSL, your site already uses a certificate issued by Oracle. This certificate can be used for other secure communication links, including staff member and customer access and email. See Configure SSL Security Settings, Configure SMIME Security Settings, and Certificate Validation Options.

For a list of configuration settings you can use to protect your site and improve your security, see Site Protection.

### Emailing Links to Answers

You can email links to answers from the customer portal or the administration interface. If a login is required for customers to access an answer, a user name and password will be required.

Answer visibility depends on who is trying to access the answer—a customer or a staff member—and where they are accessing it from—the customer portal or the administration interface. From the customer portal, visibility is controlled by a number of fields, including the Status field, which is defined on the administration interface. For example, if an answer status has been set to Private, then that answer is not visible to customers. See How to Control Answer Visibility.

For customers accessing answers from the customer portal, each answer link is protected by a security token with a limited lifetime that is defined in the SEC_EU_EMAIL_LINK_EXPIRE configuration setting. The default value is eight hours, meaning that a customer has eight hours to click the link and read the information published in the answer. We recommend using this security token to limit the time answers are available to customers. Because attackers need time...
to build phishing sites (for luring a user into clicking a link), the smaller the window of time you allow for access to your answers, the more secure your site will be.

For example, if an email with an answer link is copied by an attacker, access to the security token and the link has been compromised. If your site requires customers to log in to see an answer, the answer itself is safe, but the attacker can create a phishing scenario using a modified link that takes customers to an external site where their login credentials are stolen. It takes time to accomplish this, so the shorter the window of opportunity, the lower the likelihood of success. Setting the security token expiration in SEC_EU_EMAIL_LINK_EXPIRE helps discourage attackers. See How You Secure Customer Passwords.

From the administration interface, profile permissions control staff members’ access to answers. Permissions of the staff member who sends an email link to an answer do not transfer to the receiver, so data security is maintained.

Image Links in Incoming HTML Email

When HTML is rendered from a customer email, the EGW_VISUAL_EMAIL configuration setting defines how inline images are retrieved and rendered. These HTML image links could be used for unauthorized data transfer and tracking purposes. For example, when an incident is opened, a web page revealing an agent’s location (IP address) or browser type might be automatically accessed.

You can disable image links in incoming HTML email by setting the EGW_VISUAL_EMAIL configuration setting to No. Keep in mind that this setting not only disables image links when creating the incident thread, but also renders the email as plain text, without any formatting. There are also cases where EGW_VISUAL_EMAIL does not affect HTML threads with images, for example, when some kind of integration has taken place. It is also important to note that even after the setting is disabled, existing incidents might still be vulnerable.

Abuse-Detection Security

A potential threat to any website is a “denial of service” (DoS) attack where the attacker issues a large number of requests for service. Perpetrators of DoS attacks typically target sites or services hosted on high-profile web servers such as banks and credit card payment gateways.

DoS attacks can slow the response time to legitimate visitors, overwhelm the database server, and generate excessive emails that interfere with normal operation. To prevent these attacks, B2C Service provides web form and survey security through CAPTCHA, which automatically requires human validation when abuse is suspected. CAPTCHA validation is typically triggered only if there appears to be active abuse of a website. However, you can customize CAPTCHA requirements from the customer portal. See Web Form and Survey Security and Web Form Security.

- Require CAPTCHA Validation on Submit
- Open CAPTCHA Within a Form
- Set the Abuse Detection Cookie
Overview of Security-Related Configuration Settings

Certain configuration settings have a direct effect on security. Some affect the administration side of B2C Service and others affect the customer portal or an external website.

By making a conscious decision to determine the appropriate level of security that fits your business, you can define configuration settings to reflect a suitable security level. Configuration settings that specifically impact security are detailed in the sections that follow. Paths to each setting in the Configuration Settings editor, descriptions, and default values are also listed. Configuration settings in this section are grouped into these categories.

- Site protection
- Session data
- Password protection
- File-attachment security
- Chat security
- Social-experience security

For a complete list of security-related configuration settings by security level and significance, see Security Level.

**Note:** Depending on your site’s configuration, some settings may be hidden. If you cannot find a certain configuration setting, contact your Oracle account manager.

Site Protection

One of the most important steps you can take to protect your site is to limit access to the greatest extent possible while still meeting the requirements of your staff members and customers.

By restricting access to your site or certain functionality within your site, you can reduce opportunities for unwanted visitors with malicious intent to gain access to your assets. Configuration setting descriptions that affect your site’s protection are listed in the following two tables.

<table>
<thead>
<tr>
<th>Configuration Setting</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common/General/Security</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SEC_VALID_ADMIN_HOSTS</td>
<td>Defines which hosts can access the administration interface.</td>
<td>Blank</td>
</tr>
<tr>
<td>SEC_VALID_INTEG_HOSTS</td>
<td>Defines which hosts can access the integration interface. Only staff members who log in from the listed IP addresses, including network groups, can access the API interface.</td>
<td>Blank</td>
</tr>
<tr>
<td>RightNow User Interface/General/Security</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Chapter 13: Security Practices

#### Configuration Setting | Description | Default Value
--- | --- | ---
CLIENT_SESSION_EXP | Requires staff members to log in again after a specified period of inactivity on the Service Console. To reduce the risk of a misappropriated agent session, we recommend keeping the default value of 15.  
**Note:** This setting is not used strictly for security. It is also used in the desktop usage administration feature. | 15

### RightNow User Interface/Tool Bar/General

#### LOGIN_SECURITY_MSG
Defines a message to display after staff members click the Login button on the Login window.  
You can use this setting to issue a security statement, distribute terms of a use agreement, or any login message you want staff members to agree to before the Service Console or the Agent Browser UI opens. | Blank

### Common/General/Security

#### CP_REDIRECT_HOSTS
Defines which hosts are allowed as redirect targets from the customer portal. The default setting (blank) prevents all redirects outside of your interface domain.  
If you have more than one interface that you need to redirect to, each interface domain name must be specified in CP_REDIRECT_HOSTS.  
- Blank = Prevents all redirects outside of your interface domain.  
- * = Allows all redirects, including redirects to external sites. (Not recommended.)  
**Note:** Redirects within your interface domain, as well as hosts specified in related configuration settings are implicitly allowed. Therefore, those domains do not need to be listed in the CP_REDIRECT_HOSTS setting. | Blank
### Configuration Setting

<table>
<thead>
<tr>
<th>Configuration Setting</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEC_VALID_ENDUSER_HOSTS</td>
<td><strong>Note:</strong> This setting applies only to PHP pages. It does not block access to static assets such as URLs, images, JavaScript, folders, or files. For more information, contact your Oracle account manager. Defines which hosts can access the customer portal. Only customers coming from a host in the valid list are allowed access to the customer portal. <strong>Tip:</strong> The valid list is practical only if the set of allowed hosts is confined to 10 or fewer domains.</td>
<td>Blank</td>
</tr>
<tr>
<td>SEC_INVALID_ENDUSER_HOSTS</td>
<td>Defines which hosts are not allowed access to the customer portal. The invalid list is used to prevent spiders from known locations.</td>
<td>Blank</td>
</tr>
<tr>
<td><strong>RightNow User Interface/General/Security</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>SUBMIT_TOKEN_EXP</td>
<td>Defines the amount of time, in minutes, that the submit token used for token verification is valid.</td>
<td>30</td>
</tr>
</tbody>
</table>

---

### Clickjacking Protection

Clickjacking is an attack on browser security that can mislead your customers into clicking a concealed link.

On a clickjacked page, attackers load another page in a transparent layer over your original page. Users think they are clicking visible buttons, while they are actually performing actions on the hidden page. The hidden page may even be an authentic one, such as a page from a well-known, reputable business. This makes it possible for attackers to trick your customers into performing unintended actions.

A common defense against clickjacking is to attempt to block the site you are trying to protect from being loaded into a frame.

The ClickjackPrevention widget, included by default in the standard and mobile templates, ensures that your customer portal cannot be viewed inside a frame or iFrame.

If you do not use frames, you can edit the `standard.php` file of your template file to minimize the risk of clickjacking. For the complete procedure, see [Remove ClickjackPrevention from the Template](#).

For more information on clickjacking, including definitions for X-Frame-Options response headers, search for the Clickjacking Defense Cheat Sheet on the [OWASP Foundation](#) website.
Cross-Site Request Forgery

Cross-site request forgery (CSRF) causes a user’s browser to load pages (including forms) that typically require authentication in an attempt to perform actions on behalf of the user.

If the user has a valid authenticated session for the site the attacker is causing to load into the browser, those requests will succeed. If proper protections are not in place, this may let the attacker perform unintended actions on behalf of the user.

Submit tokens ensure that the contact who opened the page is the only contact who can submit the form. The SUBMIT_TOKEN_EXP configuration setting lets you define the amount of time the submit token is valid and is set, by default, to expire 30 minutes from the time the token was sent. After 30 minutes, the contact will receive a new token. The expiration process is invisible to the contact making for a seamless user experience.

For more information about CSRF vulnerabilities, search for the CSRF Prevention Cheat Sheet on the OWASP Foundation website.

Redirect Security

Linking from one page to another is a security risk you should consider. For example, you may have placed a link in your URL to redirect users to different locations within your site.

Typically, these are links to other files on your site but they can also be links to another interface, either on your site or on an external site. Attackers can take advantage of redirects by creating URL links in these locations.

- Questions on your page
- Uploaded files
- Emails

In each of these scenarios, an attacker bets that users will click the link they create and be redirected to an external site where data can be maliciously harvested.

To protect your site from this type of attack, you can set the value of the CP_REDIRECT_HOSTS configuration setting to a list of interface domains that are legitimate redirect targets. The default value is blank, which limits redirects to pages only within your interface domain. Keep in mind that redirects to domains specified in related configuration settings are implicitly allowed.

This table displays sample values for CP_REDIRECT_HOSTS.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blank</td>
<td>Prevents all redirects outside of your interface. (Default)</td>
</tr>
<tr>
<td>*</td>
<td>Allows all redirects. (Not recommended.)</td>
</tr>
</tbody>
</table>
### Chapter 13

#### Security Practices

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>*.example.com</td>
<td>Allows redirects to all sites in the example.com domain.</td>
</tr>
<tr>
<td>one.example.com, two.example.com</td>
<td>Allows redirects to sites one and two in the example.com domain.</td>
</tr>
<tr>
<td>example.custhelp.com, *.test.com</td>
<td>Allows redirects to example.custhelp.com and any interface in the test.com domain.</td>
</tr>
</tbody>
</table>

For information about securely publishing answer links on your site, see *Email Security*.

## Session-Data Security

To maintain state information about staff members and customers, we use session data that is passed between the staff member’s or customer’s system and the web server.

When an individual is logged in, data from the session can provide the necessary authentication for accessing your data that would not otherwise be available. Session data security prevents attacks that stem from the trust the system has in authenticated users. Without session data security, attackers may be able to capture session data and reuse it. These are commonly referred to as “replay” attacks or “man-in-the-middle” attacks.

The `SESSION_HARD_TIMEOUT` configuration setting helps reduce session exploitation by forcing staff members to reauthenticate after a specified period of time. Set to twelve hours by default, this setting creates a new session while destroying the previous session each time the staff member reauthenticates. See *How You Force Session Expiration*.

The `CP_FORCE_PASSWORDS_OVER_HTTPS` configuration setting is enabled by default and helps protect staff members and customers from malicious activity such as password theft. This setting requires that all login operations, such as login name and password, be performed over HTTPS. Therefore, logged-in users interact entirely on HTTPS.

**Note:** Pages that use passwords within standard widgets are automatically redirected to HTTPS.

If your site is password protected, you should require customers to log in to the customer portal. Even if only your answer pages are password protected, the `CP_CONTACT_LOGIN_REQUIRED` configuration setting enforces secure logon to your pages and controls on the customer portal. The `CP_CONTACT_LOGIN_REQUIRED` setting also prevents unauthenticated chat sessions.

B2C Service offers different session management schemes for the administration interface and the customer portal. However, for both interfaces, we perform these actions:

- Encrypt session data stored in cookies.
- Set the Secure flag and the HTTP Only flag on cookies.
- Make session data difficult to use from a different computer system.
- Require staff members to reauthenticate after twelve hours. See the `SESSION_HARD_TIMEOUT` setting description in the first table.
- Require staff members to reauthenticate after a specified period of inactivity. See the `CLIENT_SESSION_EXP` setting description in the first table.
- Require all login operations to be performed over HTTPS. See the `CP_FORCE_PASSWORDS_OVER_HTTPS` setting description in the second table.
Configuration setting descriptions that affect your site’s session data are listed in these tables.

<table>
<thead>
<tr>
<th>Configuration Setting</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>RightNow User Interface/General/Security</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CLIENT_SESSION_EXP</td>
<td>Requires staff members to reauthenticate after a specified period of inactivity on the Service Console.</td>
<td>15 minutes</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This setting is not used strictly for security. It is also used in the desktop usage administration feature. See Desktop Usage Control.</td>
<td></td>
</tr>
<tr>
<td>SESSION_HARD_TIMEOUT</td>
<td>Requires staff members to reauthenticate after a specified period of time.</td>
<td>12 hours</td>
</tr>
<tr>
<td></td>
<td>This setting creates a new session each time the staff member reauthenticate. The previous session is destroyed.</td>
<td></td>
</tr>
<tr>
<td>RightNow User Interface/General/Security</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CP_LOGIN_MAX_TIME</td>
<td>Defines the time (in minutes) a customer can be logged in without needing to log in again. If a session goes past the defined setting, the customer is required to log in again. The default is 0, which means that the time is set by CP_LOGIN_COOKIE_EXP.</td>
<td>0</td>
</tr>
<tr>
<td>RightNow User Interface/Customer Portal/Login</td>

<tr>
<td>CP_CONTACT_LOGIN_REQUIRED</td>
<td>Defines if the customer portal requires a customer to be logged in when accessing most pages or controls. Also prevents unauthenticated chat sessions.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This setting does not apply to the login, password recovery, and account creation pages, or pass-through authentication (PTA). PTA is described in Configuring Pass-Through Authentication.</td>
<td></td>
</tr>
<tr>
<td>CP_COOKIES_ENABLED</td>
<td>Defines if the customer portal tries to set cookies on a visitor's browser.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Password Protection

No matter your security situation, you have considerable flexibility in setting up passwords for your staff and your customers.

If the data protected by a password is not critical or subject to privacy legislation, the default values in Oracle B2C Service may be acceptable. The most compromising dangers to passwords include:

- Password cracking by brute-force attack or an exhaustive key search.
- Nefarious activities, such as phishing and other social engineering attacks.
- Inadvertent release by users (staff members or customers) who write down their passwords, send them in emails, or expose them to the public in other ways.

The choice of password controls depends on your security situation. For example, if users do not log in often, setting password expiration parameters can result in unnecessary locked accounts and frustrated users. While locking accounts can prevent some brute-force and denial-of-service attacks, it can also increase administrative overhead.

### Configuration Settings

<table>
<thead>
<tr>
<th>Configuration Setting</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP_FORCE_PASSWORDS_OVER_HTTPS</td>
<td>Requires all login operations to be performed over HTTPS. Pages that use passwords within standard widgets are automatically redirected to HTTPS.</td>
<td>Yes</td>
</tr>
<tr>
<td>CP_LOGIN_COOKIE_EXP</td>
<td>The time (in minutes) before the customer portal login cookie expires. Set the value to -1 if you want the cookie to expire when the browser is closed. Set the value to 0 if you never want the cookie to expire.</td>
<td>60</td>
</tr>
<tr>
<td>CP_MAX_LOGINS</td>
<td>Defines the total number of concurrent users that can be logged in to your support site at any given time. A value of 0 means there is no limit. If you set a value for this setting, you must also set a non-zero value for CP_LOGIN_MAX_TIME.</td>
<td>0</td>
</tr>
<tr>
<td>CP_MAX_LOGINS_PER_CONTACT</td>
<td>Defines the total number of active, concurrent logins a single user can be logged in with. A value of 0 means there is no limit. If you set a value for this setting, you must also set a non-zero value for CP_LOGIN_MAX_TIME.</td>
<td>0</td>
</tr>
</tbody>
</table>
If you require your users to change their passwords regularly, you need to save history data to prevent reuse (at least five previous passwords). It is common for users to make a minor change to their password and eventually cycle back to the original, so it is difficult to assess the value of this strategy.

If you are concerned that passwords could be compromised by poor user-handling (writing passwords down) or by some form of attack, consider requiring regular changes. However, mandating frequent password changes in an environment where they are strong and are not shared does not enhance security and may actually hamper it by creating an environment that causes people to store passwords in electronic or written media.

No matter your security situation, you have considerable flexibility in setting up passwords for your staff and your customers. The topics in this section provide helpful information about your configuration options and identify tips for configuring secure passwords throughout your system.

### How You Configure Staff-Member Passwords

You can strengthen passwords by defining requirements such as minimum password length, maximum number of character repetitions and occurrences, and the minimum number of upper and lowercase characters, numbers, and special characters allowed.

You configure passwords for your staff from the configuration list on the navigation pane (Configuration > Staff Management > Password Configuration).

The options available to you in setting up password requirements can enhance security on your site as well as help protect your customers' information. This table describes the security benefits of defining specific requirements for passwords.

<table>
<thead>
<tr>
<th>Password Configuration</th>
<th>Security Benefit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Invalid Logins</td>
<td>Locking accounts after a designated number of consecutive login failures makes it more difficult, but not impossible, for attackers to use brute-force password cracking. If an attacker is able to obtain an encrypted password, they can guess the algorithm used to encrypt it and simply run different strings looking for a match. While time-consuming, current computing technology makes it possible to guess up to - million passwords per second (and this number increases by 10 percent per year). In B2C Service, the default is 5 invalid login attempts before the account is locked.</td>
</tr>
<tr>
<td>Expiration Interval</td>
<td>The password expiration interval helps mitigate risk for accounts that have been compromised or accounts that have not been used for long periods of time. By setting a conservative value for the number of days a password stays in effect, you can help lower the risk of attack. (Default = 90.) Note: PCI-compliance requires expiration interval to be 90 days or less.</td>
</tr>
<tr>
<td>Password Length</td>
<td>While it is helpful to use case changes and special characters to enlarge the character set, enforcing longer passwords is an easy way to improve password strength. (Default = 8.) For example, if 76 characters are used randomly, it takes no more than 12 hours to crack a 6-character password. Cracking time increases to 6 years for an 8-character password, and it would take 230 million years to crack a 12-character password. Of course, password cracking typically takes advantage of the tendency to use common words in passwords so dictionary attacks can break passwords more quickly. For maximum security, even longer passwords (no less than 10 characters) are necessary. For example, a 12-character password composed of 3 words from a 100,000 word dictionary could take more than</td>
</tr>
</tbody>
</table>
How You Secure Customer Passwords

Configuration settings and password requirements enable you to secure customer passwords in B2C Service.

Configuration Settings

The EU_CUST_PASSWD_ENABLED configuration setting controls the visibility of the Password field on the customer portal login window. This setting is enabled by default because it offers significant protection for your organization and your customers. However, if your organization does not require customer passwords, you can remove the Password field from the login window by disabling this setting.

<table>
<thead>
<tr>
<th>Configuration Setting</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Common/General/Security</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>SEC_EU_EMAIL_LINK_EXPIRE</td>
<td>Defines the duration in hours that a temporary link to reset a customer's password is valid. This setting also defines the length of time a customer has access to answers on your site. See Emailing links to answers in Email Security.</td>
<td>8</td>
</tr>
<tr>
<td><strong>RightNow User Interface/General/End-User</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>EU_CUST_PASSWD_ENABLED</td>
<td>Displays the password field on the customer portal page.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Password Requirements

As with staff member passwords, you can define requirements to strengthen passwords on your customer portal. The editor for configuring customer passwords contains the same fields as those for staff passwords (see How You Configure Staff-Member Passwords). The only differences between the two editors are the default values.

See Define Customer Password Requirements for the procedure to define requirements for customers accessing your customer portal.

How You Recover Forgotten Passwords

Administrators must contact their Oracle account manager to recover forgotten password credentials. Other staff members can recover both their user name and password by using the B2C Service account self-service feature.

You also can use this functionality as a tool to maintain the integrity of your organization's login policies for all staff members. Accessed by clicking Login Help on the Login window, the account self-service feature can be set up to open the login procedure in online help or send staff an email if they have forgotten their user name or password. This functionality is also available if your site has single sign-on (SSO) enabled. See Redirection to the B2C Service Login Page.

This table describes the configuration settings for your forgotten-password options.

<table>
<thead>
<tr>
<th>Configuration Setting</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>RightNow User Interface/Tool Bar/General</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ACCT_RECOVER_STATUS</td>
<td>Specifies the functionality of the Login Help link on the B2C Service Login window. See Login Help Options.</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>• 0 = Opens the login procedure in online help.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 1 = Sends an email containing user name or a link to the Password Reset page for entering a new password (default).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 2 = Changes the email message staff members receive when they click Login Help. The alternate message is defined in ACCT_RECOVER_ALT.</td>
<td></td>
</tr>
<tr>
<td>ACCT_RECOVER_ALT</td>
<td>Specifies the alternate email message to send when the configuration setting ACCT_RECOVER_STATUS is set to 2.</td>
<td>Blank</td>
</tr>
</tbody>
</table>

Customers can also recover user names and passwords from the login window on the customer portal. If the password is forgotten, the correct user name must be entered, and then a link to the Password Reset page is emailed to the address associated with that user name. The password is reset when the link is sent and login is not allowed until the process is completed. Customers must do this within the time frame contained in the SEC EU EMAIL LINK EXPIRE configuration setting. See How You Secure Customer Passwords and Email Security.
How You Enforce Password Requirements

After assessing your specific security situation, you may want to consider enforcing password requirements.

- Lock staff accounts after three to five invalid login attempts. (The B2C Service default is 5.)
- Set password length to a minimum of 10 characters.
- Require special characters and numbers.
- Require both uppercase and lowercase characters.
- Avoid using words or phrases that can be identified with a person, such as their name, address, telephone number, job title, type of car, and so on.
- Encourage users to choose passwords that are easy to remember and to type. For example, common words, song lyrics, poems and so on, with slightly misspelled words, go a long way toward security.
  - 2BeOrNot2Bee?
  - MaryhadaLittlelam
  - JollyBARN+be4Cow
- Stress the importance of keeping passwords secure by memorizing them and keeping them secret.

File-Attachment Security

Attachments that B2C Service allows for incidents, answers, community questions and comments, and features that are used in mailings and surveys are a security concern because they can contain malicious code (malware) or data that is part of an attack on your site.

All incoming attachments are scanned for malware, but you should always consider the possibility that attackers could evade detection. Uploaded files containing HTML are a particular problem because they can provide links to sites that can harvest private data from unsuspecting people. For example, an attacker could upload a file that appears to be a link to an incident, but is actually a link to the attacker's site, which prompts the receiver to enter user name and password credentials.

Here are some guidelines to consider when working with attachments.

- Staff members should never follow a link unless they are confident that it is safe, and no data should ever be entered to a linked site. If it is necessary to access a referenced site, instead of clicking a link, look at the web address and verify that it goes where you think it should. Then type the correct web address into your browser.
- HTML files might contain executable code in the form of JavaScript or ActiveX controls that potentially can have a significant impact on your system. If browser security works properly, this should not happen.
- Browsers are one of the least secure types of software. You can disable some of this functionality, but you may need it for many complex sites or applications, including B2C Service. Therefore, be careful when working with data from untrusted sources and educate your users about the risks associated with improper handling of uploaded files.

As an additional precaution, you can prevent attachment viewing by requiring that users download file attachments in order to be viewed. This protects the B2C Service application as well as the associated data, and it also allows additional levels of scanning to be applied. The FATTACH_OPEN_ENABLED configuration setting lets staff members view attachments on the agent desktop. As a preventative measure, this setting is disabled. Disabling
FATTACH_OPEN_ENABLED does not change the display of attachments for customers, so attachments from external sources can be verified as safe before they are placed in answers.

Even so, it is possible for a malicious user to create incidents with very large attachments that could be used to attack site. To prevent this, the FATTACH_MAX_SIZE configuration setting controls the maximum allowable attachment. The default (and the maximum allowable limit) is approximately twenty megabytes per attachment.

**Note:** Regardless of the file-attachment limits you define, file upload will fail if the upload takes more than five minutes.

To learn how to restrict the number of file attachments on the Ask a Question page, see *Configure File Attachments.*

This table describes configuration settings for file attachments.

<table>
<thead>
<tr>
<th>Configuration Setting</th>
<th>Description</th>

<td>20971520 (20 MB)</td>
</tr>
<tr>
<td></td>
<td><strong>Tip:</strong> Too much available disk space can make your site vulnerable to DoS attacks. Consider the types of attachments that will be uploaded to your site, and then set this value to as small as practical for your needs. As far as security goes, the more disk space you can fill, the better.</td>
<td></td>
</tr>
<tr>
<td>FATTACH_OPEN_ENABLED</td>
<td>Lets staff members open file attachments on the agent desktop.</td>
<td>No</td>
</tr>
</tbody>
</table>

**Chat Security**

B2C Chat (Chat) lets customers experience interactive, real-time conversations with agents. There are a number of configuration options that protect these exchanges of information and the underlying services that make them possible.

For complete details and procedures about configuring Chat see these topics:

- *Chat for Agents*
- *Chat for Supervisors*
- *Chat for Customers*

This table describes Chat configuration settings.
### Configuration Setting

<table>
<thead>
<tr>
<th>Configuration Setting</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHAT_WS_API_IP_HOST</td>
<td>Defines the list of IP addresses and subnet masks to make requests to the Chat API. If this setting is enabled and left blank, all hosts are allowed. To enable this hidden setting and define your allowed IP addresses and subnet masks, submit a request on our support site.</td>
<td>Blank</td>
</tr>
<tr>
<td>SEC_VALID_CHAT_API_HOSTS</td>
<td>Defines which hosts and subnet masks of hosts are allowed to access the Chat SOAP interface from any chat-related request coming from a customer to the server.</td>
<td>Blank</td>
</tr>
<tr>
<td>CP_CONTACT_LOGIN_REQUIRED</td>
<td>When enabled, enforces secure logon to prevent unauthorized chat sessions.</td>
<td>No</td>
</tr>
<tr>
<td>CHAT_CORS_ALLOWLIST</td>
<td>Defines the list of origins allowed to make cross-origin requests through the Chat server.</td>
<td>Blank</td>
</tr>
<tr>
<td>INC_PRIVATE_TRANSCRIPT_ONLY</td>
<td>Allows chat transcripts to be added to incidents as private notes.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Common/General/Security

- **SEC_VALID_CHAT_API_HOSTS**: Defines which hosts and subnet masks of hosts are allowed to access the Chat SOAP interface from any chat-related request coming from a customer to the server. | Blank

  **Note**: If this setting is left blank, the server accepts requests from all hosts.

### Chat/General/Server

- **CHAT_CORS_ALLOWLIST**: Defines the list of origins allowed to make cross-origin requests through the Chat server. | Blank

  **Note**: If this setting is left blank, the server accepts requests from all origins.

### Chat/General/Create Incident

- **INC_PRIVATE_TRANSCRIPT_ONLY**: Allows chat transcripts to be added to incidents as private notes. | No

  **Note**: If enabled, customers cannot see past chats.

### Server Protection

The Chat SOAP interface can be protected from potential threats by restricting access to valid chat servers.

The **SEC_VALID_CHAT_API_HOSTS** configuration setting defines the list of IP addresses and subnet masks specifying the legal chat servers that are allowed to access the Chat SOAP interface. If this setting is left blank, all hosts are allowed.
Additionally, users can be protected from cross-origin resource sharing (CORS) attacks by defining the origins allowed to make CORS requests in the CHAT_CORS_ALLOWLIST configuration setting. See “Cross-Origin Resource Sharing Protection” in Chat API Protection.

Chat API Protection

B2C Service supports a Chat API that must be enabled by Oracle. When enabled, the API is protected by a configuration setting that specifies the IP addresses and subnet masks to make requests to the Chat API. If this setting is enabled and left blank, all hosts are allowed.

**Note:** Access to the Chat API is defined by the hidden CHAT_WS_API_IP_HOST configuration setting. To enable this setting and specify the IP addresses and subnet masks you want to allow, [Submit a Service Request](#).

User Protection

By enabling the INC_PRIVATE_TRANSCRIPT_ONLY configuration setting, you can change the privacy of the information in a Chat exchange. Instead of being added to an incident as public information, it is added as a private note, which restricts access to the data. If there is a chance that staff members will enter sensitive information during a chat session, this setting should be enabled.

It is also possible to configure Chat to allow off-the-record chats in which the exchanged data is not recorded and can be seen only in real time by the agent.

Cross-Origin Resource Sharing Protection

Cross-origin resource sharing (CORS) lets client-side code make requests from one origin to another origin. This functionality can be abused by an attacker to retrieve information from your site or to perform actions as a valid user. You can protect your site from potential threats by restricting access to valid requests. The CHAT_CORS_ALLOWLIST configuration setting defines the list of hosts or IP addresses allowed to make cross-origin domain requests. If this setting is left blank, all origins are allowed.

**Tip:** Keep in mind that restricting cross-origin resource sharing does not prevent cross-site request forgery (CSRF). For information about CSRF protection, see [Cross-Site Request Forgery](#).

For more information about testing for CORS vulnerabilities, search “Test cross origin resource sharing” on the [OWASP Foundation](#) website.

External-Queue Security

External chat queues allow sites outside of B2C Service that use the Chat API to access B2C Service chat data.

Since external queues may be subject to more risk, we recommend allowing only those external queues that are operationally necessary. To prevent potential misuse, you must add the chat queues that you deem acceptable from the Chat Session Queue editor on the Customizable Menus page. Then, you must designate those queues for use with third-party-initiated chat requests as external. Chat requests pre-routed to the external queues you define will be routed to agent desktops by an external routing system. The chat server and the external routing system exchange data through the third-party queue API. See [Add or Edit a Chat Session Queue](#).
Self Service for Facebook Authentication

B2C Service Self Service (Self Service) lets you embed a set of service and community features directly on your organization's Facebook page.

After you create a Facebook page, you must enable Facebook on the Configuration Settings editor (FACEBOOK_ENABLED). When the Self Service application is installed on your Facebook page, it provides two values — your application ID and your secret key. You must assign these values to their respective configuration settings (FACEBOOK_APPLICATION_ID and FACEBOOK_APPLICATION_SECRET) in order to authenticate the link between Facebook and B2C Service. To ensure the integrity and security of your connection, you should keep these values confidential.

In addition, incidents can be created from your Facebook page. The FACEBOOK_INCIDENTS_ENABLED configuration setting is enabled by default so your customers can submit questions without leaving Facebook. If you do not want incidents to be created from your Facebook page, then you must disable this setting. See Open Login Credentials for Social Accounts.

To learn more about Self Service, see Overview of Self Service for Facebook.

- Overview of Social Experience

Twitter Security

When you add Twitter channel accounts, designated agents can respond to Twitter messages publicly or privately from the agent desktop.

Due to Twitter's unique functional design, we recommend that you encourage your customers to communicate privately when resolving support issues through the Twitter channel. Because your organization's tweets can be read, reposted, and replied to by any other Twitter user, using public tweets to resolve sensitive service issues can be risky. For this reason, it is vital that your agents follow the best practices for using Twitter's private messaging feature.

If you prefer that all Twitter searches be done securely over an SSL channel, contact your Oracle account manager.

Open Login Credentials for Social Accounts

B2C Service supports two open login standards, OAuth and OpenID. Both allow easy integration of sites that support either one of those open login standards from the customer portal.

For details on the customer portal open login as it relates to Facebook and Twitter, as well as other customer portal login methods, see How Customers Log in to the Customer Portal. When your Facebook page or your Twitter account is created, they provide two values — your application ID and your secret key. To allow single sign-on, these values must be assigned to their respective configuration settings in B2C Service.

Glossary

absolute time

An exact date and time defined in an escalation action for business rules or a comparison period for custom reports. In standard reports, absolute time is the amount of time passed based on a 24-hour clock. See also relative time.

access level conditional section

A method of controlling the visibility of a portion of an answer. Only those customers with permission to view the access level assigned to the answer section can view it.

accessibility

The characteristics of a website that allow all users, regardless of disability, to have complete access to the information and features of the site.

account self-service

A feature for staff members to get help when logging in to the administration interface. If staff members forget their login information, they can request their user name or password by clicking Login Help on the Login window. Account self-service can also be set up to open the login procedure in online help or to convey an alternate message.

action

The part of a business rule that defines what happens when an object (answer, contact, incident, chat session, opportunity, organization, target, or task) meets the rule's conditions. Actions are also a part of script and workspace rules, and a component of campaigns that can perform one of several functions.

action arrow

An arrow on a workspace field or control that displays available editing options.
activate

A process that is manually run after making changes to a state, function, or rule in a rule base to check for errors, archive the current rule base, and convert the edited rule base to the active rule base. See business rules.

Active

One of the default opportunity statuses and status types. An opportunity with the Active status is currently advancing in the system toward a sale.

add-in

A custom .NET component that is loaded and activated by B2C Service to add new features and integration capabilities.

Add-In Manager

A utility for adding, updating, and deleting add-ins in B2C Service. The Add-In Manager is also used to set add-in permissions for each interface.

administration interface

The graphical user interface that staff members use to configure and manage B2C Service. See also agent desktop and Service Console.

administrator

A staff member who configures, customizes, and maintains an B2C Service application.

administrator login

The default login used by the administrator to download B2C Service and log in the first time. This special login is not a defined staff account and has no navigation set or profile associated with it. Using this login, the administrator must create a navigation set, profile, and staff account in order to access all functionality. See navigation set, profile, and staff account.
administration site
See Customer Portal Administration site.

advanced mode
A survey editing mode for creating detailed questionnaires using an extended feature set that includes survey branching and automation elements.

Agedatabase
A scheduled utility that operates on the knowledge base data to maintain dynamic answers and make searching more efficient for staff members and customers.

agent
A staff member who may be assigned incidents and chats with customers, and who may also maintain contact and organization records.

agent desktop
The graphical user interface that staff members use when working with records, mailings, surveys, campaigns, and standard and custom reports. Agent desktop also refers to a set of complementary features in B2C Service, including workspaces, workspace rules, guides, agent scripts, script rules, workflows, and add-ins, each representing a different, powerful way of interacting with records in the knowledge base. While each component serves a distinct purpose, they can be used together to create a highly adaptive work environment. See also administration interface and Service Console.

agent scripting
A feature that helps guide staff members as they enter information into records on workspaces. See also script.
aging

An automatic process that reduces an answer’s solved count as the frequency with which the answer is viewed by customers declines. As the solved count is lowered, the answer will move down the list of answers and be less visible to customers.

alias

A word that represents another word or phrase. Aliases and the words or phrases they represent can be added to the synonym list to enhance customer searching. See wordlist file.

anchor

A node on an action or decision in a campaign used to create a path. Actions and decisions have anchors for incoming and outgoing paths. Anchor also refers to a destination for hyperlinks placed at locations within documents for use in mailings and questionnaires for surveys and in answers when linking to other answers.

answer

Any knowledge base information that provides solutions to common customer support questions.

answer access level

A method of controlling what information is visible to customers. The default answer access levels are Help and Everyone, and custom access levels can be added.

answer custom field

A field for gathering and displaying additional information about answers. Answer custom fields appear when adding or editing an answer and on the Answers and answer details pages.

answer relationship

The relationship between two or more related answers. Answer relationship types include sibling, manually related, and learned link. Sibling and manually related answer relationships are defined by staff members. Learned link answers are automatically defined through customer activity. See learned link, manually related answer, and sibling answer.
answer status

A method of controlling the visibility of an answer. The default answer statuses are Public, Private, Proposed, and Review, and custom answer statuses can be added.

answer status type

The status of an answer that determines whether it can be viewed by customers. The default answer status types are Public and Private.

answer type

The format in which answers display to customers. Answer types include HTML, URL, and file attachment. See File attachment answer, HTML answer, and URL answer.

answer update notification

A way for customers to sign up to be notified whenever a particular answer is updated. Customers can also sign up for notification whenever any answer associated with a specific product or category is updated.

Answers page

A page on the customer portal where customers can view answers and search the knowledge base. Customers can view individual answers or search the knowledge base using selection criteria to narrow their search. If additional elements are enabled, customers can also search documents, websites, and communities. See also Web Indexer and Social Experience communities.

API (application program interface)

An interface that enables programmers to communicate with the Oracle database. The API includes functionality to create, update, delete, and retrieve answers, contacts, hierarchical menus, incidents, opportunities, organizations, quotes, SLA instances, staff accounts, and tasks.
application menu

An interface element containing a list of options for working in B2C Service, including access to other areas of the product and shortcuts for adding records and items to the knowledge base. The application menu also contains options for changing personal settings and password and customizing the content pane and navigation pane display. Staff members can also exit their application from this menu. See file menu.

Ask a Question

A page on the customer portal where customers can submit a question when they cannot find an answer in the knowledge base.

asset

Any product or service associated with an organization’s customers. Assets can require serial numbers or not and can be registered by customers on the customer portal or by agents on the agent desktop.

asset product

Any product or service sold or provided by an organization that can be tracked in B2C Service. Asset products are configured using the product catalog.

asset record

Information about a specific product or service provided to a specific customer that is tracked and maintained in B2C Service.

audience

All of the contacts belonging to the lists and segments associated with a mailing or survey. See also contact list and segment.

audience sampling mode

A market testing option for transactional mailings and surveys that sends a sample of test messages to portions of your audience. If more than one message is created, market testing rotates through the test messages. See market testing.
**audit log**

A list of all the actions performed on a report, record, or item in the knowledge base, including who performed the action, what the action was, and the date and time of the action.

**auto filter**

A control added to report columns for filtering report data by values in the columns.

**automatic logout**

A way of managing desktop user sessions by automatically logging out inactive sessions after a specified time of inactivity. Automatic logout is part of desktop usage administration, which assists organizations in lowering seat usage for licensing compliance. See also *force logout*.

**backup directory**

The directory that contains all the backup files created by the File Manager.

**backup file**

A file that is automatically saved each time a file is edited through the File Manager. Before the file is overwritten, the backup file is saved. The restore function can be used to revert to the backup file.

**basic page set**

The template and set of customer portal pages that have been optimized for display on browsers with limited or no JavaScript capabilities.

**billable task**

A way of classifying and recording the amount of time agents spend working on incidents. The default billable task is Miscellaneous, and custom billable tasks can be added.
block

A section of widget code that can be customized to extend the view of a standard widget. Widget code that is not within a block cannot be modified.

block quotes

A symbol or HTML tag that designates a section of text that is not part of the most current email reply, such as previous entries in the email conversation. See also checksum and techmail.

boolean searching

A knowledge base search that allows customers to connect multiple keywords using & (AND) and |(OR) operators.

bounced email

Email that is undeliverable. Emails can be bounced when email accounts are not functioning properly or are full at the time the mailing is sent. Outreach and Feedback tracks bounced emails. See also email management.

broadcast mailing

A mailing sent to one or more contact lists or segments. Broadcast mailings can be sent at a scheduled time and can also be used in campaigns.

broadcast survey

A survey sent as a broadcast mailing in which the message, audience, and mailing options are defined in the survey.

builder

A community member whose primary role is to create hives and groups for a community. Access to builder functions is provided by the Builder–Custom and Builder–Template user types. See user type.
Bulkdel

A utility for deleting several incidents at once.

business objects

The page of the Customer Portal Administration site that defines the set of answer, contact, and incident fields that can be used to define input and output fields on the customer portal.

business rules

A component for defining processes to automate workflow, notification, and escalation. Business rules can automatically route incidents, opportunities, and chat sessions; send email and Outreach messages; escalate answers, incidents, opportunities, and tasks; update records; assigns SLAs; and create Offer Advisor targets. See also script rules, target rules, and workspace rules.

cached data

Report data that has been temporarily stored in the database for quicker report generation. This data is cached nightly by the Agedatabase utility and can be purged regularly. Cached data also refers to local cache files stored on a staff member’s workstation. This includes all option lists data (any data accessed from a drop-down menu or menu list such as customizable menu items) plus additional data such as report and workspace definitions, questions, documents, and standard text.

Campaign

A multiple-step marketing process based on business logic. Campaigns can contain any number of actions and decisions and move contacts through a series of steps when specified criteria have been met.

Canceled

A mailing and survey status that indicates a mailing or survey has been manually canceled before being completed.
case section

A logical group of conditional sections where one, and only one, conditional section displays to the customer. As soon as the first conditional section is matched, the content for that conditional section is added, and no other conditional sections within the case section are evaluated. Case sections make content more relevant and targeted to a specific audience than independent conditional statements. See also condition.

Case statement

A type of conditional element used for multiple-choice decisions that allows more diverse branching capabilities to be added to campaigns and surveys based on conditions defined in the workflow. Case statements are unique because they have an outgoing path for every condition. As soon as the first choice (condition) is matched, the path for that choice is followed, and no other conditions within the case statement are evaluated.

category

An option for grouping answers and incidents that allows more precise organization in the knowledge base. Staff members can classify answers and incidents by category and up to five additional levels of sub-categories, allowing more refined searching by customers and staff members. See also product.

category page

A custom page that serves as a landing page for grouping and accessing custom content pages in a community.

certificate

A digital piece of information for email and Internet security that includes the name of the certification authority, the holder of the certificate, the certificate holder’s public key, the dates the certificate is valid, the serial number, and the digital signature of the certification authority. Certificates are also called public and public key certificates.

certificate revocation list

A list of certificates that have been suspended or revoked before they have expired. The certification authority maintains, updates, and publishes the certificate revocation list at regular intervals.
certification authority

A third party authorized to issue certificates and authenticate the identity of the holder of the certificate.

channel

The source of an incoming incident or outgoing response. Channels are grouped as standard email channels (Service Email, Outreach Email, Phone, Fax, Post, Service Web, Outreach Web, Chat, and Email) and social channels (Community, Twitter, YouTube, RSS feeds, and Facebook). Channels are also used to indicate contact, opportunity, and organization notes.

channel account

A shared credential that permits one or more designated staff accounts to pass through a social media site when login and password authentication is required. Channel accounts can be created for communities, Facebook, and Twitter.

channel type

The social channels tracked in contact records when storing social account user names. Channel types include Facebook, Twitter, and YouTube.

chart style

A collection of display settings that can quickly be applied to charts used in reports. Chart styles control most of the graphical configuration of charts.

chat agent status

A method of tracking an agent's availability to chat. The default chat agent statuses are Unrestricted, Unqualified, Unspecified, In Meeting, and On Break, and custom statuses can be added.

chat agent status type

The status of an agent's availability to chat. Default chat agent status types are Available, Unavailable, and Logged Out.
chat session
A real-time, two-way dialog between a customer and one or more chat agents. See Chat.

chat session queue
A sequence of unassigned requests for chat sessions. The default chat session queue is Default Chat Queue, and custom queues can be added. Requests are added to chat session queues automatically by business rules.

chat session routing
A process of routing customer requests for a chat to a specific chat session queue based on rules in the Chat rule base.

checksum
A calculated value that represents the content of a block of quoted text. This value is sent within the block quote tags of the email message and is used to determine if text has been added to the original message. See also techmail.

choice question
A question type that allows customers to choose their answer from a menu, option, check box, or list.

Click-Once installer
A utility used to install the Smart Client on staff members’ workstations.

client
The interface that displays on a customer’s computer when submitting a request to chat with an agent.

clone
To create an exact copy of an existing site or interface.
Closed
One of the default opportunity statuses and status types. An opportunity with the Closed status has resulted in a sale.

clustering
An automatic process that groups the knowledge base into clusters of related answers and labels each cluster group with keywords that define those answers. See also data mining and topic browsing.

co-browse
A feature in Chat that enables agents to guide customers through web pages using their mouse or other pointing device to demonstrate actions. Co-browsing may also be available on incident workspaces to let customers share their desktop with agents when they are on the phone.

Code Assistant
A Customer Portal tool to aid migration of custom code from earlier framework versions to a newer version. The tool offers code suggestions for migrating widgets, converting to a new UI version, and removing features that are no longer supported.

color scheme
A collection of colors that can be applied to chart styles. Multiple colors can be defined and combined into one color scheme. Charts that use the same scheme use the same set of colors.

comment
A form of content created by members when responding to posts in a community.

community
A social web solution consisting of customizable hives, members, groups, and custom pages.
community privacy level
The level of privacy that determines whether a login is required to access community content.

comparison period
A reporting parameter used to compare a report’s time period to an identical length of time in the past. Comparison periods are defined when creating or editing a custom report and can be included in standard reports.

compatibility set
A set of Customer Portal widgets designed to be used together. Best practice recommends using widgets from the same compatibility set on any given customer portal page rather than combining them from different compatibility sets.

competitor
An option for identifying other parties pursuing the same opportunity.

compile
A process that runs the compiler engine to check states, functions, and rules within a rule base to ensure there are no errors. See activate.

Completed
A mailing and survey status that indicates a broadcast mailing or broadcast survey has been sent. The system automatically sets the status to Completed from the Sending status.

complex expression
A search technique that enables customers and staff to search for a broader set of content. This technique allows wildcard searching using an asterisk (*) at the end of a word or partial word and a tilde (~) before a word to perform a similar phrases search on that word only. Word stemming and logical operators are also supported. This technique is available on the administration interface and the customer portal.
computed field

A column whose value is derived from calculations performed on database fields. Computed fields can be added to output levels in custom reports.

condition

The part of a business rule that determines whether an answer, contact, incident, chat session, opportunity, organization, target, or task matches a business rule. Rules can contain multiple conditions. Conditions are also a part of script and workspace rules.

conditional formatting

A method of highlighting specific information in report columns that does not require creating data exceptions.

conditional section

A section of text in a document that appears only to those contacts meeting certain criteria. Conditional sections can also be placed in answers and tagged with specific answer access levels. In message templates, conditional sections can be used to filter content by contact, profile, runtime variable, or record type. See also access level conditional section.

conference

A feature in Chat that enables an agent to conference another agent into a chat session with a customer.

configuration button

The button in a staff member’s navigation set containing a list of all the configuration items necessary to configure and customize an organization’s application. Items can be added to or removed from this button from the Navigation Sets editor or, with the Customize Navigation Sets profile permission, the Customize List window. See also configuration list.

Configuration Settings editor

The interface element used to customize the functionality and features of the administration interface and the customer portal.
configuration list

All of the configuration items associated with the configuration button in a staff member's navigation set. The configuration list is organized in a tree on the navigation pane.

configuration settings

All of the settings accessed from the Configuration Settings editor to configure and customize the administration interface and the customer portal in B2C Service.

Configuration Wizard

An interactive utility for configuring web indexing on the customer portal. Web indexing allows customers to search the knowledge base along with web pages and other web-accessible documents within a specified domain. See Web Indexer.

Connect Object Explorer

A ROQL query interface that helps Customer Portal developers become familiar with the Connect for PHP API and explore Connect objects and metadata.

contact

Any individual with a contact record in the knowledge base. Contact records can be added by staff members on the Service Console and by customers on the customer portal. Contact records are also added automatically when a customer without a record submits a question on the Ask a Question page of the customer portal. See also primary contact.

contact custom field

A field for gathering and displaying additional information about contacts. Contact custom fields appear when adding or editing a contact record and on the Your Account page of the customer portal.
contact list
A static or fixed group of contacts that is used to choose the contacts who receive a broadcast mailing or survey. Contacts can be added to lists.

contact role
An option for classifying contacts by their roles in opportunities.

contact type
An option for classifying contacts by types, such as job positions or decision-making roles.

Content Library
A component for creating content that can be used in mailings, web pages, and surveys. Content includes documents, tracked links, files, templates, and snippets.

content page
A type of custom page to which community content and functions can be added using panels. See also category page.

content pane
The area on the console where staff members work with items selected from the navigation pane or the application menu.

content pane tabs
An interface element for switching between the items currently open on the Service Console. Content pane tabs display at the top of the content pane by default. Staff members can click a tab to return to a report or item or right-click a tab and select from a number of options.
context-sensitive answers

A subset of SmartAssistant that allows organizations to construct special Related Answer links from any web page to provide additional information to their customers. See also help access level.

control

A tool for placing titles, spacers, reports, and other advanced features on a workspace.

cross tab

A method of displaying report data in a table format.

CSV (comma-separated value)

A file format with commas separating one column value from the next. Each row is delineated by a hard return. Also called comma-delimited.

cultures

A predefined set of attributes, such as decimal symbols and display formats, used to populate fields on the Currencies editor. Cultures are comparable to regions in Microsoft Windows. See also Currency.

Currency

A monetary denotation based on country of origin. Currencies can be defined for each country or province in which an organization does business. See also Exchange rate.

custom field

A field for gathering and displaying additional information about answers, contacts, incidents, opportunities, organizations, quotes, sales products, staff accounts, and tasks. Custom fields appear when adding and editing records. Depending on the type and visibility, they may also appear on the customer portal.
custom object

Any custom table created or managed from the object designer. Custom objects can be added to B2C Service to integrate organization-specific data with the database. Although custom objects are not native to B2C Service, they can be tied to standard objects and added to workspaces, workflows, custom reports, and navigation sets. See also object and standard object.

custom page

A category or content page that can be fully customized to extend areas of a community in need of additional resources or exposition. See category page and content page.

custom report

A report that is created by copying and editing one of the standard reports in B2C Service and saving it as a new report, or by combining data from selected tables in the database to create a new report. Custom reports can include customized output, data computation, and scheduling. See also standard reports.

customer

A contact or organization that has a service or purchase history in the knowledge base.

customer account

Information consisting of a user ID and password that allows customers to access certain functions on the customer portal, such as the Account Overview page. Customers can create an account by clicking the Sign Up link or the Your Account tab on the customer portal. Customer accounts are also automatically created when a customer without an account submits a question, which adds a contact record to the knowledge base.

Customer Portal Administration site

The site where administrative tasks, such as selecting the page set, viewing widget definitions and logs, and defining page set mapping, are performed.
**dashboard**

Any combination of individual reports shown together in one report. Using dashboards, staff members can search for and view a wide range of data from different reports without opening each report individually. The customer portal also includes a dashboard on the Customer Portal Administration site.

**data dictionary**

A list of all the tables in the Oracle database that can be accessed from the Service Console. Data dictionary also refers to the list of available tables and fields that can be used in custom reports and is accessed from the report designer. Functions, output variables, and computed fields can also be selected from the data dictionary when working with a custom report.

**data import template**

A saved format used by the Data Import Wizard to map columns in a CSV file to columns in the database. See Data Import Wizard.

**Data Import Wizard**

An interactive utility used for importing records into the database.

**data lifecycle management**

Provides built-in policies to archive and purge unused or unrequired data automatically and periodically.

**data mining**

The exploration and analysis of large quantities of data to discover meaningful patterns and rules. Data mining enables organizations to turn raw data into information they can use to gain a marketplace advantage.

**data set**

The database tables and table joins that determine what data can be returned in a report. Data set also consists of the database columns a segment (dynamic list in Outreach and Feedback) will have access to and what filters will be used to determine the final data set.
data type

A set of data having predefined characteristics such as strings, integers, or dates. Each column in a database table is assigned a data type. Data type also refers to the type of custom field specified when adding answer, contact, incident, opportunity, organization, quote, sales product, staff account, and task custom fields. Data types for custom fields consist of menu, radio, integer, date, date/time, text field, and text area fields.

database

The tables that store information that is retrieved, edited, and added in an B2C Service application. See also data dictionary.

Dbaudit

A utility that builds and populates the schema and performs the database portion of the B2C Service update. Dbaudit can also be used to view the database schema.

Dbstatus

A scheduled utility that escalates incidents, answers, tasks, and opportunities based on business rules. Dbstatus also sends emails to those customers who have requested to be notified when a particular answer has been updated. See Answer update notification and Business rules.

Dead

One of the default opportunity statuses and status types. An opportunity with the Dead status is no longer being pursued by a sales representative.

decision

A component of a campaign. Decisions filter contacts by specified criteria and can have Yes and No paths.

decryption

The process of converting encrypted text into readable text using private keys assigned to authorized persons.
default directory

The directory containing original default copies of all the files customizable through the File Manager. During an update, any files that have changed will also be updated in the default directory. Using the restore function, a file can be restored to the original configuration. See File Manager.

deliverability

The degree to which an email message aligns with industry-accepted practices to ensure delivery to an intended recipient. Emails with low deliverability are often blocked by ISPs and spam filters.

dependency

A relationship or association between items in the database in which the use of one item impacts the functionality of the other item. When a dependent item is deleted, such as deleting a contact list used in a mailing, all items that use the dependent item become invalid and must be manually updated.

deploy

To stage customer portal pages from the development folder and then promote the staged files into production. See also stage and promote.

deployment log

The record of actions taken on customer portal files, including staging, promoting, rolling back, and updating through upgrades and service packs.

deprecated

A condition that indicates a feature or widget has been replaced with different functionality or a newer widget.

design space

The section of the workspace designer where fields and controls are added, edited, moved, and removed to create a workspace.
desktop usage administration

Functionality for managing desktop user sessions to help organizations lower seat usage for licensing compliance and reduce costs. The administrator can manage both active and inactive sessions using force logout and automatic logout options. See automatic logout and force logout.

desktop workflow

A sequence of workspaces, scripts, decisions, and actions presented to staff members as a dynamic interface to support complex business processes.

development area

The set of customer portal files that can be edited and viewed without being available to customers. Designers and developers can work on these files and test their changes until they are satisfied that the files can be made publicly available to their customers, at which point the development files are staged and promoted to the production area. See also production area.

display position

The position where a new answer appears on the Answers page. Options include Historical Usefulness; Place at Top, Middle, or Bottom; Fix at Top, Middle, or Bottom. The display position is selected from the answer’s Display Position drop-down menu.

disposition

An option for classifying and recording how incidents are ultimately resolved. Up to six levels of dispositions are available.

distribution list

A mailing list of non-staff member email addresses used for scheduling reports or any mailing event.
docked filter
A runtime selectable filter or output variable that is added to the top of a report. Docked filters let report users select different runtime filter values and output variables in the report, bypassing the Search window.

document
The material used in a survey or mailing, or served as a web page that can contain text, snippets, conditional sections based on contact filters, merge fields, links, and web forms.

DomainKeys (DK)
A form of email authentication that uses a cryptographic signature to verify that an email message originated from a specific organization. DomainKeys differs from DKIM authentication primarily by the email headers used to generate the signature.

DomainKeys Identified Mail (DKIM)
A form of email authentication that uses a cryptographic signature to verify that an email message originated from a specific organization. DKIM differs from DomainKeys authentication primarily by the email headers used to generate the signature.

dormant incident
An incident that is not returned when performing word- or phrase-based searches. After remaining in the Solved status for a specified time, incidents become dormant to ensure that the knowledge base is populated with the most useful and timely information.

Draft
The preliminary status of a mailing or survey. When a mailing or survey is created, it is set to the Draft status. The status will also return to Draft if the mailing or survey's schedule is canceled.
drill down

To start at a top or general level and become more specific at each lower level. The drill-down feature enables access to additional output levels in reports.

drill-down filter

The fields in an output level used to filter the data returned when drilling down to another output level. This impacts what data is returned in the drill-down level.

drill-down link

The field in an output level that is used as a link to drill down to the next output level.

dynamic form

A form that hides or displays fields based on a customer’s response to other fields on the form.

editor

A layout format on the content pane when working with records and configuration items. Editors contain the fields for adding and editing records and items.

Else clause

The clause that follows the Then clause of a business rule. If the conditions of a rule are met, the actions in the Then clause are invoked. If the rule’s conditions are not met, the actions in the Else clause are invoked.

email address sharing

Functionality that allows a single email address to be shared by multiple contacts, such as members of a family or team. When enabled, a contact-matching process is used to associate records and transactions initiated by a shared email address.
email answer
A feature that enables customers to email answers they are viewing to a specific email address.

email management
Functionality that sends and receives email messages, processes bounced messages, intelligently routes incoming inquiries based on business rules, and automatically suggests answers to inquiries.

email message
An email that is automatically sent to customers or staff members. The process of sending email messages is triggered by events in B2C Service. For instance, when a customer submits a question, the Question Receipt message will be sent to the customer’s email address. Using the Message Templates editor, staff members can customize each message and standardize their design to give them all the same look and feel. See message templates and Global template.

encryption
The process of translating a text message into unreadable text to ensure security. Encrypted messages may be read only by authorized persons with access to a private key that allows them to convert the message back into readable text.

escalation
A means of tracking answers, incidents, opportunities, and tasks using business rules. When a rule’s conditions are met, the rules engine schedules escalation to the new level. When the scheduled time (based on absolute or relative time) arrives, the rules engine sets the escalation level and takes the action specified by the rule, such as sending an email, notifying a manager, or following up with a customer. See business rules.

even split mode
A market testing option for broadcast mailings and surveys that sends test messages to equal portions of an audience. See market testing.
event (Named/Exit/Finish)

An action defined in a script rule or workspace rule that can be used to trigger other rules or workflow connectors. Events are defined by adding event fire actions, such as the Fire a Named Event action.

Everyone access level

An access level designed to allow answers to be visible to all customers depending on the answer status.

exception

A method of highlighting report data that meets certain criteria. Data exceptions also allow email alerts to be sent when data in a scheduled report meets the exception criteria.

exchange rate

A scale of monetary conversion from one currency to another. See Currency.

explorer

A layout format on the content pane that displays a tree on the left, containing folders and other items, and a detailed list of the selected folder’s contents (subfolders and files) on the right. Explorers are available for certain configuration items and components in B2C Service.

expression

A component of fixed and runtime selectable filters that defines a function, database column, value, or any combination of the three.

extend

Using the widget builder to create a new widget by modifying the behavior and attributes of an existing widget.
external event

A program or script that runs as the result of an event occurring in B2C Service, an action specified in a business rule, or an action in a marketing campaign.

external suppression list

An email delivery filter used to exclude an explicit set of email addresses from all mailings and surveys. When a mailing or survey is launched, contacts with email addresses in the list are filtered from the audience by default.

FCRR (first contact resolution rate)

A statistic that reports how often staff members or groups solve incidents with only one response. This number is displayed as the percentage of incidents solved with only one staff response.

file

A file that is uploaded to Outreach for attaching as a link in a document or snippet. From the Content Library, files can be uploaded and their characteristics can be defined.

file attachment

A file that is attached to an answer, contact, incident, opportunity, organization, or task, or sent with an incident response or quote. Files that are permanently attached to an incident or answer can be viewed by customers who view the record. Files that are sent with an incident response can be opened with the customer’s email client and are not permanently attached to the record.

file attachment answer

A type of answer that appears as a file attachment.

file link

A clickable link to a file attachment that is inserted in a snippet or a document.
File Manager
The interface used to modify files for B2C Service products. Administrators can modify files used to customize a site’s Chat images, custom scripts, wordlist files, dictionary files, and certificate directories.

File menu
The interface element used to access the application menu. The File menu is located to the left of the Home tab on the ribbon. See also application menu.

final message
A mailing format used to send the mailing as final. In broadcast mailings and surveys, final messages are sent to all audience members who have not yet received a test message.

first due
A queuing pull policy that uses the incident due date or longest wait to determine which incidents or chats to retrieve from the queue.

fixed filter
A component of Analytics and Outreach and Feedback segments used to define the data set available in the report or segment. Fixed filters are statements constructed from expressions, functions, and operators, and cannot be altered when using a segment or when running a report. See also custom report and segment.

flag
A method for defining the priority of a record. A flag displays at the top of records and staff members can add text to the flag and change the flag importance (red=high, blue=medium, green=low, white=no importance).

flow diagram
A graphical representation of a campaign, survey, or desktop workflow. Flow diagrams allow staff members to diagram the events and decisions of a campaign, survey, or business process. When a campaign or survey is launched, contacts are automatically moved through the flow based on the specified criteria. When a desktop workflow is associated with
a record editor in a profile, staff members with that profile will move through the flow when opening a record of the corresponding type. See also desktop workflow.

**force logout**

A way of managing desktop user sessions by manually logging out staff accounts who are currently logged in. Force logout is part of desktop usage administration, which assists organizations in lowering seat usage for licensing compliance. See also automatic logout and desktop usage administration.

**forecast**

A projection of revenue for an opportunity that may close in a given sales period.

**foreign key**

A column or columns that contain values found in a primary key of another table. Foreign keys are used to ensure relational integrity and are rarely primary keys. See also primary key.

**Forward to Friend link**

A link that enables contacts to forward the message to another email address. This type of link can be added to documents, templates, and snippets for use in mailings, surveys, or web pages.

**framework**

The underlying code structure of the Customer Portal, which offers a standard reference implementation as well as the ability to customize code for particular applications.

**function**

A mathematical operator that can be applied to data from database fields to modify the data that is returned in an output column. Function also refers to a container for business rules. Functions are used anywhere in a business process that dictates doing the same thing in more than one place. Functions reduce the number of rules needed by allowing the same rules to be evaluated from multiple states. See also business rules and rule state.
Give Feedback

A link on the sidebar on the Customer Portal template that customers can click to submit feedback about an organization’s website, customer service, or product satisfaction.

**global header**

The global header, located at the top of the Agent Browser User Interface, contains options for working in B2C Service.

**Global template**

An element of message templates functionality containing the content that frames the message-specific content in each system-generated notification and email message. The global template is used to standardize the design of outgoing messages to give them the same look and feel. See *message templates*.

**group**

A way to organize staff accounts in B2C Service. In communities, group refers to a collection of members based on a common interest, cause, or organization.

**group type**

A classification used to organize groups in a community and expand searching of related members and content.

**grouping**

A method for grouping data in a segment. Filters can be used when grouping and are applied to the data after the grouping is completed.

**guest**

Any community visitor who is not logged in with a community account.
guide

A collection of branching questions, responses, answers, and text explanations used in guided assistance. Guide also refers to information about a promotion generated by a marketing staff member. This information appears on the Offer Advisor window to help agents present the promotion to customers. See guided assistance and Offer Advisor.

guided assistance

A component that helps agents quickly locate answers and text explanations using branching questions to guide them to the answers they need. The answers and explanations agents find can be sent to customers in incident responses or relayed to customers over the phone. Guides can also be made available to customers on the customer portal to help them find their own answers to questions.

hash

A ten-digit alphanumeric string used to identify a specific hive, page, group, or member for certain community functions.

help access level

An answer access level for context-sensitive answers. Help answers are not visible to customers except through special hyperlinks. See context-sensitive answers.

Hosting Management System (HMS)

An application used to manage a B2C Service update. It manages scheduling and notifications, and includes checklists of tasks that must be performed prior to and following an update to a new release.

hive

A resource entity, such as a blog or message board, used by community members to communicate about a central topic, theme, or goal. Hives are sometimes referred to as resources.
hive permissions

The set of permissions that allow members to perform specific actions in the hive, such as adding members, posting content, or commenting on posts.

hive privacy level

The hive access status determined by the community privacy level and hive permissions. See community privacy level and hive permissions.

hive template

A hive that is set to the Template status, making it accessible as a design template but not editable or searchable by the community. See also hive.

hive type

A classification used to organize hives and expand searching of related content.

HTML answer

A type of answer that appears to customers as standard HTML on the customer portal.

HTML editor

An editor for formatting and editing answers, mailings, campaigns, documents, questionnaires, invitation messages, and message templates in HTML without previous HTML experience.

identity provider

A third party that authenticates user information and sends verification to a service provider, such as B2C Service, allowing single sign-on for the user. See also SAML 2.0 open login.
IMP (import) file

A data file with an extension of .imp that is used by the Kimport utility to map values in the CSV file to columns in the database.

In Meeting

One of the default chat agent statuses. This status indicates that the agent is in a meeting and is unavailable to chat. The In Meeting chat agent status has an Unavailable status type.

Inactive

One of the default opportunity statuses and status types. An opportunity with the Inactive status is no longer being pursued but could be activated at a later date.

inbox

An agent’s personal queue consisting of all the incidents that have been assigned to the agent.

inbox limit

The maximum number of incidents in an agent’s inbox that cannot be exceeded when pulling from a queue. The inbox limit is set in the profile to which the agent is assigned.

incident

Any question or request for help submitted by a customer through the Ask a Question page, email, a chat session, site or answer feedback, or from an external source using the API. Incidents can also be added by agents when they work with customers by phone, fax, or mail, and when responding to a private Twitter message.

incident archiving

A process that permanently removes incidents from the database. Archived incidents are then stored in searchable data files. Staff members can access archived incidents once the Archived Incidents component has been added to their navigation set.
incident custom field

A field for gathering and displaying additional information about incidents. Incident custom fields appear when adding or editing an incident and on the Ask a Question and Support History pages on the customer portal.

incident thread masking

A method of protecting sensitive customer information, such as social security and credit card numbers, from displaying in incident threads. Three default system masks are available and custom masks can be created.

incident queue

A sequence of unassigned, unresolved incidents. When an incident queue is added, it can be defined as the default queue. Incidents are added to queues automatically by business rules or manually by re-queuing and are handled in a first-in, first-out manner.

incident severity

An option for classifying and recording an incident's importance and urgency.

incident status

A method of tracking an incident's state. The default incident statuses are Solved, Unresolved, Updated, and Waiting, and custom statuses can be added.

incident status type

The status of an incident as it moves through the system. Default incident status types are Solved, Unresolved, and Waiting.

incident thread

The list of all activity on an incident, including the original question, agent responses and updates, customer updates, records of conversations, and internal notes about the incident (which are not visible to customers). The incident thread lists activity in chronological order and can be filtered by thread type.
index

A database item that can be added to a database field to speed up searches for information in the field. Adding an index to a field increases the amount of time it takes to write information to the field, and indexing a large number of fields decreases the overall responsiveness of the database. Generally, only fields containing a large amount of information that are regularly searched on should be indexed. In B2C Service, indices can be added to most custom fields and custom objects. See also custom field and custom object.

indexing

A process in which the text of an answer or incident is stemmed and indexed into keywords and phrases. These keywords and phrases are used to build the answer and incident phrases tables that are used during text searching. When an answer is added or updated, the Keywords, Summary, Question, and Answer fields are stemmed and indexed to create one-, two-, and three-word phrases. When an incident is added or edited, the Subject field and incident thread are stemmed and indexed to create one-word phrases.

industry type

An option for classifying organizations by type of industry.

information gaps

A report that clusters incidents and compares the topics to answer clusters, allowing organizations to pinpoint those areas (or gaps) in the knowledge base needing additional answers.

initial state

A required state in every rule base. The rules engine evaluates a new or updated object using all rules in the initial state. Unless one or more rules in the initial state transition the object to a function or different state, the rules engine stops after all the rules in the initial state have been processed. See also rule state.

inline

A method of displaying output definitions and filter definitions as lines of text in the report. See also output definition.
inlay
A portion of code controlling a number of functions that you can deploy on an external web page or on traditional customer portal pages.

inline editing
A feature for editing values directly on a report without having to open each record to make changes. Staff members can edit individual values in one record or select several rows to change values in multiple records. Staff members must have permission in their profile to edit the specific record type, and inline editing must be enabled in the report.

inner join
A relational database operation that selects rows from two tables on the condition that the value in the specified column of the primary table is equal to the value in the specified column of the secondary table. See also outer join.

interface
The console, windows, and pages used by staff members and customers to access a B2C Service application and interact with a single knowledge base. The interface name determines the URL for the website, the name of the executable, and the .cfg directory name. See also administration interface and agent desktop.

Interface Manager
A utility for managing multiple interfaces using one knowledge base.

invitation method
A way of distributing a broadcast survey, transactional survey, or website link survey.

Kexport
A utility for exporting either single tables or an entire database from an B2C Service application.
Keyword indexer

A utility that creates an index of the keywords found in incidents, answers, file attachments, and documents indexed by the Web Indexer. The keyword indexes are used when searching incidents, answers, file attachments, and other indexed documents. See also *Web Indexer*.

Kimport

A utility for importing data, either single tables or an entire external database, into the database.

knowledge base

All information (such as answers, assets, incidents, contacts, organizations, opportunities, products, staff accounts, tasks, mailings, and campaigns) maintained and presented by B2C Service in a meaningful way. Knowledge base also refers to the interrelationships among the pieces of information.

knowledge engineer

The staff member responsible for populating and maintaining the answers in the knowledge base. Responsibilities may include identifying when answers should be added, editing proposed answers, and reviewing existing answers to keep them current.

Langcvt

A utility for changing the language pack in Oracle Service Cloud from English to an alternative language pack. This utility converts the message bases and pre-populated knowledge base to the new language.

language

The language for a specific interface that determines, in part, what answers are visible for viewing by customers.

Launched

A mailing and survey status that indicates a transactional mailing or transactional survey has been launched and can be included in a rule or campaign.
**layout**

A predefined format that can be used in custom reports to apply fonts, colors, and other display options. Layouts can also be used in dashboards to apply a predefined structure for inserting reports.

**lead**

A potential opportunity. A lead is a contact discovered through a marketing campaign and forwarded to a sales representative through Opportunity Tracking. See *opportunity* and Opportunity Tracking.

**lead rejection type**

An option for classifying and recording the reasons for rejecting a lead.

**leaf level**

A level of product, category, or disposition that does not contain any sublevels. See *product linking*.

**learned link**

Related answers that have a learned relationship as a result of customer activity.

**Live Chat**

A link on the sidebar on the Customer Portal template that customers can click to submit a request to chat with a chat agent.

**Live Media bar**

The toolbar that displays when Chat is enabled. The Live Media bar allows agents to log in, log out, set their status, and manage chats. See *Chat*.
local settings

Customizations made by staff members to dialog and tool window sizes and locations, as well as content pane and navigation pane settings, console color and tint, toast notifications, and report appearance, including display and data settings and column formatting. Changes made by staff members to customize these settings affect only their workstation. In addition, staff members can return to the system defaults at anytime.

logical expression

An expression that defines the relationship between report filters or business rule conditions. The components of a logical expression are joined using Boolean logic and can be grouped and joined with AND, OR, and NOT operators.

logical operators

The symbols, (+) and (–), that can be used in most search techniques in Service to explicitly find answers that have a word (+) or that do not have a word (–).

Login window

A dialog box for entering user name, password (if required), and site information to access the administration interface of a B2C Service application.

Lookup field

A field in a custom object designated to store values that are used as the names of the object’s records. These names display on editor tabs and the navigation pane’s Recent Items list. For instance, the Recent Items list displays incident reference numbers since the Reference # field is designated as the lookup field for incidents. Values in lookup fields are also displayed in reports instead of the ID values from fields in other tables that link to the lookup field’s table. For instance, while the incidents table’s Assigned Account field stores account ID numbers, the values displayed for this field in reports are from the accounts table’s Full Name field.

Lost

One of the default opportunity statuses and status types. An opportunity with the Lost status has been lost, for example, to a competitor.
mailbox

An email box specified in B2C Service and dedicated to collecting email inquiries sent by customers, responses to mailings, and bounced messages. Incoming emails are processed by the Techmail utility. See also Oracle-managed Service mailbox and Techmail.

mailer daemon (rnmd)

A utility that monitors Outreach and Feedback, listening for requests from other components to start the email process. The mailer daemon is installed during the initial installation and can be configured to send messages in the most efficient manner for an organization.

mailing

A collection of one or more messages sent to one or more contacts. A mailing can contain multiple messages for testing purposes.

mailing status

A method of tracking the state of a mailing. The default mailing statuses include Draft, Launched, Scheduled, Preparing to Send, Sending, Suspended, Suspended by Error, Canceled, and Completed.

manual policy

A pull policy that enables agents to manually pull incidents into their inbox from any queue designated in their profile.

manually related answer

A relationship between two or more answers manually defined by a staff member.

market testing

A method for testing different message formats in mailings and surveys on a percentage of the audience before launching a final email. For broadcast mailings and surveys, market testing is available in even split and random
sampling modes. For transactional mailings and surveys, market testing is available in audience sampling mode. See *audience sampling mode, even split mode, and random sampling mode*.

**mask**

A defined pattern that determines the format of information that can be typed in a field.

**matrix question**

A question type for displaying a series of survey questions in a table. Matrix questions are useful when a group of questions can be responded to with the same set of answer choices.

**member**

A community user who has a login and can be associated with one or more groups in the community.

**member type**

A classification for community group members that defines their role and provides access to certain group functions.

**merge field**

A variable field that looks up account, contact, incident, opportunity, organization, or tracked link information and inserts it in the text of a document, snippet, document template, message template, quote template, or the message content and mail attributes of mailings and surveys.

**merge report**

A report that can be included in marketing and survey content that dynamically limits the data returned so that customers see only their own information. For instance, if the report lists contacts and their open incidents, customers see only their own open incidents.

**message**

An email consisting of a collection of HTML, text, and images in a particular format.
message base
An editable text string that allows international language support and customization of headings, labels, buttons, and other text on the administration interface and customer portal and in email messages and notifications.

Message Bases editor
The interface element used to customize the message bases, including all the headings, labels, buttons, and other text, on the administration interface and customer portal.

message templates
A component for customizing and standardizing the content of administrator notifications, administrator emails, and contact emails. Message templates consist of a global template, which is used to standardize the design of outgoing messages, and a set of system-generated messages. See also global template.

migration
The process of moving from one version of the Customer Portal framework to a newer one. Migration can occur independently of updating to a newer version of B2C Service. See also updating.

mobile customer portal
The template and set of customer portal pages that have been optimized for display on mobile devices such as iPhones, Androids, and Palms. See also template and reference implementation.

model question
The associated question and answer that reside in the Virtual Assistant database. Model questions are linked to answers in the knowledge base and are displayed as similar questions on the Answers page of the customer portal. See Virtual Assistant.

Monitor
A feature in Chat that allows a supervising agent to monitor the chat sessions of other agents and to intervene when necessary.
**Msgtool**

A utility for creating a configuration report for a B2C Service site, or for changing configuration settings when an error has been made in one of the settings that subsequently locks staff members out of the Configuration Settings editor.

**multi-select**

A feature for updating more than one record at a time.

**multiline**

A method of displaying report data grouped under headings based on common values in report columns.

**natural language**

Any approach that accepts and correctly handles human language. For example, English, French, and Japanese are natural languages, while computer languages, such as FORTRAN and C, are not. The knowledge base can be searched using natural language technology.

**navigation buttons**

The buttons on the navigation pane associated with record types and components. Clicking a button displays the record type or the component's navigation list.

**navigation list**

All the reports, folders, and items associated with a specific record type or component in B2C Service. Navigation lists are organized in a tree on the navigation pane.

**navigation pane**

The area on the left and right side of the console where staff members work with navigation lists, select items to open on the content pane, and search the knowledge base. In the default configuration, the left navigation pane contains Recent Items and Navigation tool windows; the right navigation pane contains the Quick Search tool window. What appears on the navigation pane depends on the navigation set assigned in each staff member’s profile and...
the permissions assigned in the profile. Each navigation pane can also be customized by staff members. See also Configuration button, navigation buttons, and Tool window.

**navigation set**

Any combination of navigation buttons and their associated navigation lists. The Configuration button can also be added to navigation sets. Staff members are assigned a default navigation set in their profile.

**next-update checklist**

The UMS checklist that keeps track of all recurring tasks for each product enabled in your application. When the next update is scheduled, the tasks in this list checklist are automatically added to the pre-update checklist.

**normalized URL**

A URL that has been reformatted to ensure that documents that are referred to by multiple URLs will be indexed only once. Normalization may include reformatting domain names (for example, removing capital letters) or removing query parameters.

**note**

Information that can be added to campaigns, contacts, documents, mailings, opportunities, organizations, and surveys for internal reference. Notes can also be added to incidents in the incident thread.

**notification**

A message that notifies appropriate staff members about incidents, answers, mailings, campaigns, opportunities, and system errors. See also Answer update notification.

**object**

Any standard or custom table in the Oracle database. Object also refers to the specific answer, contact, incident, chat session, opportunity, organization, target, or task that is evaluated by the rules in the object’s rule base. See also custom object, standard object, and rule base.
**object event handler**

A PHP script with an integrated test harness (automated test script) that executes as the result of an event occurring on a standard or custom object in B2C Service. See also *custom object*, *standard object*, and *process model*.

**offer**

A promotion developed by marketing personnel or a product suggestion generated automatically by Offer Advisor that is presented to a customer by an agent.

**Offer Advisor**

Functionality for creating and presenting promotions to customers and for making automatic recommendations based on customer attributes and purchase history.

**On Break**

One of the default chat agent statuses. This status indicates that the agent is on break and is not available to chat. The On Break chat agent status has an Unavailable status type.

**open login**

The ability to log in to the customer portal using an already established external account, such as Facebook, Twitter, or Google. When the external site validates the customer and the customer approves the transfer of information to B2C Service, a contact record is created using the email address and the customer is automatically logged in to the customer portal.

**operating system**

The program that, after being initially loaded onto the computer by a bootstrap program, manages all other programs in a computer. UNIX, Windows, VMS, OS/2, and AIX are all examples of operating systems.
**operational database**

The database that contains the live data that is viewed, retrieved, and edited in a B2C Service application. While reports that are run on the operational database can access real-time data, the reports cannot process as much information as reports that are run on the report database. See also *report database*.

**operator**

A symbol or word that represents a mathematical or logical action that can be applied to a condition or value.

**opportunity**

Information about a specific sale or a pending deal that is tracked and maintained in the knowledge base.

**opportunity custom field**

A field for gathering and displaying additional information about opportunities. Opportunity custom fields appear when adding or editing an opportunity.

**opportunity status**

A method of tracking an opportunity’s state. The default opportunity statuses are Lead, Reject, Active, Closed, Lost, Inactive, and Dead. Custom statuses can also be added.

**opt-in**

The explicit granting of permission by a contact to receive email communications from an organization. Opt-ins can be specific to certain mailing lists or applied globally across all mailing lists.

**opt-out**

An explicit request by a contact to be removed from a specific mailing list or from all lists, most often communicated by email or web form. Also called *Unsubscribe*. 
Oracle-managed Service mailbox

The recommended type of Service mailbox created by Oracle. Oracle configures the initial mailbox setup, including enabling incoming email and defining the Pop Server, POP Account, and Password fields. Administrators can also create general Service and Outreach mailboxes for their application.

post-update checklist

A UMS checklist that contains tasks that are specific to and created by your organization. The tasks on this list are enabled when your update is complete. See also pre-update checklist and next-update checklist.

Analytics

A business reporting solution that enables organizations to capture, organize, present, and disseminate real-time actionable knowledge with speed and ease. Using Analytics, organizations can increase insights by identifying customers based on previous interactions across all channels.

Chat

A component that provides customers with access to chat agents for questions and issues that require human interaction.

Connect Desktop Integration (JavaScript API)

A public API that enables customers and partners to integrate data contained on a workspace with a web page that is contained on the workspace. If external information is presented about the current record in a web page, this API can be used to update or read workspace data from the web page. See also workspace.

Connect PHP API

A backward-compatible, public API that enables customers and partners to integrate with the B2C Service platform using PHP scripts. Connect PHP API is primarily used to integrate with the customer portal, but it can also be accessed through the File Manager, process designer, and analytics. Connect PHP API leverages the Connect Common Object Model, which is also leveraged by Connect Web Services for SOAP.
Connect Web Services

A backward compatible, public API that enables customers and partners to integrate with the B2C Service platform using industry leading standards such as WSDL 1.1 and SOAP 1.1. It provides broad support for a wide variety of languages, platforms, and tools. Connect Web Services leverages the Connect Common Object Model, which is also leveraged by Connect PHP API. See also Connect PHP API.

Customer Portal

The website interface that customers access for customer support. The customer portal is integrated with Service so customers can query the knowledge base for answers, ask questions, provide feedback, manage their customer account, and request chat sessions. It consists of a standard set of files that can be customized, uploaded, staged, and promoted to make the site available to customers. See also Mobile customer portal.

B2C Service (Service)

A customer service and support solution that intelligently assists both customers and agents with inquiry resolution across standard and social channels. Service assists customer service and support organizations that need to easily capture, respond to, manage, and track all service interactions in one consolidated application.

Desktop Add-Ins

An add-in framework for the B2C Service platform that enables customers and partners to build custom .NET components, controls, and applications for the agent desktop. See also agent desktop.

Feedback

A customer survey tool for gathering information about customers’ experiences with an organization. With a wide range of customization and formatting options, questions types, and full analytics for efficient reporting, surveys provide organizations with a flexible method of tracking customer satisfaction.

Opportunity Tracking

A sales automation solution that enables staff members to easily manage all opportunity, organization, and contact information and track all quote interactions in one consolidated application.
Outreach

An email and campaign solution for delivering personalized, richly formatted email communications to targeted segments of customers and prospects and for launching full-scale marketing campaigns.

Self Service

A Facebook application that provides access to customer-facing features of B2C Service, such as Find Answers and Ask a Question, directly from Facebook’s web and mobile interfaces.

Social Experience

A set of complementary components, including Communities, Channels, and Self Service for Facebook, each representing a different, powerful way of interacting with customers using social media. While each component serves a distinct purpose, they can be used together to create a wide-ranging social web presence.

Social Experience communities

A comprehensive social web solution consisting of B2C Service Community and B2C Service Innovation Community that lets customers connect, discuss, and contribute through forum discussions, question-and-answer sessions, resource libraries, and suggestions for service improvements.

Virtual Assistant

A solution for identifying the intention behind a customer’s question using semantic search technology and linguistic dictionaries to return highly relevant search results and provide virtual assistant chats.

Oracle B2C Service

A customer experience suite combining web, social, and contact center experiences for a unified, cross-channel service solution in the cloud.

Smart Client

The web-based software that allows local applications to interact with the server-based applications. The smart client can be installed on staff workstations using the Click-Once installer. See also Click-Once installer.
standard object

Any standard table that is native to B2C Service. Standard objects store data, including record types such as answer, contact, incident, opportunity, organization, and task. Other standard objects include accounts (staff accounts), assets, quotes, and sales products. See also custom object and object.

organization

Any company, business unit of a large company, or government agency that has an organization record in the knowledge base.

organization address type

A way of storing multiple addresses for a single organization. The default organization address types are Billing and Shipping; custom address types can be added.

organization association

A feature for associating a contact with a specific organization. Organization association links the incident and opportunity history of the contact and organization.

organization custom field

A field for gathering and displaying additional information about organizations. Organization custom fields appear when adding or editing an organization.

organization hierarchy

A feature for creating or changing the hierarchy of organizations. A hierarchy can be created by making one or more organizations subordinate to another organization. Twelve hierarchy levels can be used.

outer join

A relational database operation that selects rows from two tables regardless of whether the specified columns contain corresponding values. An outer join will return all rows from the primary table and any rows from the secondary
table where the value in the specified column of the primary table is equal to the value in the specified column of the secondary table. See also inner join.

output definition

A description of a report that can be viewed when generating a report or when hovering over the report title and columns. Output definitions are predefined for all standard reports and can be defined when creating a custom report.

output level

A distinct section of a report that outputs report data. Reports can have multiple output levels, each of which can have their own filters, groupings, data exceptions, headers, footers, and descriptions. Output levels in a report are related through drill-down links and drill-down filters.

owner

The member who holds complete authority over a community group or hive. A member who creates a group or hive is designated as its owner unless ownership is transferred.

page

A web page or a customer portal page in an Oracle Service Cloud application.

page set mapping

The customer portal functionality that allows a specific page set to be mapped to a specific user agent. Customers are then directed to the most appropriate page set as determined by the browser or user agent accessing the customer portal.

panel

A customizable object used to display dynamic content on community pages. Panels can be added to custom pages and some standard pages. See also custom page.
**path**

The connector between items in a campaign flow diagram. A path can be one of four types (Standard, Submit, Yes, or No) and can connect two actions or an action and a decision in campaigns. See also *action* and *decision*.

**Personal settings**

An application option that lets staff members override settings in their staff account and customize settings that apply to the interface defaults in B2C Service. Settings defined in staff accounts that can be changed include default currency, default country, time zone, and email notifications. The staff account settings changed from the Personal Settings option will also be made to the corresponding settings in the staff account.

**pipeline**

Calculated revenue that has not yet been acquired but is forecasted to close in a specified time period.

**polling survey**

A survey that displays as a single question on a customer portal page or any page external to the customer portal. After customers submit their response, they see a poll results chart or a thank you message. See also *Customer Portal*.

**post**

Content added by users of a social media site, such as a Facebook status update or a text entry in Social Experience communities. See Social Experience communities.

**post type**

The structure of a post as defined by the sequence of fields and controls used to create its content.

**pre-update checklist**

The *UMS* checklist that becomes active when you request an update. It includes a list of Oracle-created tasks and any custom tasks that should be completed before your update.
preliminary screen pop
The toast notification that displays when an incoming chat request is received. The preliminary screen pop displays as a two-column table, and agents can view information about the chat request before accepting or declining the request.

Preparing to Send
A mailing and survey status that indicates a broadcast mailing or broadcast survey is about to be sent.

price schedule
An option for creating various pricing levels that can be assigned to sales products. Price schedules allow the same product to have different prices, such as wholesale and retail prices.

primary contact
The main individual associated with an incident or opportunity. All primary contacts have an associated contact record in the knowledge base. In Service, a primary contact must be associated with an incident for agent responses. In Opportunity Tracking, either a primary contact or an organization must be associated with an opportunity to serve as a point of contact for sales representatives during the sales process. See also contact.

primary key
A database table column that is indexed to enforce a unique constraint, meaning that a given value cannot appear more than once in the column. This column is used to uniquely identify each record in the table. Primary keys are often the target of a foreign key in a different table. See also foreign key.

priority
A ranking that defines the order in which incidents are pulled from multiple queues. The priority ranking also identifies which queues agents can retrieve incidents from.

private
One of two default answer status types. Answers that are marked Private are never visible to customers. See Answer status type.
private key
A password-protected key used by the holder to create digital email signatures and decrypt messages that were encrypted using the holder’s associated public key.

privileged access answers
Answers that are assigned a custom access level for viewing by certain contacts and organizations assigned to the appropriate service level agreement (SLA). See SLA.

process model
The virtual container that encompasses all event handlers (standard and custom) in B2C Service. Using the process designer, a process model can be exported, imported, deployed, and rolled back. See also custom object, object event handler, and standard object.

product
An option for grouping answers and incidents that allows more precise organization in the knowledge base. Staff members can classify answers and incidents by product and up to five additional levels of sub-products, allowing more refined searching by customers and staff members. See also category.

product catalog
The list for organizing sales and asset products. See Asset product and Sales product.

product linking
An option for linking products to categories and products to dispositions so that category and disposition choices are narrowed to only those associated with the selected product for staff members working with incidents and customers searching on the customer portal.

Production area
The set of publicly available customer portal files and pages. The production area is updated when files in the development folder are staged and promoted. See also Development area.
profile
A mechanism for controlling access to administration functions and for assigning staff members specific permissions, default workspaces, a default navigation set, and report access.

promote
To copy all customer portal pages from the staging area into the production folder, where they become publicly available on an organization’s website.

promotion
A specific message (for example, a discount, renewal notice, or announcement) delivered to a specific group of customers using Offer Advisor. Promotions are generally created by marketing staff members and presented to customers by agents. See Offer Advisor.

proof
A way to review the content of a mailing or survey to ensure the message is approved by the necessary contacts and staff members and as a final check for any mistakes. Proofs can be sent to a proof list or group of staff members who, in turn, can accept or reject the proof. Proof messages can also be sent to staff members when changes have been made to message templates. See also message templates.

proof list
A contact list that is available to receive proof messages, enabling its contacts to review mailings and surveys before they are finalized.

propose answer
A function for proposing that an incident’s solution be added to the answers available to customers. The proposed answer is reviewed by the knowledge engineer, who determines if it should be made public and, if so, its access level, status, language, and visibility.
Proposed

One of the default answer statuses. This answer status indicates that the answer has been proposed by a staff member from an incident. Answers with a Proposed status are not visible to customers. See Answer status.

Public

One of the default answer statuses and status types. Answers marked Public may be visible to customers depending on their access level and language. See Answer status and Answer status type.

public certificate

See Certificate.

public key

Public information that may be attached to email messages to allow those who reply to the message to encrypt their response. The public key also verifies that the digital signature was created with the associated private key, thereby ensuring the integrity and authenticity of the message. Public keys are often referred to as public certificates, although certificates hold additional information besides the public key.

public key certificate

See Certificate.

publish report

A method of preserving a report's graphical and tabular output as a snapshot. After a report is published, it cannot be modified and the report data will remain unchanged even as the knowledge base is updated.

pull policy

The method for determining which queues agents can retrieve incidents or receive chat requests from and in what order. Pull policies include Strict Priority, Manual, and First Due.
pull quantity
The specified number of incidents to be retrieved from the queue at one time when an agent pulls incidents.

question
The main element in a survey. Text, choice, and matrix question types can be created. Questions can be used in multiple surveys, mixing and matching as necessary. See Choice question, Matrix question, and Text question.

questionnaire
The complete set of questions and all the pages in a survey. Using the HTML editor, staff members can create dynamic surveys using a graphical interface to add questions and create survey branches based on how customers answer. A questionnaire must be created for each survey.

queue
See Chat session queue and Incident queue.

queued report
A report that has been manually or automatically scheduled to run in the background after entering the report’s search criteria. When a queued report has been generated, a toast notification displays with a link to open the report.

Quick Access toolbar (QAT)
One or more buttons used as shortcuts to commands on the ribbon. The initial set of buttons on the Quick Access toolbar is specified by what is displayed on the content pane, but staff members can customize the toolbar to add frequently used buttons. By default, the Quick Access toolbar appears above the ribbon.

Quick Search
A component used to search for records and files when only limited information is known. Quick Search can be used to search the knowledge base no matter what navigation list is displayed or what is open on the content pane.
Service contains a number of default Quick Search reports, and other reports can be added to the Quick Search button in navigation sets.

**quota**

The revenue goal assigned to a sales representative during a specified time period, such as month or quarter.

**quote**

A formal price assigned to a sales product for a particular customer during a sales period. Quotes also include any discounts applied as well as the valid dates for the quote.

**quote custom field**

A field for gathering and displaying additional information about quotes. Quotes custom fields appear when sending a quote with an opportunity.

**quote template**

A template defined for a specific type of quote. Quote templates are used when generating a quote for an opportunity. See also *quote*.

**random sampling mode**

A market testing option for broadcast mailings and surveys that sends test messages to a specified percentage of the audience. See *market testing*.

**record**

Any individual answer, asset, contact, incident, opportunity, organization, or task in the knowledge base. Records can also be created for custom objects, which can be added to B2C Service to integrate organization-specific data with the Oracle database. See also custom object, standard object, and record type.

**record type**

A database table that stores all records of the same type, such as answers and incidents. See Record.
**record pool**

The memory space used to temporarily store all records loaded in a single desktop workflow session. See Desktop workflow.

**record tabs**

The layout of information contained in a record. Each tab contains specific fields and options related to the record that can be viewed and updated as necessary.

**recurrence**

A scheduling method used to send or initiate the same report, mailing, survey invitation, campaign, or cloud search on a regular daily, weekly, monthly, or annual basis.

**reference implementation**

The standard set of files used to create the default customer portal as it exists without customization.

**regular expression**

A combination of operators and character strings used to define a search field or a condition statement in a business rule.

**Reject**

One of the default opportunity statuses and status types. A lead with the Reject status has been rejected by a staff member.

**related answers**

A feature that assists customers in finding answers to questions related to the current web visit. Related answers appear on the answer details page and are sorted by relatedness; those answers that appear at the top of the list are most related to the answer being viewed.
relationship item

A control used to create workspaces. Relationship items can include lists of records as well as other information such as audit logs and file attachments.

relative time

The amount of time between events based on the business work hours defined in service level agreements or default response requirements. Some functions, such as `rel_date_diff()`, support relative time values, as do some database fields such as `inc_performance.rel_time`. Note that the Relative option available for use in some filters has a different meaning where a dynamic time period can be defined instead of a time period using a static date and time. See also absolute time.

relative value

A field value set by a workflow, script rule, or workspace rule that adds or subtracts, appends, or prepends, a value to the field’s previous value (for instance, increasing the value of an integer field by 1).

report

Any standard report, custom report, or list of records accessed from a navigation list on the navigation pane. Standard and custom reports can also be accessed from the Reports explorer. Reports are also used to display lists of answers or a customer’s incidents on the customer portal.

report database

A copy of the operational database that is used for reporting purposes. Reports that are run on the report database can process more information than reports run on the operational database. The data in the report database is copied from the operational database at scheduled intervals and therefore may not be as current as the data in the operational database. Also called replication database. See also operational database.

report control

A control that inserts a report into a workspace. See also workspace.
report linking

A feature for creating links between reports. Linked reports and dashboards can be seamlessly opened from other reports, just as report levels can be opened from other levels in the same report. Both conditional and unconditional links can be created.

report schedule

An option for subscribing to a standard or custom report. Staff members can schedule the report to be sent to an individual staff member, a group of staff members, a distribution list, an external email address, or any combination of these options.

report section

A section of an output level that contains a component of the report's output, such as a title, chart, or tabular data.

report variable

An item added to a report that is used to return different data or data in different formats in the same column. For example, a single report can be created that displays the number of incidents by staff member, group, queue, or status. When running a report, the variable value is selected from the Search window or from docked filters.

Reportgen

A scheduled utility that sends out scheduled reports. See Report schedule and Scheduled report.

re-queuing

The action of moving an incident from an agent's inbox into a queue.

resolution time

The maximum allowable time (in minutes) set by a service organization for resolving incidents. See also response requirements.
response interval

The days of the week and times when a service organization makes itself available to respond to and solve incidents on a daily basis. Days and hours can be specified. See also response requirements.

response requirements

The maximum time allowed (in minutes) for incident response and resolution within the operating hours defined by the organization. The response requirements are used to measure agent performance in responding to and solving incidents and can also be used for SLAs that do not have customized response requirements. See also SLA and response interval.

response time

The maximum allowable time (in minutes) set by a service organization for initially responding to new incidents. See also response requirements.

result grouping

A feature in a report definition for selecting fields to group data by. Result grouping provides a more organized view of a report. Multiple levels can be defined for result grouping. The more levels used, the finer the detail will be.

Review

One of the default answer statuses. This status can be used to notify the knowledge engineer when a public answer needs to be reviewed. See also answer status.

ribbon

All the tabs and buttons for performing actions and functions on an entire report, individual records in a report, or items in an explorer tree or list. The buttons on each tab are grouped by related functions, and each group is labeled. The tabs and buttons on the ribbon change based on what is displayed on the content pane.

rollover

A method of displaying additional report details by hovering over data described in the report's output definition.
rollup

A method of displaying report data that groups records together by specific fields. The grouped records are displayed under headings that can be expanded or collapsed to display or hide the records under the heading.

root certificate

A self-signed certificate generated by a party that signs other public certificates. Certification authorities may authorize other entities to issue certificates. The root certificate belongs to the top-level certification authority.

round-robin queue

A type of incident queue in which unresolved incidents are automatically assigned to agents in a rotating fashion.

RPA (responses per assignment)

A statistic that calculates the average number of times a staff member or group responded to each incident.

RSS (Really Simple Syndication)

The primary standard used for the syndication of web content. RSS is an XML-based format used primarily for distributing news headlines on the Internet. B2C Service contains an RSS channel so staff members can monitor RSS feeds for content.

rule

See Business rule.

rule base

All rules, states, functions, and variables associated with a particular object type (answers, contacts, incidents, chat sessions, opportunities, organizations, targets, and tasks) in business rules.
rule log

A feature for viewing the rule or rules that have fired against a specific answer, contact, incident, opportunity, organization, or task. See also business rules.

rule state

A container for business rules. Every rule base must contain an initial state, and states can be added to handle all stages of object processing. Rules in the initial state can transition objects to other states in the rule base. See also initial state.

rules engine

The software that evaluates objects to determine if they meet the conditions of any rules in the rule base and then executes the actions defined in the rules.

runtime selectable filter

A component that defines the initial data set available in a report and allows staff members and customers to customize the data returned. Runtime selectable filters are statements constructed from expressions, functions, and operators, and can be customized when running a report.

S/MIME (Secure Multipurpose Internet Mail Extensions)

A standard for sending secure email messages that can verify the sender’s identity. S/MIME emails can be encrypted for security and signed to verify authenticity.

safe mode

A login method that allows staff members to log in to B2C Service without activating add-ins. Safe mode is available after malfunctioning add-ins have prevented administrators and staff members from logging in. See Add-in.

sales period

The period of time used to track the revenue goals assigned to each sales representative. The default sales periods are annual, semi-annual, quarterly, monthly, and weekly.
sales product

An option for identifying items or services sold by an organization. Sales products can be added to quotes and promotions.

sales products custom field

A field for gathering and displaying additional information about sales products. Sales products custom fields appear on the Custom Fields page of the Product Details editor.

sales representative

A staff member who may be assigned opportunities and who may also maintain contact and organization records.

SAML (Security Assertion Markup Language)

An XML-based protocol in which an identity provider authenticates a user’s identity and passes that information to a service provider, which can then decide to allow the user access to the service without requiring an additional login procedure. See also identity provider, SAML 2.0 open login, and single sign-on.

SAML 2.0 open login

A type of single sign-on that uses Security Assertion Markup Language (SAML) and is the protocol that B2C Service uses for its single sign-on feature. See also SAML and single sign-on.

Scheduled

A mailing and survey status that indicates a broadcast mailing or broadcast survey is ready to be sent and will be emailed at the scheduled send date and time.

scheduled report

A report that is sent as an HTML email or HTML email attachment to staff members, distribution lists, or external email addresses at specified times. Scheduled reports can also be sent when alerts defined in data exceptions are triggered. See also exception.
schema

The structure of a database system described in a formal language supported by the database management system. In a relational database, the schema defines the tables, the fields in each table, and the relationships between fields and tables.

score

A calculated value that ranks the order of displayed answers. An answer’s score is determined by its solved count and any display position that was set when the answer was added or updated. Score also refers to the relative weight assigned to each choice in a choice question for surveys. Score values can be used for survey calculations to trigger rules or campaign actions based on a contact’s answers and also for reporting purposes.

screen pop

See Third-party screen pop.

script

A control that can be added to a custom workspace to help staff members enter record information in a logical order. Scripts can contain multiple pages with fields and other controls as well as branching logic to guide staff members to different pages based on actions they take on a script page.

script rules

A type of rule used to trigger actions, such as setting the value of a field, on script pages when specified conditions are met.

search and selection criteria

The runtime selectable filters and sorting options that can be defined when searching for a particular record. See also runtime selectable filter.
search index

A matrix that includes a list of important words within a document and their document of origin, allowing efficient searching. In some cases, the matrix is a database table. In other instances, the matrix is a file stored on a hard drive. For a word or phrase to be searchable within an incident, answer, file attachment, or external document, it must first be indexed.

search priority word

A word that is associated with an answer or a document. The associated answer or document will always be displayed to customers when the search priority word is included in their search text.

secure email

Incoming and outgoing email that has authenticity (the sender is who it appears to be), integrity (content has not changed during transmission), and privacy (only the intended recipient can read it).

seeding

The initial set of answers in the knowledge base.

segment

The criteria for creating dynamic lists of contacts based on user-defined filters. Multiple filters can be created and logical expressions can be used to create the exact data set needed to target contacts. After a segment is created, it can be used in broadcast mailings and surveys and the group of contacts will be constantly adjusted and updated as they meet or fall outside of the segment’s requirements.

self-learning knowledge base

The automatic generation of self-service content based on customer interactions so that the most pertinent information is presented. See also knowledge base.
sender ID

A form of email authentication that identifies IP addresses authorized to send mail on behalf of a specific organization. Sender ID differs from SPF authentication primarily by the components of the email used to authenticate the message.

Sender Policy Framework (SPF)

A form of email authentication that identifies IP addresses authorized to send mail on behalf of a specific organization. SPF differs from Sender ID authentication primarily by the components of the email used to authenticate the message.

Sending

A mailing and survey status that indicates the broadcast mailing or broadcast survey is currently being sent to contacts. The system automatically sets the status to Sending after the mailing or survey is done being prepared to send or at the scheduled date and time.

Service Console

The user interface where staff members work in B2C Service. Staff can add and edit records and items, generate standard reports and create custom reports, access their notifications, and chat with customers from this console. Administrators can also configure and customize their application from the console. Also called administration interface or agent desktop.

service level agreement

See SLA.

sharing

The process of sharing contacts, tasks, or both between Microsoft Outlook and B2C Service. All sharing functions are initiated from Outlook.

sibling answer

Related answers that share the same product or category. Sibling answers may also contain the same file attachments.
single sign-on

A method for a user (in B2C Service, a staff member or customer) to log in to one application, known as an identity provider, and then be authenticated and logged in to another application, such as B2C Service, without being required to log in separately to the second application. See also identity provider and SAML 2.0 open login.

sitemap

A page on a web server using the XML-based Sitemap protocol. The page typically lists all the URLs for a site along with metadata for each URL, including the priority of each page and when it was last updated.

SLA (service level agreement)

A contract that is applied to contacts and organizations specifying the level and type of customer service they are eligible to receive. Generic SLAs are created by administrators, and SLA instances are applied to specific customers, either automatically through business rules or manually by staff members. SLA instances are called service contracts on the customer portal and can be accessed from the Account Overview page. See also response requirements.

SLA instance

A customer’s individual copy of an SLA. An SLA is a generic contract that has not been applied to a specific customer. An SLA instance is a copy of the generic SLA applied to a specific customer.

slicing

A method of grouping tabular report data by a common element. When slicing, a common value in a field can be chosen and only those rows that have that value will be returned in the report. Other slice groups can be selected from links or a tree element.

Smart Interaction Hub (SIH)

Functionality for directing customer interactions to the most qualified source for resolution by leveraging agent skills.
Smart Merge

A feature that allows staff members to merge similar answers in the knowledge base to provide more meaningful answers to customers and to reduce answer duplication.

SmartAssistant

Oracle technology that uses business rules to automatically suggest possible answers to customer email questions and Ask a Question queries. Staff members can use SmartAssistant to search for answers in the knowledge base that are related to an open incident or a current chat session. See also suggested answers.

SmartSense

Oracle technology that estimates a customer’s emotional state or attitude based on the words and language the customer uses when submitting a question in Service. SmartSense also rates the incident responses sent by agents. The SmartSense ratings for both customer and agent appear wherever they have been placed on the workspace. In Feedback, SmartSense evaluates text questions submitted by customers in surveys.

snippet

Any text or part of a document that can be used in more than one document. Snippets can be added to documents from the Content Library component.

Solved

One of the default incident status types and incident statuses. An incident marked Solved has been resolved.

solved count

The method for determining where an answer will display in the list of answers. The most useful answers (those with the highest solved count) are pushed to the top of the list, while those with the lowest ratings are moved down on the list. When a customer clicks one of the options in “Is this answer helpful?” on the answer details page, it directly affects the solved count. The solved count is increased for answers that are viewed, and the last answer viewed has a higher solved count than answers viewed earlier in the same web visit. The solved count is also increased when an agent uses a SmartAssistant suggested answer when responding to a customer’s question. By default, customer influence on an answer’s ranking accounts for 75 percent of an answer’s score, and agents affect 25 percent. Over time, an answer’s solved count gradually declines as it is viewed less frequently.
sort order

The sort order of a report’s output columns. The default sort order is defined when generating a report and can be modified when running the report.

spacer

A control that is manually added to a workspace to maintain the row and column arrangement when fields and controls are moved and removed or to create white space in a workspace.

special response

A short version of the answer that can be used as the excerpt text returned by search results. It can also be used to format the answer content based on how and where the answer displays. Special response can be used by products such as Oracle Digital Assistant and chat applications.

spider

See Web spider.

SSL (secure sockets layer)

An industry standard for secure Internet-based transfer of information.

staff account

The settings for a staff member authorized to access an B2C Service application, including user name, password, profile, group assignment, and email information.

staff account custom field

A field for gathering and displaying additional information about staff members. Staff account custom fields appear on the Custom Fields page of the Staff Accounts editor.
staff member

Any employee with a staff account and profile authorized to access a B2C Service application.

stage

To compile and optimize all the customer portal pages from the development folder, where they are created and tested, into the staging folder, where they appear exactly as they will when the staged files are promoted into production. Stage also refers to the level of completion of a particular opportunity within a specific strategy. Tasks can be defined within a stage and can be required to be completed before the opportunity can move to the next stage. See also promote, strategy, and task.

standard reports

The complete set of predefined reports available in B2C Service. Standard reports can be copied and used to create custom reports.

standard text

Any text prepared in advance that can be sent to customers when responding to incidents, appended to responses by a business rule, or sent by an agent during a chat session. Also called standard response.

State

A field that classifies how contacts and organizations were added and what actions have occurred since their creation. The State field is automatically populated when a contact or organization record is added or updated, and staff members can also manually update the State field. State field options include Service, Outreach, Opportunities, and any combination of the three. State also refers to the current stage of an object in rules processing. See Rule state.

status

The current state of an answer, incident, mailing, opportunity, survey, or task. See Answer status, Incident status, Mailing status, Opportunity status, Survey status, and Task status.
status type

The current state of an answer, incident, or opportunity. Default answer status types are Public and Private. Default incident status types are Unresolved, Solved, and Waiting. Default opportunity status types are Active, Closed, Dead, Inactive, Lead, Lost, and Reject.

stopword

A word that is not included in the keyword indexes in Service and is not searchable as a result. Pronouns, articles, and adverbs are common stopwords.

strategy

A sales plan defined by an organization that includes stages and associated tasks that must be completed in order for opportunities to move through each stage. Strategies allow organizations to define multiple sales plans based on their business processes and help ensure that policies and procedures are enforced.

strict priority

A pull policy that defines the order in which the system pulls incidents or chats from multiple queues. The strict priority ranking also identifies from which queues agents can retrieve incidents.

style

All of the specifications that can be defined for presenting graphical and tabular data in a report, including fonts, colors, and borders.

subscription

A type of cloud search that pulls all available thread content from a custom Facebook or RSS channel account at regular intervals. See also cloud search.
suggested answers

The list of answers from the knowledge base that is returned when SmartAssistant is invoked, either by staff members working on incidents or engaged in chat sessions or through business rules that append answers to email questions and Ask a Question queries from customers. See also SmartAssistant.

suggestion

A product recommendation automatically generated by Offer Advisor using a predictive model based on customer purchase history.

Support Home

The entry page on the customer portal. This page provides customers with quick access to the tools they need to answer their questions and receive immediate customer service.

survey

A method of gathering customer responses and feedback. Surveys can be sent as mailings, served as a web page, or sent as events triggered by a campaign or business rule. See Feedback.

survey status

A method of tracking the state of a survey. The default survey delivery statuses include Draft, Scheduled, Launched, Recurrence Scheduled, Preparing to Send, Sending, Suspended, Expired, Suspended by Error, Canceled, and Completed.

Suspended

A mailing and survey status that indicates a mailing or survey has been temporarily suspended from the Sending or Launched status.

Suspended by Error

A mailing and survey status that indicates a transactional mailing or transactional survey encountered an error and has been temporarily suspended.
synchronization
The process of collecting and combining contact and task records in B2C Service and Microsoft Outlook to ensure data is consistent between applications. Also called sync.

syndicated widget
A Customer Portal widget that can access the Oracle Service Cloud database from any external web page. The code used to place the syndicated widget on a web page is available under tag documentation on the Customer Portal Administration site.

system attribute
A customized field that can be added to account (staff account), answer, asset, contact, incident, opportunity, organization, quote, sales product, and task standard objects. System attributes can be displayed in reports and workspaces, and can be used when defining relationships between standard and custom objects. See custom object and standard object.

table instance
A component of a data set that specifies the database tables that data can be selected from and how database tables are joined in a report or segment.

target
A specific group of customers sharing common characteristics to whom a promotion is presented. A customer may belong to more than one target.

target rule
A type of business rule that has the sole purpose of creating a target consisting of contacts who meet the conditions established by the rule.
task

An action or activity scheduled to be completed within a specified time. Tasks can be standalone, or they can be associated with answers, campaigns, contacts, documents, incidents, mailings, opportunities, organizations, surveys, and stages in a sales strategy.

task custom field

A field for gathering and displaying additional information about tasks. Task custom fields appear when adding or editing a task.

task inheritance

A feature for linking a task's assigned staff member, contact, or organization to the equivalent value in a record associated with the task.

task status

A method of tracking a task's state. The default task statuses are Not Started, In Progress, Completed, Waiting, and Deferred.

Techmail

A scheduled utility that retrieves mail from specified POP3 mailboxes. Service processes some of the mail into new incidents and routes the incidents using business rules (depending on settings). Outreach and Feedback process bounced messages to assist in tracking incorrect email addresses.

template

A structured format used in a document in which specified sections are locked and cannot be edited and a section is open for customized content. The customer portal also uses templates to apply a uniform style to individual pages of the support site. Templates are also available as a starting point for creating a workflow's flow diagram, and templates can be added for community groups and hives.
territory
A specific geographical sales region configured in Opportunity Tracking. Sales representatives can be assigned specific territories for opportunity assignment. Up to twelve levels of territories can be defined.

test message
A mailing message that can be sent to small cross-sections of an audience to test a response before launching a final message.

text explanation
A text field that can be associated with a response in a guided assistance guide. The text explanation is displayed after an agent selects the associated response from a question in the guide. See Guided assistance.

text field
A customizable field containing text that is commonly added to reports. After a text field is created, it can be added to any custom report and then adjusted as necessary.

text matching
A feature in Offer Advisor that enables agents to search for specific terms that best express the customer’s interests. After a search, the list of promotions and suggestions on the Offer Advisor window will be reordered, and the ranking of each will reflect its relevance to the terms entered by the agent. See Offer Advisor.

text question
A question type that allows customers to type their answer to a question.

theme
A group of related text responses to a survey question. Themes are created by topic monitoring and identified by common keywords. Themes are also used in the customer portal to apply CSS styling to multiple elements of a support site by applying a single theme. See Customer Portal and topic monitoring.
third-party screen pop
A feature that lets staff members open a Service Console or report from a third-party application. See Service Console.

Time Billed
A way to track the time spent responding to incidents. Data from the Time Billed field can be used for customer billing and for determining average incident resolution time.

Tool window
A default interface control on the Service Console for accessing reports, records, and items, and for searching the knowledge base. Recent Items and Navigation tool windows appear on the left navigation pane, and the Quick Search tool window appears on the right navigation pane. Tool windows can be put in any order, displayed in separate, floating windows, or removed from the console.

toolbar
One or more icons used as commands on a workspace. The initial set of icons on the workspace’s toolbar is specified in the record type’s workspace configuration, but administrators can customize the toolbar to add frequently used icons.

topic browsing
A feature that provides clustering and guided browse functionality on the customer portal so customers can browse specific topics to find related answers.

topic monitoring
A process that groups survey text responses into clusters of related responses called themes and labels each theme with keywords that define the responses. Topic monitoring is also used in social monitoring to group related cloud search results. See also data mining and themes.

tracked link
A link that can be tracked by Outreach and reported on for statistical purposes.
tracked link category

An option for classifying tracked links for reporting purposes. A tracked link category can have one subcategory level.

transactional mailing

A mailing that is sent only when an event occurs. Transactional mailings are sent to a contact when the contact meets specified criteria in a campaign and can be scheduled to be sent immediately, on a specific date, or at an interval in the future.

transactional survey

A survey that is sent only when an event occurs. Transactional surveys are sent to a contact when the contact meets specified criteria in a campaign or business rule and can be scheduled to be sent immediately, on a specific date, or at an interval in the future.

transfer

A feature in Chat that enables an agent to transfer a customer to another agent during a chat session.

trending

A method of predicting a trend for a specified date range in the future based on a report’s current data. Trending periods are defined when creating or editing a custom report and can be included in standard reports.

trigger

The part of a script or workspace rule that defines the event that causes the rule conditions to be evaluated and (if matched) the rule action to occur.

Unqualified

One of the default chat agent statuses. This status indicates that the agent is not available to chat. The Unqualified chat agent status has an Unavailable status type.
Unresolved

One of the default incident status types and statuses. Incidents with an Unresolved status have recently entered the system, either by a customer or by an agent.

Unrestricted

One of the default chat agent statuses. This status indicates that there are no restrictions to the agent's availability to chat. The Unrestricted chat agent status has an Available status type.

Unspecified

One of the default chat agent statuses. This status indicates that the agent is logged out of Chat. The Unspecified chat agent status has a Logged Out status type and is displayed to agents by default.

Unsubscribe link

A link in a mailing that contacts can click to opt out of future mailings or surveys.

Updated

One of the default incident statuses. An incident marked Updated has been updated by a customer from Your Account. Updated incidents have an Unresolved status type.

Upgrade site

A site created during the update process. It has the latest version of the software, and data from your current production site. You can use it to test, configure, and prepare your site for the update.

updating

The process of moving from one release of Oracle Service Cloud to a newer release. See also migration.
Update Management System (UMS)
A dynamic checklist tool that guides you through a series of tasks that test the core functionality of your updated site.

URL answer
A type of answer that consists of a link to an external URL. The URL address and the content of the web page are displayed.

user agent settings
The shortcut on the customer portal administration dashboard that allows page set mapping. See also page set mapping.

User link
A navigation element on community pages containing links to the logged-in user’s profile, inbox, favorites, and subscriptions, and a sign-out option.

user type
The community role of a member account as defined by the nature of actions that the member is permitted to take.

utility
Any of a number of programs in B2C Service to help manage and configure an installation. Utilities include Agedatabase, Bulkdel, Dbaudit, Dbstatus, Kexport, Kimport, Langcvt, Msgtool, Reportgen, Techmail, and Wltool.

validation
The process of error-checking items such as desktop workflows, scripts, rules, advanced surveys, and campaigns. Items are validated to ensure that all required properties have been completed and that the configuration is functional. B2C Service also validates email addresses for industry-accepted formatting.
variable
A temporary data item in a rule base. The variable is assigned an initial value that can be modified through rule actions, used as a rule condition to trigger other actions, and restored to its initial value for the next round of rules processing. Variables also refer to shortcuts defined for a larger string that can be inserted in the body of an answer or inserted inline during a chat session. When the variable is inserted in the body of the answer or in a chat response, it is replaced with the value specified in the variable.

versioning
The system of numbering the Customer Portal framework and widgets to denote varying levels of changes. Major and minor changes are not backward compatible, while nano changes are applied automatically to all Customer Portal installations.

view partial
A reusable segment of code for common functionality that can be called from widget views to avoid duplicating the same code in multiple widget view files.

virtual assistant
A process of routing incoming chats to a simulated agent that uses knowledge base data to respond to customer questions. Virtual assistant chats can ease the volume of chats requiring an agent. See Oracle Virtual Assistant.

visibility
A setting that determines where a custom field or customizable menu item will appear. Visibility settings specify the interfaces in a multiple-interface installation where these fields appear. The settings can also define whether the fields appear on the administration interface and customer portal and whether certain custom fields with customer visibility can be edited.

visit
See Web visit.
Waiting

One of the default incident status types and incident statuses. An incident marked Waiting has been responded to by a staff member and is waiting for a response from the incident creator.

web form

A document in Outreach that allows contacts to input information that can be submitted to the database. Web forms are served as web pages by B2C Service.

Web Indexer

A search method that lets customers simultaneously search the knowledge base along with web pages and other web-accessible documents within a specified domain.

Web spider

A software application that visits web sites and reads their pages and other documents in order to create entries for a search engine index.

web visit

The period of time a customer spends looking for a satisfactory answer to a question. The end of a web visit generally occurs when a customer closes the browser or leaves the interface or when a specified time period elapses.

web visit tracking

A feature that tracks information about a customer’s current web visit. That is, it tracks the pages on the customer portal that the customer clicked before submitting a question.

website link survey

A type of survey that is published as a web page and can be linked to from any source.
weight

A displayed value given to resulting answers of a text search. The value is equal to the sum of the weights (for indexed words) of all the matched words from the text search. Weight also refers to an internal value given to each indexed keyword for an answer or incident. The value is relative to a constant and is based on number of occurrences, capitalization, and location of the word (ranked high to low: Keywords, Summary, Question, and Answer field for answers; Subject field and incident thread for incidents).

widget

A collection of files that generates a specific function when it is placed on a page of the customer portal. Widgets can be buttons, fields, reports, or other elements that can access the B2C Service database and communicate with other widgets through events or to the server through AJAX requests.

widget builder

A tool that generates custom widget code, including placeholders to allow additional editing of the code. The widget builder, accessed on the Customer Portal Administration site, can extend an existing widget or create a new one.

Win/loss reason

An option for classifying and recording reasons for winning or losing an opportunity.

Wltool

A utility that is manually run after making changes to one of the wordlist files. See Wordlist file.

word stemming

A feature used in keyword indexing and text searching that finds the root of each word and stores the stemmed root instead of the whole word, thereby saving large amounts of space while making a search broader and more appropriate.

wordlist file

Any of the files that can be modified to customize indexing, text searching, and SmartSense emotive ratings. See File Manager.
workflow

See Desktop workflow.

workgroup

All of a record's open, associated records (for instance, an incident's contact, organization, and tasks) that are docked to the Service Console. All records in a workgroup are saved and closed in a single operation. When another non-associated record is opened, the records in the workgroup are collapsed on a single content pane tab.

working record

The record being evaluated or acted upon by a workflow element or connector. For instance, a workspace element can display the first or last record opened in the workflow or a record named elsewhere in the workflow. See Desktop workflow.

workspace

The configuration of the content pane when working with answers, contacts, incidents, opportunities, organizations, and tasks; when working in Chat; and when working with quotes, quote products, and service opportunities. Standard workspaces exist for each type of workspace, and custom workspaces can be created. The workspaces staff members use depend on the workspaces selected in their profile.

workspace rules

A type of rule used to dynamically adjust the display, behavior, and values of fields and controls on a workspace based on staff member actions. Each rule is triggered by one or more events and conditions.

workspace designer

The tool used to create and edit custom workspaces.

WYSIWYG (what you see is what you get)

See HTML editor.
Your Account

A tab on the customer portal that opens the Account Overview page where customers can view and update all the questions they have previously submitted and view any answer or product/category notifications to which they are subscribed. They can also view their service contracts, edit their account information, and change their password. This component is restricted and requires a customer account.
