Oracle customers have access to electronic support through Oracle Support. For information, visit Get Started with Technical Support or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.
1 Auto Update Program

Starting with the May 2014 release, new sites are automatically enrolled in the AUP. See Answer ID 6409 on our support site.

If your site uses standard product functionality and configuration options, then it qualifies for the AUP. Sites that use customizations can qualify for the AUP if the custom capability is built within the Connect APIs. To see if your site qualifies, contact your Oracle technical migration manager or account manager for a review of your implementation.

When you enroll your site in the AUP, a quarterly site update is initiated. The update automatically generates an upgrade site and an update date. It also sends notifications to your organization sent through an incident generated on our support site. The upgrade site is available for you to test before the update date, which you can change if necessary. Any questions or problems during testing can be reported to customer support, which is available to assist you during each update cycle.

Prior to an update, be sure to review all B2C Service update documentation. This includes release notes, the Update Guide, Workstation Specifications, and System Requirements. See Answer ID 5168 on our support site to select the newest release to view these documents. The update process is described in the following steps:

1. An email notifies you to the general availability of the latest B2C Service version. All notifications are sent to your organization contacts who have opted into AUP messaging through Account Settings.
2. A reminder notification is sent after general availability, confirming that the Auto Update cycle is starting soon, and that a date for the start of the update cycle will be provided.
3. Your upgrade site is created and a notification sent which contains the update date and upgrade site URLs. Your current site is now locked into the newest version and must update to this version. The update is automatically set two weeks in the future.
4. Your organization conducts acceptance testing on the upgrade site. Report questions or problems to Oracle Technical Support through Submit a Service Request. If you have any outstanding projects that will conflict with the update, you can reschedule the update date or time as desired using Answer ID 7537 on the Oracle Cloud Portal.
5. Your site is updated to the new version of B2C Service. Site downtime is typically five to fifteen minutes. A notification is sent to confirm the start and completion of the site update.

A few notes to consider when using the AUP:

- Support for service requests submitted during the update cycle is subject to the normal service level targets specified for your organization and service request severity.
- Oracle customers are responsible for addressing deprecations within their site before the deprecated capability is removed, and before the site's readiness to update is lost. Deprecations are described in Answer ID 5974.
- The AUP does not override any other existing contractual agreements between your organization and Oracle.
- If you have any questions or concerns about the AUP, please contact Auto Update Program management at maup_upgrade@mailca.custhelp.com.
2 Core Features

Getting Started for Administrators

Download the Oracle B2C Service Client and Log In

Oracle B2C Service, the customer experience suite, delivers comprehensive customer experience applications that drive revenue, increase efficiency, and build loyalty. Download the client and log in to begin working in B2C Service.

Before you get started, you will want to review the system requirements and the environmental configuration information in Answer ID 31. Cookies must be enabled on your workstation in order to work in the application.

2. Click Install Oracle Service Cloud.
   A security message warns you that the application should not be installed unless you know that it is from a trusted source.
3. Click Install.
   After the client downloads to your workstation, the Login window opens.
4. To view all deployment files and processes, click View Log File.
   You can configure several login options for your application, including login help and Login window customizations. Other login options can help you control and track login behavior. See Login Help Options.
5. Enter administrator in the Username field.
   You must enter this user name the first time.
6. Enter the password assigned when your site was created. After logging in the first time, you must change your password. See Change Your Password.
   User names and passwords are case sensitive. Keep this in mind as you add staff accounts. See Staff Accounts Editor.

   Tip: The Interface field displays the name of the interface from which you launched the installer. This drop-down menu will also contain the names of any additional interfaces you install for this site, beginning with the first interface installed.
7. Click Login.

The Service Console opens after the system updates and loads all necessary support files.

After you download B2C Service, all of the necessary components are automatically installed so you can begin configuring and customizing your application immediately.

Initial Setup

Before you get started, it's important to understand how navigation sets, profiles, and staff accounts work together as you initially configure your application.

The administrator login you used to download B2C Service is a special account, meaning it is not a defined staff account and has no profile or navigation set associated with it. Consequently, your access to functionality is limited to the Analytics explorers, the administrator’s notifications, and a default configuration list. This list contains essential items for initially configuring your application so your staff can begin working.

Navigation Sets, Profiles, and Staff Accounts

Navigation sets control the navigation lists and buttons that staff members see on the console navigation pane. No staff members can work in your application without a navigation set.

You can create unique navigation sets for staff members who have any combination of responsibilities, such as working with incidents, maintaining answers in your knowledge base, and creating mailings and surveys.

Staff members must also be associated with a profile to give them permission to add and edit reports, records, and other items. You can create as many profiles as you need based on the areas that staff members will work in and the functionality they need to access. When you create profiles, you must assign a default navigation set to each profile.

**Note:** It’s important to consider the security of your site when granting staff members permissions. See Administration Interface Configuration for information about protecting your site when assigning staff member profile permissions. To learn how you can develop a security plan that fits the needs of your organization, see How You Develop a Security Plan.

The final element all staff members need is a staff account, which contains the login information they’ll need to access the application. Configure the initial setup for your staff in this order:

1. Create navigation sets consisting of navigation buttons and their associated navigation lists.
2. Create profiles and assign a navigation set to each profile.
3. Create a staff account for each staff member and assign a profile to each staff account.

Since you need access to all functionality, the first navigation set and profile you’ll create is your own (see Create a Navigation Set for the Administrator). Then, add a staff account for yourself and begin using your new login information.

**Tip:** If you intend to use custom workspaces instead of the default standard workspaces, you might want to create your custom workspaces before creating profiles, since you assign the workspaces staff members use in their profiles. If you decide to create your profiles and staff accounts first, you can always update profiles later with the custom workspaces. See Overview of Workspaces.

- Staff Accounts Editor
How You Determine the Functionality Your Organization Needs

In order to configure your application with all the functionality your organization needs, it makes sense to identify those needs before creating your own navigation set.

While you can update any navigation set after you create it, we recommend doing it beforehand to save time and work. Answers to the following questions can help determine what additional functionality beyond the defaults you want to use. If you answer Yes to any question, contact your Oracle account manager to enable the product or component.

- Do you plan to use Outreach to communicate with your customers through mailings and campaigns and Feedback to survey your customers and prospects? If Yes, enable Outreach and Feedback. See Overview of Mailings, Overview of Campaigns, and Overview of Surveys.
- Do you want your sales staff to be able to manage and track all opportunity and related organization and contact information, and track quote interactions sent to customers and prospects? If Yes, enable Opportunity Tracking. See Overview of Opportunities and How You Manage Quotes.
- Do you want your customers to interact with one another and your staff from a single location? If Yes, leverage the peer-to-peer support using Community Self Service in Customer Portal. See Overview of Community Self Service.

Those products that are not enabled by default, Outreach and Opportunity Tracking, must be enabled in order for certain items to appear in the default list of configuration items for the administrator special account. For instance, if you want tracked link categories and the external suppression list to appear in your list of configuration items, contact your Oracle account manager to enable Outreach before you start this procedure. Likewise, if you want the product catalog, price schedules, strategies, quote templates, territories, and sales periods in your list of configuration items, Opportunity Tracking must be enabled. If you create navigation sets before Outreach and Opportunity Tracking are enabled, you will have to manually add those items to the list of configuration items for the Configuration button after the products are enabled.

Additionally, Feedback is not enabled by default, and while there are no configuration items associated with Feedback, it must be enabled in order to access the Surveys and Questions explorers and create questions and surveys.

Create a Navigation Set for the Administrator

Your navigation set must contain all the navigation buttons you want to access. For instance, if you want to add and edit incidents, add the Incidents button to your navigation set and select the reports you want associated with this button.

Your navigation set will include the Configuration button, which will contain the configuration items you’ll need to configure and customize your application. We focus on adding items to the Configuration button in this procedure, but the same steps apply when adding reports and other items to any navigation button you want in your navigation set. See Overview of Navigation Sets.

1. Log in to your application using the administrator login.
2. Click Configuration on the navigation pane.
   The default list of configuration items displays.
3. Expand Application Appearance, and then double-click Navigation Sets.
   The Navigation Sets explorer opens.
4. Click New.
   The Navigation Sets editor opens.
Notice that File Menu displays first in the list. While this is not a navigation button, it is part of every navigation set, and you can configure it with the items you want to be able to create from the application menu (accessed by clicking File next to the Home tab on the ribbon).

Keep in mind, however, that you must also have the corresponding permission in your profile for every item or record type you add to this menu. See Configure the File Menu.

5. On the content pane, scroll and select Configuration in the list of buttons.

The folders display containing default configuration items associated with the Configuration button for the administrator special account.

6. Expand each folder to view its items.

File Menu will always appear first in the list, but since it isn’t a button that appears on the navigation pane, you can move the Configuration button under the File Menu and it will appear first on the navigation pane. Just click the button in the top portion and then click Move Up to position it where you want it in the list.

7. On the left side of the content pane, click the plus sign next to Components to expand the list of configuration items.

8. Expand the Common and Service subfolders.

Items appear in alphabetical order.

Note that Outreach and Opportunity Tracking folders don’t appear in the default list. In order for them to appear, they need to be enabled before you create your navigation set. Contact your Oracle account manager.

<tr>
<td><strong>Countries</strong></td>
<td>Add countries and provinces to maintain accurate address information for the organizations and contacts in your knowledge base. See <a href="#">Add or Edit a Country or Province</a>.</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>This folder contains configuration options specific to Service.</td>
</tr>
<tr>
<td><strong>Knowledge Base</strong></td>
<td>Configure options so search results are more effective for customers when searching for answers and to broaden the scope of search capabilities for both customers and staff.</td>
</tr>
<tr>
<td><strong>External Search Configuration</strong></td>
<td>Configure the Web Indexer to index and search documents that are not part of your knowledge base (for example, web pages and entire websites). See <a href="#">Overview of Finding Content on the Customer Portal</a>.</td>
</tr>
<tr>
<td><strong>Answer Stopwords</strong></td>
<td>View or change the list of stopword for answers that will be excluded from indexing and searching. See <a href="#">Configuring B2C Service for Customer Portal</a>.</td>
</tr>
<tr>
<td>Folder/Configuration Item</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Search Priority Words</td>
<td>Create words that are associated with a public answer or a web document that will always display when the word is included in the search text. See Configuring B2C Service for Customer Portal.</td>
</tr>
<tr>
<td>Topic Browse</td>
<td>Test the cluster groups for the Browse search method or schedule clustering for the next run of the Agedatabase utility.</td>
</tr>
<tr>
<td>Incident Stopwords</td>
<td>View or change the list of stopwords for incidents that will be excluded from indexing and searching. See Add or Edit an Incident Stopword.</td>
</tr>
<tr>
<td><strong>Service Level Agreements</strong></td>
<td>Track the effectiveness of your customer service and control the service and support you provide to your customers.</td>
</tr>
<tr>
<td>Response Requirements</td>
<td>Define the time (in minutes) that agents have to initially respond to incidents and the time (in minutes) allowed to solve incidents. By defining response requirements, you can monitor how agents are meeting your organization’s service goals. See Overview of Service Level Agreements.</td>
</tr>
<tr>
<td>Service Level Agreements</td>
<td>Create SLAs (service level agreements) to assign to the contacts and organizations in your knowledge base. You choose the duration of each SLA, the number of incidents that can be submitted through the SLA, and the response requirements based on the support you want to offer customers. See Overview of Service Level Agreements.</td>
</tr>
<tr>
<td>Holidays</td>
<td>Add all the holidays your organization observes, per interface. Response requirements, including any custom response requirements you have created, are suspended during holidays. See Overview of Service Level Agreements.</td>
</tr>
<tr>
<td>Products/Categories/Dispositions</td>
<td>Add service products and categories to group the answers and incidents in your knowledge base. You can add products and categories to each interface you have configured as well as add additional levels of products (subproducts) and categories (subcategories). Add dispositions to record how incidents were resolved (what was done for the status to change to Solved). You can add up to six levels of dispositions and require that agents select a disposition before an incident’s status can change to Solved. Link products to categories and products to dispositions so that only the categories and dispositions that have been linked to a product appear when the product is selected on the administration interface or your customer portal. See Search Optimization Using Products, Categories, and Dispositions and Product Linking.</td>
</tr>
<tr>
<td>Standard Text</td>
<td>Define text and responses for agents to insert when responding to incidents or engaged in chat sessions, or to add as a business rule action. When you define standard text, you designate where it is available to staff: Incident Text and Rule Text. See Overview of Content Library. When Chat is enabled, Chat Text and Chat URL options are also available.</td>
</tr>
<tr>
<td>Folder/Configuration Item</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Variables</td>
<td>Define shortcuts instead of entering long strings of text. Variables can be inserted in the Question and Answer fields of answers or inline when responding to customers during a chat. When customers view the answer or receive a response from an agent during a chat, the variable is replaced with the value you define. See <a href="#">Overview of Content Library</a>.</td>
</tr>
<tr>
<td>Channels</td>
<td>Customize all the channels customers use to communicate with your organization, including the standard channels through which incidents are created (Service Email, Outreach Email, Phone, Fax, Post, Service Web, Outreach Web, Chat, and Email) as well as the social channels (Twitter, YouTube, RSS, and Facebook). You can also create custom channels for RSS, and Facebook. The remaining standard and social channels can be edited, including updating their name and disabling them. See <a href="#">Overview of Channels</a>.</td>
</tr>
<tr>
<td>Channel Accounts</td>
<td>Configure your application so staff members can respond to contacts through Facebook or Twitter. Without a channel account, your staff can respond only through email. See <a href="#">Overview of Channels</a>.</td>
</tr>
<tr>
<td>Database</td>
<td>This folder contains options to add and update items in your database to ensure the information is complete and up-to-date.</td>
</tr>
<tr>
<td>Data Dictionary</td>
<td>View a list of all the tables in the Oracle database and all columns in each table. See <a href="#">View Your Database Data Dictionary</a>.</td>
</tr>
<tr>
<td>Custom Fields</td>
<td>Gather additional information about answers, contacts, incidents, opportunities, organizations, quotes, sales products, staff accounts, and tasks. See <a href="#">Custom Field Types</a>.</td>
</tr>
<tr>
<td>Object Designer</td>
<td>Create custom objects in order to integrate your organization’s data with B2C Service. You can manage and report on the data in the same way you manage and report on incidents, answers, contacts, tasks, and other standard objects. See <a href="#">Custom Object Types</a>. If you disable the custom objects feature before creating your navigation set, the Object Designer will not display in the default list.</td>
</tr>
<tr>
<td>Incident Thread Correction</td>
<td>Convert an incident response thread into a note thread. Note threads are never seen by customers in their incident responses. If you have Edit/Delete Committed Thread Content permission set in your profile, you can edit incident thread content, including deleting images. See <a href="#">Edit or Convert a Response Thread</a>.</td>
</tr>
<tr>
<td>Data Import Templates</td>
<td>Add data import templates to map columns in a CSV file to columns in your database. You can then skip the column mapping process when uploading records from a CSV file with the same column ordering. See <a href="#">Add or Edit a Data Import Template</a>.</td>
</tr>
<tr>
<td>Data Import Wizard</td>
<td>Upload multiple records using the Data Import Wizard. See <a href="#">How Data Import Works</a>.</td>
</tr>
<tr>
<td>Email Address Sharing</td>
<td>Enable email address sharing so a group of related contacts (such as a family or a team) can maintain individual contact records while sharing one email address. See <a href="#">Email Address Sharing</a>.</td>
</tr>
</tbody>
</table>
9. Select the configuration item and click **Add**. You can also drag the item and place it where you want it in the list or double-click the item.
   a. To add more than one item at the same time, press Ctrl while selecting each item and click **Add**.
   b. To search for a specific item to add, click **Find in List**. This feature also locates items in folders that aren’t expanded.

10. To set an item as the default for the configuration list, right-click it and select **Set As Default**. The item you set as the default will automatically open on the content pane when the configuration list displays when you log in.

11. To remove an item from the configuration list, select it and click **Remove**.

12. To group your items into more categories than currently exist in the configuration list, click **New Folder**.
   a. Enter the name of the folder.
   b. Drag items to the folder.

13. To rename a folder, including one of the default folders, right-click it and select **Rename**. Then enter a new name.

14. To move an item in the list, select it and click **Move Up** or **Move Down**, or drag it where you want it in the list.

15. To create a navigation list for each type of record and item that you want to be available in your navigation set (such as answers, incidents, contacts, and organizations), repeat the previous steps.

   The check box next to each button is selected by default. To remove a button from your navigation set, just clear its check box.

16. To add items to the file menu so you can use this shortcut to add records and items to the knowledge base, scroll to the top of your list and click **File Menu**. See **Configure the File Menu**.

17. Click **Save**.

    The **Save As** window opens.

18. Enter a name for the navigation set in the Navigation Set Name field and click **OK**.

    Next, create a profile with full administration permissions and associate your navigation set with this profile. Then add your staff account assigned to the full access profile. Thereafter, use your staff account information (name entered in the Username field and password, if you define one) to log in. See **Profiles** and **Staff Accounts Editor**.

    **Tip:** There’s another way to customize your configuration list or any navigation list after you create your navigation set. With the Customize Navigation Sets permission in your profile, you can add items to a list directly from the navigation pane (by clicking the **Gear** button in the Configuration list). When you add items this way, you are changing only your lists, not the original navigation set. See **How You Customize Navigation and Configuration Lists**. To examine the implications of customizing your navigation set from the navigation pane, see **Overview of Navigation Sets**.

**Related Topics**
- Change Your Navigation Pane Settings

**Optional Configuration Items**

There are several optional configuration items you may want to enable.

Although B2C Service contains a default **configuration list** for the special administrator account, there are more items you can add to your configuration list depending on what functionality you want. However, the majority of the items won't be available for you to add until the associated product or component is enabled. Contact your Oracle account manager to enable products and components listed in this section.
Configuring your application so your staff can work in B2C Service is an important first step in the setup process. Another important element is managing staff sessions for site security and desktop usage metering and licensing compliance. See *Overview of Session Management and Login Controls* to learn about your options.

The following table describes the items that display under Components after their associated product or component is enabled. The alphabetical list is organized in folders: Analytics, Audiences, Common, Content Library, Feedback, Opportunity Tracking, Outreach, and Service items. Unless specifically noted, all items appear in the default configuration list if you enable the product or component before creating a navigation set. Otherwise, you must manually add the item to your configuration list.

<table>
<thead>
<tr>
<th>Folder/Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Analytics</strong></td>
<td>The Analytics folder contains all Analytics explorers and the Report Management item. The Analytics explorers are available to you with your special administrator account from the Analytics button on the navigation pane. In addition, the Analytics navigation button is part of new navigation sets, and you can add any Analytics explorers to this button for your own navigation set or any of the other navigation sets you create.</td>
</tr>
<tr>
<td><strong>Explorers</strong></td>
<td>Analytics explorers include Chart Styles, Color Schemes, Images, Reports, Styles, and Text Fields.</td>
</tr>
<tr>
<td><strong>Report Management</strong></td>
<td>Manage reports more easily and gain insight into where and how reports are being used in your application. Using the Report Management item, you can identify certain types of reports to help make system and report maintenance easier. This item does not have to be enabled, but you must manually add it to your navigation set. You can add it to the Analytics button, the Configuration button, or any other navigation button.</td>
</tr>
<tr>
<td><strong>Audiences</strong></td>
<td>The following configuration items appear in the Audiences folder after you enable Outreach and Feedback.</td>
</tr>
<tr>
<td><strong>Contact Lists Explorer</strong></td>
<td>Add the Contact Lists explorer to a navigation list in order to access and create static lists of contacts for use in mailings and surveys. You must manually add this explorer to one of your navigation lists or the configuration list.</td>
</tr>
<tr>
<td><strong>External Suppression List</strong></td>
<td>Add a list of email addresses that you want to exclude from mailings. The External Suppression List displays in the Outreach folder in the default configuration list if you enable Outreach before creating your navigation set.</td>
</tr>
<tr>
<td><strong>Segments Explorer</strong></td>
<td>Add the Segments explorer to a navigation list in order to access and create dynamic lists of contacts for use in mailings and surveys. You must manually add this explorer to one of your navigation lists or the configuration list.</td>
</tr>
<tr>
<td><strong>Common</strong></td>
<td>Common items apply to all products: Feedback, Opportunity Tracking, Outreach, and Service.</td>
</tr>
<tr>
<td><strong>Access Control</strong></td>
<td>Add Access Control to a navigation list in order to define community users' access to the community.</td>
</tr>
<tr>
<td><strong>Currencies/Exchange Rates</strong></td>
<td>Add currencies for all the countries in which you do business and add exchange rates for each currency so your sales representatives have up-to-date rates when sending quotes to customers. This item appears in the Internationalization folder in the default configuration list if you enable Opportunity Tracking before creating your navigation set.</td>
</tr>
<tr>
<td><strong>Customer Portal</strong></td>
<td>Access the Customer Portal Administration site to perform administrative tasks, including staging and deploying your customer portal pages. You must enable the MOD_CP_DEVELOPMENT_ENABLED configuration setting in Common/Oracle Products/Modules in order to make changes to your development site. If you do not enable this setting, you cannot make changes to your customer portal, and your customers will see the default reference implementation with no customization.</td>
</tr>
<tr>
<td>Folder/Item</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Engagement Engine Rules</td>
<td>Create rules to give your organization greater control over where, when, and how proactive and reactive chats are provided to your customers. After this component is enabled, you must manually add it to your list of items for the Configuration button.</td>
</tr>
<tr>
<td>Language Skills</td>
<td>Add language skills to your application so you can route incoming chats to the agent with the most appropriate skill set. Chat and Smart Interaction Hub must be enabled before you can add this item to your configuration list. Contact your Oracle account manager.</td>
</tr>
<tr>
<td>Product Skills</td>
<td>Add product skills to your application so you can route incoming chats to the agent with the most appropriate skill set. Chat and Smart Interaction Hub must be enabled before you can add this item to your configuration list. Contact your Oracle account manager.</td>
</tr>
<tr>
<td>SA Auto Tuner</td>
<td>Fine-tune SmartAssistant to provide more relevant results to your customers and help reduce the incidents submitted to your support site. In addition to improving incident deflection rates, information produced by the autotuning feature can be useful for refining the knowledge base and providing guidance to agents. You must enable the KF_SA_OPTIMIZATION_ENABLE configuration setting and manually add this component to your list of items for the Configuration button.</td>
</tr>
<tr>
<td>Scripts Explorer</td>
<td>Create scripts for workspaces that can contain fields and controls and branching logic to guide agents to different pages based on actions they take on a script page. This item appears in the Application Appearance folder if you enable agent scripting before creating your navigation set.</td>
</tr>
<tr>
<td>Service Update Notifications</td>
<td>View changes that have been made in this version that may affect your organization if you are updating from an earlier version. You can view compatibility exceptions and deprecations and make changes inline to help you track how service updates affect your site. This component does not have to be enabled, but you must manually add it to your list of items for the Configuration button.</td>
</tr>
<tr>
<td>Single Sign-On Configurations</td>
<td>Administer single sign-on (SSO) integrations with external applications that reside outside B2C Service. Single sign-on integrations let you use B2C Service as an identity provider to store and authenticate customer credentials. After configuring an SSO service provider and application, staff members can then access the external application without being asked for their login credentials. This component does not have to be enabled, but you must manually add it to your list of items for the Configuration button.</td>
</tr>
<tr>
<td>Virtual Assistant Editor</td>
<td>Route incoming chats to a simulated agent that uses knowledge base data to respond to customer questions. Virtual assistant chats can ease the volume of chats requiring an agent. Your site must be integrated with Virtual Assistant in order to use a virtual assistant.</td>
</tr>
<tr>
<td>Workspaces/Workflows</td>
<td>When the desktop workflow feature is enabled, Workspaces changes to Workspaces/Workflows in the Application Appearance folder. No action on your part is required. You can then create desktop workflows that can be used in place of a single workspace for each editor.</td>
</tr>
<tr>
<td>Content Library</td>
<td>When Outreach or Feedback is enabled, this folder displays in the list of configuration items and contains Documents, File Attachments, Snippets, Templates, and Tracked Links explorers. You'll use these explorers to access and manage mailings, campaigns, questions, surveys, audiences, and content library items (documents, file attachments, snippets, templates, and tracked links).</td>
</tr>
<tr>
<td>Folder/Item</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Feedback</td>
<td>When Feedback is enabled, this folder displays in the list of configuration items and contains the Questions and Surveys explorers. The Surveys navigation button also appears in a new navigation set when Feedback is enabled, and you can add these explorers to the Surveys button (or any other button in new navigation sets).</td>
</tr>
<tr>
<td>Opportunity Tracking</td>
<td>The following items appear under Opportunity Tracking after Opportunity Tracking is enabled.</td>
</tr>
<tr>
<td>Price Schedules</td>
<td>Add price schedules to assign to your sales products. You can add multiple price schedules for greater flexibility when sending quotes to customers.</td>
</tr>
<tr>
<td>Product Catalog</td>
<td>Add your organization’s sales products for use with quotes in Opportunity Tracking and Offer Advisor in Service.</td>
</tr>
<tr>
<td>Promotions</td>
<td>Add promotions to offer to customers and automatic recommendations based on customer attributes and purchase history. You can also add target rules, which define groups of customers called targets, for use in promotions and product suggestions. Offer Advisor must be enabled before this item is available. If enabled before you create your navigation set, Promotions will appear in the Opportunity Tracking folder in the default list for the special administrator account. If enabled after you create your navigation set, you will need to manually add it to your list.</td>
</tr>
<tr>
<td>Quote Templates</td>
<td>Add quote templates and organize them into folders to automate and standardize quote generation.</td>
</tr>
<tr>
<td>Sales Periods</td>
<td>Add sales periods to track how sales representatives are meeting their sales quotas.</td>
</tr>
<tr>
<td>Strategies</td>
<td>Add strategies to track your sales processes. Also add the stages and tasks specific to each strategy.</td>
</tr>
<tr>
<td>Territories</td>
<td>Add territories and assign each sales representative to a territory for opportunity assignments. You can add additional levels of territories (subterritories) to cover all the geographical areas in which you do business.</td>
</tr>
<tr>
<td>Outreach</td>
<td>The following configuration items appear in the Outreach folder after Outreach is enabled.</td>
</tr>
<tr>
<td>Campaigns Explorer</td>
<td>The Campaigns explorer also displays in the Outreach folder. The Campaigns navigation button appears in new navigation sets when Outreach is enabled, and you can add this explorer to the Campaigns navigation button (or any other navigation button).</td>
</tr>
<tr>
<td>Mailings Explorer</td>
<td>The Mailings explorer also displays in the Outreach folder. The Mailings navigation button appears in new navigation sets when Outreach is enabled, and you can add this explorer to the Mailings navigation button (or any other navigation button).</td>
</tr>
<tr>
<td>Tracked Link Categories</td>
<td>Add tracked link categories to group and classify your tracked links so your staff can quickly find particular tracked links. You can also generate reports to evaluate their effectiveness.</td>
</tr>
<tr>
<td>Service</td>
<td>Optional items in this folder apply to Service.</td>
</tr>
<tr>
<td>Archived Incidents</td>
<td>Access outdated incidents that have been removed from your knowledge base. This item does not have to be enabled, but you must manually add it to your list of items for the Configuration button.</td>
</tr>
<tr>
<td>Guided Assistance Explorer</td>
<td>Configure your application with an alternate search method for agents to quickly find information when working with customers on the phone or when responding to an incident and for customers when searching for answers on your customer portal.</td>
</tr>
</tbody>
</table>
### B2C Service

#### Chapter 2

#### Using B2C Service

<table>
<thead>
<tr>
<th>Folder/Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This item appears in the Service folder if you enable guided assistance before creating your navigation set.</td>
<td></td>
</tr>
<tr>
<td>Incident Thread Masking</td>
<td>Automatically mask incident thread content that matches certain common patterns, such as credit card, social security, and telephone numbers. You can also define up to five custom patterns that are masked from view when new thread entries are created. Incident thread masking must be enabled for this item to be available. When enabled, you can add it to your list of items for the Configuration button. Contact your Oracle account manager to enable incident thread masking.</td>
</tr>
</tbody>
</table>

### Open a Configuration Item

Before you begin customizing your site, it's a good idea to look at the key elements on the console from the perspective of customer service agents, sales representatives, and marketing personnel.

1. Click **Configuration** on the navigation pane.
   The configuration list displays.
2. Double-click an item in the list. The item tree displays on the content pane.
   The tree displays the text and responses defined for your application. Some configuration items, including *standard text*, can be organized in folders. If the configuration item contains folders, as the standard text item does in our example, you can expand all of them by clicking the arrow in the tree.

You can also add folders to *custom fields* across all products, *variables* in Service, and the *product catalog* and *quote templates* in Opportunity Tracking.

**Tip:** Tabs on the content pane display all of the items you currently have open. When more than one item is open, just click a tab to return to that item or right-click a tab and select from the following options: Open in New Window, Close, Close All But This, and Close All. You can also press Ctrl+W or Ctrl+F4 to close the active tab or click Close (X) on any content pane tab. See *Close Multiple Records Simultaneously*. Right-click options differ for records in a *workgroup*. When you right-click the content pane tab of the primary record, your only option is to close all associated records in the workgroup. When you right-click an associated record that is the active tab, your options include *Accept Changes*, *Cancel Changes*, and *Undock*. See *Record Workgroups*. On administration editors, you can undock any editor by clicking *Undock* on the active tab. This action opens the editor in a separate window and allows you to move between the window and console without having to close the window first.

3. To expand a single folder in the tree, click the arrow to expand the folder contents.
4. To change the name of a folder, click the folder.
   To quickly locate an item in the tree, click the **Search** arrow. The search menu displays.
   You can search by whole word or case and also search the list from the bottom up. If your tree contains folders, results will return a folder matching the text you enter. Clicking **Next** returns any items within the folder that contain the search text.

5. To edit one of the standard text entries, click it in the tree. The editor displays the fields for the standard text.
   a. Make any changes you want and click **Save**.
      This saves your changes and leaves the editor open.
   b. To save your changes and close the editor, click **Save and Close**.

---

**ORACLE**

16
**Note:** If another staff member makes changes to the same entry and saves it before you save your changes, you will receive a message to refresh or reload the editor in order to view the most current data.

6. To add a standard text entry, click **New**. Your new entry displays in the active folder.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a folder</td>
<td>Right-click in the tree and select New Folder or right-click a folder to add a subfolder.</td>
</tr>
<tr>
<td>Add an item</td>
<td>Click New. The editor opens.</td>
</tr>
<tr>
<td>Delete folders and items</td>
<td>To delete a folder, right-click it and select Delete. Be aware that when you delete a folder, all items in the folder are also deleted.</td>
</tr>
<tr>
<td></td>
<td>To delete an item, select it and click Delete. The item is removed from the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>If the item you want to delete contains sub-items, you must delete the sub-items first. Sub-items can be added to those configuration items that offer additional levels of functionality. This includes <strong>products</strong>, <strong>categories</strong>, and <strong>dispositions</strong> in Service; <strong>tracked link categories</strong> in Outreach; and <strong>territories</strong> in Opportunity Tracking.</td>
</tr>
<tr>
<td>Expand and collapse folders</td>
<td>Click the arrow in the tree to expand all folders, and click it again to collapse them. To expand or collapse a single folder in the tree, click the arrow to expand or collapse the folder contents.</td>
</tr>
<tr>
<td>Edit an item</td>
<td>Click an item in the tree. The item information displays on the editor.</td>
</tr>
<tr>
<td>Reorganize folders and items</td>
<td>Drag an item and drop it in the new position. When you move a folder, all items in the folder also move. You can reorder within a folder or move items to another folder. You can also drop a folder onto another folder to create a hierarchy.</td>
</tr>
<tr>

- Add Folders
Add Folders

Folders and subfolders provide a way to organize items in B2C Service.

Certain configuration items can be organized in folders (custom fields across all products, standard text and variables in Service, and the product catalog and quote templates in Opportunity Tracking).

Adding folders gives you more flexibility in organizing your data. For instance, you might want to add a folder for each type of sales product your organization sells or add folders to organize your quote templates by quote types. And after you add folders, you can move them in the tree to create the hierarchy you want.

1. Double-click the item in the configuration list. The tree of the item displays on the content pane.
2. Right-click in the tree and select New Folder. The Folder editor opens and a New Folder entry appears in the tree.
3. Enter the folder name and press Enter. The new folder displays in the tree and the Label field on the editor populates with the name of the new folder.
   
   **Tip:** You can click Save or you can save the new folder and close the editor simultaneously by clicking Save and Close.

4. To add a subfolder, right-click a folder and select New Folder.

Folders and Items in the Tree

In addition to adding folders to certain configuration items to better organize and group your data, you can also rearrange folders and items in the tree using drag-and-drop operations.

When you move a folder, all items in the folder also move. You can also drag a folder onto another folder to create an additional level in the hierarchy and reorder within a folder or move items to another folder.

**Tip:** Remember that you can also add subfolders by right-clicking a folder and selecting New Folder.

Getting Started for Users

Download Oracle B2C Service and Log In

No matter which channel you use to interact with customers, you need to quickly and accurately respond to them.

With B2C Service, you have a variety of powerful tools to help ensure that every customer interaction is a positive experience.

2. Click Install Oracle Service Cloud.
A security message warns you that the application should not be installed unless you know that it is from a trusted source.

**Note:** If B2C Service has been configured to use an external identity provider (IdP) for agent authentication, an additional button (Install Oracle Service Cloud–Internal Login) displays on the Launch page. Clicking this button opens the Oracle Service Cloud Login window without embedding the IdP’s login page. This lets accounts that do not have the SSO Login (SAML 2.0) profile permission log in without using the external IdP. See Single Sign-on Support in B2C Service.

3. Click **Install**.

   After B2C Service downloads to your workstation, the **Login** window opens. (This can take a few minutes.)

   ![Login Window](image)

   The Login window may look different from the one shown here if your administrator has customized it.
   a. To view all deployment files and processes, click **View Log File**.

4. If you need help logging in, for example, if you’ve forgotten your password, click **Login Help**.

5. Enter your user name in the Username field.

   Your user name and password are defined in your staff account and both are case sensitive.

   o If you attempt to log in to this application using the same user name and interface name as another staff member who is already logged in on a different workstation, and the cache files are stored in the same location for the two instances, you will receive a message that the application is already running and the subsequent session will not be started. However, if you are using the same user name and interface as another staff member, but the cache files are not stored in a shared location (in a non-virtualized environment), the cache files will not be overwritten and the second session will start, overriding and ending the first session.

   o If you attempt to log in to the same site you are already logged in to on the same workstation using the same user name and interface, or another staff member is already logged in on that workstation with the same user name and interface, the initial instance will be brought to focus and no message appears.

   o Although user names and passwords are case sensitive, two staff accounts with user names that are identical except for case cannot be logged in on the same workstation at the same time. If you attempt to do so, the Login window closes and the console for the first staff member logged in will be brought to focus and no message appears.

6. If you have been assigned a password, enter it in the Password field. (Passwords are optional in B2C Service.)

   The Interface field displays the name of the interface you entered in step 1. The drop-down menu contains the names of any additional interfaces installed for this site, beginning with the first interface installed.

7. Click **Login**.

   The Service Console opens after the system updates and loads all necessary support files.

   The application icon now appears in your system tray. Hover over the icon to view your site name.
What displays when you initially log in depends on how your application is configured and what permissions have been assigned in your profile.

After downloading B2C Service and logging in the first time, access your application from Start/All Programs/RightNow/your site name.

- Login Help Options
- Session Expiration

Session Expiration

This topic describes how long the console remains active after logging in and how to prevent lost work after your session expires.

B2C Service is set up to automatically log you out after a specific period of inactivity on the console (by default, fifteen minutes). After your session expires, you will receive a Console Locked message, and you must re-enter your password to resume work without any loss of data.

If you choose to exit the application, all your unsaved work will be lost. In addition, after entering four incorrect passwords, you will be locked out of the console and must re-launch the application. Any unsaved work will be lost.

Note: If you log in through an identity provider using the single sign-on process, you will not have the opportunity to re-enter your password to continue working in the application. Any unsaved work will be lost.

Overview of the Service Console

The Service Console (also called the agent desktop) is where you work with B2C Service.

Whether you respond to incidents to answer customer questions, create and send mailings to contacts, or work opportunities and send quotes to customers, you can access everything you need from the Service Console. And while the interface is easy to navigate, we recommend that you take the time to learn about the key areas on the Service Console and how to perform some basic tasks.

File Menu

Many of the options you will need to access when working in your application are accessed from the File menu.

Click File on the ribbon to access a menu of options for working in your application. The file menu is divided into two panels. The left panel contains content-dependent options at the top, meaning that the options you see depend on what is currently displayed on the content pane (for example, a Print option appears when a report is open). Below this section are global options, meaning they are constant and will always appear on the file menu no matter what is displayed on the content pane (Community, Links, Help, Add-In Logging, Options, and Exit). The panel on the right side of the menu contains shortcuts for adding records and items to the knowledge base.

<table>
<thead>
<tr>
<th>Section and Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-dependent Options</td>
<td>The top section on the left panel contains options for performing actions on what is displayed on the content pane. These options will change to reflect the active tab on the content pane. You can add content-dependent options to the Quick Access toolbar.</td>
</tr>
<tr>
<td>Global Options</td>
<td>This section on the left panel contains options for accessing other areas in the application. Global options display no matter what is displayed on the content pane. You can also add global options to the Quick Access toolbar.</td>

</tr>
</tbody>
</table>

**Related Topics**

- How You Customize the Links Menu
- How You Configure Outlook Integration

**Console Ribbon**

The console ribbon displays tabs and buttons associated with the report, editor, or explorer you are working with.

Next to the file menu is the ribbon, which displays on all reports, records, and explorers. The ribbon consists of tabs and buttons for performing actions on an entire report, individual records in a report, or items in an explorer tree or list. See [Common Functionality Ribbon](#).

**Tip:** If nothing opens on the content pane when you log in, the ribbon will be empty. See [Change Your Navigation Pane Settings](#) to define what opens on the content pane when you log in.

**Navigation Pane**

On the left side of the Service Console is a navigation pane containing Recent Items and Navigation tool windows.

There's also a navigation pane on the right containing the Quick Search tool window, which you can use to search for any record or item in the knowledge base. Although this setup is part of the default configuration, the tool windows can be put in any order or displayed in separate, floating windows. Tool windows can also be removed from the console. See [How You Move Tool Windows](#).

This image shows the default configuration for the left navigation pane. The Answers navigation list is the active list in this example, displayed by clicking Answers on the navigation pane.
The majority of your work will begin on the left navigation pane where you can select the reports, records, and other items you need. At the top is Recent Items, which lists the records and items you have recently opened. Next is the Navigation tool window, which contains all of the navigation buttons in your navigation set.

Each record type (answers, assets, contacts, incidents, opportunities, organizations, and tasks) and component (such as analytics, campaigns, mailings, and surveys) has a corresponding navigation button. Your administrator has created a navigation set containing the navigation buttons you can access and assigned it to your profile. This determines the buttons and associated navigation lists that appear on the navigation pane. (Configuration may also be part of your navigation set if your administrator added it.)

**Note:** By default, the navigation list that appears when you log in will be the navigation list that was active when you logged out.

Navigation lists are organized in a tree and can contain any of the following items.

- **Folders**—Folders are used to organize reports, dashboards, and other items in a navigation list.
- **Reports**—Reports include records reports (answers, assets, contacts, incidents, opportunities, organizations, or tasks), standard reports, and custom reports.
- **Dashboards**—Dashboards are any combination of individual reports shown together in one report on the content pane.
- **Explorers**—Explorers display information on the content pane in hierarchical folders and are available for certain components and configuration items. Explorers can be added to any navigation list. See Associate Products and Categories to an Answer.
- **Miscellaneous items**—Notifications and the archived incidents component are just a few of the other items that can be placed in a navigation list.

**Related Topics**

- How You Customize Navigation and Configuration Lists
- Change Your Navigation Pane Settings
Tool Window Buttons

Tool window buttons let you customize the display of windows.

The buttons next to each tool window title let you customize a single window or all windows. For instance, the top tool window on each navigation pane (both left and right in the default console configuration) contains a Minimize button, which collapses the navigation pane so all tool windows on that navigation pane run down the side of the console.

In this example, only the left navigation pane is collapsed. The right navigation pane, containing Quick Search, is maximized. To maximize the left navigation pane, click the right arrow at the top.

You can also close individual tool windows by clicking X (Close) next to a window title and customize the items in any navigation list and the Quick Search menu by clicking the Gear (Customize List) icon. See How You Customize Navigation and Configuration Lists.

How You Move Tool Windows

Being able to move tool windows gives you the flexibility to arrange your console to suit your own work preferences.

You might want all windows to remain on the navigation pane but want them in a different order. Or you might want to move all tool windows to the left or right navigation pane or to the status bar to create more space on the content pane. Plus, you can return the windows to their default locations at anytime. Click File and select Options > Reset Tool Windows or see Change Your Personal Settings and select the Reset Local Settings check box.

In the default console configuration, Recent Items and Navigation display on the left navigation pane and Quick Search displays on the right.

When you drag a window to another area on the console, the content pane momentarily changes to light gray, the area where you can dock the window is highlighted in blue, and a docking area indicator displays. In this example, we’re moving the Quick Search tool window to the left navigation pane.
When you release your mouse, Quick Search is docked on the left navigation pane.

Using the same technique, you can move all tool windows to the status bar.
When a tool window is docked to the status bar, just click its button to display a full flyout. For the **Quick Search tool** window, the first docked filter displays on the button. Simply enter an entry and click **Search**. If you want to change to another Quick Search report, click the arrow next to Search to display the full Quick Search menu.

**Tip:** To move a tool window from the status bar, move your pointer to the dotted divider line to the left of the tool window you want to move and drag it to its new location.

Available Actions from a Navigation or Configuration List
The actions available from a navigation or configuration list vary depending on the item you have selected and your profile permissions.

When you display the list you want, just double-click a report or other item to open it on the **content pane**. You can also right-click any item to select other actions. Be aware that certain actions require one or more profile permissions.

<table>
<thead>
<tr>
<th>Right-Click</th>
<th>Available Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report or Other Item</td>
<td>Select from the following actions.</td>
</tr>
<tr>
<td>Open</td>
<td>Select this action to open the report or item on the content pane. This is the only right-click option available for configuration items.</td>
</tr>
<tr>
<td>Open in New Tab</td>
<td>Select this action to open a second copy of a currently open report in a new tab on the content pane. This action is available only when you right-click a report that is already open.</td>
</tr>
<tr>
<td>Queue</td>
<td>Select this action to manually schedule the report to run in the background.</td>
</tr>
<tr>
<td>View Report Definition</td>
<td>Select this action to view the report definition in a new window.</td>
</tr>
<tr>
<td>Edit Report Definition</td>
<td>Select this action to edit the report. If you select this action for a standard report, the report does not open. Instead, the content pane displays options for creating a schedule to generate and distribute the report and for changing profile permissions for the report if your profile lets you assign permissions. Also, a message displays at the top of the content pane telling you that this is a read-only report. This action will not display if you do not have appropriate Analytics permissions in your profile.</td>
</tr>
<tr>
<td>The remaining right-click actions appear only if you have the Customize Navigation Sets permission in your profile.</td>
<td></td>

<td>Select this action to rename a folder in a navigation list.</td>
</tr>
<tr>
<td>Remove from List</td>
<td>Select this action to remove a folder and all of its contents from the navigation list.</td>
</tr>
</tbody>
</table>
How You Customize Navigation and Configuration Lists

You can customize what displays in your navigation and configuration lists to help you work more efficiently.

If your *profile* lets you customize your navigation set, a Gear icon (Customize List) displays at the top of the Navigation tool window. You can add any report or dashboard you have permission to run, search for items to add, search for a report or item to add, add multiple items at the same time, remove items, and rearrange items in your list. You can add items only from the Available Items list, not folders. (Folders do not apply to Quick Search reports.)

**Related Topics**

Add Items to or Remove Items from a Navigation or Configuration List

This procedure customizes only your navigation list, not the navigation set assigned in your profile.

1. Display the list you want to change.
2. Click the Gear icon.
   - The Customize List window opens. The tree under Available Items on the left lists all the folders for the reports and components you have permission to access. The tree under Selected Items on the right displays the contents of your list.
3. To add an item, expand the appropriate folder under Available Items.
   - a. Select the item and click Add.
   - You can also double-click the item or drag the item to your list and drop it where you want it to display.
   - b. To add multiple items at the same time, press Ctrl while making your selections and click Add.
   - **Tip:** To set an item as the default for the list, right-click the item under Selected Items and select Set as Default. The item will automatically open on the content pane when that item’s list displays when you log in.
4. To remove an item, select it and click Remove.
   - Other ways to remove items include right-clicking an item and selecting Remove from List or selecting an item and pressing Delete.
5. Click OK.
   - Your changes are saved and the window closes.

**Related Topics**
- Search for an Item to Add to Your Navigation List
- Organize Items in a Navigation List

Search for an Item to Add to Your Navigation List

You can search for items you want to add to your navigation list.

1. Click Find in List next to Available Items.
   - The Find window opens.
2. Enter your search term in the Find What field.
3. Click **Find Next**.
4. To match case or whole word, select the appropriate check box.
5. To specify the direction of the search in Available Items, select **Up** or **Down**.
   As you enter letters, the system highlights the first item in the list that begins with the letters you enter. If this is the item you want, close the window. Otherwise, continue entering or click **Find Next** to scan for the next occurrence. If no match is found, a message displays on the bottom of the window.
6. If your search returns a match and you want to add it to your list, close the window and click **Add**.
7. Click **OK**.
   Your changes are saved and the window closes.

**Related Topics**
- Add Items to or Remove Items from a Navigation or Configuration List
- Organize Items in a Navigation List

**Organize Items in a Navigation List**
You can organize items in your navigation list to more easily access the items you use most.

1. To reorder items in the list, select an item and click **Move Up** or **Move Down**. This action moves the item up or down one position. You can also drag an item to where you want it in the list.
   **Tip:** The Move Up and Move Down buttons are context-sensitive. For instance, if you select the first item in your list, the Move Up button is disabled. Likewise, if you select the last item in your list, the Move Down button is disabled.
2. To add a folder to your list, click **New Folder** and name the folder.
   If no item in your list is selected, the new folder is placed at the end of the list. If an item is selected, the new folder is placed immediately after the selected item. And if a folder is selected, the new folder is placed beneath the parent folder. This button is disabled when you have multiple items selected in your list.
3. To rename a folder, select a folder, click **Rename**, and enter the new name.
4. Click **OK**.
   Your changes are saved and the window closes.

Available Actions from the Recent Items List

The records and items you’ve recently opened are listed in the Recent Items tool window.

Records and items are grouped into four categories, including Pinned, Today, Yesterday, and Older. Only the categories that have recent items display (for example, if only one record or item was opened today, the Today category will be the only one listed in the recent items list). By default, the last ten items you opened are listed, but you can increase or decrease that number if you want. See Change Your Navigation Pane Settings.

Tip: Configuration items are not tracked in the recent items list.

You can double-click an item to open it or right-click an item to display additional actions. Unlike navigation lists, which require a profile permission for certain actions, all staff members can perform the actions from the recent items list.

### Available Actions

<table>
<thead>
<tr>
<th>Right-Click</th>
<th>Available Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open</td>
<td>Select this action to open the item on the content pane.</td>
</tr>
<tr>
<td>Copy Tooltip to Clipboard</td>
<td>Select this action to copy the item’s tooltip to the clipboard. You can then insert the tooltip in another record or item. Tooltips vary according to the item or record type. For instance, an incident tooltip contains the reference number, subject, contact name, contact ID, contact email address, contact phone number, and organization name; the tooltip for an answer contains the answer summary, answer ID, language, and answer access levels; and the tooltip for a mailing contains the mailing name.</td>
</tr>
<tr>
<td>Copy Text to Clipboard</td>
<td>Select this action to copy the item’s name or summary information to the clipboard. You can then insert the text in another record or item. For instance, copying text to the clipboard for an answer copies the text in the Summary field. Copying text to the clipboard for an incident copies the number in the Reference # field. And copying text to the clipboard for a mailing copies the mailing name.</td>
</tr>
<tr>
<td>Remove from List</td>
<td>Select this action to remove the item from the recent items list.</td>
</tr>
</tbody>
</table>

Recent items also appear in other areas of the product to help you quickly select commonly used items when updating record fields. See How You Search from Open Records and Assign a Record from a Report.

How You Search Recent Items

This topic describes how to use search to quickly locate a record in your recent items.

You can search for recent records and items using a text search and filter by type (for example, incident record type). Click the Search field drop-down menu to view all record types available to search in your recent items.
Note: Only record and item types recently opened will appear in the drop-down menu. For example, if you recently opened a contact record and an incident but not an organization, only Contact and Incident will appear in the drop-down menu.

How You Pin Recent Items

By default, the last ten records and items you opened appear in your recent items list, but you can increase or decrease that number whenever you want.

There might be times when you have an item that you don’t want to scroll off the recent items list, no matter how many items you’ve set to appear in your list. For those instances, you can pin one or more items to ensure they remain in your recent items list for as long as you need.

Click the Pin icon that appears when you hover over an item. Pinned items appear at the top of the Recent Items tool window.

When you no longer want an item pinned, just hover over it and click the Unpin icon.

How Buttons in Your Navigation Set are Displayed

By default, one row of buttons displays at the end of the Navigation tool window no matter which navigation list is active.

Clicking Configure Buttons, indicated by the right arrow next to the row of buttons, displays the remaining buttons in your navigation set and options to show more or fewer buttons.

- **Show More Buttons**—Select this option to add a navigation button in a large format. As you add a button, its smaller version is removed from the bottom of the navigation pane. This action adds large buttons one at a time.

- **Show Fewer Buttons**—Select this option to show fewer navigation buttons in the large format. Selecting this option removes the buttons one at a time. As each large button is removed, its smaller version is added to the bottom of the navigation pane.
You can also change the number of buttons that display by pointing to the slider bar and dragging the bar up or down when the pointer becomes a double-headed arrow.

To change the order of the buttons on the Navigation tool window, see Change Your Navigation Pane Settings.

Overview of the Content Pane

The content pane is the area of the console that displays the report or other item you select from a navigation list, from your list of recent items, or from the file menu.

The content pane also displays results from a search. The exact placement of the content pane depends on whether you have one or two navigation panes on the Service Console. In the default configuration, the content pane displays in the middle of the console.

You may work with any of the following items on the content pane.

- **Reports**—Access a custom report to edit the report definition or a standard or custom report to generate the report.
- **Dashboards**—Access a dashboard, which is any combination of reports that display together in one report.
- **Records**—Access a report containing a list of records and select one or more to open. See Open an Incident for Editing. You can also open an individual record from the Recent Items tool window. See Available Actions from the Recent Items List.
- **Explorers**—Access any of several components and configuration items that display information in hierarchical folders. See Associate Products and Categories to an Answer.
- **Notifications**—Access your messages when there is a change in the status of your incidents and answers in Service, mailings and campaigns in Outreach, or opportunities. You will also receive a notification when you are assigned a new incident, answer, or opportunity. See Notifications.
- **Search results**—Access items and records from a standard search or a Quick Search. See Record Search Options. (The Quick Search menu is a default tool window that displays on the navigation pane. See Navigation Pane for details about tool windows.)

To change the way information displays on the content pane, including the content pane tabs, see Application Options.

Content Pane Tabs

Tabs on the top of the content pane display all the items you currently have open.

When more than one item is open, just click a tab to return to that item or right-click a tab and select from the following options: Open in New Window, Close, Close All But This, and Close All. You can also press Ctrl+W or Ctrl+F4 to close the active tab or click Close (X) on any content pane tab. See Close Multiple Records Simultaneously.

Right-click options differ for records in a workgroup. When you right-click the content pane tab of the primary record, your only option is to close all associated records in the workgroup. When you right-click an associated record that is the active tab, your options include Accept Changes, Cancel Changes, and Undock. See Record Workgroups.

Tip: On certain workspaces editors, including incidents, contacts, organizations, and tasks, you can undock an open record by clicking Undock on the active tab or Undock on the ribbon. This action opens the record in a separate window and lets you move between the window and console without having to close the window first.
Application Options

After you become familiar with the agent desktop, you may want to customize certain areas based on your personal preferences and what works best for you.

You can change settings specific to your staff account that are reflected when you add certain records to the knowledge base, change your password, and customize how the navigation pane, content pane, and tool windows display. Click File and select Options on the left. The application options display on the right.

<td>The option in this section lets you edit your email signature.</td>
</tr>
</tbody>
</table>
### Field/Button | Description
---|---
Email Signature | If you have an email address specified in your staff account and the permission to customize your signature, make your changes in this text box.

Application Behavior | Options in this section let you select application behavior settings.

Automatically Sign Out when Last Console is Closed | Select this check box to prevent the Exit message from displaying when you close the last console or select Exit on the file menu. This is a global setting stored on your workstation and applies to all the interfaces on this site that you can access.

Always Correctly Refresh Editors when Application is Resized | Clear this check box to ensure that editors load faster on the console. This option displays only when B2C Service is installed on 64-bit operating systems.

**Note:** This option is designed to compensate for a Windows limitation when resizing one or more windows on 64-bit operating systems. However, when this option is enabled, which it is by default, you may experience more screen flickering and editors may load more slowly. Also, be aware that when you clear this option, editors that have been resized may not refresh properly.

Disable Rich Client Visual Experience | Select this check box to use software rendering instead of hardware rendering on the console display. This option is effective if you have limited hardware, such as a slow graphics card, which might cause repainting or display issues. However, if you have adequate hardware, selecting this check box may slow down operations.

Local Data | This section contains options for resetting your local settings and refreshing your local cache.

Reset Local Settings | Select this check box to reset local settings to the interface defaults.

Rebuild Local Data Cache | Select this check box to remove your local cache entries and request current copies from the server.

Authentication | The option in this section lets you change the password for logging in to your application.

Change Password | Click this button to change your password. See Change Your Password.

3. Click **OK**.

**Related Topics**
- Add or Edit a Staff Account
- Rebuild Your Local Cache

**Rebuild Your Local Cache**
You can remove your local cache entries while logged in and request current copies from the server without manually deleting the files.
Your local cache files store all option lists data (any data accessed from a drop-down menu or menu list, such as customizable menu items) plus additional data such as report and workspace definitions, questions, documents, and standard text. If you aren’t sure whether your local copy of common data matches the data on the server, rebuild your local cache to retrieve the most up-to-date data.

**Note:** Contact your administrator or supervisor before rebuilding your local cache.

1. Click **File** and select **Options > Personal Settings**.
2. Select the **Rebuild Local Data Cache** check box under Local Data.
3. Click **OK**.
   A prompt asks you to confirm your request.
4. Click **Yes**.
   A progress bar displays on the content pane. After all data is received from the server and written to the cache, the progress bar and window close.

### Change Your Password

Your organization may have security policies that require strong passwords for staff to use to log in.

If this is the case, your staff account contains a password you must use each time you log in. You may also need to change your password at regular intervals.

If your profile contains the SSO Login (SAML 2.0) permission for *single sign-on*, you cannot change your password in B2C Service. See **Agent Login Using an IdP-initiated SSO**.

1. Click **File** and select **Options > Personal Settings**.
   Your personal settings display.
2. Click **Change Password**.
3. Enter your current password and press Tab. Don’t forget that your password is case sensitive.
4. Enter the new password and press Tab.
   If an entry does not meet your organization’s password requirements, such as password length or character repetition, the system highlights the incorrect entry.
5. Re-enter your new password.
6. Click **OK**.
   The Oracle server verifies your password history (both current and new passwords) and, if errors are found, displays the requirements that were not met.

### Change Your View Options

As you become familiar with your application and navigating the console, you may want to change the way information displays on the content pane.

By default, when you open an item, it appears in full window display. You can change the default content pane display to a split window or pop the content pane in a new window. You can also change the placement of the **content pane tabs**, change how information displays in records, change the interface color, and display date, time, and time zone in the status bar.

**Tip:** All view options are **local settings**.

1. Click **File** and select **Options > View Options**.
2. Select from the view options listed.

3. Click OK.

Change Your Navigation Pane Settings

Navigation pane settings determine the order of the navigation buttons and the Configuration button on the navigation pane, which buttons display, and what opens on the content pane when you log in.

You can customize these and other settings to suit your specific work responsibilities and preferences.

Note: Navigation pane settings are local settings. Consequently, any customizations you make from this option, except for resetting your navigation set, will be removed if you select the Reset Local Settings check box from the Personal Settings option. See Change Your Personal Settings.

1. Click File and select Options > Navigation Pane.
2. Select from the navigation pane options listed.

<table>
<thead>

3. **Click OK.**
Change Tool Window Visibility

In addition to manually closing tool windows from the navigation pane, you can also change tool window visibility from your application options.

1. Click File and select Options > Tool Windows.
2. Clear the check box next to any tool window you want to hide. All tool windows are visible by default.
3. Click OK.

Tip: You also have the option to add a custom tool window to the Service Console. Using the NAVPANE_CUSTOM_WEB_CONTROL_URL configuration setting (RightNow User Interface/Tool Bar/General), you can embed a web page on the navigation pane. After you add a fully qualified domain name in the Value field, a Custom Web Control tool window will display in the Tool Window Visibility list. However, you must select the check box in the list in order to display your custom tool window on the console. You can then move it just like any of the default tool windows.

Open the Reports Explorer

Certain components and configuration items display data in hierarchical folders similar to Windows Explorer.

The main elements and basic functionality of explorers in B2C Service are the same, but options may differ slightly from one explorer to another. Explorers can be added to any navigation list or your configuration list, just like any report or other item. For instance, the list of campaigns in your application display in an explorer, yet you can add the Campaigns explorer to a navigation list other than the Campaigns navigation list.

1. Click Analytics on the navigation pane.
2. Double-click Reports Explorer in the navigation list. The explorer opens on the content pane.

Tip: Although the default requires that you double-click an item to open it, you can change the default so that items open with a single click. See Change Your Navigation Pane Settings to select this option.

The following explorers are available in B2C Service. Certain components contain multiple explorers.

- Analytics
- Campaigns
- Mailings
- Surveys
- Content Library
- Audiences
- Navigation Sets
- Workspaces/Workflows
- Client Workflow Images
Explorer Display States

Explorers display in one of three states: Folders On, Folders Off, and Search On. The display state determines what information you see and what functionality is available. You change states using the Folders and Find buttons on the ribbon.

**Folders On**—In the default Folders On state, explorers display a folders tree on the left and a detailed list of the selected folder’s contents (subfolders and items) on the right. The columns that display in the list are specific to each explorer. For instance, the Reports explorer shows Created, Updated, Initial Run, and Refresh on Edit columns, while the Mailings explorer might show Last Launched, Sent, and Clicked columns.

**Folders Off**—When you turn off folders, the tree is hidden and the content pane displays only the detailed list of the selected folder’s contents. However, the folder hierarchy is maintained. Depending on where you are in the hierarchy when you turn off folders, you can double-click a folder to drill down or click Up to move up one level.

Click Folders to turn off folders. (You can also click X on the top right of the folders tree to turn off folders.) Click Folders again to display the tree and turn folders on.

**Search On**—The third explorer display state is Search On. The left side of the content pane displays the Find menu. Click Find to change to Search On. Click it again to turn off search. (You can also click X on the top right of the Find menu to turn off search.)

| Tip: | Turning off search puts the explorer in the Folders Off state. To turn off search and display the folders list, click Folders instead of closing the Find menu. |

Search for a Report from the Reports Explorer

The steps for searching are the same in all explorers. You can search any of the available columns in the list by selecting a column from the Find Using drop-down menu.

Three data types are supported in explorer searches: strings (words), dates, and integers (numbers). The data type of the column you select determines the available search criteria.

- **String**—The Name column is the default search column in all explorers. Because this is a string data type, you can search for strings that start with, contain, end with, or match the value you enter in the search box. You can also match the case by selecting the Case Sensitive check box.

- **Date**—If the column you select is a date data type, you can search for dates before, on, or after today's date. You can also click the calendar to display the current month’s calendar and select another day, or click the arrows at the top of the calendar to change months.

- **Integer**—If the column you select is an integer data type, you can search for values that are less than, equal to, or greater than a number. Either enter a number in the search box or select one using the arrows.

1. Double-click Reports Explorer in your navigation list.
The explorer opens on the content pane.

2. Click **Find**.
   The left side of the content pane displays a Find menu, hiding the folders tree.
3. Click the **Find Using** drop-down menu and select a column to search.
4. Select an option for your search criteria.
5. Enter your search text in the text box and click **Find**.
   The search results display in the list on the right side of the content pane. You will receive a message when no matches are found.
6. To remove the text entered from the previous search, click **Clear**.

### Search Results Actions

The actions you can perform after a search vary according to the search results and your profile permissions.

In addition to the common actions you can initiate from the ribbon or by right-clicking a file, you have an additional option, Open Containing Folder, when you right-click a file returned in an explorer search. Select **Open Containing Folder** to display the folder containing the selected file. This automatically closes the Find menu and returns the explorer to the Folders On display state.

Right-clicking a folder returned in your search provides another option in addition to Open Containing Folder:

- **Open Containing Folder**—Select this option to display the parent folder in the tree.
- **Open Folder**—Select this option to display the folder in the tree.

Both actions close the Find menu and return the explorer to the Folders On display state.

### Advanced Search Options

You can use advanced search options to remove the results from your search, search your current results, or keep your current results and add results from your next search. By default, conducting a new search removes the previous search results.

Click **Show Advanced Options** on the bottom of the Find menu. (You can click anywhere on the line to display the advanced options.) The option then changes to Hide Advanced Options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search globally, replace results</td>
<td>Select this option to remove the results from the previous search and replace with results from this search. This is the default option.</td>
</tr>
<tr>
<td>Search within results, replace results</td>
<td>Select this option to search only the current results and keep only those that match this search.</td>
</tr>
<tr>
<td>Search globally, append to results</td>
<td>Select this option to keep results from the previous search and add results from this search.</td>
</tr>
</tbody>
</table>

**Tip:** You can also select the **Return Non-Matching Items** check box to return all files that do not match your search criteria.
Explorer Tree

The primary way of moving around explorers is from the tree, although you can also select actions and change focus in the explorer from the list, ribbon, and address bar.

Depending on the permissions in your profile and the explorer you are working in, certain actions may not be available. For instance, if you select a standard report in the Reports explorer, the Delete action from the list and the button on the ribbon are not available since you can’t delete standard reports.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change the list</td>
<td>Select a folder in the tree to change the list of subfolders and items that appear.</td>
</tr>
<tr>
<td>Expand or collapse all folders</td>
<td>Right-click a folder to expand or collapse all folders in the tree. You can also click the plus or minus sign next to a folder to expand or collapse a single folder.</td>
</tr>
<tr>
<td>Add a folder</td>
<td>Right-click a folder and select New Folder. A new folder is created under the selected folder and you are given the opportunity to name it. This option is not available when you right-click a root or standard folder.</td>
</tr>
<tr>
<td>Delete a folder</td>
<td>Right-click a folder and select Delete. When you select this action, you will be asked to confirm the deletion. This option is not available when you right-click a root or standard folder.</td>
</tr>
<tr>
<td>CAUTION: Deleting a folder deletes all of its contents as well. This action cannot be reversed.</td>
<td></td>
</tr>
<tr>
<td>Rename a folder</td>
<td>Right-click a folder and select Rename. The selected folder is put into an editable state. This option is not available when you right-click a root or standard folder.</td>
</tr>
<tr>
<td>Reorganize folders</td>
<td>Drag and drop a folder and its contents into another folder and move items from one folder to another. Drag-and-drop may be restricted by permissions in your profile. Also, you cannot execute a drag-and-drop that would result in a folder containing more than 12 levels.</td>
</tr>
</tbody>
</table>

Explorer List

The actions available when working with the list depend on the explorer and the list of items. Some actions can also be initiated from the ribbon. The actions available also depend on whether you right-click a subfolder or an item.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open a subfolder</td>
<td>Right-click a subfolder and select Open Folder. This action causes the parent folder to be selected in the tree and its contents to display in the list. This option is available only when you right-click a folder. You can also double-click a folder to open it.</td>
</tr>
</tbody>
</table>
### Option | Action
--- | ---
**Edit an item** | Right-click an item and select Edit. This action is available only when you right-click an item. You can also double-click the item to open it for editing. In the Reports explorer, double-clicking will run the report.

**Open an item** | Right-click an item and select Open to view the item. This action is available only when you right-click an item.

**Queue a report** | Right-click a report and select Queue. This action manually schedules the report to run in the background. This option is available only on the Reports explorer.

**Copy an item** | Right-click an item and select Copy. Select this action when you want to add an item that contains many of the same attributes as the item you right-click. This option is not available when you right-click a folder.

**Delete a subfolder or item** | Right-click a subfolder or item and select Delete. You will be asked to confirm the deletion. **CAUTION:** Deleting a folder deletes all of its contents as well. This action cannot be reversed. This option is not available when you right-click a standard folder.

**Rename a subfolder or item** | Right-click a subfolder or item and select Rename. The folder or item is put into an editable state for you to rename. This option is not available when you right-click a standard folder.

**View a report definition** | Right-click a report and select View Definition. The report definition opens in a new window.

**Add a folder** | Right-click in the white space of the list and select New Folder. After you name the folder and press Enter, the new folder displays in the list and also under the parent folder in the tree.

**Reorganize folders and items** | Drag and drop a folder and its contents into another folder and move items from one folder to another using drag-and-drop. You can also drag folders or items in the list and drop them onto a folder in the tree. (You cannot, however, drag from the tree to the list, since dragging a folder into one of its descendants is never permitted.) Certain explorers may not permit drag-and-drop operations.

**Resize and re-sort columns** | Drag the left column boundaries to resize columns. Click a column header to re-sort the data in ascending or descending order.

### Explorer Ribbon

Many of the actions you initiate from the explorer list can also be selected by clicking a button on the ribbon.

The explorer ribbon contains only the Home tab. Clicking certain buttons, such as New and Open, changes the tabs and buttons that are available. The Help button is located on the far right of the ribbon. Click this button to access help for the current task.

Shortcut keys are also available for all ribbon buttons so you can enter a key combination to perform an action rather than clicking a ribbon button. Press Alt plus the first letter of the ribbon tab that you want to display shortcut keys for. (For instance, press Alt+H to display the shortcut keys for buttons on the Home tab.) This is a one-time action. When you use a shortcut key, the ribbon returns to its default display.
<table>

- Overview of Creating Basic Custom Reports
- Overview of Dashboards
- Overview of Managing Reports on the Reports Explorer

### How You Change Folders from the Address Bar

You can change folders and focus in the tree by entering a path, or partial path, in the address bar.

As you work in the tree, the address bar is updated with the path of the selected folder whenever you change folders. Clicking Back or Forward also updates the path in the address bar.

**Tip:** You can enter just a few characters in the address bar and the system will present you with possible path completions. Use your mouse or other pointing device or the arrow key to select the path you want. Then press Enter or click Go to change folders.

### Save an Item in an Explorer

When you create or edit an item in an explorer, you have more than one option for saving the item. No matter which explorer you are working with, the steps are essentially the same.

1. Click the **Home**.
   
   **Note:** When saving a custom report, click the arrow on **Save** on the Quick Access toolbar and select a save option.

2. To save changes to the item without closing it, click **Save**.
3. To save changes to the item and close it, click **Save and Close**.
   
   This option is faster than saving a change and then manually closing the window.

4. To save a new item or save a copy of the item you are editing with a different name, click **Save As**. The **Save As** window opens.
Using B2C Service

Chapter 2
Core Features

### Session Management and Login Controls

#### Overview of Session Management and Login Controls

B2C Service provides a number of security measures to assist you in safeguarding your organization’s data and that of your customers.

As your organization’s administrator, you can expire sessions to help reduce session exploitation, control both active and inactive desktop user sessions to lower seat usage for licensing compliance, and control and track login behavior on the administration interface.

#### How You Force Session Expiration

This topic describes how to force session expiration for staff members.

Reducing session exploitation can help your organization protect its data. And B2C Service is set up to automatically expire sessions so you can control the length of time before staff sessions expire. Although you have other ways to force staff members to reauthenticate, the session hard timeout feature should be the primary method you use since it requires no manual intervention on your part.

The SESSION_HARD_TIMEOUT configuration setting ([RightNow User Interface/General/Security](#)) can be set for a time value between a minimum of 1 hour and a maximum of 8,760 hours (1 year). The default value is 12 hours.

A warning message alerts staff members five minutes before their current session is set to expire and tells them to reauthenticate. After entering login credentials, the staff member will be authenticated, a new session will be created, and the session ID will be updated throughout the product. The staff member can continue working without any loss of data.

**Note:** Desktop Add-Ins (.NET API), Connect Desktop Integration (JavaScript API), and Co-browse will receive a notification when a new session has been created. See [Desktop Add-Ins Developer Guide](#) and [Connect JavaScript API Developer Guide](#).

If a staff member dismisses the warning message (by clicking Cancel), the Service Console locks when the session expires. After the staff member enters login credentials and is authenticated, a new session is created and the staff member can proceed without losing any work.

Agents who are chatting with customers must also enter their password to reauthenticate. If an agent does not reauthenticate, any open chat sessions are sent back into the queue for assignment to the next available agent.
Desktop Usage Control

Our desktop usage administration feature is controlled by the SESSION_MANAGEMENT_ENABLED configuration setting. This setting is enabled by default and lets you to control and manage both active and inactive sessions.

Contact your Oracle account manager for information about desktop usage metering and licensing compliance.

Log Out a Staff Member Manually

While session hard timeout is the preferred way to force staff members to reauthenticate, you can also manually log out individual staff accounts when the situation warrants.

This action terminates the staff member’s session, locks the Service Console, and forces the staff member to reauthenticate in order to continue working. When an agent is engaged in a chat and is logged out, but then does not reauthenticate, the chat is sent back into the queue for assignment to the next available agent.

In order to manually log out staff accounts, staff members must have the Groups/Accounts/Distribution Lists permission on the Administration tab of the Profiles editor. See Administration Permissions to assign this permission.

When you manually log out a staff account, the server sends the information to the client. When the staff member then tries to perform an action, like saving an open record or clicking a button, a Console Locked message displays. After the staff member enters login credentials and is authenticated, a new session is created and the staff member can proceed without losing any work. Also, the end date and time are updated in the User Transactions (user_trans) table in the Oracle database, enabling you to view and track your desktop user sessions.

Using the Logged In Staff Accounts standard report, you can see which staff members are currently logged in, the date and time they logged in, and how long they have been logged in. You’ll also see a Force Logout button on the Record group of the ribbon for logging out a selected staff account. (You can also right-click a staff account in the list and select Force Logout.)

Note: If you prefer, you can create your own custom report to manually log out staff members. You’ll need to use fields from the Accounts (accounts) and User Transactions (user_trans) tables to display currently logged-in staff accounts and their login start and end times.

1. Do one of the following:
   - From the configuration list, double-click Logged In Staff Accounts in Staff Management.
   - From the Reports explorer, double-click Staff Management in Common/Site Administration.

2. Select a staff account in the list and click Force Logout.
   A message asks you to confirm the action and warns you that all of the staff member’s unsaved changes will be lost.

3. Click OK.
   A message tells you that the staff member’s session has been terminated.

4. Click OK.

5. Repeat the previous steps as necessary to log out additional staff accounts.

When a staff member tries to perform an action after being logged out, a Console Locked message displays. After the staff member reauthenticates (by entering the correct password), a new session is created and the staff member can proceed without losing any work.
Automatically Logging Out Inactive Sessions

In addition to manually logging out active sessions, you can also set up your application to automatically log out inactive sessions.

You'll configure automatic logout of inactive sessions using a configuration setting and a profile setting, which work together to give you more flexibility in managing your desktop user sessions and maintaining site security.

- **CLIENT_SESSION_EXP**—Use this configuration setting to specify the time in one-minute intervals that a session can be inactive before a staff account is automatically logged out. The default value of the CLIENT_SESSION_EXP configuration setting (RightNow User Interface/General Security) is 15 minutes and the maximum value is 1440 (24 hours).

Even if you disable desktop usage administration, you can still use the CLIENT_SESSION_EXP configuration setting to maintain security on your site.

- **Session Timeout field**—Use this field on the Profiles editor to specify a time (0–1440 minutes) other than the time defined in the CLIENT_SESSION_EXP configuration setting that a session can be inactive before a staff account is automatically logged out, or set this field so that staff members with a particular profile are exempt from being automatically logged out due to inactivity. By default, this field is null, meaning that the value in CLIENT_SESSION_EXP will be used for automatic logout. Entering any value in this field overrides the value defined in CLIENT_SESSION_EXP.

  **Note:** Even if you exempt certain staff members from being automatically logged out due to inactivity, staff member sessions will still expire and staff must reauthenticate when the time set in the SESSION_HARD_TIMEOUT configuration setting expires.

Here's how automatic logout of inactive sessions works. When the time of inactivity has been exceeded, the client sends a logout request to the server, which will update the end date and time in the User Transactions (user_trans) table in the Oracle database.

Staff members will receive a Console Locked message asking for their password to reauthenticate. After a staff member enters login credentials and is authenticated, a new session is created and the staff member can continue working without any loss of data.

For staff members who choose to exit the application, all their unsaved work will be lost. In addition, after entering four incorrect passwords, a staff member will be locked out of the console and must re-launch the application. Any unsaved work will be lost.

Agents who are chatting with customers when they are automatically logged out must also enter their password to reauthenticate. If an agent does not reauthenticate, any open chat sessions are sent back into the queue for assignment to the next available agent.

  **Note:** Staff members who log in through an identity provider (that is, using the single sign-on process) will not have the opportunity to re-enter their password to continue working in the application. Any unsaved work will be lost.
Configure Automatic Logout by Profile

This topic describes how to configure automatic logout based on a specific profile.

You may want to exempt certain personnel from an automatic logout, or you may want to change the time that a session can be inactive before a staff account is automatically logged out. Either way, you can customize automatic logout by profile to override the time set in the CLIENT_SESSION_EXP configuration setting.

**Note:** When the SESSION_MANAGEMENT_ENABLED configuration setting is disabled, this profile setting is disregarded.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Profiles**.
   
   The report opens on the content pane.
3. Select the profile you want to edit and click **Open**.
4. Click the **Other** tab to display the Session Timeout field.
   
   The default value of the Session Timeout field is null, meaning that the value specified in the CLIENT_SESSION_EXP configuration setting will be used for automatic logout. Change the null default only if you want to override the value in CLIENT_SESSION_EXP.
5. To exempt staff members associated with this profile from being automatically logged out, enter 0 in the field.
6. To set another value, which will override the value specified in the CLIENT_SESSION_EXP configuration setting, enter the number of minutes in the field.

   **Note:** Even if the value in CLIENT_SESSION_EXP is set to 0, any value other than 0 in the Session Timeout field will be used to automatically log out staff members associated with this profile when the minutes of inactivity have been exceeded.
7. Click **Save**.
8. Repeat this procedure for all the profiles you want to configure for automatic logout.

Login Help Options

You have a number of options that can be added to your application to control login behavior and assist staff members when logging in. You can also add your organization’s branding to the Login window to communicate a message to your staff members.

B2C Service contains an account self-service feature to assist staff members who are having problems logging in. Staff members access this feature using the Login Help link on the Login window.

Using the ACCT_RECOVER_ALT and ACCT_RECOVER_STATUS configuration settings (**RightNow User Interface/Tool Bar/General**), you can configure your application to perform one of the following actions when staff members click Login Help.

- **Open the login procedure in online help**—In addition to providing the steps required to log in, this procedure directs staff members to their organization’s administrator for their login information and explains the default behavior of the account self-service feature.
• **Send staff an email if they have forgotten their user name or password**—This is the default in the ACCT_RECOVER_STATUS configuration setting. When staff members click Login Help, the **Account Self Service** window opens.

Staff members who have forgotten their user name simply enter their email address and click Submit. If their email address is unique, they will receive an email containing their user name. If not unique, they will receive an email telling them to contact their administrator.

Staff members who have forgotten their password select I Forgot My Password. An additional field displays. Staff members must enter their email address and user name. If both email address and user name match what's defined in their staff account, they will receive an email containing a link to the Password Reset page for entering a new password. As a security measure, if either user name or email is incorrect, no email is sent.

**Note:** Use the Accounts email messages ([Site Configuration/Message Templates/Administrator Emails/Accounts](#)) to customize the emails sent to staff members when they have forgotten either their user name or their password.

• **Show alternate message**—If you want to display an alternate message to staff members when they click Login Help, change the value in the ACCT_RECOVER_STATUS configuration setting to 2 and enter your new message in the ACCT_RECOVER_ALT configuration setting.

**How You Add Your Branding on the Login Window**

The Login window is an ideal place for you to communicate a message to your staff.

Using our branding feature, you can include any message content you want when staff members log in to your application. And if your site is configured for multiple interfaces, you can customize each interface’s Login window according to its audience and the message you want to convey.

Two areas can be customized using the following configuration settings. (Expand Site Configuration, double-click Configuration Settings, and then locate **RightNow User Interface/Tool Bar/General**.)

- **BRAND_CONTENT_URL**—Specifies the URL used to display content on the banner area of the **Login** window. The default contains Oracle content announcing releases, webinars, and events.

  **Tip:** Make sure to enter a fully qualified domain name to display the web page you want. Also, the web page must use fully qualified paths to images, or the images will not display.

- **BRAND_WELCOME_MSG**—Specifies the welcome message displayed on the **Login** window. Default is blank.
How You Provide Login Information to Staff Members

You can provide staff members with details about their login activity for the previous sixty days.

The My Account Login Statistics report, located in Common/Site Administration/Staff Management, lists when the staff member last logged in successfully, the IP address of the last successful login, when the last login attempt failed, and the IP address of the last failed login attempt. A drill-down is also available that lists all the unsuccessful login attempts since the last successful login.

<table>
<thead>
<tr>
<th>My Account Login Statistics</th>
<th>Login Activity Since 11/28/2014 12:00 AM</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Account</strong></td>
<td>Nindy Fletcher</td>
</tr>
<tr>
<td>Login Date of Current Session</td>
<td>01/28/2015 01:25 PM</td>
</tr>
<tr>
<td>Last Successful Login Date</td>
<td>01/28/2015 10:15 AM</td>
</tr>
<tr>
<td>Last Successful Login IP Address</td>
<td>10.140.74.199</td>
</tr>
<tr>
<td>Last Unsuccessful Login Attempt Date</td>
<td>01/28/2015 01:05 PM</td>
</tr>
<tr>
<td>Last Unsuccessful Login Attempt IP Address</td>
<td>10.140.74.199</td>
</tr>
</tbody>
</table>

You may also want to add the My Account Login Statistics report to your staff members’ navigation sets. In addition, if you set this report as the default in a navigation list, and that navigation list displays when staff members log in, the report will automatically open on the content pane. In this way, your staff can track their own login activity on a regular basis.

The staff member’s name in the Account column on the My Account Login Statistics report links to the Unsuccessful Login Attempts by Account report, another standard report in B2C Service. While staff members can see their individual
unsuccessful login attempts in this report, you can run the report to see all failed login attempts throughout your system and spot any trends or problems that may exist.

![Unsuccessful Login Attempts Table]

Administration Login Limits

You can control the number of concurrent administration logins per site.

Any range between 1 and 40,000 is allowed, and 40,000 is the default. Limiting the number of allowed sessions per site can help you manage system resources. Contact your Oracle account manager to change the default setting. See Desktop Usage Control to learn about the other ways to manage and control desktop user sessions.

Staff Account Locking

By default, the system locks a staff account after the staff member enters an incorrect password five times.

This measure can help you and your organization maintain site security. You can change any of the password requirements using the Password Configuration editor accessed when you click Configuration on the navigation pane and expand Staff Management. See Configure Staff-Member Passwords.

Related Topics

Login Agreement Functionality

You can distribute a terms of use agreement, a security statement, or any login message you choose to staff members accessing the administration interface.

Your message or statement will display after staff members click Login on the Login window. Staff members must agree to the statement or message before the Service Console or the Agent Browser UI opens. To review or change your message, see the LOGIN_SECURITY_MSG configuration setting (RightNow User Interface/Tool Bar/General).

How You Save Login Credentials

For security purposes, staff members must enter their user name and password each time they log in.
If you want to provide staff members with the option to save their login credentials, enable the `ACCT_ALLOW_REMEMBER_ME` configuration setting (RightNow User Interface/Tool Bar/General). Thereafter, each staff member’s browser control will handle the user’s login credentials using auto complete.

Navigation Sets

Overview of Navigation Sets

Navigation sets control the navigation lists and buttons that staff members see on the navigation pane of the agent desktop.

Every staff member has a profile, and every profile must include a navigation set that all staff members with that profile use when they work in B2C Service. A navigation set is a combination of navigation buttons and their associated navigation lists. If you do not create navigation sets and assign them to profiles, staff members will not have access to navigation buttons and lists.

You can perform any of these tasks:
- Configure navigation sets to provide access to only areas of the system that staff members need to perform their job.

  For example, an agent working in your technical support group probably does not need access to marketing campaigns or sales opportunities. In that case, navigation lists for Campaigns and Opportunities can be left off their navigation sets.

- Create as many navigation sets as your organization needs.

  When you add a profile, you select the navigation set that staff members with the profile will use. The staff members assigned to the profile have access to only those reports and items defined in their profile navigation set unless you allow staff members with that profile to customize their navigation set. See Add or Edit a Profile and How You Customize Navigation and Configuration Lists.

- Add reports and components to the navigation buttons.

  You also can add Quick Search reports to navigation sets to allow searching for contacts, incidents, or other types of records directly from the navigation pane. The first time you open the Navigation Sets explorer, the right side is generally empty because no navigation sets have been created.

After you create navigation sets, the explorer displays the tree structure on the left and navigation sets on the right. The explorer includes options to copy, edit, delete, and rename any navigation set that you create. Public and private reports and dashboards can be added to navigation buttons. However, staff members must have the appropriate Analytics permissions in their profile to open them.
The **Navigation Sets** explorer does not contain standard folders, but you can create custom folders to help keep your navigation sets organized. For information about working with folders, see *Add Folders*. For detailed information about explorer functionality, see *Open the Reports Explorer*.

**Note:** Changes you make to your navigation set on the Service Console will also display on the Agent Browser UI.

To understand how navigation sets, profiles, and staff accounts work together, see *Navigation Sets, Profiles, and Staff Accounts*.

If your installation of Service contains multiple interfaces, also see *Staff Member Accessibility*.

### Create a Navigation Set

Follow this procedure to create a navigation set.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Navigation Sets**. The **Navigation Sets** explorer opens.
3. Click **New**. The Navigation Sets editor opens on the content pane. By default, the File Menu component is selected on the right side of the content pane and New Items displays on the left. When any other component or record type is selected on the right, the left side of the content pane displays Public Reports and Components.
4. To enter information about the navigation set, enter a description in the **Summary** field. You name the navigation set when you save it.
5. To set the options available through the file menu, see *Configure the File Menu*.
6. On the right side of the content pane, select the check boxes next to the types of records or components you want to include in the navigation set. All are selected by default. Separate navigation lists can be created for each type of record or component you select. For example, select the **Incidents** check box to include a navigation list staff members can use when they work on incidents. You cannot clear the check box next to the File Menu component, because the file menu is always available.
7. Click one of the selected record types or components to begin creating a navigation list for the record type or component.

**Note:** Most navigation lists for the navigation buttons you select are initially empty when creating a navigation set. However, the navigation list for the Configuration button is populated with default configuration items. The items in this list can be customized using the same functionality used to customize the other navigation lists. See *Create a Navigation Set for the Administrator*.

8. On the left side of the content pane, expand **Public Reports and Components** and then expand the subfolders to see the available items. If you know the name of a report or component (or part of the name) you want to add to a navigation list, click **Find in List** to search for the item.

**Note:** In addition, you can search for the report based on its ID.

9. To add reports and dashboards to the navigation list do one of the following:
   - Select the reports you want to add from the left column and drag them to the lower portion of the right column.
Double-click or select the reports or components you want to add and click **Add**.

To add more than one item at the same time, press Ctrl while selecting each item.

10. To add explorers to the navigation list, select the navigation item you want to add the explorer to from the right column, expand Components in the left column, expand the folder for the explorer you want to add, and drag it to the lower portion of the right column.

11. To add notifications to the navigation list, expand the Common folder under Components in the left column, select **Notifications**, and drag it into the lower portion of the right column.

   This lets staff members open any notifications they receive. See **Notifications**.

12. To add a folder to the navigation list to help organize items in the list, click **New Folder**.

   a. Enter the name you want for the folder.

   b. Drag explorers, reports, or other items to the folder.

   c. To rename a folder, click the folder, click **Rename**, enter the new name for the folder, and click outside the folder name to save the new name.

13. To set a report, explorer, or other item as the default for this navigation list, right-click it and select **Set As Default**. See **Available Actions from a Navigation or Configuration List**.

   **Note:** The default item for a navigation list opens on login only if the navigation list was the active list when the staff member logged out last time. See **Change Your Navigation Pane Settings** for how staff members can change this behavior.

14. To create a navigation list for each type of record that you want to be available in the navigation set, repeat steps 7 through 13.

15. To choose the order in which the navigation buttons display on the navigation pane, click a record type or component on the upper portion of the right column and click **Move Up** or **Move Down** to position it in the list.

16. To add Quick Search reports to the navigation set, see **Add Quick Search Reports to a Navigation Set**.

17. Click **Save**.

   The **Save As** window opens where you can enter a name for the navigation set in the **Name** field.

18. Click **OK**.

## Configure the File Menu

The file menu, accessed by clicking File next to the ribbon’s Home tab, includes a section on the right for creating records and items. This list is blank until you configure the file menu in navigation sets.

After you've configured it, staff members can click File and use the shortcuts you've added.
If you do not set any options for the **file menu** in the navigation set, staff members with profiles that use that navigation set will not have the option to create items using this shortcut. Also, if you set menu options for items that the staff member’s profile doesn’t grant permission for, those options will not appear in the file menu.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Navigation Sets**.
   - The Navigation Sets explorer opens on the content pane.
3. Right-click the navigation set you want to configure the file menu for and select **Open**.
4. If **File Menu** is not selected at the top of the upper portion of the right column, click it.
5. Expand **New Items** in the left column.
6. Select the items you want to add to the file menu and click **Add**.
   - You can also double-click items to add them. To add more than one item at the same time, press Ctrl while selecting each item.
7. To add a folder to the file menu to help organize menu items, click **New Folder**.
   - a. Enter the name you want for the folder.
   - b. Drag menu items to the folder.
   - c. To rename a folder, select the folder, click **Rename**, enter the new name for the folder, and click outside the folder name to save the new name.
8. To choose the order in which the menu options appear when File is selected, click an item in the lower portion of the right column and then click **Move Up** or **Move Down** to position it in the list.
9. To group menu options, select **File Menu**, expand New Items on the left, and then select **Horizontal Separator** from the bottom of the list.
   - a. Click **Add**.
   - b. Click **Move Up** and **Move Down** to position the horizontal separators.
10. Click **Save**.

### Add Quick Search Reports to a Navigation Set

You can add Quick Search reports to a navigation set so that staff members can access Quick Search from any navigation list on the agent desktop. These reports allow staff members to open records, even with limited information and regardless of the type of record they are working on.
When you create a navigation set, you can define which Quick Search reports appear on the Quick Search drop-down menu on the navigation pane. The same Quick Search menu appears for every navigation button in the navigation set.

**Note:** Remember that staff members can move or hide the Quick Search tool window and other tool windows on the navigation pane. For information about changing what appears on the navigation pane, see *Change Tool Window Visibility*.

B2C Service includes the following predefined Quick Search reports.

- Answer Quick Search
- Asset Search
- Campaign Search
- Contact Quick Search
- Contact Quick Search for Dashboard
- Contact to Channel Type Quick Search
- Document Search
- Incident Search
- Mailing Search
- Outreach Task Search
- Opportunity Search
- Organization Quick Search
- Quick Search Dashboard
- Service Task Search
- Survey Search

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Navigation Sets**.
   
   The Navigation Sets explorer opens.
3. On the right side of the explorer, right-click the navigation set you want to add Quick Search reports to and select **Open**.
4. Do one of the following:
   - If the Quick Search component check box on the upper portion of the right column is cleared, select it.
   - If the Quick Search component check box is already selected, click it.

   You may need to scroll down to locate Quick Search. If any reports are defined, they appear in the lower portion of the right column.

   The Quick Search component is highlighted.
5. On the left side of the content pane, expand the list under Public Reports.
6. Drag a search report from the left column and drop it in the lower portion of the right column.
   
   You can also add search reports by double-clicking them or by selecting them and clicking **Add**.
7. Click **Save**.
Copy a Navigation Set

After you create a navigation set, you can copy it to use as the starting point for another navigation set.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Navigation Sets.
   The Navigation Sets explorer opens.
3. On the right side of the explorer, right-click the navigation set you want to copy and select Copy.
   The Copy As window opens.
4. To add the copied navigation set to a folder, click the folder name.
5. Enter the name of the copied navigation set in the Name field.
6. Click the OK.
   The copy you added appears on the explorer in the folder you selected.

Edit a Navigation Set

After you create a navigation set, you can edit it to meet changing needs. For example, you might want to include additional reports in a navigation set or remove a component from it.

Editing a navigation set used in a profile does not impact staff members who have permission to customize their navigation sets. See How Custom Navigation Sets Work with Profiles.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Navigation Sets.
   The Navigation Sets explorer opens.
3. Right-click the navigation set you want to edit and select Open.
   The navigation set opens on the Navigation Sets editor.
4. Click the record type or component you want to edit. Its navigation list displays in the lower portion of the right column on the content pane.
5. To add a report, explorer, or other item to the navigation list, expand the list of Public Reports or Components, drag the item from the left column, and drop it in the lower portion of the right column.
6. To remove a report or item from the navigation list, right-click it and select Remove.
7. Repeat these steps for each navigation list you want to modify.
8. Click Save.

Delete a Navigation Set

Occasionally, you might want to delete a navigation set that’s no longer required.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Navigation Sets.
   The Navigation Sets explorer opens.
3. Right-click the navigation set you want to delete and select Delete.

   Note: If you try to delete a navigation set used in a profile, a message informs you that deletion is permanent and cannot be undone. If you delete the navigation set, you must edit the profile to select a different navigation set.
A message opens asking you to confirm deletion of the navigation set.

4. Click **Yes** to confirm deletion.

How Custom Navigation Sets Work with Profiles

Custom navigation sets give staff members permission to change the items in their navigation lists.

If you assign the Customize Navigation Sets permission in a profile, it is important that you understand what happens when you edit the navigation set associated with the profile. Some changes you make to the navigation set automatically override changes made by staff members, while other changes have no effect on the navigation set you define.

**Tip:** Staff members can reset their navigation set to their profile default navigation set by accessing their navigation pane settings (File > Options > Navigation Pane), and then selecting the Reset Navigation Set to Profile Default check box. See *Change Your Navigation Pane Settings*.

We recommend that you consider the following implications when updating navigation sets.

- Changing the default navigation set for a profile resets all navigation lists. All personalized navigation lists are removed.
- Changing the profile for a specific staff account removes the staff member’s personalized navigation lists.
- Adding or removing buttons from navigation sets determines what buttons are available on staff members’ navigation sets, even if those staff members have permission to personalize their navigation set. After buttons are added to or removed from navigation sets, the changes are applied to staff members’ navigation sets the next time they log in to the agent desktop.
- Editing navigation sets to add or remove items, such as reports or explorers, from navigation lists, has no effect on staff members’ navigation sets if their profiles include the Customize Navigation Sets permission. To apply the changes to those staff members’ navigation sets, you must edit their profiles and clear the Customize Navigation Sets check box. When you do so, all personalized navigation lists are removed and staff members use the navigation set defined in their profile.

Assign a Navigation Set to a Profile

After you create navigation sets, you assign them to profiles used by your staff members.

You also can assign permission allowing staff members to customize the navigation set to their individual needs.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Profiles**.
   
   The report opens on the content pane.
3. Double-click the profile you want to assign the navigation set to.

   The Profiles editor opens.
4. Click **Search** in the **Navigation Set** field, select the navigation set you want staff members with this profile to use, and click **OK**.
5. To give staff members permission to change the items in their navigation lists, select **Customize Navigation Sets**.

   Staff members with this permission can add reports, dashboards, and explorers to their navigation lists and remove items they do not use. Changes that staff members make to their own navigation set do not impact
other staff members’ navigation sets. However, there are some additional considerations when this permission is granted. For information about the impacts of assigning this permission, see How Custom Navigation Sets Work with Profiles.

6. Click Save.

Staff Management

Overview of Staff Management

Every staff member who accesses or works in B2C Service requires a staff account.

Staff management includes these tasks.

- Creating and editing profiles
- Creating and editing staff accounts
- Assigning permissions
- Configuring staff-member passwords

Before creating a staff account, you must create a profile for that account. Profiles define the products and information staff members can work with when logged in to B2C Service. Staff accounts include staff-member-specific information, such as the account login, phone number, and assigned profile. Staff accounts are organized in folders according to groups defined by job duties or other criteria, though you can also define secondary groupings by manager.

When you create a staff account, you also can specify an initial password, which can later be changed by you or the staff member after log in. You control the requirements passwords must conform to by defining the minimum password length, format, expiration options, and the number of invalid logins allowed.

Profiles

Profiles let you control what areas of B2C Service your staff members can access and what specific actions they can perform in those areas.

Profiles contain general options for Service administration functions and more specific options for each of the products within the system. For example, profiles define whether your staff members can view and edit business rules. They also define whether your agents can respond to customers, assign incidents, conduct chat sessions in B2C Chat, and perform other activities.

Navigation sets and custom workspaces are associated with profiles on the Profiles editor. While creating and using custom workspaces is optional, navigation sets must be created and associated with profiles before you add staff accounts. Otherwise, staff members will not have access to any records, reports, or components. See Overview of Navigation Sets and Overview of Workspaces.

You may decide to define your profiles based on the structure of your organization. For example, you may want separate profiles for administrators, managers, agents, sales representatives, marketing personnel, and knowledge engineers. After you create profiles, you can add staff accounts and assign a profile to each account.
Create the following items before adding profiles.

- **Navigation sets**—Profiles without navigation sets do not allow access to reports and other components. See Create a Navigation Set.
- **Custom workspaces (optional)**—If you use custom workspaces, we recommend creating them before creating profiles so you can assign workspaces to specific profiles. See Create a Workspace.

**Add or Edit a Profile**

Use this procedure to add or edit a profile.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Profiles**.
   The report opens on the content pane, listing the profiles that have already been created.
   
   **Tip:** If a profile already exists that is similar to the profile you want to create, you can copy the existing profile and edit the copy to create the new profile.
3. To add a profile, click **New**.
   The Profiles editor opens.
4. To edit an existing profile, double-click the profile.
5. Enter the name of the profile in the **Name** field.
   When you move to another field on the content pane, the name you type is automatically added to the Label field.
6. From the Interfaces section, select the check boxes next to the interfaces you want the profile to access under the Access column.
7. If your site has multiple interfaces, click the interface you want to configure the profile for. The permissions granted for the first interface you configure are also granted for all other interfaces the profile can access.
8. Click **Search** under the Navigation Set column to specify the navigation set you want to use for the profile. The Select Navigation Set window opens.
   a. Select the navigation set from the list.
   b. Click **OK**.
9. To allow the staff accounts associated with the profile to customize their navigation set, select **Customize Navigation Sets** check box.
10. By default, standard workspaces are selected in new profiles. To assign custom workspaces or workflows to the profile, click the **Search** icon next to the workspace you want to change. The Workspaces / Workflows window opens.
    a. Select the workspace you want to use.
    b. Click **OK**.

   **Note:** If you do not assign a workspace to a browser editor slot, the workspace or workflow from the non-browser editor will be used. If the non-browser editor row is blank, the standard desktop console workspace will be used.
11. To grant access to add-ins that are installed on the site, click the **Agent Desktop Add-Ins** tab.

   **Note:** Options on this tab are active when add-ins are installed using the Add-in Manager.

   a. To let staff members with this profile install add-ins on their workstations without uploading the add-in to the server, select **Developer Access**.
      This option lets developers test add-ins without the add-ins being downloaded to other staff members' workstations. Add-ins must be placed in subdirectories of the `%APPDATA%`/
RightNow_Technologies/your_site/version/Users/profile_number/AddIns directory. Each add-in must be contained in a separate subdirectory.

b. To let staff members with this profile use add-ins, select the check boxes next to the add-ins they can access.

12. To grant access to Agent Browser UI extensions that are installed on the site, click the **Agent Browser UI Extensions** tab.

   **Note:** Options on this tab are active when extensions are installed using the Add-in Manager.

   a. To let staff members with this profile use extensions, select the check boxes next to the extensions they can access.

13. To grant access to installer options, click the **Deployment** tab.

14. To change the automatic logout setting for staff members with this profile, click the **Other** tab and enter a value (in minutes) in the **Session Timeout** field.

15. To create a profile for external users to have collaboration-only access, click the **Other** tab and select the **External User** check box.

   Service Collaboration must be enabled for this check box to appear.

16. To set the .NET browser control to run in IE11 emulation mode rather than the default IE7 mode, click the **Other** tab and select the **Set Browser Controls to use IE11 emulation mode** check box. Contact your Oracle account manager to enable this option if you are a new customer.

   A warning message appears indicating that this option will change the registry key of the user’s computer so .NET browser controls in the B2C Service application will use IE11 emulation mode, and that the option should be thoroughly tested before used in production. Click **Yes** to continue with this option. Agents must log out and log in again for the registry key to be set.

   **Note:** If the **Set Browser Controls to use IE11 emulation mode** check box has been previously selected, but is cleared, a warning will be shown indicating that once set, the registry will need to be manually cleared.

   In addition, the **Open Pop-ups in New Browser Control** and **Send URL as Post Data** options in workspaces should be cleared, and **No Application** should be selected.

17. To grant permissions to the profile, click **Permissions**.

   The Profiles Permissions editor opens displaying a number of tabs.

   **Note:** See **Set Profile Permissions** to learn about the tabs, and how to use the available options to assign permissions to a profile.

18. To view an audit log of changes made to the profile, click **Audit Log**.

19. To add notes to the profile, click **Notes**.

20. Click **Save**.

Set Profile Permissions

Using the tabs on the Profile Permissions editor, you can assign various administrative, read, edit, and delete permissions to staff members’ profiles.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, double-click **Profiles**, and then double-click the profile you want to edit.
   The Profiles editor opens.
3. Click **Permissions**.
   The Profile Permissions editor opens.
4. Click the tabs to access options and assign permissions.

Administration Permissions

The Administration tab is the default tab on the Profile Permissions editor. By enabling options on this tab, you can grant staff members permissions related to administrative functions of the system.

You can give permission to configure staff accounts and distribution lists, create and edit agent scripts, access business process settings, and add and edit business rules. Hover over the permissions on this tab to view the product areas the permissions impact.

**Organization Permissions**

The Organizations tab lists the possible Service, Outreach, and Opportunities states for organizations. It defines permissions for the staff members with this profile to read, edit, or delete organizations that are in the selected states.
The state of an organization can be manually set by staff members when adding or editing an organization, or automatically by the system based on how the organization was added. For example, an organization that has been added while creating an incident defaults to the Service state.

There are seven states:

- Service
- Outreach
- Opportunities
- Opportunities and Outreach
- Service and Outreach
- Service and Opportunities
- Service and Opportunities and Outreach

When you define the permissions by state on the Organizations tab, consider which staff members should be able to take actions on organizations in the various states. For example, you might give agents read and edit access to organizations in any state that includes Service. However, you may decide that you do not want them to delete any organizations in the Service and Opportunities, Service and Outreach, and Service and Opportunities and Outreach states.

### Contacts Permissions

The Contacts tab lists the possible Service, Outreach, and Opportunities states for contacts. It defines permissions for the staff members with this profile to read, edit, delete, or move contacts that are in the selected states.

Staff members can manually set the state of a contact when adding or editing a contact record, or automatically by the system based on how the contact was added. For example, a contact who enters the system needing customer support would initially be classified in the Service state. If the contact expresses interest in a sales product and an opportunity is created, the contact’s state changes to Service and Opportunities.

</tr>
</tbody>
</table>
| Pull Policy                               | Click this drop-down menu to select a pull policy that determines the queues that incidents are retrieved from and their order. The pull policies include:  
  Manual—Lets staff members manually pull incidents from any queues available to them, allowing them to select a particular queue. Incidents are pulled from the selected queue in order of due date.  
  Strict priority—Uses the priority ranking of the available queues to determine which queue to pull incidents from, starting with the highest ranking queue. Incidents are pulled from this queue until the staff member's pull quantity is met, the staff member's inbox limit is met, or the queue is empty. If the queue is empty before the staff member's pull quantity is met, then incidents are pulled from the queue with the next highest priority ranking.  
  First due—Uses the incident due date to determine which incidents to retrieve, pulling incidents that are nearest to their due date first. Incidents are pulled from all the staff member's available queues in the order of due date until the staff member's pull quantity is met, the staff member's inbox limit is met, or all queues are empty. Queue ranking does not affect the pull order. |
| Pull Quantity                             | Enter the number of incidents to be retrieved from the queues at one time when a staff member with this profile pulls incidents. The maximum pull quantity is 99.                                                                                                                                 |
| Inbox Limit                               | Enter the number of incidents that can be in a staff member's inbox at one time. The maximum inbox limit is 999.                                                                                                                                                                                                                           |
| Pull From Single Round Robin Logged In Queue | Select this check box to specify that staff members with this profile will be assigned new incidents from the same round-robin logged-in queue in which the most recently solved incident originated. When the check box is not selected, all round-robin logged-in queues are considered when assigning incidents.  
This setting has no effect when staff members manually pull incidents using the Fill Inbox feature. |
| Advanced Routing - Incident Queues        | Click to select the advanced routing incident queue you want to be available for this profile, and click +. After selecting a queue, click the drop-down menu to designate it as Primary or Overflow and its order of priority. The queue can be moved up or down in the queue list. If needed, you can then select additional advanced routing incident queues to associate with this profile.  
Pull policy must be set to strict priority or first due for advanced routing of incidents.  
Advanced routing must be enabled for this option to appear. |

</tr>
</tbody>
</table>
Custom Objects Permissions
You must specify permissions for your staff members to read, delete, and perform other actions on custom object records.

All deployed custom objects are listed on the Custom Objects tab of the Profiles editor and are organized by the package they are contained in. Similar permissions can be granted for each object, though the Notes permissions are available only for objects with a notes field. Permissions can also be specified when editing custom objects on the Object Designer.

Note: Custom objects must be enabled for this tab to appear. Contact your Oracle account manager.

Using B2C Service

Chapter 2

Core Features

---

**Field** | **Description**
---|---
**Analytics** | These options define the analytics permissions for staff members with this profile.
**Select All** | Select this check box to select all check boxes in the Analytics section.
**Create/Edit Reports** | Select this check box to let staff members with this profile create custom reports and edit custom reports they have access to. This permission is required to open the Reports explorer.
**Customize Reports** | Select this check box to let staff members with this profile customize a report after it has been generated. This permission is required to access Analyze options on the Reports explorer ribbon.
**Create/Edit Public Reports** | Select this check box to let staff members with this profile create and edit public reports and create public folders on the Reports explorer.
**Modify Inline Report Editing** | Select this check box to let staff members with this profile create reports with inline editing. This permission also lets staff members edit data inline on the Agent Browser UI.
**Print/Export/Forward Reports** | Select this check box to let staff members with this profile print, export, and forward reports.
**Create/Edit Schedules** | Select this check box to let staff members with this profile create and edit schedules for reports and dashboards.
**Create/Edit Custom Scripts** | Select this check box to let staff members with this profile create and edit report custom scripts. **Note:** Submit a Service Request if you don’t see this check box and need to create or edit custom scripts.

---

**Related Topics**

- Custom Object Types

**Analytics Permissions**

Options on the Analytics page determine the reports that staff members with this profile can access for each available interface.

You also can assign access to the analytics features, such as creating custom reports and dashboards.

If you are unable to perform certain actions on a report or dashboard, the cause may be that you lack the Analytics permissions needed to perform the actions.
### Field | Description
--- | ---
**Administrator** | Select this check box to give staff members with this profile administrator all analytics permissions. This permission is required to edit standard reports. By selecting this check box, all other check boxes are automatically selected.

**Reports** | The options in this section let you select which reports staff members with this profile can run and edit. Custom folders that do not contain reports do not display in the list of reports.

**All** | Select this check box to let staff members with this profile Open or Edit all folders.

**Open** | Select this check box to let staff members with this profile run the reports in each folder. You can expand report folders to select individual reports.

**Edit** | Select this check box to let staff members with this profile edit the reports in each folder. You can expand report folders to select individual reports.

**Search** | Select this option to search for a report. This feature is useful for finding a report and setting its permissions.

---

### Staff Accounts Editor

Use the Staff Accounts editor to perform a variety of staff-management tasks.

The editor enables you to perform these tasks.

- Add staff members
- Assign staff members to profiles
- Group staff members according to level, department, area of expertise, manager, or other categories that apply to your organization

#### Note:
These grouping options help you route incidents and opportunities to the appropriate group and to report on groups of staff members that share similar job duties or the same manager.

- Configure and manage staff-member passwords

### Configure Staff-Member Passwords

You can enhance your staff members' password security by specifying options that can prevent repeated invalid login attempts, set password length and character requirements, and expiration details.

#### Note:
You must configure staff member passwords before adding staff accounts.
Password configuration is an important part of security for your organization and for your application. To learn about the tools you can use for password security, see Password Protection. Also see How You Recover Forgotten Passwords and How You Secure Customer Passwords.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Password Configuration**. The Password Configuration editor opens on the content pane.
3. Enter field information to configure password requirement settings.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login Requirements</td>
<td>This section contains the option to establish a limit on invalid login attempts.</td>
</tr>
<tr>
<td>Number of Invalid Logins</td>
<td>Drag the slider to the number of failed login attempts you want to allow before the system locks out the account. Alternately, enter the number you want in the field to the right of the slider. A value of 0 disables this function. The default value is 5. Only administrators possessing the Groups/Accounts/Distribution Lists profile permission can unlock a staff account. After a successful login, the invalid login count is reset to 0.</td>
</tr>
<tr>
<td>Password Expiration</td>
<td>This section contains options to customize time periods that affect password expiration. If the Password Expires check box is cleared for a particular staff account, it overrides any password expirations defined in the password configuration settings.</td>
</tr>
<tr>
<td>Expiration Interval</td>
<td>Drag the slider to the number of days that passwords stay in effect. Alternately, enter the number you want in the field to the right of the slider. After adding a staff account or updating the account password from the Staff Accounts editor or the Change Password window, the expiration date value is reset. A value of 0 turns password expiration off. The default value is 90.</td>
</tr>
<tr>
<td>Grace Period</td>
<td>Drag the slider to the number of days after the password expires in which staff members can enter a new password and still be allowed to log in. Alternately, enter the number you want in the field to the right of the slider. After the grace period ends, staff members’ accounts are locked, and you must reset the expiration date or the password. The default value is 14.</td>
</tr>
<tr>
<td>Warning Period</td>
<td>Drag the slider to the number of days before the password expires in which staff members will be alerted to the approaching expiration date. Alternately, enter the number you want in the field to the right of the slider. During the warning period, staff members can log in normally and are notified of the number of days until the current password expires. The default value is 7.</td>
</tr>
<tr>
<td>Password Requirements</td>
<td>This section contains options to customize the format of staff account passwords and limit their reuse.</td>

<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Length</td>
<td>Drag the slider to the minimum number of characters required for a staff account password. Alternately, enter the number you want in the field to the right of the slider. The default value is 8. Password length cannot exceed 20 characters.</td>
</tr>
<tr>
<td>Character Repetitions</td>
<td>Drag the slider to the maximum number of consecutive repeated characters permitted in a password. Alternately, enter the number you want in the field to the right of the slider. For example, if Character Repetitions is set to 2, then a password such as 11011011 would be allowed, but 1110000 would not be allowed. The default value is 2.</td>
</tr>
<tr>
<td>Character Occurrences</td>
<td>Drag the slider to the maximum number of times a character can be used in a password. Alternately, enter the number you want in the field to the right of the slider. For example, if Character Occurrences is set to 2, then a password such as 10123456 would be allowed, but 10101234 would not be allowed. The default value is 2.</td>
</tr>
<tr>
<td>Lowercase Characters</td>
<td>Drag the slider to the minimum number of lowercase characters required in a password. Alternately, enter the number you want in the field to the right of the slider. The default value is 1.</td>
</tr>
<tr>
<td>Uppercase Characters</td>
<td>Drag the slider to the minimum number of uppercase characters required in a password. Alternately, enter the number you want in the field to the right of the slider. The default value is 1.</td>
</tr>
<tr>
<td>Special Characters</td>
<td>Drag the slider to the minimum number of special characters required in a password. Alternately, enter the number you want in the field to the right of the slider. The default value is 1.</td>
</tr>
<tr>
<td>Numbers and Special Characters</td>
<td>Drag the slider to the minimum number of special characters, including numbers, required in a password. Alternately, enter the number you want in the field to the right of the slider. The default value is 1.</td>
</tr>
<tr>
<td>Number of Previous Passwords</td>
<td>Drag the slider to the number of passwords that will be stored in memory for each staff account. Alternately, enter the number you want in the field to the right of the slider. Staff members cannot use any of the currently stored passwords when changing passwords. The default value is 10.</td>
</tr>
</tbody>
</table>

4. Click **Save**.
Add or Edit a Staff Account

When you add a staff account, you define the login information for the staff member and associate a profile with the staff member.

The following items must be created or configured before creating staff accounts.

- Profiles. See Profiles.
- Password security options. See Configure Staff-Member Passwords and Password Protection.
- Staff account custom fields (optional). If you use staff account custom fields, we recommend creating them before creating staff accounts. See Custom Field Types.

When adding or editing a staff account, you can also define a name for the staff member to display in Chat and a signature for responding to incidents. The Staff Accounts editor is also where you enter the default country and currency.

A staff member can send S/MIME (Secure Multipurpose Internet Mail Extensions) email using a signature, encryption, or both. To send encrypted S/MIME email, the staff member must be issued a certificate that is then uploaded to the staff account. Certificates can be obtained from an authorized certification authority and must contain the staff member’s email address. To send signed S/MIME email, the Envelope From/Bounce Address of the outgoing email must be a mailbox address (rather than an individual staff member email address) that includes a certificate and a private key. See How SMIME Security Works.

Note: You can only add 100,000 accounts and you cannot create a duplicate account with the same login credentials.

1. Click Configuration on the navigation pane.
2. Expand Staff Management, and double-click Staff Accounts by Group (or another Accounts report). The report opens on the content pane, listing the accounts that have already been created.

By default, the standard Accounts reports (Staff Accounts by Group, Staff Accounts by Manager, and Staff Accounts by Profile) display only active accounts and accounts that have been temporarily disabled. Accounts that have been permanently disabled are not displayed. To change the accounts displayed, click Search and select the accounts you want to view. When displayed on the report, temporarily disabled accounts are shown in italic text and permanently disabled accounts are displayed in gray text.

3. Do one of the following:
   - To add a staff account, click New.
   - To edit a staff account, double-click the account on the report.

The Staff Accounts editor opens.

4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Assistant Account</td>
<td>This read-only check box is selected if the staff account has been designated as the virtual assistant. Only one staff account can represent the virtual assistant. For this check box to display, your site must be integrated with Virtual Assistant.</td>

<tr>
<td>Invalidate Password</td>
<td>Select this check box to invalidate the staff member’s password. Selecting this check box also disables the Change Password button. Staff members without a valid password can reset their password from the Login Help link on the Login window. The Invalidate Password check box remains selected until the staff member resets the password. After the password has been reset, the check box is automatically cleared.</td>
</tr>
<tr>
<td>*Display Name</td>
<td>Enter a name for the staff member to be displayed in email communications and to customers during a chat session.</td>
</tr>
<tr>
<td>Phone Number</td>
<td>Enter the phone number of the staff member in this field.</td>
</tr>
</tbody>
</table>
## Field | Description
--- | ---
*Profile* | Click the **Search** icon next to this field to open the **Profiles** window. Select the profile you want to associate with this staff member and click **OK**.

*Group* | Click the **Search** icon next to this field to open the **Account Groups** window where you assign the staff member to a group.

Disabled | Click this drop-down menu to define whether the staff account is disabled. You can choose from the following options.
- **Not Disabled**—Select this option to make the account available for assignment to incidents and other types of records and to display the account in report filters. This is the default option.
- **Disabled from Assignment**—Select this option to exclude the account from being assigned to incidents and other types of records.
- **Disabled from Assignment/Report Filters**—Select this option to exclude the account from being assigned to incidents and other types of records and from appearing in report filters.
- **Permanently Disabled**—Select this option to permanently disable the account. Accounts that are permanently disabled display in reports but cannot be re-enabled. The user name of a permanently disabled account cannot be used for a different staff account.

If an employee leaves your organization, we recommend disabling the employee's staff account instead of deleting it. When staff accounts are deleted, they no longer display in reports and are not available for use in custom reports used to track staff account actions.

Account Locked | Select this check box to temporarily lock the staff account. You might choose to do this if, for example, a staff member takes a leave of absence. This check box is also selected automatically if a staff member has exceeded the number of invalid logins. Clear the check box to unlock the staff account.

*Default Currency* | Click this drop-down menu to select the currency you want to associate with the staff account. The United States dollar (USD) is the only currency option in this menu until you add others through the Currencies editor.

Time Zone | Click this drop-down menu to select the account time zone.

This drop-down menu is unavailable for accounts with any of the following permissions selected for their profile: Administration, Incident Add/Edit, Incident Send Response, Incident Delete, or SLA - Add/Disable/Delete.

If you wish to change the time zone associated with this staff member’s location, contact your Oracle account manager to have the option enabled. (Note that the option should not be enabled if you are using SLAs.)
<table>

<tbody>
<tr>
<td><strong>Default Country</strong></td>
<td>Click this drop-down menu to select the country associated with this staff member.</td>
</tr>
<tr>
<td><strong>Territory</strong></td>
<td>Click this drop-down menu to select the sales territory associated with this staff member.</td>
</tr>
</tbody>
</table>
| **External Screen Pop Port** | Enter the port number that the system will listen on for external screen pop requests.  
                               | This field displays only if the EXT_CONSOLE_WS_ENABLED configuration setting is enabled on the Configuration Settings editor.  
                               | The EXT_CONSOLE_WS_PORT configuration setting defines the port value for all staff members. However, if a value is specified in the External Screen Pop Port field, that value overrides the value specified in EXT_CONSOLE_WS_PORT. |
| **Email Address**        | Enter the staff member’s email address. This is required to receive scheduled reports and system notifications. |
| **Email Notifications**  | Click this drop-down menu to select the email notifications the staff member receives when an event occurs, such as an incident being assigned. The following options are available.  
                               | **No Notifications**—Select this option to prevent email notifications from being sent to the staff member.  
                               | **Short Notification Once**—Select this option to send a brief email notification when an event occurs and the staff member is not logged in. Subsequent events do not trigger additional notifications until the staff member logs in and logs out again.  
                               | **Detailed Notification Once**—Select this option to send a detailed email notification when an event occurs and the staff member is not logged in. Subsequent events do not trigger additional notifications until the staff member logs in and logs out again.  
                               | **Detailed Notification Always**—Select this option to send a detailed email notification for every event that triggers a notification, not just the first one. When this option is selected, the staff member receives email even when logged in. |
| **Email Signature**      | Enter a signature for the staff account to be appended to incident responses.                           |
| **User Can Customize**   | Select this check box to let the staff member customize the email signature. When staff members who have this permission access options from the file menu (File > Options > Personal Settings), they can enter their own signature in the Email Signature field. |
| **S/MIME Account Certificate** | Click the Folder icon to locate the file containing the public S/MIME account certificate.  
                               | The certificate must contain the email address of the staff account. |
5. To assign the staff account to a manager, click **Department**. See [Organize Staff Members by Manager](#).

   The Department editor can also be used to assign staff accounts to groups. In addition, the page displays other staff members assigned to the same group and manager.

6. To define custom field information, click **Custom Fields**.

   The **Custom Fields** editor opens. Any staff account custom fields created in your application will display.

7. To enter channel information, click **Channels**.

8. To view a log of changes that have been made to the staff account, click **Audit Log**.

9. Click **Save**.

**Assign a Staff Account to a Group**

Every staff account you create must be assigned to a group.

When deciding how to group your staff members, you should plan how you want them organized for reporting. For example, groups can be based on a specialty area of agents or the region of sales representatives.

1. Click **Configuration** on the **navigation pane**.
2. Expand **Staff Management**, and then double-click **Staff Accounts by Group** (or another Accounts report).
3. Double-click the staff account you want to assign to the group.
4. Do one of the following:
   - Click the Search icon next to the account Group field.
   - Click the Department tab on the ribbon and click the Search icon next to the Group field.

   The Account Groups window opens.
5. To assign the account to an existing group, select the appropriate group. Staff members with the Profiles permission enabled on the Administration tab can change group assignments by dragging staff accounts from the open report to the Group folders on the left side of the report.

6. To assign the account to a new group, click New Group and enter a name for the group.
7. To change the display order of the groups, select the group you want to move and click the up or down arrow.
8. To rename a group or add a description to a group, right-click the group and select Edit. The Edit Group window opens.
   a. Enter the name you want for the group in the Label field.
   b. Enter notes or other information you want regarding the group folder in the Description field.
   c. Click OK.
9. To delete a group, right-click the group, select Delete, and click OK to confirm the deletion message. You can delete only those groups that do not have associated staff accounts.

10. Click OK to close the Account Groups window.
11. Click the Save to save the changes to the staff account and group.

Sort the Staff Accounts in a Group
You can change the ordering of groups displayed in group lists or of staff accounts displayed in groups, such as in report filters.

1. Open a staff account in the group you want to sort.
2. Click Department on the ribbon.

   All staff members in the account’s group display in the Staff in Group list. See Organize Staff Members by Manager for information about the Departments editor.
3. Click Sort above the Staff in Group list. The Sort Staff in Group window opens.
   a. Select the option next to the sort option you want to use.
      - Sort by First Name, Last Name—Select this option to sort the accounts in the group by first name, starting with first names beginning with A.
      - Sort by First Name, Last Name (reversed)—Select this option to sort the accounts in the group by first name, starting with first names beginning with Z.
      - Sort by Last Name, First Name—Select this option to sort the accounts in the group by last name, starting with last names beginning with A.
      - Sort by Last Name, First Name (reversed)—Select this option to sort the accounts in the group by last name, starting with last names beginning with Z.
   b. Click OK.
4. To customize the sort order, select an account you want to move in the Staff in Group list and click the up or down arrow.
5. Click Save.

Organize Staff Members by Manager
You can organize staff members in a manager hierarchy, listed beneath their managers or team leads.

You create the manager hierarchy, which is used in Opportunity Tracking, and can also be used to help you better report on the performance of managers and their staff. You can create up to twelve levels of accounts in the hierarchy.
Tip: You can also view accounts in the manager hierarchy using the standard Staff Accounts by Manager report (Public Reports/Common/Site Administration/Staff Management).

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Staff Accounts by Group** (or another Accounts report).
3. Double-click the account you want to assign to a manager.
4. Click **Department** on the ribbon. The Departments editor opens where you can specify the account group and manager hierarchy. You can also view lists displaying the other staff members in the same group and the manager hierarchy.

**Note:** Staff groups can be managed on the Department page. See **Assign a Staff Account to a Group** for information about creating and editing groups and adding and ordering staff accounts in groups. Staff members with the Profiles permission on the Administration tab can change group assignments by dragging staff accounts from the open report to the Group folders on the left side of the report.

5. Click the **Search** icon next to the Manager field. The Account Manager Hierarchy window opens.
6. Select the manager you want to assign the account to.
7. Click **OK**.
8. Click **Save**.

Delete a Staff Account

Like other types of records in B2C Service, you also can delete staff accounts. However, it is important that you understand what happens when you delete them.

Staff accounts that are deleted are completely removed from your site. They no longer display in reports and are no longer available for use in custom reports you use to track the actions of staff accounts. For this reason, when an employee leaves your organization, we recommend disabling the account instead of deleting it.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Staff Accounts by Group** (or another Accounts report).
3. Select the staff account you want to delete.
4. Click **Delete**. A message asks you to confirm the deletion.
5. Click **Yes** to delete the staff account.

Customizable Menus

Overview of Customizable Menus

Customizable menus help you develop logical, consistent ways to organize objects such as contacts, incidents, tracked links, and sales products in ways that are most useful to your organization.

When you customize drop-down menus, you increase the likelihood of an organized, accurate, and up-to-date knowledge base, which is essential for providing an exceptional customer experience. The available customizable menu items on your navigation pane depend on the B2C Service products that are enabled on your site, your navigation set, and your profile permissions.
Keeping your knowledge base organized and up-to-date is an important way to provide superior customer service. When you create custom drop-down menus with the exact options you need, staff members can classify incidents and answer using those options, and customers can select specific product and category for community posts and to refine their searches for answers. Both customers and staff members benefit from the flexibility that results when you classify incidents and answers in ways that make the most sense for your organization.

**Note:** The Customizable Menus tree contains a System Menus folder, containing default menu items, and a Custom Menus folder, which you can use to create menu items for menu-only custom object. If custom objects is not enabled on your site, the tree will not contain any folders and only the default menu items will be listed in the tree. Contact your Oracle account manager to enable custom objects. See [Add a Custom Object Menu Item](#).

Select a customizable menu item to learn how to add and edit it.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Win/loss reasons</td>
<td>Identify win/loss reasons to determine what contributes to the outcome of opportunities.</td>
</tr>
</tbody>
</table>

## Add or Edit a Country or Province

Adding countries and provinces to the knowledge base helps maintain accurate address information.

Because the countries and provinces appear in drop-down menus when staff members enter contact and organization information, consistent names and abbreviations for unfamiliar countries are guaranteed. You can also define format masks to require that staff members use the same format when entering phone numbers and postal codes.

The United States is automatically included, and you can add any other country where you have contacts and organizations. Provinces cannot be added independently, but must be associated with the appropriate country. You can
add them when you add the country or at a later time when you edit the country. When staff members enter an address and select a country, the State/Prov field contains a drop-down menu of the states or provinces associated with that country.

You can also delete countries and provinces on the Countries editor by clicking Delete. When you delete a country or province, any contacts and organizations that were associated with that country or province no longer have a country or province association.

1. Click **Configuration** on the **navigation pane**.
2. Expand **Internationalization**, and then double-click **Countries**.
3. The Countries tree displays on the **content pane**.
   - Do one of the following:
     - To add a country, click **New** to display the editor.
     - To edit a country, click it in the tree.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Select a country from the Country/ISO Code list at the top of the editor or enter the name of the country in the field.</td>
</tr>
<tr>
<td><strong>Abbreviation</strong></td>
<td>When you select a country from the list on the editor, the Abbreviation field is populated with the 2- or 3-digit abbreviation the country uses. This may or may not be the same as the ISO code for the country, which appears in parentheses after the name in the list of countries. If you entered a country name instead of selecting one from the list, the country does not have an ISO code. As a result, the Locate Address button next to the Address field on a contact, organization, or incident is disabled.</td>
</tr>
<tr>
<td>Phone Mask</td>
<td>Enter a mask to restrict what staff members can enter in the phone number field.</td>
</tr>
<tr>
<td>Phone Code</td>
<td>Enter the international phone code for the country.</td>
</tr>
<tr>
<td>Postal Mask</td>
<td>Enter a mask that restricts what staff members can enter when they enter postal codes for contacts in this country.</td>
</tr>
</tbody>
</table>

5. To add a province, click **Add** (in the Provinces section on the right side of the editor), and then enter the province name in the Name field.
6. To edit the name of a province associated with the country you are editing, select the province name and enter the new name. You can move provinces within the list using the up and down arrows next to the **Provinces** list.
7. Click **Save**.

**Related Topics**
- Input Masks
Add or Edit an Organization Address Type

Organization address types let you maintain multiple addresses for the organizations in the knowledge base.

The default address types are Billing and Shipping. When your organization needs other address types, you can add as many as you need. For example, you might find it useful to have an international address type or a headquarters address type.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Click the arrow next to the System Menus folder to expand the list.
4. Select Organization Address Types to display the editor.
5. Do one of the following:
   - To add an address type, click New.
   - To add a new address type directly under an existing address type in the tree, select the existing address type and click New.
   - To edit an address type, click it in the tree.
6. Enter a name for a new address type or edit an existing name in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. Click Save.

You can delete any address type except Billing by selecting it and clicking Delete.

CAUTION: When you delete an organization address type that has been used in an organization record, this action deletes all address data previously associated with that address type.

Add or Edit a Contact Type

Using contact types, you can organize the contacts in your knowledge base into classifications that are important to your organization.

When staff members add or edit contacts, they can select the contact type from the menu options you add. You might want to add contact types that reflect the position of a contact, such as manager, buyer, agent, and assistant. Or you could add contact types that reflect a contact's function with respect to your organization, such as technical expert, decision maker, and reference.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder to view the list.
4. Click Contact Types to display the editor.
5. Do one of the following:
   - To add a contact type, click New.
   - To add a new contact type directly below an existing contact type in the tree, select the existing contact type and click New.
To edit a contact type, click it in the tree.

6. Enter a name for a new contact type or edit an existing name under the Label column. The corresponding field under the Label column in the Interface Visibility section is populated or revised as you type.

7. Click Save.

Add or Edit a Price Schedule

Multiple price schedules provide greater flexibility for pricing sales products.

You may price a sales product differently for preferred customers, or you may have various price schedules for customers in different countries.

Because products in the product catalog can have an associated price schedule, you should add price schedules before you add sales products.

Note: The Delete option is not available for price schedules that are associated with sales products. If you want to delete a price schedule associated with a sales product, first edit the sales product to remove the price schedule association.

1. Click Configuration on the navigation pane.
2. Expand Sales in the configuration list, and then double-click Price Schedules. The Price Schedules tree displays on the content pane.
3. Do one of the following:
   - To add a price schedule, click New to display the editor.
   - To edit a price schedule, click it in the tree.
4. Enter field information.

<table>
<thead>
<tr>

Add or Edit a Sales Product

When you add sales products, you define the product catalog used to create quotes and Offer Advisor promotions and suggestions.

You also add sales product to use as customer asset.

You can enable or disable sales products, establish visibility, add identification fields, enter product descriptions, associate price schedule, associate a product, and enter custom field values. Since sales products can be associated with price schedules and service products, you should add price schedules and service products first.

Note: If you try to delete a sales product that is used in an Offer Advisor promotion by selecting it in the tree and clicking Delete, a dependency conflict window opens and notifies you that deletion is not allowed.

1. Click Configuration on the navigation pane.
2. Expand Sales in the configuration list, and then double-click Product Catalog.
   The Product Catalog tree displays on the content pane.
3. Do one of the following:
   - To add a sales product, click New to open the Product Details editor.
   - To edit a sales product, click it in the tree.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Product Name</strong></td>
<td>Enter the sales product name. The item name in the Product Catalog tree on the left side of the content pane and the corresponding field in the Label column in the Interface Visibility section are populated or revised as you type.</td>
</tr>
<tr>
<td>ID</td>
<td>Enter an identifier for the sales product in this field. This can be a catalog number, product name, or any other identifier your organization wants to use.</td>
</tr>
<tr>
<td>Suggestion Exclude</td>
<td>Select this check box to exclude the sales product from being automatically suggested to a customer through Offer Advisor. If cleared, the product is eligible for suggestion to customers who match Offer Advisor purchase history data.</td>
</tr>
<tr>
<td>Disabled</td>
<td>Select this check box to prevent the sales product from displaying when creating a quote, promotion, or customer asset or from being available as a suggested product in Offer Advisor.</td>
</tr>
<tr>
<td>Sales Catalog</td>
<td>Select this check box to make the sales product available for use in Opportunity Tracking and Offer Advisor. If cleared, or if the Disabled check box is selected, the sales product will not be available in Opportunity Tracking or Offer Advisor.</td>
</tr>
</tbody>
</table>

### Add a Price Schedule to a Sales Product

Price schedules provide an additional method for classifying information about sales products, but their use is optional.

If you do not create price schedules or add them to sales products, the sales products are not available to staff members creating quotes. Only those products associated with the selected price schedule can be used in a quote.

1. Click **Configuration** on the navigation pane.
2. Expand **Sales** in the configuration list, and then double-click **Product Catalog**.
The Product Catalog tree displays on the content pane.

3. Click a product in the tree to open the Product Details editor.
4. Click New to the right of Price Schedules.
   A row is added to the table.
5. Click the Price Schedule drop-down menu and select a price schedule.
6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Price</td>
<td>Double-click this field and enter a price.</td>
</tr>
<tr>
<td>Currency</td>
<td>This read-only field is determined by the price schedule you select.</td>
</tr>
<tr>
<td>*Start Date</td>
<td>Click each month, day, and year component of this date field and enter an effective start date for the price schedule. Or click the calendar and select a date. When you add a price schedule, this field is populated with the current date.</td>
</tr>
<tr>
<td>End Date</td>
<td>This read-only field is blank if you select only one price schedule for the sales product. However, if you add the same price schedule with a different price, the start date for the later-starting price schedule becomes the end date for the earlier-starting price schedule.</td>
</tr>
<tr>
<td>Notes</td>
<td>Enter any notes you want to add to the price schedule.</td>
</tr>
</tbody>
</table>

7. Click Save.

Add a Custom Object Menu Item

After menu-only custom objects are created and deployed, you can add them in Customizable Menus.

You add custom object menu items through the Custom Object Menu editor.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the Custom Menus folder.
4. Select a custom menu item in the tree.
   The Custom Object Menu editor opens on the content pane.
5. Click New.
   The new menu item is added to the Custom Object Menu editor.
6. Enter a name for the menu item.
7. Click Save.
Edit a Custom Object Menu Item

After menu-only custom objects are created and deployed, you can copy, edit and delete them in Customizable Menus.

You edit, copy and delete custom object menu items through the Custom Object Menu editor.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the Custom Menus folder to view the list.
4. Select a custom menu item in the tree.
   The Custom Objects Menu editor displays on the content pane.
5. To change the display sequence of a menu item, select it in the tree and click the up or down arrow next to the Label column.
6. To rename a menu item, select it on the editor and enter the new name.
7. To copy a menu item, select it on the editor and click Copy.
8. To delete a menu item, select it on the editor and click Delete.

How You Organize Information with Products, Categories, and Dispositions

When you use products and categories to group incidents and answers, your knowledge base is more organized. As a result, staff members and customers can quickly find answers to their questions.

For example, a company that manufactures and sells cellular phones might add products such as Smart Phones, Camera Phones, and Accessories. Categories might include Technical Specifications and Warranty Information.

Products and categories organize data in the same ways, and you can choose to use either or both when you configure Service. If you use both, incidents and answers can be organized into specific classifications, and customers can search for answers using product and category filters. Customers can select specific products and categories to refine community posts and searches. You can create up to six levels each of products and categories and specify the number of levels agents must enter when working with incidents. Although products and categories are powerful options for keeping the knowledge base well organized, you are not required to use them.

An incident's disposition refers to the way the incident is ultimately solved. You may want to require that agents select a disposition before they save an incident when they change the status to Solved. Dispositions do not appear on the customer portal.

Incident dispositions can provide important information and insight about your organization's interactions with customers. You can add as many dispositions as you need, and you can also add sub-levels of dispositions to a total of six levels. For example, you might have a top-level disposition of Sent to Regional Billing. With additional levels, you can organize incidents into specific sub-dispositions such as East Coast, Midwest, Rocky Mountain, and Pacific Northwest. Service lets you define the number of disposition levels agents must select before marking an incident solved.

Perform these tasks to configure product, categories, and dispositions.

- Define levels of products, categories, and dispositions on the administration interface—Set the number of product, category, and disposition levels you want to require on the administration interface.
Using B2C Service

Chapter 2
Core Features

• **Define levels of products and categories on the customer portal**—Set the number of product and category levels you want to require customers to select on the Ask a Question and community pages.

• **Add products, categories, and dispositions**—Add the products and categories you want to use for grouping answers and incidents in the knowledge base. The products and categories you add appear to staff members who work with answers and incidents on the *content pane*. They also appear on the customer portal for customers to use when searching for and subscribing to answers and using the community. Add dispositions so agents can indicate how an incident was ultimately resolved.

• **Link products to categories**—To restrict category selections to only the categories associated with a selected product, enable and configure *product-category linking*. Product-category linking affects staff members working with incidents and customers searching on the customer portal.

• **Link products to dispositions**—To restrict staff member selection of dispositions based on the incident’s product, enable and configure *product-disposition linking*.

**Related Topics**
- Product Linking

**Specify the Number of Required Product Levels for Incidents**

You can use up to six levels of products, categories, and dispositions to classify incidents and answers in the knowledge base.

By creating subproducts, for example, you can let your customers further refine their searches. This also lets staff members classify incidents and answers more precisely. If you have created multiple levels of products, categories, and dispositions, you can also define the number of levels that staff members are required to select on the administration interface.

**Note:** Although this procedure describes how to configure the number of product levels on an incident workspace, follow these same steps to define the Minimum Level value for the Category and Disposition fields.

1. Click **Configuration** on the *navigation pane*.
2. Expand **Application Appearance**, and then double-click **Workspaces**.
   The Workspaces explorer displays on the *content pane*.
3. Right-click the custom incident workspace where you want to specify the number of product levels and select **Open**.
   You cannot edit the standard incident workspace, but you can copy it and edit the copied workspace.
4. Select the **Product** field on the design space.
5. Click **Minimum Level** on the ribbon’s Design tab and enter the number of required product levels.
   Allowed values range from 0 to 6.
6. Click the **Save** icon on the Quick Access Toolbar.
7. Assign this workspace to the applicable **profile**. See *Profiles* if you need help with this process.

**Search Optimization Using Products, Categories, and Dispositions**

Customers can use products and categories to narrow their search results on the customer portal.

Because the search results are filtered on the *customer portal* through these classifications, the search finds answers and community entries that are more likely to resolve customers’ questions. Likewise, agents can search for incidents and answers based on products and categories when responding to incidents. They can also classify incidents and answers when they work on them by selecting products and categories, thereby increasing the organization of information within the *knowledge base*. 
Note: For Knowledge Advanced customers, the lists of products and categories available to content authors depend on how items are configured in Knowledge Advanced. See Category and Product Visibility for Knowledge Advanced Authors for more information.

Before you add products and categories, take some time to plan how you want use them to organize incidents and answers. For example, if you have many products that share a common set of support issues, you might want to add a top-level product name to group them instead of using individual product names. Or you might want to add subproduct levels to further filter the products. Top-level products and categories classify incidents and answers in broad groupings, but you can add five more levels of subproducts and subcategories to further refine classification.

When agents classify incidents according to their disposition, your knowledge base contains the information you need to understand how incidents have been closed. Additional levels of subdispositions let you further refine the classification of incidents.

The following procedures describe working with products, but the procedures to add and edit categories and dispositions are identical. Simply replace product information with category or disposition information where appropriate.

- Add or Edit a Product
- Add a Subproduct
- Edit Visibility Settings for Multiple Products Simultaneously

Add or Edit a Product
Add or edit a product to narrow customer search results on the customer portal.

The following procedure describes working with products, but the procedures to add and edit categories and dispositions are identical. Simply replace product information with category or disposition information where appropriate.

1. Click Configuration on the navigation pane.
2. Expand Service, and then double-click Products/Categories/Dispositions. The content pane displays separate columns for products, categories, and dispositions.

   Note: By default, the editor displays all three columns, indicated by the highlighted Products, Categories, and Dispositions buttons in the Show group on the ribbon. To hide one or more columns, click the associated button so that it is no longer active. The column is removed from the editor until you click the button again or until you close and reopen the editor.

3. Do one of the following:
   - To add a product, click in the Products column and click New. The New Product window opens.
   - To edit a product, right-click it and select Edit.

   Tip: To add a product at the same level as a selected product, right-click the product and select Add Sibling. To add a subproduct, right-click and select Add Child.

4. Enter the name of the product in the Name field.
   The word you enter in the Name field is a keyword for all answers associated with this product. When customers search by the product name, all answers associated with this product are returned.

5. To make the product visible to staff members working with incidents, select Administration.
   Regardless of interface or visibility settings, all service products and categories are visible when adding or editing answers on any interface.
6. To make the product visible to customers on the customer portal, select **End-user**. (The End-user check box is not available when adding or editing dispositions.)

Selecting the visibility settings for a parent level does not automatically set the same settings for the parent sublevels. Visibility must be set individually for each. You can also make subproducts visible even if the parent product is not visible.

**Note:** For Knowledge Advanced customers, visibility of products and categories depend on how items are configured in Knowledge Advanced. See *Category and Product Visibility for Knowledge Advanced Authors* for more information.

7. To enter a description for the product, click **Description** and enter it in the **Description** field.

8. Click **Save**.

   The product appears in the Products column.

### Add a Subproduct

Add a subproduct to narrow customer search results on the customer portal.

The following procedure describes working with products, but the procedures to add and edit categories and dispositions are identical. Simply replace product information with category or disposition information where appropriate.

1. Click **Configuration** on the navigation pane.

2. Expand **Service**, and then double-click **Products/Categories/Dispositions**.

   The **content pane** displays separate columns for products, categories, and dispositions.

   **Note:** By default, the editor displays all three columns, indicated by the highlighted Products, Categories, and Dispositions buttons on the Show group on the **ribbon**. To hide one or more columns, click the associated button so that it is no longer active. The column is removed from the editor until you click the button again or until you close and reopen the editor.

3. Do one of the following:
   - Right-click the product you want to add the subproduct to and select **Add Child**.
   - Select the product you want to add the subproduct to and click **New > Child** on the **ribbon**.

   The **New Product** window opens.

4. Enter the name of the subproduct in the **Name** field.

5. To enter information about the subproduct, click **Description** and enter it in the **Description** field.

6. Select each visibility check box where you want the subproduct to appear.

7. Click **Save**.

   The subproduct appears below the product you added it to.

   **Note:** You can also define a subordinate relationship by dragging one product and dropping it onto another product. See *Change the Order of a Product, Category, or Disposition*.

### Edit Visibility Settings for Multiple Products Simultaneously

Edit product visibility for staff members and customers for multiple products simultaneously.

The following procedure describes working with products, but the procedures to edit categories and dispositions are identical. Simply replace product information with category or disposition information where appropriate.

1. In the Products column, press Ctrl while selecting each product.

2. Click **Edit**.

   A multi-edit window opens.
3. Select **Visibility**.
4. To make the products visible to staff members working with incidents, select the **Administration** check box. Regardless of interface or visibility settings, all service products and categories are visible when adding or editing answers on any interface.
5. To make the products visible to customers on the **Customer Portal**, select the **End-user** check box. The End-user check box is not available when editing the visibility of dispositions.
6. Click **Save**.

### Change the Order of a Product, Category, or Disposition

You can reorder products, categories, and dispositions as necessary, including creating subordinate relationships.

You cannot move an item when another item of the same type is open on the editor. For example, if you are editing a product, you cannot move any other product until you close the product editor.

The following procedure describes working with products, but the procedures to reorder categories and dispositions are identical. Simply replace product information with category or disposition information where appropriate.

1. Click **Configuration** on the **navigation pane**.
2. Expand **Service**, and then double-click **Products/Categories/Dispositions**.
3. Select the product you want to move and hold down the mouse button or other pointing device.
4. Drag it to its new position in the Products column. If you want to make the product a subproduct of another product, drag it onto the other product.
5. Release the mouse button.

### What Happens When You Delete Products, Categories, and Dispositions

You can delete products, categories, and dispositions that do not have sublevels.

When deleting a product or other item that has sublevels, you must delete all of the sublevels first. You also cannot delete multiple products, categories, or dispositions simultaneously.

You do not receive a dependency conflict warning when you delete products, categories, or dispositions used in rules. Rules that use the deleted item may no longer function as expected, requiring you to edit the rules and reactivate the rule base. See **Add a Rule**.

In addition, you do not receive a dependency conflict warning when deleting products or categories that are used in answers. Answers that are associated with deleted products or categories may not display as expected. We recommend viewing the **Answers by Category** and **Answers by Product** reports before deleting products or categories that may be associated with answers.

### Delete a Product That Has Subproducts

When deleting a product or other item that has sublevels, you must delete all of the sublevels first.

The following procedure describes working with products, but the procedures to delete categories and dispositions with sublevels are identical. Simply replace product information with category or disposition information where appropriate.

**Note:** You do not receive a dependency conflict warning when you delete products, categories, or dispositions used in rules. Rules that use the deleted item may no longer function as expected, requiring you to edit the rules and reactivate the rule base. See **Add a Rule**. In addition, you do not receive a dependency conflict warning when deleting products or categories that are used in answers. Answers that are associated with deleted products or categories may not display as expected. We recommend viewing the **Answers by Category** and **Answers by Product** reports before deleting products or categories that may be associated with answers.
1. Expand the highest product level to display all subproducts.

2. Do one of the following:
   - Right-click each subproduct and select **Delete**.
   - Click **Delete** on the ribbon.

   A message asks you to confirm each deletion.

3. Repeat these steps until all subproducts have been deleted.

### Product Linking

If your organization has large numbers of categories or dispositions, staff members and customers must review long lists of menu items to find appropriate options. You can simplify their choices with product linking.

When **products** are linked to **categories**, only the linked categories are displayed when customers select products on the **customer portal** or when staff members select products while working on incidents. When products are linked to **dispositions**, only the linked dispositions are displayed when agents select products for incidents. Product linking is a powerful tool for enhancing efficiency for both staff members and customers.

**Note:** When product links have not been defined or product linking has been disabled, all categories and dispositions are available, regardless of the selected product. Product-category linking is independent of product-disposition linking, so you can enable one or the other or both.

Leaf products are those products that do not have any subproducts. Similarly, leaf levels of categories have no subcategories and leaf-level dispositions have no subdispositions. Links can be created only between leaf levels of products and categories and between leaf levels of products and dispositions. However, implicit linking occurs between the parent levels of products, categories, and dispositions that are linked. Parent products implicitly contain the same links that the leaf products below them contain. In other words, a parent product’s links are “inherited” from their leaf products.

Assume, for example, you want to link a leaf-level product called Prepay to categories, and the Prepay product is a subproduct of Call Plans. Also assume that none of the other leaf products under Call Plans have category links.

When you edit the Prepay product and select **Category Links**, assume you select the General category, which creates two links, one to each of its leaf categories: Information and Help. Also assume you select Account and Billing, which is a leaf category (no subcategories).

When you save your links, return to the Products/Categories/Dispositions editor, and drill down on the Category-Links report, you see the three categories you just linked to the Prepay product. For example,

```
Account and Billing
General > Help
General > Information
```

Although you linked the leaf product, Prepay, to the categories, its parent product (Call Plans) was implicitly linked to the same categories. So even though you cannot directly link a parent product to categories, you implicitly link it by linking one or more of its leaf products.
How You Link Products, Categories, and Dispositions

Service can automatically create links to categories and dispositions based on answers and incidents in the knowledge base, or you can manually define the links for each product.

When you manually link products, you can select and link products one at a time or you can select multiple products to link in one operation.

Note: The greater the number of products, categories, and dispositions your organization uses, the more flexibility product linking can offer. However, this requires you to carefully consider how you link products to categories and dispositions. If you create too many links, you risk losing the efficiency product linking offers. If you create too few, you may prevent customers and staff members from selecting the appropriate category or disposition.

Use the following procedures to link products with categories and dispositions.

- Create Links Automatically
- Create Links for One Product at a Time
- Create or Remove Links for Multiple Products Simultaneously
- Link Categories to Products
- Link Dispositions to Products

Create Links Automatically

Create product-category and product-disposition links automatically.

CAUTION: This action replaces all product-category and product-disposition links (including any you have created manually) with the automatically created links. Carefully review this procedure before creating links automatically.

1. Click Configuration on the navigation pane.
2. Expand Service, and then double-click Products/Categories/Dispositions.
   The top levels of products, categories, and dispositions are listed in columns on the editor.
3. To create product-category links automatically, click Auto-Build and select Product-Category Links.
   A message opens to tell you that you cannot use the editor during the linking process and that all existing product-category links will be deleted.
4. Click Yes to continue.
   This schedules the automatic linking process for the next time Dbstatus runs (which happens every fifteen minutes). The editor is inactive until the Auto-Build process is complete, so you cannot edit products, categories, or dispositions during that time.
   A link is created for every product-category combination of leaf products and leaf categories associated to answers in the knowledge base. In other words, in any given answer, every leaf product associated with the answer is linked to every leaf category associated with the answer.
5. To create product-disposition links automatically, click Auto-Build and select Product-Disposition Links.
   A message opens to tell you that you cannot use the editor during the linking process and that all existing product-disposition links will be deleted.
6. Click Yes to continue.
   This schedules the automatic linking process for the next time Dbstatus runs (which happens every fifteen minutes). The editor is inactive until the Auto-Build process is complete, so you cannot edit products, categories, or dispositions during that time.
A link is created for every product-disposition combination of leaf products and leaf dispositions associated to incidents in the knowledge base that were created within the last thirty days. In other words, every leaf product associated with an incident is linked to every leaf disposition associated with the incident.

To edit the automatically generated list of product links, see Create Links for One Product at a Time and Create or Remove Links for Multiple Products Simultaneously.

Now that you have created links, you must enable product linking for them to take effect. See Enable Product Linking.

Create Links for One Product at a Time
Create category and disposition links for one product at a time.

1. Click Configuration on the navigation pane.
2. Expand Service, and then double-click Products/Categories/Dispositions.
3. In the Products column, identify the product you want to link.
   a. To view subproducts under a product, click the + sign next to a product to expand it.
   b. To find a product, click Find and enter a search term in the Find window. The first product that matches your search term is highlighted in the tree. To continue searching, click Find Next.
   
   Note: Remember that you can link categories and dispositions only to products that are leaf products. If the product you select has subproducts, the Category Links and Disposition Links buttons are disabled on the product editor.
4. Right-click the product you want to link and select Edit.
   The product editor opens.
5. To create category links, click Category Links. The category tree displays on the content pane.
   a. Select the check boxes for each category you want to link to the product. If you select a category that has subcategories, all subcategories are linked to the product. If you select a subcategory, all levels of its parent category are implicitly linked.
   b. Click Save.
6. To create disposition links, click Disposition Links. The disposition tree displays on the content pane.
   a. Select the check boxes for each disposition you want to link to the product. If you select a disposition that has subdispositions, all subdispositions are linked to the product. If you select a subdisposition, all levels of its parent disposition are implicitly linked.
   b. Click Save.

Now that you have created links, you must enable product linking for them to take effect. See Enable Product Linking.

Create or Remove Links for Multiple Products Simultaneously
Create or remove category and disposition links for multiple products simultaneously.

1. Click Configuration on the navigation pane.
2. Expand Service, and then double-click Products/Categories/Dispositions.
3. On the Products/Categories/Dispositions editor, select the first product you want to link.
4. Press Ctrl while selecting additional products.
5. After selecting the last product, right-click and select Edit.
   The multi-edit window opens.
6. To create or remove category links, click Category Links.
Note: Although you can select top-level products on the editor, linking occurs only with leaf-level products. If you want to create links for all of a top-level product's leaf products, you must select each of the leaf products separately instead of selecting only the top-level product. Because linking occurs only between leaf-level products, categories, and dispositions, the links you create while multi-editing do not apply to any top-level products you select, but only to the leaf-level products you select. However, after you have created links to leaf products, the parent product is implicitly linked.

a. To link categories to the selected products, select the check boxes for each category you want to link in the Add Categories column.

b. To remove category links from the selected products, select the check boxes for each category you want to remove the link from in the Remove Categories column.

c. Click Save.

7. To create or remove disposition links, click Disposition Links.

a. To link dispositions to the selected products, select the check boxes for each disposition you want to link in the Add Dispositions column.

b. To remove disposition links from the selected products, select the check boxes for each disposition you want to remove the link from in the Delete Dispositions column.

c. Click Save.

Now that you have created links, you must enable product linking for them to take effect. See Enable Product Linking.

Link Categories to Products

Product linking is bidirectional. Besides linking products to categories, you also can link categories to products.

1. Click Configuration on the navigation pane.
2. Expand Service, and then double-click Products/Categories/Dispositions.
3. In the Categories column, right-click the category you want to link and select Edit.

You must select a leaf category (that is, one that has no subcategories). If you select a category that has subcategories, the Product Links button on the editor is disabled.

The category editor opens.

4. Click Product Links.

The products tree displays on the content pane.

5. Select the check boxes for the products you want to link to the category.

If you select a product that has subproducts, all subproducts are linked to the category. If you select a subproduct, all levels of its parent product are implicitly linked.

6. Click Save.

Now that you have created links, you must enable product linking for them to take effect. See Enable Product Linking.

Link Dispositions to Products

Product linking is bidirectional. Besides linking products, you also can link dispositions to products.

1. Click Configuration on the navigation pane.
2. Expand Service, and then double-click Products/Categories/Dispositions.
3. In the Dispositions column, right-click the disposition you want to link and select Edit.

You must select a leaf disposition (that is, one that has no subdispositions). If you select a disposition that has subdispositions, the Product Links button on the editor is disabled.

The disposition editor opens.

4. Click Product Links.

The products tree displays on the content pane.
5. Select the check boxes for the products you want to link to the disposition.
   If you select a product that has subproducts, all subproducts are linked to the disposition. If you select a subproduct, all levels of its parent product are implicitly linked.

6. Click **Save**.

Now that you have created links, you must enable product linking for them to take effect. See *Enable Product Linking*.

### Enable Product Linking

Enable product-category or product-disposition linking when you want to restrict the display of categories or dispositions to only those that are linked to the selected product.

Product-category linking affects agents working with incidents and customers searching on the customer portal. Enable product-disposition linking when you want to restrict the dispositions agents can select when working with incidents to only those associated with the product they have selected.

Product-category linking and product-disposition linking are independent, so they are enabled separately. You can enable either or both types of linking.

1. Click **Configuration** on the navigation pane.
2. Expand Service, and then double-click Products/Categories/Dispositions.
3. To enable product-category linking, click **Enable > Product-Category Linking**.
4. To enable product-disposition linking, click **Enable > Product-Disposition Linking**.
5. Log out and then log back in for the changes to take effect.

### Disable Product Linking

Even after you have created product links, you can disable the product-linking feature.

When the feature is disabled, staff members can select any product-category and any product-disposition combination when they work with incidents. On the customer portal, customers can select any product-category combination when they conduct a search or request notifications.

1. Click **Configuration** on the navigation pane.
2. Expand Service, and then double-click Products/Categories/Dispositions.
3. To disable product-category linking, click **Enable** and clear the **Product-Category Linking** check box.
4. To disable product-disposition linking, click **Enable** and clear the **Product-Disposition Linking** check box.
5. Log out and then log back in for the changes to take effect.

### Copy Product Links

If you want a product to have the same category or disposition links as another product, simply copy the category links or disposition links from the original product, and those links are applied to the product you are editing.

If you want to copy both category and disposition links, you must copy them each separately as described in the following procedure.

1. Click **Configuration** on the navigation pane.
2. Expand Service, and then double-click Products/Categories/Dispositions.
3. Do one of the following:
   - Right-click the product you want to copy links to and select **Edit** to open the product editor.
   - To select multiple products press Ctrl, right-click, and select **Edit** to open the multi-edit window.

4. Do one of the following:
   - To copy category links, click **Category Links** on the ribbon.
   - To copy disposition links, click **Disposition Links** on the ribbon.
5. Click **Copy Links From** on the ribbon. The **Copy Links from Product** window opens.

6. If necessary, expand the product tree to display the product you want to copy links from.

7. Select the product you want and click **OK**.

8. Click **Save**.

   **Note:** If the product you are editing already has existing links, these links are not removed by copying links from another product. Instead, the product now contains both its original links as well as the copied links.

### Remove a Link

There may be times when you want to remove product-category or product-disposition links, such as when your organization modifies dispositions as a result of a business process change.

You can manually remove product links one at a time. You can also remove multiple product links in one operation using the multi-edit mode, described in *Create or Remove Links for Multiple Products Simultaneously*.

1. Click **Configuration** on the navigation pane.
2. Expand **Service**, and then double-click **Products/Categories/Dispositions**.
3. Right-click the product you want to remove links from and select **Edit**.
4. To remove category links from the product, click **Category Links**.
   a. To remove all category links from the product, click **Remove All Links**.
   b. To remove specific category links, clear the check boxes for the categories you no longer want to link to this product.
      All associated implicit links are also cleared.
   c. Click **Save**.
5. To remove disposition links from the product, click **Disposition Links**.
   a. To remove all disposition links from the product, click **Remove All Links**.
   b. To remove specific disposition links, clear the check boxes for the dispositions you no longer want to link to this product.
      All associated implicit links are also cleared.
   c. Click **Save and Close**.

### Product Linking When Working with Answers

Regardless of whether product linking is enabled or of what categories are linked to products, all products and all categories are available on the Products/Categories tab when you add or edit an answer.

When you select a product that has subproducts (including one or more levels of subproducts), all subproducts below the product you selected are also selected, all the way down to the leaf level. Any parent product levels are also selected implicitly. As these images show, selecting CA 9900 automatically selects that product’s subproducts. It also implicitly selects the two parent levels: Conversa Phones and Mobile Phones.
There may be times when you want to associate an answer with a top-level product but you do not want to associate that product’s subproducts with the answer. In that case, you can right-click the product to select it without selecting any of the subproducts. Instead of a check mark next to the product, you will see the check box filled in with the color green, as shown in the following figure, where the Conversa product is selected but its subproducts are not.

The ribbon for the standard answer workspace contains a Validate Category Links button that lets you determine if the products and categories you selected for the answer are linked. If the categories you selected are linked to selected products, a message informs you that all selected categories are linked to at least one selected product. If you select one
or more categories that are not linked to the products you selected, a message lists the categories that are not linked to any of the selected products.

**View a Product Report**

You can view product, category, and disposition reports on the Products/Categories/Dispositions editor.

This procedure describes how to display a product report, but the procedure is the same for viewing category and disposition reports.

1. Click **Configuration** on the navigation pane.
2. Expand **Service**, and then double-click **Products/Categories/Dispositions**.
3. Select the product for which you want to view a report.
4. Click **Product Reports** and select one of the available options: Visibility, Answers, Incidents, Category Links, orDisposition Links.
   - The report displays on the lower part of the editor.
5. To see the answers, incidents, or category or disposition links associated with the product, click the value in the Answers column.
   - A list of all records or links is displayed.
6. To minimize the report, click the icon with two down arrows next to the Undock icon at the far right of the report header.
7. To display the same report for a different product, select the product and click **Refresh** in the report header (not Refresh on the ribbon).
8. To copy information in a report column (for example, to copy an incident reference number so you can search for the incident), right-click the item and select **Copy Cell to Clipboard**.

You can also view reports when you’re editing an individual product, category, or disposition. The reports are available as buttons on the editor ribbon.

The following reports are available for products.

- **Visibility**—Shows the product and all subproducts with check marks in the **Admin** and **End-user** columns that indicate where the product is visible on each interface.
- **Answers**—Shows the product, including any subproducts, and the number of answers associated with each. You can then drill down on the number of answers to view all answers associated with the specific product.
- **Incidents**—Shows the product, including any subproducts, and the number of incidents associated with each. You can then drill down on the number of incidents to view all incidents associated with the specific product.
- **Category Links**—Shows the number of category links for the selected product. (If the selected product is a parent product, category links are displayed for each of the subproducts that is linked to a category.) You can drill down on the number of links to view the category links for each product.
- **Disposition Links**—Shows the number of disposition links for the selected product. (If the selected product is a parent product, disposition links are displayed for each of the subproducts that is linked to a disposition.) You can drill down on the number of links to view the disposition links for each product.

The following reports are available for categories.

- **Visibility**—Shows the category and all subcategories with check marks in the **Admin** and **End-user** columns that indicate where the category is visible on each interface.
- **Answers**—Shows the category, including any subcategories, and the number of answers associated with each. You can then drill down on the number of answers to view those answers.
• **Incidents**—Shows the category, including any subcategories, and the number of incidents associated with each. You can then drill down on the number of incidents to view those incidents.

• **Category Links**—Shows the number of product links for the selected category. You can drill down on the number of links to view the products linked to each category.

The following reports are available for dispositions:

• **Visibility**—Shows the disposition and all subdispositions with check marks in the Admin column that indicate where the disposition is visible on each interface. (Dispositions are not visible on the customer portal so End-user visibility is not an option.)

• **Incidents**—Shows the disposition, including any subdispositions, and the number of incidents associated with each. You can then drill down on the number of incidents to view those incidents.

• **Disposition Links**—Shows the number of product links for the selected disposition. You can drill down on the number of links to view the products linked to each disposition.

### How Incident Statuses Work

The four default incident statuses may be enough for your organization. However, if additional incident statuses can help you better organize the incidents in the knowledge base, you can add them.

An incident’s status is its state in the *knowledge base*. Service has four default incident statuses: Solved, Unresolved, Updated, and Waiting. Additionally, there are three default *status types*, which are Solved, Unresolved, and Waiting. These are displayed in the drop-down menu in the Status column on the editor. Not surprisingly, the Solved incident status uses the Solved status type. Likewise, the Waiting status uses the Waiting status type, and the Unresolved status uses the Unresolved status type, which is also used by the Updated status. You can rename the default statuses, but you cannot change their types, which are disabled on the Incident Statuses editor. The following list describes the default incident statuses.

• **Solved**—The incident has been resolved.

• **Unresolved**—The incident has been recently added, either by an agent or a customer.

• **Updated**—The incident has been updated by a customer through the Your Account page or by replying to an agent’s email.

• **Waiting**—An agent has responded to the incident and is waiting for a response from the customer. If the customer does not respond within the time specified in CI_HOURS (Agedatabase Utility > Batch Processing > Close Incidents), *Agedatabase* sets the incident status to Solved.

Service can automatically set an incident’s status when agents send a response. This is a property of the Incident Thread relationship item that can be set when you create an incident *workspace*. The property is called Status Change on Response, and you can set it for one of the following options:

• The status does not change when an agent sends a response.

• The status changes to Waiting.

• The status changes to Solved.

For information about setting properties for relationship items on workspaces, see *Overview of Workspace and Script Elements*.

The four default incident statuses may be enough for your organization. However, if additional incident statuses can help you better organize the incidents in the knowledge base, you can add them. When you add an incident status, you must assign it to one of the three default status types.
Note: If you delete a custom incident status, all incidents set to that status are changed to the default status with the same status type. For example, if you delete a custom incident status with the status type Solved, all incidents that were associated with that status are changed to the Solved incident status with the Solved status type.

Add or Edit an Incident Status

If necessary, you can add a new incident status or edit an existing one.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree displays on the content pane.
3. Expand the System Menus folder.
4. Click Incident Statuses to display the editor.
5. Do one of the following:
   - To add an incident status, click New.
   - To add a new incident status directly below an existing incident status in the tree, select the existing incident status and click New.
   - To edit an incident status, click it in the tree.

You can change the names of the default incident statuses, but the functionality of each remains the same. Incidents with the same status type behave the same way, regardless of their name.

6. Enter a name for a new incident status or edit an existing one in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. Click the Status drop-down menu and select a status type. Options include Unresolved, Solved, and Waiting.
   After you save an incident status, you cannot change its status type.
8. Click Save.

Add or Edit an Incident Severity Level

Your organization might find it useful to classify incidents by their severity level so that agents can resolve the highest severity incidents first.

Additionally, reports that include incident severity can be useful management tools.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder.
4. Click Incident Severities to display the editor.
5. Do one of the following:
   - To add an incident severity, click New.
   - To add a new incident severity directly below an existing incident severity in the tree, select the existing incident severity and click New.
   - To edit an incident severity, click it in the tree.

6. Enter a name for a new incident severity or edit an existing one in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. If you do not want the incident severity to be visible on the interface, clear the Visible check box.
How You Route Incidents to Queues

Using incident rules, you can route unresolved incidents to different queues based on the criteria you define.

For example, you might add incident queue for different product lines or service areas. Or you might have a first tier for basic customer service and additional tiers for problems of increasing complexity. When you create profile for staff accounts, you can assign one or more queues to each profile and specify how incidents are pulled from that queue. Based on their profile, agents can retrieve a specified number of incidents from the queues to which they have access.

Queues also help you manage incident escalation to meet your organization's service level agreements (SLA (service level agreement)), balance agent workload, and track agent productivity and efficiency.

You can perform any of these tasks when managing queues.

### Task | Description
--- | ---
Add queues | You can select a default queue to which all new incidents are automatically routed, and you can add multiple incident queues for effective incident routing. See Add or Edit an Incident Queue.
Assign queues to profiles | You can define available queues, queue ranking, pull policy, pull quantity, and inbox limit for staff members with the profile. See Profiles.
Create business rules to populate queues | You can create business business rules to automatically assign incoming incidents to incident queues based on conditions you specify. Incident rules have a Set Field/Queue ID action you can use to route queues based on the conditions of the rule. See Add a Rule.
Instruct agents about queues | Agents can manually pull incidents from queues assigned in their profile. When agents log out, the unresolved incidents in their inbox remain there unless they assign them back into a queue. See Reassign or Re-Queue an Incident.
Monitor queues | Agents can monitor queuing statistics through the Queues report, where queued incidents and statistics are displayed. Queue statistics can be regenerated at any time. See How You Monitor Incident Queues.

### Add or Edit an Incident Queue

When adding an incident queue, you can define whether the queue uses a round-robin incident assignment and specify the queue as the default queue where unassigned incidents are routed.

You can also delete queues from the Incident Queues editor.

Before you can access incident queues, your profile for Service permissions must allow incident queues. In addition to queue access, Service permissions also define queue rank, pull policies and quantities, and inbox limits. See Service Permissions.
Note: If you try to delete an incident queue that is used in a business rule, a window opens to display the rules that depend on the queue. Before you can delete the incident queue, you must first edit the rules so they no longer use the queue.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder.
4. Click Incident Queues to display the editor.
5. Do one of the following:
   - To add an incident queue, click New.
   - To add a new incident queue directly below an existing incident queue in the tree, select the existing incident queue and click New.
   - To edit an incident queue, click it in the tree.
6. Enter a name for a new incident queue or edit an existing one in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. Click the Queue Type drop-down menu and select one of the following options: Standard, Round Robin (All), or Round Robin (Logged In).
   Note: A round-robin queue automatically assigns incidents in this queue to agents in a rotating fashion. For example, if four agents are assigned to the round robin queue, incidents are assigned in this order: Agent 1, Agent 2, Agent 3, Agent 4, Agent 1, Agent 2, and so on. If you select Round Robin (All), incidents are assigned to all staff members whose profile includes the queue, even if they are not logged in.
8. To designate the queue for use with advanced routing of incidents, select the Advanced Routing option and enter the following field information. Advanced Routing must be enabled for this option to appear.
   The Advanced Routing settings are described in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting Minimum Score</td>
<td>Enter a value from 0 to 5 for each skill. Incoming chats will be first routed to those agents meeting this score.</td>
</tr>
<tr>
<td>Lowest Minimum Score</td>
<td>Enter a value from 0 to 5 for each skill. Only agents meeting this minimum skill level can be assigned chats from this queue.</td>
</tr>
<tr>
<td>Relax Score Requirement After</td>
<td>Enter a value in seconds for the queue. The score requirement will be relaxed after the time you specify. Skills are relaxed at the queue level. A value of 0 seconds disables skill relaxation.</td>
</tr>
<tr>
<td>Score Decrement Amount</td>
<td>Enter the score value from 1 to 5 for each skill to be decremented when it meets the relaxation time.</td>
</tr>
<tr>
<td>Overflow Timer</td>
<td>Enter a value in seconds after which the chat will be routed equally to agents assigned the queue as a primary or an overflow. Overflow will be disabled if this field is set to 0, and only agents assigned the queue as a primary will receive chats from this queue.</td>
</tr>
</tbody>
</table>

9. If you want this incident queue to be the default queue, select the Default check box.
Only one queue can be the default queue. If a default queue has already been identified and you select the default check box for this queue, this queue becomes the default.

10. Click **Save**.

### How You Monitor Incident Queues

Staff members with the appropriate permissions can monitor incident queues using the Queues report. Depending on their profile, this report may appear in any navigation list designated by the administrator.

![Queues report](image)

The Queues report lets staff members drill down to display the agents who are currently handling incidents and the incidents themselves. For a real-time snapshot of all queues at any time, click **Refresh**.

### How You Organize Answer Statuses

An answer’s status controls whether or not it’s public, and describes its state in the knowledge base.

If you want to organize the answers in the knowledge base with a greater level of classification than that offered by the default answer statuses in Service, you can add more answer statuses.

Service provides four default answer statuses, described in this list. Every answer status is associated with a status type that is either Public or Private.

- **Private**—The Private answer status prevents answers from being displayed on the administration interface and the customer portal. It is associated with the Private status type.

- **Proposed**—Answers with the Proposed status are incidents that agents have submitted as potential answers for the knowledge base. Proposed answers are associated with the Private status type.

- **Public**—Answers with the Public status are visible on the customer portal. Public answers have a Public status type.

- **Review**—The Review answer status means the answer should be evaluated to determine if it is still necessary. An answer’s status is set to Review when it has been part of the knowledge base for a specified amount of time or when its solved count reaches zero. See *Solved Count Aging*. Answers with a Review status are associated with a Private status type by default.

**Note:** If you delete a custom answer status, all answers with that status are changed to have either a Public or Private status, depending on the status type of the deleted answer status. For example, if you delete a custom answer status with a Public status type, all answers that were associated with that status are changed to Public status with the Public answer status type.
Add or Edit an Answer Status

You can add a new answer status or edit an existing one.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder.
4. Click Answer Statuses to display the editor.
5. Do one of these:
   - To add an answer status, click New.
   - To add a new answer status directly below an existing answer status in the tree, select the existing answer status and click New.
   - To edit an answer status, click it in the tree.

   **Note:** You can change the names of the default answer statuses, but the functionality of each remains the same. Answers with the same status type behave the same way, regardless of their name.

6. Enter a name for a new answer status or edit an existing one in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. Click the Status drop-down menu and select Public or Private.
   After you save the answer status, you cannot edit its status type. Answers set to the Private status type are not visible on the customer portal, even if you select end-user visibility on the answer access level. They are also not visible on the administration interface.
8. Click Save.

How You Control Answer Access

Answer access levels provide a way to control which answers in the knowledge base become public and visible to customers.

In addition to the default answer access levels, you can add custom answer access levels to allow specific contacts and organizations to view certain groups of answers that are not available to all customers.

Service has these default answer access levels:

- **Help**—The Help answer access level provides online help to customers through context-sensitive answers.
- **Everyone**—The Everyone answer access level makes answers visible to all staff members and customers.

You cannot delete the Help and Everyone answer access levels, although you can rename them.

In addition to the default answer access levels, you can add custom answer access levels to allow specific contacts and organizations to view certain groups of answers that are not available to all customers.
You control the answers customers can view when you create a service level agreement (SLA) and select custom access levels to associate with it. Customers with that SLA can view answers having those custom access levels. See Create an SLA for information about assigning answer access levels to an SLA.

In order for answers to appear on the customer portal, the Status, Language, Access Level, Product, and Category fields must be set to a visibility that allows access by customers. If even one field does not allow visibility, the answer is not visible on the customer portal. In addition, if you have sections within an answer with restricted visibility, that section must be assigned an access level associated with the answer and have end-user visibility selected. See How to Control Answer Visibility.

Sibling answers with access levels that are at or below the contact's SLA are visible to the contact. See Sibling Answers.

**Related Topics**
- Add or Edit an Answer Access Level

**Add or Edit an Answer Access Level**
You can add a new answer access level or edit an existing one.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder.
4. Click Answer Access Levels to display the editor.
5. Do one of these:
   - To add an answer access level, click New.
   - To add a new answer access level directly below an existing answer access level in the tree, select the existing answer access level and click New.
   - To edit an answer access level, click it in the tree.
6. Enter a name for a new answer access level or edit an existing one in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. If you do not want the answer access level to be visible on the interface, clear the Visible check box.
8. Click Save.

**Billable-Task Tracking**
The Time Billed feature in Service lets you track the amount of time agents spend on customer issues and questions.

When you enable this feature, agents can add their time to an incident as they work on it. Service contains one default billable task, Miscellaneous, and you can add any custom billable tasks that meet your organization's needs.

For example, you might add a Telephone billable task to see how much time agents are spending on the telephone answering customer questions. See Add Time Billed to an Incident learn how agents record billable time when they work on incidents.

**Note:** You cannot delete the Miscellaneous billable task. If you delete a custom billable task, all occurrences of that task in incidents have no value and you may lose valuable time-tracking information.
The standard incident workspace contains the Time Billed tab. To enable the feature on other workspaces, add the Time Billed relationship item to the workspace. Other Time Billed properties include the ability to require agents to enter time billed before they mark an incident solved or whenever they edit an incident. These properties are Time Required for Edit and Time Required for Solved. See Create a Workspace.

Related Topics
• Add or Edit a Billable Task

Add or Edit a Billable Task

You can add a new billable task or edit an existing one.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder.
4. Click Billable Tasks to display the editor.
5. Do one of the following:
   o To add a billable task, click New.
   o To add a new billable task directly below an existing billable task in the tree, select the existing billable task and click New.
   o To edit a billable task, click it in the tree.
6. Enter a name for a new billable task or edit an existing one in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. Click Save.

How Channel Types Work

Channel types are used by contacts to provide their user names for Twitter, YouTube, and Facebook through the customer portal.

By providing user name information, the contact's incidents are automatically associated with the contact. This assists agents in identifying and responding to contacts who are using Twitter, YouTube, and Facebook.

If given the proper visibility through the Channel Types editor, contacts and staff members can add and edit channel type user names.

• Contacts can add and edit their Twitter, YouTube, and Facebook user names through widgets on the customer portal.
• Staff members can add and edit Twitter, YouTube, and Facebook user names for contacts from a custom contact workspace.

The standard contact workspace does not contain a field for channel usernames. If you want your agents to add information about channel user names, you must add the Channel Usernames field to a custom contact workspace and assign that workspace to the profile used by agents.

See Edit a Channel Type to rename or remove channel types.
Add the Channel Usernames Field to a Contact Workspace

The standard contact workspace does not contain a field for channel usernames. If you want your agents to add information about channel user names, you must add the Channel Usernames field to a custom contact workspace.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Workspaces.
   The Workspaces explorer opens.
3. Right-click the custom contact workspace you want to add the field to and select Open.
   You cannot edit the standard contact workspace, but you can copy it and edit the copy.
4. Click the Insert Field tab on the ribbon.
5. Click the Channel Usernames field, move the cursor to where you want to position the field on the workspace, and click to place the field.
6. To change the field label, adjust the size, make it a read-only field, or make it a required field, click the field on the workspace and select options on the ribbon’s Design tab.
7. Click Save.
8. Assign this workspace to a profile used by your agents. See Profiles if you need help with this process.

Edit a Channel Type

You can permit staff members and contacts to add and edit social media user names based on the channel type visibility settings.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Click the System Menus drop-down arrow, then click Channel Types.
   The Channel Types editor is displayed.
4. To rename a channel type:
   a. Click it in the Label column.
      The Interface Visibility section displays, showing the names of all available interfaces, the languages they are implemented in, and the language-specific label of the channel.
   b. Enter the new name for the channel type. When you move to another field, the Label field in the Interface Visibility section is populated with the name you typed.

   Note: When using multiple-language interfaces, enter the label in the Label field in the language of the interface.

5. To remove channel type visibility for staff members and contacts, clear the Contact Visible check box next to the applicable channel type.
   This removes staff member visibility for the channel type in the Channel Usernames field on custom contact workspaces. In addition, visibility is removed from the applicable widget on the customer portal.
6. To change the display sequence of channel types on the custom contact workspace and the customer portal, click the up or down arrow next to the Contact Visible column.
7. Click Save.
Tracked Link Categories for Outreach and Feedback

You can add tracked link categories to your Outreach and Feedback applications to group and organize tracked links.

When tracked links are assigned to categories, you can enhance your reporting on customer clicks of links in your mailings and surveys. You can also see how certain categories performed and which are getting the most hits. For example, you could create tracked link categories for each of your product offerings on your website. You can also delete tracked link categories on the editor.

**Note:** Use care when deleting tracked link categories. When you delete a tracked link category, the category is set to Unspecified and you may lose tracking data as a result.

**Related Topics**

**Add or Edit a Tracked Link Category**

You can add tracked link categories to your Outreach and Feedback applications to group and organize tracked links.

1. Click **Configuration** on the **navigation pane**.
2. Expand Outreach, and then double-click **Tracked Link Categories**. The tree displays on the **content pane**.
3. Do one of the following:
   - To add a tracked link category, click **New**.
   - To edit a tracked link category, click it in the tree.

**Note:** Use care when deleting tracked link categories. When you delete a tracked link category, the category is set to Unspecified and you may lose tracking data as a result.

To add another parent-level tracked link category in the same session, you must first press Ctrl and click the highlighted category in the tree (to deselect it) before clicking **New**.

4. Enter a new name or edit an existing one in the **Tracked Link Category Name** field. The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
5. To add a description to the tracked link category, enter one in the **Description** field. The Description field in the Interface Visibility section is populated or revised when you move the cursor to a different field or save the tracked link category.
6. If you do not want the tracked link category to be visible on the **interface**, clear the **Visible** check box.
7. Click **Save**.

**Add Levels of Tracked Link Categories**

By adding levels of tracked link categories to Outreach and Feedback, you can further classify your tracked links.

You can add a subordinate category level by selecting a tracked link category and clicking New. You can create up to six levels of tracked link categories.

1. Click **Configuration** on the **navigation pane**.
2. Expand Outreach, and then double-click **Tracked Link Categories**.
The tree displays on the content pane.

3. Click the tracked link category you want to add a level to and click New.
4. Enter the name and description of the subcategory.
5. Click Save.
   The new category level appears under the category in the tree.
6. Click Save to save the subcategory.

Add or Edit a Contact Role

Contact roles allow sales representatives to identify contacts according to their role in opportunities.

Contacts can be associated with multiple opportunities, but their roles in each opportunity can be different. For example, a contact might be a buyer in one opportunity and a reference in another. By defining contact roles, your sales representatives can select a contact role for the contacts associated with an opportunity. Based on this information, your staff members know which contact to work with at each point in the sales cycle.

Contact roles are specific to Opportunity Tracking. Therefore, staff members see the Set Contact Role button only when they edit contacts that are associated with an opportunity.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder.
4. Click Contact Roles to display the editor.
5. Do one of the following:
   o To add a contact role, click New.
   o To add a new contact role directly under an existing contact role in the tree, select the existing contact role and click New.
   o To edit a contact role, click it in the tree.
6. Enter a name for a new contact role or edit an existing one in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. Enter any notes regarding the contact role in the Notes field.
8. Click Save.

Add or Edit an Opportunity Status

Opportunity statuses represent the current state of opportunities in your knowledge base.

When staff members assign a status to an opportunity, one of the seven default opportunity status types is also assigned. The seven default opportunity statuses include Lead, Reject, Active, Closed, Lost, Inactive, and Dead. You can define additional statuses if you need them. For example, if your organization uses a Pending custom opportunity status that is assigned the Active status type, any opportunities set to the Pending status will be considered active. The default status types are displayed in the drop-down menu in the Status column on the editor.
Note: If you delete a custom opportunity status, all opportunities set to that status are changed to the default status with the same status type. For example, if you delete a custom opportunity status with the status type Active, all opportunities that were associated with that status are changed to the Active opportunity status with the Active status type.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder.
4. Click Opportunity Statuses to display the editor.
5. Do one of the following:
   - To add an opportunity status, click New.
   - To add a new opportunity status directly below an existing opportunity status in the tree, select the existing opportunity status and click New.
   - To edit an opportunity status, click it in the tree.

Note: You can change the names of the default opportunity statuses, but the functionality of each remains the same. Opportunities with the same status type behave the same way, regardless of their name.

6. Enter a name for a new opportunity status or edit an existing one in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. Click the Status drop-down menu and select a status type.
   Note: After you save an opportunity status, you cannot change its status type.
8. Click Save.

Add or Edit a Competitor

A competitor is any individual or organization who is selling goods or services in the same industry as your organization. When adding or editing an opportunity, sales representatives can select from a list of competitors that you define.

Using this information, you can track which other parties are competing for your opportunities and whether your organization is winning or losing to them.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder.
4. Click Competitors to display the editor.
5. Do one of the following:
   - To add a competitor, click New.
   - To add a new competitor directly below an existing competitor in the tree, select the existing competitor and click New.
   - To edit a competitor, click it in the tree.
6. Enter a name for a new competitor or edit an existing one in the Label column.
The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.

7. If you do not want the competitor to be visible on the interface, clear the Visible check box.

8. Click Save.

Add or Edit a Win/Loss Reason

When adding or editing an opportunity, sales representatives can select from a list of win/loss reasons that you define.

Using this information, you can track the main reasons why your organization is winning or losing opportunities.

1. Click Configuration on the navigation pane.
2. Expand Application Appearance, and then double-click Customizable Menus.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder.
4. Click Win/Loss Reasons to display the editor.
5. Do one of the following:
   o To add a win/loss reason, click New.
   o To add a new win/loss reason directly below an existing win/loss reason in the tree, select the existing incident win/loss reason and click New.
   o To edit a win/loss reason, click it in the tree.
6. Enter a name for a new win/loss reason or edit an existing one in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. If you do not want the win/loss reason to be visible on the interface, clear the Visible check box.
8. Click Save.

How Industry Types Work

Industry types allow staff members to classify organizations according to the industry they are associated with. When adding or editing an opportunity, sales representatives can select from a list of industry types that you define.

Using this information, you can track which industries your customers are associated with.

The standard opportunity workspace does not contain a field for industry type. If you want your sales representatives to add information about industry types, you must add the Industry field to an opportunity workspace and assign that workspace to the profile used by sales representatives. See Add the Industry Field to an Opportunity Workspace to add this field to an opportunity workspace. Also see Create a Workspace.

To add or edit an industry type, see Add or Edit an Industry Type.

Add the Industry Field to an Opportunity Workspace

Industry types allow staff members to classify organizations according to the industry with which they are associated. If you want your sales representatives to add information about industry types, you must add the Industry field to an opportunity workspace and assign that workspace to the profile used by sales representatives.

The standard opportunity workspace does not contain a field for industry type.

1. Click Configuration on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Workspaces**.
   The Workspaces explorer opens.
3. Right-click the custom opportunity workspace you want to add the field to and select **Open**.
   You cannot edit the standard opportunity workspace, but you can copy it and edit the copy.
4. Click the **Insert Field** tab.
5. Click **Opportunity Fields** and select **Organization Fields** to view organization fields you can add to the workspace.
6. Click the **Industry** field, move the cursor to where you want to position the field on the workspace, and click to place the field.
7. To change the field label, adjust the size, make it a read-only field, or make it a required field, click the field on the workspace and select options on the **Design** tab.
8. Click **Save**.
9. Assign this workspace to the profile used by sales representatives. See **Profiles** if you need help with this process.

### Add or Edit an Industry Type

Industry types allow staff members to classify organizations according to the industry they are associated with. When adding or editing an opportunity, sales representatives can select from a list of industry types that you define.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Customizable Menus**.
   The Customizable Menus tree opens on the content pane.
3. Expand the System Menus folder.
4. Click **Industry Types** to display the editor.
5. Do one of the following:
   - To add an industry type, click **New**.
   - To add a new industry type directly below an existing industry type in the tree, select the existing industry type and click **New**.
   - To edit an industry type, click it in the tree.
6. Enter a name for a new industry type or edit an existing one in the Label column.
   The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.
7. If you do not want the industry type to be visible on the interface, clear the **Visible** check box.
8. Click **Save**.

### Add or Edit a Lead Rejection Type

A lead is an opportunity that has been prequalified by your marketing or service department, associated to a sales stage with a Lead status type, and assigned to a sales representative. Sales representatives can either accept or reject a lead.

When sales representatives reject leads, they must select from a list of lead rejection types. Using this information, you can track why leads are being rejected.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Customizable Menus**.
   The Customizable Menus tree opens on the content pane.
3. Expand the **System Menus** folder.
4. Click **Lead Rejection Types** to display the editor.
5. Do one of the following:
To add a lead rejection type, click **New**.

To add a new lead rejection type directly below an existing lead rejection type in the tree, select the existing lead rejection type and click **New**.

To edit a lead rejection type, click it in the tree.

6. Enter a name for a new lead rejection type or edit an existing one in the Label column. The corresponding field in the Label column in the Interface Visibility section is populated or revised as you type.

7. If you do not want the lead rejection type to be visible on the interface, clear the **Visible** check box.

8. Click **Save**.

---

**Business Rules**

**Overview of Business Rules**

Business rules are powerful tools for simplifying and automating common business tasks. They link data from all B2C Service products in the knowledge base, resulting in a responsive, consistent customer experience.

A business rule is an “if-then” statement: If these conditions apply, then take this action. For example, if a customer has a billing question, then route the incident to an accounting staff member. If a new contact is from the East Coast, then send a marketing email about the opening of a New York store. If an agent proposes an answer for the knowledge base, then route that answer to the knowledge engineer for review.

Business rules can also include an Else clause: If the conditions of the rule are not met, then take a different action. Extending the billing question example, a rule can route the incident to accounting. If the question is not about billing (that is, the incident does not match the rule condition), then route it to technical support.

B2C Service has eight rule types:

- Answer
- Chat
- Contact
- Custom Object
- Incident
- Offer Advisor
- Opportunity
- Organization
- Task

Each of these sets of rules—including the associated states, functions, and variables—is a rule base. The entity to which a rule base applies—answer, incident, contact, chat, opportunity, organization, target (for Offer Advisor rules), task, or custom object—is known as the object type.

Custom object business rules must use the business rules engine only available on the Agent Browser UI. Some of the benefits of the business rules engine are:

- Makes creating business rules easier.
- Introduces searching for fields and values in rules.
• Gives access to related objects and attributes when defining rules.
• Runs reports on business rules.

See *Business Rules on the Agent Browser UI* for more information.

**Note:** Every object type has its own rule base, and every rule base is separate from other rule bases. The contacts rule base processes only contacts, the organizations rule base processes only organizations, and so on.

Business rules help you provide a consistent, accurate, and timely experience for customers while streamlining the efficiency of staff members. When the rules engine updates information automatically and immediately, your entire organization has access to a knowledge base that is accurate and current in every customer interaction. For example, marketing staff members always know a customer’s email preferences, even when the customer changes opt-in choices. Sales representatives can be sensitive to a prospective customer when they know the customer is experiencing technical support issues. And agents can reinforce your organization’s marketing campaigns when they know what emails a customer has received.

Besides the many advantages of keeping the knowledge base accurate and current, business rules also let staff members work efficiently and consistently. When you create rules to answer routine customer questions, customers enjoy an immediate response. At the same time, staff members work more productively without the distraction of repetitive tasks. As a result, they can deliver more responsive customer service and follow-up.

Business rules route incidents to the suitable support person, notify an engineer when answers in the knowledge base should be reviewed, and automatically answer customer questions. They send marketing emails and surveys. They escalate overlooked opportunities and set strategies based on conditions you define. Rules update contacts and organizations, set custom fields, and assign tasks. For specific examples of business rules with a discussion of the logic used to create them, see *Examples of Business Rules*.

**How are Rules Processed?**
The rules engine is the software that processes the rules in a rule base.

The rules engine begins processing when:
- Staff members add or edit answers, contacts, incidents, opportunities, organizations, or tasks.
- Customers submit questions on the Ask a Question page.
- Customers update their contact records or incidents.
- Customers request chat sessions.
The rules engine looks at every new or updated object and checks to see if the conditions of any rules are met. If rule conditions are met, the action associated with that rule occurs.

Assume, for example, that you add a contact. Adding the contact triggers the rules engine to begin processing rules in the contact rule base. The rules engine applies rules to the contact, checking to see if the contact matches the conditions of any of the rules. If the contact matches the conditions of a rule, the rules engine executes the action in that rule. The action might apply an SLA to the contact, set the state, send a marketing email, or perform any other action in the contact rule base. If the contact matches conditions in multiple rules, the actions of all those rules occur.

The next time the contact record is updated by the customer or a staff member, the rules engine processes the contact again.

**Note:** The rules engine is triggered when the contact (or other object) is updated, not when the rule base is updated. If you create or edit a rule, objects are not evaluated to see if they meet the conditions of the new or updated rule. Rules processing happens only when objects are added or updated.

### Ways to Use Business Rules in Your Organization

There are many ways you can use rules to automate workflow in your organization.

These are some common ways to use business rules:

- **Route incoming incidents**—Use rules to route incoming questions to the most qualified staff member, group, or queue based on criteria you define, such as product, incident severity, or language.

- **Escalate answers, incidents, opportunities, and tasks**—Assess potential problems and alert managers to critical issues by using escalation levels. Identify tasks with elapsed deadlines, and escalate incidents that have not received timely responses. Escalate answers to ensure adequate review, and follow up on opportunities to prevent ignoring potential sales.

- **Update answers, contacts, incidents, opportunities, organizations, and tasks and notify staff members**—Create rules to consistently handle and track updates to answers, contacts, incidents, opportunities, organizations, and tasks and notify staff members when assignments have changed.

- **Suggest answers to incoming questions**—Business rules let you suggest answers to customers’ questions before they submit them. When rules successfully answer questions, fewer incidents are added, reducing agents’ workloads.

- **Create SLA instances for contacts and organizations**—Automatically apply SLA instances for contacts and organizations. For example, create a rule to apply SLA instances to all customers who submit questions about a new product. See [Overview of Service Level Agreements](#).

- **Route chat requests to queues**—Route requests for chat sessions to a specific queue to manage chats optimally. See [Chat for Agents, Supervisors, and Customers](#) for information about chat sessions.

- **Send marketing email**—Send email to contacts who meet specific conditions. For example, send a regional email message to all contacts within a specific geographic area or a product-specific message for opportunities with a certain status. See [Overview of Mailings](#) for complete details about creating, managing, and sending marketing email.

- **Conduct surveys**—Automatically distribute surveys to customers to monitor customer satisfaction and other performance measures. See [Overview of Surveys](#) for complete details about creating, managing, and sending surveys.

- **Define target customers for promotions**—Use Offer Advisor rules to assign customers who meet certain criteria to specific target groups. Then agents who are solving incidents can use Offer Advisor to present offers to eligible customers. See [Overview of Offer Advisor Administration](#) for information about configuring Offer Advisor and [Overview of Incidents](#) to learn how agents use the feature.
Best Practices for Planning Business Rules

Before you begin creating rules for your organization, it is important to examine your business processes, including how you update contacts and organizations, handle incidents and answers, route requests for chats, follow up opportunities, and define targets for marketing promotions.

After you have a clear idea of the processes your organization uses, you can develop an effective method for applying business rules to automate these processes. This section describes the essential steps to help you get started.

**Identify and outline business processes**—To create a more efficient system for handling routine procedures, first outline the procedures to determine what processes can be automated.

For example, if you routinely assign questions about one product to a certain queue, you can create a rule to automatically route those incidents to the queue. Or if opportunities are not followed up promptly, rules can escalate those opportunities after a certain amount of time.

Review this list of questions to trigger ideas for designing business rules that can increase efficiency in your organization:

- How do you handle incoming customer questions?
- What is the review process when answers are created?
- What happens when incidents are reassigned to other agents?
- How does management get involved when incidents remain unresolved?
- What happens when sales opportunities are identified?
- How are prospective customers contacted?
- How do you identify target groups for promotions?
- How can you group incoming customer questions and route them most effectively?
- Which inquiries are not being handled properly?
- What other processes can you use to automatically route and manage incoming questions, responses, and updates?

**Develop a rules flowchart**—Flowcharts are useful for viewing and grouping processes to determine the best way to apply business rules. Creating a flowchart can help you:

- Organize business processes.
- Gain process consensus between management and staff.
- Develop a blueprint for staff training.
- Develop thorough testing methods with less backtracking.
- Create an overview of the information management process.
- Provide a future point of reference.

**Review functionality of rules**—After mapping your organization’s processes, review what rules can do to automate them. When you understand how rules function, you can begin planning ways to implement them.
Create rules—Once you understand how rules work, you can create rules to automate business processes. Begin by reviewing the flowchart of current processes to determine the most appropriate methods for automating routine processes.

Prioritize processes for applying rules—You must consider the organization of states, functions, and rules to ensure that rules perform as you intend them to. Rules in a state process in order until all the rules process or until a rule transitions to a function or a different state or stops processing.

Verify and fine-tune rules—An important part of configuring rules is verifying that they perform as expected.

Train staff—Once you set up rule bases, you must train your staff. They should be familiar with how your organization handles routine business procedures, how rules automate those procedures, and how their positions play a role in rules processing.

Evaluate processes and rules as required—Once you start adding rules to automate processes and become more familiar with them, you can consider more efficient and effective ways to route and manage data. Periodically reevaluate your business processes looking for more effective ways to handle questions, responses, updates, and opportunities. Also reevaluate when your organization experiences workflow changes. For example, update routing rules when staff accounts are added or removed.

As you examine your business processes and think about automating them with rules, it is helpful to understand how to design effective business rules. Elements of Rules and Rule Bases provides an overview of the elements of business rules so you can begin designing and working with rules.

• Create a Rule Base

Elements of Rules and Rule Bases
Before you create a rule base, you should be familiar with the elements of rules and rule bases and how these elements are related.

When you open the Rules editor, the left side of the content pane displays the rules in each of the rule base states and functions as well as a list of the rule base variables. The right side of the content pane is the editor, which lets you add and edit states, functions, and variables for a rule base. This is also where you add and edit conditions and actions for individual rules.

States and functions—States and functions provide a way for you to organize business rules and define the sequence for processing rules. Each rule base must have at least one state—the initial state—before rules processing can begin.

Variables—A variable is a piece of data with a value that can change during rules processing. You define what its default, or starting, value should be. Then, based on conditions you specify, the variable can be modified by rule actions. You can also use the value of a variable as a condition of a rule. The value of the variable is temporary, existing only during the particular rules processing session. When rules processing is started the next time, the variable value is reset to the default value.

Conditions—A rule is basically an “if-then” statement. If something meets this condition, then take this action. The “if” statement is the rule condition. An example of a condition statement is “If the contact’s state equals Montana.” Each rule base has a unique set of conditions that the rules engine can use to evaluate the object.

Note: Keep in mind that having multiple conditions in a rule is more common than having only one. For the sake of simplified discussion, assume that any singular “condition” referenced in this section may actually be a set of conditions.
Logical expressions—When you add two or more conditions, rules processing uses a logical expression to define the relationship of the conditions. Logical expressions join conditions using an AND (\&) or an OR (|) relationship between them. For example, you might want to look for customers who have purchased Product A and who have also purchased a one-year warranty. Or you might want to find customers who have purchased Product A or Product B. The default logical expression joins all conditions with AND. If you want all conditions to apply, it is not necessary to edit the logical expressions.

Actions—Actions comprise the “then” part of an “if-then” rule or the “then” and “else” parts of an “if-then-else” rule. If the conditions you specified in a rule are met, then the rules engine implements the rule actions. The list of available actions depends on the rule object type. An action can be as simple as stopping the rules processing or more complex, such as assigning an incident to an agent, sending that agent a notification, and defining an escalation process if the incident is not resolved within a certain time frame.

States and Functions in Business Rules

States and functions provide a way for you to organize business rules and define the sequence for processing rules. Each rule base must have at least one state—the initial state—before rules processing can begin.

States and functions are listed alphabetically in the Rules tree, and the rules within each state and function are listed in the order in which you want them to execute.

States are containers for rules. You can add as many states as you need for each stage of your business. You can set up rules in the initial state, for example, that are applied to all new opportunities (or other object type, depending on the rule base). Then, depending on the conditions of rules in the initial state, you can transition the opportunity into another state to continue processing the rules in that state.

For example, you might want to evaluate each new opportunity and assign it to a specific sales group. You could add rules in the initial state that transition to states called Government Agencies, Educational Institutions, or Medical Groups, depending on the industry type of the organization. Those states could contain rules that are unique to opportunities in the different industries.

Functions are also containers for rules. Functions group sets of rules that you want to use in multiple places. You can set up many separate rules that call the same function, or set of rules, thereby reducing the number of individual rules you need. When a rule in one state calls a function, all the rules within that function process. After all the rules in the function process, the rules engine resumes processing in the original state with the next rule in that state.

Note: The primary difference between states and functions is what happens when the rules engine processes the last rule. When the last rule in a state is processed, the rules engine stops processing (unless it encounters a stop processing rule before the last rule or it transitions to a function or another state). When the last rule in a function is processed, the rules engine proceeds to the next rule in the state from which the function was called.

While functions are useful tools for grouping rules, avoiding duplication, and making maintenance easier, you are not required to use them in a rule base. You can still take advantage of the powerful features of business rules by adding as many states as you need, based on the processes you want to automate, and then creating rules within each state.

Variables in Business Rules

A variable is a temporary data item that is assigned a default value at the start of rules processing. The variable can be modified by rule actions during processing.

Other rules can then use it as a condition for triggering certain actions based on its value. The value of the variable is not stored in the database, so it returns to its default value the next time the rules engine begins processing.
**Note:** A custom field can be used to accomplish the same function as a variable. If you are deciding whether to use a custom field or a variable, ask yourself whether you need the data for future reference. A variable is temporary, so it returns to the initial value each time the rules engine is run. A custom field, on the other hand, is fixed. That is, at the end of rules processing, it stores the final value in the database to be available at the start of the next round of rules processing for the object.

Rule variables are useful when you want to accumulate a value and save it conditionally or perform some action based on the accumulated value. A common example of a variable is a score. You can modify a variable based on whether the object being evaluated matches rule conditions. Then you can assign different actions based on the variable's value. For an example of a rule using a variable, see *Create a Variable to Measure Service Quality*.

See *Add or Edit a Variable* for the procedure to add or edit a variable.

<table>
<thead>
<tr>

<th>Actions</th>
</tr>
</thead>
</table>
| Integer            | • Set equal to an absolute value.  
|                    | • Increment by $n$.  
|                    | • Decrement by $n$.  
|                    | • Set equal to the value of another integer variable or custom field. |
| Text Field         | • Set equal to an absolute string.  
|                    | • Prepend character string.  
|                    | • Append character string.  
|                    | • Set equal to the value of another character variable or custom field.  
| Date Field         | • Set equal to an absolute value.  
|                    | • Increment by $n$ days.  
|                    | • Decrement by $n$ days.  
|                    | • Set equal to the value of another date variable or custom field or object date or date/time field. |
| Date/Time          | • Set equal to an absolute value.  
|                    | • Increment by $n$ days, hours, or minutes.  
|                    | • Decrement by $n$ days, hours, or minutes.  
|                    | • Set equal to the value of another date/time variable or custom field or object date or date/time field. |

See *Actions to Set Custom Fields and Variables* for information about how leading and trailing spaces are handled when rule actions are used to set variables.

**Related Topics**
- *Create a Rule Base*

**Rules Processing Order**

All the rules in a state process in the order you specify.

Rules processing for new objects begins in the state you have designated as the initial state. (Existing objects begin in whatever rule state they were in when they were last updated.) The only way rules other than those in the initial state
process is if rules in that state have actions that transition to another state or call a function. Otherwise, rules processing for new objects ends when the rules engine reaches the last rule in the initial state.

**Note:** The Offer Advisor rule base is an exception to the requirement for an initial state. Because only one state—Targets—is permitted for this type of rule, this state is the default when you open Offer Advisor rules. You cannot add states or functions in Offer Advisor rules. See *Overview of Offer Advisor Administration*.

By default, when rules processing transitions to another state or calls a function, it begins processing all the rules in that state or function and continues until it reaches the end. However, you can stop processing by adding an action such as Stop Processing Rules, Transition State and Stop, Transition State and Continue, or Call Function.

## Create a Rule Base

An object's rule base includes all the rules, states, functions, and variables associated with that object. The process for creating a rule base consists of creating all the elements that make up the rule base and includes these main steps.

This process, especially states and functions, does not apply to custom object business rules, which use the new business rules engine.

1. Open the Rules editor and select the object type of the rule base (answer, contact, incident, chat, opportunity, organization, task, or Offer Advisor) on the ribbon.
2. Create an *initial state* for the rule base.
3. Add additional states, functions, and variables as necessary.
4. Add rules to each state and function.
5. Reorder the rules within states and functions as necessary.
6. Activate the rule base.
7. Verify that the rules are performing as expected.

## Add a State

This procedure explains how to add a state to the contact rule base. However, the steps are the same for adding states to any rule base.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, then double-click Rules.
3. Click Contact to view active contact rules.
This section provides instructions on how to add a function to a rule base. It also describes how to add or edit a variable in a business rule.

**Add a Function**

1. While editing a rule base, right-click **Functions** in the rules tree, then select **New Function**.
   - The Functions editor is activated.
2. Enter the name of the function in the **Function Name** field. Use a name that identifies the performance of the function, for example, **Escalation**.
3. To add a note about the function, enter comments in the **Notes** field.
   - After you save the function, you can hover over it in the tree to view the note.
4. Click **Save**.
   - The function appears in the tree.
5. To add more functions, repeat these steps.

**Add or Edit a Variable**

This procedure describes the steps to add a variable to a business rule or edit an existing one.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Rules**.
3. Click the button for the rule type to which you want to add the variable.
   - The incident rule base is selected by default.
4. Click **Edit**.
5. Do one of these:
   - Right-click **Variables** in the Rules tree, then select **New Variable**.
   - Right-click a variable, then select **Edit Variable**.
   - The editor is activated.
6. Enter field information.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Variable Name</td>
<td>Enter the name of the rule variable in this field.</td>
</tr>
<tr>
<td>Data Type</td>
<td>Select the variable data type. The options include Integer, Text Field (to a maximum of 255 characters), Date Field, and Date/Time. After you have saved a variable, you cannot edit its data type.</td>
</tr>
<tr>
<td>Default</td>
<td>Enter a value that will be the variable initial value every time the rules engine is invoked in the rule base.</td>
</tr>
<tr>
<td>Notes</td>
<td>Enter any note you want to add to the variable. The note will be visible when you hover over the variable in the tree.</td>
</tr>
</tbody>
</table>

7. Click **Save**.
8. To delete a variable, right-click it, select **Delete Variable**, and then confirm that you want to delete the variable. If the variable you are trying to delete is used in any rule, a variable dependency list shows which rules use the variable. You must delete the condition or action of any rule using the variable before you can delete the variable. See **Dependency Conflicts**.

### Add a Rule

After you add states and functions for an object type, you can add rules.

**CAUTION:** An extremely high number of complex rules can cause the system to run out of memory and cause errors. If, for example, you have more than 675 highly complex rules (each with 20 conditions, 20 Then actions, and 20 Else actions), then memory errors are likely to occur. More than 1,000 rules of moderate complexity (3 conditions, 5 Then actions, and 3 Else actions) can be run without error, although it might take more than a minute to save the rule base.

The basic steps for adding a rule are similar for all types of rules, although the condition and action options available vary by rule type. The procedure shown here uses opportunity rules as an example.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Rules**.
3. Click **Opportunity** on the ribbon to view active opportunity rules.
4. Click **Edit** on the ribbon to enter the edit mode.
5. Right-click the state or function to which you want to add the rule, then select **New Rule**. The **Edit Opportunity Rule** window opens.
6. Enter the name of the rule in the **Rule Name** field.
7. To add a note about the rule, enter comments in the **Notes** field. Add any information or special instructions that may be helpful when staff members hover over the rule in the rules tree.
8. To add a condition, click **Add IF Condition Based On**. Opportunity rule conditions include Opportunity, Contact, Organization, and Rule Variables (if variables have been added), each with a drop-down menu containing the fields for the condition. (Rules for other object types have different menus for selecting conditions. See **Business Rule Conditions** for a description of the conditions for each object.)

**Note:** You might decide you want the rule actions to apply to all opportunities. In that case, you can create a rule that has only actions, but no conditions. The actions must be added to the **Then clause**.
Using B2C Service

Chapter 2
Core Features

a. Select **Opportunity**, **Contact**, **Organization**, or **Rule Variables** to display the drop-down menu of fields, and then select the field for the condition.

For example, select the Contact field with the Service State to identify contacts who have entered the system through customer support.

b. Click **Select Operator** and select the operator that applies to the field you selected.

Using the example from the previous step, if the operator is “equals,” different operators appear in the Select Operator drop-down menu when you select different fields.

c. Enter the value.

9. To add another condition to the rule, repeat the previous step.

You can require that only one of the conditions be met before the rule action is executed, that all of them are met, or that some combination is required. To understand the relationships when a rule contains multiple conditions, see **Business Rule Logical Expressions**.

In our example, add a second condition using a contact custom field called “Are you a current customer?” and set the field to equal No. This identifies customers who have expressed enough interest to call customer support, but who are not yet contacts.

10. To delete a condition after you have added it to a rule, select the **Delete Condition** check box.

The editor is refreshed.

11. Click **Add Action–Then** to choose the action that will be executed if the conditions are met. In this example, the action is sending an email to a sales manager.

12. Select the **To Assignee** check box. You will also need to select a staff member or group from the drop down. For example, to send the opportunity email to Sales, scroll down and select **Sales**.

13. To add an action to the Else clause, click **Add Action–Else** and select an action. For example, contacts that do not match the rule conditions have an Opportunities or Outreach state or are already contacts. In that case, you might want to add an action that sends these contacts a survey to determine customer satisfaction.

14. To delete an action after adding it to a rule, select the **Delete Action** check box.

The editor is refreshed.

15. To add more actions to the rule, repeat step 10 or 11, depending on whether you want to add the action to the Then or the Else clause.

16. Click **Save**.
Rule validation prevents saving meaningless rules. For example, a rule with no condition automatically executes the actions in the Then clause. If the rule also contains an Else clause, the rule is invalid because a non-existent condition cannot be unmatched. Rules with no action are also invalid.

If the rule is successfully saved, it appears in the Rules tree under the appropriate state or function. If the save is not successful, a message prompts you to replace an invalid value or add a missing value.

**Business Rule Conditions**

The conditions of a rule compose its “if” statement. If these conditions are met, then the rules engine performs the action specified in the rule.

Examples of conditions include “If the contact’s state equals Montana,” “If the incident customer thread contains ‘warranty’,” or “If the forecast for the opportunity is greater than $5,000.” The basic form of a condition is “If [this object] [has this relationship to] [the basis for comparing the object].”

**Tip:** It is not necessary to add conditions to a rule. If, for example, you want the rule action to be applied to all objects, then simply do not add any condition to the rule.

A condition contains these primary elements:

- **Field**—The field is the element you want to consider in the rule. In the previous examples, the fields are state, customer thread, and forecast. Each type of rule (answer, contact, incident, chat, opportunity, organization, Offer Advisor, and task) has a set of fields that are used to add conditions for its rules.

- **Operator**—The operator is the relationship between the field and the value. In the preceding examples, the operators are equals, contains, and greater than. The selection of operators varies with the field. Some are simply “equals” and “not equals,” while others express more complex relationships.

- **Value**—The value is the comparison you want to make with the field. In the examples, the values are Montana, warranty, and $5,000. The format of the value changes, depending on the field. You might select a menu option, enter a string of text, or select a check box or option to define the value.

The fields are organized according to their type. In the first example (“If the contact’s state equals Montana”), the state field is a contact field. The second example has the field customer thread, which is an incident field, and the third example field, forecast, is an opportunity field.

When you click **Add IF Condition Based On**, a list of field types specific to the type of rule appears, each with a drop-down menu of the available fields. For example, contact rules let you select Contact and Organization fields, while incident rules let you select Incident, Contact, and Organization fields.

</tbody>
</table>

Some conditions depend on how you have configured your site. Customizable menu items, such as products, categories, and dispositions, appear as conditions only if they have been added. If the rules engine does not detect the presence of customizable menu items, custom fields, and other items, such as SLAs, mailboxes, Outreach emails and mailings, and Feedback surveys, they do not appear in the list of conditions. If you add them while you create rules, you must close the Rules editor and reopen it for them to display.

**Note:** You can add items to a customizable menu that already has items in it without needing to close the Rules editor for them to be visible.

In addition to the fields that are specific to each type of rule, all rules can use rule variables for rule conditions. If no variables have been defined in the rule base, the Rule Variables field type is disabled.
Relative Time Conditions
Relative time calculates the number of minutes or hours from the current time or from a specific event, such as time created or time updated.

Several rule conditions let you select a date and time. For example, you might want to add a rule with the condition “If the task due date is within the range from April 1 to April 30.” The following conditions allow date/time selection.

- Banner Updated for answers, contacts, incidents, opportunities, and organizations
- Acquired and Created for contact rules
- Created, Updated, Initial Contact, Forecast Close, Date Closed, Lost Date, and Recall for opportunity rules
- Acquired for organization rules
- Purchased Products Date Purchased for Offer Advisor rules
- Completed Date, Created, Updated, Due Date, Planned Completion Date, and Start Date for task rules

The ability to set a condition based on a specific date and time (whether that date/time value is before, after, equal to, or within a range you specify) is a useful tool. However, there may be times when you want to set a relative date/time value. For example, you may want a condition “If the task due date is less than 8 hours from now.” In that case, you can select a relative time for the rule condition. Relative time calculates the number of minutes or hours from the current time or from a specific event, such as time created or time updated.

See Select the Relative Time Condition Using a Task Due Date to set a relative time condition using a task due date, but the procedure is the same for setting other relative time conditions.

Select the Relative Time Condition Using a Task Due Date
This procedure shows you how to set a relative time condition using a task due date, but the procedure is the same for setting other relative time conditions.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, then double-click Rules.
3. Click Task on the ribbon.
4. Click Edit on the ribbon.
5. Right-click the rule you want to add the relative time condition to, then select Edit.
6. Click Add IF Condition Based On, then select Tasks > Due Date. In this example, assume you want to send a reminder email to staff members who have tasks due within the next eight hours.
7. Select the Relative check box to set the condition based on a time relative to the task due date.
8. Click the drop-down menu above the Relative check box.
   The Relative Time window opens.
9. Complete the fields in the Relative Time window.
   a. Click the Direction drop-down menu, then select + (Future).
   b. Enter 8 in the Offset field.
   c. Click the Unit drop-down menu, then select Hours.
   d. Click Save to save your settings and close the Relative Time window.
10. Click the drop-down menu next to the condition Relative check box, then select what you want the time you
    specified in step 9 to be compared.
    For example, if you wanted the rule to be triggered eight hours after a task is created, you could select
    Tasks.Created from the menu. In our example, you can leave the menu set to the default value of “Now,”
    because you want this rule to be triggered eight hours after any event occurs that causes the rule to be checked
    (such as when a task is edited).
11. Click the Select Operator drop-down menu, then select Less Than.
    In this example, we want the rule to be triggered when a task due date is less (earlier) than the relative time we
    specified.

With this type of condition, you must add an action before you can save the rule. See Business Rule Actions.

Custom Fields and Masks in Conditions
Before reviewing the conditions for each type of rule, it is important to understand how custom fields are handled and
how to enter conditions for fields that use masks.

If you have added custom fields for contacts, organizations, incidents, answers, or opportunities, they will appear in the
condition drop-down menu.

Some fields have masks that let you define a format for a field to ensure that staff members enter them correctly. For
example, you might want to define a custom field for a catalog number that uses a mask to force the correct sequence
of letters, numbers, and formatting characters.

When you add a condition for any field that uses a mask, you must omit the formatting characters when you enter
the value for that condition. For example, if you add a custom field with the ULF-M#M#, the entered data consists of
an uppercase alphabetic character, a hyphen, and two numbers, such as M-63. If you want to create a rule using the
custom field as a condition, the value for the condition must be “M63” and not “M-63” with the hyphen.

Previous Fields in Conditions
Previous fields let you detect changes that occur to the fields.

Many conditions have “Previous” fields, including, for example, Previous Status, Previous Escalation Level, Previous
Assigned, Previous Group, and Previous Strategy Hierarchy. These fields all contain the value currently stored in the
database. The field reflects the value when the object is added or updated or when rules processing begins.

Conditions for Each Rule Base
See the linked topics listed here to view the tables associated with each type of rule base.
In each table, the first column lists the field, the second column describes what the field refers to, and the third column describes how to select the value, based on its format. For example, formats might include text that you type or a menu option you select.

**Note:** When the format of a value consists of menu selections, you can choose multiple options by pressing Ctrl while making each selection. Or if the value displays check boxes, you can make multiple selections.

Some conditions depend on how you have configured your site. Customizable menu items, such as products, categories, and dispositions, appear as conditions only if they have been added. If the rules engine does not detect the presence of customizable menu items, custom fields, and other items, such as SLAs, mailboxes, Outreach emails and mailings, and Feedback surveys, they do not appear in the list of conditions. If you add them while you create rules, you must close the Rules editor and reopen it in order for them to display.

**Note:** You can add items to a customizable menu that already has items in it without needing to close the Rules editor for them to be visible.

In addition to the fields that are specific to each type of rule, all rules can use rule variables for rule conditions. If no variables have been defined in the rule base, the Rule Variables field type is disabled.

Purchased Products Conditions for Offer Advisor Rules

When choosing conditions for an Offer Advisor rule, select from the fields described in the following table and enter the value in the specified format.

Offer Advisor rules have a single purpose: to define targets—that is, groups of customers—that meet the conditions you specify. Regardless of the condition you select, the default action is always “Contact will match this target.”

In addition to incident, contact, and organization conditions for Offer Advisor rules, you can also select a unique Purchased Products condition. This condition is a combination of three conditions, all of which must be met by a purchased product entry in order for the Purchased Products condition to be met. These criteria are product, price, and date purchased.

**Note:** Offer Advisor must be enabled on your site for this object type to appear. Contact your Oracle account manager.

This table describes the condition fields available for purchased products and how to select the value based on its format.

<table>
<thead>
<tr>

</table>
Business Rule Operators

An operator expresses the relationship between a condition field and its value, determining how the field is applied to the value of the condition.

For example, in the condition “If an answer assignment equals customer support,” the operator is “equals.” Each field has its own set of operators, depending on what is logical for that field. A rule with the condition “If an answer assignment is greater than or equal to customer support,” for example, has no relevance and cannot be applied to an answer.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>equals</td>
<td>The field matches the value exactly, including case. When you use this field for specific text content, you must include single quotes around the text of interest. For example, you can set criteria to be Organization.Name equals 'ABC Company'.</td>
</tr>
<tr>
<td>not equals</td>
<td>The field does not match the value.</td>
</tr>
<tr>
<td>is null</td>
<td>The field does not contain a value.</td>
</tr>
<tr>
<td>is not null</td>
<td>The field contains a value.</td>
</tr>
<tr>
<td>less than</td>
<td>The field is less than the value.</td>
</tr>
<tr>
<td>less than or equal to</td>
<td>The field is less than or equal to the value.</td>
</tr>
<tr>
<td>greater than</td>
<td>The field is greater than the value.</td>
</tr>
<tr>
<td>greater than or equal to</td>
<td>The field is greater than or equal to the value.</td>
</tr>
<tr>
<td>in range</td>
<td>The field is within the range you specify. You must indicate a beginning and ending value when you select this operator.</td>
</tr>
<tr>
<td>not in range</td>
<td>The field is not within the range you specify. You must indicate a beginning and ending value when you select this operator.</td>
</tr>
<tr>
<td>contains</td>
<td>The field matches only text string values. This operator uses word stemming, but only in the Summary field, Subject field, and incident threads. Stemmed searches are not case sensitive. For example, if you want the rule to apply to different forms of a word, such as singular, plural, or a different verb tense, select “contains” and enter the singular form as the value. When you include</td>
</tr>
<tr>
<td>Operator</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>multiple words in the value, the rule applies when the text strings contain all the words, which do not have to occur sequentially.</td>
<td></td>
</tr>
<tr>
<td>does not contain</td>
<td>The field does not contain the text string in the value. This operator uses word stemming, but only in the Summary field, Subject field, and incident threads. Stemmed searches are not case sensitive. Word stemming is not supported for custom fields, only text strings.</td>
</tr>
<tr>
<td>matches regular expression</td>
<td>The field matches the regular expression entered in a text string value. The regular expression compiler validates the expression. If an error code is returned, the rule is not saved.</td>
</tr>
<tr>
<td>does not match regular expression</td>
<td>The field does not match the regular expression entered in a text string value. The regular expression compiler validates the expression. If an error code is returned, the rule is not saved.</td>
</tr>
<tr>
<td>in response interval</td>
<td>This operator is used only with the Incident Created condition for incident rules to indicate that the incident was added within normal working hours. That is, the incident was added within the response requirements of the SLA associated with the incident or within the default response requirements if no SLA is associated with the incident. The data in the condition's hh:mm field is not used when this operator is selected.</td>
</tr>
<tr>
<td>not in response interval</td>
<td>This operator is used only with the Incident Created condition for incident rules to indicate that the incident was not added within normal working hours. That is, the incident was added outside the response requirements of the SLA associated with the incident or outside the default response requirements if no SLA is associated with the incident. The data in the condition hh:mm field is not used when this operator is selected.</td>
</tr>
<tr>
<td>modified this edit</td>
<td>This operator indicates that the field value has been changed during the current edit of the object. This change can occur manually as a result of staff member or customer edits or automatically through a utility or rule action. All values use this operator.</td>
</tr>
<tr>
<td>not modified this edit</td>
<td>This operator indicates that the field value was not changed during the current edit of the object. All values use this operator.</td>
</tr>
</tbody>
</table>

**Business Rule Logical Expressions**

Logical expressions use AND (&) and OR (|) to define the relationship between rule conditions.

To edit the logical expression after you have defined conditions, click in the **Logical Expressions** field and make the changes. Use logical expressions when you want to link the conditions in the following ways:

- You want all conditions to apply in order for the rule to initiate its action. Use AND (&) to link the conditions. The expression 1 & 2 & 3 means that the rule action occurs only when all three conditions are met. Because the default logical expression is AND, it is not necessary to use a logical expression when you want all conditions to apply. If you delete the logical expression in this case, the conditions remain linked by AND.
• You want any one of the conditions to apply in order for the rule to initiate action. Use OR (|) to link the conditions. The expression `1 | 2 | 3` means that the rule action occurs if any one of the three conditions are met.

• You want to group the conditions. Using parentheses, you can create an expression such as `1 & (2 | 3)`. This expression requires that condition 1 be met and that either condition 2 or condition 3 must also be met. If you do not use parentheses, AND always has precedence over OR, which determines the order of execution. In that case, `1 & 2 | 3` requires that both conditions 1 and 2 be met or that condition 3 be met.

- Add a Rule

### Business Rule Actions
The condition is the “if” part of a rule “if-then” statement, and the action is the “then” part. The action specifies what occurs to the object (answer, contact, incident, chat, opportunity, organization, target, or task) when the condition is met.

Actions are also used in the optional Else clause when you want to specify what happens when the object does not match the rule conditions. Every action that is available in an object Then clause is also available in the Else clause.

**Note:** An action that can only be used once in the Then clause (for example, setting an incident status) is also restricted to a single use in the Else clause, although you can use the same action in both clauses of a rule.

Before you define actions for rules, review these considerations:
- **Action Execution**
- **Action Order**
- **Dependency Conflicts**—If you delete an email or survey that is used in a Send action in a contact, incident, or opportunity rule, you can still activate the rule base but the rules engine will not process the action. No error will be logged to indicate that the mailing or survey was not sent.
- **Actions to Set Custom Fields and Variables**
- **Actions for Rule Bases**
- **Rules for Escalation of Answers, Incidents, Opportunities, and Tasks**—You define the conditions that will schedule an object escalation and what actions you want to occur when that escalation level is reached.

### Related Topics
- Add a Rule

### Action Execution
The rules engine can execute actions immediately when a record is saved, or it can defer the action until a later time.

All actions that modify an object (answer, contact, incident, chat, opportunity, organization, target, or task) are executed immediately upon saving the record. For example, an action can change the status of an incident, set an answer access level, or set a custom field. These actions are executed before the next condition is evaluated. Actions that transition to another state or function or those that stop processing are also executed immediately.

All other actions are passed to the API as deferred actions. Some of these delayed actions are executed immediately after the rules engine finishes processing, while others are flagged to be handled later. Examples of actions that are executed immediately after rules processing include applying SLA instances and sending email. Events such as escalation are scheduled to be handled later.
You must select an object event handler from the Execute Object Event Handler drop-down menu to trigger an external event action. For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed. See Object Event Handlers.

**Note:** External events have been deprecated and might be permanently removed in a future release. The Execute External Event option was disabled in the February 2015 release.

When business rules are triggered (by adding or updating an object), the rules engine processes every rule in the initial state, and continues processing until it reaches the last rule, regardless of how many rules have already been matched. Unless otherwise directed, the rules engine processes only the rules in the initial state. To process rules in other states or functions, you must set an action for one or more rules in the initial state to transition to another state or function.

These actions are available for all rule bases (assuming that additional states and functions exist to be transitioned to):

- **Stop Processing Rules**—Stops processing, regardless of how many rules remain in the state. Use this action when you do not want the object compared to any more rules in this or any other state. When you select the Stop Processing Rules action, the rules engine stops evaluating the object against the rules base. However, the action does not prevent future processing of the object. When the object is updated, the rules engine will process it again. If you want to prevent the object from being processed in future updates, create a state that has no rules and transition the object into it.

- **Call Function**—Transitions to the function you specify and processes the rules in the function. After the actions in the function rules are executed, control returns to the next action in the rule that called the function. If you call a function that contains a rule with either an action to stop processing or to transition to another state, the rules engine never returns to the rule that called the function.

  For example, assume the calling rule contains two actions in this order:

  a. Call a function containing a rule with a stop-processing action.
  b. Assign the incident to a specific queue.

  In this example, the queue assignment is never made because the prior action stopped processing.

- **Transition State and Stop**—Transitions to the state you specify and stops processing. Use this action when you want the object moved from one state to another, such as from the Created state to the Updated state, but you do not want processing to continue. In effect, you are setting up the object for the next edit so rules processing starts at the appropriate state. For example, depending on your business process, you may want to set up a separate state for incidents that have been updated so they do not continue to be compared to rules in the initial state.

- **Transition State and Continue**—Transitions to the state you specify and continues processing all the rules in that state until all of those rules process (unless you add another action to stop processing, transition to another state, or call a function). Use this action when you want the object to continue to be compared to the rules in the state you transition to.

You can add certain actions without selecting a value. With this functionality, the rule actions are consistent with values that can be set to No Value in records. For example, you can save an incident without assigning it to a staff member (by selecting the No Value option). Actions that can be added without selecting a value (that is, the value is set to No Value) include:

- Set Product
- Set Category
- Set Disposition
- Set Mailbox
• Set Assigned
• Set Queue

**Note:** You must assign a value to any required field. For example, if products and categories are required, you cannot select a No Value option to the Set Product action in a rule.

**Related Topics**
- Business Rule Actions

**Action Order**
In general, the order of rule actions is unimportant. The exceptions are the Append Thread actions and the Do Not Send Response action.

Append Thread actions depend on order because the appended information is added to the outgoing email response in the same order that the rule actions occur in the rule.

The following Append Thread to Response actions are added to the response thread in the order that you specify in the rule actions, so that you can effectively format the outgoing email response:

- Append Response Template to Response Field
- Append Existing Solution (by Answer ID) to Response Field
- Append SmartAssistant Response to Response Field

**Note:** If the Append Response to the Uncommitted Response Buffer action is used in conjunction with multiple Append Thread actions, all appended items are added to the uncommitted response rather than the incident thread. This does not apply to the Append Response Template to Notes Field action.

The Do Not Send Response action is used to prevent automatic incident update responses if you use a message system outside of B2C Service to deliver your responses. The Do Not Send Response action should always be added as the last rule to ensure that it is applied to all responses. If it does not execute last, another rule could request a response causing an automatic response through B2C Service.

**Related Topics**
- Business Rule Actions

**Actions to Set Custom Fields and Variables**
You can define rule actions that set custom fields and variables.

When a custom field or variable has a text field data type or a custom field has a text area data type, you can create a rule to perform any of the following actions on the custom field or variable:

- Set equal to a literal text string
- Prepend with a literal text string
- Append with a literal text string
- Set equal to the value of another custom field or variable

When you enter a text string, the system removes any leading or trailing spaces before it inserts the custom field or variable in the database. For example, if you set a custom field to the value **hello**, and add an action that appends the word **there** to the same field, then the resulting value will be **hellothere**.
To create spaces between the words, use quotation marks. In this example, set the custom field to “hello” and append “there” (with a space before the t in there) to get the result hello there.

**Note:** The quotation marks are removed in the result. The quotation marks at the beginning and end of a string are removed, but any quotation marks that are embedded in the string will remain in the string.

**Related Topics**
- Business Rule Actions

**Actions for Rule Bases**
This topic contains descriptions of the actions available for rules within each object type.

The available actions depend on the rule object type. These four actions, available in all rule bases and described in *Action Execution*, are not included in these tables.

- Stop Processing Rules
- Call Function
- Transition State and Stop
- Transition State and Continue

Some actions depend on items you have added. This includes customizable menu items, such as products, categories, and dispositions, as well as custom fields, SLAs, mailboxes, Outreach emails and mailings, and Feedback surveys. If you have not entered any menu options for incident severity, for example, “Severity” will not appear as an action for incident rules. You can add incident severity levels, but you must close the Rules editor for them to appear in the list of actions. If, however, you already have severity levels and add another one, it will appear without you needing to close the Rules editor.

This list links to tables that describe actions for the specific rule types:

- Actions for Answer Rules
- Actions for Contact Rules
- Actions for Incident Rules
- Actions for Chat Rules
- Actions for Opportunity Rules
- Actions for Organization Rules
- Action for Offer Advisor Rules
- Actions for Task Rules

**Actions for Answer Rules**
These are the actions that you can choose for answer rules.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Set Field</strong></td>
<td>Select this option, then select a field to set or change.</td>
</tr>
</tbody>
</table>
## Action | Description
--- | ---
**Answer Access** | Sets the Access Level field to the access level you select. To select multiple access levels, press Ctrl while making each selection.

**Assigned** | Sets the Assigned field to the staff account you select.

**Status** | Sets the Status field to the status you select.

**Banner Flag** | Sets the importance of the flag to the level you select from the drop-down menu and adds any text you type in the Banner Note field.

**Set Custom Field** | Select an answer custom field and set the value. You must add an answer custom field to your site for it to display.

**Set Variable** | Set the variable to an absolute value, increment or decrement the variable, or append or prepend a character string. The available actions depend on the variable's *data type*. For variables to display, they must be added to the Rules tree.

**Email** | Select this action to send the following type of email notification.

**Send Escalation Notification** | Sends an escalation notification to the staff member or group you select. You can also select a check box to send the escalation notice to the staff person assigned to the answer.

If multiple recipients are selected, press Ctrl and click a recipient to add it to (or clear it from) the list of selected recipients.

**Execute Object Event Handler** | Select this action to trigger an external event and then select the type of object event handler from the drop-down menu. For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed.

**Send Notification to Answer Sibling Assignee(s)** | Sends a notification to the owners of sibling answers.

**Escalate** | Escalate the answer to the selected level and set other escalation settings.

**Clear Escalation** | Clear the escalation level.

## Actions for Incident Rules
These are the actions that you can choose for incident rules.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Send Marketing Email</strong></td>
<td>Sends the mailing you select from the drop-down menu to the contact. The default time for sending the mailing is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the mailing.</td>
</tr>
<tr>
<td><strong>Send Transactional Survey</strong></td>
<td>Sends the survey you select from the drop-down menu to the contact. The default time for sending the survey is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the survey. The survey will only be sent to the contact once per incident, regardless of how many times the rule is matched. At least one transactional survey (set for rule visibility) must have been added for this option to appear.</td>
</tr>
<tr>
<td><strong>Execute Object Event Handler</strong></td>
<td>Select this action to trigger an external event and then select the type of object event handler from the drop-down menu. For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed.</td>
</tr>
<tr>
<td><strong>Execute External Event</strong></td>
<td>This option was disabled in the February 2015 release. Note: External events have been deprecated and might be permanently removed in a future release. Instead, use the Execute Object Event Handler action described in the previous row.</td>
</tr>
<tr>
<td><strong>Set Field</strong></td>
<td>Select this option, then select a field to set or change. If customizable menu options have not been created, the Set Field action for that option (product, category, disposition, queue, or severity) does not appear on the menu.</td>
</tr>
<tr>
<td><strong>Assigned</strong></td>
<td>Sets the Assigned field to the staff account you select.</td>
</tr>
<tr>
<td><strong>Status</strong></td>
<td>Sets the Status field to the status you select.</td>
</tr>
<tr>
<td><strong>Product</strong></td>
<td>Sets the Product field to the product you select.</td>
</tr>
<tr>
<td><strong>Category</strong></td>
<td>Sets the Category field to the category you select.</td>
</tr>
<tr>
<td><strong>Disposition</strong></td>
<td>Sets the Disposition field to the disposition you select.</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>Sets the Interface field to the interface you select.</td>
</tr>
<tr>
<td><strong>Queue ID</strong></td>
<td>Sets the Queue field to the queue you select.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Mailbox</td>
<td>Sets the Mailbox field to the mailbox you select. Only those mailboxes enabled for outgoing mail are options on this menu.</td>
</tr>
<tr>
<td>Severity</td>
<td>Sets the Severity field to the severity level you select.</td>
</tr>
<tr>
<td>Banner Flag</td>
<td>Sets the importance of the flag to the level you select from the drop-down menu and adds any text you type in the Banner Note field.</td>
</tr>
<tr>
<td>Apply SLA Instance</td>
<td>Credits the incident against the SLA for the contact or organization and lets you apply an SLA instance if one does not exist.</td>
</tr>
<tr>
<td>Set Custom Field</td>
<td>Select an incident custom field and set the value. You must add an incident custom field to your site in order for it to display.</td>
</tr>
<tr>
<td>Set Variable</td>
<td>Set the variable to an absolute value, increment or decrement the variable, or append or prepend a character string. The available actions depend on the variable data type. For variables to display, they must be added to the Rules tree.</td>
</tr>
<tr>
<td>Append Thread</td>
<td>Select this action to append any of these responses to the incident Note or Response fields. These actions should appear in the order you want the response to be formatted. For example, if you want standard text to appear before suggested answers in the response, add the Append Response Template to Response Field action before adding the Append SmartAssistant Response to the Response Field action. The Append Response Template to Notes Field action appears only in the incident thread, not in the response.</td>
</tr>
<tr>
<td>Append Response Template to Notes Field</td>
<td>Appends the standard text you select to the incident Note field. This action is available only if you have added standard text and selected the Rule Text check box on the Standard Text editor.</td>
</tr>
<tr>
<td>Append Response Template to Response Field</td>
<td>Appends the standard text you select to the incident Response field. This action is available only if you have added standard text and selected the Rule Text check box on the Standard Text editor.</td>
</tr>
<tr>
<td>Append Existing Solution (by Answer ID) to Response Field</td>
<td>Appends the solution for the Answer ID you enter to the incident Response field.</td>
</tr>
<tr>
<td>Append SmartAssistant Response to Response Field</td>
<td>Appends the SmartAssistant suggested answer links to the incident response. If you restrict the SmartAssistant suggested answers by product or category, the product or category value must appear in the subject or message text of the incident in order for matching answer links to be generated.</td>
</tr>
<tr>
<td>Append Response to the Uncommitted Response Buffer</td>
<td>Use this action in conjunction with any of the Append Thread actions except Append Response Template to Notes Field. This action appends the content you add to the incident response to the incident proposed response field rather than the incident thread. Content in the proposed response can be edited before it is saved to the thread.</td>
</tr>
<tr>
<td>Email</td>
<td>Select this action to send one of these email notifications. If you delete an email or transactional survey that is used in a rule, the rule base can still be activated, but the action will not be executed, and you will not be notified that the email was not sent.</td>
</tr>
<tr>
<td>Send Email Response to Sender</td>
<td>Sends an email to the sender containing the incident subject and response. To include the question and incident details in the email, select the appropriate check boxes. Do not add this action unless you have selected one of the incident rule actions that append a thread to an incident response. See actions available for Append Thread in this table.</td>
</tr>
<tr>
<td>Email Incident Information</td>
<td>Sends a copy of the Question Receipt email message to the address you type in the field or select from a menu. You can also send the information to the staff person assigned to the incident.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| To include administration and customer fields, select the appropriate check boxes. | To include administration and customer fields, select the appropriate check boxes.  
- Administration fields must be selected before you can select customer fields.  
- Administration fields include the reference number, subject, date created, date last updated, status, assigned staff member, and the incident thread, including private notes.  
- Customer fields include the contact’s email address, first and last names, contact type, title, office phone number, organization, and any contact and organization custom field data. |
| Send Escalation Notification         | Sends an escalation notification to the staff member or group you specify.  
You can also select a check box to send the escalation notice to the staff person assigned to the incident. If multiple recipients are selected, press Ctrl and click a recipient to add it to (or clear it from) the list of selected recipients. |
| Send Marketing Email                 | Sends the mailing you select from the drop-down menu to the contact for the incident.  
The default time for sending the mailing is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the mailing. This option does not appear if Outreach is not enabled and if no mailings have been created. |
| Send Transactional Survey            | Sends the survey you select from the drop-down menu to the contact for the incident.  
The default time for sending the survey is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the survey. The survey will only be sent to the contact once per incident regardless of how many times the rule is matched.  
At least one transactional survey (set for rule visibility) must have been added in order for this option to appear. |
| Send Receipt Email                   | Sends a receipt email to the contact associated with an incident that was created through channels other than email or the Ask a Question page.  
That is, if an incident is created by an agent on behalf of a customer, this action sends an email to the contact. |
| Execute Object Event Handler         | Select this action to trigger an external event and then select the type of object event handler from the drop-down menu.  
For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed. |
| Execute External Event               | This option was disabled in the February 2015 release.  
**Note:** External events have been deprecated and might be permanently removed in a future release. Instead, use the Execute Object Event Handler action described in the previous row. |
| Do Not Create Incident               | Select this action to prevent an incident from being added. When an incident is being updated, this action has no effect. |
| Do Not Send Email Receipt Message    | Select this action to prevent the normal transmission of the email receipt message to the sender. If the incident meets the rule conditions, an automatic response is not sent to the customer. |
| Do Not Send Response                 | Select this action to prevent an automatic response from being sent when an incident is updated.  
For example, if your responses are delivered through a message system outside of B2C Service, you can use this rule to suppress an automatic response. To ensure all responses are suppressed, this rule must be executed last. |

<tr>
<td>Email</td>
<td>Select this action to send one of these email notifications. If you delete an email or transactional survey that is used in a rule, the rule base can still be activated, but the action will not be executed, and you will not be notified that the email was not sent.</td>
</tr>
</tbody>
</table>
## Email Opportunity Information
Sends the opportunity information to the email address you select from a menu of staff members, groups, and distribution lists. (Press Ctrl to make multiple selections.)
You can also select a check box to send the information to the staff person assigned to the opportunity. To include administration fields and customer fields, select the appropriate check boxes.

## Send Escalation Notification
Sends an escalation notification to the staff member or group you specify. You can also select a check box to send the escalation notice to the staff person assigned to the opportunity.

## Send Marketing Email
Sends the mailing you select from the drop-down menu to the contact for the opportunity. The default time for sending the mailing is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the mailing.

## Send Transactional Survey
Sends the survey you select from the drop-down menu to the contact for the opportunity.
The default time for sending the survey is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the survey. The survey will only be sent to the contact once per incident, regardless of how many times the rule is matched.

At least one transactional survey (set for rule visibility) must have been added for this option to appear.

## Execute Object Event Handler
Select this action to trigger an external event and then select the type of object event handler from the drop-down menu.
For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed.

## Execute External Event
This option was disabled in the February 2015 release.

### Note:
External events have been deprecated and might be permanently removed in a future release. Instead, use the Execute Object Event Handler action described in the previous row.

## Escalate
Select this action to escalate the opportunity to the level you specify and set other escalation settings.

## Clear Escalation
Select this action to clear the escalation level.

Action for Offer Advisor Rules
Regardless of the conditions for Offer Advisor rules, the only action that occurs is predefined: “Contact will match this target.”

See Overview of Offer Advisor Administration.

Actions for Task Rules
These are the actions that you can choose for task rules.

Task rules are executed first when a task is updated at the same time as another object. Therefore, task actions based on non-task conditions are executed using the current value for the object rather than the updated value.

For example, assume you have created a contact rule that sets a contact’s Opportunities state to Yes if the contact’s global opt-in value is Yes. Also assume you have created a task rule that escalates a task if the contact’s Opportunities state equals Yes. If a staff member updates the contact for a task by setting the global opt-in to Yes and then saves the task, then the task will not be escalated. Because the task rule is executed before the contact rule, the contact’s Opportunities state is not yet updated to Yes, so the task escalation does not happen.

Rules for Escalation of Answers, Incidents, Opportunities, and Tasks

The escalation function in business rules helps your organization track answers, incidents, opportunities, and tasks. You can use rules for escalation to scan for problems, such as lack of follow-up by a staff member. Then the rule actions occur, such as reminding the assigned staff member, notifying a manager, or sending an email to a customer. Every escalation requires two rules. The first one specifies the conditions that schedule an escalation and create an escalation level. The second rule defines the actions that occur when the escalation level is reached.

To help you start thinking about escalation functions, these questions might remind you of situations you want to automate.

- How are answers, incidents, opportunities, and tasks assigned to staff members?
- How soon should answers be reviewed after being proposed or created?
- What is an acceptable response time for incidents?
- What time frame is acceptable for sales representatives to contact new opportunities?
- What happens if a task is not completed by its scheduled completion date?
- Who should be notified if answers, incidents, opportunities, or tasks are not handled in a timely manner?
- What happens if the next level responder does not take action?

The scheduling of escalation involves these escalation options:

- **Relative time**—Calculates the number of minutes or hours from a specific day of the week or from an event, such as time created or time updated. The relative time field must have a value for this option to be meaningful. For example, if you escalate an incident based on initial response and a response has not been sent yet, escalation cannot be scheduled.

- **Response interval**—Uses the work hours defined in your default response requirements. When you select this option, only working hours are used to determine relative time. If you clear this check box, incidents may escalate during non-working hours. The Response interval escalation option is available only in incident rules.

- **Revalidate**—Verifies that the object continues to match the rule conditions after being updated. If it no longer matches, the object is removed from the scheduled escalation queue.

- **Recalculate**—Reschedules escalations that are based on events (such as time updated or time of last response) when the object is updated and continues to meet the rule conditions. For example, if you schedule an escalation four hours after an incident is updated, the original escalation schedule is recalculated if the incident is updated before four hours elapse. The updated escalation is scheduled for four hours after the most recent update.
Note: When the rules engine schedules an escalation but the Recalculate option is not selected, updating the object does not update the scheduled escalation. The escalation remains scheduled until it is executed or until revalidation removes it. For example, if you set an incident escalation action +4 hours relative to “Now,” the rules engine schedules escalation when the rule first executes. If the incident is updated and the conditions still match, the escalation time continues to be based on the original time, not the updated time.

- Clear Escalation action—Prevents escalation. For example, you might schedule escalation to ensure that a response is sent within a certain time frame, but you should clear escalation after the response has been sent. It is a good practice to select Revalidate to cancel the scheduled escalation when the Clear Escalation action is executed.

Note: Unlike incidents and tasks, answers and opportunities never reach a state where they cannot be escalated, as incidents do when they are solved and tasks do when they are completed. To help you manage these escalations, use the Clear Escalation action to prevent escalation and Revalidate to ensure that scheduled escalations are removed.

Before you create escalation levels, you must understand the Dbstatus utility, which escalates objects and runs by default four times an hour.

- Process for Escalating Incidents

How Escalation Rules Work
While escalation rules are most commonly applied to incidents, they can also be useful for managing answers, opportunities, and tasks.

Escalation rules always come in pairs:
- The first rule creates the escalation level for any incident, answer, opportunity or task that matches the rule conditions. It tells the Dbstatus utility to set the escalation to the defined level when the time for escalation has passed.
- The second rule specifies what you want to happen after the incident, answer, opportunity or task reaches this escalation level.

For an example of escalation rules, see Escalate an Incident.

Tip: We recommend creating a separate function where you can place escalation rules. See Add a Function.

- Process for Escalating Incidents
- Create a Rule that Sets the Escalation Level
- Create a Rule that Triggers Actions on an Escalated Object
Process for Escalating Incidents

Here are the main steps necessary to create and implement rules that escalate incidents. The process is the same for escalating answers, opportunities, and tasks.

1. Outline the chain of events for responding to an incident. For example, be sure you understand how much time an agent has to respond to an incident before the agent’s supervisor should be notified. Continue this process through all levels of escalation.

2. Add an escalation function to the incident rule base.

3. Add the first rule to the escalation function.
   This rule creates the escalation level and defines the conditions that cause the rules engine to set an escalation level. For example, the condition might be a previous escalation level or an Unresolved incident status.

4. Add the second rule to the escalation function.
   This rule specifies the action to take when the incident reaches the defined escalation level. For example, you might add an action to notify a supervisor.

5. Repeat steps 3 and 4 for every escalation level.

6. Add a rule that calls the escalation function. Create a rule with no conditions and an action that calls the escalation function you created in step 2, then add this rule to the initial state as the second-to-last rule.

   **Note:** Normally, you want the other rules in the state to be applied before escalation, and the last rule in a state is usually an action to transition to the next state.

7. Repeat step 6 for every state in the incident rule base.

What happens now when an incident is added or updated?

- The rules engine applies all rules in the initial state to the incident, including the rule that calls the escalation function. When it calls the escalation function, the rules engine begins processing the rules in the function, comparing the incident to the conditions of each rule. If the incident matches the conditions of a rule, the rules engine schedules the escalation and defines when it should escalate to the specified escalation level.

- Then, during a scheduled run, the Dbstatus utility compares the incident to the escalation schedule and, if the time indicated in the escalation action has passed, it sets the incident escalation level to the one defined in the rule.

- Because the incident has just been modified by having an escalation level set, the rules engine reprocesses the incident. When it applies the rules in the escalation function to the updated incident, the escalation level now matches the conditions of the second rule in the escalation function. Consequently, the escalation action (such as notifying a supervisor) occurs. Rules can escalate an incident multiple times before it is solved.

How the Dbstatus Utility Updates the Escalation Level

One function of the Dbstatus utility is updating the escalation level of answers, incidents, opportunities, and tasks.

Although the rules engine sets the escalation level for an object, Dbstatus updates the object. During one of its scheduled runs, Dbstatus notes the time, then searches the knowledge base looking for answers, incidents, opportunities, and tasks that have a scheduled escalation time less than the current time. It then updates those objects with the defined escalation level.

After Dbstatus updates the object, the rules engine reprocesses the object to see if it now matches other rules in the escalation function. This allows multiple steps of escalation based on the number of escalation levels you created.

Rules to escalate tasks, incidents, and opportunities use the configuration settings and message bases associated with the interface of the object being escalated. Answer escalations use the configuration settings and message bases of the interface from which Dbstatus runs.
Create a Rule that Sets the Escalation Level

This procedure shows you how to create a rule that sets an escalation level when the escalation level is applied to an incident, but the procedure is the same when applied to answers, opportunities, and tasks.

**Tip:** We recommend creating a separate function where you can place escalation rules. This procedure assumes that the rules you create are placed in an escalation function.

Escalation rules always come in pairs. This procedure creates a rule that sets the escalation level for an incident that matches the rule conditions. It tells the `Dbstatus` utility to set the escalation to the defined level when the time for escalation has passed. The next rule must specify what you want to happen after the incident reaches this escalation level.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Rules**.
3. Click the button for the rule type you want to create. The incident rule base is selected by default.
4. Click **Edit**.
5. Right-click the escalation function where you want to place the new rule and select **New Rule**.
6. Enter the rule name in the **Rule Name** field.
7. Add the conditions that will trigger the escalation.

**Tip:** When you create a rule to escalate an incident or other object that has not yet been escalated, you can add a condition of `Escalation Level equals Unspecified` to ensure that you don’t escalate an object that already has an escalation level previously set by another rule.

8. Click **Add Action–Then** and select **Escalate**.
9. Enter the values in the escalation action fields.

</thead>
<tbody>
<tr>
<td>Escalate to Level</td>
<td>Enter a name for the escalation level you are creating in this field.</td>
</tr>
<tr>
<td>Relative</td>
<td>Select this check box to trigger escalation at a time relative to a day or event, which you select from the drop-down menu to the right of the check box. In the drop-down menu to the left of the check box, select a value to establish the time relationship to the event. For example, you might select a relative time such as +4 hours relative to Time Created. Clear this check box to base escalation on absolute time.</td>
</tr>
<tr>
<td></td>
<td>This field lets you schedule the escalation using absolute time. That is, you set the specific time you want rather than scheduling escalation relative to another time. Click the drop-down menu to open the current month calendar and select the escalation date. To change the date or time, click the value you want to change, then enter a new value. Click anywhere in the date or time to set the exact date and time you want the answer, incident, opportunity, or task to escalate to this level. This option appears only if the Relative check box is cleared.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Click the arrow to open a window for selecting the direction, offset, and units for the relative time value. +1 Hours is the default. Enter the direction, offset, and unit for this field, then click Save. This option appears only if the Relative check box is selected.</td>
</tr>
<tr>
<td>Direction</td>
<td>Select + (future) or − (past) to indicate the direction of the offset for the escalation time from the relative time you define. For example, you might want to escalate an incident 8 hours after (+8 Hours) the time of the last response or an opportunity 4 hours before (–4 Hours) the Forecast Close time.</td>
</tr>
<tr>
<td>Offset</td>
<td>Select this field and enter a new value to change the number of minutes or hours before or after the relative time.</td>
</tr>
<tr>
<td>Unit</td>
<td>Click the drop-down menu, then select minutes or hours.</td>
</tr>
<tr>
<td></td>
<td>Click the arrow to display the drop-down menu and select Now, Today, Tomorrow, any day of the week, or any of the answer, incident, opportunity, or task options listed below. This establishes the base time to which Dbstatus applies the relative escalation time. You must select the Relative check box to display the menu.</td>
</tr>
<tr>
<td></td>
<td>If you select Today, Tomorrow, or any day of the week, the time associated with that date field is midnight. Therefore, if you create a rule to escalate an answer or an opportunity +3 hours relative to Wednesday, then the escalation would be scheduled for the next Wednesday at 3 A.M.</td>
</tr>
<tr>
<td></td>
<td>The same scenario holds true for incident escalation only if the Use Response Intervals check box is cleared. If the Use Response Intervals check box is selected, the schedule for escalation depends on the work hours that have been set since only work hours are counted.</td>
</tr>
<tr>
<td></td>
<td>If, for example, work hours on Wednesdays begin at 6:00 A.M., then escalation for the incident would be scheduled for Wednesday at 9:00 A.M.</td>
</tr>
<tr>
<td>Answers</td>
<td>Select one of these escalation options based on the time the answer was added or updated or is scheduled to be reviewed or published.</td>
</tr>
<tr>
<td>Answers.Created</td>
<td>Select this option if you want the escalation time to be calculated from the time the answer was added.</td>
</tr>
<tr>
<td>Answers.Updated</td>
<td>Select this option if you want the escalation time to be calculated from the time the answer was updated.</td>

### Core Features

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Incidents</strong></td>
<td>Select one of these escalation options based on the time the incident was added, updated, or responded to, or the time it is due.</td>
</tr>
<tr>
<td>Incident.Created</td>
<td>Select this option if you want the escalation time to be calculated from the time the incident was added.</td>
</tr>
<tr>
<td>Incident.Updated</td>
<td>Select this option if you want the escalation time to be calculated from the time the incident was updated.</td>
</tr>
<tr>
<td>Incident.Date Last Responded</td>
<td>Select this option if you want the escalation time to be calculated from the time the incident was last responded to. If the database contains no value for this field (because only the initial response has been recorded with no subsequent responses), the escalation action will not occur.</td>
</tr>
<tr>
<td>Incident.Date Initial Solution Response</td>
<td>Select this option if you want the escalation time to be calculated from the time of the initial solution to the incident. If the value for this field in the database is null (because the incident has not been responded to yet), the escalation action will not occur.</td>
</tr>
<tr>
<td>Incident.Date Due</td>
<td>Select this option if you want the escalation time to be calculated based on the relative time due set in your default response requirements.</td>
</tr>
<tr>
<td><strong>Opportunities</strong></td>
<td>Select one of these escalation options for opportunities.</td>
</tr>
<tr>
<td>Opportunity.Created</td>
<td>Select this option if you want the escalation time to be calculated from the time the opportunity was added.</td>
</tr>
<tr>
<td>Opportunity.Updated</td>
<td>Select this option if you want the escalation time to be calculated from the time the opportunity was updated.</td>
</tr>
</tbody>
</table>
| Opportunity.Initial Contact| Select this option if you want the escalation to be calculated from the date the customer for the opportunity was initially contacted by a sales representative. The time associated with this date field is midnight. Therefore, if you create a rule to escalate +3 days relative to Time Initial Contact and the initial contact occurred on Monday morning, the escalation would be scheduled for midnight on Thursday.  
If the value for this field in the database is null (for example, if the customer for the opportunity has not been contacted yet), the escalation action will not occur. |
| Opportunity.Forecast Close | Select this option if you want the escalation to be calculated from the date the opportunity is forecasted to close. The time associated with this date field is midnight. Therefore, if you create a rule to escalate 12 hours before the forecasted close (that is, –12 hours relative to Time Close Forecasted) and the opportunity was forecasted to close on Friday, the escalation would be scheduled for Friday at noon.  
If the value for this field in the database is null (for example, the opportunity does not have a forecasted close date yet), the escalation action will not occur. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opportunity.Date Closed</td>
<td>Select this option if you want the escalation to be calculated from the date the opportunity closes. The time associated with this date field is midnight. Therefore, if you create a rule to escalate 6 hours after the close date and the opportunity closed on Tuesday, the escalation would be scheduled for 6:00 A.M. Wednesday. If the value for this field in the database is null (for example, the opportunity has not closed yet), the escalation action will not occur.</td>
</tr>
<tr>
<td>Opportunity.Lost Date</td>
<td>Select this option if you want the escalation to be calculated from the date the opportunity was lost.</td>
</tr>
<tr>
<td>Opportunity.Recall</td>
<td>Select this option if you want the escalation to be calculated from the date the customer for the opportunity should be called again.</td>
</tr>
<tr>
<td>Tasks</td>
<td>Select one of these escalation options for tasks.</td>
</tr>
<tr>
<td>Tasks.Completed Date</td>
<td>Select this option if you want the escalation time to be calculated from the date the task was completed.</td>
</tr>
<tr>
<td>Tasks.Created</td>
<td>Select this option if you want the escalation time to be calculated from the date the task was added.</td>
</tr>
<tr>
<td>Tasks.Due Date</td>
<td>Select this option if you want the escalation time to be based on the task due date.</td>
</tr>
<tr>
<td>Tasks.Planned Completion Date</td>
<td>Select this option if you want escalation to be based on the planned completion date of the task.</td>
</tr>
<tr>
<td>Tasks.Start Date</td>
<td>Select this option if you want escalation to be based on the task start date.</td>
</tr>
<tr>
<td>Tasks.Updated</td>
<td>Select this option if you want escalation to be based on the date the task was updated.</td>
</tr>
<tr>
<td>Use Response Interval</td>
<td>Select this check box to use the work hours defined in the default response requirements set up for your organization. If you clear this check box, incidents meeting the conditions might escalate during non-working hours and holidays. This check box applies only to incident escalation and does not appear with escalation actions for tasks, answers, and opportunities.</td>
</tr>
<tr>
<td>Revalidate</td>
<td>Select this check box to revalidate the answer, incident, opportunity, or task, which means that if it is edited and no longer matches the conditions of this rule, the escalation action is removed from the scheduled escalations queue. After an escalation that requires revalidation has been scheduled, the conditions of the rule must continue to match when the object is updated. If they do not, the pending escalation is canceled.</td>
</tr>
<tr>
<td>Recalculate</td>
<td>Select this check box to recalculate escalation time for the answer, incident, opportunity, or task when it is updated. The rules engine reschedules escalation based on the relative time value, such as four hours after Time Updated. You must select a relative time value that is not static in order</td>
</tr>
</tbody>
</table>
This image shows a rule that sets an escalation level.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>for the Recalculate feature to be meaningful. If you select a static value, for example, Time Created, escalation is not rescheduled because Time Created remains static even when the object is updated. If, however, you select Time Updated, escalation is rescheduled because the Time Updated value changes when the object is updated.</td>
</tr>
</tbody>
</table>

10. Click Save.

The next rule must specify what you want to happen after the incident reaches this escalation level. To do this, you create another rule in the escalation function, as described in Create a Rule that Triggers Actions on an Escalated Object.

- Add a Function

Create a Rule that Triggers Actions on an Escalated Object

This procedure shows you how to create a rule that performs an action when the escalation level is applied to an incident, but the procedure is the same when applied to answers, opportunities, and tasks.

Tip: We recommend creating a separate function where you can place escalation rules. This procedure assumes that the rules you create are placed in an escalation function.
Escalation rules always come in pairs. This procedure follows the creation of a rule that sets the escalation level for an incident that matches the rule conditions (see Create a Rule that Sets the Escalation Level). It tells the Dbstatus utility to set the escalation to the defined level when the time for escalation has passed. This procedure creates the next rule to specify what you want to happen after the incident reaches this escalation level.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, then double-click Rules.
3. Click the button for the rule type you want to create. The incident rule base is selected by default.
4. Click Edit.
5. Right-click the escalation function where you want to place the new rule, then select New Rule.
6. Enter a name for the rule in the Rule Name field.
7. Click Add IF Condition Based On and select Escalation Level equals <Escalation Level>.
   This is the name of the escalation level created in the rule that sets the escalation level.
8. Click Add Action–Then to add the appropriate actions based on your business process.
   For example, the rule action could be to send an escalation email to the assigned staff member of the incident.
9. Click Save.

You have now created a rule that sets the escalation level and a rule that specifies the actions to be taken when the escalation level is detected during rules processing. As you create additional rules to set escalation levels and perform actions, remember that only rules in the initial rule state initially process unless those rules transition to another state or call a function. For the rules engine to process the rules in the function you place your escalation rules in, you must have a rule that calls the escalation function.

To add more escalation levels and actions, repeat this process. After you have created your escalation rules, activate the rule base. See Compilation and Activation of Rule Bases.

Compilation and Activation of Rule Bases

Whenever you make changes to a rule base, you must compile it to make sure that no errors exist. You must then activate it so that the changes take effect.

Compiling lets you examine the state transitions and function calls to ensure that the rule base correctly reflects your intentions. You can compile the rule base as many times as necessary to ensure that it functions as planned.

You can activate the rule base when the compiling process convinces you that it functions the way you intend it to. Activating the rule base archives the version of the rule base that existed before you began making changes and incorporates the changes into the current rule base. Until you activate the rules you have been editing, they will not process any records. To view the rules that are currently active, see How to View Rule Bases.

Note: Whenever you make any changes to a rule base, you must activate the rule base for the changes to take effect. However, activating the rule base does not automatically evaluate items in the knowledge base and execute rules in the updated rule base. Assume, for example, that you have updated the incident rule base to include a rule that applies an SLA instance to all incidents from a specific organization. Activating that rule base does nothing to change existing incidents from that organization because the rules engine is invoked only when incidents are added or updated, not when rule bases are activated.
Compile a Rule Base
This procedure uses contact rules as an example, but you can compile any type of rule using the same procedure.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Rules**.
3. Click **Contact**, then click **Edit** to view the contact rules you will compile.
4. Click **Compile**.
   A message asks you to confirm that you want to compile the rule base.
5. Click **OK**.
   The compiler engine checks rules, states, and functions. If no errors occur, a message lets you know that the rule base compiled correctly.
6. Click **OK**.
   You can now continue editing the rule base.

Activate a Rule Base
This procedure uses contact rules as an example, but you can activate any type of rule using the same procedure.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Rules**.
3. Click **Contact**, then click **Edit** to view the contact rules you will activate.
   **Tip:** You can check whether changes to a rule base have been activated by comparing the Created and Last Updated dates. If these dates and times are not the same, then changes have been made, but the updated rule base has not been activated. In addition, the date in the Last Updated column will be red to alert you that changes have not been activated.
4. Click **Activate**.
   A message asks you to confirm that you want to activate the rule base.
5. Click **OK**.
   The compiler engine checks rules, states, and functions. If no errors occur, a message lets you know the rule base compiled correctly.
6. Click **OK**.
   You can now continue editing the rule base.

Abandon Changes to a Rule Base
Abandon changes to a rule base to revert back to the last activated version.

**CAUTION:** This action deletes all of the changes you have made to the rules, functions, states, and variables in the current editing session.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Rules**.
3. Click the button for the rule base you want to abandon.
   The incident rule base is selected by default.
4. Click **Edit** to view the rules currently in the edit state.
5. Click **Abandon** on the Rules editor.
   A message asks you to confirm that you want to delete all of the changes made in this editing session.
6. Click **OK** to delete the copy of the rule base you are editing, including all states, functions, rules, and variables. All of the changes you have made are deleted, and the rule base reverts to the last activated version.

### Objects in the Null State

If the knowledge base contains records that were created before the rule base for that record type was activated, those records are considered to be in a null state.

This means that the records will not be processed by the rule base when they are next edited, unless you move them into an active state in the rule base. Records might also need to be reassigned to an active state if you delete the state where they previously existed, so that the rule base will process them when they are updated.

If records associated with the rule base are in a null state when you activate the rule base, you will see a message similar to:

**Move the 114362 contacts in state with ID value of Null to _____**

You can then click the drop-down menu to select the state where the records should be assigned.

The records you move to an active state are not processed by the rule base just because you move them to a new state. However, they will be processed the next time they are edited, unless they remain in the Null state or a state that has been deleted. In those cases, they will never be processed.

**Note:** If you have deleted escalation levels when editing a rule base, you must also select new values for those levels. If you select Null to replace the existing escalation level value, pending escalations are deleted and the objects are not escalated. See *Rules for Escalation of Answers, Incidents, Opportunities, and Tasks*.

### Change State Values When Activating a Rule Base

Change the state value of records in a null state to an active state so they can be processed by a rule base.

1. When you see a message about moving records in a null state, click the drop-down menu and select the state where you want to move the records.
2. Click **Save**.
   - A message lets you know that the rule base was activated.
3. Click **OK** to exit the rule base.

### How to View Rule Bases

When you view active rules, you see the rules, states, functions, and variables in the selected rule base that are currently active that impact the incidents and other types of records on your site.

When you open the Rules editor, the View Active button on the ribbon is selected. Unless you intend to make changes to your rule base, it is a good idea to use the View Active option instead of Edit to prevent accidental modification of the rule base and help you track changes to the rule base. When changes to the rule base are necessary, you can tell if someone else has already begun making changes by looking at the Last Updated column on the Rules editor or the Edited date when reviewing the active rule base.

In addition to viewing the rule base without editing it when you select View Active, you also have the option of restoring the archived rule base. If, after viewing the rule base, you decide you want to revert to the previously archived version of the rule base (that is, the last one that had been activated prior to the current version), you can restore the archived version. After restoring the archived rule base, you must activate it for the restored version to become the new current version.
Note: You can prevent staff members from editing rules by clearing the Rules Edit check box on the Administration permissions tab of the Profiles editor, but still let them view rules by selecting the Rules View check box. See Administration Permissions.

Related Topics
- View a Rule Base
- Restore the Archived Version of the Rule Base

View a Rule Base
Follow this procedure to view a rule base.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, then double-click Rules.
3. Click the button for the rule type you want to view.
   Because View Active is selected by default, the rules displayed on the content pane are the active rules on your site. The incident rule base is selected by default.
   The content pane displays the dates the rule base was activated, edited, and archived and the staff member who performed these actions. It also displays the transitions from one state to another and the states from which functions are called.
   An entry in the Edited column indicates that a copy of the active rule base has been created. A staff member might have made changes or simply used the Edit option to open the rule base.
4. To view a state, right-click the state and select View State.
5. To view a function, right-click the function and select View Function.
6. To view a rule, right-click the rule and select View Rule.

Restore the Archived Version of the Rule Base
Follow this procedure to restore the archived version of the rule base.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, then double-click Rules.
3. Select the rule type button for the rule base you want to restore.
   The incident rule base is selected by default.
4. Click Restore.
   You are asked to confirm that you want to restore the archived rule base.
5. Click OK to confirm the restoration of the archived rule base.
6. Click Activate to activate the restored version of the rules base.

Note: If you close this window without activating the rules base, the restored version is abandoned and the current version of the rules base remains active.

Search a Rule Base
You can search for names of states, functions, rules, and variables in rule bases, whether you are viewing active rules or editing them. This lets you easily find the items you need to view or edit, especially when working in a large rule base.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, then double-click Rules.
3. Click the button for the rule base you want to view.
   The incident rule base is selected by default.
4. Click Search located above the tree.
   The Find window opens.
5. Enter the text you want to find in the rule base tree in the Find What field.
   By default, the search is not case sensitive.
   **Tip:** Wildcards are automatically added to the beginning and end of the text that you enter. This lets you search for items using text strings that are in the item names but that are not at the beginning or end of the names. For example, entering b in the Find What field returns all items containing the letter “b.”
6. To make the search case sensitive, select the Match Case check box.
7. To locate items in the tree only if their names exactly match the search value you enter, select the Match Whole Word check box.
8. To search for items starting at the bottom of the tree and proceeding up, select Up. To start from the top of the tree, select Down. Down is the default.
9. Click Find Next to locate the first state, function, rule, or variable in the rule base that matches the text you entered.
10. Click Find Next again to locate subsequent items in the tree that match the text.
11. Click Close when you are finished with the search.

Modify a Rule Base

You can modify a rule base, including all states, functions, and the rules contained in each.

Modifying a rule base lets you:

- Change the names of states, functions, and rules, and the conditions and actions in rules.
- Duplicate a rule to change its name, conditions, or actions. This option makes it easy to add a rule with similar properties.
- Delete a rule.
- Temporarily disable a rule to prevent it from being considered when the system is processing workflow.
- Move a rule to another state or function or change the order of a rule within a state or function by dragging and dropping.

When you open a rule base and edit it, the system maintains the active rule base while you edit a copy in the Rules editor. Your changes are not saved until you activate them. This prevents any disruption in rules processing during the editing process, and ensures that you can revert to a functional rule base should you make any accidental changes while editing.

**CAUTION:** If you delete a state or function, you also delete all the rules within that state or function.

1. Right-click any rule in the rule base, then select one of the following options:
   - **Edit**—Make the changes and save the rule. If the rule was not successfully updated, a message indicates the value that is not valid.
   - **Duplicate**—Rename the rule, make the necessary changes, and save the new rule.
   - **Delete**—A message asks you to confirm the deletion.
Disable/Enable—The tree refreshes and a lock icon appears next to the rule to reflect its disabled status. The menu option changes to Enable when you right-click a disabled rule.

2. Make other changes to the rule base as necessary, such as reordering rules.

Because opening a rule base to make changes creates a copy of the active rule base, this action changes the Last Updated column on the Rules editor (or the Edited date when you view active rules), regardless of whether you make any changes.

Regardless of how you modify a rule base, you must activate it for the changes to take effect. See Compilation and Activation of Rule Bases.

Verify a Rule Using the Rule Log

You can use the rule log to view the list of rules that have fired against a specific answer, contact, incident, opportunity, organization, or task.

The rule log lets you verify that a rule base works as intended and that no unintended actions occur as a result. The rule log also identifies whether the Then or Else clause was used to process the rule.

**Note:** When testing escalation, you might have to run the Dbstatus utility manually. However, keep in mind that manually running Dbstatus to confirm an object’s escalation also escalates everything that has reached the scheduled escalation time, not just the object you are testing. Be certain to configure email settings before you construct rules to check inquiries and responses that were sent by email. See Overview of Email Management for information about customizing email configuration settings.

1. Add and save a record, such as an incident, that matches the conditions of the rule.
2. Obtain the ID number of the object you want to view.
   - Open the record on a workspace, click **Info**, note the ID number, and close the record.
   - Open a report that includes the ID number of the record, such as the incident ID (**incidents.incident_id**) field. Note the ID number and close the report.
3. Click **Configuration** on the navigation pane.
4. Expand **Site Configuration**, then double-click **Logs**.
5. Click **Rule Log**.
   - The rule log opens on the content pane.
6. Click the **Type** drop-down menu, then select the type of record you want to view.
7. Enter the ID in the field and click **Search**.
   - This image shows a rule log for an incident that triggered three rules.
8. Check that the appropriate rules were applied to the record. If not, check the rules conditions and actions to see why the record was processed in that way.

The rule log might contain more than one entry, depending on when it was last purged. The Agedatabase utility purges the log after a configurable period of time (with a default of 30 days). The rule log might also indicate no matching rules.

Dependency Conflicts

If you attempt to delete an item (such as a rule variable, staff account, or queue) referenced in a rule, the system checks to see if the item is related to business rules. If it is related, then a dependency conflict might occur.

You will not receive a dependency conflict warning if you delete a product, category, or disposition used in a rule. However, if you try to delete a custom field that is used in incident rules, you will see a Dependency Conflict window that describes the conflicts.

Before you can delete the custom field, you must resolve the dependency by editing or deleting the rule that causes the dependency.

**Note:** If you delete an email or survey that is used in a Send action in a contact, incident, or opportunity rule, you can still activate the rule base but the rules engine will not process the action. No error will be logged to indicate that the mailing or survey was not sent.

Examples of Business Rules

These examples can help you to understand business rules better and create rule bases to streamline your organization’s business practices.

- Rules for Routing Customer Support Questions
- Example of Automatically Sending Emails and Surveys
- Example of Setting Incident Status in Response to an Event or Action
- Example of Using SmartAssistant to Suggest Answers Before Questions are Submitted
- Escalate an Incident
• Create a Variable to Measure Service Quality
• Examples of Applying Service Level Agreements (SLAs)
• Example of Using Relative Time Conditions

As there can be more than one way to accomplish the same objective using business rules, you might find other conditions and actions that let you achieve the same results as the sample rules described in this section. For complete details about working with business rules, including an overview of rules as well as procedures for creating rule bases, adding and editing rules, activating rule bases, and troubleshooting, see Overview of Business Rules.

Rules for Routing Customer Support Questions

One of the more common uses of business rules is to route incidents to the most appropriate staff member, group, or queue based on the criteria you define.

These conditions can be related to the incident itself or to a field in the contact or organization record associated with the incident.

It might make sense to route certain types of incidents to a specific staff member. But the rules engine cannot determine which staff members are logged in, so you risk having the incident assigned to a staff member who is not at work when the incident is routed. To ensure a timely response for your customers, a better practice is to assign incidents to queues from which all logged-in agents can pull.

In the following examples, each rule has two actions: to route the incidents that match the criteria to the queue for Team A, and then to move the incidents to a different state called “To be Processed.” (Best practice recommends you move incidents out of the initial state after the rules engine has routed them so the rules engine does not continue to process an incident using the rules of the initial state whenever it is updated.) In reality, you might have additional actions in any given rule. For example, after assigning an incident to a queue, you might want to append SmartAssistant-suggested answers to the incident before you transition it to a different rule state.

• Example of Routing Incidents by Source
• Example of Routing Incidents by Products or Categories
• Example of Routing Incidents by Time Created
• Other Incident Routing Conditions
• Example of Building on Basic Incident Routing Rules
• How the Else Clause Can Simplify Business Rules

Example of Routing Incidents by Source

You can use rules to route incidents to a specific queue or staff member.

You might have one queue dedicated to handling incidents that originate from the Ask a Question page on your customer portal, another one for replying to email incidents, and another for chat requests. If this is how your support team is organized, you will need a rule in the initial state for each type of incident source.

This image shows a rule that routes incidents to a specific queue.
Note: It is also a good idea to add a final rule to catch any incidents that enter your system through other sources, so they can be assigned to a staff member instead of being overlooked.

Example of Routing Incidents by Products or Categories
You can use rules to route incidents by their associated product.

Routing incidents by products or categories lets you direct them to the staff members who are experts in those areas. This can be especially useful if members of your support team have highly specialized areas of knowledge. This image shows a rule that routes incidents by their associated product.

Example of Routing Incidents by Time Created
You can use rules to route incidents by the time created.

For example, if a customer submits a question before or after your support staff’s normal working hours, you might want to route the incident to a backup staff member or queue who can respond to the customer. This image shows a rule that routes an incident to a Tier 1 Queue when the incident is submitted outside the normal working hours of 8:00 A.M. to 4:00 P.M.
**Note:** You can accomplish the same goal by using the operator In Response Interval. This operator is used only with incident rules to indicate that the incident was added within normal working hours. “Normal working hours” means either the response requirements of the SLA associated with the incident or the default response requirements if no SLA is associated with the incident.

You might not want to route every incident created outside working hours to a backup queue. Instead, you might decide to route only those that are added by certain customers. In that case, you can add another condition for the type of SLA the customer has, or for the customer’s organization.

**Note:** The default logical expression joins the conditions with AND (\&), meaning that both conditions must be met to trigger the action. If the logical expression used OR (\|), the action would be triggered if either one of the conditions was met.

### Example of Building on Basic Incident Routing Rules

Rules for routing incidents can be simple, but simple rules can serve as the building blocks for developing more complex rules.

In this example, you add to the rule that routes incidents created outside working hours by customers from a particular organization. (See *Example of Routing Incidents by Time Created* for the original rule.)

Assume that your organization wants to send a reply email to the customer who submits the incident. The reply should include suggested *SmartAssistant* responses to the question and list normal working hours. Also assume that you want to set the banner *flag* to high importance and send the incident to a customer support supervisor who can follow up if necessary to ensure that the customer receives a reply.

The rule will resemble this image.
Note: In the revised rule, the Transition State action must be last for the other actions to be processed. After you have added an action to stop processing rules or transition the state, the Add Action button is no longer available. As a result, you must first delete the existing Transition State and Continue action from the original rule, add the intermediate actions, and then add the Transition State and Continue action.

Other Incident Routing Conditions
Besides source, products, categories, and time created, you can route incidents based on several other conditions. This list describes some of the more common incident conditions. For a complete list, see Incident Conditions.

- **Subject and threads**—You might want to find all incidents that contain a specific word or phrase or, conversely, exclude those incidents from being impacted by rule actions. You can set conditions to search for text in the incident subject as well as customer and staff threads.

  Note: When you create a rule comparing a string to the Incident Customer Thread, Incident Staff Thread, Incident Proposed Response, or Incident Summary, you can use the Limit buffer by option that appears to specify the number of characters of the string the rule will search for in the most recent entries, up to a maximum of 4000 characters. This can be helpful if you want to disregard initial standard text. If no value is entered, the entire thread is compared.

- **Status**—Setting the incident status as a rule condition lets you find and act on all incidents with the specified status. For example, you might want to send a reminder email to all customers who have an incident with the status Waiting.

- **Previous fields**—It might be useful to note when an incident status, assigned staff member or group, or escalation level changes during rules processing. You can specify the previous value (that is, the value for the field stored in the database when the incident is added or updated or when rules processing begins) for these fields as conditions for incident rules.

- **Assigned staff member, group, or queue**—If one of your staff members is out of the office unexpectedly, you might want to create a rule to reassign that person’s incidents. Similarly, one group or queue might have
a heavier than normal volume of incidents and you might want to create a rule to direct some or all of those incidents to a different group or queue.

- **SmartSense ratings**—You might want to email incidents that have strongly positive customer SmartSense ratings to the staff member’s supervisor so that management can recognize agents who are serving customers well. It might also be useful to let management know when a staff member’s SmartSense rating is negative so corrective action can be taken if necessary. See SmartSense.

You can also route incidents based on rules you create using conditions for contacts and organizations. For example, you might want to route incidents based on a customer’s geographic region, the date your organization acquired them as a customer, or their industry.

**How the Else Clause Can Simplify Business Rules**

You can probably use rules to accomplish everything you want without ever using the Else clause. But using the Else clause can simplify your rules.

Rules are if-then statements: If this condition occurs, then take this action. Maybe you want incidents with a high severity level to be routed to one queue, and those with any other severity level to be routed to a second queue.

Your rules could look like this:

- If Incident.Severity equals High, set queue ID to Queue 1.
- If Incident.Severity equals Average, set queue ID to Queue 2.
- If Incident.Severity equals Low, set queue ID to Queue 2.
- If Incident.Severity equals None, set queue ID to Queue 2.

Depending on the number of severity levels your organization uses, this could get unwieldy rather quickly. Instead, you might create a different set of rules to accomplish the same thing:

- If Incident.Severity equals High, set queue ID to Queue 1.
- If Incident.Severity not equals High, set queue ID to Queue 2.

Even though the second rule set is more manageable than the first, the Else clause offers you a single-rule solution.

**Example of Automatically Sending Emails and Surveys**

Rules can automate some of your marketing efforts.

Assume, for example, that you want to send a message to all new customers in a specific geographic area to let them know about a new store opening in their region. To accomplish this, your contact rule might look like this.
Sending a survey is similar. The next image shows an incident rule that sends a customer support satisfaction survey when an incident is solved.

**Note:** The survey will only be sent to the contact once per incident, regardless of how many times the rule is matched.

**Tip:** We recommend setting the survey to send at least +1 minute after the incident is solved. Otherwise, if you leave the setting to its default value of zero hours, the customer might receive the survey before they receive the Incident Solved notification.

**Example of Setting Incident Status in Response to an Event or Action**

You can set rules to change the status of an incident when an event occurs or an action is taken.

In this example, when an email is not delivered to the recipient and triggers an automated reply instead (that is, it bounces), the incident status is set to Bounced. This alerts staff members that the email wasn’t received. They can then resend the email or use an alternate contact method. This example uses the “Techmail–Incoming Auto-Reply Message” source in the Transactions (transactions) table.
Example of Using SmartAssistant to Suggest Answers Before Questions are Submitted

This example is an action that offers suggested solutions to your customers when they submit incidents. These suggestions might help them resolve their issues themselves, without requiring help from your support team.

The example rule described in Example of Building on Basic Incident Routing Rules contained the action Append SmartAssistant Response to Response Field.

SmartAssistant works by evaluating the text of the customer’s question and determining which answers in the knowledge base best match the question. It then presents a list of these answers (to the maximum number specified in SA_NL_MAX_SUGGESTIONS) to the customer in one or both of two ways:

- On the Ask a Question page of the customer portal before the customer completes submitting the question
- In the response thread of the incident that gets sent to the customer

To display the suggested solutions when the customer clicks the Continue button on the Ask a Question page but not append them to the incident response thread, the incident source condition must be equal to SmartAssistant on Ask a Question.

To append the suggested solutions to the incident response thread but not display them when the customer submits a question, the incident source must be equal to Ask a Question.

To offer the suggested solutions to the customer when they ask the question and in the incident response thread, the condition for the incident source must have the check boxes for both SmartAssistant on Ask a Question and Ask a Question selected.

Escalate an Incident

Business rules let you escalate answers, incidents, opportunities, and tasks according to the conditions you define. This example shows how to create rules to escalate incidents.

Escalation lets you identify potential problems and take action before actual problems ensue. You might want to escalate incidents that have not been resolved within your organization’s default response requirements. You can
escalate answers that have been lingering in the review process and prevented from being published. Task escalation lets you notify staff members when tasks are pending, and opportunity escalation prevents a potential sale from being overlooked.

Each escalation action contains two rules:

- The first rule specifies when to escalate the incident and creates an escalation level.
- The second rule specifies what happens when the escalation level defined in the first rule is reached.

1. Create a function to contain the escalation rules, so that you can access the rules from any state in the incident rule base.
2. Create the first rule. This rule tells the `Dbstatus` utility to set an incident escalation level when the incident matches the rule conditions.
   a. Trigger the escalation if the incident status is unresolved, the incident has no current escalation level, and no response has been sent to the customer.
   b. In the action, create an escalation level called `Tier 1 Escalation`, which will be triggered 24 hours from the time the incident was created.
   c. Clear the `Use Response Interval` check box.
      The 24 hours is calculated based on actual clock time. If the check box were selected, only your organization's normal working hours would be used to calculate the time.
   d. Select the `Revalidate` check box.
      Any updates to the incident will cause the rule conditions to be evaluated to see if they still match. For example, if an agent responds to the customer, then you do not want the escalation to occur.
   e. Clear the `Recalculate` check box.
      The escalation time is relative to the time the incident was created, which is a static value that does not change during rules processing.

Your first escalation rule should look like this.

3. Create a rule that says what happens when the incident reaches the `Tier 1 Escalation` level.
   a. One of your conditions must be that the incident escalation level equals the level you created in the first rule.
   b. Add other conditions as necessary.
Your second escalation rule should look like this.

Now you have created a rule to set the escalation level for any incident that matches the conditions, and a rule to specify what action should be taken when the escalation level is detected during rules processing.

Create a Variable to Measure Service Quality

A variable is a temporary data item that is assigned a default value at the start of rules processing. You can define rule actions that update the variable during rules processing, and you can also define conditions based on the value of the variable.

A common example of a variable is a score that you set and modify according to the conditions you define. Then you can assign different actions based on the variable value.

In this example, let's assume that you want to be sure your management team is aware of high-priority service issues.

- Your organization expects your agents to communicate positively with all customers.
- Because the XYZ Corporation constitutes a significant part of your business, you want to be sure that contacts from that company are satisfied with the service they receive from your organization.
- You want to be especially sure that managers from the XYZ Corporation are happy with your service.

**Note:** A custom field can also accomplish the same function as a variable. The difference is that the value of the custom field is stored in the database at the end of rules processing. If its value changed during rules processing as a result of actions applied to it, that value remains and is what the custom field contains the next time the object is processed by the rules engine. In contrast, the value of a variable is not stored in the database, so its value is always 0 when rules processing begins the next time.

1. Create a variable called service_quality.
2. Create rules that set the value of the variable.

   Because you want the variable to change based on different conditions, you will need multiple rules to accomplish this. Rather than adding these rules to a state, create a function that scores the incident. Then you can call the function from multiple states instead of having to add the set of rules to each state from which you want to run them.
   a. Create a function called Service Quality Scoring.
b. Create rules within the Service Quality Scoring function that assign the appropriate weighting to the various factors you want to track. You might choose to create a set of incident rules similar to these to identify service issues:

- If the staff member’s *SmartSense* rating is Somewhat Angry, Angry, or Very Angry, then increment the value of `service_quality` by +6.

- If the staff member’s SmartSense rating is Neutral, then increment the value by +1.
- If the organization is the XYZ Corporation, then increment the value by +2.
- If the customer SmartSense is Somewhat Angry, Angry, or Very Angry, then increment the value by +6.
- If the *contact type* is Manager or Vice-President, then increment the value by +2.

3. Create rules that specify the actions for different values of the variable.

You might decide that high values of the `service_quality` variable warrant attention from a customer support supervisor or manager. Your rules might look like these two figures:

- If `service_quality` is greater than 5 and less than or equal to 7, then email the incident information to the customer support supervisor at your organization.

- If `service_quality` is greater than 7, then email the incident information to the manager of customer support.

- If `service_quality` is greater than 5 and less than or equal to 7, then email the incident information to the customer support supervisor at your organization.

- If `service_quality` is greater than 7, then email the incident information to the manager of customer support.
Using these rules, you can see that:

- No email is triggered if a manager (+2) at XYZ (+2) is happy or neutral (no change because rule conditions are not met), and if the agent SmartSense rating is neutral (+1). In this situation, the value is 5 (2+2+1).
- Any time a staff member’s SmartSense rating registers anywhere in the angry range, the customer support supervisor is notified, because the value is at least 6.
- An angry customer will trigger a notification to the supervisor, because the value is also 6.
- An unhappy (+6) manager (+2) from XYZ (+2) results in a service_quality value of at least 10, and possibly more, depending on the agent’s SmartSense rating. This situation triggers an email to the manager of your customer support department.

**Note:** Whenever the rules engine begins processing a new or updated incident, the value of the service_quality variable is initialized to 0 again.

**Examples of Applying Service Level Agreements (SLAs)**

Business rules let you apply SLAs (service level agreements) automatically to your customer records. You can apply SLAs using contact, organization, or incident rules.

When you apply an SLA to a customer (either automatically through business rules or manually through the Service Console), you define a certain level of customer support to which the customer is entitled. Then, when the customer submits an incident, the incident can be credited against the SLA, effectively reducing the number of remaining incidents by one. In addition to using business rules to apply SLAs to the customer record, you can also use them to credit an incident to an SLA.

SLAs can be applied only to contacts that are not associated with organizations. If a contact belongs to an organization, then the SLA must be applied to the organization. Any incidents submitted by contacts belonging to the organization will be credited to the organization’s SLA.

**Note:** Before you add rules to apply an SLA, you must Create an SLA.
Apply an SLA Using a Contact Rule

In this example, we apply a service level agreement (SLA) to all customers whose contact records are created during a particular month.

You must already have SLAs to apply them. See Create an SLA.

1. Add a new contact rule.
2. Click Add IF Condition Based On > Contact > Created.
3. Click Select Operator > in range.
4. Use the calendar controls to set the date range.
5. Click Add Action–Then > Modify Service Level Agreements > Create SLA Instance.
6. Select the SLA from the drop-down menu.
7. Add any other actions needed, such as state transitions, then click Save.

Your rule should resemble this image.

![Image of contact rule example]

Apply an SLA Using an Incident Rule

You can apply an SLA based on the conditions of an incident.

You must already have SLAs to apply them. See Create an SLA.

In this example, your organization has just released a new product that is causing customers some confusion. When customers submit a question to your support team through the Ask a Question page regarding that product, you want to automatically assign them an SLA that lets them submit a certain number of additional incidents regarding that product for a specified time period.

**Note:** Unlike contact and organization rules, incident rules do not have a Create SLA Instance action.

1. Add a new incident rule.
2. Click Add IF Condition Based On > Incident > Product.
3. Click Select Operator > equals.
4. Select the product.
5. Click **Add Action–Then > Set Field > Apply SLA Instance**.
6. Select the SLA from the drop-down menu.
7. Select the **Create instance if one does not exist** check box.

   **Note:** If the SLA has already been applied to the contact, it is not necessary to select the check box.
8. Select the **Use the latest version of the SLA** check box.
9. Add any other actions needed, such as state transitions, then click **Save**.

Your rule should resemble this image.

![Rule Image]

**Related Topics**
- Apply an SLA Using a Contact Rule

**Example of Using Relative Time Conditions**

This is an example of selecting a relative time for a rule condition.

Several rule conditions let you select a date and time. For example, you might want to add a rule with the condition “If the task due date is within the range from April 1 to April 8.” The following conditions allow date/time selection.

- Banner Updated for answers, contacts, incidents, opportunities, and organizations
- Acquired and Created for contact rules
- Created, Updated, Initial Contact, Forecast Close, Date Closed, Lost Date, and Recall for opportunity rules
- Acquired for organization rules
- Purchased Products Date Purchased for target rules
- Completed Date, Created, Updated, Due Date, Planned Completion Date, and Start Date for task rules

The ability to set a condition based on a specific date and time (whether that date/time value is before, after, equal to, or within a range you specify) is a useful tool. However, there may be times when you want to set a relative date/time value. For example, you might want a condition “If the task due date is less than 8 hours from now.” In that case, you can select a relative time for the rule condition. Relative time calculates the number of minutes or hours from the current time or from a specific event, such as time created or time updated.

This image shows a rule that can be used to notify a staff member who has been assigned a task that is due within the next eight hours.
Custom Fields

Overview of Custom Fields

When you first implement B2C Service, you might find that additional fields are needed to collect the information you require.

By adding custom fields to your knowledge base, you can be sure you are collecting the information required to best meet your organization's needs. For example, a company that sells shoes might need to store the customer's shoe size.

After you've added custom fields, you can add them to workspace and script, use them as search filters in reports, and use them as audience filters in Outreach or Feedback.

Custom Field Types

By adding custom fields to your knowledge base, you can be sure that you are collecting the information required to best meet your organization's needs.

<table>
<thead>
<tr>
<th>Custom Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common</td>
<td>You can add these types of Common custom fields: Staff Account, Contact, Organization, Sales Products, and Task.</td>
</tr>
<tr>
<td>Staff Account</td>
<td>Add this type of custom field to store additional information about your staff members in their staff account (for example, their hiring date). Staff account custom fields appear on the Custom Fields page of the Staff Accounts editor. (Not supported on the Agent Browser UI.)</td>
</tr>
<tr>
<td>Contact</td>
<td>Add this type of custom field to gather additional information about your contacts (for example, their age). Contact custom fields can be displayed when adding or editing a contact record, while engaged in a chat session, and on the customer portal.</td>
</tr>
</tbody>
</table>
### Custom Field Type

<table>
<thead>
<tr>
<th>Custom Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Organization</strong></td>
<td>Add this type of custom field to gather additional information about your organizations (for example, the number of employees in the organization). Organization custom fields can be displayed when adding or editing an organization.</td>
</tr>
<tr>
<td><strong>Sales Products</strong></td>
<td>Add this type of custom field to specify additional information about sales products in your product catalog (for example, international product availability). Sales products custom fields appear on the Custom Fields page of the Product Custom Fields editor. (Not supported on the Agent Browser UI.)</td>
</tr>
<tr>
<td><strong>Task</strong></td>
<td>Add this type of custom field to store additional information about tasks for your staff members when adding or completing a task.</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>You can add these types of Service custom fields: Incident and Answer.</td>
</tr>
<tr>

<td>Add this type of custom field to gather additional information about customers’ questions (for example, model and serial numbers). Incident custom fields can be displayed when adding or editing an incident and on the Ask a Question and Support History pages.</td>
</tr>
<tr>
<td><strong>Answer</strong></td>
<td>Add this type of custom field to store and provide additional information about answers in your knowledge base (for example, version numbers the answer applies to). Answer custom fields can be displayed when adding or editing an answer and on the Answers and answer detail pages.</td>
</tr>
<tr>
<td><strong>Opportunity Tracking</strong></td>
<td>You can add these types of Opportunity Tracking custom fields: Opportunity and Quote.</td>
</tr>
<tr>
<td><strong>Opportunity</strong></td>
<td>Add this type of custom field to gather additional information about opportunities (for example, the contact’s previous service or product). Opportunity custom fields can be displayed when adding or editing an opportunity.</td>
</tr>
<tr>
<td><strong>Quote</strong></td>
<td>Add this type of custom field to store additional information about the sales quotes sent to customers (for example, the date the quote was requested). Quote custom fields can be displayed when adding or editing an opportunity. (Not supported on the Agent Browser UI.)</td>
</tr>
</tbody>
</table>

You can create folders to group and organize your custom fields in the Custom Fields tree. By dragging and dropping custom fields in the tree, you can reorder them or move them into folders.

When you add or edit custom fields, those modifications can be completed in real time or scheduled and performed in the background. Staff members and customers can continue to use your site while the background operation is in progress. After a custom field operation is scheduled, it cannot be modified or aborted.

## Add or Edit a Custom Field

Adding custom fields is similar for each of the custom field types. Although this procedure is for adding a contact custom field, use the same procedure to add all other types of custom fields.

When adding a custom field, you can specify whether it is visible and editable on the **Service Console** and, for some custom fields, visible and available to gather details on the **Customer Portal**. You can also specify a **data type** for the field, choose whether the field is required or not, and set a default value. **Text field** data types let you create an input mask to require that information entered in the field matches a defined format.

**Note:** A combined maximum of 500 custom fields and **system attribute** can be created for each **standard object**. That is, if you have 100 incident custom fields, you could create 400 system attributes for the incident object. In addition, a combined maximum of 9 custom fields and system attributes can be indexed for each standard object.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Custom Fields**.

3. Do one of these:
   - To add a contact custom field, in Custom Fields click **Contact**, then click **New**.
   - To edit a contact custom field, click it in the tree.

4. Enter the name of the custom field in the **Name** field.
   - **Tip**: You can assign a shortcut key to the custom field after you have added it on the workspace designer.

5. Click **Data Type** and select the data type for this field.
   - **Note**: You cannot change the data type when editing an existing custom field.

<table>
<thead>
<tr>

Custom Field Visibility Settings

When adding custom fields, you have several visibility options. The visibility options define where and how custom fields are presented on the administration interface and the customer portal.

Custom fields with end-user visibility are displayed on the customer portal. If you display a custom field that is not editable by customers, it does not appear on the Ask a Question page. There are other ways to determine visibility on the customer portal, such as widgets and page code.

**Note:** Answer, incident, contact, opportunity, organization, quotes, and tasks custom fields must also be added to the appropriate record's workspace. The Admin Edit visibility setting must be selected for a custom field to be available to add to workspaces and scripts. After a custom field is added to a workspace or script, its visibility, read-only, and required attributes are determined by the properties set in the workspace or script.

### Field

#### Description

**Quotes Edit**
Select this check box to allow staff members to enter or change the value of the custom field when adding or editing a product in an opportunity's quote. The custom field appears on the Quote Product Edit window. You cannot select this check box if the Admin Edit check box is cleared.

**Purchased Products Display**
Select this check box to add the custom field to the purchased_products database table. The field is not visible to staff members or customers. You cannot select this check box if the Admin Edit check box is cleared.

**Purchased Products Edit**
Select this check box to add the custom field to the purchased_products database table. The field is not visible to staff members or customers. You cannot select this check box if the Admin Edit or Purchased Products Display check box is cleared.

**Analytics/Segments Display**
Select this check box to allow the custom field to be used as a filter or output column in custom reports. Selecting this check box also allows the use of this field for filtering and grouping in segments.

**Task**
These visibility options are available for task custom fields.

**Admin Display**
Select this check box to allow the custom field to be added to task workspaces and to display the custom field when adding and editing tasks.

**Admin Edit**
Select this check box to allow staff members to enter or change the value of the custom field when adding or editing a task. You cannot select this check box if the Admin Display check box is cleared.

**Analytics Display**
Select this check box to allow the custom field to be used as a filter or output column in custom reports.

### Input Masks

Input masks are defined patterns that determine the format of information that can be typed in a text field.

Input masks are useful for preventing data entry errors when a **text field** has a specific input format that must be followed.

To define a mask pattern, two characters are required to represent one character or digit in a masked text field. The first character does not display in the masked text field, but acts as a rule to define the acceptable input format. The second character displays in the masked text field and acts as an input hint for staff members and customers.

This table describes the first and second characters that define mask patterns.

<table>
<thead>
<tr>
<th>Mask character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First character</td>
<td>Formatting character (space, hyphen, parentheses)</td>
</tr>
<tr>
<td>F</td>
<td>Formatting character (space, hyphen, parentheses)</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td>U</td>
<td>Uppercase letter</td>
</tr>
<tr>
<td>L</td>
<td>Lowercase letter</td>
</tr>
<tr>
<td>M</td>
<td>Ignore case (lowercase, uppercase, and numbers are acceptable)</td>
</tr>
</tbody>
</table>

### Second character

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>Numeric (number only)</td>
</tr>
<tr>
<td>A</td>
<td>Alphanumeric (either letter or number)</td>
</tr>
<tr>
<td>L</td>
<td>Alpha (letter only)</td>
</tr>
<tr>
<td>C</td>
<td>Alphanumeric or formatting character</td>
</tr>
</tbody>
</table>

### Input mask examples

This table describes input mask types, their associated patterns, and how they display to staff members and customers in text fields.

**Note:** In a masked text field, the # symbol signifies a numeric character and the @ symbol signifies an alphabetic or non-numeric character. Formatting characters, such as spaces, hyphens, and parentheses, are static so staff members and customers cannot replace them with other characters.

Custom Objects

Overview of Custom Objects

Custom objects allow administrators and developers to rapidly build and extend applications that support unique business processes.

By creating custom objects, you can seamlessly integrate organization-specific data with B2C Service, letting you manage and report on the data in the same way you manage and report on incident, contact, and other standard object. Because custom object data is stored in the database, you can add custom objects to workspace, desktop workflow, custom report, and navigation set.

**Note:** Building a complete custom object solution often requires creating different types of custom objects, including packages, objects, menu-only objects, and system attributes. For the sake of simplified discussion, these items are all referred to as custom objects in this documentation unless stated otherwise.

You can take your time when initially creating custom objects to ensure they are correct since they are not written to the database until you deploy them. In addition, since you can export custom objects and import them into other B2C Service sites, you can create, deploy, and test custom objects on a non-production site, export them, and then import them into your production site. See [Deploy Custom Objects](#).

After deploying objects that have the appropriate option selected, workflow and workspace types are automatically created for them and additional profile permissions are made available. This lets your staff members work with custom objects exactly as they work with standard objects. For example, if you create and deploy an object to store product registration information, a new workspace type will be created that you can use to create new product registration workspaces. You can then add the workspace to your navigation set and edit your profile to grant permissions to manage product registration information. Standard reports are also automatically created for objects that have associated workflows and workspaces so you can quickly locate specific custom object records and view the relationships between objects. See [What to Do with Custom Objects After Deployment](#).

Object Designer

You use the object designer to create custom objects, import objects that were created on other sites, and deploy custom objects to your database.

To access the object designer, you first must assign the Object Designer permission to your profile on the Administration tab of the Profile Permissions editor. See Administration Permissions. You might also need to add the Object Designer component to your navigation set. See Create a Navigation Set for the Administrator.

**CAUTION:** Because of the high degree of change that can be made to your application and database using custom objects, we recommend that few staff members be granted permission to use the object designer.
Custom Object Types

Several types of items are available to use in your custom objects solutions, and all are created using the Objects Designer. While some solutions will require one or two of these items, other, more complex, solutions might require all of these items.

- **Package**—Packages are containers that store objects, menu-only objects, and system attributes.
- **Object**—Objects contain fields, indices, and relationships that you define. You can create fields with different data types and other options, and some predefined fields are available for notes, transactions, and other items. When you create and deploy an object, a new table containing the fields you specify is added to the database.
- **Menu-Only Object**—Menu-only objects contain only menu options that you define. These are created to populate options in menu fields you want to add to multiple objects. Unlike objects, menu-only objects do not have options for fields, indices, and relationships (relationships to menu-only objects are created automatically when you use menu-only objects in an object). When you create and deploy a menu-only object, a new table containing the menu options is added to the database.
- **System Attribute**—System attributes are fields that can be added to standard objects, such as incidents and contacts. You can select data types, indices, and define relationships for these fields. System attributes can be used in workspaces and reports, just like custom fields can. When you create and deploy a system attribute, a new field is added to the table for the appropriate standard object (such as the incidents table).

**Note:** You can add a maximum of 200 objects, and each package can contain up to 23 objects. Menu-only objects do not count toward these limits.

The relationships you define between objects and system attributes help define what you can do with your custom object solution. For items to interact with one another, relationships must be created between them. You can define relationships between objects, system attributes, and standard objects. For example, if you created a product registration custom object, you could create a relationship between it and the contacts table. You could also create an object to store information about locations where the product could be purchased, and then create a relationship between the objects. Using this scenario, you could track who registered the product and where they purchased it, managing information in a single workspace and displaying it in custom reports.

Before you create any custom objects on your production site, we recommend that you create and deploy them on a test site to ensure they function as expected. However, you can edit or delete custom objects if necessary, whether they have been deployed or not.

**Note:** Only one staff member can edit or create objects in the object designer at a time. An option to override the lock on the object designer is displayed if you attempt to edit or create an object when another staff member is already doing so.

Custom Object Packages

Objects, menu-only objects, and system attributes are all stored in packages that you create. You can place objects in any package you want, but storing related objects in the same package helps you manage them.
The object designer includes one default package, named CO, to give you a head start when creating custom objects. You can add objects, menu-only objects, and system attributes to this package, just like you can with any of the packages you create.

**Note:** Each package can contain a maximum of 25 custom objects.

The object designer’s tree also includes a list of standard objects under the OracleServiceCloud entry to help you manage system attributes. System attributes are stored in packages just like objects are, but it can be challenging to manage numerous system attributes that are stored in several packages. The entries in the OracleServiceCloud list display all the system attributes created for different standard objects. For example, if you click the Contact entry in the OracleServiceCloud list, you will see all the system attributes that have been created for the contacts standard object, grouped by the package they are in.

### Create a Custom Object

When you create an object, you are creating a new table in the database. You can specify fields, indices, and database relationships for each object you create.

To access the object designer, you first must assign the Object Designer permission to your profile on the Administration tab of the Profile Permissions editor.

1. Click **Configuration** on the navigation pane.
2. Expand **Service**, and then double-click **Object Designer**.
3. Choose one of these options:
   - Select a package to which you want to add the custom object.
   - To create a new package for the object, click **New > Package**.

   When naming new packages, names must be between two and eleven characters in length. Package names are used in the names of tables created in the database for custom objects. For example, if you create a Warranty object in the default CO package, the resulting table name will be CO$Warranty.

4. Click **New > Object**.
5. Enter a name for the object.

   The name you define identifies the object in the database. Staff members generally see the custom object’s label, defined later in this procedure, when working with the object. Object names must start with a letter, cannot contain special characters other than the underscore character (only single underscores are allowed), and cannot contain more than twenty characters. In addition, certain words cannot be used as object or field names since they are reserved for use by other processes. If you attempt to save an object that uses a reserved word, a validation message informs you that the name must be changed.

6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Object Options</strong></td>
<td>Select options in this section to specify where the object is available and other options.</td>
</tr>
<tr>
<td>Object is Available in Workspaces, Scripting, and Workflow</td>
<td>Select this check box to make the fields available for use in scripts, workspaces, and workflows. Standard reports and workflow types are created automatically for objects that have this option enabled. Objects do not require this option to be used in custom reports. See <em>Custom Objects on the Service Console</em>. This option is enabled by default.</td>
</tr>
</tbody>
</table>
### Core Features

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object is Enabled for Transactions</td>
<td>Select this check box to enable tracking of all create and update actions taken on the object’s unique records. The transaction data is stored in the Custom Object Transactions (co_trans) table and can be viewed using the Audit Log workspace relationship item. This option is enabled by default.</td>
</tr>
<tr>
<td>Object Generates User Transactions</td>
<td>Select this check box to enable tracking of create, update, and cancel actions taken on the object’s unique records by staff members. The transaction data is stored in the Custom Object Transactions (co_trans) table and can be viewed using custom reports.</td>
</tr>
<tr>
<td>Object Generates Menu</td>
<td>Select this check box to have the object generate a menu used to populate values in menus added to other custom objects. The options in the menu are populated by the values in the <strong>lookup field</strong> specified for the object that generates the menu. For example, if custom object A generates a menu, you can select the menu to populate a menu field you add to custom object B. If object A's lookup field is set to Labels, and the object has three records created for it with labels of “One,” “Two,” and “Three,” the menu in custom object B that is populated by object A will display values of “One,” “Two,” and “Three.” Because a menu item is added for each record created for objects that generate a menu, you will want to enable this option only for objects that will have few records created for it.</td>
</tr>
<tr>
<td>Object Has Display Order</td>
<td>Select this check box to make the options in the menu generated by the object sortable by sequence numbers that you specify when creating records for the object. Selecting this check box automatically adds a DisplayOrder field to the object’s table that can then be added to the object’s workspace. This option is available only when the Object Generates Menu check box is selected.</td>
</tr>
</tbody>
</table>

7. To specify a label for the custom object that is different from the name entered in a previous step, enter the label you want in the **Label** field.  
   Labels are language specific, so you can use different labels for interfaces with different languages. When an object is initially named, the object’s label is automatically populated with the object’s name. If the object’s name is later edited, the label is not automatically updated.

8. To add a description for the custom object, enter the description you want in the **Description** field.  
   Descriptions are language specific, so you can enter different descriptions for interfaces with different languages.

9. To add notes about the custom object that you or other staff members can read, such as why the object was created, click the **Notes** arrow.  
   a. Enter the note you want in the text field.  
   b. Click **Add**.  
   c. To add additional notes, repeat the two previous steps.  
   d. To delete notes, click **Delete** for the note you want to remove.  
   e. To save changes to the notes, click **Save**.  
   You can add or delete notes in custom objects even after they are deployed.

10. Click **Fields** to add predefined or customized fields to the object.
11. Click **Indices**.
   The ID field is *indexed* by default, as are fields configured to be object lookups. Fields that have the Is In Single-Field Index option enabled also appear on this page.

   **Note:** Indexing a field that is frequently queried can help speed up queries, and you can define up to thirty indices per custom object. However, indexing a large number of fields can result in decreased performance.

12. To add an index to a field, click **Add New Index**.
13. Click **Add Field to Index**.
14. Select the field you want to index.

   **Note:** All field types, except Yes/No and Long Text fields, can be indexed.

   The selected field displays in the List of Indices in Object area. Each object can have up to eighteen indices for each object. However, this limit also includes indices that are added automatically for each child field used in relationships you create for the object. See Custom Object Relationships.

15. To add a multiple-field index, select the index you want to edit.
16. Click **Add Field to Index**.
17. Select the field you want to add to the index.

   Up to four fields can be used in multiple-field indices.
18. To remove a field from an index, select the index you want to edit and click **Delete**.
19. Click **Relationships**, to define and view table relationships for the object.
20. Click **Extra Options**.

   **Note:** Changes made on the Object Extra Options page take place when you save the object. Deployment is not necessary.

21. To associate icons with the object to display in the interface, click **Browse** and select the image you want to use.
   - 16x16—Icons of this size are used in record tabs on workspaces, the New Workspace window, and the Workspaces and Scripts explorers.
   - 24x24—Icons of this size are used on navigation buttons.
   - 32x32—Icons of this size are used on the Insert Fields tab of the workspace designer and in flow elements on the workflow designer.

22. Select the check boxes for the permissions you want to grant to staff members associated with each profile. These permissions are available for each profile. They can also be defined on the Profiles editor.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select All</td>
<td>Select this check box to select all permission check boxes for all profiles.</td>
</tr>
<tr>
<td>Create / Delete / Read / Update</td>
<td>Select check boxes in these columns to allow staff members to create, delete, read, or update records for the custom object.</td>
</tr>
<tr>
<td>Personal Notes</td>
<td>Select check boxes in this column to allow staff members to create, edit, and delete notes in custom object records. This check box displays only for custom objects that have the Notes check box selected on the Summary page.</td>
</tr>
<tr>
<td>All Notes</td>
<td>Select check boxes in this column to allow staff members with this profile to edit and delete any notes added to custom object records, regardless of which staff member added the notes.</td>
</tr>
</tbody>
</table>
Add a Field to a Custom Object

You add fields to objects and system attributes from the object designer Fields page.

When creating fields, you select the field type and specify options for the field that change depending on the type of field you create. While the options on the Fields page are similar when editing objects and system attributes, there are some differences, which are noted in the procedure.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Object Designer**.
3. Select the object or system attribute to which you want to add a field.
4. Click **Fields**.

   **Note:** Each object can contain a maximum of 500 fields, but the actual number of fields you can add is restricted by the amount of space each field uses in the database. For example, while an object could have 500 fields with a Yes/No data type, far fewer fields with a Text data type would be allowed since text fields use much more space in the database than Yes/No fields.

5. To add predefined fields to the object, select the fields you want in the Predefined Fields area of the page. Predefined fields are not available for system attributes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created Time</td>
<td>Select this check box to add the CreatedTime field to the object table. This field tracks when custom object records are created and is updated automatically.</td>
</tr>
<tr>
<td>Created by Account</td>
<td>Select this check box to add the CreatedByAccount field to the object table. This field tracks which staff members create custom object records and is updated automatically. When you add this field to a custom object, a relationship to the accounts table is automatically created.</td>
</tr>
<tr>
<td>Updated Time</td>
<td>Select this check box to add the UpdatedTime field to the object table. This field tracks when custom object records are edited and is updated automatically.</td>
</tr>
<tr>
<td>Updated by Account</td>
<td>Select this check box to add the UpdatedByAccount field to the object table. This field tracks which staff members update custom object records and is updated automatically. When you add this field to a custom object, a relationship to the accounts table is automatically created.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
File Attachments | Select this check box to add the FileAttachments field to the object table. Add this field to allow file attachments to be added to custom object records. When you add a file attachment to a custom object record, you can change the file name, but the Description and Display Name properties that can be specified for attachments added to standard object records, such as incidents, are not available.

Labels | Select this check box to add the Labels field to the object table. This field should be added if individual records in the custom object require their own visible labels. (For example, each incident status on your site has a distinct label and each status is a unique record in the incident statuses table.) A separate Label field is created for each language used on your B2C Service site. This lets you enter a different label for each language.

Descriptions | Select this check box to add the Descriptions field to the object table. This field is used to store text descriptions of records you add to the object.

Notes | Select this check box to add a Notes field to the object table where notes about individual records can be stored.

---

6. To add a customized field to the custom object, click **Add New Field**.
7. Select the type of data the field will store.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes/No</td>
<td>Select this option to add a field to store Yes or No values (stored as 1 and 0, respectively, in the database). Staff members use drop-down menus to enter values in Yes/No fields.</td>
</tr>
<tr>
<td>Date</td>
<td>Select this option to add a field to store a date. Staff members can type values in date fields or select dates using a calendar.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Select this option to add a field to store a date and time. Staff members can type values in date/time fields or use a calendar to select dates.</td>
</tr>
<tr>
<td>Integer</td>
<td>Select this option to add a field to store numeric values (for example, product or registration numbers). Integer fields can store numbers from -2147483648 to 2147483647.</td>
</tr>
<tr>
<td>Text</td>
<td>Select this option to add a text field. Text fields can be configured to store text, email addresses, or URLs.</td>
</tr>
<tr>
<td>Menu</td>
<td>Select this option to add a field with a drop-down menu from which staff members can select items. Only one value can be selected at a time in custom object menu fields.</td>
</tr>
<tr>
<td>Decimal</td>
<td>Select this option to add a field to store decimal-format data.</td>
</tr>
</tbody>
</table>

8. Enter field information.
**Note:** Some options are disabled when using certain field types.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name you want for the field. The name you specify is used in the database. To specify a different display name for the field, enter a label name in the Interface Label area, which is also described in this table. The name cannot exceed 30 characters.</td>
</tr>
<tr>
<td>Field Options</td>
<td>Select options for customized fields in this area. Some options are disabled for certain field types.</td>
</tr>
<tr>
<td>Is Auto Update</td>
<td>Select this check box to automatically update the field value when the record is updated. This option is available only for fields with Date, Date/Time, or Integer data types. Auto-update fields are read-only.</td>
</tr>
<tr>
<td>Is Nullable</td>
<td>Select this check box to allow null values in the field. Entering values in fields that allow null values is optional when editing a record. Fields in deployed objects that have this option selected cannot be later edited to remove the option. However, fields in deployed objects can be edited to add this option. This option is always enabled for system attribute fields.</td>
</tr>
<tr>
<td>Is Read Only</td>
<td>Select this check box to give the field read-only access. When this option is selected, values stored in the field cannot be edited but can be used to display information. A default value must be specified for fields that have this option selected. This option is available only for fields with Date, Date/Time, or Integer data types.</td>
</tr>
<tr>
<td>Is In Single-Field Index</td>
<td>Select this option to add an index entry for the field in cases where the field is the only field in the index. To add a multiple-field index, click the Indices button on the ribbon and perform the steps regarding indices in the Create a Custom Object procedure. This option is available only for fields with Date, Date/Time, Integer, or Text data types.</td>
</tr>
<tr>
<td>Yes/No Field Settings</td>
<td>Click the Constant Default drop-down menu and select a default value for the field. The available options are None, Yes, and No.</td>
</tr>
<tr>
<td>Date and Date/Time Field Settings</td>
<td>Select options for Date and Date/Time fields in this area.</td>
</tr>
<tr>
<td>Dynamic Default</td>
<td>Click this drop-down menu to select a value used to dynamically populate the field. The dynamic values available for Date and Date/Time fields are the current date or the current time, respectively. This field is set to None by default. Dynamic default values are written to a record when the record is saved to the database. When editing an existing record, the dynamic default value is incremented only when another field is edited and the record is saved.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Constant Default</td>
<td>Enter a value in this area to use as a default for the field or click the calendar to select a date from a calendar. When you select a date from the calendar for a Date/Time field, the time is automatically set to 12:00 A.M. If you want a different time, you can type it in the field.</td>
</tr>
<tr>
<td>Minimum Value*</td>
<td>Enter a value in this area or click the calendar icon to select the minimum date allowed in the field. You can enter dates between January 1, 1000 and December 30, 9999. This option is available only for Date fields.</td>
</tr>
<tr>
<td>Maximum Value*</td>
<td>Enter a value in this area or click the calendar icon to select the maximum date allowed in the field. You can enter dates between January 2, 1000 and December 31, 9999. This option is available only for Date fields.</td>
</tr>
</tbody>
</table>

**Integer Field Settings**

- **Dynamic Default**
  - Click this drop-down menu to select a value used to dynamically populate the field. The dynamic values available for integer fields are the current staff member's account ID or an incremental value. This field is set to None by default. Incremental values apply to individual records. All records with dynamic default integer fields initially have a value of 1 in the field. In addition, dynamic default values are written to a field when the record is saved to the database. When editing an existing record, the dynamic default value is incremented only when another field is edited and the record is saved.

- **Constant Default**
  - Enter a value in this area to use as a default for the field. This option is disabled when an option other than None is selected in the Dynamic Default field.

- **Minimum/Maximum**
  - Enter the minimum and maximum values allowed for the field in these fields.

**Text Field Settings**

- **Field Usage**
  - Click this drop-down menu to select the type of text field you want to create. These field types are available:
    - Plain Text—Select this option to configure the text field to store from 1 to 255 characters. The maximum number of characters is typed in the Length of Field field.
    - Long Text—Select this option to configure the text field to store one megabyte of characters.
    - Email—Select this option to configure the text field to store email addresses, up to 80 characters in length. Validation is automatically performed on the text entered in this type of field to ensure it corresponds to email patterns defined in the DE_VALID_EMAIL_PATTERN configuration setting.
    - URL—Select this option to configure the text field to store URLs, up to 255 characters in length. Validation is automatically performed on text entered in the field to ensure it corresponds to URL patterns.
  - All text field types, except Long Text, can be indexed.

- **Length of Field**
  - Enter the maximum number of characters that plain text fields can store in this area. Values from 1 to 255 can be entered.
### Table: Field Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This option is available only for plain text fields.</td>
<td></td>
</tr>
<tr>
<td>Pattern</td>
<td>Enter a regular expression string pattern to define a format that will be used to verify the contents entered in the field. The carat (^) character is automatically added to the start of the pattern and the dollar sign ($) character is automatically added to the end. This ensures that strings entered in the custom object field match the entire regular expression. For example, if you want to create a field to store phone numbers in a format of 123-456-7890, enter a pattern of [0-9]{3}-[0-9]{3}-[0-9]{4}.</td>
</tr>
<tr>
<td>Note: This option is available only for plain text and long text fields.</td>
<td></td>
</tr>
<tr>
<td>Case Sensitive Sorting</td>
<td>Select this check box to recognize case when sorting, with lowercase characters ordered before uppercase characters in ascending order. For example, if the field contents include values of CAT, Cat, cat, and CAt, and case-sensitive sorting is enabled, the contents will be sorted as cat, Cat, CAt, and CAT.</td>
</tr>
<tr>
<td>Defacto Unique for Analytics</td>
<td>Select this check box to group the field contents by the custom object unique key or ID number rather than the field values. For example, the First Name field in the contacts table is configured to use this option in reports. When running a report that groups incidents by contacts’ first names, the report automatically groups by the contact ID number (contacts.c_id), which is the primary key in the contacts table. This prevents the incidents submitted by all people with the same first name from being grouped together.</td>
</tr>
</tbody>
</table>

### Menu Field Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Menu</td>
<td>Click this drop-down menu to select an existing menu field, menu-only custom object, or a custom object with the Object Generates Menu option selected to populate the field menu options. A read-only relationship to the custom object associated with the selected menu is automatically created.</td>
</tr>
<tr>
<td>Dynamic Default</td>
<td>Click this drop-down menu to select a default value for the menu field that changes dynamically depending on which staff member uses the field and which interface the staff member is logged into. Dynamic default values can be selected for the Accounts By Group, Accounts By Manager, Interfaces, and Languages menu fields.</td>
</tr>
<tr>
<td>Constant Default</td>
<td>Click this drop-down menu to select a static default value for the menu field. The available options are populated by the options in the menu field.</td>
</tr>
<tr>
<td>Use Current User/Interface/ Language as Default</td>
<td>Select this check box to set the default value of the menu field to the value that pertains to the logged-in staff member who is working with the custom object records. This option displays only when one of these is selected in the menu field settings drop-down menu:</td>
</tr>
<tr>
<td>◦ Accounts by Manager—When this field is used, selecting the check box uses the name of the logged-in staff member as the field default value.</td>
<td></td>
</tr>
<tr>
<td>◦ Accounts by Group—When this field is used, selecting the check box uses the name of the logged-in staff member as the field default value.</td>
<td></td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
| Interfaces—When this field is used, selecting the check box uses the name of the interface the staff member is currently logged in to.  
Languages—When this field is used, selecting the check box uses the language of the interface the staff member is currently logged in to.
| Decimal Field Settings | Select options for decimal fields in this area.
| Decimal part (0 to 5) | Enter the number of digits to display to the right of decimal point, from 0 to a maximum of 5.
| Maximum Value | Enter the maximum value allowed for the decimal field.
| Minimum Value | Enter the minimum value allowed for the decimal field.
| Interface Label | Specify field names in this section. Different labels and descriptions can be used for interfaces with different languages.
| *Label | Enter the label you want for the field name in this text box. By default, the name specified in the Name field is used as the label. Staff members generally see the field label name when working with the field. When a field is initially named, the field label is automatically populated with the field name. If the field name is later edited, the label is not automatically updated.
| Description | Enter an optional description for the field in this text box. The description displays as a tooltip when viewing the field in workspaces or the report designer.

9. To make a text or integer field a lookup field for an object, click the option in the Object Lookup column. This option is not available for system attribute fields. The field defined as the object lookup is automatically added as a single-field index to the object. If you do not specify a lookup field, the ID field is automatically selected as a lookup field. If you select the Labels check box on the Fields page, the Labels field that is added to the object is automatically selected as the object lookup field.

Lookup fields help identify records when you’re working with them. Values in lookup fields are displayed on the editor tab when you’re editing records and in the Recent Items list on the navigation pane. For example, when editing an incident, the incident reference number displays on the editor tab since Incidents.Reference # (incidents.ref_no) is configured as a lookup field in the database. In addition, lookup field values are displayed in reports for fields in other tables that join to the lookup field. For example, if you create an object with a Name field designated as the lookup field, then define a relationship to another object with a NameID field and use this field to join the objects, and then run a report with NameID as an output column, the values in the Name field will be displayed in the column.

In addition, lookup field values are displayed in reports for fields in other tables that join to the lookup field. For example, if you create an object with a Name field designated as the lookup field, then define a relationship to another object with a NameID field and use this field to join the objects, and then run a report with NameID as an output column, the values in the Name field will be displayed in the column.

10. To delete a field, click X.

11. To edit an existing field, select the field in the list of fields and make the changes you want. Most fields in deployed custom objects can still be edited, though some options may be disabled for certain field types.

12. Click Save.
Custom Object Relationships

The relationships that you define for your objects determine if the data in the objects can interact with data in other custom objects or standard objects.

Objects must be related to use fields from one object on another object's workspace. For example, if you want fields from the incidents table to be available for use on a custom object's workspace, the incidents table must have a relationship with the custom object.

When relationships are defined, objects are either parents or children of the object you are editing. Most custom objects and standard objects can be either parents or children of other custom objects. Relationships can be made to these standard objects:

- Accounts
- Answers
- Assets
- Community Comment
- Community Question
- Community User
- Contacts
- Incidents
- Opportunities
- Organizations
- Quotes (cannot be a parent in relationships)
- Sales products (cannot be a parent in relationships)
- Tasks

**Note:** Relationships between the quotes and opportunities standard objects are not supported.

Whether you are defining parent or child relationships, two types of relationships are available:

- Aggregation—This creates a close relationship between records in the objects. Use this type if you want records in the child table to be automatically deleted when their parent record is deleted from the parent table. For example, incidents belonging to a contact are deleted when the contact is deleted. If several tables are joined with aggregation relationships, deleting a record in the parent table automatically deletes all related records in the other tables.

- Association—This creates a loose relationship between records in the objects. Use this type if records in the child table should not be automatically deleted when their associated records in the parent table are deleted. For example, deleting a staff account does not delete incidents created by the account.

When you define relationships between objects, they are joined by integer fields that contain unique values (the field contains a unique value for each record in the object). Each custom object can have one such field. For example, incidents are linked to contacts using the Incidents.Incident ID (incidents.i_id) and Contacts.Contact ID (contacts.c_id) fields. These are both integer fields that contain unique values.
Note: Relationships to menu-only objects are automatically created when the menu-only object is used to populate menu fields in custom objects. These relationships cannot be manually deleted, but are deleted when the menu-only object is no longer used to populate menu fields or when the menu-only object is deleted.

Relationship Restrictions
Before you create relationships, it is important to be aware of constraints in the relationships you can add to an object.

- A maximum of 18 indexes can exist for each custom object. This limit includes indexes you create as well as indexes that are created automatically. An index is added automatically for each child field used in a relationship.
- Aggregation relationships have limits that do not apply to association relationships:
  - A maximum of five aggregation relationships can be created for each object.
  - A maximum of four objects can be joined using consecutive aggregation relationships where each object is a parent of another, with object A being the parent of object B, which is the parent of object C, and so on. This limit does not apply to read-only relationships that are automatically created when certain standard menus are used to populate menu fields in the custom object.
  - Self-referencing relationships cannot be configured for aggregation relationships.

Define a Relationship
Define a relationship for a custom object.

1. Click Configuration on the navigation pane.
2. Expand Database, and then double-click Object Designer.
3. Select the object or system attribute you want to edit relationships for or create a new object.
4. Click Relationships.
5. Click Add, to add a Parents of Object relationship or a Children of Object relationship.
   a. Click Type.
   b. Select the type of relationship.
      - Aggregation—Use this relationship type if you want records in the child table to be automatically deleted when their parent record is deleted from the parent table. For example, incidents belonging to a contact are deleted when the contact is deleted.
      - Association—Use this relationship type if records in the child table should not be automatically deleted when their associated records in the parent table are deleted. For example, deleting a staff account does not delete incidents created by the account.
   c. Click Parent Object or Child Object.
   d. Select the object you want to link to.
   e. If creating a parent relationship, click Child Field.
   f. Select the field in the object you are editing that you want to use as the link to the parent object.
      If the object does not have a field that you can use as the link, or if you don’t want to use one of the existing fields, you can select Auto Generate New to have an integer field created automatically. The new field will then be added to the object you are editing, and will be used as the link to the parent table. You can view the new field on the object’s Fields page.
   g. If creating a child relationship, click Child Field.
   h. Select the field in the child object that you want to use as the link to the object you are editing.
Note: If the child is a standard object, you will need to select an integer or menu system attribute that has been created for the standard object. If a system attribute does not exist, or if you want to use a different system attribute, select Auto Generate New. A new system attribute with an integer data type will automatically be created for the standard object.

6. If you create more than one relationship to the same object, select the option in the Main column next to the relationship you want to use as the main relationship between the object and the custom object.

7. To delete a relationship, click **Delete**.

8. To edit an existing relationship, click **Edit Relationship > Edit**.

9. Click **Save**.

   This also saves any system attributes that have been automatically created for standard objects in the steps above.

Self-Referencing Relationships

Self-referencing relationships can be defined for custom or standard objects that are joined by association relationships.

Self-referencing relationships are configured to make an object a parent or child of itself. Workspaces for objects with self-referencing relationships can include relationship items for the object. For example, an incident workspace that includes the Incidents View relationship item can be used to associate one incident with another.

This type of configuration gives you a wide range of customization options. For example, if you have a relationship in which the incidents object is a parent of itself, you can configure incident workspaces to let you create sub-incidents or related incidents to help you track incidents related to the same issue. Or, if contacts is made a parent of itself, you can create contact workspaces that allow links to other contacts, such as customers living in the same residence.

Create a System Attribute

System attributes are custom fields on standard objects, and are created and managed from the object designer. You can create system attributes for accounts, answers, assets, contacts, incidents, opportunities, organizations, quotes, sales products, and tasks.

A combined maximum of 500 system attributes and custom fields can be created for each standard object. That is, if you have 100 incident custom fields, you could create 400 system attributes for the incident object. In addition, each standard object can have a maximum of 18 system attributes and custom fields that are indexed.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Object Designer**.
3. Select the package where you want to place the system attribute.
4. Click **New > System Attribute**, and then select the standard object for which you want to create the field.

   The Object Fields editor displays, with the list of fields (system attributes) for the object.
5. Click **Add New Field**, and then select the field type.
6. Enter the fields.
### Core Features

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Name</em></td>
<td>Enter a column name for the field up to 30 characters long. The name cannot contain spaces.</td>
</tr>
<tr>
<td><em>Package</em></td>
<td>Select an existing package, or click <strong>Add Package</strong>.</td>
</tr>
<tr>
<td>Field Options</td>
<td>Select field options:</td>
</tr>
<tr>
<td></td>
<td>◦ Is Auto Update</td>
</tr>
<tr>
<td></td>
<td>◦ Is Nullable</td>
</tr>
<tr>

<td>These vary depending on the field type. For example, text fields have Field Usage and Length of Field settings.</td>
</tr>
<tr>
<td><em>Label</em></td>
<td>Enter a label if desired. The field name is the default.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a display name for the field.</td>
</tr>
</tbody>
</table>

7. To define relationships for the system attribute, click **Relationships**.
8. Follow the procedure described in **Custom Object Relationships**.

   This step is optional for system attributes. If you need to define a relationship to a custom object, you can do so when editing the object.

   **Note:** Relationships between the quotes and opportunities standard objects are not supported.

9. To define indexes for the system attribute, click **Indices**.
10. Perform the steps regarding indexes in the **Create a Custom Object** procedure.

    Adding indexes to system attributes is optional.

11. Click **Save**.
12. Click **Deploy**.

After you deploy the system attribute, it can be used in reports, workspaces, and custom objects, and you can manage and edit the system attribute from the object designer.

Menu-Only Custom Objects

Menu-only custom objects store menu options for populating menu fields in other custom objects. This lets you to use the same menu lists to populate menu fields in multiple custom objects.

In addition, because management of items in menu-only objects is handled from the Customizable Menus tree, it is simple to add, edit, or delete items in the menus whenever you need.

For example, if you were creating a product registration solution, you could create a menu-only object that lists locations where customers can purchase your products. You could then create another custom object that stores when the product was purchased, who purchased it, and where they purchased it. You could use the menu-only object to populate the menu field that tracks where the product was purchased.

Configuring menu-only custom objects is straightforward since all configuration is performed on the object designer Summary page. *Ribbon* buttons to access the Fields, Indices, Relationships, and Extra Options pages are disabled. You don’t need to configure relationships to menu-only objects since they are created automatically when you use the menu-only objects to populate menu fields in other custom objects.

**Note:** Changes to menu items in a deployed menu-only object are performed using the Customizable Menus configuration item. After a menu-only object is deployed, it is treated the same way as other menu objects, such as *industry types* or *incident queues*.

Create a Menu-Only Custom Object

You can create a custom menu-only object.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Object Designer**.
3. To create a package for the object, click **New > Package**.
4. Enter the name you want for the package.
   - Package names must be eleven characters or less.
   - **Note:** You can also add custom objects to the default CO package. Package names are used in the names of tables created in the database for custom objects. For example, if you create a WarrantyMenu object in the CO package, the resulting table name will be CO$WarrantyMenu.
5. Select the package you want to add the custom object to.
6. Click **New > Menu Only Object**.
7. Enter a name for the object in the **Name** field.
   - The name you define identifies the object in the database. Staff members generally see the custom object’s label, defined below, when working with the object. Object names must start with a letter, cannot contain special characters other than the underscore character (only single underscores are allowed), and cannot contain more than twenty characters. In addition, certain words cannot be used as object or field names since they are reserved for use by other processes. If you attempt to save an object that uses a reserved word, a validation message informs you that the name must be changed.
8. Click **Add**.
9. Click the new row and then enter a name for the menu item.
10. Repeat steps 7 and 8 to add other menu items.
11. To add language-specific labels to the menu items, click **Convert to Menu with Labels**.

---

**Oracle**

225
This action cannot be undone and it cannot be selected after the object is deployed. Use this option if your site has interfaces with different languages.

- Click **Show Label Grid**, to display the label grid.
- Enter the text you want to display for the menu item for each interface in the grid's **Label** field.
- To hide the grid, click **Hide Label Grid**.

**Note:** After menu-only objects with labels are deployed, you can modify the text for the labels by editing the objects from Customizable Menus.

12. To change the ordering of the menu items in the list, click the up or down arrow next to the name of the item that you want to move.
13. To specify a label for the custom object that is different from the name entered in step 7, enter the label you want in the **Custom Object Labels Label** field.

Labels are language specific, so you can use different labels for interfaces with different languages. When an object is initially named, the object’s label is automatically populated with the object’s name. If the object’s name is later edited, the label is not automatically updated.

14. To add a description for the object, enter the description you want in the **Custom Object Labels Description** field.

Descriptions are language specific, so you can use different descriptions for interfaces with different languages.
15. To add notes about the custom object that you or other staff members can read, such as why the object was created, click the **Notes** arrow.

a. Enter the note you want in the text field.
b. Click **Add**.

To add additional notes, repeat steps 15a and 15b. To delete notes that have previously been added, click **Delete**.

d. To save changes to the notes, click **Save**.

You can add or delete notes in custom objects even after they are deployed.

**Use a Menu-Only Object in a Custom Object**

You can create a menu-only object in a custom object.

1. Edit the custom object that will use the menu field.

   **Tip:** In addition to populating menu fields in objects, you can use menu-only objects to populate the options for system attributes with menu data types.

2. Click **Fields**.
3. Edit or add a menu field to the custom object.
4. Click **Menu Field Settings > Menu** and select the menu-only object you created.
5. Click **Save**.
6. Deploy the custom objects when you are ready.

**Edit or Delete a Custom Object**

Before custom objects are deployed, you can change any part of their configuration or delete them without impacting the database since they have not been written to the database.

If you make numerous changes to custom objects that you later choose not to deploy, you can roll back the changes and the custom objects will revert to the state they were in at the time of the previous deployment (if the custom objects have never been deployed, all custom objects are removed).
After deploying custom objects, you can still update or delete them if necessary, although you must then redeploy them to implement the changes to the database. We recommend redeploying custom objects only if necessary since the database will be altered.

There are some important considerations to keep in mind before you delete custom objects or fields in custom objects.

- Deleting custom objects that have relationships to other objects results in the relationships also being deleted.
- Deleting fields in custom objects that are used in relationships will also delete the relationships.
- Deleting fields from custom objects that are used in indices will also delete the indices, whether they are single-field or multi-field indices.
- When you delete menu-only custom objects that are used in menu fields in other custom objects, those menu fields are also deleted.

**Note:** Staff members with the Bulk Delete permission enabled can delete up to 1000 custom object records at a time. See [Administration Permissions](#) and [Perform Bulk Delete](#). You can create custom data lifecycle management policies for archiving and purging custom objects. See [Data Lifecycle Management](#).

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Object Designer**.
3. To edit a custom object, select the object in the **Custom Objects** list and make your changes.

   **Note:** To edit items in a menu-only custom object that has been deployed, use the Customizable Menus configuration item. After a menu-only object is deployed, it is treated the same way as other menu objects, such as industry types or incident queues.

4. To delete a custom object, select the object in the **Custom Objects** list and click **Delete**.
5. Click **Yes**.
   a. To restore the deleted custom object, click **Undelete**.
   This button is disabled if the custom object was not previously deployed.
6. Click **Save**.
7. Deploy the custom objects.
8. Close the object designer.

   If you attempt to close the object designer without saving your changes, a Data Modified message displays asking if you want to save the changes. If you select No, all changes to your objects will be lost.

**Roll Back Changes to Custom Objects**

If you make numerous changes to custom objects that you later choose not to deploy, you can roll back the changes.

The custom objects will revert to the state they were in at the time of the previous deployment.

**Note:** If the custom objects have never been deployed, they are removed.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Object Designer**.
3. Click **Rollback**.
4. Click **OK**.
Deploy Custom Objects

After you create custom objects, you must deploy them to apply the changes to the database.

When you deploy custom objects, the database is updated to add new fields, tables, relationships, and indices for the custom objects, so it is important that they are correct before you deploy them.

When a deployment occurs, the object designer is unavailable until the deployment completes so you should carefully consider when to deploy to ensure your site is not negatively impacted. Use the Deploy Immediately option with care on production sites. An email is sent to a specified address upon completion or if the deployment fails to complete.

When you deploy custom objects, all custom objects in all packages are deployed. Custom objects that have previously been deployed will be examined for changes. If no changes have been made to those objects since the previous deployment, the objects are ignored during deployment.

During deployment, several tasks are performed that can take some time. The custom objects are first written to a file, and then the database is updated to add the tables, fields, indices, and keys for your custom objects. Given how intensive this process is, deploying on your production site should be performed after business hours or when work on the site is at a minimum. You can schedule deployments to occur when you want and you can specify the maximum amount of time that can be granted to the deployment, so scheduling a deployment for off-peak times is easy.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Object Designer**.
3. Click **Deploy**.
4. Enter the email addresses you want to send notifications to in the **Email Address** field. Separate multiple addresses with commas.
5. Specify when you want the deployment process to begin.
   a. To immediately deploy all custom objects, select **Deploy Immediately**.
   b. To specify a time when you want the deployment process to start, enter the date and time you want the deployment to begin.
      
      You can either enter the date and time you want or you can click the calendar next to the field and select the date for the deployment. The default time is the current time, adjusted for the time zone defined in your staff account. The start time can be no more than forty-eight hours past the current time.
   c. Click **Cutover Window** and select the amount of time after the cutover start time that the deployment process can start.
      
      The process may not start immediately at the specified cutover start time due to issues that prevent the cutover from starting such as the database being unavailable or a utility being unable to run. If the cutover cannot start during this window, the deployment process is halted. If the deployment process fails to begin during the cutover window, you will need to open the object designer and select the deployment options again. No other options are available on the object designer until deployment completes.
6. Click **Deploy**.
7. Click **Yes**.
After custom objects are deployed, new workspace types are made available for objects that have the Object is Available in Workspaces, Scripting, and Workflow option enabled so you can work with them in the same way you work with incidents or contacts. In addition, standard reports are automatically created for deployed objects that have this option enabled.

You also can view a report that shows the number of deployed custom objects on your site using the Agent Browser User Interface (Agent Browser UI). See View Custom Object Use for more information.

Export and Import of Custom Objects

Before you deploy custom objects on your production site, we recommend that you first test them on a test site that is similar to your production site. This helps ensure that the custom objects function as expected and interact with other data in your site the way you want.

After verifying that the custom objects are configured correctly on the test site, you can export the objects from the test site and then import them into your production site. The imported objects will include all the fields, indices, and other attributes originally configured for them. The relationship configuration of the objects is also included if all of the related custom objects are exported and imported.

**Note:** Only custom objects that have been deployed can be exported. In addition, only system attributes, menu-only objects, and objects that have the Object is Available in Workspaces, Scripting, and Workflow option selected can be exported. Because a maximum of 23 custom objects can be imported at a time (not including menu-only objects), we recommend exporting no more than 23 custom objects at a time. Multiple export files can be created and then imported.

Export Custom Objects

You can export custom objects from a site.

Verify that the custom objects are configured correctly on a test site.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Object Designer**.
3. Click **Export**.
   - Packages that do not contain deployed objects are disabled and cannot be selected for export.
4. Click the arrow next to a package to display the objects in the package and then select the check boxes next to the objects you want to export.
   a. To select all the objects in the package, select the check box next to the package name.
5. Click **Next**.
6. If the objects selected for export have aggregate child relationships to other custom objects that are not selected for export, the next page of the wizard gives you the option to also include the parent custom objects in the export.
   a. Clear the check boxes next to the objects you do not want to export. By default, custom objects that are aggregate parents of objects selected for export will also be exported.
7. Click **Next**.
8. Enter the path and file name to which you want to save the export file.
9. Click **Finish**.
10. To export additional objects, which you may need to do if exporting more than 23 objects, repeat steps 3 through 9.
Import Custom Objects

After exporting custom objects from a test site, you can then import them into your production site.

1. Click Configuration on the navigation pane.
2. Expand Database, and then double-click Object Designer.
3. Click Import.
4. Enter the path and file name of the file to import.
5. Click Next.

If you import objects with the same package and object names as existing objects on the site, you can either merge the imported objects with the existing ones or create new objects with different names. If you choose to merge the objects instead, the existing object is updated to include additional fields that are in the imported object. No changes are made to fields in the existing object that are not in the imported object.

**Note:** Menu-only objects and system attributes cannot be merged. When these are imported into a site that has matching items with the same names, the imported custom objects will automatically be given new names.

6. Select options for the imported objects.
   a. To create a new custom object instead of merging a custom object, click **merged into the existing custom object > imported as a new custom object**. A default name for the new object displays next to the drop-down menu. Click the default name and enter a new name in the text box to define a different name.
   b. To prevent a custom object from being imported, clear the check box. To clear the check boxes next to all custom objects, click **Unselect All**.

   If you clear the check boxes next to objects with a parent-child relationship and then add the child object back to the import, the parent objects check boxes are selected automatically. This ensures that all objects required for a relationship are included in the import. You can then clear the check boxes next to the parent objects if you do not want to import them.

7. Click Finish.
8. To import additional objects, which you may need to do if importing more than twenty-five objects, repeat these steps.
9. To deploy the imported objects on your site, click Deploy.

What to Do with Custom Objects After Deployment

After deploying custom objects, they are treated in the same way as standard objects and custom fields. However, before you can work with custom object records or report on them, you must perform some additional steps.

- Create workspaces your staff members will use to work with custom object records. See Custom Objects on the Service Console.
- Add reports to your staff members' navigation sets so they can create and access custom object records. See Custom Objects in Navigation Sets.
- Edit profiles to specify permissions for staff members to use the custom object workspaces and work with the object records. See Custom Object Permissions in Profiles.
- Create some custom reports to track information about your custom object data, such as when records are created, the number of records created, and which staff members worked with them. See Custom Objects in Analytics.
• If you create custom objects to import existing information stored in an external database into B2C Service, use the Data Import Wizard to copy the information into your site. See Custom Objects in the Data Import Wizard.

Custom Objects on the Service Console
Deployed custom objects can be added to your Service Console components, including workspaces, workspace rules, workflows, and agent scripts.

Using objects and system attributes in these areas is no different from using standard objects and custom fields. However, where default workspaces are automatically created for standard objects, workspaces are not automatically created for custom objects so you need to create them so your staff members can add and edit records for your custom objects.

When creating workspaces for custom objects, the Insert Field tab on the workspace designer’s ribbon gives you access to the custom object’s fields as well as fields of objects that are parents of the custom object.

In this example, the workspace is being created for the WorkOrder custom object. Since incidents and the Service Category custom object are both parents of the WorkOrder custom object, the fields from the parent objects can also be added to this workspace.

If an object is the child of another object in a relationship, and if both objects can have workspaces created for them, you can edit the parent object’s workspace to add a relationship item for the child object. The names of the relationship items for child objects are derived from the object’s label followed by “View” (for example, a relationship item for an object named Warranty will be named Warranty View). This relationship item lets you access the child object’s records while working with a record for the parent object. For example, you can add the Incident View relationship item to a contact workspace to let you access incidents when viewing a contact record.

Note: If the same object is added as a child in multiple relationships to the same parent (for example, if the contacts object is specified as the child of the incidents object in two relationships), the workspace designer’s ribbon will still contain only one view item for the object. However, when you add the view item to a workspace, you can specify which report to use for the view item. This lets you define which of the child relationships the view item will use.

If you have created a self-referencing relationship between objects, such as making incidents a child of itself, you can add a view item for the object to the object’s workspace. This configuration lets you create parent/child associations between different records for the same object. For example, adding the Incidents View item to an incidents workspace lets you create or edit a child incident when editing the parent incident.

Tip: Browser controls added to workspaces can include variables in the URLs to pass information about custom object records to a web page. The variable has a format of $package_name$object_name.field_name. For example, to pass information about a field named PaymentType in an object named WorkOrder in the CO package, append $co $WorkOrder.PaymentType to the browser control’s URL. See Answer ID 5169 to access the B2C Service Connect Desktop Integration (Javascript API) documentation.

Custom Objects in Navigation Sets
Staff members who require access to custom object records must be able to open the records from their navigation set.

Custom reports that are configured to let you open custom object records can be added to navigation sets, and options to create new custom object records can be added to the file menu using the Navigation Sets editor.
In addition, you can add standard search reports to navigation sets to help you quickly locate specific custom object records. These reports are automatically created for all deployed custom objects and are located in **Public Reports > Common > Views—Common > Search Reports—Custom Objects**.

### Custom Object Permissions in Profiles

The workspaces or workflows you want to use to create and edit custom object records are specified in your profile.

You specify **workspaces** or **workflows** for custom objects in the same way that you associate customized workspaces to edit **incidents** or other **standard objects**.

In addition to associating workspaces or workflows with custom objects, you need to specify permissions for your staff members to read, delete, and perform other actions on custom object records. Each deployed custom object is listed on the Custom Objects tab of the Profiles editor.

The custom objects are organized by the package they are in. Similar permissions can be granted for each object, though the Notes permissions are available only for objects with fields that have notes.

**Related Topics**
- Profiles
- Custom Objects Permissions

### Custom Objects in Analytics

Deployed objects that have the Object is Available in Workspaces, Scripting, and Workflow option enabled automatically have standard reports created for them.

You can find the reports in **Public Reports > Common > Views—Common > Search Reports—Custom Objects** and **Editor Reports—Custom Objects**. These reports are primarily intended to be used as Quick Search reports and in workspaces to provide access to the custom object records.

All deployed custom objects are available for use in **custom reports**, so you can create the custom reports you need to track your data. Using custom object data is no different than using data in standard tables, with the exception that data in menu-only custom objects is not available for **inline editing**.

When creating reports in the report designer, you can find your custom objects in the **data dictionary**. The fields created for system attributes and the tables created for objects each have unique naming conventions. These conventions are also followed when viewing custom objects in the Data Dictionary located on the navigation pane (**Configuration > Database > Data Dictionary**).

- System attribute fields—Fields created for system attributes are listed in the table they are associated with, just as custom fields are. However, where the database names for custom fields are prepended with c$, the database names for system attributes are prepended with the name of the package they are in followed by the dollar sign. For example, after creating an incidents system attribute named ManagerReviewed in the CO package, a field named “Manager Reviewed (CO$ManagerReviewed)” will display in the incidents table.

- Object tables—Tables that store object data are listed by the object label names. The table database names are derived from the name of the object, prepended with the name of the package and the dollar sign ($). For example, an object in the CO package that is named ProdReg with a label of Product Registration displays in the data dictionary as “Product Registration (CO$ProdReg).”

**Tip:** To use custom object transactional data in a custom report, you need to use fields from the Custom Object Transactions (co_trans) table instead of the Transactions (trans) table.
Custom Objects in the Data Import Wizard

You can use the Data Import Wizard to import a large number of records into your custom objects from an external file. After deploying custom objects and configuring workspace, navigation set, and other components, you can enter data in the custom object records just like you enter information for individual incident, contact, or task.

However, you can also use the Data Import Wizard to import a large number of records into your custom objects from an external file. Data can be imported into objects as well as system attributes. Because custom objects are used to integrate your organization’s unique data into B2C Service, you will likely want to consider using this option to copy data from an external database into your site.

Custom Processes

Overview of Custom Processes

Custom processes are predefined object event handlers (PHP scripts) that run as the result of an event occurring on standard or custom objects.

Object event handlers can help your organization automate tasks based on the events that trigger them. For instance, when an incident is updated, an object event handler can be triggered to update a record in an external system. Event handlers can also be used in rules, surveys, and campaigns.

Object event handlers are added and managed on the process designer in a virtual container called the process model. After you add your object event handlers, you must deploy the process model to use the object event handlers in B2C Service. The process model is not written to the Oracle database until it is deployed.

We recommend testing the process model in a non-production site. When you are finished testing the process model, you can export it from your non-production site, import it into your production site, and then deploy it. For more information, see Best Practices for Testing Object Event Handler Scripts.

Note: The process designer interacts with the Connect Common Object Model (CCOM), which is publicly accessible and backward compatible. The CCOM can also be accessed using these APIs:

- Connect PHP API Developer Guide
- REST API for Oracle B2C Service
- Connect Web Services Developer Guide

Process Designer

You use the process designer to add object event handlers and deploy process models to the Oracle database.

To access the process designer, your profile must have the Process Designer permission on the Administration tab enabled. See Administration Permissions. In addition, you might need to add the Process Designer component to your navigation set to view it. See Create a Navigation Set for the Administrator.
CAUTION: Due to the high degree of workflow change that can be made to your application when using custom processes, we recommend that few staff members be granted access to the process designer.

When you open the process designer, you will notice that the tree includes a list of standard objects under the OracleServiceCloud entry and custom objects under the CO package or other packages you create in the object designer. Only deployed custom objects are available on the process designer. See Create a Custom Object and Custom Object Packages.

The objects shown in the tree can be associated with the event handlers you add using the process designer. If you intend to use event handlers in rules, surveys, or campaigns, you do not need to associate them with objects. See Triggers for Object Event Handlers.

Object Event Handlers

Object event handlers are available for both custom objects and standard objects.

Custom object event handlers act on custom objects, whereas standard object event handlers act on standard objects in the Connect Common Object Model, including Answer, Contact, Incident, Opportunity, and Organization.

Note: When creating an object event handler, required test harness code must be implemented in the PHP script to ensure compatibility with B2C Service. See Example of an Object Event Handler Script.

You can also add event handlers to use in rules, surveys, and Campaign. These event handlers do not need to be associated with the objects listed on the process designer. See Triggers for Object Event Handlers.

Best Practices for Testing Object Event Handler Scripts

Before you add an object event handler, we recommend reviewing our best practices to ensure that you are aware of potential issues. These best practices can be helpful when creating and testing object event handler scripts.

- Have a complete test in mind. Consider all of the expected conditions and effects of the object event handler script and test for them in the test harness.
- Handle expected and possible errors with try/catch statements.
- Perform both of these tasks:
  - Select the Can Suppress check box on the process designer.
  - Include SuppressExternalEvents in a ->save in your script.

  Note: If neither of these tasks is performed, the script might re-enter itself in an infinite loop.

- Consider the test harness when integrating with external systems. For instance, the $run_mode parameter and the apply() method of your object event handler script can be tested to determine whether they are being run as part of a test or not. You must decide how to test against external integrations or systems.
- Objects passed after an edit contain only the data that was modified during the edit. For instance, if an incident thread is modified during an edit, only that thread is passed. Other data associated with the object (such as other incident threads) needs to be passed using a new instance of the object.
- Object event handler script headers include Package: and objects: tags. The package tag defines the package where you place the script rather than the package where the objects are located. The objects tag defines which
objects the event handler impacts. You must list the objects using their PHP names. For instance, if you have a custom object named Warranty located in the CO package, the object’s name in the tag will be `CO/Warranty`.

- Custom processes do not affect the behavior of PHP global variables. See `Variable scope` in the standard PHP documentation.

- When testing an object event handler script *before* deployment:
  - Any regular or error output displays in a dialog when the test is complete.
  - Any errors encountered prevent the State field from being marked Tested.
  - Any errors encountered within the test harness are not logged and are not counted against the runtime errors of a deployed script.

- When testing an object event handler script *after* deployment:
  - Any deployed object event handler script that encounters five errors (without any intervening success) will be disabled and the status of the State field will be changed to Errored. Otherwise, the script will become disabled on or after the fifth run if the error:success ratio becomes greater than or equal to 50%.
  - Error and success rates will stop recording when the error:success ratio falls below 10%.
  - All runtime errors are recorded to the Info log. See `Log File Errors and Information`.

Add an Object Event Handler

Using the process designer, you can create a new object event handler.

1. Click `Configuration` on the navigation pane.
2. Expand `Site Configuration`, then double-click `Process Designer`.
   The process designer opens on the content pane.
3. Click `New`.
   The Server Process Object Event Handler editor opens.
4. Enter a name for the object event handler in the **Procedure Name** field.
   Object event handler names must start with a letter, end with a letter or number, and contain only letters, numbers, and underscores.
5. Click the folder icon next to the **PHP Code File** field and select a file to load.
   The Procedure Name field is then updated with the name of the file in the PHP Code File field, the State field displays Requires Save, and all PHP code displays as read-only in the PHP Content field.
   **Tip:** We recommend that you name your PHP code file according to its event function or manually update the Procedure Name field after loading the file.
6. To execute the event handler asynchronously, select **Execute Asynchronously**. (This option is selected automatically if the PHP script includes the async keyword.)
   This option schedules the event handler to execute using a queuing system. If the first attempt fails for some reason, such as a server being unavailable, the event handler execution will be retried automatically up to four times. The first retry occurs 90 seconds later, the second occurs 450 seconds later, the third occurs 3,150 seconds later, and the fourth occurs 34,650 seconds later.
   You can use this option with an event handler that does not need to execute immediately and that is not required by the operation that triggered the event. For instance, if you have an integration that updates contact information in an external database when a contact is created in B2C Service, you can use an async event handler since the data can be sent any time.
   **Note:** You must select the **Execute Asynchronously** check box if you use cURL commands in your event handler. Do not select this option if you are adding an event handler for use in surveys or campaigns.
7. Click **Save**.
   The status of the State field changes to Not Tested and the **Test** button is enabled.
8. Click **Test** below the **State** field to test the PHP code file for errors and to verify the test harness.
   If no errors are encountered and your test harness validates, a message displays and asks if the object event handler test result was correct.
9. Click **Yes** to acknowledge that the test ran as you expected.
   The message closes, the status of the State field changes from Not Tested to Tested, and the **Test** button is disabled.
10. Click **Save** to save the process model.
11. Associate the event handler with an object and event type that will trigger it.
    This step is not needed when creating event handlers to use in rules, surveys, or campaigns. See *Triggers for Object Event Handlers*.

Before you can use the object event handler, the process model must be tested and deployed. See *Deploy the Process Model* and *Roll Back the Process Model*.

**Example of an Object Event Handler Script**

This example object event handler script adds a note to an organization when it is created in the Oracle database.

The types of objects and actions with which the script can function are indicated at the beginning of the script. The required test harness code is located approximately halfway through the script.

**Note:** An additional sample script that uses client for URLs (cURL) to perform an action in an external database is provided in the *Connect PHP API Developer Guide*.

```php
<?
/*
* CPMObjectEventHandler: organization_create
* Package: OracleServiceCloud
* Objects: Organization
* Actions: Create
* Version: 1.1
*/

// This object procedure binds to v1_1 of the Connect PHP API
use \RightNow\Connect\v1_1 as RNCPHP;
// This object procedure binds to the v1 interface of the process designer
use \RightNow\CPM\v1 as RNCPM;

/**
* An Object Event Handler must provide two classes:
* - One with the same name as the CPMObjectEventHandler tag
*   above that implements the ObjectEventHandler interface.
* - And one of the same name with a "_TestHarness" suffix
*   that implements the ObjectEventHandler_TestHarness interface.
* *
* Each method must have an implementation.
*/

class organization_create
implements RNCPM\ObjectEventHandler
{
    public static function
apply( $run_mode, $action, $obj, $n_cycles )
    {
        $note = new RNCPHP\Note;
        $note->Text = "\n" . date(DATE_RSS) . "\n" . "A note added by " . __CLASS__ . '__FUNCTION__ . "\n";
        if (is_null($obj->Notes))
            $note->Text .= "\n"
        $obj->Notes = $note;
        $obj->Save();
    }
}
Triggers for Object Event Handlers

Using the process designer, you can associate an event handler with a standard or custom object and a create, update, or destroy action.

After adding an event handler to the process designer, you must specify how the event handler will be triggered. Only event handlers specifically written for the object type and action can be selected when making these associations.

Object event handlers can also be triggered by rules, surveys, and campaigns when the conditions you specify are met. For information about using event handlers in rules, see Actions for Rule Bases.
Note: Only object event handlers written for contacts can be used in surveys and campaigns.

You can also use the process designer to associate event handlers with create, update, or delete actions performed on standard and custom objects. When the action occurs on the associated object, the event handler is triggered automatically. The event handler must be written to work with the associated object and action.

For example, this *Example of an Object Event Handler Script* is triggered when organizations are created.

**Associate an Event Handler with an Object**

Use the process designer to associate object actions with event handlers.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Process Designer**.
   
   The process designer opens on the content pane.
3. Select the custom or standard object that you want to associate with the object event handler from the tree.
   
   Note: By design, custom process error logging always executes with full permissions. It isn't associated with the profile permissions of the account whose operation triggered the process.

   The Custom Event Handlers editor opens on the content pane and the drop-down menu in the column that is associated with the PHP code file is activated.
4. Click the drop-down menu in the applicable column (Create, Update, or Destroy) and select the object event handler that you want to associate the object with.
5. To allow the object event handler to be suppressed from the SuppressExternalEvents processing option that is part of Connect Web Services for SOAP and the Connect PHP API, select the check box in the Can Suppress column.
6. Click **Save**.

Before you can use the object event handler, the process model must be tested and deployed. See *Deploy the Process Model* and *Roll Back the Process Model*.

**Export the Process Model**

You can export process models, for example, from your test site.

Before you deploy a process model on your production site, we recommend that you first test it on a test site that is similar to your production site. This helps ensure that the object event handlers function as expected and interact with the B2C Service data in the way you want. After verifying that the process model is configured correctly on the test site, you can export it from the test site and then import it into your production site.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Process Designer**.
   
   The process designer opens on the content pane.
3. Click **Export** on the ribbon.
   
   The Export Process Model Wizard opens.
4. Select the check boxes next to the object event handlers that you want to export.
**Import the Process Model**

You can import process models, for example, into your production site.

Before you deploy a process model on your production site, we recommend that you first test it on a test site that is similar to your production site. This helps ensure that the object event handlers function as expected and interact with the B2C Service data in the way you want. After verifying that the process model is configured correctly on the test site, you can export it from the test site and then import it into your production site.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Process Designer**.
   The process designer opens on the content pane.
3. Click **Import** on the ribbon.
   The **Import Process Model Wizard** opens.

   **Note:** When exporting and importing the process model, you choose which object event handlers to include and exclude. Since you cannot save more than fifty object event handlers (with unsaved content) at one time, the maximum number of object event handlers that can be imported at one time is fifty.

4. Click the **Browse** icon to select the .zip file that contains the process model you want to import.
5. Click **Next**.
   If you import an object event handler with the same name as an existing event handler, you can either replace (overwrite) the imported event handler or import it as a new event handler with the number “1” appended to its name.

   The next page of the wizard shows you the object event handlers that can be imported.
6. Select the check boxes next to the object event handlers that you want to import.
7. Select options for the imported object event handlers.
   a. To create a new object event handler, click the arrow next to the text that reads replace event handler and select imported as a new event handler.
   b. To prevent an object event handler from being imported, clear the check box next to it.
8. To import object event handler mappings, select **Import Event Handler Mappings**.
9. Click **Next** to complete the import.
   A message informs you that the import was successful.
10. Click **OK** to close the message and the wizard.
11. To deploy the imported process model on your site, click **Deploy** on the ribbon. See **Deploy the Process Model**.
12. Click **X** on the console to close the process designer.
Deploy the Process Model

After you create and test the process model, it must be deployed. When the process model is deployed, all object event handlers are mapped to custom and standard objects in the database and are ready for execution when an event occurs in B2C Service.

Because of the changes at the database level, it is important that you test the process model before deploying it. See Best Practices for Testing Object Event Handler Scripts for information about potential issues and best practices when creating and testing object event handler scripts.

To assist you with testing, export and import functionality is available so you can test the process model on a test site before deploying it to a production site. See Export the Process Model and Import the Process Model.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, then double-click Process Designer.
   The process designer opens on the content pane.

   | **Note:** Before you deploy the process model, we recommend that you first review the object event handlers to confirm that no additional changes are needed.

3. Click Deploy on the ribbon.
   The Deploy window opens.
4. Enter the email addresses in the Email Address field to which you want to send notifications.
   Addresses entered in this field receive emails when deployment completes or when an issue preventing deployment is encountered. The logged-in staff account’s email address is automatically added.

   | **Note:** Multiple addresses must be separated by commas.

5. Click Deploy.
   A message informs you that you are about to deploy the server process model, which disables the process designer until the deployment is complete.
6. Click Yes to close the message and start the deployment.
   A message notifies you when the deployment is finished and that the process designer will be refreshed.
7. Click OK to close the message and return to the process designer.
8. Click Save.

Roll Back the Process Model

If you have not yet deployed the process model, you can roll it back to revert to the state it was in at the time of the most recent deployment.

If the process model has never been deployed, rolling it back removes all object event handlers.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, then double-click Process Designer.
   The process designer opens on the content pane.
3. Click Rollback on the ribbon.
   The Rollback window opens and a message informs you that all saved changes made on the process designer since the last deployment will be removed, and that after a rollback has been performed it cannot be undone.
4. Click OK to close the Rollback window and start the rollback process.
5. Click Save.

View Custom Process Error Logs

Custom process error monitoring provides a read-only report with information on errors that occur when running custom processes.

You must add the Process Designer to the navigation sets of all profiles that will create and monitor custom processes. You can diagnose custom process errors without having to contact our support staff. Errors are processed asynchronously at 15-minute intervals by the Data Quality Assessment (DQA) utility.

1. Click Error Log on the Show group of the process designer ribbon.
   The CPM Errors report displays.

The error log report shows:

- Operation (such as Create or Update)
- Class (object such as Organization or Contact)
- Object ID
- Error summary
- Error content
- Time of occurrence
- Interface

Custom Process Logging for Debugging Scripts

The logging framework can be used for debugging runtime problems with custom process scripts during development and testing.

Two entities are used in custom process logging:

- **Terminals**—Provide the logging function. You define terminals in PHP scripts that you import to the process designer. The Terminal class is provided with Connect Common Object Model (CCOM) version 1.3 and later.
- **Probes**—Control which terminals are used for logging. You create probes on the Agent Browser UI using the probe designer.

**Note:** The probe designer currently works only on the Agent Browser UI. However, you create the custom process models for logging in the Service Console.

Probes control which terminals are activated based on these fields:

- Terminal Name
- Log Level

When a probe is enabled, it activates all terminals whose:

- Terminal name matches the name, wildcard, or regular expression provided in the probe. Terminal names are defined in the custom process model script.
- Log level is as severe as, or more severe than, the log level provided in the probe.

You use these rules for writing regular expressions in the Terminal Name field:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Indicates</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>One or more of the previous character</td>
</tr>
<tr>
<td>*</td>
<td>Zero or more of the previous character</td>
</tr>
<tr>
<td>.</td>
<td>Any character</td>
</tr>
</tbody>
</table>
| \w        | Any word character (alphanumeric or underscore). Only matches standard ASCII characters (no accented or non-Latin characters).
This expression is equivalent to [A-Z a-z 0-9 _].

For example:
- ter+ will match ter and terr, but not te or term
- ter* will match te, ter, and terr, but not term
- term.* will match term, term1, and termm

Probes have these log levels, which are listed in order of decreasing severity:

<table>
<thead>
<tr>
<th>ID</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>FATAL</td>
</tr>
<tr>
<td>2</td>
<td>ALERT</td>
</tr>
<tr>
<td>3</td>
<td>CRITICAL</td>
</tr>
<tr>
<td>4</td>
<td>ERROR</td>
</tr>
<tr>
<td>5</td>
<td>WARN</td>
</tr>
<tr>
<td>6</td>
<td>TRACE</td>
</tr>
<tr>
<td>7</td>
<td>INFO</td>
</tr>
<tr>
<td>8</td>
<td>DBG</td>
</tr>
</tbody>
</table>

You must perform these tasks to implement custom process logging:

1. **Enable Custom Process Logging**.
2. **Define the Terminals in the Custom Process Script**.
3. **Create the Object Event Handler**.
4. **Create Probes for Logging**.

After creating the probes, you perform operations to test your custom processes, then **examine the custom process logs**.

---

**Enable Custom Process Logging**

You must have custom process logging enabled to use it.

1. Confirm that the ENABLE_CPM_LOGGING configuration setting is enabled. This setting is **not** enabled by default. To enable this hidden setting, contact your Oracle account manager or **Submit a Service Request**.
Define the Terminals in the Custom Process Script

You define terminals for custom process logging in PHP scripts that you import to the process designer.

Custom process logging uses this PHP syntax:

```php
use \RightNow\Connect\v1_3 as versioned_namespace;
versioned_namespace\Terminal::logger(terminal_name, log_level, log_message);
```

For example:

```php
use \RightNow\Connect\v1_3 as RNCPHPV3;
RNCPHPV3\Terminal::logger(terminal1, 'Fatal', 'This is a fatal error.');
```

1. Create a PHP file, like you would for any custom process script, that defines the terminals you wish to use for logging.

The following example shows a PHP script for logging events associated with custom processes for Organization objects.

```php
<?

/**
 * CPMObjectEventHandler: OrgTest
 * Package: RN
 * Objects: Organization
 * Actions: Create, Update, Destroy
 * Version: 1.2
 **/

/**
define("Fatal","1");
define("Alert","2");
define("Critical","3");
define("Error","4");
define("Warning","5");
define("Trace","6");
define("Info","7");
define("Debug","8");
**/

// This object procedure binds to v1_2 of Connect PHP.
use \RightNow\Connect\v1_2 as RNCPHP;
// This object procedure binds to the v1 interface of SPM.
use \RightNow\CPM\v1 as RNCPM;
use \RightNow\Connect\v1_3 as RNCPHPV3;

class OrgTest implements RNCPM\ObjectEventHandler
{
    public static function apply( $run_mode, $action, $obj, $n_cycles )
    {
        $terminalObj = new RNCPHPV3\Terminal;
        $terminalObj::logger("terminal1", 1, "This is a fatal error.");
        $terminalObj::logger("terminal1", 'Fatal', "This is a fatal error.");
        $terminalObj::logger("terminal1", 'Debug', "This is a debug message.");
        $terminalObj::logger("terminal1", 'Info', "This is an info message.");
        $terminalObj::logger("terminal2", 'Critical', "This is a critical error.");
        $terminalObj::logger("terminal2", 'Info', "This is an info message.");
        $terminalObj::logger("terminal3", 'Alert', "This is an alert.");
        $terminalObj::logger("terminal4", 4, "This is an error.");
        $terminalObj::logger("terminal6", 'Debug', "This is a debug message.");
        $terminalObj::logger("terminal6", 'Warning', "This is a warning.");
    }
}
```
if (is_null($obj->Notes))
{
    $obj->Notes = new RNCPHP\NoteArray;
}
$note = new RNCPHP\Note;
$note->Text = date( 'r' ) . "\n";

switch ( $action )
{
    case RNCPM\ActionCreate:
        $note->Text .= "Created";
        break;

    case RNCPM\ActionUpdate:
        $note->Text .= "Updated";
        break;

    case RNCPM\ActionDestroy:
        $note->Text .= "Destroyed";
        break;

    default:
        assert( !'!!! Unknown action !!!' ) || die( -1 );
}
$note->Text .= " by " . __CLASS__ . "\n";

if (RNCPM\RunModeLive != $run_mode)
{
    echo( "Hello from OrgTest, run_mode= $run_mode, action= $action, id= {$obj->ID} n_cycles= $n_cycles\n""); // */
    echo( "Note= " . $note->Text );
    return;
}

$note->Text .= " by " . __CLASS__ . "\n";
$note->Text .= " by " . __CLASS__ . "\n";
$note->Text .= " by " . __CLASS__ . "\n";
$note->Text .= " by " . __CLASS__ . "\n";
$note->Text .= " by " . __CLASS__ . "\n";
$note->Text .= " by " . __CLASS__ . "\n";
$note->Text .= " by " . __CLASS__ . "\n";
$note->Text .= " by " . __CLASS__ . "\n";

class OrgTest_TestHarness implements RNCPM\ObjectEventHandler_TestHarness
{
    public static function setup()
    {
        // Nothing special to set up.
        return;
    }

    public static function fetchObject( $action, $object_type )
    {
        $org = new RNCPHP\Organization;
        switch ( $action )
        {
            case RNCPM\ActionCreate:
                $org->Name = 'A new Org';
                break;

            case RNCPM\ActionUpdate:
                $org->Name = 'An updated Org';
                break;
        }
        return $org;
    }
}
Create the Object Event Handler

You create the object event handler from the custom process logging PHP script. Then you associate the event handler with an object.

You must perform these tasks before creating object event handlers:

- Add the process designer to the navigation sets of all profiles that will create custom processes.
- **Define the Terminals in the Custom Process Script** in the custom process PHP scripts.

See **Object Event Handlers** for more information on creating object event handlers. See **Assocate an Event Handler with an Object** for more information on associating event handlers with objects.

1. From the process designer, create an object event handler in your PHP script that defined the terminals.
2. Save and test the object event handler.
3. Associate the object event handler with the object for which the PHP script was written.
4. Save and deploy the custom process model.

Create Probes for Logging

You create probes for logging custom processes by using the probe designer on the Agent Browser User Interface.

You must add the probe designer to the navigation sets for profiles that need to use it. The Probe Designer is found in **Components > Common** in the Navigation Sets editor on the Service Console.

**Note:** The Probe Designer currently can be used only in the Agent Browser UI.

1. Click the Navigation Menu icon in the Agent Browser UI, then navigate to **Probes**.
   The Probe Designer opens in the Probes report.
2. Click **New** on the toolbar.
   The Probe workspace opens.
3. Enter a name for the probe in the **Name** field.
4. Enter a terminal that is defined in your PHP script for custom process logging in the Terminal Name field. You can also use wildcards and regular expressions.
5. Select a logging level that is defined for the terminal from the Log Level drop-down menu. Every terminal with that log level and higher (greater severity) will be logged.
6. Select the Enable check box to enable the probe.
   Note: The maximum number of enabled probes is 50.
7. Click Save and Close to save the probe and return to the Probe Designer.
8. Click Refresh on the toolbar to see the new probe. If you have many probes, you can use the Filters option to limit the number of probes displayed per page. The maximum number is 10000.

Examine the Probe Logs
After creating the probes, you test them, and then examine the probe logs.

1. From the probe designer, click Log in the row for the probe whose log you wish to examine.
   The CPM Logs report opens. The notifications for each logged event are grouped as a run. The run number is a unique number generated to group the logs generated in a single execution of the custom process model.
2. Use the Filters option to search by time, log level, and probe ID.
   The maximum number of records that can be displayed is 10000.

Asset Management

Overview of Asset and Product Registration
Knowing which products and services your customers are using helps you respond to their needs. For instance, an organization selling mobile phones can more quickly assist a customer if they know which model the customer owns. Organizations can also proactively contact customers with information pertaining to the products they own.

Using B2C Service, you can configure the assets you want to associate with your customers. These assets can require serial numbers or not, depending on your needs, and can be registered by customers on the customer portal or by agents on the agent desktop.

Note: An assets solution can be created using custom objects or an integration. However, using the asset and product registration tool makes it easy to quickly implement an assets solution and adopt future enhancements.

Asset Planning
There are a number of ways you can use assets. Some organizations will want to track assets without serial numbers, others will want to track serialized assets, and others will use external applications to validate serial numbers.

The steps you use to manage assets vary depending on your organization's needs. Consider these general use cases before you configure your asset management system.

• You want to track assets that do not use serial numbers—In this instance, you need to create asset products, but you do not need to create individual asset records since they can be created when customers or agents
register an asset with a contact or organization. When creating products in the product catalog for non-serialized asset products, you will not select the Serialized check box. See Add or Edit a Sales Product to Use with Assets.

- **You want to track assets with unique serial numbers and want to validate the serial numbers using B2C Service**—In this instance, you need to create asset products, and then add an asset record for every unique serial number. After the asset records are created, customers can register their product on the customer portal by entering their product's serial number. The system then associates the contact or organization with the asset record that has the serial number the customer entered.

When creating asset records in advance of product registration, the records should have a serial number, a status of Unregistered, and not be associated with a contact or organization.

- **You want to track assets with unique serial numbers and you have an external serial number validation system**—In this instance, you need to create asset products (see Add an Asset Record), but you do not need to create asset records. However, you need to use a customized customer portal widget that accesses your validation system. When a customer enters a serial number, the custom widget sends the information to the external system to validate. If the serial number is validated, the custom widget then creates an asset record, populates it with the correct information, and creates the association between the contact or organization record. Contact your Oracle account manager for information about custom widgets.

- **You want to track assets with unique serial numbers but do not need to validate the serial numbers**—In this instance, you need to create asset products, but not individual asset records. Using a custom widget, customers enter serial numbers for their products on the customer portal, but the serial numbers aren’t verified. The custom widget then creates asset records and populates them with the serial numbers your customers provide along with other pertinent information.

Regardless of how you manage assets, standard reports make it easy to view information related to them. These reports are available in the Reports explorer’s Public Reports/Service/Assets folder. You can also create custom reports if the standard reports do not meet your needs.

## How You Set Up Assets

Before your agents and customers can manage assets, you must configure the items you want to track.

- Configure asset statuses to help you track asset usage if the three default statuses (Active, Retired, and Unregistered) do not meet your needs. See Add or Edit an Asset Status.

- Create the products or services you want to track in the product catalog and specify if they should have serial numbers. See Add or Edit a Sales Product to Use with Assets.

- Configure your workspaces and assign them to the appropriate profiles. You can create custom asset workspaces or use the default workspaces. You can also create custom incident, contact, and organization workspaces to add asset fields and relationship items. See Asset Workspaces.

- Configure navigation sets to let agents easily create assets and view asset reports. See Assets and Navigation Sets.

- If you want to use serialized products and perform serial-number validation in B2C Service, create asset records and associate them with your customers. If you have an existing database where you store assets, you can import the data into B2C Service using the Data Import Wizard. See Asset Planning and Add an Asset Record.

- If you want your customers to be able to view and register their products on the customer portal, add the appropriate widgets to the customer portal pages. See Product Registration on the Customer Portal.
• Assets are similar to the other standard objects in B2C Service such as incidents, contacts, and answers. Just as with these objects, you can add system attributes to the asset object if you require additional fields to meet your needs. See Create a System Attribute.

Add or Edit an Asset Status

Asset statuses help you manage assets by tracking which assets are in use, which are no longer used or supported, and which assets have not been associated with customers.

The three default statuses are Active, Retired, and Unregistered, and are associated with three status types, also named Active, Retired, and Unregistered. These status types have different purposes.

• **Active**—This is used for assets that are associated with contacts or organizations.
• **Retired**—This is used for assets that have previously been associated with contacts or organizations, but are no longer in use. Instead of deleting these records, you can use the Retired status type to continue to track assets that are no longer used.
• **Unregistered**—This is used for assets that have not been associated with contacts or organizations.

You can rename the three default statuses and add additional statuses to help you better organize assets. When you add a status, you must assign it to one of the three status types. You cannot modify the asset status types or add custom status types.

1. Double-click **Customizable Menus** in **Configuration > Application Appearance**.
2. Expand the System Menus folder.
3. Click **Asset Statuses** to display the editor.
4. To edit an existing status, click the status.
5. To add a new status, click **New**.
6. Click **Status** and select a status type.
7. Enter a name for a new status or edit an existing one in the **Label** field.
8. Click **Save**.

Add or Edit a Sales Product to Use with Assets

To configure assets, you must add sales products you want to associate with contacts and organizations.

These can be any unique item or resource you want to track. You add these items using the product catalog. However, if you have an existing asset management system, you can bulk import asset products using the Data Import Wizard. See Import Asset Records.

If you currently use sales products with **quote** and **Offer Advisor** promotions and suggestions, you can also use them for asset management and product registration. See Add or Edit a Sales Product.

**Note:** If you delete an asset product, all **asset record** configured to use the product will also be deleted.

1. Double-click **Product Catalog** in **Configuration > Opportunity Tracking**.
2. Do one of the following:
   - Click **New** to add a new product.
   - Click an existing product to edit it.
3. Enter the name in the **Product Name** field.
4. To add an additional identifier for the product, enter it in the **ID** field.
5. To prevent the product from being used by agents or displaying in editors, select **Disabled**.
6. To make the asset available for use in opportunity tracking, select **Sales Catalog**.
This isn't necessary when configuring products for use in asset management.

7. To make the asset available for use in B2C Service (Service), select Service Catalog.
   This option must be selected to create asset records using the product, and to associate it with contacts and organizations.

8. To prompt customers and agents to enter a serial number for an asset related to the product, select Serialized.
   It's important to consider your organization's requirements before selecting this option. See Asset Planning.

9. To associate a service product with the asset product, select it from the Service Product drop-down menu.
   Any incidents created from the Service Console or customer portal that apply to the asset will automatically be populated with the selected service product.

10. Click Save.

Asset Workspaces

Agents use asset workspaces to create, edit, and view assets. Incident, contact, and organization workspaces can also be modified to include asset information.

Standard asset and asset multi-edit workspaces are available for adding and editing assets. These standard workspaces are automatically added to profiles when assets are enabled. You can use these standard workspaces or create custom workspaces. Creating custom workspaces for assets is no different than creating workspaces for other standard objects. See Overview of Workspaces.

Note: If you want to use custom asset workspaces, you must select them on the Profiles editor's Interfaces page. See Custom Workspaces.

You should also review your incident, contact, and organization workspaces to ensure they include the asset fields and relationship item that agents need to work with assets that are associated with these record types.

- **Asset fields**—You can add fields from the assets table to incident workspaces. This gives your agents the ability to view or modify asset information when they work with an incident that's associated with an asset record. These fields include information such as the asset’s name, price, and serial number.

- **Assets relationship item**—You can add the Assets relationship item to contact and organization workspaces. This is needed for agents to view the assets associated with contact and organization records. Using the relationship item, agents can delete existing asset relationships, or open the Assets editor to add asset records to a contact or organization.

Assign Asset Profile Permissions

Profile permissions must be specified for those staff members who require access to assets. These permissions allow staff members to view, add, edit, and delete assets.

1. Double-click Profiles in Configuration > Staff Management.
2. Double-click the profile you want to assign permissions to.
3. Select Permissions.
4. Click the Service tab.
5. Select the appropriate check boxes under the Asset heading.
6. To assign all asset permissions to the profile, select Select All.
7. Click Save.

Assets and Navigation Sets

You can modify navigation sets to let agents work with assets on the Service Console and the Agent Browser UI.

You must add the Assets navigation button to the navigation sets used by your agents so they can access asset records. You can also add the New Asset item to the file menu so agents can quickly add assets. In addition, you can add asset
reports, located in Public Reports\Service\Assets, to the Asset navigation button, or any other navigation button. See Overview of Navigation Sets.

Add an Asset Record

After configuring assets, your agents can add and manage assets on the Service Console.

Assets can also be bulk imported from a file using the Data Import Wizard. See Import Asset Records. Assets can be added on the Assets editor, and when viewing contact and organization records.

1. Do one of the following:
   - If you're viewing a record in the Assets editor, click New.
   - If your navigation set is configured to add assets from the file menu, click File > Asset. See Configure the File Menu.
   - If your contact or organization workspace includes the assets relationship item, view the asset list in the contact or organization record, click Add > Add New.

2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Name</td>
<td>Enter a name for the asset record in this field.</td>
</tr>
<tr>
<td>*Product</td>
<td>Click this drop-down menu and select the asset product. See Add or Edit a Sales Product to Use with Assets.</td>
</tr>
<tr>
<td>Serial Number</td>
<td>If using serialized assets, enter the asset’s serial number in this field. See Asset Planning.</td>
</tr>
<tr>
<td>Contact/Organization</td>
<td>Click the buttons next to these fields to select the contact or organization you want to associate with the asset. These fields are populated when creating an asset from the contact or organization record. When creating asset records for future registration, the fields may be left empty. See Asset Planning.</td>
</tr>
<tr>
<td>Price</td>
<td>Enter a price for the asset in this field. Click the currency shown to select a different currency, and click the button to view exchange rates. See Add or Edit a Currency.</td>
</tr>
<tr>
<td>*Date Purchased</td>
<td>Enter the date the asset was purchased or obtained, or click the calendar next to the field to select a date.</td>
</tr>
<tr>
<td>Date Installed</td>
<td>Enter the date the asset was installed or activated, or click the calendar next to the field to select a date.</td>
</tr>
<tr>
<td>Date Retired</td>
<td>Enter the date the asset was retired or deactivated, or click the calendar next to the field to select a date.</td>
</tr>
</tbody>
</table>
### Core Features

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Click this drop-down menu and select a status for the asset. See <em>Add or Edit an Asset Status</em>.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description or notes for the asset in this field.</td>
</tr>
</tbody>
</table>

3. To associate the asset with a new incident, click the **Incidents** tab.
   a. Click **Add New** and complete the fields. See *Edit Key Incident Fields*.
4. To view the audit log for the asset record, click the **Audit Log** tab. See *Audit Logs*.
5. If you’re adding the asset from the contact or organization record, click **OK**.
6. Click **Save**.

### Import Asset Records

If you have an existing database where you store assets, you can import asset records instead of creating them manually.

You can also import information that associates assets with your customers.

You import this information into B2C Service using the **Data Import Wizard**. The file that contains the data you want to import can include the following information. See *How Data Import Works*.

- Name—This is the name of the asset product. This field is required.
- Product ID—This maps to the `product_catalog.product_id` field. This field is required.
- Serial number
- Asset status
- Organization ID—This maps to the `orgs.org_id` field. This lets you associate the asset with an existing organization.
- Contact ID—This maps to the `contacts.c_id` field. This lets you associate the asset with an existing contact.
- Purchase date
- Install date
- Retire date
- Description

### Product Registration on the Customer Portal

The objects that are called assets on the Service Console are called registered products on the Customer Portal.
When you have created assets on the Service Console and configured product registration for your customer portal, your customers can register their products themselves.

**Add Product Registration Files to Your Customer Portal**

The widgets necessary for product registration are included in the standard widgets on the reference implementation. The page files, however, aren't provided as part of the reference implementation.

The procedure for adding product registration files instructs you to overwrite several of the reference implementation pages. If you have customized these files, best practice suggests making a copy of these files and then customizing the new files with the same changes that you made to the original reference implementation pages. Having backup files also lets you revert from the new functionality to your previous implementation if necessary.

1. Download the `product_registration.zip`.
2. Unzip the files to your workstation.
3. Copy the unzipped files to the appropriate customer portal file.

<table>
<thead>
<tr>
<th>Downloaded Files</th>
<th>Customer Portal Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asset32.png</td>
<td>/cp/customer/assets/themes/standard/images/icons</td>
</tr>
<tr>
<td>standard.php</td>
<td>/cp/customer/development/views/templates</td>
</tr>
<tr>
<td>ask.php</td>
<td>/cp/customer/development/views/pages</td>
</tr>
<tr>
<td>detail.php</td>
<td>/cp/customer/development/views/pages/account/questions</td>
</tr>
<tr>
<td>overview.php</td>
<td>/cp/customer/development/views/pages/account</td>
</tr>
</tbody>
</table>

4. Copy the `assets` folder from the unzipped files to `/cp/customer/development/views/pages/account`. The folder should contain the following files.
   - `asset_registration_confirmation.php`
   - `detail.php`
   - `list.php`
   - `register_asset.php`
   - `serialnumber_validate.php`
   - `update_registered_product.php`

5. Modify the `site.css` file in `/cp/customer/assets/themes/standard` by following these steps.
   a. Open the downloaded `site.css` file in a text editor and copy all content.
   b. Open the `/cp/customer/assets/themes/standard/site.css` file in a text editor.
   c. Paste the copied content from the downloaded file to the end of the `/cp/customer/assets/themes/standard/site.css` file.
   d. Save `site.css`.

   **Note:** You're going to add content to the existing `site.css` file. Do not replace `/cp/customer/assets/themes/standard/site.css` with the downloaded `site.css` file.

6. To let your customers view products that are registered to other members of their organization, set a non-zero value for the `MYQ_VIEW_ORG_ASSETS` configuration setting.
Using B2C Service

Chapter 2
Core Features

b. Double-click Configuration Settings in Site Configuration > Configuration.

c. Enter MYQ_VIEW_ORG_ASSETS in the Key field and click Search.

d. In the row for MYQ_VIEW_ORG_ASSETS, click the Value column.

e. Enter 1 if you want customers to be able to see products from others in their organization, or type 2 if you want them to see products from others in their organization and all its subsidiaries.

f. Click Save.

Overview of Product Registration Widgets

Various Customer Portal widgets support the product registration feature.

- **AssetCheck**—The AssetCheck widget, located in the core/widget/standard/input folder, directs customers to the Product Registration page. If the product requires a serial number, the widget also validates that number. This widget contains the ProductCatalogInput widget and is used on the custom Register a Product > Product Validation page (assets/serialnumber_validate/).

- **ProductCatalogInput**—The ProductCatalogInput widget, located in the input folder, displays a drop-down menu for collecting hierarchical tree data for products. It’s used to submit product values for registered products. This widget contains the ProductCatalogDisplay widget and is contained in the AssetCheck widget.

- **ProductCatalogDisplay**—The ProductCatalogDisplay widget is located in the output folder. It displays the value of the specified product catalog field. The system fields that can be displayed are listed on the Business Objects page of the Customer Portal Administration site, as shown in the following figure. This widget is contained in the ProductCatalogInput and DataDisplay widgets.

  **Note:** The business objects for assets can be used only on pages where assets can be created, updated, or viewed. They aren't supported on the Ask a Question page.

- **AssetOrgList**—The AssetOrgList widget, located in the search folder, displays a drop-down menu that allows customers to search for registered products associated with their own record or for products associated with other contacts in their organization or its subsidiaries. The MYQ_VIEW_ORG_ASSETS configuration setting must be set to a value equal to or higher than the display_type attribute of the widget, which has a default value of 2.

- **ProductCatalogSearchFilter**—The ProductCatalogSearchFilter widget, located in the search folder, displays a drop-down menu containing a hierarchical tree for the product catalog. This widget is contained in the AdvancedSearchDialog widget.

How to View Registered Products on the Customer Portal

When you added product registration files, a modified template file (standard.php) was included. The modified template contains an option on the Your Account drop-down menu for Registered Products.

The product registration files also include an updated Account Overview page with a new Registered Products section.

  **Note:** If you migrated your Customer Portal to the current version from an earlier framework version and implemented product registration before deciding you want to revert to the earlier version, the Registered Products section remains on the Account Overview page and will display all registered products available on the site. To prevent this from occurring, edit the reverted overview.php file to remove the RegisteredProducts div class section.

When logged-in customers select the Registered Products option on the Your Account tab or click the See All Registered Products link on the Account Overview page, a list of products registered to the customer opens. This page is generated by the /account/assets/list.php file.
Your customers can search their registered products on this page by any combination of product, status, and keyword.

Clicking a registered product opens the Registered Product details page. This page displays information about the product as well as any associated incidents. It also includes links that let customers edit the product or go to the Ask a Question page.

Clicking the Edit Registered Product link opens the Update Registered Product page, where your customers can edit the product name and status and add or edit the installed and retired dates.

View Registered Products from Other Staff Members in an Organization
By default, customers can see only their own registered products on the Registered Products List page.

If you want to let customers view other products associated with members of their organization, you need to edit a configuration setting and place the AssetOrgList widget on the page.

1. Enable the MYQ_VIEW_ORG_ASSETS configuration setting as described in Add Product Registration Files to Your Customer Portal.
3. Locate the following line of code.
   
   ```html
   <div id="rn_PageContent" class="rn_QuestionList">
   
   4. Enter the following code just above the line you located in step 3.
   
   ```html
   <rn:widget path="search/AssetOrgList" search_on_select="true" />

   Note: When the search_on_select attribute is true, customers do not have to click the Search button after making their menu selection for displaying registered products because the report refreshes automatically.

5. Save list.php.

Overview of Registering a Product
Your logged-in customers can open the page to register a product from the Account Overview page or the Registered Products list page.

On the Account Overview page, they can click the Register a New Product link in the Registered Products section.

Alternately, if they select the Registered Products option on the Your Account tab drop-down menu, the page displays a list of registered products and a link to register a new product.

Clicking either of these Register a New Product links opens the first page in the product registration sequence to validate the product.

Customers select a product from the drop-down menu, which displays all items created in the Product Catalog on the Service Console that have the Service Catalog check box selected.

If the product does not have the Serialized check box selected in the Product Catalog, the screen provides a message to the customer that a serial number isn't required. Having selected a valid product, the customer can then click Continue to register the product.
If, however, the product requires a serial number because the Serialized check box is selected in the Product Catalog on the Service Console, the message states that the serial number is required.

- The serial number for a serialized product does not match a serial number that was entered on the Service Console for the product.
- The serial number has already been registered to another customer.
- The product’s status on the Service Console isn’t Unregistered.

After clicking Continue, the Product Registration step is displayed. The product and serial number are now read-only, and the customer can complete some of the remaining fields, including name (which is populated with the name it was given on the administration interface), status, date purchased (also populated with the date from the administration interface), date installed, date retired, and description.

**Note:** If the product does not require a serial number, the act of registration creates and activates a new asset record. Therefore, the Status selection defaults to Active, and the Name and Date Purchased fields are blank. If the product requires a serial number, it must match an existing asset record that was created on the Service Console. When it was created, the asset was set to the Unregistered status and the Name and Purchase Date were entered. Therefore, when the customer registers the product, the Name and Purchase Date fields are populated. However, because the customer should not be registering a product with an Unregistered status, the Status isn’t set and the Unregistered status isn’t available.

### Registered Product Update

When logged-in customers select the Registered Products option on the Your Account tab or click the See All Registered Products link on the Account Overview page, a list of products registered to the customer opens. Then clicking a registered product opens the Registered Product Details page.

If customers click the Edit Registered Product link on the page, the Update Registered Product page opens.

The product and serial number are read-only, but customers can change the following fields on the page:

- Date Purchased
- Name
- Status
- Date Installed
- Date Retired
- Description

Clicking the Continue button opens the Account Overview page, where the Registered Products section contains the edited product.

### Site Configuration

### Overview of Site Configuration

You can customize configuration settings, either individually or across multiple interfaces, to enable, disable, and configure B2C Service functions. You can also change certain text used in B2C Service by customizing message bases, which are text strings that appear on the administration interface and the customer portal.
The Configuration Settings and Message Bases editors display as their own respective reports with category folders and runtime selectable filters that make searching easy. You can control how your output displays using either cross tab (default) or rollup views and edit values for configuration settings and message bases text inline. You can also see any changes that have been made to your configuration settings and message bases, including the old and new values, from the audit log.

Other site configuration options include the File Manager that you can use to change wordlist and dictionary files, and the Log Viewer, which can help you troubleshoot issues your site may have.

For information about configuring customer portal pages and working with the customer portal, see Configuring B2C Service for Customer Portal.

Search for a Configuration Setting

Runtime selectable filters let you define which configuration settings display on the content pane. You can search by site or interface, configuration setting type, category folder, configuration setting name, and value.

The first time you open the Configuration Settings editor, you must perform a search. Because settings are categorized as either site or interface specific, the configuration settings Search window lets you specify what type of setting you want to see.

**Note:** Depending on your site’s configuration, some settings may be hidden. If you cannot find a certain configuration setting, contact your Oracle account manager.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Configuration Settings**. The **Search** window opens. (The Configuration Settings editor also opens but is inactive at this point.)

You have several options on the Search window. You can:

- Use the search fields to filter the configuration settings that are returned on the editor.
- Accept all default filters by simply clicking Search to return every interface-specific configuration setting on the site you are logged in to.
- Click **Cancel** to bypass the window and search using the buttons on the ribbon or the search fields on the top of the editor.
Customize the filters and save them as your defaults by selecting Save as Default Values from the Settings drop-down menu before clicking Search. The next time you access configuration settings from your configuration list, the Search window does not open because the system remembers your defaults. Instead, the Configuration Settings editor opens with your previously filtered search results.

Design the layout of your Search window by selecting Enter Search Design Mode from the Settings drop-down menu.

As you configure your application, you will likely use a combination of these options depending on the configuration settings you want to access. However, for the purpose of this procedure, we show you how to customize your search results using the filters on the Search window.

3. Select the filters, sort options, and record limit to be displayed on the editor.

**Tip:** If you use the search default settings, every interface-specific configuration setting on the site you are logged in to will be returned. If you have a large site, you may want to consider narrowing your search to return only the settings you need to see. One way to do this is to filter the settings by category folder. If you know the main folder in which the settings you want to see are located, select only that folder from the Folders field.

<table>

<tr>
<td>Save as Default Values</td>
<td>Select this option to save the filter values you select to the local settings on your workstation. These saved values are used as the defaults the next time you search and are logged in with the same staff account. Saving your search filters bypasses the Search window and automatically opens the Configuration Settings editor to display your previously filtered search results. The default values are overwritten if you select different values and click this button again. If the search criteria is later edited to change filters, the default filter values stored in your local settings are ignored.</td>
</tr>
<tr>
<td>Restore Default Values</td>
<td>Select this option to restore the search values to the default search values. This deletes saved search values from your local settings. This button is disabled if the current search parameters were not populated from your local settings. See Change Your Personal Settings.</td>
</tr>
</tbody>
</table>
4. Click **Search**.

Your search criteria displays on the content pane.

### How the Configuration Settings Editor Works

After performing a search, the Configuration Settings editor displays your search results on the content pane.

Reports drive the data that displays, and you can choose either cross tab or rollup mode for the layout view. In rollup view, if you have more than one interface, you can edit a configuration setting for multiple interfaces at one time. (Cross tab is the default.)

This image shows the Configuration Settings editor displaying search results in cross tab mode.

Most of the buttons on the Configuration Settings editor ribbon reflect common B2C Service functionality and work the same way as they do in reports. For information about working with reports in B2C Service, see *Overview of Managing Reports on the Reports Explorer*.

### Configuration Settings Editor Home Tab

From the Home tab on the ribbon, you can create and edit configuration settings, search and filter the data, define how you want the data to display, and export the data in a variety of formats. You can also edit values inline under the value columns.
### Group/Button | Description
---|---
**Record** | The buttons in this group let you open existing configuration settings and create and delete custom settings.

- **Open** | Click this button to open the selected configuration setting.

- **Delete** | Click this button to delete a custom configuration setting. Standard configuration settings cannot be deleted. Therefore, this button is available only for custom settings.

- **New** | Click this drop-down menu to create a custom configuration setting. Data type options include Text, Integer, Menu, Yes/No, and Date/Time. You cannot change the data type after you have selected it.

**Editing** | The buttons in this group let you edit configuration setting values.

- **Save** | Click this button to save your changes.

- **Edit Selection** | Click this button to open either the Site or <interface name> window and enter the value of the selected configuration setting. In the default cross-tab view, you can edit only one row at a time. Therefore, if more than one row is selected, this button is disabled.

- **Auto Save** | Click this button to automatically save your inline edits. Auto Save works only for inline edits. The Save button is disabled when Auto Save is selected. See Edit an Individual Value Inline and Edit Values in Multiple Rows Using the Ribbon.

- **Restore** | Click this button to return the selected configuration setting to its default value.

**Data Set** | The buttons in this group let you search for configuration settings, refresh the display, and reset the search criteria to the defaults.

- **Search** | Click this button to open the Search window and select criteria for runtime selectable filters. See Search for a Configuration Setting.

- **Refresh** | Click this button to reload the data shown using the current search criteria.

  **Note:** This button works differently when you edit a configuration setting. If you change a value before saving, clicking the Refresh button reverts to the previously saved value.

- **Reset** | Click this button to reload the data shown using the default search criteria.

- **Find** | Click this button to locate text, numeric values, or special characters on the current page. Cells that contain the search value are highlighted. See Find Content in a Report. The Find button works only on the currently displayed page.

- **Find Next** | Click this button to highlight the next instance of the search value entered on the Find window.

- **Clear** | Click this button to clear the search value entered on the Find window.

**View** | The buttons in this group let you define display options, view changes that have been made, and manage failed deployments.

- **Cross Tab** | Click this button to display configuration settings in a table format. This is the default view.

- **Rollup** | Click this button to display configuration settings in rollup levels. The data rolls up by configuration setting name. If you have more than one interface, this view lets you edit multiple rows at the same

### Configuration Settings Editor Page Setup Tab

The Page Setup tab lets you configure printing options. You can also change the background, margins, and width of reports.

Each tab has one or more groups containing buttons you can use to modify printing or display options. Some groups have an arrow to the right of the group name that you can click to open a window. For example, you can click the arrow on the Background group to open the Display Options window.

Windows give you access to the same features you can access from the ribbon, although the windows group the options differently, and sometimes contain options not available from the ribbon.
### Group/Button | Description
--- | ---
Print Margin | Click this button to select the size of the margins used when printing. The available options are Normal, Narrow, Medium, and Wide.
Size | Click this button to select the paper size. The available options are Letter, Legal, Executive, A3, A4, and A5.
Portrait/Landscape | Click these buttons to print in portrait or landscape mode.
Page Header/Page Footer | Select these check boxes to include a page header and page footer when printing the report.
Print to Fit | Select this check box to scale your output to your printer default page width and send it to the printer.
**Background** | The buttons in this group let you add a background color. You can add a gradient color to blend into the primary color and choose how intense the colors should be with the Transparency setting. Click the arrow on the Background group to open the Display window.
Fill Color | Click this drop-down menu to select a background color.
Gradient | Click this drop-down menu to apply a gradient to the background. This option is available only after you have selected a fill color.
Transparency | Click this drop-down menu to apply a transparency to the background. This option is available only after you have selected a fill color.
**Display** | The buttons in this group let you add margins and set the width. Click the arrow on the Display group to open the Display window.
Margin | Click this button to define the amount of white space around the printed output. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.
Width | Click this button to select the width of the entire printed output. The available options are Best Fit and fit to Window.

### Configuration Settings Editor Folder Structure
Configuration settings are organized in a hierarchical folder structure. The number of settings in each category folder display next to the folder name.

Keep in mind that this number varies depending on how you have defined the filters in your search. For instance, suppose you leave the default selections, Logged In in the Configuration Base field and Select All in the Type field of your search. In this case, all settings, including settings inside each subfolder, will display on the content pane. On the other hand, if you were to select Site in the Type field, only the site-level configuration settings would display.

If you have a large site, you may want to consider narrowing your search to return only the settings you need to see. One way to do this is to filter the settings by category folder. If you know the main folder in which the settings you want to see are located, select only that folder from the Folders field.

Expand the folder contents to drill down to only the configuration settings you want to see. For example, you could navigate to the General folder in **Common/General** to display all settings in the General folder, including its subfolders. You could then expand the settings by each subfolder.

This image shows the folders expanded by the Outgoing Email folder in **Common/General/Outgoing Email**. In this case, the four configuration settings in the Outgoing Email folder are the only settings that display on the content pane.
Tip: To display configuration settings in alphabetical order, click in the Key column header.

<table>
<thead>
<tr>
<th>Folder</th>

The subfolders include Answer Display Page, Contact Services, Customer Portal, End-User Interface, General, Login/Session Window, Misc. Customization, Miscellaneous, Open Login, Sales, Service Level Agreements, Support, and Tool Bar. Note: Many of the configuration settings found under the Answer Display Page, Contact Services, and End-User Interface subfolders apply to the customer portal.</td>
</tr>
</tbody>
</table>

**Configuration Settings Editor Audit Log**

The audit log makes it easy for you to see changes that have been made to the configuration settings.

Depending on where you are on the Configuration Settings editor, different information displays. For instance, clicking the Audit Log button on the ribbon from the main Configuration Settings editor displays the following information about the changes made.

- Date and time of change
• Who made the change
• Affected interface—Site or interface name
• Configuration setting name
• Old value
• New value

You can also search for a specific configuration setting you want to see changes for from the audit log.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When</td>
<td>Enter the start and end dates or click the calendars to select the dates for the time period of the changes you want to see. The current day is the default start date.</td>
</tr>
<tr>
<td>Relative</td>
<td>Select this check box and then click the calendar to enter relative start and end dates.</td>
</tr>
<tr>
<td>Who</td>
<td>Click this drop-down menu to display changes made by a particular staff member. All is the default.</td>
</tr>
<tr>
<td>Key</td>
<td>Enter the name of a specific configuration setting in this field. Tip: You can also enter just the first few letters and append either the percentage sign (%) or an asterisk (*) to serve as a wildcard. All settings that begin with the letters you type will be returned.</td>
</tr>
<tr>
<td>Configuration Base</td>
<td>Click this drop-down menu and select the interface for which you want to display changes to configuration settings. All—Displays all site- and interface-specific settings. Logged In—Displays only interface-specific settings for the interface you are logged in to. Site—Displays only site-specific settings that are shared across all interfaces on this site. &lt;interface name&gt;—Displays only interface-specific settings that apply to the selected interface.</td>
</tr>
</tbody>
</table>

**Note:** Clicking the Audit Log button with a specific configuration setting open displays changes to that setting only.

### Export Configuration Setting Metadata

Exporting and importing metadata can save time, especially when you have large numbers of custom settings. You can export configuration setting metadata and then import that data into another site using the Data Import Wizard.

All attributes associated with configuration settings are available for the interfaces you choose to display. Configuration setting attributes include ID, key (name), description, enter (site or interface specific), data type, minimum and maximum value, maximum text length, pattern constraint, predefined menu, folder and folder ID, default value, configuration base (site or particular interface), and values.

1. From the Configuration Settings editor, click **Meta Data** on the ribbon.
   The **Meta Data** window opens.
2. Specify options and enter field information.

**How You Customize Configuration Settings**

Configuration settings are used to enable, disable, and configure products and components and many functions and features. You can customize these settings through the Configuration Settings editor.

Reports drive the data that displays on the content pane, and you can format the output returned using *cross tab* (default) and *rollup* views. In rollup view, you can edit a single configuration setting for multiple interfaces at one time.

Configuration settings are organized in a hierarchical folder structure and are categorized as either shared across all interfaces (site specific) or interface specific. Also, when you create a new custom configuration setting, you define if the setting will be a site- or interface-level setting. This classification is what lets you view and edit settings across multiple interfaces at the same time. You can also edit configuration setting values inline on the content pane.

To find configuration settings, use the Search feature on the Configuration Settings editor. See *Search for a Configuration Setting*.
Edit a Configuration Setting

While standard settings cannot be deleted and their field parameters cannot be edited, the value of a standard configuration setting can be edited.

Configuration setting values can be edited either inline or by clicking the Edit Selection button. You can also edit a single configuration setting across multiple interfaces at the same time using rollup mode. You can easily see when a value has been changed from the default value because an underscore displays on the changed value. If you change the value back to the default, the underscore no longer displays. When a change is pending, the edited field displays a tick mark. When you hover over the tick mark, a tooltip tells you how to save or discard your change.

**Tip:** When you first open the Configuration Settings editor, the Search window opens where you can search for a specific configuration setting. After you are in the editor, you can click the Search on the ribbon. See "Search for a Configuration Setting".

1. Select the row that displays the configuration setting you want to edit.
2. Do one of the following:
   - Click **Edit Selection**. Either the Site window or an interface-specific window opens.
   - Click in the Value column to edit the setting value inline.
   - Double-click the setting to open the setting on the content pane and edit the Value field.
3. Enter or select the new value. Editing options are specific to the field data type. For example, if a setting can be enabled or disabled, a Yes/No drop-down menu displays in the Value field.
4. To revert to the default value, click **Restore**.
5. Click **Save**.
   - The new value displays with an underscore.

You may be required to log out of B2C Service and log back in for your changes to take effect.

Edit the Same Configuration Settings Across Multiple Interfaces

You can edit a single configuration setting across multiple interfaces at the same time using rollup mode.

You cannot edit different configuration settings on the same interface at the same time.

1. From the Configuration Settings editor, click **Rollup** on the ribbon.
2. Press Ctrl while selecting the rows you want to edit. You can also press Shift to select multiple consecutive rows.
   
   **Note:** Selecting multiple rows across different configuration settings will disable the Edit Selection button.
3. Click **Edit Selection** on the ribbon.
4. Enter or select the new value.
5. Click **OK**.
   - The values of all the selected rows are updated.
6. Click **Save** on the ribbon.
   - The new values display with an underscore.

You may be required to log out of B2C Service and log back in for your changes to take effect.

Create a Custom Configuration Setting

When you create a new configuration setting, it is considered a custom configuration setting. By default, every custom configuration setting name starts with CUSTOM_CFG_ and is automatically assigned to a Custom folder in the folder hierarchy.
You define whether your custom setting will be an interface-specific setting or one that is shared across all interfaces (site specific). For site-specific settings, you can view and edit settings across multiple interfaces at the same time. After you create a custom configuration setting, you can edit only its value and its folder location.

1. Click **New** on the ribbon and select the data type: **Text**, **Integer**, **Menu**, **Yes/No**, or **Date/Time**.
   A new configuration setting opens on the content pane.

2. Enter field information.

<table>
<thead>
<tr>

</tbody>
</table>

3. Click **Save**.

After closing the editor, the custom configuration setting displays in the tree in the Custom folder you saved it in.

You may be required to log out of B2C Service and log back in for your changes to take effect.

### How You Configure the Administration Interface

Configuration settings let you create an administration interface that meets the business needs of your organization. Some of the most common settings are used to specify security settings, manage notifications, define incident functionality, categorize tracked links, and configure forecasting for opportunities.

**Security settings**—Use B2C Service security settings to protect your site by configuring how staff members and customers will access your site, as well as which hosts are allowed access to the administration interface and the customer portal.

- Learn about the settings related to site protection, passwords, and file attachments in *Overview of Security-Related Configuration Settings*. For a complete list of security-related configuration settings, see *Security Level*.
- For an in-depth discussion about security practices in B2C Service and how to protect your data, see *Overview of Oracle B2C Service Security and Compliance*.

**Notifications**—Notifications are accessed from the Communications Center navigation list and contain your messages about system errors and record assignments and updates. Notifications can also display reports to show the performance of incident queues. By default, the *Agedatabase* utility purges notification messages that are older than ten days. However, you can change the number of days after which notifications are removed by changing the NOTIF_AGE_DAYS configuration setting. To learn more about the different kinds of notifications, see *Open Your Notifications*.

**Incidents**—You can specify how long incidents remain open, active, and in the database. This table describes the configuration settings you can use to customize incident life.

<table>
<thead>
<tr>
<th>To…</th>
<th>Use this setting…</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify how many hours <em>waiting</em> incidents remain open before being closed automatically.</td>
<td>CI_HOURS</td>
</tr>
<tr>
<td>Specify which days to use when calculating how long an incident has been open.</td>
<td>CI_WAITING_CALC_DAYS</td>
</tr>
<tr>
<td>To...</td>
<td>Use this setting...</td>
</tr>
<tr>
<td>-----------------------------------------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>Specify the number of days after which solved incidents are deleted from the database.</td>
<td>PURGE_DELETE_INCIDENTS</td>
</tr>
<tr>
<td>Specify the number of days after which solved incidents go dormant.</td>
<td>DORMANT_INCIDENTS</td>
</tr>
</tbody>
</table>

**Opportunities**—You can let sales representatives send *quotes* as PDF documents, though this option is disabled by default. Access the SEND_SA_QUOTE_AS_PDF configuration setting to enable this option. See *Send a Quote to a Customer*.

- How You Customize Configuration Settings

### How You Customize the Links Menu

The Links menu, accessed by clicking File, provides quick access to commonly visited URLs. You can customize the links to meet the needs of your organization.

By default, the list of links includes the customer portal pages of the current interface and the Service Console. You can customize the links to meet your organization's needs by adding links to other websites your staff members may need to access. You can also add submenus that contain multiple links. This lets you organize your links by grouping related links in a single submenu title. This image shows a Links menu with a custom link, a separator, and a submenu with two links.

![Links Menu Example](image)

**Note:** In order for the Customer Portal option to appear on the Links menu, the development area must be enabled (see the MOD_CP_DEVELOPMENT_ENABLED configuration setting in *Common/Oracle Products/Modules*) and staff members must have customer portal permissions in their profile.

Using the procedures to add a custom link and to add a submenu with links, you can duplicate the custom links shown in the figure by defining the value of the TBAR_LINK_LIST configuration setting (*RightNow User Interface/Tool Bar/Links*) as:

```
item(1, "Google","http://www.google.com")
```
Add a Custom Link

You can add custom links to appear in the External Links option on the Links menu.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Configuration Settings**.
   
   The **Search** window opens.
3. Enter TBAR_LINK_LIST in the **Key** field and click **Search**.
   
   The Configuration Settings editor opens with TBAR_LINK_LIST displayed in table format (cross-tab mode).
4. Double-click TBAR_LINK_LIST.
   
   The setting opens in a new tab on the content pane.
   
   **Tip:** You can also edit the Value column inline. However, this type of change is easier to make from the setting tab.
5. Enter the link in the **Value** field using the following syntax:

   ```
   item (#, "<link name>", "<action>")
   ```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>Enter a link number in this field. The link number can be any positive integer. 0 is reserved for adding separators.</td>
</tr>
<tr>
<td>&quot;&lt;link name&gt;&quot;</td>
<td>Enter the link name as you want it to appear in the Links drop-down menu.</td>
</tr>
<tr>
<td>&quot;&lt;action&gt;&quot;</td>
<td>Enter the URL of the website you want to open when the link is clicked.</td>
</tr>
</tbody>
</table>

6. To create another custom link, press Enter to begin a separate line, and enter the link definition as defined in the Custom Link Syntax table. Enter each link definition on a separate line.
7. To place a separator line between links, enter the following on a separate line between the links where you want the separator to appear:

   ```
   item(0,"","")
   ```
8. Click **Save**.

After closing the editor, the new custom links appear in the External Links option on the Links menu after you log out and then log back in.

Add a Submenu with Links

You can add a custom submenu and links to appear in the External Links option on the Links menu.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Configuration Settings**.
   
   The **Search** window opens.
3. Enter TBAR_LINK_LIST in the **Key** field and click **Search**.

Add a Custom Link

You can add custom links to appear in the External Links option on the Links menu.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Configuration Settings**.
   
   The **Search** window opens.
3. Enter TBAR_LINK_LIST in the **Key** field and click **Search**.

Add a Submenu with Links

You can add a custom submenu and links to appear in the External Links option on the Links menu.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Configuration Settings**.
   
   The **Search** window opens.
3. Enter TBAR_LINK_LIST in the **Key** field and click **Search**.
The Configuration Settings editor opens with TBAR_LINK_LIST displayed in table format (cross-tab mode).

4. Double-click TBAR_LINK_LIST.
The setting opens in a new tab on the content pane.

**Tip:** You can also edit the Value column inline on the content pane. However, this type of change is easier to make from the setting tab.

5. Enter the submenu name and associated links in the **Value** field using the following syntax:

```
menu (#, "<menu name>",
item (#,"<link name>","<action>")
item (#,"<link name>","<action>")
)
```

### Field | Description
--- | ---
# | Enter a number for the option. This submenu or option number can be any positive integer. 0 is reserved for adding separators.
"<menu name>" | Enter the name of the submenu as you want it to appear on the Links option of the file menu.
"<link name>" | Enter the link name as you want it to appear in the Links submenu.
"<action>" | Enter the URL of the website you want to open when the link is clicked.

6. To enter additional links to the submenu, enter more “item” lines using the syntax described in the Custom Link Submenu Syntax table. Enter each link definition on a separate line.

7. To place a separator line between links of the submenu, enter the following on a separate line between the links where you want the separator to appear:

```
item(0,"",""
```

8. Click **Save**.

After closing the editor, the new custom submenu and links appear in the External Links option on the Links menu after you log out and then log back in.

---

### Message Bases Editor

#### Search for a Message Base

Message bases are text strings that appear on the administration interface, the customer portal, and in email messages and notifications. Runtime selectable filters let you define which message bases display on the content pane. You can search by interface, category folder, message base name, default text and custom text values.
By customizing message bases with the Message Bases editor, you can change the descriptive text within your application. Message bases also provide international language support and let you change the text to accommodate regional dialects.

The first time you open the Message Bases editor, you must perform a search. Because settings are categorized as interface specific, the message bases Search window lets you specify what type of message base you want to see.

After you open the Message Bases editor, you can click a message base link and locate the file in the list that appears in the left column. If you do not know the location of the message base you want to edit, you can run a report of the message bases to find the one you want to edit. The report displays each message base label, organized by location, along with the message associated with each label.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then, double-click Message Bases.
   The Search window opens. (The Message Bases editor also opens but is inactive at this point.)
   You have several options on the Search window. You can:
   ◦ Use the search fields to filter the message bases that are returned on the editor.
   ◦ Accept all default filters by simply clicking Search to return every message base on the site to which you are logged in.
   ◦ Click Cancel to bypass the window and search using the buttons on the ribbon or the search fields on the top of the editor.
   ◦ Customize the filters and save them as your defaults by selecting Save as Default Values from the Settings drop-down menu before clicking Search. The next time you access message bases from your configuration list, the Search window does not open because the system remembers your defaults. Instead, the Message Bases editor opens with your previously filtered search results.
   ◦ Design the layout of your Search window by selecting Enter Search Design Mode from the Settings drop-down menu.

As you configure your application, you will likely use a combination of these options depending on the message bases you want to access. However, for the purpose of this procedure, we show you how to customize your search results using the filters on the Search window.

3. Select the filters, sort options, and record limit to be displayed on the editor.

   **Tip:** If you use the search default settings, every message base on the site you are logged in to will be returned. If you have a large site, you may want to consider narrowing your search to return only the message bases you need to see. One way to do this is to filter the message bases by category folder. If you know the main folder in which the message bases you want to see are located, select only that folder from the Folders field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filters</td>
<td>This section displays the runtime selectable filters. If a filter displays a menu list, you can select all options in the list by selecting the Select All check box, or you can clear all options in the list by clearing the Select All check box.</td>
</tr>
</tbody>
</table>
| Message Base | Select the check boxes next to the interfaces for which you want to display message bases.  
Select All—Displays all message bases.  
Logged In—Displays only message bases for the interface you are logged in to. (Default) |
<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;interface name&gt;</td>
<td>Displays only message bases that apply to the selected interface.</td>
</tr>
<tr>
<td>Folders</td>
<td>Select the folders that contain the message bases you want to display.</td>
</tr>
<tr>
<td>Key</td>
<td>Enter the name of a specific message base in this field. This field is not case sensitive. You can also enter just the first few letters and append either the percentage sign (%) or an asterisk (*) to serve as a wildcard. All message bases that begin with the letters you type will be returned.</td>
</tr>
<tr>
<td>Text</td>
<td>Enter message base default text (or a portion of the default text) to return message bases with a value that matches the text you type. This field is not case sensitive and accepts blank spaces.</td>
</tr>
<tr>
<td>Custom Text</td>
<td>Enter message base customized text (or a portion of the text) to return message bases with a value that matches the text you type. This field is not case sensitive and accepts blank spaces.</td>
</tr>
<tr>
<td><strong>Limit and Order</strong></td>
<td>This section lets you limit the number of rows returned and how the output should be sorted.</td>
</tr>
<tr>
<td>Limit To</td>
<td>This check box, selected by default, limits the number of rows returned. Limiting the records returned prevents more records being returned than can be easily viewed or printed.</td>
</tr>
<tr>
<td>Rows</td>
<td>Enter the number of rows to be returned. The default value of 10,000 is the maximum number of rows that can be returned per page.</td>
</tr>
<tr>
<td>Per Page</td>
<td>Select this check box to change the number entered in the Rows text box from a hard limit on the total number of rows returned to a limit on the number of rows returned on each page. This is automatically selected when you select Limit To.</td>
</tr>
<tr>
<td>Order By</td>
<td>Click the current sort order next to the Order By field to select different sort options. The default sort order is displayed with the primary sort field listed first, followed by any subsequent sort fields. The direction each sort field is ordered in is also indicated (Asc for ascending order and Desc for descending order). See Change Sort Order Using the Ribbon and Change Sort Order Using Column Headers.</td>
</tr>
<tr>
<td><strong>Settings</strong></td>
<td>This drop-down menu gives you options to design and then save your Search window layout. It also lets you set, restore, and reset your default filter values.</td>
</tr>
<tr>
<td>Enter Search Design Mode</td>
<td>Select this option to design the layout of your Search window. See Overview of the Search Window.</td>
</tr>
<tr>
<td>Set as Default Layout</td>
<td>Select this option to save your search layout as the default.</td>
</tr>
<tr>
<td>Restore Default Layout</td>
<td>Select this option to reset your search layout to the system default.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
Save as Default Values | Select this option to save the filter values you select to the local settings on your workstation. These saved values are used as the defaults the next time you search and are logged in with the same staff account. Saving your search filters bypasses the Search window and automatically opens the Message Bases editor to display your previously filtered search results.

**Note:** The default values are overwritten if you select different values and click this button again. If the search criteria is later edited to change filters, the default filter values stored in your local settings are ignored.

Restore Default Values | Select this option to restore the search values to the default search values. This deletes saved search values from your local settings. This button is disabled if the current search parameters were not populated from your local settings. See [Change Your Personal Settings](#).

Reset Values | Select this option to reset the search parameter values to the default values that were populated when the editor opened. Clicking this button also resets the Search window to the default size if it has been resized.

4. **Click Search.**

Your search results display on the content pane.

Notice that each page is a clickable number across the top of the content pane. The number of folders that displays depends on which page you view and which settings are displayed. By default, the system displays, at most, 10,000 message bases per page with the folders that the text values are contained in displayed on the left.

**How the Message Bases Editor Works**

After performing a search, the Message Bases editor displays your search results on the content pane. Reports drive the data that displays, and you can choose either cross tab or rollup mode for the layout view.

In rollup view, if you have more than one interface, you can edit a message base across multiple interfaces at one time. Cross tab is the default. This image shows the Message Bases editor displaying search results in cross tab mode.
Most of the buttons on the Message Bases editor ribbon reflect common B2C Service functionality and work the same way as they do in reports. For information about working with reports in B2C Service, see Overview of Managing Reports on the Reports Explorer.

Message Bases Editor Home Tab
From the Home tab on the ribbon, you can create and edit message base text, search and filter the data, define how you want the data to display, and export the data in a variety of formats. You can also edit values inline under the text columns.

<table>

</table>

Message Bases Editor Page Setup Tab
The Page Setup tab lets you configure printing options. You can also change the background, margins, and width of reports.

Each tab has one or more groups containing buttons you can use to modify printing or display options. Some groups have an arrow to the right of the group name that you can click to open a window. For example, you can click the arrow on the Background group to open the Display Options window.

Windows give you access to the same features you can access from the ribbon, although the windows group the options differently, and sometimes contain options not available from the ribbon.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Print</td>
<td>The buttons in this group let you configure printing options and add the Page Header and Page Footer sections. Click the arrow on the Print group to open the Page Setup window. See Print a Report. This button group displays only if your profile includes the Print/Export/Forward Reports permission. See Analytics Permissions.</td>
</tr>
<tr>
<td>Print Margin</td>
<td>Click this button to select the size of the margins used when printing. The available options are Normal, Narrow, Medium, and Wide.</td>
</tr>
<tr>
<td>Size</td>
<td>Click this button to select the paper size. The available options are Letter, Legal, Executive, A3, A4, and A5.</td>
</tr>
<tr>
<td>Portrait/Landscape</td>
<td>Click these buttons to print in portrait or landscape mode.</td>
</tr>
<tr>
<td>Page Header/Page Footer</td>
<td>Select these check boxes to include a page header and page footer when printing the report.</td>
</tr>
<tr>
<td>Print to Fit</td>
<td>Select this check box to scale your output to your printer default page width and send it to the printer.</td>
</tr>
<tr>
<td>Background</td>
<td>The buttons in this group let you add a background color. You can add a gradient color to blend into the primary color and choose how intense the colors should be with the Transparency setting. Click the arrow on the Background group to open the Display window.</td>
</tr>
<tr>
<td>Fill Color</td>
<td>Click this drop-down menu to select a background color.</td>

<td>Click this button to select the width of the entire printed output. The available options are Best Fit and fit to Window.</td>
</tr>
</tbody>
</table>

### Message Bases Editor Folder Structure

Message bases are organized in a hierarchical folder structure. The number of message bases in each category folder display next to the folder name. Keep in mind that this number varies depending on how you have defined the filters in your search.

By default, the system displays a maximum of 10,000 message bases per page with the folders that the text values are contained in displayed on the left. Each page is a clickable number across the top of the content pane.

If you have a large site, you may want to consider narrowing your search to return only the message bases you need to see. One way to do this is to filter the message bases by category folder. If you know the main folder in which the message bases you want to see are located, select only that folder from the Folders field.

Expand the folder contents to drill down to only the message bases you want to see. For example, you could navigate to the Global Date Lists folder in **Common/Global Date Lists** to display all message bases in the Global Date Lists folder, including its subfolders. You could then expand the message bases by each subfolder.

This image shows the folders expanded by the Messages folder in **Common/Email/Messages**. In this case, the five message bases in the Messages folder are the only message bases that display on the content pane.

---

**Tip:** To display message bases in alphabetical order, click in the Key column header.
Message Bases Editor Audit Log

The audit log makes it easy for you to see changes that have been made to the message bases. Depending on where you are on the Message Bases editor, different information displays.

For instance, clicking Audit Log on the ribbon from the main Message Bases editor displays the following information about the changes made.

- Date and time of change
- Who made the change
- Affected interface
- Message base name
- Old value
- New value

You can also search for a specific message base you want to see changes for from the audit log.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When</td>
<td>Enter the start and end dates or click the calendars to select the dates for the time period of the changes you want to see. The current day is the default start date.</td>
</tr>
<tr>
<td>Relative</td>
<td>Select this check box and then click the calendar to enter relative start and end dates.</td>
</tr>
<tr>
<td>Who</td>
<td>Click this drop-down menu to display changes made by a particular staff member. All is the default.</td>
</tr>
<tr>
<td>Key</td>
<td>Enter the name of a specific message base in this field. <strong>Tip:</strong> You can also enter just the first few letters and append either the percentage sign (%) or an asterisk (*) to serve as a wildcard. All message bases that begin with the letters you type will be returned.</td>
</tr>
</tbody>
</table>
| Message Base | Select the check boxes next to the interface for which you want to display changes to message bases:  
  - **All**—Displays all message bases. (Default)  
  - **Logged In**—Displays only message bases for the interface to which you are logged in.  
  - `<interface name>`—Displays only message bases that apply to the selected interface. |

**Note:** Clicking Audit Log on the ribbon with a specific message base open displays changes to that message base only.

Export Message Base Metadata

Exporting and importing metadata can save time, especially when you have large numbers of message bases. You can export message base metadata and then import that data into another site using the Data Import Wizard.

All attributes associated with message bases are available for the interfaces you choose to display. Message base attributes include ID, key (name), enter (site or interface specific), description, maximum length, folder and folder ID, and text and custom text values.

1. From the Message Bases editor, click **Meta Data** on the ribbon.  
   The **Meta Data** window opens.  
2. Specify options and enter field information.
### Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folders</td>
<td>Select the folders that contain the message bases you want to display. The Custom folder is selected by default.</td>
</tr>
<tr>
<td>Key</td>
<td>Enter the name of a specific message base in this field. This field is not case sensitive. You can also enter just the first few letters and append either the percentage sign (%) or an asterisk (*) to serve as a wildcard. All message bases that begin with the letters you type will be returned.</td>
</tr>
</tbody>
</table>
| Message Base   | Select the check boxes next to the interfaces for which you want to display message bases:  
- **Select All**—Displays all site- and interface-specific message bases.  
- **Logged In**—Displays only interface-specific message bases for the interface to which you are logged in. (Default)  
- `<interface name>`—Displays only interface-specific message bases that apply to the selected interface. |

3. Click **Search**. Your search results display on the content pane.

4. Click the **Options** drop-down menu and select **Export > Delimited > Comma**.
   
The **Export Options** window opens.

5. Specify export options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>Lists the default location where your CSV file will be saved.</td>
</tr>
<tr>
<td><img src="icon" alt="Save As" /></td>
<td>Click this button to open the Save As window where you can specify a location (other than the default) to save your file.</td>
</tr>
<tr>
<td>Launch Application</td>
<td>Clear this check box if you do not want the file to open after you export it.</td>
</tr>
</tbody>
</table>
| Append date/time to file name using the following format | Select this check box to add the date and time to your file name.  
To change the format in which the date and time is added to your file, enter your preferred format in the field next to the check box and then click **Reset**. |
| Save the selected directory as the default directory | Select this check box to make the directory specified in the Location field your default directory.                                          |
| Add report name to output     | Clear this check box to remove the report name from the CSV file.                                                                               |
6. Click **OK**.

Now you can import your CSV file from the Data Import Wizard.

**How You Customize Message Bases**

Message bases are text strings that appear on the administration interface, the customer portal, and in email messages and notifications. You can customize these with the Message Bases editor.

By customizing message bases with the Message Bases editor, you can change the descriptive text within your application. Message bases also provide international language support and let you change the text to accommodate regional dialects.

Reports drive the data that displays on the content pane, and you can format the output returned using cross tab (default) and rollup views. In rollup view, you can edit a single message base for multiple interfaces at one time. Like configuration settings, message bases are organized in a hierarchical folder structure.

To find message bases, use the Search feature on the Message Bases editor described in the Search for a message base procedure.

When the Message Bases editor opens, each page is a clickable number across the top of the content pane. By default, the system displays, at most, 10,000 message bases per page with the folders that the text values are contained in displayed on the left. The number of folders that displays depends on which page you view and which settings are displayed.

**Edit Message Base Text**

While standard message bases cannot be deleted and field parameters cannot be edited, the text values of standard message bases can be edited inline or from the ribbon. You can also edit the same message base on multiple interfaces at once using rollup mode.

You can easily see when a text value has been changed from the default value because an underscore displays on the changed value. If you change the value back to the default, the underscore no longer displays. When a change is pending, the edited field displays a tick mark. When you hover over the tick mark, a tooltip displays telling you how to save or discard your change.

Another feature you’ll want to know about is the ability to lock your message base text values to ensure that the text displays as you expect on update. Because the system always uses the custom text value on update, and since the default value may change with new releases, locking the current value is the only way to ensure that your text stays the same from release to release. See the procedure that follows to lock your text values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note:</td>
<td>You must clear this check box to import the file from the Data Import Wizard because it uses the value specified in the Header Location field to import the data.</td>
</tr>
</tbody>
</table>
**CAUTION:** We recommend that you document all changes made to the message bases. As you continue to edit the message bases, your installation becomes less similar to the documentation and the default product. In some cases this can make training and troubleshooting more difficult. Before you begin editing a message, you may want to copy the existing message text from the Default Text field and paste it into the Description field of the open message base. This reduces the chance of errors if you ever need to change your edited message back to the previous value.

1. Select the row that displays the message base you want to edit.

   **Tip:** When you first open the Message Bases editor, the Search window opens where you can search for a specific message base. After you are in the editor, you can click the Search on the ribbon. See *Search for a Message Base*.

2. Do one of the following:
   - Click **Edit Selection** on the ribbon. The `<interface name>` window opens.
   - Click in the Text column to edit the text value inline.
   - Double-click the message base to open it on the content pane and edit the Description field and/or the Custom Text field.

3. To edit the message base description, enter your changes in the **Description** field.

4. Enter or select the new custom text value.

   **Note:** Do not add hard returns to message base text. Hard returns may cause a JavaScript error to occur on the page or window where the text appears.

5. To revert to the default text value, click **Restore**.

6. Click **Save**.

   The new custom text displays with an underscore.

7. Verify the change by checking the page where the edited message base appears.

Changes to the message bases do not take effect immediately. You must log out of B2C Service and log back in or refresh the customer portal page.

### Edit the Same Message Base on Multiple Interfaces

You can edit the same message base on multiple interfaces.

You cannot edit different message bases on the same interface at the same time.

1. From the Message Bases editor, click **Rollup** on the ribbon.

   The Message Bases editor displays in rollup mode.

2. Press Ctrl while selecting the rows you want to edit.

3. Click **Edit Selection** on the ribbon.

4. Enter the new text value.

5. Click **OK**.

   The values of all the selected rows are updated.

6. Click **Save**.

   The new values display with an underscore.

7. Verify the changes by checking the pages where the edited message bases appear.

Changes to the message bases do not take effect immediately. You must log out of B2C Service and log back in or refresh the customer portal page.

### Lock a Text Value

If you have defined a value in the Custom Text field, you can lock that value and it will be used on update.

1. Select a message base from the Message Bases editor.
2. Click **Lock** on the ribbon.

If you have defined a value in the Custom Text field, then that value is locked and will be used on update. If the Custom Text field is *not* defined, then the default text value is copied into the Custom Text field and that value is locked. Either way, the text value will be used from that point on, regardless of any default text value changes in a new release.

**Tip:** If you have more than one interface, you can lock multiple message bases at the same time by displaying the report in rollup view.

Create a Custom Message Base Entry

When you create a new message base entry, it is considered custom. By default, every custom message base entry name starts with CUSTOM_MSG_ and is automatically assigned to a Custom folder in the folder hierarchy.

After you create a custom message base entry and save it, you can edit its label with custom text. You can also edit the Description field at this point.

1. Click **New** on the ribbon.
   A new message base entry opens on the content pane.

2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Message Base Entry Information</strong></td>
<td>Fields in this section define the parameters for the custom message base, including name, field length, description, folder location, entry type, default text, and custom text.</td>
</tr>
<tr>
<td><strong>Key</strong></td>
<td>Enter the name of your custom message base after CUSTOM_MSG_, which populates in this field. All custom message bases must start with CUSTOM_MSG_.</td>
</tr>
<tr>
<td><strong>Maximum Length</strong></td>
<td>Enter the maximum length allowed in the Custom Text field (1-300,000 characters).</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Enter a description of the message base in this field.</td>
</tr>
<tr>
<td><strong>Folder</strong></td>
<td>Click the <strong>Search</strong> icon to define a folder location for your custom message base. By default, all message bases must be located in the Custom folder or a custom subfolder. Ten subfolders can be nested under the Custom folder. Each subfolder can contain three child folders.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
*Entry Type | Select from the drop-down menu to add a plain, HTML, or shortcut key attribute to your message base. Both the Default Text and Custom Text fields accept plain, HTML, and shortcut key attributes. The HTML option lets you apply HTML to your text. For example, if you want your text to display in bold, you could enter `<b>Bold text</b>` in the fields. The Hotkey option lets you add a shortcut key to your text by prepending an ampersand (`&`) to the text you enter in the fields.

Default Text | This field is not required; however, if you plan to export and then import your message bases, you must enter a value in this field (or under the Values section). Otherwise, the data import will return an error. Enter the default text that you want to display on all interfaces. The text you enter in this field populates the Default Text fields for all interfaces under the Values section.

Note: If you want your interfaces to display different default text, leave this field blank and enter your default text values in each interface row under the Values section.

Values | This section displays the interface name and lets you set your default text for each interface.

Default Text | Enter the default text you want to display for each interface.

Custom Text | Enter the custom text you want to display on each interface. If you define a value in this field, it overwrites the value in the Default Text field. This field is disabled until you save your new custom message base. In other words, this field can be edited only on existing message bases.

3. **Click Save.**
   Now that you have saved your message base, you can edit the Custom Text field.
4. To define a value for custom text, enter it in the **Custom Text** field.
   
   **Note:** If you define a value for this optional field, it overwrites the value in the Default Text field.
5. **Click Save and Close.**
   The custom message base displays in the tree under the Custom folder you saved it in.
6. To preserve your text value on update, you must lock the text value.

Changes to the message bases do not take effect immediately. You must log out of B2C Service and log back in or refresh the customer portal page.

### Manage Files with the File Manager

The File Manager provides direct access to files located on the hosting servers that can be used to customize your organization’s application. Using the File Manager, you can view, edit, replace, and back up files that control many aspects of B2C Service.
By default, the File Manager provides access to the most commonly modified files. For descriptions of the directories and files that are accessible using the File Manager, see File Manager Directories.

**CAUTION:** Changes to the files available in the File Manager may immediately affect what customers and staff members see. Because changes to these files can have significant impact, you may want to give only certain staff members access to the File Manager. You can grant or deny access to the File Manager through the Configuration permission on the Administration tab of the staff member’s profile. See Profiles.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **File Manager**.

The File Manager opens on the content pane.

**Note:** By default, the mail/cci directory displays when you open the File Manager. However, the mail files are read-only. You can, however, copy any existing file to use in the content of your organization’s system-generated notifications and emails. See Overview of Message Templates.

The Available Interfaces section contains links to the available interfaces for this installation of B2C Service. On the right, you can select a directory from the Switch To drop-down menu to navigate to another directory. This section contains all the files located in the selected directory. Using the Upload function, you can upload a supported file to the current directory by browsing for the file.

| **Go** | Click this button to upload the file to the directory in which you are currently located. A file must be specified in the Upload field. |
| **Comment** | Enter a comment to the log file in this field. |

### Backup and Default Files

Each directory accessible through the File Manager has an associated backup and default directory.

The File Manager automatically saves a backup file in the backup directory when a file is uploaded, edited, or restored. It also maintains permanent, read-only copies of the originally installed default files in the default directory. If necessary, files that have been edited can be restored from the default file or the backup copy using the restore function. See *Restore a File from the Backup or Default Directory*.  

**Note:** The files in the backup and default directories cannot be edited or overwritten, only viewed and downloaded.

We strongly recommend backing up all customized files on a disk, computer, or network so in the event that you need to revert to an old version of a file, you can restore to a working file. For information about making a backup copy of a file using the download feature, see *Download a File*. For information about making a temporary backup copy of a file using the copy feature, see *Copy or Move a File*.  

### Related Topics
- Manage Files with the File Manager

### Download a File

By downloading a file, you can edit the file locally to obtain the desired results, and then upload the file to the server. The download function also lets you save backup copies of your customized files.

1. Click **Configuration** on the navigation pane.  
2. Expand **Site Configuration**, and then double-click **File Manager**.  
The File Manager opens on the content pane.
3. Select the directory that contains the file from the Switch To drop-down menu.
4. Click the Download icon in the Action column for the file you want to download.
   A message asks you to save the file or find a program to open it.
5. Click Save.
   The Save As window opens.
6. Navigate to the directory where you want to save the file and enter the name of the file.
7. Click Save to download the file to the selected directory on your workstation.

**Related Topics**
- Manage Files with the File Manager

### Upload a File

You can upload files to the hosting facility. This direct access to files on the server gives you the ability to manage files and provides you with a convenient interface for uploading and downloading files.

In the wordlist and dictionary directories, you can upload only those files that already exist in the directory. For example, if you try to upload a file called mydict.txt to the dictionary directory when the actual file is userdic.tlx, an error message displays and the upload does not execute.

**Note:** Only certain file types can be uploaded through the File Manager. For a list of file types that can be uploaded into each directory, see **File Manager Directories**.

1. Select the directory that contains the file from the Switch To drop-down menu.
2. Do one of the following:
   - Enter the full path of the file you want to upload in the Upload field.
   - Click Browse to open the Choose File window where you can search your local and network file systems for the file. Select the file and click Open.
   The file path and name populates the Upload text box.
   A file name cannot include spaces or special characters. In addition, a file name that includes uppercase characters is converted to lowercase when it is uploaded. After the file is uploaded, it can be copied with a new name if the file requires a name with uppercase characters. See **Copy or Move a File**.
3. Click Go to upload the file to the current directory.
   If the uploaded file has the same file name and extension as the file you want to replace, it automatically overwrites the file. A backup copy of the current file is saved in the backup directory before the file is overwritten.

**Related Topics**
- Manage Files with the File Manager

### View a File

You can view a file to help you identify the file purpose or to help you troubleshoot issues.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click File Manager.
   The File Manager opens on the content pane.
3. Select the directory that contains the file from the Switch To drop-down menu.
4. Click the View/Edit icon to the left of the file you want to view.
   The contents of the file are displayed on the content pane.
5. Click Cancel to return to the main File Manager page when you have finished viewing the file.
Note: When viewing or editing a file through the File Manager, you may need to scroll down to see the Save and Cancel buttons.

Related Topics
  • Manage Files with the File Manager

Edit a File
The File Manager lets you edit files located on the hosting server.

1. From the File Manager, click the name of the file you want to edit or click the View/Edit icon to the left of the file.
2. Edit the file as necessary.
3. Enter a brief comment in the Comment field to help you track the editing history. For information about viewing comments, see Log File Management.
4. Click Save.

A backup copy of the current file is saved in the backup directory and the current file is overwritten with the modified file. Because saving a file impacts the backup copy of the file, you will receive a warning if you attempt to save the file without making any changes.

Related Topics
  • Manage Files with the File Manager

Copy or Move a File
You can copy or move a file to the current directory or the backup directory to organize and back up your files. However, you cannot move or overwrite the files in the default directories.

When copying files, you may want to adopt a naming convention for old or backup copies of a working file. The File Manager default file name is copy_<filename>. Be consistent with whatever naming convention you choose.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click File Manager.
   The File Manager opens on the content pane.
3. Select the directory that contains the file from the Switch To drop-down menu.
4. Click the Copy icon in the Action column of the file you want to copy or move.
5. To move the copy of the file to the backup directory, select it using the directory drop-down menu in the current directory.
6. To change the resulting file name from the default copy_<filename>, enter the new name in the text box to the right of the directory drop-down menu.
7. Click Save to copy or move the file to the specified directory and file name.
8. Enter a brief comment in the Comment field to help you track the editing history. For information about viewing the editing history, see Log File Management.
9. To create additional copies of the same file, repeat steps 3 through 8.
10. Click Cancel to return to the directory where the copied file is located.

Restore a File from the Backup or Default Directory

You can restore a file to the most recent backup copy in the backup directory or to the original default file in the default directory. You might choose this option if you are having problems editing a file and want to revert to an earlier version.

Read-only, backup copies of all files accessible through the File Manager are created in each default directory during installation to serve as permanent backup copies. Before a file is overwritten (edited, uploaded, or restored), a backup copy is saved in the backup directory. When you use the restore function and there is both a backup and default file, you are prompted to choose which file you want to restore. If only one file exists, either a default file or a backup file, a dialog box prompts you to confirm the restoration from the existing file.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **File Manager**.
   - The File Manager opens on the content pane.
3. Select the directory that contains the file you want to restore from the **Switch To** drop-down menu.
4. Click the **Restore** icon in the Action column of the file you want to restore.
   - A warning message asks you to verify that you want to restore the file.
5. Click **OK**.
   - If both backup and default files exist, you are prompted to choose either the backup or default file.
6. To restore from the default file, select **Default** and click **Commit** to return to the directory list of files.
7. To restore from the backup file, select **Backup** and click **Commit** to return to the list of files.

**Related Topics**
- Manage Files with the File Manager

Delete a File

You can delete copies of files or uploaded files that you no longer need. However, you can delete only those files that you have copied, moved, or uploaded.

You cannot delete the original files that were created during installation or update. Before the file is deleted, a copy of the file is saved in the backup directory.

**CAUTION:** Deleting a file can affect your production site. Be sure that the file you are deleting is not necessary for proper functioning of your site. Always make backup copies of files that you may need in the future.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **File Manager**.
   - The File Manager opens on the content pane.
3. Select the directory that contains the file you want to delete from the **Switch To** drop-down menu.
4. Click the **Delete** icon in the Action column of the file you want to delete.
   - A warning message asks you to continue or cancel the action.
5. Click **OK** to delete the file.

**Related Topics**
- Manage Files with the File Manager
File Manager Directories

The File Manager gives you access to the directories described here along with access to the backup and default directories.

- **Mail files**—The PHP files in the ma/cc directory as well as the files in the expanded File Manager have been deprecated and may be permanently removed in a future release. You can customize your message content, including headers and footers, using *message templates* instead of making changes to multiple PHP files. See [Overview of Message Templates](#).

  **Note:** The mail files display as read-only in the File Manager so that you can copy any existing message content to your organization's system-generated notifications and emails, which are defined by the message templates.

- **CSS files**—This directory has been deprecated and is not used by standard B2C Service functionality. You can upload and download CSS files to the customer portal assets folder through WebDAV. See [Overview of WebDAV](#).

- **Custom scripts**—This directory is used to store legacy files for any customization work done on your site.

- **Outreach and Feedback files**—Using the default files in the ma/cc directory, you can customize pages used with Outreach and Feedback mailings and surveys. These directories do not display if Outreach and Feedback is not enabled.

<table>

</tr>
<tr>
<td><code>top.phph</code></td>
<td>Used to add page elements to the top and left of HTML pages that have been generated by PHP scripts.</td>
</tr>
</tbody>
</table>

- **Image files**—This directory has been deprecated and is not used by standard B2C Service functionality. You can upload and download image files to the customer portal assets folder through WebDAV. See the cross-references listed under CSS files above.

- **Chat file directories**—The Chat image files directory contains the images used in Chat, including the logo used on the client window. The Chat Agent transcript images directory contains the images used to modify the Transcript section of the chat sessions workspace. The Chat Agent transcript templates directory contains the style sheet, JavaScript file, and HTML template used to modify the Transcript section of the chat sessions workspace. These directories do not display if Chat is not enabled.

- **Wordlist files**—The files in this directory enable you to customize the words used during keyword indexing, text searching, and SmartSense rating. See [SmartSense](#) and [Wordlist Files](#) for more details.

- **Asian language dictionaries**—The Asian language dictionaries directory contains additional dictionary word lists that are used for part-of-speech (POS) tagging and similar phrase searching. See [Asian Language Dictionaries](#) for more information.

- **Spellchecker dictionaries**—The spellchecker dictionary directory, `spell/dict`, contains an additional dictionary word list, `userdic.tlx`, which is used for spell checking and similar phrase searching. Add words you want to be
included in the spell checking dictionary. Words added to this file are not flagged as misspelled during spell checking. Enter each word on a separate line.

- **Integration files**—The files in this directory are templates used for external events and email integration. Contact your Oracle account manager for help with these files.

- **Certificate directories**—The Additional root certificates, Intermediate certificates, and Certification revocation lists directories are used to store files used for email security. See Email Security Features.

- **Log file**—The log file is a useful tool for tracking the history of a file. It records the details of the actions taken on a file (for example, uploading, restoring, copying, or deleting), including the staff member who executed the action, the IP address of the staff member’s workstation, the date and time of the action, and comments. See Log File Management for more information.

**Wordlist Files**
The files in this directory let you customize the words used during keyword indexing, text searching, and SmartSense rating.

*Note:* The Wltool utility runs automatically after editing these files. However, if you edit the exclude_incidents.txt or exclude_answers.txt files, the Keywordindexer utility must be run by Oracle Cloud Operations before your changes become active. To schedule this, Submit a Service Request.

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
</table>
| aliases.txt         | This file is initially empty, but you can add synonyms, phrases, or aliases to link terms specific to your industry to similar terms that may be used during a search. For example, a customer might search for an acronym, such as “GPS,” but all of your answers regarding GPS might spell out “global positioning system” rather than using the initials. The aliases.txt file lets you link terms that customers might search on with synonymous terms in your answers.  
The first word in the line is the search word that customers can enter. It can contain spaces so you can use phrases as synonyms for the search word. It cannot contain ampersands or slashes, although it can contain hyphens. All entries on the line must be uppercase and comma delimited, as shown in this example:  
GPS, GLOBAL POSITIONING SYSTEM, NAVIGATIONAL SYSTEM  
If a customer enters the first word in a line as a search word, all answers containing that word or any other term on the line are returned. In this example, a customer who enters GPS as a search word is directed to all answers containing “GPS,” “global positioning system,” or “navigational system.” |
| do_not_suggest.txt  | This file is initially empty, but you can add terms you do not want to appear in Suggested Searches on the Answers page. Enter each word on a separate line of the text file.                                                                                                                                                                                                                                                                      |
| exclude_answers.txt | This file contains common words such as prepositions, adverbs, and pronouns that are excluded from indexing and searching functions on the customer portal. If you have specific words that you do not want customers to be able to search on, you can add these stopwords to the exclude_answers.txt file to exclude them from being indexed. Stopwords must be uppercase and entered on separate lines.  
*Note:* Words in this file are also excluded when using SmartAssistant to search for an answer. |
| exclude_incidents.txt| This file contains common words such as prepositions, adverbs, and pronouns that are excluded from indexing and search functions on the administration interface. If you have specific words that you do not want agents to be able to search on, you can add these stopwords to the exclude_incidents.txt file to exclude them from being indexed. Stopwords must be uppercase and entered on separate lines. |
### Core Features

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>**Note:**SmartAssistant does not exclude words from <code>exclude_incidents.txt</code> when searching incidents on the administration interface or the customer portal.</td>
<td></td>
</tr>
<tr>
<td><code>exclude_responses.txt</code></td>
<td>This file contains common words such as prepositions, adverbs, and pronouns that are excluded from use in clustering responses. If you have specific words that you do not want agents to be able to search on, you can add these stopwords to the <code>exclude_responses.txt</code> file to exclude them from being indexed. Stopwords must be uppercase and entered on separate lines.</td>
</tr>
<tr>
<td><code>smartsense.txt</code></td>
<td>This file contains emotive override words and values that are checked before the standard emotive word list. You can add unrated words, give different ratings to already rated words, or remove words. Each word is rated between -10 and +10. Word values are used for internal calculations to result in the final displayed SmartSense ratings of +3 to -3. The word and its value must be separated by a tab and entries must be entered on separate lines. Any changes affect new incidents, updated incidents, and text question responses in surveys. When adding words to this file, you must add all forms of the word (on separate lines), not just the root word.</td>
</tr>
</tbody>
</table>
| `thesaurus.txt`      | This file contains a list of words and their synonyms used in the Similar Phrases search technique on the Answers page. Words in the text search are matched with synonyms to extend the searching capability to include ontologies. The word and its synonyms must be uppercase and comma delimited as seen in this example: 

ABIDE, BIDE, STAY, ENDURE, STOMACH, BEAR, STAND, TOLERATE, BROOK, SUFFER

where ABIDE is the main word and BIDE, STAY, ENDURE, and so on are synonyms. In `thesaurus.txt`, each word in the list is a synonym of the first word, not synonyms of each other. For example, the word “abide” has the synonyms “stay” and “endure.” Endure has no synonyms, unless “endure” had its own entry.  

**Note:** The synonyms can be multi-word phrases, but the first term in the line must be a single word.                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Related Topics**

- **SmartSense**

**Asian Language Dictionaries**

The Asian language dictionaries directory contains additional dictionary word lists that are used for part-of-speech (POS) tagging and similar phrase searching. By adding words to the user dictionary files with special parameters, you can override the default segmentation.

**Note:** User dictionary files are available only for Chinese and Japanese languages, specifically Mandarin (`user.dict_CN.utf8`), Cantonese (`user.dict_HK.utf8`), Taiwanese (`user.dict_TW.utf8`), and Japanese (`user.dict_JP.utf8`).

You can create user dictionaries for words specific to an industry or application by adding new words, personal names, and transliterated characters of other alphabets. In addition, you can specify how existing words are segmented. For example, you may want to prevent a product name from being segmented even if it is a compound. The system performs a lookup of more than 500,000 words to determine segmentation. Using the dictionary, alias list, and keywords, you can influence how words are segmented.
If you edit a user dictionary file, you must use a specific format. The word you want to add is followed by the user
dictionary part-of-speech tag (listed below), and an optional decomposition pattern (DecompPattern) in the form of a
comma-delimited list of numbers specifying the number of characters from the word to include in each component of
the string. (Use a zero (0) to indicate that a DecompPattern is not needed.)

For example, the user dictionary entry AABBC ORGANIZATION 2,2,2 indicates that AABBC should be decomposed
into three, two-character components.

**User Dictionary POS Tags for Mandarin, Cantonese, and Taiwanese** (case insensitive)

</tr>
</tbody>
</table>

### Email the Log File

You can send the log file through email.

1. Enter your email address in the **Your Email Address** field. This will be the From address.
2. Enter the recipient’s email address in the **Send the Log File To** field.
3. Click **Email Log File**.

### Download the Log File

You can download the log file to your workstation in either CSV (comma-separated value), comma-delimited, or HTML format.

1. Select the format for downloading the file (Comma Delimited, CSV, or HTML).
2. Click **Download Log File**.
3. Select the location where you want the file saved and click **Save**.

### Log File Errors and Information

Log files let you view errors and other information generated by the CGI and PHP scripts, the Techmail and Agedatabase utilities, and B2C Service products.

The log files can be helpful in troubleshooting issues with your B2C Service application. These log files are available:

- **Error log**—This log contains application and data errors.
- **Info log**—This log contains informational errors, such as processing too much data.
• **Security log**—This log contains security errors, such as an invalid security string.

• **External Search log**—This log describes external searches of your site pages performed by spiders or robots. See [Overview of Finding Content on the Customer Portal](#).

• **Rule log**—This log describes the business rules that have fired against a specified record. See [Verify a Rule Using the Rule Log](#).

### Open Log Files

Open log files to view information in the error, info, and security logs.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Logs**.
   
   The content pane displays the log viewer.
3. Click **Error Log**, **Info Log**, or **Security Log** on the ribbon to open the corresponding log file.
4. Select options from the Log File drop-down menus.

</table>

When you open the error, info, or security logs, all messages in the log are displayed and are grouped together by application. You can click the header for each group to expand or collapse the messages listed in the group.

**Error type**

Click this drop-down menu and select the type of messages that you want to view. The following options are available.

- ◦ **All**—Select this option to see all types of messages. This is selected by default when you open the log file.
- ◦ **Campaign**—Select this option to see messages generated by campaigns.
- ◦ **Configuration**—Select this option to see messages generated when using the Configuration Settings editor.
- ◦ **Internal**—Select this option to see internal server errors.
- ◦ **POP3 Protocol**—Select this option to see messages returned by Techmail when it is trying to retrieve email from the Service or Outreach mailboxes.
- ◦ **Rules**—Select this option to see messages generated when rules are being processed.
- ◦ **SMTP Protocol**—Select this option to see messages created by Techmail when it is trying to send email.
- ◦ **SQL**—Select this option to see SQL messages returned by the database management system.
- ◦ **SSL**—Select this option to see messages created with email using SSL.
- ◦ **Unclassified Bounce Message**—Select this option to see messages generated when an Outreach email is bounced for a reason that cannot be classified.

The columns in the error, info, and security logs display the name of the application that generated the message, the error type, and the date and time the event occurred. Details of the first message in the list are also shown.

**Note:** Messages in the log files are removed after thirty days.

5. To view the details of a specific message, select the message on the log.
6. Click **X** on the upper right of the content pane to close the log viewer.

### Service Update Notifications

You can view changes that have been made in this version of the product that may affect you if you are updating from an earlier version. Two standard reports, Compatibility Exceptions and Deprecations, drive the data that display on the content pane.
The layout for both reports is similar, designed with a split-level display of the content pane. The top portion of the content pane is scrollable, displaying data that you can search, filter, slice, and export. The bottom portion of the content pane is always visible, displaying data specific to the row you have selected in the top content pane.

- **Compatibility Exceptions**—This report describes changes that may result in different behavior or functionality from previous versions. It also describes which users are affected by the change, its business impact, and the steps you can take to remedy the effects of the change.

- **Deprecations**—This report describes items that have been deprecated in this release, the reason for their deprecation, if replacements are available and what they are, and the migration steps you can take to replace the functionality that was deprecated.

You can choose to view all service updates data or slice the data to view only the application areas you want to see. You can also make inline edits to the Status column of each report to help you track how service updates affect your site.

### View Service Update Notifications

You can choose to view all service updates data or slice the data to view only the application areas you want to see.

Before you can view service updates data, you must add the Service Update Notifications component to the configuration list for the Configuration button. See [Create a Navigation Set for the Administrator](#).

1. Click **Configuration** on the navigation pane.
2. Double-click **Service Update Notifications** in the configuration list.
   - The Compatibility Exceptions report opens.
3. To view deprecated items, click **Deprecations** on the ribbon.
4. To copy text from any row in the top portion of the content pane, select the text, right-click, and select **Copy Cell to Clipboard**.

### Service Update Notification Ribbon

Most of the buttons on the service update notifications ribbon reflect common B2C Service functionality and work the same way as they do in reports.

In addition to viewing Compatibility Exceptions and Deprecated Items reports, you can search and filter the report data, define how you want the data to display on the report, and export data in a variety of formats. You can also edit the Status column of each report.

<table>
<thead>
<tr>
<th>Group/Button</th>

</tbody>
</table>
### B2C Service

#### Using B2C Service

**Chapter 2**

**Core Features**

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit Log</td>
<td>Click this button to view the audit log for the selected row.</td>
</tr>
<tr>
<td>Data Set</td>
<td>The buttons in this group let you search for data in the report, refresh the display, and reset the search criteria to the report defaults.</td>
</tr>
<tr>
<td>Search</td>
<td>Click this button to open the report Search window to select criteria for variables and runtime selectable filters. See <a href="#">How You Search in Reports</a>.</td>
</tr>
<tr>
<td>Refresh</td>
<td>Click this button to reload the data shown using the current search criteria of the report.</td>
</tr>
<tr>
<td>Reset</td>
<td>Click this button to reload the data shown using the report default search criteria.</td>
</tr>
<tr>
<td>Find</td>
<td>Click this button to open the Find window to enter text, numeric values, or special characters you want to locate in the report output. Report cells that contain the search value are highlighted on the report. See <a href="#">Find Content in a Report</a>.</td>
</tr>
<tr>
<td>Find Next</td>
<td>Click this button to highlight the next instance of the search values entered on the Find window.</td>
</tr>
<tr>
<td>Clear</td>
<td>Click this button to clear the search values entered on the Find window.</td>
</tr>
<tr>
<td>Analyze</td>
<td>The buttons in this group let you sort the data shown on the report and apply auto-filtering, rollups, and slicing to the data.</td>
</tr>
<tr>
<td>Auto Filter</td>
<td>Click this button to enable auto-filtering in the report. Auto-filtering provides column filtering after the report has been generated. See <a href="#">Enable Auto Filters</a>.</td>
</tr>
<tr>
<td>Sort</td>
<td>Click this button to open the Sort window and select which output columns to sort by and the sort method. See <a href="#">Change Sort Order Using the Ribbon</a> and <a href="#">Change Sort Order Using Column Headers</a>.</td>
</tr>
<tr>
<td>Rollups</td>
<td>Click this button to select rollup options and open the Rollups window. See <a href="#">Define Rollups</a>.</td>
</tr>
<tr>
<td>Slice</td>
<td>Click this button to select slice options and open the Slice window. Slicing groups data so you can view only the subset of records you are interested in. See <a href="#">How You Slice Report Data</a>.</td>
</tr>
<tr>
<td>Report</td>
<td>The buttons in this group let you export the report, forward the report in an email, and save and restore default settings.</td>
</tr>
<tr>
<td>Export</td>
<td>Click this button to export the data from a report to a file for use with third-party applications. You can export report data in the following formats: HTML, PDF, Excel, XML, Image, and Delimited. You can also copy report data to the clipboard. See <a href="#">Export Report and Dashboard Data</a>. Permission to export, print, and forward reports must be enabled in your profile for this button to display. See <a href="#">Analytics Permissions</a>.</td>
</tr>
<tr>
<td>Forward</td>
<td>Click this button to send the report to individuals or distribution lists in an email. See <a href="#">Forward a Report</a>. Permission to export, print, and forward reports must be enabled in your profile for this button to display. See <a href="#">Analytics Permissions</a>.</td>
</tr>
<tr>
<td>Default Settings</td>
<td>Click this button and select Save as Default to save your personalized display and data settings for a report for later use. Select Restore to remove personalized display and data settings from a report and restore the settings to those defined in the report. See <a href="#">Reset Display and Data Settings</a>.</td>
</tr>
<tr>
<td>Print</td>
<td>Click the arrow on this button to access printing options.</td>
</tr>
<tr>
<td>Publish</td>
<td>Click this button to save the current report as a read-only snapshot of the current data. The snapshot will be an exact representation of the current data set, including any display options or customizations. You will be prompted to name the report and save it to a folder in the Reports tree where it can be accessed through the Reports explorer. See <a href="#">Overview of the Analytics Explorers</a>.</td>
</tr>
</tbody>
</table>
Compatibility Exceptions

When changes to this version of B2C Service cause changes to existing APIs, the administration interface, functionality, or how features are configured, these changes are noted as compatibility exceptions.

The Compatibility Exceptions report displays by clicking the Compatibility Exceptions button on the ribbon. This report describes the changes, identifies who might be impacted by the change, and notes its potential business impact. It also describes the steps you can take to mitigate the results of the change. The following report columns display on the top of the content pane.

- **Application Area**—Area of B2C Service affected by the service update.
- **Status**—Contains a drop-down menu that can be edited inline to designate how a service update has been addressed. Status options include New, Not Applicable, and User Remediated.
- **Affected Items**—Lists the application components affected by the service update.
- **Release Introduced**—Date the service update was added to the product.

The following report rows display on the bottom of the content pane specific to the selected row.

- **Affected Users**—Lists the user types affected by the service update.
- **Business Impact**—Describes the effect of the service update on business activity.
- **Reason for Change**—Describes the cause of the required service update.
- **Required Changes**—Lists the steps required before your site can take advantage of the service update.
- **Comments**—Captures any additional explanation regarding the service update.

Deprecated Items

The Deprecated Items report describes items that have been deprecated in this release, the reason for their deprecation, if replacements are available and what they are, and the migration steps you can take to replace the functionality that was deprecated.

When a component or feature has been deprecated, it is usually replaced with newer functionality. Your existing functionality remains unchanged for two years, so you will not experience problems as a result of deprecation. However, you should migrate to the new functionality within that time frame.

The deprecation may occur to B2C Service functionality or to third-party components used within the B2C Service application, such as PHP features. When replacements are not available, the report contains information you need to review in order to modify your current functionality to phase out use of the deprecated item.

The Deprecated Items report displays by clicking the Deprecated Items button on the ribbon. The following report columns display on the top of the content pane.

- **Application Area**—Area of B2C Service affected by the service update.
- **Status**—Contains a drop-down menu that can be edited inline to designate how a service update has been addressed. Status options include New, Not Applicable, and User Remediated.
- **Affected Items**—Lists the application components affected by the service update.
- **Release Announced**—Release the deprecation was announced.
- **Scheduled Removal**—Release the functionality/component is scheduled to be removed.

The following report rows display on the bottom of the content pane specific to the selected row.

- **Affected Users**—Lists the user types affected by the deprecation.
• **Business Impact**—Describes the effect of the deprecation on business activity.
• **Reason for Change**—Describes the reason for the deprecation.
• **Remediation Steps**—Lists the steps required to accommodate the deprecation.
• **Comments**—Captures any additional explanation regarding the deprecation.

**Edit Status Inline**
You can designate how a service update has been addressed by editing the status inline.

1. Do one of the following:
   - Select the row in the report you want to edit.
   - Press Ctrl while selecting each row you want to edit at the same time. You can also press Shift to select multiple consecutive rows.
2. Do one of the following:
   - Hover over the status until the field is highlighted in blue, and then click to activate the drop-down menu.
   - Click **Edit** on the ribbon to apply edits to multiple rows.
3. Select one of the following options from the drop-down menu.
   - **New**—Designates that you still need to address the service update. New is the default option.
   - **Not Applicable**—Designates a service update that does not affect your site. For example, there may be a compatibility exception for Chat, but your site does not use Chat.
   - **User Remediated**—Designates that you have completed the steps to address the issue. For example, you have read the compatibility exception, understand the suggested workaround, and have remediated the issue.
4. Do one of the following:
   - To apply the edit inline, press Enter or click outside the column you are editing.
   - Click **OK** to apply edits to multiple rows.

**Change the Interface Display Name**
You may decide you want to change the name of the interface as it displays for staff members.

Changing the interface name affects only the display of the interface name as it appears to staff members on the agent desktop. URLs to your interface continue to use the original interface name.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Interfaces**.
3. Click the interface name you want to edit.
4. Enter the new interface name in the **Display Name** text box.
5. Click **Save**.

**Add or Edit a Currency**
By adding currencies, you can define the currency associated with each country or province in your knowledge base.

If your organization conducts business outside of the United States, you might need to add foreign currencies to your knowledge base. You can add multiple currencies and set exchange rates for each. After you create currencies, you can...
assign a default currency to each staff account, and your staff members can use them to select the appropriate currency for contacts, organizations, and forecasts.

**Note:** You can add and edit currencies, but you cannot delete them.

1. Click **Configuration** on the navigation pane.
2. Expand **Internationalization**, and then double-click **Currencies/Exchange Rates**.

   The content pane displays the Currencies and Exchange Rates trees.

3. To edit a currency, select the currency in the tree and go to step 7.
4. To add a currency, click **New** and select **Currency**.

   The Installed Cultures list opens.

   When you select a culture, the Currency editor automatically populates with the associated culture information contained in the related region on you workstation. After you select a standard culture and save the currency, you cannot change the culture association.

   The list of installed cultures depends on the regions installed on your workstation and varies based on your operating system. You can see the list of installed regions by opening Region and Language Options in the Windows Control Panel. If the matching culture does not appear in the list, you can either add a custom currency or contact your organization’s information technology team and have the associated language pack installed on your workstation.

5. To select a standard culture, double-click the culture that matches the currency.

   The Currency editor opens.

6. To add a custom culture, double-click **Custom Culture** at the top of the Installed Cultures list.

   **Tip:** If you initially choose to create a custom culture, you can select a standard culture by editing the currency. This lets you associate a standard culture with the currency if the standard culture becomes available on your workstation.

7. Enter field information.

<table>

8. Click **Save**.
Add or Edit Exchange Rates

After you add currencies, you can add and edit exchange rates.

Currencies must be created before adding exchange rates. See Add or Edit a Currency.

If your organization conducts business outside of the United States, you might need to add foreign currencies to your knowledge base. You can add multiple currencies and set exchange rates for each. Keeping currencies and the associated exchange rates up-to-date helps your sales representatives provide the most accurate quotes for customers.

1. Click Configuration on the navigation pane.
2. Expand Internationalization, and then double-click Currencies/Exchange Rates.
   The content pane displays the Currencies and Exchange Rates trees.
3. Do one of the following:
   - To add exchange rates, click New and select Exchange Rate.
   - To edit exchange rates, click the date in the tree.
   The Exchange Rate editor opens.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start Date</td>
<td>The Start Date becomes the name of the exchange rate in the tree. Enter the date that the exchange rates take effect or click the drop-down calendar and select a start date. The start date can be a past date but not a future date.</td>
</tr>
<tr>
<td>Rates</td>
<td>Enter exchange rates in this table. The number in the table cell is the multiplier used to convert the currency in the first column to the currency in the corresponding column.</td>
</tr>
</tbody>
</table>

5. Click Save.

As shown in this image, one U.S. dollar (USD) is equivalent to 1.10154 Canadian dollars (CAD), 5.94126 Croatian kunas (HRK), 0.78517 euro (EUR), and 0.96471 Australian dollars (AUD). Similarly, to convert other currency to U.S. dollars, multiply the number of Canadian dollars by 0.98406, the number of Croatian kunas by 0.16833, the number of euros by 1.27264, and the number of Australian dollars by 1.03650.
Screen Pops

Screen pop functionality lets you communicate with B2C Service from a third-party program to submit a screen pop request.

For instance, you can open, or “pop,” a report or an editor as a new content pane tab on the Service Console by sending a request from a third-party application. When you pop an editor, you can view and edit records from the new window. When you pop a report, you can pass runtime filter values to the report and perform all normal report functions.

**Note:** Before you can integrate the screen pop feature with an external program, it must be enabled and configured. Contact your Oracle account manager.

How You Configure Third-Party Software for Screen Pops

After screen pop has been enabled and configured, you must configure your third-party software to submit an HTTP GET in the proper format. You can generate the screen pop request URL by scripting Microsoft.XMLHTTP, Internet Explorer, or any other HTTP-aware controls or languages.

HTTP GET is the only supported method. All others will return a 403 Forbidden error message. In addition, a request from a computer other than the localhost will also return a 403 Forbidden error message. If HTTP GET is used from the localhost, Oracle B2C Service returns a status code of 200 OK, 403 Forbidden, or 404 Not Found.

**Note:** The staff member making the screen pop request must be logged in to Oracle B2C Service at the time of the request.

Following is an example of a URL for a screen pop request.

http://localhost:<port>/screenpop?param1=value1&param2=value2

The port variable is populated with the value specified in the EXT_CONSOLE_WS_PORT configuration setting located in RightNow Common/Screen Pop/General.

**Tip:** You can override the EXT_CONSOLE_WS_PORT value for individual staff members by updating the External Screen Pop Port field on the Staff Accounts editor.

Enter screen pop function parameters and associated values.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>t</code></td>
<td>Specifies the type of screen pop, either editor (t=editor) or report (t=report). The editor screen pop opens a record editor of the type specified by the recordType variable. The report screen pop opens the report specified by the id variable.</td>
</tr>
<tr>
<td>recordType</td>
<td>Specifies which editor is displayed when the console is popped.</td>
</tr>
<tr>
<td>1</td>
<td>Incident</td>
</tr>
<tr>

## Email Management

### Overview of Email Management

Communicating clearly and promptly through email is essential to providing great customer experiences. Handling high volumes of email efficiently requires you to give careful thought to important topics such as process, automation, and security.

With B2C Service, you can achieve high quality and efficiency in all of your service and marketing communication. Whether responding to service questions or broadcasting mailings and surveys to large audiences, the email management features give you complete control over the handling of inbound and outbound email messages.
How Email Works in Service

Service provides a powerful email management system for handling email communication between your customers and your customer service team.

**Note:** B2C Service includes a component known as “Service” where you can customize email management functions for Service mailboxes.

The system evaluates each incoming email to ensure it meets your criteria for customer service, and then manages all back-and-forth email replies between the agent and contact until the incident is resolved. Along the way, B2C Service can automate key service functions to help your team deliver timely, world-class service.

**Tip:** A set of system-generated administrator notifications, administrator emails, and contact emails are sent to staff and contacts to support activities and events occurring throughout the system. Message templates let you quickly apply your organization’s brand across all notifications and emails. You can also customize your messages, including the message content, enabling and disabling specific notifications and emails, and defining the message format as HTML or text. For complete details and procedures about working with the Message Templates editor, see [Overview of Message Templates](#).

This flowchart shows how incoming customer email messages are handled in Service.
When a customer emails a question to your customer support email account, Service handles it using the following email management process.

1. **A contact record is associated**—The Techmail utility first searches all contact records for the email address in the Reply To field of the mail header in the message. If no match is found, Techmail looks for the address in the mail header From field. If no match is found in the From field, Techmail looks in the Sender field. If a match is found, the contact record is associated with the incoming request. If the customer’s email address is not found in an existing contact record, a new contact record is created for the customer.

By default, the incoming email processing order comes from the mail header fields in this order: Reply To, From, Sender. However, if the business policies of your organization restrict use of the Reply To mail header, you can change the processing order to use the From mail header by setting the EGW_CONT_ASSOC configuration setting to 1 in the Configuration Settings editor. See *Edit a Configuration Setting*. 
Also by default, an email address cannot be shared by multiple contact records. However, when email address sharing is enabled and an email is received from an address shared by two or more contacts, Techmail invokes a contact-matching process to associate the contact. See Email Address Sharing.

2. **Contact validity is verified**—After the email management system identifies a matching contact record, customer information is evaluated to determine whether it meets your organization’s requirements for service. If SLAs are required, the system checks to ensure the customer has a valid SLA before creating an incident. If the customer does not have a valid SLA, an auto-response denying assistance is generated and sent to the customer. See Overview of Service Level Agreements.

3. **An incident is created**—Once a contact record is matched and any SLA requirements are met, Techmail creates an incident using the contents of the email message. If the message is multipart (a common MIME type containing both HTML and text versions of the same message), the text version of the message is added to the incident thread and the HTML version is discarded. If the message contains HTML only, it is converted to text and added to the thread.

4. **The incident is processed by business rules**—Upon incident creation, Oracle B2C Service sends the contact an auto-generated receipt for the question. However, business rules are often configured to perform additional functions such as assigning an SLA, sending an auto-response, and assigning the incident to an agent for a response. Rules can also be configured to escalate the incident if the assigned agent does not answer the customer’s question within a specified time period. See Overview of Business Rules.

5. **The agent responds**—When an agent responds to the contact’s question, an email is sent to the contact containing the agent response. Occasionally, a contact may reply with additional questions or information for the agent. Techmail identifies the reply message by looking for specific markers (such as the contact email address, the reference number in the subject line, and the message tracking string in the mail header) and applies the update to the incident, extending the conversation until resolved. See Email Reply Processing and Cross-Site Email Management.

To further complement the email management process described here, additional options are available for customizing the process to meet unique business needs. For descriptions of these settings, see Advanced Configuration for Email Handling.

- Best Practices for Sending Email

**Email Reply Processing**

Service lets customers update incidents by replying to email messages. However, sometimes customers include the original message in their reply, quoting back the email they received. There are several ways that the Techmail utility can manage this scenario.

When the Techmail utility detects an email reply, it attempts to identify the part of the message containing the customer’s reply, and strips out any text that may have been quoted back from the original message thread. In this way, new replies are added to the incident as a new entry in the incident thread, while text from previous thread entries is ignored. Techmail uses several methods to determine which blocks of text in a message consist of previous thread entries.

Most email clients mark or “block quote” the original message when replying. In text messages, the original text is often block quoted by inserting a greater than symbol (>) or a vertical bar (|) at the beginning of each line of the original text. In HTML messages, the original message is usually enclosed in block quote HTML tags (<blockquote>). Parameters in the block quote HTML tag indicate how the message should be displayed (for example, each line begins with a vertical bar or an indent). The Techmail utility block-quoted reply detection method finds block-quoted text and removes it from the email, leaving only the reply from the customer.
Tip: You can define additional characters besides > and | as block-quoted text indicators in the EGW_QUOTE_CHARS configuration setting. See Advanced Configuration for Email Handling.

If you enable the EGW_REPLY_BETWEEN_ENABLED configuration setting and select the Force Reply Between Lines check box, Techmail can easily separate the reply from the original email text, as customers are directed to compose their reply between two distinct line markers. If you enable the configuration setting but do not select Force Reply Between Lines on the Incoming Email settings of the mailbox, Techmail first checks for a reply between the lines. If it does not find text between the markers, it looks for the > or | block-quoted text indicators or block quote HTML tags. In addition, when the Force Reply Between Lines check box is not selected, the system inserts checksum code at the bottom of the email so that the reply part of the email can be identified.

Tip: The EGW_CHECKSUM_STYLE configuration setting defines the style that is applied to the checksum code. To make the checksum code font blend with the background color of your email, you can change the style and text formatting by editing this setting through the Configuration Settings editor. See How You Customize Configuration Settings.

If a customer replies to multiple points within the original email, intermixing the reply with the original text, the message may contain multiple blocks of quoted text. In this case, the replies may refer to the original text above them, which may be important, so Techmail includes the entire email message in the incident.

If a customer replies within the original text, and the reply text begins with a block quote, such that the reply is indistinguishable from the original text, Techmail can determine that additional text has been added within the original text by comparing checksums in the reply to checksums in the original message. If the checksums differ, the entire email is added to the incident to ensure that no reply text is lost.

Techmail can also detect and remove “boilerplate” messaging while leaving the customer’s content intact. Boilerplate messaging is text that has been added to an email message by a mail client, such as a line of embedded advertising text. This helps to ensure that the thread is not diluted with advertising and contains only information pertinent to the discussion.

Single-Send Email Response Logic
If a contact is associated with multiple email addresses, service responses are sent to all associated addresses by default.

This means that if an incident contact has a primary email address and two alternate email addresses, every time an incident response is sent to that contact, it is sent to all three email addresses. You can limit your responses to be sent to a single email address by enabling the site-wide configuration setting OE_SVC_SENDMAIL_SINGLE_ADDRESS (Common/General/Outgoing Email).

After enabling the configuration setting, service responses are sent only to the specified email address and agents can select which one of the contact email addresses they want to send the response to from the incident workspace. See Advanced Configuration for Email Handling. That email address value remains for the life of the incident. However, any new incidents for that contact will default to the primary email address. See How You Send Incident Responses.
The default value for a response sent from the incident workspace is the primary email address. However, if the incident is created from the customer portal or a chat session (when no login is required), or by the Techmail utility, the value is set to the email address the request was sent from. Following are examples using these cases:

- **Customer portal (when no login is required)**—If the email address is available on the Ask A Question page and matches an alternate address of a contact, the alternate address is used as the response address.
- **Chat (when no login is required)**—If the email address is available on the Chat page and matches an alternate address of a contact, the alternate email address is used as the response address.
- **Techmail**—If incoming incidents are processed by Techmail, it evaluates the email address for a match from the contact record and uses the matching address as the response address.

**Related Topics**

- How Email Works in Service

**Cross-Site Email Management**

Service automatically handles email between separate B2C Service sites and the site-specific incidents are accurately updated on each site even if unique reference numbers are used for the same incident. Therefore, you can be confident that when emails pass between sites, all incident information will be current and accurate.

For instance, suppose your organization has an airline division and a hotel division, each with its own site. Now suppose that an incident was created from the airline site about a hotel issue. An incident response is sent to the hotel site and, when processed, the incident is assigned a reference number that is appropriate for that site—a different number from the airline site reference number. An agent on the hotel site responds to the incident. In the meantime, an agent on the airline site has new information that she adds to the original incident. The system recognizes the relationship between the two incidents and both are updated appropriately on their respective sites. See *Overview of Incidents*.

- How Email Works in Service

**How Email Works in Outreach and Feedback**

Outreach and Feedback provides an efficient system for handling all email communication related to mailings and surveys, including proofs, market tests, and delivery error notifications.

This flowchart shows the general sequence of email communication supported by this process.
As the flowchart illustrates, the process of sending mailings and surveys includes a number of points where outgoing and incoming email communication can occur.

- **Message proofing**—After a mailing or survey is designed, staff can send one or more proof versions to the necessary contacts and staff members for feedback and approval.

- **Market testing**—This option lets staff send small batches of a mailing or survey in advance to a subset of the audience to test different designs and messaging. They can then review the results before selecting and sending the final version.

- **Message delivery**—After proofs have been approved and market testing is complete, the mailing or survey can be sent or scheduled for delivery to the remaining audience.

- **Customer reply**—A customer who receives a mailing or survey may attempt to reply to it by email. The Techmail utility can process these replies and convert them to incidents.

- **Delivery error notification**—In the event that a mailing or survey is sent to an address that is invalid or is experiencing technical issues, the recipient mail server may return a delivery error or “bounce” notification in the form of an email sent to the Envelope From/Bounce Address defined in your outgoing email settings. See *Edit an Oracle-Managed Service Mailbox*. The Techmail utility can process most delivery errors and address them appropriately, as described in *Email Bounce Handling*. 
Unless the From and Reply To fields are customized within a mailing or survey, the system uses the addresses defined in the default mailbox for all proofs, market tests, and production mailings and surveys. Specifically, if the optional field, Friendly From/Branded Address is defined, then that address displays as the From address in delivered email. However, if only the Envelope From/Bounce Address is defined, and Friendly From/Branded Address is blank, then the address in Envelope From/Bounce Address is used. Mailbox settings are accessed from the navigation pane (Configuration > Site Configuration > Mailboxes). See Edit an Oracle-Managed Service Mailbox.

This email management process applies to most basic Outreach and Feedback implementations. However, additional options exist for customizing the process to meet your organization’s unique needs. See Advanced Configuration for Email Handling for descriptions of these additional options.

How Mailboxes Work

Mailboxes are used to define outgoing email settings and to specify the email accounts to pull email messages from. You cannot send or receive email in B2C Service until at least one mailbox is configured and enabled for the interface you are using.

There are two types of mailboxes that can be used with Service—Oracle-managed Service mailboxes, the recommended type, and Service mailboxes, also referred to as general Service mailboxes. Oracle-managed Service mailboxes and general Service mailboxes are used only with the Service application, while Outreach mailboxes are used with either Outreach or Feedback.

You can configure mailboxes to handle only outgoing email, only incoming email, or both. You can also define security settings for your mailboxes.

- **Outgoing email settings** define the identifying information to be included in outgoing email sent by the mailbox, such as the Envelope From/Bounce Address, Friendly From/Branded Address, Reply-To Address, and Display Name.

- **Incoming email settings** define the POP server, POP account, and password used to access incoming email. Other incoming settings provide methods to filter mail messages (by applying discard filters and restricting file attachments by size and file type) and forward rejected messages to another email address.

**Note:** If you use Oracle-managed Service mailboxes, the Incoming Email Enable check box and the POP Server, POP Account, and Password fields on the Incoming Email page are read-only fields because they have already been defined by Oracle.

- **Security settings** can be used to enable SSL and S/MIME authentication for your email. See Email Security Features.

**Note:** To enable processing of bounce errors in Outreach or Feedback, the Envelope From/Bounce Address in your Outreach mailbox outgoing email settings must use the POP server and the POP account defined in the incoming settings. For example, if the POP server is mail.rnmk.com and the POP account is globalsupport, then the Envelope From/Bounce Address needs to be defined as globalsupport@mail.rnmk.com. See Email Bounce Handling.

- Best Practices for Using Branded Email Domains
Edit an Oracle-Managed Service Mailbox

We recommend using Oracle-managed Service mailboxes because of several inherent advantages, including easy setup, faster and more reliable email processing, and reliability.

Oracle-managed Service mailboxes are mailboxes that Oracle initially configures for you by defining crucial incoming email settings. You can customize Oracle-managed Service mailbox settings that let you brand your mailbox, but settings that control the essential functions of incoming email processing are read-only. This eliminates any risk of those settings being misconfigured. Because Oracle handles these settings for you, you can be certain that your mailbox has been set up correctly. Oracle-managed Service mailboxes give you the following benefits.

- **Easy setup**—Oracle configures crucial incoming email settings for you, such as enabling incoming email and defining your Pop Server, POP Account, and Password fields.
- **Faster and more reliable email processing**—Techmail has been designed to handle large volumes of messages through parallel message processing, which ultimately enables your staff to respond to incidents faster.
- **Reliability**—Oracle monitors Oracle-managed Service mailboxes twenty-four hours a day, seven days a week.

**Note**: This procedure assumes that Oracle has already added an Oracle-managed Service mailbox for you. Oracle-managed Service mailboxes can be added from the B2C Service Configuration Assistant. For information on accessing the Configuration Assistant, see Answer ID 6354.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Mailboxes**. The Mailboxes tree displays on the content pane with the primary interface expanded to display your existing mailboxes.
   a. To edit Oracle-managed Service mailboxes on additional interfaces, expand the additional interface for which you want to edit a mailbox.
3. Select an Oracle-managed Service mailbox in the tree.
   The outgoing email settings display on the editor.
   Oracle-managed Service mailboxes display only if one (or more) has been added to your site. Oracle-managed Service mailboxes can be added from the B2C Service Configuration Assistant. For information on accessing the Configuration Assistant, see Answer ID 6354.
4. Enter the following field information to enable mailbox functionality.

   **Note**: For Oracle-managed Service mailboxes, the Incoming Email Enable field is **read-only**. However, this field can be edited from the B2C Service Configuration Assistant. For information on accessing the Configuration Assistant, see Answer ID 6354.

<table>
<thead>

<tr>
<td></td>
<td><strong>Note:</strong> This check box is selected by default for general Service and Outreach mailboxes, but not for Oracle-managed Service mailboxes. When the Default check box is selected, it becomes disabled and cannot be cleared. You must set another mailbox as the default, and then save your changes in order to clear this check box.</td>
</tr>
</tbody>
</table>

5. Enter the following field information to configure outgoing email for this mailbox.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Envelope From/Bounce Address</td>
<td>Enter the email address that is used as the return path for bounced emails. (For Oracle-managed Service mailboxes, this field is set to the email address that was designated when Oracle initially added the mailbox to your site.) The value in this field displays as the From address in the outgoing email unless the Friendly From/Branded Address field is defined. See Email Bounce Handling.</td>
</tr>
<tr>
<td>Tip:</td>
<td><strong>Tip:</strong> To ensure that your bounced emails process correctly, we recommend using the email address provided when your account was set up. For example, a typical Oracle-managed Service or general Service mailbox would be “<a href="mailto:example@mail.custhelp.com">example@mail.custhelp.com</a>.” A typical Outreach mailbox would be “<a href="mailto:example@mail.rnmk.com">example@mail.rnmk.com</a>.”</td>
</tr>
<tr>
<td>Friendly From/Branded Address</td>
<td>Use this optional field to brand your email message. If you use this field, this is the email address your recipients will see in the email you send. For example, if you want the email address that displays to your recipients to be different from the email address defined in the Envelope From/Bounce Address, enter the address the way you want it to appear in this field.</td>
</tr>
<tr>
<td></td>
<td>If you define an email address in this field, it displays as the From address in the outgoing email.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Reply-To Address</strong></td>
<td>Typically, the reply-to address is the same as the address specified in the Envelope From/Bounce Address field, but you can use this optional field if you want customers to send their responses to a different email address. (For Oracle-managed Service mailboxes, this field is set to the email address that was designated when Oracle initially added the mailbox to your site.) The Reply-To Address field must contain a valid email address in order to receive messages. If the Reply-To Address field is not defined, then either the Envelope From/Bounce Address or the Friendly From/Branded Address is used as the default email address.</td>
</tr>
<tr>
<td><strong>Display Name</strong></td>
<td>Enter the name you want to appear on outgoing messages as the sender. For example, Global Wireless Customer Service.</td>
</tr>
</tbody>
</table>

6. To enter incoming email information, click **Incoming Email** on the ribbon.  
The incoming email settings display on the editor.  
7. Enter the following field information to configure incoming email for this mailbox.

**Note:** For Oracle-managed Service mailboxes, the POP Server, POP Account, and Password fields are read-only. However, this field can be edited from the B2C Service Configuration Assistant. For information on accessing the Configuration Assistant, see **Answer ID 6354**.

<table>
<thead>
<tr>

<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Message Pull Limit</strong></td>
<td>Enter the maximum number of email messages to pull from the mailbox during a Techmail run. The remaining messages are left on the POP server until the next time Techmail runs. The default pull limit is 5,000 messages. Messages that are filtered are not counted toward this limit. Only emails that create incidents are counted. For example, if Message Pull Limit is set to 100 and the mailbox contains 200 messages, but 50 of them are filtered by rules, Techmail pulls 100 of the remaining messages from the mailbox and leaves 50 for future processing.</td>
</tr>
<tr>
<td><strong>Max Attachment Size</strong></td>
<td>Enter the maximum size, in number of bytes, allowed for file attachments. The default maximum size is 5,000,000 bytes (5MB).</td>
</tr>
<tr>
<td><strong>Maximum Description Size</strong></td>
<td>Enter the maximum size, in bytes, allowed for the incident description. If an email exceeds this limit, it is added to the incident as a file attachment and a small thread entry refers agents to the attached file. The default value is 250,000.</td>
</tr>
</tbody>
</table>
| **Force Reply Between Lines** | Select this check box to require that customers enter their reply between the two line markers included in an incident response email. When customers reply between these lines, Techmail separates their reply from the quoted response text and adds it as a new thread.  
  - If this check box is selected and customers do not reply between the lines, an incident thread is not created from their reply. Another email is sent automatically to request that they reply between the lines.  
  - If this check box is not selected and customers do not reply between the lines, Techmail looks for block-quoted text indicators to find the customer's reply. See Email Reply Processing. |
| **Delete Bulk Messages**      | Clear this check box to turn bulk messages into incidents. By default, this box is selected to delete bulk email. An email is considered bulk when the Precedence: header is set to bulk, junk, or list. |
| **Delete Returned Messages**  | Clear this check box to turn returned messages into incidents. By default, this check box is selected to delete returned email. An email is considered to be returned when the From address begins with postmaster or mailer_daemon, or if the MIME type is Multipart/Report.  
  This option is not available for Outreach mailboxes. |
### Field Description

</tr>
<tr>
<td>File Types</td>
<td>Click this tab and enter a list of attachment types you will not accept based on the file name extension. Separate entries in the list with commas or new lines. (Do not add hard returns within this filter.) Specific file names can be specified, or an asterisk (*) can be used as a wildcard to match any characters. For example, to exclude all executable files, screen savers, and any script titled worm.vbs, enter: *.exe, *.scr, worm.vbs</td>
</tr>
</tbody>
</table>

8. To enter security settings, click **Security** on the ribbon and see *Email Security Features*.
9. To view the mailbox configuration **audit log**, click **Audit Log** on the ribbon.
10. Click **Save**.

### Add or Edit a General Service Mailbox

General Service mailboxes are not managed by Oracle. Therefore, you handle the entire mailbox setup yourself. If you decide to use general Service mailboxes, keep in mind that your mailbox will not be monitored by Oracle and advantages that are inherent to Oracle-managed Service mailboxes will not be available.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Mailboxes**. The Mailboxes tree displays on the content pane with the primary interface expanded to display any existing mailboxes.
   a. To add or edit Service mailboxes on additional interfaces, expand the additional interface for which you want to add or edit a mailbox.
3. Do one of the following:
   o Click **New** on the ribbon and select **New Service Mailbox**.
   o To edit a mailbox, select it in the tree.

The outgoing email settings display on the editor.
Add or Edit an Outreach Mailbox

If you use Outreach or Feedback on your site, you also need to add an Outreach mailbox.

**Note:** To ensure accurate processing of replies, inbound messages, and bounces, Outreach mailboxes cannot be shared with either type of Service mailbox. Techmail handles messages in Oracle-managed Service mailboxes and general Service mailboxes differently from how it handles them in Outreach mailboxes. For this reason, you must set up one mailbox for Service and a separate mailbox for Outreach and Feedback.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Mailboxes**. The Mailboxes tree displays on the content pane with the primary interface expanded to display any existing mailboxes.
   - To add or edit Outreach mailboxes on additional interfaces, expand the additional interface for which you want to add or edit a mailbox.
3. Do one of the following:
   - Click **New** on the ribbon and select New Outreach Mailbox.
   - To edit a mailbox, select it in the tree.

   The outgoing email settings display on the editor.
4. Enter field information described in the **Mailboxes Editor** table to enable mailbox functionality.
5. To configure outgoing email for this mailbox, enter field information described in the **Outgoing Email Settings** table.
6. To configure incoming email for this mailbox, click **Incoming Email** on the ribbon and enter field information described in the **Incoming Email Settings** table.
7. To enter security settings, click **Security** on the ribbon and see **Email Security Features**.
8. To view the mailbox configuration audit log, click **Audit Log** on the ribbon.
9. Click **Save**.

How You Designate a Default Mailbox

The default mailbox is the mailbox that is used to send Service incident responses. You must designate one default mailbox for Service—either an Oracle-managed Service mailbox or a general Service mailbox.

After designating a default Service mailbox, the mailbox name will then display in the Mailbox field on the Details tab of the agent’s incident workspace. This lets your agents easily associate incidents with the correct mailbox when responding to customers. See **Add Incident Information on the Details Tab**.

**Note:** If you do not designate a default mailbox by selecting the Default check box, agents must manually select a mailbox each time they respond to an incident.
The default mailbox is designated by the Default check box on the Outgoing Email page of the editor. After the default mailbox is set, a green check mark displays on top of the mailbox icon in the tree. This check box is selected by default for general Service and Outreach mailboxes, but not for Oracle-managed Service mailboxes. Therefore, if your Oracle-managed Service mailbox is the only Service mailbox you have, you must designate it as the default mailbox by selecting the Default check box.

**Note:** If you communicate with your customers through mailings and campaigns and survey your customers and prospects, you must also designate a default Outreach mailbox.

**Email Security Features**

B2C Service provides security and privacy options for all incoming and outgoing email. Using accepted industry standards, the email security features help protect your communication in three important ways.

- **Authentication** assures the message recipient that the sender is who it appears to be and that no other parties are misrepresenting themselves as the sender.
- **Message integrity** ensures that the content of the message has not been deliberately or accidentally changed during transmission.
- **Privacy** ensures that the message is not readable by anyone other than the intended recipient.

To safeguard your email communication, B2C Service supports SSL and S/MIME security methods along with the ability to manage certificates and authentication options. Together, these features can provide a high level of security for messages traversing the Internet between you and your customers.

Security configuration is an important part of your B2C Service application and we realize that your organization may have unique security needs. For an in-depth discussion about security practices in B2C Service and how to protect your data, see *Overview of Oracle B2C Service Security and Compliance*.

**Configure SSL Security Settings**

SSL (secure sockets layer) protocol is the industry standard for securing Internet-based data transfer. SSL encrypts the data stream during transmission to prevent the exposure of sensitive information, such as passwords, to unauthorized parties.

Servers with SSL capability have been issued a public certificate and a private key by a certification authority. When a client (such as Techmail) communicates with an SSL-enabled server, the server sends the client its public certificate for verification. After the certificate has been validated to be current and signed by a trusted certification authority, the communication channel between the client and server is encrypted and can then be used to securely exchange information. The information remains encrypted as it travels between the two parties and is secure until the server or client decrypts it at the other end.

If you are hosting a POP mail account on your own mail server, configuring an SSL connection between the Techmail utility and the mail server protects the security of email messages as they are processed.

**Note:** SSL is not used for accessing POP accounts hosted by Oracle because the mail server and Techmail utility reside within the same secure network.
SSL settings let you specify the method used to establish the secure connection and set conditions on how strictly Techmail validates the server SSL certificate before connecting.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Mailboxes**.
   The Mailboxes tree displays on the content pane.
3. Click the mailbox you want to edit in the tree.
4. Click **Security** on the ribbon.
   The mailbox security settings display on the content pane.
5. Enter field information to select the SSL method and set certificate verification requirements.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSL Method</td>
<td>Click this drop-down menu to select an SSL option that determines how Techmail retrieves messages from the mailbox.</td>
</tr>
<tr>
<td>Disabled</td>
<td>Select this option to use regular POP3 (on port 110) without SSL encryption. This is the default setting. Note: The check boxes for accepting SSL certificates are grayed out if you select Disabled for the SSL method.</td>
</tr>
<tr>
<td>Using POP3 SSL port</td>
<td>Select this option to use POP3 with SSL encryption on port 995.</td>
</tr>
<tr>
<td>Using STLS command</td>

<td>Accept Untrusted SSL Certificates</td>
<td>Select this check box to bypass verification that the mail server SSL certificate is signed by a trusted certificate authority.</td>
</tr>
<tr>
<td>Accept Expired or Not Yet Valid SSL Certificates</td>
<td>Select this check box to bypass verification that the mail server SSL certificate is current and not yet expired.</td>
</tr>
<tr>
<td>Accept SSL Certificates With Incorrect Host Name</td>
<td>Select this check box to bypass verification that the mail server host name is the same host specified in the SSL certificate.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

**How SMIME Security Works**

In addition to SSL encryption, Oracle-managed Service mailboxes and general Service mailboxes support S/MIME, an industry standard for ensuring the security of message content through the use of electronic signatures, encryption, or both.
An email address that uses S/MIME has a **public certificate** as well as a **private key** that corresponds to the public certificate. The public certificate authenticates the sender and can be used for encryption. The person who replies to the email can use the sender's public certificate to encrypt the reply, which can then be decrypted only by the original sender using the original sender's private key.

There are certain situations where S/MIME security options are **not** available.

- In Outreach and Feedback mailboxes.
- When editing multiple incidents simultaneously. You can send a response to more than one incident at a time, but you cannot use secure mail when doing so.
- When using delayed reporting on the Workspace editor. S/MIME works only if you clear the Delay Report Execution check box in the Report Behavior drop-down menu for the Contacts relationship item control on the Workspace editor Design tab. See **Overview of Workspace and Script Elements**.

This image shows a secure correspondence between two parties, both of whom have S/MIME capability.
Customers who have S/MIME email can send messages signed with their public certificate to any Oracle-managed Service mailbox or general Service mailbox. When Techmail receives a signed message, it verifies and stores the customer’s certificate and uses it to encrypt any response messages sent to that customer. The customer can then decrypt the response using the private key for the certificate.

**Note:** Agents responding to a signed message can send a non-encrypted response by selecting Do Not Encrypt from the incident response options. See *Sign and Encrypt an Incident Response*.

Service S/MIME settings also let you set conditions on how strictly Techmail validates a customer’s public certificate for incoming messages. If Techmail cannot verify a customer’s public certificate, it does not update the customer’s contact record with that certificate.

**Tip:** When Techmail attempts to decrypt an incoming message or verify an attached certificate (and you have enabled the EGW_SAVE_EMAIL_HEADERS configuration setting to save incoming email headers), the results are appended to the saved mail header.

Note that the customer’s original message is not encrypted. In order to encrypt messages sent from a customer to an Oracle-managed Service mailbox or general Service mailbox, the mailbox must be configured with its own certificate and key, as described in the following procedure. Agent response emails are then signed with the mailbox certificate which customers can use to validate the messages and send encrypted replies. Techmail uses the certificate key to decrypt those replies and process the message contents normally.

### Configure SMIME Security Settings

In addition to SSL encryption, Oracle-managed Service mailboxes and general Service mailboxes support S/MIME, an industry standard for ensuring the security of message content through the use of electronic signatures, encryption, or both.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Mailboxes**. The Mailboxes tree displays on the content pane.
3. Click the mailbox you want to edit in the tree.
4. Click **Security** on the ribbon. The mailbox security settings display on the content pane.
5. Enter field information to identify the mailbox’s public certificate/private key file and set certificate import requirements.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox Personal Certificate and Key</td>
<td>Click the Browse icon to locate the file containing the public certificate and private key assigned to the mailbox by the certification authority. The file you import should be in a password-protected Personal Information Exchange PKCS#12 format, using a .pfx or .p12 file extension. It must also contain the email address of the mailbox exactly as it was entered for outgoing email. See <em>Edit an Oracle-Managed Service Mailbox</em>. When prompted, enter the original password (the password used to encrypt the file) and the new password (the password the private key is to be encrypted with in the database).</td>
</tr>
</tbody>
</table>

**Note:** The file is not imported until you save all mailbox settings.
## Certificate Validation Options

To supplement the SSL and S/MIME email security settings, B2C Service provides you with the resources for managing the validation and revocation of certificates. These resources are accessed using the File Manager.

- **Trusted certification authorities**—Service uses a predefined list of trusted certification authorities for verifying certificates from POP3 servers and S/MIME email senders. This list contains well-known root certification authorities. Depending on your organization’s circumstances, you may want to add or remove trusted certification authorities.

- **Certification revocation lists**—Certification authorities regularly publish certificate revocation lists, which you can use to check the validity of certificates. If you upload any lists, certificate revocation checking is automatically enabled. As a result, all root certification authority certificates that are used (in either SSL connections or email certificates) must have a corresponding certificate revocation list. If there is no corresponding list, the certification check fails.

- **Intermediate certificates**—Some certificates that are not defined as trusted root certificates still need to be stored in order to verify a customer’s certificate (the one that was used to sign the customer’s S/MIME email). These are called intermediate certificates and are automatically extracted from emails, requiring no intervention on your part. You can also upload intermediate certificates if, for example, you receive signed emails without the necessary intermediate certificate embedded in them.

Additionally, the configuration setting, USE_KNOWN_ROOT_CAS (Common/General/Single Sign-On), controls whether the known root certificate authorities list that is embedded within the Oracle server is consulted when verifying X509 certificates. For example, when checking S/MIME email or SAML 2.0 signatures.

### Table: Certificate Validation Options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Import Untrusted Certificates</strong></td>
<td>Select this check box to bypass verification that the mailbox certificate file will to be imported (set in the mailbox personal certificate and key field) or a contact certificate extracted from a signed S/MIME email is signed by a trusted certification authority. Changing this setting does not affect previously imported and stored certificates.</td>
</tr>
<tr>
<td><strong>Import Expired or Not Yet Valid Certificates</strong></td>
<td>Select this check box to bypass verification of the certificate date for the mailbox certificate file to be imported (set in the mailbox personal certificate and key field) or a contact certificate extracted from a signed S/MIME email. The Techmail utility will then accept certificates from S/MIME emails sent to this mailbox that have expired or are not yet valid. This setting applies to every certificate in the certificate chain, from the root certificate through any subordinate certificates to the POP3 server's certificate. Changing this setting does not affect previously imported and stored certificates.</td>
</tr>
<tr>
<td><strong>Do not use S/MIME signature certificates</strong></td>
<td>Select this check box to allow unverified S/MIME signed emails for incident creation and updates. If this check box is selected, certificates from signed emails are not stored with the contact record.</td>
</tr>
<tr>
<td><strong>Ignore certificate integrity sign errors</strong></td>
<td>Select this check box to allow incidents to be created and updated even if an email fails the signature check.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

- Manage Files with the File Manager

Add or Remove Certification Authorities

Service uses a predefined list of trusted certification authorities for verifying certificates from POP3 servers and S/MIME email senders.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and double-click File Manager.
   The File Manager displays on the content pane.
3. Click the Switch To drop-down menu and select Additional Root Certificates.
4. Click Browse and select the root certificate file you want to upload.
   The file should be in DER Encoded Binary X.509 (.cer or .crt) or Base-64 Encoded X.509 (.pem) format.
5. Click Go to upload the file.
6. To delete a root certificate file, click the Delete File icon on the line that contains the file you want to delete.
   a. Click OK to confirm the deletion.

Add or Remove Certification Revocation Lists

Certification authorities regularly publish certificate revocation lists, which you can use to check the validity of certificates.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration and double-click File Manager.
   The File Manager displays on the content pane.
3. Click the Switch To drop-down menu and select Certificate Revocation Lists.
4. Click Browse and select the intermediate certificate file you want to upload.
   The file should be in a DER Encoded Binary (.crl) format.
5. Click Go to upload the file.
6. To delete a certificate revocation list file, click the Delete File icon on the line that contains the file you want to delete.
   a. Click OK to confirm the deletion.

Add or Remove Intermediate Certificates

Some certificates that are not defined as trusted root certificates still need to be stored in order to verify a customer’s certificate (the one that was used to sign the customer’s S/MIME email). These are called intermediate certificates and are automatically extracted from emails, requiring no intervention on your part.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration and double-click File Manager.
   The File Manager displays on the content pane.
3. Click the Switch To drop-down menu and select Intermediate Certificates.
4. Click Browse and select the intermediate certificate file you want to upload.
   The file should be in DER Encoded Binary X.509 (.cer, .crt) or Base-64 Encoded X.509 (.pem) format.
5. Click Go to upload the file.
6. To delete an intermediate certificate file, click the Delete File icon on the line that contains the file you want to delete.
   a. Click OK to confirm the deletion.
How You Troubleshoot Filtered Out or Rejected Email

Incoming email messages are filtered out or rejected by the Techmail utility for a variety of reasons, such as the header content, email subject, or because the sender does not have a customer account (that is, a contact record in the knowledge base).

The logic that determines which email messages are processed is based on mailbox settings, configuration settings, and the business rules your site uses. The Incoming Email Filter Details report ([Public Reports/Service/Email Reports](#)) can help you troubleshoot why certain emails are being filtered out or rejected by Techmail. This report lists every email filtered out or rejected in the past twenty-four hours, including the email address the message was sent to, the date the email was created, the filter type, the filter description, and the name of the mailbox from which the email was sent. Techmail stores this information in the Techmail Filter Details (tm_filter_details) table. For a description of information logged in this table, see the Data Dictionary located on the navigation pane ([Configuration > Database > Data Dictionary](#)).

This table lists the filter types associated with the Techmail Filter Details table as well as the settings and rules that cause a message to be filtered out by Techmail.

<table>
<thead>
<tr>
<th>Filter Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>techmail_filter_address</td>
<td>This message was filtered out because the email address matches a value on the Addresses tab in the Discard Filters section of your Incoming Email settings.</td>

### Email Bounce Handling

Occasionally, a recipient mail server determines that an email message cannot be delivered and replies with a “bounce” notification (delivery error). To process these errors, the Envelope From/Bounce Address in your Outreach mailbox outgoing email settings must use the POP server and POP account configured in the incoming settings.

**Note:** To ensure that your bounced emails and replies process correctly, you must use the email address that was provided when your account was set up.

When the Techmail utility encounters a bounce error, it attempts to classify the error as one of the following bounce types.

**Soft bounce**—An email was returned because of a temporary problem with the recipient’s mailbox (for example, the mailbox has exceeded its available size limit). Service incident emails that result in soft bounces are not automatically re-sent by the system. If you want to resend an incident response that has bounced, you must manually respond to the incident again. Conversely, when Techmail detects that a soft bounce has been returned from a mailing or survey invitation email, it places that message in a mail queue and attempts to resend it for up to seven days (the default value specified by the BOUNCE_RETRY_WINDOW configuration setting).

However, if a contact’s email address returns soft bounces three consecutive times with no contact activity in the previous fifteen days (as specified by the INVALID_NUM_BOUNCES and INVALID_NUM_DAYS configuration settings), the address is marked invalid. After a contact’s email address has been invalidated, the system does not send mailings or surveys to that address. See [Invalid Contact Email Addresses](#).

**Hard bounce**—An email was returned because of a permanent problem with the recipient’s mailbox, and the problem is not expected to be resolved (for example, the recipient mail server indicates that the email address does not exist). When a hard bounce is received, the contact email address is marked invalid and no resend attempt is made.

**Note:** If email address sharing is enabled, and a shared email address is invalidated due to a hard bounce, the address is marked as invalid for each contact associated with it. See [Email Address Sharing](#).

**General bounce**—A mailing or survey invitation email was returned due to technical problems with the delivery of the message. That is, the problem is not on the sender’s end nor the recipient’s end, but in the transmission of the message over the network in between. It is therefore difficult to predict the likelihood of resolution. General bounces are logged in the database but no further action is taken. No resend attempt is made and the contact email address is not marked invalid.

**Unknown bounce**—An email was returned for a reason that could not be determined. Unknown bounces are logged in the database but no further action is taken. No resend attempt is made and the contact email address is not marked invalid.
In other cases, Techmail may receive an error code indicating that a mailing or survey invitation email was blocked by the recipient mail server. When this happens, Techmail attempts to identify the reason for the block and classifies it as one of the following block types.

- **Content block**—An email was blocked due to its content. In other words, some part of the message content triggered a filter that prevented the message from being delivered.

- **Sender block**—An email was blocked due to the sender’s reputation. This means that the sender has not developed a trusted relationship with the recipient mail provider.

- **General block**—An email was blocked for a reason that could not be determined.

When Techmail encounters a block error, it logs the error in the database but does not attempt to resend the message, nor does it invalidate the contact email address.

Delivery errors logged by the system can be accessed with reports, specifically the Invalid Email Address Domains report (Public Reports/Outreach/Contacts/Database Snapshot) and the Invalid Email Addresses by Mailing report (Public Reports/Outreach/Contacts).

You may also find it valuable to build a custom report using other data stored in the Bounced Messages (bounced_msgs) table. For example, you could create a custom report that includes the email address that the message was sent to, the text of the error received, the type of block or bounce it was classified as, and whether the email address was invalidated as a result. See Overview of Custom Reports.

B2C Service stores a copy of the original email message for 60 days. (You can change or disable this purging interval by editing the OE_BOUNCE_PURGE_DAYS configuration setting.) See Edit a Configuration Setting.

When a delivery error is returned from an incident response, a View Bounce Messages button appears in the header of the response thread that was bounced. Clicking this button opens a window displaying the contents of any delivery errors resulting from the response. See View a Bounced Message.

**Note:** Because email technology is constantly evolving, B2C Service regularly monitors delivery errors that are not categorized and attempts to classify them accordingly. If an email is blocked or bounced for a reason that cannot be determined (an unknown bounce or general block has occurred), it is often because not enough information was provided by the delivery error to classify it appropriately.

### Invalid Contact Email Addresses

In a contact workspace, an invalid email address is flagged by a warning indicator to the right of the Email field.

In the database, validity is tracked for primary and alternate email addresses in three fields: contacts.email_invalid, contacts.email_alt1_invalid, and contacts.email_alt2_invalid. When these fields are updated, the contact audit log is updated accordingly. These fields can also be used in reports or as conditions in an incident or contact rule. See Overview of Creating Basic Custom Reports and Overview of Business Rules.

If an agent attempts to send an incident response to a contact with at least one valid primary or alternate email address, B2C Service sends the message to the valid address and no warning is given. However, if an agent attempts to send a response to a contact whose primary and secondary email addresses are all marked invalid, B2C Service displays a warning message asking whether to proceed. If the agent clicks Yes, the system sends the response and sets all of the email addresses back to a valid state. However, if the response results in a bounce message that indicates an address is still not valid, Techmail invalidates the address once again.

Especially useful for identifying invalid email addresses is the Contacts with Invalid Email Addresses report you (Public Reports/Common/Contact Reports). This report lists all contacts with one or more invalid primary or alternate email address, resulting from both hard and soft bounces. It also lists the most recent invalid date.
**Tip:** It is not possible to override bounce detection to prevent Techmail from setting an email address to invalid. However, if a message that is not a bounce message is received from an address flagged as invalid, Techmail automatically updates the contact and revalidates the address. You can manually revalidate a contact’s address by slightly modifying it, saving the record, and then reopening the record and setting it back to its original state. For example, if you change the address joe@example.com to joe@example.com.invalid and save the contact, then change it back to joe@example.com, the address is set as valid.

### Email Loop Detection

Occasionally, an email message may be sent to an address that returns an automated reply (such as an out-of-office notification). If Techmail then receives and processes the automated reply, another message (such as an incident receipt or rule response) could be sent, generating another automated reply, forming an email loop.

To avoid this problem, the Techmail utility automatically terminates email loops using three detection methods.

- **Duplicate messages**—If Techmail detects that it has processed an identical email earlier in the same run, the duplicate email is deleted. Emails are considered duplicates if they are found in the same mailbox and contain the same email address, subject, send date, and body as a previous message.

- **B2C Service messages**—Techmail also looks for any incoming message header that contains a reply-to address matching the reply-to address of any mailbox. In this way, Techmail deletes any messages originating from the system (such as receipts and escalation notifications) to prevent continuous internal email loops within Service.

- **Multiple messages**—Techmail also enforces a maximum number of messages allowed from a single email address in a specified period of time, regardless of content. By default, no more than twenty-three messages are allowed from the same address in the same twelve-hour period. Additional messages from that address within that time period indicate that an email loop has occurred and are deleted to terminate the loop.

**Note:** To ensure accurate processing of replies, inbound messages, and bounces, Outreach mailboxes cannot be shared with either type of Service mailbox. Techmail handles messages in Oracle-managed Service mailboxes and general Service mailboxes differently from how it handles them in Outreach mailboxes. For this reason, you must set up one mailbox for Service and a separate mailbox for Outreach and Feedback.

This table describes the configuration settings you can use to configure the Techmail email loop prevention function. See *Edit a Configuration Setting*.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RightNow Common/Service Modules/Oracle Email</td>
<td></td>
</tr>
<tr>
<td>EGW_LOOP_PREVENT_ENABLED</td>
<td>If enabled, any email where the reply-to email address matches the reply-to email address of any Oracle-managed Service mailbox, general Service mailbox, or Outreach mailbox is discarded and no incident is created. In this way, the mailbox deletes any messages from itself, which can prevent continuous email loops. Default is enabled (Yes).</td>
</tr>
<tr>
<td>EGW_DISCARD_DUPLICATE_ENABLED</td>
<td>If enabled, any email having the same date, email address, subject, and body as an existing incident are classified as a duplicate message and are discarded. Default is enabled (Yes).</td>
</tr>
<tr>
<td>EGW_MAX_MSG_DURATION</td>
<td>Specifies the number of hours in which EGW_MAX_PER_ADDRESS is calculated. By default, the system only accepts 23 messages from a given email address in a 12-hour period. Since a high number of messages in a short period of time is reasonable, it is recommended the duration not be less than 8 hours or more than 24 hours. Default is 12.</td>
</tr>
</tbody>
</table>
### Core Features

**Setting** | **Description**
---|---
EGW_MAX_PER_ADDRESS | Specifies the maximum number of emails that are accepted from an individual email address within a EGW_MAX_MSG_DURATION hour period. This is used to identify and stop auto-responder email loops. For example, if this setting is set to 23, and 24 emails are received from the same address within EGW_MAX_MSG_DURATION hours, the 24th email from that address is discarded and no response email is sent, thereby breaking the email loop. Setting the value to zero turns off this loop detection. Default is 23.

In the rare event that Techmail’s automated detection features are insufficient to prevent an email loop, you can use either of the following options to break the loop by temporarily discarding messages received from a specific email address.

- To end a loop using business rules, set up a temporary rule to delete email received from the address causing the loop. See *Add a Rule*.
- To end a loop using mailbox settings, temporarily add the email address to the Discard Addresses field for incoming email on the Mailboxes editor. See *How Mailboxes Work* and *Edit an Oracle-Managed Service Mailbox*.

### Advanced Configuration for Email Handling

To better fit our email management processes to your business needs, you can customize a variety of configuration settings to modify default behavior of the system.

The settings described in the procedures found in this section are used to configure mail processing functions such as the email gateway, contact record creation, email loop prevention, and *mailer daemon* (also called RNMD) parameters. See *How the Configuration Settings Editor Works*.

### Edit Common Outgoing Email Configuration Settings

You can configure the resend limit, custom headers, single-send email response logic, and the number of days before purging the message field from the Configuration Settings editor.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Configuration Settings**.
   - The Search window opens, where you can filter your search results.
3. To display all outgoing email settings, select the **Site** check box (in addition to the Logged In check box, which is selected by default) below the Configuration Base field.
4. Clear the **Select All** check box below the Folders field and then select the **Common** check box.
5. To search for a specific configuration setting in the Common folder, enter the setting name in the Key field.
   - **Tip:** You can search part of a configuration setting name by appending a wildcard (either an asterisk or a percentage sign) to the end of your search term.
6. Click **Search**.
   - The Configuration Settings editor displays the settings in the Common folder that match your search criteria.
   - To display configuration settings in alphabetical order, click in the Key column header.
7. Expand the folders under **Common/General** and edit the configuration settings in the Outgoing Email folder.
   - For information about a setting, click the setting and see the description that appears on the Configuration Settings editor. For complete details about the Configuration Settings editor, including searching, editing, and creating custom configuration settings, see *Edit a Configuration Setting*.

- Overview of Site Configuration

Edit Service Email Configuration Settings
You can configure mail processing functions such as the email gateway, contact record creation, contact association priority for incoming email, and email loop prevention from the Configuration Settings editor.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click Configuration Settings.
   The Search window opens, where you can filter your search results.
3. Clear the Select All check box below the Folders field and then select the RightNow Common check box.
4. To search for a specific configuration setting in the RightNow Common folder, enter the setting name in the Key field. (The Key field is not case sensitive.)
   Tip: You can search part of a configuration setting name by appending a wildcard (either an asterisk or a percentage sign) to the end of your search term.
5. Click Search.
   The Configuration Settings editor displays the settings in the RightNow Common folder that match your search criteria.
   To display configuration settings in alphabetical order, click in the Key column header.
6. Expand the folders under RightNow Common/Service Modules and edit the configuration settings in the Oracle Email folder.
   For information about a setting, click the setting and see the description that appears on the Configuration Settings editor. For complete details about the Configuration Settings editor, including searching, editing, and creating custom configuration settings, see Edit a Configuration Setting.

- Overview of Site Configuration

Edit Outreach and Feedback Email Configuration Settings
You can configure mail processing functions such as bounced email processing, delivery of campaigns and mailings, invalid contacts, and mailer daemon utility (also called RNMD) parameters from the Configuration Settings editor.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click Configuration Settings.
   The Search window opens, where you can filter your search results.
3. Clear the Select All check box below the Folders field and then select the Outreach and Feedback check box.
4. To search for a specific configuration setting in the Outreach and Feedback folder, enter the setting name in the Key field. (The Key field is not case sensitive.)
   Tip: You can search part of a configuration setting name by appending a wildcard (either an asterisk or a percentage sign) to the end of your search term.
5. Click Search.
   The Configuration Settings editor displays the settings in the Outreach and Feedback folder that match your search criteria.
   To display configuration settings in alphabetical order, click in the Key column header.
6. Expand the folders under Outreach and Feedback/General.
7. Edit the configuration settings in the specific Bounced Mail Processing, Campaigns, Invalidate Contacts, Mailer Utility, Mailings, Miscellaneous, and RNM Daemon folders.

For information about a setting, click the setting and see the description that appears on the Configuration Settings editor. For complete details about the Configuration Settings editor, including searching, editing, and creating custom configuration settings, see *Edit a Configuration Setting*.

### Add or Edit a Distribution List

Distribution lists are email address lists that you can use when scheduling reports, configuring rule notifications, and forwarding incidents and opportunities. You can also use email address lists in the CC and BCC fields in incident responses.

Distribution lists are used to define sets of email addresses not associated with contact records or *staff accounts* in your knowledge base. For example, you might want to schedule an email report to be sent to a group of executives who do not have staff accounts in B2C Service. By adding their addresses to a distribution list, you can then include that list when defining subscribers to that report.

You can see all of the distribution lists your organization uses in the Distribution Lists report, located in **Public Reports/Common/Site Administration/Communication Configuration**.

The Distribution Lists editor consists of a list of available addresses. Addresses are included in the distribution list by selecting the check box next to the address in the list.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Distribution Lists**.
   - The Distribution Lists tree displays on the content pane.
3. Do one of the following:
   - To add a distribution list, click **New** on the ribbon.
   - To edit a distribution list, click it in the tree.
4. Enter the distribution list name in the **List Name** field.
5. To add an internal note about the distribution list, enter it in the **Notes** field.
6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution List Members</td>
<td>This section contains the list of addresses available for the distribution list.</td>
</tr>
<tr>
<td><img src="icon" alt="Filter" /> Filter</td>
<td>Enter filter text and click the drop-down menu to select a column to filter the address list. Filtering is available only when editing a list that has been saved.</td>
</tr>
<tr>
<td><img src="icon" alt="New" /> New</td>
<td>Click this button to add a new address to the address list.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![Import](image) | Click this button to open the Import Email Addresses window and enter multiple email addresses that you want to add to the address list. You can also add first and last names for each address.  

**Note:** You can copy and paste a list of contact email addresses into the Email field, but each address must appear on its own line followed by a return. |
| ![Select All](image) | Select this check box to include all available addresses in the distribution list, or select the check box next to an individual record to include the record in the distribution list. |
| ![Remove](image) | Click this button to remove the selected member from the address list.  

**CAUTION:** Deleting the email address removes it from all distribution lists that it has been added to. |
| ![Copy](image) | Click this button to copy the selected address in the address list. |

**Email** Enter the email address.  
First Name Enter the first name associated with the email address.  
Last Name Enter the last name associated with the email address.  
Notes Enter internal notes about the email address. |

7. To enter a different name for the distribution list based on interface, select the Label value next to the Language name in the Interface Label section and enter the name.  
This is helpful if your site has multiple interfaces of different languages. By default, the label is set to the list name you defined in step 4.  
8. To view the audit log, click the Audit Log button on the ribbon.  
9. Click Save.  

**Related Topics**  
- Add Email Addresses to Distribution Lists
Add Email Addresses to Distribution Lists

You can add email addresses to your distribution lists from the Distribution Lists editor. You can also copy and paste multiple addresses that are saved in another program, such as Microsoft Word, Excel, or Notepad. After the email addresses are added, new addresses can be included in distribution lists.

1. On the Distribution Lists editor, click Import.
   The Import Email Addresses window opens.
2. Do one of the following:
   o Enter the email addresses you want to add.
   o Copy and paste multiple email addresses from another program.

   | Note: Each address must appear on a single line followed by a return.

3. To include first and last names along with an email address, you must type that information (on a single line followed by a return) in the following order and format.
   <first name>, <last name>, <email address>
   For example, Lucy, Bauer, lucybauer@example.com
4. Click OK to add the email addresses to the distribution list.
   A message tells you that any changes made to distribution lists will be saved first and asks if you want to continue.
5. Click Yes.
   A Success window displays.
6. Click OK.

Best Practices for Sending Email

We follow key internal processes to protect the integrity of our hosted mail domains. In addition, we promote and enforce high standards of behavior among our customers who share resources in our multi-tenant hosting environment.

As an administrator, it is equally important to align your processes with the best practices described here to minimize the risk of interference with your email communication. Many external factors can impact the deliverability of email. Due to the vast amount of spam transmitted to consumers each day and the aggressive systems used to combat it, legitimate business emails are sometimes filtered without notice. In addition, customers who do not recognize the sender or contents of a valid message may regard it as spam, putting organizations at risk of having their addresses blocked by ISPs or email reputation management services.

| Note: The following practices apply only to mail sent from Service. |
Implement authentication—Organizations that send messages from branded domains should use a form of authentication to protect their reputations and delivery rates, while guarding against phishing scams and forged messages.

- **Sender Policy Framework**—Sender Policy Framework (SPF) is an email authentication option that designates permitted senders of email originating from your domain, excluding those with mismatched or incorrectly specified SPF records. If your email address was supplied by Oracle using custhelp.com or rnmk.com domains, SPF has been implemented for you and no further action is needed. Otherwise, see Answer ID 2489 on our support site for information about implementing SPF on your site.

- **DomainKeys/DomainKeys Identified Mail**—DomainKeys (DK) and DomainKeys Identified Mail (DKIM) are email authentication options that use cryptographic signatures to designate email as originating from an authorized email delivery provider, excluding messages sent from those with unsigned or incorrectly assigned signatures. If we supplied your email address using custhelp.com or rnmk.com domains, your emails are already signed by B2C Service and no further action is needed. Otherwise, see Answer ID 2701 on our support site for information about implementing DK and DKIM on your site.

Include your address and privacy policy—Edit your mail footers to include your business address and a link to your privacy policy. All emails governed by the CAN-SPAM law must contain the physical address or post office box of your organization. In addition, a link to your organization’s privacy policy explaining how profile information is used can build trust with your contacts. For information about editing your mail footers, see How the Message Templates Editor Works and How You Customize the Global Template.

Review invalid email addresses—Use reports to regularly monitor all contacts marked as invalid. A high percentage of invalid addresses indicates a need to reevaluate your contact record maintenance practices. In addition, the Invalid Email Address Domains report helps you check for contact email addresses from well-known domains that contain common typographical errors (such as “htomail.com” instead of “hotmail.com”). For information about creating and using reports, see Overview of Creating Basic Custom Reports.

Send from familiar addresses—Use easily identifiable email addresses in your mailbox configuration to help recipients recognize your organization as the sender. Do not include special (non-alphanumeric) characters, as they can cause filters to falsely identify the email as spam.

Refine the message subject—The subject line is the first part of your message that your contacts see, so it must be concise and informative. When responding to an incident, make sure the subject clearly states the topic being discussed. If a contact fails to enter a descriptive and accurate subject, consider modifying it for clarity.

Promote addition to address books—Ask contacts to add your email address to their address books. This reaffirms their interest and ensures consistent delivery of your messages to their inbox.

Avoid using content associated with spam—Do not use all caps, special characters, or certain words often associated with spam in incident responses, as these can register false positives in many spam filters.

Honor abuse complaints—Regularly monitor administration accounts, such as abuse@yourdomain.com or postmaster@yourdomain.com, and honor all abuse complaints as unsubscribe requests by opting out or disabling the associated contact record.

**Note:** The Answer Update notification message is one of several subscription-based notifications sent from Service and includes an unsubscribe link for each updated answer. If an answer matches multiple subscription criteria (for example, it was subscribed to by both answer ID and product), the message provides options to unsubscribe from each subscription type. In this way, a contact can unsubscribe from answers without assistance from your staff.
Message Templates

Overview of Message Templates

Message templates let you customize your administrator notifications, administrator emails, and contact emails for each interface.

You can customize your message content, enable and disable notifications and emails, as well as define the message format as HTML or text. Message templates also let you quickly apply your organization’s brand across all notifications and emails, including Service email.

**Note:** Staff members must have the Message Templates permission on the Administration tab of the Profiles editor in order to customize message templates. See [Administration Permissions](#).

How the Message Templates Editor Works

The Message Templates editor contains the global template and a set of system-generated messages.

Using an HTML editor similar to the HTML editors used to create content for mailings, surveys, and answers, you can edit the global template and the messages directly on the [Service Console](#). See [How the HTML Editor Works](#).

The global template contains the content that frames the message-specific content in each of your individual messages. Think of the global template as a wrapper for your entire set of notifications and emails. Using the HTML editor, you can standardize the design of your outgoing messages giving them all the same look and feel. For example, you can insert your organization’s logo in the header and your customer service information in the footer of the global template. When you are ready to deploy your global template, your brand can be applied to a single message or across all of your messages.

This image shows the global template open on the Message Templates editor.
The system-generated messages are sent to staff and contacts to support activities and events occurring throughout the system. Using an HTML editor, you can personalize your email subject lines to tailor your message to different audiences with advanced editing. You can also insert links that appear as clickable text and use merge fields to customize each message. The tools that display on the HTML editor are context-sensitive and are the logical tools you would use for the specific message you are customizing.

Additionally, you can edit multiple messages at the same time, which is especially useful if you want to compare similar messages or if you work with more than one interface. Each time you edit a message template, it opens on a subtab, making it easy to move between different message templates.

This image shows the Incident Closed message template open on a subtab. The different types of context-sensitive tools and links included on this specific message template are highlighted.

Message Templates Ribbon

The message templates ribbon contains buttons for accessing the individual system-generated messages and for working with the global template. You can view the live global template, edit and deploy the global template, and deploy the entire set of messages and the global templates across all interfaces at the same time.

**Note:** The buttons on the message templates ribbon are inactive until you select the interface you want to customize.

Some buttons apply only to the global template while others apply to the system-generated messages. Those differences as well as the buttons available on the message templates ribbon are described in this table.

</table>
### Group/Button | Description
--- | ---
Design | Click this button to set the global template and the messages to open in design mode on the HTML editor. This is the default mode.
Source | Click this button to set the global template and the messages to show the source code on the HTML editor.
Proofing | 
Spelling | Click this button to spell check the global template.
Deploy | 
Deploy All | Click this button to deploy the global templates as well as the entire set of messages across all interfaces at the same time.

**Note:** You must save after clicking the Deploy All button to commit your edits to the database.

### Message Templates Subtabs

Managing multiple message templates across multiple interfaces is easy through the use of content pane subtabs.

Using the Message Templates editor, you can work with multiple templates at the same time, which is especially useful if you want to compare similar messages or if you work with more than one interface. In addition, you can also move to other areas of B2C Service without needing to close your message templates. For instance, say you need to open an incident while you are editing your message templates. There is no need to close the message templates you are working on because you can move to your incident workspace and come back to your message templates when you are ready. Here's how they work.

When you open a message template, the Home tab displays as does the tab for the message template. Both tabs appear below the Message Templates editor content pane tab and are called subtabs. This image shows the Incident Solved message template for two separate interfaces, each one open on its own subtab.
Notice the number in parentheses on the Message Templates editor tab. This identifies the number of subtabs you currently have open (in this case, the number 3 represents the Home subtab and two Incident Solved subtabs).

You’ll use the Home subtab when you want to return to the Message Templates main editor to open other templates or the global template. As shown in this image, clicking the Home subtab displays the interfaces you have available on the left and a list of categories for the message type (administrator notifications, administrator emails, contact emails, or print pages) displays on the right. From here you can select a template to open or click a button on the Show group of the ribbon to change the message type.

If you want to edit the global template, click the Home subtab, click the applicable interface on the left, and click the Edit Template button on the ribbon as shown in this image.
Note: Because each interface has its own global template, you cannot edit more than one global template at the same time.

As shown in the image, each message template subtab contains buttons that correspond to the buttons on the Editor group of the Message ribbon: OK, Cancel, and Undock. All subtabs, except for the Home subtab, contain these buttons for taking actions on the individual message templates. From the active subtab (or when you hover over an inactive subtab), these buttons let you save and cancel your changes as well as undock your message template without needing to use the ribbon buttons. Hovering over a subtab also shows a tooltip that includes the name of the message, interface, and the last updated and deployed dates.

- **OK**—Clicking this button accepts the changes you have made and closes the subtab. However, it does not save changes to the database until you click the Save or Save and Close button on the message templates ribbon.
- **Cancel**—Clicking this button closes the subtab if you haven’t made changes to the message template. If you have made changes, a message asks if you want to save your changes.
- **Undock**—Clicking this button undocks the message template from the editor and opens it in its own window. To redock the message to the editor, click the Dock to Console button on the window ribbon.

How You Customize the Global Template

The global template contains the content that frames the message-specific content in your individual messages. You can standardize the look of your messages by inserting your own logo. You can also customize your headers and footers to display information that needs to be communicated in all of your messages.
Note: Because each interface has its own global template, you cannot edit more than one global template at the same time.

In the middle of the HTML editor for the global template are two placeholders—one is an image placeholder and the other is a placeholder for the message-specific content. You can insert HTML above and below the placeholders. The global template, like all messages, is interface specific.

Tip: Since the system default global template cannot be restored from the Message Templates editor, we recommend that you copy and paste the original template HTML into a text file, such as Notepad, in case you need it at a later time. You can do this from the Source tab on the HTML editor.

Edit the Global Template

You can edit the global template to customize the content that frames the message-specific content in each of your individual messages.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click Message Templates. The Message Templates editor opens.
3. Select the interface you want to customize. By default, the categories for administrator notifications display on the right.
4. Click Edit Template on the ribbon. The global template for the interface you selected opens.
5. To insert your logo or another image, double-click the image placeholder to the right of the content placeholder. The Image Editor window opens. See Insert an Image.
6. To edit the global template using the hyperlinks, buttons, and other features available on the HTML editor, use the HTML editor. See How You Add HTML in Design Mode.
7. To customize your header and footer content, enter above or below the placeholders.
8. To discard your pending changes and revert to the most recently saved global template, click Refresh on the ribbon.
9. To see the currently deployed template, click View Live Template on the ribbon. The content pane refreshes to display the version of the global template that is currently applied to all notifications and messages.
10. To spell check the global template, click Spelling on the ribbon.
11. To preview your changes to the global template, click the Preview tab at the bottom of the HTML editor.
12. Click Save on the ribbon to save your edits to the global template.

At this point, your changes are not active because they have not been deployed or committed to the database. See How You Deploy the Global Template.
How You Deploy the Global Template

When you deploy the global template, you copy the version you are currently editing to the version that is sent throughout the system to the entire set of messages.

After you deploy, you still have the option to make changes to your global template because you have not committed anything to the database. It is also true at this point that you can no longer view the active version of the global template. After you save, your deployed version is the only one you can see.

To make your deployed version active, you must commit your changes to the database by saving after you deploy. It is only after you have saved your deployment that your global template changes are active and are also applied to the entire set of active messages.

**Note:** Because each interface has its own global template, you cannot edit more than one global template at the same time.

Deploy the Global Template

If you’ve made changes to your global template but have not changed any of your individual messages, the global template is all you need to deploy.

1. After saving changes to the global template, click **Deploy Template**.
   A message asks you to confirm your decision to deploy.
2. Click **OK**.
   Your deployed version is copied to the version that is sent throughout the system.
   
   **Note:** At this point, if you click View Live Template, the version you are editing displays. Likewise, if you open any of your messages, your edited version has been applied, but it has yet to be committed to the database.
3. Click **Save** to commit your deployed version to the database.

Now, your deployed version is your active global template and is applied to your entire set of active messages.

Deploy the Global Template and the Messages at the Same Time

If you’ve made changes to both your global template and any of your individual messages, you can deploy everything at the same time.

1. After saving changes to the global template, click **Deploy All**.
   A message asks you to confirm your decision to deploy the global template as well as all of your messages.
   
   **Note:** Deploy All applies to the global templates and messages across all interfaces.
2. Click **OK**.
   Your deployed version is copied to the version that is sent throughout the system and the Last Deployed labels on all of your messages display “Pending...” under the message descriptions. However, neither your deployed global template nor your messages are active at this point.
3. Click **Save** to commit your deployed version and all of your messages to the database.

Now, your deployed version is your active global template and is applied to your entire set of messages. Your deployed messages are also active.
How You Customize Messages

B2C Service provides a variety of system-generated messages that are sent to staff members and contacts to support activities and events occurring throughout the system.

All messages are enabled by default, but you can disable messages that you don’t need. You can also define the message format (HTML or text) as well as edit and deploy a single message or all messages.

**Tip:** Remember to use the global template to apply your organization’s branding across all your messages.

At the top of most message templates is a subject line that you can customize to tailor your message to different audiences. You can also add *merge fields* and conditions to your subject line to further personalize your subject.

**Note:** There are certain message templates that do not contain a subject line, such as those that forward emails and print templates as well as the Survey Proof and Send Quote templates.

Messages open with standard HTML editor tools such as links that appear as clickable and dynamic content, including *case sections*, *conditional sections*, *incident threads*, and merge fields and reports. Tools that display on the HTML editor are context-sensitive and are the logical tools you would use for the type of message you are customizing. For complete details on how to use these context-sensitive tools in messages, see *How You Add HTML in Design Mode*.

**Message Types**

The buttons on the Show group of the message templates ribbon can be used to switch between the different types of messages that are available, including administrator notifications, administrator email messages, and contact email messages.

**Administrator Notifications**—B2C Service can send automatic notifications to alert staff members of key events such as incident escalations, answer, task and opportunity assignments, mailing completions, and system errors. You can also send custom broadcast notifications containing short text messages from the Notifications component on the agent desktop. Staff members are alerted to new notifications through a toast and can view all their notifications from the Notifications component. When a notification is sent to staff members who are not logged in to B2C Service, a notification email is sent instructing them to log in to view the notification. See *Notifications*.

**Tip:** To send emails containing more information about the event that triggered a notification, you can select a detailed notification option from the Email Notifications menu on the Staff Accounts editor (see *Add or Edit a Staff Account*). Staff members can also set notification preferences in their personal settings (see *Change Your Personal Settings*).

**Administrator Emails**—Incident, opportunity, answer, and task information can be automatically emailed to staff members by business rules or forwarded manually. Contact, organization, and asset information can be forwarded manually. Staff members can also be sent automated account assistance emails if they have difficulty logging in.

**Contact Emails**—Customers can receive a broad range of email messages supporting their activities on your site, such as incident receipts and responses, answer and community update subscriptions, and account assistance requests.
Links and Dynamic Content Elements

B2C Service contains an HTML editor for creating dynamic content in messages. When you edit a message, you can use word processing functions to create HTML, as well as dynamic content, such as case sections, conditional sections, or incident threads.

You can add several types of links and dynamic content to your content. Links appear as clickable text when the document is used in a message. When a link is added, you have the option of defining certain attributes depending on the type of link. Links and dynamic content elements are located in the toolbox.

**Note:** The tools that display on the HTML editor are context sensitive and are the logical tools you would use for the specific message you are customizing. Links and dynamic content that were designed with message templates in mind are described in the following table. For a complete list of links, including those not listed in the following table, see the Toolbox Section table in *How You Add HTML in Design Mode*.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Links</td>
<td>Buttons in this section are used to insert the available context-sensitive links in your message content.</td>
</tr>
<tr>
<td>Account Assistance Link</td>
<td>Inserts a link to the Account Assistance page on your customer portal where customers can request an email containing either their user name or a link to a page for resetting their password. See <a href="#">Insert an Account Assistance Link</a>.</td>
</tr>
<tr>
<td>Agent Browser UI Incident Link</td>
<td>Inserts a link to the incident that triggered the sent message so that agents can access the incident from the Agent Browser User Interface. See <a href="#">Insert an Agent Browser UI Incident Link</a>.</td>
</tr>
<tr>
<td>Answer Link</td>
<td>Inserts a link to any answer you specify. See <a href="#">Insert an Answer Link</a>.</td>
</tr>
<tr>
<td>Customer Portal Incident Link</td>
<td>Inserts a link to the incident that triggered the sent message. For example, the standard Question Receipt email sends a confirmation message after a customer submits a question through the Ask a Question page, an email, or a chat session. By adding a Customer Portal Incident Link to your Question Receipt message template, you can provide your customers with easy access to the incident created from their question. See <a href="#">Insert a Customer Portal Incident Link</a>.</td>
</tr>
<tr>
<td>Incident Link</td>
<td>Inserts a link to any incident you specify in the message. See <a href="#">Insert an Incident Link</a>.</td>
</tr>
<tr>
<td>Profile Link</td>
<td>Inserts a link to the Account Settings page on your customer portal where customers can change their user name and update their profile information. See <a href="#">Insert a Profile Link</a>.</td>
</tr>
<tr>
<td>Proof Comments Link</td>
<td>Inserts a link to a web page where the recipient can give feedback about the survey they have been asked to proofread. See <a href="#">Insert a Proof Comments Link</a>.</td>
</tr>
<tr>
<td>Proof Survey Link</td>
<td>Inserts a link to the survey you want your proofreaders to review. See <a href="#">Insert a Proof Survey Link</a>. This link is included, by default, on the Survey Proof message template.</td>
</tr>
<tr>
<td>Setup Password</td>
<td>Inserts a link to the Finish Account Creation page on your customer portal. See <a href="#">Insert a Setup Password Link</a>.</td>
</tr>
<tr>
<td>Button</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Survey Link</td>
<td>Inserts a link to a survey. See Insert a Survey Link.</td>
</tr>
<tr>
<td>Survey Results Link</td>
<td>Inserts a link to a web page that shows the survey responses. Insert a Survey Results Link. This link is included, by default, on the Survey Notification message template.</td>
</tr>
<tr>
<td>This Answer Link</td>
<td>Inserts a link to the incident that triggered the sent message. See Insert a This Answer Link.</td>
</tr>
<tr>
<td>This Discussion Link</td>
<td>Inserts a link to the email discussion that triggered the sent message. See Insert a This Discussion Link.</td>
</tr>
<tr>
<td>Unsubscribe All Answers Link</td>
<td>This button inserts a link that lets contacts who receive answer notifications unsubscribe from future communications. See Insert an Unsubscribe All Answers Link.</td>
</tr>
<tr>
<td>Unsubscribe This Answer Link</td>
<td>Inserts an unsubscribe link to a specific answer that’s been returned as the result of a repeatable answer section. See Insert a This Answer Link.</td>
</tr>
<tr>
<td>View Subscriptions Link</td>
<td>Inserts a link customers can use to update the list of notifications they are subscribed to. See Insert a View Subscriptions Link.</td>
</tr>
<tr>
<td>Dynamic Content</td>
<td>Buttons in this section are used to insert dynamic content in your message content.</td>
</tr>
<tr>
<td>Attached File List</td>
<td>Inserts a list of file attachment links that will display as long as attachments have been added to the record the template is referencing. See Print Templates. This button is available only for print templates.</td>
</tr>
<tr>
<td>Answer Section</td>
<td>Click this button to add any repeatable answer details on your answer update notification messages. See Insert an Answer Section.</td>
</tr>
<tr>
<td>Case Section</td>
<td>Click this button to add a case section to your conditional text. See Insert a Case Section.</td>
</tr>
<tr>
<td>Conditional Section</td>
<td>Inserts a conditional section that you can define to filter content by contact, profile, runtime variable, or record type. For example, you could add a conditional section that displays a coupon based on the product specified in the incident. See Insert a Conditional Section.</td>
</tr>
<tr>
<td>Incident Thread</td>
<td>Inserts an incident thread that displays all communication between the parties associated with the incident. See Insert an Incident Thread.</td>
</tr>
<tr>
<td>Merge Field</td>
<td>Inserts a merge field. See Insert a Text Merge Field.</td>
</tr>
<tr>
<td>Merge Report</td>
<td>Inserts a merge report. See Merge a Report into Content.</td>
</tr>
</tbody>
</table>
Print Templates

Standalone print templates are available for viewing records and items from the agent desktop as well as printing hard copies of incidents, answers, tasks, organizations, contacts, opportunities, quotes, and assets.

You can customize these templates to apply your organization’s brand, add dynamic content, and display any custom fields you may be using. In addition, print templates have been designed to include a list of file attachment links. As long as file attachments exist in the record that the print template references, then that list of attachment links will display. This is especially useful for agents who frequently reference answers. See Links and Dynamic Content Elements.

Display Sibling Answer File Attachments on the Answer Print Message Template

You can specify file attachment properties on the Answer Print message template so that sibling answers display any attachments included in the sibling answer. When sibling attachments are set to display, the attachment file names are listed when you print a hard copy.

Sibling answers must be enabled on the answer workspace for the list of sibling file attachments to display. See Sibling Answers and Options Properties. In addition, the Attached File List element is included by default on the Answer Print message template. If the Attached File List element has been removed, you must add it to the template before starting this procedure.

1. From the Answer Print message template, do one of the following:
   - Double-click the File Attachments List element.
   - Right-click the File Attachments List element and then select Attached File List Properties.

   The File Attachments List window opens.

2. Select Show Sibling Attachments.

3. Click OK.

4. Click Save.

   Note: You must deploy and commit your changes to the database before they will take effect. You must also log out and then log back in to see the changes on your site. See Deploy One Message.

Any sibling attachments associated to an answer display in the file attachments list on your Answer Print message template.

Message Ribbon

When you edit a message, it opens below the Message Templates editor content pane tab on its own subtab with its own ribbon.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Editor</td>
<td>When you undock a message template, the label for this group changes to Commit.</td>
</tr>

<td></td>
</tr>
<tr>
<td>Info</td>
<td>Hover over this button to see the message name and ID and the document ID associated with the message.</td>
</tr>
</tbody>
</table>

### Format Messages

By default, all B2C Service notifications and emails are enabled and sent in multipart format, which includes text and HTML versions of the same message in a single email. You can customize the format settings from the Message Templates editor.

You can disable most messages and you can specify the format as text only. The version that displays to recipients is ultimately determined by their mail client settings, but most mail clients display the HTML version by default.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, and then double-click **Message Templates**.
   The Message Templates editor opens.
3. Select the interface you want to customize.
   By default, the categories for administrator notifications display on the right.
4. Click the appropriate button on the ribbon Show group.
   The categories for the message type (administrator notifications, administrator emails, or contact emails) display on the right.
5. Click the arrow to the left of the category to see the individual notifications or emails associated with the category.
   Descriptions of each message as well as Last Deployed and Last Updated labels are listed under the category. Both labels show the date and time the latest deployment and edit was made. If a message has been edited but has not been deployed or if a deployment has not been committed to the database, the labels display “Pending...” instead of the date and time.
6. To disable any of the messages, clear the **Send** check box next to the message. By default, all messages are enabled.
Note: Messages that do not have a Send check box cannot be disabled because they support essential functions.

7. To send the message as text, clear the HTML check box next to the message to be sent. By default, all messages are sent in multipart format.
   Messages that do not have an HTML check box are console-only notifications and are not sent by email.

8. Click Save.

How Message Editing Works

When you open a message to edit, the system maintains the active message while you edit a copy on the message window. Your changes are not committed until you deploy and save them. This prevents any disruption in automatic notifications and emails during the editing process.

Because you are making edits to a copy of your message, the active content on your site is not affected until you are confident in your changes and ready to deploy them. In case you make any accidental changes while editing, you can restore your message by reverting to the original system default message at any time.

You can also view your active content so that you can copy and paste it into the version you are working on. For instance, suppose you have made changes to your edited version and then want to go back to some of the elements used in your active version. This feature lets you see a read-only version of the active content that you can copy and paste into your working message.

Tip: Remember to use the global template to apply your organization's branding across all your messages. See How You Customize the Global Template.

Edit a Message

Your individual messages can be edited using the Message Templates editor.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click Message Templates.
   The Message Templates editor opens.
3. Select the interface you want to customize.
   By default, the categories for administrator notifications display on the right.
4. Click the appropriate button on the ribbon Show group.
   The categories for the message type (administrator notifications, administrator emails, contact emails, or print templates) display on the right.
5. Click the arrow to the left of the category to see the individual notifications or emails associated with the category.
6. Click Edit to the right of the HTML check box for the message you want to customize.
   The message opens on a subtab and becomes the active subtab.
7. To edit the subject of the message, enter in the Subject field.
   For the best practice on creating effective subject lines, see Ensuring that contacts read your message.
8. To edit a merge field in the subject, double-click the merge field. See Insert a Text Merge Field.
9. To add a merge field in the subject, click the Merge Field icon (to the right of the Subject field) and select the field.
**Tip:** You can add up to 5 merge fields to your subject line with a maximum of 400 total characters. However, remember that the best subject lines are simple, descriptive, and to the point. Also keep in mind that email clients have their own limits on the maximum number of characters allowed in subject lines. Being aware of these limits will help you determine the best subject line length for your message. You cannot add merge fields to the subject of print templates or any of the forward-type messages.

10. To add conditional subject lines to your message, click **Advanced** to the right of the Merge Field icon next to the Subject field and see **Add a Conditional Subject Line**.
11. Enter in the content placeholder (which is designated by the area inside the red box), and edit the message using the hyperlinks, buttons, dynamic content, and other features available on the HTML editor. See **How You Add HTML in Design Mode**.
12. To view your most recently deployed content, click **Live**.
13. To revert to the system default message, click **Restore**.
14. To remove the global template from your message, click **Template**. If you click Template again, the global template is reapplied to your message.
15. To spell check your content, click **Spelling**.
16. To preview your message, click the **Preview** tab at the bottom of the HTML editor.
17. To see how your dynamic content displays, either by incident or contact, click the **Search** icon next to the Preview Incident or Preview Contact field.
   The **Search** window opens where you can search for an incident or a contact to use when the message is previewed on the Preview tab.
18. To send your edited message to another staff member for review, click **Proof** on the ribbon.
19. Click **OK** on the ribbon to save your edits and close the message.

At this point, your changes are not active because they have not been deployed or committed to the database. See **How You Deploy the Global Template**.

### Add a Conditional Subject Line

You can personalize your email subject lines to tailor your message to different audiences with advanced subject editing.

For example, you can change the subject line dynamically based on characteristics such as product, category, or custom field. In addition to the default subject line, you can add up to ten conditional subject lines to each message template.

List your additional subjects in order of importance because the first one that matches will define the subject line of the message. If no conditions are met, the default subject line is used. (The default subject line will always be listed last.)

**Note:** There are certain message templates that do not contain a subject line, such as those that forward emails and print templates as well as the Survey Proof and Send Quote templates. Therefore, you cannot add conditional subject lines to these messages.

1. From an open message template, click **Advanced** to the right of the Merge Field icon next to the Subject field.
   The **Advanced Subject** window opens.
   **Tip:** In addition to the default subject line, you can add up to ten conditional subject lines (for a total of eleven) to each message template.
2. Click **Add Subject**.
   The **Subject Condition** window opens.
3. Select the appropriate option for the type of condition you are adding.
   The available options are context-sensitive and depend on the type of message template you are editing. Options can include Associated Contact, Recipient Profile, or Associated Record.
4. Select a segment, profile, or record type for the condition. When defining an associated record condition, you will also need to define an operator type and value.

Notice how the Title field populates based on your selection. This field populates only if you have not already typed a title.

5. To change the title populated in the previous step, enter the title as you want it to appear in the Title field.

6. Click OK to insert the subject.

Each new subject line is added above the default subject line.

7. To add another subject line, repeat the applicable steps starting at step 2.

8. To edit the subject line so that it reads the way you want it to, remove the default subject line from the field in the Subject column and enter the subject the way you want it to display to your customers.

9. To add merge fields to your additional subject lines, click the Merge Field icon next to the Subject field. See Insert a Text Merge Field.

You can add up to five merge fields to your subject line with a maximum of 400 total characters.

10. To edit any merge fields, right-click the merge field and select Merge Field Properties.

11. To edit a condition, click Edit in the Actions column and make any necessary changes to your condition.

12. To remove a condition, click Remove in the Actions column.

13. To reorder your additional subject lines, select the subject line you want to move and click the up or down arrow next to the Action column.

The default subject is always last. Therefore, you need to have more than two additional subject lines defined for the up and down arrows to be available.

14. To preview your subject lines, click the Preview tab.

Tip: This is a great way to efficiently test your default subject line and any advanced subjects without the hassle of manually sending proof emails to yourself. Simply preview by applying the appropriate record that will be used by each subject.

15. Click OK.

The Subject field is now labeled Conditional Subject and is uneditable. After you add conditional subject lines to your message, you must use the advanced editing feature to make changes.

Proof Messages

When you are finished editing your message, you can send a proof to key staff for feedback on your design. For instance, you may need your legal department to review language or your marketing department to review branding.

You can also customize your proof for a specific incident or contact to ensure that your dynamic content works the way you intend it to.

Note: This feature sends the most recently saved version of your message. Therefore, you must save your edits to send a proof of the message you are working on.

Save works differently depending on whether you are working from a subtab or an undocked message. Therefore, the procedures differ slightly.

Send a Proof Message from a Subtab

When you are finished editing your message, it's a good idea to send a proof to key staff for feedback on your design. For instance, you may need your legal department to review your language or your marketing department to review your branding.

Save works differently depending on whether you are working from a subtab or an undocked message. Therefore, the procedures differ slightly. If you are sending a proof message from an undocked message, see Send a Proof Message from an Undocked Message.
Note: This feature sends the most recently saved version of your message. Therefore, you must save your edits to send a proof of the message you are working on.

1. Click the subtab for the message you want to send and then click **Save** on the ribbon.
2. Click **Proof**.
   A message tells you to save and reopen your message. However, because you have already saved, you can continue with step 3.
3. Click **OK**.
   The **Send Message Proof** window opens.
4. Enter the email addresses of your reviewers in the address fields or click one of the buttons to select reviewers from a list.
5. To include any comments you want to appear in the message, enter them in the **Comment** text box.
6. To customize your proof message so that your reviewers can see your dynamic content, click the **Search** icon next to the Customize Proof field on the bottom of the window. Depending on the message you are editing, either the Incident Search window or the Contact Search window opens.
   a. To customize your proof message by incident, enter the incident reference number in the **Reference #** field and click **Search**. The Incident Search window closes and the reference number populates the Customize Proof field on the Send Message Proof window.
   
      Tip: You can also enter part of a reference number in the Reference # field. A list of incidents that match your search criteria displays in the grid below the Reference # field. You can then select a reference number and click the Select button. The Incident Search window closes and the reference number you selected populates the Customize Proof field on the Send Message Proof window.
   
   b. To customize your proof message by contact record, enter your search criteria in one or more of the available fields and click **Search**. A list of contacts that match your search criteria displays in the grid below the search criteria fields. You can then select a contact and click **Select**.
   
      The Contact Search window closes and the contact name you selected populates the Customize Proof field on the Send Message Proof window.

7. Click **Send**.

Send a Proof Message from an Undocked Message
When you are finished editing your message, it's a good idea to send a proof to key staff for feedback on your design. For instance, you may need your legal department to review your language or your marketing department to review your branding.

Save works differently depending on whether you are working from a subtab or an undocked message. Therefore, the procedures differ slightly. If you are sending a proof message from a subtab, see *Send a Proof Message from a Subtab*.

Note: This feature sends the most recently saved version of your message. Therefore, you must save your edits to send a proof of the message you are working on.

1. Click **OK** on the message ribbon.
   Your message closes.

   Note: Because the system sends the most recently saved version of your message and there is no Save button on the message ribbon, you must save your edits from the message templates ribbon in order to send a proof of the message you are working on.

2. Click **Save** on the message templates ribbon.
3. Click **Edit** to the right of the HTML check box for the message you were editing.
The message opens on a subtab.

4. Click **Proof**.
   
   The **Send Message Proof** window opens.

5. Enter the email addresses of your reviewers in the address fields or click one of the buttons to select reviewers from a list.

6. To include any comments you want to appear in the message, enter them in the **Comment** text box.

7. To customize your proof message so that your reviewers can see your dynamic content, click the **Search** icon next to the Customize Proof field on the bottom of the window. Depending on the message you are editing, either the Incident Search window or the Contact Search window opens.
   
   a. To customize your proof message by incident, enter the incident reference number in the **Reference #** field and click **Search**. The Incident Search window closes and the reference number populates the Customize Proof field on the Send Message Proof window.

   **Tip:** You can also enter part of a reference number in the Reference # field. A list of incidents that match your search criteria displays in the grid below the Reference # field. You can then select a reference number and click the Select button. The Incident Search window closes and the reference number you selected populates the Customize Proof field on the Send Message Proof window.

   b. To customize your proof message by contact record, enter your search criteria in one or more of the available fields and click **Search**. A list of contacts that match your search criteria displays in the grid below the search criteria fields. You can then select a contact and click **Select**.

   The Contact Search window closes and the contact name you selected populates the Customize Proof field on the Send Message Proof window.

8. Click **Send**.

**How You Deploy Messages**

To make your changes live, you must deploy and then commit your changes to the database.

There are three ways to deploy your messages.

- Click **Deploy** next to the message on the Home subtab.
- Click the **Deploy** button on the message ribbon.
- Click the **Deploy All** button on the message templates ribbon or the message ribbon.

This image shows the Deploy All button on the message templates ribbon as well as the Deploy link next to the messages on the Home subtab.
This image shows the Deploy All button and the Deploy button on the message ribbon.

The order in which you choose to deploy depends on several things. If you are editing only one message, it’s probably most efficient to click Deploy on the message ribbon as soon as you have finished making your changes.

If you are editing several messages, you can save your changes as you make them by clicking the Save button on the message ribbon. When you are finished with all of your message edits, you can click the Deploy All button, and then click the Save button on the ribbon to commit all of your messages at the same time. Deploying all also applies to the global templates (across all interfaces) for all your messages unless you have chosen to remove it within your individual messages. This method eliminates the need for you to respond to the confirmation message that opens each time you deploy from an individual message.

**Tip:** You can always go back to the system default message by opening your message and clicking Restore on the ribbon.

**Deploy One Message**
You must deploy your message to make your changes active.

1. Click **Deploy** on the ribbon.
   A message asks you to confirm your decision to deploy.
2. Click **OK** to continue.
3. Click **OK** on the ribbon.
   The subtab or editor closes depending on whether you are working from a docked or undocked message.
4. Click **Save** on the ribbon to commit your deployment.

Your deployed version is now active.

**Deploy Multiple Messages at the Same Time**
You must deploy your messages to make your changes active.

This procedure assumes you have edited more than one message and have saved your changes.

1. Click **Deploy All** button on the ribbon.
   A message asks you to confirm your decision to deploy all messages as well as the global template.

   **Note:** Deploy All applies to the global templates and messages across all interfaces.

2. Click **OK** to confirm.
3. Click **Save** on the ribbon to commit all your deployments to the database.
Your deployed versions are now active and all of the message labels display the same date and time.

## Incident Response Tracking

Incident response tracking lets you see how customers react to interactions they have with your agents. This helps improve customer support because you can see if your customers are using the information you send them.

For instance, suppose you are sending 500 emails a week. Incident response tracking can show you how many of those emails are opened and how many links are clicked that result in a visit to your customer portal.

In addition, incident response tracking is effective in helping you evaluate aspects of your customer experience solution, including the quality of your agent responses. Not only can you see the actions contacts take before submitting an incident, but you can also track what happens after submitting an incident. For example, suppose your agent sends an answer link in response to a contact's question. If the contact clicks the link, you can see every action the contact takes on your customer portal.

Simply stated, message templates track customer-facing incident responses, which lets you see activity related to the following contact email messages.

- **Question Receipt**—This email is sent to contacts to confirm the receipt of their question from the Ask a Question page, an email, or a chat session.
- **Rule Email**—This email is sent to a contact when the Send Response action is triggered by a business rule.
- **Incident Closed**—This email is sent to a contact when an *incident status* changes to Solved.
- **Incident Solved**—This email is sent to a contact when a staff member responds to the incident and the incident status is Solved.
- **Incident Waiting**—This email is sent to a contact when a staff member responds to the incident and the incident status is Waiting.
- **Incident Unresolved**—This email is sent to a contact when a staff member responds to the incident and the incident status is Unresolved.

You can track how often these incident response emails are viewed as well as how customers use the information that you provide in your response, such as viewed answers, clicked links, and customer portal pages that were accessed. Only unique views and clicks are tracked so you can be confident that your statistics are accurate. This also helps to keep stored data manageable.

You can also use tracked links in your messages to automatically track your hyperlinks. Before you can insert tracked links into your message content, you need to add them to your system. For complete details and procedures on adding tracked links to your system, and then inserting tracked links from the HTML editor, see *Add a Tracked Link* and *Insert a Tracked Link*.

Incident response tracking data is accessed through standard reports located in public reports which are accessed either from the Reports Explorer or from the Customize List window (accessed by clicking the Gear icon on your navigation list). Statistics used for this report are stored in the Message Transactions (*message_trans*) table. For a description of the information logged in the Message Transactions table, see the Data Dictionary located on the navigation pane (*Configuration > Database > Data Dictionary*).
Note: The configuration setting MESSAGE_TEMPLATES_PURGE_DAYS defines how long data in the Message Transactions (message_trans) table is stored. By default, data is removed after 400 days. This ensures that your database tables stay at a manageable size. You can change the value of this setting using the Configuration Settings editor, accessed from the navigation pane (Configuration > Site Configuration > Configuration Settings). From the Configuration Settings editor, the setting is located in RightNow Common/Message Templates/General. See How You Customize Configuration Settings.

- **Incident Message Statistics**—This report provides statistics comparing the number of incident responses sent and the number that contacts viewed over time. (Public Reports/Service/Incident Reports/Incident Activity)

- **Incident Message Transactions**—This report was designed to be added to an incident workspace. It provides statistics on runtime activity, such as message content, date and time of incident creation, message type (answer or tracked link), and if a customer portal session resulted from any contact interaction. (Public Reports/Service/Views/Service/Editor Reports - Service)

- **Incident Message Web Visit Details**—This report maps the incident that triggers the email as well as the customer portal session that results from a contact clicking a link in an email. It is inherently related to the Incident Message Transactions report because the runtime filter it requires is a web visit ID. (Public Reports/Service/Views/Service/Editor Reports - Service)

**Examples of Message Templates**

This set of examples includes scenarios where message templates can be used to accomplish more advanced and specific needs.

- Define Conditional Content Based on Message Thread Count
- When to Use Case Sections vs. Conditional Sections
- Apply Product-Specific Logos

**Define Conditional Content Based on Message Thread Count**

In addition to limiting the thread count on your incident thread properties, this example shows you how to display content based on the number of threads that are included within the sent message.

For example, if you set your message thread count to be greater than ten, when the number of threads included with the message exceeds ten, you could create a conditional section based on this message thread count threshold with content telling your customers to call the customer support team for a faster resolution.

**Note:** Keep in mind that if you have already limited the thread count in your incident thread properties, this also affects the number of threads that display. For example, if you limit your thread count to three, you'll need to make sure any conditional sections based on this message thread count do not exceed three. In other words, if you create a conditional section based on four threads and you limit the number of message threads to three, the condition will never match because the incident thread count limit will keep the message from reaching the value of four threads. See Insert an Incident Thread.

1. Add a conditional section or a case section to your message template.
2. Select **Associated Record**.
3. Expand the Special Fields folder and select **Message Thread Count**.
4. Select an operator from the **Operator** drop-down menu.
5. Enter a value for the operator in the **Value** field.
6. Click **OK** to add the logic to your conditional content.
   At this point, you’ve defined only the If condition. Next, you need to define the content that will display.
7. Place your cursor inside the condition you just added and enter the content you want to display when the condition value is matched.

The following image shows the Case Section with the conditional content “Please call us to resolve your issue.” set to display when the message thread count is greater than ten.

When to Use Case Sections vs. Conditional Sections

Understanding when to use a case section instead of an independent conditional section is important in making your content as effective as it can possibly be. These examples describe scenarios that put the best option to use.

Understanding the difference between case sections and independent conditional sections is essential to be sure your conditional content works the way you expect. Simply stated, a case section shows one, and only one, condition out of a group of conditions. This makes case statements a great tool for setting up OR statements. In contrast, a conditional section can be used to show one or more conditions at the same time. Which one to use depends entirely on your goal.

**Show or hide one section**—Let’s say you want to show a toll-free support number to customers in the U.S. In a straightforward scenario such as this, when the answer is either “yes” or “no,” a simple conditional section does the job. Just define the content you want to display for your single condition and when it matches, your content displays. When the condition does not match, nothing displays.

**Show more than one section**—In another scenario, you might want to show a toll-free support number to U.S. customers and a list of store locations to customers in Colorado. You can do this by defining two conditional sections—one showing the phone number based on country and another showing locations based on state. For customers who live in Colorado, both the toll-free number and the store locations will display.

**Show 1 of 2 sections**—If you would rather list only store locations for customers in Colorado and show a toll-free support number to other customers, but you don’t want to show both, this is where a case section comes in handy. In your conditional section, list the locations and define your condition based on state. In the default section, define the toll-free number. For customers with a Colorado address, only the locations display. For all other customers, the phone number displays.

**Show 1 of 3 sections**—Building on the previous scenario, let’s define a case section with multiple conditions where your default section will show an international number to customers living outside of the U.S. Again, you want to show only one condition to each segment of customers. Base the first condition on the state of Colorado, the second condition on the country being the U.S., and define the international number in the default section. Remember, in a case section, the first condition that matches is the only one that displays.
In action, here’s how the last scenario plays out.

- If the contact record indicates a Colorado address, the store locations display.
- If the contact record indicates a U.S. address outside of Colorado, the second condition matches and the toll-free U.S. number displays.
- If the contact record has no address or if it does not match Colorado or U.S., the international number you defined for the default section displays.

**Note:** If you do not define the default section and the first two conditions do not match any criteria, nothing displays.

### Apply Product-Specific Logos

This example shows you how to use case sections and conditional sections to brand your message templates based on products within the same interface.

For instance, say you have one interface that represents two separate brands—each one with its own logo. You’ve already defined each brand as its own product. Now, you want your customer-facing message templates to display the correct logo depending on which product the message refers to. If you had a separate interface for each brand, the global template could be used to apply the same branding across the entire interface. However, since you have only one interface, the global template will not work because it is applied across all messages per interface. Therefore, you must remove the global template from the individual message templates and then use case and conditional sections to display the appropriate logo based on product.

Most likely, you’ll want to focus this effort on the customer-facing, incident-related message templates, although any of the messages found in the Contact Emails message type should be considered. In some cases, taking a more generic approach in which the global template could be used might make more sense.

1. From an open message template, click **Template** on the ribbon. This action removes the global template from the message template.
2. Insert your cursor where you want your logo to display and click **Case Section** in the toolbox. A case section is inserted in the message template.
3. Select the conditional section inside the case section, right-click, and select **Conditional Section Properties**. The **Conditional Section** window opens.
   a. Select **Associated Record**.
   b. In the Record section, expand the Incident Fields folder and select **Product**.
   c. Select **Equals** from the **Operator** drop-down menu.
   d. Select the product you want associated with this conditional section from the **Value** drop-down menu.
   e. Click **OK**.
4. Right-click inside the case section and select **Add Conditional Section**.
5. Repeat steps 3a-3d to define the condition for your second product.
6. Click inside the first conditional section and click Image in the toolbox. The **Image Editor** window opens.
   a. Enter the URL where the logo you want to display for this product is located.
   b. Click **OK**.
7. Repeat step 6 for the second conditional section.
   **Note:** Leave the Default section blank (do not delete it). This way, if the product is unknown, then no image will display.
8. Click **Save**.
9. Repeat steps 1-8 for each message template you want to apply different logos to.
Tip: After you define the first case section, you can easily select the case section, copy it, and then paste it into your other message templates.

At this point, your changes are not active because they have not been deployed or committed to the database. See *How You Deploy the Global Template*.

## Data Import

### Overview of Data Import

With data import features, you can add new contacts, answers, assets, incidents, organizations, and custom objects to your Oracle database from a data file.

For example, you can import lists of prospects or recently acquired customers into your knowledge base as new contacts or update existing answers to keep your database synchronized with an external knowledge base.

You can also import configuration setting values and message base text values that you have edited from the Configuration Settings and Message Bases editors. For example, suppose you want to create a site in another language and need to make changes to your text labels. You can create a CSV (comma-separated value) file that includes all of your message base text and do a global search and replace. Then, using the Data Import Wizard, import your file and your changes will be made to the message bases. For complete details and procedures about the Configuration Settings and Message Bases editors, see *Overview of Site Configuration*.

Additionally, you can import custom configuration setting and message base metadata into other sites. This can save time, especially when you have large numbers of custom settings and message bases.

B2C Service provides the following import features.

- **Data Import Wizard**—Use the powerful import wizard to map the data file to columns in the Oracle database and prescan the file for problems, such as duplicate records or invalid email addresses. After an import, you can run external events or business rules on the imported records. You can also add contacts to a mailing list or use them to initiate a campaign.

- **Data import templates**—For imports that you want to perform more than once, you can create column mapping templates that can be selected when importing data with the wizard.

- **Data imports reporting**—View the Data Imports report to track information about past imports.

**Note:** In order to access the Data Import Wizard and template editor, staff members must have the Data Import permission in their profile. A staff member with this profile permission can import any of the supported record types, even if the staff member’s only responsibility is to import contact data for marketing purposes. See *Administration Permissions*.
How Data Import Works

To import data, you need a data file containing the information you want to import. The most commonly used file format is CSV (comma-separated value), but delimiters other than commas can also be specified.

In addition to importing data to the primary table of a supported record type, you can map data to certain database fields in associated tables. For example, when importing data to the Incidents (incidents) table, you can map columns to the Threads (threads) table to create customer proxy or note threads associated with each incident.

The data import features are designed to import specific data sets into the knowledge base, not to support full data migrations. You should be aware of the following restrictions when preparing an import.

- If Service is disabled, answer, asset, and incident record types are not available for import.
- The maximum number of fields that can be mapped is 50.
- Associated table mapping is applied only when the import creates new records. Such mapping is ignored when existing records are updated by the import.
- Only certain values can be mapped to the associated tables of a record. For example, you cannot map a value for the threads.entered field. This value is set to the date and time the import occurred.
- The Products and Categories fields are not available for mapping to answers. If you want to associate imported answers with products or categories, you must update them manually from within B2C Service.

Import Data

You can add new contacts, answers, assets, incidents, organizations, and custom objects to your Oracle database by using the Data Import Wizard.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Data Import Wizard**.
   The Data Import Wizard opens.
3. Enter field information.

<table>
<thead>
<tr>

</tbody>
</table>
| Config Base Value       | Select this option to designate configuration setting value data as the type of record you want to import. Configuration base value records are essentially the “child” records of configuration base entries. The following fields are required in the Column in File and Field columns for mapping to work. Other columns may also be required depending on the data types of the configuration settings you are importing.  
ID = Configuration Entry ID *(configbase_entry_id)*  
Key = Configuration Base ID *(configbase_id)*  
Value = Configuration Value *(value)*  
**Prerequisite:** You cannot create a configuration base value unless you have a configuration base entry to map it to. Therefore, you must create a configuration base entry before you can create a configuration base value. |
| Contact                 | Select this option to designate contact data as the type of record you want to import. This is the default record type.                                                                                     |
| Incident                | Select this option to designate incident data as the type of record you want to import.                                                                                                                     |
| Message Base Entry      | Select this option to designate message base data as the type of record you want to import. For example, you can create a CSV file that includes your custom message bases and then import the file to your other sites. The following fields are required in the Column in File and Field columns for mapping to work.  
Key = Message Base Text Key *(entry_key)*  
Type = Message Base Entries Type *(type)*  
Maximum Length = Message Base Text Maximum Length *(max_length)*  
Text = Text *(text)*  
**Prerequisite:** You must create a message base entry before you can create message base text to go with it. |
<table>
<thead>
<tr>
<th>Field/Item</th>
<th>Description</th>
</tr>
</thead>
</table>
| Message Base Text   | Select this option to designate message base text data as the type of record you want to import. Message base text records are essentially the “child” records of message base entries. The following fields are required in the Column in File and Field columns for mapping to work.  
ID = Message Base Entry ID (msgbase_entry_id)  
Message Base = Message Base ID (msgbase_id)  
Custom Text = Message Base Custom Text (custom_text)  
**Prerequisite:** You cannot create a message base text unless you have a message base entry to map it to. Therefore, you must create a message base entry before you can create a message base text. |
| Organization        | Select this option to designate organization data as the type of record you want to import.                                                                                                                                                          |
| Custom Object       | Select this option to designate custom object data as the type of record you want to import. Custom objects must be enabled for this option to display. To enable custom objects, contact your Oracle account manager. |
| **Data File**       | Click Browse to the right of the field to access the file containing the data you want to import. Windows/MS-DOS format is the only supported CSV file type.  
The maximum number of fields that can be mapped is 50.                                                                                       |
| **Header Location** | Click this drop-down menu to select the location of the column headers that identify the contents of the data file.                                                                                                                                     |
| First Line of Data File | Select this option if the column headers are located in the first row of the data file.                                                                                                             |
| No Headers Specified | Select this option if there are no column headers defined for the data file.                                                                                                                                                                      |
| Header File         | Select this option if the column headers are located in a separate CSV file. The header file cannot contain fewer columns than the data file.                                                                                           |
| **Import Header File** | Click Browse to the right of the field to access the CSV file containing your header information. This field is active when Header File is selected from the Header Location drop-down menu.                   |
| Staging Directory   | Click Browse to the right of the field to select a location for staging the good and bad output files that are generated during the data prescan process. By default, the location                                                                 |

</tr>
<tr>
<td><strong>Delimiter</strong></td>
<td>Enter the character used to separate columns in the data file. The default delimiter is a comma. The tab character is not a supported delimiter.</td>
</tr>
</tbody>
</table>
### Field/Item | Description
---|---
**Stop Import on Error** | Select this check box to prevent any more records from being imported if an error is found during the import process. If this check box is not selected, the import continues despite any error, and only records without errors are imported. The check box is cleared by default.

**Run External Events** | Select this check box if you want external events to run against the data you are importing. The check box is cleared by default.

**Run Workflow Rules** | Select this check box if you want business rules to run against the data you are importing. The check box is selected by default.

4. Click **Next**. The content pane displays fields for defining column mapping and duplicate criteria as well as a preview of the records in the data file.

5. Enter field information.

### Field/Icon | Description
---|---
**File Encoding** | Click this drop-down menu to select the encoding type of the data file. The default encoding type is UTF8.

**Select Template** | Click this drop-down menu to select a previously saved template to use for mapping the data file columns to the database. See *Add or Edit a Data Import Template*. This menu lists only templates for the record type you are importing.

**Name** | Enter a template name and click Save As Template on the ribbon to save the current column mapping as a template. Click Clear to clear the field contents. The default delimiter is a comma. The template name must be unique for the record type, and the tab character is not a supported delimiter.

**Column Mappings** | This section defines how columns in the data file are mapped to fields in the database.

**Add** | Click this icon to create a new row in the column mapping grid.

**Remove** | Click this icon to remove a selected row from the mapping grid.

**Column in File** | Click the drop-down menu to select the column name specified in the data file or header file, or the column number if no header was specified.

**Field** | For each data column that you want to import, click the drop-down menu and select the database field that you want to map the column to. The data from the column is inserted into the specified database field. If you have specified column headers that exactly match the database field names (such as *first_name*), the system attempts to automap the field for you. If the data file contains a column that you do not want to insert into your database, leave this field set to No Value. For information about database fields, see the Data Dictionary located on the navigation pane (*Configuration > Database > Data Dictionary*).
6. To map a column to a table associated with a new import record type, click **Add** in the section corresponding to the associated table.

Table mapping is available only for new records.

- **Notes**—Maps columns to the Notes (notes) table for answer, contact, and organization imports. Supported fields include `chan_id` and `text`.
- **Threads**—Maps columns to the Threads (threads) table for incident imports. Supported fields include `chan_id`, `seq`, `note`, and `entry_type`.
- **Addresses**—Maps columns to the Organization Addresses (org_addrs) table for organization imports. Supported fields include `oat_id`, `city`, `country_id`, `postal_code`, `prov_id`, and `street`.

For information about database fields, see the Data Dictionary located on the navigation pane **Configuration > Database > Data Dictionary**.

Be aware of the following restrictions when preparing an import.

- Associated table mapping is applied only when the import creates new records. Such mapping is ignored when existing records are updated by the import.
- Only certain values can be mapped to the associated tables of a record. For example, you cannot map a value for the `threads.entered` field. This value is set to the date and time the import occurred.

7. Enter field information to map a column to a table associated with a new import record type.

<table>
<thead>
<tr>
<th>Field/Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>Click this icon to create a new entry in the mapping grid.</td>
</tr>
<tr>
<td>Remove</td>
<td>Click this icon to remove an entry from the mapping grid.</td>
</tr>
<tr>
<td>Column in File</td>
<td>Click the drop-down menu to select the column name specified in the data file or header file, or the column number if no header was specified.</td>
</tr>
<tr>
<td>Field</td>
<td>This field displays the database field that you can map a column to. The data from the column is inserted into the specified database field.</td>
</tr>
</tbody>
</table>
8. To define custom criteria used to identify duplicate records, clear the Use Default check box.

9. Click Next.

The system prescans the data file for errors (such as incorrectly formatted email addresses) and the content pane displays the results.

**Note:** If the data file is significantly large, the prescan and import processes can take a considerable amount of time. The Data Import Wizard supports up to one million records per import. If the data file exceeds this size, you must split the data into multiple files of a million records or less.

10. Review the sample output in the good records preview to confirm that your file is mapped properly.

The Summary section of the results page displays the number of records to be inserted, updated, ignored, and added during the import process, as well as the number and types of errors returned during the prescan.

Other results include the prescan status as well counts and previews of good and bad records, as categorized by the prescan process. The good records preview consists of a random sample of up to 10,000 records that were found to be formatted correctly. The bad records preview consists of up to the first 10,000 records that resulted in an error.

For each record, the preview displays each mapped column, the data to be inserted, and the record row number in the data file. The bad records also include an error description to assist with troubleshooting. See Data Import Error Handling.

11. To enter a name for the import as it appears on the Data Imports report, enter the name in the Name field. By default, the import is given the name of the data file you are importing.

12. To see a full list of the good or bad records found during the scan process, click Open CSV File to open the list in a CSV file.

13. To view a CSV file containing the good or bad records, click Open CSV File next to the good or bad record counts.

14. To ignore errors returned by the prescan process and continue importing the records that did not return errors, select the Ignore Errors check box beneath the bad record count.

**Note:** If errors are reported for records that you want to include in the import, you must resolve the errors before proceeding.

15. Click Next.

The data imports to the database.

When the import starts, the content pane displays the real-time import status, a list of any errors found during the import, and summary counts of records that were inserted, updated, ignored, added, or that experienced errors.

Back and Next are unavailable during the import process.

16. To pause the import process after it starts, click Stop on the toolbar. Click Start to resume the import.

Any records listed as returning errors are not imported to the database. Also, if you close the wizard before the import is finished, the import process ends prematurely and you must begin the procedure again to complete the import.

When the import process is complete, the Import Status field displays Import Complete.
All imported records are immediately available for use. Any additional processing that you specified on the initial screen of the wizard (such as the running of a campaign, business rules, or external events) triggers automatically for the new records as soon as they are imported.

**Duplicate Record Handling for Data Imports**

The Duplicate Criteria section of the Data Import Wizard displays the criteria used to prevent instances of redundant records, which can be especially helpful when importing contacts.

During the import process, fields listed in the criteria are compared with existing values in the primary record table in search of duplicate records. When importing contacts, duplicate values in the `email`, `email_alt1`, and `email_alt2` fields of the data file are also detected. When a duplicate is found, action is taken as specified in the Duplicate Records drop-down menu on the initial page of the wizard.

Duplicate criteria consists of a logical expression formatted as $\text{field\_name}=$ (mapped column), where mapped column is the column number or header name. Multiple fields evaluate using Boolean logic.

The default expression varies based on the type of records imported and the columns mapped to the knowledge base. The following fields are automatically included as default duplicate criteria whenever they are included in the mapping grid.

- **Email Address**—When importing contacts, to simplify detection of redundant values in the primary and secondary email address fields (`email`, `email_alt1`, and `email_alt2`), the expression references them together as `any_email`. For example, `any_email={1}`.
- **Contact ID, Organization ID, Incident ID, Answer ID**—These fields are included as default criteria when importing their primary record type. Because these fields are unique for every record, additional criteria would not be more restrictive. For this reason, OR logic is used whenever they are added to the duplicate criteria. For example, `any_email={1} OR c_id={2}`.
- **First and Last Name**—If email address sharing is enabled, `first_name` and `last_name` is included when importing contacts. This narrows the criteria by permitting multiple contacts that share a common email address as long as they have different first or last names. For example, `any_email={1} AND first_name={2} AND last_name={3}`.
- **Login**—When importing contacts, this field is included in the default criteria if it is mapped. For example, `login={1}`.
- **Organization Name**—When importing organizations, this field is required and is always included in the default criteria. For example, `name={1}`.
- **Reference #**—When importing incidents, this field is included in the default criteria if it is mapped. For example, `ref_no={1}`.
- **Key (configuration setting name)**—When importing configuration base entries, these required fields are included in the default criteria. For example, `entry_key={Key}`.
- **ID and Key**—When importing configuration base values, these required fields are included in the default criteria. For example, `configbase_id={ID} AND configbase_entry_id={Key}`.
- **Key (message base name)**—When importing message base entries, this required field is included in the default criteria. For example, `entry_key={Key}`.

For added flexibility, you can define custom criteria by clearing the Use Default check box and entering a logical expression using any combination of mapped fields. For instance, if you want to avoid creating duplicate contacts with the same last name (mapped to column 1) and user ID (mapped to column 2), you can enter `last_name={1} AND login={2}`. If column headers are specified in the data file or header file, you can refer to them by header name instead, such as `last_name={Last Name} AND login={User ID}`.
Note: If you define custom criteria that does not include the email field, and email address sharing is not enabled, records matching existing contacts create new contacts with a numerical value appended to the email address. See Email Address Sharing.

When customizing duplicate criteria, supported Boolean operators and characters can be inserted by clicking the buttons above the Criteria field or by simply entering them in the Criteria Field.

Data Import Error Handling

If the Data Import Wizard prescan process returns errors, you can select the Ignore Errors check box to ignore them and continue importing only those records without errors. However, if the prescan reveals errors involving records that you need to import, you must resolve the errors in order to proceed.

You can do so by manually repairing the records in the data file and rerunning the wizard, or you can click the Back button to return to the column mapping page and either clear the mapping for columns that returned errors or map them to another field. However, if you want to import all the data as originally mapped, you need to repair the records in the data file.

To make the task of repairing the data file simpler, the prescan result page displays the erroneous data along with row numbers and error descriptions to help you locate each problem record in your original data file and correct the issue that led to the error. To view the complete list of errors in a text editor or spreadsheet program, click the Open CSV File button next to the record count.

The CSV file can also be accessed locally from the staging directory defined on the initial screen of the wizard. For most Windows operating systems, the default location is C:/Documents and Settings/<username>/My Documents/My Imports/. For Windows 7, the default location is C:/users/<username>/My Documents/My Imports/.

The staging directory contains a subdirectory for each import with the naming convention <current date>-<import attempt number> (for example, “2010-05-15-1”). The subdirectory of each import contains the following files.

- <data_file_name>.bad.csv contains all records that returned an error during the prescan process.
- <data_file_name>.good.csv contains all records that did not return an error.
- <data_file_name>.badaux.csv and <data_file_name>.goodaux.csv contain diagnostic information that can be provided to support for troubleshooting errors.

After the data file is repaired, you can start the import procedure again and the errors that were addressed in the previous prescreen process should no longer occur.

In rare instances, an error may occur during import that was not detected during the prescan process. If you selected the Stop Import on Error check box on the initial screen of the wizard, the import status changes to Import Error and the process stops to prevent further records from being imported. If the Stop Import on Error check box is cleared (the default setting), the import continues despite any error and only records without errors are imported.

Add or Edit a Data Import Template

You can create data import templates for use in the Data Import Wizard. Templates let you skip some import wizard steps, such as mapping columns to database files and customizing duplicate criteria, when performing imports of multiple data files that have the same column ordering.
After a template is created, you can select it when mapping data field columns through the Data Import Wizard. This can be useful if you frequently import records from an external source where the data format does not change but the data is more current.

**Note:** Data import features are designed to import specific data sets into the knowledge base, not to support full data migrations. For this reason, you should be aware of certain restrictions when preparing an import.

1. Click **Configuration** on the navigation pane.
2. Expand **Database**, and then double-click **Data Import Templates**.
   The Data Import Templates tree displays on the content pane.
3. Do one of the following:
   - To add a template, select a record type in the tree and click **New** on the ribbon to display the editor.
   - To edit an existing template, click it in the tree.

   The Data Import Templates editor opens. It consists of a set of fields for mapping columns to database fields in primary and associated tables, defining criteria for detecting duplicate records, and viewing interface visibility information for the template.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field/Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter the name of the template.</td>
</tr>
<tr>
<td><strong>Column Mappings</strong></td>
<td>This section defines how columns in the data file are mapped to fields in the database.</td>
</tr>
<tr>
<td><strong>Add</strong></td>
<td>Click this icon to create a new row in the column mapping grid.</td>
</tr>
<tr>
<td><strong>Remove</strong></td>
<td>Click this icon to remove a selected row from the column mapping grid.</td>
</tr>
<tr>
<td><strong>Column in File</strong></td>
<td>The column number that the data file will be mapped to. The maximum allowed value is 9999.</td>
</tr>
<tr>
<td><strong>Field</strong></td>
<td>For each data column that you want to import, click the drop-down menu and select the database field that you want to map the column to. The data from the column is inserted into the specified database field. If the data file contains columns that you do not want to insert into your database, leave this field blank. For information about database fields, see the Data Dictionary located on the navigation pane (Configuration &gt; Database &gt; Data Dictionary).</td>
</tr>
</tbody>
</table>

**Tip:** If you map a column to `ma_org_name`, the Data Import Wizard populates the field with the text value from the data file. If you want to associate a contact with an organization, you can either map the `org_id` to Organization ID or map the name of the organization to Organization ID. The Data Import Wizard looks up the organization and associates the name to the correct organization. If the lookup fails, an error occurs.
5. To map a column to a table associated with the import record type, click Add in the section corresponding to the associated table.
   - Notes—Maps columns to the Notes (notes) table for answer, contact, and organization imports. Supported fields include chan_id and text.
   - Threads—Maps columns to the Threads (threads) table for incident imports. Supported fields include chan_id, seq, note, and entry_type.
   - Addresses—Maps columns to the Organization Addresses (org_addrs) table for organization imports. Supported fields include oat_id, city, country_id, postal_code, prov_id, and street.

   **Note:** For information about database fields, see the Data Dictionary located on the navigation pane (Configuration > Database > Data Dictionary).

6. Enter field information.

<table>
<thead>
<tr>
<th>Field/Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>Click this icon to create a new entry in the mapping grid.</td>
</tr>
<tr>
<td>Remove</td>
<td>Click this icon to remove an entry from the mapping grid.</td>
</tr>
<tr>
<td>Column in File</td>
<td>Enter the column number that the data file or header file will map to. The maximum allowed value is 9999.</td>
</tr>
<tr>
<td>Field</td>
<td>This field displays the database field that you can map a column to. The data from the column inserts to the specified database field.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Enter the default value to insert when an imported record does not contain data for the column.</td>
</tr>
</tbody>
</table>

7. To define custom criteria used to identify duplicate records, click the Criteria field and see Duplicate Record Handling for Data Imports.
8. To enter a different name for the template based on interface, select the Label value next to the interface name in the Visibility section and enter the name. (This is helpful if your site has multiple interfaces of different languages.) By default, each Label value is populated with the name of the template you defined in step 4.

9. Click **Save**.

## Data Import History

Occasionally, you may want to review information about previous imports to understand how imported records were created in your site. Historical details about past imports are available in two locations, based on when the import was performed.

Imports are tracked in the Data Imports report, located in **Public Reports/Common/Site Administration/Data Imports**. The Data Imports report contains information such as the type of records imported, start and completion dates and times, import file names, import status, and information about file locations and column mapping. The statistics used for this report are stored in the Data Imports (data_imports) table and can also be accessed by creating a custom report. For a description of the information logged in the Data Imports table, see the Data Dictionary located on the navigation pane (Configuration > Database > Data Dictionary).

- Overview of Creating Basic Custom Reports

## Element Manager on the Agent Browser UI

Element Manager lets you automatically group, package, migrate, and deploy configurable components across B2C Service instances. You can easily migrate configurations from development, to test, and then to production environments.

Element Manager lets you export and import reports, workspaces, workflows, and dashboards.

**Note:** Element Manager works only on the Agent Browser UI. If you try to access it from the Service Console, a message tells you it is available only on the Agent Browser UI. For more information, see *Element Manager*.

## SAML 2.0 Open Login

### Overview of SAML 2.0 Open Login

B2C Service supports SAML 2.0 single sign-on (SSO) integrations, which let your agents and customers log in using credentials supplied by external identity providers (IdPs).

Agents can also use B2C Service as an IdP to provide login credentials and authentication services to third-party applications. This lets your agents seamlessly access these applications from the Service Console or Agent Browser UI without being required to re-enter their credentials.
The procedures to implement your single sign-on configuration differ depending on what you want to accomplish.

- If you want your agents or customers to log in to B2C Service using credentials from an external IdP, see **Single Sign-on Support in B2C Service**. Single logout is supported when using this configuration.
- If you want your agents to be able to access external applications from the Service Console or Agent Browser UI without being asked for login credentials, see **Log in to External Applications Using B2C Service as the Identity Provider**.

**Note:** This functionality isn't available for customers.

### Single Sign-on Support in B2C Service

B2C Service includes single sign-on (SSO) support for agents working on the Service Console or Agent Browser UI and customers using the Customer Portal.

Typically, agents and customers log in using the logins and passwords specified in their B2C Service staff account and contact records. With single sign-on, however, agents and customers are authenticated by a different application, and B2C Service accepts authentication and logs them in.

**Note:** To enable single sign-on for agents, customers, or both, contact your Oracle account manager.

B2C Service supports two types of SSO:

- IdP-initiated SSO
- Service Provider (SP)-initiated SSO (supported only for agents)

#### IdP-initiated SSO

When agents and customers log in to a external identity provider, the IdP must authenticate their identity. Then they select a connection to the Service Console (for agents) or your customer portal (for customers).

After verifying the login credentials, the IdP encapsulates the result of the verification in an assertion that’s signed using an X509 certificate and sends the assertion to B2C Service. The application verifies the signature and (if successful) accepts the account information for logging in to the B2C Service system. The assertion sent by the identity provider uses SAML 2.0 (Security Assertion Markup Language) architecture. This implementation of SAML 2.0 open login lets B2C Service accept identity provider assertions. The use of encrypted SAML tokens are supported. These are decrypted by B2C Service using an internal API.

**Note:** The identity provider's login page can be embedded in the B2C Service Login window, providing a seamless method for agents to access the application and any service provider applications configured in B2C Service. See **Authentication Using an External Identity Provider on the B2C Service Login Window**.

An overview of the IdP-initiated single sign-on process is shown here.
SP-initiated SSO

B2C Service also supports SSO initiated from a service provider (SP) instead of an IdP. For example, an agent may attempt to access B2C Service by launching the login window. If SSO is enabled for this specific agent, B2C Service automatically redirects the agent to the appropriate login page the external IdP. The IdP captures the agent credentials and, if the authentication is successful, redirects the agent back to B2C Service with a SAML assertion.

**Note:** Customer login isn't supported using SP-initiated SSO.

Agent Login Using an IdP-initiated SSO

IdP-initiated SSO for agents occurs when single sign-on is enabled for agents who log in to the agent desktop by first logging into an external identity provider.

This flow diagram shows the process flow of an agent accessing the Service Console with an IdP-initiated SSO.
1. An agent enters a user name and password to log in to the organization’s identity provider (such as a PingFederate Server-based application). When the information is verified, the agent is logged in to the identity provider.

2. The identity provider displays a list of service providers, including B2C Service, that the agent can connect to.

4. The identity provider generates a signed SAML 2.0 assertion using the account login, email address, account ID, or a staff account custom field as the assertion subject. See How You Identify the SAML Subject for Agent Login.

   **Note:** The assertion must be signed using XML Signature Syntax and Processing recommendations. If the certificate used to sign the assertion is self-signed, it must be uploaded to the Additional Root Certificates (certs/root) directory in the File Manager. See Certificate Validation Options. The certificate must also be listed in the SAML_20_SIGN_CERTS configuration setting or it will not be accepted for SAML signing. See Define Single Sign-on Configuration Settings. Additionally, the assertion cannot be encrypted.

5. The identity provider then submits the assertion to the B2C Service SSO launch page using HTTP POST binding (since that’s the only binding method supported). The SSO launch page is similar to the standard launch page except that it automatically starts the ClickOnce URL, which logs the agent in after validation.

6. B2C Service decodes and verifies the assertion and validates the account by confirming that the assertion matches an account in the Oracle database.

   - Staff members logging in through an identity provider must have the SSO Login (SAML 2.0) permission enabled in their profile. See Considerations When Using Single Sign-on.
   - Because accounts cannot be created through the single sign-on process, only existing accounts can be logged in. (The public API can be used to create or update accounts if necessary.)
7. B2C Service redirects the agent to the ClickOnce URL, which signals the installer to use the SSO login instead of the standard login, and passes the necessary parameters for automatic login.

8. B2C Service verifies the account using the parameters of the ClickOnce URL for authentication. If necessary, the B2C Service client is downloaded and installed. The application is then launched, and the agent is logged in. See *Server and client configuration issues in ClickOnce deployments* for information about browser scripting and compatibility with ClickOnce applications.

**Customer Login Using an IdP-initiated SSO**

IdP-initiated SSO for customers occurs when single sign-on is enabled for customers logging in to your customer portal.

This flow diagram shows the process of a customer accessing the customer portal with an IdP-initiated SSO.

**Customer Single Sign-On Overview**

1. A customer enters a user name and password to log in to an identity provider. When the identity provider verifies the information, the customer is logged in.

2. The identity provider displays a list of service providers, including your customer portal, that the customer can connect to.

3. The customer selects the customer portal.

4. The identity provider generates a signed SAML 2.0 assertion using the customer’s email address, contact record ID, login name, or a contact custom field as the assertion subject. See *Considerations When Using Single Sign-on*.
Note: The assertion must be signed using **XML Signature Syntax and Processing**. If the certificate used to sign the assertion is self-signed, it must be uploaded to the Additional Root Certificates (certs/root) directory in the **File Manager**. See **Certificate Validation Options**. The certificate must also be listed in the SAML_20_SIGN_CERTS configuration setting or it will not be accepted for SAML signing. See **Define Single Sign-on Configuration Settings**. Additionally, the assertion cannot be encrypted.

5. The identity provider then submits the assertion, using HTTP POST binding (because that's the only binding method supported), to the openlogin controller at http://<your_site>.custhelp.com/ci/openlogin/saml. This controller calls the SSO validation and logs in the customer.

6. B2C Service decodes the assertion, validates the customer by confirming that the assertion matches a contact record in the database, and logs the customer in on your Support Home page. (A redirect parameter can specify that a different page opens instead. See **How You Redirect Contacts After Login**.)

   Contact records cannot be created through the SSO process, so only existing customers can be logged in. (The public API can be used to create or update contacts if necessary.)

### Set Up Single Sign-on (SSO) Using an External Identity Provider

Complete these steps to configure single sign-on for your site.

1. Contact your Oracle account manager to enable single sign-on for agents, customers, or both.
2. Add the single sign-on permission to the profiles that will use it. See **Add the SSO Profile Permission**.
3. **Define Single Sign-on Configuration Settings**.
4. Set up external identity providers (IdPs). See **Methods for Setting Up Identity Providers**.
   a. Identify the SAML subject for agent login. See **How You Identify the SAML Subject for Agent Login**.
   b. Identify the SAML subject for contact login. See **How You Identify the SAML Subject for Contact Login**.

### Add the SSO Profile Permission

You can add the single sign-on (SSO) permission on the Administration tab of the Profiles editor.

For the SSO profile permission to be available, it must be enabled. Contact your Oracle account manager.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, then double-click **Profiles**.
   The list of profiles displays.
3. Double-click the profile to which you want to assign single sign-on permission.
   The Profiles editor opens.
4. Click **Permissions**.
   The Permissions page opens with the Administration tab selected.
5. Select **SSO Login (SAML 2.0)**.
   A warning message notifies you that all staff members having this profile will be prevented from logging in directly to B2C Service and must instead log in through single sign-on with an identity provider. The warning message also notifies you about restrictions for the Customer Portal administration and Public SOAP API account authentication permissions.

   **Note:** Single sign-on must be enabled for this check box to display. To enable single sign-on for agents, customers, or both, contact your Oracle account manager.

6. Click **OK**.
7. Click **Save**.

**Related Topics**

- Administration Permissions
Considerations When Using Single Sign-on

When single sign-on (SSO) is enabled for agents on your site, an SSO Login (SAML 2.0) permission check box appears on the Administration tab of the Profiles editor. When you add this permission to a profile, staff members with that profile can log in only through an identity provider.

**Configuration Settings**—For security purposes, we recommend that if the SSO Login (SAML 2.0) permission is enabled, then SEC_END_USER_HTTPS also be enabled. If both are enabled, then the SAML assertion must be sent to a secure protocol (*https://*). To enable SEC_END_USER_HTTPS, contact your Oracle account manager. For an in-depth discussion about security practices in B2C Service, see *Overview of Oracle B2C Service Security and Compliance*.

**Restrictions**—Several restrictions apply to staff members whose profile includes the SSO Login (SAML 2.0) permission. Because of the restrictions described here, we recommend creating a profile that does not have the SSO Login (SAML 2.0) permission enabled and assign at least one staff account to that profile. In the event a problem occurs with your identity provider, that account can log in to B2C Service and change other staff member profiles (and assign them passwords, if necessary) so agents can continue to work until the problem is resolved.

- The staff members cannot log in to B2C Service using their B2C Service credentials, and will see an access denied message if they try to do so. Possible reasons for the denial are displayed in the message, including that the account belongs to a profile that allows logins only through single sign-on.
- The profile’s **CP Promote**, **CP Stage**, and **CP Edit** permissions are disabled and cannot be selected when the SSO Login (SAML 2.0) permission is selected. In addition, staff members using the profile cannot deploy the customer portal. For more information about Customer Portal permission options, see *Assign Permissions for Customer Portal*.
- The staff members cannot edit development pages in WebDAV because WebDAV authentication requires a user name and password.
- Agents associated with a profile that has the SSO Login (SAML 2.0) permission selected cannot use their username and password for SOAP API authentication.
- The password options on the Staff Accounts editor are disabled; therefore, passwords cannot be modified for staff members with profiles that have the SSO Login (SAML 2.0) permission enabled. See *Add or Edit a Staff Account*.

**Define Single Sign-on Configuration Settings**

The configuration settings described in this procedure support the implementation of SAML 2.0 open login.

1. Click **Configuration** on the navigation pane.
2. Expand **Site Configuration**, then double-click **Configuration Settings**.
   The Search window opens.
3. Clear the **Select All** check box in the Folders menu and then select the **Common** check box.
4. Click **Search**.
   The Configuration Settings editor opens with the Common folder displayed on the content pane.
5. Expand the folders in the **Common/General/Single Sign-On** path to display the SAML_20_SIGN_CERTS and USE_KNOWN_ROOT_CAS configuration settings on the content pane.
6. Click in the Value column to edit the configuration setting values. See *Edit a Configuration Setting*.
Chapter 2
Core Features

### Configuration Setting

<table>
<thead>
<tr>
<th>Configuration Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAML_20_SIGN_CERTS</td>
<td>Identifies the only certificate(s) (a comma-separated list of SHA-1 hex thumbprints) accepted for SAML 2.0 signatures for agent or contact IdP-initiated SSO. You can use the value ANY-TRUSTED to accept any certificate that's trusted by the root CAs for the site. Default is blank. <strong>Tip:</strong> If ANY-TRUSTED is used, we recommend that the USE_KNOWN_ROOT_CAS configuration setting be disabled for security reasons. During IdP-initiated SSO, for either agents or contacts, only certificates listed in the SAML_20_SIGN_CERTS configuration setting are accepted for SAML 2.0 assertion signing for IdP-initiated SSO. This means that if no certificates are listed in the setting—which is its default—then no certificate will be accepted for SAML signing of IdP-initiated single sign-on requests. Listed certificates must still pass other validation criteria (that is, they must be trusted) before they can be accepted for SAML 2.0 assertion signing. If the certificate used to sign the assertion is self-signed, it must be uploaded to the Additional Root Certificates (certs/root) directory in the File Manager. See Certificate Validation Options. You can also prefix the list of certificate thumbprints with CERT_VALIDATION:IGNORE_TRUST. This indicates that the certificate used to sign the token (matching one of the certificate thumbprints in the list) doesn’t need to be signed by a trusted root CA from the certificate store (i.e. the certificate signature chain’s root CA doesn’t need to be in the list of well-known CAs, assuming USE_KNOWN_ROOT_CAS is set or added to the Additional Root Certificates store). See Add or Remove Certification Authorities. For example, when a value of CERT_VALIDATION:IGNORE_TRUST, 06767A1E3D41A358A8BCA912F36C0E3C5425CD4F, 87C5D22D2EE2E151ED61DA3D6F4EEC7D08676 is entered, two certificates will be accepted for SAML token signatures (with the SHA-1 thumbprints given), but neither will be validated to have been signed by a trusted root CA.</td>
</tr>
<tr>
<td>USE_KNOWN_ROOT_CAS</td>
<td>Controls whether the known root certificate authorities list that’s embedded within the Oracle server is consulted when verifying X509 certificates, for example, when checking S/MIME email or SAML 2.0 signatures. Default is enabled (Yes).</td>
</tr>
</tbody>
</table>

7. Click **Save**.
8. From the search criteria fields on the top of the editor, click the **Folders** drop-down menu, clear the **Common** check box, and then select the **RightNow Common** check box.
9. Click **Search**. The RightNow Common folder displays on the content pane.
10. Expand the folders in the **RightNow Common/Single Sign-On/General** path to open the SAML_ERROR_URL configuration setting on the content pane. You can use this setting to specify the URL where users will be sent if their SAML SSO log-in attempt fails. The setting supports the %error_code% and %session% placeholder variables, which are replaced with the error code the user encountered and the session of the user if the user has cookies disabled. The default value for the setting is blank. These errors can be returned when using the %error_code% variable.
<table>
<thead>
<tr>
<th>Error name</th>
<th>Error ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAML_TOKEN_REQUIRED</td>
<td>14</td>
<td>No SAMLResponse POST value was sent to the CP controller. A SAML response is required in order to start the authentication process.</td>
</tr>
<tr>
<td>SAML_TOKEN_FORMAT_INVALID</td>
<td>15</td>
<td>The SAML response was found, but it could not be successfully Base 64 decoded.</td>
</tr>
<tr>
<td>FEDERATED_LOGIN_FAILED</td>
<td>16</td>
<td>The call to the federated_login API call failed. This usually means that the SAML assertion succeeded, but the user does not yet exist in the database.</td>
</tr>
<tr>
<td>SSO_CONTACT_TOKEN_VALIDATE_FAILED</td>
<td>17</td>
<td>The call to the sso_contact_token_validate API failed. This can happen in a number of ways, but the most common is that the SAML assertion contains something other than the contact login as the subject. If that login does not exist in the database, the token validation will fail.</td>
</tr>
<tr>
<td>CONTACT_DISABLED_ERROR</td>
<td>6</td>
<td>The SAML assertion/login succeeded, but the contact is disabled in the database.</td>
</tr>
<tr>
<td>COOKIES_REQUIRED_ERROR</td>
<td>3</td>
<td>The user does not have cookies enabled. Cookies are required in order to log in to CP.</td>
</tr>
</tbody>
</table>

11. Click Save.

Methods for Setting Up Identity Providers

You can configure identity providers using two different methods.

- Edit the SAML_20_SIGN_CERTS configuration setting and enter the certificate thumbprint of the IdP that posts the SAML assertion. This option is generally used with IdP-initiated SSO. See Define Single Sign-on Configuration Settings for a description of the configuration setting.
- Configure the IdP using the Single Sign-On Configurations editor. Identity providers configured using this method are used only for SP-initiated SSO. These are ignored when validating SAML assertions for IdP-initiated SSO. See Authentication Using an External Identity Provider on the B2C Service Login Window.

For B2C Service to accept SAML 2.0 open login assertions from external identity providers, each identity provider must be configured to send the assertion URL to the B2C Service application, either to the SSO launch page for agent login or to the openlogin controller for customer login (or to both):

- Identify the SAML subject used in the assertion for agent login.
- Identify the SAML subject used in the assertion for customer login.

B2C Service can accept authentications from multiple identity providers. Configuration details vary from provider to provider, so each one must be configured separately to make the application available through the identity provider. Because the procedures vary, we cannot provide specific details. However, this list includes some requirements and constraints you must consider as you configure an identity provider:

- B2C Service supports only the HTTP POST binding type, so the identity provider should be configured to send SAML responses and assertions using that method.
- The certificate used to sign the assertion must be included as part of the assertion in the XML signature.
- The identity provider server is expected to be time-synchronized with the Oracle server, so a validity range of plus or minus five minutes of the SAML assertion should be adequate.
**Note:** If Windows ADFS (Active Directory Federation Services) is used as the identity provider, the fixed validity ranges (five minutes for Subject.SubjectConfirmationData.NotOnOrAfter and one hour for Subject.Conditions.NotOnOrAfter) can cause validation errors if the application’s clock is behind the time of the identity provider, even if that difference is as small as one second. To mitigate the potential problem, a NotBeforeSkew parameter can be issued in these PowerShell prompts.

```powershell
PS C:/Users/Administrator> add-pssnapin microsoft.adfs.powershell
PS C:/Users/Administrator> set-adfsrelyingpartytrust -targetname "<relying party name>" -NotBeforeSkew 2
```

In this example, 2 means two minutes; however, you can change the value as needed.

### How You Identify the SAML Subject for Agent Login

The parameter used to identify the SAML subject contents must be passed to the SSO launch page as a GET parameter.

The subject value must be unique for the single sign-on to be successful. For example, if multiple staff members can have the same value for an account custom field, then do not use that custom field as the subject.

The value defines how the SAML subject is mapped to an existing staff account in the Oracle database. Only one field can be passed in the assertion subject, whose parameter name is `p_subject`.

Acceptable values for `p_subject` depend on whether the flow is IdP-initiated SSO or SP-initiated SSO. If SSO is initiated by B2C Service (in other words, SP-initiated SSO), the only allowed value for `p_subject` is `Account.Login`. If SSO is initiated by an external provider (in other words, IdP-initiated SSO), the `p_subject` value can be any one of the following:

- **Account.Login**—The assertion subject is the account login, which is the preferred mapping since it requires no additional lookup from the database. That is, the value can be passed to the `sso_account_login()` API. This is the default mapping value if `p_subject` isn't set. The `Account/Login` value is case sensitive.

  **Note:** This is the only value permitted for `p_subject` when the SSO is initiated by B2C Service in an SP-initiated process.

- **Account.Emails.Address**—The assertion subject is the account email address. The `Account.Emails.Address` value is case insensitive.

- **Account.ID**—The assertion subject is the account ID in the Oracle database.

- **Account.CustomFields.[customfield-name]**—The `customfield-name` variable is the actual name of the custom field in the database (and the name of the database column), and the assertion subject is the account custom field value. The custom field name is the last name in the dot-separated value. It is automatically defined with lowercase notation and the `c$` prefix.

The custom field value is case insensitive. These staff account custom field data types aren't supported for use in an assertion:

- Menu
- Yes/No
- Date/Time
- Date Field

This is an example of an assertion URL that passes the value of a custom field called `accounts.c$external_id` field for the staff account being verified.

```plaintext
https://my_site/cgi-bin/my_interface.cfg/php/admin/sso_launch.php?
p_subject=Account.CustomFields.ExternalPhone
```
CAUTION: The latest version of the single sign-on URL for agents no longer accepts custom fields. Previously, custom fields in the query helped identify the SAML subject type. However, the SAML subject type passed by the external entity provider is now specified in the single sign-on configuration. An example of a URL using the new configuration follows.

https://my_site/cgi-bin/my_interface.cfg/php/sso/saml2/sp/post/acs.php

How You Identify the SAML Subject for Contact Login

For contacts, only IdP-initiated SSO is supported. The parameter used to identify the SAML subject contents must be passed to the openlogin controller as a GET parameter.

The format of the URL is:

your_site/ci/openlogin/saml/subject/SAML_subject

For example:

mysite.example.com/ci/openlogin/saml/subject/contact.emails.address

The subject value must be unique in order for the single sign-on to be successful. For example, if email address sharing is enabled, the potential for more than one contact having the same email address exists (even if the primary email address for one is the alternate email address of another), so you should not use the email address as the subject. A similar situation might occur with custom fields if multiple customers can have the same value for a contact custom field.

The parameter, named subject, is optional and defaults to contact.login. Its values include the following:

- **contact.emails.address**—The assertion subject is the contact email address, and the value can be the contact’s primary email address or one of the alternate email addresses. The contact.emails.address value is case insensitive.

- **contact.id**—The assertion subject is the contact ID in the Oracle database.

- **contact.login**—The assertion subject is the contact login, which is the preferred mapping since it requires no lookup from the database. This is the default mapping value if subject isn’t set. The contact.login value is case sensitive.

- **contact.customfields.[customfield-name]**—The customfield-name variable is the actual name of the custom field in the database (as well as the name of the database column), and the assertion subject is the contact custom field value. The assertion subject is then passed to the API as CustomField and the name in the subject GET parameter is sent to the API as the CustomFieldName value. The c$ prefix is added if necessary.

**Note:** The custom field value is case insensitive. These contact custom field data types aren't supported for use in an assertion:

- Menu
- Yes/No
- Date/Time
- Date Field
- Opt-in
How You Redirect Contacts After Login

After the assertion has been verified and contacts are identified and logged in, they will be directed to your Support Home page by default.

If you prefer to direct contacts to another page, you can add a redirect parameter to the URL that passes the subject parameter. The redirect parameter can point to any page (/app/*) or controller endpoint (/ci/* or /cc/*). It must follow the subject parameter, as shown in this example URL:

https://your_site/ci/openlogin/saml/subject/contact.id/redirect/app/ask

Authentication Using an External Identity Provider on the B2C Service Login Window

Your staff members can log in on the B2C Service Login window using authentication from external IdPs. This lets agents log in once to be authenticated across several service-provider (SP) applications.

Single logout is also supported, so that when agents log out of any SP application, they’re also automatically logged out of the IdP and any other SPs where they were logged in.

See Define an External IdP for Agent Authentication on the Login Window for information about configuring external IdPs.

Note: Deployments involving B2C Service and Oracle Sales CX use Oracle Identity Management because Oracle Identity Management is bundled with Oracle Sales CX.

When the staff member logs in to the IdP, an encrypted SAML token is generated and passed to B2C Service. This method increases security because user IDs and passwords aren’t sent between the applications.

After being authenticated, B2C Service provides authentication services to other SPs, alleviating the need to integrate them and the external IdP.

Define an External IdP for Agent Authentication on the Login Window

Follow this procedure to configure an external identity provider for agent authentication on the Login window.

This procedure assumes that:

- You have added the Single Sign-On Configurations component to the configuration list for the Configuration button. See Create a Navigation Set for the Administrator.
- You have access to the Identity Provider editor defined by the hidden configuration setting SSO_ENABLE_EXTERNAL_IDP. This setting is not enabled by default. To enable this hidden setting, contact your Oracle account manager or Submit a Service Request.

1. Click Configuration on the navigation pane.
   a. Click New on the ribbon and select SSO Identity Provider.
   b. The Identity Provider editor opens on the content pane.
   c. Enter field information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provider Entity ID*</td>
<td>Enter a unique name for the IdP in this field.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to enable the IdP. You can configure multiple IdPs.</td>
</tr>
<tr>
<td>Web SSO</td>
<td>Select this check box to redirect agents to the IdP when they log in on the B2C Service Login window. <a href="#">Log in with an External Identity Provider on the B2C Service Login Window</a>, Only one active IdP can be enabled for Web SSO.</td>
</tr>
<tr>
<td>Enforce Audience Restriction</td>
<td>Select this check box to force the <code>aud</code> attribute (audience) of the SAML token to include the custom audience URL. Enforcing an audience restriction ensures that only tokens meant for the specific site are consumed.</td>
</tr>
<tr>
<td>Custom Audience URL</td>
<td>Enter the custom audience URL that the SAML token must match, for example: <code>https://customaudience.com/services/saml</code></td>
</tr>
<tr>
<td></td>
<td>If the Enforce Audience Restriction check box is selected, and the custom audience URL isn't specified, then the token must include the interface URL in its audience list. Entries in this field are ignored when Enforce Audience Restriction isn't selected.</td>
</tr>
<tr>
<td>NameID Format</td>
<td>Select either Unspecified or Email Address from the drop-down menu. The NameID attribute is used in two places for enhanced validation:</td>
</tr>
<tr>
<td></td>
<td>- Incoming SAML assertion from the IdP</td>
</tr>
<tr>
<td></td>
<td>- Outgoing logout request to the IdP</td>
</tr>
<tr>
<td>Subject Type</td>
<td>Click the drop-down menu and select the subject type used in the SAML token. The options are Email, Login Name, and Account ID. The default value is Login Name.</td>
</tr>
<tr>
<td>Label*</td>
<td>Click the arrow next to Labels to expand this section. Enter the name as you want it to display for the IdP in the Label column. You can specify different names to use for different interfaces and languages.</td>
</tr>
<tr>
<td>SAML Token Parameters</td>
<td>Click the arrow next to SAML Token parameters to expand this section and configure the SAML token parameters.</td>
</tr>
<tr>
<td>Token Validity Offset</td>
<td>Enter the number of seconds that the timestamp on SAML tokens is adjusted by to account for discrepancies between the Oracle Service Cloud and external IdP clocks.</td>
</tr>
<tr>
<td>Token Validity</td>
<td>Enter the number of seconds that the timestamp on SAML tokens will be accepted.</td>
</tr>
<tr>
<td>Certificates</td>
<td>Click the arrow next to Certificates to expand this section. The fields in this section are used to import the certificates you want to use to validate requests and SAML tokens received from the IdP.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Do Not Verify Trust Chain for Certificates</td>
<td>Select this check box to prevent verification of the trust chain for the certificates you import. This lets you use self-signed certificates or certificates that don’t adhere to OpenSSL trust chain verification.</td>
</tr>
<tr>
<td>Import Certificate</td>
<td>Click the folder next to the field name to select the location of the certificate you want to use. The certificate displays in the Certificate field.</td>
</tr>
<tr>
<td>Import Alternate Certificate</td>
<td>Click the folder next to the field name to select the location of an alternate certificate to use when validation fails using the primary certificate. The certificate displays in the Alternate Certificate field.</td>
</tr>
<tr>
<td>Signing Parameters</td>
<td>Click the arrow next to Signing Parameters to expand this section where you can enter information to configure the signing method.</td>
</tr>
<tr>
<td>Add Certificate to Signature</td>
<td>Clear this check box to prevent the signing certificate from being added to the SAML response/assertion signature.</td>
</tr>
<tr>
<td>Sign Response</td>
<td>Clear this check box to prevent the response part of the SAML token from being signed.</td>
</tr>
<tr>
<td>Sign Assertion</td>
<td>Clear this check box to prevent the assertion part of the SAML token from being signed.</td>
</tr>
</tbody>
</table>
| Sign Method                                                | Click this drop-down menu to select the XML signature method used to sign the SAML token. You can select:  
  - RSA + SHA-1  
  - RSA + SHA-256  
  - RSA + SHA-512  
| Sign Digest Method                                         | Click this drop-down menu to select the digest method used to sign the SAML token signature. You can select:  
  - SHA-1  
  - SHA-256  
  - SHA-512  
<p>| Auto Provisioning                                          | Click the arrow next to Auto Provisioning to expand this section where you can enable and configure the ability to automatically create staff accounts and enable or disable auto-provisioning for each IdP.                                          |
| Enable Auto-Provisioning                                   | Select this check box to enable this IdP for auto-provisioning of staff accounts.                                                                                                                                                                                           |
| Default Profile                                            | Click the Search icon to select the profile you want to associate to this IdP.                                                                                                                                                                                              |
| Default Group                                              | Click the Search icon to select the group you want to associate to this IdP.                                                                                                                                                                                                |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Enter the value for the staff member as it corresponds to the EMail attribute mapping.</td>
</tr>
<tr>
<td>User Name</td>
<td>Enter the value for the staff member as it corresponds to the Login attribute mapping.</td>
</tr>
</tbody>
</table>

c. Click **Save**.
d. To export the B2C Service metadata to an XML file, click **Export SP Metadata** on the ribbon and then browse to the XML file that's created into the external IdP's web server. This establishes a trust relationship between the IdP and B2C Service. If the external IdP encounters a problem with the entity ID in the exported metadata, the entity ID can be changed. Contact your Oracle account manager.
e. To import the metadata from the external IdP into B2C Service, click **Import IdP Metadata** on the ribbon and browse to the file you want to import.
f. Click **Save and Close** to save your changes and close the editor.

3. To create or edit a profile, click **Permissions** on the ribbon, and select the **SSO Login (SAML 2.0)** check box in the Administration section.

   For more information on profile permissions, see **Profiles**.

4. To create or edit a staff account in B2C Service and associate the profile with it. See **Add or Edit a Staff Account**.

   **Note:** The staff account must also be a registered user in the external IdP and the user ID must match the B2C Service user name.

**Log in with an External Identity Provider on the B2C Service Login Window**

After the external IdP is configured, staff members open the B2C Service Login window as they normally would. However, the IdP's login page is now embedded in the window.

You must have the SSO Login (SAML 2.0) profile permission selected in your profile.

   The external IdP’s login page is embedded in the Login window.

2. Enter your login information.
   The IdP verifies your credentials, generates a SAML token, and sends it to B2C Service. The SAML token is authenticated with the certificate used to sign the token.
   You are then logged in to B2C Service.
Bypass the External Identity Provider

If staff members do not have the SSO Login (SAML 2.0) profile permission, the IdP can be bypassed, letting them log in using their Oracle Cloud Service credentials.

After configuring and enabling an IdP in B2C Service, your site’s launch page includes an option for Install B2C Service—Internal Login.

**Note:** This option is intended for troubleshooting single sign-on issues, and isn’t meant to be used as a conventional sign-on process.

2. Select **Install B2C Service—Internal Login**. The login window without the embedded IdP page is loaded. This is an example of a URL for a launch page: https://your_site/cgi-bin/interface_name.cfg/php/admin/launch.php

Use OpenID-based External Identity Providers

B2C Service supports the use of OpenID Connect (OIDC) external identity providers for single sign-on authorization for agents.

OpenID Connect (OIDC) is a widely used authorization protocol based on JSON, and OAUTH 2.0 standards. OIDC support lets administrators define and manage OIDC providers on the Agent Browser UI.

Using OIDC has these benefits:

- Agents have seamless access to B2C Service.
- OIDC eliminates the need for multiple credentials. Agents can log into B2C Service using their credentials with popular OIDC providers.
- OIDC can be used for web single-sign on.
- A single logout terminates the session, regardless of where the logout originates.
- Unlike SAML, OIDC is light weight and can be used on mobile platforms.

You perform these tasks to set up OIDC:

1. Register B2C Service with the OpenID Connect Provider.
2. Define the OpenID Connect Provider in B2C Service.

OIDC authorization uses this process:

1. An agent tries to log in to B2C Service.
2. B2C Service sends an authorization code request to the OIDC provider.
3. The OIDC provider challenges the user for their credentials. This is usually performed on a login page.
4. If the agent logs in successfully, or is already logged in to the OIDC identity provider, the OIDC provider returns an authorization code to B2C Service.
5. B2C Service sends an identity (ID) token request to the OIDC provider using the obtained authorization code.
6. The OIDC provider issues the ID token.
7. B2C Service creates a user session using the ID token.
Register B2C Service with the OpenID Connect Provider

You register B2C Service as a client with the OpenID Connect (OIDC) provider.

1. Enter information about B2C Service in the OIDC provider:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed Grant Types</td>
<td>Authorization Code</td>
</tr>
<tr>
<td>Client Type</td>
<td>Confidential</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The B2C Service URL to redirect to after the authorization code is generated: https://your_site/cgi-bin/your_interface.cfg/php/sso/oidc/idp/oidcs.php</td>
</tr>
<tr>
<td>Logout URL</td>
<td>The B2C Service URL where to post the logout request: https://your_site/cgi-bin/your_interface.cfg/php/sso/saml2/idp/post/logout.php</td>
</tr>
<tr>
<td>Post Logout Redirect URL</td>
<td>This is the same as the redirect URL: https://your_site/cgi-bin/your_interface.cfg/php/sso/saml2/idp/post/oidcs.php</td>
</tr>
</tbody>
</table>

Define the OpenID Connect Provider in B2C Service

You use the OIDC Providers editor in B2C Service to enter information about OpenID Connect external identity providers.

This procedure assumes that:

- You have added the Single Sign-On Configurations component to the configuration list for the Configuration button. See Create a Navigation Set for the Administrator.
- You have enabled the hidden configuration setting SSO_ENABLE_EXTERNAL_IDP. This setting is not enabled by default. To enable this hidden setting, contact your Oracle account manager or Submit a Service Request.

1. In the Agent Browser UI, click the Navigation Menu icon, then select Single Sign-On Configurations.
2. Click New on the toolbar.
3. The New OpenID Connect Provider editor displays.
4. Enter field information. All fields are required except Active.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provider Entity ID</td>
<td>Enter a unique name for the OpenID Connect (OIDC) provider in this field.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to enable the OIDC provider.</td>
</tr>
<tr>
<td>Authorization Endpoint</td>
<td>The URL on the OIDC provider for requesting authorization code</td>
</tr>
<tr>
<td>Token Endpoint</td>
<td>The URL on the OIDC provider for requesting ID token</td>
</tr>
<tr>
<td>Client ID</td>
<td>Unique ID assigned to B2C Service by the OIDC provider.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Client Secret | Confidential key assigned to Oracle Service Cloud by the OIDC provider
Scope | openid
ID Token Provider | Select the link to navigate to the page where you configure the ID token provider.
Web SSO | Select this check box to make the OIDC provider the default external identity provider.
  **Note:** Only one active identity provider can be enabled for Web SSO (across both the SAML and OIDC protocols).
Subject Type | Click the drop-down menu and select the subject type used in the ID token. The options are Email, Login Name, and Account ID. The default value is Login Name.
Logout URL | The URL on the OIDC provider for sending logout requests/responses
Token Validity | Enter the number of seconds that the timestamp on ID tokens will be accepted. This takes precedence over the timestamp on ID tokens.
Certificates | Click the arrow next to Certificates to expand this section. Click the Choose file next to the Import Certificate field to select the location of the certificate you want to use to validate ID tokens received from the OIDC provider. The certificate populates in the Certificate field. You can also specify an alternate certificate to use when validation fails using the primary certificate.
  You can click the X Delete icon to delete the certificate. Certificates can be deleted if there is more than one certificate configured for the IdP or if the IdP is inactive.

**Note:** If the certificate used to sign the ID token is self-signed, it must be uploaded to the Additional Root Certificates (certs/root) directory in the File Manager. See [Manage Files with the File Manager](#).

## Log in to External Applications Using B2C Service as the Identity Provider

You can configure B2C Service to act as an identity provider to store and authenticate credentials for other applications. This allows your agents to seamlessly access applications that reside outside the Oracle cloud from the Service Console or Agent Browser UI.

To enable the option to use B2C Service as an identity provider, you must:

- Enable the SSO_IDP_ENABLE_EXT_APPS configuration setting.
- Add the Single Sign-On Configurations component to your navigation set.

Using the Single Sign-On Configurations editor, you can create and administer SSO service providers and SSO service applications. Service providers are containers where you group multiple service applications. Each service application in a service provider will have the same SAML response and assertion methods.
**Note:** Service providers and applications hosted by Oracle display on the Single Sign-On Configurations editor, though you cannot modify most of their properties. You can, however, edit their labels and enable and disable them on your site. For information about hosted SSO integrations, contact your Oracle account manager.

1. Navigate to **Single Sign-On Configurations**.
2. In the Single Sign-On Configurations editor, create a service provider.
3. Create a service application.
4. Add the service application to a workspace where agents can then access the external application without being asked for sign-in credentials.

   See *Add Applications to the Service Console or Agent Browser UI*.

When an external application is configured to use B2C Service as the identity provider, agents will be redirected to a PHP login page if they attempt to access the external application's login page directly from a URL.

These procedures describe how to create an SSO service provider and an SSO service application, and how to view the audit log to see all related activity.

- Create an SSO Service Provider
- Create a Service Application
- View the Single Sign-On Configurations Audit Log

**Create an SSO Service Provider**

Follow the steps outlined in this procedure used to create an SSO provider.

Before you can create an SSO service provider, you must add the Single Sign-On Configurations component to the configuration list for the Configuration button. See *Create a Navigation Set for the Administrator*.

1. Click **Configuration** on the navigation pane.
2. Double-click **Single Sign-On Configurations** in your navigation list.
   - The Single Sign-On Configurations tree opens with the SAML tab active.
3. Click **New** on the ribbon, then select **SSO Service Provider**.
   - The Service Provider editor opens.
4. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provider Entity ID*</td>
<td>Enter a unique name for the service provider in this field.</td>
</tr>
<tr>
<td>Enabled</td>
<td>Clear this check box to prevent the service provider from being enabled for single sign-on integrations. After you're ready to use the service provider and its associated service applications, select the check box to enable it.</td>
</tr>
<tr>
<td>Use as Template</td>
<td>Select this check box to use the values for this service provider as your template values. If designated as the template, this service provider values are used for generating the SAML token when an Add-In requests a SAML token without specifying a specific service provider ID.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Audience Type</td>
<td>Click the drop-down menu to select the type of audience for the service provider. Options include:  ◦ None—Generated SAML token is valid for all domains and URLs.  ◦ Restricted—Generated SAML token is valid only for the specific domains and URLs defined by the token.  ◦ Custom—Generated SAML token is valid for the domains and URLs defined in the Custom Audience URL field. The default value is Restricted.</td>
</tr>
<tr>
<td>Custom Audience URL</td>
<td>Enter the domains and URLs you want to specify as valid in this field. This field displays only when the Audience Type is set to Custom.</td>
</tr>
<tr>
<td>Labels*</td>
<td>Click the arrow next to Labels to expand this section. Enter the name as you want it to display for the service provider in the Label column. You can specify different names to use for different interfaces and languages.</td>
</tr>
<tr>
<td>SAML Token Parameters</td>
<td>Click the arrow next to SAML Token Parameters to expand this section and enter information to configure the SAML assertion.</td>
</tr>
<tr>
<td>Assertion Consumer Service URL*</td>
<td>Enter the URL where the SAML token will be posted. SAML responses and assertions will be sent to this location using HTTP POST binding.</td>
</tr>
<tr>
<td>Assertion Audience Restriction</td>
<td>Enter the domain for which the SAML assertion is intended or for which it’s valid.</td>
</tr>
<tr>
<td>Assertion Validity Duration</td>
<td>Enter the time, in seconds, for which the SAML assertion is valid. Values can be from 0 to 86,400 (24 hours). The default value is 300 (5 minutes).</td>
</tr>
<tr>
<td>Assertion Validity Start</td>
<td>Enter the relative offset, in seconds, to the current time when a generated SAML assertion’s validity should start. Values can be from -1800 to +1800. The default value is 0.</td>
</tr>
<tr>
<td>Include InResponseTo element in Assertion</td>
<td>Select this check box to include the InResponseTo element in the SAML assertion. The default value is No (unchecked).</td>
</tr>
<tr>
<td>Logout Parameters</td>
<td>Click the arrow next to Logout Parameters to expand this section. The fields in this section are used to configure single logout for external service applications when using B2C Service as the identity provider. See Single Logout for SSO Applications.</td>
</tr>
<tr>
<td>Logout URL</td>
<td>Enter the URL where the identity provider sends the logout request to the service provider.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Logout Validity Duration (in seconds) | Enter the number of seconds the identity provider’s logout request will be valid.

Certificates | Click the arrow next to Certificates to expand this section. The fields in this section are used to configure certificates for single logout for external service applications when using B2C Service as the identity provider.

Do Not Verify Trust Chain for Certificates | Select this check box to prevent verification of the trust chain for the certificates you import. This lets you use self-signed certificates or certificates that don’t adhere to OpenSSL trust chain verification.

Import Certificate | Click the folder next to the field name to select the location of the certificate you want to use. The certificate displays in the Certificate field.

Import Alternate Certificate | Click the folder next to the field name to select the location of an alternate certificate to use when validation fails using the primary certificate. The certificate displays in the Alternate Certificate field.

Signing Parameters | Enter information to configure the signing method in this section.

Add Certificate to Signature | Clear this check box to prevent the signing certificate from being added to the SAML response/assertion signature.

Sign Response | Clear this check box to prevent the response part of the SAML token from being signed.

Sign Assertion | Clear this check box to prevent the assertion part of the SAML token from being signed.

Sign Method | Click this drop-down menu to select the XML signature method used to sign the SAML token. You can select:
- RSA + SHA-1
- RSA + SHA-256
- RSA + SHA-512

Sign Digest Method | Click this drop-down menu to select the digest method used to sign the SAML token signature. You can select:
- SHA-1
- SHA-256
- SHA-512

5. Click **Save**.

### Create a Service Application

Use the following procedure to create a service application.

Before you can create a service application, you must add the Single Sign-On Configurations component to the **configuration list** for the Configuration button. See *[Create a Navigation Set for the Administrator]*.

1. Click **Configuration** on the navigation pane.
2. Double-click **Single Sign-On Configurations** in your navigation list.
The Single Sign-On Configurations tree opens with the SAML tab active.

3. Select the SSO service provider you want the service application associated with.

The Service Provider editor opens.

4. Click **New** on the ribbon and select **SSO Service Application**.

5. Enter the URL that a browser using the application should navigate to in the **Base URL** field.

6. Click the **Type** drop-down menu and select the type of application.

   Options include the following:
   - Oracle ATG Web Commerce Service Center
   - Oracle ATG Engagement Engine
   - Oracle InQuira Knowledge
   - Unspecified

7. To prevent the service application from being available on the Service Console or Agent Browser UI, clear the **Enabled in Console** check box.

8. To prevent the service application from being available in a browser control, clear the **Available in Browser Control** check box.

9. To define how you want the service provider to display on the Service Console or Agent Browser UI, click the arrow next to **Labels** and enter the name you want to use for the service provider in the **Label** column.

   You can specify different names to use for different interfaces and languages.

10. Click **Save**.

### View the Single Sign-On Configurations Audit Log

Use the following procedure to view the Single Sign-On Configurations editor audit log.

1. Click **Configuration** on the navigation pane.

2. Double-click **Single Sign-On Configurations** in your configuration list.

   The Single Sign-On Configurations editor opens.

3. Click the name of the service provider, service application, or identity provider you want to examine.

4. Click **Audit Log**.

   The **Audit Log** window opens displaying the time the action occurred, the staff member who made the change, the type of action, and where on the administration interface the action was performed.

### Add Applications to the Service Console or Agent Browser UI

After you configure SSO service providers and service applications, you must add the service applications you want your agents to access to the Service Console or Agent Browser UI.

1. Create or edit the workspace your staff members will use to access the external applications.

2. Add a browser control to the workspace.

   SSO service applications you have created are available as options in `workspace` browser controls.

3. Select the service application from the **Application** drop-down menu on the ribbon’s Design tab, and drag it to the workspace.

When your staff members use the workspace, they will be able to access the application and will not be asked for credentials.

### Redirection to the B2C Service Login Page

After configuring external applications to use Oracle B2C Service as the identity provider, agents who attempt to directly access the external application’s login page will be redirected to a PHP login page where they can enter their B2C Service credentials.
If agents forget their login information, they can click Login Help on the page to recover their information. Using the ACCT_RECOVER_STATUS and ACCT_RECOVER_ALT configuration settings (RightNow User Interface/Tool Bar/General), you can choose what action is taken when staff members forget their user name or password. See Login Help Options.

**Note:** Setting ACCT_RECOVER_STATUS to 0 disables login help functionality on the PHP login page, because this value opens the login help procedure in the B2C Service online documentation.

## Single Logout for SSO Applications

Single logout for internal service providers is enabled automatically. Logout for external service providers requires editing the service provider configuration.

If your agents use single sign-on (SSO) to log in to other applications using Oracle Service Cloud as the identity provider, they can be automatically logged out of all the service providers they're logged into when they log out of any one of them. The applications can be external or internal to the Oracle cloud. This enhances the security for all the applications, because users would be forced to reenter their credentials after they log out of any one of them.

- **Internal service providers**—Single logout for internal service providers is enabled automatically and requires no configuration other than that described in Create an SSO Service Provider. Logout requests by service providers internal to the Oracle cloud do not require certificates because they're assumed to be secure.

- **External service providers**—Configuring single logout for an external service provider requires editing the service provider configuration in the Single Sign-On Configurations editor to add logout parameters and certificates.

  **CAUTION:** You must also configure the NameID Format parameter. If the NameID Format parameter for B2C Service and the external IdP do not match, then your agents might not be logged out automatically from other service providers. See Define an External IdP for Agent Authentication on the Login Window.

Logout requests by external service providers must be signed using valid certificates to ensure that the logout request can be trusted. External service providers can also use alternate certificates to help transition from expiring certificates.

- Enable Single Logout for an External Service Provider

## Enable Single Logout for an External Service Provider

If your agents use single sign-on (SSO) to log in to other applications using B2C Service as the identity provider, they can be automatically logged out of all the service providers they're logged into when they log out of any one of them.

This procedure assumes that:

- Single sign-on is enabled on your site and that you have already added the external service provider to B2C Service.
• You have added the Single Sign-On Configurations component to the configuration list for the Configuration button. See Create a Navigation Set for the Administrator.

1. Click Configuration on the navigation pane.
2. Double-click Single Sign-on Configurations in your navigation list.
   The Single Sign-On Configurations tree opens.
3. Select the service provider for which you want to enable single logout in the tree.
   The Service Provider editor opens.
4. Click the arrow next to SAML Token Parameters.
5. Click the arrow next to Logout Parameters and enter the URL where the identity provider sends the logout request to the service provider in the Logout URL field.
6. Enter the number of seconds the identity provider’s logout request will be valid in the Logout Validity Duration field.
   The default value is 600 seconds.
7. Click the arrow next to Certificates to expand the section.
8. Click the folder next to the Import Certificate field to select the location of the certificate you want to use to validate logout requests.
   After you select the certificate file, it populates the Certificate field.
9. To use a second certificate to validate logout requests, click the folder next to the Import Alternate Certificate field and select the certificate you want to use.
   Using an alternate certificate is useful if you’re transitioning from an expiring certificate.
10. Click Save.

Use OAuth Authorization to Access the Connect REST API

You can use an external identity provider (IdP) to store your credentials, and use these credentials for making requests to the Connect REST API. You can also use these credentials to make requests to the Knowledge Advanced REST API.

You must perform these tasks to use an external IdP for making REST API requests.
1. Configure the External Identity Provider.
2. Download a security certificate from the external IdP to your local computer.

Configure the External Identity Provider
This is a general procedure. The exact steps depend on the particular identity provider (IdP) used.

2. Specify the primary audience to be the Connect REST API endpoint, for example:
   https://mysite.example.com/services/rest/
3. Specify the secondary audience, if needed, to be the Knowledge Advanced REST API endpoint, for example:
   https://mysite.example.com/services/km/api/latest/
4. Set the scope to /all, so that when an OAuth access token is requested from the IdP, the primary and secondary audiences are set in the token.

Download a security certificate from the external IdP to your local computer. Then Configure B2C Service for OAuth Authorization.
Configure B2C Service for OAuth Authorization

You must perform these tasks to use OAuth authorization with the Connect REST API. These tasks aren't required if you plan to use OAuth authorization only with the Knowledge Advanced REST API.

This procedure assumes that you have access to the Identity Provider editor defined by the hidden configuration setting SSO_ENABLEEXTERNAL_IDP. This setting is not enabled by default. To enable this hidden setting, contact your Oracle account manager or Submit a Service Request.

1. Create a profile for the OAuth user that has the SSO Login (SAML 2.0) permission enabled under Administration permissions.
   See Add or Edit a Profile for more information.
2. Create a staff account for the OAuth user and assign the OAuth user profile to it.
   See Add or Edit a Staff Account for more information.
   | Note: The OAuth user staff account must not be disabled or locked.
3. Define the external IdP in B2C Service.
   See Define the External Identity Provider for OAuth Authorization.
4. Retrieve a token from the external IdP.
   | Note: The OAuth user must be defined in the external IdP.

You can now use the token in REST API for Oracle B2C Service and REST API for Knowledge Advanced in B2C Service calls. To Revoke OAuth Access Tokens, use the Manage Access Tokens editor.

Define the External Identity Provider for OAuth Authorization

You define the external identity provider (IdP) on the OAUTH tab of the Single Sign-On Configurations editor.

You must perform these tasks before defining the external IdP:

- Configure the external IdP.
- Download the security certificate from the external IdP to your computer.
- Add the Single Sign-On Configurations component to the configuration list for the Configuration button, for example to the Site Configuration tree. See Create a Navigation Set for the Administrator.

1. Click Configuration on the navigation pane.
   The Single Sign-On Configurations editor opens with the SAML tab active.
3. Click the OAUTH tab.
4. Click New on the ribbon and select SSO Identity Provider.
   The Identity Provider editor opens on the content pane.
5. Enter this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provider Entity ID</td>
<td>Required. Enter a unique entity ID for the external IdP.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the external IdP active.</td>
</tr>
<tr>
<td>Enforce Audience Restriction</td>
<td>Select this check box to force the aud attribute (audience) of the OAuth token to include the custom audience URL.</td>
</tr>
</tbody>
</table>
Enforcing an audience restriction ensures that only tokens meant for the specific site are consumed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom Audience URL</td>
<td>Enter the custom audience URL that the OAuth token must match, for example:</td>
</tr>
<tr>
<td></td>
<td><a href="https://customaudience.com/services/rest">https://customaudience.com/services/rest</a></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the Enforce Audience Restriction check box is selected, and the custom</td>
</tr>
<tr>
<td></td>
<td>audience URL isn’t specified, then the token must include the interface URL in its</td>
</tr>
<tr>
<td></td>
<td>audience list.</td>
</tr>
<tr>
<td>Token Validity</td>
<td>Enter the length of time in seconds from 1 to 86400 (1 day) for the OAuth token</td>
</tr>
<tr>
<td></td>
<td>to remain valid from the time issued. If no expiration time is set by the external IdP, the default validity is 120 seconds.</td>
</tr>
<tr>
<td></td>
<td>The length of time that the token is valid is the lesser of the following:</td>
</tr>
<tr>
<td></td>
<td>– Time issued plus token validity</td>
</tr>
<tr>
<td></td>
<td>– Expiration time set by the issuing IdP</td>
</tr>
<tr>
<td>Label</td>
<td>Required. To change the display name of the external IdP, click the arrow next to Labels and enter a label as you want it to display. The default is New IDP Provider.</td>
</tr>
</tbody>
</table>

6. Click the arrow next to **Certificates** drop-down arrow, then click the folder next to the Import Certificate field.
7. Browse for the security certificate you downloaded from the external IdP, then click **Open**.
   The certificate is imported.
8. Click **Save**.

The external IdP definition is shown in the **Identity Providers** list.

Use the Manage Access Tokens editor to **Revoke OAuth Access Tokens** as needed.

**Revoke OAuth Access Tokens**

You use the Manage Access Tokens editor to revoke OAuth access tokens.

You must add the Manage Access Tokens component to the **configuration list** for the Configuration button, for example to the Common tree. See *Create a Navigation Set for the Administrator*.

1. Click **Configuration** on the navigation pane.
2. Expand **Common**, then double-click **Manage Access Tokens**.
   The Search window opens.
3. Enter or choose search terms, then click **Search**.
   Access tokens are displayed in the list.
4. Click the **Revoke** link in the Action column to revoke a token.
   That token can no longer be used to makes REST API calls.
5. Click the **Unrevoke** link to make the token valid again.
   You can unrevoke tokens as long as they have not expired.
Add-Ins

Overview of Add-Ins

The desktop add-in framework lets application developers add custom components, or add-ins, to Oracle B2C Service to integrate with other applications on staff members' workstations.

Add-ins are uploaded using the Add-In Manager. From the manager, you can provide or deny access to individual add-ins for each profile and interface. Staff members who are granted access to use add-ins will have the necessary add-in files downloaded to their workstations. For information about managing add-in permissions through profiles, see Profiles. For information about creating add-in files, see Desktop Add-Ins Developer Guide.

Note: In severe cases, a malfunctioning add-in can prevent the Service Console from functioning properly and can even prevent administrators from logging in to remove the malfunctioning add-in. If this occurs and you are required to exit the administration interface without completing the normal logout process, the system notifies you the next time you log in that Oracle B2C Service did not exit properly the last time, and asks if you want to log in using safe mode. Safe mode temporarily disables your add-ins, allowing you to log in and remove the malfunctioning add-in.

Add-In File Conventions

The add-in files you upload must conform to certain conventions to be recognized by the Add-In Manager.

- The files must be either direct linked library (DLL) files that reference the add-in views or zipped (.zip) archives.
- Zip files can contain any number of files but must not contain subdirectories. If subdirectories are included in the zipped archive, the subdirectories will be removed.
- Zip files must contain only one .dll file that references the add-in views. If more than one add-in is included in the zipped archive, the add-ins will not be properly activated. The .dll file in the zipped archive that contains the reference to the add-in views must have the same name as the zipped archive.
- The names of .dll files you upload must be unique and the names of the assemblies they contain must match the .dll file names. If the name of the assembly does not match the name of the .dll file you upload, the assembly will not link correctly with the profiles that should have permission to use it.

Install a New Add-In

Using the Add-In Manager, you can quickly upload files and assign profile permissions to use the add-ins.

You can also specify custom values for .NET attributes from the Add-In Manager. Additionally, you can specify different values for each profile and interface and the specified values are stored in the Oracle database. This eliminates the need to store custom values for attributes in client-side XML configuration files.

The Add-In Manager is available to only those staff members with the Configuration permission selected on their profile’s Administration tab.

1. Click Configuration on the navigation pane.
2. Expand **Site Configuration**, then double-click **Add-In Manager**. The Add-In Manager opens on the content pane.

3. To open an existing add-in for editing, click the add-in name. If the add-in's `.dll` or `.zip` file has been modified or replaced by a different file, you can update the add-in to reflect the changes.

4. To install a new add-in, click **New**, then select **Agent Desktop Add-In**.

   **Note:** When the Open window initially displays, only `.dll` files appear. To view `.zip` files, click the Files of Type drop down menu and select Compressed Add-In Files.

   a. Select the add-in's file and click **Open**.
   
   The **Add-In Details** editor displays. The Name and API DLL Version fields are populated.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the <code>.dll</code> or <code>.zip</code> file you uploaded.</td>
</tr>
<tr>
<td>API DLL Version</td>
<td>The version of the add-in API that the file was built against.</td>
</tr>
<tr>
<td>Created</td>
<td>The date and time the add-in was initially uploaded.</td>
</tr>
<tr>
<td>Created By</td>
<td>The staff member who uploaded the add-in.</td>
</tr>
<tr>
<td>Updated</td>
<td>The date and time the add-in was most recently updated.</td>
</tr>
<tr>
<td>Updated By</td>
<td>The staff member who most recently updated the add-in.</td>
</tr>
</tbody>
</table>

5. To select a different file for the add-in, click **Folder** in the Name field, select the file, and then click **Open**.

6. To add a note to the add-in, enter it in the **Notes** field.

7. To specify the profiles that can access the add-in, click **Profile Access**.
   a. Select the profile in the Profiles Allowed to Access section.
   b. Select the appropriate interface check boxes in this section. Only **interfaces** that the profile has permission to access are displayed in the Interfaces section.
   c. To give the selected profile access to the add-in on all interfaces, select the **Select All** check box.
   d. To grant add-in access to all profiles on all interfaces, click **Apply All**.
   e. To remove add-in access from all profiles and interfaces, click **Clear**.

   When you enable the add-in for a profile and interface, the class names, property names, and default values for the add-in's configurable properties display.

8. Select the property you want in the Server Configuration Properties section, then double-click the property's **Value** field.
   a. To change the value for a property with a string or numeric type, enter the numbers or text you want for the property's value.
   b. To change the value for a property with a Boolean (yes/no) type, select or clear the check box that is displayed.

9. To specify different property values for another interface, select the interface and repeat step 7.

10. To specify different property values for another profile, select the profile and repeat step 7.

11. To automatically apply the property values you specified to other profiles and interfaces, click **Apply**, then select the appropriate option.
   a. To apply the property values to all interfaces for the profile, select **Apply this Configuration to All Interfaces for the Selected Profile**.
b. To apply the property values to all profiles and interfaces, select Apply this Configuration to All Profiles and Interfaces.

12. To automatically remove customized property values from profiles and interfaces, click Restore and select the appropriate option.
   a. To reset the values for all profiles and interfaces, select Restore the Default Configuration to All Profiles and Interfaces.
   b. To reset the values for all interfaces enabled for the selected profile, select Restore the Default Configuration to All Interfaces for the Selected Profile.

13. Click Save.

Install an Updated Add-In

If you edit or replace files used for an add-in you have previously installed, you need to update the add-in in the Add-In Manager.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, then double-click Add-In Manager.
   The Add-In Manager opens on the content pane.
3. Click the name of the add-in you want to update.
4. Click Update.
   Note: When the Open window initially displays, only .dll files appear. To view .zip files, click the Files of Type drop-down menu and select Compressed Add-In Files.
5. Select the add-in's updated file, then click Open. The display is updated to reflect any changes from the updated add-in file.
6. Make any edits to the add-in that you need.
7. Click Save.

Remove an Add-In

You will sometimes need to remove add-ins that you no longer use from your site. This is done using the Add-In Manager. You cannot remove add-ins when an upgrade test site exists.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, then double-click Add-In Manager.
   The Add-In Manager opens on the content pane.
3. Click the name of the add-in you want to remove.
4. Click Delete.
5. Click Save.

View the Audit Log for an Add-In

The audit log displays the type of action performed on the add-in, the staff member who made the change, when the action occurred, and where on the administration interface the action was performed.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click Add-In Manager.
The Add-In Manager opens on the content pane.
3. Click the name of the add-in you want to examine.
4. Click the **Audit Log** button on the ribbon. The Audit Log window opens.
5. Click **X** on the top right to close the window.

### Use Add-Ins in Scripts and Workspaces

After you upload an add-in, you can place it in scripts and workspaces. This functionality can be added in several ways, depending on how the add-in is written.

If the add-in includes functionality to accept information from rule and branch conditions, you can configure *script* branches and script and *workspace* rules to send information to the add-in and perform actions based on the add-in's response. For instance, if your organization handles customers whose products are still under warranty differently than customers with expired warranties, you could create a script branch that opens one script page if a customer's product is still under warranty and another page if it is not.

The add-in can be displayed anywhere you want on the script or workspace, or you can hide it using functionality in the script and workspace designers. You can also configure script branches and script and *workspace rules* to communicate with the add-in. We provide a script example here.

1. Add a custom field to your script where customers enter their product’s serial number.
2. Place an add-in on the script that compares the value entered in the custom field to a list of serial numbers that are under warranty.
3. Create two script branches that branch to different pages on the script.
4. Configure the branches to fire when the customer clicks the **Next Page** button on the script’s navigation panel (or when another action is taken).
5. Create one *If* condition for each branch that is checked when an add-in’s control condition returns a certain value.
6. When you edit the conditions, you can enter the information you want to send to the add-in in the **Add-In Parameter** field.
   - In this example, you send the custom field’s ID number to the add-in. The add-in would then find the value entered in the custom field on the script and compare it to an external database that contains serial numbers that are under warranty.
7. Set different operators and values for the conditions in each branch.
   - If you want the add-in to return true when it finds the serial number in the external database, set the operator to **equals** and the value to **true**.
   - Set the other branch’s operator and value to **equals** and **false**.

Using this configuration, one branch is triggered when the add-in finds that a serial number is under warranty, and the other branch is triggered when the add-in finds it is not under warranty.

Using script or workspace rules, you could further expand this example to update the external database with the serial number entered on the script when other conditions are met.

### View Add-In Log Messages

After add-ins are installed, you can view log files of the activity related to add-ins you use or that you have added or deleted from the Add-In Manager.
Add-in logging is particularly useful for add-in developers or administrators who need to test or troubleshoot add-ins. You can also view which add-ins are enabled for your profile that might impact the behavior of the Service Console.

All messages on the Log Messages window are removed when you log out of B2C Service. However, you can save the messages for later viewing or remove the messages without logging out of the application. These options apply only to the messages displayed on the window’s active tab.

**Note:** The entries on the Log Messages window are deleted when you log out of the administration interface. In addition, the messages are unique to your session and do not include messages related to other staff member sessions. However, you can save the messages to text files for later viewing.

1. Click **File** and then select **Add-In Logging**.
   a. To view the current log file, select **View Current Log File**.
   b. To view the previous log file, select **View Previous Log File**.

The Log Messages window opens. Two tabs are available on the window. The Log Messages tab shows only messages you choose to see, and the In Memory Log Messages tab displays all messages related to your add-in activity during your current session. Each message is associated with one of these message types.

<table>
<thead>
<tr>
<th>Message Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error messages describe problems add-ins encounter that prevent them from working correctly.</td>
</tr>
<tr>
<td>Warning</td>
<td>Warning messages describe possible issues that may prevent add-ins from working as expected.</td>
</tr>
<tr>
<td>Information</td>
<td>Information messages describe events that happen to add-ins, such as when they are activated or deleted on the Add-In Manager.</td>
</tr>
<tr>
<td>Verbose</td>
<td>Verbose messages describe the flow of add-in actions, such as when an add-in executes an action. These messages are not displayed on the In Memory Log Messages tab.</td>
</tr>
<tr>
<td>Activity Tracing</td>
<td>Activity Tracing messages provide additional details about add-in activity, such as the amount of time it takes to execute an add-in action. These messages are not displayed on the In Memory Log Messages tab.</td>
</tr>
</tbody>
</table>

2. To view only certain types of messages or messages pertaining to certain activities, click the **Log Messages** tab and then select which message types you want to view from the drop-down menus.

<table>
<thead>
<tr>
<th>Drop-down Menu</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activation Logger</td>
<td>Message types in this drop-down menu are written to the log file when add-ins are activated or initialized. Entries will also be written when initialization fails or an exception occurs during activation or initialization.</td>
</tr>
<tr>
<td>Distribution Logger</td>
<td>Message types in this drop-down menu are written to the log file when add-in files are uploaded, updated, or removed.</td>
</tr>
<tr>
<td>Component Logger</td>
<td>Message types in this drop-down menu are written to the log file by active add-ins that use the IGlobalContext.LogMessage API.</td>
</tr>
</tbody>
</table>
3. To remove log messages you do not want to see, select the tab showing the messages and then click **Clear Messages**.
4. To save the log file to a text file you can open for later viewing using a third-party text editor, select the tab with the messages you want to save and then click **Save Messages**.
   A window opens where you select the location and name of the text file containing the log messages.

### View Add-Ins Enabled for Your Profile

The add-ins that are enabled for your profile can impact the behavior of the Service Console.

Therefore, you will want to view lists of the enabled add-ins to see which ones you can access on the interface to which you are logged in, and add-ins that are not applicable to the current interface.

1. Click **File** and select **Options > Add-Ins**.
   The list showing the add-ins enabled for your *profile* displays on the right. The list displays four columns of information showing the file name, display name, mode, and version number of each installed add-in. The mode can be either production or development. Add-ins in production mode were installed using the Add-In Manager. Add-ins in development mode were manually added to the workstation, generally for testing purposes.
2. Click **OK** to close the list.

### Agent Browser UI Extensions

You can import Agent Browser UI Extensibility Framework files into Oracle B2C Service to create extensions by using the Add-In Manager.

You use this process:

1. Create custom content to display on the Agent Browser UI by using the extensibility framework. See the *Agent Browser UI Extensibility Framework Developer Guide*.
2. Create an extension by using the Add-In Manager. See *Overview of Agent Browser UI Extensions*.

### Download Add-Ins and Extensions

You can download add-in and extension files from the Add-In Manager by using the Download button on the ribbon.

Files must first be saved in the Add-In Manager before they can be downloaded.

Downloading add-in and extension files let you troubleshoot any errors that might occur in using these files. You can also use the download capability to import add-ins and extensions to other sites.

1. In the Add-In Manager, select the add-in or extension that you wish to download.
2. Click **Download** on the ribbon.
3. In the **Save As** window, select where you want to save the add-in or extension, and click **Save**.
Add-ins are saved as `.zip` archives.
Extensions that consist of a single file, such as `.js` or `.json`, are saved as the file itself. Extensions that contain multiple files are saved as `.zip` archives.

## Multiple Interfaces

### Overview of Multiple Interfaces

When you use multiple interfaces, each interface can be a unique configuration of the data in your installation's single knowledge base.

Each installation of B2C Service initially contains one knowledge base and one interface. The knowledge base contains all the data needed to run B2C Service and organizes it in a meaningful way by connecting the related components, such as products, answers, and staff accounts. The interface, on the other hand, is designed solely to display the data stored in the knowledge base.

Multiple interfaces let you apply a unique configuration of your data to each interface in your installation's single knowledge base. For example, you might want an interface for your retail customers that is different from the one for your corporate customers. You may need Spanish- and French-language sites in addition to your primary English-language site to serve all your North American customers. Or perhaps your company produces different product lines and you want to create an interface for your medical electronics customers that is different from the one you use for your computer system customers.

In addition to offering multiple customer sites, you can also control how information is displayed on the agent desktop. Using visibility settings for specific fields in each interface, you choose what can be viewed by your staff members.

Additional interfaces are cloned from the original, or primary interface. The new interface is then configured separately from the primary interface. The process is the same regardless of the number of interfaces that have already been created.

**Note:** You must set up customer portal pages separately for each interface.

### Alternatives to Multiple Interfaces

Before configuring multiple interfaces, you should consider whether that solution best addresses your organization's needs since other options may be more appropriate.

- **Multiple knowledge bases**—If your organization has sensitive information that you do not want to share across interfaces, you might want to consider using separate knowledge bases rather than multiple interfaces. When using multiple interfaces, many records on the agent desktop can be viewed by all staff members, including those with access to just one interface. For example, agents with permission to view contacts can view all contacts, regardless of the interface. Using separate knowledge bases lets you offer different support sites, just as you can with multiple interfaces, but the installations are completely separate and each site has a unique set of data.

- **Privileged Access**—If you want only to grant varying levels of information to different groups of customers but do not have sensitive information and do not require a unique configuration for each interface, consider using privileged access rather than multiple interfaces. You must set the ANS_PRV_ENABLED configuration setting to
Yes in order to enable privileged access to answers. This setting is located in the Configuration Settings editor in RightNow User Interface/End-User Interface/Answers. See Edit a Configuration Setting.

**Note:** Contact your Oracle account manager for information about multiple knowledge bases.

### Interface Options and Settings

When you clone an existing interface, the new interface is initially identical to the original interface. You must make changes to the cloned interface so that it presents the information you want in the format you want it to display.

It is important to understand how all interfaces are affected by changes you make to a single interface. Some changes appear on all interfaces regardless of the interface where you created or changed them. Some changes appear only on the interface where you make them. And still other types of changes appear only on the interfaces you select.

**Note:** The configuration and analytics items in the following lists are displayed beneath their default locations on the navigation pane. However, they may display in different locations or not at all depending on your navigation set configuration. The lists also display common and interface-specific record types.

### Common Items and Settings

Certain items and settings are shared across all interfaces and are not interface specific. Therefore, when you add or change one of the items on one interface, it automatically appears on the other interfaces.

For example, staff accounts added while logged in to one interface can be viewed and edited from any interface.

The following items are common across all interfaces.

#### Configuration

- **Staff Management**
  - Accounts
  - Password Configuration
  - Profiles
- **Application Appearance**
  - Client Workflow Images
  - Customizable Menus (Answer Statuses, Asset Statuses, Billable Tasks, Chat Agent Statuses, Chat Session Queues, Contact Roles, Contact Types, Incident Queues, Incident Sevities, Incident Statuses, Opportunity Statuses, and Organization Address Types)
- **Site Configuration**
  - Distribution Lists
  - Mailboxes
  - Process Designer
  - Rules
  - Site-specific configuration settings
Chapter 2
Core Features

- Site-specific message bases

  - Internationalization
    - Countries

- Service
  - Answer Stopwords
  - Channels
  - Guided Assistance
  - Service Level Agreements (SLAs appear on all interfaces. However, you must set the response requirements separately for each interface.)

- Opportunity Tracking
  - Product Catalog
  - Sales Periods
  - Strategies

- Outreach
  - External Suppression List

- Database
  - Data Dictionary
  - Object Designer (custom objects)
  - Incident Thread Correction
  - Data Import Template
  - Data Import Wizard
  - Email Address Sharing

Analytics

- Report Styles
- Chart Styles
- Color Schemes
- Report Images
- Text Fields

Record types

- Contacts
- Organizations
- Tasks
- Standard reports
- Incidents
- Answers
• Opportunities

Interface-Specific Items and Settings
In contrast to common items and settings, others are unique to an interface and impact only the interface they are configured on.

For example, to create a survey, you must log in to the interface from which the survey will be used. These items are indicated in the following list.

Other items and settings, such as message bases, are interface specific, but can be configured from any interface. Before configuring the item or setting, you select the interface you want to configure.

Configuration
• Application Appearance
  ◦ Navigation Sets—Can be configured only for the logged-in interface
  ◦ Scripts—Can be configured only for the logged-in interface
  ◦ Workspaces/Workflows—Can be configured only for the logged-in interface

• Site Configuration
  ◦ Customer Portal
  ◦ File Manager
  ◦ Interfaces
  ◦ Interface-level configuration settings
  ◦ Interface-level message bases
  ◦ Message Templates

• Service
  ◦ External Search Configuration—Can be configured only for the logged-in interface
  ◦ Incident Stopwords—Can be configured only for the logged-in interface
  ◦ Response Requirements
  ◦ Search Priority Words—Can be configured only for the logged-in interface
  ◦ Topic Browse
  ◦ Variables

• Opportunity Tracking
  ◦ Promotions—Can be configured only for the logged-in interface

Record types
• Custom reports—These are configured from the interface they display on, but can display data from multiple interfaces. See Export a Report Definition to an XML File to learn about copying reports from one interface to another.
• Audiences
  ◦ Contact Lists
Options with Interface Visibility Settings

There is another set of options that may be shared across interfaces, but only if you set the visibility setting of the option to appear on the selected interfaces.

The following list includes those options that can be visible on other interfaces if you set them to appear on the specific interfaces.

**Configuration**

- Application Appearance
  - Customizable Menus (Answer Access Levels, Competitors, Industry Types, Lead Rejection Types, and Win/Loss Reasons)
- Site Configuration
  - Add-in Manager
  - Logs
- Internationalization
  - Currencies/Exchange Rates
- Service
  - Holidays
  - Products/Categories/Dispositions
  - Standard Text
- Opportunity Tracking
  - Product Catalog
  - Price Schedules
  - Quote Templates
  - Territories
When to Use Multiple Interfaces

The decision to use multiple interfaces depends on what you want to accomplish with each interface. The following list summarizes the procedures involved in creating and configuring an additional interface. After you have completed the first two procedures, you need to decide which of the remaining procedures listed in this section you need to implement. Your decision depends on what you want to accomplish, but it is likely that you will want to implement many, if not all of them.

1. How You Determine Interface Needs—Decide how your staff and customers are going to use the new interface to determine how it must be configured. Your Oracle account manager can assist you in defining your objectives.
2. Change the Interface Display Name—Change the interface name that appears on the agent desktop.
3. Staff Member Accessibility—Use navigation sets, workspaces, and profiles to establish the interfaces staff members have permission to access and work on.
4. How You Manage Visibility in Configuration Items—Customize configuration items with specific visibility settings such as custom fields and products.
5. How You Configure and Customize the Interface—Customize the interface-specific configuration settings for each new interface through the Configuration Settings editor.
6. How You Manage Multiple Interfaces by Creating Business Rules—Define rules to automatically assign incidents and opportunities to the proper interface and queue or staff member.
7. How You Configure Mailboxes for Multiple Interfaces—Customize your Service and Outreach mailboxes for each interface.
8. How You Customize Message Templates for Multiple Interfaces—Customize the notifications and emails that can be sent to your staff members and your customers from each interface.
9. How You Add Answers for Multiple Interfaces—Determine the content you want to provide to your customers through the customer portal and create your answers.

How You Determine Interface Needs

When you clone an interface, the new interface is a duplicate of the original interface and has the same customized configuration.

For this reason, we recommend waiting to clone your interface until you complete configuring the original interface. This can help reduce the amount of customization you need to do on the cloned interface, particularly if you want the interfaces to be similarly configured.

Before you clone interfaces, you should consider how your staff members and customers will use the new interface and what changes you need to make to accomplish the intended purpose. As a starting point, consider whether the language will change, whether the new interface needs to send and receive email, what custom fields and customizable items you want to appear on the new interface, which configuration settings (site or interface specific) and message bases need to change, and whether you can use business rules to manage the new interface.
Note: Because configuration settings and message bases are categorized as site or interface specific, it’s critical to know which settings will affect all interfaces (site specific) and which ones will affect only one interface (interface specific). Since there are fewer site-specific settings, it is easier to identify those by searching for all site-specific settings on the Configuration Settings editor. Using this search criterion, you can easily see which settings are applied across all interfaces and decide what is best for your situation. See Search for a Configuration Setting and Search for a Message Base.

Also consider what level of access your staff members and customers should have to the new interface to determine if you need to modify profiles or reconfigure customer portal pages. You should also identify who, if any staff members besides you, will have administration permissions on all interfaces. Ideally, a limited number of administrators have access to all interfaces. If you have a large number of administrators, it can be challenging to prevent unwanted additions or deletions of fields or items that affect the incorrect interface.

While performing this step, start thinking about naming conventions for your staff accounts, profiles, customizable menus, and custom fields. For example, the names you select for profiles configured for an internal interface could begin with “internal” to make it easier to identify the profiles that belong to the interface.

Change the Interface Display Name
You may decide you want to change the name of the interface as it displays for staff members.

Changing the interface name affects only the display of the interface name as it appears to staff members on the agent desktop. URLs to your interface continue to use the original interface name.

1. Click Configuration on the navigation pane.
2. Expand Site Configuration, and then double-click Interfaces.
3. Click the interface name you want to edit.
4. Enter the new interface name in the Display Name text box.
5. Click Save.

Staff Member Accessibility
There are three components that affect how your staff members access your interfaces: navigation sets, workspaces, and profiles. To present the appropriate information to staff members, and allow access to only those interfaces and features required by your organization, it is important to understand how the components work together.

Related Topics
- Navigation Sets in Relation to Multiple Interfaces
- Workspaces in Relation to Multiple Interfaces
- Profiles in Relation to Multiple Interfaces

Navigation Sets in Relation to Multiple Interfaces
By selecting proper reports for each navigation set, you can limit the results for staff members to the interface they primarily work from.

For example, you may want to set the incidents reports that display in the navigation list to only those reports that filter by a particular interface. See Create a Navigation Set.

Navigation sets define what appears to staff members on the agent desktop. In addition to the buttons on the navigation pane, you can determine which reports staff members can access and which appear by default when the console opens or a navigation button is clicked.
After your navigation sets are configured, you can assign them to profiles. See Profiles.

Workspaces in Relation to Multiple Interfaces
Workspaces can help define how staff members use your interfaces. Since each profile uses separate workspaces for each interface, you can create different workspaces to accommodate staff members who use different interfaces.

For example, staff members who log in to an interface used by external customers may use a contact workspace that includes the contact first name and last name fields. Staff members who log in to an internal interface may use a contact workspace that shows only the contact email address field. By using different workspaces on each interface, you can display only those fields staff members need to view or fill in on that particular interface. After your workspaces are created, you can assign them to the necessary profile. See Custom Workspaces.

Profiles in Relation to Multiple Interfaces
When you clone an interface, all profiles with permission to access that interface automatically have permission to access the new interface. If you do not want certain profiles accessing the cloned interface, you must edit the profile settings to remove that permission.

Each staff member is assigned a profile that determines which interfaces the staff member can access. Profiles also determine the queues staff members can pull incidents from, so you must ensure that the profile can access the appropriate interfaces.

In addition, you can specify the navigation set and the workspaces staff members use through their profile. For each profile, you can specify the navigation set used on each interface, as well as the workspaces used for each record type on each interface. See Add or Edit a Profile.

How You Manage Visibility in Configuration Items
You can specify the interfaces where certain configuration items appear, while others are visible across all interfaces.

Those items visible on all interfaces are listed in Common Items and Settings. When you add one of these items to your interface, it appears on all interfaces. For example, if you add a custom incident status, staff members working on incidents from any interface can set an incident to that status.

Other configuration items, such as custom fields, contain visibility settings for selecting the interfaces on which they appear. These items are listed in Options with Interface Visibility Settings. Some of these let you select the interfaces and others let you specify not only the interface, but also whether the item is visible on the customer portal or the agent desktop. If you have separate customer portal pages for different product lines, for example, you will likely want to restrict sales products to unique interfaces so that they appear only on the appropriate site.

To specify the interfaces where you want the configuration item to appear, simply select the check boxes for each interface.

In a multiple language installation, you can specify that configuration items appear on all interfaces but change the name for each interface to show the translated version of the item. You do this by logging in to the proper interface and entering the foreign language word in the Label field.

How You Configure and Customize the Interface
Each interface has its own configuration settings. When you cloned your interface, any customized configuration settings were copied to the new interface. You must manually adjust any configuration settings that should be changed for the new interface.

For example, you may choose to let customers ask a question on one interface but not the other. See How You Customize Configuration Settings.
How You Manage Multiple Interfaces by Creating Business Rules

When you create rules for multiple interfaces, you must be aware of the visibility settings for your custom fields and customizable menu items.

The rules engine can access all custom fields and customizable menu items regardless of their visibility settings, so all conditions and actions that use those fields and items are available to you, even if they cannot be displayed on the interface. See Options with Interface Visibility Settings for a complete list of options.

Because the rules engine does not filter fields and menu items based on their visibility on the interface, you run the risk of setting a field or menu option that is not visible. To prevent meaningless actions and ensure that the rules engine sets the field or menu item you want it to, you can specify the interface as one of the rule conditions when you create incident, chat session routing, opportunity, and target rules. And, if the object meets certain conditions, you can use a rule action to set the interface to a different one for rule processing.

It is important that an object be processed on the correct interface because the rules engine uses the message bases and configuration settings of the interface associated with the object. For example, if you try to use an English-language interface to process an incident that was sent in German, any message bases used to respond to the incident will be in English. For that reason, it is important that objects be processed on the correct interface. Fortunately, rule actions let you set the interface when the rule conditions are met.

And although you cannot set the language or mailbox in a rule action, you can use them as conditions to set the interface in the rule. Assume, for example, you have two interfaces: one English-language interface and one German. Also assume that Techmail is scheduled to run only on the English interface. While you cannot change an incident language to German in a rule, you can change its interface. And, because the interface uses the message bases of the interface processing the rule, changing the interface accomplishes the same results.

The following rule demonstrates this:

\[
\text{If Incident.Language equals German} \\
\text{Then Set Interface Name to german_interface}
\]

See Overview of Business Rules. For examples of commonly used business rules, see Examples of Business Rules.

How You Configure Mailboxes for Multiple Interfaces

If you have Service enabled, you must create at least one Service mailbox for the new interface in order to send and receive email. If Outreach or Feedback is enabled, you must create at least one Outreach mailbox to create and send mailings and surveys.

If you have multiple mailboxes for the interface, you must specify a default Service mailbox and a default Outreach mailbox. Even though you can configure your interface to send email from a single address, if you have multiple mailboxes, you must configure each mailbox separately. However, you can configure mailboxes for all interfaces, from any interface, using the Mailboxes editor. See How Mailboxes Work.

Note: To ensure accurate processing of replies, inbound messages, and bounces, Outreach mailboxes cannot be shared with either type of Service mailbox (Oracle-managed Service or general Service). Techmail handles messages in Service mailboxes differently from how it handles them in Outreach mailboxes. For this reason, you must set up one mailbox for Service and a separate mailbox for Outreach and Feedback.

Distribution lists are not interface specific so any distribution list you add on one interface is available on all other interfaces. See Add or Edit a Distribution List.
How You Customize Message Templates for Multiple Interfaces

You may want to change the notifications, emails, and print templates that can be sent to your staff members and your customers from each interface. You may also want to change the content that is sent by interface.

Message templates let you define the format of your messages and disable certain messages if they do not pertain to an particular interface. You can also customize your logo, your headers and footers, and your message content. For example, if you have a parent company with multiple subsidiaries, each with a unique brand, the look and feel of each interface can be defined using the global template. The global template is then applied across every single message that is enabled on that interface. See *How the Message Templates Editor Works*.

How You Add Answers for Multiple Interfaces

When you create answers to populate your knowledge base, you need to think about which interfaces you want them to appear on and then associate each interface with the proper answer access level.

For example, you could create two custom answer access levels, Internal and External, each with visibility on different interfaces. Answers with the Internal access level would display on only the interface used by your organization’s employees. Answers with the External access level would display on only the interface used by your external customers. To have the answer appear on both interfaces, select the access level Everyone.

Although we recommend that you use answer access levels as the key element for determining answer visibility, there are other ways to control where answers are displayed and who can view them. Here are the other methods you can use to control the display of answers.

<table>
<thead>
<tr>
<th>Item</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer Access Levels</td>
<td>Select the interface you want the access level to display on.</td>
</tr>
<tr>
<td>Products and Categories</td>
<td>Select the interfaces where each of your products and categories are visible.</td>
</tr>
<tr>
<td>Answer Statuses</td>
<td>Select the Public answer status type to display answers on the customer portal. All other types restrict the display so customers cannot see them.</td>
</tr>
<tr>
<td>Languages</td>
<td>Create the answer on a language interface to restrict the answer display to that language.</td>
</tr>
<tr>
<td>Conditional Sections</td>
<td>Insert a section with certain visibility restrictions within an answer.</td>
</tr>
</tbody>
</table>

If a section of the answer is assigned an access level that is not visible to customers on a particular interface, but the answer is visible, then customers can view the answer but not the conditional section. See *Insert a Conditional Section*.
Common Functionality

Overview of Common Functionality

B2C Service is designed for efficiency by making procedures as similar as possible.

When you know how to attach files to an incident, for example, you can use that knowledge to attach files to any kind of record. By understanding common functionality, you improve your confidence and efficiency when working in B2C Service.

Common functionality applies to searching, opening, forwarding, copying, printing, assigning, flagging, and attaching files to different types of records. Also common to B2C Service are standard workspaces, audit logs, spell checking, workgroups, Outlook appointments, and notifications. Because the majority of common functions are performed using the ribbon, it is important that you first become familiar with it.

Common Functionality Ribbon

All items that appear on the content pane—reports, explorers, and records—display a ribbon at the top of the page, just below the Oracle logo button at the top left of the console.

The ribbon has tabs and buttons that let you work with a report, an individual record in the report, or an item in the explorer tree. Buttons are organized into groups, and each tab may include several groups.

Click any ribbon tab to display the buttons for that tab. Or, with your mouse or other pointing device positioned anywhere in the ribbon, scroll down to move one tab to the right. Scroll up to move one tab to the left.

Some buttons on the Home tab contain an arrow, including Open, New, Print, Copy, Assign, and Delete. Clicking the arrow rather than the button displays a list of associated records you can take the action on instead of the incident, which is the default record that the action applies to. For example, if you click Open, the incident that you have selected on the content pane opens. If you click the arrow on Open, a menu displays the records you can open (incident, contact, organization, or mailing) that are associated with the selected incident.

Some tabs, buttons, and groups always appear on the ribbon no matter what is displayed on the content pane. Others are content dependent. That is, they change to reflect what appears on the content pane and the allowable actions for that report, explorer item, or record.

**Note:** If nothing opens on the content pane when you log in, the ribbon is empty except for the Home tab. See Change Your Navigation Pane Settings to see how to define what opens on the content pane when you log in.

When you want to display a larger section of a report and do not need access to the ribbon, you can easily minimize it. You will still have access to the tabs and buttons you need.

- To minimize the ribbon, double-click any tab with focus or press Ctrl+F1.
- To restore the ribbon, double-click any tab or press Ctrl+F1.
- To display and click buttons on a tab without maximizing the ribbon, just click that tab.
Customize the Quick Access Toolbar

The Quick Access toolbar, which appears next to the Oracle logo button at the top left of the console by default, provides shortcuts to commands on the ribbon.

The initial set of buttons on the Quick Access toolbar is specified by what is displayed on the content pane, but you can customize the toolbar to add buttons you frequently use. (The customized toolbar is stored in local settings on your workstation. See Change Your Personal Settings.)

Tip: Some ribbon content cannot be added to the Quick Access toolbar, including check boxes, combination boxes, text fields, and some other input fields.

1. To add a button to the Quick Access toolbar, right-click the button on the ribbon and select Add to Quick Access Toolbar.
2. To add a content-dependent or global option on the file menu to the Quick Access toolbar, click File, right-click the option on the left panel of the file menu, and select Add to Quick Access Toolbar.
3. To remove a button from the Quick Access toolbar, right-click the button on the toolbar and select Remove from Quick Access Toolbar.
4. To move the Quick Access toolbar from above the ribbon to below the ribbon, click the drop-down menu on the Quick Access Toolbar and select Place Quick Access Toolbar Below the Ribbon.
5. To reset the Quick Access toolbar to its default settings, click the drop-down menu on the Quick Access Toolbar and select Reset Quick Access Toolbar to default.

Display Shortcut Keys on the Ribbon

Shortcut keys are available for all ribbon buttons so you can enter a key combination to perform an action rather than clicking a button on the ribbon.

1. While editing a record or working in an explorer, press Alt plus the first letter of the ribbon tab that you want to display shortcut keys for. For example, press Alt+H to display the shortcut keys on the Home tab of the ribbon.
2. Enter the keys associated with a particular button to perform the button’s action.
   After using this method to perform an action, the shortcut keys no longer display. See Shortcut Keys.

Record Search Options

One way to find a specific record when a report is open is by scanning the list of displayed records to see if you can spot it.

B2C Service offers other much more efficient methods of searching for records. Besides simply looking in a report for a record, you have the following search options.

- **Search for a Record from a Report**—If you do not immediately see the record you want in the report, you can search for it. The filters that appear when you click Search depend on the report and which filters have been defined for it.
- **Overview of Quick Search**—With the Quick Search component, you can search for a specific record by entering as much or as little information about the record as you have. The list of records that match the information you enter is displayed, and you can select the one you want.
- **How You Search from Open Records**—You can search for contacts and tasks from any open record that has a contact or task associated with it. You can also search for organizations from some types of open records.

Search for a Record from a Report

Reports can be used to display lists of records. When you open a report, you can easily search for a record from that report.

Double-click any report in a navigation list to display a list of records in the report on the content pane. (The reports in your navigation lists are determined by the navigation set assigned to your profile.) The information displayed on the content pane depends on the report you selected and which fields were defined when the report was created. When you search for records using the report Search function, you can identify records that meet the criteria you specify. For example, you can search for incidents assigned to a certain staff member, answers that contain particular words or phrases, or tasks that are due this week. You can then sort your search results in ascending or descending order based on any of the filters you used for searching.

1. With a report displayed, click Search on the Home tab of the ribbon. A Search window opens, displaying the search filters that are available for that report. (Each report uses the filters specified in the report definition.)

   **Tip:** You can resize the Search window to display all of the filters available for a given report. The size of the Search window is retained until you resize it again or reset the workstation local settings. See Change Your Personal Settings.

2. To specify a filter that has a check box, select the check box next to each filter you want to use in your search or clear the check box for those you do not want to use.

3. To specify a date filter, click the calendar button in the field to display the current month’s calendar. Then select the date. (Use the arrows at the top of the calendar to change the month if necessary before selecting the date.)

4. To specify a text filter, enter text in the field. You can use an asterisk (*) as a wildcard in your search term.
   a. When you are searching for answers, you can use the search text type fields Phrases, Similar Phrases, Exact Search, Complex Expression, or Answer ID. See Answer Text Field Search Options.

5. To limit the number of records returned in the search, select the Limit To check box and enter a number in the Rows field. The total number of search results is restricted to this value. If the Limit To check box is cleared, the search results are unlimited.

6. To limit the number of records returned per page to the number specified in the Rows field, select the Per Page check box. Instead of the total number of search results being limited to the value in the Rows field, every page will return that number of results.

7. To establish the order for sorting search results, click the text in the Order By field. The Sort window opens.
   a. Select the primary field you want to sort by from the Sort Items By drop-down menu.
   b. To sort by the selected field in ascending order, select Ascending. To sort in descending order, select Descending.
   c. To sort on additional fields, select the fields to sort on from the Then By drop-down menus. When you define multiple sort fields, the records are initially sorted by the first sort field. If any of the records have the same value for the first sort field, those records will then be sorted by the subsequent sort fields.
   d. To remove all sort options, click Clear All.
   e. Click OK.

8. To save your selections as default search filters for the report, click Settings and select Save as Default Values.

9. To restore the filters to the default settings for the report, click Settings and select Restore Default Values. You can also restore the defaults from the Personal Settings option. See Change Your Personal Settings.

10. To reset the current selection criteria to their default values that were populated when the report was opened, click Settings and select Reset Values.
B2C Service
Using B2C Service

Chapter 2
Core Features

Tip: You can customize the Search window layout in the report you are using, and save it to your local workstation so you will see the same filter positions, sizes, and ordering when you next open the report. See Overview of Custom Reports.

11. Click Search to display the records that match your search criteria.

• Special Characters Allowed When Searching

Answer Text Field Search Options

When you are searching for answers, you can use the search text type fields Phrases, Similar Phrases, Exact Search, Complex Expression, or Answer ID.

All search types look for different word forms such as singular, plural, or different verb tenses. For example, searching for reflect will find answers that contain reflection, reflections, reflected, reflecting, or reflects.

All search types use the logical operators + (AND) and – (NOT). Insert + before a word to find answers that must include the word. Insert – before a word to exclude answers containing that word. For a list of special characters that can be used for searching, see Special Characters Allowed When Searching.

The answer Summary, Question, Answer, and Keywords fields are searched for matching terms.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phrases</td>
<td>Select this search technique to search for answers containing the words in the phrase or question you enter. Multi-word phrases usually produce better search results.</td>
</tr>
<tr>
<td>Similar Phrases</td>
<td>Select this search technique to search for answers that contain the words or phrase you enter as well as answers containing synonyms for the words you enter.</td>
</tr>
<tr>
<td>Exact Search</td>
<td>Select this search technique to search for answers with the same pattern of words as the words you enter. Only answers containing an identical pattern of words are matched, although the words in the matching answers may be separated by stopwords such as a, an, or the.</td>
</tr>
<tr>
<td>Complex Expression</td>
<td>Select this search technique to search for answers containing the complex expression you enter. This technique allows wildcard searching using an asterisk (*) at the end of a word or partial word and a tilde (~) before a word to perform a similar phrases search on that word only.</td>
</tr>
<tr>
<td>Answer ID</td>
<td>Enter a range of answer IDs to search for answers with answer IDs within the specified range. Wildcard characters are not supported in Answer ID searching.</td>

Special Characters Allowed When Searching

B2C Service supports wildcard search and also allows other characters to produce more accurate results.

Tip: All of these guidelines apply when you are searching using a complex expression. When you are searching using phrases, similar phrases, and exact search, only the following characters apply: + - _ / @ : < > & and white space. Other punctuation is ignored and also acts as a word separator.
This table contains a list of the characters you can use, including how the characters are interpreted as well as the importance of the placement of the characters in the text string. Also included is a list of invalid search characters.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>Always considered the logical operator meaning “must include.”</td>
</tr>
<tr>
<td>-</td>
<td>May appear in the middle of a word or number, but when it is placed at the beginning of a word or number, it is always taken to mean “must not include.”</td>
</tr>
<tr>
<td>.</td>
<td>May appear in the middle of a word or number, but is otherwise considered punctuation.</td>
</tr>
<tr>
<td>_</td>
<td>May appear in the middle of a word, but is otherwise unrecognized.</td>
</tr>
<tr>
<td>/</td>
<td>May appear in the middle of a capitalized word or a number, but is otherwise considered punctuation. And/or uses the / as punctuation to separate the word “and” from “or,” but I/O is recognized as a single word.</td>
</tr>
<tr>
<td>@</td>
<td>May appear in the middle of a word, but is otherwise unrecognized.</td>
</tr>
<tr>
<td>*</td>
<td>Allowed only at the end of a word or number. It will act as a word separator otherwise. One exception is that it is specifically recognized as a leading character when directly preceding the @ to allow regular expression searching of the sort: *@example.com.</td>
</tr>
<tr>
<td>:</td>
<td>Allowed within a number only. Otherwise, it is considered punctuation.</td>
</tr>
<tr>
<td>&lt;&gt;</td>
<td>Text enclosed within the angle brackets “&lt;” and “&gt;” is ignored. Otherwise, the angle brackets are treated as punctuation.</td>
</tr>
<tr>
<td>&amp;</td>
<td>Allowed as part of an embedded word, but is otherwise considered punctuation.</td>
</tr>
<tr>
<td>Whitespace (tab, return, space)</td>
<td>Ignored and acts as a word separator.</td>
</tr>
<tr>
<td>~</td>
<td>Allowed after a word to specify a broader search on the following word by using synonym expression and spelling correction.</td>
</tr>
</tbody>
</table>

Overview of Quick Search

Quick Search lets you access any record or file when you have only limited information about the item.

Quick Search is an ideal way to search the knowledge base no matter what navigation list is displayed or what is open on the content pane. For instance, you could be working on a contact record and want to view an answer without changing navigation lists. Using the Answer Quick Search report, which you can access from a drop-down menu on the Quick Search tool window, just enter the answer ID and click Search. The answer opens on the content pane, and you can take any action you need.
All Quick Search reports access data in the operational database instead of the report database to ensure that the most current data is always returned. See Overview of Managing Reports on the Reports Explorer.

**Note:** B2C Service contains a number of predefined Quick Search reports. The reports that appear in the Quick Search drop-down menu depend on what reports were added to the Quick Search button in your navigation set. Additionally, if you have permission to customize your navigation set, you can add and remove Quick Search reports as necessary. You cannot, however, add folders or other items to the list of Quick Search reports. See How You Customize Navigation and Configuration Lists.

Search for an Answer with Quick Search

You can use Quick Search to search for a variety of records, including answers.

1. Click the **Quick Search** drop-down menu on the Quick Search **tool window** and select **Answer Quick Search**. You can also press F3 to make the Quick Search tool window active. If Quick Search is closed, pressing F3 will open it in an undocked window.
2. Enter the answer ID and click **Search**. The answer opens on the **content pane**.

   **Note:** Since the answer ID must match exactly, only one answer can match the answer ID you enter. However, other quick search types let you enter just the first few characters of the search term, returning all records that match your partial search criteria on the content pane, where you can select the record you want.

3. To perform another search, click **Clear** to clear the Answer ID field.

Predefined Quick Search Reports

The fields that display when you change Quick Search reports are unique to the type of record or file you are searching for.

Keep in mind that your list of Quick Search reports may be different from the reports described here.

<table>

423
How You Search from Open Records

You can search for contacts, organizations, or tasks from many types of open records. For example, when you are working on an incident, you might need to search for a contact to associate with the incident.

This lists describes the types of searches you can do from various open records.

- Search for a contact from an open incident, opportunity, organization, task, asset, or contact list.
- Search for an organization from an open contact, incident, opportunity, task, or asset.
- Search for a task from an open answer, contact, incident, opportunity, or organization.

Make a practice of checking your recent items before searching. Just click the link in the field next to the Search button to view a list of the records you've recently worked on, if any are available. If you find the record you're looking for, select it. This is a quick way to associate a record, such as a contact, with an open record without having to conduct a search. If you don't find the record you're looking for, or if no records are available, then conduct a search.

This functionality applies only to incident, contact, organization, task, chat, asset, and custom object workspace types. If the Show Recent Items in Fields check box is cleared on the View Options window, recent items will not display in the search list.

Search for a Contact from an Open Record

Search for a contact from an open incident, opportunity, organization, task, asset, or contact list.

1. Open the Contact Search window using one of the following methods:
   - If you are working on an incident, opportunity, organization, or contact list, click the Contacts tab. Then click Add Existing (or, for contacts lists, click Add Contact and select Add Existing).
   - If you are working on an incident, opportunity, task, or asset, click Search to the right of the Contact field.
2. Enter an entry in any of the available fields.
   - Tip: You can use an asterisk (*) as a wildcard in your search term. The Recent Contacts section of the Contact Search window also displays a list of recently opened contacts you can select.
3. Click the CX State drop-down menu and select from the following options (by default, all states are selected).
   - Select All
   - Service State
   - Outreach State
   - Opportunities State
4. Click Search. The contacts that match the search criteria are returned on the Contact Search window.
   - If only one contact matches the search criteria, that contact is automatically selected and the Contact Search window closes.
5. Do one of the following:
   - Select the contact you want to associate with the open record and click Select. The Contact Search window closes and the contact appears on the Contacts tab of the record (for organizations and contact lists), in the Contact field (for tasks and assets), or both (for incidents or opportunities).
   - If the contact does not appear in the list, click New Contact at the bottom left of the window to open a new contact subtab. Complete the fields and click OK.

When the new contact subtab opens, it is populated with any search terms you entered in the First Name, Last Name, Email, Phone, and Postal Code fields in the Search window. If you are adding a secondary contact to the record, the address and organization name fields (including Postal Code) are populated from the primary contact's organization.
Search for an Organization from an Open Record

Search for an organization from an open contact, incident, opportunity, task, or asset.

1. On an open contact, opportunity, task, or asset, click **Search** to the right of the Organization field. The **Organization Search** window opens.
2. Enter the first few characters of the organization's name in the **Organization Name** field. An implied wildcard is used, so all organizations that begin with the letters you enter are returned in the search results.
   
   **Tip:** The Recent Orgs section of the **Organization Search** window also displays a list of recently opened organizations you can select.

3. Click the **State** drop-down menu and select from the following options (by default, all states are selected).
   - Select All
   - Service State
   - Outreach State
   - Opportunities State

4. Click **Search**. The organizations that match the search criteria are returned on the **Organization Search** window.
   
   If only one organization matches the search criteria, that organization is automatically selected and the **Organization Search** window closes.

5. Select the organization you want to associate with the open record and click **Select**. The **Organization Search** window closes and the organization appears in the Organization field.

   - Or, if the organization does not appear in the list, click **New Organization** to open a new organization subtab. Complete the fields and click **OK**.

   This procedure also applies when you want to search for and associate an organization on a new contact subtab opened from the Contacts tab of an incident, opportunity, organization, or contact list.

Search for a Task from an Open Record

Search for a task from an open answer, contact, incident, opportunity, or organization.

1. On an open answer, contact, incident, opportunity, or organization, click the **Tasks** tab.
2. Click **Add** and select **Add Existing**.
   
   The **Task Search** window opens.

3. Enter the first few characters of the task name in the Task Name field. An implied wildcard is used so all task names that begin with the letters you enter are returned.
   
   **Tip:** The Recent Tasks section of the **Task Search** window also displays a list of recently opened tasks you can select.

4. Click **Search**.
   
   The tasks that match your entry are returned on the **Task Search** window. If only one task matches the search criteria, that task is automatically selected and the **Task Search** window closes.

5. Do one of the following:
   - Select the task you want to associate with the open record and click **Select**. The **Task Search** window closes and the task appears in the list of tasks on the Tasks tab.
   - If the task does not appear in the list, click **New Task** to open a new task subtab. Complete the fields and click **OK**.
Overview of Standard Workspaces

You can work with different records when you are not actually changing the information in them. By understanding standard workspaces and how to open, forward, copy, and print records, you will become more efficient while working in the product suite.

B2C Service provides a standard workspace for each record type (answers, assets, contacts, incidents, opportunities, organizations, and tasks), plus a standard workspace for quotes, quote products, and service opportunities on their respective windows. B2C Service also contains standard chat workspaces for staff members working in Chat. Each workspace defines the buttons and tabs on the ribbon, the buttons on the Quick Access toolbar, which fields are available, what toolbars and buttons are displayed on record tabs, and how the information is organized on the content pane.

B2C Service also provides standard multi-edit workspaces for each record type. Each multi-edit workspace defines fields for updating more than one record in a single operation instead of performing the same action on each individual record.

Your organization may use the standard workspaces, or your administrator may have created one or more custom workspaces. No matter which workspaces your organization uses, your profile contains a workspace for each record type you have permission to access (and quotes, service opportunities, and chat workspaces, if applicable). Keep in mind that the workspace your profile uses may display a different ribbon, different buttons on the Quick Access toolbar, a different combination of fields, or a different location for fields on the content pane.

Tip: You can drag and drop record tabs to rearrange their order on each workspace. If you rearrange tabs, the tab order for that workspace is stored in the local settings on your workstation until you reset the local settings. See Change Your Personal Settings.

For information about working with specific records and a description of their standard workspaces, see any of the following references.

- **Organizations**—See Overview of Organizations.
- **Contacts**—See Overview of Contacts.
- **Tasks**—See Overview of Tasks.
- **Incidents**—See Overview of Incidents.
- **Answers**—See Overview of Answers.
- **Opportunities**—See Overview of Opportunities.
- **Assets**—See Overview of Asset and Product Registration.

Open an Incident for Editing

If your duties include responding to customers, publishing answers to your website, working with opportunities and sending quotes to customers, or keeping customer information up-to-date, you can easily access information and take the actions you need.

The procedure to open records is the same for all record types (incidents, answers, contacts, opportunities, organizations, tasks, and assets).

1. Click **Incidents** on the navigation pane.

**Tip:** The default setting requires that you double-click an item to open it. However, you can change the default so that items open with a single click. See *Change Your Navigation Pane Settings*.

You can zoom in and out of a report using the slider on the bottom right of the content pane. Click the plus sign to zoom in on specific details or click the minus sign to zoom out to see more of the report. You can also drag the slider left or right to decrease or increase magnification.

3. Right-click an incident and select *Open > Incident*. The content pane populates with the incident's information.

Additional ways to open a record include the following options.

- Selecting the record and clicking *Open* on the ribbon
- Clicking *Open* in the Action column
- Double-clicking the record

**Forward a Record**

There might be times when you need to forward an incident, opportunity, task, or asset. For example, you might need information from another staff member before you can reply to a customer’s incident. Or maybe you need to forward an opportunity for review and approval.

When you forward a record, you can forward any files that are attached to the record, send response files, and add comments. You can also customize how the forwarded information is displayed. See *How You Customize Messages*. If you are adding a record instead of editing an existing one, you must first save the record before you can forward it.

1. Do one of the following:
   - Right-click a record in a report and select *Forward*. The *Forward* window opens.
   - With a record selected in a report, click *Forward*.
   - With a record open, click *Forward*.

2. Enter field information.

- Search for a File to Attach to a Record

## Select a Recipient

When you forward records, you can open the Select Names window from the To, Cc, and Bcc fields.

From this window, you can select from folders containing all currently enabled staff accounts, staff account groups, distribution lists, and email addresses from all distribution lists.

If your administrator has not added distribution lists, the Distribution Lists and Addresses folders will not display. See *Add or Edit a Distribution List*.

1. Click **To**, **Cc**, or **Bcc** to open the **Select Names** window.
2. To import your contacts from the default Contacts folder in Outlook, select the **Load Outlook Contacts** check box. This is useful for displaying contacts that are not included in B2C Service.
3. Select the name of the recipient and click **To**, **Cc**, or **Bcc** to insert the name in the field. To select multiple recipients, press Ctrl while making these selections.

**Tip:** You can enter the first few letters of the name in the field at the top of the **Select Names** window. The first name in the list that matches the letters you entered is highlighted. Notice that this name may be an individual's name, an email address, or a group or distribution list.

4. Click **OK**.
5. Click **Send** to forward the record to the recipients you selected.
Check Names Window

When forwarding records, if you enter a name, a partial name, or an email address that is not found in the knowledge base, and then tab to the next field or click Send, the Check Names window opens.

This window displays suggestions for staff accounts, staff account groups, distribution lists, and email addresses based on what you entered in the To, Cc, or Bcc fields. From this window, you can double-click a list item to select a recipient or click the Cancel button to return to the previous window and re-enter the name.

Copy a Record

B2C Service lets you copy a record to use as a starting point for creating another record.

Assume you have a contact record that is associated with an organization. When you add another contact from the same organization, you might want to copy the original contact and edit the names to avoid having to re-enter organization information.

1. Do one of the following:
   - With a report open on the content pane, right-click the record you want to copy and select Copy. The Copy window opens.
   - With the record open, click Copy on the ribbon.

2. Select the option for each of the data items you want copied with the record.

3. Edit the copied record as necessary.
4. Click **Save**.

### Print a Record

When you want a hard copy of a record, you can print it from the open record or from a report that includes the record.

1. Do one of the following:
   - Right-click the record on a report and select **Print**. The **Print Dialog** window opens.
   - With the record open, click **Print** on the **ribbon**.
2. Click **File** and select **Print**.
   The **Print** window opens.
3. Click **Print**.

**Tip:** When you print incidents, contacts, tasks, opportunities, answers, organizations, assets, or quotes, the format is defined by print pages in message templates. You can customize these templates from the Message Templates editor. See **Print Templates**.
Close Multiple Records Simultaneously

You can close multiple open records at the same time using the right-click menu.

1. Select the records you want to close.
2. Right-click an individual tab and select one of the following options.
   - **Open in New Window**—Opens the active tab in a separate window.
   - **Close**—Closes the active tab. You can also press Ctrl+W or Ctrl+F4 to close the active tab.
   - **Close All But This**—Closes all open tabs except the active one.
   - **Close All**—Closes all tabs.

**Note:** Right-click options differ for workgroups. For example, when you right-click the tab of the primary record in a workgroup, your only option is to close all associated records in the workgroup. See [Record Workgroups](#).

Audit Logs

When you click the Audit Log tab on a record, you can see if other staff members have worked on the record.

You can view each action taken on the record, when it was updated, who made the change, the action performed, and a description of the action (for example, sending a response). This information is valuable for keeping track of interactions with customers, especially if more than one staff member has worked on the same record. The audit log shows any automatic changes that resulted from the application of business rules or through configuration settings. The audit log for incidents and contacts also shows any actions taken by the customer on the customer portal.

In addition to records (answers, assets, contacts, incidents, opportunities, organizations, and tasks), B2C Service provides an audit log for campaigns, contact lists, documents, mailings, segments, surveys, and quotes.

<td>Displays the staff member who performed the action. If Administrator is listed in this column, the action was the result of a business rule or an automatic update by Oracle B2C Service.</td>
</tr>
<tr>
<td>What</td>
<td>Displays the type of action performed.</td>
</tr>
<tr>
<td>Description</td>
<td>Displays a brief description of the action performed or provides additional information about the action.</td>
</tr>
</tbody>
</table>

The Audit Log tab for quotes contains additional information. See [How You Manage Quotes](#).

**Tip:** You can click a column heading to sort the list by the column you select. Click the column heading again to reverse the list.
Assign a Record from a Report

There are several operations that are similar for different kinds of records. Among those operations are assigning staff members and adding flags to records, checking the spelling, attaching files, including browsing and searching for files to attach, and working with multiple records.

Sometimes you might need to assign a record to another staff member. For example, a task might have been incorrectly assigned to you or you need a colleague to complete part of an incident before you can respond to a customer. Or maybe you are creating contact and organization records and need to assign a salesperson to the account based on their location. The staff member you assign the record to will receive a notification. See Notifications.

1. Do one of the following:
   - With a report displayed on the content pane and a record selected in the report, click Assign on the ribbon. The Assign [Record] window opens to display a list of staff members who can be assigned the record. (The list shows only those staff members who have permission in their profile to work on that type of record.)
   - Right-click the record in the report and select Assign or Assign > [Type of record].

2. Do one of the following:
   - Select a staff member from the Recent list, if any appear. Up to ten of the most recent selections are shown.
   - Use the auto-complete function to quickly find a name in the list of staff members. Begin entering the staff member or group name you want to assign the record to in the search field above the list. As you type, the list of names is filtered to show only names that contain the sequence of letters you entered, and the focus is on the first name on the filtered list. Enter additional letters of the name to narrow the list further.

   **Note:** For hierarchical menus, matching names will have all of their ancestors shown in the list, and they will be expanded. The children will also be in the list, but they are collapsed. To manually search for a name in the list, click the right arrow next to a group or manager name to display the names below it.

3. With the staff member you want to assign the record to highlighted, press the Enter key or click OK. When you open the record, the staff member or group you selected will appear in the Assigned field (for answers, incidents, opportunities, and tasks) or the Salesperson field (for contacts and organizations).

Assign an Open Record

You can assign an open record to another staff member. The staff member you assign the record to will receive a notification.

1. Click the Assigned field drop-down menu. (For a contact or organization, click the Salesperson field drop-down menu.)
2. Do one of the following:
   - Select a staff member from the Recent list, if any appear. Up to ten of the most recent selections are shown.
   - If you are assigning an open contact, incident, organization, or task, use the auto-complete function to quickly find a name in the list of staff members. Begin entering the staff member or group name you want to assign the record to in the search field above the list. As you type, the list of names is filtered to show only names that contain the sequence of letters you entered, and the focus is on the first name on the filtered list. Enter additional letters of the name to narrow the list further.
Note: For hierarchical menus, matching names will have all of their ancestors shown in the list, and they will be expanded. The children will also be in the list, but they are collapsed. To manually search for a name in the list, click the right arrow next to a group or manager name to display the names below it.

3. If you are assigning an open answer or opportunity, begin entering the name of the staff member or group you want to assign the record to in the Find field below the list. As you type, the focus moves to the first name on the list that contains the sequence of letters you entered. Enter additional letters of the name to narrow the list further.
   - To find a previous matching name, click the up arrow.
   - To find the next name that matches in the list, click the down arrow next to the Find field.

Note: List hierarchy is used in determining match precedence.

4. Do one of the following:
   - With the staff member you want to assign the record to highlighted, press the Enter key to select it.
   - Click a staff member or group name from the list to select it.

The menu closes and your selection appears in the field.

Add a Flag to a Record

The standard workspace for answer, incident, opportunity, contact, and organization records includes a flag that lets you define the priority and enter a message regarding the record. When other staff members open the record, the flag and text you added appear on the record.

1. Click the area next to the white flag at the top of the content pane. A menu displays options for selecting the importance of the flag and editing text in the banner.
2. To change the importance of the flag from No Importance, select High (indicated by a red flag), Medium (indicated by a blue flag), or Low (indicated by a green flag).
3. To add text to the flag, select Edit Flag Text and enter text in the field.

Spell Checking

B2C Service uses three methods of spell checking.

The first method of spell checking is an inline spell checker that automatically identifies misspelled words on various tabs and fields as you type. The second method is manual and checks any fields for which the spell check property has been selected. The third method automatically checks your spelling when you save the record.

The spell checking methods in use depend on the selections your administrator used to configure the workspaces for adding and editing records. On any workspace, it is possible that none of the fields have spell check enabled, that some fields are spell checked automatically, or that fields are spell checked only when you click Spell Check on the ribbon.

Note: If the language of an incident is different from the language of the interface from which the incident response is created, the spell checker uses the dictionary that is associated with the language specified in the incident’s Language field. If this value is changed during an edit of the incident, the dictionary for the newly selected language is used to check the spelling. In addition, if an incident is being edited on an interface that supports spell checking, but the incident has a language that does not support spell checking, then Spell Check is disabled.
Correct an Inline Misspelling

If your administrator has configured inline spell checking for fields in the workspaces you use, any text you enter in those fields is checked in real time.

B2C Service automatically corrects any misspelled words you have added to your dictionary as well as any misspelling that has only one alternate spelling suggestion. The spell checker identifies misspelled words by underlining them with a wavy red line.

**Note:** Words added during a spell check session are saved to your local dictionary. Future spell checking is performed using the user dictionary on the server as well as the local dictionary on your workstation.

Inline spell checking can occur when you enter information on the incident thread, on the Notes tab for contacts, organizations, answers, opportunities, tasks, and in survey questions. When you move the cursor out of a field that contains a misspelling, the indicator for misspelling (the wavy red line) no longer appears. But it reappears when you move the cursor back to the field containing the misspelling.

Right-click the misspelled word and select one of the spell check options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Suggested alternate words</td>
<td>Select one of the five suggestions for alternate spellings. The misspelled word is replaced with the one you selected.</td>
</tr>
<tr>
<td>AutoCorrect</td>
<td>Select AutoCorrect and a suggested alternate word. Whenever B2C Service encounters this particular misspelling, it automatically replaces it with the word you selected.</td>
</tr>
<tr>
<td>Ignore All</td>
<td>Select this option to ignore all occurrences of this spelling in the record you are editing.</td>
</tr>
<tr>
<td>Add to Dictionary</td>
<td>Select this option to add the word to your personal dictionary. It will no longer be flagged as misspelled.</td>
</tr>
</tbody>
</table>

Check Spelling Manually

Rather than correcting each misspelled word individually as you work, you may prefer to wait until you are done entering all information for the record before you check the spelling.

Only the fields that are designated for spell checking are checked. Misspelled words in other fields will not be identified. If no fields have spell check properties, a message will let you know there are no fields marked for spell check.

In order to check spelling manually, the workspace ribbon must contain Spell Check. Ribbons are defined when your administrator creates workspaces, which are then assigned to your profile.

1. Click **Spell Check**.
   - The **Spell Checker** window opens, and the first misspelled word is highlighted in the Not in Dictionary field.
2. Select one of the spell checker options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore Once</td>
<td>Click this button to ignore this occurrence of the misspelled word.</td>
</tr>
<tr>
<td>Ignore All</td>

<tr>
<td>Change</td>
<td>Click this button to replace this occurrence of the misspelling with the suggestion you select from the options in the Suggestions field.</td>
</tr>
<tr>
<td>Change All</td>
<td>Click this button to replace all occurrences of the misspelling with the suggestion you select from the options in the Suggestions field.</td>
</tr>
<tr>
<td>Suggest More</td>
<td>Click this button to find additional suggested replacements for the misspelled word.</td>
</tr>
<tr>
<td>Options</td>
<td>Click this button to select the spelling options you want the spell checker to use when it checks your spelling.</td>
</tr>
<tr>
<td>Undo</td>
<td>Click this button to undo the most recent change to a word. Additional button clicks undo one change at a time, in reverse order of the original changes. Only the changes that have been made since the Spell Checker window was opened can be undone.</td>
</tr>
<tr>
<td>Help</td>
<td>Click this button to open help information for the spell checker.</td>
</tr>
<tr>
<td>Cancel</td>
<td>Click this button to cancel the spell check.</td>
</tr>
</tbody>
</table>

3. Click OK.

Set Spell Check Options

You can set specific options to streamline your spell check.

1. Click Spell Check.
   The Spell Checker window opens.
2. Click Options.
   The Spell Checker Options window opens.
3. Select any spelling options you want used during the spell check and clear any you do not want used.

   Note: You must select either Phonetic Suggestions or Typographical Suggestions (or both) for the spell checker to return suggestions for misspelled words.

4. Select an option to specify speed and accuracy of the spell check.
5. Click OK.
Automatic Spell Checking

Your administrator may have configured your workspace to automatically check spelling when you save a record.

If this applies to your workspace and no spelling errors are found, you will not see any evidence of the spell checking process when you save the record. If the record contains misspellings, the Spell Checker window opens and you can make corrections as described in Check Spelling Manually. If you click Cancel to stop checking the record’s spelling, a message notifies you and asks if you still want to save the record. Click Yes to cancel the spell checking and save the record.

Note: Your administrator may have disabled your ability to cancel an automatic spell check.

Overview of the Attachments Tab

Using the Attachments tab, you can attach files to records—answers, contacts, incidents, opportunities, organizations, and tasks—as well as to campaigns, surveys, mailings, and documents.

The Attachments tab lets you add files containing information that may not fit neatly into a record. For example, you might want to attach a file that contains graphic elements to an incident. When one or more files are attached to a record, the Attachments tab displays a paper clip icon.

The attachments report on the Attachments tab contains columns that provide the following information about each file attachment: file name, file size, date and time the file was created, date and time the file was updated, description, file visibility (Private column), and links for opening, downloading, and deleting the attachment.

The Private column appears only for incidents and answers and displays the visibility of the attachment on the customer portal. See View Attachment Properties.

Tip: You can drag file attachments located on your workstation and drop them onto any incident, answer, opportunity, contact, organization, or task if the Attachments tab is active.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Properties</td>
<td>Click this button to view or edit the properties of a file attachment. See View Attachment Properties.</td>
</tr>
</tbody>
</table>
### Answer File Attachments

Files that are attached to answers are not the same as file attachment answers.

A file that is attached to an answer on the Attachments tab appears as an attachment within the answer on the Answers page, and is used to provide additional information. A file attachment answer appears as a clickable attachment on the Answers page, and displays the full answer content when clicked.

Sibling answer attachments with access levels that are at or below the contact’s SLA are visible to the contact. See *Sibling Answers*.

### Incident File Attachments

Files that are attached to incidents are not the same as files attached to incident responses.

When you attach a file to an incident, that file becomes permanently attached to the incident. Likewise, if a customer attaches a file to an incident when submitting a question, that attachment also becomes permanently attached to the incident. You and other staff members can access the files from the Attachments tab of the incident, while the customer can access them from the Your Account page on the customer portal. In addition, some incident file attachments may be accessed from the Messages tab. See *Incident Attachments Tab*.

**Note:** HTML email updates that are larger than the maximum description size are attached to the incident as an HTML file instead of as a text file.

Attaching a file to an email response lets the customer open the file directly from the email client instead of having to log in to the customer portal to view it. All files attached to an incident or incident response are recorded in the knowledge base and audit log. See *Attach Files to an Incident Response*.

### Browse for a File to Attach to a Record

When you want to attach a file to a record, you can locate the file by browsing or searching. The following procedures describe each method.

You can attach an unlimited number of files to a record, but each file can be no larger than 20 MB by default. Contact your administrator to learn if additional file size limitations exist on your system.

1. Click the **Attachments** tab.
2. Click **Add Files** and select **Browse**.
   - A window opens and displays the files and folders on your workstation.
3. Select the file to attach.
4. To attach additional files, press Ctrl while selecting the files.
5. Click **Open**.

### Search for a File to Attach to a Record

You can search for files you want to attach to a record.

1. Click the **Attachments** tab.
2. Click **Add Files** and select **Search**.
   - The **File Search** window opens.
3. Enter field information.
### Core Features

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search directory</td>
<td>Enter the name of the directory where you want to search for the file, or click <strong>Browse</strong>.</td>
</tr>
<tr>
<td>Browse</td>
<td>Click <strong>Browse</strong> to display the file structure and make a selection from the list of available directories.</td>
</tr>
<tr>
<td>Part of file name or extension</td>
<td>Enter all or part of the file name in this field. This field uses an implicit wildcard at the end of the entry.</td>
</tr>
<tr>
<td>Filters</td>
<td>To select a filtering option for narrowing the search, clear the <strong>All Files (<em>.</em>)</strong> check box, which is selected by default.</td>
</tr>
<tr>
<td>Documents (*.doc, *.xls, *.pdf, *.txt)</td>
<td>Select this check box to search for document files.</td>
</tr>
<tr>
<td>Audio (*.mp3, *.wav, *.wma)</td>
<td>Select this check box to search for audio files.</td>
</tr>
<tr>
<td>Images (*.jpg, *.bmp, *.gif)</td>
<td>Select this check box to search for graphics files.</td>
</tr>
<tr>
<td>All Files (<em>.</em>)</td>
<td>Select this check box if you do not want to restrict the search by file type.</td>
</tr>
</tbody>
</table>

4. Click **Search** to display a list of files that meet the search criteria.
5. Click a file to select it for uploading.
6. To attach additional files to the record, press Ctrl while selecting the files.
7. Click **Add Files**.

### View Attachment Properties

You can view properties for file attachments. You can also add file information and designate whether to index the file for answer file attachments.

1. Select a file attachment from the list and click **Properties** on the Attachments tab toolbar.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*File Name</td>
<td>This field displays the file name. You can change the name of the file.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Enter the name you want the file to display as on the customer portal.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the file to provide more information about it.</td>
</tr>
<tr>
<td>Private</td>
<td>Select this check box to make the attachment private.</td>
</tr>
<tr>
<td>Indexed</td>
<td>Select this check box to index the file. Text contained in the attachment is searched when customers perform a search on the customer portal.</td>
</tr>
</tbody>
</table>

The Private check box appears only for files that are attached to answers and incidents. Customers do not see private attachments on the customer portal.

The Indexed check box appears only for files that are attached to answers.
How You Update Multiple Records

Multi-editing lets you update more than one record in a single operation instead of performing the same action on each individual record.

This feature saves time when you need to make the same change to several records. For example, you might want to add the same flag to several records.

Note: In addition to opening a multi-edit workspace that let you make the same change to multiple records simultaneously, you can also open multiple records in a single operation by right-clicking the selected records, selecting Open Separately, and selecting the type of record you want to open. Rather than opening a multi-edit workspace, as described in Edit Multiple Records, this procedure opens each record separately. You can then edit each record independently of the others.

The changes you can make to multiple records depend on the workspace defined by your administrator. This table lists the fields you can edit for each record type when working on that record's standard workspace. If you are working on custom workspaces, the fields that are editable depend on the workspace your administrator configured and may include more or fewer fields than those available on the standard workspace for that type of record.

<table>

Edit Multiple Records
You can edit multiple records at the same time from the B2C Service application.

1. Double-click a report to display a list of records.
   You can specify unique criteria to search for all records you want to update. See Search for a Record from a Report.
2. Press Ctrl while selecting each record you want to edit.
3. Click Open on the ribbon.
   The fields that you can edit for the type of record you are working with display on the content pane.
4. Edit the records. Depending on the type of field, you can accomplish this in one of several ways.
   The drop-down menus for all fields default to No Change. To remove the prior field entries for multiple records, select the check box next to the field you want to change.
   - To change a field associated with a drop-down menu, click the drop-down menu and select an option.
     Tip: A shortcut is available for re-assigning multiple answers, contacts, incidents, opportunities, organizations, or tasks. Select the records from a report, click Assign on the ribbon, and select a staff member or group from the Assign window. See Assign a Record from a Report.
   - To change a date field, click the drop-down menu associated with the field to open the current calendar month and select a date. If necessary, use the arrows at the top to change the month before clicking a day.
   - To change a search field, click Search (the magnifying glass to the right of the field), enter the search criteria in the window that opens, click Search, and select an option from the list of displayed results.
   - To change a text field (such as the Response field on the Messages tab of the incident workspace), enter the new entry for the field.
   
   Note: If a field is required when editing a record, it is also required for editing multiple records of the same type. It is possible, however, to select a value of “No Value” as a valid entry on the multi-edit workspace. The next time you edit one of the records separately, you are required to select a value for the field.
5. Click Save.

Delete Multiple Records
You can delete multiple records at the same time from the B2C Service application.

CAUTION: Deleting records can affect other staff members within your organization. Deleting contacts, for example, permanently removes not only the contacts from the knowledge base, but also all incidents and opportunities for which the contact is the primary contact. Be sure you understand the consequences of deleting records before you do so. See What Happens When You Delete a Contact.

1. Double-click a report to display a list of records.
2. Press Ctrl while selecting each record on the content pane you want to delete.
3. Click Delete on the report ribbon.
4. Click Yes on the Delete message to delete the selected records.

Forward Multiple Records
You can forward multiple records at the same time from the B2C Service application.

1. Double-click a report to display a list of records.
2. Press Ctrl while selecting each record on the content pane that you want to forward.
3. Click **Forward** on the report **ribbon**.
4. Follow the procedure for forwarding single records as described in **Forward a Record**.

**Note:** All of the files attached to all of the incidents you selected appear in Incident Files. Select the check box for every file attachment you want to forward with the associated incident. Recipients receive individual emails for each incident you forward. If an incident has file attachments and you selected the check boxes for those attachments, the forwarded incident contains the attachments.

## Record Workgroups

B2C Service helps you manage multiple open records without confusion by grouping all associated records into a single workgroup.

Workgroups apply to incidents, answers, campaigns, contacts, contact lists, documents, mailings, opportunities, organizations, surveys, and tasks. When you open any type of record and then open other records associated with the initial record, you create a workgroup. The set of records in a workgroup can be saved and closed in a single operation.

For instance, the standard incident **workspace** lets you add or edit other information associated with the incident, including contacts, organizations, and tasks. When you open a record associated with the open incident (for example, opening the contact record by clicking the contact name and selecting Open), the record opens on a subtab below the incident's content pane tab and becomes the active tab. This creates a workgroup consisting of an incident and a contact record.

**Tip:** Typically, you will also have an incidents report open, which you will use to open each incident.

Each time you add or edit an additional record associated with the incident, it opens on another subtab and becomes part of the workgroup. You can move easily between the records in the workgroup by clicking on the subtabs.

A record tab contains buttons that correspond to the buttons on the Editor group of the ribbon: OK, Cancel, and Undock. All subtabs, except for the primary record (in this case, the incident), contain these buttons for taking actions on the individual record within the workgroup.

- **OK**—Clicking this button accepts changes made to the record and closes the subtab. However, it does not save changes to the database until you click Save or Save and Close on the ribbon.
- **Cancel**—Clicking this button closes the subtab if you haven’t made changes to the record. If you have made changes, a message asks if you want to discard your changes.
- **Undock**—Clicking this button undocks the record from the editor and opens it in a new window. It remains in the workgroup. You can move between working in the window and working with other records in the workgroup without closing the window. (To redock the window to the editor, click Dock on the window.)

Continuing the example of the incident workgroup, clicking the incident subtab moves the focus to the incident in the workgroup. Since the incident is the primary record in the workgroup, there are no buttons on the subtab. The initial content pane tab for the primary record shows the number of records in the workgroup in parentheses.

Expanded tooltips on Save and Save and Close buttons on the ribbon and Quick Access toolbar let you know which records will be saved by each action.

- **Save**—Clicking this button saves all records in the workgroup and all editors remain open.
- **Save and Close**—Clicking this button saves all records in the workgroup but closes all editors as well.
In addition, the save icon displays on each individual record in the workgroup when you hover over one of the save buttons, another visual indicator of which records will be saved. To create workgroups, see Create an Incident Workgroup.

Create an Incident Workgroup

The following procedure is an example of creating an incident workgroup.

Keep in mind that you can open any record for the incident, not just the ones identified in this procedure. Also keep in mind that the steps are the same for creating other types of workgroups.

1. Right-click an incident in an incidents report and select Open > Incident.
The incident displays on the content pane.
2. Click the Contacts tab.
3. Right-click a contact and select Open.
The contact opens on a subtab.
4. To open additional records associated with the incident, repeat the previous two steps, replacing the references to contact information with information about the type of record you are opening.

When you click Save on any record in the workgroup, all records in the workgroup are saved. Likewise, when you click Save and Close on the ribbon, all records are saved and closed.

**Note:** If you close any record in a workgroup without saving it, it does not impact your changes on any of the workgroup’s other records.

Now, if you open a second incident, all the records associated with your first incident remain open, grouped on a single tab, with the number of records in the workgroup displayed in parentheses on the tab. Just as you did with the first workgroup, you can open as many records as necessary for the second incident to create another workgroup. You can also open as many workgroups as necessary. A workgroup is active until you close it. If you reopen the incident, only the incident is opened and not the associated records that were part of the workgroup from the earlier editing session.

Record Information Available in Outlook Appointments

This topic describes the record information that is transferred to Outlook appointments for each record type.

When you add and edit contacts, incidents, opportunities, organizations, and tasks, you can create an Outlook appointment associated with the record you are working on. By default, the Appointment button is available on the standard workspaces for contacts, incidents, opportunities, and organizations and may be available on workspaces for tasks if your administrator added it.

Depending on the type of record you are creating an appointment for, B2C Service automatically adds record information to the Outlook appointment, including the subject of the appointment.

<table>

### Add an Outlook Appointment

You can add an Outlook appointment for contact, incident, opportunity, organization, and task records.

1. Right-click the record that you want to create an appointment for and select **Open** followed by [Record Type]. The record opens on the **content pane**.

2. Click **Appointment** to open the **Appointment** window. The available record information displays in the appointment.

3. To add or edit any of the appointment information, enter the information in the appropriate field.

4. To add a color category to the appointment, click **Categorize** and select the category. The first time you assign a default color category to an appointment, you are prompted to rename the category.

   B2C Service automatically adds the category EM (Experience Management) to all new appointments. The appointment category displays above the Subject field.

5. To add multiple color categories to the appointment, click **Categorize** and select All Categories.
The **Color Categories** window opens. From this window you can quickly select multiple categories, rename and delete categories, change category colors, and add shortcut keys.

6. Make your changes to the appointment’s categories and click **OK**.
7. Click **Save**.
   It now appears in your Outlook calendar.

### Notifications

Your notifications appear on the content pane when you double-click **Notifications** from any navigation list that contains the **Notifications** component.

You also receive desktop alerts, often referred to as “toast,” when you first log in to B2C Service and when new notifications are received while you are logged in. Notifications are triggered when:

- An **answer**, **incident**, **opportunity**, or **task** is assigned to you.
- An answer, incident, opportunity, or task that was assigned to you has been reassigned to another staff member.
- An answer, incident, opportunity, or task has been escalated.
- An answer is scheduled for review.
- An incident is updated, closed, or reopened.
- A **mailing** is launched or completed.
- A system error has occurred.
- A broadcast **notification** is sent to you from another staff member.

### Open Your Notifications

The Notifications component lets you view and manage the notifications you receive.

The following procedure assumes you open your notifications from the Communication Center navigation list, which is displayed when you click the Communication Center button on the navigation pane. However, the navigation list in which the Notifications component appears depends on the navigation set assigned to your profile. You can open your notifications from any navigation list that contains Notifications.

1. Click **Communication Center** on the **navigation pane**.
2. Double-click **Notifications**.
   The content pane displays your notifications. From the list of your notifications, you can send a **message**, delete one or more notifications, and refresh the display.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>Click this button to open the <strong>Send Notification</strong> window, where you can enter a message and select a recipient. This button is enabled only when your profile has permission to send notifications.</td>
</tr>
<tr>
<td>Delete</td>
<td>Click this button to delete the selected notification.</td>
</tr>
<tr>
<td>Delete All</td>
<td>Click this button to delete all notifications.</td>
</tr>
<tr>
<td>Refresh</td>
<td>Click this button to refresh the list of notifications.</td>
</tr>
</tbody>
</table>
The list of your notifications contains the following column headings.

- **Type**—Displays the icon that is associated with the notification type.
- **Who**—Displays who sent the notification.
- **Notification Type**—Displays the type of notification.
- **Message**—Displays a summary of the notification.
- **When**—Displays the date and time the notification was sent.

**Related Topics**
- Send a Broadcast Notification

**Desktop Alerts**

Notifications display as desktop alerts, also known as toast notifications, when you are logged in to B2C Service.

The desktop alert message is displayed in a window on the lower right section of the display for several seconds until it fades away. These notifications also appear in your list when you double-click Notifications on the navigation pane, and they remain in your list until you delete them.

If you have been sent a notification while you are logged in, the desktop alert appears when the Notifications list is automatically refreshed. The default refresh interval is fifteen minutes, but your administrator may have changed that interval. Alerts also appear if new notifications are available when you manually refresh the list.

**Tip:** If you do not want your system to display a desktop alert when you receive a notification, you can disable alerts by clearing the Display Toast Notifications check box from your personal settings. See [Change Your Personal Settings](#).

**Send a Broadcast Notification**

If your profile gives you permission, you can also send broadcast notifications from this component.

Your profile may give you permission to send notifications to other staff members. If so, you can select the recipients manually or send a notification to all logged-in staff members.

1. Double-click **Notifications** on the **navigation pane**.
2. Click **New** to open the **Send Notification** window.
3. To send the notification to all staff members who are logged in, select the **Send To All Logged In Users** check box.
   
   When you select this check box, you cannot select individuals because **To** is grayed out.
4. To send to selected staff members, click **To** to open the **Select Names** window.
   
   To import your contacts from the default Contacts folder in Outlook, select the **Load Outlook Contacts** check box. This is useful for displaying contacts that are not included in B2C Service.
   
   a. Select one or more names from the list.
   b. Click **To** to add the names to the field.
   c. Click **OK** to close the **Select Names** window. The names you selected appear in the To field of the **Send Notification** window.
5. Enter your message in the **Message** field of the **Send Notification** window.
6. Click **Send**.
Tip: You can also enter the first few letters of the name you want to send the notification to in the To field of the Send Notification window. If only one staff member’s name begins with those letters, the field is automatically populated when you move to the Message field. If multiple staff members’ names begin with the same letters, you can select the one you want from the Check Names window that opens when you move to the Message field.

HTML and Text Editors

How the HTML Editor Works

When creating content for use in mailings, surveys, message templates, or answers, you can add HTML using an HTML editor built into the system.

The HTML editor for answers is different from the HTML editor used for mailings, surveys, and message templates. The information in this section pertains to the HTML editor for mailings, surveys, and message templates. For details about the HTML editor for answers see HTML Editor for Answers.

The HTML editor contains many of the same options available in basic word processing applications and also has specialized operations such as adding web forms, conditional sections, incident threads, merge fields, and merge reports.

You can create content in design or source mode. Using design mode, you can create dynamic, well-formatted content even if you do not have previous HTML experience. You can include special formatting in your text and add graphics, links, and other HTML features. You can also add links to existing content. See How You Add HTML in Design Mode.

Note: For design mode to be available in Outreach and Feedback, the HTML Design Mode permission must be selected for both Outreach and Feedback in your profile. See Outreach Permissions and Feedback Permissions.

Using source mode, you can create content using HTML source code. Regardless of which mode you use to create content, you can preview how it appears to customers from the Preview tab.

The links and dynamic content elements that display on the HTML editor are context-sensitive and depend on what type of content you are creating.

- Preview Content

How You Add HTML in Design Mode

B2C Service contains an HTML editor for creating dynamic content.

When in design mode, you can use word processing functions to create HTML, as well as dynamic content, such as adding a conditional section or a merge field. You can add several types of links to your content as this image shows.
The links and dynamic content elements that display on the HTML editor are context-sensitive and depend on what type of content you are creating.

**Note:** For design mode to be available in Outreach and Feedback, the HTML Design Mode permission must be selected for both Outreach and Feedback in your profile. Otherwise, only source mode is available. See [Add HTML in Source Mode, Outreach Permissions, and Feedback Permissions](#).

Links appear as clickable text when the document is used in a message, mailing, or survey or as a web page. When a link is added, you have the option of defining certain attributes depending on the type of link. Links, as well as forms and dynamic content elements, are located in the toolbox.

**Tip:** You can define style and class properties on most toolbox and tasks elements (or options) by right-clicking the element after you add it to the canvas. Keep in mind that style and class must be defined in a CSS file that is available on your web server, and linked to in the `<head>` tag of a message, mailing, or survey template. See [Edit Style and Class](#).

Using the toolbar, you can create HTML using many of the same options available in basic word processing applications. Functions include:

- Cut, copy, and paste
- Find and replace text
- Print the document
- Undo and redo changes
- Switch to full screen
- Format text in numbered or bulleted lists
- Adjust indentation
- Center, left-justify, or right-justify text and images on the page
- Insert line breaks
- Change font size and style attributes (such as bold, italic, and underline)
- Apply special text formatting (such as color, highlighting, superscripts, and subscripts)
- Copy text formatting using the style applier
Additional functions are accessed through the Toolbox and Tasks sections. In the Toolbox section, there are HTML, Links, and Dynamic Content sections. When creating documents in Outreach and Feedback, there is also a Forms section. In the Tasks section, there are Start Over and Content sections. For detailed information about these functions, see the Toolbox Section and Tasks Section tables here: Links and Dynamic Content Elements.

Tip: You can insert HTML by clicking a button in the Toolbox or Tasks section, or by dragging and dropping the button to a specific location on the canvas.

Links and Dynamic Content Elements

You can add several types of links and dynamic content elements to your content. When an element is added, you have the option of defining certain attributes depending on the type of element.

Links appear as clickable text when the content is used in a message, mailing, or survey. The tools displayed on the HTML editor are context sensitive and are the logical tools you would use for the specific content you are creating.

Links and dynamic content elements are found in the Toolbox and Tasks sections of the HTML editor. Within the Toolbox, there are HTML, Links, and Dynamic Content sections. In Outreach and Feedback, there is also a Forms section. Within the Tasks, there are Start Over and Content options.

Tip: You can insert HTML by clicking any button in the Toolbox or Tasks section, or by dragging and dropping the button to a specific location on the canvas.

</tr>
</tbody>
</table>
## Incident Thread

Click this button to insert an *incident thread* that displays all communication between the parties associated with the message. See [Insert an Incident Thread](#).

## Merge Field

Click this button to insert a merge field. See [Insert a Text Merge Field](#).

## Merge Report

Click this button to insert a merge report. See [How Merge Reports Work](#).

## Start Over

Buttons in this section are used to clear all HTML content and allow users to start over.

- **Use Existing**: Click this button to clear all HTML elements and start over with an existing document.

- **Upload HTML**: Click this button to clear all HTML elements and start over with content uploaded from an HTML file.

## Content

Buttons in this section are used to insert snippets and symbols and manage HTML anchors.

- **Apply Template**: Click this button to select a template to apply to a document. You cannot apply a template to templates or snippets. See [Create a Template](#).

  After a template has been applied to a document, it can be cleared by clicking the Apply Template button, then clicking the Clear Template button on the Choose Template window.

- **Insert Snippet**: Click this button to insert a snippet. See [Create a Snippet](#).

- **Insert Symbol**: Click this button to insert a special symbol. A symbol map opens. Double-click the symbol you want to insert.

- **Insert Address**: Click this button to insert a physical address. See [Insert a Physical Address](#).

  **Note**: The CAN-SPAM Act of 2003 requires that commercial email messages contain the sender’s valid physical postal address.

- **Manage Anchors**: Click this button to add or remove an anchor or go to an anchored site. See [Insert an Anchor](#).

- **Test CAN-SPAM**: Click this button to test the document for CAN-SPAM compliance. See [CAN-SPAM Compliance](#).

  This button is available only when editing a document in a mailing message or survey invitation message.
Modify Page Properties
You can modify the HTML properties of your content to change colors of the text and links, insert a background image or color, and change the title.

1. Right-click in the document and select **Page Properties**.
   The **Modify Page Properties** window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Click this color box to choose a color to use as the background or enter the HTML hexadecimal value of the color in the field to the right of the color box.</td>
</tr>
</tbody>
</table>

3. Click **OK**.
Edit Style and Class
You can define style and class attributes for most toolbox and tasks elements by right-clicking the element after you add it to the canvas.

Keep in mind that style and class must be defined in a CSS file that is available on your web server and linked with the <head> tag of a template.

1. Right-click an element after you add it to the canvas.
2. Select Edit Style for <element type> element.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class</td>
<td>Enter any class name you want to assign to the element in this field. You must define the class in your HTML content by either using the &lt;style&gt; tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the &lt;link&gt; tag.</td>
</tr>
<tr>
<td></td>
<td>Note: Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings or surveys.</td>
</tr>
<tr>
<td>Style</td>
<td>Enter any style attributes you want to assign to the element in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).</td>
</tr>
</tbody>
</table>

4. Click OK to apply the attributes.

Insert an Account Assistance Link
Account assistance links let you link to the Account Assistance page on your customer portal. From this page, your recipients can get help if they do not have or have forgotten their user name or password.

1. Click Account Assistance in the Links section of the Toolbox.
   The Account Assistance window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
<tr>
<td>Class</td>
<td>Enter any class name you want to assign to the link in this field. You must define the class in your HTML content by either using the &lt;style&gt; tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the &lt;link&gt; tag.</td>
</tr>
<tr>
<td></td>
<td>Note: Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS.</td>
</tr>
</tbody>
</table>
### Insert an Agent Browser UI Incident Link

Inserting an Agent Browser UI Incident Link lets you link to the incident that triggered the sent message so that agents can access the incident from the Agent Browser User Interface.

The Agent Browser UI Incident Link is included, by default, on any incident-related administrator notification and administrator email message template. See *How You Customize Messages*.

1. Click **Agent Browser UI Incident Link** in the Links section of the Toolbox.
   The **Agent Browser UI Incident Link** window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Text</strong></td>
<td>Enter the text you want to appear as the link.</td>
</tr>
</tbody>
</table>
| **Class** | Enter any class name you want to assign to the link in this field. You must define the class in your HTML content by either using the `<style>` tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the `<link>` tag.  
   **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS. |
| **Style** | Enter any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic). |
| **Target** | Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window. |
3. Click **OK**.
Insert an Anchor

From the HTML editor, you can add and remove anchors. Anchors are placed at designated locations within your content as destinations for hyperlinks.

When you place an anchor in your content, it is invisible when you are in design mode. The anchor code, sometimes referred to as a bookmark, displays only in source mode.

1. Click Manage Anchors from the Tasks section.
   The Manage Anchors window opens.
2. Enter the anchor name in the Anchor Name field.
3. Click Add Anchor to add the anchor at the insertion point.
4. To delete an anchor, select it and click Delete.
5. To rename an anchor, select it, click Rename, and enter a new name for the anchor.
6. Click OK.
7. Click Close.

Insert an Answer Section

You can use an answer section to display repeatable answer details on your answer update notification messages when more than one answer is sent in the same email. Any content that you include inside the answer section will be repeated. Content outside of the answer section will not be repeated.

Let’s say you want your message to include the contact’s name and you want to show the answer ID for each answer. In this case, you would insert the Answer ID merge field inside your answer section and the Contact Name merge field outside of the answer section. By inserting Answer ID inside the answer section, this merge field will repeat when more than one answer is sent. Since Contact Name is outside of the answer section, it will not repeat.

This image shows an answer section which is included, by default, on the Answer Update Notification and Answer Update Notification Expired message templates. You can customize both of these templates in message templates. See How You Customize Messages.

1. Click Answer Section in the Dynamic Content section of the Toolbox.
   An answer section is inserted into your template.
2. Insert the cursor inside the answer section and click Merge Field to add any fields you want to repeat when more than one answer is sent in the email.

   Note: Keep in mind that any content outside of the answer section will not be repeated when more than one answer is sent in the same notification email. Therefore, if you have content you do not want repeated, add those merge fields outside of the answer section.
Insert an Answer Link

There are two ways you can link to answers from B2C Service. Inserting an Answer Link lets you link to any answer you need to reference in the message sent to your customer. Inserting a This Answer Link lets you link to the answer that triggered the sent message.

Both the Answer Link and This Answer Link are included, by default, on any answer-related message template. See How You Customize Messages.

1. Click Answer Link in the Links section of the Toolbox.
   The Answer Link window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer ID</td>
<td>Enter the answer ID for the answer you want to link to in this field.</td>
</tr>
<tr>
<td>*Text</td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
<tr>
<td>Class</td>
<td>Enter any class name you want to assign to the link in this field. You must define the class in your HTML content by either using the <code>&lt;style&gt;</code> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <code>&lt;link&gt;</code> tag.</td>

Insert a Browser Link

Browser links let you add a hyperlink to an email message that opens a browser-based version of the same content. This is useful for messages to contacts whose email clients disable image rendering by default.

1. Click **Browser Link** in the Links section of the Toolbox.
   
   The **Browser Link** window opens.

2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Text</td>
<td>Enter the text you want to appear as the hyperlink text.</td>
</tr>
</tbody>
</table>
   | Class | Enter any class name you want to assign to the link in this field. You must define the class in your HTML content by either using the `<style>` tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the `<link>` tag.  
   | **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings. |
   | Style | Enter any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic). |
   | Target | Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window. |

3. Click **OK**.

Insert a Case Section

Case sections help you make your content more relevant to your target audience than it would be by using independent conditional sections.

You can specify a logical group of conditions where one, and only one, condition displays to your customer. In a case section, as soon as the first condition is matched, the content for that condition is added and any other conditions are ignored. If no condition within a case section is matched, then the content in the default section displays (as long as you have defined it).

For example, you could create a case section that displays information to customers based on their location. The first condition within the case section might be specific to postal codes. If none match, then the next condition could be more general, such as states. If neither match, then the default section (if present) displays.

You can add as many conditional sections to your case section as you need to make your content relevant. See *When to Use Case Sections vs. Conditional Sections*. 
**Tip:** Case sections and conditional sections can also be helpful when designing surveys for use on mobile devices. See *How You Customize Surveys for Use on Mobile Devices.*

1. **Click** Case Section in the Dynamic Content section of the Toolbox.
   A case section opens on the content pane.
2. **Do one of the following:**
   - **Double-click** Conditional Section inside the Case Section.
   - **Right-click** and select **Add Conditional Section.** See *Insert a Conditional Section.*

   You can apply style and class attributes by right-clicking an element after you add it to the canvas. See *Edit Style and Class.*

3. **To add another conditional section to your case section,** repeat step 2.
4. **To add content to the Default section,** enter it in the field below the default section header.

   **Tip:** If you add a conditional section after the default section, it will not be evaluated. Therefore, we recommend that you do not add anything after the default section.

### Insert a Chat Link

If you have Chat enabled, you can insert a link to the Live Help page for your customers to chat with an agent. For information about enabling Chat, contact your Oracle account manager.

1. **Click** Chat Link in the Links section of the Toolbox.
   The Chat Link window opens.
2. **Enter field information.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Text</td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
<tr>
<td>Class</td>
<td>Enter any class name you want to assign to the link in this field. You must define the class in your HTML content by either using the <code>&lt;style&gt;</code> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <code>&lt;link&gt;</code> tag.</td>
</tr>
<tr>

3. **Click** OK.
How Cloud Links Work

Cloud links let your contacts track or post your communications on several leading social media sites. You can include cloud links in documents, templates, snippets, mailings, campaigns, surveys, and survey invitation messages.

When a contact clicks a cloud link, the specified service opens in a web browser and prompts the contact for confirmation. The action taken upon confirmation depends on the service being used and the type of link you provided.

**Note:** Most social media services use cookies to identify contacts and automatically log them in to private accounts. As a result, a cloud link's transition to the confirmation page is often seamless. However, if a contact has not created or logged in to an account before clicking a cloud link, the service usually prompts the contact to do so before forwarding for confirmation.

When you create a cloud link, you can select from several leading services and link types. You may also be required to enter the key that is used to identify your organization on the service you have selected.

<table>
<thead>
<tr>
<th>Link Type</th>
<th>Description/Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facebook (Share on Profile)</td>
<td>Clicking this link lets contacts share your communication as a message to their Facebook friends, or post a link to a web browser version of your message on their Facebook profile. No key is required.</td>
</tr>
<tr>
<td>Facebook (Find Us)</td>
<td>Clicking this link takes contacts to your Facebook group page, where they can join your Facebook group. When this option is selected, you must type your Facebook group ID in the Key field. For example, if your Facebook group URL is <a href="http://facebook.com/group.php?gid=0123456789">http://facebook.com/group.php?gid=0123456789</a>, then the key is 0123456789.</td>
</tr>
<tr>
<td>Flickr</td>
<td>Clicking this link takes contacts to your Flickr group page, where they can join your Flickr group. When this option is selected, you must type your Flickr group ID in the Key field. For example, if your Flickr group URL is <a href="http://flickr.com/groups/companyname">http://flickr.com/groups/companyname</a>, then the key is companyname.</td>
</tr>
<tr>
<td>Twitter (Tweet)</td>
<td>Clicking this link lets contacts post a link to a web browser version of your message on their Twitter account. No key is required.</td>
</tr>
<tr>
<td>Twitter (Follow)</td>
<td>Clicking this link takes contacts to your Twitter page, where they can follow your organization with their Twitter account. When this option is selected, you must type your Twitter group ID in the Key field. For example, if your Twitter URL is <a href="http://twitter.com/companyname">http://twitter.com/companyname</a>, then the key is companyname.</td>
</tr>
<tr>
<td>YouTube</td>
<td>Clicking this link takes contacts to your YouTube channel page, where they can join your YouTube channel. When this option is selected, you must type your YouTube group ID in the Key field. For example, if your YouTube group URL is <a href="http://youtube.com/companyname">http://youtube.com/companyname</a>, then the key is companyname.</td>
</tr>
<tr>
<td>LinkedIn</td>
<td>Clicking this link takes contacts to your LinkedIn group page, where they can join your LinkedIn group. When this option is selected, you must type your LinkedIn group ID in the Key field. For example, if your LinkedIn group URL is <a href="http://linkedin.com/groupRegistration.php?gid=012345">http://linkedin.com/groupRegistration.php?gid=012345</a>, then the key is 012345.</td>
</tr>
<tr>
<td>MySpace (Share on Profile)</td>
<td>Clicking this link lets contacts post a link to a web browser version of your message on their MySpace profile. When this option is selected, you must enter a title for your posted link in the Key field.</td>
</tr>
<tr>
<td>Community</td>
<td>Clicking this link takes contacts to your Community Self Service page. No key is required.</td>
</tr>
</tbody>
</table>
Insert a Cloud Link

Use cloud links to let your contacts track or post communications on social media. You can include cloud links in documents, templates, snippets, mailings, campaigns, surveys, and survey invitation messages.

1. From the HTML or Text tab on the HTML editor, click **Cloud Link** in the Links section of the Toolbox. The **Cloud Link** window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Link Type</strong></td>
<td>Click this drop-down menu to select the type of cloud link you want to insert. You can select from the following options.</td>
</tr>
<tr>
<td>Facebook (Share on Profile)</td>
<td></td>
</tr>
<tr>
<td>Facebook (Find Us)</td>
<td></td>
</tr>
<tr>
<td>Flickr</td>
<td></td>
</tr>
<tr>
<td>Twitter (Tweet)</td>
<td></td>
</tr>
<tr>
<td>Twitter (Follow)</td>
<td></td>
</tr>
<tr>
<td>YouTube</td>
<td></td>
</tr>
<tr>
<td>LinkedIn</td>
<td></td>
</tr>
<tr>
<td>MySpace (Share on Profile)</td>
<td></td>
</tr>
<tr>
<td>Community</td>
<td></td>
</tr>
<tr>
<td><strong>Key</strong></td>
<td>Enter the unique key value associated with the selected link type. This field is inactive when the link type is Facebook (Share on Profile), Twitter (Tweet), or Community.</td>
</tr>
<tr>
<td><strong>Information (i)</strong></td>
<td>Hover over this icon for information about the key required for the selected link type.</td>
</tr>
<tr>
<td><strong>Target</strong></td>
<td>Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window. This field displays only when inserting cloud links in the HTML editor.</td>
</tr>
<tr>
<td><strong>Link Text</strong></td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
</tbody>
</table>
3. Click OK.

**Note:** The social media services described in this procedure, with the exception of Community Self Service, are not provided by or affiliated with Oracle. To obtain support or information about terms and conditions for the services mentioned, contact the service provider.

### Insert a Conditional Section

You can add conditional content that displays only when specific criteria is met. For example, you could add a conditional section to a document used in a mailing for a segment of customers who live in a specific postal code.

In the system-generated message templates (administrator notifications, administrator emails, and contact emails), you can insert conditional sections that display content based on contact, profile, runtime variable, or record type. These options are also available in mailings and surveys when you insert a conditional section within an incident thread. For example, in certain message templates or if you’ve added a conditional section within an incident thread in a mailing or survey, you can define the conditional section to display a coupon based on the product specified in the incident. See *Edit a Message* and *How Incident Threads Work*.

**Note:** The available options are context-sensitive and depend on what type of content you are customizing.

If you add more than one conditional section, each condition evaluates separately and if more than one condition matches, content is shown for each matched condition. If you want to display content from only one condition, consider using a *case section* instead of independent conditional sections. See *Insert a Case Section*.

For more information on how to use surveys on mobile devices, see *How You Customize Surveys for Use on Mobile Devices*.

1. Click **Conditional Section** in the Dynamic Content section of the Toolbox.

   The **Conditional Section** window opens.

2. Enter a title for the conditional section in the **Title** field.

3. Select an option from the drop-down menu to include content based on whether the contact is included or not included in the selected segment.

4. For mailings and surveys, select a segment from the Segments menu. Segments are created when you define audiences.
   a. To create a segment, click **New Segment**. See *Create a Segment*.

5. For message templates or conditional sections inserted within incident threads in mailings and surveys, select the Associated Contact, Recipient Profile, Runtime Variable, or Associated Record option. These options are context-sensitive based on the type of content you are customizing.
   a. To display text based on contact, see step 3.
   b. To display text based on recipient profile, select an option from the drop-down menu to include content based on whether the recipient is in or not in the selected profile, and then select a profile.
   c. To display text based on runtime variable, select **Include Contact Information Section**. This option is available only in the Email Incident Information (administrator email) message template. It lets the agent decide whether contact information will be sent in the email. See *Edit a Message*.
d. To display text based on a record type, select an option from the drop-down menu to include content based on whether the condition is true or false, and then select a record.

e. Next, select an operator to use in comparing the record to the data value, and then type a value that the record is compared to. See Filter Operators for Segments.

6. Click OK to insert the conditional section.

Tip: You can apply style and class attributes by right-clicking an element after you add it to the canvas. See Edit Style and Class. For message templates or conditional sections inserted within incident threads in mailings and surveys, style and class attributes are applied on the incident type thread properties. See Insert an Incident Thread.

7. Enter the content you want to display to your audience in the text box below the conditional section header.

Note: Due to the volume of conditional sections that accumulate as new content is created, the Agedatabase utility regularly purges the database of orphaned conditional sections (those that have been defined but not used in any campaign, document, or mailing). The PURGE_COND_SECTION_DAYS configuration setting specifies the number of days after which an orphaned conditional section is purged from the database. The default value is 7 days. Set to 0 to turn off conditional section purging.

- Overview of Message Templates

Insert a Customer Portal Incident Link

There are two ways to link to incidents from B2C Service. Inserting a Customer Portal Incident Link lets you link to the incident that triggered the sent message. Inserting an Incident Link lets you link to any incident you need to reference in the message sent to your customer.

For instance, the standard Question Receipt email sends a confirmation message after a customer submits a question through the Ask a Question page, an email, or a chat session. By adding a Customer Portal Incident Link to your Question Receipt message template, you can provide your customers with easy access to the incident created from their question. See How You Customize Messages.

1. Click Customer Portal Incident Link in the Links section of the Toolbox.
   The Customer Portal Incident Link window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Text</td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
<tr>
<td>Class</td>
<td>Enter any class name you want to assign to the link in this field. You must define the class in your HTML content by either using the &lt;style&gt; tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the &lt;link&gt; tag.</td>
</tr>
</tbody>
</table>

Note: Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS.
### Insert a File Link

After files have been added, you can place them in your HTML content as links.

1. Click **File Link** in the Links section of the Toolbox.
2. The **File Attachment** window opens.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field/Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Files</td>
<td>Select a file from this list. See Add a File.</td>
</tr>
<tr>
<td>New File</td>
<td>Click this text to add a file. When you add the file, it's automatically selected in the menu.</td>
</tr>
<tr>
<td>*Text</td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
<tr>
<td>Class</td>
<td>Enter any class name you want to assign to the link in this field. You must define the class in your HTML content by either using the <code>&lt;style&gt;</code> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <code>&lt;link&gt;</code> tag.</td>
</tr>
</tbody>
</table>

**Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS.

| Style        | Enter any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic). |
Using B2C Service

</tr>
</thead>
<tbody>
<tr>
<td>Target</td>
<td>Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.</td>
</tr>
</tbody>
</table>

3. Click **OK**.

**Tip:** You can also apply style and class attributes by right-clicking an element after you add it to the canvas. See *Edit Style and Class*.

### Insert a Forward to Friend Link

Forward to Friend links let your customers forward your mailing or survey to additional email addresses. Recipients of the forwarded message receive a copy of the mailing or survey, but are not added to your contact list.

When contacts click the link, a page opens asking them for the email addresses of the friends they want to forward the mailing or survey to.

**Note:** The Subject field of the Send To A Friend form contains the subject from the forwarded message and cannot be edited. Contacts sending to multiple recipients must separate email addresses with a comma or semicolon. Recipients of these emails see the message, “This message was sent to you by <email_address>,” regardless of whether the sender includes comments when forwarding the message.

1. Click **Forward to Friend Link** in the Links section of the Toolbox.
2. The **Forward to Friend Link** window opens.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Text</td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
<tr>
<td>Class</td>
<td>Enter any class name you want to assign to the link in this field. You must define the class in your HTML document by either using the <code>&lt;style&gt;</code> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <code>&lt;link&gt;</code> tag. <strong>Note:</strong> Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS.</td>
</tr>
<tr>
<td>Style</td>
<td>Enter any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).</td>
</tr>
<tr>
<td>Target</td>
<td>Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.</td>
</tr>
</tbody>
</table>
3. Click **OK**.

**Insert a Hyperlink**

You can insert hyperlinks in your HTML content and then define the hyperlink properties. You can also choose whether to link to an external site or an anchor in this or another document.

1. Click **Hyperlink** in the HTML section of the Toolbox.
   The **Hyperlink** window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>External Link</strong></td>
<td>Select this option to insert a link to a website outside of B2C Service.</td>
</tr>
<tr>
<td>*Link</td>
<td>Enter the full URL of the hyperlink in this field.</td>
</tr>
<tr>
<td>![Open Hyperlink]</td>
<td>Click this icon to open the hyperlink in a web browser.</td>
</tr>
<tr>
<td>Link Text</td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
<tr>
<td><strong>Target</strong></td>
<td>Select a target from this drop-down menu:</td>
</tr>
<tr>
<td>![New Window]</td>
<td>New Window—The URL opens in a new browser.</td>
</tr>
<tr>
<td>![Same Window]</td>
<td>Same Window—The URL opens in the same frame.</td>
</tr>
<tr>
<td>![Parent Window]</td>
<td>Parent Window—The URL opens in the same frameset.</td>
</tr>
<tr>
<td>![Browser Window]</td>
<td>Browser Window—The URL opens in the same window.</td>
</tr>
<tr>
<td><strong>Internal Link</strong></td>
<td>Select this option to insert a link to an internal anchor. This option is available only if an anchor has been added to the document. See <strong>Insert an Anchor</strong>.</td>
</tr>
<tr>
<td>Anchor</td>
<td>Click this drop-down menu to select an anchor to link to.</td>
</tr>
<tr>
<td>Link Text</td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
<tr>
<td><strong>Email</strong></td>
<td>Select this option to insert a link to an email address.</td>
</tr>
<tr>
<td>*Address</td>
<td>Enter the email address in this field. For example, enter <a href="mailto:lucybauer@example.com">lucybauer@example.com</a> to create a link to Lucy Bauer’s email address.</td>
</tr>
</tbody>
</table>

**Note:** You do not need to prepend the email address with the `mailto:` tag. The system adds the `mailto:` tag when you enter the email address in the field.
### Insert an Image

You can insert an image that is accessible through a URL in your HTML. You can also define the size of the image, its border properties, and alignment.

1. Click **Image** in the HTML section of the Toolbox.
   - The **Image Editor** window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Image URL</strong></td>
<td>Enter the URL where the image is located.</td>
</tr>
<tr>
<td>Open URL</td>
<td>Click this icon to open the URL in a web browser.</td>
</tr>
<tr>
<td>Alt Text</td>
<td>Enter the alternative text for the image.</td>
</tr>
<tr>
<td>Width</td>
<td>Enter the width, in pixels, you want the image to appear as.</td>
</tr>
<tr>
<td>Height</td>
<td>Enter the height, in pixels, you want the image to appear as.</td>
</tr>
<tr>
<td>Border</td>
<td>Enter the width, in pixels, of the image border.</td>
</tr>
<tr>
<td>Alignment</td>
<td>Click this drop-down menu to select the image alignment: Inline, Left, Middle, Right, Top, or Bottom. The default alignment is Inline.</td>
</tr>
</tbody>
</table>

3. Click **OK**.

### How Incident Threads Work

You can add an incident thread to your HTML so that all communication regarding an incident displays in your content. The incident thread lists all activity about an incident, including the original question, responses and updates from agents, customer updates, records of conversations, and internal notes about the incident.

You can define thread properties, which apply to the entire thread entry, as well as dynamic thread content, which lets you dynamically add content for a specific thread type. From the thread properties, you can customize the look of your incident thread by defining style and class attributes, display order, and limits on the number of threads (up to 99) that display in your messages. You can also set character limits on your incident threads to truncate the text that displays in the email message.

In addition to defining style and display attributes for the entire thread, you can define where to include your dynamic content—either before or after the thread entry for each specific thread type. Choose whether your content displays...
only in the most recent entry, in all entries, or in all entries except the most recent one. In the sample shown here, the response thread type offers customers a coupon before the thread entry and only in the most recent response thread.

This image shows the Response Thread Type incident thread. This particular thread type is designed to display a coupon at the start of the thread entry content and to be included only in the most recent entry.

![Response Thread Type incident thread image]

**Note:** While dynamic content added from thread type windows is included in the email that is eventually sent, it is not stored in the database. Therefore, it cannot be retrieved later.

**Insert an Incident Thread**

Use incident threads to display all communication related to an incident in your HTML content.

1. Click **Incident Thread** in the Dynamic Content section of the Toolbox. An incident thread opens on the content pane.
2. To edit the thread properties, double-click the incident thread. The **Thread Properties** window opens.
   
   Thread properties display by incident thread type. In Outreach and Feedback, all thread types, except for the Private Note thread type, are selected by default. In message templates, whether or not the Private Note check box is selected by default depends on the message type. For example, message templates that are designed for agents will have the Private Note check box selected by default. However, on message templates that are designed for customers, the check box will be cleared.

3. To define the types of threads that display in your content, clear or select the check boxes in the Thread Type section.

   **Note:** Because thread types are specific to the type of thread, you may need to edit several (or all) thread types depending on which B2C Service products your organization uses.

<table>
<thead>
<tr>
<th>Thread Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customer Entry</td>
<td>Select this check box to display threads submitted by the customer.</td>
</tr>
<tr>
<td>Thread Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Response</td>
<td>Select this check box to display threads for incident responses submitted from the Response option on the incident workspace. This option maps to the Response incident thread type ID in the <code>threads.entry_type</code> field.</td>
</tr>
<tr>
<td>Customer Proxy</td>
<td>Select this check box to display threads for incidents submitted by an agent on behalf of the customer from the incident workspace. This option maps to the customer proxy incident thread type ID in the <code>threads.entry_type</code> field.</td>
</tr>
<tr>
<td>Chat Transcript</td>
<td>Select this check box to display incident threads created from a chat session. This option maps to the Chat Transcript incident thread type ID in the <code>threads.entry_type</code> field.</td>
</tr>
<tr>
<td>Auto Response</td>
<td>Select this check box to display responses that are automatically added to the thread from a business rule. This option maps to the Auto Response incident thread type ID in the <code>threads.entry_type</code> field.</td>
</tr>
<tr>
<td>Private Note</td>
<td>Select this check box to display threads added as private notes on the incident workspace or threads added through business rules to the Notes thread. This option maps to both the Note and Rule Response Template incident thread type IDs in the <code>threads.entry_type</code> field.</td>
</tr>
</tbody>
</table>

4. To apply formatting styles for your thread content and headings, click the link on the Thread Properties window that is specific to the type of thread you want to edit. For example, clicking the Response link opens the Response Thread Type window.

5. Enter field information.

<table>
<thead>
<tr>
<th>Field/Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thread Properties</td>
<td>Enter information in this section to define how the content and heading of your incident thread will display. Thread properties apply to the entire thread entry. Thread properties are not available when using the text editor. See Create Text Content in Documents.</td>
</tr>
<tr>
<td>Field/Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Content Style</td>
<td>Enter any HTML style and class attributes you want the content of your entire incident thread to display. By default, font-size: 12pt; border: 1px solid #BBB.</td>
</tr>
<tr>
<td>Heading Style</td>
<td>Enter any HTML style and class attributes you want the heading of your entire incident thread to display. By default, font-size: 12pt; border: 1px solid #CCC; background-color: #E0EAD8.</td>
</tr>
<tr>
<td>Dynamic Thread Content</td>
<td>This section is used to define the placement of your content and in which thread entries to include the content. It applies only to the content displayed in the email message. The options in this section apply only to the specific thread type.</td>
</tr>
<tr>
<td>Content Placement</td>
<td>The options in this drop-down menu define the placement of your content—either Before Thread Entry, which is selected by default, or After Thread Entry.</td>
</tr>
</tbody>
</table>
| Inclusion           | The options in this drop-down menu define where in the incident thread your content displays. Options include the following.  
  - Most Recent Entry—Displays your content in only the most recent thread of this type. (Default)  
  - All Entries—Displays your content in every thread of this type.  
  - All Entries Except Most Recent—Displays your content in every thread of this type except the most recent one. |

6. Define the content to include in addition to your incident thread using the HTML editor on the Thread Type window. See *How the HTML Editor Works*.

7. Click **OK** to save your content and close the window.

8. Repeat steps 4 to 7 for each thread type your system uses.

9. To change the thread order to display the oldest threads first, select **Oldest to Newest** in the **Thread Order** drop-down menu in the Display section of the Thread Properties window. By default, the most recent threads display.

10. To limit the number of threads that display, select **Limit Thread Count** in the Display section of the Thread Properties window.

    The Limit Thread Count check box is available only if the thread order is set to Newest to Oldest.

    a. Enter the number of threads you want to display (up to 99) in the field next to the Limit Thread Count check box.

11. To truncate the text that displays within each thread (for all thread types), select **Limit Text To** in the Display section of the Thread Properties window.

    The Use Ellipsis check box is available only if the Limit Text To check box is selected.

    a. Enter the number of characters you want to display in the field next to the Limit Text To check box.

    b. Select the **Use Ellipsis** check box to display an ellipsis (...) at the end of the truncated characters if the text exceeds the set character limit.
12. Click OK to close the Thread Properties window.

**Tip:** You may want to consider showing conditional content based on the number of threads that are included within the sent message. See *Define Conditional Content Based on Message Thread Count*.

13. Add any other links or dynamic content you need to customize your message using the hyperlinks, buttons, dynamic content, and other features available on the HTML editor of the message template.

If an incident is triggered, all communication regarding the incident displays in your message.

### Insert an Incident Link

There are two ways you can link to incidents from B2C Service. Inserting an Incident Link lets you link to any incident you need to reference in the message sent to your customer. Inserting a Customer Portal Incident Link lets you link to the incident that triggered the message.

1. Click **Incident Link** in the Links section of the Toolbox.
   
   The **Incident Link** window opens.

2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incident ID</td>
<td>Enter the incident ID for the incident you want to link to in this field.</td>
</tr>
<tr>
<td>*Text</td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
<tr>
<td>Class</td>
<td>Enter any class name you want to assign to the link in this field. You must define the class in your HTML content by either using the <code>&lt;style&gt;</code> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <code>&lt;link&gt;</code> tag.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS.</td>
</tr>
<tr>
<td>Style</td>
<td>Enter any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).</td>
</tr>
<tr>
<td>Target</td>
<td>Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.</td>
</tr>
</tbody>
</table>

3. Click **OK**.

How Merge Fields Work

Merge fields let you look up account, asset, contact, incident, opportunity, organization, community, or tracked link information, and insert it in the text. For example, you could insert a merge field for the first name field and have contacts’ first names appear in their mailing.

You could also insert a number of incident fields for documents that are sent as a result of an incident rule or in a campaign that uses an incident action. In the case where a merge field value does not exist, you can specify a default value. Additionally, you can add merge fields to a URL parameter. See Insert a Merge Field to a URL Parameter.

Another category of merge field includes those that do not logically align with any of the other categories. These merge fields are found in the Special Fields folder. Some let you insert merge fields related to certain configuration settings, such as the number of hours an incident set to Waiting stays open, or the amount of time in which an incident can be reopened after it is solved. There are also special fields that let you personalize the Subject field of the survey invitation message by displaying the survey expiration date or the number of days until the survey expires. Other special fields include interface name, generation time, SLA name, and merge fields related to community content. As with all merge fields, those found in the Special Fields folder are context-sensitive to the type of content you are creating.

There are two ways merge field content can be added: text and image. When you insert a text merge field, you insert the text from part of the record, such as a contact email address. See Insert a Text Merge Field. When you insert an image merge field, you insert the content from any text or text area custom field into an `<img>` tag within the HTML where it is displayed, such as a message template, mailing, survey, or answer. The custom field should contain the absolute or relative path to the image you want to display in the content. See Insert an Image Merge Field.

Insert a Text Merge Field

Merge fields let you look up account, asset, contact, incident, opportunity, organization, community, or tracked link information and insert it in the text. When you insert a text merge field, you insert the text from part of the record, such as a contact email address.

1. Click Merge Field in the Dynamic Content section of the Toolbox. The Merge Field window opens.
2. Click the Type drop-down menu and select Text.
   a. Enter field information and values.

<table>
<thead>
<tr>
<th>Field/Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Merge Fields</td>
<td>Select a database column from this list.</td>
</tr>
<tr>
<td>Default</td>
<td>Enter the default value of the merge field in this field. The default value is used if a value does not exist for the field in a contact record or incident. If you want to include the field only when a value exists, put the merge field in a conditional section. This field is unavailable when adding merge fields to a URL parameter.</td>
</tr>
<tr>
<td>Format</td>
<td>Click this drop-down menu to select the format. The options that display are dynamic based on the type of merge field you select. This field is not available when adding merge fields to a URL parameter.</td>
</tr>
<tr>
<td>Field/Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Label</td>
<td>Enter a label that displays next to the merge field in this field. This field is unavailable when adding merge fields to a URL parameter.</td>
</tr>
<tr>
<td>Limit Text To</td>
<td>Select this check box to truncate the text that displays as a result of a text-based merge field. For fields that are not text-based, such as date fields, this check box does not display. This field is set to 2500 characters, by default, on the Body merge field that displays in the template. Social and discussion message templates are located under the Discussion category of the Contact Emails message type.</td>
</tr>
<tr>
<td>Characters</td>
<td>Enter the number of characters you want to allow in text-based merge fields. This truncates the text that is sent in email messages. This field is available only if the Limit Text To check box is selected. For fields that are not text-based, such as date fields, this field does not display. This field is set to 2500 characters, by default, on the Body merge field that displays in the template. Social and discussion message templates are located under the Discussion category of the Contact Emails message type.</td>
</tr>
<tr>
<td>Use Ellipsis</td>
<td>Clear this check box to remove the ellipsis (...) from the end of the truncated characters if the text exceeds the set character limit. This check box is selected by default. This check box is available only if the Limit Text To check box is selected. For fields that are not text-based, such as date fields, this field does not display.</td>
</tr>
</tbody>
</table>

b. Click **OK**.

3. Click **Save**.

**Tip:** You can apply style and class attributes by right-clicking an element after you add it to the canvas. See *Edit Style and Class*.

** Insert an Image Merge Field**

Image merge fields let you insert the content from any text or text area custom field into an `<img>` tag within the HTML where it is displayed, such as a message template, mailing, survey, or answer.

Before you can insert an image merge field to your content, you must add a custom field to your knowledge base. See *Add or Edit a Custom Field*.

The custom field must contain the absolute or relative path to the image you want to display in the content.

1. Click **Merge Field** in the Dynamic Content section of the Toolbox.
   The **Merge Field** window opens.
2. Click the **Type** drop-down menu and select **Image**.
a. Enter field information and values.

<table>
<thead>
<tr>
<th>Field/Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| *Merge Fields | Select a text or text area custom field from this list.  
**Note:** The values in the custom field should contain the names of images stored on your web server. |
| Default URL | Enter the default value of the merge field. The default value is used if a value does not exist for the custom field in a record. The value should be an absolute URL to an image (for example, http://www.example.com/images/logo.gif). |
| Base URL | Enter the base URL for the merge field if you use relative URLs in the custom field. The value of the custom field is appended to this URL. For example, if the base URL is http://www.example.com/images/ and the value of the custom field is logo.gif, the result will be http://www.example.com/images/logo.gif. Leave this field blank if the custom field uses an absolute URL. |

b. Click OK.

3. Click Save.

**Tip:** You can apply style and class attributes by right-clicking an element after you add it to the canvas. See *Edit Style and Class*.

Insert a Merge Field to a URL Parameter

You can add merge fields to URL parameters you want to attach to links in your messages. URL parameters can be defined on a mailing message, a survey invitation, or a tracked link. In these cases, the value of the merge field is appended to the URL as a parameter.

For example, if you wanted to pass the login field value from the contact record, specifying http://www.global.example/regform.php?user=$contacts.login would return a URL such as http://www.global.example/regform.php?user=jsmith.

1. Enter any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field located below the HTML editor.
2. Click the Merge Field icon to the right of the URL Parameters field. The Merge Field window opens.
   a. Select the database field you want to merge. Merge fields are populated with data from the contact record, account data or an associated incident, asset, opportunity, organization, or tracked link. You can also use the special fields that are available.
   The value of this field is appended to the URL as a parameter.
   b. Click OK to insert the merge field with the appended URL parameter.

How Merge Reports Work

In addition to merging data into your content one field at a time, you can select and merge full reports. Then you can filter the report output and edit its appearance. Merged reports extend data access to your marketing and survey communications so you can develop more dynamic and contextually relevant content.
In most cases, a primary filter is applied to limit the report output so that customers see only their own information. For example, if a report displays a list of all open incidents, customers see only their own open incidents when they view the merged report. Primary filters are automatically applied in the following cases:

- `contacts.c_id`—Primary filter for any mailing (broadcast or transactional) and any survey invitation message. If merging a report on a web page, the contact must be recognized by click-through parameters or cookies.
- `incidents.i_id`—Primary filter for any transactional mailing or survey that is sent using incident rules.
- `opportunities.op_id`—Primary filter for any transactional mailing or survey that is sent using opportunity rules.
- `chats.chat_id`—Primary filter for any transactional mailing or survey that is sent using chat rules.

In certain situations, you may want to disable the primary filter in the merged report, which can be done by clearing the Automatically Apply Primary Filter check box on the Merge Report window. However, special handling is required to ensure that the resulting data is appropriate for your audience. For example, if you want to include a report in a closed incident survey listing each customer’s open incidents, the automatic primary filter can restrict the report to show only the incident that triggered the survey. If you disable the primary filter, the report shows all incidents for all contacts. To prevent this, you can manually add a primary filter by editing the report and adding a filter on `contacts.c_id = ''`. If you then save the report and send the survey, the merged report filters on individual `c_id` values and displays to customers only incidents associated with their contact record. (Filters can also be performed on `incidents.i_id`, `opportunities.op_id`, and `chats.chat_id`, as needed.)

**CAUTION:** Disabling the automatic primary filter removes safeguards intended to restrict the scope of the report to the records related to the recipient. As a result, all data is returned for the report just as it would if opened from the Reports explorer. Depending on how the report is configured, this can be processor intensive and, in some cases, result in contacts receiving information related to other contacts. Unless a primary field filter has been added to the report, we recommend that this check box remain selected.

When merging a report into your content, you must select a preview contact to be used for filtering data on the Preview tab of the content editor. This filter limits the data shown in the preview and provides a more accurate representation of the finished content. You can also edit the merge report display properties and set a default value to be used when no data is returned.

From the Preview tab, you can also use the optional Preview Contact field to filter your preview by a particular contact. This lets you see how your dynamic content, such as merge fields and conditional sections, looks in your content. For example, if you have a conditional section for contacts in a specific postal code, you can preview your message to a single contact who matches a specific postal code to see if your conditional section works as intended. This improves the accuracy of your messages and, ultimately, saves you time.

### Merge a Report into Content

Merge a report in the HTML editor in both HTML and text mode.

1. On the Design tab of the HTML editor, place the cursor where you want to position the report.
2. Click **Merge Report** in the Dynamic Content section of the Toolbox.
   
   The **Merge Report** window opens listing all reports available in your profile.
3. Click the **Search** icon next to the Preview Contact field.
   
   The **Contact Search** window opens where you can search for a contact to use when the report is previewed on the content editor Preview tab.
   
   a. Select the contact and click **Select**.
4. Select the report you want to merge into your content.
5. To disable the primary filter when the report is run, clear the **Automatically Apply Primary Filter** check box.
   
   The check box is selected by default.
CAUTION: Disabling the primary filter removes the safeguards that restrict the scope of the report to the records related to the recipient.

6. To edit the merge report properties, click the **Properties** tab and select a report format from the **Output Type** drop-down menu.
   For a description of each merge report property, see *Merge Report Properties*.

7. To specify a default value used when the report returns no information, click the **Default** tab and enter the default value.
   **Tip:** You can also specify a default value after the report is merged by editing the contents of the merge report placeholder.

8. Click **OK**.
   The merge report placeholder is inserted into your content.

9. Click the **Preview** tab to see how your content looks.
   **Tip:** In documents, snippets, and templates, the optional Preview Contact field lets you see how your dynamic content that is specific to a contact looks. For example, if you have a conditional section for customers in a specific postal code, you can preview a contact who matches that postal code to see if your conditional section works as intended. To preview by contact, repeat step 3.

### Merge Report Properties

Merge report properties are defined on the Properties tab of the Merge Report window when merging a report into HTML content. In addition to merge report properties, other properties are available when merging into text content. The available properties depend on the option you select in the Output Type field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output Type</strong></td>
<td>Click this drop-down menu to select the output type option. Output types define how your report data displays when it is merged into your HTML content. Options include the following:</td>
</tr>
<tr>
<td><strong>Table</strong></td>
<td>Displays report data as a table.</td>
</tr>
<tr>
<td><strong>Record</strong></td>
<td>Displays report data as a record, without table rows.</td>
</tr>
<tr>
<td><strong>List</strong></td>
<td>Displays report data as a list.</td>
</tr>
<tr>
<td><strong>Single Value</strong></td>
<td>Displays only the value of the field in the first row and first column of your report content.</td>
</tr>
<tr>
<td><strong>Max Rows</strong></td>
<td>Enter the maximum number of rows for the report data. Click the up or down arrow to increase or decrease the value. This field is available only for Table, Record, and List output types.</td>
</tr>
<tr>
<td><strong>Table Properties</strong></td>
<td>The settings in this section define the appearance of the table when it is merged into your HTML content. Table properties are available only when the Output Type field is set to Table.</td>
</tr>
<tr>
<td><strong>Caption</strong></td>
<td>Enter the caption you want to appear at the top of the table. This setting is also available when merging a report into text content.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table Style</td>
<td>Enter any style attributes you want to apply to the table.</td>
</tr>
<tr>
<td>Table Class</td>
<td>Enter any class attributes you want to apply to the table.</td>
</tr>
<tr>
<td>Caption Style</td>
<td>Enter any style attributes you want to apply to the table caption. Style attributes define how the text appears. For example, color: red; font-weight: bold; font-style: italic.</td>
</tr>
<tr>
<td>Column Headers</td>
<td>Select this check box to display column headers for the table. This setting is also available when merging a report into text content.</td>
</tr>
<tr>
<td>Column Header Style</td>
<td>Enter any style attributes you want to apply to the column headers of the table. Style attributes define how the text appears. For example, color: red; font-weight: bold; font-style: italic.</td>
</tr>
<tr>
<td>Column Header Class</td>
<td>Enter the class name you want to apply to the column headers of the table. You must define the class in your HTML content by either using the <code>&lt;style&gt;</code> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <code>&lt;link&gt;</code> tag.</td>
</tr>
<tr>
<td>Cell Style</td>
<td>Enter any style attributes you want to apply to the table cells. Style attributes define how the text appears. For example, color: red; font-weight: bold; font-style: italic.</td>
</tr>
<tr>
<td>Cell Class</td>
<td>Enter the class name you want to apply to the table cells. You must define the class in your HTML content by either using the <code>&lt;style&gt;</code> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <code>&lt;link&gt;</code> tag.</td>
</tr>
<tr>
<td>Cell Format</td>
<td>Click this drop-down menu to select a case format for the table cells. Options include Lowercase, Uppercase, and Proper Case (which capitalizes the first letters of every word). This setting is also available when merging a report into text content.</td>
</tr>
<tr>
<td>Width</td>
<td>Enter the width of the table and select pixels or percent from the drop-down menu.</td>
</tr>
<tr>
<td>Border</td>
<td>Enter the width, in pixels, of the table border.</td>
</tr>
<tr>
<td>Frame</td>
<td>Click this drop-down menu to apply an HTML style to your frame. Options include the following:</td>
</tr>
<tr>
<td></td>
<td>Void—Outside borders are not shown.</td>
</tr>
<tr>
<td></td>
<td>Above—Top outside border is shown.</td>
</tr>
<tr>
<td></td>
<td>Below—Bottom outside border is shown.</td>
</tr>
<tr>
<td></td>
<td>Hsides—Top and bottom outside borders are shown.</td>
</tr>
<tr>
<td></td>
<td>Vsides—Left and right outside borders are shown.</td>
</tr>
<tr>
<td></td>
<td>Lhs—Left outside border is shown.</td>
</tr>
<tr>
<td></td>
<td>Rhs—Right outside border is shown.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Box</strong>—Outside borders are shown on all four sides.</td>
<td></td>
</tr>
<tr>
<td><strong>Border</strong>—Outside borders are shown on all four sides.</td>
<td></td>
</tr>
<tr>
<td><strong>Rules</strong></td>
<td>Click this drop-down menu to apply an HTML style to the lines in your table. Options include the following:</td>
</tr>
<tr>
<td><strong>None</strong>—No lines are shown.</td>
<td></td>
</tr>
<tr>
<td><strong>Groups</strong>—Lines are shown between row groups and column groups.</td>
<td></td>
</tr>
<tr>
<td><strong>Rows</strong>—Lines are shown between rows.</td>
<td></td>
</tr>
<tr>
<td><strong>Cols</strong>—Lines are shown between columns.</td>
<td></td>
</tr>
<tr>
<td><strong>All</strong>—Lines are shown between rows and columns.</td>
<td></td>
</tr>
<tr>
<td><strong>Cell Padding</strong></td>
<td>Enter the padding, in pixels, of the table cells.</td>
</tr>
<tr>
<td><strong>Cell Spacing</strong></td>
<td>Enter the spacing, in pixels, of the table cells.</td>
</tr>
<tr>
<td><strong>Primary Background Color</strong></td>
<td>Click this color box to select a primary color for the table cell background or enter the HTML hexadecimal value of the color in the field to the right of the color box.</td>
</tr>
<tr>
<td><strong>Alternating Background Color</strong></td>
<td>Click this color box to select a color for the alternating table cell background or enter the HTML hexadecimal value of the color in the field to the right of the color box.</td>
</tr>
<tr>
<td>The alternating background color helps with readability by adding color variation from one table row to the next.</td>
<td></td>
</tr>
<tr>
<td><strong>Border Color</strong></td>
<td>Click this color box to select a primary color for the table border or enter the HTML hexadecimal value of the color in the field to the right of the color box.</td>
</tr>
<tr>
<td><strong>Record Properties</strong></td>
<td>The settings in this section define the appearance of the record when it is merged into your HTML content.</td>
</tr>
<tr>
<td>Record properties are available only when the Output Type field is set to Record.</td>
<td></td>
</tr>
<tr>
<td><strong>Record Style</strong></td>
<td>Enter any style attributes you want to apply to the entire record.</td>

<tr>
<td>List Class</td>
<td>Enter the class name you want to apply to the list text. You must define the class in your HTML content by either using the <code>&lt;style&gt;</code> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <code>&lt;link&gt;</code> tag.</td>
</tr>
<tr>
<td>Format</td>
<td>Click this drop-down menu to select a case format for the list text. Options include Lowercase, Uppercase, and Proper Case (which capitalizes the first letters of every word). This setting is also available when merging a report into text content.</td>
</tr>
</tbody>
</table>
**Field** | **Description**
--- | ---
**Single Value Properties** | The settings in this section define the appearance of the values of the field in the first row and first column of your report content.
Single value properties are available only when the Output Type field is set to Single Value.
**Format** | Click this drop-down menu to select a case format for the single value text. Options include Lowercase, Uppercase, and Proper Case (which capitalizes the first letters of every word).
This setting is also available when merging a report into text content.
**Style** | Enter any style attributes you want to apply to the single value output. Style attributes define how the text appears. For example, color: red; font-weight: bold; font-style: italic.
**Class** | Enter the class name you want to apply to the single value output. You must define the class in your HTML content by either using the `<style>` tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the `<link>` tag.

**Note:** Regarding class attributes, because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS.

- Merge a Report into Content

**Insert a Physical Address**
You can include a physical address in your HTML so it passes CAN-SPAM requirements by entering it in a separate area.

1. Click **Insert Address** in the Content section of Tasks.
   The **Insert Address** window opens.
2. Enter the physical address of your organization in the **Sender's Postal Address** field.
3. Click **OK**.
   Your address is added to its own section in the document.

   **Tip:** You can apply style and class attributes by right-clicking an element after you add it to the canvas. See *Edit Style and Class.*

**Related Topics**
- CAN-SPAM Compliance

**Insert a Profile Link**
Profile links let you link to the Account Settings page on your customer portal where customers can change their user name and update their profile information.

1. Click **Profile Link** in the Links section of the Toolbox.
   The **Profile Link** window opens.
2. Enter field information.

### Insert a Proof Comments Link

A Proof Comments Link lets you add a link to a web page where the recipient can give feedback about the survey they have been asked to proofread.

For instance, you might want to add comment fields to gather feedback about specific parts of your message rather than the message as a whole. The Survey Proof message template is defined in message templates.

1. Click **Proof Comments Link** in the Links section of the Toolbox.
   
   The **Proof Comments Link** window opens.

2. Enter field information.

<table>
<thead>
<tr>

Insert a Proof Survey Link

Inserting a Proof Survey Link lets you add a link to the survey that you want your proofreaders to review.

Unlike broadcast and transactional surveys that include a survey link and a comment field in the invitation message sent as part of the proof message, website link surveys rely on the message that is defined by the Survey Proof message template. The Proof Survey Link is included, by default, on the Survey Proof message template.

1. Click **Proof Survey Link** in the Links section of the Toolbox.
   The **Proof Survey Link** window opens.
2. Enter field information.

<table>
<thead>

**Insert a Reset Password Link**

Reset password links let you link to the Account Assistance page on your customer portal. If any of your recipients do not yet have a password defined in their contact record, providing a reset password link can help them gain access to the customer portal.

1. Click **Reset Password** in the Links section of the Toolbox.

   The *End User Reset Password Link* window opens.

2. Enter field information.

<table>
<thead>
<tr>

</table>

3. Click **OK**.

**Insert a Survey Link**

There are two ways you can link to surveys from B2C Service—a Survey Link or a Link to This Survey.

From mailings, documents, and certain message templates, you can insert a Survey Link to add a link to any existing survey listed in your Surveys explorer. From a survey, you can insert a Link to This Survey to add a link to the survey you have open. The Link to This Survey is included, by default, on the survey invitation message when you create a new survey.

1. From a document, mailing or message template, click **Survey Link** in the Links section of the Toolbox. The **Survey Link** window opens.

2. Enter field information.

<table>
<thead>
<tr>
<th>Field/Option</th>

<td>Select this check box to allow text to wrap in the cell.</td>
</tr>
</tbody>
</table>

b. Click **OK**.

**Tip:** Additional options for inserting, merging, splitting, and deleting cells are available by right-clicking the table and selecting **Table Editor**.

### Insert a This Answer Link

There are two ways you can link to answers from B2C Service. Inserting an Answer Link lets you link to any answer you need to reference in the message sent to your customer. Inserting a This Answer Link lets you link to the answer that triggered the sent message.

Both the Answer Link and This Answer Link are included, by default, on any answer-related message template.

1. Click **This Answer Link** in the Links section of the Toolbox.
   The **This Answer Link** window opens.
2. Enter field information.

</tr>
</tbody>
</table>

### Insert a Tracked Link

Tracked links let you track the number of link clicks in your survey, mailing, or web page. You can also use tracked links in several of the standard system-generated contact email messages. Adding tracked links to your contact emails are especially useful in tracking your customer-facing incident responses.

You must define your tracked links before you can insert them in your HTML.

1. Click **Tracked Link** in the Links section of the Toolbox.
   - The **Tracked Link** window opens.
2. Enter field information.

**Convert Links to Tracked Links**

When a document, template, snippet, or notification with HTML content is saved, you can choose to convert the links in the HTML to tracked links.

B2C Service automatically finds any links by searching for HTML anchor tags with an `href` attribute that do not begin with “mailto:” or “#.” In addition, the system finds links that are part of an image map by searching for HTML area tags with an `href` attribute. When you save, the system searches for links and prompts you to convert them to tracked links. After you confirm, the links are validated and converted to tracked links. The tracked links are named using the link text and the URL.

For example, the link `<a href=http://oracle.com/>Oracle Home Page</a>” will be named “Oracle Home Page – oracle.com.” If the link is an image or part of an image map, the name includes “[Image: <image_name>]” or “[Image Map: <image_name>].”

1. Save the document, template, or snippet.
   The HTML content is scanned and the Tracked Link Conversion message opens if links are found.
2. Click **Yes** to convert the links to tracked links.
   The **Convert Tracked Links** window opens. Each link in the document is validated and the results display in the window.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link Name</td>
<td>This column lists the names of the tracked links created from the HTML links.</td>
</tr>
</tbody>
</table>
### Field | Description
---|---
Link Target | This column lists the URLs of the tracked links. You can open the link in a browser by clicking the link target.
Status | This column lists the status of the link validation. The status can be Valid, Broken, or Validating.
Action | Click Edit in this column to edit the tracked link name and target.
Check All | Click this text to select all check boxes in the list of tracked links. Selected links are converted.
Uncheck All | Click this text to clear all check boxes in the list of tracked links. Cleared links are not converted.

4. Select the links you want to convert by clicking the check boxes next to the link names.
5. To edit the name and URL of a link, click **Edit**.
   The **Edit Tracked Link** window opens.
   a. Enter the name of the tracked link in the **Link Name** field.
   b. Enter the URL of the tracked link in the **Link Target** field.
   c. To open the link in a web browser, click the **View URL in Web Browser** icon.
   d. Click **OK** to save changes to the tracked link.
6. Click **OK** to convert the selected tracked links.

   **Note:** The tracked links can be viewed or edited from the Tracked Links explorer. The links are stored in a folder named Automatically Generated and a subfolder named by the date the conversion was done (YYYY MM DD).

**Related Topics**
- Automatically Generated Folders
- Add a Tracked Link

**Insert an Unsubscribe All Answers Link**

Inserting an Unsubscribe All Answers Link lets you add a link that contacts who receive answer notifications can use to unsubscribe from future communications.

Answer notification messages are defined in message templates.

1. Click **Unsubscribe All Answers Link** in the Links section of the Toolbox.
   The **Unsubscribe From All Notifications Link** window opens.
2. Enter field information.
### Insert an Unsubscribe Link

Unsubscribe links let your contacts opt out of future mailings and surveys.

You can create an unsubscribe link that allows them to globally opt out of all future mailings and surveys, opt out of surveys only, or opt out of audiences defined by a custom opt-in field. You can unsubscribe contacts with a single click of the link, or direct them to a page to confirm that they want to unsubscribe. When prompting for confirmation, you can choose to set the opt-in field to No either before or after contacts confirm through the Unsubscribe page.

**Note:** All mailings include a List-Unsubscribe mail header which some mail clients use to automatically provide an unsubscribe link when the message is viewed by a recipient. However, because this header is not supported by all mail clients, you should add an unsubscribe link to your message, as described in this procedure.

1. Click **Unsubscribe Link** in the Links section of the Toolbox.
   
   The **Unsubscribe Link** window opens.

2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Opt-in Field</td>
<td>Click this drop-down menu to select a previously defined custom opt-in field. select Survey Opt-in to let contacts unsubscribe from surveys, or select Global Opt-in to let</td>
</tr>
</tbody>
</table>
### Core Features

<table>
<thead>
<tr>

<th>Click this drop-down menu to select how the link functions. You can select from three options:</th>
</tr>
</thead>
<tbody>
<tr>
<td>◦ One Click - Sets all global, survey, and custom opt-in fields to No when contacts click the link.</td>
<td></td>
</tr>
<tr>
<td>◦ Prompt, then set field - Opens a web page where contacts must confirm their choice to unsubscribe before the field is set.</td>
<td></td>
</tr>
<tr>
<td>◦ Set field, then prompt - Opens a web page to confirm, but the field is set first.</td>
<td></td>
</tr>
<tr>
<td>The default option is One Click.</td>
<td></td>
</tr>
</tbody>
</table>

| *Text | Enter the text you want to appear as the link in this field. |

<table>
<thead>
<tr>
<th>Class</th>
<th>Enter any class name you want to assign to the link in this field. You must define the class in your HTML content by either using the <code>&lt;style&gt;</code> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <code>&lt;link&gt;</code> tag.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS.</td>
<td></td>
</tr>
</tbody>
</table>

| Style | Enter any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic). |

| Target | Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window. |

3. Click **OK**.

**Tip:** You can also apply style and class attributes by right-clicking an element after you add it to the canvas. See *Edit Style and Class*.

### Insert an Unsubscribe This Answer Link

When you use answer sections to display repeatable content on the Answer Update Notification message template, an Unsubscribe This Answer Link is included, by default, inside the answer section. This link adds an unsubscribe link to each answer that is included in the email notification.

The Unsubscribe This Answer Link is available only on the Answer Update Notification message template.

1. Click **Unsubscribe This Answer Link** in the Links section of the Toolbox. The **Unsubscribe From Notification Link** window opens.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

### Insert a Web Form

When creating HTML content, you have the option to add web forms to collect customer data. You can add any database contact field, contact custom field, or survey question to the web form, letting you populate a contact record based on the submitted form.

A contact record is created each time a contact submits a form, unless any of the following occurs:

- The email address is included in the form.
- Cookies are set through a survey or campaign.
- The contact opens the form from a link in a mailing.

If an email address exists or the repeat visitor has a cookie set for the form, the contact record is updated rather than creating a new record. If email address sharing is enabled and the email address is shared by multiple contacts, the web form submission is associated with the contact deemed to be the best fit. See **Email Address Sharing**.

Also, if a contact submits a value for Organization Name (**contacts.ma_org_name**) in a web form, B2C Service searches existing organization records for a match. If a match is found, the contact is associated to the matching organization.

**Note:** There is no client-side validation when a web form is used in an email. For security reasons, most email clients disallow the submission of forms from email messages. Therefore, embedding a web form in the body of a mailing or survey invitation message can result in an extremely low submission rate. As an alternative, we recommend creating the web form in a served web page and including a link to the page in your message. See **Edit Serve Web Page Attributes**.
You can also insert standard HTML objects in the form, such as images and tables, and click and drag form elements into place through the HTML editor. When you finish the web form, you can add a Submit button with one click.

1. From a document, click **Web Form** in the Forms section of the Toolbox.
   The web form section is added to the HTML content bordered by an orange dotted line.
2. Insert the cursor in the web form section and click **Form Field** to insert a field.
   The **Form Field** window opens.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field/Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Web Form Fields</td>
<td>Select a database field from this list.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Select this check box to add a default value for the field and then type or select the value from the text box.</td>
</tr>
<tr>
<td>Required</td>
<td>Select this check box to make the field required.</td>
</tr>
<tr>
<td>Note</td>
<td>You must add your own visual indicator that the field is required (for example, *).</td>
</tr>
<tr>
<td>Class</td>
<td>Enter the class name you want to assign to the field. You must define the class in the HTML of your document by either using the &lt;style&gt; tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the &lt;link&gt; tag.</td>
</tr>
<tr>
<td>Note</td>
<td>Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS.</td>
</tr>
<tr>
<td>Style</td>
<td>Enter any style attributes you want to assign to the field in this text box. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).</td>
</tr>
<tr>
<td>Label</td>
<td>Enter a label for the field as you want it to display. The default label is the name of the web form field.</td>
</tr>
<tr>
<td>Display As</td>
<td>If an opt-in field or radio custom field is selected, select Radio Buttons or Check Boxes to select how to display the field in the web form.</td>
</tr>
</tbody>
</table>

**Note:** Custom field masks are not enforced in web forms.

4. Click **OK** to insert the field.
5. To add a survey question, click **Survey Question**. The **Survey Question** window opens.
   a. Select a survey question from the Questions list.
To create a question, click **New Survey Question**. A window opens where you can create a question. See *How Questions Work*.

c. To show the question and the answer as two separate fields on the web form, select the **Split Question** and **Answer Tag** check box. This lets you control where the question and answer portions of the question display.

d. Click **OK** to insert the question.

6. Click **Submit Button** to add the Submit button to the web form.

**Note:** You must include a Submit button with the form. If using your own HTML code, you must include the attributes used in the Submit button. Therefore, we recommend that you use the HTML editor to insert the Submit button. You can double-click the button to edit the button text, or switch to source mode to use advanced options such as using an image for the button.

After you add a web form to a document and serve the document in a campaign or survey, you can modify the URL of the web form page to include parameters to prefill one or more of the fields on the form.

### Insert a Web Page Link

Web page links let you link to another document in B2C Service. When you create a campaign that serves a web page as an action, you make the page available to link to.

1. From a document, mailing, or survey, click **Web Page Link** in the Links section of the Toolbox. The **Web Page Link** window opens.

   **Note:** Your campaign must be launched for it to appear in the Web Page Links list. See *Launch or Suspend a Campaign*.

2. Enter field information.

<table>
<thead>
<tr>
<th>Field/Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Web Page Links</em></td>
<td>Select a web page from this list. See <em>Edit Serve Web Page Attributes</em> for information about web pages served in campaigns.</td>
</tr>
<tr>
<td><em>Text</em></td>
<td>Enter the text you want to appear as the link in this field.</td>
</tr>
<tr>
<td>Class</td>
<td>Enter any class name you want to assign to the link in this field. You must define the class in your HTML content by either using the <code>&lt;style&gt;</code> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <code>&lt;link&gt;</code> tag. <strong>Note:</strong> Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings.</td>
</tr>
<tr>

## Add HTML in Source Mode

The HTML editor contains an option to create your documents using HTML code. You can enter HTML code directly in the editor to create your content.

The editor displays your code using colored text to indicate structure and syntax. There are additional functions available that you can access through the Toolbox and Tasks sections. The links and dynamic content elements that display on the HTML editor are context-sensitive and depend on what type of content you are creating. When you save, the system automatically validates your code formatting and notifies you about any errors.

**Note:** By default, the editor requires your code to be XHTML compliant before it can be saved. To allow code to be saved without XHTML compliance, disable the HTML_TIDY_ENFORCE_XHTML configuration setting ([RightNow User Interface/Misc. Customization/HTML Editor](#)).

1. Click the **Source** tab at the bottom of the HTML editor.

Source mode automatically places the cursor after the opening `<body>` tag. This image shows the HTML editor in source mode with the HTML tab selected.
The Source tab has a toolbar and a section for entering your source code. Using the toolbar, you can create HTML using some of the same options available in basic word processing applications. Functions include:

- Cut, copy, and paste
- Find and replace text
- Print the document
- Undo and redo changes
- Switch to full screen
- Enable or disable syntax highlighting

**Tip:** It’s a good idea to preview your work when using Source mode. When you switch between the Source and Preview tabs, your cursor stays where you left it, making it easy to check your work. See Preview Content.

Additional functions are accessed through the Toolbox and Tasks sections. You can insert HTML by clicking a button in the Toolbox or Tasks section, or by dragging and dropping the button to a specific location on the canvas. For detailed information about these functions, see the Toolbox Section and Tasks Section tables in Links and Dynamic Content Elements.

### Preview Content

You can preview the HTML and text versions of your content. The content displays as customers will see it in their email client or on a web page.

1. Click the **Preview** tab at the bottom of the HTML editor.
2. To see how your dynamic content displays, either by incident or contact, click the **Search** icon next to the Preview Incident or Preview Contact field.

The **Search** window opens where you can search for an incident or a contact to use when the message is previewed on the Preview tab.

### How You Create and Edit Text-Only Messages

You can create text-only messages for your customers who can receive only plain text emails.

Unlike the HTML editor, the text editor does not contain text formatting options. It does, however, contain links for additional functions related to B2C Service, such as adding a **merge field**, or **conditional section**. You can also add several types of links to your content. When a link is added, you have the option of defining certain attributes depending on the type of link. Links in plain text cannot be clicked and customers need to copy the URL into their web browser.

Using the toolbar, you can use several of the same options available in basic word processing applications. Functions include:

- Cut, copy, and paste
- Find and replace text
- Print the document
- Undo and redo changes
- Switch to full screen
Additional functions are accessed through the Toolbox and Tasks sections.

### Organizations

#### Overview of Organizations

Organization records provide a complete view of all activity for an organization and all the contacts, incidents, opportunities, and tasks associated with that organization.

Perhaps you have multiple customers from one organization. For example, a sales representative might have an opportunity that involves engineers, purchasing agents, and support managers from one organization. In those situations, it is vital to have a complete overview of all activity within the organization. An organization is a business entity with an organization record in the knowledge base. Organizations can refer to companies, divisions of companies, government agencies, educational institutions, or nonprofit associations.

Organization records are an optional way of consolidating customer information, but if you have several individual customers who belong to one organization, maintaining that information in an organization record is an efficient and effective way to group data. For example, if you work for a cell phone company that provides products and services only to individual consumers, you do not need organization records in the knowledge base. If, however, you sell to business accounts that distribute cell phones to their employees, it makes sense to group all of those employees (each with an individual contact record) under the organization they are associated with. This links the data associated with each of the contacts to the organization, providing you with a single-source view of all activity within the organization.

By definition, an organization can have an unlimited number of contacts. A contact, on the other hand, can be associated with only one organization. Organizations can be structured in a hierarchy that enables you to add subsidiaries, divisions, or regional offices to accurately reflect all areas of the organization.
The *customer portal* in B2C Service can be configured so contacts can view all *incidents* associated with their organization. When contacts view other incidents, they can often find answers to their questions, which reduces the number of incidents they submit.

When your knowledge base contains organization records, you can track a specific organization’s incidents and see trends or problem areas. You can view all of the incidents for the organization from the organization record without having to select each contact individually. Likewise, you can view all *opportunities, tasks, attachments, and notes* associated with the organization, and view all changes that have been made to the organization record using the *audit log*.

**How SLAs Work with Organizations and Contacts**

A service level agreement (SLA) is a contract that can be applied to customers, both organizations and contacts, in Service.

SLAs let you specify and track the level and type of support a customer is eligible to receive. For example, an SLA might include the number of questions that can be submitted through different *channels* and the duration of support. Administrators create generic SLAs (that is, an SLA template) that can then be applied to specific customers. An SLA instance is a copy of the generic SLA applied to a unique customer. SLA instances can be applied automatically through *business rules* or manually by staff members. Familiarize yourself with the following points before adding or editing organizations.

- SLAs can be applied to contacts and organizations. Contacts that are not associated with an organization can have their own SLA instances. However, contacts that are associated with an organization do not have individual SLA instances. Instead, they are covered under the SLAs applied to their organization.

- Customers can view and track their SLAs on the Account Overview page of the customer portal, where SLAs are called contracts. Depending on how your administrator has configured the customer portal, all contacts associated with an organization may be able to view the responses to questions submitted by all contacts within their organization.

- Your administrator can set up business rules to automatically apply SLA instances to organizations or contacts when incidents enter the system (from the Ask a Question page, email, or chat). After applying an SLA instance, business rules can then credit the incident to the specific SLA.

- If your organization uses SLAs and you have SLA permissions set in your profile, part of your duties may be to apply SLA instances to organizations and to contacts that do not have an organization association. See *SLA Instance Field* for specific instructions about applying SLA instances.

**Standard Organization Workspace**

B2C Service provides a standard workspace for working with organizations.

The workspace defines which fields are available, what buttons are displayed on the *ribbon*, and how the information is organized on the *content pane*. Your organization may use the standard workspace, or your administrator may have created one or more customized workspaces. Your *profile* defines the workspace you see when you work with organizations, whether it is the standard workspace or a customized workspace. See *Standard Workspaces* or *Custom Workspaces*. 
# Organization Workspace Ribbon

The buttons on the standard organization workspace ribbon are used to perform actions on the workspace. For information about the ribbon in general, see *Common Functionality Ribbon*.

### Organization Workspace Record Tabs
From an open organization record, you can view all contacts, tasks, attachments, notes, incidents, opportunities, and the organization’s position in a hierarchy. You can also view the audit log, which lists all actions taken on the organization record.

- **Contacts**—Lists all contacts associated with the organization. The number of contacts associated with the organization displays in parentheses next to the tab name. For each contact, the tab displays the name, email address, organization name, office phone number, and title. You can open, print, copy, remove from the organization, send an email, and set the contact role from the Contacts tab. See Add New Contacts to an Organization.
  
  **Note:** Contact roles are used only in opportunity tracking.

- **Opportunities**—Lists all opportunities associated with the organization. The number of opportunities associated with the organization displays in parentheses next to the tab name. For each opportunity, the tab displays the opportunity name, the staff person it is assigned to, status, stage, the sales representative forecast, the manager forecast, and the date it was last updated. You can open, copy, delete, print, forward, and reject an opportunity from the Opportunities tab. See Overview of Opportunities.

- **Notes**—Contains all notes associated with the organization. Notes can be sorted by date. Remember that customers never see the notes added by staff members. See Add an Organization.

- **Tasks**—Lists all tasks associated with the organization. The number of tasks associated with the organization displays in parentheses next to the tab name. For each task, the tab displays the task name, due date, completion date, staff member assigned to the task, and priority. You can open, copy, delete, print, and forward any task and mark tasks complete by clicking a button on the tab’s toolbar or by right-clicking the task and making your selection. See Add a Task.

- **Incidents**—Lists all incidents associated with the organization. The number of incidents associated with the organization displays in parentheses next to the tab name. For each incident, the tab displays status, response time, resolution time, source, reference number, and subject. You can open, copy, delete, print, forward, and propose an incident as an answer from the Incidents tab. See Incident Creation.
  
  **Note:** If you change the incident’s contact to one that is not associated with the organization, the incident will not appear on the tab.

- **Hierarchy**—Contains the hierarchical structure of the organization. See Organization Hierarchies.

- **Attachments**—Lists all attachments associated with the organization. The Attachments tab displays the file name, size, date created, date updated, and a description for each attachment. See Overview of the Attachments Tab.

- **Audit Log**—Lists all actions taken on the organization record by all staff members. Also displayed are automatic changes initiated by B2C Service that resulted from the application of business rules. When an action is generated by the system, the Who field contains Administrator. You can also see who worked on the organization, when it was added or updated, the actions taken, and descriptions of the actions. See Audit Logs.

### Add an Organization
You can add organizations independently of other records, or you can add them when you work on contacts.
Because other staff members may have permission to add organizations, the organization you plan to add may already be in the knowledge base. To avoid duplicating organization records, search the knowledge base before adding an organization to be sure it does not already exist. See *Record Search Options*.

1. Do one of the following:
   • Click **New**.
   • If your navigation set is configured to add organizations from the **file menu**, click **File** and select **Organization**. See *Configure the File Menu*.
   • Click **Search** next to the **Organization** field from a contact record, and then click **New Organization** on the **Organization Search** window.

   A new organization opens on a subtab.

2. Enter field information.

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>*<strong>Organization Name</strong></td>
<td>Enter the name of the organization in this field.</td>
</tr>
<tr>
<td><strong>Billing</strong></td>
<td>Click <strong>Edit</strong> in the lower right corner of the field to display a window for entering the organization’s address. Enter information in the Street, City, and Postal Code fields, and make selections on the Country and State/Prov. fields drop-down menus. When you select the country, the associated states or provinces appear in the State/Prov. menu. Press Enter when you are finished to close the window and display the address. To select another address type, either Shipping or any custom address organization type, click the arrow and select the address type. Then complete the address information.</td>
</tr>
<tr>
<td><strong>SLAs</strong></td>
<td>Click <strong>Add</strong> or <strong>Edit</strong> in this field to open the SLA Viewer window and add or remove an SLA instance for the organization. (If you have read-only permission in your profile, you will only be able to view an SLA instance that has already been applied.) See <em>SLA Instance Field</em>. This field applies only to Service.</td>
</tr>
<tr>
<td>*<strong>State</strong></td>
<td>Click this drop-down menu and select one or more of the following check boxes.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Service</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>Outreach</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>Opportunities</strong></td>
</tr>
<tr>
<td></td>
<td>The State field classifies how the organization was added (whether through Service when working on an incident, Oracle B2C Service Outreach when adding contacts, or opportunity tracking when working on an opportunity). The State field may be updated automatically, and you can also update it manually.</td>
</tr>
<tr>
<td><strong>Salesperson</strong></td>
<td>Click this drop-down menu to select a salesperson assigned to the organization. This field defaults to your name on the standard organization workspace. See <em>Assign a Record from a Report</em>.</td>
</tr>
<tr>
<td><strong>Login</strong></td>
<td>Enter a name in this field to designate a login for members of the organization to use when logging in to the customer portal. If your customer portal was configured to</td>
</tr>
</tbody>
</table>
### Core Features

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>require an organization login, customers must know the organization login name so their contact record can be associated and authenticated with the organization. This field applies only to Service.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter a password in this field to assign a login password to the organization. This field applies only to Service.</td>
</tr>
</tbody>
</table>

3. To add contacts to the organization, click the **Contacts** tab. See Add New Contacts to an Organization.

4. To associate the organization with a new opportunity, click the **Opportunities** tab, click **Add New**, and complete the opportunity fields. See Overview of Opportunities.

5. To add notes to the organization record, click the **Notes** tab, click **Add**, and enter your comments in the field.

   **Note:** Add notes to the organization when you want to provide information for other staff members. Notes are not visible to customers. Click Note Channel (next to Organization Note on the subheading of the Notes tab) to select the channel through which you gained the information you are adding to the note. Besides selecting No Channel, options include Phone, Fax, Post, CSS Web, and Email.

6. To associate tasks with the organization, click the **Tasks** tab, where you can add, edit, print, copy, assign, delete, and forward tasks associated with the organization and mark them complete. See Tasks Tab.

7. To associate the organization with a new incident, click the **Incidents** tab, click **Add New**, and complete the incident fields. See Add an Incident.

8. To define the organization in terms of its parent or subsidiary divisions, click the **Hierarchy** tab. See Organization Hierarchies.

9. To attach files to the organization record, click the **Attachments** tab. See Overview of the Attachments Tab.

10. To view the audit log for the organization, click the **Audit Log** tab. See Audit Logs.

11. To add a flag to the organization, click the area next to the white flag at the top of the content pane. See Add a Flag to a Record.

12. If the organization you are adding is on a subtab (because you are adding the organization to a contact), click **OK**.

   **Note:** Closing the new organization subtab saves the organization data in memory, but the organization is not added to the knowledge base until you save the contact you added the organization to.

13. Click **Save**.

### Add New Contacts to an Organization

You can add new or existing contacts to an organization. This procedure is for adding new contacts.

1. Right-click the organization you want to add contacts to and select **Open**.

   On the standard organization workspace, the organization opens with the Contacts tab as the active record tab.

2. Click **Add New** on the Contacts tab.

   A new contact opens on a subtab.

3. Enter the contact’s first and last names in the appropriate fields.

4. Select one or more check boxes in the **State** drop-down menu.

5. To enter additional contact information, complete any of the remaining fields on any of the record tabs. See Add a Contact.

6. Click **OK**.
Clicking OK on the new contact subtab closes the subtab and saves the contact information in memory, but the contact is not added to the knowledge base until you save the organization.

7. To add more contacts to the organization, repeat the previous steps.
8. Click Save.

Add Existing Contacts to an Organization

You can add new or existing contacts to an organization. This procedure is for adding existing contacts.

The existing contacts may or may not already be associated with an organization. All incidents for which the contact was the primary contact are now associated with the organization you add the contact to. Opportunities for which the contact is the primary contact do not change their organization association when you add the contact to the organization. For more information about contacts, see Overview of Contacts.

1. Right-click the organization you want to add contacts to and select Open.
   On the standard organization workspace, the organization opens with the Contacts tab as the active tab.
2. Click Add Existing.
   The Contact Search window opens.
3. Enter an entry in any of the available fields: Contact Last Name, Contact First Name, Phone, Email, Postal Code, or Organization.
   You can use an asterisk (*) as a wildcard in your search term.
4. Select one or more check boxes in the State drop-down menu.
5. Click Search.
   The contacts that match the search criteria are returned on the Contact Search window.

   | Note: When only one contact matches the search criteria, the Contact Search window closes and that contact appears on the Contacts tab.

6. Select the contact you want to associate with the organization and click Select.
   The window closes and the contact appears on the organization's Contacts tab.
7. Click Save.

Edit an Organization

You might need to view or update organization information.

Depending on the permissions set in your profile, you can view organization information, edit organizations, copy, print, and delete organizations, and remove contacts from an organization.

1. Right-click the organization and select Open.
   The organization record opens.
2. Make the necessary changes to any field on any tab.
3. Click Save.

Delete an Organization

This procedure describes how to delete an organization.
CAUTION: Deleting organization records can affect other staff members within your organization. This action permanently removes not only the organizations from the knowledge base, but also all contacts associated with the organization and the incidents and opportunities for which the contacts are primary contacts. See What Happens When You Delete a Contact.

1. Right-click the organization and select Delete.  
   A message asks you to confirm that you want to delete the organization.
2. Click Yes.

Remove Contacts from an Organization

This procedure describes how to remove contacts from an organization.

1. Right-click the organization and select Open.  
The standard organization workspace displays the organization record with the Contacts tab as the active tab.
2. In the list of contacts, right-click the one you want to remove from the organization and select Remove.
3. Click Yes on the message that confirms the removal of the contact.
4. To remove additional contacts, repeat these steps.
5. Click Save.

The contacts are removed from the organization but not from the knowledge base.

Organization Hierarchies

The Organization Hierarchy feature in B2C Service lets you create a hierarchy for any organization that has subordinate organizations.

If an organization in your knowledge base has several subsidiaries or regional or international offices, each having an organization record in the knowledge base, you can add the subordinate organizations to the parent organization to create an organization hierarchy. After you create a hierarchy for an organization, you can easily add and remove organizations and change the order of the hierarchy structure.

An organization can have an unlimited number of subordinates, organized into a maximum of twelve levels per parent organization.

CAUTION: Changing an organization's hierarchy can impact the incidents and opportunities associated with all organizations in the hierarchy. Therefore, make sure you understand the consequences of changing the structure of an organization's hierarchy.

How You Work with the Hierarchy Tab

On the Hierarchy tab, you can add a new or existing organization, open or print an organization, remove an organization from the hierarchy, find an organization in the hierarchy, and refresh to restore the hierarchy to its previously saved state and discard your edits.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>Click and select one of the following options.</td>
</tr>
</tbody>
</table>
### Button | Description
---|---
Add New | Select to open a new organization on a subtab and add an organization to the hierarchy.
Add Existing | Select to open the Organization Search window and add an existing organization to the hierarchy.
Open | Click to open the selected organization and edit it.
Print | Click to print the selected organization.
Remove | Click to remove the organization from the hierarchy.
Find | Click to open the Find window and search the hierarchy for an organization.
Refresh | Click to restore the organization hierarchy and discard any changes you have made.

**CAUTION:** Removing an organization also removes its subordinate organizations from the hierarchy.

**CAUTION:** To delete an organization that is part of an organization hierarchy, first remove the organization from the hierarchy. Then delete the organization from the knowledge base. As always, use caution when deleting organizations. See *Delete an Organization.*

### Add a New Organization to the Hierarchy
This procedure describes how to add a new organization to the hierarchy.

1. Right-click the organization and select **Open**.
2. Click the **Hierarchy** tab.
3. Click **Add > Add New**.
4. Enter the organization name.
5. Select one or more check boxes in the **State** drop-down menu.
6. To enter additional organization information, complete any of the remaining fields on any of the record tabs.
7. Click **OK** to close the new organization subtab and add the organization to the hierarchy of the organization you are editing.
8. To change the position of the organization you added, expand the hierarchy and drag and drop the organization.
9. Click **Save**.

**Related Topics**
- **Add an Organization**

### Add an Existing Organization to the Hierarchy
This procedure describes how to add an existing organization to the hierarchy.

1. Right-click the organization and select **Open**.
2. Click the **Hierarchy** tab.
3. Click **Add** and select **Add Existing**.
   The Organization Search window opens.
4. Enter search criteria in the fields to filter your organization search and click **Search**. The organizations that match your search criteria display.

5. Select an organization from the list and click **Select**.
   - To move only some of the selected organization’s subsidiaries to the organization hierarchy, clear the check boxes for those you do not want to move.
   - Click **OK** to close the window and move the organization and selected subsidiaries to the hierarchy.
   - To view the full organization hierarchy, right-click any organization within the hierarchy and select **Expand All**.

If the organization you select is not already part of a hierarchy, selecting it closes the Organization Search window and adds the organization to the hierarchy of the original organization.

**Note:** If the organization you are adding is part of another hierarchy, a message notifies you that the selected organization contains subsidiaries. Moving the organization also moves all its subsidiaries unless you select to move only specific subsidiaries.

6. Click **Save**.

## Contacts

### Overview of Contacts

Customer data is the foundation of B2C Service. It includes basic information such as a customer’s name, email address, and phone number, as well as information about customer service issues, opportunities, and marketing mailings opt-in status.

Every customer has a contact record in the **knowledge base** that contains information about the customer. But before you can understand contacts, you must first understand how contacts and organizations are associated and also how contacts are associated with incidents and opportunities.

The contact information you add and edit becomes part of your organization’s **knowledge base** and is shared with all staff members. If you are a sales representative, for example, you should know if a customer is having support issues before you try to close a sale. If you are a service agent, you can better help customers if you understand their past support questions. And if you work in marketing, you must know whether the customer prefers plain text or HTML email.

When customer information is kept up-to-date, the knowledge base provides complete information to your entire organization. The results make your job easier and provide a superior customer experience.

Familiarize yourself with the following points before adding or editing contacts.

- An organization is any business entity that has an organization record in the knowledge base. For example, organizations can refer to companies, divisions of companies, government agencies, educational institutions, or nonprofit associations.
- Contacts may or may not belong to an organization. If your customers are other organizations, you might have several contacts associated with an organization record. If, on the other hand, your customers are individuals rather than organizations, every contact record represents a unique customer. It is also possible that you have both organizations and contacts as customers.
- Each contact is associated with only one organization, but an organization can have many contacts. Each contact record displays all incidents, opportunities, tasks, surveys, marketing activity, attachments, and notes for the contact, as well as the audit log, which displays all activity for the contact record.
• Every incident must have a **primary contact**. If your profile gives you the appropriate permissions, you can change contact associations and delete contact records. Because these actions can have far-reaching consequences on incidents as well as opportunities, it is important to understand what happens when you make such changes.

## Standard Contact Workspace

Oracle B2C Service provides a standard workspace for working with contacts.

The standard contact workspace defines which fields are available, what buttons are displayed on the **ribbon**, and how the information is organized on the **content pane**. Your organization may use the standard workspace, or your administrator may have created one or more customized workspaces. Your **profile** defines the workspace you see when you work with contacts, whether it is the standard workspace or a customized workspace. See **Standard Workspaces** or **Custom Workspaces**.

## Contact Workspace Ribbon

The buttons on the standard contact workspace ribbon are used to perform actions on the workspace.

For more information about the ribbon in general and the Quick Access toolbar, see **Common Functionality Ribbon**.

Contact Workspace Record Tabs

From an open contact record, you can view all opportunities, notes, tasks, incidents, surveys, marketing activity, and attachments associated with the contact. You can also view the audit log, which lists all actions taken on the contact record.

- **Opportunities**—Lists all opportunities associated with the contact. The tab contains the number of opportunities associated with the contact in parentheses next to the tab name. For each opportunity, the tab displays the opportunity name, the staff person it is assigned to, status, stage, the sales representative and manager forecasts, and the date it was last updated. You can open, copy, delete, print, forward, and reject an opportunity by clicking a button on the tab’s toolbar or by right-clicking the opportunity and making your selection. See *Overview of Opportunities.*

- **Notes**—Contains all notes associated with the contact. Notes can be viewed and selected by contact or organization and sorted by date. Remember that customers never see the notes added by staff members. See *Add a Contact.*

- **Tasks**—Lists all tasks associated with the contact. The tab contains the number of tasks associated with the contact in parentheses next to the tab name. For each task, the tab displays the task name, due date, completion date, the staff member assigned to the task, and priority. You can open, copy, delete, print, and forward any task and mark tasks complete by clicking a button on the tab’s toolbar or by right-clicking the task and making your selection.

- **Incidents**—Lists all incidents associated with the contact. The tab contains the number of incidents associated with the contact in parentheses next to the tab name. For each incident, the tab displays status, time beyond the response threshold, time beyond the resolution threshold, source, reference number, and subject. You can open, copy, delete, print, forward, and propose an incident as an answer by clicking a button on the tab’s toolbar or by right-clicking it and making your selection. See *Incident Creation.*
• **Surveys**—Contains all survey activity associated with the contact. The tab contains the number of surveys associated with the contact in parentheses next to the tab name. For each survey, the tab displays when the customer completed the survey, the survey score, and the type and name of the survey. The Action column allows you to view the contact’s response. See [Overview of Surveys](#).

• **Outreach Activity**—Contains all outreach activity associated with the contact, such as mailings that were viewed or tracked links that were clicked. The Outreach Activity tab contains the number of mailings associated with the contact in parentheses next to the tab name. The tab displays when the activity occurred, what the activity was, a description of the activity, the name of the mailing, and any documents for each listed activity. See [Overview of Mailings](#).

• **Attachments**—Lists all attachments associated with the contact. The tab displays the file name, size, date created, date updated, and a description for each attachment. See [Overview of the Attachments Tab](#).

• **Audit Log**—Lists all actions taken on the contact record by you, other staff members, and the customer. It also displays any automatic changes initiated by B2C Service that resulted from the application of business rules or through configuration settings. See [Audit Logs](#).

**Note:** Your administrator may add additional tabs to a custom contact workspace assigned to your profile. The Role Sets View control can be added to a custom contact workspace to define Community Self Service roll sets for the contact.

### Add a Contact

Contacts can be added to the knowledge base by customers and staff members.

Because many staff members can have permission to add contacts, the contact you plan to add may already be in the knowledge base. To avoid duplicating contact records, search the knowledge base before adding a contact to be sure it does not already exist. See [Record Search Options](#).

A customer can add a contact record when creating an account on the [Customer Portal](#). Staff members can add contacts using a contact workspace. They can also add them when working on incidents, opportunities, organizations, tasks, assets, and contact lists.

1. Do one of the following:
   - Click **New** on the **ribbon**.
   - If your navigation set is configured to add contacts from the **application menu**, click **File** and select **Contact**. See [Configure the File Menu](#).

   You can also add a contact while working on many types of open records, using one of the following methods:
   - Right-click in the **Contact** field of an open incident, opportunity, task, asset, or contact list, then select **Add New**. The new contact opens on a subtab, which contains the same fields and tabs as the standard contact workspace does.
   - Use the Contacts tab of an open incident, opportunity, or organization record to add a new contact. See [How You Add Contacts from Other Records](#).

2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<tr>
<td><strong>Last Name</strong></td>
<td>Enter the contact’s last name in this field.</td>
</tr>
<tr>
<td>Email</td>
<td>Enter the contact’s email address in this field. To add alternate email addresses, click the arrow and select Email Alt 1 or Email Alt 2. Then enter the alternate email address in the field. If you enter an email address that is already in the knowledge base, you will receive an error message and not be able to save the contact. If email address sharing is enabled, meaning multiple contacts can share the same email address, a yellow icon with a black exclamation point displays when you enter an email address that is associated with a different contact in the system. If this icon appears, you can save the contact without changing the contact’s email address. Email address sharing validation begins when the Email address field receives focus and ends when the field loses focus. See Email Address Sharing.</td>
</tr>
<tr>
<td>Office Phone</td>
<td>Enter the contact’s phone number in this field. To add other phone numbers, click the arrow, select one of the options, and enter the phone number in the field. The options include Mobile, Fax, Assistant, and Home.</td>
</tr>
<tr>
<td>Address</td>
<td>Click <strong>Edit</strong> in the lower right corner of the field to display a window for entering the contact’s address. Enter information in the Street, City, and Postal Code fields, and make selections on the Country and State/Prov. fields drop-down menus. When you select the country, the associated states or provinces appear in the State/Prov. menu. Press Enter when you are finished to close the window and display the address you entered.</td>
</tr>
<tr>
<td>Contact Type</td>
<td>Click this drop-down menu and select a contact type. These options are unique to your organization and were added by your administrator. See Add or Edit a Contact Type.</td>
</tr>
<tr>
<td>Channel Usernames</td>
<td>Click <strong>Add</strong> in this field to open the Channel Usernames window where you can add Facebook, Twitter, and YouTube user names for contacts. See Overview of Channels. This field does not display unless your administrator has configured a custom contact workspace for the Channel Usernames field. See Overview of Workspaces. In addition, contacts can provide their own Facebook, Twitter, and YouTube user names through the ChannelAllInput and ChannelAllDisplay widgets on the customer portal.</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>Click this drop-down menu and select one or more of the following check boxes: Service, Outreach, or Opportunities. The State field classifies how the contact was added, whether through Service when working on an incident, Outreach when adding contacts, or Opportunity Tracking when working on an opportunity, and what areas of B2C Service the contact has since had activity in. The State field may be updated automatically, and you can also update it manually.</td>
</tr>
<tr>
<td>Organization</td>
<td>Click <strong>Search</strong> to the right of the Organization field to open the Organization Search window and search for an organization to associate with the contact. See Associate a Contact with an Organization.</td>
</tr>
<tr>
<td>Salesperson</td>
<td>Click this drop-down menu and select the salesperson assigned to the contact. This field defaults to No Value. See Assign a Record from a Report.</td>
</tr>
</tbody>
</table>
### Field | Description
---|---
Title | Enter the contact’s title in this field.
Login | Enter a name in this field to designate a login for the customer to use when logging in to the customer portal. If the customer added the contact record on the customer portal, this field displays the login the customer entered. This field applies only to Service. A login must be unique for each contact even if email address sharing is enabled. See [Email Address Sharing](#). The login may not contain a space, single quote, double quote, less than, or greater than character. We recommend that you use ASCII characters when creating a customer login.
SLAs | An SLA is a service level agreement. Click Add or Edit in this field to add, edit, or remove an SLA instance for the contact. (If you have read-only permission in your profile, you will only be able to view an SLA instance that has already been applied.) See [SLA Instance Field](#). This field applies only to Service and only for contacts that do not have an organization association. If the contact is associated with an organization, you must apply SLA instances to the organization, not the contact.
Global Opt-in | Click this drop-down menu and select Yes if the customer has opted to receive marketing mailings and No if the customer does not want to receive them.

3. To associate the contact with a new opportunity, click the Opportunities tab. (This tab is on top by default on the standard contact workspace.) Click Add New to open a new opportunity on a subtab, and then complete the fields. See [Overview of Opportunities](#).
4. To add note to the contact record, click the Notes tab, click Add, and enter your comments in the field.
   Add notes to the contact when you want to provide information for other staff members. Notes are not visible to customers. Click the Contact Note drop-down menu to select the channel through which you gained the information you are adding to the note. Besides selecting No Channel, options include Phone, Fax, Post, CSS Web, and Email.
5. To associate task with the contact, click the Tasks tab where you can add, open, print, copy, assign, delete, and forward tasks associated with the contact and mark them complete. See [Tasks Tab](#).
6. To associate the contact with a new incident, click the Incidents tab. Click Add New to open a new incident on a subtab, and then complete the fields. See [Add an Incident](#).
7. To view survey the contact has participated in, click the Surveys tab.
8. To view mailings the contact has received, click the Outreach Activity tab.
9. To attach files to the contact record, click the Attachments tab. See [Overview of the Attachments Tab](#).
10. To view the audit log for the contact record, click the Audit Log tab. See [Audit Logs](#).
11. To add a flag to the contact, click the area next to the white flag at the top of the content pane. See [Add a Flag to a Record](#).
12. If the contact you are adding is on a subtab (because you are adding the contact to a contact list, incident, opportunity, or task), click OK.
   **Note:** Closing the New Contact subtab saves the contact data in memory, but the contact record is not added to the knowledge base until you save the record you have added the contact to.
13. Click Save.
How You Add Contacts from Other Records

You can add or edit a contact from the Contacts tab when you work with incidents, opportunities, and organizations. These options are also available by right-clicking any contact.

<table>
<thead>
<tr>

<td>Click to display a drop-down menu of options that include actions you can take, such as printing, forwarding, publishing, or exporting the contact data.</td>
</tr>
</tbody>
</table>

The following columns are available on the Contacts tab.

- Primary (for incidents and opportunities)
- Full Name
- Email Address
- Organization Name
- Office Phone
- Title
- Contact Role (for opportunities)
- Action

The Action column contains Open, Delete (secondary contacts only for incidents), and Print options for the contact. You can also access these options by right-clicking the contact. Other right-click options include Copy, Remove, Email, Set Contact Role (opportunities only), and Copy Cell to Clipboard. (The right-click options are the same as those offered by the buttons on the Contacts tab toolbar.)

- Add a Contact
- Search for a Record from a Report

Contact Associations

Changing a contact organization association has implications for the incidents and opportunities associated with the contact.

If you change the organization for a contact who is the primary contact for an incident, the incident's organization association changes to match that of the contact. Secondary contacts from a different organization remain with the incident even when you change the organization association of the primary contact. The effect of changing a contact’s organization association does not change the opportunity's organization association. The contacts associated with the opportunity remain the same, regardless of the organization they are associated with.

It is possible to add contacts and not associate them with any other type of record in the knowledge base. But the real value of B2C Service comes from being able to associate contact records with organizations, incidents, opportunities, tasks, and contact lists. All staff members with permissions in their profile, whether they work in Service, Opportunity Tracking, Outreach, or Feedback, can open and update contact records, ensuring that every staff member has the most current information about all contacts.

Associate a Contact with an Organization

When you know that a contact you are adding belongs to an organization that is already in the knowledge base, you should associate the contact with the organization.

If the organization is not yet in the knowledge base, you can enter organization information for the contact to create an association between the two types of records. You can associate a contact with an organization at any time. For example, you can associate a contact with an organization when you add the contact. Or you can edit the contact later to add the organization association. The procedure for associating a contact with an organization is the same whether or not the contact is currently associated with another organization.

**Note:** If you change a contact’s organization association, you also change the organization association for all incidents for which the contact is the primary contact. However, the organization association for the contact’s opportunities do not change when you change the contact’s organization association.

1. Do one of the following:
   - Right-click a contact on the **content pane** and select **Open > Contact**. The contact record opens. If the contact is associated with an organization, the organization name appears in the record.
   - If your navigation set is configured to add contacts from the file menu, click **File** and select **Contact**. See **Configure the File Menu**.
2. Click **Search** to the right of the **Organization** field.
   
   You can also click the link in the **Organization** field, then select an organization from the list of recently viewed organizations. See **How You Search from Open Records**.
   
   The **Organization Search** window opens.
3. To search by organization name, enter the first few characters in the **Organization Name** field.
   
   An implied wildcard is used so all organizations that begin with the letters you enter are returned.
4. To search by State, select any or all of the Select All, Service State, Outreach State, or Opportunities State check boxes in the drop-down menu.

5. Click Search.

The list of organizations that match the search criteria appears.

6. Do one of the following:
   - Select the organization you want to associate the contact with and click Select or press Enter. The Organization Search window closes and the organization appears in the contact record.
   - If the organization does not appear in the list, click New Organization to open a new organization on a subtab and complete the fields. (The search term you entered in the Organization Name field on the search window appears in the Organization Name field on the new organization subtab.) See Add an Organization.

7. Click Save.

How You Associate Contacts with Incidents

When you work on an incident in B2C Service and add a new or existing contact to the incident, that contact-incident association is automatically created when you save the incident.

A contact-incident association is also created when you add an incident to a contact by clicking the Incidents tab and clicking the Add New button. See Add an Incident.

How You Associate Contacts with Opportunities

When you work on an opportunity in Opportunity Tracking and add a new or existing contact to the opportunity, the contact-opportunity association is automatically created when you save the opportunity.

A contact-opportunity association is also created when you add an opportunity to a contact by clicking the Opportunities tab and clicking the Add New button. See Overview of Opportunities.

Remove a Contact from a Record

There might be times when you want to remove a contact from a record but do not want to delete the contact from the knowledge base. In those instances, you can remove the contact from the incident, opportunity, organization, or contact list.

To remove a contact from an open task, right-click the name in the Contact field and select Clear.

1. Do one of the following:
   - On the Contacts tab of the record, select the contact you want to remove and click Remove.
   - Right-click the contact and select Remove.

A message asks you to confirm that you want to remove the contact.

2. Click Yes.

The contact remains in the knowledge base but is no longer associated with the record.

3. Click Save.

Edit a Contact

It is highly likely you will encounter situations where you need to update contact information for contacts that are already in the knowledge base.
This procedure assumes a contacts report is displayed on the *content pane*. See *Search for a Report from the Reports Explorer*.

Depending on the permissions set in your *profile*, you can edit a contact record whenever you need to add or change customer information. You can also copy, print, and delete contacts and set a contact role.

1. Right-click the contact and select **Open > Contact**.
   The contact record opens.
2. Make the necessary changes to any field on any tab.
3. Click **Save**.

**What Happens When You Delete a Contact**

There are usually consequences when a contact is deleted. If the contact is associated with multiple incidents or multiple opportunities or both, different results may occur with each record, depending on the type of associations and the association of other contacts with the record.

In cases where the contact has multiple incidents and opportunities, follow the flowchart for each record the contact is associated with to discover what will happen to the record if you delete the contact.

For example, assume a contact is associated with two opportunities. Also assume that the first opportunity does not have an organization association while the second one does, and that neither opportunity has a secondary contact. Deleting the contact removes the contact from the knowledge base and deletes the first opportunity. The second opportunity remains in the knowledge base, although the contact no longer appears on the Contacts tab.

**Note:** When you delete secondary contacts for incidents and opportunities, the incidents and opportunities are not deleted.
Delete a Contact
This procedure describes how to delete a contact.

**CAUTION:** Deleting contact records can affect other staff members within your organization. This action permanently removes not only the contacts from the knowledge base, but also all incidents for which the contact is the primary contact. Opportunities can also be deleted, so you must understand the consequences of deleting contacts before doing so. See *What Happens When You Delete a Contact* for specific results of deleting contacts.

Staff members with the Bulk Delete permission enabled can delete up to 1000 contact records at a time. See *Administration Permissions* and *Perform Bulk Delete*. Transactions associated with those contacts are deleted asynchronously. Purging transactions is controlled by data lifecycle management policies. See *Data Lifecycle Management*.

1. Right-click a contact and select **Delete**.
   A message asks you to confirm that you want to delete the contact.
2. Click **Yes**.

   **Tip:** If you want to delete a contact but do not want to delete the incidents and opportunities associated with that contact, you can specify different contacts for the incidents and opportunities before you delete the original contact. See *Reassociate the Contact with an Incident* or *Reassociate the Contact with an Opportunity*.

Set a Contact Role
You can set a contact role from an opportunity.

1. Open an opportunities report.
2. Right-click an opportunity and select **Open > Opportunity**.
3. Click the **Contacts** tab.
4. Right-click the contact and select **Set Contact Role**.
   The **Set Contact Role** window opens.
5. Click the **Contact Role** drop-down menu and select a contact role for the opportunity contact.
6. Click **OK**.
7. Click **Save**.

   **Note:** The contact role may be different for different opportunities, which is why it is set from the opportunity, not from the contact. For example, a contact might serve as a decision maker in one opportunity and a referral in another.

Reassociate the Contact with an Incident
Deleting a contact also deletes the incidents for which the contact is the primary contact. If the contact is associated with incidents but is not the primary contact, those incidents will not be deleted.

If you do not want to delete the **incidents** for which the contact is the primary contact, you can reassociate the incidents with a different contact before you delete the original contact.

1. Right-click the contact you want to delete and select **Open > Contact**.
2. Click the **Incidents** tab.
   The tab displays all incidents for which the contact is the primary.
3. Right-click the first incident and select **Open**.
The incident opens on a subtab.

4. Click the **Contacts** tab on the incident.

5. Click **Add Existing**.
   
The **Contact Search** window opens.

6. Search for a contact on the **Contact Search** window using the procedure described in *Search for a Contact from an Open Record*.

   The contact you select appears on the Contacts tab of the incident.

   **Note:** If a contact is added to an incident using the Search button next to the Contact field of the incident, the existing primary contact is automatically removed from the incident and replaced with the new primary contact. This logic also applies when clicking the contact’s name in the Contact field and selecting Change or Add New. If a contact is added to an incident using the Add New or Add Existing functionality from the Contacts tab on the incident, the primary contact remains and the new contact is added as a secondary contact.

7. Select the option under the Primary column for the contact you added.
   
   This makes the new contact the primary contact for the incident.

8. Click **OK** to close the incident.

9. Repeat these steps for every incident you want to associate with a different contact.

10. Click **Save**.

   The incidents you reassociated no longer appear on the Incidents tab of the contact. Now you can delete the contact that was originally the primary contact. See *What Happens When You Delete a Contact*.

**Reassociate the Contact with an Opportunity**

Clicking the Opportunities tab on an open contact displays the opportunities associated with the contact.

If no opportunities are listed, you can safely delete the contact without deleting any opportunities. If the contact is associated with other opportunities but is not the primary contact, those opportunities will not be deleted when the contact is deleted. If you want to delete the contact but not the opportunities associated with the contact, you can reassociate the opportunities with a different contact.

1. Right-click the contact you want to delete and select **Open > Contact**.
2. Click the **Opportunities** tab.

   The tab displays all opportunities for which this contact is the primary contact.

3. Right-click the first opportunity and select **Open**.

   The opportunity opens on a subtab.

4. On the Contacts tab, click **Add** and select **Add Existing**.

   The **Contact Search** window opens.

5. Search for a contact on the **Contact Search** window using the procedure described in *Search for a Contact from an Open Record*.

   The contact you select appears on the Contacts tab of the opportunity.

   **Note:** If a contact is added to an opportunity using the Search button next to the Contact field of the opportunity, the existing primary contact is automatically removed from the opportunity and replaced with the new primary contact. This logic also applies when clicking the contact name in the Contact field and selecting Change or Add New. If a contact is added to an opportunity using the Add New or Add Existing functionality from the Contacts tab on the opportunity, the primary contact remains and the new contact is added as a secondary contact.

6. Select the option under the Primary column for the contact you added.

   This makes the new contact the primary contact for the opportunity.

7. Click **OK**.
8. Repeat these steps for every opportunity you want to reassociate.
9. Click Save.

The opportunities you reassociated no longer appear on the Opportunities tab of the contact. Now you can delete the contact that was originally the primary contact. If the contact you deleted belonged to an organization, the opportunity remains with the organization, although the reassociated contact appears on the opportunity as well. See What Happens When You Delete a Contact.

Email Address Sharing

Email address sharing gives you the ability to associate a single email address with multiple contact records, which allows a group of related contacts (such as a family or a team) to maintain individual contact records while sharing an email address.

**Note:** Contact records that share the same email address must have a unique login, or, for contacts without a login, they must include a unique combination of first name and last name, as duplicate contact records cannot exist in the knowledge base. For example, Bill Short and Bill Short can share the same email address as long as they have different logins. If multiple contacts’ logins are left blank, their first or last name must be unique. In this case, Bill Short and William Short can share the same email address, since each name is unique. Email addresses associated with a single contact record must be unique—that is, for a single contact, the values of `contacts.email`, `contacts.email_alt1`, and `contacts.email_alt2` cannot contain the same address.

After email address sharing is enabled, records and transactions initiated by a shared email address are associated with the contact considered to be the best fit. The contact-matching process used to determine the best fit is shown in this flowchart.
When shared contact addresses are in different fields (for example, contacts.email_alt1 and contacts.email_alt2), the system selects the contact whose address is in the field of highest precedence (contacts.email_alt1). However, if the shared addresses are in the same field (for example, both are in contacts.email_alt1), the system attempts to match the values in the First Name and Last Name fields if available. If no match is found based on field precedence or name values, the system selects the contact record last updated in the database.

Areas Affected by Email Address Sharing

The contact-matching process applies to areas of the product suite that associate contacts by email address, including chats, mailings, surveys, web forms, site feedback, email transactions, and Create an Account and Ask a Question requests on the customer portal.

Contact-matching logic is used only in cases in which the contact is not explicitly identified by a cookie. These areas in B2C Service are affected when email address sharing is enabled.

**Enable Email Address Sharing**

To make email address sharing available, it must first be enabled.

**CAUTION:** Enabling email address sharing removes important safeguards that prevent the creation of duplicate contacts and protect your reputation for sending mailings and surveys. Also, disabling email address sharing after it has been enabled can cause conflicts when duplicate email addresses are encountered. For these reasons, email address sharing is disabled by default and we recommend it be enabled only if it is required for your business processes and only after thorough consideration has been given to the potential impact.
1. Click **Configuration** on the *navigation pane*.
2. Click **Database**, then double-click **Email Address Sharing**.
   The Email Address Sharing editor displays on the *content pane*.
3. Select **Enabled**.
4. Click **Save**.
   A message warns you that duplicate email address safeguards will be removed.
5. Click **OK**.

After email address sharing is enabled, staff members who are currently logged in to B2C Service must log out and log back in for the change to take effect.

**Contact Synchronization with Oracle Commerce Service Center Integration**

Contacts are synchronized between Oracle Commerce Service Center (CSC) and B2C Service, letting you view CSC contact information and order details on the Service Console.

From there, you can take action on an existing CSC order or place a new order in CSC on behalf of the customer. CSC must be enabled. Contact your Oracle account manager. See *Oracle Commerce Service Center* for more information on working with CSC on the Service Console.

**Tasks**

**Overview of Tasks**

With task functionality, you can add tasks to records you are working on.

In addition, you can add standalone tasks that are not related to specific records. By keeping track of all tasks in B2C Service, you can monitor everything you must do from a single location, all but eliminating the possibility of forgetting a critical task. You can add tasks from the *file menu* or the Tasks tab on records. By familiarizing yourself with the standard *workspace* for tasks, you will know how to add and edit tasks during your workday.

**Standard Task Workspace**

B2C Service provides a standard workspace for working with tasks.

The standard task workspace defines which fields are available, what buttons are displayed on the *ribbon*, and how the information is organized on the *content pane*. Your organization may use the standard workspace, or your administrator may have created one or more customized workspaces. Your *profile* defines the workspace you see when you work with contacts, whether it is the standard workspace or a customized workspace. See *Standard Workspaces* or *Custom Workspaces*.

**Task Workspace Ribbon**

The buttons on the standard task workspace ribbon are used to perform actions on the workspace.
<table>

**Task Workspace Record Tabs**

The standard workspace for tasks includes these tabs.

- **Summary**—Contains all key fields for the task. You can also select a record with which you want to associate the task. Depending on the height of the Service Console on your screen, the key fields might be displayed on the content pane, rather than on a separate Summary tab.

- **Attachments**—Contains the attachments associated with the task. The tab displays the file name, size, date created, date updated, and a description for each attachment.

- **Audit Log**—Lists the actions taken on the task, including the time the action was taken, who carried out the action, what the action was, and a description of the action.

- **Notes**—Contains task notes that can be sorted by date. Remember that customers never see the task notes added by staff members.
Tasks Tab

Besides adding and editing tasks on the task workspace, you can add or edit them from the Tasks tab when you are working on an answer, campaign, contact, document, incident, mailing, opportunity, organization, or survey.

These options are also available by right-clicking a task.

Delete a Task

Deleting a task removes it permanently from the knowledge base.
When you delete answers, campaigns, contacts, documents, incidents, mailings, opportunities, organizations, or surveys that have associated tasks, any tasks associated with the records are also deleted. The type of record that a task is associated with is determined by the value of the Task Type field.

1. Open a task report.
2. Do one of the following:
   - Right-click on a task and select **Delete > Task**.
   - Open a task and click **Delete**.

   The **Task Delete** confirmation window displays.
3. Click **Yes**.

**Related Topics**
- **Overview of Tasks**

### Complete a Task

You can change the status of a task to Complete.

1. Open a task report.
2. Select one or more tasks to complete.
   - To select multiple tasks, press Ctrl while selecting tasks.
3. Right-click the selected tasks and select **Complete Task**.

   You can also select a single task and click **Complete** in the Action column to complete it. You cannot complete multiple tasks this way.

### Add a Task

You can add a standalone task to serve as a reminder to yourself, or you can add a task to a specific record when you are working on the record.

When you add a task, you define its name, the staff member it is assigned to, relevant dates, and other task information. You can also associate it with existing records. When you add a task in a workgroup, clicking the OK button accepts changes made to the record and closes the subtab. However, it does not save changes to the database until you click Save or Save and Close.

1. Do one of the following:
   - Click **New**.
   - If your navigation set is configured to add tasks from the **file menu**, click **File** and select **Task**.
   - If you want to add a new task from an open record (such as an incident) or from items like mailings and campaigns, click **Add New**.

   The new task opens in a separate window.
2. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the task.</td>
</tr>
<tr>
<td>Assigned</td>
<td>This field defaults to your name in the standard tasks workspace, but you can click the drop-down menu to assign the task to a different staff member if you have permission.</td>
</tr>
<tr>
<td>Status</td>
<td>Click this drop-down menu and select a status. The status options include Not Started, In Progress, Completed, Waiting, and Deferred.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>Enter a value for the percentage of the task that is complete.</td>
</tr>
<tr>
<td>Priority</td>
<td>Click this drop-down menu and select Low, Normal, or High as the task’s priority.</td>
</tr>
<tr>
<td>Due Date</td>
<td>Click this drop-down menu to open the current month’s calendar and select the date the task is due. Use the arrows at the top to change the month if necessary.</td>
</tr>
<tr>
<td>Planned Completion</td>
<td>Click this drop-down menu to open the current month’s calendar and select the task’s planned completion date.</td>
</tr>
<tr>
<td>Date Completed</td>
<td>Click this drop-down menu to open the current month’s calendar and select a completion date for the task.</td>
</tr>
</tbody>
</table>
| Task Type             | Click this drop-down menu to select a task type. When you select a task type, the associated record on the right side of the content pane is highlighted to indicate that it is a required field. In other words, if you define a task as having an **Opportunities** task type, you must select an opportunity for the task. You do not have to select a task type if you do not want to associate the task with a specific record.  
  If you are adding the task from an open record, the task type selection defaults to the type of record being edited. |
| Notes                 | Enter any notes about the task in this field.                                                                                                                                                              |

3. To associate the task with a record:
   a. Click **Search** to the right of the Record field.
   b. Enter information in the search fields.
   c. Select the record you want to associate with the task.

   If you have selected a task type, you must make a selection for the associated record (opportunity, organization, contact, incident, answer, campaign, mailing, survey, or document).

4. To attach files to the task, click the **Attachments** tab.

5. To view the audit log for the task, click the **Audit Log** tab.

6. To add notes to the task, click the **Notes** tab:
   a. Click **Add**.
   b. Enter your comments in the field.
   c. Click the **Task Note** drop-down menu to select the channel through which you gained the information you are adding to the note.

   Add notes to the task when you want to provide information for other staff members. Notes are not visible to customers.

7. Click **Save**.

   If you added the task on a subtab of a workgroup, all records in the workgroup will be saved.
Edit a Task
Depending on the permissions set in your profile, you can edit, copy, and delete individual and multiple tasks, forward tasks, and mark them complete.

A task report is displayed on the content pane.
1. Right-click the task you want to edit.
2. Click **Open > Task**
   The task opens.
3. Make the necessary changes.
4. Click **Save**.

- Overview of Tasks
- How You Update Multiple Records

How You Inherit Task Fields

When a task is associated with a record, some values for that task can be “inherited” from the associated record.

For example, you might add a task and define it as an opportunity task by setting the Task Type field to Opportunities. After you have selected the opportunity you want to associate with the task, you can choose to set the assigned staff member, organization, and contact for the task to the same ones that are associated with the opportunity. Then, if you should later change the opportunity’s assigned staff member, organization, or contact, the same change will occur on the associated task.

The concept of inheritance hinges on the task type. If you do not select an option from the Task Type drop-down menu, the task field values cannot be inherited from a record associated with the task. For instance, you can use the Inherit property to make the task’s assigned staff member, organization, and contact the same as the opportunity’s values. If, however, you leave the task type unspecified, you cannot use the Inherit property for those fields.

All of the task types—opportunities, organizations, contacts, incidents, answers, campaigns, mailings, surveys, and documents—allow the Assigned field to be inherited from the associated record. Use the Inherit property when you want the task to always be assigned to the staff member who is assigned to the record, even when the staff member assigned to the record changes. If you want a particular staff member to be assigned to the task, regardless of who is assigned to the actual record, do not use Inherit.

For example, assume you set the Assigned field of a Mailings task to Inherit. If you change the staff member assigned to the mailing, the staff member assigned to the associated task also changes to the new staff member. If you want the task to always be assigned to the same person assigned to the mailing, even if that staff member changes, select
Inherit. If, on the other hand, you want a particular staff member to be assigned to the mailing task, regardless of who is assigned to the actual mailing, do not use Inherit.

- Inherit the Assigned Field

Inherit Contact and Organization Fields

With certain task types, you can set the organization field, the contact field, or both to inherit those field values from the associated record.

When you add or edit an opportunity or incident task type, you can set the organization and contact fields to inherit those fields from the opportunity or incident. And when you add or edit a contact task type, you can set the organization field to inherit the organization associated with the contact.

When the task contact, organization, or both are tied to the associated record through the Inherit property, you can ensure that the fields are the same for both the task and the record. An additional benefit is the simplicity of completing those task fields.

This procedure sets contact and organization fields to Inherit for an incidents task type. The procedure is the same for opportunity and contact task types.

1. Open a task.
2. Click the Task Type drop-down menu and select Incidents.
   The Incident field label turns red and includes an asterisk, indicating that it is now a required field, and an Inherit button appears to the right of the Organization and Contact fields.
3. Select the incident you want to associate with the task.
4. Click Search for the Incident field.
5. Enter your search criteria in the search fields.
6. Click Search.
7. Select the incident you want from the list of search results.
8. Click Select.
   The Incident Search window closes and the incident appears in the Incident field of the task. If only one incident matches the search criteria, the Incident field is automatically populated.
9. Click Inherit to the right of the Contact field.
   The Inherit button changes to Contact Locked (with a lock symbol) indicating the Inherit property is active, the value in the Contact field changes to the contact for the incident, and the field is disabled and appears grayed out.
10. Click Inherit to the right of the Organization field.
    The Inherit button changes to Organization Locked (with a lock symbol) indicating the Inherit property is active, the value in the Organization field changes to the organization for the incident, and the field is disabled and appears grayed out.
    If the incident does not have an organization, the field is locked anyway. If you later add an organization to the incident, the task Organization field contains the same organization value as the incident.
11. To unlock the inheritance, click Locked to the right of the Contact or Organization field.
    The value in the field remains the same, but the field is enabled and you can change the value now that the Inherit property is no longer active.

- How You Inherit Task Fields
- Inherit the Assigned Field

Inherit the Assigned Field

This procedure uses the Answer task type as an example, but the procedure is the same for all task types.

1. Open a task.
2. Click the Task Type drop-down menu and select Answers.
   The Answer field label turns red and includes an asterisk, indicating that it is now a required field, and an Inherit button appears to the right of the Assigned field.
3. Select the answer you want to associate with the task.
   a. Click Search to the right of the Answer field.
   b. Enter information in the Search field.
   c. Choose the desired answer from the results list and click Select.
      The Answer Search window closes and the answer appears in the Answer field of the task. If only one answer matches the search criteria, the Answer field is automatically populated.
4. Click Inherit to the right of the Assigned field.
   The Inherit button changes to Assigned Locked (with a lock symbol) indicating the Inherit property is active, the value in the Assigned field changes to the staff member assigned to the answer, and the field is disabled and appears grayed out.
5. To unlock the inheritance, click Locked to the right of the Assigned field.
   The staff member name in the field remains the same, but the field is enabled and you can change the value now that the Inherit property is no longer active.

Overview of Outlook Integration

Microsoft Outlook can be integrated with B2C Service, enabling you to share your contacts and tasks and synchronize your email.

Using Outlook integration, your data will be more complete and up-to-date, and you'll no longer need to switch back and forth between applications. You can also create contacts and incidents when syncing Outlook email with B2C Service.

Outlook integration comprises the following components:

- Contact synchronization—Enter contact information one time, in either B2C Service or Outlook, and have that information shared in both applications.
• **Task synchronization**—Enter task information one time in either application and have that information shared in both applications.

• **Email integration**—Append Outlook email, including attachments, to existing contacts, organizations, opportunities, and incidents in B2C Service.

Besides synchronizing contacts, tasks, and email between Outlook and B2C Service, you can also implement a Microsoft smart tag in Outlook to open incidents directly from an email.

### How You Configure Outlook Integration

You must complete a few actions to use Outlook integration.

- Enable Outlook integration. Contact your Oracle account manager.
- Add or update profiles to include Outlook integration permission. See *Add Outlook Integration Permissions to a Profile*.
- Install Outlook integration software on agent workstations. See *Install Outlook Integration*.

#### Add Outlook Integration Permissions to a Profile

You can be assigned full Outlook integration permissions (contact synchronization, task synchronization, and email integration) or any combination of the three permissions.

Updating your *profile* is a necessary first step as B2C Service will check your permissions before installing the appropriate Outlook integration components. All staff members who will be using Outlook integration must have the profile containing Outlook integration permissions assigned to their staff account.

Staff members who are using Outlook 2007 must enable smart tags through *Tools > Options > Mail Format > Editor Options > Proofing > AutoCorrect Options > Smart Tags*. Staff members who are using Outlook 2010 or 2013 must enable smart tags through *File > Options > Mail > Editor Options > Proofing > AutoCorrect Options > Actions*.

1. Click **Configuration** on the *navigation pane*.
2. Expand **Staff Management** and then double-click **Profiles**.
   
   The report opens on the *content pane*.
3. Double-click the profile you want to edit.
   
   The Profiles editor opens.
4. Click **Permissions** on the *ribbon*.
   
   The **Permissions** page opens.
5. Click the **Outlook Integration** tab.
6. To select all of the check box options on the Outlook Integration tab, select the **Select All** check box.
7. To let staff members append Outlook email to contacts, organizations, opportunities, and incidents in B2C Service, select the **Email Integration** check box.
8. To let staff members share contacts between Outlook and B2C Service, select one or more of the **Contact Synchronization** check boxes.
   
   o To share contacts that are in the Opportunities state, select the **Opportunities Contacts** check box.
   
   o To share contacts that are in the Service state, select the **Service Contacts** check box.
   
   o To share Outlook contacts with B2C Service, select the **Outlook to Server** check box.
   
   o To share B2C Service contacts with Outlook, select the **Server to Outlook** check box.
9. To let staff members share tasks between Outlook and B2C Service, select one or both of the **Task Synchronization** check boxes.
To share B2C Service tasks with Outlook, select the **Server to Outlook** check box.
To share Outlook tasks with B2C Service, select the **Outlook to Server** check box.

10. To select different email synchronization reports for determining the contacts, opportunities, and incidents to return during email synchronizations, click the **Search** button to the right of the report you want to change.
   a. After selecting a new report, click **OK** to close the Select Report window.
   All of the Outlook integration reports are read-only standard reports that can be copied and modified.

11. Click **Save**.

- Profiles
- Add or Edit a Staff Account

**Install Outlook Integration**
After Outlook integration has been enabled and you have been assigned the correct profile permissions, you must install the necessary components on your workstation.

When you install Outlook integration, B2C Service checks your profile to see which components (email, contact, and task) you have permission to share and synchronize. The installation process adds Share and Sync buttons to your Outlook toolbar.

1. Close Outlook.
2. From B2C Service, click **File** and select **Links > Install Outlook Integration**.
   The **Oracle Service Cloud Outlook Sync Setup** wizard opens.
3. Click **Next** to open the Select Installation Folder window.
   **Tip:** We recommend that you install Outlook integration in the default location of **C:/Program Files/Oracle Service Cloud Outlook Sync**.
4. To install Outlook integration in a different location, click **Browse**, select the folder where you want to install Outlook integration, and click **OK**.
5. To see a list of the drives where Outlook integration can be installed, click **Disk Cost**. Click **OK** when you are finished.
6. Do one of the following:
   o If you are the only staff member who uses your workstation, select the **Just Me** option.
   o If other staff members have accounts on your workstation and must also use Outlook integration, select the **Everyone** option.
7. Click **Next** to open the **Confirm Installation** window.
8. Click **Next** to begin the installation.
   After the installation is complete, the **Installation Complete** window opens.
9. Click **Close** to complete the installation.

With the proper components installed, you’ll want to review and possibly customize your sync options before using Outlook integration.

Contact, Task, and Email Sync Options

Outlook integration contains default synchronization options, but you can make any necessary changes to the defaults.

To start with, you’ll enter server details and your B2C Service user name and password. You can then customize contact and task sync options, including preferences for sync direction (such as from B2C Service to Outlook, but not vice versa) and the types of actions that can initiate synchronization. For email integration, you can choose which types of records (contact, organization, incident, and opportunity) you want Outlook email appended to. (Email integration occurs only from Outlook to B2C Service.)

**Note:** You must have administrative permissions on your workstation to change sync options. If you do not have administrative permissions, contact your administrator.

Sync Settings Options

Enter server details and your B2C Service user name and password to let you change default sync options.

1. Open Outlook.
2. Click the arrow next to the Sync Email button and select **Sync Settings**.
   The **Sync Settings** window opens.
3. Enter field information.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

If both the From Oracle Service Cloud to Outlook and From Outlook to Oracle Service Cloud check boxes are selected, a two-way contact synchronization occurs. If the same data you are updating in Outlook has been updated by another staff member working in B2C Service, the data from B2C Service will be used during the two-way synchronization.
Chapter 2
Core Features

**Note:** When a contact record is first created in B2C Service as a result of a sync, the Salesperson field in the contact record is assigned to the staff member who performed the sync. Subsequent synchronizations do not affect this field. You can, however, manually update the Salesperson field by editing the contact record in B2C Service.

5. **Click OK** to save the sync contact settings and close the Sync Settings window.

### Task Sync Options

Select task sync options for Outlook integration.

1. Open Outlook.
2. Click the arrow next to the Sync Email button and select **Sync Settings**.
   
   The **Sync Settings** window opens.
3. Click the **Sync Task** tab.
4. Select options.

</tr>
</tbody>
</table>

**Note:** If both the From Oracle Service Cloud to Outlook and From Outlook to Oracle Service Cloud check boxes are selected, a two-way task synchronization occurs. If the same data you are updating in Outlook has been updated by another staff member working in B2C Service, the data from B2C Service will be used during the two-way synchronization.
5. Click **OK** to save the task sync settings and close the Sync Settings window.

### Email Sync Options

Select email sync options for Outlook integration.

1. Open Outlook.
2. Click the arrow next to the Sync Email button and select **Sync Settings**.
   - The **Sync Settings** window opens.
3. Click the **Sync Email** tab.
4. Select options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed Record Types for Email Sync</td>
<td>This section contains check boxes for selecting the types of records that are allowed for email synchronization. All check boxes are selected by default. Email is always synchronized one way from Outlook to B2C Service.</td>
</tr>
<tr>
<td>Organization</td>
<td>Select to append email data from Outlook to the B2C Service organization record associated with the contact that has the same email address as the selected email.</td>
</tr>
<tr>
<td>Contact</td>
<td>Select to append email data from Outlook to the B2C Service contact record with the same address as the selected email.</td>

<td>Select to append email data from Outlook to one or more opportunities in B2C Service for the contact associated with the email address.</td>
</tr>
</tbody>
</table>
| Incident                   | Select to append email data from Outlook to one or more incidents in B2C Service for the contact associated with the email address. Then select one of the following options to designate how the email should be appended to records in B2C Service: **Customer Entry**, **Response**, or **Private Note**.  
   - The Customer Entry option is selected by default. |
| Auto Sync Events           | This section contains options for selecting when you want to sync email.     |
| Attempt Sync When Saved    | Select to append email data from Outlook to B2C Service when an email is saved in Outlook. |
| Attempt Sync When Open     | Select to append email data from Outlook to B2C Service when an email is opened in Outlook. |
| Sync On Demand Only        | Select to append email data from Outlook to B2C Service only when Sync Email on the Outlook toolbar is clicked. This option is selected by default. |
5. Click **OK** to save the email sync settings and close the Sync Settings window.

### How You Synchronize Contacts

While viewing or editing a contact in Outlook, you can click a button to share the contact between Outlook and B2C Service.

If two-way synchronization is set up and you click Sync All Contacts, all your Outlook contacts are added to B2C Service. Before you can add B2C Service contacts to the Outlook Contacts folder, your staff account must be associated with the contacts. At least one of the following conditions must be true for each contact that you want to add.

- The contact is associated with an incident or opportunity that is assigned to you.
- The Salesperson field on the contact's record displays your name.
- The Salesperson field on the contact's organization record displays your name.

**Note:** When email address sharing is enabled in B2C Service, which is the ability for more than one contact to have the same email address, duplicate email addresses are detected when performing contact synchronizations between B2C Service and Microsoft Outlook. See *Email Address Sharing*.

After contact integration is set up on your workstation and the Contacts folder is selected, your Outlook toolbar contains these buttons.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Sync Contact Button" /></td>
<td>Click to sync the selected contact between Outlook and B2C Service.</td>
</tr>
<tr>
<td><img src="image" alt="Sync All Contacts" /></td>
<td>Click this drop-down menu to display contact sync options.</td>
</tr>
<tr>
<td>Sync All Contacts</td>
<td>Select to sync all contacts between Outlook and B2C Service.</td>
</tr>
<tr>
<td>Sync Settings</td>
<td>Select for sync options.</td>
</tr>
</tbody>
</table>

**Related Topics**

- [Contact Sync Options](#)

**Sync a Contact Between Outlook and B2C Service**

Sync a contact between Outlook and B2C Service.

1. From Outlook, click on the contact you want to sync.
2. Click **Sync Contact**.
   If you have not previously shared Outlook data, you must enter your B2C Service user name and password to verify your permission before continuing.
   A message lets you know that the contact was synchronized successfully.
3. Click **OK**.

B2C Service now contains a contact record associated with the contact you shared.

### Sync All Contacts Between Outlook and B2C Service

Sync all contacts between Outlook and B2C Service.

1. From Outlook, click **Sync All Contacts**.
   A **Synchronization Succeeded** message lets you know that the contacts were synchronized successfully.
2. Click **OK**.
   The **Sync All Contacts** window opens, confirming the number of contact records that were synchronized between Outlook and B2C Service.
   **Tip:** To view details about the individual contacts that were synchronized, click the plus sign next to the group of contacts you want to view.
3. Click **OK**.

### How You Synchronize Tasks

While viewing or editing a task in Outlook, you can click a button and share the selected task or all your tasks with B2C Service.

If two-way synchronization is set up and you click Sync All Tasks, all your Outlook tasks are added to B2C Service, and all your B2C Service tasks are added to the Outlook Tasks folder.

After task integration is set up on your workstation and the Tasks folder is selected, your Outlook toolbar contains these buttons.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Sync Task" /></td>
<td>Select a task from the list and click this button to sync the selected task between Outlook and Oracle Service Cloud.</td>
</tr>
<tr>
<td><img src="image" alt="Sync All Tasks" /></td>
<td>Click this drop-down menu to display task sync options.</td>
</tr>
<tr>
<td>Sync All Tasks</td>
<td>Select to share all tasks between Outlook and B2C Service.</td>
</tr>
<tr>
<td>Sync Settings</td>
<td>Select for sync options.</td>
</tr>
</tbody>
</table>
Sync a Task Between Outlook and B2C Service

Sync a task between Outlook and B2C Service.

1. From Outlook, click on the task you want to sync.
2. Click Sync Task.
   The Sync Task window opens, confirming that the task from Outlook has been synchronized with B2C Service.
3. Click OK.

B2C Service now contains the task you shared from Outlook.

Sync All Tasks Between Outlook and B2C Service

Sync all tasks between Outlook and B2C Service.

1. From Outlook, click Sync All Tasks.
   A message displays the number of tasks that were synchronized between Outlook and B2C Service.
2. Click OK.
   The Sync All Tasks window opens, confirming the number of tasks that were synchronized between Outlook and B2C Service.
   
   **Tip:** To view details about the individual tasks that were synchronized, click the plus sign next to the group of tasks you want to view.

3. Click OK.

Email Integration

You can append Outlook email to contacts, organizations, opportunities, and incidents in B2C Service.

Email integration can also be used to create contacts and incidents from Outlook email if no associated email address exists in the knowledge base at the time of synchronization.

Email integration is a one-way data transfer from Outlook to B2C Service. Email data is copied from Outlook and appended to the selected records in B2C Service.

**Note:** When email address sharing is enabled, which is the ability for more than one contact to have the same email address, duplicate email addresses are detected when performing email synchronizations between B2C Service and Microsoft Outlook. If a duplicate email address is discovered, the Sync Email window displays all contacts that are associated with the email address, along with their individual records. You can choose one or more of the applicable contacts for email integration. You’ll also have the option to create a new contact with the shared email address during the synchronization. See Email Address Sharing.

After email integration is set up on your workstation and an email folder is selected, your Outlook toolbar contains these buttons.
### Core Features

<table>
<thead>

### Append Outlook Email to a Record in B2C Service

Append Outlook email to a record in B2C Service.

1. From Outlook, select or open the email you want to append to a record in B2C Service. Only one email can be synchronized at a time. Selecting multiple emails will disable **Sync Email**.

2. Do one of the following:
   - If you selected the email in a list of messages, click **Sync Email** on the Outlook toolbar. The **Sync Email** window opens.
   - If you have a new or existing email message open, click the **Add-Ins** tab and then click **Sync Email**.

3. To filter the list of returned records, enter the contact's name, email address, organization name, or associated record name in the **Filter Tree** field and click **Go**. To return to the original list of records, click **Clear**.
   
   **Tip:** Although wildcards are not supported, you can enter just a few characters in the **Filter Tree** field. After clicking **Go**, the system will present you with any matching records.

4. Select the appropriate check boxes associated with the addresses in the email. For example, if you select all check boxes, the same email will be added to the individual Notes tabs of the contact and organization records as well as all selected opportunities. The email text appears as a private note in the message thread of all selected incidents.
   
   If the email includes attachments, you can select the attachments you want to include with the email, and they will appear on the Attachments tab of the selected record. For instance, when you select an attachment under **Append to Contact**, the email attachment is stored on the Attachments tab of the contact record in B2C Service. You can also drag Outlook attachments to the Attachments tab of existing records in B2C Service.

5. If the sender's email address does not exist in the **knowledge base**, a red exclamation point and a disabled check box display next to the email address. You can choose to add a contact record and incident using the contact's email address.

6. Click **OK** to append email to the appropriate records in B2C Service.
   
   After a successful synchronization, **Sync Email** is disabled for that message.

   This image shows an email after it has been appended to the Notes tab of the opportunity.
Install B2C Service SmartTag

B2C Service lets you install a smart tag that recognizes incident reference numbers in email messages.

If you are using Outlook 2007, smart tags must be enabled through Tools > Options > Mail Format > Editor Options > Proofing > AutoCorrect Options > Smart Tags.

If you are using Outlook 2010 or 2013, smart tags must be enabled through File > Options > Mail > Editor Options > Proofing > AutoCorrect Options > Actions.

Outlook recognizes certain types of data in your email, and lets you perform actions on that data. B2C Service SmartTag recognizes incident reference numbers in email messages. When you right-click the reference number in an email, the incident automatically opens in B2C Service.

1. Close Outlook.
2. In B2C Service, click File and select Links > Install Incident Reference Number Smart Tag.
3. Click Next to open the Select Installation Folder window.
   - Tip: We recommend that you install SmartTag in the default location of C:/Program Files/Oracle Service Cloud SmartTag.
4. To install SmartTag in a different location, click Browse, select the folder where you want to install SmartTag, and click OK.
5. To see a list of the drives where SmartTag can be installed, click Disk Cost. Click OK when you are finished.
6. Click Next to open the Confirm Installation window.
7. Click Next to begin the installation.
   - After the installation is complete, the Installation Complete window opens.
8. Click Close to complete the installation.

Open an Incident Using B2C Service SmartTag in Outlook

Open an incident using B2C Service SmartTag in Outlook.

In Outlook 2007, the incident number is underlined with a dotted purple line, indicating it is a smart tag. In Outlook 2010 and 2013, the incident number is not underlined.

1. Hover over the incident number smart tag in the email message.
   - The smart tag indicator appears.
Click the smart tag indicator and select **Open Incident within Service Console**.

**Note:** If you are using Outlook 2010 or 2013, you must right-click the reference number and select **Additional Actions** to open the incident and view smart tag preferences.

If the **Service Console** is already open, the incident opens. If the Service Console is not open when you select **Open Incident**, you must log in to B2C Service for the incident to open.

### Oracle Applications Integration

### Oracle Applications Integrations with B2C Service

B2C Service supports integrations with a host of other Oracle applications to add industry-leading, cutting-edge capabilities to your implementation.

Current offerings include:

- **Oracle Commerce Service Center**
- **Oracle Engagement Engine Cloud Service**
- **Oracle Knowledge Management**
- **Oracle Intelligent Advisor**
- **Oracle CX Sales**
- **Oracle Social Network**
- **Oracle CX Marketing**
- **Oracle Digital Assistant**

**Note:** For more information about any of the Oracle products listed here, contact your Oracle account manager.

### Oracle Commerce Service Center

With the integration of Oracle Commerce Service Center, you can quickly take needed actions and respond to commerce support questions directly from B2C Service.
After integration, contacts created in Commerce Service Center (CSC)—formerly ATG Commerce Service Center—are synchronized with B2C Service, letting you use the Service Console to:

- Respond quickly to commerce support questions.
- View existing CSC contact information and order details.
- Take action on an existing CSC order or place a new order in CSC on behalf of the customer.

For more information about Oracle Commerce Service Center, see the Oracle Knowledge for B2C Service Integration Guide.

**Note:** Oracle Commerce Service Center must be enabled and configured by Oracle. Contact your Oracle account manager.

How You Work with Oracle Commerce Service Center on the Service Console

With the integration of Oracle Commerce Service Center (CSC), you can respond quickly to commerce support questions from the agent desktop.

Contacts are synchronized between Oracle Commerce Service Center (CSC) and B2C Service, letting you view CSC contact information and order details on the Service Console. From there, you can take action on an existing CSC order or place a new order in CSC on behalf of the customer.

**Note:** CSC must be enabled. Contact your Oracle account manager.

You can add two controls, ATG Contact Details and ATG Contact Orders, to a custom contact workspace that give you quick access to CSC information, including contact information and order details. See Add a Control to the Design Space.
Additionally, you can add the CSC Shop button to the contact or incident ribbon for easy access to the CSC. The Shop button opens CSC in a new browser window. See *Customize the Ribbon*.

**Oracle Engagement Engine Cloud Service**

B2C Service supports integration with Oracle Engagement Engine.

The integration of Oracle Engagement Engine—formerly ATG Engagement Engine—gives you greater control over when, where, and how proactive and reactive chats are provided to your customers. In addition, it gives you information about what pages on your customer facing website your customers were viewing when they decided to initiate a chat, and lets your customers request a phone call from an agent.

For more information about Oracle Engagement Engine, see *Using Oracle Engagement Engine*.

| Note: | Oracle Engagement Engine must be enabled and configured by Oracle. Contact your Oracle account manager. |

**Oracle Knowledge Management**

You can integrate B2C Service with on-premise Oracle Enterprise Knowledge to provide a full-featured knowledge authoring and management solution, enabling contact center agents and customers to quickly and easily find accurate answers to customer inquiries from within the agent desktop and customer portal.

The Oracle Enterprise Knowledge integration leverages best-in-class content authoring and content management capabilities that enable agents and authors to create content that can be segmented for specific audiences, products,
and categories, and managed and published using content versioning and history and flexible workflows, including translation support.

For agents and customers, Enterprise Knowledge includes Intelligent Search technology, which finds exact answers to questions based on their meaning, and searches unstructured content, structured data sources, and transactional business applications in parallel. Intelligent Search incorporates customer context, call context, and system contextual information to provide highly relevant answers to customer questions.

- **Customer Portal**—Enterprise Knowledge can be embedded in the customer portal to provide customer-facing natural language search and intent-based solutions. Unlike typical self-service solutions that match search terms, Enterprise Knowledge uses natural language processing to understand the true intent of the customer’s inquiry. Then, using other search enhancement features, such as industry-specific libraries, it identifies and presents the best possible answer. Enterprise Knowledge in Customer Portal increases resolution rates while reducing calls and support costs, transforming the self-service experience.

- **Agent Desktop**—The Enterprise Knowledge integration with Agent Desktop embeds the same intent-based search functionality directly within the dynamic agent desktop to maximize agent productivity and improve call resolution rates. In addition, Enterprise Knowledge streamlines the call wrap-up process by automatically providing embedded links to associate the right knowledge with each service request resolution task. You can also configure incident workspaces with the Enterprise Knowledge options available to the workspace profiles.

For more information about integrating with Enterprise Knowledge, see the Oracle Knowledge for B2C Service Integration Guide.

### Oracle Intelligent Advisor

Oracle Intelligent Advisor (Intelligent Advisor) interviews can be embedded as questionnaires in the Service Console and Agent Browser UI by using a workspace control, and in your customer portal by adding the provided sample widget. Interviews can also be delivered on mobile devices.

Intelligent Advisor is especially useful when customer service must comply with regulations or internal company policies. When policy changes occur, rules and interview flows can quickly be updated and re-deployed, ensuring your organization’s advice is always accurate and up-to-date. Intelligent Advisor features include:

- Easy mapping of B2C Service data into and out of Intelligent Advisor interviews.
- A management console for tracking and deploying policy versions.
- Web services for integrating decision-making with other applications and processes.
- The ability to generate prepopulated PDF forms, using the built-in Business Intelligence Publisher integration.

A broad range of industries use Intelligent Advisor including:

- Public sector, for applications like benefit entitlements, licensing, and border control operations.
- Higher education, for scholarship eligibility, transfer credit assessments, and course prerequisites.
- Financial services, for insurance claims, premium calculations, and loan eligibility.

This image shows an example Intelligent Advisor interview delivered on the customer portal.
Microsoft Word (or Excel) is used to author rules.
Oracle Intelligent Advisor must be enabled and configured by Oracle. Contact your Oracle account manager. See Answer ID 5597 to access Intelligent Advisor documentation. Oracle Intelligent Advisor is available for integration with the following releases:

- Service Console: February 2013 and later
- Agent Browser UI: August 2015 and later

**Oracle CX Sales**

B2C Service supports integration with Oracle CX Sales.

Using the Sales Accelerator for B2C Service, service agents can:

- View all Oracle CX Sales opportunities for organizations (B2B) and contacts (B2C).
- Create opportunities and sales leads in Oracle CX Sales directly from incidents in B2C Service for contacts associated with organizations (B2B), or not associated with organizations (B2C). Assign these opportunities and leads automatically to the primary account managers in Oracle CX Sales.
- View all sales leads and opportunities created in B2C Service. Filter the leads and opportunities by incident, service representative, contact, or organization.

For more information about the Sales Accelerator for B2C Service, see Answer ID 4755 on our support site.
Oracle Social Network

When Oracle Social Network is integrated with B2C Service, agents can collaborate with other agents to more quickly resolve customer questions.

Oracle Social Network (OSN) can be integrated with the agent desktop. From the incident workspace, agents can create conversations containing the details of their findings and post questions to other agents. This collaboration encourages knowledge sharing among your staff and decreases response time to customers.

For more information about OSN, see Using Oracle Social Network.

Note: To enable and configure OSN, contact your Oracle account manager.

Oracle CX Marketing

B2C Service supports integrations of Oracle Eloqua and Oracle Responsys with Oracle CX Marketing.

The following integrations with Oracle CX Marketing are supported:

- **Oracle Eloqua**—Bidirectional synchronization of organizations and contacts
- **Oracle Responsys**—Synchronization of contacts from B2C Service to Oracle Responsys

The integrations are created using preconfigured adapters in Oracle Integration Cloud Service. For more information, see the following articles:

- Integrating Oracle CX Marketing (Eloqua) with Oracle B2C Service
- Integrating Oracle CX Marketing (Responsys) with Oracle B2C Service

Oracle Digital Assistant

B2C Service supports integration with Oracle Digital Assistant.

With Oracle Digital Assistant, you create and deploy skills and digital assistants for natural language communication to help your customers accomplish a variety of tasks. For more information, see Oracle Digital Assistant.

Reference Information

Reference Information

B2C Service uses format tokens for date and time, regular expressions, shortcut keys and SmartSense.

B2C Service uses date and time format tokens to determine how dates and times are expressed throughout the application and how results are grouped in analytics. See Date and Time Format Tokens for Analytics and Date and Time Format Tokens for Configuration Settings.

Regular expressions use operators and character strings to specify a set of character strings. See Regular Expressions.

To help you be more efficient and quickly navigate B2C Service, default shortcut keys are included for creating records and other items, navigating the console and content pane, and performing functions. See Shortcut Keys.
SmartSense can help you determine the attitude of customers and staff members in incident correspondence, customer responses to Feedback surveys, and in posts returned from cloud searches. See *SmartSense* and *How You Evaluate SmartSense Ratings*.

### Date and Time Format Tokens for Analytics

Use these format tokens to specify date and time formats in reports.

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HH24</td>
<td>Displays hours in 24-hour format. For example, 1 PM = 13.</td>
</tr>
<tr>
<td>HHI2</td>
<td>Displays the hour in 12-hour format. For example, 5 PM = 5.</td>
</tr>
<tr>
<td>HH</td>
<td>Displays the hour in 12-hour format. For example, 5 PM = 5.</td>
</tr>
<tr>
<td>AM</td>
<td>Displays the AM/PM indicator.</td>
</tr>
<tr>
<td>PM</td>
<td>Displays the AM/PM indicator (same function as AM).</td>
</tr>
<tr>
<td>MI</td>
<td>Displays the minutes as a two-digit number.</td>
</tr>
<tr>
<td>SS</td>
<td>Displays the seconds.</td>
</tr>
<tr>
<td>D</td>
<td>Displays the numeric day of the week with Sunday as zero. For example, Monday = 1.</td>
</tr>
<tr>
<td>DD</td>
<td>Displays the numeric day of the month.</td>
</tr>
<tr>
<td>DDD</td>
<td>Displays the numeric day of the year. For example, April 7 = 97.</td>
</tr>
<tr>
<td>DY</td>
<td>Displays the three-letter abbreviation for the day of the week. For example, Monday = Mon.</td>
</tr>
<tr>
<td>DAY</td>
<td>Displays the full day name. For example, Monday.</td>
</tr>
<tr>
<td>WW</td>
<td>Displays the week of the year as a number. The week begins on a Sunday, so the first week (week 1) of a new year is the first week that contains a Sunday. For example, in 2015, the first Sunday was January 4th. This means that the dates January 1st through 3rd of 2015 are considered to part of the last week of the previous year. So, February 22, 2015 = 8.</td>
</tr>
<tr>
<td>WWW</td>
<td>Displays the full month name followed by the first date of the week. For example, Sunday July 27, 2008 = July 27. This can be useful to identify a week by its start date rather than simply seeing a number as provided with WW.</td>
</tr>
<tr>
<td>WEEKS</td>
<td>Rounds the entered date value to the beginning of the week, using Sunday as the start of the week. For example, Thursday July 16, 2009 = 07/12/2009.</td>
</tr>
<tr>

<tr>
<td></td>
<td>This token can be used only with the <code>date_add</code> and <code>date_trunc</code> functions.</td>
</tr>
<tr>
<td>MM</td>
<td>Displays the month as a two-digit number. For example, November = 11.</td>
</tr>
<tr>
<td>MON</td>
<td>Displays the three-character abbreviated month name. For example, March = Mar.</td>
</tr>
<tr>
<td>MONTH</td>
<td>Displays the full month name. For example, March.</td>
</tr>
<tr>
<td>Q</td>
<td>Displays the numeric quarter of the year. For example, October 31 = 4.</td>
</tr>
<tr>
<td>YY</td>
<td>Displays the last two digits of the year. For example, 2008 = 08.</td>
</tr>
<tr>
<td>YYYY</td>
<td>Displays the four-digit year. For example, 2008.</td>
</tr>
<tr>
<td>YYYYX</td>
<td>Displays the international four-digit year around the end of or beginning of the year. For example, December 31, 2008 = 2009. This is used in conjunction with WW such that all week groupings will consistently include 7 days even at the start and end of the calendar year. YYYYX will return the Year for the week where Sunday is the first day of the week. For example, if grouping by Year/Week (WW), even though the dates January 1, 2015 through January 3, 2015 occur in 2015, since they are included with WW as being in week 52 (last week of 2014), YYYYX will keep the year consistent and return 2014. If you are going to group by week using WW and want to include the Year number, use YYYYX.</td>
</tr>
<tr>
<td>YYIX</td>
<td>Displays the international four-digit year. This is used in conjunction with IW such that all week groupings consistently include 7 days even at the start and end of the calendar year. YYIX will return the Year for the week where Monday is the first day of the week. For example, even though the dates December 29, 2014 through December 31, 2014 occur in 2014, since they are included with IW as being in week 1 (first week of 2015), YYIX will keep the year consistent and return 2015. If you are going to group by week using IW and want to include the Year number, use YYIX.</td>
</tr>
<tr>
<td>J</td>
<td>Displays the Julian date. For example, 2008-08-08 11:18:30 = 733627.</td>
</tr>
<tr>
<td>IW</td>
<td>Displays the international week of the year as a number. IW follows ISO 8601:1988 standards. The IW week begins on a Monday and ends on a Sunday. The first week (week 1) of a new year is the first week that contains four or more days in that year. For example, in 2015, January 1st was a Thursday. This means that the week beginning on Monday, December 29, 2014 contains 3 days in 2014 and 4 days in 2015. So, any dates in that time period will be week 1 (of the new year). For example, December 30, 2014= 01.</td>
</tr>
<tr>
<td>IWW</td>
<td>Displays the international full month name followed by the first date of the week. For example, Wednesday December 31, 2007 = December 31. This can be useful to identify a week by its start date rather than simply seeing a number as provided with IW.</td>
</tr>
</tbody>
</table>
### Core Features

#### Token

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DD</td>
<td>Displays the number of days.</td>
</tr>
<tr>
<td>HH</td>
<td>Displays the number of hours.</td>
</tr>
<tr>
<td>MI</td>
<td>Displays the number of minutes.</td>
</tr>
<tr>
<td>SS</td>
<td>Displays the number of seconds.</td>
</tr>
</tbody>
</table>

## Date and Time Format Tokens for Configuration Settings

Use these format tokens to specify date and time formats in configuration settings.

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%a</td>
<td>Displays the three-character abbreviated weekday name. For example, Monday = Mon.</td>
</tr>
<tr>
<td>%A</td>
<td>Displays the full weekday name. For example, Monday.</td>
</tr>
<tr>
<td>%b</td>
<td>Displays the three-character abbreviated month name. For example, March = Mar.</td>
</tr>
<tr>
<td>%B</td>
<td>Displays the full month name. For example, November.</td>
</tr>
<tr>
<td>%d</td>
<td>Displays the two-digit numeric day of the month. The first through ninth days of the month are preceded by a zero (01-09).</td>
</tr>
<tr>
<td>%D</td>
<td>Displays the date as MM/DD/YY (same as %m/%d/%y).</td>
</tr>
<tr>
<td>%e</td>
<td>Displays the numeric day of the month. The first through ninth days of the month are not preceded by a zero.</td>
</tr>
<tr>
<td>%H</td>
<td>Displays hours in 24-hour format. For example, 1 PM = 13.</td>
</tr>
<tr>
<td>%I</td>
<td>Displays the hour in 12-hour format. For example, 5 PM = 5.</td>
</tr>
<tr>
<td>%j</td>
<td>Displays the numeric day of the year. For example, April 7 = 97.</td>
</tr>
<tr>
<td>%m</td>
<td>Displays the month as a two-digit number. For example, November = 11.</td>
</tr>
<tr>
<td>%M</td>
<td>Displays the minutes as a two-digit number.</td>
</tr>
</tbody>
</table>
## Regular Expressions

Regular expressions use operators and character strings to specify a set of character strings. They can be used when configuring business rules to allow more flexibility in the criteria used to route incidents. Regular expressions can also be used in mailbox filters and custom objects.

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%n</td>
<td>Inserts a hard return.</td>
</tr>
<tr>
<td>%p</td>
<td>Displays the AM/PM indicator.</td>
</tr>
<tr>
<td>%r</td>
<td>Displays the time as HH:MM:SS AM/PM (same as %I:%M:%S %p).</td>
</tr>
<tr>
<td>%R</td>
<td>Displays the time as HH:MM (same as %H:%M).</td>
</tr>
<tr>
<td>%S</td>
<td>Displays the seconds as a two-digit number.</td>
</tr>
<tr>
<td>%t</td>
<td>Inserts a tab character.</td>
</tr>
<tr>
<td>%T</td>
<td>Displays the time as HH:MM:SS (same as %H:%M:%S).</td>
</tr>
<tr>
<td>%y</td>
<td>Displays the last two digits of the year. For example, 2008 = 08.</td>
</tr>
<tr>
<td>%Y</td>
<td>Displays the four-digit year. For example, 2008.</td>
</tr>
<tr>
<td>%z</td>
<td>Displays the abbreviated time zone name. For example, Mountain Standard Time = MST.</td>
</tr>
<tr>
<td>%Z</td>
<td>Displays the full time zone name. For example, Mountain Standard Time.</td>
</tr>
</tbody>
</table>

**Note:** Since the values in drop-down menus are fixed, using regular expressions to match items in a drop-down menu (for example, Product or Category) is not supported. If you want to include an If condition for items in a drop-down menu, use EQUALS or CONTAINS instead of a regular expression.

The first table below lists some of the regular expression operators that work with business rules and mailboxes. B2C Service accepts any regular expression using POSIX Extended syntax. The second table lists examples of how regular expressions can be used.

Regular expressions begin and end with slash (/) delimiters, but they are not required when using regular expressions in business rules or report filters. However, slashes are used to separate multiple regular expressions in some configuration settings, such as EGW_AR_MODR_HEAD_FLTR.
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>Matches any character in the brackets.</td>
</tr>
<tr>
<td>[0-9]</td>
<td>Matches any number between 0 and 9.</td>
</tr>
<tr>
<td>[A-Z]</td>
<td>Matches any character A-Z or a-z.</td>
</tr>
<tr>
<td>[^]</td>
<td>Matches any characters NOT in the brackets. The first character in the brackets must be ^.</td>
</tr>
<tr>
<td>text1</td>
<td>text2</td>
</tr>
<tr>
<td>.</td>
<td>Matches any single character except a new line.</td>
</tr>
<tr>
<td>?</td>
<td>The preceding item is optional and matched at most once.</td>
</tr>
<tr>
<td>*</td>
<td>The preceding item is repeated as many times as necessary to match. Also matches if preceding item is not present.</td>
</tr>
<tr>
<td>+</td>
<td>The preceding item is matched one or more times.</td>
</tr>
<tr>
<td>{n}</td>
<td>The preceding item is matched exactly n times.</td>
</tr>
<tr>
<td>{n,}</td>
<td>The preceding item is matched n or more times.</td>
</tr>
<tr>
<td>{n,m}</td>
<td>The preceding item is matched at least n times, but not more than m times, and as few times as possible.</td>
</tr>
<tr>
<td>( )</td>
<td>Used to group elements of the regular expression, as in arithmetic.</td>
</tr>
<tr>
<td>\w</td>
<td>Any alphanumeric character.</td>
</tr>
<tr>
<td>^</td>
<td>Match if at start of line.</td>
</tr>
<tr>
<td>$</td>
<td>Match if at end of line.</td>
</tr>
<tr>
<td>\</td>
<td>Quote or escape a character that would otherwise be interpreted as a syntactic character. Characters that must be quoted are: + ?</td>
</tr>
<tr>
<td>&lt;text&gt;</td>
<td>Match the string (case insensitive) only if it is surrounded on both sides by any non-word character (such as a space, dash, or a special character ([^%:^*+</td>
</tr>
</tbody>
</table>
This regular expression... | matches...
---|---
^Example | “Example” at the beginning of a line
Example$ | “Example” at the end of a line
^Example$ | “Example” as the only word on the line
^...$ | any line with exactly three characters
.......1 | any reference number ending in “1”
t.e | tae, tbe, tce, t%e, tie, the, toe...
at*e | ae, ate, atte, attte...
at+e | ate, atte, attte
at?e | ae, ate
m[aeiou]t | mat, met, mit, mot, mut
cat|mat | cat, mat
lo{4}ng | loooong
lo[2,4]ng | loong, looong, loooong
ward | ward\. | ^ward | “ward” surrounded by spaces (this prevents “forward” or “backward” from matching), “ward” at the end of a sentence, and “ward” at the beginning of a line (no preceding space)
\<jump\> | Jump, jump, JuMp, etc. The regular expression does not match jumping, jumped, etc.

Shortcut Keys

To help you be more efficient and quickly navigate B2C Service, default shortcut keys are included for creating records and other items, navigating the console and content pane, and performing functions.

**Tip:** You can hover over buttons on ribbons to display shortcut keys. In addition, you can press the Alt key plus the first letter of the ribbon tab to display shortcut keys for the tab.

- Display Shortcut Keys on the Ribbon
SmartSense

SmartSense can help you determine the attitude of customers and staff members in incident correspondence, customer responses to Feedback surveys, and in posts returned from cloud searches.

When working with incidents or reviewing survey responses or cloud search results, you can use SmartSense to determine which customers need immediate attention and when to notify supervisors or other staff members about specific incidents or situations. The emotive rating can also be used as a condition in incident rules.

In incidents, two SmartSense ratings can be placed on the incident workspace: one for the customer and one for the staff member editing the incident. SmartSense scans the text and rates the words and phrases in all customer entries for the customer rating and all responses for the staff member rating.

Although the following descriptions discuss SmartSense as it applies to incidents, it also applies to surveys. In surveys, responses to text questions, including SmartSense evaluations of each response, appear on the Results tab of the survey. See Topic Monitoring.

Note: SmartSense recognizes modifiers and negatives in all supported languages as well as some emoticons and acronyms. The SmartSense rating may be exaggerated if emotive words are set in all capital letters or the sentence contains an exclamation point.

When your administrator adds Contact SmartSense, Staff SmartSense, or both to the workspace you use for working on incidents, you will see the colored meter on the workspace. This image shows an incident workspace with both SmartSense meters displayed. The workspace you use for incidents depends on your profile and how your administrator configured incident workspaces.

The SmartSense meter on the Results tab for responses to a Feedback text question appears the same as it does on the incident workspace.

On a new incident, both meters start at neutral. This is represented by the neutral face icon displayed in the center of the meter. Each time the incident is updated by the customer on the customer portal, the contact SmartSense rating is updated. When a staff member adds a response on the incident workspace, the staff SmartSense rating is updated. Current threads are weighted more heavily than earlier threads. The contact SmartSense rating is not affected when a staff member updates an incident on the incident workspace by adding a customer entry. Only comments that the customer makes through the customer portal are evaluated for the SmartSense rating.
The farther to the left (the red zone of the meter), the more negative the rating, while ratings toward the right, or blue zone, are more positive.

Only response threads are considered for the staff SmartSense rating in incidents, as note threads are not evaluated. Additionally, SmartSense processes only the first 4,000 words in each incident thread rather than the entire thread, helping to make emotive indexing process faster for incident threads with a large number of words.

**How You Evaluate SmartSense Ratings**

While SmartSense is an effective tool for assessing a customer's general attitude, it may not always provide a completely accurate rating.

As a single rating, the SmartSense rating may be an oversimplification. If a word has several meanings, the SmartSense rating may not be exactly precise for one or more of the meanings. If a word is not in the SmartSense list, it will not be considered, and sentences containing complex negation or qualification could be misinterpreted by SmartSense. If a customer writes both positive and negative remarks in an incident (for example, is pleased with the product but expresses anger or frustration about a support issue), the emotive rating may result in a neutral value, since the extreme words will balance each other. Despite these potential difficulties, SmartSense gives a useful overall estimate of emotional levels and can help you provide superior service to your customers.

While the SmartSense word list is proprietary and cannot be viewed, your administrator can specify word ratings that extend or override those used by SmartSense. This allows custom values for words that have specific meanings for a particular organization or industry.

Your administrator can also disable SmartSense. If disabled, SmartSense evaluations are not performed on incidents, survey results, and cloud search results, and emotive rating options are not available when choosing conditions for business rules.

Dynamic Agent Desktop

Overview of the Dynamic Agent Desktop

The dynamic agent desktop is your staff members’ portal to your knowledge base.

The dynamic agent desktop is comprised of a set of complementary features, each representing a different, powerful way of interacting with records. While each component serves a distinct purpose, they can be used together to create a highly adaptive work environment. This can help you match your customers’ needs to an appropriate set of agent tools and free your staff to focus only on those parts of the process that cannot be automated.

To get the most from your agent desktop, be sure to review each feature and consider how it can help your team. The desktop features listed here share common concepts and functionality, so after you are familiar with one desktop feature, learning the others becomes easier. For example, after you learn to create workspaces, you’ll have most of the knowledge you need to create agent scripts.

As you evolve beyond the default configuration to an optimized interface, you’ll increase agent productivity and extend the impact of their actions, producing a more dynamic, responsive operating environment. Keep in mind that all of the agent desktop features apply to the Service Console. However, many features are also supported on the Agent Browser UI. For a complete list of supported features, see Answer ID 8173 on our support site.

<table>
<thead>
<tr>
<th>Feature/Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Workspace" /></td>
<td><strong>Workspace</strong>—A configuration of the content pane, including the fields, controls, and ribbon that display when working with answers, assets, contacts, incidents, opportunities, organizations, or tasks; when working in B2C Chat; or when working with quotes, quote products, or service opportunities. Standard workspaces are provided for each of these workspace types, and custom workspaces can be created. The workspaces staff members use depend on their profile. See Overview of Workspaces.</td>
</tr>
<tr>
<td><img src="image" alt="Workspace rules" /></td>
<td><strong>Workspace rules</strong>—Rules that dynamically adjust the display, behavior, and values of fields and controls on a workspace based on staff member actions. Each rule is triggered by one or more events and conditions. See Workspace Rules.</td>
</tr>
<tr>
<td><img src="image" alt="Guide" /></td>
<td><strong>Guide</strong>—An interactive tool that helps agents quickly locate solutions when composing incident responses or troubleshooting customer issues over the phone. Guides are built using controls to display questions, branches, text explanations, and answer links. They can be added to workflows, placed on workspaces, or presented on the Customer Portal. See Overview of Guided Assistance.</td>
</tr>
<tr>
<td><img src="image" alt="Agent script" /></td>
<td><strong>Agent script</strong>—A series of pages connected by branching logic that help agents enter information in a logical order. Scripts are built using fields and controls to display questions, text, and answers, and update records. They can be added to workflows or placed on workspaces. See Overview of Agent Scripts.</td>
</tr>
</tbody>
</table>
Feature/Icon | Description
--- | ---
| **Script rules**—Rules used to trigger actions (such as setting the value of a field or calling a named event) on script pages when specific conditions are met. Like workspace rules, each script rule is triggered by one or more events and conditions. See [Script Rules](#).

| **Desktop workflow**—A sequence of workspaces, scripts, decisions, connectors, and actions presented to staff members as a dynamic interface to efficiently support and automate complex business processes. See [Overview of Desktop Workflows](#).

| **Add-ins**—The desktop add-in framework allows application developers to add custom components, or "add-ins," to B2C Service in order to integrate with other applications on staff members' workstations. When you upload an add-in, you can place it on scripts and workspaces in the same way you add controls, such as report or browser controls. The add-in can be displayed anywhere you want on the script or workspace or you can hide it using functionality in the script and workspace designers. You can also configure script branches and script and workspace rules to communicate with the add-in. See [Overview of Add-Ins](#).

Considerations for Mapping Your Business Processes to the Agent Desktop

Time spent defining a business process is a worthwhile investment. Decisions made before implementation can save much time and trouble later on. Careful consideration of all aspects of a business process can make it more effective and easier to maintain and can help to avoid process holes and bottlenecks.

The first step in mapping your organization's processes to the agent desktop is to clearly define your business needs. Whether your goals are simple or complex, certain basic parameters should be identified and accounted for in your desktop design. Here, we'll provide you with some basic questions to help you identify the requirements and resources you'll need to structure and refine your business processes.

Put simply, a process is a sequence of events—actions followed by other actions, governed by conditions and augmented by exceptions. Following is a sampling of essential questions that should be answered in preparation for defining a fully formed process.

- **What activities are you supporting?** What is your primary goal and responsibility for the process you are defining? Are you developing an entirely new process from scratch, or are there existing processes or systems that should be considered? If you're integrating with an external system, is there any functional overlap that's easier to manage within B2C Service?

- **Who are your stakeholders?** Identify everyone who has an interest in the success (or failure) of your process. Success is defined by accounting for and delivering on all needs of your consumers, staff, group managers, directors, and executives. To achieve that success, it's important to give these stakeholders a voice when designing and testing your business process.

- **What outputs are required?** For each stakeholder, list the specific process output that they require to fulfill their needs. List any events and conditions that factor into those outcomes and, when appropriate, define alternate outcomes for cases where exceptions to those criteria occur. For example, each of these stakeholders requires a specific output that their business process must account for:
  - A customer may need an **answer** to a question or **service** for a product they've purchased.
A manager may need **custom reports** to ensure that customer requests are met within a specified time period and that satisfaction scores are high.

A director from another department may be responsible for incorporating **customer feedback** into initiatives for new products or services.

A sales executive may be responsible for acting on business **opportunities** or **account issues** identified by your agents.

- **What are your channels?** How are you communicating with your customers—email, telephone, or chat? Are you monitoring the social cloud or providing a community to promote your services? Is your team logging incidents or opportunities manually, or are they being generated by some other means?

- **Who are your resources?** Identify the people who'll be responsible for completing any necessary tasks. For example, who'll be responsible for viewing and responding to customer inquiries? To whom will they escalate outstanding or complex issues? Who'll be charged with developing and monitoring team performance? And who'll be charged with maintaining these processes as needs change in the future? Do these people have staff accounts in B2C Service with appropriate profile permissions?

- **What can be automated?** As you list the resources needed to service your stakeholders, consider each task carefully and ask yourself, “Does this output require human interaction, or can it be wholly or partly automated?” Can you reduce the number of human resources you require, or the time you require of them, while delivering full value to your stakeholders? With desktop automation, you might be surprised how often the answer is “Yes.” The more tasks that are automated, the more focused your team will be on tasks that actually require their attention.

- **What is your testing strategy?** After your process definition is complete, how’ll you test it? Is it large enough that it should be rolled out in phases, or to a subset of your users in advance? Do agents have a means for providing you with meaningful feedback? The more complex your processes, the more important it is to fully test all scenarios your agents may encounter and ensure all process outputs are sufficient for stakeholder needs.

After you've answered these questions, you're ready to begin defining your business process. At a very basic level, this involves listing the required actions, the conditions under which they occur, and any alternate outputs stemming from exceptions, and ordering them in an appropriate sequence. Then, you might sketch out a chart or detailed diagram to illustrate the flows implied by those business needs. Illustrating the order of action with a flow diagram can help you understand the finer nuances of your process and make it easier to verify your logic. For example, you may find instances where one part of a process overlaps another or creates a bottleneck, giving you the opportunity to streamline and increase the effectiveness of your flow.

### Guidelines for Testing Your Agent Desktop Design

As you carefully map out and design your dynamic agent desktop, be sure to test it thoroughly before deploying to your operational environment.

Here are some helpful guidelines.

- **Make frequent use of preview and validation**—As you design workspaces, guides, scripts, workflows, and rules, make a habit of correcting mistakes to your work as you go. The Home tab of each editor provides a Preview or Validate button to help you check for problems. If you correct configuration issues promptly, you'll probably find them easier to resolve because your design decisions should still be fresh in your mind.

- **Account for the profile restrictions of your agents**—When you preview a workflow or a script, it'll display as it would to any staff member who has the same set of profile permissions you have. To view it as it will appear to a specific staff member with different permissions, log in using a test account with the same profile as that staff member.
• **Phase in major changes**—In some cases, testing in a non-production environment may not find every conflict or hole in your process. Workspaces and workflows are specific to each profile, so if an agent desktop is designed to be used by multiple profiles across a large number of agents, you might also consider rolling it out in phases, or to a small subset of your staff before taking it fully live.

• **Invite suggestions for improvement**—Incorporate a method (such as an incident submission element or internal survey) for your agents to submit feedback about any problems found or suggestions for further refinements. And consider keeping it in place to augment your standard processes—timely, specific feedback can be just as useful during day-to-day production use as it’s during the testing phase.

### Workspaces

#### Overview of Workspaces

Workspaces define the appearance of the agent desktop when staff members add, view, and edit records in B2C Service.

When you open a record—such as an incident, contact, opportunity, or custom object—the workspace determines the layout of fields, controls, and tabs on the content pane as well as the arrangement of buttons on the ribbon and the Quick Access toolbar (QAT).

B2C Service provides a set of standard workspaces suitable for most common record maintenance, but also gives you complete flexibility to create custom workspaces to help your staff work more efficiently. In addition, you can create workspace rules to dynamically change the behavior of fields and controls based on certain triggering events.

The workspaces used by staff members are defined in their staff profile, with one workspace associated for each type of record the profile can access. Different profiles can use different workspaces. However, each editor within a profile must be set to use a specific workspace, so all staff who share a profile will use the same set of workspaces. For example, when you create an incident workspace and assign it to the incident editor of a specific profile, all staff members with that profile will see that workspace when they add, view, or edit incidents. See [Overview of Staff Management](#).

**Tip:** Many functions used to design workspaces are also used to design agent scripts. To understand how workspaces can best be implemented in your agent desktop, you should also become familiar with guides, scripts, script rules, and workflows. For a summary of these features, see [Overview of the Dynamic Agent Desktop](#).

### Open the Workspaces Explorer

The Workspaces explorer is used to access and manage all of the workspaces on your site. With this explorer, you can browse, search, and organize workspaces in hierarchical folders on the content pane using functions similar to Windows Explorer.

Initially, the explorer lists only the Standard folder containing the standard workspaces. The folder is read-only and the standard workspaces cannot be opened, edited, or deleted—they exist mainly to be selected in staff profiles. However, you can copy standard workspaces to use as the basis for creating your own custom workspaces. See [Create a Workspace](#).

Listed next to each workspace name is its workspace type, based on the type of record it opens. The workspace type determines which fields and controls can be added to the workspace. For example, the Incident workspace type
provides access to controls and database fields that are related to incidents. In addition, some workspace types are multi-edit, meaning they are used when staff members open multiple records of the same record type at the same time (up to 250 records can be edited at once). This lets you display one workspace when staff members open a single record and display a different workspace when they edit multiple records of the same type simultaneously.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and double-click **Workspaces**. The Workspaces explorer opens on the content pane.

   **Note:** If desktop workflows are enabled on your site, you will see Workspaces/Workflows listed under Application Appearance instead. See *Create a Desktop Workflow*. To enable desktop workflows, contact your Oracle account manager.

3. To display the list of standard workspaces, click the **Standard** folder in the tree under Workspaces.

### Standard Workspaces

B2C Service provides a preconfigured set of standard workspaces, one of each workspace type, suitable for most common record editing. Each is named for its workspace type and is used as the default workspace for its corresponding editor for all new profiles.

**Note:** Standard workspaces are not available for *custom objects* because custom objects are, by definition, nonstandard objects. However, you can create workspaces that provide access to custom objects that have Object is Available in Workspaces, Scripting, and Workflow field visibility.

This table lists the standard workspaces and when they are used. Your explorer may list fewer workspaces depending on which B2C Service products are enabled on your site. Contact your Oracle account manager for information about enabling products. For information about workspaces on the Agent Browser UI, see *Administering the Agent Browser User Interface*.

<table>

**Custom Workspaces**

In addition to standard workspaces, B2C Service gives you complete flexibility to create your own custom workspaces to help your staff work more efficiently.

Custom workspaces are used to provide your team with access to records stored in custom objects, which by definition have no standard workspaces of their own. Custom workspaces are created on a workspace designer (shown here) consisting of a ribbon and a design space. You define a workspace by dragging and dropping fields and controls from the ribbon to the design space.
The design space is the working area where you arrange fields and controls as you want them to appear on the workspace. In most standard workspaces, a summary panel at the top of the design space displays the most frequently accessed fields for the record type, while a tab set at the bottom provides controls and information related to the record, such as associated records, file attachments, and an audit log.

The summary panel and tab set both contain a table, hidden by default, that forms an underlying grid for aligning fields and controls. To aid you in laying out the workspace, you can display outlines around items on the design space to help you identify the table cells they are in. See Design Space Layout Options.

After you add a field or control to the design space, you can select it to adjust its properties on the designer ribbon.

<table>
<thead>
<tr>
<th>Tab</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Home</td>
<td>Contains buttons for managing the entire workspace. You can preview the workspace, customize the ribbon that will be displayed with the workspace, create workspace rules, add spell-check functionality, and display an outline on the workspace to guide your design. You can also add notes, review the audit log, insert fields, and alter display and behavior properties for fields and controls.</td>
</tr>
<tr>
<td>Insert Field</td>
<td>Lists the fields you can add to the workspace. The type of workspace you select when creating a new workspace determines the fields available. For example, when creating an incident workspace, you can add incident, contact, and organization fields. See Workspace and Script Fields.</td>
</tr>
<tr>
<td>Insert Control</td>
<td>Lists controls and relationship items you can add to the workspace. Controls include spacers, tab sets, scripts, reports, title bars, and other items you can use to enhance the display or add functionality. Relationship items also add functionality to the workspace, but vary based on the type of workspace you are creating. See Workspace and Script Controls.</td>
</tr>
<tr>
<td>Design</td>
<td>Displays when you select an item on the design space and contains buttons you can use to modify the properties of the selected item. For example, you can change fonts and margins for a field, or set a field to read-only if you want to display it only for informational purposes. The options available on the Design tab vary based on the control or field that is selected.</td>
</tr>
</tbody>
</table>
Create a Workspace

You can create a custom workspace from scratch by starting with a blank workspace. You can also copy an existing workspace or import a workspace from an exported workspace file to use as the basis for a new workspace.

After you create a custom workspace, you can tailor the design by adding and removing fields and controls, adjusting properties, and arranging the layout to suit your business needs.

This procedure describes how to create workspaces. To import a workspace from an exported workspace file, see *How You Export and Import Workspaces*.

1. From the Workspaces explorer, click **New**. (If workflows are enabled, the button will be labeled New Workspace.) The **New Workspace** window opens.
2. In the Start With a Blank Workspace section, select a workspace type.
   
   **Note:** If your site has an Agent Browser User Interface associated with it, a message displays with a link to more information. Click **OK** to continue.
   
   The workspace designer opens.
3. To design the workspace, see **Edit a workspace**.
4. Click **Save**.

**Related Topics**
- **Edit a Workspace**

Copy a Workspace

The following procedure describes how to copy a workspace.

1. From the Workspaces explorer, right-click the workspace you want to copy and select **Copy**. The **Copy Workspace As** window opens.
2. Select the folder to which you want to add the copied workspace.
3. Enter a name for the copied workspace in the **Name** field.
4. Click **OK**.

The workspace you added appears on the explorer in the folder you selected.
Delete a Workspace

The following procedure describes how to delete a workspace.

1. From the Workspaces explorer, right-click the workspace you want to delete and select **Delete**. A **Confirm Workspace Deletion** message appears.

2. Click **Yes** to delete the workspace.

   If you delete a workspace that is selected for a standard object editor in a profile, the profile will revert to the standard workspace for the editor type. For example, if you delete a workspace that happens to be selected in a profile for the incident editor, the profile will automatically use the standard incident workspace for that editor.

   If you delete a workspace that is selected for a custom object editor in a profile, the profile will revert to no workspace selection because there are no standard workspaces for custom objects.

Edit a Workspace

You can edit a workspace to modify what fields, controls, and properties your staff members have access to.

The designer ribbon provides access only to fields, controls, and properties that apply to the workspace type. Controls specific to answers, for example, cannot be added to opportunity workspaces.

By default, most workspace types are blank on top with a single tab on the bottom. Workspaces that are displayed in their own windows, such as quotes and quote products, are empty. You can adjust the location of the tabbed area on the workspace by selecting the workspace on the design space and choosing the location you want from the Tab Alignment button on the Design tab. You can also adjust the space allotted to the two main areas of the workspace by selecting options from the Threshold Height and Summary Panel Height buttons on the Design tab.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Workspaces**. (If workflows are enabled, the item is labeled Workspaces/Workflows.)

   The Workspaces explorer opens on the content pane.

3. Right-click the workspace you want to edit and select **Open**.

   The workspace opens on the content pane.

4. Drag the fields you want from the Insert Field tab onto the design space.

5. Drag the controls and relationship items you want from the Insert Control tab onto the design space.

6. To modify the properties for fields and controls, select the item, click the Design tab, and make the appropriate changes.

7. To customize options specific to chat workspaces, click **Options** on the Home tab.

8. To customize the workspace ribbon, click **Ribbon** on the Home tab.

9. To add workspace rules that alter the display or behavior of items on the workspace or the values in its fields, click **Rules** on the Home tab. You can also select an item on the workspace and then click **Add Rule** on the Rules tab.

   **Note:** The Rules button and Rules tab are available only when workspace rules are enabled, and are not available for multi-edit workspaces. To enable workspace rules, contact your Oracle account manager.

10. To view a history of all actions taken on the workspace, such as when the workspace was created and edited and by whom, click **Audit Log** on the Home tab.
11. To invoke spell checking on fields that have the spell checking property enabled whenever a record that uses this workspace is saved, click Spell Check on the Home tab and select Auto-Check Spelling on Save.

12. To permit staff members to cancel automatic spell checking, click Spell Check and select Allow Canceling Auto-Check. When this option is not selected, staff members will be unable to save the record if they cancel spell checking.

13. To add notes about the workspace, click Notes on the Home tab to open the Workspace Notes window.
   a. Enter any notes you want in the text field.
   b. Click OK.

   Notes added to your workspace are for internal use and are visible only when editing the workspace. They do not appear when working with records.

14. To hide the banner flag on an answer, contact, incident, opportunity, or organization workspace, click the Insert Control tab and clear the Banner Flag check box.
   When visible, staff can use the banner flag to set an importance indicator and enter text pertaining to the record. The banner flag does not appear on asset, chat, task, quote, quote product, or multi-edit workspaces.

15. To see what your workspace will look like when it is used by staff members, click the Home tab and click Preview.
   You can choose to see the workspace as it will display when creating a record or when editing an existing record on the agent desktop or on the Agent Browser UI.

16. Click Save or Save As.

Staff members may need to log out and then log back in to see any changes you have applied.

Best Practices for Creating Workspaces

When optimized properly, workspaces are extremely flexible and useful for achieving a high degree of efficiency for staff members.

When developing custom workspaces for your site, keep the following best practices in mind.

- **Design for appropriate screen resolution**—Be sure to tailor workspace layouts to your agents' screen resolution. If your display is set to a higher resolution than that of the people who will use your workspace, they may find that the layout is difficult to use. Test appropriately when making design changes such as adding a column or adjusting the size of a field or add-in control.

- **Optimize your layouts**—Give careful thought to the number and sequence of controls and fields in the layout of workspaces and tabs, providing only the information, fields, and controls staff members need to do their job. Also, try to avoid nesting tab sets, panels, and tables more than two or three levels deep. Streamlined layouts can optimize workspace performance and improve staff efficiency. They are also much easier to update as new processes are rolled out to your team.

- **Add shortcut keys and tab indexes**—Agents can be more efficient when they can keep their fingers on the keyboard. After you have optimized your workspace layout, select a Tab Order option to specify the order in which field focus is advanced when the Tab key is pressed, such as top-to-bottom or left-to-right (see the Tab Order button description at Behavior Properties). Add shortcut keys to the most commonly accessed fields to provide even faster navigation, and train your team to use them (see the Text label description of Label Properties).

- **Hide or require fields**—Reduce visual clutter and improve performance by making fields visible only when they need to be, and only to agents who need access to them. For example, some fields might be required only when a new record is being created, and then hidden or displayed in a read-only format the rest of the time. When a workspace is shared by multiple profiles, you can choose to hide some of your fields from profiles of
agents that don’t use them. For profiles of agents that must complete a specific field, you can make that field required for that specific profile. See How You Set Hidden, Required, and Read-Only Properties.

- **Use different tabs for different tasks**—Tabs can be used to organize alternate field layouts tailored to common tasks. For example, in addition to a base tab containing an incident discussion thread, you could create another tab containing a guided assistance control and fields commonly used to solve technical issues. Additional tabs could contain alternate layouts for resolving billing issues, tracking and returning orders, soliciting feedback, or creating sales opportunities. Whatever content you add, be sure each tab and field has an accurate, descriptive label. Also, be sure to order the tab set appropriately based on priority, with the most frequently used tabs first. Then set tab indexes and define shortcut keys so your agents can navigate quickly using their keyboard. See Add Tabs to the Design Space.

- **Delay loading data-heavy controls**—Some controls, such as reports and browsers, may take awhile to load based on the amount of data they return. To reduce the initial load time of your workspace, you can delay the loading of these controls when they are located on tabs that are not visible when the workspace is initially opened. See Report Properties and Workspace and Script Browser Controls.

- **Use scripts and workflows to simplify your workspaces**—Scripts and desktop workflows can be effective alternatives for complex workspaces. A workspace laden with a large number of fields, controls, and rules can be challenging to create, use, and maintain. By splitting up some of those processes across multiple elements, you can reduce the risk of functional or procedural conflicts while also simplifying and improving the performance of the interface for your agents. See Overview of Agent Scripts and Overview of Desktop Workflows.

### Workspace Rules

The efficiency provided by custom workspaces can be extended even further using workspace rules.

**Note:** Workspace rules are not available for multi-edit workspaces.

Workspace rules are an automation layer used to set properties for different workspace items based on actions and conditions occurring in the workspace. Workspace rules can save your agents a lot of time by simplifying or completely automating routine tasks. For example:

- If your workspace contains a lot of fields and controls, you can use rules to show only the information that is relevant based on the type of interaction, the data being entered, or the identity of the contact or agent.

- If a specific tab on the workspace correlates to a specific incident category, you could add a rule that focuses a specific tab based on the category value when the editor loads.

- If agents are required to select from a certain subset of dispositions when solving incidents, you could create a workspace rule to make the Disposition field required and hide several of its items when incidents are set to Solved.

- If incidents are escalated among groups based on product and profile, you could add a rule that sets the Assigned field to a specific group based on the product value selected and the profile of the logged-in staff member when a certain button control is clicked.

With every few clicks you save your agents, you help them become more efficient. Over time, automating your most repetitive tasks can help your team avoid distraction and better focus on the task at hand—assisting your customers.
Overview of Workspace Rules

With workspace rules, you can dynamically adjust the display, behavior, and values of fields and controls on a workspace based on staff member actions. (Workspace rules are not available for multi-edit workspaces.)

Workspace rules are created and managed on the Service Console for staff actions taken on the agent desktop and the Agent Browser UI. However, not all workspace rule elements are supported on the Agent Browser UI.

Each rule is triggered by one or more events and conditions you define, and can result in one or more actions, including the following.

- Set the value of a field.
- Set the required status of a field.
- Make a field or control read-only.
- Show or hide a field or control.
- Show only a select group of menu items.
- Open a guided assistance guide (if Guided Assistance is enabled).
- Open a specific script (if Agent Scripting is enabled).
- Create a named event to trigger another workspace rule or a script rule.

In simplest terms, a workspace rule is basically a “when-then” statement you use to control the behavior of fields and controls on your workspace, such as:

- When the status is changed, then make the Product field required.
- When the disposition is changed, then make the Status field noneditable.

At a basic level, each rule defines a triggering event and a resulting action that will occur after the event is triggered. In some cases, you may find that the triggers available for rules are not precise enough to address a specific business need. You can make a rule more restrictive by adding conditions under which the event will trigger an action. If conditions are specified in a rule, actions will be triggered only if those conditions are met. For example, your rule could state that when a button is clicked, if the status is Unresolved, assign the record to the logged-in staff member. The button click is the triggering event, but the Unresolved status is the condition under which that event will trigger the action after the button is clicked.

There are two types of actions: Then and Else. Every rule has at least one Then action, which is the result of the triggering event and conditions. However, after conditions are specified for a rule, you can also add one or more Else actions. An Else action is triggered in cases where the rule conditions are not met. For example, a rule could state that when the status changes, if the value of the status is Solved, make the Disposition field editable, or else make the Assigned field editable. In this case, when the rule is evaluated, the Assigned field will be made editable if the record status has not been set to Solved.

**CAUTION:** Since business rules are checked after workspace rules, changes made to a record by workspace rules can be overridden by business rules if the rules have similar actions.
Workspace rules can be created and managed from two locations on the workspace designer ribbon. Clicking Rules on the Home tab gives you an overview of all the rules for the workspace. This is helpful if you need a quick look at all the rules that impact the workspace behavior. You can also add, edit, delete, and order all the rules on the workspace from this location. If you want to know which rules are associated with a specific field on your workspace, you can select the field on the design space, then click the Rules tab to view a filtered list.

The Rules button and Rules tab are available only when workspace rules are enabled. For information about enabling workspace rules, contact your Oracle account manager.

Workspace Rules Tab

As with the Rules button on the Home tab, you can also view, add, edit, delete, and order any of the rules from the Rules tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Selection</td>
<td>Click this drop-down menu to view a hierarchical listing of all the items on the workspace design space. Selecting an item from the hierarchy will select it on the design space.</td>
</tr>
<tr>
<td>Show Details</td>
<td>Click this button to view the properties of the selected item.</td>
</tr>
<tr>
<td>Delete</td>
<td>Click this button to remove the selected item from the workspace.</td>
</tr>
<tr>
<td>Contextual Button</td>
<td>One or more contextual buttons may also display in the Selected Object button group, depending on the item selected. Click these buttons to modify item properties based on the selected item.</td>
</tr>
<tr>
<td>Add Rule</td>
<td>Click this button to open the Rule Wizard where you can add a rule.</td>
</tr>
<tr>
<td>Filter List</td>
<td>Click this button to filter the visibility of rules in the list.</td>

</tr>
<tr>
<td>Edit Rule</td>
<td>Select a rule in the rule list and click this button to edit the rule.</td>
</tr>
<tr>
<td>Delete Rule</td>
<td>Select a rule in the rule list and click this button to delete the rule.</td>
</tr>
<tr>
<td>Move Up</td>
<td>Select a rule in the rule list and click this button to move the rule up one position in the list to reorder the rules.</td>
</tr>
</tbody>
</table>
Add a Workspace Rule

You create rules using the Rule Wizard, which you can open from the Rules tab or from the Rules button on the Home tab.

With some exceptions, the method used to create workspace rules is the same as that used to create script rules. The procedures to create rules from the Rule Wizard can also be used when creating script rules.

1. On the open workspace, click the Home tab and click Rules to open the Rules window.
2. Click Add Rule. The Rule Wizard opens.
3. Select one or more triggers to fire the rule.
4. Click Conditions to add conditions that determine whether the triggering event will result in an action.
5. Click Then Actions to define the actions that should occur if the conditions are met.
6. Click Else Actions to define the actions that should occur if the conditions are not met.
7. Click Properties and type the name of the rule in the Rule Name field.
8. Enter any notes you want to add to the rule in the Notes field.
9. To deactivate the rule, clear the Active check box.
10. Click Finish.

Workspace Rule Triggers

Rule triggers are events that occur in a workspace that cause a rule to be evaluated. If you add more than one trigger to the rule description, the rule will be evaluated after any of the selected triggers occur.

Designing for efficiency—To best support the maintenance and performance of your workspaces as they grow and change over time, always try to construct workspace rules that are scalable and suited to the need at hand. For example, rather than setting up a rule that hides a tab on a workspace when the editor loads, you might simply edit the workspace itself and set the tab to be hidden by default. Rule actions that are triggered unconditionally when “The editor loads” can be eliminated by simply having the workspace default to the desired state, which is more efficient for your system to perform.

Workspace Rule Triggers Description
Available triggers vary based on the fields and controls that have been added to the workspace.

All rule triggers listed in this table are supported in the Service Console and on the Agent Browser UI.
<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The editor loads</td>
<td>Add this event to trigger the rule immediately after a record is opened using the workspace. When using this trigger, rule conditions are evaluated at the time the record is opened. If any of the conditions require that items be changed after the record is opened, the rule will not fire.</td>
</tr>
<tr>
<td>The record is saved without closing</td>
<td>Add this event to trigger the rule immediately after a record is saved without being closed. For example, you could have a rule that runs when a staff member clicks the Save button instead of Save and Close. This event does not affect records which are closed when saved or without being saved. This trigger should not be used as a last check before the record is saved, since it changes the values displayed in the workspace after the save occurs, not before.</td>
</tr>
<tr>
<td>A field changes</td>
<td>Add this event to trigger the rule immediately after the value of a field is changed. When added, click the underlined text to select a field that will trigger the rule. Available fields vary depending on the type of workspace you are editing. For example, when creating a rule on an incident workspace, you can select fields from the incidents, contacts, and organizations tables. However, not every field in these tables is available for use in workspace rules. When using this trigger, the rule is evaluated at the time any change is made to the selected field. If the selected field is a text field, the rule will be evaluated the moment any character in the field is changed. If the selected field is a currency, the rule will be evaluated when the field loses focus. Not all fields are supported on the Agent Browser UI.</td>
</tr>
<tr>
<td>An input control value changes</td>
<td>Add this event to trigger the rule immediately after the value of an input control is changed to another value or to no value. When added, click the underlined text to select an input control that will trigger the rule. Available input controls include any menus, options, list boxes, and text boxes that are not used to trigger other rules. This event is available only when an input control has been added to the workspace. When using this trigger, the rule is evaluated immediately after any change is made to the input control. If you want to verify that a specific value was selected, add An Input Control Has a Certain Value as a condition.</td>
</tr>
<tr>
<td>A button is clicked</td>
<td>Add this event to trigger the rule immediately after a button on the workspace is clicked. When added, click the underlined text to select a button from the workspace that will trigger the rule. This trigger is available only when a button has been added to the workspace.</td>
</tr>
<tr>
<td>An image is clicked</td>
<td>Add this event to trigger the rule immediately after an image is clicked. When added, click the underlined text to select an image from the workspace that will trigger the rule. This trigger is available only when an image has been added to the workspace.</td>
</tr>
<tr>
<td>A hyperlink control is clicked</td>
<td>Add this event to trigger the rule immediately after a hyperlink is clicked. When added, click the underlined text to select a link from the workspace that will trigger the rule. This trigger is available only when a hyperlink has been added to the workspace.</td>
</tr>
<tr>
<td>The exit script event fires</td>
<td>Add this event to trigger the rule immediately after the Exit button is clicked, or when an exit script event is fired by a rule in a script placed on the workspace. Rule conditions are evaluated at the time that the event is fired.</td>
</tr>
</tbody>
</table>
### Event Descriptions

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The finish script event fires</td>
<td>Add this event to trigger the rule immediately after the Finish button is clicked, or when a finish script event is fired by a rule in a script placed on the workspace. Rule conditions are evaluated at the time that the event is fired.</td>
</tr>
<tr>
<td>The guide finished</td>
<td>Add this event to trigger the rule immediately after the Finish button is clicked in a Guided Assistance relationship item indicating that a staff member has finished using a guide. This trigger is available only when the Guided Assistance relationship item has been added to the workspace.</td>
</tr>
<tr>
<td>An input control value is selected</td>
<td>Add this event to trigger the rule immediately after an input control value is selected. When added, click the underlined text to select an input control that will trigger the rule. Available input controls include any menus, options, and list boxes that are not used to trigger other rules. This event is available only when an input control has been added to the workspace. When using this trigger, the rule is evaluated at the time a value is selected from the input control. If you want to verify that a specific value was selected, add An Input Control Has a Certain Value as a condition.</td>
</tr>
<tr>
<td>A named event fires</td>
<td>Add this event to trigger the rule immediately after a named event is fired by another rule on the workspace or by a rule in a script placed on the workspace. When added, click the underlined text to enter the name of the event that will trigger the rule. Rule conditions are evaluated at the time that the event is fired.</td>
</tr>
</tbody>
</table>

### Add a Workspace Rule Trigger

The following procedure describes how to add a rule trigger to a workspace.

1. On the Rule Wizard, click **Triggers** to list available trigger items.
2. Click **Add** next to the triggers you want to add to the rule description.
3. If a trigger you have added to the rule description contains underlined text, click the underlined text to specify the source of the trigger action (such as the field, control, or event name). See *Workspace Rule Triggers Description* for a description of trigger actions.
4. Do one of the following:
   - Click **Next** to add conditions to the rule.
   - Click **Then Actions** to add actions to the rule.
   - Click **Finish** to save your trigger in the rule.

### Workspace Rule Conditions

Rule conditions are additional criteria that determine whether a rule action will be triggered.

Conditions are evaluated at the time that the trigger event occurs. If all conditions are met (and the logical expression is valid), the rule Then actions will be taken immediately after the triggering event. If any condition in the rule is not met, the rule Else actions will be taken. If no Else actions are defined and any condition is not met, no action will be taken.

### Workspace Rule Conditions Description

Available conditions vary based on the fields and controls you have added to the workspace.

All rule conditions listed in this table are supported in the Service Console and on the Agent Browser UI.
<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The logged in account has a certain value</td>
<td>Add this condition to take action based on whether the logged-in account has a certain value. Click the underlined text to select the account to be evaluated.</td>
</tr>
<tr>
<td>The logged in account’s profile has a certain value</td>
<td>Add this condition to take action based on whether the logged-in account’s profile has a certain value. Click the underlined text to select the profile to be evaluated.</td>
</tr>
<tr>
<td>A new record is being created</td>
<td>Add this condition to take action based on whether a new record is being created.</td>
</tr>
<tr>
<td>An existing record is being edited</td>
<td>Add this condition to take action based on whether an existing record is being edited.</td>
</tr>
<tr>
<td>The current editor is a child editor</td>
<td>Add this condition to take action based on whether the record is open in a child editor.</td>
</tr>
<tr>
<td>The current editor is a primary editor</td>
<td>Add this condition to take action based on whether the record is open in a primary (non-child) editor.</td>
</tr>
<tr>
<td>The record is copied</td>
<td>Add this condition to take action if the record is being copied from another record. <strong>Tip:</strong> This condition can be useful if you want to automatically set field values when records are copied.</td>
</tr>
<tr>
<td>The record is not copied</td>
<td>Add this condition to take action if the record is not being copied from another record.</td>
</tr>
<tr>
<td>A field has a certain value</td>
<td>Add this condition to take action based on whether a field has been set to a specified value. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is required</td>
<td>Add this condition to take action based on whether a field is required. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is optional</td>
<td>Add this condition to take action based on whether a field is optional (not required). Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is read only</td>
<td>Add this condition to take action based on whether a field is read-only. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is editable</td>
<td>Add this condition to take action based on whether a field is editable. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is hidden</td>
<td>Add this condition to take action based on whether a field is hidden. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is visible</td>
<td>Add this condition to take action based on whether a field is visible. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>An object is read only</td>
<td>Add this condition to take action based on whether a control is read-only. Click the underlined text to select the control to be evaluated.</td>
</tr>
<tr>
<td>An object is editable</td>
<td>Add this condition to take action based on whether a control is editable. Click the underlined text to select the control to be evaluated.</td>
</tr>
<tr>
<td>An object is hidden</td>
<td>Add this condition to take action based on whether a control is hidden. Click the underlined text to select the control to be evaluated.</td>
</tr>
<tr>
<td>An object is visible</td>
<td>Add this condition to take action based on whether a control is visible. Click the underlined text to select the control to be evaluated.</td>
</tr>
<tr>
<td>An input control has a certain value</td>
<td>Add this condition to take action based on whether an input control has a certain value. Click the underlined text to define the input control to be evaluated.</td>
</tr>
<tr>
<td>An add-in control condition returns a certain value</td>
<td>Add this condition to take action based on whether an add-in control returns a certain value. Click the underlined text to select the add-in control and the parameters to be evaluated.</td>
</tr>
</tbody>
</table>
Add a Workspace Rule Condition

The following procedure describes how to add a rule condition to a workspace.

1. From the Rule Wizard, click **Conditions** to list available conditions.
2. Click **Add** next to the conditions you want to add to the rule.
3. If a condition you have added to the rule description contains underlined text, click the underlined text to open the **Edit Condition** window. See **Workspace Rule Conditions Description** for a description of rule conditions.
4. To evaluate two or more conditions using a logical expression, click **Combine the Conditions Using a Logical Expression**. See **Edit a Workspace Rule Logical Expression**.
5. Do one of the following:
   - Click **Next** to add actions to the rule.
   - Click **Finish** to save your condition in the rule.

### Workspace Rule Operators

Operators specify IF conditions in workspace rules.

A workspace rule operator expresses the relationship between a selected field for a condition and its value, determining how the field is applied to the value of the condition. For example, in the condition “If the logged-in account equals Alex Thompson,” the operator is “equals.” Each field has its own set of operators, depending on what is logical for that field. A workspace rule with the condition “If an answer assignment is greater than or equal to customer support,” for example, has no relevance and cannot be applied to an answer.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>equals</td>
<td>The field matches the value exactly, including case.</td>
</tr>
<tr>
<td>not equals (exclude No Value)</td>
<td>The field does not match the value exactly (excluding case), and does not contain a null value.</td>
</tr>
<tr>
<td>not equals (include No Value)</td>
<td>The field does not match the value exactly (including case), or contains a null value.</td>
</tr>
<tr>
<td>is null</td>
<td>The field does not contain a value.</td>
</tr>
<tr>
<td>is not null</td>
<td>The field contains a value.</td>
</tr>
<tr>
<td>in list</td>
<td>The field values you want to search for are specified by selecting check boxes in a menu. The selected options are displayed in a separate Selected Items list to assist you when selecting from menus with a large number of options. When using this operator with integer fields, the numbers in the Value field must be comma-separated. When using this operator with text fields, the text strings in the Value field must be comma-separated and each text string must be offset by single quotes. For example, ‘red’, ‘green’, ‘orange’. Spaces between entries are ignored.</td>
</tr>
<tr>
<td>not in list</td>
<td>The field values you do not want to search for are specified by selecting check boxes in a menu. The selected options are displayed in a separate Selected Items list to assist you when selecting from menus with a large number of options. This operator is available only with menu field expressions. When using this operator with integer fields, the numbers in the Value field must be comma-separated. When using this operator with text fields, the text strings in the Value field must be comma-separated and each text string must be offset by single quotes. For example, ‘red’, ‘green’, ‘orange’. Spaces between entries are ignored.</td>
</tr>
<tr>
<td>less than</td>
<td>The field is less than the value.</td>
</tr>
</tbody>
</table>
### Edit a Workspace Rule Logical Expression

When you add multiple conditions to a rule, the conditions are automatically joined together to form a logical expression.

The logical expression defines how the conditions are evaluated together to determine whether rule actions should be performed. By default, the logical expression uses Boolean AND logic rather than OR logic. Conditions joined by an AND operator must all be met for rule actions to be performed. When using the OR operator, any condition can be met.

1. Add more than one condition to the rule.
2. Click **Combine the Conditions Using a Logical Expression**.
   The **Edit Logical Expression** window opens. The conditions you added are automatically joined with AND logic and are displayed in an AND tree node.
3. To add a condition joined with OR logic, click **Add OR Node** and drag the condition to the OR node.

   **CAUTION:** Deleting a node from the logical expression will also delete any conditions listed beneath that node in the tree structure, and there is no Undo option.

When you add nodes to the expression, the nodes are displayed in a tree structure, with conditions displayed either under an AND node or an OR node. Conditions under the same AND node are joined to each other using AND logic. Conditions under the same OR node are joined to each other using OR logic. Conditions can be dragged from one node to another to define their logical relationships.

4. To delete a node from the logical expression, select the node and click **Delete Node**.
5. To view a text definition for the logical expression, click **View Text Definition**.
   a. Click **OK**.

### Workspace Rule Actions

Immediately after a rule is triggered (and all conditions are met), its actions are performed.

Actions provide a wide array of functions to meet your business needs. They can be used to set the value of a field or change its required, read-only, or visibility status. They can set the visibility of controls on the workspace. Actions can even hide individual items within menus. For example, an action can change the properties of the Status field to allow staff members to select from only two of the four incident statuses.

Every rule must have at least one Then action, which is the result of the rule being triggered and its conditions being met. Else actions can be added if conditions have been defined in the rule. Else actions can use any of the same actions as Then actions, except they are performed when the rule conditions are *not* met. For a list of available workspace rule actions, see **Workspace Rule Actions Description**.
**Note:** If a rule action triggers a connector in a desktop workflow, the workflow will advance to the next element without running any subsequent rules in the workspace. See *Add a Connector Event*.

Workspace Rule Actions Description
The available rule actions depend on the type of workspace and the fields and controls you have added and are described in the following table.

All rule actions listed in this table are supported in the Service Console and on the Agent Browser User Interface.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set the value of a field</td>
<td>Add this action and click the underlined text to select a field and the value you want to set for that field. In addition to setting an absolute value, you can set relative values for some field types. Relative values are defined by adding or subtracting (or appending or prepending) a value to the previous value.</td>
</tr>
<tr>
<td>Set menu field to include menu items</td>
<td>Add this action and click the underlined text to select items you want to appear in a specified menu field. When selecting items in hierarchical menus, you can select the parent item to add the parent and all child items to the list, or you can select only the child items you want.</td>
</tr>
<tr>
<td>Set menu field to exclude menu items</td>
<td>Add this action and click the underlined text to select items you want to hide from a specified menu field.</td>
</tr>
<tr>
<td>Make a field required</td>
<td>Add this action and click the underlined text to select a field that you want to require staff members to complete.</td>
</tr>
<tr>
<td>Make a field optional</td>
<td>Add this action and click the underlined text to select a field that you want to be optional (not required) for staff members to complete.</td>
</tr>
<tr>
<td>Make a field read only</td>
<td>Add this action and click the underlined text to select a field that you want to be uneditable by staff members.</td>
</tr>
<tr>
<td>Make a field editable</td>
<td>Add this action and click the underlined text to select a field that you want to be editable by staff members.</td>
</tr>
<tr>
<td>Hide field</td>
<td>Add this action and click the underlined text to select a field that you want to be hidden from staff members.</td>
</tr>
<tr>
<td>Show a field</td>
<td>Add this action and click the underlined text to select a field that you want to be visible to staff members.</td>
</tr>
<tr>
<td>Set the value of an input control</td>
<td>Add this action and click the underlined text to select an input control and the value you want to set for that control.</td>
</tr>
</tbody>
</table>

**Note:** A control with a value that can be changed at runtime must be added to the workspace for this action to be available on workspaces used on the Agent Browser UI.
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set the URL of a web browser control</td>
<td>Add this action and click the underlined text to select a browser control and specify a URL for it to load.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> A browser control must be added to the workspace for this action to be available on workspaces used on the Agent Browser UI.</td>
</tr>
<tr>
<td>Assign the value of a text box control to a</td>
<td>Add this action and click the underlined text to select a text box control and give its value to a text field.</td>
</tr>
<tr>
<td>field</td>
<td><strong>Note:</strong> A text box control must be added to the workspace for this action to be available on workspaces used on the Agent Browser UI.</td>
</tr>
<tr>
<td>Make an object read only</td>
<td>Add this action and click the underlined text to select a control that you want to be uneditable by staff members.</td>
</tr>
<tr>
<td>Make an object editable</td>
<td>Add this action and click the underlined text to select a control that you want to be editable by staff members.</td>
</tr>
<tr>
<td>Hide an object</td>
<td>Add this action and click the underlined text to select a control that you want to be hidden from staff members.</td>
</tr>
<tr>
<td>Show an object</td>
<td>Add this action and click the underlined text to select a control that you want to be visible to staff members.</td>
</tr>
<tr>
<td>Focus a tab</td>
<td>Add this action and click the underlined text to select a tab or sub tab that you want to receive focus.</td>
</tr>
<tr>
<td>Hide a ribbon button</td>
<td>Add this action and click the underlined text to select a button on the ribbon that you want to be hidden.</td>
</tr>
<tr>
<td></td>
<td>When you choose to hide a ribbon button, all instances of the button on the workspace ribbon will be hidden.</td>
</tr>
<tr>
<td>Show a ribbon button</td>
<td>Add this action and click the underlined text to select a button on the ribbon that you want to be visible.</td>
</tr>
<tr>
<td>Invoke a guide</td>
<td>Add this action and click the underlined text to select a guide to display to staff members.</td>
</tr>
<tr>
<td></td>
<td>This option is available only if guided assistance is enabled on your site.</td>
</tr>
<tr>
<td>Prompt agent to select a guide</td>
<td>Add this action to prompt staff members to select a guide to display.</td>
</tr>
<tr>
<td></td>
<td>This option is available only if guided assistance is enabled on your site.</td>
</tr>
<tr>
<td>Prompt agent to search for a guide using a</td>
<td>Add this action and click the underlined text to select a report and prompt the agent to search for a guide using the selected report.</td>
</tr>
<tr>
<td>report</td>
<td>This option is available only if guided assistance is enabled on your site.</td>
</tr>
<tr>
<td>Run a script</td>
<td>Add this action and click the underlined text to select a script control and the script that you want to run in it.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Fire a named event</td>
<td>Add this action and click the underlined text to enter the name of an event that you can use to trigger a script branch, desktop workflow connector, or another rule. Named events let you trigger a workspace rule from a script rule or a script rule from a workspace rule. For example, you could create a script rule to fire a named event when a button control is clicked. You could then create a workspace rule to set the Status field to Solved when the named event is fired.</td>
</tr>
<tr>
<td>Execute an editor command</td>
<td>Add this action and click the underlined text to select an editor command that you want to run. Any of the record commands that are available as ribbon buttons for the workspace type can be selected, such as Save, Print, Propose, and Refresh.</td>
</tr>
<tr>
<td>Execute an add-in action</td>
<td>Add this action and click the underlined text to select an add-in action that you want to run.</td>
</tr>
<tr>
<td>Add standard text to thread</td>
<td>Add this action and click the underlined text to select a standard text to insert into an incident thread. Any standard text that has Rule Text enabled can be inserted as a customer entry, response, or private note type threads. The Incident Thread relationship item does not need to be added to the workspace for this action to occur. However, the new thread entry will not be committed until the incident is saved.</td>
</tr>
<tr>
<td>Display a message box</td>
<td>Add this action and click the underlined text to define a customized message that will display in a new window. For example, you can use this action to alert the agent when an incident contains a high severity issue or is missing important information. You can define the window title and the text of the message and select an icon to indicate the message context (none, error, information, question, or warning).</td>
</tr>
<tr>
<td>Make the editor read only</td>
<td>Add this action to make all content in the editor read-only, preventing further changes from taking place to the record. For example, you could add this action to prevent agents from making changes to solved incidents.</td>
</tr>
<tr>
<td>Show Best Answers Dialog</td>
<td>Add this action to display the Best Answers dialog. The Best Answers displays a list of answers marked as best answers. You can also select the answer that best resolve the incident.</td>
</tr>
</tbody>
</table>

Add or Edit a Workspace Rule Action

The following procedure describes how to add or edit a rule action to a workspace.

1. From the Rule Wizard, do one of the following:
   - Click **Then Actions** to list available Then actions.
   - Click **Else Actions** to list available Else actions.
2. Click **Add** next to the conditions you want to add to the rule.
3. If the action you have added to the rule description contains underlined text, click the underlined text to open the **Edit Action** window. See **Workspace Rule Actions Description** for a description of rule actions.
4. To change the order of the actions listed in the rule description, click **Change the Order of the Then (or Else) Actions**.
   a. Click the action you want to move, then click the up or down arrow to move the action where you want it.
   b. Click **OK**.
5. Click Finish.

Modify Workspace Rules

After you add rules, you can easily edit them, reorder them, or delete them when they are no longer needed. These functions can be accessed from both the Rules tab and the Rules button on the Home tab.

Rules are fired in the sequence in which they are listed. Adjusting them can impact how other rules affect the workspace. For example, if multiple rules set different values for the same field, the field will be set to the value assigned by the last rule in the sequence.

1. Do one of the following:
   - From an open workspace, click the Home tab and then click Rules. The Rules window opens and lists all workspace rules.
   - Click an item on the workspace and then click the Rules tab. The rule list displays all rules triggered by the selected item. (If you want to display the rules that reference the selected item, or all rules in the list, click Filter List and select the option you want.)

2. In the rule list, select the rule you want to modify.
3. To edit the rule, click Edit Rule.

   The Rule Wizard opens. See Adding workspace rules.
4. To copy the rule, click Copy Rule.

   The Rule Wizard opens the rule copy where you can make any needed changes to rule. The Copy Rule button is available only when modifying rules using the Rules button on the Home tab. It does not appear on the Rules tab.
   a. Click Finish to save the rule copy.
5. To change the order of the rule, click the up or down arrow to move the rule where you want it.

   **CAUTION:** Deleting a rule is permanent and cannot be undone. To ensure that a rule is not needed before deleting it, you can disable it instead. To disable a rule, click the Rules button on the Home tab and clear the Active check box next to the rule.
6. To delete the rule, click Delete Rule.

Considerations for Avoiding Workspace Rule Conflicts

You should understand the sequence in which rules are performed in order to avoid rule conflicts.

**Note:** Some agent scripting and workspace rule elements are not currently supported on the Agent Browser UI. Test your workspace rules on the agent desktop (Service Console or Agent Browser UI) used by your staff members.

Because processes for workspace rules, script rules, script branching rules, and workflows are often running at the same time, care must be taken to ensure that their actions do not conflict. For instance, when a script is added to a workspace, the script rules will be running even when the script does not have focus on the workspace. If a script rule and a workspace rule are configured to update the same field, an agent may find that the field does not update to the value they might expect. For this reason, it is helpful to understand the sequence in which rules are performed. Currently, rules are processed in the following order:

1. Workspace rules
2. Script current page rules
3. Script current page branching logic

If additional scripts appear on the same workspace, processing continues as follows:

1. Script 2 current page rules
2. Script 2 current page branching logic
3. Script 3 current page rules
4. Script 3 current page branching logic

While a large number of rules may be difficult to track, remember that you can avoid most common types of conflicts by limiting the number of rules you create and avoiding overlap in triggers. For example, if a workspace rule and script rule are both triggered by a change to the Category field, you will want to make sure that these rules do not act on the same field or control (such as trying to set two different values for the Product field). If they must do so, add appropriate conditions to the rules to narrow their focus and impact.

Since most trigger events are common to workspace rules, script rules, and workflow connectors, it is important to try to minimize or reserve certain types of triggers for certain functions. For example, it is generally best to avoid or minimize the number of data changed triggers (such as “A field changes”) in your scripts. This is especially true for the first page of scripts, as this page will load when the workspace does and is therefore more likely to run into a conflict.

Finally, work performed in the agent desktop is augmented by another feature that is usually thought of as separate and distinct—the server-side business rules. Don’t forget to consider your existing business rules when designing your agent desktop, especially those functions most commonly performed by rules, such as changing incident assignment. And be sure to consider your agent desktop designs when adding new business rules. Tracking functional overlaps between business rules and your agent desktop is just as important as preventing conflicts within the desktop to ensure expected results.

Preview a Workspace

When you are editing a workspace, it can be helpful to preview the workspace to see what it will look like when staff members use it. This can help you assess whether it meets your needs or if it needs further changes.

The preview feature displays the workspace as it will appear to any staff member who has the same set of administration permissions as you have. To view the workspace as it will appear to a staff member with different permissions, you must log in using a staff account with the same profile as the staff member.

**Note:** As in production, previewed reports used on report controls or relationship items automatically attempt to filter on the record shown using the workspace to display information related to the record. For this reason, you should make sure that each report contains at least one filter for the primary identification types for the workspace type. For example, reports used in incident workspaces should filter on incident (i_id), contact (c_id), or organization (org_id). If such a filter does not exist, the previewed report could return all records.

1. Do one of the following:
   - While editing a workspace, click the **Home** tab.
   - Right-click a workspace on the Workspaces explorer and select **Open**.
2. To view the workspace as it will appear to staff members when they add records using this workspace on the agent desktop, click **Preview** and select **Agent Desktop New**.
   A preview of the new record opens.
3. To view the workspace as it will appear on the agent desktop with data from a specific record, click **Preview** and select **Agent Desktop Existing**.
   a. Enter the record ID number.
   b. Click **OK**.
   The record preview opens.
4. To view the workspace as it will appear to staff members when they add records using this workspace on the Agent Browser UI, click **Preview** and select **Agent Browser UI**.
   The **Preview in Agent Browser UI** window opens.
   a. To view a new record, click **Preview**.
You can also click **Copy URL to Clipboard**, and then paste the URL in a web browser.

A preview of the new record opens on the Agent Browser UI.

b. To view the workspace as it will appear with data from a specific record, enter the incident ID or reference number and click **Preview**.

You can also click **Copy URL to Clipboard**, and then paste the URL in a web browser.

c. Click **X**.

**Note:** If you are not already logged in to the Agent Browser UI, you will be prompted to log in before the preview opens on the Agent Browser UI.

5. To view a chat workspace as it will appear with data from a specific chat session, click **Preview**.

   a. Enter the chat session ID. (Chat session IDs can be found on the tab of an agent’s active chat session as well as the All Chats report.)

   b. Click **OK**.

   The chat preview opens.

6. Click **X** on the top right or press **Esc**.

When you click **Preview** on a multi-edit workspace, the workspace displays without any record data. You cannot enter a reference or ID number to view existing data as you can when you select **Opening a Record** on a single-record workspace.

---

**How You Export and Import Workspaces**

Administrators can spend a lot of time creating and optimizing custom workspaces to support complex business processes. However, because workspaces are often comprised of fields and controls that are unique to the interface in which they were created, they cannot simply be copied between interfaces.

To save time when creating workspaces in multiple interfaces, B2C Service lets you export a workspace as an XML file containing descriptions of all the workspace elements, including fields, controls, layout, and rules. The XML file can then be used by the import wizard to import the workspace to another interface. The export/import features can help you migrate a workspace efficiently while accounting for fields and controls that are not configured identically between interfaces. This is helpful if you have a custom workspace you like on one B2C Service interface and want to create a copy or similar workspace on a different interface.

Consider the following when exporting or importing workspaces.

- Workspace notes are not included when exporting a workspace to an XML file.
- When a workspace is exported as an XML file, the file includes a hash value that will be used when the file is imported to determine if the file has been modified externally. If the file has been modified, it will not be available for importing, and an error message notifies you that the file is invalid.
- The XML file can be no larger than 1 MB.

**Export a Workspace**

This procedure describes the steps to export a workspace.

1. On the Workspaces explorer, right-click the workspace you want to export and select **Open**.

   The workspace opens.

2. Click **File** and select **Export Workspace**.

   The **Save As** window opens.

3. Select the directory where you want to save the workspace definition file and enter the file name.
4. Click Save.

**Import a Workspace**

This procedure describes how to import a workspace.

1. From the Workspaces explorer, click **New**. (If workflows are enabled, the button will be labeled New Workspace.) The **New Workspace** window opens.
2. Click **Import Workspace from an Exported Workspace File** to open the Import Workspace wizard.
3. Click **Next**.
4. Do one of the following:
   - Enter the full path of the workspace definition file you want to import.
   - Click **Browse** to find the file on your workstation and click **Open**.
5. Click **Next**.
6. To map the file to a workspace type, click the **Map To Type** drop-down menu and select the record type you want to map the workspace to. By default, the imported workspace is mapped to the same workspace type as the original workspace.
   
   **Note:** If items from the workspace you are importing are not used by the workspace type you are converting it to, the next window lists these invalid items and informs you that they will be replaced by spacers, field placeholders, or removed from the imported workspace. Since most database fields and workspace controls are not shared by workspace types, the majority of fields and controls will often not be included in the new workspace when you convert the type. However, this option is helpful if you want to import the general layout from a workspace with a different type.

7. Click **Next**.
8. If the workspace includes records from a custom object, click the **Map To Record Type** drop-down menu and select the record type you want to map the records to. If B2C Service detects a record type of the same name already in the site, it is selected by default.
9. Click **Next**.
10. Click **Finish**.

   The workspace designer opens with the imported workspace. Any fields on the workspace that do not exist on the site you are importing the workspace into will be indicated as unavailable.

11. Edit the workspace to remove or replace fields that are not available. See **Edit a Workspace**.
12. Click **Save**.

   When you save a workspace, reports that are used by the workspace report controls will be checked to ensure they exist on the site. If a report does not exist, a message will be placed in the control stating the report is no longer available. You can save a workspace that has invalid reports, but you will need to select new reports for the controls before they can be used by the workspace.

---

**Guided Assistance**

**Overview of Guided Assistance**

Guided assistance gives agents and customers the ability to locate answers or text explanations by selecting responses from question branches in guides. This lets agents quickly find information they can provide to customers when working with them on the phone, when responding to an incident, or when chatting.

In addition, guides can be embedded in answers so customers can use them on the Customer Portal.
Note: Many factors control answer visibility. For instance, if an answer or section of an answer is available only to customers whose SLAs give them permission to view certain answer access levels, that answer will not be visible to customers without that SLA even if they click an answer in a guide. See Overview of Answers.

Not all guided assistance features are currently supported on the Agent Browser UI. For a complete list of supported features, see Answer ID 9022 on our support site.

To understand how guides can best be implemented in your agent desktop on the Service Console and the Agent Browser UI, you should also become familiar with workspaces, scripts, script rules, and workflows. For a summary of these features, see Overview of the Dynamic Agent Desktop.

Provide Guided Assistance to Agents and Customers

You can create as many guided assistance guides as you need to help your agents and customers locate appropriate responses to questions related to different topics.

You can create guides to help agents answer questions about different products and other guides to help answer questions about service plans. Each guide can include multiple question branches, so you can use a single guide to lead agents to answers regarding different models of a product or multiple service plans.

Note: These configuration options will not be available until guided assistance is enabled. To enable guided assistance, contact your Oracle account manager.

1. Add the Guided Assistance explorer to your configuration list for the Configuration button. See Create a Navigation Set for the Administrator.
2. Assign guided assistance permission to profiles. See Assign Guided Assistance Permission to Profiles.
3. Create guides for your agents or customers. See Create or Edit a Guide.
4. To display a guide to agents, add the Guided Assistance control to a workspace selected in the agent profiles. See Guided Assistance Relationship Item.
5. To display a guide to customers, add the GuidedAssistant widget to the Customer Portal.

Assign Guided Assistance Permission to Profiles

You first need to edit your profile to include permission to create guides. Staff members with appropriate profile permission can create, copy, delete, and rename guides from the Guided Assistance explorer.

Guided assistance permission is not available on the Profiles editor unless guided assistance is enabled on your site. To enable guided assistance, contact your Oracle account manager.

1. Click Configuration on the navigation pane.
2. Expand Staff Management, and then double-click Profiles.
   The Profiles report displays on the content pane.
3. Right-click a profile and select Open.
   The Profiles editor displays on the content pane.
4. Click Permissions.
5. Click the Service tab and select the Guided Assistance – Add/Edit check box under More Options.
6. Click Save.
   Staff associated with the profile you have edited must log out of B2C Service and log back in to apply the changes you have made.

Create or Edit a Guide

The Guided Assistance explorer provides all the tools you need to manage the guides you create.

You can copy and delete guides and organize them in custom folders in the same way you work with items in any explorer. See Open the Reports Explorer.

CAUTION: If you attempt to delete a guide that is being used in another guide, a dependency warning will list each location where the guide is used and provide you with an option to cancel the deletion. If you choose to continue deleting the guide, all references to the guide will be invalidated and you will need to manually update each reference to either remove it or replace it with a valid guide.

To more easily see relationships between guided assistance questions and responses, view the data in a tree format. See Overview of Managing Reports on the Reports Explorer.

1. Click Configuration on the navigation pane.
2. Double-click Guided Assistance Explorer in the configuration list.
   The Guided Assistance explorer opens on the content pane.
3. To create a new guide, do one of the following:
   o Click New on the Guided Assistance explorer ribbon. The guided assistance designer opens.
   o If your navigation set is configured to add guides from the application menu, click File and select Guided Assistance Guide.

When creating a guide, you add questions to the guide, add text for the question responses, and associate answers or text explanations with each response. You can also insert existing guides into other guides if you have a set of common questions and answers you want to use in multiple guides.

4. To edit an existing guide, right-click the guide in the list and select Open.
   The buttons on the designer ribbon give you access to all the tools you need to preview, validate, and edit a guide.

### Node Properties and Actions

The buttons in this group let you add text, images, and web pages to questions. You can also edit, delete, and export questions and all the items in the branches for each question.

Some of the options available in this group are also available when you right-click a question or response in the guide.

| Text | Click this button to edit the text for the selected question or response. |
| Agent Text | Click this button to add explanatory text to the selected question. The agent text is displayed beneath the question and is visible only to the staff members who is using the guide. |
| Display Type | Click this button to change the question type for the selected question. You can change the question type to Button, Menu, List, Radio, Link, Text, or Image. |
| Question Name | Click this button to add a name for the question, which is used to display the question in the designer and when passing the question as a parameter name to an external URL (Call URL node). |
| Response Value | Click this button to set the value for the response, which is used when passing the response as a parameter value to an external URL (Call URL node). |
| Delete | **CAUTION:** When deleting a question or response, all the images, web pages, questions, and responses beneath the item will also be deleted. |
| Edit | Click this button to open the Edit Question Properties window to change the properties of the selected question. You can also change the question properties from the ribbon. |
In addition, you can select an answer associated with a question response, and then click this button to open a search window to find a different answer to associate with the response.

See Add Questions and Responses to a Guide.

### Extract

Click this button to open the Extract Guide window where you can copy the selected question branch to a new guide or to an XML file.

---

## Add Questions and Responses to a Guide

The questions you add to guides can be simple or complex.

If you think your agents may need additional context to better understand a question, you can add a web page or an image that will appear with the question text. See Add an Image Control to a Workspace or Script.

You can also save time by inserting the content from another guide into the guide you are creating. Inserting guides can save time if you have a number of common questions, responses, and answers that are used throughout a number of guides.

**Tip:** When editing a guide, you can press Ctrl+F to search for specific text on the content pane. This can be helpful for locating descriptions or answer IDs referenced within a guide.

1. Select a question type button on the ribbon to add the first question to the new guide. For a description of the question types, see the Guided Assistance Designer Ribbon table in Create or Edit a Guide. After you add a question, the designer displays the question and its responses using default text. The question is added with the default text selected for editing.
2. Double-click the text for the question.
   The Edit Question Properties window opens.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question Name</td>
<td>Enter a question name to be used as the name of the parameter to be passed to a URL as defined in a Call URL node. This field is associated with the Question Name button on the ribbon.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the question to display in the guide. This section contains an HTML editor and toolbox to help create guides. The HTML editor and toolbox are similar to the editor and toolbox used for answers. See Adding HTML answers.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>When inserting an image from the toolbox, you must select a client workflow image and choose to display it either inline (in the body of the answer) or in a window. See <a href="#">Add an Image Control to a Workspace or Script</a>. When inserting an inline web page from the toolbox, you must specify the URL address, width, and height.</td>
</tr>
<tr>
<td>Agent Text</td>
<td>Enter an internal note to further explain the logic in the question. This text will not display in guides and is available only to staff members. This field is associated with the Agent Text button on the ribbon.</td>
</tr>
<tr>
<td>Question Responses</td>
<td>Displays all question responses that are associated with the question being edited. Responses can be added, edited, and deleted. In addition, a display type can be set to change the format of the responses. This field is associated with the Response Value button on the ribbon.</td>
</tr>
<tr>
<td>Name-Value Pairs</td>
<td>Click this section header to display name-value pairs that are associated with the question. Name-value pairs can be added and deleted and are used in Call URL nodes to pass parameters for integration purposes. See <a href="#">How You Pass Parameters Through Call URL Nodes</a>.</td>
</tr>
</tbody>
</table>

4. Click OK.
5. To add responses to the question, click Response.
   The new response is added to the question.
6. To edit a question response, double-click the response to open the Edit Response Properties window.
   a. Enter the text and value for the response.
   b. Click OK.
7. To add another question to the guide, select one of the responses in a question you have added and click one of the question type buttons on the ribbon. The designer is updated to display the new question. When agents use the guide, they will see the new question when they choose the response the new question is branched from.
8. Click Save on the Quick Access toolbar. The Save As window opens if you have not yet named the guide.
   **Note:** If there are problems with the guide (that is, if one or more questions are not associated with an answer or text explanation), a validation message will display the errors. Click Continue to save the guide or click Cancel to cancel. If problems exist with your guide, we recommend that you fix them before making the guide available to agents.
   a. Enter a name for the guide in the Name field.
   b. Click OK.
Chapter 3
Dynamic Agent Desktop

Associate Answers and Text Explanations with Question Responses

For a guide to be valid, all questions in the guide must be associated with responses, and all responses must be associated with other questions or with one or more public answers or text explanations.

The following procedure explains how to associate answers and text explanations with responses. After a guide has been saved, you can click Create Answer on the ribbon to create an answer to associate with your guide.

1. To associate an answer with a question response, select the response and click Associated Answer on the ribbon. The Add or Edit an Answer Node window opens.
   a. If you know the ID number of the answer you want, enter it in the Answer ID field and click Select.
   b. To search for an answer, enter search criteria in the fields, click Search, select the answer you want, and click Select. The window closes and the answer is associated with the response.

2. To change an answer that has been associated with a response, double-click the answer on the guided assistance designer. The Add or Edit an Answer Node window opens.
   a. Select a different answer and click Select.

   **Tip:** When you edit a guide, you can view the answers associated with responses by right-clicking an answer and selecting View Answer.

   The answer in the guide is replaced with the new answer.

3. To associate a text explanation with a question response, select the response and click Text Explanation on the ribbon.
   a. Enter the text you want for the explanation and press Enter. The explanation displays beneath the response.

4. To change the text for an explanation already added to the guide, do one of the following:
   o Select the explanation, click Text on the ribbon, and enter the text you want.
   o Double-click the explanation and enter the text you want.
   a. Enter the text you want and click OK.

   If the text explanation exceeds 200 characters, the Edit Node Text window opens when you double-click the text explanation.

5. Click Validate on the ribbon to verify that each question response is associated with a public answer or a text explanation. A message opens stating that the guide successfully validated or that it contains errors.
   a. Click OK.

   **Note:** Validation also occurs automatically when saving a guide. If validation errors occur when saving, you can click Continue on the Validation Results window to save without first correcting the errors. However, the guide will not function properly until all validation errors have been corrected. If problems exist with your guide, it is important to fix them before making the guide available to agents or customers.

6. Click Save on the Quick Access toolbar.
How You Pass Parameters Through Call URL Nodes

Call URL functions and parameters can route customers to an absolute or relative URL, helping them find a solution more quickly.

A Call URL node is used to link a guide response to an absolute or relative URL. For instance, a customer-facing guide could lead customers to a solution that requires the involvement of support agents. In this case, you could add a Call URL node to route customers from the guide to your Ask a Question page. This can be done by entering the relative URL /app/ask in the Call URL properties.

**Note:** Following a Call URL node can be unsettling to customers if they do not expect to leave the guide. To avoid confusion, be sure that the text of the question or response preceding each Call URL node indicates the action that will result when the option is selected.

You can also pass parameters through the Call URL function by defining name-value pairs in the question or response properties. For example, when linking to the Ask a Question page, you can pass parameters to automatically set values for fields such as Product, Category, or a custom field. To accomplish this, you must first update the question name to indicate the name of the parameter you want to set. You can then edit the response properties to set the value you want.

Alternately, you can add name-value pairs to question properties to declare a static parameter. Static parameters are parameters that are carried through the remaining branches on a guide and are passed through any Call URL function that exists in the question subhierarchy. To test Call URL functions and parameters, click the Preview button and select an option for previewing your guide.

Pass a Parameter Using Response Properties

The following procedure describes how to pass a parameter using response properties. This procedure assumes you have created a guide containing a question and a response with a Call URL node.

1. From the open guide, right-click the question containing the response and Call URL node, and select **Edit**. The **Edit Question Properties** window opens.
2. Enter the name of the parameter you want to pass in the **Question Name** field.
   - If passing a parameter to a B2C Service field, such as a field on the Ask a Question page, use the format `table.fieldname`. For example, to pass a parameter to the Products field, enter `incidents.prod`. Custom fields are indicated in the format `table.c$fieldName`, such as `incidents.c$priority`.
3. In the Question Responses section, select the response containing the Call URL node and click **Edit Response**. The **Edit Response Properties** window opens.
4. Enter the parameter value you want to pass in the **Response Value** field.
   - If passing a parameter to a B2C Service field, be sure to use a value consistent with the purpose and type for the field. For example, to set a Yes/No field, use a response value of 1 for Yes and 0 for No. To pass a value to the Products field, you would enter a number or number sequence corresponding to the product ID.
5. Click **OK**.
6. Click **OK**.
7. Right-click the Call URL node and select **Edit**. The **Edit Call URL Properties** window displays the URL, parameter pass method, and all name-value pairs that will be passed as parameters.
8. Select a parameter pass method from the Parameter Pass Method field. Available options include Get and Post. The Post method must be used when passing parameters to set fields on a page, such as when setting the Product field on the Ask a Question page.
9. Click OK.
10. Click Save.

Pass a Static Parameter Using Question Properties
The following procedure describes how to pass a static parameter using question properties. This procedure assumes you have created a guide containing a question and a response with a Call URL node.

1. From the open guide, right-click the question you want to declare the static parameter for and select Edit. The Edit Question Properties window opens.
2. Expand the Name-Value Pairs section and click Add.
3. Enter the name of the parameter in the Name field.
   If passing a parameter to a B2C Service field, such as a field on the Ask a Question page, use the format `table.fieldname`. For example, to pass a parameter to the Products field, enter `incidents.prod`. Custom fields are indicated in the format `table.c$fieldname`, such as `incidents.c$priority`.
4. Enter the parameter value you want to pass in the Value field.
   If passing a parameter to a B2C Service field, be sure to use a value consistent with the purpose and type for the field. For example, to set a Yes/No field, use a response value of 1 for Yes and 0 for No. To pass a value to the Products field, you would enter a number or number sequence corresponding to the product ID.
5. Click OK.
6. Right-click the Call URL node and select Edit. The Edit Call URL Properties window displays the URL, parameter pass method, and all name-value pairs that will be passed as parameters.
7. Select a parameter pass method from the Parameter Pass Method field. Available options include Get and Post. The Post method must be used when passing parameters to set fields on a page, such as when setting the Product field on the Ask a Question page.
8. Click OK.
9. Click Save.

Guide Preview
You can preview a guide to confirm that it appears and functions as you want it to.

The Preview button on the ribbon provides two options for previewing guides.

• Agent Preview—This option opens the guide in a separate window and shows you the guide exactly as your agents will see it, including the slider bar you can expand to view the navigator.
• Web Preview—This option opens the guide in a separate window and shows you the guide as your customers will see it.

Note: The Web Preview feature does not include the toolbar that is available on the Agent Preview feature. To configure display options for guides that are included in answers, edit the Answer Details page of your Customer Portal.
Use Agent Preview

The following procedure describes the steps to preview guides using the Agent Preview option.

1. When viewing a guide, click **Preview** and select **Agent Preview**. A window opens, showing only the first question in the guide.
2. To view the guide contents, respond to the first question just as you would if you were an agent using the guide. Additional questions, responses, answers, and **text explanations** display as you navigate the guide branches.
3. To view the guide branches, select the **Expand Navigator** check box at the top of the window. A panel on the left side of the window displays the guide contents.
4. To quickly view the content under a question or response, select the question or response on the left side of the window and click **Navigate** at the top of the window. The content of the question or response displays on the right.
5. Click **OK**.

Use Web Preview

The following procedure describes the steps to preview guides using the Web Preview option.

1. When viewing a guide, click **Preview** on the ribbon and select **Web Preview**. A window opens, showing only the first question in the guide.
2. To view the guide contents, respond to the first question just as you would if you were a customer using the guide. Additional questions, responses, answers, and text explanations display as you navigate the guide branches.
3. Click **OK**.

Guided Assistance Relationship Item

Before your agents can use guides, you must add the Guided Assistance relationship item to a custom incident or chat workspace.

When added, the Guided Assistance relationship item functions as a container for displaying guides to your staff on the agent desktop. Guides can be displayed manually, based on a guide search or selection performed by an agent. See **Guide Search Options**. They can also be loaded dynamically, based on a workspace or **script rule**. For example, you can design a workspace rule to display a guide automatically when the editor loads based on the incident category, or you can load a different guide when an agent selects a certain incident disposition. See **Guided Assistance Functions in Workspace and Script Rules**.

**Note:** A separate Guided Assistance field can be added to answer workspaces and scripts. This field lets you associate answers directly to guides for search-matching purposes. See **How You Associate Answers to Guides**. Guides can also be embedded in answers so customers can use them on the customer portal.

- Create a Workspace
Guide Search Options

You can provide your agents with the ability to manually select and display guides on the Guided Assistance relationship item. When these options are enabled, agents can use a set of buttons at the top of the control to search for and select a guide appropriate for their needs.

**Note:** When providing guide search to your agents, you must ensure that each guide is appropriately associated to one or more answers. See [How You Associate Answers to Guides](#).

Several design options are available for guide searching. By default, the Guided Assistance Search report is used when performing searches, but you can select a different search report to use instead. Also, as an alternative to displaying the default Search for a Guide and Select a Guide buttons, you can display the guide search fields inline at the top of the control. You can also choose to hide the left navigation page if you want to restrict agents from jumping freely to different sections of the guide.

In addition, when the Guided Assistance relationship item is added to incident workspaces, Guided Assistance is automatically displayed on the ribbon. By default, this button provides both select and search options for locating guides. However, you can edit Guided Assistance to show or hide either option. Or, if you do not want Guided Assistance to display at all, you can remove it. See [Ribbon and Quick Access Toolbar Buttons](#).

<tbody>
<tr>
<td>Search Report</td>
<td>Click this button to select the report you want to use when searching for guides from a workspace. The report is displayed when you click the Search for a Guide button on the guided assistance panel or you click the Guided Assistance button on the incident ribbon and select Search. The report is also shown on the guided assistance panel on the incident workspace when the Show Search Inline option is enabled on the incident workspace. By default, the standard Guided Assistance Search report is used to search for guides. We recommend that you do not change the default report unless you require a custom report with different fields.</td>
</tr>
<tr>
<td>Show Search Inline</td>
<td>Selecting this option displays search fields on the guided assistance panel you can use to search for a guide. The fields that are displayed come from the search report you select for finding guides.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
Selecting this option prevents the Search for a Guide and Select a Guide buttons from displaying on the guided assistance panel, though these can still be accessed from the Guided Assistance button on the incident workspace ribbon.

Show Search Button | This option adds the Search for a Guide button on the guided assistance panel. Clicking this button on a workspace opens the Search for a Guide window where you can enter search criteria to find the guide you want.

If this check box is not selected on the workspace designer, the Search for a Guide window can still be opened from the Guided Assistance button on the incident workspace ribbon.

Show Select Button | This option adds the Select a Guide button to the guided assistance panel. Clicking this button opens the Select a Guide window where you can select the guide you want from a list of available guides. See Guide Search Options.

If this option is disabled, the Select a Guide window can still be opened from the Guided Assistance button on the incident workspace ribbon.

Show Navigation | This option adds the Expand Navigator check box and slider bar to the guided assistance panel. Clicking this button on a workspace lets you view all the branches in the guide simultaneously. See Guide Preview.

Edit the Guided Assistance Button
The following procedure describes the steps to edit the Guided Assistance button.

1. From the open incident workspace, click the Home tab and click Ribbon.
2. Select Guided Assistance.
3. Click Edit Button on the ribbon editor.
   The Guided Assistance Button Editor opens.
4. Select the size and style options you want for the button.
5. Click the Available Options drop-down menu and select the option you want to display on the button.
   a. Choose Select a Guide if you want only the Select option on the button. This option opens a window listing all the guides configured on your site that your agents can select from.
   b. Choose Search for a Guide if you want only the Search option on the button. This option opens the Search for a Guide window where agents can search for the guide they want using the content from answers associated with the guide.
   c. Choose Both Select and Search for a Guide to show both options on the button.
6. To change the search report you want to display when the Search option is selected, click Select Search Report to open the Select Report window.
   Note: By default, the standard Guided Assistance Search report is used to search for guides. We recommend that you use this report unless you require different search options.
   a. Select the report you want agents to use to search for guides.
   b. Click OK.
7. Click **OK** to save the changes to **Guided Assistance**.

**How You Associate Answers to Guides**

In order for your agents to search for guides effectively, you must understand how guide searching works and manage your content accordingly.

Because guide content (such as question text) is highly contextual and not wholly descriptive of a topic, it is *not* indexed for searching. However, answers associated with each guide are very relevant to searching, so the content of those answers *is* indexed. For this reason, when a search is performed, the results are based on the content of associated answers, not on the content of the guides themselves. For example, searching for the product Phones will return guides that are associated with answers set to that product.

Therefore, in order for a guide to be searchable, you must associate it to an answer. And so that it can be searched for intuitively, the answer content must be relevant to the topic addressed by the guide.

There are two ways to associate an answer to a guide.
- **How You Find Guides Associated to Answers**
- **How You Select a Guide from the Answer’s Guided Assistance Field**

**Note:** You do not need to associate the answer with a guide if the answer is already associated with a response in the guide. For procedures detailing how to add fields, controls, and relationship items to workspaces, and how to create workspace rules, see **Overview of Workspaces**.

**Related Topics**
- Associate an Answer with a Guide

**How You Find Guides Associated to Answers**

You can associate answers to guides and later find guides associated to those answers using the Guide Dependency report.

When editing the Guided Assistance relationship item on a workspace, you can select a response on the guide and use the Associated Answer button to associate an answer to it. This creates a natural association because, in this case, the answer is part of a solution path defined by the guide. See **Associate Answers and Text Explanations with Question Responses**.

**Tip:** To help you identify guides associated to a particular answer, the Guide Dependency report lists answers and other guides that have been linked to by each guide. The Guide Dependency report is located in **Public Reports/Service/Guided Assistance** on the Reports explorer.

**How You Select a Guide from the Answer’s Guided Assistance Field**

You can select a guide from the guided assistance field by associating a guide using the Guided Assistance field on an answer or custom workspace.
Sometimes, a guide may not contain any responses that link to answers from the knowledge base. For example, responses could be associated only with text explanations. In this case, to make the guide searchable, you must associate it with an answer using the Guided Assistance field in the answer editor. On the default answer workspace, the Guided Assistance field is located on the Details tab. (For custom workspaces, you can add the answers.guided assistance field from the Insert Field ribbon tab on the workspace editor.) For example, if the answer is associated with a guide named Service Plan Assistance, that guide will be returned in guide searches when the search criteria matches the answer contents.

Use one of the following reports on the Reports explorer to help you identify guides that will be impacted by changes to guides or the removal of associated content.

- **Public Reports/Service/Guided Assistance/Guide Dependency**—Lists answers and other guides that have been linked to by each guide.
- **Public Reports/Service/Guided Assistance/Guided Assistance Search**—Lists Guided Assistance guides that contains the answers matching the specified search criteria.

**Associate an Answer with a Guide**

You must associate an answer with a guide in order for the guide to be searchable.

1. With the answer open, navigate to the tab or other location where the Guided Assistance field is displayed. In the default answer workspace, this field is located on the Details tab.
2. Click **Select Guide** to the right of the field to open the **Select a Guide** window.
3. Select the guide you want to associate the answer with.
4. Click **OK** to close the **Select a Guide** window.
5. Click **Save**.

**Related Topics**
- Add Answer Details

**Guided Assistance Functions in Workspace and Script Rules**

Guided assistance functions are available as triggers and actions when configuring rules for incident and chat workspaces. For example, you can design a rule on an incident workspace that will open a guide based on the product or category.

Although the Guided Assistance control is not available for scripts, incident scripts that share a workspace with a Guided Assistance control can also access these functions. For instance, in a workspace that contains both an incident script and Guided Assistance control, you can create a script rule that is triggered when the guide is completed. See **Script Rules**.

<table>

## How You Export and Import Guides

After you create a guide, you can export it to a guide definition file and import it into other B2C Service interfaces to create a new guide. This lets you create a single guide for use in several interfaces.

You can also extract a subset of the guide questions and responses to either create a new guide or save to a guide definition file that you can then import into another site. This function also includes an option to replace the extracted branch with an embedded reference to the new guide, which can be useful for simplifying the configuration of a complex guide.

### Export an Entire Guide

The following procedure describes the steps to export an entire guide.

1. On the Guided Assistance explorer, right-click the guide you want to export and select **Open**. The guide opens on the content pane.
2. Click **File** and select **Export Definition** from the menu. The **Save As** window opens.
3. Select the directory where you want to save the guide definition file and enter the file name.
4. Click **Save**.

### Export Part of a Guide

The following procedure describes the steps to export a subset of questions and responses for a guide.

1. On the Guided Assistance explorer, right-click the guide you want to extract from and select **Open**.
The guide opens on the content pane.

2. Right-click the question at the top of the section you want to extract and select **Extract**.
   The **Extract Guide** window opens. By default, the selected part of the guide will be saved in the Guided Assistance explorer as a new guide.
   a. Enter a name for the new guide.
   b. To replace the selected part of the open guide with an embedded reference to the new guide, select the **Replace** check box.

3. To export the selected section as a guide definition file, select **Export to File**.
   a. Click **Browse** and select the location where you want to save the file.
   b. Enter a name for the new guide.
   c. Click **Save**.

4. Click **Extract**.
   All responses, answers, and **text explanations** that are part of the extracted question branch will be included in the extracted guide.

**Import a Guide Definition File**

You can import a guide from other B2C Service interfaces.

1. From an open guide on the designer, click **File** and select **Import Definition** from the menu.
   A message appears indicating that the import process will overwrite the current open guide.
2. Click **Yes** to allow the import to overwrite the current open guide.
   **Note:** Guide definition files include a hash value that is used when the file is imported to determine if the file has been modified externally. If the file has been modified, it will not be available for importing, and an error message notifies you that the file is invalid.

3. Select the guide definition file containing the guide you want to import and click **Open**.
   The imported guide displays on the content pane.
4. If the guide was exported from a different B2C Service site, verify that the answers associated with question responses are correct and choose different answers if necessary.
5. Click **Save** on the Quick Access toolbar. The **Save As** window opens if you have not yet named the guide.
   a. Enter a name for the guide.
   b. Click **OK**.

**Agent Scripts**

**Overview of Agent Scripts**

Agent scripts add powerful functionality to workspaces and workflows, leading staff members through a series of pages to help them enter information in a logical progression.

Script pages can contain most fields and controls available to workspaces, with the exception of **relationship items**. They can also include questions and branching logic, similar to **guides**, so you can create wizards to guide staff members to different pages based on the information entered or actions taken on a previous page. Combining branching logic with page layout capabilities, agent scripting provides your staff with a methodical, efficient interface for capturing information and resolving issues.
For example, you could create a script to help your agents identify new customers and prompt for contact information before entering incident information. The script could also include questions to determine what product the customer is calling about and branching logic to guide agents to a page containing troubleshooting information and database fields for capturing information pertinent to that product.

To further extend the efficiency provided by scripts, you can add script rules. Like workspace rules, script rules are triggered by events and conditions to perform actions on script pages, such as setting the value of a field or calling a named event.

After you create a script, it can be inserted into one or more workspaces using the Script workspace control (see *Add a Script Control to the Design Space*) or presented as a standalone component of a desktop workflow using the Script workflow element (see *Edit Script Attributes*).

Many functions used to design scripts are also used to design workspaces. To understand how agent scripts can best be implemented in your agent desktop, you should also become familiar with workspaces, *workspace rules*, guides, and workflows. For a summary of these features, see [*Overview of the Dynamic Agent Desktop*].

### Assign Scripts Permission in Profiles

Before you can create or access agent scripts, you first need to update your profile to include scripting permission. Staff members with scripting permission included in their profile can create, copy, and delete scripts from the Scripts explorer, as well as add them to workspaces and workflows.

Scripting permission is not available on the Profiles editor unless agent scripting is enabled on your site. To enable agent scripting, contact your Oracle account manager.

1. Click **Configuration** on the navigation pane.
2. Expand **Staff Management**, and then double-click **Profiles**.
   The report opens on the content pane.
3. Right-click the profile you want to add scripts permission to and select **Open**.
   The Profiles editor opens.
4. Click **Permissions**.
5. Select the **Scripting** check box on the **Administration** tab.
6. Click **Save**.

**Note:** Staff associated with the profile you have edited must log out of B2C Service and log back in to apply the changes you have made.

### Open the Scripts Explorer

The Scripts explorer is used to access and manage all of the agent scripts on your site.

With this explorer, you can browse, search, and organize scripts in hierarchical folders on the content pane using functions similar to Windows Explorer.

**Note:** B2C Service does not include a set of standard scripts because all scripts are designed with unique content to meet specific business needs.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Scripts Explorer**.
The Scripts explorer opens. The explorer displays the tree structure on the left and lists scripts and custom folders on the right. Listed next to each script name is its script type, based on the type of record it is used to update. The script type determines which fields and controls can be added to the script. For example, the Incident script type provides access to controls and database fields that are related to incidents. See Script Types.

You can create custom folders to help you organize the scripts you create by right-clicking the Scripts item in the Folders tree and selecting New Folder. Simply click a folder to display a list of the scripts it contains.

**Note:** You can also add the Scripts explorer to any of your navigation lists if your profile allows. See Download the Oracle B2C Service Client and Log In.

## Script Types

Each agent script is associated with a script type, named for the type of record it updates, that determines which fields and controls can be added to the script.

B2C Service provides the following standard script types.

- Answer
- Asset
- Chat
- Contact
- Incident
- Opportunity
- Organization
- Task

In addition, you can create scripts for custom objects that have Object is Available in Workspaces, Scripting, and Workflow field visibility. See Overview of Custom Objects.

When you create a script, you need to select the type of script you want to ensure the appropriate fields are available for use in the script and that the script type matches the type of workspace you want to add the script to. For example, when creating a script to use on an incident workspace, you would select an incident script type, giving you access to controls and database fields that are related to incidents.

The script types available to you depend on the products that are enabled in your application. For instance, B2C Service Opportunity Tracking must be enabled in order for the opportunity script type to be available, and B2C Chat must be enabled for the chat script type to be available.

**Note:** If you plan to add your script to a workspace, the script type must match the workspace type. However, there are fewer script types than workspace types because scripts are not available for use in quote, quote product, or multi-edit workspaces. See Standard Workspaces.
Script Designer

Scripts are created on a script designer consisting of a design space, a ribbon, and a page selector.

You define a script by dragging and dropping fields and controls from the ribbon onto the design space and arranging them as you want them to appear on the script page.

The design space is the working area where you arrange fields and controls as you want them to appear on the script page. When you create a new script page, the design space consists of three areas—a header and a footer shared by all pages, and a main area for content specific to the page. You can add fields and controls to any of these areas.

Each area contains a table, hidden by default, that forms an underlying grid for aligning fields and controls. To aid you in laying out the script page, you can display outlines around items on the design space to help you identify the table cells they are in. See Design Space Layout Options.

After a field or control has been added to a page, you can select it to adjust its properties on the designer ribbon.

<table>
<thead>
<tr>
<th>Tab</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Home</td>
<td>Contains buttons for managing the entire script. You can preview the script, add pages and branches, configure the ribbon for scripts added to workflows, add notes, view the audit log, add an outline around the script, and show or hide the page selector. The Insert group on the Home tab also includes shortcuts to the controls you can add from the Insert Control tab.</td>
</tr>
<tr>
<td>Insert Field</td>
<td>Lists the fields you can add to the script. The type of script you select when creating a script determines the fields available. For example, you can add incident, asset, contact, and organization fields when creating an incident script. See How Fields Are Added to Workspaces and Scripts.</td>
</tr>
<tr>
<td>Insert Control</td>
<td>Lists controls and questions you can add to the script. Controls include spacers, tabs, title bars, and other items you can use to enhance the display or add functionality. See Workspace and Script Controls. Questions controls are used to configure script branching. See How Branches Work in Scripts. The values staff members enter in questions and their corresponding controls are available for use with the script rules and branches, but they are not saved to the record in the database.</td>
</tr>
<tr>
<td>Page</td>
<td>Contains buttons for adding, editing, deleting, and ordering pages and branches. This tab also includes buttons to display or hide the header and footer on pages. See How Branches Work in Scripts and Place the Header on Script Pages.</td>
</tr>
<tr>
<td>Rules</td>
<td>Using the buttons on this tab, you can create rules that alter the script according to the conditions you define. For example, you can create a rule to assign an incident to a specific staff member when the incident is submitted by a particular organization. See Script Rules.</td>
</tr>
<tr>
<td>Design</td>
<td>This tab displays when you select an item added to a script and contains buttons you can use to edit the display of the selected item. For example, you can change fonts and margins for a field or set a field on the script to read-only if you want to display it only for informational purposes. The options available on the Design tab vary depending on the control or field selected on the script design space. For descriptions of all the options available on the Design tab, see Design Property Descriptions.</td>
</tr>
</tbody>
</table>
In addition to editing field and control properties on the designer ribbon, you can also right-click an item on the design space to access contextual menu options. The available options vary based on the item you right-click but generally include such actions as branching to a page, resetting tab indexes, or deleting the item.

When a page is complete, you can use the page selector to add more branches and pages to your script (see How Branches Work in Scripts). The page selector displays a tree view of the pages and branches of the script, showing their relationship to one another. You can click a page or branch to view it on the design space or right-click to access a menu from which you can quickly add, edit, delete, or rename pages and branches. You can also use the arrow keys on your keyboard to navigate between pages, or delete a page by pressing Delete. Script pages that are inaccessible due to a removed branch or other reason are also indicated on the page selector.

**Tip:** To hide the page selector, click the **Home** tab, click **Page Selector**, and select **Show Selector** to switch it on or off. You can also select Use Large Icons on Show Selector to switch between using large and small icons on the page selector.

### Create a Script

The following procedure describes how to create scripts.

You can create scripts from scratch by starting with a blank script. You can also copy an existing script or import a script from an exported script file to use as the basis for a new script. You can then adjust the design by adding and removing fields and controls, setting properties, and arranging the layout to suit your business needs.

1. From the Scripts explorer, click **New**.
   A window opens where you can select the type of script you want to create.
2. In the Start With a Blank Script section, select a script type. See **Script Types**.
   The script designer opens.
3. Click **Save**.
   To import a script from an exported script file, see **Export a Script**.

### Copy a Script

The following procedure describes how to copy a script.

1. From the Scripts explorer, right-click the script you want to copy and select **Copy**.
   The **Copy Script As** window opens.
2. Select the folder to which you want to add the copied script.
3. Enter a name for the copied script in the **Name** field.
4. Click **OK**.
   The script you added appears in the folder you selected.

### Delete a Script

The following procedure describes how to delete a script.

1. From the Scripts explorer, right-click the script you want to delete and select **Delete**.
   A **Confirm Script Deletion** message displays.
2. Click **Yes** to delete the script.

**Note:** If you delete a script that is used in a workspace, the workspace will still include the Script control. You will need to edit the workspace to remove the control or select a new script for the control. See **Add a Script Control to the Design Space**.
Edit a Script

Whether you are editing a blank script or an imported script, the features you use on the script designer are the same.

When creating a new script, the script designer opens with a page already added that contains a header, footer, and text control. You use the options available on the ribbon tabs to remove or edit this default content, and add fields, controls, and other pages to the script. If your script is to be used in a workflow, you can also customize the script ribbon. The fields and controls available for a script will vary depending on the type of script you are creating. For example, a contact script will provide access only to contact and organization fields.

The following procedure provides an overview of the steps needed to edit a blank incident script, though the same procedures can be used for other script types. Cross-references to more detailed editing procedures are provided in the appropriate step.

1. Click **Configuration** on the navigation pane.
2. Expand **Application Appearance**, and then double-click **Scripts Explorer**.
   The Scripts explorer opens on the content pane.
3. Right-click the script you want to edit and select **Open**.
   The script opens on the content pane.
4. Drag the fields you want from the Insert Field tab onto the design space. See **Workspace and Script Fields**.
5. Drag the controls and questions you want from the Insert Control tab onto the design space. See **Workspace and Script Controls**.
   You can also drag controls onto the design space using the icons on the Home tab Insert group.
6. To modify the properties of a field or control, select the item, click the Design tab, and make the appropriate changes. See **Field and Control Properties**.
7. To add script rules that alter the display, content, or behavior of items on the page, click the **Rules** tab and then click **Add Rule**. See **Script Rules**.
8. To add a new page to the script, select the existing page on the page selector that you want the new page placed after.
   a. Click the **Home** tab and click **Add Page**.
      The new page is added to the script and displayed on the page selector.
9. To add a branch to the script, select the page you want to add the branch to on the page selector and create the branch by right-clicking a field or control or by using the **Add Branch** window. See **How Branches Work in Scripts**.
10. To reposition a page in the script, drag it to the position you want on the page selector.
    **Tip:** After a page has been moved, logic used in the branches linking the page to other pages may no longer be valid. We recommend validating the script after moving pages to ensure the script pages can all be reached.

    When you move a page, the page and all pages that branch off it are moved to the location you specify. When reordering pages, you can move a page that branches off one page to branch off a different page, or remove branching from the page completely.
11. To rename a page, select the page, click the **Page** tab, enter the name you want in the ribbon Name field, and press Enter.
12. To add or remove the header and footer from script pages, click the **Page** tab, click **Header** or **Footer**, and select the option you want. See **Place the Header on Script Pages**.
13. To customize the ribbon for a script that is used in a workflow, click **Ribbon** on the **Home** tab. See **Ribbon and Quick Access Toolbar Buttons**.
    Because ribbons are not displayed on scripts when they are added to workspaces, the Ribbon button is available for scripts only if workflows are enabled on the site. For information about enabling workflows, contact your Oracle account manager.
14. To view a history of all actions taken on the script, such as when the script was created and edited and by whom, click Audit Log on the Home tab.

15. To add notes about the script, click the Home tab and then click Notes to open the Script Notes window.
   a. Enter any notes you want in the text field.
   b. Click OK.

   Notes added to your script are for internal use and only visible when editing the script. They do not appear when working with records.

16. To see what your script will look like when it is used by staff members, click the Home tab and click Preview. You can choose to see the script as it will display when creating a record or when editing an existing record. See Preview a Script.

17. To confirm that the pages are all accessible from a branch or a navigation button, click the Home tab and click Validate. The Script Validation Results window will list any inaccessible pages.
   a. Click OK.

   **Note:** Validation is also performed automatically when you save a script. If errors are found, the Script Validation Results window will include a Cancel button, so you can correct the error before saving, and a Continue button you can click to save the script as it is. You can save and use a script that does not validate. However, until all errors are corrected, some pages or functions may be inaccessible to staff members when they use the script.

18. Click Save on the Quick Access toolbar.

If you save changes to a script that staff members might be using at the moment, it is a good idea to have them log out and then log back in to be sure your changes have been applied.

### Considerations for Removing Items from Scripts

You can easily remove fields, controls, branches, rules, and entire pages from your script. However, it is important to be aware of the following considerations before you remove items.

- If your script has only one page, you cannot remove it.
- When you remove a table on a page, the fields and controls on the table are also removed.
- When you remove a page, all fields and controls on the page are removed along with branches and rules created from the page.
- When you remove a page with other pages branching off it, those pages are also removed.
- When you remove an item used by a rule or branch, the rule or branch will likely be impacted, and you will need to edit or delete it.
- When you remove a branch used to access a page, the page is not removed. However, this can result in an orphaned page if the deleted branch provided the only path to the page.

**Note:** Pages that cannot be accessed by a branch or navigation button are grayed out on the page selector. When you validate the script, these pages are listed in the validation message.

### Remove an Item from a Script

When you are certain you no longer need an item and know how your changes will impact the rest of your script, you can remove fields, controls, branches, rules, and entire pages from your script.

1. From your open script, do one of the following:
   a. Select the item you want to remove on the design space.
Click the Design tab and select the item you want to remove from the drop-down menu on the Selected Object group.

**Tip:** Selecting the item you want to remove from the drop-down menu helps to ensure that you select the correct item before you delete it. For example, you can be certain you select a specific field on a table rather than the entire table. See *Access Design Space Items Using the Ribbon.*

1. Click Delete on the Design tab.
   The Delete Confirmation window opens, asking if you want to delete the item. If the item you are deleting is used in rules or branches, a warning will list the affected rules and branches.
2. Click Yes to delete the item.

To delete a page or branch, select the item on the page selector and click the Home tab.

1. Click Delete.
   The Delete Confirmation window opens, asking if you want to delete the item.
2. Click Yes to delete the item.

---

**Place the Header on Script Pages**

Headers and footers can contain any of the fields or controls you can add to script pages.

Unlike the content you add to other areas of a page, which is displayed only on that page, the content you add to the header and footer is shown on every page where the header and footer is displayed. For example, if you want to display contact information at the top of every page of the script, you could add the first name, last name, and phone numbers contact fields to the script header, and then display the header on all pages of the script.

By default, the header that is shown on the initial script page contains the progress label control, which shows staff members what page of the script they are on. The default footer contains the navigation panel control, which adds buttons staff members can use to move between script pages. See *Navigation Panel Control Buttons.*

The following procedure describes how to place the header on script pages. You use a similar procedure when placing the footer on script pages.

1. From your open script, click the Page tab.
2. To show the header only on the selected page, click Header and select Show Header On This Page.
   The header is added to the page on the design space.
3. To show the header on all pages in the script, click Header and select Show Header On All Pages.
4. To remove the header, click Header and select Don’t Show Header On Any Pages.
   The header is removed from all pages in your script, along with any fields or controls you added to the header.
5. To add content to the header or footer, click the Insert Field or Insert Control tab and drag the items you want to the design space.

---

**Navigation Panel Control Buttons**

The navigation panel contains four buttons that let you navigate between pages in the script even if there are no branches to the pages. Some of the buttons can be used in the When condition in branches and script rules, so you can create your own functionality for these buttons.
Since these buttons are available in a single control, you can quickly add the buttons to any page you want. The page footer contains this control by default. The following buttons are included in the control.

- **Beginning**—Click this button to return to the first page of the script.
- **Previous**—Click this button to return to the previous page in the script.
- **Next**—Click this button to proceed to the next page in the script. By default, this is the next page that is on the same tree level, shown on the page selector, as the current page. However, a branch can be created to load a different page when this button is clicked.
- **Exit/Finish**—Click this button to trigger any rules or branches that include the Exit Script Event Fires or Finish Script Event Fires triggers. When you are on the last page of a script, Exit is renamed Finish. This button is not enabled unless a rule or branch is configured to use one of these conditions.

**How Branches Work in Scripts**

This topic explains adding branches to scripts.

Scripts use branching logic for guiding agents to specific pages based on conditions you specify. For example, you could design a script to branch to a certain page if the Organization Name field is set to a specific value. You can also create branches that are triggered when different responses are selected from question controls, such as the Radio Question or Menu Question controls, or from the Next, Exit, and Finish buttons on the navigation panel.

Branches can be created using different methods and simple or complex logic, depending on your needs. After you create branches, you can easily edit, reorder, and delete them using the tools available on the ribbon.

You can create branches quickly by right-clicking fields and controls on the design space. You can also define more complex branches using the **Add Branch** window. The options on the window are similar to those used to add workspace or script rules.

**Tip:** While you can create branches from most of the controls and fields available for scripts, question controls are ideal for branching, allowing you to quickly branch to other pages using agents’ responses to the questions you add to the script.

**Add a Branch by Right-Clicking a Field or Control**

When you want to take agents to another page in a script when they change a value in a field or a control, the easiest way to create the branch is to right-click the field or control and create the branch using options on the right-click menu.

1. From your open script, select the page you want to add the branch to on the page selector.
2. Right-click the field or control on the design space that you want to branch from.
   A menu opens showing branching and other options. The branching options vary depending on the item you select. You can branch from question controls when a specific question choice is selected, and you can branch from fields and controls when their value changes or when actions are taken, such as when you click a button control.
3. To create a branch from a question control, right-click the question control and select the question response you want to trigger the branch from.
   - **Note:** This step is necessary only when creating a branch from a question control.
4. Select the page you want the branch to go to. The page options vary slightly depending on the item you create the branch from and which page you are on when you create the branch.
Add a Branch Using the Add Branch Window

You can create complex branches that fire when different events occur or when multiple fields are changed. Creating branches using the Add Branch window is similar to creating script or workspace rules and many of the procedures you use are identical, including those to select triggers and conditions.

This section provides an overview of creating a branch using the Add Branch window. For information about script rules, see Script Rules. For detailed procedures to create workspace rules, see Add a Workspace Rule.

1. From your open script, select the page you want to add the branch to on the page selector.
2. Do one of the following:
   - Click the Page tab and then click Add Branch.
   - Right-click the page you want to add a branch to on the page selector.
3. Select whether you want to branch to a new page or a page you have already placed on the script. The Add Branch window opens.
   
   Three buttons display on the top of the Add Branch window—Triggers, Conditions, and Go to Page. You construct the branch by clicking each button and specifying the triggers that determine when the branch should be checked, what conditions must be met for the branch to take agents to a new page, and the page the branch will take agents to.

4. Select one or more triggers that will cause the branch to fire. Specifying branch triggers is identical to specifying triggers for script and workspace rules and the triggers that are available for branches are the same as those available for script rules. As with script rules, there are four triggers that are unique to scripts beyond those also available as workflow triggers.
   - Page Loaded—Select this item to trigger the branch immediately after the page the branch is on is opened.
   - A Button is Clicked—Select this item to trigger the branch when Next on the navigation panel is clicked to proceed to the next page.
   - The Exit Script Event Fires—Select this item to trigger the branch when Exit on the navigation panel is clicked to exit the page. The Exit button displays on the script page only if there is a branch or subsequent page allowing staff members to navigate to another page. For this reason, exit script events usually occur before the script has reached the final page.
   - The Finish Script Event Fires—Select this item to trigger the branch when Finish on the navigation panel is clicked to leave the script. Finish displays only if there is no branch or subsequent page to navigate to from the script page. For this reason, finish script events usually occur after the script has reached the final page for the branch. For descriptions of the other triggers and how to add them to your branch, see Workspace Rule Triggers Description.

When multiple triggers are specified, the branch conditions will be checked if any of the actions for the trigger occur. For example, the branch could be triggered when the value in a field on the script is changed or when a button on the script is clicked.

5. Click Conditions to add conditions that must be met to trigger the branch. The conditions available for script branches are identical to those available for workspace and script rules. See Workspace Rule Conditions.
6. Click **Go to Page** to select the page you want the script to display immediately after the branch is triggered and all conditions are met.
   
   This step is not necessary if you chose to create a branch to a new page in step 3 since the branch will be automatically configured to go to the new page. However, you can select a different target page if you want.
   
   a. Select the appropriate option to define where the branch should go when the branch conditions you specify are met. You can select **Go to Beginning of Script** (the first page of the script), **Go to Next Page**, **Go to Previous Page**, or **Go to a Certain Page**.
   
   b. If you select **Go to a Certain Page**, this option is added to the branch description. Click the underlined text in the branch description to open a window where you can select the page you want.
   
   c. Select the page you want to branch to.
   
   d. Click **OK**.

7. Click **Finish**.

8. Repeat these steps to add other branches from the page.

   **Tip:** Branches are fired in the order in which they are listed. This can impact how the branches affect the script.

### Modify Branches

This section describes how to edit, delete, and reorder script rules using the tools available on the Page tab.

After you add branches, you can easily edit, reorder, and delete them from the Page tab. It is important to update existing branches when you make changes to your script to ensure the branches work as you expect. For example, when you add a new branch to a page, you need to make sure that other branches on the page do not have similar conditions. If they do, you can edit or delete the other branches, or reorder the branches so the branch you want to trigger will be checked first.

1. From your open script, select the page the branch is on from the page selector and click the **Page** tab.
   
   The branches list, located on the Branching group, displays all the branches created on the page.

2. In the branches list, select the branch you want to modify.

3. To edit the branch, click **Edit Branch**.
   
   The **Edit Branch** window opens. See **How Branches Work in Scripts**.

4. To change the order of the branch, click the up or down arrow to move the branch where you want it.

   **Note:** Just like script and workspace rules, branches are fired in the sequence in which they are listed. This can impact how the branches affect the script.

5. To delete the branch, click **Delete Branch**.

### Script Rules

You can create script rules to trigger actions on script pages when the conditions you specify are met. For example, you can create a rule that automatically sets the value of a field on a script page when a button on the page is clicked or the page is opened.

**Note:** Whereas workspace rules apply to the entire workspace, script rules impact only the script pages the rules are created on.
After you create script rules, they can be modified if you need to change their triggers, conditions, or actions. You can also reorder the rules on your page to ensure they fire in the order you want. If you no longer need a rule, you can also quickly delete it. See *Modify Script Rules.*

Generally, script rules impact only the items on the script page you add the rules to. However, using named events, you can use script rules in conjunction with workspace rules to trigger an action on a workspace when conditions on the script are met. For example, a workspace rule that sets the incident workspace Status field to Solved can be triggered when a staff member clicks a button on a script page. See *How Events are Used in Workspace and Script Rules.*

**Related Topics**

- Overview of the Dynamic Agent Desktop

**Create a Script Rule**

You create script rules from the Add Rule window, which is opened from the Rules tab on the script editor. You specify the triggers, conditions, actions, and properties just as you would when creating a workspace rule. However, there are a few triggers and actions that are unique to script rules.

This section provides an overview of the process to create a script rule and describes the triggers and actions that are unique to scripts. For detailed procedures to create script and workspace rules, see *Add a Workspace Rule.*

**Note:** Creating script rules is similar to creating script branches, though branches take agents to script pages whereas rules trigger actions you specify in the rule.

1. From your open script, select the page you want to place the rule on from the page selector.
2. Click the *Rules* tab and click *Add Rule.*
   
   The *Add Rule* window opens. Five buttons display along the top of the window—Triggers, Conditions, Then Actions, Else Actions, and Properties. You construct the rule by clicking each button and adding different items to the rule description.
3. Select one or more triggers that will cause the rule to fire. There are four triggers that are unique to scripts beyond those available as workspace rule triggers.
   
   - **Page Loaded**—Select this item to trigger the rule immediately after the page the rule is on is opened.
   - **A Button is Clicked**—Select this item to trigger the rule when *Next* on the navigation panel is clicked to proceed to the next page.
   - **The Exit Script Event Fires**—Select this item to trigger the rule when *Exit* on the navigation panel is clicked to exit the page. Exit displays on the script page only if there is a branch or subsequent page allowing staff members to navigate to another page. For this reason, exit script events usually occur before the script has reached the final page for the branch.
   - **The Finish Script Event Fires**—Select this item to trigger the rule when the Finish button on the navigation panel is clicked to leave the script. Finish displays only if there is no branch or subsequent page to navigate to from the script page. For this reason, finish script events usually occur after the script has reached the final page for the branch.

   For descriptions of the other triggers and how to add them to your rule, see *Workspace Rule Triggers.*

4. Click *Conditions* to add conditions that must be met for the rule to fire and perform the actions you specify.
   
   The conditions available for script rules are identical to those available for workspace rules. See *Workspace Rule Conditions.*
5. Click **Then Actions** to define the actions that should occur immediately after the triggering event if the conditions are met.

   There are two actions that are unique to script rules:
   - **Fire Exit Script Event**—Select this action to fire a subsequent rule that uses the Exit Script Fires condition. Using this option, you can add your own Exit button to a script page to trigger the same rule fired by Exit on the navigation panel control.
   - **Fire Finish Script Event**—Select this action to fire a subsequent rule that uses the Finish Script Fires condition. Using this option, you can add your own Finish button to a script page to trigger the same rule fired by Finish on the navigation panel control. See *How Events are Used in Workspace and Script Rules*. For descriptions of the other rule actions and how to add them to your rule, see *Workspace Rule Actions*.

6. Click **Else Actions** to define the actions that should occur if the conditions are not met.

   The Fire Exit Script Event and Fire Finish Script Event actions described in step 5 are also available to use as Else actions in script rules. See *Workspace Rule Actions*.

7. Click **Properties** and enter the name of the rule in the Rule Name field.

8. Enter any notes you want to add to the rule in the Notes field.

9. To deactivate the rule, clear the **Active** check box.

10. Click **Finish**.

### Modify Script Rules

After you add script rules, you can easily edit them, reorder them, or delete them when they are no longer needed. This section describes how to edit, delete, and reorder script rules using the tools available on the Rules tab.

Rules are fired in the sequence in which they are listed. Adjusting them can impact how other rules affect the script. For example, if multiple rules set different values for the same field, the field will be set to the value assigned by the last rule in the sequence.

1. From your open script, select the page the rule is on from the page selector and click the **Rules** tab. The rule list displays all rules created on the page.
   - To view only rules that are triggered by or that impact a specific item on the page, such as a field or control, select the item, click **Filter List** on the **Rules** tab, and select **Rules Triggered by Selected Object** or **Rules that Reference Selected Object**.
     
     The rule list updates to display only rules that are related to the selected item.

2. In the rule list, select the rule you want to modify.

3. To edit the rule, click **Edit Rule**.

   The **Edit Rule** window opens. See *Script Rules*.

4. To change the order of the rule, click the up or down arrow to move the rule where you want it.

   **Note**: Deleting a rule is permanent and cannot be undone. To ensure that a rule is not needed before deleting it, you can disable it instead. To disable a rule, edit the rule, click **Properties** on the **Edit Rule** window, clear the **Active** check box, and click **Finish** to save the change.

5. To delete the rule, click **Delete Rule**.
How Events are Used in Workspace and Script Rules

Events are defined by adding event fire actions. This topic describes how to use events in workspace and script rules using the various event types.

Script rules, workspace rules, and workflow connectors can be triggered by actions taken by staff members, such as changing a field value or saving a record. However, they can also be triggered by other rules using rule-defined events. Events are defined by adding event fire actions, which vary by event type.

- **Named Event**—Named events are defined by adding the Fire a Named Event action to a script rule or workspace rule and specifying a name for the event.
- **Exit Script Event**—Exit script events are defined by adding the Fire Exit Script Event action to a script rule. (Exit script events are also fired automatically when a staff member clicks Exit in a script.)
- **Finish Script Event**—Finish script events are defined by adding the Fire Finish Script Event action to a script rule. (Finish script events are also fired automatically when a staff member clicks Finish in a script.)

**Note:** Although exit script events and finish script events perform similar roles, they are intended to serve slightly different purposes. Exit script events usually occur before the script has reached a final page for the branch, while finish script events usually occur after the script has reached a final page. In this way, you can distinguish between an early exit from the script and a case where the script was followed to completion.

After an event is defined as a rule action, the event can be used to trigger other rules. Any workspace rule or script rule configured for the workspace that uses the event as a trigger is run immediately after the event is fired—conditions are evaluated and, if they are matched, the rule actions are run. Events can also be used to trigger any workflow connector that is connecting from the workspace.

Exit and finish script events can be fired only in script rules. However, named events can be fired in either script or workspace rules. Therefore, while you can use a named event, exit script event, or finish script event to trigger a workspace rule from a script rule, only a named event can be used to trigger a script rule directly from a workspace rule. (A workspace rule could take other non-event actions that result in a script rule being fired indirectly.)

**Fire a Named Event in a Rule**

Whether you are firing a named event in a script rule or a workspace rule, the process for using it is the same.

The following procedure explains how to fire a named event in a rule.

1. From your open script, create a new rule and specify the triggers and conditions that should run the rule. See Add a Workspace Rule.
2. Click the Then Actions tab and click Add next to the Fire a Named Event action.
3. Click the underlined named event text in the Rule Description area.
4. Enter a name for the named event that will fire when the rule runs.
   - **Tip:** The name you specify has no restrictions on the characters you can use and is not case sensitive. However, we suggest entering a simple name since you will need to enter it again when adding the event as a rule trigger.
5. Click OK.
6. Click Finish.
Trigger a Rule When a Named Event is Fired

The following procedure explains how to use an event as a trigger for another rule. The process for using an exit script event or finish script event is similar.

1. From your open script, create the rule that you want the named event to trigger and specify conditions and actions for the rule. See Add a Workspace Rule.
2. Click Add next to A Named Event Fires.
3. Click the underlined named event text in the Rule Description area to open a window where you can enter the name of the named event that you want to trigger the rule.
4. Click OK.
5. Specify any remaining triggers, conditions, and actions you want to use in the rule. See Script Rules.
6. Click Finish.

Preview a Script

When you are editing a script, it can be helpful to see what it will look like when staff members use a workspace that includes the script. The preview feature lets you see the script as it will appear on a workspace, so you can modify it if necessary.

When previewing a script, you can navigate between pages using the navigation buttons and branches you create to verify they function as expected.

**Note:** When you preview a script, it will display as it would to any staff member who has the same set of profile permissions you have. To view the script as it will appear to a specific staff member with different permissions, you must log in using a staff account with the same profile as the staff member.

1. From your open script, click the Home tab.
2. To view the script as it will appear to staff members when creating new records using a workspace with this script, click Preview and select New Record.
   A preview of the new record opens.
3. To view the script as it will appear when editing an existing record on a workspace, click Preview and select Opening a Record.
   a. Enter the record ID number.
   b. Click OK. A preview of the record opens with the script fields populated with values from the record you specified.
4. Click X on the window or press Esc.

Export a Script

This topic describes how to export a script as an XML file.

Scripts can be exported as XML files and stored on your workstation or network and then imported to other interfaces. This is helpful if you have a script on one interface and want to quickly create a duplicate or similar script on a different interface. The exported script XML file includes all of the script elements, including fields, controls, branches, rules, and the script layout.

1. From the Scripts explorer, right-click the script you want to export and select Open.
   The script opens.
2. Click File and select Export Script.
The **Save As** window opens.

3. Select the directory where you want to save the script definition file and enter the file name.
4. Click **Save**.

**Note:** When a script is exported to a script definition file, the file includes a hash value that is used when the file is imported to determine if the file has been modified externally. If the file has been modified, it will not be available for importing, and an error message will notify you that the file is invalid.

### Import a Script

This topic describes how to import a script using the script import wizard.

An imported script becomes its own unique copy and can be modified without impacting the original. When you are ready to import the script, the script import wizard guides you through the import process.

1. From the Scripts explorer, click **New**.
   The **New Script** window opens.
2. Click **Import Script from an Exported Script File** to open the **Import Script** wizard.
3. Click **Next**.
   The next window asks you for the name of the script definition file you want to import.
4. Do one of the following:
   - Enter the full path of the script definition file.
   - Click **Browse** to find the script definition file on your workstation and click **Open**.
5. Click **Next** to select the script type.
6. Click the **Map To Type** drop-down menu and select a record type to map the workspace to. By default, the imported script is mapped to the same script type as the original script.

**Note:** If items from the script you are importing are not used in the script type you are converting it to, the next window lists these items and informs you that they will be replaced by spacers, field placeholders, or removed from the imported script. Since most database fields and script controls are not shared by script types, the majority of fields and controls will generally not be included in the new script when you convert the type. However, this option is helpful if you want to import the general layout from a script with a different type.

7. Click **Next**.
8. Click **Finish**.
   The script designer opens with the imported script.
9. Edit the script to remove or replace fields that are not available and then save the script. See **Edit a Script**.

When you save a script, reports that are used in the script report controls are checked to ensure they exist on the site. If a report does not exist, a message is placed in the control stating the report is no longer available. You can save a script that has invalid reports, but you will need to select new reports for the controls before they can be used in the workspace.
Workspace and Script Elements

Overview of Workspace and Script Elements

To provide you with a consistent, intuitive design environment, workspace and agent script editors share a common set of design elements for constructing agent desktops for your staff members.

In many instances, the design space, fields, controls, and rules available for creating workspaces function the same when creating scripts. First, you add fields and controls to the design space, and then adjust the properties of each item so that it displays and behaves as desired. You can also customize the buttons that appear on the ribbon and the Quick Access toolbar for workspaces and for scripts that are used in workflows. Because the design tools are similar for workspaces and scripts, the experience you gain in creating workspaces can help you better understand and create scripts, and vice versa.

**Tip:** To understand how workspaces and scripts can best be implemented in your agent desktop, you should also become familiar with other desktop components such as guides and workflows. For a summary of agent desktop features, see Overview of the Dynamic Agent Desktop.

Design Space Layout Options

The design space is the working area where you arrange fields and controls as you want them to appear on your workspace or script.

On most new workspace layouts, the design space contains a summary panel and a tab set control, while script layouts feature a content area with header and footer sections. Each of these design areas contains a table, hidden by default, that forms an underlying grid for aligning fields and controls.

Initially, these tables contain a single row and column, and the first item added to them fills the height and width of a single cell. As you add other elements, additional rows and columns are automatically added with new cells holding each added field and control. Moving or removing an item from a cell will cause the other cells to adjust automatically to fill the space left by the removed item.

**Tip:** Although there is no limit to the number of rows and columns allowed, you should avoid using large numbers of them so that the layout is easier to use. Also, when adding items to a workspace, try to keep fields and controls roughly the same height on the same row, since the height of the row is determined by the tallest element. For example, a date field is generally displayed with only one line of information, whereas a notes field with a text box is taller.

When adding and arranging items on the design space, it can be helpful to show the table outlines to help you identify the layout structure.

**Related Topics**
- Display or Hide Design Space Table Outlines
- Change the Number of Table Rows and Columns Used by a Field or Control
Display or Hide Design Space Table Outlines

Use this procedure to display or hide design space table outlines on your workspace or script.

1. From an open workspace or script, click the **Home** tab.
2. Click **Show Outline** to display the outline.
3. Click **Show Outline** again to hide the outline.

   When Show Outline is highlighted, the table outline is displayed.

Change the Number of Table Rows and Columns Used by a Field or Control

You can change the display of information when you increase or decrease table rows and columns used by a field or control.

In some cases you may want a field or control to span more than one table cell. For example, if you add an incident subject line to a workspace with three columns in the table, the subject line will be only one column wide, too narrow to display much information. By spanning the field over multiple columns, you can expand the field to display the full content of the subject line. You can also span an item over multiple rows if you want it to expand vertically.

**Note:** In order to span an item over multiple columns or rows, there must be empty table cells adjacent to the cell containing the item you are expanding.

1. From an open workspace or script, click the field or control that you want to edit on the design space.
2. Click the **Design** tab.
3. Click **Table Cell**.

   The number of rows and columns the selected table cell occupies is shown when selecting row and column span options.

4. To span the field or control over an additional table row, click **Increase Row Span**.
5. To span the field or control over one less table row, click **Decrease Row Span**.
6. To span the field or control over an additional table column, click **Increase Column Span**.
7. To span the field or control over one less table column, click **Decrease Column Span**.
8. Click **Save** on the Quick Access toolbar.

Workspace and Script Fields

A field holds a piece of information that is stored in the knowledge base. For example, a contact record includes fields for name, email, address, and phone number.

To add a field to a workspace or script, just drag it from the ribbon and place it on the design space. You can also promote staff efficiency by defining a shortcut key in the field label that can be used to focus the field.

For information about a field on the ribbon, you can hover over it for a description. Fields are listed in alphabetical order. Different icons are displayed next to each field showing the field type, which impacts how the field will be shown. In addition, required, linkable, and customer-entered fields have unique properties when using them on workspaces and scripts.

**Tip:** Information about each field can also be found in the Data Dictionary. You can access the data dictionary by clicking **Configuration > Database > Data Dictionary**.
Workspace and Script Field Types

The fields you can add to your workspace or script are shown on the Insert Field tab, and are associated with icons to indicate the type of input they accept. For example, fields that accept phone numbers are displayed with a phone icon.

You can hover over a field icon to see a description of the field and the field name as it appears on the API, regardless of any changes that might have been made to the message base label.

Required Fields for Workspace Types

Each workspace and script type has certain required fields when working on records.
B2C Service requires that certain fields always be populated when using workspaces or scripts to update certain record types. For instance, all incidents must have a contact, so the contact field is always required when it is added to incident workspaces and scripts. Likewise, opportunities must always have a contact or organization, so you must add a contact field or an organization field, if not both, to all opportunity workspaces and scripts.

In some cases, fields are required only if a record is associated with another record. For example, when using a contact workspace, if a contact is associated with an organization, the Organization Name field is required. If the contact is not associated with an organization, the field is not required.

You can save a workspace or script that does not include fields required for its type, but you must include them if the workspace or script will be used to create new records. When you place one of these required fields, you cannot edit the Required property since these fields are always required.

Tip: Labels for required fields appear in red text with an asterisk. Fields that are not always required can be set to required by changing their Required properties or by using workspace rules. Most fields are required by default when placed on a script page, with the exception of chat scripts. However, in many cases, you can change the Required property to be not required after you place it on the script. See How You Set Hidden, Required, and Read-Only Properties and Workspace Rules.

This table lists fields that are always required when added to each type of workspace. Fields required for each script type are the same as those required for the corresponding workspace type.

Workspace and Script Custom Fields

The availability and behavior of custom fields in the knowledge base is affected by the following visibility settings.

- **Admin Display**—When selected, the custom field is available in the list of fields that can be added to the design space.
- **Admin Edit**—When selected, the custom field will be set to Read Only by default when it is added to the design space. After the custom field has been added to the design space, this setting has no effect.
- **Chat Display**—When this option and the Admin Display check box are both selected, the custom field is available in the list of fields that can be added to chat workspaces.
- **Required on Accessibility Interface**—When selected, the custom field will be set to Required by default when it is added to the design space. After the custom field has been added to the design space, this setting has no effect.

**Note:** If an additional instance of a field is placed on the design space, it will automatically be set to the same Required setting as the first instance. It is not possible to set the same field to both required and non-required in the same workspace.

When a workspace or script is used by staff members, all behavior related to visibility, read-only, and required attributes is determined by the properties defined for each field. See *How You Set Hidden, Required, and Read-Only Properties*.

**Related Topics**
- Custom Field Visibility Settings

Customer-Entered Fields

The following fields can be added to the Account Settings page on the customer portal so customers can personalize their knowledge base search results. These fields have a default read-only property when added to a workspace or script, and are not available on contact multi-edit workspaces.

- **Lines Per Page**—The number of items to list per page when the customer is searching on the Answers page.
- **Search Text**—The default search text to use for searching on the Answers page.
- **Search Type**—The default search method.

Linkable Field Types

When you add the following fields to a workspace or script, staff members can click the action link associated with the field to access special functionality.

- **Email field**—This field includes a click-to-email link that opens the staff member’s email client with a blank message to the selected address. This behavior can be disabled by selecting the Disable Email Icon option on the Design tab.
- **URL field**—A custom text field set to URL usage includes a link to open a URL in a web browser.

How Fields Are Added to Workspaces and Scripts

The design space is structured by a table, even if you have not enabled the display of its rows and columns by clicking the Show Outline button.
How the table changes when you add fields to a workspace or script depends on several factors: where you add them, whether other fields already exist in the column or row, and whether the column or row contains controls. You can add fields above or below another field or control, or you can add them to the right or left. For example, the following image shows how the Assigned field is selected and placed in a new row below Reference # and Contact ID on the workspace. When you select the field and hover over the workspace, a horizontal indicator shows where the field will be placed.

These examples have the table outline displayed for clarity. To display the outline for a workspace or script, click **Show Outline** on the Home tab.

Simply click to add the field in that position.

To add a field to the right or left of another field or control, click the field on the ribbon and hover over either side of a field on the design space. When the vertical indicator appears, click to add the field to the table.

This action adds the field to a new column in the table.
As columns are added, the original columns are evenly redistributed to make room. For example, when you add a field to the right side of a two-column table, the original columns narrow to span the left two-thirds of the workspace and the new column fills the remaining third.

When a table contains open cells, as it does in the previous image, you can drag a field directly into one of the cells. When the field is positioned over a cell, the cell will become highlighted to show you where the field will be placed. Like the indicators, this highlight appears whether or not you click **Show Outline**.

**Tip:** You can also add a column or row to the table by right-clicking any empty cell and selecting Add Column or Add Row.

### Add a Field to a Workspace or Script

The following procedure describes how to add a field to a workspace or script.

1. From an open workspace or script, click the **Insert Field** tab.
2. Click **Object Type Selector**.

   **Note:** The fields available depend on the type of workspace or script you are adding them to. See **Standard Workspaces** or **Script Types**. Custom fields can be added to the design space only if their Admin Edit visibility setting is selected. See **Overview of Custom Fields**.

3. Click the type of field you want to add to the workspace.
4. To view fields that do not fit on the ribbon, click the up and down arrows on the scroll bar on the right of the ribbon.
5. To view all the fields available for the workspace type you are editing, click **Expand Fields** below the scroll bar.
6. Click the field you want to add.
7. To add the field to an open cell in the design space table, hover over the cell and then click when it becomes highlighted.
To insert the field between fields or controls already added to the design space, hover the mouse between the fields or controls and then click when the line indicator appears.

To set a shortcut key for the field, click Text on the Design tab, enter a label for the field, and enter an ampersand (&) in front of the character you want to be the shortcut key. For example, to allow staff members to move the focus to a field with the label “Details” by pressing Alt+T, enter Details.

**Tip:** You can also click the label on the design space to edit the label value without clicking Text.

**Move a Field on the Design Space**

You can easily rearrange the fields on the design space by moving them from one location to another.

1. From the open workspace or script, click the field you want to move, keeping the left mouse button depressed.
2. Drag the field to its new location on the design space.
3. Release the mouse button to position the field in the new location.

**Remove a Field from the Design Space**

You can also quickly remove any fields that you no longer need.

Just as rows and columns can be added to a table when you add fields to the design space, the table rows and columns will be deleted when you move or delete the only remaining field in the row or column.

1. From the open workspace or script, do one of the following:
   - Right-click the field and select Delete. The Delete Confirmation window opens.
   - Select the field, click the Design tab, and then click Delete.

   **CAUTION:** The Delete Confirmation window displays a warning if the field you are deleting is used in a rule. If the rule checks or changes the value of the field you want to remove, the window will display a warning, but the rule will remain active after the field is removed. However, if the rule affects the required, visibility, or read-only properties of the field you want to remove, you will receive a warning and the rule will be disabled after the field is removed. See Overview of Workspace Rules.

2. Click Yes to confirm the deletion.

**Workspace and Script Controls**

In addition to fields, you can enhance your workspace or script by adding controls.

Controls are used to place features, such as buttons, text labels, reports, tables, and tab sets, onto the design space. Depending on the control, you can modify its properties to change its appearance or add functionality. For example, you can add the Title Bar control to a design space and then edit the title text, font, size, and color. Most controls can be added to every type of workspace and script as many times as you want.

Controls are added to workspaces from the workspace designer Insert Control tab. If your site is configured to use custom add-in components, they will also be displayed on this tab. (Your profile determines the custom add-ins you can access.) Custom add-ins can be added, moved, and deleted from workspaces in the same way as you would add,
move, and deleted controls and relationship items. For information about custom add-ins, contact your Oracle account manager.

While some controls are used to increase general usefulness, others are required to edit certain information. For example, you have the option to add a workspace title with the Title Bar control, but you can use a workspace without a title bar just as easily. Alternately, it is necessary to add the Rich Text Incident Thread relationship item to a workspace to let staff members view or add incident threads. See *Relationship Items*.

**Tip:** You can easily identify a control that has been placed on a workspace by double-clicking the control. The control name will appear in the drop-down menu on the Selected Object button group on the Design tab.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answer Display</td>
<td>Displays an answer on a workspace or script. To select the answer you want, click <strong>Answer ID</strong> on the Design tab and enter the answer ID number.</td>
</tr>
<tr>
<td>Browser</td>
<td>Adds a browser window to a workspace or script. Click <strong>URL</strong> on the Design tab to enter a URL for the browser. You can also set a URL for the browser from a workspace rule or script rule. See <em>Workspace and Script Browser Controls</em>.</td>
</tr>
<tr>
<td>Button</td>
<td>Inserts a button control on a workspace or script. Workspace rules and script rules can be created to trigger an action when the button is clicked. For example, you can create a button that displays a hidden field when staff members click the button. See <em>Workspace and Script Button and Image Controls</em>.</td>
</tr>
<tr>
<td>Flip Tile</td>
<td>Places two tabs on a workspace for use on the Agent Browser UI. You can add fields and other controls to each side of the flip tile. The flip tile lets staff members view and edit workspace fields that are added to either side of the dynamic tile that flips to show front and back elements.</td>
</tr>
<tr>
<td>Hyperlink</td>
<td>Places a hyperlink on the workspace or script. Click <strong>URL</strong> on the Design tab to enter a URL for the link.</td>
</tr>
<tr>
<td>Image</td>
<td>Adds an image to your workspace or script to display a logo, a diagram, or other type of image. Properties for this control let you choose the image you want and specify how the image should be displayed. You can create workspace rules and script rules that trigger actions when images are clicked. See <em>Workspace and Script Button and Image Controls</em>.</td>
</tr>
<tr>
<td>Intelligent Advisor</td>
<td>The Intelligent Advisor control can be added to workspaces when Intelligent Advisor is enabled on your site, providing access to policy administration tools for determining eligibility and tracking compliance for programs and services. For information about Intelligent Advisor, see Oracle Applications Integrations with B2C Service. To enable Intelligent Advisor with B2C Service, contact your Oracle account manager.</td>
</tr>
<tr>
<td>List Box</td>
<td>Adds a list containing entries you specify that can be selected by the agent. You can create workspace rules and script rules that are triggered when one or more list items are selected. See <em>Workspace and Script List Box, Menu, Option, and Text Box Controls</em>.</td>
</tr>
<tr>
<td>Menu</td>
<td>Adds a drop-down menu containing entries you specify that can be selected by the agent. You can create workspace rules and script rules that are triggered when a menu item is selected. See <em>Workspace and Script List Box, Menu, Option, and Text Box Controls</em>.</td>
</tr>
<tr>
<td>Control</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Navigation Panel</td>
<td>Adds a script navigation panel that allows agents to access the beginning page, previous page, next page, or exit the script. Selection can be presented as buttons or links. By default, this control appears in button style in the script footer. You can create workspace rules and script rules that are triggered when Exit is clicked. See <em>Workspace Rule Triggers</em>. This control is available to scripts only.</td>
</tr>
<tr>
<td>Oracle Business Intelligence Report</td>
<td>Inserts a read-only Oracle Business Intelligence Report. The report path you enter must match the path used in OBIEE (Oracle Business Intelligence Enterprise Edition).</td>
</tr>
<tr>
<td>Panel</td>
<td>Groups fields and controls and provides the ability to scroll within subsections of a workspace or script. You can nest a panel within a table and then add multiple fields to the panel. A scroll bar lets staff members view all fields on the panel. See <em>Workspace Panel Controls</em>.</td>
</tr>
<tr>
<td>Progress Label</td>
<td>Adds a simple progress indicator that displays the current page number and total number of pages in the script. By default, this control appears in the script header. This control is available to scripts only.</td>
</tr>
<tr>
<td>Radio Buttons</td>
<td>Adds options (radio buttons) to a workspace or script. You can create workspace rules and script rules that are triggered when an option is selected. See <em>Workspace and Script List Box, Menu, Option, and Text Box Controls</em>.</td>
</tr>
<tr>
<td>Report</td>
<td>Places a report container on a workspace or script. Click the Report property and select the report you want to display on the workspace. See <em>Default Reports Used on Standard Workspaces</em>.</td>
</tr>
<tr>
<td>Script</td>
<td>Adds agent scripts to a workspace. When you add this control, the Select a Script window opens where you can select the script you want to add. You can also select a different script by selecting the script control and clicking the Script button on the Design tab. See <em>Add a Script Control to the Design Space</em>. This control is available to workspaces only.</td>
</tr>
<tr>
<td>Spacer</td>
<td>Adds white space, fills gaps within a workspace or script, or holds a place for a field you want to insert later. When added to the design space, spacers have a light gray background to let you know where they are. However, when the workspace or script is viewed by an agent, the spacers are not visible because they are the same color as the background. You can move or delete a spacer just as you can move and delete other fields and controls.</td>
</tr>
<tr>
<td>Splitter Panel</td>
<td>Inserts a panel on a workspace for use on the Agent Browser UI. The splitter panel is divided into two sections by a splitter bar. The splitter lets staff members resize workspace elements to enhance their view of the Agent Browser UI. You can add fields and other controls to each panel, and nest a splitter panel within other splitter controls to create additional panels.</td>
</tr>
<tr>
<td>Survey by Proxy</td>
<td>Adds a survey to a workspace or script that can be filled out by an agent on behalf of a customer. When this control is added, you choose the survey you want by clicking Survey on Design tab. If you select a survey that allows anonymous responses, you can select the Anonymous check box on the Design tab to permit survey responses to be entered when a valid contact is not associated with the record being viewed. The Survey by Proxy control is available when creating incident, opportunity, and contact workspaces and scripts. See <em>Overview of Surveys</em>. This control is available only when Feedback is enabled. Polling surveys are not supported by this control.</td>
</tr>
</tbody>
</table>
### Control | Description
--- | ---
Tab Set | Adds a tab set to a workspace or script. Tabs can be added and renamed as desired, and multiple tab sets can be placed or nested on the design space. See *Add Tabs to the Design Space*.  
Table | Adds a table to a workspace or script. Tables form a grid for aligning other fields and controls. They can also be nested in other tables. See *Add a Table to the Design Space*.  
Text | Adds a text block to a workspace or script. Using the buttons in the Label group on the Design tab, you can define the background color, text alignment, and content. You can also enter text, including variables, that will display when agents use the workspace. See *Add Text with the Text Control*.  
A text control default background color and font match the workspace it is used on.  
Text Box | Adds a text box to a workspace or script. You can create workspace rules that are triggered when agents enter specific text in the text box. See *Workspace and Script List Box, Menu, Option, and Text Box Controls*.  
Title Bar | Adds a text block to be used for headers or sections within tables. Using the buttons in the Label group on the Design tab, you can define the background color, text alignment, and content. By default, the Title Bar control uses a heading style font and a different background color than the rest of the workspace.

**Relationship Items**

This topic describes workspace relationship items.

B2C Service features a set of relationship items that provide functionality unique to certain workspaces. Relationship items are special controls, such as incident threads and audit logs, that are used when working with records and related objects. Many relationship items display a list of related objects and include basic functions for adding, editing, copying, and deleting related records, as well as removing record relationships.

Relationship items differ from the standard controls mainly in the types of workspaces they can be used on and the number of times they can be added to a workspace. While controls can be added numerous times on most types of workspaces, relationship items are specific to the type of workspace and can be added to a workspace only once.

In the standard workspaces, most relationship items appear on tabs, but you can place them anywhere on the workspace. The items you can add when you create a workspace depend on the type of workspace you create.

**Tip:** You can easily identify a relationship item that has been placed on a workspace by double-clicking the item. The name will appear in the drop-down menu on the Selected Object button group on the Design tab.
<table>

<p>|                        | In answer workspaces, the audit log shows all actions taken on both the answer and its siblings.                                                                                                                                 |
| Chat Control           | Contains the area for composing a response to the customer and includes the buttons for adding SmartAssistant answers, searching the knowledge base, and inserting standard text. This relationship item is available on chat workspaces. |
| Chat Transcript Control| Contains all chat correspondence between the customer and agent, including a time stamp for each instance of sending text. This relationship item is available on chat workspaces. |
| Co-browse              | The co-browse relationship item can be added to incident and chat workspaces when co-browsing is enabled on your site. When using a workspace with this relationship item, agents can invite customers to a desktop-sharing session. See Chat for Agents, Supervisors, and Customers. |
| Collaboration          | The Collaboration relationship item can be added to incident workspaces when Service Collaboration is enabled on your site. You can select the default page view for the control from the drop-down menu under Options in the workspace editor. When using a workspace with this relationship item, agents can collaborate with other agents to resolve customer questions. See Service Collaboration. |
| Contacts               | Provides the ability to add, edit, print, copy, delete, and email contacts, as well as remove their association with the primary record. The column headings for the list of contacts include the name, email address, organization name, office phone, title, and action options. The Contacts relationship item is available on incident, opportunity, and organization workspaces. |
| [Custom Object] View   | Provides the ability to add, edit, copy, print, and delete custom object records, as well as remove their association with the primary record for the workspace. The column headings for the list of records include the object ID, labels, and action options. This relationship item is named for the custom object |</p>

<tr>
<td>Guided Assistance</td>
<td>Provides the ability to search for and open guided assistance guides to help agents quickly find answers or text explanations when working with customers. You can select properties for this relationship item to show buttons on the relationship item that agents can use to search for and select applicable guides. You can also use workspace rules to automatically open a guide on workspaces that include this relationship item, or trigger a workspace rule when a guide has been completed. See <em>Guided Assistance Relationship Item</em>.</td>
</tr>
<tr>
<td></td>
<td>This relationship item can be added only to incident and chat workspaces. However, you can add the <code>answers.guided assistance</code> field to answer workspaces to associate a guide with an open answer.</td>
</tr>
<tr>
<td>Incident View</td>
<td>Provides the ability to view and work with incidents associated with a contact or organization. Toolbar buttons allow adding, editing, copying, deleting, forwarding, and proposing incidents and filling the inbox. The column headings for the list of incidents include the status, response time, resolution time, source, reference number, and subject as well as action options. The Incident View relationship item is available when creating chat, interaction, contact, organization, and asset workspaces.</td>
</tr>
<tr>
<td>Label</td>
<td>Allows placement of a label on the chat workspace.</td>
</tr>
<tr>
<td>Learned Links</td>
<td>Lists all answers linked to the currently open answer by visitors to your site as they browsed your knowledge base. These links are “learned” by the system as your visitors move from answer to answer. Toolbar buttons allow the ability to edit, print, preview, promote, and block and unblock links. This relationship item is available when creating answer workspaces.</td>
</tr>
<tr>
<td>Manually Related Answers</td>
<td>Lists all answers that have been manually linked by staff to the currently open answer. Toolbar buttons allow the ability to add, edit, copy, print, and delete answers, as well as remove their association with the primary record. This relationship item is available when creating answer workspaces.</td>
</tr>
<tr>
<td>Notes</td>
<td>Notes relationship items can be specific to individual workspaces.</td>
</tr>
<tr>
<td></td>
<td>Answer Notes—Allows staff members to add notes, select the note channel, and sort notes by date on answer workspaces.</td>

<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Custom Object Notes</td>
<td>Allows staff members to add notes, select the note channel, and sort notes by date on custom object workspaces.</td>
</tr>
<tr>
<td>Meta Answer Notes</td>
<td>Allows staff members to add notes that pertain to the sibling answers.</td>
</tr>
<tr>
<td>Opportunity Notes</td>
<td>Allows staff members to add notes, select the note channel, switch the views between opportunity, contact, and organization notes, and sort notes by date on opportunity workspaces.</td>
</tr>
<tr>
<td>Organization Notes</td>
<td>Allows staff members to add notes, select the channel, and sort notes by date on organization workspaces.</td>
</tr>
<tr>
<td>Task Notes</td>
<td>Allows staff members to add notes, select the note channel, and sort notes by date on task workspaces.</td>
</tr>
<tr>
<td>Note:</td>
<td>If you want staff members to be able to edit or delete existing notes when copying records, you will need to assign Edit/Delete Notes permissions in their profile for the appropriate record types. See Overview of Staff Management.</td>
</tr>
<tr>
<td>Outreach Activity View</td>
<td>Displays a report of outreach activity associated with the contact, such as mailings that were viewed or tracked links that were clicked. If the report is populated (that is, if the contact has had outreach activity), the column headings include when the activity occurred, what the activity was, a description, the name of the mailing or tracked link, and any documents for each listed activity. The Outreach Activity View relationship item is available when creating contact workspaces.</td>
</tr>
<tr>
<td>Opportunities View</td>
<td>Provides the ability to view and work with opportunities associated with a contact or organization. Toolbar buttons allow adding, editing, copying, printing, deleting, rejecting, and forwarding opportunities. The column headings for the list of opportunities include the name, assigned staff member, status, stage, the sales representative’s value, the manager’s value, and the date updated, as well as action options. The Opportunities View relationship item is available when creating chat, contact, and organization workspaces.</td>
</tr>
<tr>
<td>Organization Hierarchy</td>
<td>Provides the ability to work with organizations to create a hierarchy in an organization workspace. Toolbar buttons allow adding, editing, printing, and deleting organizations, as well as removing their association with the primary record.</td>
</tr>
<tr>
<td>Page Peek</td>
<td>Displays a snapshot of the web page customers were viewing when they initiated the chat. This relationship item can be added to chat and interaction workspaces.</td>
</tr>
<tr>
<td>Products and Categories</td>
<td>Displays product and category trees in order to view and define the links between products and categories for answers. The Products and Categories relationship item is available when creating answer and multi-edit answer workspaces.</td>
</tr>
<tr>
<td>Quote Products</td>
<td>Displays the list of products associated with a selected price schedule for a quote and provides the ability to edit products for a quote. The Quote Products relationship item is available when creating quote workspaces.</td>
</tr>
<tr>
<td>Quotes</td>
<td>Provides the ability to view and work with quotes associated with an opportunity. Toolbar buttons allow adding, editing, printing, copying, deleting, and sending quotes. The column headings for a list of quotes include the name and status, whether it was sent, the forecast, and action options. The Quotes relationship item is available when creating opportunity workspaces.</td>
</tr>
<tr>
<td>Rich Text Incident Thread</td>
<td>Provides the ability to add responses, customer entries, and private notes to incidents with a variety of HTML formatting attributes, such as font, style, color, alignment, bullets, images, links, and...</td>
</tr>
<tr>
<td>Relationship Item</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Sibling Relationships</td>
<td>Lists all answers that share the same product or category as the currently open answer and can also contain the same file attachments. Toolbar buttons allow adding, editing, printing, deleting, and previewing sibling answers, as well as removing their association with the primary record. This relationship item is available when creating answer workspaces.</td>
</tr>
<tr>
<td>SLA Instance View</td>
<td>Allows staff members to view a report of SLAs that have been associated with a contact or organization and provides the ability to add, open or disable an instance. The column headings include the SLA instance name, active date, expire date, self-service, total incidents, and action options. The SLA Instance View relationship item is available when creating contact and organization workspaces.</td>
</tr>
<tr>
<td>SLA Container</td>
<td>Provides the ability to select SLAs for contacts and organizations by displaying the SLA selection field, which opens the SLA Viewer for adding SLA instances. The SLA Container relationship item is available when creating contact and organization workspaces.</td>
</tr>
<tr>
<td>Survey History View</td>
<td>Allows staff members to view a report of surveys that have been sent to contacts. If the report is populated (that is, if the contact has received surveys), the column headings include when the survey was completed, the score, the type of survey, its name, and action options. The Survey History View relationship item is available when creating contact workspaces.</td>
</tr>
<tr>
<td>Tasks</td>
<td>Provides the ability to view and work with tasks associated with a record. Toolbar buttons allow adding, editing, printing, copying, deleting, completing, and forwarding tasks, as well as removing their association with the record. The column headings for a list of tasks include the name, due date, completed date, assigned staff member, and priority, as well as action options. The Tasks relationship item is available when creating the following kinds of workspaces.</td>
</tr>
<tr>
<td></td>
<td>• Answer</td>
</tr>
<tr>
<td></td>
<td>• Contact</td>
</tr>
<tr>
<td></td>
<td>• Incident</td>
</tr>
<tr>
<td></td>
<td>• Mobile Contact</td>
</tr>
<tr>
<td></td>
<td>• Mobile Incident</td>
</tr>
<tr>
<td></td>
<td>• Opportunity</td>
</tr>
<tr>
<td></td>
<td>• Organization</td>
</tr>
<tr>
<td>Time Billed</td>
<td>Provides the ability to view and enter the amount of time billed for an incident. Toolbar buttons allow adding, editing, and deleting a time billed entry. The column headings for a list of time billed entries include the starting date and time, the amount of time spent, the staff member who entered the time billed, and the task, as well as action options. The Time Billed relationship item is available when creating incident workspaces.</td>
</tr>
<tr>
<td>Visitor Browser History</td>
<td>Allows staff members to view a list of URLs a contact visited before starting a chat. The Visitor Browser History relationship item is available when creating chat and interaction workspaces.</td>
</tr>
</tbody>
</table>
Question Controls

B2C Service provides a set of question controls that are used to configure branching in scripts.

Questions are available as buttons, options, lists, text fields, menus, and yes/no buttons. Most of these question types are similar to standard controls—for example, you add items to a menu question in the same way you add items to a menu control. However, questions differ from other controls in a few key ways.

- Questions include labels while other controls do not. The label can be used to present the text of the question being asked.
- Questions are required by default but can be set to non-required by using the Required property on the Design tab. This differs from other controls, which are never required.
- A question added to one script page can be used in the rules and branches created on other pages in the script. Conversely, a control can be used only in the rules and branches on the script page the control is added to.
- Some question types have different properties than their corresponding standard controls. For example, the image property cannot be defined for button questions as it can for button controls.

For information about using question controls in script branching, see *How Branches Work in Scripts*.

**Note:** The values that agents enter in questions and their corresponding standard controls are available for use with the script rules and branches. However, they are not saved in the database.

Add a Control to the Design Space

Placing controls on a workspace or script is similar to adding fields. Like fields, controls occupy cells on the underlying table for the design space.

After you add a control, you can reposition it to display anywhere on the design space. Controls can be added to tables, panels, and tab set controls, and you can place them above, below, or next to fields and other controls.

**Note:** When you add a control to a table that already contain fields or other items, the size of the table rows and columns is adjusted to accommodate the new object.

1. From an open workspace or script, click the **Insert Control** tab on the designer ribbon.
2. Click the control you want to add.
3. Drag the control to the design space and hover over the location where you want to place the control. A vertical or horizontal line indicates where the control will be placed on the design space.
4. Release the mouse button.
5. To edit the properties of the added control, see *Edit a Field or Control*. 
Move a Control on the Design Space
You can easily move controls to other locations on your design space. As with fields, moving controls can cause the removal of a row or column from the design space table if the control was the only remaining item in the row or column.

1. From the open workspace or script, click the control you want to move, keeping the left mouse button depressed.
2. Drag the control to its new location on the design space.
3. Release the mouse button to position the control in its new location.

Delete a Control from the Design Space
You can easily delete controls if they are no longer needed. As with fields, deleting controls can cause the removal of a row or column from the design space table if the control was the only remaining item in the row or column.

1. From the open workspace or script, right-click the control and select **Delete**. The **Delete Confirmation** window opens.

   **CAUTION:** If the control you are deleting is referenced in a workspace rule, the Delete Confirmation window will display a warning including the name of the rule. If you click Yes to delete the control, the reference will be removed and the rule will be disabled. See **Workspace Rules**.

2. Click **Yes** to confirm the deletion.

Workspace and Script Button and Image Controls
You can add buttons to workspaces and scripts that you can use with rules to trigger actions when clicked.

Image controls are used to display a logo, diagram, or any other graphic. Images can also be used to trigger rules when clicked, but their more common purpose is to visually enhance the design. For example, you could add a button to a workspace to display an additional tab set when a staff member clicks it.

**Tip:** Because the agent desktop uses image rendering components of Internet Explorer installed on your workstation, we recommend that your browser be configured to check for newer versions of stored pages every time web pages are visited. In this way, any image updates you perform as you design your workspace will be displayed promptly without requiring you to log out and back in to B2C Service.

When you add a button or image to a workspace or script, it will have no effect on your rules until you configure the rules to use it. For information about using buttons and images in workspace rules, see **Workspace Rule Triggers**.

Add Content to Button Controls
You can modify button controls added to the design space to customize the appearance on a workspace or script.
When you add a button to the design space, the button contains default text. You can easily change the text and add an image to the button by selecting it on the design space and changing the button properties from the Design tab. You can also size the button and specify where it should be positioned.

1. From the open workspace or script, click the button control you added to the design space.
2. Click the Design tab.
3. To change the default text on the button, click Text.
   a. Enter the text you want on the button.
   b. Press Enter to save the text.
   
   **Tip:** You can change the font attributes of text on a button by clicking the button and choosing from the Label group options on the Design tab.

4. To add an image to the button, click Image. The Select Image window opens, showing the images you have added using the Client Workflow Images explorer.
   a. Select the image you want to add to the button.
   b. To add a new image to the list, click Add New Image.
   c. To remove an image that was previously added to the button, select the No Value check box.
   d. Click OK to add the image to the button.
   e. To position the image on the button in relation to text on the button, click Image Align and select where you want the image in relation to the text. The available options are Left, Right, Top, Bottom, and Center.

   **Note:** For information about adding images for use with workspaces and scripts, see Add an Image Control to a Workspace or Script.

5. To manually define the width of the button margins, click Margin. The available options are None, Narrow, Medium, Wide, and Custom.
   a. To set custom margin widths, select Custom and enter the number of pixels you want for the button margins in the Top, Bottom, Left, and Right fields.

6. To manually define the button size, click Size on the Design tab and select Enable Auto Sizing to disable it.
   a. Click Size again and enter the number of pixels you want for the button size in the Width and Height fields.
   b. To re-enable auto sizing, click Size and select Enable Auto Sizing.

7. To position the button on the table cell that contains it, click Position on the Design tab to view available options.
   a. Select where you want the button placed on the table cell from the Position options.
   b. To stretch the button on the table cell, select how you want the button displayed from the Stretch options.

8. Click Save.

### Add an Image Control to a Workspace or Script

When you add an image to a workspace or script, you can specify options such as the size, position, and layout of the image.

1. Drag the control to the design space. See Add a Control to the Design Space.
   The Select Image window opens showing the images you have added using the Client Workflow Images explorer.
2. To add a new image to the list, click Add New Image.
3. Select the image you want to add and click OK. The image is added to the design space.
   To select a different image, select the image you want to replace, click the Image button, and choose the new image from the Select Image window.
4. To manually define the image size, click Size on the Design tab and select Enable Auto Sizing to disable it.
a. Click **Size** again and enter the number of pixels you want for the image size in the Width and Height fields.

b. To re-enable auto sizing, click **Size** and select **Enable Auto Sizing**.

5. To specify a layout for the image on the table cell, click **Image Layout** and select from None, Tile, Center, Stretch, and Zoom.
   The Image Layout button is inactive when auto sizing is enabled.

6. To position the image on the table cell that contains it, click **Position**.
   a. Select where you want the image placed on the table cell from the Position options.
   b. To stretch the image on the table cell, select how you want the button displayed from the Stretch options.

   **Tip:** Stretch options from the Position button work best when a layout option is selected from the Image Layout button on the Design tab.

7. Click **Save**.

**Client Workflow Images Explorer**

Using the Client Workflow Images explorer, you can add images to use in workspaces and scripts.

After you have opened the explorer, you can add and manage images the same way you do in the Images explorer. See **Images Explorer**.

Click **Configuration** on the navigation pane, expand **Application Appearance**, and then double-click **Client Workflow Images**.

**Note:** You can add the Client Workflow Images explorer to **navigation lists** in the same way you can add other explorers. See **Overview of Navigation Sets**.

**Add Text with the Text Control**

You can use text controls to add text that will display to your agents. You can also include variables to display values from the database. For example, you could add text, including the customer's name, that new agents can read when speaking with a customer who calls regarding an incident.

1. Click the **Insert Control** tab and add a text control to the design space.
2. Click the text control on the design space and enter the text you want.
3. To change the font attributes for the text you entered, select the text you want to change and select options from the font attributes on the Label group on the Design tab. See **Label Properties** for descriptions of these options.
4. To add a variable to the text, click the text control where you want to add the variable.
5. Do one of the following:
   a. Click **Insert Merge Field** on the Design tab.
   b. Right-click the control and select **Insert Merge Field**.
6. Do one of the following:
   a. Select the name of the database table with the field you want in the Table Name field.
   b. Select **Current User** to add a variable for the display information (such as the first name) of the staff member who is using the workspace or script.
Note: Custom object workspaces and scripts can also use custom object fields as merge fields. However, workspaces and scripts for parent standard objects, such as contacts or incidents, cannot access these fields.

7. Select the field you want to include on the text control on the Field Name field.
   The variable you define is displayed in the Preview field.
8. Click OK to add the variable to the text control.

Workspace and Script List Box, Menu, Option, and Text Box Controls

List box, menu, option, and text box controls give you the ability to trigger workspace rules, script rules, script branches, or workflows from agent selections or text entries.

List box, menu, option, and text box controls differ only in the type of input they accept from your agents and are added to workspaces in the same way you add any other control. However, with the exception of the text box control, you need to add entries to these controls that agents can select before the controls are useful.

Note: The values entered in these controls are not saved in the record being edited. These controls are intended for use only with workspace rules, script rules, script branches, and workflows.

After you add menu and list entries or options to the controls, you can create rules that are triggered when agents select the entries or buttons, or when they enter certain text in a text box. You can also add rule conditions based on the value of these controls. See Workspace Rules.

You can specify options on the Design tab for the list box, option, and text box controls to change their behavior or appearance. For definitions of the options for these and other controls, see Workspace and Script Controls.

Add and Edit Items for List Box, Menu, and Option Controls

The following procedure explains how to add and edit items for list box, menu, and option controls.

1. From an open workspace or script, click the Insert Control tab and add a list box, menu, or radio button control to the design space.
2. Click the control on the design space and click the Design tab.
   Three default items are added to the control when you add it to the design space.
3. To change the text of an item in the control, select the item you want to edit on the items list and click Edit Item. The Edit Item window opens.
   a. Enter the text you want the item to display.
   b. Click OK.
   
   Note: For option controls, you can also edit the text of an item by simply clicking the item on the design space.

4. To add an item to the control, click Add Item on the Design tab to open the New Item window.
   a. Enter the text of the item you want to add to the control.
   b. Click OK to add the new item to the control.
5. To change the order of an item on a control, select the item you want to move on the items list and click Move Up or Move Down to order the item as you want it.
6. To remove an item from the list, select the item you want to remove on the items list and click Delete Item.
7. To change the layout of an option control, select the control on the design space, click **Layout** on the Design tab, and select **Horizontal** or **Vertical**.

8. To allow staff members to make multiple selections from a list box, click the list box control on the design space, click the **Design** tab, and select the **Allow Multiple Selections** check box.

### Edit Items from the Edit Items Window

If you want to add or edit several items on list, menu, or option controls, it can be faster to do so from the Edit Items window than from the Design tab. You can reorder items from the window as well as add and edit items on the control.

1. From an open workspace or script, right-click the control on the design space and select **Edit List Items**, **Edit Items**, or **Edit Radio Buttons**, depending on the type of control you select.

   The **Edit Items** window opens. The window lists all the menu items, list items, or radio buttons on the control.

2. To add another item to the control, click **Add Item** and enter the item text.

3. To edit item text, select the item in the list and click **Edit Item**.

4. To remove an item from the list, select the item you want to remove and click **Delete Item**.

5. To reorder items in the list, select the item you want to reorder and click the up or down arrow to move the item where you want it.

6. Click **OK**.

### Default Reports Used on Standard Workspaces

This topic describes the default reports used on standard workspaces.

Workspaces and scripts can include reports to let staff members view or access information related to the record they are editing. For example, the standard incidents workspace contains a tasks report to display the tasks associated with the incident. Most of the standard workspaces contain reports, and you can configure custom workspaces and scripts to show the reports you want to see.

**Note:** Record command options are not applied when viewing reports in workspaces.

Many standard workspaces contain reports, most of which have row limits of 100 rows. If you want to use a standard workspace but with a different report than the default one, you can copy the workspace and edit the copy to replace the default report with the report you want.

</table>

**Note:** Some standard workspaces also define default search reports for certain elements. For example, the Search Knowledge Base button on the Messages tab of the Incident workspace uses the Search Knowledge Base report. See [How You Select Search Reports](#).

## How You Add Reports and Relationship Items to Custom Workspaces and Scripts

When you add the report control to the design space, you need to select the report you want it to display.

Reports used on workspaces and scripts may include runtime selectable filters and variables. However, with the exception of the reports used for search reports, these will not be available when the reports are viewed on workspaces or scripts.

By default, reports you add to workspaces do not run when you open the workspaces to create new records, since the records do not yet include data that can be filtered on. However, you can force reports to run for new records from the Report Behavior button on the Design tab.

You can also select reports for *relationship items* to show information related to the record you are viewing. For example, the Contacts relationship item shows information about the contact related to an incident you are viewing. These relationship items are configured to use certain reports by default, but you can select different reports to use on your workspace if you want.

**Note:** If the same object is added as a child in multiple relationships to the same parent (for example, if the contacts object is specified as the child of the incidents object in two relationships), the workspace designer ribbon will still contain only one view item for the object. However, because new view reports are automatically created for each child relationship you define, when you add the view item to a workspace, you will be prompted to select which report to use. See [Overview of Custom Objects](#).

Reports used on report controls or relationship items automatically attempt to filter on the record being edited to display information related to the record. Therefore, these reports should contain at least one filter for the primary identification types for the kind of workspace or script you are using. For example, reports used in incident workspaces should filter on incident (*i_id*), contact (*c_id*), or organization (*org_id*).

### Add a Report to a Report Control or Change a Report on a Relationship Item

You can add a report to a report control on a workspace. You can also change a report on a relationship item.

1. From an open workspace or script, click the **Insert Control** tab.
2. Click the report control or the relationship item containing a report and drag it to the design space where you want it.
3. Click the control or relationship item on the workspace and click the **Design** tab. Configuration options for the report control are displayed on the Options button group.
Tip: You can also double-click an object on the design space to select the Design tab and access properties related to the object.

4. Click Report to open the Select Report window.
5. Select the report you want to add to the workspace and click OK.
6. Click Save.

Note: If you add a report control to a workspace without selecting a report for the control, you will not be able to save the workspace.

How You Select Search Reports

Some database fields and relationship items include search functionality that agents can use to find and associate records with the records being edited.

When using a workspace or script, agents can access the search function by clicking Search located next to the field or on the relationship item. For example, the button to open the Contact Search window from an incident workspace is located to the right of the contact field.

When you open a search window, the window displays a report and the docked filters that are used to search for records. Some search windows also include secondary reports that are not searchable, but which can be used to display information below the primary search report. For example, a secondary search report can be used to display all contacts associated with an organization when you are searching for a contact in the primary search report.

Drill-down levels and report links can be used in search reports for database fields but are disabled on the search report relationship items.

The standard reports that are used by default with this functionality are designed to allow staff members to quickly locate the records they want. However, if the default reports do not meet your needs, you can specify the standard or custom reports you want to use for the primary and secondary search reports.

**Note:** Searches are performed from workspace search reports using docked filters. For this reason, the search reports you specify must include docked filters in order to search for records. See *Overview of Custom Reports*.

### Select Primary and Secondary Search Reports for the Contacts Search Window

You can add primary and secondary search reports to a field or a relationship item. The following procedure explains how to add search reports to the Contacts Search window.

1. From an open workspace or script, do one of the following:
   - Click the Contact field on the design space.
   - Click the Contact relationship item on the design space.
2. Click the **Design** tab.
3. To change the primary search report, do one of the following:
   - Click **Search Report**. The **Select Report** window opens.
   - To add a secondary search report, click **Secondary Search Report**.
4. Select the report you want to use.
5. Click **OK**.
6. Click **Save**.

### Report Properties

In addition to selecting the report you want to appear on a workspace or script, you can modify the report properties to enable certain behaviors and functions. The following report functions are available on the Design tab.

- **Time Limit**—Specifies the maximum amount of time a report can take to generate on the workspace. See *Set a Time Limit for a Report Control*.
- **Hide Report Commands**—Hides and disables the report commands (for example, New, Open, Copy, Delete, Print, Forward, Assign, and Propose) on the workspace.
- **Show Row Count**—Displays the number of records in a report next to the tab title.

The properties described here can also be accessed by clicking Report Behavior on the Design tab.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delay Report Execution</td>
<td>Select this option if you want the report to run only when the tab the report is shown on is selected. If this option is not selected, the report runs when the workspace opens. This option is enabled by default. If the report is visible when the workspace is opened (for example, it appears on the top tab), it will always run immediately even if the property is enabled.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Filter on Primary Key Only</td>
<td>Select this option if you want the report to filter only on the primary key. If this option is not selected, the report will also filter on any related objects. For example, when this option is enabled, an incidents report will use only the incident ID filter to filter the results. When the option is disabled, the report will also filter the report on any of the workspace fields selected on the Report Filter Mapping Wizard. See <a href="#">Filter Workspace Fields on a Workspace Report</a>.</td>
</tr>
<tr>
<td>Open Existing Records in Separate Workgroup</td>
<td>Select this option if you want records opened from this report to be displayed in a new workgroup tab. This allows the opened record to be saved independently from the record the control is on. If this option is not selected, records will be opened on a subtab and edits are saved when any record in the subtab workgroup is saved.</td>
</tr>
<tr>
<td>Delete Records Immediately</td>
<td>Select this option to delete records in the report when a staff member clicks Delete and confirms the deletion request. If this option is not selected, records will be queued for deletion and not actually deleted until the record being edited is saved.</td>
</tr>
<tr>
<td>Create New Records in Separate Workgroup</td>
<td>Select this option if you want new records created from a parent record to open in a new workgroup tab. This allows the new record to be saved without saving the parent record. If this option is not selected, new records will open on a subtab and edits are saved when any record in the subtab workgroup is saved. This property is available for the Incident View, Opportunity View, Task View, and Custom Object View relationship items.</td>
</tr>
<tr>
<td>Refresh Report When Data Changes</td>
<td>Select this option if you want the report to be run again when related data is changed. (For example, if a staff member is using a workspace that contains the Incidents by Organization or Contact report and changes the contact, the report refreshes to update with new information.) This property is not available for the Manually Related Answers, Learned Link, Incident View, and Custom Object View relationship items.</td>
</tr>
<tr>
<td>Execute for New Records</td>
<td>Select this option if you want the report to run when you open the workspace to create a new record. This option is disabled by default to prevent reports that rely on data in the record from attempting to run when a new record is being created. This property is not available for the Manually Related Answers, Learned Link, Incident View, and Custom Object View relationship items.</td>
</tr>
</tbody>
</table>

Filter Workspace Fields on a Workspace Report

With workspace filter mapping, you can leverage data on a workspace with internal and external object tables.

Use the Report Filter Mapping Wizard to select any field on a workspace to filter on the report and set its runtime value as the filter value.

1. Select the report on the Design tab of the workspace.
2. Click Report Behavior and clear the Filter On Primary Key Only option.
3. Click Filter Mappings.
4. Click the Use drop-down menu and select Parent.
   - A list of all available fields for the workspace display in the Value drop-down menu.
5. Select the field you want the report to filter at runtime.
6. Click Finish.
Set a Time Limit for a Report Control

You can specify the maximum amount of time a report can take to generate on a workspace using the Time Limit option.

Specifying a time limit can improve workspace performance since workspaces are unavailable until reports on the workspace generate. If a report takes longer to generate than the time limit you specify, a warning message will display and the workspace will load without the report.

1. From the open workspace or script, click the report control you want to modify.
2. Click the **Design** tab and click **Time Limit**.
3. Select the **Limit Report Execution** check box and then enter the maximum number of seconds you want to permit for a report to generate. You can select a value up to 240 seconds.
4. Click **OK**.

**Note:** Reports placed on a workspace should be configured to return data that is related only to the record that is open. For example, a report on a Contact tab should return information about the contact rather than all contacts in the database. Reports that consistently time out in a workspace and cannot be further restricted should be removed from the workspace and run separately.

Workspace Panel Controls

A panel is a special workspace control that provides grouping for fields and controls and lets you create scrolling subsections of the workspace.

When you add more fields than the panel control can accommodate, a scroll bar appears automatically. This lets you add multiple fields to a panel even though the panel size is controlled.

You can customize each panel on your workspace to use different background colors, font colors, padding, and margins. This is helpful if you want to create distinct groupings of data on your workspace.

This image shows a panel control on the right. The panel has been defined to span three rows. The single panel contains the Assigned, Product, Category, Disposition, and Queue fields.

The next image shows what happens to the panel control when more fields are added to the workspace, creating additional rows. Note that the panel still spans only three rows and now displays a scroll bar.
And this last image shows how the panel is displayed to staff members using the workspace. They can scroll down on the panel to complete all fields.

**Add a Script Control to the Design Space**

You can add scripts to workspaces to provide a sequence of steps and form elements for your agents to follow when working on records.

Script controls can include the same fields and controls available for workspaces, and you can use the same script on as many workspaces as you want. If you want to place a set of fields and controls on several workspaces, you can add them to a script and then simply place the script on the workspaces.

Script controls are available only when scripting is enabled. For information about enabling scripts, contact your Oracle account manager.

Scripts can also include pages and branching, so you can easily create a script to lead your agents through a procedure. For example, you could place a script control on an incident workspace to guide new agents through entering information for the record when a customer phones with a new incident. See *Script Designer*.

As with workspaces, scripts are interface specific. In addition, the scripts that you can place on a workspace must be of the same type as the workspace. For example, you can place a control for an incident script on an incident workspace and you can place a control for a contact script on a contact workspace. For this reason, when you place a script control on a workspace, you can select only scripts that are of the same type as the workspace, and that were created on the same interface.

**Note:** You can place multiple script controls on the same workspace.

1. From an open workspace, click the **Insert Control** tab and click **Script**.
2. Click the location on the design space where you want the script.
   The **Select a Script** window opens.
3. Select the script you want to use and then click **OK**.
4. To change the script used on the script control, click the script control and click **Script** on the **Design** tab to open the **Select a Script** window.
5. To change the size of the script control, click the control on the workspace, click the **Design** tab, select the **Set Fixed Height** check box, and click **Size** to enter a size for the control. See *Design Property Descriptions*. 
Add a Table to the Design Space

You can add table controls to the design space to organize and align fields and controls within a set of content cells.

By default, a newly placed table control features two rows and two columns containing spacers. You can adjust the number of rows and columns by editing the table properties or by inserting fields or controls around or between other fields and controls in the table. You can also enhance the appearance of a table by adjusting colors, borders, scroll bars, and size.

Tables can be nested within the cells of other tables. However, for optimal workspace performance, we recommend limiting the number of nested tables as these can increase workspace processing time.

1. From the open workspace or script, click the Insert Control tab and click Table.
2. Click the location on the design space where you want the table. The table contains two rows and columns by default.
3. To add columns or rows to the table, click the table on the design space, click the Design tab, and click Add Column or Add Row. The table updates to show the new columns and rows.
   - **Tip:** If you find it difficult to select the table by clicking on its outer border, it may be easier to select it using the Current Selection drop-down menu. See Access Design Space Items Using the Ribbon.
4. To edit table properties, such as borders and background color, see Layout Properties.

Add Tabs to the Design Space

You can add individual tabs and tab sets, or groups of tabs.

1. From the open workspace or script, click the Insert Control tab on the ribbon, click Tab Set, and click the location on the design space where you want the tab set.
   - **Tip:** You can nest tab sets within other tab sets.
2. To add tabs, do one of the following:
   a. Right-click next to an existing tab and select Add Tab.
   b. Right-click an existing tab and select Add Tab Before or Add Tab After.
3. Rename the tab.
   a. Click the new tab.
   b. Click the Design tab.
   c. Click Text on the Label group and enter the name you want for the tab.

How You Move a Tab

You can move individual tabs and tab sets, or groups of tabs. Tabs are moved with the same methods used to move fields and controls on the upper section of the workspace.

Staff members have the option of dragging the tabs to rearrange them on the workspace. If they do this, the tabs positions are stored in their local settings. Your changes to the tab positions will not affect staff members who have
customized their tab positions on the workspace. For an overview of account settings that can be customized by staff members, see *Download the Oracle B2C Service Client and Log In.*

Right-click the tab and select **Move Left** or **Move Right.**

Or

Click the *action arrow* on the tab and select **Move Left** or **Move Right.** See *How You Access Design Properties from the Actions List* for a description of action arrows.

### Delete a Tab or Tab Set

You can delete individual tabs and tab sets, or groups of tabs. Tabs are deleted with the same methods used to move fields and controls on the upper section of the workspace.

1. Right-click the tab or tab set and select **Delete.**
2. Click **Yes** on the **Delete Confirmation** message.

### Workspace and Script Browser Controls

By adding a browser control to a workspace or script, you can display a web browser inline with your records.

You can specify the URL you want, and you can include variables in the URL to link B2C Service data—such as record IDs, custom field values, or custom object field values—with the web page you open or through Connect PHP API. See *Answer ID 2429.*

Also, the page loaded in the browser can contain Connect JavaScript code to view and edit information about the record being edited. See *Answer ID 5169.*

### Add a Browser to a Workspace or Script

Use this procedure to add a browser to a workspace or script.

1. Click the **Insert Control** tab and click **Browser.**
2. Click the location on the design space where you want the browser.
   The browser is added to the workspace.
3. Click the browser control and click the **Design** tab.
4. Click **URL** and enter the URL you want the browser control to open when the workspace is opened.
   You can also set the URL of a browser control using a workspace rule. See *Workspace Rule Actions.*
5. To delay the loading of the browser in a tab until the tab is active, select the **Delay Page Load** check box. The Delay Page Load check box is selected by default.
6. To change the size of the browser control, click the **Design** tab and select the **Set Fixed Height** check box.
   a. Click **Size** to enter a size for the control.
7. To open windows from the browser content in child browser controls, select the **Open Pop-ups in New Browser Control** check box.
If this check box is not selected, windows will open in a full Internet Explorer browser, which can cause session variables to be lost. To ensure session variables are maintained, select the check box.

8. To send the URL as POST data so that it is sent securely, select the **Send URL as Post Data** check box. If you do not select this check box, the URL is sent as GET data. If you select this check box, you must enter a URL that starts with https in the URL field.

9. To suppress any warning prompts (such as script errors and authentication requests) that may occur in the browser control when a URL is loaded, select the **Suppress Errors and Authentication Dialogs** check box.

### Field and Control Properties

Fields and controls (including relationship items and script questions) have attributes you can configure using the options on the Design tab of the designer ribbon. Many of these attributes are shared by numerous items such as size, label position, and read-only attributes.

**Note:** When you change the properties of a field or control, the design space is updated to reflect your changes.

The properties you can edit depend on the field or control you are editing. Click any of the following links to learn more about the associated property.

- Considerations for Using the Default Value Property
- Custom Field Properties
- How You Set Hidden, Required, and Read-Only Properties
- Considerations for Setting Hidden and Read-Only Properties for Required Fields

For a full list of all properties and their descriptions, see **Design Property Descriptions**.

**Related Topics**

- Overview of the Dynamic Agent Desktop
- Edit a Workspace
- Edit a Script

### View Item Properties

You can quickly view all the properties for a field or control from the Design and Rules tabs. This helps you see what properties are already applied to an item before you edit the item.

1. From an open workspace or script, click an item on the design space.
2. Click **Show Details** on the Design tab.
   - The **Selected Object Details** window opens. The information that displays depends on the item you select and the properties that are applied to it. Any property applied to the item will be shown on the window, including the item positioning on the workspace and any visibility, hidden, or read-only attributes. See **Field and Control Properties** for descriptions of the properties that can be applied to items on workspaces.
3. Click **Close**.

### Edit a Field or Control

You can edit a field or a control on the design space of a workspace or script.
When you select a field or control on the design space, the Design and Rules tabs are displayed on the ribbon with buttons appropriate for the selected item. To select an item, you can click it on the design space or you can select it from the Current Selection drop-down menu on the Design tab.

1. From an open workspace or script, click a field or control on the design space and click the Design tab. The options displayed on the tab vary depending on the item you select.

   Tip: You can also double-click an object on the design space to select the Design tab and access properties related to the object.

2. Click a button on the Design tab to adjust the property you want to change. See Design Property Descriptions. The object is updated on the design space to reflect the change.

3. Click Save.

- Access Design Space Items Using the Ribbon

How You Select Multiple Fields and Controls
If you want to edit properties shared by a number of fields and controls, you can select them and then edit them simultaneously.

You can select multiple fields and controls on the design space to edit properties they share or remove them from your design space. When you select multiple fields and controls, Delete on the Design tab will be available on the ribbon, along with buttons to edit common attributes of the selected fields and controls. For example, if you select two fields and a title bar, you will be able to click Read Only on the Design tab, since both fields and controls have this attribute.

Press Ctrl while selecting the fields and controls on the design space that you want to edit or delete.

Access Design Space Items Using the Ribbon
You can select fields and controls using the ribbon to access design space items.

The Current Selection drop-down menu displays a tree structure showing all the fields and controls on the design space. You can use this menu to select items on the design space to view or edit.

When you navigate the tree structure and click a field or control, it is highlighted on the design space and the options on the Design tab are updated to reflect the actions you can take on the item. This lets you quickly find and select a specific field or control on the design space and access its properties without having to locate it on the design space.

1. From an open workspace or script, click an item on the design space to activate the Design and Rules tabs on the ribbon.
2. Click the Design or Rules tab.
3. From the Selected Object group on the ribbon, click the Current Selection drop-down menu.
   The tree opens listing the fields and controls on the design space. The item you selected in step 1 is automatically selected in the tree.
4. Expand or collapse the tree to navigate to the field or control you want to view.
5. Click the item in the tree to select it on the design space.

How You Access Design Properties from the Actions List
In addition to using the buttons on the Design tab to edit fields and controls on the design space, you can open an actions list that is unique for each item. The actions list contains some of the same options accessed from the Design tab.

Using the actions list can be helpful when the designer ribbon is collapsed. You can access the actions list either by right-clicking an item on the design space or by selecting the item and clicking the action arrow. The action arrow
appears on the upper right side of each selected item on the design space. The list of action options display. To select an action, click it in the list.

**Custom Field Properties**

You can add custom fields to workspaces and scripts just like a standard database field.

Since you can modify certain properties of custom fields when you create them on the Custom Fields editor, there are some considerations to be aware of when editing custom fields you add to a workspace.

- If a default value was defined for the custom field when it was created, that default value will appear when you place the field onto the design space. To override the original default field value and set a different default value from the design space, you must enable the Default Value, From Workspace, or From Script property. See Considerations for Using the Default Value Property.

- If a mask was specified for the custom field when it was created, you can view the mask by clicking RNT Mask on the Design tab on the ribbon. You cannot specify masks for custom fields when you place them on the design space. See Overview of Custom Fields.

- If you add a custom field that was configured to be required when it was created, the required property for the field will be enabled on the design space by default. However, you can disable the required property if you do not want to require the field. See How You Set Hidden, Required, and Read-Only Properties.

**Note:** Custom field properties defined on the editor affect field behavior only on the workspace or script you are editing. Properties affecting the behavior of custom fields on the customer portal are defined on the Custom Fields editor and are not affected by field properties set in a workspace or script.

**Considerations for Using the Default Value Property**

When you edit a workspace or script, you can set a default value for some fields on the workspace.

When a staff member creates a new record using the workspace or script, the field is automatically populated with the default value that you select.

The default value is applied only to new records created in the workspace or script. Records created from other channels, such as the *Ask a Question page*, are not impacted.

In addition to the Default Value property, there are a few other methods by which values can be set. When configuring your business processes in B2C Service, carefully consider the following order in which these defaults are applied.

1. Values defined by B2C Service itself, as described by the Data Dictionary.
2. Values applied by the workspace Default Value property.
3. Values applied when creating a record for a contact selected in a report.
4. Values applied from entering information in a search filter, such as when searching for a contact that is not found, then creating a new contact.
5. Values applied by rules triggered when the editor loads.

Staff members with appropriate permission can change the default value of a field. For example, if you have a group of agents that generally handles incidents for a certain product, you can create an incident workspace that has a default product specified for the Product field. As a result, all incidents that the group creates will initially be set to the default product. However, if they need to associate a different product (and they have appropriate permissions), they can change the field to a different value.
Enable the Default Value Property and Set a Default Value for a Field

When you add a field to the design space that can have a default value, the Default Value From Workspace property for the field is initially disabled and must be enabled before you can define a default value.

1. From the open workspace or script, click a field on the design space.
2. Click the Design tab and click Default Value.

   Note: Default Value displays only if the selected field accepts default values from the workspace.

3. Select From Workspace or From Script to enable the Default Value property.

A check displays next to the property that you have enabled.

4. Click the field you want to add the default value to. Editing options are displayed according to the field type. For example, you can enter text directly into a text field on the design space or select from a drop-down menu on a menu field.
5. Click Save.

How You Set Hidden, Required, and Read-Only Properties

You can apply Read–Only, Required, and Hidden properties to many of the items you add to a workspace or script.

- **Read–Only**—Read–Only items are displayed to agents, but agents cannot change the values in the fields or controls. This property is not available for multi-edit workspaces.
- **Required**—Required items are displayed to agents. When agents use the workspace or script to edit a record, they are required to enter a value for the field in order to save the record.
- **Hidden**—Hidden items are not displayed to agents.

When you set any of these properties, you can choose when the property should be applied to the item. You can choose to apply the property only when the workspace or script is used to create a record, only when it is used to open an existing record, or both.

Note: Multi-edit workspaces do not include the option to apply the Required or Hidden properties when creating new records, since these workspaces are not used when creating records.

You can also apply these properties to the item on a per-profile basis, allowing you to use the same workspace or script for several profiles if you want different profiles to have different settings for these properties. For example, you can create a workspace that includes fields showing contacts’ phone numbers and addresses. You can then set the Hidden properties by profile so the fields are shown to staff members with one profile, but are not visible to staff members with a different profile.

Set the Read–Only Property

This procedure uses the Read–Only property as an example, but applies to the Hidden and Required properties as well.

1. From the open workspace, click the item you want to make Read–Only.
2. Click the Design tab and click Read–Only.
3. To make the item read–only for all profiles when creating a new record, select On New.
4. To make the item read–only for all profiles when opening an existing record, select On Open.
5. To make the item read–only on a per-profile basis, select Profile–Based. The profile selection window opens.
   a. Select the check boxes in the On New column next to the profiles you want to apply the property to. Profiles you select will have read–only access to the item when staff members with the profile use the workspace or script to create a new record.
   b. Select the check boxes in the On Open column next to the profiles you want to apply the property to. Profiles you select will have read–only access to the item when staff members with the profile use the workspace or script to open an existing record.
6. Click **OK**.
7. Click **Save**.

**Considerations for Setting Hidden and Read-Only Properties for Required Fields**

You can set the Hidden and Read–Only properties for required fields when the combination of properties does not prevent a required field from being set. However, attempting to set certain combinations of the Hidden and Read–Only properties on required items is not allowed.

When setting these properties for required fields, you should consider the following limitations.

- Standard fields that are required for a workspace, such as the Contact field on incident workspaces, cannot have their Required properties disabled or Read–Only properties enabled for new records.
- If you set a field property to Read–Only for new records, you cannot also enable the Required property for new records.
- If you set a field to be hidden when creating a record, you cannot also enable the Required property when creating a record.
- If you set a field to be required when opening a record, you can set the Hidden property for that field to any value.
- If you set a field to be required when creating a record, you can enable the Hidden property when opening an existing record.
- If you set a field to always be required, you can enable the Hidden property when opening an existing record.
- If you set a field to always be required, you can enable the Hidden property when creating a record if you also set a default value for the field on the design space. See **Considerations for Using the Default Value Property**.

**Design Property Descriptions**

When editing fields or controls that you add to a workspace or script, you can adjust different properties depending on the element you select. When you add an item to the design space, you can select it and then edit its properties using the options available on the Design tab.

The options on the Design tab are organized by groups and described in the following sections. Not all groups are available for all elements on workspaces or scripts.

- **Selected Object Properties**
- **Behavior Properties**
- **Label Properties**
- **Layout Properties**
- **Options Properties**

**Note:** For the sake of simplicity, descriptions that refer to fields may also apply to controls and relationship items.

**Selected Object Properties**

The options in the Selected Object group let you select the element to edit and delete. Options for tab controls are also available here.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Selection</td>
<td>This field shows the name of the item currently selected on the design space.</td>
</tr>
</tbody>
</table>
## Property | Description
--- | ---
Show Details | Click this button to display a list of properties and corresponding values for the selected item.  
Delete | Click this button to delete the item currently selected on the design space.  
Add Tab | Click this button to add a tab. This button displays only when a tab set is selected.  
Add Tab After | Click this button to add a new tab after the tab that is currently selected.  
Add Tab Before | Click this button to add a new tab before the tab that is currently selected.  
Move Left | Click this button to move the tab that is currently selected one position to the left.  
Move Right | Click this button to move the tab that is currently selected one position to the right.  
Tab Indexes | Click this button to define the order in which the fields and controls on the currently selected tab can be tabbed through using the keyboard Tab key.  
Set Child Tab Indexes from Top to Bottom | Select this option to start the tabbing sequence with the upper left item on the selected tab, proceed down to the end of the column, continue at the top of the next column, and so on, ending with the item at the lower right.  
Set Child Tab Indexes from Left to Right | Select this option to start the tabbing sequence with the upper left item on the selected tab, proceed across to the end of the row, continue at the left of the next row, and so on, ending with the item at the lower right.  

### Behavior Properties

The options in the Behavior group let you modify read-only, required, and hidden properties for the selected element. You can also change the tab order of the selected element.

| Property | Description |
--- | --- |
Read Only | Click this button to specify when this property should be applied to the selected element.  
  - On New—The item will be read-only when the workspace or script is used to create a new record. Multi-edit workspaces do not have this option.  
  - On Open—The item will be read-only when the workspace or script is used to open an existing record.  
  - Profile Based—The item will be read-only for staff accounts using selected profiles. Each profile can have different On New and On Open options applied.  
  The Read Only property cannot be set to On New if the object Required property is also set to On New for any or all profiles, and a default value is not set for the object. |

<td>• Profile Based—The item will be hidden for staff accounts using selected profiles. Each profile can have different On New and On Open options applied.</td>
</tr>
<tr>
<td></td>
<td>Required fields cannot be hidden when creating records.</td>
</tr>
<tr>
<td>Tab Order</td>
<td>Click this button to define the order in which the fields and controls can be tabbed through on the parent table of the workspace or script, using the keyboard Tab key. You can manually specify the tab order value for each item or you can assign the tab order automatically.</td>
</tr>
<tr>
<td>Set Parent Table's Tab Indexes from Top to Bottom</td>
<td>Select this option to automatically assign tab order values for all items. When you select this option, the tab ordering will start with the upper left item on the parent table, proceed down the column, then continue at the top of the next column, ending with the item at the lower right. This selection will reset any numerical ordering that has been defined using the Value property.</td>
</tr>
<tr>
<td>Set Parent Table's Tab Indexes from Left to Right</td>
<td>Select this option to automatically assign tab order values for all items. When you select this option, the tab ordering will start with the upper left item on the parent table, proceed across the row, then continue at the left of the next row, ending with the item at the lower right. This selection will reset any numerical ordering that has been defined using the Value property.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a value in the property to customize the order in which fields and controls can be tabbed through on the workspace or script. The first field or control is 0, and each subsequent press of the Tab key steps through the items in numerical order. By specifying a numerical order, you can define whatever tab sequence you want. However, for ease of use, it is usually best to follow the order of the fields and controls as they are arranged on the design space.</td>
</tr>
</tbody>
</table>
Label Properties

The options in the Label group let you adjust the fonts and placement of labels for fields you add to your workspace or script.

<table>
<thead>
<tr>
<th>Property</th>

</tr>
<tr>
<td>Align Text Left/Center/Right</td>
<td>Click these buttons to move the label to the leftmost, center, or rightmost side of the available space for the label.</td>
</tr>
<tr>
<td>Label Position</td>
<td>Click this drop-down menu to select the label position in respect to the field. You can position the label at the right, left, top, or bottom of the field. The default label position is to the left of the field.</td>
</tr>
<tr>
<td>Text</td>
<td>Click this button to change the text for the label of a field or control. When changing the label for a control, such as a tab, a text box will display. Enter the text you want for the label in the text box and press Enter. When changing the label for a field, the label will be highlighted when you click the Text button and you can edit the label on the design space. You can also click the label on the design space without clicking the Text button. To allow the use of shortcut keys (Alt + &lt;selected character&gt;), enter an ampersand (&amp;) in front of the character you want to be the shortcut key. For example, to allow staff members to move the focus to a control with the label “Details” by pressing Alt+T, enter De&amp;tails.</td>
</tr>
</tbody>
</table>

**Note:** Text fields used in scripts are limited to 1,000 characters.

Layout Properties

The options in the Layout group let you change the padding, margins, and height of workspace or script elements. You can also increase or decrease the number of rows or columns used by the selected element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Cell</td>

## Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Increase/Decrease Row Span</td>
<td>Select these options to increase or decrease the number of table rows used by the selected field or control. The number of rows used is increased or decreased by one each time this option is selected.</td>
</tr>
<tr>
<td>Increase/Decrease Column Span</td>
<td>Select these options to increase or decrease the number of table columns used by the selected field or control. The number of columns used is increased or decreased by one each time this option is selected.</td>
</tr>
<tr>
<td>Position</td>
<td>Click this button to select the position of the selected object on the table cell that contains it. You can also select options to stretch the object on the table cell.</td>
</tr>
<tr>
<td>Padding</td>
<td>Click this button to define the amount of space between the boundaries of the selected control and its contents on the left, top, right, and bottom. For example, you can specify that the text in a panel will begin 50 pixels below the top of the panel. The available options are None, Narrow, Medium, Wide, and Custom. Select Custom to define a specific number of pixels to use for the top, bottom, left, and right padding.</td>
</tr>
<tr>
<td>Margin</td>
<td>Click this button to define the amount of space between the selected control and other fields and controls on the left, top, right, and bottom. The available options are None, Narrow, Medium, Wide, and Custom. Select Custom to define a specific number of pixels to use for the top, bottom, left, and right margins.</td>
</tr>
<tr>
<td>Size</td>
<td>Click this button to specify the size of the selected control. For some controls, you can select Enable Auto Sizing to automatically adjust the control height and width to its natural size. If you disable auto sizing, you can enter the height and width (in pixels) of the field or control on the workspace. On some fields and controls, the MultiLine or Set Fixed Height properties on the Design tab Options group must be enabled before you can edit the Height property.</td>
</tr>
</tbody>
</table>

### Options Properties

The properties you can edit on the Options group depend on the element you select.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accepts Return</td>
<td>Select this check box if you want staff members to be able to press Enter in a multi-line field.</td>

</tr>
<tr>
<td>Activity Position</td>
<td>Click this button to set the position of the activity status indicator on the Chat Transcript Control relationship item.</td>
</tr>
<tr>
<td>Allow Delete</td>
<td>Select this check box to allow agents to delete files that have been attached and saved to a record. If this check box is not selected, attached files can be deleted only if the Save button has not yet been clicked.</td>
</tr>
<tr>
<td>Allow Multiple Selections</td>
<td>Select this check box to allow agents to select more than one item in a list box control.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow Tab Reordering</td>
<td>Select this check box to allow staff members to drag and reorder the tabs of the selected tab set. If this check box is not selected, the tabs cannot be reordered by staff members.</td>
</tr>
<tr>
<td>Always Show Parent with Visible Child</td>
<td>Select this check box for a hierarchal menu to display parent items in cases where the parent is hidden but one or more of its children are visible. A parent displayed in this manner cannot be selected.</td>
</tr>
<tr>
<td>Anonymous</td>
<td>Select this check box to permit survey responses to be entered when a valid contact is not associated with the record being viewed. This option is available only if the survey allows anonymous responses.</td>
</tr>
<tr>
<td>Answer ID</td>
<td>Click this button and enter an answer ID for an Answer Display control.</td>
</tr>
<tr>
<td>Auto Ellipsis</td>
<td>Select this check box if you want an ellipsis (…) automatically added when the text of the title bar exceeds the space allocated to it.</td>
</tr>
<tr>
<td>Auto Scroll Control Position</td>
<td>Click this button to set the position of the auto scroll control on the Chat Transcript Control relationship item.</td>
</tr>
<tr>
<td>Border Style</td>
<td>Click this button to select a border style for the selected table control. The available options are None, Fixed Single, and Fixed 3D.</td>
</tr>
<tr>
<td>Background Image URL</td>
<td>Click this button and enter a URL for an image you want to display in the table background on the Agent Browser UI.</td>
</tr>
<tr>
<td>Can Assign to Group</td>
<td>Select this check box to permit staff members to assign the record to a group rather than a specific staff member. If this check box is not selected, staff members must assign the record to a staff member within a group.</td>
</tr>
<tr>
<td>Cell Border Style</td>
<td>Click this button to select a border style for the cells in the selected table control. The available options are None, Single, Inset, Inset Double, Outset, Outset Double, and Outset Partial.</td>
</tr>
<tr>
<td>Control Context</td>
<td>Click this drop-down menu and select an option that controls how names in the Assigned field for tasks are grouped. The options are:</td>
</tr>
<tr>
<td></td>
<td>• Default—Names are displayed in a flat alphabetical list.</td>
</tr>
<tr>
<td></td>
<td>• Sales—Names are displayed by Manager hierarchy.</td>

<tr>
<td>Default Channel</td>
<td>Click this button to define the default channels for customer entries and notes.</td>
</tr>
<tr>
<td>Default Channel for Customer Entry</td>
<td>Select the default channel to use for the customer’s entry on a record from this list. Options include No Default, Phone (the default value), Fax, Post, Web, and Email.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default Channel for Note</td>
<td>Select the default channel to use for the note on an incident, contact, organization, or opportunity from this list. Options include No Default, Phone, Fax, Post, Web, and Email.</td>
</tr>
<tr>
<td>Default Font</td>
<td>Click a drop-down menu from this button group to select a default font and font size for the Rich Text Incident Thread control.</td>
</tr>
<tr>
<td>Default Notification Action</td>
<td>Click this button to specify when to notify subscribers when an answer is updated. Options include No Change, Do Not Notify, Hourly, Daily, Weekly, and Monthly.</td>
</tr>
<tr>
<td>Default Phone Type</td>
<td>Click this button to select the default phone type that should be displayed on the workspace. For example, you can choose Office Phone or Mobile Phone.</td>
</tr>
<tr>
<td>Default Thread</td>
<td>Click this button to define the default thread type for new incidents or incidents being edited.</td>
</tr>
<tr>
<td>Default Thread on Edit</td>
<td>Click this drop-down menu and select an option to define the default thread for an incident being edited. Options include No Default, Private Note, Response (the default value), and Customer Entry.</td>
</tr>
<tr>
<td>Default Thread on New</td>
<td>Click this drop-down menu and select an option to define the default thread for a new incident. Options include No Default, Private Note, Response, and Customer Entry (the default value).</td>
</tr>
<tr>
<td>Default Value</td>
<td>Click this button and select From Workspace or From Script if you want to specify a default value for a field. When this option is enabled, you can edit the field on the design space to specify the default value that will be used when the workspace or script is used to create a record. The value can be changed by staff members who have permission to edit the field. See Considerations for Using the Default Value Property. The default value is applied only to new records created in the workspace or script. Records that were created from other channels, such as the Ask a Question page, are not impacted.</td>
</tr>
<tr>
<td>Delay Page Load</td>
<td>Select this check box to prevent the web page specified in the browser control from loading until the tab the control is on is selected. When this option is disabled, the web page will load as soon as the workspace or script opens, even if the browser control is not initially displayed. If the browser is visible when the workspace or script page is opened (for example, it appears on the top tab), it will always open immediately even if this property is enabled.</td>
</tr>
<tr>
<td>Disable Email Icon</td>
<td>Select this check box to disable the Send Email envelope button that appears next to the Email Addresses field. When this check box is cleared, clicking the Send Email button opens the contact email address in a new message in the workstation default mail client, outside of B2C Service.</td>
</tr>
<tr>
<td>Display Options</td>
<td>Click this button to select toolbar options for the Chat Control relationship item.</td>
</tr>
<tr>
<td>Show Toolbar</td>
<td>Select this option to display the Chat Control toolbar.</td>
</tr>
<tr>
<td>SmartAssistant</td>
<td>Select this option to display the SmartAssistant button on the Chat Control toolbar.</td>
</tr>
<tr>
<td>Search Knowledgebase</td>
<td>Select this option to display the Search Knowledgebase button on the Chat Control toolbar.</td>
</tr>

</tbody>
</table>
| **Report** | Click this button to open the **Select Report** window to select a report for the control. See *How You Add Reports and Relationship Items to Custom Workspaces and Scripts*.  

**CAUTION:** The Select Report window displays all reports, not just those that apply to the selected workspace. Be sure to select a report that applies to the workspace. For example, do not select an opportunity search report to appear in the Organization field of a contact record. |
| **Report Behavior** | Click this button to configure report behavior properties. See *Report Properties*. |
| **Required for Solved/Waiting** | Select this check box if staff members must select a value for the item before they can set a record status to Solved or Waiting. |
| **Response Options** | Click this button to select options for the Rich Text Incident Thread control on incident workspaces or the Chat Control control on chat workspaces. |
| **Allow Encoding Choice** | Select this option to allow agents to choose between rendering chat comments as HTML or plain text. |
| **Always Leave as Plain Text** | Select this option to always render chat comments as plain text. |
| **Always Send as HTML** | Select this option to always render chat comments as HTML. |
| **Confirm Response When Saving and Send On Save is Selected** | Select this option if you want the staff member to confirm that the incident response should be sent. |
| **Commit Response When Incident is Saved** | Select this option if you want the staff response to be committed to the incident thread when the response is saved. |
| **Add a Response When Selecting Send On Save if No Response Already Exists** | Select this option to automatically display the response options panel when you select the Send on Save check box on the Rich Text Incident Thread control. Clearing the check box closes the response options. Additionally, when this property is enabled, clicking the slider on the Messages tab to open the response options panel automatically selects the Send on Save check box, and closing the response options clears the check box.  

If this option is disabled, then expanding the response options panel enables the Send on Save check box, but clicking the Send on Save check box does not automatically expand the panel. Clearing the Send on Save check box automatically collapses the panel, but collapsing the panel does not automatically clear the Send on Save check box. |
| **Always show email message header for responses** | Select this option if you want the email message header to always display when the response is sent. |
| **Reassign the Incident When Send On Save is Selected** | Click this drop-down menu and select one of the following options for reassigning an incident when a response is sent.  

- No Change—The incident Assigned field does not change.  
- To Current Agent—The Assigned field changes to the staff member working the incident.  
- To Unassigned—The Assigned field is set to No Value. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Automatically Select Send On Save When Opening an Incident | Click this drop-down menu and select an option that indicates when an incident response should be sent automatically. The options are:  
- Never—A response is never sent automatically.  
- On New—A response is sent for a new incident.  
- On Edit—A response is sent when an incident is edited.  
- On New and Edit—A response is sent whenever an incident is added or edited.  
To automatically select the Send on Save check box only when sending a response, an agent can click the slider bar at the left of the incident thread and enter the response using the response options section.  
This option is not supported on the Agent Browser UI. |
| Change the Incident's Status when Send On Save is Selected | Click this drop-down menu and select an option for changing the incident status when a response is sent. The options are:  
- No Change—The incident status does not change when a response is sent.  
- To Waiting—The incident status changes to Waiting when a response is sent.  
- To Solved—The incident status changes to Solved when a response is sent. |
| RNT Mask | Click this button to view the mask for the selected custom field. Standard fields do not have mask properties.  
See [Input Masks](#) for information about specifying masks for custom fields. |
| Script | Click this button to open the **Select a Script** window to change the script used in a script control. See [Add a Script Control to the Design Space](#). |
| Search Report | Click this button to open the **Select Report** window to select a search report. See [How You Add Reports and Relationship Items to Custom Workspaces and Scripts](#).  
This property is used for items that include a search report, such as the Contacts, Tasks, Guided Assistance, and Custom Object View relationship items. |
| Secondary Search Report | Click this button to open the **Select Report** window to select a secondary search report. See [How You Add Reports and Relationship Items to Custom Workspaces and Scripts](#).  
This property is used for relationship items that can include a secondary search report, such as the Contacts and Tasks relationship items. |
<p>| Set Fixed Height | Select this check box to enable the Height layout property. When this option is not selected, the control will fill the maximum allowed space. |
| Show Categories | Click this button to show or hide the categories tree on the Products and Categories relationship item. The categories tree is visible by default. |
| Show Image | Select this check box to display the paper clip icon for file attachment and quote controls when files are attached to the record. |</p>

<td>Splitter Anchor</td>
<td>Click this drop-down menu to select the splitter anchor. Options are Left, Right, Top, and Bottom. The options available in the menu depend on the splitter orientation. If the splitter orientation is set to Vertical, you can anchor the splitter to the Left or Right. If the splitter orientation is set to Horizontal, you can anchor the splitter to the Top or Bottom.</td>
</tr>
</tbody>
</table>
| Splitter Orientation           | Click this drop-down menu to select the splitter orientation.  
  • Vertical—The splitter is divided into two vertical sections, one on the left and one on the right.  
  • Horizontal—The splitter is divided into two horizontal sections, one on the top and one on the bottom.                                                                                                                                  |
| Splitter Position              | Click this button to enter the number of pixels the splitter is offset from the anchor side. If the Splitter Orientation property is set to Horizontal, the default splitter position is 300. If the Splitter Orientation property is set to Vertical, the default splitter position is 100.                                           |
| Summary Panel Alignment        | Click this button to select if the Summary Panel will appear as the first tab in the tab set or as a persistent panel above the tab set. Options are First Tab or Top. The default value for a new workspace is Top.  
  This button is only available when the workspace primary tab set is selected. This property is applicable only when a workspace is used on the Agent Browser User Interface.                                                                 |
  
  | Note: When enabled on an incident workspace on the Agent Browser UI, the summary panel displays above the tab set containing summary information about the incident. |
| Summary Panel Height           | Click this button to enter the height of the summary panel in pixels.  
  This button is available only when the workspace primary tab set is selected.                                                                                                                                                                                                          |
| Suppress Errors and Authentication Dialogs | Select this check box to suppress any warning prompts (such as script errors and authentication requests) that may occur in the browser control when a URL is loaded.                                                                                                                                                          |
| Survey                         | Click this button to select a survey for the Survey by Proxy control.                                                                                                                                                                                                                                                                        |
| Tab Alignment                  | Click this button to select where you want tab sets placed on the dashboard. The available options are Left, Right, Top, and Bottom.                                                                                                                                                                                                        |
| Tab Display Style              | Click this drop-down menu and select a tab display style option from the following list.  
  • Regular—Displays the selected tab set as the default, horizontal style.  
  • Accordion Single Open—Displays the selected tab set as an accordion with only the selected tab open. When a different tab in the tab set is open, the previous open tab will close.  
  • Accordion Multiple Open—Displays the selected tab set as an accordion, allowing for multiple tabs to remain open.  
  
<p>| Note: The accordion tab set display applies only to workspaces on the Agent Browser UI. |
| Thousands Separator            | Select this check box to add a thousands separator to an integer when the value is entered on a workspace (for example, &quot;10000&quot; becomes &quot;10,000&quot;).                                                                                                                                                                                                 |
| Thread Display                 | Click this drop-down menu and select Show Thumbnails and then specify the number of threads that will display on the incident workspace. The incident threads will display as thumbnails once the specified threshold is met.                                                                                                                                 |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Thread Orientation</strong></td>
<td>Click this drop-down menu to select a thread orientation for the Rich Text Incident Thread control. The available options are Vertical, Horizontal, or Horizontal with Splitter. By default, a vertical thread orientation is used.</td>
</tr>
<tr>
<td><strong>Threshold Height</strong></td>
<td>Click this button to enter the threshold height for the summary panel in pixels. If the space available for the summary panel is less than this value, the summary panel becomes the first tab on the tab set. The minimum value of the threshold height is 100 pixels greater than the value specified in the Summary Panel Height control.</td>
</tr>
<tr>
<td><strong>Time Limit</strong></td>
<td>Click this button to select the maximum amount of time that the report specified in the report control should take to generate. You can select a value up to 240 seconds. Specifying a time limit can improve performance since workspaces are unavailable until reports on the workspace generate. Reports that take longer than the specified time limit to generate will not be displayed on the workspace. See Set a Time Limit for a Report Control.</td>
</tr>
<tr>
<td><strong>Time Required</strong></td>

</tr>
<tr>
<td><strong>Wrap Text</strong></td>
<td>Select this check box to wrap the label text if needed to fit the label in the space provided.</td>
</tr>
</tbody>
</table>
Ribbon and Quick Access Toolbar Buttons

When designing a workspace, or a script that will be used in a workflow, you can select which buttons to place on the ribbon, the Quick Access toolbar, and the Actions drop-down menu (for the Agent Browser UI).

Most of the buttons you can place on the ribbon can also be placed on the Quick Access toolbar. Staff members see only the buttons you select, which vary by the type of workspace or script you are creating. In addition, if you are configuring workspaces for the Agent Browser UI, you will configure the Actions drop-down using the ribbon configuration.

**Note:** Ribbon and Quick Access toolbar configuration options are available for scripts only when desktop workflows are enabled for your site. Contact your Oracle account manager to enable desktop workflows.

The ribbon buttons available vary by workspace type. Buttons available to each script type are the same as those available to the corresponding workspace type, with the exception of the Expand button, which is not supported by scripts.

How You Work with Ribbon and Quick Access Toolbar Buttons

Buttons are added and removed from the ribbon and Quick Access toolbar using the ribbon designer.

You can add tabs and tab groups to your ribbon to organize the buttons on the ribbon, and you can arrange tabs, groups, and buttons in any order you want. You can also change button display options to help optimize the ribbon display. Certain ribbon buttons include special features you can use to access record information and links to web pages.

By default, the ribbon and Quick Access toolbar for a new workspace or script contain the same buttons as the standard workspace for the corresponding workspace type. Therefore, it is not necessary to edit the ribbon or Quick Access toolbar if the standard buttons are adequate. Also, if you have made changes, you can restore the default content at any time by clicking the Reset to Default button on the ribbon designer window.

Open the Ribbon Designer

You can customize the ribbon and the Quick Access toolbar by using the ribbon designer.

The top of the ribbon designer features a ribbon preview that shows the tabs, button groups, and buttons currently on the ribbon as well as the buttons on the Quick Access toolbar. The bottom part of the ribbon designer includes a clickable path to the ribbon item currently selected on the preview, design options for customizing the selected item, and a list of ribbon items editable from the same path. The path, design options, and list change dynamically as different items are selected on the ribbon preview.

For instance, when you select the Save button group on the default Home tab, the ribbon designer displays the path of the selected group (Editing Tab: Home), a list of the button groups currently defined at that location, and design options for customizing the button groups. Clicking a group or a button on the ribbon preview changes the design options and list to reflect the item you have selected.

1. From the open workspace or script, click the Home tab and click Ribbon.

Customize the Ribbon

Ribbon tabs contain button groups, which contain buttons. You can easily add, remove, or rename any of these items using the ribbon designer. You can also add vertical separators to organize buttons within a group. To select an item you want to edit, click it on the preview ribbon.

You can right-click items on the ribbon designer to access a list of actions you can take on each item. This gives you a shortcut to many of the same functions described in the following procedure.

1. To add a tab to the ribbon, click Add Tab on the bottom of the ribbon designer.
   a. Enter a name for the new tab in the Ribbon Tab Name field.
   b. Click OK.
2. To add a button group to a tab, click the tab you want to add the group to (either on the ribbon preview or in the item list).
   a. Click Edit Tab.
   b. Click Add Group.
Using B2C Service

Chapter 3
Dynamic Agent Desktop

To add a button to a button group, click the button group you want to add the button to (either on the ribbon preview or in the item list).

- Click **Edit Group**.
- Click **Add Buttons** to open the **Add or Remove Buttons** window.
- Select the check boxes next to the buttons you want to add to the button group.
- Click **OK**.

**Note:** When adding buttons to the ribbon, be sure to include only buttons that agents actually need to use. If a button group contains numerous buttons, you can either create another group to make the ribbon easier to navigate, or you can edit the group and click **Add Separator** to add a vertical line to the group to break up buttons in the group.

4. Click **OK** on the ribbon designer.

### Rename a Tab, Group, or Button

Use this procedure to rename a tab, group, or button (either on the ribbon preview or in the item list).

1. To rename a tab, click the tab you want to rename.

   **Note:** The Home tab cannot be renamed.

   - Click **Rename Tab**.
   - The **Rename Tab** window opens.
   - Enter a new name for the tab in the **Tab Name** field.
   - Click **OK**.

2. To rename a button group, click the button group you want to rename.

   - Click **Rename Group**.
   - The **Rename Group** window opens.
   - Enter a new name for the group in the **Group Name** field.
   - Click **OK**.

3. To rename a button, click the button you want to rename.

   - Click **Rename Button**.
   - The **Rename Button** window opens.
   - Enter a new name for the button in the **Button Name** field.
   - Click **OK**.

4. Click **OK**.

### Move Tabs, Groups, Buttons, and Separators

Use this procedure to move items on the ribbon designer.

1. Click the tab, group, button, or separator you want to move.

2. Click the up or down arrow at the right of the item list to move the item where you want it.

3. Click **OK**.

### Delete Tabs, Groups, Buttons, and Separators

Use this procedure to delete items on the ribbon designer.
CAUTION: If you delete a tab, all the groups and buttons on the tab are also deleted. If you delete a button group, all the buttons in the group are deleted. The Home tab cannot be deleted.

1. Click the tab, group, button, or separator you want to delete.
2. Click **Delete Tab**, **Delete Group**, or **Delete Button**.
3. Click **Yes** to confirm the deletion.

**Edit Ribbon Buttons**

You can edit buttons on the ribbon to change their size and to specify if text should be included with the icons.

1. On the ribbon preview, click the button you want to edit.  
   **Tip:** You can also right-click tabs, groups, and buttons on the ribbon preview to access Edit, Delete, and Rename options.
2. Click **Edit Button** to open the **Edit Button** window.
3. To select a different size for the button, select **Big Button** or **Small Button** from the **Button Size** drop-down menu.
4. To select a different style for the button, select **Icon and Text** or **Icon Only** from the **Button Style** drop-down menu.
5. Click **OK**.

**Set a Link to a URL on the Links Button**

You can define a link to a URL on the Links button, allowing staff members access to the URLs you specify.

The Links button is added to the ribbon in the same manner as other ribbon buttons. However, this button has unique functionality. You can edit the Links button to create a menu of links to URLs. When staff members click the Links button drop-down menu, they will see the list of links you defined. Selecting one of the links takes them to the specified URL.

1. Click **Links** (either on the ribbon preview or in the item list). See **Customize the Ribbon** for the procedure to add buttons to the ribbon.
2. Click **Edit Button**.
   The **Edit Links** window opens.
3. Select the size of the Links button from the **Button Size** drop-down menu.
4. Select whether to display the button with an icon and text or only an icon from the **Button Style** drop-down menu.
5. Right-click the link browse tree and select **Add Link**.
6. Enter the name of the link (what staff members will see on the menu) in the **Label** field.
7. Enter the URL in the **URL** field that will open when staff members click the link.
8. To remove a link, right-click the link you want to remove and select **Remove Link**.
9. To add a folder, right-click the link browse tree and select **Add Folder**.
   a. Enter the name of the folder in the **Label** field.
10. To add a separator, right-click the link browse tree and select **Add Separator**.
11. Click **OK**.

**Set Information Options on the Info Button**

You can define the information that displays when staff members hover over or click the Info button.

The Info button is added to the ribbon in the same manner as other ribbon buttons. However, the Info button has unique functionality. You can edit this button to add information about the record being edited on the workspace or script. When staff members hover over the button or click it, they can view the information you want to display.
Tip: To reduce clutter on your workspace, consider configuring the Info ribbon button to show fields that are always read only, such as the Date Created and Date Updated fields on an incident.

1. Click **Info**, either on the ribbon preview or on the bottom of the designer. See Customize the Ribbon for the procedure to add buttons to the ribbon.
2. Click **Edit Button**.
   The **Info Item Editor** opens.
3. Click the **Button Size** drop-down menu to select the size of the Info button.
4. Click the **Button Style** drop-down menu to select whether to display the button with an icon and text or only an icon.
5. Expand the field tree in the Available Info Fields column and select the fields you want to add to the Info button.
6. Click the right arrow, located between the Available Info Fields and Selected Info Fields columns, to place the fields in the Selected Info Fields column.
   Fields are displayed on the Info button in the order they are added.
7. To remove fields from the Info button, select the fields in the Selected Info Fields column and click the left arrow, located between the Available Info Fields and Selected Info Fields columns, to remove the fields.
8. Click **OK**.

Add or Remove Quick Access Toolbar Buttons
You can customize the Quick Access toolbar to add buttons that are commonly used by your staff members. For example, the Save button is often added to the Quick Access toolbar so records can be saved without having to select a tab on the ribbon to access the Save button.

1. Click **Configure Quick Access Buttons** on the Quick Access toolbar on the Ribbon Preview.
   The **Configure Quick Access Buttons** window opens.
2. Select the check boxes next to the buttons you want to add to the Quick Access toolbar.
   Tip: Buttons will appear on the Quick Access toolbar in the order you select them.
3. Clear the check boxes next to the buttons you do not want.
4. Click **OK**.
   The buttons on the Quick Access toolbar shown on the ribbon designer are updated to reflect the changes you made.

Restore Default Content on the Ribbon and Quick Access Toolbar
After you edit a ribbon, you may decide you want to restore the default content.

The ribbon defaults can be restored at any time. When you restore the defaults, the content on the Quick Access toolbar is also reset. In addition, buttons on the ribbon will be reset to use their default size and style.

1. On the lower left corner of the ribbon designer, click **Reset to Default**.
2. Click **Yes**.

Desktop Workflows

Overview of Desktop Workflows
To promote efficiency and reduce the chances for human error, you can create highly customized desktop workflows that guide agents through complex customer interactions and data updates.
When following elaborate business processes, staff members often evaluate critical information and perform a variety of actions across multiple records. A desktop workflow is a sequence of workspaces, scripts, decisions, and actions—even other embedded workflows—that supports a business process. Using an intuitive design interface, you define a workflow by assembling a set of elements into a logical order to form a flow diagram, then adding decision logic to advance the flow.

After you have designed a workflow, you can provide staff members access to it by selecting it in place of a workspace for an editor within their profile. When a record is opened into that editor (an incident, for example), the staff member is guided dynamically through the workflow, starting at the entry point. Events and conditions are evaluated and executed in the sequence you have specified. (For instance, when a staff member updates the value of a field, the workflow can evaluate the update and open a related record in a different workspace.)

In this way, you can provide your staff with an environment tailored to their skills and responsibilities. When their activities are supported by an optimized workflow, staff members can worry less about remembering the details of your complex business processes and focus more on completing them accurately.

Note: Before designing desktop workflows, it is important to first become familiar with workspaces, workspace rules, guides, agent scripts, and script rules—and the strengths and benefits of each—to better understand how workflows are used to integrate them. See Overview of the Dynamic Agent Desktop.

Desktop Workflow Design Canvas and Ribbon

When editing a desktop workflow, you perform most tasks using the ribbon and canvas. These resources provide all of the tools and elements you need to design any workflow, simple or complex.

The workflow design ribbon includes three standard tabs (Home, Insert, and View) as well as two contextual tabs (Element Tools and Path Tools) that become visible when an element or connector is selected. Each tab has one or more groups containing buttons you can use to modify the desktop workflow or its elements on the canvas.

Desktop Workflows Home Tab

The Home tab gives you access to options that impact the entire desktop workflow. For example, you can select workflow elements, perform basic editing functions, add notes, and validate and preview the workflow.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Designer</td>
<td>The buttons in this group provide access to basic design functions.</td>
</tr>
<tr>
<td>Preview</td>
<td>Click this button to preview the desktop workflow. See Preview a Workflow.</td>
</tr>
<tr>
<td>Audit Log</td>
<td>Click this button to view a history of all actions taken on the desktop workflow, such as when it was created and edited and by whom.</td>
</tr>
<tr>
<td>Notes</td>
<td>Click this button to add notes about the desktop workflow.</td>
</tr>
<tr>
<td>Clipboard</td>
<td>The buttons in this group provide access to basic editing commands when working with components on the canvas. Clipboard functions are restricted to the open workspace. They cannot be used to copy elements from one workflow to another.</td>
</tr>
</tbody>
</table>
Using B2C Service

Chapter 3

Dynamic Agent Desktop

### Desktop Workflows Insert Tab

The Insert tab lets you add components to your flow diagram, either one at a time or in predefined workflow templates.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Template** | The buttons in this group let you select a predefined flow template to apply to your desktop workflow. See [Apply a Workflow Template](#).  
**CAUTION:** When you add a template, any content you previously added is deleted from the canvas. |
| New vs. Edit | Hover over this button to see a preview of the New vs. Edit workflow template. Click the button to add the template to the canvas. See [New vs. Edit Workflow Template](#). |
| Add Task | Hover over this button to see a preview of the Add Task workflow template. Click the button to add the template to the canvas. See [Add Task Workflow Template](#). |
| Copy Incident | Hover over this button to see a preview of the Copy Incident workflow template. Click the button to add the template to the canvas. See [Copy Incident Workflow Template](#). |
| Create Contact | Hover over this button to see a preview of the Create Contact workflow template. Click the button to add the template to the canvas. See [Create Contact Workflow Template](#). |
| **Elements** | The buttons in this group let you select elements to add to your flow diagram. For a description of available elements, see [How You Design a Flow Diagram](#). Elements can also be accessed from the Home tab. |

### Desktop Workflows View Tab

The View tab provides options for changing your view of the design canvas.

<table>
<thead>
<tr>
<th>Group/Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paste</td>
<td>Click this button to paste the contents of the clipboard.</td>
</tr>
<tr>
<td>Cut</td>
<td>Click this button to cut selected elements from the canvas to the clipboard.</td>
</tr>
<tr>
<td>Copy</td>
<td>Click this button to copy selected elements from the canvas to the clipboard.</td>
</tr>
<tr>
<td>Delete</td>
<td>Click this button to delete selected elements from the canvas.</td>
</tr>
<tr>
<td><strong>Elements</strong></td>
<td>The buttons in this group let you add elements to your flow diagram. For a description of available elements, see <a href="#">How You Design a Flow Diagram</a>. Elements can also be accessed from the Insert tab.</td>
</tr>
<tr>
<td>Validate</td>
<td>Click this button to check the flow diagram for errors. See <a href="#">Workflow Validation</a>.</td>
</tr>
</tbody>
</table>
### Group/Button | Description
--- | ---
**Canvas** | The settings in this group let you select canvas options. B2C Service remembers any changes you make to these settings to give you a consistent, personalized design experience.

**Element Labels** | Select this check box to display labels for elements in the diagram. Name labels are displayed by default.

**Connector Labels** | Select this check box to display labels for connectors in the diagram. Labels are displayed by default.

**Validation Results** | Select this check box to display validation icons in the diagram. Validation results are hidden by default. See Workflow Validation.

**Working Record** | Select this check box to display working record labels for elements in the diagram. Labels are displayed by default.

**Grid** | Select this check box to display the design grid. The grid is displayed by default.

**Grid Size** | Click this drop-down menu to select the size of the canvas grid.

**Zoom** | The buttons in this group let you select a zoom level for the canvas.

100 percent | Click this button to view the canvas at its normal size.

Fit To Screen | Click this button to adjust the zoom level to show all elements.

Extents | Click this button to show the entire canvas.

As described in the previous table, you can change the view of the design canvas from the View tab to more easily review and edit your flow diagram. Included in these controls is the ability to adjust the zoom level.

### Set Zoom Options
You can set zoom options that are available from the View tab.

1. Click **Zoom** on the View tab. The **Zoom Options** window opens.
2. To specify a desired zoom level, select an option in the Zoom To section.
   a. To adjust the zoom level to show all components, select **Fit to Screen**.
   b. To show the entire canvas, select **Extents**.
3. Enter a zoom percentage in the **Percent** field. Click the up or down arrow to increase or decrease the value.

   **Tip:** You can also change the magnification of the canvas using the zoom slider located in the bottom right corner of the Service Console.

4. Click **OK**.

### Desktop Workflows Contextual Tabs
The contextual and standard groups and buttons that display on the ribbon of the workflow editor depend on the selected tab.
When you select an element or connector on the canvas, the ribbon displays a fourth contextual tab. When an element is selected, the Element Tools tab appears. This tab is divided into two sections. On the left are contextual groups and buttons, meaning they change depending on the element selected. On the right are standard groups and buttons, meaning they display no matter what element is selected.

This image displays the Element Tools tab and shows the contextual group of buttons for the Workspace element on the left and the standard group of buttons on the right.

**Create a Desktop Workflow**

B2C Service provides an intuitive graphical interface for creating and editing desktop workflows. When designing a workflow, you can drag elements from the Home or Insert tab and order them on the canvas.

1. **Click** Configuration on the navigation pane.
2. **Expand** Application Appearance, and then double-click Workspaces/Workflows. The Workspaces/Workflows explorer opens on the content pane.

   **Note:** If the Desktop Workflow feature is not enabled on your site, you will see only Workspaces listed in the Application Appearance folder. To enable desktop workflows, contact your Oracle account manager.

3. **Click** New Workflow on the ribbon to open a new desktop workflow with a blank design canvas.
4. **To design the flow diagram**, see *How You Design a Flow Diagram*.
5. **Click** Save on the Quick Access toolbar to save the desktop workflow. The Save As window opens.
Before saving, B2C Service automatically validates your flow diagram and reports any errors. Click Cancel to correct errors before saving or click Continue to save the flow in its current state. However, the workflow will not function properly until all validation errors are corrected.

6. Select the folder you want to save the desktop workflow in and enter the name of the desktop workflow in the Name field.
7. Click Save.

How You Design a Flow Diagram

A desktop workflow is defined by dragging elements to the canvas, ordering them, and connecting them to form a flow diagram.

The flow diagram is a graphical representation of the actions and decisions your workflow will perform and the order in which it will perform them. Your flow diagram can be as simple as a single path connecting a few workspaces or it can be complex, routing your staff members through dozens of workspaces, scripts, actions, and decisions. The intuitive graphical interface accommodates most business processes, extending access to advanced features and functions found throughout the application.

When an element is selected on the canvas, an Element Tools ribbon tab appears, allowing you to define its attributes, which vary by element type. For example, Workspace elements are used in workflows to display records using a designated workspace. Therefore, when adding a Workspace element, you must specify the workspace you want to use and the record you want to display.

When a record is opened in a staff member’s workflow session, it is loaded into a memory space called the record pool, along with all of its associated records (such as contact and organization). As additional records are opened in the same workflow session, those records are added to the same record pool. Because many records are often open in the record pool at once, the term “working record” is used to describe the record being acted on by a specific element.

Each element on the canvas displays an icon and two labels that help to identify its function. The top label contains the element name. The bottom label identifies the element working record. The icon varies by element type as well as the record type.

When an element is selected on the canvas, you can select a working record from the Working Record button group on the Element Tools tab. If multiple records of the same record type are open in the record pool, the Working Record button group will expand with additional buttons so you can select the specific record you want the element to act on. For example, if several incidents are open in the record pool, you can set a Workspace element to display the incident that was opened to initiate the workflow (the initial record), the most recent incident opened in the workflow (the last record), or an incident that has been named elsewhere in the workflow (a named record).

For a menu of available working records, select an element on the workspace, click the Element Tools tab, and then click the Expand Working Records button below the scroll bar in the Working Record button group.

If a workflow is unable to locate an open record that matches the designated working record, B2C Service will display a workflow execution error and end the workflow session.
Create a Flow Diagram

The function of the working record varies by element type.

1. From the open workflow, drag and drop an element from the ribbon onto the canvas.

<table>
<thead>
<tr>
<th>Element/Menu</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workspace</td>
<td>Drag and drop this element to open the working record in a workspace. See Edit Workspace Attributes.</td>
</tr>
<tr>
<td>Script</td>
<td>Drag and drop this element to initiate a script. See Edit Script Attributes. Script elements are only available when scripting is enabled. For information about enabling scripts, contact your Oracle account manager.</td>
</tr>
<tr>
<td>Decision</td>
<td>Drag and drop this element to branch the workflow based on conditions that you define. The working record defines the record and fields available for conditions. See to Decision Attributes.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Drag and drop this element to nest another workflow into the open workflow. The working record defines the record that opens in the embedded workflow. See Edit Workflow Attributes.</td>
</tr>
<tr>
<td>Set Fields</td>
<td>Drag and drop this element to set values for one or more fields in the working record. See Best Practices for Editing Set Fields Attributes.</td>
</tr>
<tr>
<td>Comment</td>
<td>Drag and drop this element to add comments or notes to the workflow. See Add a Comment to a Workflow.</td>
</tr>
<tr>
<td>Connector</td>
<td>Drag and drop this element to add a connector to the workflow. See Connect an Element.</td>
</tr>
<tr>
<td>Create</td>
<td>Click this drop-down menu and drag and drop a record type to create a new record in your workflow. You can choose to create an answer, contact, incident, opportunity, organization, quote, quote product, or task. See Edit Create Attributes.</td>
</tr>
<tr>
<td>Load</td>
<td>Click this drop-down menu and drag and drop a record type to load a record into your workflow based on a report query. You can choose to load an answer, contact, incident, opportunity, organization, quote, quote product, or task. See Load Attributes.</td>
</tr>
<tr>
<td>Clear</td>
<td>Click this drop-down menu and drag and drop a record type to clear the association between the working record and an organization, contact, answer, incident, or opportunity. See Edit Clear Attributes.</td>
</tr>
<tr>
<td>Element/Menu</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Change</td>
<td>Click this drop-down menu and drag and drop a record type to associate the working record to a different organization, contact, answer, incident, or opportunity. See Edit Change Attributes.</td>
</tr>
<tr>
<td>Copy</td>
<td>Drag and drop this element to copy the working record and give it a name that can be referenced later in the workflow. See Edit Copy Attributes.</td>
</tr>
<tr>
<td>Save</td>
<td>Drag and drop this element to save all records open in the workflow. To close the records after saving, click Close After Save on the ribbon. See Save Attributes. Business rules will be run on all open records at the time the Save element is triggered.</td>
</tr>
<tr>
<td>Return</td>
<td>Drag and drop this element to return to a parent workflow from a nested workflow. Edit the element label text to define a return event name that can be referenced in the subsequent connector in the parent workflow. See Return Attributes.</td>
</tr>
</tbody>
</table>

**Note:** A quote product created and saved by automation elements cannot be edited afterward in the same workflow. If need arises, the Save element should be moved to occur after the edit in the sequence, or the Save element should be omitted and staff should be directed to click Save instead.

2. To connect one element to another, click an anchor on the first element and drag the connector to an anchor on the second element. The anchor is highlighted when the connector is able to link to it. The connector arrow will point from the first element to the second. See Connect an Element.

3. To change the formatting of an element, select the element and see the associated actions.

<table>
<thead>
<tr>

</tr>
<tr>
<td>![Text]</td>
<td>Click this button to enter the text of the element label.</td>
</tr>
<tr>
<td>Notes</td>
<td>Click this button to enter notes about the element.</td>
</tr>
<tr>
<td>Size</td>
<td>The buttons in this group let you change the height and width of the element.</td>
</tr>
</tbody>
</table>
4. To cut, copy, or paste one or more elements, click the appropriate button on the Clipboard group of the Home tab.

5. To undo an action on the canvas, click **Undo** on the Quick Access toolbar.

6. To redo an action on the canvas, click **Redo** on the Quick Access toolbar.

### Element Attributes

After you have added an element to the canvas, you must edit its attributes to make it functional. You can hover over any element on the canvas to see its type, name, and other information.

**Note:** You must define attributes for each element added or a validation error will occur when attempting to save the workflow. See *Workflow Validation*.

Elements vary by shape according to their functions.

- **User Interface**—Rectangular elements used to denote items that display to staff members, such as workspaces, scripts, and other embedded workflows.
- **Automation**—Circular elements used to denote automated events that run in the background, such as setting field values and creating and saving records.
- **Search**—Polygonal elements that require staff members to perform a search, such as loading a record or associating a record with another record.
- **Decision**—Diamond-shaped and polygonal elements that denote logical evaluations that are used to branch the flow across two or more paths based on conditions that you define.

### Edit Workspace Attributes

This topic describes how to edit workspace element attributes.

The Workspace element is used to display the working record in a workspace. After you add this element to your flow diagram, you must edit its attributes to associate it with a new or existing workspace. You must also select the working record that the workspace will display.

**Note:** Multi-edit and chat workspaces cannot be associated to a Workspaces element.

1. From your open workflow, select a Workspace element on the canvas.
   The Element Tools tab displays on the ribbon.

2. Click a button in the Workspace button group.
   The name label is updated with the name of the selected workspace.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Workspace</td>
<td>Click this drop-down menu to select a workspace to use in the workflow.</td>
</tr>
</tbody>
</table>
### Button Description

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Workspace</td>
<td>Click this button to select a new workspace type or import a workspace definition. For information about creating a new workspace, see <em>Edit a Workspace</em>. For information about importing a workspace, see <em>Import a Workflow</em>.</td>
</tr>
<tr>
<td>Edit Workspace</td>
<td>Click this button to edit the selected workspace. See <em>Edit a Workspace</em>.</td>
</tr>
<tr>
<td>Options</td>
<td>Click this drop-down menu to access workspace attribute options.</td>
</tr>
<tr>
<td>Enable Save</td>
<td>Select this option to include the Save button group when displaying a record with the workspace. To hide the Save button group, clear this option. This button is enabled by default.</td>
</tr>
<tr>
<td>Open in Subtab</td>
<td>Select this option to open the element in a subtab instead of replacing the current editor. Outgoing connectors are not supported.</td>
</tr>
<tr>
<td>Focus Subtab</td>
<td>Select this option to set the focus to the subtab.</td>
</tr>
</tbody>
</table>

3. Click a button in the Working Record button group to select the record you want to display using the workspace. The working record label is updated with the name of the selected working record.

4. If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record you want to display using the workspace.

   **Tip:** For a menu of available records, click *Expand Working Records* below the scroll bar in the Working Record button group.

---

### Edit Script Attributes

The Script element is used to open the working record in a script. After you add this element to your flow diagram, you must edit its attributes to associate it with a new or existing script. You must also select the working record that will be passed to the script.

When a script is included in a workflow, be sure it includes a field, an exit script event, a finish script event, or a rule containing a named event so that the flow can be advanced. Field changes, exit script events, and finish script events can be used to advance the flow, as can a script rule that fires a named event. See *How Events are Used in Workspace and Script Rules*.

1. From your open workflow, select a Script element on the canvas.
   The Element Tools tab displays on the ribbon.
2. Click a button in the Script button group.
   The name label is updated with the name of the selected script.
3. Select a script attribute.
Using B2C Service

Chapter 3
Dynamic Agent Desktop

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Script</td>
<td>Click this drop-down menu to select a script to use in the workflow.</td>
</tr>
<tr>
<td>New Script</td>
<td>Click this button to select a new script type or import a script definition. For information about creating a new script, see Create a Script. For information about importing a script, see Export a Script.</td>
</tr>
<tr>
<td>Edit Script</td>
<td>Click this button to edit the selected script. See Edit a Script.</td>
</tr>
<tr>
<td>Options</td>
<td>Click this drop-down menu to access workspace attribute options.</td>
</tr>
<tr>
<td>Enable Save</td>
<td>Select this option to include the Save button group when displaying a record in the script. To hide the Save button group, clear this option. This button is enabled by default.</td>
</tr>
</tbody>
</table>

4. Click a button in the Working Record button group to select the record you want to pass to the script. The working record label is updated with the name of the selected working record.

Because quotes and quote products have no corresponding script type, they are not available as working records for Script elements.

5. If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record you want to pass to the script.

   **Tip:** For a menu of available records, click Expand Working Records below the scroll bar in the Working Record button group.

**Decision Attributes**

The Decision element is used to branch your workflow based on conditions that you define. After you add this element to your flow diagram, you can edit its attributes to branch your flow to different paths based on whether certain conditions are met.

The decision can be based on a simple “yes/no” evaluation of one or more conditions, such as the identity and profile of the logged-in account, the working record creation state, and the value of a specified field. If all conditions are met, the Yes path is followed. If any conditions are not met, the No path is followed.

Alternately, you can base a decision on a single field that has multiple possible values, with each selected value having its own outgoing path. For example, by basing a decision on the incident Status field, you can route incidents down different paths based on their status.

**Note:** The fields available for evaluation in a condition will vary based on the working record type selected for the decision.
Define Decision Attributes

The following procedure describes the process for defining Decision attributes on a workflow.

1. From your open workflow, select a Decision element on the canvas.
2. From the Working Record button group on the Element Tools tab, select a working record to associate to the decision.
   The working record label is updated with the name of the selected working record.
3. If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record you want to associate to the decision.
   Tip: For a menu of available records, click Expand Working Records below the scroll bar in the Working Record button group.
4. Do one of the following:
   - Click Edit. The Decision window opens.
   - Double-click the Decision element.
5. To define conditions for a yes/no decision, see Define Conditions for a Yes/No Decision.
6. To define conditions based on a field with multiple possible values, see Define Conditions Based on a Field with Multiple Possible Values.
7. Click OK.

Define Conditions for a Yes/No Decision

The following procedure describes the process and options available for defining conditions for a Yes/No decision.

1. On the Decision window, click Add next to the condition you want to add to the decision description.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The logged in account has a certain value</td>
<td>Add this condition to verify the identity of the logged-in account.</td>
</tr>
<tr>
<td>The logged in account's profile has a certain value</td>
<td>Add this condition to verify the profile of the logged-in account.</td>
</tr>
<tr>
<td>A new record is being created</td>
<td>Add this condition to verify that the working record is being created.</td>
</tr>
<tr>
<td>An existing record is being edited</td>
<td>Add this condition to verify that the existing record is being edited.</td>
</tr>
<tr>
<td>The current editor is a child editor</td>
<td>Add this condition to verify that the working record is displayed in a child editor.</td>
</tr>
<tr>
<td>The current editor is a primary editor</td>
<td>Add this condition to verify that the working record is displayed in a parent editor.</td>
</tr>
<tr>
<td>The record is copied</td>
<td>Add this condition to verify that the working record is being copied from another record.</td>
</tr>
</tbody>
</table>
### Condition

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The record is not copied</td>
<td>Add this condition to verify that the working record is not being copied from another record.</td>
</tr>
<tr>
<td>A field has a certain value</td>
<td>Add this condition to verify the value of a certain field.</td>
</tr>
</tbody>
</table>

2. If the condition you have added to the decision description contains an underlined link, click the link to edit the condition. The **Edit Condition** window opens.

3. If specifying a condition value for a field, click the **Field** drop-down menu and select a field.

4. Click the **Operator** drop-down menu and select an operator.

5. Enter a value in the Value field.

6. Click **OK**.

7. To edit the logical expression used to evaluate two or more conditions, click **Combine the Conditions Using a Logical Expression** and see **Edit a Workspace Rule Logical Expression**.

8. Click **OK**.

---

### Define Conditions Based on a Field with Multiple Possible Values

The following procedure describes the process for defining conditions based on a field with multiple possible values.

1. On the **Decision** window, select the **Decision on a Field with Multiple Possible Values** option.

2. Click the **Property or Field** drop-down menu and select a property or field to evaluate.

3. To verify a client type, select the check box next to the client types you want to use in the decision.

4. To verify a value in a menu field, select the check box next to the value you want to use in the decision.

5. To remove a menu field value from the decision, clear its check box.

6. To verify a value in a date field, click **Add Choice** and then click the calendar button in the Choice column to select a date.

7. To verify a value in a text field, click **Add Choice** and enter the value in the Choice column.

8. To remove a date or text value you have added, click **Remove** in the Action column.

9. To include an option for all other values, select the **Include a Value for Other** check box.

10. Click **OK**.

   An outgoing anchor is added to the element for each value selected.

---

### Edit Workflow Attributes

The Workflow element is used to open the working record in an embedded workflow.

After you add the Workflow element to your flow diagram, you must edit its attributes to associate it with a new or existing workflow. You must also select the working record that will be opened in the embedded workflow.

**Note:** If you want an embedded workflow to return to the primary flow, it must contain at least one Return element. See **Return Attributes**.

1. From your open workflow, select a Workflow element on the canvas.
   The Element Tools tab displays on the ribbon.

2. Click a button in the Workflow button group.
   The name label is updated with the name of the selected workflow.
### Best Practices for Editing Set Fields Attributes

This topic describes best practices for avoiding field conflicts when editing set field attributes.

The Set Fields element is used to set values for one or more fields in the working record. After you add the Set Fields element to your flow diagram, you must edit its attributes to select the working record containing the field you want to update and the value you want to set it to.

When setting multiple field values, pay close attention to the order in which you are setting them. Remember that some fields in the record you are updating may also change dynamically due to rule configuration or a functional dependency on other fields.

This consideration is particularly important when updating certain key fields in Opportunity Tracking. The following fields should be set in this specific order based on how the values are related to one another.

1. Schedule
2. Quote Total
3. Grand Total
4. Discount
5. Forecast

For example, quote totals often vary based on the schedule that has been selected. If you change the value of the Schedule field, the Quote Total field value will be reset. So, if you are setting values for these two fields, be sure to apply the schedule before setting the quote total. Also, the discount value and the forecast should be specified after the grand total has been set. By setting these fields in the correct order, you can avoid setting fields incorrectly due to overriding functional dependency.

### Edit Set Fields Attributes

The following procedure describes how to edit Set Field attributes from a workflow.

1. From your open workflow, select a Set Fields element on the canvas.
   - The Element Tools tab displays on the ribbon.
2. Click a button in the Working Record button group to select the record containing the field you want to set. The working record label is updated with the name of the selected working record.

3. If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record containing the field you want to set.

   **Tip:** For a menu of available records, click **Expand Working Records** below the scroll bar in the Working Record button group.

4. Do one of the following:
   - Click **Edit**. The **Set Fields** window opens.
   - Double-click the **Set Fields** element.

5. Click **Add Field** to add a field to the element.

6. In the Fields column, click the **Select a Field** drop-down menu, expand the appropriate table, and select the field you want to set.

7. In the Value column, enter the value that you want to set the field to.

   **Note:** In addition to setting explicit (absolute) values, you can set relative values for some field types by adding or subtracting (or appending or prepending) a value to the previous field value. See **Relative Field Values**.

8. To remove a field you have added, click **Remove** in the Action column.

9. Click **OK**.

   The field and value selected are displayed in the text box next to the Edit button.

10. To display a confirmation message when the field is set, click **Confirmation Message** and enter the message.

11. Click **OK**.

### Relative Field Values

In addition to setting absolute field values for date, date/time, integer, text, and text area fields, you can set relative values.

When setting a value for one of these field types, clicking the Value drop-down menu presents additional options for adding or subtracting (or appending or prepending) a value to the previous value of the field. For example, you can increment the value of an integer field by 1 or append text to a contact text field. For date and date/time fields, you can also set a value relative to the time of action, such as adding one day to the current date and time.

Options for setting relative field values vary by field type.

<table>
<thead>
<tr>
<th>Field Type</th>
<th>Value Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Add or subtract a number of days or weeks to or from the previous value or the current date.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Add or subtract a number of minutes, hours, days, or weeks to or from the previous value or the current date and time.</td>
</tr>
<tr>
<td>Integer</td>
<td>Add or subtract an integer value to or from the current value.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Value Options</td>
</tr>
<tr>
<td>------------</td>
<td>--------------</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: The resulting value cannot be greater than the maximum value defined for the field or less than the minimum. Therefore, the maximum value you can add or subtract is the maximum value minus the minimum value of the field. For example, if the field maximum is 8 and the field minimum is -8, the maximum value you can add or subtract from the current value is 16.</td>
</tr>
<tr>
<td>Text Field</td>
<td>Prepend or append a text value to the current text value.</td>
</tr>
<tr>
<td>Text Area</td>
<td>Prepend or append a text value to the current text value.</td>
</tr>
</tbody>
</table>

**Edit Create Attributes**

The Create element is used to create a new record in the workflow. After you add this element to your flow diagram, you can edit its attributes to specify the field values, a confirmation message, and a name for the record you are creating.

Workflows that contain Create elements can create records even when used by staff members who do not have permission in their profile to create records of the same type. For example, a staff member who does not have permission to create an incident can still be associated with a workflow that results in the creation of an incident, and the incident **audit log** will show the staff member as the creator of the incident.

1. From your open workflow, click a Create element on the canvas.
2. The Element Tools tab displays on the ribbon.
3. Do one of the following:
   - Click **Set Fields**. The **Set Fields** window opens.
   - Double-click the **Set Fields** element.
4. Click **Add Field** to add a field to the element.
5. In the Fields column, click the **Select a Field** drop-down menu and select the field you want to set.
6. In the Value column, enter the value that you want to set the field to.
7. In addition to setting explicit (absolute) values, you can set relative values for some field types by adding or subtracting (or appending or prepending) a value to the previous field value. See **Relative Field Values**.
8. To remove a field you have added, click **Remove** in the Action column.
9. To display a confirmation message when the field is set, click **Confirmation Message** and enter the message.
   a. Click **OK**.
10. To name the record, click **New Record Name** and enter the name in the working record label. The new record name appears in the Working Record button group for elements of the same record type.

**Note**: When a new record is created with the Create element, it is not yet saved to the database. To ensure the record is saved, be sure to open the working record in a workspace that has the Save button enabled or follow the Create element with a Save element. See **Save Attributes**.
Load Attributes

The Load element is used to find and load an existing record into the record pool. After you add this element to your flow diagram, you can use it to prompt the agent to search for a record, or you can select a specific record to load every time.

**Note:** The option to load a specific record is not available when loading quotes or quote products.

If you want to prompt agents to perform a search, you must select the primary search report that will be used to find the record to be loaded. You may also select an optional secondary search report. The Load element can have two outgoing connectors to branch the flow based on the button clicked by staff on the Search window (OK/Select or Cancel). In most cases, the Load element will prompt staff members to search for a record using a primary and secondary search report.

However, when using the Load element to open a quote, quote product, or task, the Secondary Search Report button is replaced on the ribbon with a Parent Record button group. When you select a parent record for these record types, the Load element will prompt staff members to select from a list of records associated to the parent. For example, to load a quote, staff members select from a list of quotes associated with the specified parent opportunity.

Records opened with the Load element are simply loaded into memory and are not automatically displayed in workspaces. To display a loaded record to your staff members, you will need to follow the Load element with a workspace or workflow associated with the appropriate working record.

**Prompt Agents to Search for a Record to Load**

Use this procedure to add search reports for the Load element.

1. From your open workflow, click a Load element on the canvas. The Element Tools tab displays on the ribbon.
2. Click **Search Report**. The Select Report window opens.
   - By default, the standard report for searching the designated record type is selected. For example, if you are loading an incident, the Incident Search report is selected by default.
3. Select a primary report to display in the Search window.
4. Click **OK**.
   - Select a secondary report.
   - Click **OK**.
   - Select a secondary search record from the Secondary Search Record button group.
6. To load a quote, quote product, or task, click a button in the Parent Record button group to select the parent of the record you want to load.
7. To name the record, click **New Record Name** and enter the name in the working record label.
   - The new record name appears in the Working Record button group for elements of the same record type.

**Load a Specific Record**

Use this procedure to add a specific record to the Load element.

1. From your open workflow, click a Load element on the canvas.
   - The Element Tools tab displays on the ribbon.
2. Click **Load Type** and select **Constant Record**.
The Load element changes to a circular automation element and the ribbon buttons refresh to display the attributes for this load type.

3. Click Record.
4. Search for and select the record you want the element to load.
5. Click Select.
6. Click OK.
7. To rename the record, click New Record Name and enter the new name in the working record label.
   The new record name appears in the Working Record button group for elements of the same record type.

**Edit Clear Attributes**

The Clear element is used to clear the association of the working record with any organization, contact, answer, incident, or opportunity. After you add a Clear element to your flow diagram, you must edit its attributes to select the working record you want to disassociate.

You can also clear a record association by using a Set Fields element to set the value to No Value, but using the Clear element can make the flow diagram easier to understand.

1. From your open workflow, click a Clear element on the canvas.
   The Element Tools tab displays on the ribbon.
2. Click a button in the Working Record button group to select the record you want to clear the association from.
   The working record label is updated with the name of the selected working record.
3. If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record you want to clear the association from.
   For a menu of available records, click Expand Working Records below the scroll bar in the Working Record button group.
4. To display a confirmation message when the record association is cleared, click Confirmation Message and enter the message.
5. Click OK.

**Note:** When an association is cleared by a Clear element, the update is not automatically saved in the database. To save the change made by the Clear element, be sure to open the working record in a workspace that has the Save button enabled or follow the Clear element with a Save element. See Save Attributes.

**Edit Change Attributes**

The Change element is used to find and load an existing record to associate with the working record.

After you add the Change element to your flow diagram, you must edit its attributes to select the primary and secondary search reports that will be used to find the record to be associated. The Load element can have two outgoing connectors to branch the flow based on the button clicked by staff on the Search window (OK or Cancel).

When using a Change element to change the contact associated with an incident, the behavior is the same as when you click Search on the Contact field in an incident workspace. If the new primary contact is not already associated to the incident (as a secondary contact, for example), the previous primary contact becomes disassociated from the incident. If the new primary contact is already associated to the incident as a secondary contact, the previous primary contact becomes a secondary contact. The same behavior applies to contacts associated with opportunities.

1. From your open workflow, click a Change element on the canvas.
The Element Tools tab displays on the ribbon.

By default, the standard report for searching the designated record type is selected. For example, if you are associating an incident, the Incident Search report is selected by default.

3. Select a primary report to display in the Search window.

4. Click OK.

   a. To select no secondary search report, select the No Value check box.
   b. Click OK.

**Note:** When you associate records with the Change element, neither record is automatically saved or displayed to staff members. To save the change made by the Change element, be sure to open the working record in a workspace that has the Save button enabled or follow the Change element with a Save element. See Save Attributes.

To display the working record or associated record to staff members, you will also need to follow the Change element with a workspace or workflow of the same record type and specify the record you want to display.

**Edit Copy Attributes**

The Copy element is used to create a new record in the workflow. After you add this element to your flow diagram, you can edit its attributes to specify the field values, a confirmation message, and a name for the record you are creating.

When a new record is created with the Copy element, it is not automatically saved to the database or displayed to staff members. To ensure the new record is saved, be sure to open the working record in a workspace that has the Save button enabled or follow the Copy element with a Save element. See Save Attributes.

To display the copied record to staff members, you will need to follow the Copy element with a workspace or workflow of the same record type and specify the copy as the working record you want to display.

1. From your open workflow, click a Copy element on the canvas.

   The Element Tools tab displays on the ribbon.

2. Click a button on the left of the Working Record button group to select the type of record you want to copy.

   The last record of that type is selected by default and the working record label is updated with the name of the selected working record.

3. To select a different record of the selected type, click a button on the right of the Working Record button group to select the record you want to copy.

   **Tip:** For a menu of available records, click Expand Working Records below the scroll bar in the Working Record button group.

4. To select the parts of the original record to include in the record copy, click the Copy Details drop-down menu and select the parts you want to copy. Available options vary by record type.

<table>
<thead>
<tr>
<th>Record Type</th>
<th>Copyable Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incident</td>
<td>Threads, incident contacts, and file attachments.</td>
</tr>
</tbody>
</table>
### Record Type

<table>
<thead>
<tr>
<th>Record Type</th>
<th>Copyable Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact</td>
<td>Contact lists, file attachments, and notes.</td>
</tr>
<tr>
<td>Answer</td>
<td>Sibling relationships, file attachments, and notes.</td>
</tr>
<tr>
<td>Opportunity</td>
<td>Opportunity contacts, opportunity competitors, quotes, quote products, file attachments, and notes.</td>
</tr>
<tr>
<td>Organization</td>
<td>Organization addresses, file attachments, and notes.</td>
</tr>
<tr>
<td>Task</td>
<td>File attachments and notes.</td>
</tr>
</tbody>
</table>

Quotes and quote products can be copied but have no copy detail options.

5. To display a confirmation message when the record is copied, click **Confirmation Message** and enter the message.
   a. Click **OK**.
6. To name the copied record, click **New Record Name** and enter the name in the new record label. The new record name appears in the Working Record button group for elements of the same record type.

### Save Attributes

The Save element is used to save all records that are open in the record pool. To close the records after saving, click to highlight the Close After Save button on the ribbon.

After you add a Save element to your flow diagram, you can edit its attributes to change its appearance.

**Note:** When the record pool is saved with a Save element, each record update triggers business rules immediately in the background. Because business rules introduce another layer of complexity, it is important to use the Save element only when necessary and to keep your business rule processes separate and distinct from your desktop workflows.

### Return Attributes

The Return element is used to return an embedded workflow to the primary workflow to resume the flow of action.

After you add a Return element to your flow diagram, you can change its label name to define an event name that can be used in the primary workflow. By ending different branches of an embedded workflow with Return elements having unique names, you can advance the primary flow in different directions based on the route that was followed. If you create multiple Return elements with the same label name, any one of them will fire that named event.

**Note:** A Return element added to a workflow that is not embedded in another workflow will have no effect.

Connect an Element

Connectors are used to link elements and indicate flow direction. Some connectors are followed immediately upon performing an action in the originating element. Others are triggered only by events and conditions that you define. Connectors leading from Decision elements are followed only if the conditions are met.

To connect one element to another, click an anchor on the first element and drag the connector to an anchor on the second element. The anchor is highlighted when the connector is able to link to it. The connector arrow will point from the first element to the second.

Other ways to connect elements include:
- Hover over the first element and click a blue arrow to link to an adjoining element.
- Drag one element over another, hover over its blue arrow until it turns dark blue, and then drop to automatically connect the elements.
- Click an element from the ribbon, and then hover over an element on the canvas and click its blue arrow to drop and auto-link the new element.
- Drag and drop a connector from the ribbon to the canvas, and then drag the ends of the connector to the elements you want to link.

Tip: You can easily connect to a different element or delete a connector. From your open workflow, do one of the following:
- Click a midpoint on the connector to select it and drag one of its ends to an anchor on a different element to create a different connection.
- Click a midpoint on the connector to select it and press Delete.

How You Edit a Square or Curved Connector

From your open workflow, click a midpoint on a square or curved connector to select it and drag the calibration points to adjust the shape of the connection.

These images show the calibration points on square and curved connectors.
Add a Connector Event

You must add connectors to connect one element to another in a workflow.

When a record or script is displayed to a staff member, it must remain open long enough for your staff members to complete their work before advancing to the next element in the workflow. Therefore, when connecting from a Workspace, Script, or Workflow element, you must define one or more triggering events (such as a field value change) that will cause the path to be followed. You can also specify conditions under which the event will cause the path to be followed.

**Note:** If a connector is triggered by an event in a workspace rule or script rule, the flow will advance without running any subsequent rules in that workspace or script.

1. From your open workflow, click the connector on the canvas.
   The Path Tools tab displays on the ribbon.
2. Click **Add Events**.
   The **Select Connector Events** window opens.
3. Click **Add** next to the event you want to add to the connector.
   Available events vary based on the type of element you are connecting from.

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The editor loads</td>
<td>Add this event to follow the path when a record is loaded using the workspace.</td>
</tr>
<tr>
<td></td>
<td>When using this event, the connector conditions are evaluated at the time a record is opened. If any of the conditions require that items be changed after the record is opened, the path will not be followed.</td>
</tr>
<tr>
<td>The record is saved without closing</td>
<td>Add this event to follow the path when an open record is saved without closing.</td>
</tr>
<tr>
<td></td>
<td>This event is not triggered if records are closed when saved, or closed without being saved. This includes records opened in child editor windows that do not feature Save buttons.</td>
</tr>
<tr>
<td>A field changes</td>
<td>Add this event to follow the path when the value of a field is changed. When added, click the underlined text to select a field that will trigger the event. Available fields vary depending on the type of workspace you are connecting from. For example, when connecting from an incident workspace, you can select fields from the incidents,</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>contacts, and organizations tables. However, not every field in these tables is available for use in connector events.</td>
</tr>
<tr>
<td></td>
<td>When using this event, connector conditions are evaluated at the time any change is made to the selected field. If the selected field is a text field, the conditions will be evaluated the moment any character in the field is changed.</td>
</tr>
<tr>
<td>An input control value changes</td>
<td>Add this event to follow the path when the value of an input control is changed to another value or to no value. When added, click the underlined text to select an input control that will trigger the path. Available input controls include any menus, options, list boxes, and text boxes that are not used to trigger other paths.</td>
</tr>
<tr>
<td></td>
<td>This event is available only when an input control has been added to the workspace. When using this trigger, conditions are evaluated at the time any change is made to the input control. If you want to verify that a specific value was selected, add An Input Control Has a Certain Value as a condition.</td>
</tr>
<tr>
<td>An input control value is selected</td>
<td>Add this event to follow the path when an input control value is selected. When added, click the underlined text to select an input control that will trigger the path. Available input controls include any menus, options, and list boxes that are not used to trigger other paths.</td>
</tr>
<tr>
<td></td>
<td>This event is available only when an input control has been added to the script. When using this trigger, conditions are evaluated at the time a value is selected from the input control. If you want to verify that a specific value was selected, add An Input Control Has a Certain Value as a condition.</td>
</tr>
<tr>
<td>A button is clicked</td>
<td>Add this event to follow the path when a specified button is clicked. When added, click the underlined text to select a button from the workspace that will trigger the event.</td>
</tr>
<tr>
<td>An image is clicked</td>
<td>Add this event to follow the path when an image is clicked. When added, click the underlined text to select an image from the workspace that will trigger the event.</td>
</tr>
<tr>
<td></td>
<td>This trigger is available only when an image has been added to the workspace.</td>
</tr>
<tr>
<td>A hyperlink control is clicked</td>
<td>Add this event to follow the path when a hyperlink is clicked. When added, click the underlined text to select a link from the workspace that will trigger the event.</td>
</tr>
<tr>
<td></td>
<td>This trigger is available only when a hyperlink has been added to the workspace.</td>
</tr>
<tr>
<td>The exit script event fires</td>
<td>Add this event to follow the path when the Exit button is clicked, an exit script event is fired by a rule from a script called in a workflow, or from a script placed on a workspace called in a workflow. Connector conditions are evaluated at the time that the event is fired. See How Events are Used in Workspace and Script Rules.</td>
</tr>
</tbody>
</table>
### Add a Connector Condition

Workspace elements can have more than one outgoing connection, each triggered by a different set of events and conditions. In this way, a single workspace can route staff members through different sequences of actions and decisions based on the event that was triggered.

1. From your open workflow, click the connector on the canvas. The Path Tools tab displays on the ribbon.
2. Click **Add Conditions**. The Select Connector Conditions window opens.
3. Click **Add** next to the conditions you want to add to the connector. Available conditions vary based on the type of element you are connecting from.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The logged in account has a certain value</td>
<td>Add this condition to follow the path if the logged-in account has a certain value. Click the underlined text to select the account to be evaluated.</td>
</tr>
<tr>
<td>The logged in account's profile has a certain value</td>
<td>Add this condition to follow the path if the logged-in account's profile has a certain value. Click the underlined text to select the profile to be evaluated.</td>
</tr>
<tr>
<td>A new record is being created</td>
<td>Add this condition to follow the path if a new record is being created by the originating workspace.</td>
</tr>
<tr>
<td>Condition</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>An existing record is being edited</td>
<td>Add this condition to follow the path if an existing record is being edited in the originating workspace.</td>
</tr>
<tr>
<td>The current editor is a child editor</td>
<td>Add this condition to follow the path if the record is open in a child editor.</td>
</tr>
<tr>
<td>The current editor is a primary editor</td>
<td>Add this condition to follow the path if the record is open in a primary (non-child) editor.</td>
</tr>
<tr>
<td>The record is copied</td>
<td>Add this condition to follow the path if the record is being copied from another record.</td>
</tr>
<tr>
<td>Tip: This condition can be useful if you want to automatically set field values when records are copied.</td>
<td></td>
</tr>
<tr>
<td>The record is not copied</td>
<td>Add this condition to follow the path if the record is not being copied from another record.</td>
</tr>
<tr>
<td>A field has a certain value</td>
<td>Add this condition to follow the path if a field has been set to a specified value in the originating workspace. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is required</td>
<td>Add this condition to follow the path if a field is required in the originating workspace. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is optional</td>
<td>Add this condition to follow the path if a field is optional (not required) in the originating workspace. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is read only</td>
<td>Add this condition to follow the path if a field is read-only in the originating workspace. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is editable</td>
<td>Add this condition to follow the path if a field is editable in the originating workspace. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is hidden</td>
<td>Add this condition to follow the path if a field is hidden in the originating workspace. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>A field is visible</td>
<td>Add this condition to follow the path if a field is visible in the originating workspace. Click the underlined text to select the field to be evaluated.</td>
</tr>
<tr>
<td>An object is read only</td>
<td>Add this condition to follow the path if a control is read-only in the originating workspace. Click the underlined text to select the control to be evaluated.</td>
</tr>
<tr>
<td>An object is editable</td>
<td>Add this condition to follow the path if a control is editable in the originating workspace. Click the underlined text to select the control to be evaluated.</td>
</tr>
<tr>
<td>An object is hidden</td>
<td>Add this condition to follow the path if a control is hidden in the originating workspace. Click the underlined text to select the control to be evaluated.</td>
</tr>
<tr>
<td>An object is visible</td>
<td>Add this condition to follow the path if a control is visible in the originating workspace. Click the underlined text to select the control to be evaluated.</td>
</tr>
</tbody>
</table>
## Add a Comment to a Workflow

The Elements button group provides a Comment element that lets you add comments to your diagram without impeding the flow of action.

Comment elements can be connected to other elements but they do not accept incoming connections. Used to convey information only, comments have no impact on the actions or events that comprise the workflow.

1. From your open workflow, drag and drop a Comment element from the ribbon onto the canvas.
2. Click the element to enter your comments.
3. To connect the Comment element to another element, click an anchor on the Comment element and drag to the element. The element is highlighted when the connector is able to link to it.

**Note:** Connectors from Comment elements are dashed lines, indicating that they do not impact the flow of action.

## Apply a Workflow Template

The Template button group on the Insert tab of the workflow designer provides several predefined templates as a starting point for creating your flow diagram.

When you choose a template, the elements and connectors associated with that template are added to your diagram. You can add and remove elements to further customize your workflow, then edit element attributes to meet your business needs.

1. From the Template group of the Insert tab, hover over a template button to see it previewed on the canvas.
   - **New vs. Edit**—This template directs staff members to one workspace if they are creating a new incident and to a different workspace if they are opening an existing incident. See [New vs. Edit Workflow Template](#).
   - **Add Task**—This template displays an incident in a workspace and then automatically creates a new task for the incident. See [Add Task Workflow Template](#).

### Condition Description Table

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>An input control has a certain value</td>
<td>Add this condition to follow the path if a specified question control value has been selected in the originating script element. Click the underlined text to select the control to be evaluated.</td>
</tr>
<tr>
<td>An add-in control condition returns a certain value</td>
<td>Add this condition to follow the path based on whether an add-in control returns a certain value. Click the underlined text to select the add-in control and the parameters to be evaluated. See <a href="#">Overview of Add-Ins</a>.</td>
</tr>
</tbody>
</table>
Copy Incident—This template displays an incident in a workspace, and then copies the incident, sets fields in the copy, and displays the copy in another workspace. See Copy Incident Workflow Template.

Create Contact—This template checks whether an open incident is associated with a contact record. If no contact is associated, it automatically creates a new contact for the incident and sets contact fields before displaying the incident in a workspace. See Create Contact Workflow Template.

2. Click a template button to add the template to the canvas.
   A message opens warning you that selecting a template will overwrite the existing content on the canvas.

3. Click OK.
   The template is inserted in the diagram.

5. Click Save.

New vs. Edit Workflow Template
This template uses a decision element to determine if the staff member is creating a new incident or opening an existing incident. Based on the decision, the staff member is either directed to a workspace designed for new incident creation or a workspace designed for editing existing incidents.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry Point</td>
<td>This element indicates the starting point of the workflow.</td>
</tr>
<tr>
<td>Editor Mode Incident</td>
<td>This Decision element checks whether the incident open in the workflow is a new incident or an existing incident. The working record is set to Incident, referring to the incident being created or opened.</td>
</tr>
<tr>
<td>Workspace Incident</td>
<td>This Workspace element displays a new incident in a workspace. The working record is set to Incident, referring to the incident being created.</td>
</tr>
<tr>
<td>(New Path)</td>
<td></td>
</tr>
<tr>
<td>Workspace Incident</td>
<td>This Workspace element displays an existing incident in a workspace. The working record is set to Incident, referring to the incident being opened.</td>
</tr>
<tr>
<td>(Edit Path)</td>
<td></td>
</tr>
</tbody>
</table>

Add Task Workflow Template
This template opens an incident in a workspace. Then, based on an event you define in the outgoing connector, a task is automatically added to the incident.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry Point</td>
<td>This element indicates the starting point of the workflow.</td>
</tr>
<tr>
<td>Workspace Incident</td>
<td>This Workspace element displays the opening incident in a workspace. The working record is set to Incident, referring to the incident that is being opened in the workspace.</td>
</tr>
<tr>
<td>Task New Task</td>
<td>This Create element automatically creates a new task associated with the incident and names the task “New Task.”</td>
</tr>
</tbody>
</table>

Copy Incident Workflow Template
This template opens an incident in a workspace. Then, based on an event you define in the outgoing connector, the incident is copied, fields are set in the copy, and the copy is displayed in another workspace.
Create Contact Workflow Template

This template uses a Decision element to determine if the incident being opened is associated with a contact record. If no contact is associated, it automatically creates a new contact for the incident and sets contact fields before displaying the incident in a workspace.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry Point</td>
<td>This element indicates the starting point of the workflow.</td>
</tr>
<tr>
<td>Has Contact? Incident</td>
<td>This Decision element checks whether the incident being opened is associated with a contact record. If so, the flow is forwarded to the Workspace element. If not, the flow is directed to the Create element. The <strong>working record</strong> is set to Incident, referring to the incident being opened in the workflow.</td>
</tr>
<tr>
<td>Contact New Contact</td>
<td>This Create element automatically creates a new contact and names the contact “New Contact.”</td>
</tr>
<tr>
<td>Set Contact Incident</td>
<td>This Set Fields element updates the incident Contact field to the new contact, associating the two records. The working record is set to Incident so the element will make the update to the incident opened earlier in the workflow.</td>
</tr>
<tr>
<td>Workspace Incident</td>
<td>This Workspace element displays the opening incident in a workspace. The working record is set to Incident so the element displays the incident opened earlier in the workflow.</td>
</tr>
</tbody>
</table>

Workflow Validation

B2C Service provides features to help you validate and preview workflows as you create them.

Because even basic workflows can contain many components that must be configured correctly in order to function properly, it is important to test your workflows thoroughly before you take them to production. As you create a flow diagram for your workflow, B2C Service validates all flow elements to ensure all required attributes have been specified. Although validation occurs in real time as you add and update elements, you can review validation errors manually at any time by clicking the Validate button on the Home tab.

You can also choose to display validation flags to help quickly identify invalid elements. When you select the Validation Results check box on the View tab, valid elements are flagged with a green check mark, while those found to be invalid are flagged with a red exclamation point and a small button you can click to view the validation error.
If you attempt to save a workflow without first addressing its validation errors, you will receive a message summarizing the errors.

**Note:** You can save a workflow without first correcting validation errors by clicking Continue on the Validation Results window. However, the workflow will not function properly until all validation errors have been corrected.

### Preview a Workflow

In order to thoroughly test the workflows you create, the Preview feature simulate the effects of the workflow you are editing, without altering your own profile settings or updating your production data.

After you select a record type and choose a new or existing record, a preview window opens to display the Service Console as it would appear to a staff member opening the same record in the live workflow. Except for saving records (which is disabled), the full functionality of your workflow is available for you to test in a read-only environment.

**Note:** Because record saving is disabled, you will not be able to test “The record is saved without closing” events in preview mode. To test subsequent elements in the flow, you must temporarily select a different event.

1. From the open workflow, click **Preview** on the Home tab.
2. Select the type of record you want to preview in the workflow.
3. Choose whether to preview your record in the Agent Desktop or the Agent Browser UI.
   - To simulate the workflow using a new record, select **New Record**.
   - To simulate the workflow using an existing record, select **Open a Record** and enter the record ID in **Enter ID**.
4. Click **OK**.
   A preview window opens where you can test the workflow.

**Tip:** Elements such as Create, Clear, Copy, and Set Fields perform automated actions in the background that advance the flow without visual indication. To verify these elements during testing, you can use the Confirmation Message button to add a visual indicator that an action has been performed.

### Export a Workflow

If you have a workflow that you want to copy to another interface, you can export the workflow and then import it on the other interface.

Exported workflows contain all included workspaces (with all elements, fields, controls, layout, and rules), decisions, actions, and other embedded workflows. Alternately, you can export the contents of your canvas as an image file for use as a visual reference.

1. On the Workspaces/Workflows explorer, right-click the workflow you want to export and select **Open**.
   The workflow opens.
2. Click **File** and select **Export > Export Definition**. The Export Workflow window opens.

**Note:** You can also export an image of the canvas to your workstation by selecting Export followed by Export Image.
3. If the workflow contains embedded workspaces, scripts, or nested workflows, select the Export Workflow Definition Only option to export the workflow definition only. By default, the workflow definition is exported along with any contained workspaces, scripts, and workflows.

4. Click OK.

   The Save As window opens.

5. Select the location where you want to save the workflow definition file and enter the file name.

6. Click Save.

   Workflow definition files are saved with a hash value that is used when the file is imported to determine if the file has been modified externally. If the file has been modified, it will not be available for importing and an error message will notify you that the file is invalid.

### Import a Workflow

You can import a workflow, including any contained workspaces, scripts, and workflows.

1. On the Home tab of the Workspaces/Workflows explorer, click New Workflow.
   
   A new workflow opens.

2. Click File and select Import Definition.
   
   A message appears indicating that the import process will overwrite the current open workflow.

3. Click Yes to allow the import to overwrite the current open workflow.

   The Import Workflow wizard opens.

4. Click Next.

5. Do one of the following:
   
   - Enter the path and name of the workflow definition file you want to import.
   - Click Browse to find the file on your workstation and click Open.

   If the workflow contains workspaces, scripts, or nested workflows, you will be prompted to select whether to include them in your import.

6. To import the workflow definition along with any contained workspaces, scripts, and workflows, click Next.
   
   a. Select the folder you want to save the workspaces and workflows in and click Next.
   
   b. Click the Map To Type drop-down menu to select a record type for each workspace and script you are importing.
   
   c. If a contained workspace includes records from a custom object, click the Map To Record Type drop-down menu and select the record type you want to map the records to. If B2C Service detects a record type of the same name already in the site, it is selected by default.

   d. Click Next.

7. To import only the workflow definition, select Import Workflow Definition Only and click Next.

8. If the workflow contains fields that do not exist in the database, they are listed in the wizard as invalid. To remove invalid field references from the workflow, click Next.

9. Click Finish.

   The desktop workflow canvas opens with the imported workflow.

### Best Practices for Creating Desktop Workflows

Desktop workflows can meet a broad range of needs, some simple and some complex. Complex workflows can be challenging to manage, but keeping your flow diagram elements grouped intuitively on your canvas can help make it easier to understand, in case the workflow needs to be revised later.
The following practices can also be helpful when creating and updating workflows.

- **Apply logic prudently**—Desktop workflows contain many points where logic may be used, such as script elements, workspace elements, decision elements, and connectors. The best places to incorporate logic will depend on your use case, but be sure to consider the full impact and scalability of the workflow when adding these functions. Creating logic that is simple and distinct with minimal overlap is much easier to maintain and modify over time.

- **Track and advance your flows**—Record updates made by workflows are tracked in record audit logs, but sometimes tracking the path a record has taken through a complex flow can be challenging. To make this easier, you can add a custom field to manage the workflow “state.” For example, if an agent completes a key step in a workflow, consider running a rule action to update an easily reviewed custom field signifying that the step was completed. With this information tracked by a field, you could even check its value in an initial decision point to bypass steps completed in previous edits of the record.

For more best practices for using the various features that comprise the dynamic agent desktop, see *Overview of the Dynamic Agent Desktop*. 
4 Analytics

Overview of Analytics

Analytics provides the tools you need to view and create reports that show information about the activities and content on your B2C Service site.

These links give you access to information about the tools used to create, manage, and share reports and dashboards.

How to Monitor Report Usage—Describes management reports you can view to monitor how and where the reports on your site are being used. This information is intended for managers and site administrators.

Overview of the Analytics Explorers—Describes the explorers you use to create and manage reports, including the images explorer

Overview of Creating Basic Custom Reports—Describes the procedures you need to follow to create a simple report. This is intended as an introduction to creating and editing reports.

Overview of Managing Reports on the Reports Explorer—Describes the tools and procedures to view existing reports, and how to modify the display of data in reports.

Overview of Dashboards—Describes how to create, edit, and view dashboards.

Overview of Custom Reports—Describes how to create custom reports, and how to edit existing reports.

View Your Database Data Dictionary—Describes the information displayed in the data dictionary. The data dictionary gives you a view into the database where the content of your site is stored.

Overview of the Transactions Database Table—Describes the information in the Transactions table. This table stores information about actions that users take on contacts, incidents, and other types of records on your site. This table is frequently used in standard reports, and you can use the table in custom reports as well.

Analytics Configuration Settings—Describes the configuration settings that impact information displayed in reports.

Monitoring Report Usage

How to Monitor Report Usage

Several reports are available to help you determine how and where your reports and dashboards are used.

As a manager or site administrator, it's important to understand who uses the reports and dashboards on your site, how often they’re used, and where they're used. You can view this information using the Expanded Report Audit Log, and the reports available in the Report Management module.

The Expanded Report Audit Log lists every instance of every report on your site being generated, printed, exported, and previewed over the previous 30 days. See View the Expanded Report Audit Log.

The reports in the Report Management module give you information about scheduled reports and dashboards, reports and dashboards that require excessive processing time, and reports and dashboards used in workspaces, report links,
and navigation sets. You can also find reports and dashboards that meet criteria you specify and generate a list of descriptions for any of your public reports and dashboards.

If you need a list of the reports available on your site, you can use the View Report Descriptions report, available in the Report Management component. With this report, you can produce a catalog of reports that displays the descriptions of standard and custom reports. This can help you find an existing report you can use to find information you want, or that you can copy to create a custom report that more precisely meets your reporting needs. See Create a List of Reports.

**Note:** The reports in the Report Management component use data that’s not available in the report designer, and perform non-standard post-processing of the data. These reports cannot be copied or edited like the standard reports. In addition, these reports aren’t accessible with the Public API.

To access the Report Management component, you need to add it to your navigation set. See Overview of Navigation Sets. You also must configure your profile permissions to access the management reports you want. See Configure Management Reports Permissions.

### Configure Management Reports Permissions

Your staff members roles can access different management reports depending on their roles.

Staff members with the Analytics Administrator permission can run all management reports. For those staff members without this permission, their access to management reports is determined by their other profile permissions. These permissions and the reports that can be accessed are described here.

- **Staff members with permission to run one or more reports, but who lack permissions to edit workspaces or navigation sets, can access the management reports in these folders.**
  - Performance
  - Find
  - Definition
  - Reference

- **Staff members who can run one or more reports and who have permission to edit workspaces can access the management reports in these folders.**
  - Performance
  - Find
  - Definition
  - Reference
  - Workspaces

- **Staff members who can run one or more reports and who have permission to edit navigation sets can access the management reports in these folders.**
  - Performance
  - Find
  - Definition
  - Reference
  - Navigation Sets
Open a Report in the Report Management Component

You can open the Report Management component from your navigation pane.

1. Click **Analytics** on the navigation pane and then double-click **Report Management**.
2. Open the folder containing the report you want to run.

<table>
<thead>
<tr>
<th>Folder</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedules</td>
<td>The reports in this folder display the scheduled reports that are being sent, helping administrators better manage receipt of scheduled reports. Depending on the report you select, you can search by individual email addresses, email subject lines, or report names. See <em>Schedule a Report</em>.</td>
</tr>
<tr>
<td>Workspaces</td>
<td>The report in this folder displays the workspaces that use a particular report, helping administrators understand the impact of changing or deleting a report. See <em>Overview of Workspaces</em>.</td>
</tr>
<tr>
<td>Navigation Sets</td>
<td>The reports in this folder display the reports included in specified navigation sets or the navigation sets that include the specified reports. This helps administrators determine if a report can be deleted or modified. See <em>Overview of Navigation Sets</em>.</td>
</tr>
<tr>
<td>Performance</td>
<td>The reports in this folder help administrators find reports that may require excessive processing to run, including reports that have no filters and reports that are automatically deferred due to processing time. These reports can then be modified to reduce the processing time or restricted to those staff members who understand the impact of running them.</td>
</tr>
<tr>
<td>Find</td>
<td>The reports in this folder are used to find reports that contain certain descriptions, custom scripts, column headings or column descriptions, and references to particular tables or columns in the database. We recommend using the <strong>Reports by Database Reference</strong> report to find reports that query a particular database field, such as when you want to delete a system attribute and need to know which reports use the field.</td>
</tr>
<tr>
<td>Definition</td>
<td>The report in this folder returns the report descriptions for the reports you specify, allowing you to easily create a catalog of reports that can be used to understand the available public reports. See <em>Create a List of Reports</em>.</td>
</tr>
<tr>
<td>Reference</td>
<td>The reports in this folder show you reports that are used in dashboards or in report links. See <em>Overview of Dashboards</em> and <em>Overview of Linked Reports</em>.</td>
</tr>
</tbody>
</table>
3. Double-click the report you want to run.

   Search options vary depending on the report you run. Some reports have required filters (the filter names display in red with an asterisk), while other filters do not require you to select values for them. You can also specify limit, paging, and sorting options, and change the layout of the search window.

   The Search window opens where you can select options to filter and sort the report’s output. Any required filters are indicated by red text. You can also use paging options to specify how many records you want to display per page.

4. Select the filter options you want and click Search. The report output displays.

   As with other reports you run, you can sort the output, print and export the report, and apply slicing and other options. You can also run the report again, selecting different search criteria in the docked filters shown above the report output.

- Slice Report Data

Create a List of Reports

With the large number of standard reports available in B2C Service, it can be challenging to understand what each report provides. Using the View Report Descriptions report in the Report Management component, you can generate listings of column and report output definitions for any standard or custom reports.

While the Analytics Administrator profile permission is required to run any of the reports in Report Management, you can export, print, or publish the output so other staff members can view the report descriptions. See How You Distribute Reports and Dashboards.

**Note:** Report output definitions are preconfigured for standard reports. For information about adding descriptions to custom reports, see Display Output Descriptions.

1. Click Analytics on the navigation pane and then double-click Report Management.
   Because you can add this component to any navigation button in your navigation set, you may need to click another navigation button to access it.

2. Expand the Definition folder and then double-click View Report Descriptions.
   The Search window opens.

3. Select the reports you want to include in the output.
   By default, all reports are selected, but since this is a required filter, you need to specify the reports you’re interested in. You can select all the reports in a top-level folder by selecting the check box next to the folder.

4. Click Search to run the report.
   The report descriptions are displayed on the content pane.
5. To see a report’s column descriptions and expressions, click the Details link in the View column.

View the Expanded Report Audit Log

The Expanded Report Audit Log provides administrators with information about reports that have been viewed or accessed. This information is recorded for all reports in your B2C Service site, regardless of where they were accessed.

This report is accessed from the Reports Explorer, but uses information from a table that's not accessible for use in custom reports. For this reason, you can't copy this report.

**Note:** The data displayed in the Expanded Report Audit Log accumulates quickly since it’s stored every time a report is run, previewed, forwarded, printed, or exported. To prevent the accumulation of this data from impeding site performance, it’s purged 30 days after the tracked event occurs. If you need data stored longer than 30 days, you will need to run the audit log on a regular basis and export the data that’s returned to another location.

This procedure describes opening the Expanded Report Audit Log from the Reports Explorer. However, it can also be added to navigation sets.

1. Click Analytics on the navigation pane.
2. Double-click Reports Explorer.
3. Expand Public Reports > Common > Site Administration > Reports.
   The report’s Search window opens.
5. Select the filters you want to use to limit the amount of data returned by the report.
6. Click Search.
   The results display on the content pane.

These are the fields you will see in the Expanded Report Audit Log.

- Report—This is the ID number of the report.
- Report Name—This is the name of the report.
- Account First Name—This is the first name of the staff member who performed the report action.
- Account Last Name—This is the last name of the staff member who performed the report action.
- Type—This is the type of action that occurred. The available options are Generated, Forwarded, Exported, and Printed.
- Start Date—This is the time the report action was initiated.
- End Date—This is the time the report action completed.
- Source Level—This is where the report action occurred. For instance, reports generated on the Reports explorer have a source of CX Console > Console Standard Report, and reports generated through the Connect Public API have a source of Public API > Connect PHP.
- Result Code—This is the result of the attempt to perform the action. The available options are Success, Too Much Data, Timed Out, and Unexpected Error.
- Description—This lists the accounts and email addresses that a forwarded report was sent to.
Analytics Explorers

Overview of the Analytics Explorers

The reporting features in B2C Service are accessed through the Analytics explorers.

Analytics explorers are accessed by clicking Analytics on the navigation pane. Your access to Analytics explorers is determined by your navigation set and profile permissions. See Overview of Navigation Sets and Analytics Permissions.

From Analytics explorers, you can create custom reports and dashboards, view standard and custom reports, and edit report styles, chart styles, color schemes, images, and text fields to use with reports and dashboards. See Download Oracle B2C Service and Log In.

Search for Analytics Items

You can search for reports, styles, images, or other types of items specific to the explorer you're using.

For instance, you can search for reports and dashboards from the Reports Explorer and text fields from the Text Fields Explorer.

Note: A separate Quick Search feature is available that enables you to search for a specific file or record no matter where you're in the product. See Overview of Quick Search.

This procedure describes how to search for reports from the Reports explorer. However, the basic procedure is the same for all explorers—only the columns available for searching change between explorers.

1. Click Analytics on the navigation pane and then double-click Reports Explorer.
2. Click Find. The left side of the content pane displays a menu, hiding the folders tree.
   
   Note: All of the Analytics explorers include a ribbon for working with items shown in the explorers.
   
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find Using</td>
<td>Click this drop-down menu to select a column in the reports list to search on. You can search by the report’s name, ID number, dates created or updated, the report’s initial run (opening report without prompting for search parameters) status, or the refresh on edit status. Each column is associated with one of three data types which determine the available search options: Strings—Search for strings that start with, contain, end with, or match the value you enter in the text box. Dates—Search for dates before, on, or after today’s date. You can also click the calendar to display the current month’s calendar and select another day, or click the arrows at the top of the calendar to change months. Integers—Search for values that are less than, equal to, or greater than a number.</td>
</tr>
<tr>
<td>Search text box</td>

</tr>
</tbody>
</table>
| Search globally, replace results | Select this option to remove the results from the previous search and replace them with results from this search.  
|                               | This is the default option.                                                  |
| Search globally, append to results | Select this option to keep results from the previous search and add results to them from this search. |
| Search within results, replace results | Select this option to search the current search results and keep only those results that match the new search. |
| Return Non-matching Items     | Select this check box to return all reports that do not match your search criteria. |

4. Click **Find**. 
The search results display on the right pane. A message displays if no results are found.

5. To remove the text entered for the previous search, click **Clear** on the **Find** menu.

6. To replace the search results with the original reports list, click **Refresh**.

7. To remove the **Find** menu and display the folders list, click **Folders**.

**Related Topics**
- Running a Standard Report (video)

**Copy Analytics Content**
You can copy reports, styles, chart styles, and color schemes shown in the Analytics explorers, and then edit the copies to create your own customized versions.

1. Open the appropriate explorer.
2. Right-click the item you want to copy.
3. Select **Copy** to open the **Copy As** window.
4. To store the new item in a custom folder, navigate to the folder.

   **Note:** Custom files cannot be stored in the Reports explorer’s or Images explorer’s standard folders.

5. Enter a name for the new item in the **Name** field.
6. Click **OK**.
Save an Item

The procedure to save custom reports, report styles, chart styles, color schemes, and text fields is similar, no matter what type of item you’re saving.

1. After editing the item, select the appropriate save option on the Home tab:
   - To save changes to the item without closing it, select **Save**.
   - To save a new item, or to save a copy of the item you’re editing with a different name, select **Save As**.
   - To save changes to the item and close it, select **Save and Close**. This option is faster than saving a change and then manually closing the window.

   **Note:** Options for saving a custom report are accessed by clicking the arrow on the **Save** button on the report designer’s **Quick Access toolbar**.

   When you select Save As, or attempt to save a new item for the first time, the **Save As** window opens to name the item.

2. To store the new item in a custom folder, navigate to the folder.
   - You can store custom files only in custom folders.
3. Enter a name for the new item in the **Name** field.
4. Click **OK**.

How You Create Custom Folders

You can create custom folders in any explorer.

Custom folders let you organize new or copied reports, **styles**, **chart styles**, **color schemes**, images, and **text fields**. You can also rename custom folders and files.

**Related Topics**

- Create a Custom Folder
- Rename a Custom Folder

Create a Custom Folder

You can add folders to any parent folder that accepts custom folders.

1. Open the appropriate explorer.
2. Right-click the parent folder you want to add the custom folder to.

   **Note:** Not all standard folders accept custom folders.

3. Select **New Folder**.
4. Enter a name for the folder.
5. Click outside the folder name, or press Enter, to save the folder.

Rename a Custom Folder

You can use the rename folder feature when saving or copying a custom folder.

1. Open the appropriate explorer.
2. Right-click the custom folder.
3. Select **Rename**.
4. Enter a new name for the folder.
5. Click outside the folder name, or press Enter.
Tip: You can also use right-click functionality to rename custom folders when you’re saving or copying items.

Reports Explorer

The Reports explorer provides you with one location to view and organize reports, and edit and create custom reports and dashboards.

The content created in the other Analytics explorers is applied to reports using the Reports explorer.

Reports are contained in folders in the Reports explorer. These folders are in a tree structure and can be expanded or collapsed to hide or display their contents. Reports that are accessible by multiple staff members are contained in the Public Reports folder, and private reports that are accessible only to the staff member who created them are stored in the My Reports folder.

Note: Other staff members’ My Reports folders aren’t displayed in the Reports explorer. However, administrators can log in with the administrator account to access every account’s folders. This ensures that private reports can be edited, moved, and deleted if necessary.

Clicking a folder in the Reports explorer’s tree displays the folder’s contents in the list on the right. A folder’s contents can include reports, dashboards, and subfolders. Reports and dashboards contained in the same folder are automatically sorted in alphabetical order and cannot be reordered. However, you can drag items from one folder to another.

Right-clicking a folder or report displays a list of actions you can take on the item, such as opening a report for editing or queuing a report.

Styles Explorer

Report styles let you quickly apply custom display settings to your reports without editing the underlying report.

Styles can also help staff members use the same display settings for their reports so that all reports generated by your staff share the same appearance. For information about applying a style to a report, see Apply a Style to a Report.

A number of default styles are available, which may be all you need. However, you can easily create and edit styles to define the specific fonts, colors, borders, and margins which are most appropriate for your target audience. You can then apply your custom styles to reports just as you would the default styles.

Tip: When configuring reports to display on the Browser User Interface, you can use any style you want, but we suggest trying the Web Theme style, which is configured for optimal display on web browsers.
You can edit style options for various components used in reports, such as text fields, column headers, exceptions descriptions, or entire report sections. You can also associate a custom chart style with your report style that will be applied to charts added to reports.

The style options vary depending on the type of component you’re editing. For example, the options for a text component include a Font tab, whereas the options for a non-text component do not, since font settings do not apply. See Overview of Report Sections for descriptions of the various components that can be added to reports.

Create a Style
The Style editor displays examples of the various report components that you can create custom styles for. This helps you identify the component you want to modify. You can also select the component you want to modify from a list if you know its name.

1. Click Analytics on the navigation pane.
2. Double-click Styles Explorer.
   The Styles explorer opens, displaying the current styles.
3. Do one of the following:
   o To create a style, click New.
   o To edit an existing custom style, right-click the style and select Edit.

   The Style editor opens.
4. Do one of the following:
   o Select the component whose style you want to modify from the drop-down menu at the top of the editor and click Edit.
   o Double-click the component on the Style editor.

   A window opens for selecting style options.
5. Select the style options you want for the selected component. See Specify Style Options.
6. To associate a custom chart style with the report style, click the name of the chart style that's currently associated with the report style, shown next to Attached Chart Style. The Select Chart Style window opens.
7. Select the chart style you want to associate with the report style.
8. Click OK.

   **Note:** The associated chart style is used by default for charts added to reports that use the report style. However, different chart styles can be selected when creating charts. See Chart Styles Explorer for information about chart style options. For information about adding charts to reports, see How to Add and Edit Charts.

9. Click Save.

Specify Style Options
After selecting the component you want to modify from the style editor, you can define options for the component’s font, margins, background colors, and borders.

You can access all the style options for the selected component from the window that displays when you select a component and click Edit.

**Tip:** You can also select common style options for the selected component using the buttons on the explorer’s ribbon.

1. Open the Style editor window for the component you have selected.
   By default, the window opens on the Font tab if the selected component includes text. See Change Font Attributes from the Font Tab for information about this tab.
2. Click the **Margins** tab to define the amount of space surrounding the component when used in reports.
3. Enter the number of pixels between the text and the left, right, top, and bottom margins.
4. If you’re editing a style for a report section, such as the report header, enter the number of pixels you want between the section’s contents in the **Spacing** field.
5. Click the **Fill** tab to modify the background fill colors for the selected component.
6. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Color/Top Color/Left Color</td>
<td>Click this box to select a primary color as the background. The text description for this option varies depending on the Gradient Mode you select.</td>
</tr>
<tr>
<td>No Fill</td>
<td>Select this check box to clear any fill colors previously selected. If this check box is selected, the other options on the Fill tab are disabled, except Color. Selecting a color automatically clears the No Fill check box, enabling the other options.</td>
</tr>
<tr>
<td>Gradient Mode</td>
<td>Select the positioning of the primary and secondary colors for the background from the Gradient Mode drop-down menu. Using gradient coloring lets you merge two colors. The following options are available.</td>
</tr>
<tr>
<td></td>
<td>◦ None—Select this option to use only the primary color as the fill color. If you select None, the Gradient Color field is disabled.</td>
</tr>
<tr>
<td></td>
<td>◦ Top to Bottom—Select this option to merge the colors from the top of the background to the bottom.</td>
</tr>
<tr>
<td></td>
<td>◦ Left to Right—Select this option to merge the colors from the left of the background to the right.</td>
</tr>
<tr>
<td>Gradient Color/Bottom Color/Right Color</td>
<td>Click this box to select a secondary color to merge with the primary color. The fill colors then merge using the method defined in the Gradient Mode menu. The text description for this option varies depending on the gradient mode you select.</td>
</tr>
<tr>
<td>Transparency (%)</td>
<td>Select a percentage to define how intense the fill colors are. A setting of 100% is completely transparent, which prevents the fill colors from displaying. A setting of 0% has no transparency, resulting in intense background colors. The selected percentage is immediately reflected in the Preview field, so you can easily scroll through the transparency percentages to find a value that best suits your needs.</td>
</tr>
<tr>
<td>Preview</td>
<td>This area provides a sample of how the fill colors you select will appear on the report background.</td>
</tr>
</tbody>
</table>

7. Click the **Borders** tab to modify the borders of a component.
8. Enter field information.

### Chart Styles Explorer

You can apply chart styles to charts shown on reports to change their appearance. You can also create custom chart styles if you have specific display requirements for your charts.

By applying a chart style, you can immediately change a chart’s fonts, colors, scales, gridlines, backgrounds, and other display attributes. The **Chart Styles** explorer includes several predefined chart styles, which you can apply to charts, and allows you to create custom chart styles. You can then apply the same chart style to charts in different reports to ensure that all the charts have a similar appearance.

**Tip:** When configuring charts to display on the Agent Browser UI, you can use any chart style you want, but we suggest trying the Web Theme style which is configured for optimal display on web browsers.

The attributes defined in chart styles vary depending on the type of chart used in a report. Likewise, the chart style options vary depending on the type of chart the style should be applied to.

- How to Add and Edit Charts

### Create or Edit a Chart Style

Chart styles are customized using the Chart Styles editor.

When you edit a chart style and select a chart type, different buttons are enabled based on the new chart type. For example, the Bar Settings button is enabled when editing a style for a vertical bar chart, whereas it’s not enabled when creating a style for a pie chart. The chart subtype, such as two- or three-dimensional and stacked or not stacked, also impacts which options are enabled.

**Tip:** The same ribbon options available on the chart styles editor are also available when you add a chart to a custom report. This allows you to customize the display of an individual chart used in a report without creating or modifying a chart style.

When creating a chart style, a sample of the currently selected chart type and subtype is shown on the content pane. The sample chart's display changes depending on the options you select so you can quickly see how a chart that uses the selected settings will appear.

**Note:** After you select a chart type and subtype, you can follow the steps in this procedure in any order you want. The steps in this procedure are listed according to the order of their associated buttons on the ribbon.

1. Click **Analytics** on the navigation pane and then double-click **Chart Styles Explorer**.
2. To create a new chart style, click **New** on the ribbon.
3. To edit a chart style, right-click the chart style and select **Edit**.
   - The chart styles editor displays a default chart type.
4. Click **Type** on the Home tab to display the chart type menu.
5. Select the chart and chart subtype you want to configure for the chart style.
   - After you configure your chart style for the selected chart type and subtype, you can select other types to configure your chart style for use with those types. This allows you to use the same chart style regardless of the types of charts you add to reports, while ensuring the charts’ colors, fonts, and other attributes are consistent.
6. To configure three-dimensional settings for a chart style with a 3D subtype, click **3D Depth** and **3D Angle** on the Home tab to enter values that impact how three-dimensional charts display.

**Tip:** You can modify the three-dimensional settings for charts with 3D subtypes by right-clicking the chart on the content pane and selecting **Rotate**. When you do so, your cursor changes and you can move your mouse or other pointing device horizontally and vertically to change the chart’s three-dimensional values. Click the left mouse button to quit rotating the chart. The right-click menu also gives you options to convert three-dimensional charts to two-dimensional charts, or two-dimensional charts to three-dimensional charts, as long as the chart type includes 3D subtypes. This right-click menu is also available when creating or viewing reports.
### Button Description

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3D Depth</td>
<td>Click this button and enter a number for the extent of the chart’s three-dimensional effect. A value of 0 removes the 3D appearance from the chart, whereas a setting of 125 maximizes the effect.</td>
</tr>
<tr>
<td>3D Angle</td>
<td>Click this button to enter values for the chart’s horizontal and vertical angles.</td>
</tr>
<tr>
<td>X Angle</td>
<td>Enter a value from 0 to 180 degrees in this field. This value determines the vertical rotation of the chart.</td>
</tr>
<tr>
<td>Y Angle</td>
<td>Enter a value from 0 to 180 degrees in this field. This value determines the horizontal rotation of the chart.</td>
</tr>
</tbody>
</table>

7. To configure colors, styles, borders, and other settings for the bar, line, or gauge elements in charts, click the Home tab and click **Bar Settings, Line Settings, or Gauge Settings**.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bar Settings</td>
<td>Click this button to customize the display of the bar elements for chart types that include bars.</td>
</tr>
</tbody>
</table>
| Bar Outline | Select this option and then select the type of outline you want around the individual bars in the chart. You can choose from the following options:  
  o None—The bars have no outline.  
  o Lighter—The bar outline is a lighter shade of the bar’s color.  
  o Darker—The bar outline is a darker shade of the bar’s color.  
  o Color—The bar outline is a specified color.  
  Choosing Color enables the Outline Color option. Select this to open the color menu where you can select a color for the outline. |
<p>| Bar Style   | Select this option and then select the style you want for the bars in the chart. You can choose Block, Cylinder, Wedge, Emboss, or Light to Dark.                                                                  |
| Multicolor Series | Select this option to make the bars in different series use different colors. When this option isn’t enabled, the bars in different series are shown using the same set of colors.               |
| Line Settings| Click this button to customize the display of the line elements for chart types and subtypes that include lines.                                                                                               |</p>
<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Line Width</td>
<td>Select this option and then select the number of pixels you want for the line’s width. Options include widths from one to ten pixels.</td>
</tr>
<tr>
<td>Symbols</td>
<td>Select this option and then select the symbol you want to place on the line to mark data points. You can choose None, Square, Circle, or Triangle.</td>
</tr>
<tr>
<td>Gauge Settings</td>
<td>Click this button to customize the display of the gauge for gauge chart types.</td>
</tr>
<tr>
<td>Gauge Color</td>
<td>Select this option to open the color menu to select a color for the gauge. You can also select No Value from the menu to use the default color.</td>
</tr>
<tr>
<td>Border Color</td>
<td>Select this option to open the color menu to select a color for the gauge’s outline. You can also select No Value from the menu to use the default color.</td>
</tr>
<tr>
<td>Show Numeric Identifier</td>
<td>Select this option to display a numeric indicator on the gauge which shows the actual value represented on the gauge.</td>
</tr>
<tr>
<td>Color Ranges</td>
<td>Select this option to open the Color Range window where you can define different colors to use for different value ranges on the gauge.</td>
</tr>
</tbody>
</table>

8. To define color ranges for a gauge chart, click **Gauge Settings** on the Home tab and select **Color Ranges**.
   a. Click **Add Range** to add a color range.
   b. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Range</td>
<td>Click this text to add a range. Before you add a range, the Color Ranges window does not show any ranges and Add Range is the only option available.</td>
</tr>
<tr>
<td>Minimum</td>
<td>Enter the percentage value the range should begin at. For example, a gauge with three color ranges could have a range that begins at 34%.</td>
</tr>
<tr>
<td>Maximum</td>
<td>Enter the percentage value the range should end at. For example, a gauge with three color ranges could have a range that ends at 66%.</td>
</tr>
<tr>
<td>Start Color</td>
<td>Click this box to open the Color window and select a color for the beginning of the range.</td>
</tr>
</tbody>
</table>
Sample ranges are shown in the Color Ranges window here.

Color ranges are unique to gauge charts and let you show ranges of different values on the chart in different colors.

9. To select a color scheme for the chart style, click **Color Scheme** on the Home tab and select the item you want from the color scheme menu. Customizable color schemes are available for all chart types except gauge charts. Color schemes can be used to define the colors used for the chart. See *Create a Color Scheme*.

10. To define the placement of labels, such as titles and legends, click the Layout tab and click the button in the Labels group that corresponds to the label you want to configure.

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Click this button to select options for the chart's title. This label displays the chart's title defined when you add a chart to a report. You can choose not to show this label, or you can show it at the left, right, top, or bottom of the chart.</td>
</tr>
<tr>
<td>Legend</td>
<td>Click this button to select options for the chart's legend. This label displays a legend to identify the chart's contents. You can choose not to show this label, or you can show it at the left, right, top, or bottom of the chart.</td>
</tr>
<tr>
<td>Category Axis Title</td>
<td>Click this button to select options for the chart's category axis title. This label identifies the chart's category axis. You can choose to show it or not show it.</td>
</tr>
<tr>
<td>Value Axis Title</td>
<td>Click this button to select options for the chart's value axis title. This label identifies the chart's value axis. You can choose to show it or not show it.</td>
</tr>
</tbody>
</table>
11. To configure scale options for the chart style, click **Value Scale** on the Layout tab and select from the options presented.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Scale</td>
<td>The options in this section let you show the primary scale, rotate the scale’s labels, and choose whether to configure the scale’s range manually. You can also choose to have these options configured automatically.</td>
</tr>
<tr>
<td>Show</td>

---

**Data Labels**

Click this button to select options for the chart’s data labels. Data labels can be displayed on the chart’s bars, lines, and other display components to show the actual values represented in the chart. You can choose to show data labels or not show them.

**Exception Box**

Click this button to select options for the chart’s exception box. This label describes the exceptions shown in the chart if the chart’s data includes exceptions and the report is configured to show exceptions on the chart. You can choose to show this label at the left, right, top, or bottom of the chart.
### Option | Description
--- | ---
Manual | Select this option to manually configure the range shown on the secondary scale. When you select this option, Scale Start and Scale End fields appear. Enter the minimum value you want for the scale in the Scale Start field and the maximum value you want in the Scale End field.

Rotate Labels | Select this option and then select a degree to rotate the label text. Your choices are None, 15, 30, 45, 0, -15, -30, and -45 degrees (clockwise).

Position | The options in this section let you choose where to place the primary scale on the chart.

Primary Scale Right | Select one of these options to place the primary scale on the right or left side of the chart. By default, the primary scale is displayed to the left of the chart.

Primary Scale Left | These options are enabled only for chart types that display data vertically.

Primary Scale Top | Select one of these options to place the primary scale at the top or bottom of the chart. By default, the primary scale is displayed at the bottom of the chart.

Primary Scale Bottom | These options are enabled only for chart types that display data horizontally.

Use Logarithmic Scale | Select this check box to use a logarithmic scale based on your report data.

12. To configure category and value grid lines shown on the chart, click **Category Grid Lines** or **Value Grid Lines** on the Layout tab.

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Scale</td>
<td>The options in this section let you choose whether to use automatic or manual offsets for the major and minor grid lines shown on the chart. The offsets determine the spacing between the grid lines.</td>
</tr>
</tbody>
</table>

| Automatic | Select this option if you want the offsets between the major and minor grid lines shown on the chart to be configured automatically. |

| Manual | Select this option to manually specify the offsets for the chart’s grid lines. When you select this option, Major Offset and Minor Offset fields are displayed. Enter the numeric offset value you want for the major grid lines in the Major Offset field, and the offset you want for the minor grid lines in the Minor Offset field. |
Option | Description
--- | ---
Display | The options in this section let you show or hide major and minor grid lines on the chart. Grid lines can make it easier to identify values on the chart.
Show Major | Select this option to display major grid lines on the chart.
Major Color | Select this option to open the color menu where you can choose the color you want for the major grid lines.
Show Minor | Select this option to display minor grid lines on the chart.
Minor Color | Select this option to open the color menu where you can choose the color you want for the minor grid lines.
Show Left | Select this option to show grid lines along the left side of the chart.
Left Color | Select this option to open the color menu where you can choose the color you want for the grid line along the left side of the chart.
Bottom Color | Select this option to open the color menu where you can choose the color you want for the grid line along the bottom of the chart.

13. To configure options for tick marks shown on the chart's scale, click **Tick Marks** on the Layout tab, and select the options you want.

<tr>
<td>Minor Tick Marks</td>
<td>Select this option to show minor tick marks on the chart.</td>
</tr>
</tbody>
</table>

14. To customize the fonts, borders, and backgrounds of different sections of the chart, click the Format tab.

   a. Click the section of the chart you want to configure on the content pane or, if you know the name of the chart section you want to configure, select it from the Current Selection drop-down menu.

   The following chart sections are available, though not all sections are available for all chart types.

   - Chart Area
   - Grid Area
   - Title
   - Legend
   - Category Axis Labels
   - Category Axis Title
   - Value Axis Title
   - Primary Scale Labels
   - Secondary Scale Labels
   - Data Labels
   - Exception Box

   b. Select from the options on the Format tab's Format group.

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
</table>
| Border | Click this button to select a border style for the selected section. The available options are:  
  - None  
  - Thin  
  - Medium  
  - Thick  
  - Dashed  

To select a color for the border, select Border Color from the menu to open the color menu.
<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
</table>
| Shadow       | Click this button to select a shadow style for the selected section’s border. The available options are:  
- None  
- Thin  
- Medium  
- Thick  
To select a color for the shadow, select Shadow Color from the menu to open the color menu. |
| Background   | Click the arrow on this button to open the color menu where you can select a background color for the selected section of the chart.                                                                          |
| Transparency | Click this button to enter a percentage to define how intense the background color is for the chart’s grid area. A setting of 100% is completely transparent, which prevents the fill colors from displaying. A setting of 0% has no transparency, resulting in intense background colors. The selected percentage is immediately reflected on the sample chart, so you can easily scroll through the transparency percentages to find a value that best suits your needs. |
| Gradient     | Click this button to select the type of gradient you want for the background of the chart area section. You can use gradient color to customize a background by blending two colors. Your options are:  
- None  
- Left to Right  
- Top to Bottom  
To select a gradient color to blend into the background color, select Gradient Color to open the color menu. |
| Font buttons | Select the font, font size, and other attributes from these buttons.                                                                                                                                 |

15. To configure settings for a different chart type or subtype, repeat steps 3 through 14.  
16. Click **Save**.

- Change Colors

**Create a Color Scheme**

The Color Schemes explorer lets you view standard color schemes used in conjunction with chart styles.
You can copy standard color schemes and edit the copies, or you can create your own custom color schemes.

Tip: When configuring charts to display on the Agent Browser UI, you can use any color scheme you want, but we suggest trying the Web Theme scheme which is configured for optimal display on web browsers.

1. Click **Analytics** on the navigation pane and then double-click **Color Schemes Explorer**.
   The explorer opens, displaying the current color schemes.
2. Click **New**.
   The **New Color Scheme** window opens, populated with default colors.
3. To change a particular color, click the box with the color to open the **Color** window. See **Change Colors**.
4. Enter the transparency value for the color scheme in the **Transparency** field.
   A transparency value of 0 displays a solid color, and a value of 255 is completely transparent with no color.
5. Click **Save**.

### Images Explorer

You can add or replace images in reports and dashboards using the Images explorer.

Photos and other images can be uploaded to use in reports and dashboards. For example, your organization’s logo can be added as an image and then added to custom reports. See **Add an Image to a Report Section** for information about adding images to reports area backgrounds or **Add an Image** for information about adding images to dashboards.

The images used with reports and dashboards can be added and replaced using the Images explorer. The ability to replace images is helpful when an image, such as a corporate logo, is modified. After the image file is replaced, the reports and dashboards with the old image automatically use the new image.

**Note:** Images can also be copied, renamed, or deleted using right-click functionality.

### Add an Image

You can add images using the Image explorer.

1. Click **Analytics** on the navigation pane, and then double-click **Images Explorer**.
2. Click **New**.
3. Click **Select One** or **More Images** to open a window where you can select the images you want to add.
   You can add .bmp, .jpg, .gif, and .png file types.
4. Select the image you want to upload.
   You can select multiple images by pressing Ctrl when selecting them.
5. Click **Open**.
6. Click **Save**.
   When saving a single image, you can specify a new name for the image. When saving multiple images, the original image names are retained.

### Replace an Image

You can replace an image with an updated image using the Images Explorer.

1. In the Images explorer, right-click the image you want to replace and select **Open**.
2. Click **Select a Different Image**.
   A window opens where you can select the new image.
3. Select the image you want to replace the existing image with.
4. Click Open.
5. Click Save.

Create a Text Field

The Text Fields explorer lets you create text fields you can add to custom reports and dashboards.

When you create a text field, you can specify the field’s text, fonts, borders, colors, and margins. You can also adjust these settings after you add the field to a report or dashboard. See Add a Text Field to a Header or Footer or How You Add Images and Text Fields to Dashboards.

For example, you could create a text field with your organization’s name, using your organization's preferred fonts and colors, which you could add to your reports’ titles. Since the text fields can be edited after they're added to reports, you can also create a template text field with your customized settings and change the wording in the field as necessary.

Using the Text Fields explorer, you can edit, copy, delete, and rename text fields using right-click functionality. You can also create new text fields.

1. Click Analytics on the navigation pane and then double-click Text Fields Explorer.
2. Click New.
   A new text field opens on the content pane.
3. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text*</td>
<td>Enter the text you want to display in this field. This text also serves as the text field name.</td>
</tr>
<tr>
<td>Text Alignment</td>
<td>Click this drop-down menu to select the horizontal alignment for the text in the text field. Options are Left, Center, and Right.</td>
</tr>
<tr>
<td>Line Alignment</td>
<td>Click this drop-down menu to select the vertical alignment for the text in the text field. Options are Top, Center, and Bottom.</td>
</tr>
<tr>
<td>Anchor Style</td>
<td>Click this drop-down menu to select the anchor style for the field. See Specify an Anchor Style for a Text Field.</td>
</tr>
</tbody>
</table>

4. Click the Size tab.
5. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Best Fit</td>
<td>Select this option to have the size of the text field automatically adjusted to best fit the available space in the report.</td>
</tr>
</tbody>
</table>
6. Click the **Font** tab to select the font settings for the text field. See *Change Font Attributes from the Font Tab*.
7. Click the **Margins** tab to define the amount of space surrounding the text in the text field.
8. Select the number of pixels between the text and each of the four text field margins.
9. Click the **Fill** tab to define the background fill colors for the text field.
10. Enter field information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specific Size (Pixels)</td>
<td>Select this option to manually enter the specific width and height settings for the text field. Any text in the field boundaries that exceeds the size of the field is clipped.</td>
</tr>
</tbody>
</table>

- **Color/Top Color/Left Color**
  - The text description for this option varies depending on the gradient mode you select. Click this box to select a primary color as the background.

- **No Fill**
  - Select this check box to clear any fill colors previously selected. If this box is selected, the other options on the Fill tab are disabled except Color. Selecting a color automatically clears the No Fill check box, enabling the other options.

- **Gradient Mode**
  - Select the positioning of the primary and secondary colors for the background from the Gradient Mode drop-down menu. Using gradient coloring lets you merge two colors. The following options are available.
    - None—Select this option to use only the primary color as the fill color. If you select None, the Gradient Color field is disabled.
    - Top to Bottom—Select this option to merge the colors from the top of the background to the bottom.
    - Left to Right—Select this option to merge the colors from the left of the background to the right.

- **Gradient Color/Bottom Color/Right Color**
