**About Strategic Workforce Planning**

Oracle Strategic Workforce Planning Cloud translates long-term corporate strategy into execution plans by ensuring that the strategy is supported by the right workforce: the right skill sets and headcount at the right time.

You look at long-term demand for resources by exploring scenarios that impact those demands. You also look at what's going to happen with your current workforce, for example, through retirement or natural attrition. Evaluating demand against supply helps you understand what gaps there may be—positive or negative—so that you can proactively plan for needed resources. You can anticipate the headcount and skills needed to support your business strategy.

Strategic Workforce Planning provides configurable drivers that enable planners to answer such questions as, “Do our employees have the right skill sets and are in the right roles to accomplish future plans?”.

To plan future workforce needs, you define strategic demand drivers such as:

- Expected revenue
- Manufactured goods
- Number of calls to a call center
- Number of invoices to process
- Insurance claims to process

You select the best calculation logic for each driver, which translates driver values into future long-term FTE.

Watch this overview video to learn about Strategic Workforce Planning:

[Overview Video](#)
You can also enable Workforce to manage and track headcount expenses. You can then align critical corporate resources—people and dollars—with the strategies that best leverage a competitive advantage. Departments can collaborate to plan headcount and related expenses such as salaries, benefits, bonuses, and taxes. Planners can see up-to-date graphics that show expenses and trends.

If Workforce is enabled with all its features, planners can manage and track headcount expenses:

- Analyze, calculate, and report on headcount, salary, bonuses, taxes, and health care expenses
- Plan for hires, transfers, promotions, terminations, and so on
- Define country-appropriate taxes and benefits

These components help you to meet your workforce planning needs:

- Compensation Planning
- Other Expenses
- Demographics
- Analysis

## Learning More About Strategic Workforce Planning

Oracle offers various resources to help you learn more.

To get more information or help about Oracle Strategic Workforce Planning Cloud and related services:

- Click **Academy** on the Home page.
- To get Help, click the arrow next to your user icon in the upper right corner of the screen, and then click **Help**.
- See these **Related Guides**.

## Related Guides

You can extend the power and flexibility of Oracle Strategic Workforce Planning Cloud. See these guides.

Strategic Workforce Planning belongs to the Oracle Fusion Human Capital Management family, integrating with its services through Data Management. For information on integrating Human Capital Management with Strategic Workforce Planning or Workforce, see Integrating Oracle HCM Cloud.

Watch this tutorial video to learn about integrating Human Capital Management with Strategic Workforce Planning using Data Management.

**Tutorial Video**
Strategic Workforce Planning is also supported by the many Oracle Enterprise Performance Management Cloud components.

To get started using Strategic Workforce Planning, see these guides:

Setting Up Your Application

Related Topics
- Implementation Checklist
  This implementation checklist helps you get started in setting up your Oracle Strategic Workforce Planning Cloud application.
- Creating an Application
  Follow these steps to create a Oracle Strategic Workforce Planning Cloud application.

Implementation Checklist

This implementation checklist helps you get started in setting up your Oracle Strategic Workforce Planning Cloud application.

Perform these tasks to set up Strategic Workforce Planning:

1. Create a Strategic Workforce Planning application. See Creating an Application.
2. If your application is multicurrency, use the Dimension Editor to add dimension members for each currency. See About Editing Dimensions in the Simplified Dimension Editor.
3. Enable features for Strategic Workforce Planning. See Enabling Strategic Workforce Planning.

Your selections for **Granularity** and **Employee Demographics** are set when you enable Strategic Workforce Planning and are also used if you later enable Workforce. Additionally, make sure you add any required custom dimensions or rename dimensions while enabling Strategic Workforce Planning. These dimensions will also be used if you enable Workforce.

While you are enabling features, the application is put in maintenance mode and only administrators can use the application. If any metadata changes are detected, the database is refreshed before features are enabled. If any validation errors are detected, they are displayed; you must resolve these errors before features can be enabled.

You must configure **Demand Drivers** and **Valid Intersections for Jobs**.

The planning and forecast range (configured in **Planning and Forecast Preparation**) can be different for Strategic Workforce Planning and Workforce. For example, you might want to use Strategic Workforce Planning for long-term planning and Workforce for short-term planning.

5. After you configure, and whenever you make configuration changes or import metadata, refresh the database:
Click **Application**, and then **Configure**. Then from the **Actions** menu, select **Refresh Database**, then **Create**, and then **Refresh Database**.

6. Enable any additional features you need for Workforce. See **Enabling Workforce**.

Your selections for **Granularity** and **Employee Demographics** are set when you enable Strategic Workforce Planning and are also used when you enable Workforce.

If you already enabled Strategic Workforce Planning, you can't add any additional dimensions or rename dimensions.

7. Configure Workforce. See **Configuring Workforce**.

The planning and forecast range (configured in **Planning and Forecast Preparation**) can be different for Strategic Workforce Planning and Workforce.

For other configuration tasks, if you’ve already configured them in Strategic Workforce Planning, you don’t also have to configure them again in Workforce.

8. After you configure, and whenever you make configuration changes or import metadata, refresh the database.

9. Set required user variables. See **Setting User Variables**.

10. Import data and run **Process Loaded Strategic Workforce Data** for Strategic Workforce Planning and **Process Loaded Data** for Workforce.

See **Importing Data**.

11. Create the required user and group accounts and grant permissions. See **Getting Started with Oracle Enterprise Performance Management Cloud for Administrators**.

12. Make the application available to planners. From the Home page, click **Application**, and then **Settings**. In **System Settings**, change **Enable Use of the Application for** to **All Users**.

13. To define the approval process, define the approval units and promotional paths for approving plans in your organization. See **Managing Approvals**.

---

### Creating an Application

Follow these steps to create a Oracle Strategic Workforce Planning Cloud application.

To create an application:

1. Log in and then select **Start** under **Human Capital**.
2. Enter an application name and description and then click **Next**.
3. Specify this information, noting that only monthly planning is supported.
   - **Start and End year**—Years to include in the application. Make sure to include the year that contains the historic actuals required for planning and analysis. For example, for an application beginning in 2019, select 2018 as the start year so that the latest actuals are available for trending and reporting purposes.
   - **First Month of Fiscal Year**—Month in which your fiscal year begins.
• **Weekly Distribution**—Sets the monthly distribution pattern, based on the number of fiscal weeks in a month.

This selection determines how data in summary time periods spreads within the base time period. When users enter data into summary time periods, such as quarters, the value is distributed over base time periods in the summary time period.

If you select a weekly distribution pattern other than **Even**, the application treats quarterly values as if they were divided into 13 weeks and distributes weeks according to the selected pattern. For example, if you select **5-4-4**, the first month in a quarter has five weeks, and the last two months in the quarter have four weeks.

• **Main Currency**—For a multicurrency application, this is the default reporting currency and the currency against which exchange rates are loaded.

• **Multicurrency**—Multicurrency support is provided by the Currency dimension and enables planning in different currencies.

  If you select **Multicurrency**, a member called **No <Member>** (for example: No Entity, No Period, No Version) is added to all dimensions to store currency information. You can’t edit or delete this member.

• **Name of Reporting Cube**—Strategic Workforce Planning delivers an ASO reporting cube called **HCMREP**. You can configure the dimensionality of the cube for your reporting requirements.

  An additional ASO cube is created when you enable Strategic Workforce Planning.

4. Click **Next**, review your selections, and then click **Create**.
Familiarizing Yourself with Strategic Workforce Planning

  You can check which original application artifacts such as forms and menus have been modified.

Navigating in Strategic Workforce Planning

Learn how to easily navigate around the application.

Useful navigation tips:
- To return to the Home page when you've navigated away from it, click the Oracle logo in the upper left corner (or your custom logo) or the Home icon.
- To see additional administrator tasks in the Navigator, click the horizontal bars next to the Oracle logo (or your custom logo)
- Expand a dashboard to full screen by clicking the Show/Hide bar at the top of the dashboard. Click it again to return to normal view.
- Hover the cursor in the upper right corner of a form or dashboard to see a menu of options appropriate to the context, such as Actions, Save, Refresh, Settings, Maximize
- In a subcomponent, use the horizontal and vertical tabs to switch tasks and categories.
  For example, use the vertical tabs to switch between reviewing Overview dashboards and planning Demand. The vertical tabs differ, depending on the features that you've enabled.
  Use the horizontal tabs to switch categories within a task.

Reviewing Modified Artifacts

You can check which original application artifacts such as forms and menus have been modified.

To review the artifacts in your application:
1. Click Application, then Configure, and then select Financials, Workforce, Projects, or Capital.

2. From the Actions menu, select Review Modified Artifacts.

3. Click Filter to select an artifact type, and then click Apply.

The artifacts that have been modified are listed.
Configuring Strategic Workforce Planning

Related Topics

- **Enabling Strategic Workforce Planning**
  Before users can start strategic workforce planning, enable the Oracle Strategic Workforce Planning Cloud features you want to use.

- **Configuring Strategic Workforce Planning**
  You configure Oracle Strategic Workforce Planning Cloud after you've enabled its features. Your Configure options depend on the features you enabled. The options import members (metadata) into the dimensions that were created when you enabled features.

- **Strategic Workforce Planning Post Configuration Tasks**
  Perform these tasks after enabling and configuring Oracle Strategic Workforce Planning Cloud features.

- **Strategic Workforce Planning Rules**
  Oracle Strategic Workforce Planning Cloud provides business rules to calculate values in the application.

### Enabling Strategic Workforce Planning

Before users can start strategic workforce planning, enable the Oracle Strategic Workforce Planning Cloud features you want to use.

Based on your selections, dimensions, drivers, forms, and rules are populated. In most cases, you can come back later and incrementally enable additional features. However, note these exceptions:

- If you want to use **Employee Demographics**, you must select it the first time you enable features.

- You must enable all the dimensions you want to include in the application and rename dimensions the first time you enable using **Map/Rename Dimensions**.

After you enable a feature, you can't later disable it.

Watch this tutorial video on enabling Strategic Workforce Planning:

![Tutorial Video](https://example.com/tutorial-video)
Note:
Enable and configure Strategic Workforce Planning before enabling and configuring Workforce. Your selections for Granularity and Employee Demographics are set when you enable Strategic Workforce Planning and are also used if you enable Workforce. Make sure you add any required custom dimensions or rename dimensions while enabling Strategic Workforce Planning. These dimensions will also be used if you enable Workforce.

1. From the Home page, click Application, and then click Configure.

2. From the Configure list, select Strategic Workforce, and then click Enable Features.
Select the features you want to enable. Except as noted, you can come back later and enable additional features, so enable only the features you need to use now.

<tr>
<td></td>
<td>These dimensions are also used if you enable Workforce.</td>
</tr>
<tr>
<td></td>
<td>Make sure you add any required custom dimensions or rename dimensions while enabling Strategic Workforce Planning.</td>
</tr>
<tr>
<td></td>
<td>For example, on the first pass, if you select the top-level Headcount Planning checkbox without selecting options under it (such as Employee Demographics), and you later enable Employee Demographics, you can't rename its associated dimensions Age Band, Gender, and Highest Degree of Education.</td>
</tr>
</tbody>
</table>

Identifying the Level of Workforce Detail to Capture

Your selection for **Granularity** in Oracle Strategic Workforce Planning Cloud is also used if you enable Workforce. You can rename **Job** or **Employee and Job** in **Map/Rename Dimensions**.

To help you decide the granularity you want:

Table 4-2  Overview of Granularity Level

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job</td>
<td>If you select <strong>Job</strong>, the Job dimension is added, which stores the roles assigned to employees. Examples of jobs: Engineer, Software Developer, and Mechanic. If you select this option, you must set defaults for Pay Type and Skill Set. Or, if you don't use this information, set them to null (the No &lt;member name&gt;).</td>
</tr>
</tbody>
</table>
Table 4-2  (Cont.) Overview of Granularity Level

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee and Job</td>
<td>With this option, the Job dimension is used with the Employee dimension to facilitate analysis of roles across the organization, to track new hire requests, and to identify employees by role. If you select this option, you must assign defaults for Job and Union Code. If you don’t track Union Codes, you can use the No Union Code member or change Union Code to something that’s meaningful to your business.</td>
</tr>
</tbody>
</table>

**Note:**
If you rename Union Code when enabling Workforce, you must still assign a default for the renamed dimension.

Enabling Headcount Planning

If you enable Strategic Workforce, then Demand Planning and Supply Planning are automatically enabled. Select from these features:

- **Employee Demographics**—Select to analyze such employee attributes as veteran status, gender, and age band. If you want to use Employee Demographics, you must select it the first time you enable features. Available only for Employee and Job granularity.

- **Demand Planning**—Enables you to look at the long-term demand for strategic jobs, based on custom demand drivers that align with your corporate goals. Some examples of demand drivers: revenue, units manufactured, and claims processed. Because demand drivers vary by industry, Oracle Strategic Workforce Planning Cloud includes no predefined demand drivers. Instead, you configure as many as you need using the Demand Driver configuration task. You can manually add or import demand drivers.

As part of Demand Planning, you can also enable:

- **Demand Driver Scaling Factor**—Enables planners to scale demand planning to account for a change in efficiency over time. That is, you can accomplish more with the same number of people. Setting the Demand Scale enables planners to increase the demand driver without increasing the resources needed using the same ratio. For example, you expect Call Center Operators to handle more calls in the future because they’re more experienced. See Scaling Demand FTE.
If **Demand Driver Scaling Factor** is enabled, but no scaling factor data is entered on the form, 100% is assumed in demand calculations.

- **Expected Productivity Gains Factor**—Enables planners to account for the impact on the productivity of FTE beyond that of Demand Scale. For example, you plan to improve a process or buy technology that improves productivity and reduces the impact on Demand FTE. Perhaps a new automated system is expected to improve productivity of 5% over last year. If you set Expected Productivity to 5% of the previous year's ratio, then doubling the number of calls requires only 95% of the previous year's ratio to meet the demand. See **Factoring Productivity Changes into Demand FTE**.

- **Supply Planning**—Enables you to assess your supply of personnel using attrition drivers. For example, you can assess your workforce using drivers such as **Attrition by Age Band** or **Attrition by Job**. If you enable **Age Based Retirement**, supply calculations can factor age-based retirement into attrition calculations. Because retirement is employee-specific, this option is available only for the **Employee and Job** level of granularity.

- **Skills Assessment**—Enables you to analyze and plan for skill proficiencies. Examples of skills you might add: Project Management or Java coding. Because skills are specific to employees, this option is available only for the **Employee and Job** level of granularity.

- **Average Compensation**—Enables you to base supply and demand compensation calculations for jobs on an average compensation rate. You can load or specify the rates. You can define whether average compensation includes salary, additional earnings, benefits, and taxes.

  To ensure correct supply and demand compensation calculations, import average compensation rates for jobs into the No_Currency member.

### Configuring Strategic Workforce Planning

You configure Oracle Strategic Workforce Planning Cloud after you’ve enabled its features. Your Configure options depend on the features you enabled. The options import members (metadata) into the dimensions that were created when you enabled features.

After performing a configuration task, click **Actions** and then **Refresh Database** to update the application.

Watch this tutorial video to learn about configuring Strategic Workforce Planning:

**Tutorial Video**

1. From the Home page, click **Application**, and then click **Configure**

2. From the **Configure** list, select **Strategic Workforce**.

3. Perform all mandatory tasks. Perform the optional tasks required for your business.
4. Refresh the application after performing configuration tasks.

### Table 4-3 Strategic Workforce Planning Configuration Tasks

<table>
<thead>
<tr>
<th>Configure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Entities</strong></td>
<td>Mandatory</td>
</tr>
<tr>
<td>Import the Entity dimension members that reflect your business hierarchy, such as departments, cost centers, and business units.</td>
<td></td>
</tr>
<tr>
<td>Entities are shared between Strategic Workforce Planning and Workforce.</td>
<td></td>
</tr>
<tr>
<td><strong>Planning and Forecast Preparation</strong></td>
<td>Optional</td>
</tr>
<tr>
<td>Set the timeframe, the starting period, and the level of granularity for planning and forecasting. You can plan and forecast on a different basis for different years.</td>
<td></td>
</tr>
<tr>
<td>The planning and forecast range can be different for Strategic Workforce Planning and Workforce. For example, you might want to use Strategic Workforce Planning for long-term planning and Workforce for short-term planning.</td>
<td></td>
</tr>
<tr>
<td>See Planning and Forecast Preparation.</td>
<td></td>
</tr>
<tr>
<td><strong>Employee</strong></td>
<td>Optional</td>
</tr>
<tr>
<td>Import employee names or employee numbers in your organization as members into the Employee dimension.</td>
<td></td>
</tr>
<tr>
<td><strong>Job Type</strong></td>
<td>Mandatory</td>
</tr>
<tr>
<td>Import job types. For example, add members such as Strategic Jobs and Non Strategic Jobs.</td>
<td></td>
</tr>
<tr>
<td>Only jobs that you identify as strategic are included in calculations that impact strategic decisions. Because different departments have different workforce requirements, when you categorize a job as strategic, you can include specific entities or departments.</td>
<td></td>
</tr>
<tr>
<td>Then you associate the job types with each job using the Job configure option.</td>
<td></td>
</tr>
<tr>
<td><strong>Job</strong></td>
<td>Optional</td>

</tr>
<tr>
<td></td>
<td>Populate the application with a dimension you added, such as projects, by importing members into the dimension.</td>
</tr>
</tbody>
</table>
Planning and Forecast Preparation

You can configure the time frame and granularity for plans for each module. You can have a different time frame and granularity for each module and for each year.

To configure the time frame and granularity for plans:

1. In Current Fiscal Year, select the current fiscal year.
2. From Period, select the current actual month. You need to update this value on a monthly basis.
3. From Plan Start Year, indicate if planners will plan in the current or next fiscal year.
4. Click Plan, and then the Years column to select the number of years to configure. For example, to configure the first five years of a ten year application, select 5 Years.
5. Select the planning basis for each year that you are configuring. If plans will be prepared at the same frequency each year, click All, and then select the frequency (for example, Monthly). If plans will be prepared at different frequencies in certain years, select the frequency in each year’s row. For example, to plan monthly in FY20 but quarterly in FY21, select Monthly in the row for FY20 and Quarterly in the row for FY21.
6. Click Forecast and repeat these steps to specify the forecasting basis.

This configuration task sets all required substitution variables.

Adding and Managing Accounts and Drivers

To add or modify accounts and drivers:

1. Select the configuration task to set up accounts or drivers.
2. Select a component or category from the list (if available).
3. Perform a task:
   • To add an artifact, select Add from the Actions menu, and then enter details in the new row.
   • To modify a group of artifacts, or to add many new ones, export the set of pre-defined artifacts (select Export from the Actions menu), and then modify the export file in Excel. You can edit predefined artifacts, make a copy of an artifact and modify it to create a new one, or add new artifacts. Then, import the modified file (select Import from the Actions menu). If available, use categories and subcategories to group functionally related artifacts.
   • To export or import all drivers, regardless of their category or grouping, use Batch Export or Batch Import.
   • To export or import only certain kinds of drivers, specify a Category or a Component, and then use Import or Export.

Notes:
   • Specify unique member names and aliases for custom members so they don’t conflict with any provided members.
• If you must delete a driver, check the formulas of the other account drivers in its group to see if they reference the driver that you want to remove. If they do, update their logic accordingly.

Setting Global Assumptions: Exchange Rates

If you created a multicurrency application, set up exchange rates. You can enter exchange rates manually as described below, or import them. For information about importing exchange rates, see Administering Planning.

To set up exchange rates manually:

1. Add members for each of your currencies in the Currency dimension.
2. Click Global Assumptions to open the Exchange Rates to <Base Currency> task. Here you’ll enter the exchange rates for the currencies that planners will use.
3. Select the members from the Point of View.
4. Enter average and ending exchange rates for each period and each currency, and then save the form.

The form is renamed to Exchange Rates to <Base Currency>, where <Base Currency> is the reporting currency you selected when you created the application. For example, if the application base currency is Yen, the form is Exchange Rates to Yen. This indicates to planners the currency against which exchange rates are used to convert their data, and enables them to enter rates specific to scenario, year, and version.

Note:

If you add a new version, you must enter exchange rates in that version.

Strategic Workforce Planning Post Configuration Tasks

Perform these tasks after enabling and configuring Oracle Strategic Workforce Planning Cloud features.

Related Topics

• Setting User Variables
  After Oracle Strategic Workforce Planning Cloud features are enabled and configured, set the predefined user variables. Each user, including administrators, must select members for the provided user variables.

Setting User Variables

After Oracle Strategic Workforce Planning Cloud features are enabled and configured, set the predefined user variables. Each user, including administrators, must select members for the provided user variables.

The members that you select for user variables set the initial POV (Point of View) when you open dashboards and forms. You can then change the POV from within dashboards and forms, and their changes are then reflected in User Variables preferences.

To set user variables:
1. From the Home page, click **Tools** and then **User Preferences**.

2. On the **User Variables** tab, select members for these user variables:
   - Currency
   - Entity
   - Job Type
   - Reporting Currency
   - Scenario—Set the scenario for Workforce
   - Scenario View—Set the scenario for Strategic Workforce Planning
   - Strategic Start Year and Strategic End Year—For Strategic Workforce Planning, limit skill set planning to a range of years by setting the start and end year
   - Version
   - Years

**Note:**

Administrators can set limits for user variables by selecting **Tools**, then **Variables**, then **User Variables**, and then selecting members for the **User Variable Definition**. Administrators can further limit data entry by assigning permissions, setting variables, and creating valid intersections.

---

### Strategic Workforce Planning Rules

Oracle Strategic Workforce Planning Cloud provides business rules to calculate values in the application.

To see all the rules in the application, from the Home page, click **Rules**.

To run a rule from within a form, either click **Actions** and then the rule or right-click in a data cell. The available rules depend on the context.

About Strategic Workforce Planning rules:

- **Calculate Demand**—Run this rule after you enter demand driver information to see the impact on demand FTE.
- **Calculate Supply**—Run this rule after you enter supply driver information to see the impact on supply FTE.
- **Process Loaded Data**—Run this rule after you import new compensation planning data for Workforce. This rule copies the data to the necessary periods in the planning year range.
- **Process Loaded Strategic Workforce Data**—Run this rule after your import new data from HCM to compute headcount projections for Strategic Workforce Planning. Running this rule sets the Headcount to 1 and the Partial Payment Factor to 100% for every employee unless you’ve loaded different values at the processing
month. This rule copies the data to the necessary periods in the planning year range.

**Best Practice Recommendations:**

- Don't run **Process Loaded Strategic Workforce Data** and **Process Loaded Data** at the same time.
- You can run the rules **Process Loaded Strategic Workforce Data** and **Process Loaded Data** for multiple entities at a time by selecting the parent entity under Total Entity. Oracle recommends that for performance reasons, you run multiple instances of rules by selecting different children under Total Entity instead of running rules for all entities in one pass.

- **Rollup WFP Cube**—Run this rule to see aggregated data.

- **Performance Considerations with Workforce Rules**
  Consider these tips to potentially improve the execution performance of Workforce rules.

Enabling Workforce

Enable and configure Oracle Strategic Workforce Planning Cloud before enabling and configuring Workforce, and then enable any additional Workforce features you need.

In most cases, you can come back later and incrementally enable additional features. However, note these exceptions:

- If you want to use **Employee Demographics**, you must select it the first time you enable features.

- Your selections for **Granularity** and **Employee Demographics** are set when you enable Strategic Workforce Planning and are also used if you enable Workforce.

- Make sure you add any required custom dimensions or rename dimensions while enabling Strategic Workforce Planning. These dimensions are also used for Workforce. If you've already enabled Strategic Workforce Planning, you can't add custom dimensions or rename dimensions when you enable Workforce.

  **Tip:**
  If your company doesn't use Union Code, you can rename the Union Code dimension to a dimension that's more meaningful for your business. You must do so when you first enable features.

Based on your selections, dimensions, drivers, forms, and accounts are populated.
After you enable a feature, you can’t later disable it.

1. From the Home page, click Application, and then click Configure.

2. From the Configure list, select Workforce, and then click Enable Features. Select the features you want to enable.

</table>
| Workforce Management         | Select to plan expenses based on employee or job hiring, terminating, and transferring to another department. **Workforce Management** options:  
  - **New Hires**—Enables planning for new hires and their impact on expenses.  
  - **Terminations**—Enables planning for employee departures and their impact on expenses.  
  - **Transfers**—Enables you to transfer employees from one department (or entity) to another. Transferring employees changes the department against which their compensation expenses are calculated. |
| Map/Rename Dimensions        | • Enable up to three additional custom dimensions in your application.  
  • Map custom dimensions to existing dimensions.  
  • Rename base dimensions.  
  You must perform this step the first time you enable Workforce. If you've already enabled Strategic Workforce Planning, you can't add custom dimensions or rename dimensions. |

Identifying the Level of Workforce Detail to Capture

Your selection for **Granularity** in Oracle Strategic Workforce Planning Cloud is also used if you enable Workforce. You can rename **Job** or **Employee and Job** in **Map/Rename Dimensions**.

To help you decide the granularity you want:

Table 5-2  Overview of Granularity Level

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Job** | If you select **Job**, the Job dimension is added, which stores the roles assigned to employees.  
Examples of jobs: Engineer, Software Developer, and Mechanic.  
If you select this option, you must set defaults for Pay Type and Skill Set. Or, if you don't use this information, set them to null (the No `<member name>`). |
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee and Job</td>
<td>With this option, the Job dimension is used with the Employee dimension to facilitate analysis of roles across the organization, to track new hire requests, and to identify employees by role. If you select this option, you must assign defaults for Job and Union Code. If you don't track Union Codes, you can use the No Union Code member or change Union Code to something that's meaningful to your business.</td>
</tr>
</tbody>
</table>

**Note:**

If you rename Union Code when enabling Workforce, you must still assign a default for the renamed dimension.

---

**About Configuring Workforce**

For most configuration tasks, if you've already configured them in Oracle Strategic Workforce Planning Cloud you don't also have to configure them again in Workforce.

The planning and forecast range (configured in **Planning and Forecast Preparation**) can be different for Strategic Workforce Planning and Workforce. For example, you might want to use Strategic Workforce Planning for long-term planning and Workforce for short-term planning.

**Configuring Workforce**

Perform these configuration tasks after you've enabled Workforce features.

1. From the Home page, click **Application**, and then click **Configure**.
2. From the **Configure** list, select **Workforce**.
3. Perform all mandatory tasks. Perform the optional tasks required for your business. Use the Filter to check the status of configuration actions. Use Actions to update task status.

4. After configuring, and any time you make changes in configuration or import metadata, refresh the database. From the Configure page, select Refresh Database from the Actions menu. Click Create, and then click Refresh Database.

</tr>
</tbody>
</table>

Note:
Oracle recommends that you use the default age bands instead of loading your own.

Note:
If you are an existing customer, continue to use your existing age bands and members.

See Importing Data. You can also add members using the dimension editor.

Tip:
After importing dimensions and members, you can view the hierarchical structure in the dimension editor.

Planning and Forecast Preparation

You can configure the time frame and granularity for plans for each module. You can have a different time frame and granularity for each module and for each year.
To configure the time frame and granularity for plans:

1. In **Current Fiscal Year**, select the current fiscal year.
2. From **Period**, select the current actual month. You need to update this value on a monthly basis.
3. From **Plan Start Year**, indicate if planners will plan in the current or next fiscal year.
4. Click **Plan**, and then the **Years** column to select the number of years to configure. For example, to configure the first five years of a ten year application, select 5 Years.
5. Select the planning basis for each year that you are configuring. If plans will be prepared at the same frequency each year, click **All**, and then select the frequency (for example, **Monthly**). If plans will be prepared at different frequencies in certain years, select the frequency in each year’s row. For example, to plan monthly in FY20 but quarterly in FY21, select **Monthly** in the row for FY20 and **Quarterly** in the row for FY21.
6. Click **Forecast** and repeat these steps to specify the forecasting basis.

This configuration task sets all required substitution variables.

### Adding and Managing Accounts and Drivers

To add or modify accounts and drivers:

1. Select the configuration task to set up accounts or drivers.
2. Select a component or category from the list (if available).
3. Perform a task:
   - To add an artifact, select **Add** from the **Actions** menu, and then enter details in the new row.
   - To modify a group of artifacts, or to add many new ones, export the set of predefined artifacts (select **Export** from the **Actions** menu), and then modify the export file in Excel. You can edit predefined artifacts, make a copy of an artifact and modify it to create a new one, or add new artifacts. Then, import the modified file (select **Import** from the **Actions** menu). If available, use categories and subcategories to group functionally related artifacts.
   - To export or import all drivers, regardless of their category or grouping, use **Batch Export** or **Batch Import**.
   - To export or import only certain kinds of drivers, specify a **Category** or a **Component**, and then use **Import** or **Export**.

### Notes:

- Specify unique member names and aliases for custom members so they don’t conflict with any provided members.
- If you must delete a driver, check the formulas of the other account drivers in its group to see if they reference the driver that you want to remove. If they do, update their logic accordingly.
Setting Global Assumptions: Exchange Rates

If you created a multicurrency application, set up exchange rates. You can enter exchange rates manually as described below, or import them. For information about importing exchange rates, see Administering Planning.

To set up exchange rates manually:

1. Add members for each of your currencies in the Currency dimension.
2. Click Global Assumptions to open the Exchange Rates to <Base Currency> task. Here you'll enter the exchange rates for the currencies that planners will use.
3. Select the members from the Point of View.
4. Enter average and ending exchange rates for each period and each currency, and then save the form.

The form is renamed to Exchange Rates to <Base Currency>, where <Base Currency> is the reporting currency you selected when you created the application. For example, if the application base currency is Yen, the form is Exchange Rates to Yen.

This indicates to planners the currency against which exchange rates are used to convert their data, and enables them to enter rates specific to scenario, year, and version.

Note:
If you add a new version, you must enter exchange rates in that version.

Configuring Benefits, Taxes, and Additional Earnings

The following sections describe how to use the Benefits and Taxes wizard to configure benefits, taxes, and additional earnings. Workforce provides 10 generic accounts for benefits, taxes, and additional earnings that can be assigned (using Default Assignments) to an employee or job, depending on the granularity.

Tip:
You can set up valid intersections for Options and Tiers to their respective parents in the Components dimension. For information on setting up valid intersections, see Defining Valid Intersections in Administering Planning.

Before You Use the Benefits and Taxes Wizard

Ensure that you have performed these tasks before you launch the wizard:

- Imported Benefits, Taxes, and Additional Earnings using Components on the Workforce Configure page. Importing the component makes it available in the wizard.
- Configured Options and Tiers on the Configure page to set up Benefits and Additional Earnings (Options) and Taxes (Tiers), which creates the options and tiers.
Then you’re ready to launch the Benefits and Taxes wizard to define each option for Benefits, Taxes, and Additional Earnings.

About the Benefits and Taxes Wizard

Using business-based questions, a wizard guides you through the steps to defining options for Benefits and Additional Earnings and defining tiers for (employer-paid) Taxes.

Examples:

- Additional Earnings: Overtime Pay, Merit Increase
- Benefits: Health Insurance, House Loan, Car Allowance
- Employer-paid Taxes: US FICA, Canada Pension Plan (CPP)

In the wizard, you specify the logic, such as whether a tax rate is a flat amount, a percentage of salary, incurred monthly, quarterly, or annually, and so on. You can also use the wizard to maintain taxes, benefits, and additional earnings. Each component can vary by scenario and version.

To launch the wizard, from Configure, click the Benefits and Taxes link. Use Filter to select the component to configure. You are guided through three steps: Details, Rates, and Review.

Note:

- Ensure that all entities have a rate and threshold (if the component uses a threshold). If the same rates and thresholds apply globally, run the rule Copy Rates Across Entities from a source entity. See Applying Rates by Hierarchy.
- Whenever you update an entity default for a benefit, tax, or additional earning, you must run the Synchronize Defaults rule to apply the entity default at the employee-job level. When you update an existing component (a benefit, tax, or additional benefit) in the wizard, you must run the Synchronize Component Definition rule to push the updated definition to employees and jobs.

Common Properties for the Components

Additional Earnings, Benefits, and Taxes share certain properties.

The components share these properties:

- Payment Terms, such as Monthly, Quarterly, or Annually.
- Payment Frequency, such as One-time Pay or Pay During Last Period. Payment Frequency is tied to Payment Terms.
- Component Types: Simple, Rate Table, Rate Table with Threshold, and Custom.

Component Types in the Wizard

On the Details screen, you select a component type (a calculation rate type) for a benefit, tax, or additional earning.

The component types:

- Simple—A single rate option per year with a threshold value. Then you assign the desired option to the appropriate drivers as defaults. Because the Simple compo-
ponent type is a single rate option or tier with a threshold value for all defaults, there's only one row: No Option for Additional Earnings and Benefits and No Tier for Taxes.

- **Rate Table**—Provides different rate options with no threshold values. With this component type, you assign the desired option or tier to the appropriate drivers as defaults. The rate table provides rows of options and tiers (you defined these rows of options and tiers with the Options and Tiers on the Configure page), with no threshold values that are assigned.

- **Rate Table and Threshold**—Provides different rate options with thresholds. With this component type, you assign the desired option or tier to the appropriate drivers as defaults. The rate table with threshold provides rows of options or tiers with thresholds as previously configured. Additional Earnings and Taxes support the Maximum Value Type of Threshold Amount, which crosses all tiers regardless of the option or tier assigned as a default.

- **Custom**—Enables you to create custom calculation logic for a component's additional earnings, benefits, or taxes. See Creating Custom Calculation Logic in a Component.

**Tip:**

A threshold is a cap or maximum value on the resulting expense value. For example, Car Allowance is a percent of salary up to a threshold of $4,000, when the Car Allowance benefit would stop. The rate changes when a cap is reached. For example, the tax rate in the first tier is 4.5% up to a threshold of $50,000, and the second tier is 12.6% up to $100,000. Not only does a threshold apply only to the tiered structure, but you can also set a maximum value with the Additional Earning, Benefit, or Tax calculations.

About One-time Pay Options

Using **One-time Pay Options** enables you to specify which month an additional earning, benefit, or tax is paid. Your options depend on which **Payment Terms** you've selected for the component.

For example, if a benefit needs to be paid once every six months in February and August, then select **Payment Terms** as **Semiannually (Calendar)**, **One-time Pay** as the **Payment Frequency**, and **Second Month** in the **One-time Pay Options**.

Another example: if your **Payment Terms** is **Annually (Fiscal Year)**, and you select **One-time Pay** as the **Payment Frequency**, then the one-time payment occurs once in the fiscal year. For **One-time Pay Options**, you can then select which month in the fiscal year (first through twelfth) the expense is calculated. If your fiscal year starts in July, and you select the eleventh month, the expense is added in May.

You access these new options in the Benefits and Taxes wizard on the **Details** page for the component.

About Maximum Value Type

The available options for **Maximum Value Type** are based on whether the component is an Additional Earning, Benefit, or a Tax.
Setting the **Maximum Value Type** to **Threshold Amount** is available only for Taxes (not Additional Earnings or Benefits). If the **Maximum Value Type** is set to **Threshold Amount**, then the threshold of each tier drives the tiered calculations. The application applies all tiers to the default assignment, as appropriate, regardless of the tier assigned as a default. If you need to apply a tiered tax with multiple tier rates, then select **Component Type** as **Rate Table and Threshold** with **Maximum Value Type** as **Threshold Amount**.

If you select the **Component type** as **Simple**, then you provide rates in **No Tier**. In this case, tiered calculation logic isn't applied even if **Maximum Value Type** is **Threshold Amount**.

You set the **Maximum Value Type** on the **Details** page of the wizard.

If the **Maximum Value Type** is not set to **Threshold Amount**, then the assignment of each option or tier row is relevant and needs to be assigned appropriately.

Let’s use US FICA tax as an example of setting the **Maximum Value Type** to **Threshold Amount**. No one row will be assigned as a default because all rows apply. So the tax rate is 7.65% of salary for the first $118,500, then 1.45% of salary over $118,500 up to $200,000. Then 2.35% tax is applied to salaries over $200,000. (You still have to select an option or tier when assigning the default; it is just ignored in the calculation.)

Example:

<table>
<thead>
<tr>
<th>Tier</th>
<th>Rate</th>
<th>Threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tier1</td>
<td>7.65</td>
<td>116,500</td>
</tr>
<tr>
<td>Tier2</td>
<td>1.45</td>
<td>200,000</td>
</tr>
<tr>
<td>Tier3</td>
<td>2.35</td>
<td>99,999,999</td>
</tr>
</tbody>
</table>

**About Earning Type**

**Earning Type** is valid only for Additional Earnings.

The earning types **Add to Gross Pay** and **Do Not Add to Gross Pay** drive the Benefits and Taxes **Value Type** and **Maximum Value Type** of Overall Earnings. So if the **Earning Type** is set to **Add to Gross Pay**, then those Additional Earnings will be included in any Benefit or Tax based on % Overall Earnings.
If the **Earning Type** is set to **Do Not Add to Gross Pay**, then any Benefit or Tax using % Overall Earnings for the **Value Type** and Maximum Value Type will exclude those Additional Earnings from any Benefit or Tax calculations based on % Overall Earnings.

### About Taxable Component

**Taxable Component** works like **Earning Type** in that any Additional Earning or Benefit set to Yes for **Taxable Component** will be included in any Tax calculation where the **Value Type** or Maximum Value Type is set to % Taxable Earnings.

### About Entering Rates

You can input component rates and logic by period and by entity in the Benefits and Taxes wizard. You can account for rates that change during the year and assess their impact on compensation expenses. For example, you can account for a tax rate that changes in July.

The **Rates** page in the Benefits and Taxes wizard opens with the YearTotal member collapsed with the Time Balance property of Account set to Balance. You can enter a value in YearTotal, and the value automatically spreads to the last of its child time periods. If no distribution exists (that is, the values for all children are zeros or are missing), the value is spread across its children. Or, you can expand YearTotal and manually enter or change rates in the level 0 members.

### About Rates and Threshold Scope

The **Threshold Scope** option (YTD or Monthly) for a component enables you to set rate tiers for an additional earning, benefit, or tax that are calculated independently each month or year. For example, an insurance program may apply rate tiers that start from zero each month.

In this example, assume employees in Finance earn $4,000, where tax is defined as **Percent of Salary**, with a **Threshold Scope** of Monthly and three rate tiers:

<table>
<thead>
<tr>
<th>Tier</th>
<th>Rate</th>
<th>Threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tier1</td>
<td>12%</td>
<td>$1,000</td>
</tr>
<tr>
<td>Tier2</td>
<td>20%</td>
<td>$3,000</td>
</tr>
<tr>
<td>Tier3</td>
<td>30%</td>
<td>$5,000</td>
</tr>
</tbody>
</table>

Their tax rate is 12% for the first 1,000 monthly compensation, 20% between 1,000 and 3,000 earned, and 30% between 3,000 and 5,000.

### Applying Rates by Hierarchy

You can apply the same rates and thresholds to members within a section of the Entity hierarchy by using the **Copy Rates Across Entities** rule. Using this rule saves you from having to manually enter or import rate data.

The **Copy Rates Across Entities** rule is especially useful when a number of entities use the same rates and thresholds for additional earnings, benefits, or taxes. On the
Rates page, you can copy component rates and thresholds from one entity to another section of the hierarchy by running this rule from the Actions menu. In the Member Selector, select the source level 0 Entity member whose rate you want to copy and the target parent or level 0 member to copy the rate to.

For example you can enter rate data for a benefit for France and then use Copy Rates Across Entities to copy the benefit rate using relationship functions to all level 0 descendants of Total Europe and level 0 descendants of Total Nordic.

Creating Custom Calculation Logic in a Component

Defining your own Workforce calculations in a custom component gives you great flexibility in applying conditional logic and specifying value drivers to calculations for additional earnings, benefits, or taxes.

For example, you could create a bonus calculation that applies to new hires who start in the first 6 months of a calendar year, but not for those who start in the last 6 months of the calendar year in their first year of hire. You can also select a value driver other than the predefined ones (for example, Flat Amount, Percentage of Salary, and so on). So, for example, you could base an additional earning such as commissions on a custom member that you create, for example, Revenue. To specify a member as the Value Type driver, you include it in the member formula for the custom component.

To customize logic in a custom component:

1. In the Benefits and Taxes wizard, on the Details page, edit an existing component, and for Component Type, select Custom.
2. Continue setting up the component, including optionally entering rates to be used in your custom logic. Include any thresholds in the member formula.
3. Create a member formula for the OWI_Custom Expense member in the Property dimension:
   a. On the Home page, select Application, then Overview, and then Dimensions.
   b. Click the down arrow to the right of Cube, and then select OEP_WFP.
   c. Click Property, right-click in the Member Name column header, and then clear Default mode.
   d. Select the member OWI_Custom Expense, scroll right to the OEP_WFP Formula column, and then click in the intersection cell.
   e. In the upper left of the grid, click the Member Formula icon.
   f. Enter the member formula.

Notes:

- Before creating your own custom calculation logic, Oracle encourages you to first do due diligence in using the predefined calculations.
- Evaluate the performance of your custom formula before taking the application into production.
• To create and use multiple custom components, modify the **OWP_Custom Expense** member formula to accommodate each component’s custom logic. For example, use nested IF conditions for each custom component type.

Tip:
See the following topics for advice on customizing calculation logic and for several sample formulas.

Creating Custom Formulas for **OWP_Custom Expense**

Use these tips and the formula examples that follow to help you create custom formulas for **OWP_Custom Expense**. These tips assume that the application granularity is Employee and Job.

• Data for properties such as Payment Terms, Payment Frequency, and Value Type are stored at the corresponding Property member > No Currency > Begbalance > Account (Benefit1:10/Earning1:10/Tax1:Tax10) at the Employee and Job combination.

• Rates are stored at **OWP_Value** > Currency > Account (Benefit1:10/Earning1:10/Tax1:Tax10) at the Employee and Job combination.

• Thresholds are stored at **OWP_Maximum Value** > Currency > Account (Benefit1:10/Earning1:10/Tax1:Tax10) at the Employee and Job combination.

• You can refer to the provided formulas for evaluating the periods to calculate the expenses based on Cal Tp-Index of the month, corresponding to different Payment Terms options.

• To add multiple custom formulas, nest them in the **OWP_Custom Expense** member formula.

Customizing Benefit and Tax Calculations

Review these examples to help you customize your benefit and tax calculations.

Use Case
You want to calculate commission as a percentage of the Commission Basis account, which is a custom account not provided with Workforce. Commission is calculated by multiplying the rate entered in the Benefits and Taxes wizard times the custom Commission Basis account.

Sample Formula

```plaintext
IF("No Property"->"BegBalance"==[OWP_EarningList.Commission])
    IF(@ISMBR(@RELATIVE("OWP_Existing Employees",0)))
        "Commission Basis"->"No Property" * ("OWP_Value"/100);
    ELSE
        #Missing;
    ENDIF
ELSE
ENDIF
```
Use Case

Building on the previous example, you want to add a benefit called Insurance, which is calculated as a percentage of the Merit account, with the following values selected in the Benefits and Taxes wizard:

- **Component Type**—Custom
- **Payment Terms**—Quarterly (Calendar Year)
- **Payment Frequency**—Pay During First Period
- **Maximum Value Type**—Flat Amount
- **Threshold Scope**—YTD
- **Taxable Component**—Yes
- **Rate for all months**—10
- **Threshold**—400
- **Value Type**—You can select any value for Value Type as we are calculating the benefit as a percentage of Merit in the custom logic.

Sample Formula

```plaintext
IF("No Property"->"BegBalance"==[OWP_EarningList.Commission])
  IF(@ISMBR(@RELATIVE("OWP_Existing Employees",0)))
    "Commission Basis"->"No Property" * ("OWP_Value"/100);
  ELSE
    #Missing;
  ENDIF;
ELSEIF("No Property"->"BegBalance"==[OWP_BenefitList.Insurance])
  IF("Cal TP-Index"==1 OR "Cal TP-Index"==4 OR "Cal TP-Index"==7 OR "Cal TP-Index"==10)
    "OWP_Expense amount"="OWP_Merit"->"OWP_Expense amount"*("OWP_Value"/100);
  ENDIF;
  IF("OWP_Expense amount"!=#MISSING)
    IF("OWP_Calculated Max Value"!=#MISSING)
      IF("OWP_CYTD(Prior)"+"OWP_Expense amount">"OWP_Calculated Max Value")
        IF("OWP_CYTD(Prior)"<="OWP_Calculated Max Value")
          "OWP_Expense amount"="OWP_Calculated Max Value"-
          "OWP_CYTD(Prior)";
        ELSE
          "OWP_Expense amount"=#MISSING;
        ENDIF;
      ELSE
        "OWP_Expense amount"=#MISSING;
      ENDIF;
    ENDIF;
  ENDIF;
ELSEIF;
ENDIF;
```

Use Case

Building on the previous examples, you want to add a Tax (Tiered Tax) named SUTA, which is calculated as a percentage of Benefit1, Benefit2, Benefit3, Benefit4, with the following values selected in the Benefits and Taxes wizard:
Component Type—Custom
Payment Terms—Monthly
Maximum Value Type—Threshold
Threshold Scope—Monthly
No rates are provided in the Rates page.
For the custom tiered tax, rates need to be provided as part of the custom formula.

Sample Formula

```plaintext
IF("No Property"->"BegBalance"==[OWP_EarningList.Commission])
  IF(@ISMBR(@RELATIVE("OWP_Existing Employees",0)))
    "Commission Basis"->"No Property" *("OWP_Value"/100);
  ELSE
    #Missing;
  ENDIF
ELSEIF("No Property"->"BegBalance"==[OWP_BenefitList.Insurance])
  IF("Cal TP-Index"==1 OR "Cal TP-Index"==4 OR "Cal TP-Index"==7 OR "Cal TP-Index"==10)
    "OWP_Expense amount"="OWP_Merit"->"OWP_Expense amount"*("OWP_Value"/100);
  ENDIF;
IF("OWP_Expense amount"!=#MISSING)
  IF("OWP_Calculated Max Value"!=#MISSING)
    IF("OWP_CYTD(Prior)"+"OWP_Expense amount">"OWP_Calculated Max Value")
      "OWP_Expense amount"="OWP_Calculated Max Value"-
    ELSEIF("OWP_CYTD(Prior)"<="OWP_Calculated Max Value")
      "OWP_Expense amount"="OWP_CYTD(Prior)"
    ELSE
      "OWP_Expense amount"=#MISSING;
    ENDIF;
  ENDIF;
ENDIF
ELSEIF("No Property"->"BegBalance"==[OWP_TaxList.SUTA])
  IF("OWP_Benefit1"->"OWP_Expense amount"+"OWP_Benefit2"->"OWP_Expense amount"+"OWP_Benefit3"->"OWP_Expense amount"+"OWP_Benefit4"->"OWP_Expense amount"<=1000)
    "OWP_Expense amount"="OWP_Benefit1"->"OWP_Expense amount"+"OWP_Benefit2"->"OWP_Expense amount"+"OWP_Benefit3"->"OWP_Expense amount"+"OWP_Benefit4"->"OWP_Expense amount"*(10/100);
  ELSEIF("OWP_Benefit1"->"OWP_Expense amount"+"OWP_Benefit2"->"OWP_Expense amount"+"OWP_Benefit3"->"OWP_Expense amount"+"OWP_Benefit4"->"OWP_Expense amount"<=1200)
    "OWP_Expense amount"=((("OWP_Benefit1"->"OWP_Expense amount"+"OWP_Benefit2"->"OWP_Expense amount"+"OWP_Benefit3"->"OWP_Expense amount"+"OWP_Benefit4"->"OWP_Expense amount")-1000)*(20/100) + 1000*(10/100);
  ELSEIF("OWP_Benefit1"->"OWP_Expense amount"+"OWP_Benefit2"->"OWP_Expense amount"+"OWP_Benefit3"->"OWP_Expense amount"+"OWP_Benefit4"->"OWP_Expense amount"<=1300)
    "OWP_Expense amount"=((("OWP_Benefit1"->"OWP_Expense amount"+"OWP_Benefit2"->"OWP_Expense amount"+"OWP_Benefit3"->"OWP_Expense amount"+"OWP_Benefit4"->"OWP_Expense amount")-1200)*(20/100) + 1200*(10/100) +
```

amount"+"OWP_Benefit4"->"OWP_Expense amount")-1200)*(30/100) +
(1200-1000)*(20/100) + 1000*(10/100);
ELSE
    "OWP_Expense amount"=(1300-1200)*(30/100) + (1200-1000)*(20/100) +
1000*(10/100);
ENDIF
ENDIF

After Configuring Using the Wizard

After configuring Additional Earnings, Benefits, and Taxes using the wizard, perform these tasks:

- Assign defaults for Salary Grades for New Hires.
- To assign the defaults to employees (in Employee only or Employee and Job granularity) and jobs (in Job only granularity), run the Synchronize Defaults rule. This rule is applied to both new hires and existing employees or jobs.

To run the rule for a single employee or job or an employee-job combination, in the form, select that row and then click Actions, and then Synchronize Defaults. Click Compensation Planning, then Manage Employees, and then Existing Employees. To run the rule for a parent level employee/job, click Actions, then Business Rules, and then Synchronize Defaults.

Example - Adding a Fringe Benefit

This example walks you through the steps to creating a new fringe benefit. Let’s say that you want the benefit to be a percentage of employees’ salary. You want to specify a different percentage for employees in North America, EMEA, and APAC, ranging from 33% to 35%.

Before you start, we assume that:

- You’ve enabled Workforce for, at a minimum, Expense Planning, Compensation Expenses, and Benefits. (All three granularity levels support benefits.)
- You’ve imported the application metadata to include the Fringe Benefit Rate component member.
- You’ve set the user variables.

Add the Fringe Benefit as a Component

First, we’ll use the Benefits and Taxes wizard to create a new benefit.

1. From the Home page, click Application, and then Configure.
2. From the Configure list, click ▼, and then Workforce.
3. From Configure: Workforce, click Options and Tiers.
4. On **Options and Tiers**, from **Component**, select **Options**.

5. From **Actions**, select **Add**, then in the text box, enter "Fringe Rate – North America". Repeat to add an option for EMEA and APAC:

| Fringe Rate - North America |
| Fringe Rate - EMEA |
| Fringe Rate - APAC |

6. Click **Save**, then **Next**, and then **Close**.

Define the Fringe Benefit

Next, we use the Benefits and Taxes wizard to set the rate for the fringe benefit options.

1. From **Configure: Workforce**, click **Benefits and Taxes**.

2. Click Filter.

3. Select the Scenario and Version for the fringe benefit and from **Components**, click **Benefits**, and then **Apply**:

<table>
<thead>
<tr>
<th>Filter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scenario: OEP_Plan</td>
</tr>
<tr>
<td>Version: OEP_Working</td>
</tr>
<tr>
<td>Components: Benefits</td>
</tr>
</tbody>
</table>

4. Under **Details**, set the fringe benefit parameters:
Set the Benefit Defaults

Next we’ll set the benefit defaults for the children members of each parent entity: North America, EMEA, and APAC.

1. Click **Workforce** on the Home page.
2. Click **Compensation Planning**, then **Defaults**, and then **Benefits**.
3. From the POV, select the Entity member.
   In this example, we’ll set the benefit default for “Sales Italy”.
4. Click **Actions**, and then **Add Benefit Default**.

5. On **Add Benefit Defaults**, for **Benefit**, select **Fringe Benefit Rate**, and for **Option**, select **Fringe Rate – EMEA**:

![Add Benefit Defaults](image)

6. Click **Launch**.

Now, whenever you add a hiring requisition (using the Add TBH business rule) to Sales Italy, the new fringe benefit rate that we set up for EMEA (for example, 34% for 2017) is applied. Compensation is automatically calculated, including the fringe benefit. (The fringe benefit rate is also applied when you run the **Synchronize Default** business rule.) If you update the fringe benefit rate using the Benefits and Taxes wizard, to apply the updated rate, run the **Synchronize Component Definition** business rule.

---

### Post Configuration Tasks

#### Related Topics
- Setting Assumptions
- Setting Defaults
  Defaults (and assumptions) drive the calculations for workforce-related expenses.
- Synchronizing Defaults
- Post Update Tasks
  After updating Workforce content from a monthly update, note the following information.

#### Setting Assumptions

Assumptions (and defaults) drive the calculations for workforce-related expenses. Assumptions include:

- Hours worked per day, week, and month, which drive salary expenses for hourly employees.
- The partial payment factor (that is, the pay percentage to apply to Maternity Status).
- The salary basis (for example, annual) and rate for Salary Grades.
- Set merit rates, which are added to salary calculations.

You can set assumptions by entity or at the No Entity level (for default assumptions). If you set assumptions for the entity, then they are used for calculations; otherwise, the assumptions set for No Entity (at the organization level) are used. The exception to this is Merit Rate, which must be set at the entity level.

Administrators set workforce assumptions during configuration. If they're granted permissions, planners can then update them as needed by clicking or tapping **Compensation Planning**, then the **Assumptions** tab.
After setting assumptions, run the **Synchronize Defaults** rule (see **Synchronizing Defaults**.) To set defaults for Salary, Additional Earnings, Benefits, and Taxes, see **Setting Defaults**.

**Setting Defaults**

Defaults (and assumptions) drive the calculations for workforce-related expenses.

If you want a default for salary, additional earnings, benefits, or taxes to be used for all employees in a specific job, select that job when adding the default. For example, if you select Accountant when adding the default for Job, then all employees who are Accountants are assigned that default.

If Employee and Job granularity is enabled, you must set defaults based on Job and Union Code. This setting defaults compensation elements for new hires for a specific job. For example, you might set the default Salary Grade to Grade 3 for a Warehouse Worker with the Union Code of Teamster.

To apply a compensation element default to all employees in all jobs, select the OWP_All <member> when setting defaults for salary, additional earnings, benefits, and taxes. For example, select the OWP_All Union Code member and the OWP_All Jobs member if you want the default compensation element to be used for all employees in any job and in any union. So for example, if you select the OWP_All Union Code member and the OWP_All Job member, then Sue Doe in Accounting (whose Union Code is Default No Union Code) would get the same compensation element default as Tom Blue in the Warehouse (whose Union Code is Teamsters).

> **Note:**

Workforce seeds a level-zero member named No Union Code as a sibling to Total Union Code. However, when you add defaults for salary, additional earnings, benefits, and taxes, No Union Code isn't available for selecting in the runtime prompt. To meet this need, Workforce expects you to add at least one sibling null metadata member (such as OWP_Unspecified Union Code) to OWP_All Union Code.

If your company doesn't use Union Code, you can rename that dimension to something that's meaningful to your business when you enable Workforce. If you didn't rename Union Code when you enabled Workforce, you can create whatever members you want in the Union Code dimension and change the alias of the dimension to your preferred name.

Set Workforce defaults by clicking or tapping **Compensation Planning**, then the **Defaults** tab. Then:

- To set Salary defaults, click **Salary**. These defaults are used for new hires or job salary defaults. Using **Assumptions**, and then **Salary Grades**, planners can then set the salary basis (for example, Annual or Hourly) and the salary rate for the Salary Grades that you imported.
If you import the salary basis and salary rates to the OEP_No Entity member, they are used across all entities. Alternately, select OEP_No Entity (in Compensation Planning, then Assumptions, and then Salary Grades).

- To set Additional Earnings defaults, click Additional Earnings.
- To set Benefits defaults, click Benefits.
- To set Taxes defaults, click Taxes.

Synchronizing Defaults

Whenever you update the entity defaults for benefits, taxes, or additional earnings using the Benefit and Taxes wizard on the Configure page, you must push the updated data to the input forms by running the Synchronize Defaults business rule.

1. Click Compensation Planning, then Manage Employees, and then Existing Employees.
2. Highlight a row with an individual or a blank row.
   - If you intend to execute the business rule for:
     - Only one person, highlight the row containing that person's name, and then run the rule
     - Multiple people or to select the dimensionality with a runtime prompt, highlight a blank row and then run the rule
3. Click Actions, then Business Rules, and then Synchronize Defaults.

The business rule recalculates and updates data in the forms.

**Note:**

When you update the metadata for a component (for example, salary grades, benefits, taxes, and additional earnings), run the Synchronize Component Definition business rule to push the updated definition to already-assigned employees and jobs. This rule doesn't update the entity defaults.

Post Update Tasks

After updating Workforce content from a monthly update, note the following information.

- Immediately after updating the Workforce May 2019 content, you must run the new rule **1X Copy Compensation Details from BegBalance to Periods**, which copies compensation details from the BegBalance member to all months. Run this rule only once for each active Scenario and Version combination with data, immediately after updating content. To run this rule, on the Home page, click Rules, then All Cubes, and then select OEP_WFSC from the Cube drop-down list. Then click Launch for the rule Copy Compensation Details from BegBalance to Periods.

- Immediately after updating the Workforce July 2018 content, you must run the new rule **One Time - Copy Rates to Months**, which copies rates from the BegBalance member to all months. Run this rule only once for each active Scenario and Ver-
sion combination with data, immediately after updating content. To run this rule, on the Home page, click **Rules**, then **All Cubes**, and then select OEP_WFSC from the **Cube** drop-down list. Then click **Launch** for the rule **One Time - Copy Rates to Months**.

- Enhancements available in certain releases include updates to some provided artifacts. If you haven’t modified these artifacts, then the artifacts and features are available to you automatically with the release. Because customized artifacts are not updated during releases, if you have customized these artifacts and want to take advantage of the new features, review the information in the appendix **Updating Workforce Artifacts to Use New Features**.

  Also, check this appendix to see the list of new rules. To make new rules available to users, you must give users access to the rules. To do so, on the Home page, select **Rules**, the OEP_WFP cube, the new rule, and then the **Permission** icon.

- For components configured with the **Payment Frequency** set to **One-time Pay**: Unless you select a **One-time Pay Option**, your component expenses continue to occur in the first month of your selected payment frequency.

- Workforce provides four forms for quickly updating and processing data on existing employees. Each form is associated with a Groovy rule that processes only the changed data. The forms are designed for optimal processing efficiency, depending on the kind of data being updated. You access these forms from the **Mass Update** tab. See Updating Employees and Jobs Details in the **Working with Planning Modules**.

  On these forms, all the Flex dimensions and the Entity dimension are initially on the Page. Oracle recommends that you analyze the form load performance and then modify the layout of these forms, moving certain dimensions from the Page to the rows based on your requirements. Year and Period are also on the Page; Oracle assumes you’ll use the selected Year and Period for loading and processing the changed data. Your Year and Period selection is equivalent to the runtime prompt values for the **Process Loaded Data** rule.

  To provide processing efficiency for multiple simultaneous users, the default parallelism for the Groovy rule is set to 2. However, if you don't provide access to these forms for planners or if you expect a low level of concurrency, then you can adjust a design-time prompt (DTP) value to increase the parallelism to 4. Doing so will increase processing speed for large-scale changes in data.

---

**Workforce Rules**

Run the Workforce business rules in the situations described here.

---

**Tip:**

For suggestions on enhancing the execution performance of rules, see **Performance Considerations with Workforce Rules**.

---

To launch a business rule, click **Actions**, then **Business Rules**, and then the rule.

- **Synchronize Defaults**—Run this rule after you update the entity defaults for a benefit, tax, or additional earning. For example, you set up a new benefit or removed an existing benefit from entity defaults. Running this rule from the New Hires or Manage Existing Employees form pushes the updated entity default at the
employee-job level. If you launch **Synchronize Defaults** using the right-click menu, you use it for a selected employee-job combination.

If you intend to execute the **Synchronize Defaults** rule for:

- Only one person, highlight the row containing that person’s name, and then run the rule.
- Multiple people, or to select the dimensionality with a runtime prompt, right-click in the white space, and then run the rule.

**Synchronize Component Definition**—Run this rule after you update an existing benefit, tax, or additional earning. For example, you updated a rate table, payment frequency, salary grade, or maximum value. Running **Synchronize Component Definition** pushes the updated component definition to employees and jobs. This rule doesn't update the entity defaults.

**Calculate Compensation**—When you update data on a form, to recalculate expenses, run the **Calculate Compensation** rule. For example, if you change an employee’s status, review that employee’s FTE, and then run **Calculation Compensation**.

**Process Loaded Data**—After you import new compensation data, run the rule **Process Loaded Data** to copy the data to the necessary periods in the planning year range. Running this rule sets the Headcount to 1 and the Partial Payment Factor to 100% for every employee unless you've loaded different values at the processing month.

**Tip:**

You can quickly make changes to the source data for existing employees, entities, and jobs in four Workforce **Mass Update** forms. Each form is associated with a Groovy rule that processes only the changed data. See Updating Multiple Employees and Jobs Details in *Working with Planning Modules*.

**Note:**

You can run the rules **Synchronize Defaults**, **Synchronize Component Definition**, and **Process Loaded Data** for multiple entities at a time by selecting the parent entity under Total Entity. Oracle recommends that for performance reasons, you run multiple instances of rules by selecting different children under Total Entity instead of running rules for all entities in one pass.

**Note:**

If you get an error message about invalid data when running a business rule, see Troubleshooting a Rule’s Error Message.
Performance Considerations with Workforce Rules

Consider these tips to potentially improve the execution performance of Workforce rules.

- Workforce rules assume that the `FIXPARALLEL` statement runs on the Entity dimension, which is ideal if you're loading the bulk of your data into the Entity dimension. However, if you load the bulk of your data into another dimension, for example, a Flex dimension such as Project, you can improve performance by modifying the `FIXPARALLEL` statement to apply to the Project dimension instead. Workforce provides a template named `OWP_Fix Parallel_T` that is used in the rules `Synchronize Defaults`, `Synchronize Component Definition`, and `Process Loaded Data`. If you modify the `FIXPARALLEL` statement to reflect your optimal dimension, all three rules take advantage of the performance enhancement.

**Tip:**
To determine the best dimension to include in the `FIXPARALLEL` statement, Oracle recommends that you do some testing using realistic and representative data.

To modify the template `OWP_Fix Parallel_T`:

1. Replace `{Department}` (which is the default Entity dimension in this template) with your optimal dimension and include the appropriate Entity selection in the subsequent `FIX` statement. See this BEFORE and AFTER example.

**BEFORE:**

```plaintext
SET UPDATECALC OFF;

FIXPARALLEL(4, @RELATIVE({Department}, 0))

FIX({Scenario}, {Version} [FlexDim1Fix] [FlexDim2Fix] [FlexDim3Fix] [CurrencyDTP])
    FIX([EmpDimFix] [JobDimFix])
```

**AFTER,** modified assuming that `Project` is `FlexDim1` and using sample member names ("All Project" and "OEP_Total Entity"). Also note the comma inserted before the reference to `Entity` in the second `FIX` statement:

```plaintext
SET UPDATECALC OFF;

FIXPARALLEL(4, @RELATIVE("All Project", 0))

FIX({Scenario}, {Version} ,@RELATIVE("OEP_Total Entity", 0) [FlexDim2Fix] [FlexDim3Fix] [CurrencyDTP])
    FIX([EmpDimFix] [JobDimFix])
```
2. Redeploy the three rules.

Note:
When you modify the template, ensure that the syntax (for example, the commas) is valid and balanced by reviewing the Design-time Prompts (DTP).

• If your organization’s usual practice is to run Synchronize Defaults immediately after running Process Loaded Data, you can reduce execution time by modifying the Process Loaded Data rule to substitute the Synchronize Defaults template in place of the Synchronize Definition template in the same relative position. By doing this, you eliminate the execution time of the Synchronize Definition template, which is unnecessary if you include the Synchronize Defaults template in the Process Loaded Data rule because Synchronize Defaults includes the logic in Synchronize Definition.

• If you load the additional earning, benefit, and tax assignments directly from a source Human Resources or Payroll system, such as Oracle Fusion Human Capital Management, then you do not need to run Synchronize Defaults nor Calculate Compensation. Running Process Loaded Data is sufficient in this use case to calculate compensation for all the loaded data, because it includes Synchronize Component Definition.
Updating Strategic Workforce Planning and Workforce

When you update Oracle Strategic Workforce Planning Cloud and Workforce, any custom modifications you have made are maintained. For example, any modifications to unlocked predefined artifacts (such as forms) are tracked internally. No changes are made to these modified artifacts during the update.

**Note:**

If you plan to modify the navigation flows, Oracle recommends that you make a copy of the predefined navigation flows and work in the copy, not the original. When you update, Oracle applies the update to the original navigation flows and leaves your modified navigation flows unchanged.

Before updating, the application is put in maintenance mode and only administrators can use the application.

If any metadata changes are detected, the database is refreshed before content update. If any validation errors are detected, you must resolve the errors before you can update content.

Use the Job Console to review the errors.

Related Topics

• **The Workflow for Strategic Workforce Planning**
  To analyze future workforce requirements using Oracle Strategic Workforce Planning Cloud, review the tasks you'll perform.

• **Setting User Variables**
  After Oracle Strategic Workforce Planning Cloud features are enabled and configured, set the predefined user variables. Each user, including administrators, must select members for the provided user variables.

The Workflow for Strategic Workforce Planning

To analyze future workforce requirements using Oracle Strategic Workforce Planning Cloud, review the tasks you'll perform.

Watch this tutorial video for an overview of the workflow in Strategic Workforce Planning:

**Tutorial Video**

In general, you'll perform tasks in this order:

1. Click **Strategic Workforce**.
2. Set up user variables.
   See **Setting User Variables**.
3. Assess the current FTE by job, individual employee information or job information, and (if **Average Compensation** is enabled) average compensation rates. Click **Overview**.
   See **Skills Assessment Planning**.
4. Review and update the assessment of employee across different skills and jobs.
   Click **Skills Assessment**.
   See **Assessing and Updating Skills**.
5. Plan the demands on your workforce. Click **Demand**. See **Demand Planning**.

6. Analyze the organization’s supply of critical jobs and skills, factoring in such aspects as attrition. Click **Supply**. See **Supply Planning**.

7. Analyze and address any gaps between your workforce requirements (demand) and available resources (supply). Click **Gap Analysis**. See **Analyzing the Gap Between Demand and Supply**.

If your administrator also enabled Workforce, see **The Workflow for Workforce**.

### Setting User Variables

After Oracle Strategic Workforce Planning Cloud features are enabled and configured, set the predefined user variables. Each user, including administrators, must select members for the provided user variables.

The members that you select for user variables set the initial POV (Point of View) when you open dashboards and forms. You can then change the POV from within dashboards and forms, and their changes are then reflected in User Variables preferences.

To set user variables:

1. From the Home page, click **Tools**, and then **User Preferences**.
2. On the **User Variables** tab, select members for these user variables:
   - Currency
   - Entity
   - Job Type
   - Reporting Currency
   - Scenario—Set the scenario for Workforce
   - Scenario View—Set the scenario for Strategic Workforce Planning
   - Strategic Start Year and Strategic End Year—For Strategic Workforce Planning, limit skill set planning to a range of years by setting the start and end year
   - Version
   - Years
Note:

Administrators can set limits for user variables by selecting **Tools**, then **Variables**, then **User Variables**, and then selecting members for the **User Variable Definition**. Administrators can further limit data entry by assigning permissions, setting variables, and creating valid intersections.
Using Average Compensation Rates

Your administrator may have enabled *Average Compensation Rates* for jobs and seeded those rates for jobs that are defined as strategic. Or, you can enter average compensation rates for jobs by clicking Overview, and then *Average Compensation Rates*. These rates are multiplied by Total Demand FTE and Total Supply FTE, resulting in Supply Compensation and Demand Compensation.

With these rates defined for jobs, you can see the financial impact of adding or eliminating jobs.

**Note:**

The values you enter here are not related to earnings calculations in Workforce.
Skills Assessment Planning

After employee and job information is imported from a Human Resources system, review the information for existing employees who are assigned to strategic jobs, including their Employee Type, FTE, age (if Age Based Retirement is enabled), and primary skill set. If Average Compensation is enabled, you can review these rates and update them if necessary.

To review employee and job information, click Strategic Workforce, then Overview, and then the horizontal tabs.

Assessing and Updating Skills

If your administrator enabled Skills Assessment, you can rate employee skills for strategic jobs.

Watch this tutorial video to learn about rating employee skills:

Tutorial Video

Evaluate and update skills by clicking Strategic Workforce, and then Skills Assessment. Then use its horizontal tabs:

- To assess the relative distribution and correlation of skills across years, click Skills Summary. Here you graphically view Average Skills Comparison and Average Skills Correlation by Entity for each Scenario planning year.
- To assess the trend over years of skills by category, click Skills by Category. You can compare years, entities, and skills categories such as Management, Technical, and so on. You can also drill into categories to examine the underlying data. (Your administrator can add categories.)
- To assess and update skill proficiencies by the individuals holding specific jobs, click Skills by Employee. This form includes Skills Gap data, which is the difference in a skill level between the Strategic Start Year and Strategic End Year. For example, say that the Skills Gap for Rob Stark is -1, which indicates that you want
his Java skill to be at a 4 (favorable) rating by FY18, and his Java skill is currently rated only as 3.

This form displays only those employees whose skill ratings already exist, usually by importing them. To add a skill and rating for an employee, see Adding Skills and Ratings for an Employee.

- To assess and update skill data for an individual, click Employee Skill Details.

Adding Skills and Ratings for an Employee

On the Skills by Employee form, you can add skills and ratings for an employee. To do so, click the employee’s name, then right-click, and then select Skill Assessment. The Skill Assessment by Employee form opens, where the non-rated skills display. Populate the skill and save the form. The skill then displays on the Skills by Employee form.
Demand Planning

Demand analysis gives you insight into what resources—headcount or FTE and strategic jobs—that the long-term strategy requires. This information helps you to be proactive in planning resources and preparing for their needed skill sets.

Watch this tutorial video to learn about working with demand drivers:

![Tutorial Video](image)

To work with demand data, click **Strategic Workforce**, and then **Demand**. Then use its horizontal tabs:

- For a graphical summary of the demand for strategic jobs, click **Summary Demand FTE**. You can view the totals by job and entity.
- To set and update the calculation logic for demand drivers and demand data by year, click **Demand Driver Data**. See About Demand Drivers.
- To provide granular information on demand drivers, click **Demand Data by Entity**. Here you set:
  - Assumptions to select a demand driver
  - The calculation logic if you want to override the calculation logic set at the demand driver level on the **Demand Driver Data** form. This isn't required; you change the calculation logic here only if you want to override the calculation logic for a job.
  - The demand rate and scale. You enter rate only for drivers whose calculation logic is **Demand = Driver / Rate** or **Demand = Driver * Rate** (or that uses Custom calculation logic, depending on how the formula is defined). **Demand Scale** applies only if **Demand Driver Scaling Factor** is enabled and if the calculation logic is based on **Previous Year’s Ratio**.
  - Expected productivity for jobs if **Expected Productivity Gains Factor** is enabled. See Factoring Productivity Changes into Demand FTE.

You can view demand data on either **Demand Data by Entity** or **Demand Data by Job**. On one form the Entity dimension is on the POV and the Job dimension is on the row. On the other form the Job dimension is on the POV and the Entity dimension is on the row. See Setting Demand Data by Entity or Job.
Note:
To focus your organization on certain forms and hide others, you can accomplish this using Navigation Flows. See "Designing Custom Navigation Flows" in Administering Planning.

- To view and adjust FTE by entity, click Demand FTE by Entity.
- To view and update demand data by job and entity, click Demand Data by Job. The charts at the bottom graphically depict Demand FTE and Headcount by year.
- To see, adjust, and calculate the total demand FTE by job by year, click Demand FTE by Job. If needed, update the data, then click Actions, and then Calculate Demand.
- If Average Compensation is enabled, you can see the calculated compensation for jobs based on the FTE calculations by clicking Demand Compensation. The calculated values on this form are read-only.

About Demand Drivers

On the Demand Driver Data tab, you set targets for demand drivers that reflect your industry. Here you enter demand data and see the impact of the demand over time. Say you want to double revenue in the next few years. To support that, you'll need the right resources in the company: the right people with the right skills at the right time. You manage demand requirements by setting and manipulating demand drivers. Examples of demand drivers: revenue units, support representatives, production personnel, support calls, insurance policies, transactions, and so on.

Your administrator configures demand drivers when configuring Oracle Strategic Workforce Planning Cloud.

Setting Demand Data by Entity or Job

Different jobs might depend on different driver calculations, which in turn calculate the demand data. For example, Sales Representatives might be related to the revenue sales driver; for every $1,000,000 in revenue, you need one Sales Representative. The number of production line personnel might be derived from the units sold driver. Customer Support data might be related to the number of support calls.

You assign the demand driver that is appropriate for each strategic job on either the Demand Data by Entity or Demand Data by Job tab. One form has the Entity dimension on the POV with the Job dimension on the row, and the other has Job on the POV with Entity on the row. The two forms share the same data points and instructions for entering values. The only difference is that their axes are reversed for the Entity and Job dimensions.

On the Demand Data by Entity and the Demand Data by Job tabs, you:

- Assign the demand driver that is appropriate for each strategic job.
- Can optionally enter an override to the default driver calculation logic that is set at the demand driver level on the Demand Driver Data form. Change the calculation logic only if you want to override the calculation logic for a job.
• Can enter an optional demand scaling factor if Demand Driver Scaling Factor is enabled and if the calculation logic is based on Previous Year's Ratio. See Scaling Demand FTE.

• Enter the demand rate for calculation logic based on Demand = Driver / Rate or Demand = Driver * Rate (or Custom calculation logic, depending on its logic).

To assign demand drivers to jobs:

1. Click Demand .
2. Click Demand Data by Entity or Demand Data by Job.
3. Select the entity to work with and the job you want to assign a demand driver for.
4. Under Assumptions, select a demand driver.

Your administrator defines the demand drivers when configuring Oracle Strategic Workforce Planning Cloud.

5. To override the default calculation logic that is set on the Demand Driver Data form, under Calculation Logic, select how to calculate the driver for a job:
   • Previous Year's Ratio
   • Demand = Driver / Rate
   • Demand = Driver * Rate
   • Custom

6. For drivers whose calculation logic is Demand = Driver / Rate or Demand = Driver * Rate (or Custom, depending on how it's defined): Under Demand Rate, enter the rate. For example:
   • The Driver is Consulting Revenue, which is $15M
   • The Rate for the Job called Partner is $5M
   • So, for every $5M in Revenue, you need 1 FTE for the Partner Job

7. Under Demand Scale, enter a scaling factor.

Demand Scale is available only if Demand Driver Scaling Factor is enabled, and applies only if the calculation logic is Previous Year's Ratio (or Custom calculation logic, depending on how it's defined). See Scaling Demand FTE.

8. Under Expected Productivity, enter a value to adjust your anticipated demand for strategic jobs by factoring in possible gains or losses in productivity.

To indicate 25%, enter .25. Expected Productivity is available only if Expected Productivity Gains Factor is enabled. See Factoring Productivity Changes into Demand FTE.

Setting the Calculation Logic of Demand Drivers

On the Demand Driver Data tab, you set the demand calculation logic and the values of the demand drivers for each year.

To set the calculation logic for a driver that calculates the Demand FTE:
1. Click **Demand**.

2. Click **Demand Driver Data**, and under **Calculation Logic**, select one of the following:

   - **Previous Year's Ratio**: Bases the demand on the previous year's demand rate and applies the **Demand Scale** value if **Demand Driver Scaling Factor** is enabled and scaling is set. If no calculation logic is specified, then **Previous Year's Ratio** is applied. See **Scaling Demand FTE** and **Factoring Productivity Changes into Demand FTE**.

   - **Demand = Driver / Rate**: Derives demand by dividing the driver by the rate. For example, for every $5 million in revenue, you need a partner.

   - **Demand = Driver * Rate**: Derives demand by multiplying the driver by the rate. For example, multiply processing units by cost.

   - **Custom**: Derives demand using a custom member formula on the dynamically-calculated member **Demand FTE Custom**. If the predefined calculation logic doesn't fit your needs, your administrator can create a custom member formula using the dimension editor.

     For example, here's a simple member formula that returns the Demand FTE as 52:

     ```
     IF ("OWP_Calculation Logic"->"OWP_Headcount Driver"->"No Year"->"Begbalance" == [OWP_Demand_CalcLogic.Custom]) "OWP_Demand FTE"->"No Property" = 52; ENDIF;
     ```

     **Note:**

     Refer to the **OWP_Demand FTE** account member in the formula because that member is used in forms. The member **Demand FTE Custom** isn't used in forms. Also, ensure that the formula is appropriate and doesn't impact performance.

3. Under **Demand Units**, enter the demand units (for example, the number of insurance policies or the number of revenue units).

4. Enter a value into **Demand Scale** to increase or decrease the calculated Demand FTE when using the **Previous Year's Ratio** calculation logic.

   If your administrator enabled the option **Demand Driver Scaling Factor**, you can use **Demand Scale** to scale your demand planning to account for a change in productivity over time. In calculating the future demand for FTE, demand scaling factors in natural logarithm as an exponent of the ratio. If you don't enter a **Demand Scale** value, the demand is assumed to be 100% of the demand driver. The demand scale applies to all jobs in the entity, regardless of whether the demand driver is based on Entity or Job. If a driver's calculation logic is not set to **Previous Year's Ratio** and you enter a value into **Demand Scale**, the value won't impact the demand calculations. (Custom calculation logic might be an exception to this rule, depending on how the formula is defined.) See **Scaling Demand FTE**.

5. Enter a value into **Expected Productivity** to further refine FTE calculations.
If your administrator enabled **Expected Productivity Gains Factor**, you can adjust FTE calculations by setting a value in **Expected Productivity**. Regardless of the calculation logic selected, **Expected Productivity** is factored into Demand FTE calculations if **Expected Productivity Gains Factor** is enabled and a value entered. See **Factoring Productivity Changes into Demand FTE**.

## Scaling Demand FTE

If your administrator enabled the option **Demand Driver Scaling Factor**, you can use **Demand Scale** to scale your demand planning to account for a change in productivity over time. In calculating the future demand for FTE, **Demand Scale** factors in natural logarithm as an exponent of the ratio.

Enter a demand scale value to increase or decrease the calculated Demand FTE when using the **Previous Year’s Ratio** calculation logic. (Demand scale applies only if you are using Previous Year’s Ratio as the calculation logic.) Demand scale enables you to increase the demand driver without increasing the resources needed using the same ratio. For example, enter 80% to reduce the calculated Demand FTE by 20% when the demand driver doubles. If you don’t enter a demand scale value, the scale is assumed to be 100% (that is, no scaling is applied).

A demand scale of X% means that for each time the demand driver doubles (for example, the number of calls to the Call Center), the productivity becomes X% of the previous year’s Demand FTE, while factoring in a linear relationship of the demand scale effect.

For example, assume that FY17 is the baseline year with an FTE of 50 Call Center Operators handling 1,000 calls per year:

<table>
<thead>
<tr>
<th></th>
<th>FY17</th>
<th>FY18</th>
<th>FY19</th>
<th>FY20</th>
</tr>
</thead>
<tbody>
<tr>
<td>Demand driver (Transaction type: number of calls)</td>
<td>1000</td>
<td>2000</td>
<td>3000</td>
<td>2500</td>
</tr>
<tr>
<td>Demand scale</td>
<td>80%</td>
<td>80%</td>
<td>80%</td>
<td></td>
</tr>
<tr>
<td>Productivity gain</td>
<td>0%</td>
<td>1%</td>
<td>1%</td>
<td></td>
</tr>
<tr>
<td>Demand FTE</td>
<td>50</td>
<td>80</td>
<td>104.2624</td>
<td>91.21628</td>
</tr>
</tbody>
</table>

You expect the demand driver (the number of calls to the Call Center) to double from FY17 to FY18, but the demand FTE (the number of Call Center Operators) doesn’t likewise double. In this case, you assume that a year’s experience increases the employees’ efficiency. For each doubling of the demand driver, you need only 80% of the demand FTE value because you assume a 20% gain in productivity.

The formula that Oracle Strategic Workforce Planning Cloud uses to calculate Demand FTE while factoring in Demand Scale and Expected Productivity gains is:

\[
((\text{PY Total Demand FTE} / \text{PY Demand Units}) \times ((\text{CY Demand Units} / \text{PY Demand Units})^{(\ln(\text{CY Demand Scale})/\ln(2))}) \times (1 - \text{Expected Productivity})) \times \text{CY Demand Units}
\]
where:

- \( PY \) = Previous Year
- \( CY \) = Current Year
- \( LN \) = Natural Logarithm

You can further refine FTE calculations by entering values in Expected Productivity. The calculation that determines the Demand FTE factors in the values you set for both Demand Scale and Expected Productivity.

See Factoring Productivity Changes into Demand FTE.

## Factoring Productivity Changes into Demand FTE

If your administrator enabled Expected Productivity Gains Factor, you can use the Expected Productivity value to account for the impact on the productivity of FTE beyond that of Demand Scale. For example, you plan to acquire a new automated system or improve a process, which improves productivity and reduces the impact on Demand FTE.

As an example, assume that FY16 is the baseline year with an FTE of 50 Call Center Operators handling 1,000 calls per year:

<table>
<thead>
<tr>
<th></th>
<th>FY16</th>
<th>FY17</th>
<th>FY18</th>
<th>FY19</th>
</tr>
</thead>
<tbody>
<tr>
<td>Demand Driver</td>
<td>1000</td>
<td>2000</td>
<td>3000</td>
<td>2500</td>
</tr>
<tr>
<td>(Transaction type: number of calls)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Expected Productivity</td>
<td>5%</td>
<td>5%</td>
<td>5%</td>
<td></td>
</tr>
<tr>
<td>Demand FTE</td>
<td>50</td>
<td>95</td>
<td>135.375</td>
<td>107.1719</td>
</tr>
</tbody>
</table>

You expect the number of calls to the Call Center (the demand driver) to double from FY16 to FY17, but you also plan to buy a new call answering system, which will increase productivity. You set Expected Productivity to 5% of the Previous Year’s Ratio, which assumes a 5% productivity gain. So, doubling the number of calls (from 1,000 to 2,000) requires only 95% of the Previous Year’s Ratio to meet the demand. The Demand FTE is decreased because the ratio that determines how many FTE are needed is based on the demand driver value (that is, the number of calls) and the Expected Productivity gains (that is, the new call answering system).

**Note:**

The calculation that determines the Demand FTE factors in the values you set for both Demand Scale and Expected Productivity. See Scaling Demand FTE.

## Viewing and Adjusting the Demand FTE

You can see a summary of the calculated demand FTE over years, based on your demand drivers and their calculation logic. You can also adjust the FTE, which affects...
the **Total Demand FTE** for each job. Adjustment FTE values are factored into the **Previous Year's Ratio** calculation logic.

To see a summary of or adjust the calculated FTE:

1. Click **Demand**.

2. Click **Demand FTE by Entity** or **Demand FTE by Job**.

   **Demand FTE by Entity** has the Entity dimension on the POV, with the Job dimension on the row. **Demand FTE by Job** has the Job dimension on the POV with Entity on the row. The two tabs share the same data and instructions for entering values. Their only difference is that their axes are reversed for the Entity and Job dimensions.

3. View the currently calculated FTE.

4. To adjust the FTE, enter an adjustment factor under **Demand FTE Adjustment**.

   For example, if you plan to hire 3 Engineers in the coming year, enter 3 in the cell for Engineer. Adjustments you enter on either **Demand FTE by Entity** or **Demand FTE by Job** are reflected in both tabs.
Supply Planning

With supply planning, you look ahead at how your workforce resources will meet your workforce demands.

Watch this tutorial video to learn about working with supply calculations:

Tutorial Video

The Supply Headcount or FTE beginning balance for a given year is reduced by the previous year’s retirement FTE. Retirement and attrition values negatively impact the Supply Headcount and FTE.

To work with supply data, click Supply. Then use its horizontal tabs:

• To see a graphical view of supply jobs and FTE, click Summary Supply FTE.
• To set attrition data by entity, click Attrition Driver. See Setting Attrition Drivers.
• To set the retirement age by entity and by year, click Retirement Age. See Setting Retirement Ages for Attrition Calculations.
• To set attrition data by age ranges, click Attrition Data by Age Band. See Setting Attrition by Age Band.
• To set attrition by job, click Attrition Data by Job. See Setting Attrition by Job.
• To see calculated FTE totals for strategic jobs by year, click Supply FTE.
• To see headcount totals for jobs, click Supply Headcount.
• To see supply compensation, click Supply Compensation. Supply compensation is calculated by multiplying the FTE for a job by its average compensation rate if Average Compensation is enabled.

Setting Attrition Drivers

Attrition drivers typically account for about 90% of employee turnover. Oracle Strategic Workforce Planning Cloud provides two attrition drivers by default:

• Attrition by Job
• Attrition by Age (if Age-Based Retirement is enabled). If Age-Based Retirement is enabled, then you can set the age for calculating attrition by retirement age.

To set attrition drivers, click Attrition Driver, and then Attrition by Job or Attrition by Age (if the option is enabled).
Setting Retirement Ages for Attrition Calculations

Supply and Attrition FTEs are derived from the Retirement Age. If the calculated age of an employee is higher than the retirement age, then that affects retirement attrition by minus one. The Retirement Age applies to all jobs and employees in an entity.

With the Employee and Job level of granularity and the Age-based Retirement option enabled, retirement is calculated at the Employee and Job level of detail.

Setting Attrition by Age Band

If your administrator enabled Age-Based Retirement and imported the ages for employees, Workforce calculates their ages for the age band calculations. Click Attrition Data by Age Band to set attrition data by age band. For each year, you can enter the number of headcount/FTE you anticipate leaving the company. Because attrition data reduces supply resources, enter the data as negative percentages. The data you enter here reduces the summary FTE.

Setting Attrition by Job

You can plan attrition data by job by clicking Attrition Data by Job. Enter the attrition values for jobs as negative percentages (for example, -.05). The data you enter here reduces supply resources.
Analyzing the Gap Between Demand and Supply

After planning the resources your plans require (demand) and the resources that you expect to be available to meet those demands (supply), you see how well they match up by looking at the gap between demand and supply. Then you can take action to minimize those gaps.

To view the gap between demand and supply, click Gap Analysis.

• To view the supply and demand summary data and their variance, click Supply vs Demand. In the top left form, you can view the data. In the charts, you can review the trends.

• To view the difference between supply and demand headcount, click Supply vs Demand Headcount. This information helps guide you in addressing the gap by updating your hiring or training plans. Examples:
  – Transfer people from non-strategic jobs to strategic jobs.
  – Add training courses to build strategic skills.
  – Hire people that have needed strategic skills.
  – Create incentive programs to retain people with strategic skills.

Working with Workforce

Related Topics
- Task Overview
- Managing Compensation Expenses
- Managing Non Compensation Expenses
- Managing Demographics
- Analyzing Workforce Expenses
- Reporting on Data
  For complete reporting on data, Workforce provides data maps, which enable you to push consolidated data from one cube to a reporting cube. For example, you can push compensation data to the reporting cube.
Task Overview

Related Topics

• The Workflow for Workforce
• Setting User Variables

After Oracle Strategic Workforce Planning Cloud features are enabled and configured, set the predefined user variables. Each user, including administrators, must select members for the provided user variables.

The Workflow for Workforce

If your administrator enabled both Oracle Strategic Workforce Planning Cloud and Workforce, first review the tasks you'll perform in Strategic Workforce Planning. See The Workflow for Strategic Workforce Planning.

In general, you'll perform Workforce tasks in this order:

1. Before creating or updating plans and forecasts, run these business rules: Synchronize Defaults and Calculate Compensation. Access these business rules from Compensation Planning, then Manage Employees, then Existing Employees.

2. Set up user variables.
   See Setting User Variables.

3. Review or enter workforce assumptions and defaults. Your administrator may have set up initial assumptions.
   Use Compensation Planning, then Assumptions and Defaults.

4. Update workforce details.
   See the table below.

5. Run the Calculate Compensation business rule again to recalculate values.

6. Review dashboards and analytics.

Note:

You might not see all the features described in this section, depending on which features your administrator enabled.

To get started, click Workforce, and then select a component.
### Table 13-1  Strategic Workforce Planning Tasks

### Setting User Variables

After Oracle Strategic Workforce Planning Cloud features are enabled and configured, set the predefined user variables. Each user, including administrators, must select members for the provided user variables.

The members that you select for user variables set the initial POV (Point of View) when you open dashboards and forms. You can then change the POV from within dashboards and forms, and their changes are then reflected in User Variables preferences.

To set user variables:
1. From the Home page, click **Tools** and then **User Preferences**.

2. On the **User Variables** tab, select members for these user variables:
   - Currency
   - Entity
   - Job Type
   - Reporting Currency
   - Scenario—Set the scenario for Workforce
   - Scenario View—Set the scenario for Strategic Workforce Planning
   - Strategic Start Year and Strategic End Year—For Strategic Workforce Planning, limit skill set planning to a range of years by setting the start and end year
   - Version
   - Years

---

**Note:**

Administrators can set limits for user variables by selecting **Tools**, then **Variables**, then **User Variables**, and then selecting members for the **User Variable Definition**. Administrators can further limit data entry by assigning permissions, setting variables, and creating valid intersections.
Managing Compensation Expenses

Before updating employee-related information, you might want to review current expenses trends and summaries by clicking or tapping Compensation, and then Overview.

Managing Hiring Requisitions

A hiring requisition adds placeholder expenses to the workforce budget until someone is hired to fill the requisition. When an employee is hired to fill the hiring requisition, the placeholder hiring requisition expense is transferred to and associated with the hired employee.

Hiring requisitions functionality is available if these Workforce features are enabled:

- Granularity type Employee or Employee and Job
- New Hires option under Workforce Management

When workforce demands exceed the number of available employees, you can use New Hires functionality to:

- Add a hiring requisition to be filled by an employee
- Change the status of a hiring requisition
- Associate a hiring requisition with an employee
- Remove hiring requisitions
- Calculate the resulting compensation expenses

Workforce initially provides 100 blank New Employee Hiring Requisitions, which you can use and then add more when you need to. To add a hiring requisition, use Compensation Planning, then Manage Employees, and then Add Hiring Requisition from the Actions gear. (Use the same sequence for the other hiring requisition options.)

When you fill a hiring requisition by hiring an employee, you associate the hiring requisition with the employee. The reconciled FTE value equals the Hiring Requisition FTE value. In other words, the FTE and headcount is reduced for the hiring requisition and assigned to the associated employee.

To associate a hiring requisition to an employee:

1. Add a hiring requisition if needed.
   See Adding Hiring Requisitions.
2. Associate the employee with the hiring requisition.
   This action transfers the FTE/headcount to the existing associated employee. The new hire requisition properties Reconciled FTE and Reconciled Headcount are populated. See Hiring Employees.
3. After the hiring requisition available FTE is assigned to an existing associated employee, you may opt to remove the hiring requisition because it no longer contributes to workforce compensation expenses.

Adding Hiring Requisitions

When workforce demands exceed the number of available employees, you can add hiring requisitions to be filled by employees. You can create multiple requisitions simultaneously, set their FTE, their employee type, their time span, and their salary.

For an overview, see Managing Hiring Requisitions.

**Note:**

This topic applies only to the Employee and the Employee and Job granularity options.

To add hiring requisitions:

1. Click Compensation Planning, then Manage Employees, and then New Hires.
2. Click Actions, and then Add Hiring Requisitions.
3. At Requisition Details, set these aspects, and then click Next:
   - Number of requisitions you're adding
   - FTE value for each
   - Employee Type (for example, Regular, Contractor, or Temporary)
4. For Calendar Information, select the Start Year and Start Month to set when the requisition's expenses are to be included in expense calculations, and then click Next.
   Optionally, select the End Year and End Month if you know the end date for an employee. Specifying an ending period is especially useful for temporary employees; doing so saves you from having to plan their departure using the Plan Departure rule. Calculations for their workforce expenses then begin and end with their start and end dates. Note that if you use the ending period option, you must select both the end year and month.
5. At Job and Salary Options, select:
   - Which Job the requisition is for
   - Which Union Code the requisition is for
   - The option for setting the requisition's salary:
     - Salary Defaults: Select to set the salary based on the salary defaults, which are set on the Defaults tab of Compensation Planning.
     - Salary Basis and Rate: Select to directly enter the salary rate (for example, 6000) and basis (for example, Monthly).
     - Salary Grade: Select to set the salary by selecting a salary grade. Your administrator imports salary grades, and you set the defaults for new hires by selecting Compensation Planning, then Assumptions, and then Salary Grades.
If you don't select a salary option, then the salary defaults are used. Selecting either **Salary Basis and Rate** or **Salary Grade** overrides any salary default assignments.

6. Click **Launch**.

   The Additional Earnings, Benefits, Taxes, headcount, and so on are calculated for the specified requisitions during the time range you specified.

If needed, you can later change the Salary Rate, Salary Basis, Salary Grade, Status, or end period for a hiring requisition you've added. See **Updating Hiring Requisitions**. To update the salary after the TBH has been associated with a hired employee, see **Updating Employee Compensation**.

### Updating Hiring Requisitions

After you've added a hiring requisition, you can update its status description, salary, or time span. You can also remove a requisition.

**Note:**

To remove a requisition, follow Step 1 below, click the **Actions** gear, and then **Remove Hiring Requisition**. When a requisition is deleted, its associated FTE/headcount and compensation expenses are no longer included in calculations.

To update a hiring requisition:

1. Click **Compensation Planning**, then **Manage Employees**, and then **New Hires**.
2. Select the requisition to update.
3. Click the **Actions** gear, and then **Change Requisition**.
4. At **Change Requisition**, select the option that applies, and then click **Next**:
   - **Status**—Select to set an informational description to the requisition: **New**, **Active**, **Approved**, **Unapproved**, **On-hold**, or **Closed**.
   - **Salary**—Select to update the salary basis, rate, or grade for the requisition. Skip to Step 5.
   - **Extend Calendar**—Select to change the requisition's end date. Calculations for a requisition's workforce expenses begin and end with the requisition's start and end dates. Skip to Step 6.
   - **Reduce Calendar**—Skip to Step 7.
5. To update the salary associated with the requisition:
   a. Select the **Year** and the **From Period** to set the effective date for your updates.
   b. Select the option for setting the salary:
      - **Salary Defaults**—Select to set the salary based on the salary defaults, which are set on the **Defaults** tab of **Compensation Planning**.
      - **Salary Basis and Rate**—Select to directly enter the salary rate (for example, 6000) and basis (for example, Monthly).
• **Salary Grade**—Select to set the salary by selecting a salary grade. Your administrator imports salary grades, and you set the defaults for new hires by selecting **Compensation Planning**, then **Assumptions**—and then **Salary Grades**. If you don’t select a salary option, then the salary defaults are used. Selecting either **Salary Basis and Rate** or **Salary Grade** overrides any salary default assignments.

6. To extend the time span for the requisition:
   a. In **Copy Properties from**, select the month to use as the basis for which requisition properties to copy to the extended range. This option enables you to carry forward into the extended range such aspects as FTE, Status, Employee Type, and Pay Type.
   b. Select the **End Year** and **End Month**. Specifying an end month and year saves you from having to plan their departure using the Plan Departure rule. Note that you must select both the end year and month.

7. To reduce the time span of the requisition, select the **End Year** and **End Month**. You must select both the end year and month.

8. Click **Launch**. The Additional Earnings, Benefits, Taxes, headcount, and so on are calculated for the specified requisitions during the time range you specified.

### Updating Employee Compensation

Depending on your application’s granularity, on **Employee Details**, you can update such information as salary, Performance Ratings, FTE, Employee Type, Union Code, and Demographics.

**Tip:**

You can also quickly update and process data on multiple existing employees. See **Updating Multiple Employees and Jobs Details**.

To view and update employee compensation:

1. Click **Compensation Planning**

2. To update an employee’s salary, select the employee from the POV, and then:
   a. Click the **Actions** gear, and then **Change Existing Details**.
   b. From **Change Employee**, select **Salary**, and then click **Next**.
   c. Select the **Year** and **From Period** as the effective date for the updated salary.
d. From **Salary Options**, select:

- **Salary Defaults**: Select to set the salary based on the salary defaults, which are set on the **Defaults** tab of **Compensation Planning**.
- **Salary Basis and Rate**: Select to directly enter the salary rate (for example, 6000) and basis (for example, Monthly).
- **Salary Grade**: Select to set the salary by selecting a salary grade. Your administrator imports salary grades, and you set the defaults for new hires by selecting **Compensation Planning**, then **Assumptions**, and then **Salary Grades**.

If you don't select a salary option, then the salary defaults are used. Selecting either **Salary Basis and Rate** or **Salary Grade** overrides any salary default assignments.

e. Click **Launch**.
   The employee’s salary is calculated during the time range you specified.

### Updating Multiple Employees and Jobs Details

To quickly update and process data on multiple existing employees or jobs and then process the updated data in Workforce, you can use the **Mass Update** forms.

Using these forms enables you to quickly review and edit information after data is loaded. Designed for optimal processing efficiency, each form is associated with a Groovy rule that processes only the changed data. Which form you use depends on the kind of data you're updating.

You can change existing properties or add a new record and then apply configured default assignments. You can change existing properties or add a new record and then override default assignments and rates. After modifying salary, you can re-apply configured default assignments for benefits, additional earnings and taxes. You can override default assignments and then apply the configured defaults.

Watch this tutorial video to learn how to update employee and job information and then process the updated data.

**Tutorial Video**

To quickly make changes to existing employees, jobs, and entity defaults:

1. Click **Compensation Planning**
   
   ![Compensation Planning Icon]

   , and then **Mass Update**

   ![Mass Update Icon]

2. Select the form that best suits your situation:
Each granularity option (Employee, Job, or Employee and Job) supports the following forms and Groovy rules. However, the Employee model supports updating only employees, and the Job model supports updating only jobs.

### Table 14-1  Forms for Making Mass Updates

<table>
<thead>
<tr>
<th>Your Objective</th>
<th>Use This Form / Tab</th>
<th>Which Groovy Rule is Run Upon Save</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign updated entity defaults for benefits, taxes, and additional earnings, based on employee or job driver details</td>
<td>Process Data and Synchronize Defaults</td>
<td>Incremental Process Data with Synchronize Defaults</td>
</tr>
<tr>
<td>Update employee properties, job properties, or salary-related information</td>
<td>Process Updated Data</td>
<td>Incremental Process Data with Synchronize Definition</td>
</tr>
<tr>
<td>Calculate the non-salary components based on the definition of components in the Benefits and Taxes wizard</td>
<td>Synchronize Defaults</td>
<td>Incremental Synchronize Defaults</td>
</tr>
<tr>
<td>Update, add, or remove an existing benefit, tax, or additional earning</td>
<td></td>
<td></td>

<td>Incremental Synchronize Definition</td>
</tr>
<tr>
<td>• Update, add, or remove an existing benefit, tax, or additional earning</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Calculate the non-salary components based on the definition of components provided in the Benefits and Taxes wizard</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Notes about the Mass Update forms:

- Oracle recommends that you not change the Start Month to a later month because calculations persist for expenses from the original month, even though the new month is displayed in Employee Details.

- **Process Data and Synchronize Defaults** and **Process Updated Data** forms: At least one Employee/Job intersection must exist on the POV before you can add another Employee/Job row to the forms using the Select Member list.

Changing an Employee's Status

To change an employee's status:

1. Click Compensation Planning, then Manage Employees, and then Existing Employees.
2. Select the employee in the row, and then from the Actions gear, click Change Existing Details.
3. From Change Employee, select Status.
4. Select the pertinent information, including the new status:
   - **Active**—The employee's workforce expenses are included fully in workforce calculations.
   - **Disability**—The employee's workforce expenses are not calculated for the specified period.
   - **Leave of Absence**—The employee's workforce expenses are not calculated for the specified period.
   - **Maternity**—The employee's workforce expenses are calculated according to the Partial Payment Factor, set in assumptions. The Partial Payment Factor
sets the pay percentage to apply to the employee's salary. To set this percentage in assumptions, click **Compensation Planning**, and then **Assumptions**.

- **On Sabbatical**—The employee's workforce expenses are not calculated for the specified period.

5. Select the year, month and duration in months of the status. You can also add a comment.

## Hiring Employees

When you hire an employee, you associate the employee with an existing hiring requisition.

When you hire an employee, you add them as a member to the Employee dimension. Then you associate the employee to a hiring requisition (TBH), which assigns their FTE and headcount to the application. (For information on hiring requisitions, see [Managing Hiring Requisitions](#)). After you reconcile the new employee with a hiring requisition, you manage the employee's workforce information on the **Existing Employees** form.

To associate a newly-hired employee with a hiring requisition:

1. Click **Compensation**, then **Manage Employees**, and then **New Hires**.
2. Click the row containing the hiring requisition to associate with the new hire, then **Actions**, and then **Associate Employee**.

   The new employee's compensation expenses are added to the totals, and the headcount and compensation expenses for the hiring requisition are cleared.

## Planning an Employee's Departure

When an employee resigns or is terminated, to stop their associated compensation expenses from being included in calculations as of their departure month, use **Plan Departure**.

To plan an employee's departure:

1. Click **Compensation Planning**, then **Manage Employees**, and then **Existing Employees**.
2. Select the employee.
3. Click **Actions**, and then **Plan Departure**.
4. Select the pertinent date and information. For example, select the month, year, reason the employee is leaving, and add optional comments.

   The employee's workforce expenses aren't included in calculations beginning with the departure month.
5. Click **Launch**.

To undo an employee's departure:

1. Click **Compensation Planning**, then **Manage Employees**, and then **Existing Employees**.
2. Click **Actions**, then **Business Rules**, and then **Process Loaded Data**.
3. Select the employee, job, and month and year of the employee's termination. Add optional comments, and then click **Launch**. The employee's workforce expenses are again included in calculations.

**Transferring Employees**

Transferring an employee changes the department (or entity) against which their compensation expenses are calculated. Managers transfer employees using either of these processes:

- **One-step Transfer**—Use the Transfer rule if you own both the source and target entities (that is, you have access permissions to the source and target entities).
- **Two-step Transfer**—Use the Transfer Out and Transfer In rules if you don't have access permissions to both the source and target entities. The two-step transfer provides security. For example, it ensures that managers in Department A can't see member data for Department B if they don't have access permissions to the Department B entity. You should transfer out an employee during the same month in which receiving department transfers in the employee.

**Note:**

After an employee is transferred out, their data is not retained in the former department as of the transfer month. When the employee is transferred to the new department, the status is set to Active for that department, and the employee's salary is calculated in the new department.

To use the two-step employee-transfer process:

1. Click **Compensation Planning**, then **Manage Employees**, and then **Existing Employees**.
2. Click the **Actions** gear, and then **Transfer Out**. Transfer Out causes the employee's name to be displayed in the **Review Pending Transfers** form.
3. To transfer the employee into the target department, in **Review Pending Transfers**, select the employee, then **Action**, and then **Transfer In**.

**Tip:**

Oracle recommends that you review pending transfers before approving a plan.

**Managing Jobs**

If the application is based on the **Job** granularity option, you can use the **Add Job** rule to add jobs and the **Change Salary** rule to change the salary for jobs. The changes are effective from the period and month that you specify.
Adding Jobs

You can add jobs and set their properties if the application is based on the Job granularity option.

To add jobs:

1. Click Compensation Planning, and then Manage Jobs.
2. Specify the POV.
3. Click the Actions gear, and then select Add Job.
4. On Job Details:
   - In Job, click the Member Selector, and then select the position.
   - Enter the full-time equivalent in FTE.
   - Enter the number of Regular, Contractor, and Temporary Headcount for the job.
   - Click Next.
5. On Calendar Information, select the Start Year and Start Month for the job, and then click Next.
6. On Pay Type, Skill Set, and Salary Options, select these options:
   - Pay Type—for example, Exempt or Non-exempt
   - Skill Set—for example, Java or Management
   - Salary Options:
     - Salary Defaults: Select to set the salary based on the salary defaults, and then click Launch. Salary defaults are set on the Defaults tab of Compensation Planning.
     - Salary Basis and Rate: Select this option, and then click Next to directly enter the Salary Rate (for example, 6000) and select the Salary Basis (for example, Monthly). Then click Launch.
     - Salary Grade: Select to set the salary by selecting a salary grade, and then click Next to select the grade. Then click Launch. Selecting Salary Grade bypasses the default assignments and instead uses the Salary Grade Basis and Rates at the specific level0 Entity member or the Company Assumptions Entity member. Salary grades are set on the Assumptions tab of Compensation Planning.

A message confirms that you successfully added the job. The expenses for the job are calculated starting from the start month and year you specified.
Note:

Because jobs are members in the Job dimension, you can't remove a job through the Workforce interface. Instead, the administrator can delete the job member using the Dimension Editor. Alternately, you could repurpose an existing job.

Changing a Job's Salary

If the application is based on the Job granularity option, you can change the salary of jobs and specify which period and year the change takes effect using the Change Salary rule.

To change a job's salary:

1. Select Compensation, and then Manage Jobs.
2. Specify the POV and click on the job to change.
3. Click the Actions gear, and then Change Salary.
4. At Salary Options:
   - From the Year Member Selector, select the effective year for the change.
   - From the From Period Member Selector, select the effective month or period for the change.
   - From Salary Options, select how to set the salary:
     - Salary Defaults: Set the salary based on the salary defaults, and then click Launch.
     - Salary Basis and Rate: Select this option, and then click Next to directly enter the Salary Rate (for example, 6000) and select the Salary Basis (for example, Monthly). Then click Launch.
     - Salary Grade: Select to set the salary by selecting a salary grade, and then click Next to select the grade. Then click Launch. Selecting Salary Grade bypasses the default assignments and instead uses the Salary Grade Basis and Rates at the specific level0 Entity member or the Company Assumptions Entity member.

A message confirms that you've successfully changed the job's salary. The expenses are calculated for the job starting from the start month and year you specified.

Planning Merit Rates

Merit rate increases are added to salary calculations. You can plan merit rates for employees using these methods:

- Based on the employee's performance rating, for example, Meets Expectations, Exceeds Expectations, or No Merit. (Your administrator can create or import performance ratings.)
By setting default percentage rates by entity in the **Default Merit** member. If the performance rating isn't set for an employee (you can set and view performance ratings on the **Employee Details** form) or if you want to plan merit rates at a more generic level, you can set default percentage rates for merit increases by entity. The merit increase for the year is included in the base salary calculations of that year and is carried forward into the base salary for subsequent years. This method is particularly useful when managers don't yet have performance information, for example, when planning merit increases for future years. To simplify planning when merit rates are the same across entities, you can also copy merit rates from one entity to another using the rule **Copy Merit Rates**.

To set merit rates:

1. Click 🔄 .
2. Click **Assumptions**, and then **Merit Rates**.
3. From the Point of View links, select the Scenario, Version, and Entity.
4. Set merit rates using the method you prefer:
   - In the performance rating row, enter the merit percentage rate.
   - If no performance rating is set, enter the merit percentage rate in the **Default Merit** row. This value is used in salary calculations only if the performance rating is blank.
   
   **Optional:** To copy the merit rates from one entity to another, run the rule **Copy Merit Rates** from the **Actions** menu. At the rule’s prompt, select the parent or child entity member whose merit rate you want to copy and the target level 0 member to copy the rate to. Selecting a source parent member enables you to easily push merit rates. Even after you’ve copied a merit rate to another entity, you can still overwrite the rate in the **Merit Rates** form.

   **Note:**

   Merit rates must be set at the level 0 entity level, whether they’re based on performance rating or the **Default Merit** member. If managers enter merit rates at the company Assumptions (No Entity) member, the rates aren't effective until they're copied or added to specific level 0 child members of Total Entity. Individual entity owners can use the rule **Copy Merit Rates** and then modify the rates if needed.

5. Click **Actions**, and then **Synchronize Component Definition**.

Running this rule recalculates tax thresholds that may change as a result of merit increases for employees.

**Calculating Compensation Expenses**

Whenever you update data in Workforce, to recalculate expenses, you must run the **Calculate Compensation** rule. Click **Actions**, and then **Calculate Compensation**.
Note:
If you get an error message about invalid data when running a business rule, see Troubleshooting a Rule’s Error Message.

Synchronizing Defaults

You must run the Synchronize Defaults business rule when entity defaults are added or existing defaults are changed. Running Synchronize Defaults pushes the updated configuration information so that form calculations are based on the updated information.

To run Synchronize Defaults, select Actions, then Business Rules, and then Synchronize Defaults. If you launch Synchronize Defaults using the right-click menu, you should use it for a selected employee-job combination.

If you intend to execute the business rule for:

- Only one person, highlight the row containing that person's name, and then run the business rule.
- Multiple people, or to select the dimensionality with a runtime prompt, highlight a blank row and then run the business rule.

Note:
When an existing salary grade, benefit, tax, or additional earning is updated, to push the updated definitions to employees and jobs, run the Synchronize Component Definition business rule. This business rule doesn’t update entity defaults.

Note:
After new data has been imported, run the business rule Process Loaded Data to copy the data to the necessary periods in the planning year range. Running this business rule copies the information from the substitution variables &CurYr and &CurMnth.

Tip:
To quickly update and process data on multiple existing employees or jobs, you can use the Mass Update forms. Each form is associated with a Groovy rule that processes only the changed data. See Updating Multiple Employees and Jobs Details.
Troubleshooting a Rule's Error Message

To make it easy for you to work with data, Workforce extensively uses Smart List drop-down lists. Smart Lists that are defined with the property Create from Members use text data (the member names), not the Smart Lists’ numeric ID. If a Smart List in your application mistakenly has numeric data or is missing data, you get an error message when you run a predefined business rule such as Process Loaded Data or Synchronize Defaults.

To find and fix incorrect Smart List values:

1. Click Compensation Planning, and then Defaults.

   Check to see if there’s invalid data (numeric instead of text data) related to employee properties and compensation.

3. To make sure there are no invalid Smart List values at the employee and job combination, click the Validate tab.

If there’s numeric data for a Smart List, your administrator can fix this error by re-loading the data for that employee and job combination or by adding the missing member to the hierarchy. Then you can select that member from the Smart List drop-down list. Or, you can select another Smart List value that fits your needs.
Managing Non Compensation Expenses

You manage non compensation expenses such as training or travel expenses using Other Expenses.

- To view a summary of expenses, click Summary.
- To add or update non compensation expenses, click Non Compensation Expenses.
Managing Demographics

Demographics describe employee attributes that are unique to each individual, such as Ethnicity, Gender, Religion, Veteran Status, Highest Education Degree, and Age Band. Analyzing demographics can help:

- Ensure fairness in hiring
- Address talent gaps as older employees retire
- Examine how many employees and what skill sets your future projects require

To view and update demographics, for example, to set an attribute for a new employee, click Demographics. Then:

- To see a graphic summary of headcount by demographic, click Headcount Overview.
- To see a graphic summary of workforce expenses by demographic, click Workforce Expenses Overview.
- To set a demographic by employee and job, click Employee Demographics.

To ensure correct calculations in the dashboards, on the Demographics by Employee form, you can select any demographic member, including the Unspecified Demographic member. However, avoid selecting a No_<demographic_member_name> member, for example, No Highest Education Degree, No Age Band, or No Gender.

Note:
Your administrator sets up which demographics the organization tracks.
Analyzing Workforce Expenses

So that you can see the big picture of headcount, compensation, and trends, skills sets, and so on, Workforce provides predefined dashboards. From a dashboard, you can drill to the detail data by clicking or tapping links. You can also perform what-if analysis in many ways. For example, change a value in the grid and see its immediate effect in the chart.

To access an analysis dashboard, in Workforce, click Analysis and then explore the data presented on the vertical tabs.
For complete reporting on data, Workforce provides data maps, which enable you to push consolidated data from one cube to a reporting cube. For example, you can push compensation data to the reporting cube.

The data maps:

- Compensation Data for Reporting—For reporting on compensation information
- Headcount Data for Reporting—For reporting on headcount data
- Non Compensation data for Reporting—For reporting on non compensation information

To access the data maps:

1. Click Application, then Data Exchange, and then Data Maps.

2. Click the data map to use, and then from Actions, click Push Data.

The data in the reporting cube is always cleared before data is pushed to it.

The Administering Planning guide describes how to set up and change data maps.
Importing Data

You can download data import templates from within the application. The templates are generated based on the features you've enabled and the custom dimensions that were added.

To download the data import templates:

1. From the Home page, click Application and then click Configure.

2. From the Configure list, select the module for which you want to download templates, and then from the Actions menu, select Download Data Load Templates.

3. Save the zip file locally, and then extract the csv files.

Perform these tasks to import data:

1. Before importing data, configure the application as described in this help system and use Configure to import the dimensional metadata.

   **Note:**
   
   Oracle recommends that you use Configure to import metadata, which ensures that metadata is loaded correctly to work with the provided rules and forms. If you choose to use the Dimension Editor to load metadata, the primary hierarchy for a dimension should go under the All member for the dimension. You can add alternative hierarchies under the Root member as well, but the member should be a Parent or rollup type member. No parent or member should be set to rollup/aggregate to the root member of a dimension, because the root member can't be displayed on any form, dashboard, or report.

   2. Specify the appropriate data import settings. See Administering Data Load Settings.

   3. **Optional:** Make a backup copy of the data import templates to which you can revert if necessary.

   4. **Optional:** Back up the application.

   5. If you created custom Smart Lists, import them before the associated data (available only for some modules.)

      To identify the Smart List to import and their entry names:
a. Click **Navigator**, and then **Smart Lists** from **Create and Manage**.
b. Select the Smart List, click **Edit**, and then **Entries**.
c. Note the associated names.

6. Open the templates in Microsoft Excel, and customize them to specify your business data.

7. Optional: To ensure that your data will import and calculate correctly, import it into a test application first.

8. Import the data into your production application.

9. For the first data import, run the rules required to process and calculate the data.

When customizing the templates:

- Don’t enter zeros.
- To import data, you must have one member at least from all dimensions in the file to import.
- Remove columns for which you have no data. For example, if your periodicity is monthly, you can delete columns for Qtrly 1 - 4.
- If member names start with zeros (0), change numeric columns to text.

## Importing Strategic Workforce Planning Data

You can download Oracle Strategic Workforce Planning Cloud data import templates from within the application. The templates are generated based on the features you’ve enabled and the custom dimensions that you added when you enabled features. See Importing Data.

Watch this tutorial video to learn about importing Strategic Workforce Planning metadata and data from Oracle Fusion Human Capital Management using Data Management.

### Tutorial Video

The templates reflect the **CurYr** that you set in the **Planning and Forecast Preparation** configuration task. After importing your data and refreshing the cube, run the rule **Process Loaded Data** to copy the data to the necessary periods in the planning year range.

The prefix of each template name depends on the application’s granularity:

- **EJ_** precedes template names for **Employee and Job** applications. For example: **EJ_SWPDemandDataLoad_Plan.csv**.
- **JO_** precedes template names for **Job-only** applications. For example: **JO_Job-PropertiesDataLoad_Plan.csv**.
Note:

If your application is multicurrency, import data into the No Currency member. (The import templates are formatted to include the No Currency member for multicurrency applications.) If you've enabled Average Compensation, also import average compensation rates at No Currency in the entity. Also, Oracle assumes that you load Actuals historical data instead of entering or calculating it.

You can import properties and OWP_FTE to any month and year because the Process Loaded Strategic Workforce Data rule prompts for the starting point. However, skills assessment data, demand, and supply data are all loaded to BegBalance.

After importing data, run the Process Loaded Strategic Workforce Data rule.

Importing Demand Units for Demand Drivers

Use EJ_SWPDemandDataLoad_Plan.csv to import demand units for demand drivers.

Importing Rates for Demand Drivers and Demand FTE

Use EJ_SWPDemandDatabyJob_Plan.csv to import demand rates for demand drivers and demand FTE. To consider the Previous Year Ratio demand calculation, import this data for the year prior to the Plan Start Year.

Importing Employee Information, FTE Per job, Entity, and Year to the Reporting Cube

Use EJ_EmployeeFTEDataLoad_REP.csv to import employee information, FTE per job, entity, year to the OEP_REP reporting cube. This information is the basis for deriving the average skill rating across different skill categories.

Importing Employee Skills Assessment Data

Use EJ_EmployeeSkillAssessmentDataLoad_Plan.csv to import skill assessment ratings for employees across different skills in the reporting cube. This information is the basis for deriving the average skill rating across different skill categories.

Importing Attrition Data by Job

Use EJ_SWPAtritionDatabyJob_Plan.csv to import values for attrition by job.

Importing Demand Data by Job

Use EJ_SWPDemandDatabyJob_Plan.csv to import values for demand data by job.

Importing New Hires

Importing Properties for New Hires

Use EJ_NewHiresPropertiesDataLoad_Plan.csv to import properties for new hires.
Importing Job Properties
Use JO_JobPropertiesDataLoad_Plan.csv to import job properties.

Importing Attrition Data by Job
Use JO_SWPAttritionDataByJob_Plan.csv to import attrition data by job.

Importing Demand Data by Job
Use JO_SWPDemandDataByJob_Plan.csv to import demand data by job.

Importing Demand Units for Demand Drivers
Use JO_SWPDemandDataLoad_Plan.csv to import demand units for demand drivers.

About Importing Employee and Job Properties
Employee and Job properties provide the basis for Supply FTE data, before attrition. Whether you've enabled only Strategic Workforce Planning, only Workforce, or both, the application relies on the properties data in the import templates JO_JobPropertiesDataLoad_plan.csv or EJ_EmployeePropertiesDataLoad_Plan.csv. After importing with the appropriate properties file and running the rule Process Loaded Strategic Workforce Data, the information is available in Strategic Workforce Planning. To see the data, click Overview, and then Review Employee Information or Review Job Information.

If your application is single currency and both Strategic Workforce Planning and Workforce are enabled, you only need to import the properties file once. When you run the rule Process Loaded Strategic Workforce Data, the data is copied from the Year and Month in the file to years in yearRange. (Strategic Workforce Planning has a substitution variable, OWP_SWPYearRange.)

If your application is multicurrency and both Strategic Workforce Planning and Workforce are enabled, you must import the properties files twice, once to include the currency member for Workforce and again at the No Currency member for Strategic Workforce Planning. Run the Process Loaded Strategic Workforce Data rule and Process Loaded Data after each import.

If you've also enabled Workforce, see Importing Workforce Data.

Importing Workforce Data

You can download Workforce data import templates from within the application. The templates are generated based on the features you've enabled and the custom dimensions that you added when you enabled features. See Importing Data.

Note:
If you want to load only changed and new Workforce data since the last load, you can improve load performance using Data Management. See Loading and Calculating Incremental Workforce Data.
The templates reflect the CurYr that you set in the Planning and Forecast Preparation configuration task. After importing your data and refreshing the cube, run the rule Process Loaded Data to copy the data to the necessary periods in the planning year range.

The prefix of each template name depends on the application’s granularity:

- **EJ** precedes template names for Employee and Job applications. For example: EJ_EmployeePropertiesDataLoad_Plan.csv.
- **EO** precedes template names for Employee-only applications. For example: EO_EmployeePropertiesDataLoad_Plan.csv.
- **JO** precedes template names for Job-only applications. For example: JO_JobOtherCompensationDataLoad_Plan.csv.

Importing Employee Properties

Use these templates to import properties for existing employees:

- **EmployeePropertiesDataLoad_Plan.csv**—Import plan properties for employees. (You don't need to load Headcount and Partial Payment Factor unless you want to explicitly set these values. If you don't load Headcount and Partial Payment values, they're set to 1 and 100% respectively for every employee.)

Note:

For the EJ_EmployeePropertiesDataLoad_Plan.csv template:
Don't load to "No Union Code" or to "OWP All Union Code". Instead add and use new child metadata member of "Total Union Code". Otherwise, the synchronize rules may not work properly.

- **EmployeePropertiesDataLoad_Actuals.csv**—Import actual properties for employees.

Importing Employee Compensation

Use **EmployeeSalaryDataLoad_Plan.csv** to import data used to calculate salary.

Importing Actual Employee Compensation

Use **EmployeeCompensationDataLoad_Actuals.csv** to import actual compensation data for employees.

To use this template, set these Data Load Settings:

1. From the Home page, click Navigator, and then under Integration, click Data Load Settings.
2. Set these parameters for importing data:
   - **Data Load Dimension**: Account
   - **Driver Dimension**: Period. Member: BegBalance,ILvl0Descendants(YearTotal)
   - **Data Load Dimension Parent**: Appendix A
Importing Employee Other Compensation Data

Use EmployeeOtherCompensationDataLoad_Plan.csv to import other compensation data—benefits, taxes, and additional earnings—for employees.

OWP_Value is an optional field. If you include the rate value in the template, that rate is copied to the planning year range for the specified employee.

Importing Salary Grades

Use Salary Grade-Basis.csv and Salary Grade-Value.csv to import salary grades into Assumptions.

Importing Properties and Rates for Additional Earnings, Benefits, and Taxes

Use these templates as examples when importing properties and rates for additional earnings, benefits, and taxes into the Benefits and Taxes wizard.

- Earnings, Benefits and Taxes-Properties.csv—Import properties for additional earnings, benefits, and taxes.
- Earnings, Benefits and Taxes-Rates.csv—Import rates for additional earnings, benefits, and taxes.

Importing Job Properties

Use JobPropertiesDataLoad_Plan.csv to import job properties.

Importing Job Salaries

Use JobSalaryDataLoad_Plan.csv to import salaries for jobs.

Importing Job Other Compensation Data

Use JobOtherCompensationDataLoad_Plan.csv to import other compensation data for jobs: benefits, taxes, and additional earnings.

Loading and Calculating Incremental Workforce Data

At the beginning of a planning cycle, you might load the entire data for a given scenario and version. However, to stay up to date with Human Resources changes, you can import new and updated information frequently. Processing and calculation performance is greatly improved when you load updated data into Workforce using Data Management.

Data Management functionality enables you to compare a source data file with a previous version of the source data file and load only records that are new or have changed since the last load. The Incremental File Adapter in Data Management identifies the data that needs loading. Additionally, Workforce provides rules that dynamically generate the appropriate calculation script, depending on the changed and new data in the data load file and calculates only the data for the modified intersections.
After the Data Management load process, the changed and new data displays in the appropriate Workforce forms. The data reflects calculations applied in the load process.

To learn how to load and calculate incremental Workforce data in Data Management, watch this tutorial video.

Loading and Calculating Incremental Workforce Data using Data Management.

**Note:**
Whenever you load data from Data Management, to copy data to future periods, you must select one of these Workforce rules: *OWP_Incremental Process Data and Synchronize Defaults* or *OWP_Incremental Process Data and Synchronize Definition*. See *Deciding Which Workforce Rules to Add*.

### Preparing the Source Data File

You first generate a source data file and register it as an Incremental File Adapter in Data Management. You then set up a data rule that designates the source data file. Data loads are run from the file designated in the data rule. The initial source data file is compared with a subsequent file; the last run file becomes the basis against which the subsequent load is compared. The Incremental File Adapter loads only the differences, which results in faster data loads.

**Tip:**
You'll experience better performance if you provide a pre-sorted source file.

**About a source data file:**
- The source data file must be a delimited data file. The data field is the last column in the file.
- Supported delimiters: Comma, Pipe, Exclamation, Semi-Colon, Colon, Tab, and Tilde.
- Data files used must contain a one-line header, which lists the dimensions you're loading. For example: `Entity,Employee,Job,Project,Version,Account,Property,Data`.
- Both numeric and non-numeric data can be loaded.
- Any deleted records between the two files is ignored. You must manually handle deleted records.
- If the file is missing (or you change the last ID to a non-existent run), the load completes with an error.
- Pre-sorting the file decreases the processing time.
• Only single Period data loads are supported for an incremental load. Multi-period loads are not supported.

• Drill down is not supported for incremental loads because incremental files are loaded in Replace mode and only the last version of the file comparison is present in the staging table. As a workaround, you can load the same data file to another location using the full data load method. In this case, you should import data only and not export it to the target application.

• Copies of the source data file are archived for future comparison. Only the last 5 versions are retained. Files are retained for a maximum of 60 days. If no incremental load is performed for more than 60 days, then set the Last Process ID to 0 and perform the load.

You can load data using the Incremental File Adapter multiple times.

Configuring the Incremental File Adapter in Data Management

Note:
Options when defining the Data Load Rule in Data Management enable you to decide if you're loading only incremental data into Workforce or loading all data every time.

To set up an incremental data source file:

1. Add an incremental data source:
   a. From the Home page, click the Navigator, and then under Integration, click Data Management.
   b. Click the Setup tab, and then under Register, click Target Application.
   c. Under Target Application Summary, click Add, and then Data Source.
   e. In Prefix, you can specify a prefix to make the source system name unique.
      Use a prefix when the source system name you want to add is based on an existing source system name. The prefix is joined to the existing name. For example, if you want to name an incremental file source system the same name as the existing one, you might assign your initials as the prefix.
   f. Click OK.
   g. From the Select dialog, select the source data load file from the Inbox. If the file is missing, click Upload to add it to the Inbox (server /u03/inbox/inbox). You may need to expand the Home folder, and then select Inbox to see the source file listing. The file must be a delimited file using one of the supported delimiters, and must contain a header record for each dimension in the first row. The data field is the last column in the file. See Preparing the Source Data File.
   h. Click OK and then Save.
      The system automatically creates the dimension details.

2. Set up the Import Format, which describes the source file structure and is executed when the source file is imported:

---

Appendix A
Importing Workforce Data
a. On the **Setup** tab, under **Integration Setup**, click **Import Format**.

b. Under **Import Format Summary**, click **Add**.

c. Under **Details**, enter a name for the Import Format.

d. In **Source**, browse to select your source.

e. From **File Type**, select the delimited file type. Oracle recommends selecting **Delimited - All Data Type**, which is common for loading text as well as numeric data.

f. From the **File Delimiter** drop-down list, select the delimiter type in the source data file: Comma, Pipe, Exclamation, Semi-Colon, Colon, Tab, and Tilde.

g. In **Target**, browse to select your Planning application, and then click **Save**.

h. Under **Mappings**, map dimensions between the **Source Column** and the target application, and then click **Save**. The **Source Column** is populated with the dimensions from the header row in your source data file.

### Note:

Only single-period loads are supported.

For more information on Import Formats, see Working with Import Formats in *Administering Data Management for Oracle Enterprise Performance Management Cloud*.

3. Define the Location, which is the level at which a data load is executed in Data Management. The Location specifies where to load the data and is associated with the Import Format.

   a. On the **Setup** tab, under **Integration Setup**, select **Location**.

   b. Under **Location**, click **Add**.

   c. Under **Details**, on the **Location Details** tab, enter a name for the Location.

   d. Browse to select your Import Format.

   e. Enter the **Functional Currency**, and then click **Save**.

   For more information, see Defining Locations in *Administering Data Management for Oracle Enterprise Performance Management Cloud*.

4. Create member mappings:

   a. On the **Workflow** tab, under **Data Load**, select **Data Load Mapping**.

   b. At the bottom of the page, verify the POV for the Location.

      i. Click the link for **Location**, which displays the **Select Point of View** dialog.

      ii. Select your **Location**, **Period**, and **Category** (Scenario).

      iii. **Optional**: Select **Set as Default** to retain this POV.

      iv. Click **OK**.

   c. Map the members from the source that you are loading to the target application:
i. At the top of the page, from Dimension, select a dimension in your source file.

ii. Click one of the five member mapping tabs (for example, the Like tab), and then click Add.

iii. Enter * in the Source Value column and also in the Target Value column to represent all values.

iv. Click Save after mapping members for each dimension. You must create a member mapping for each dimension in the source data file.

For more information, see Creating Member Mappings in Administering Data Management for Oracle Enterprise Performance Management Cloud.

5. Select the data load rule: On the Workflow tab, under Data Load, select Data Load Rule.

   a. At the bottom of the page, verify the POV for the Location, just like you did in Step 4b.

   b. In the Data Rule Summary area, click Add.

   c. Under Details, enter the data load rule name.

   d. In Category, select the category to map source system data to target Scenario members.

   e. In Period Mapping Type, select Default.

   f. You don't need to specify an Import Format, because the Import Format from the Location is used. Specify an Import Format only when you want to override the Import Format for the Location.

   g. From the Target Plan Type drop-down list, select OEP_WFP.

   h. On the Source Filters tab, in Source File, browse to select the data file that contains the data you're loading. It may be the same one from which you created the data source application, or another file that has data as well as the appropriate header. It may have the same name as the original file, or it may have a new name. The differences in the incremental load file is created automatically between the two loaded files. So if file A.txt has 100 rows and file B.txt has 300 rows where the first 100 are identical, your first load should select file A.txt when the Last Process ID is 0. The second load will be against file B.txt, and the ID automatically points to the Last Process ID that was assigned to A.

   i. In Incremental Processing Option, select whether to sort data in the source file:

      • Do not sort source file—The source file is compared as provided. This option assumes that the source file is generated in the same sort order each time. Data Management compares the files, and then extracts the new and changed records. This option makes the incremental file load perform faster.

      • Sort source file—Data Management sorts the source file before performing the file comparison for changes. The sorted file is then compared to the previous sorted version of this file. Sorting a large file consumes many system resources. If the source system provides a sorted file, avoid using
this option because it consumes computer resources and slows performance.

**Note:**

If you have a rule that uses the **Do not sort source file** option and then switch to a Sort option, then the first load will have invalid results because the files are in different order. Subsequent runs load data correctly.

• Review the **Last Process ID** value.
  When the load is first run for the original data file, the **Last Process ID** shows the value of 0. When the load is run again, the **Last Process ID** shows the run number of the last load for the original source data file. If the newly created file comparison version and the original data file show no differences, or if the file is not found, the value of the **Last Process ID** is assigned to the last load ID that ran successfully.

  To reload all data, set the **Last Process ID** back to 0, and select a new source file to reset the baseline.

**Note:**

Copies of the source data file are archived for only the last 5 versions and retained for a maximum of 60 days. After 60 days, set the **Last Process ID** to 0 and then perform the load.

j. **Click Save.**

6. Select the Load Method for the target application and add the Workforce business rules that execute the logic for the incremental load when the data load rule is run:
   a. Click the **Setup** tab, and under **Register**, click **Target Application**.
   b. Under **Target Application Summary**, from the **Type** column, select **Planning**.
   c. Under **Application Details**, click the **Application Options** tab.
   d. For **Load Method**, select **All data types with security**, and then click **OK**.
   e. Click the **Business Rules** tab, and then click **Add**.
   f. Under **Business Rule**, enter or paste the Workforce business rule name. For information on Workforce rules, see **Deciding Which Workforce Rules to Add**. For more information on adding business rules in Data Management see Adding Business Rules in *Administering Data Management for Oracle Enterprise Performance Management Cloud*.
   g. Under **Scope**, select **Data Rule**.
   h. Under **Data Load Rule**, select the data load rule you created, and then click **Save**.

7. Preview the data before exporting it.
   a. Click the **Workflow** tab, and then **Data Load Rule**.
b. Click **Execute**.

c. On the **Execute Rule** dialog, select **Import from Source** and verify the **Start Period** and **End Period**.
   To actually send the incremental data to the target application, you could also select **Export to Target**.

d. Click **Run**.

See Using the Data Load Workbench in *Administering Data Management for Oracle Enterprise Performance Management Cloud*.

8. You're now ready to execute the incremental data load. See **Executing an Incremental Workforce Data Load**.

---

**Tip:**

After loading data, to quickly update and process data on multiple existing employees, jobs, or entity defaults in Workforce, you can use the **Mass Update** forms. These forms enable you to quickly review and edit employees, jobs, and entity defaults after data is loaded. Designed for optimal processing efficiency, each form is associated with a Groovy rule that processes only the changed data. See Updating Multiple Employees and Jobs Details in *Working with Planning Modules*.

---

**Deciding Which Workforce Rules to Add**

You can decrease processing time by associating the optimal Workforce rules with a Data Management data rule:

- **OWP_Incremental Process Data with Synchronize Defaults**
- **OWP_Incremental Process Data with Synchronize Definition**

You add the rules when defining the integration file (see Configuring the Incremental File Adapter in Data Management).

---

**Table A-1   Deciding Which Workforce Rule to Add to the Integration File**

<table>
<thead>
<tr>
<th>Your Objective</th>
<th>Add This Workforce Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Apply entity defaults for additional earnings, benefits and taxes and calculate compensation based on the component definition and rates that are set in the Benefits and Taxes wizard.</td>
<td><strong>OWP_Incremental Process Data with Synchronize Defaults</strong></td>
</tr>
<tr>
<td>• Copy changed data (employee/job properties or any change in salary) to future periods in the Year Range.</td>
<td></td>
</tr>
</tbody>
</table>
Table A-1  (Cont.) Deciding Which Workforce Rule to Add to the Integration File

<table>
<thead>
<tr>
<th>Your Objective</th>
<th>Add This Workforce Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Load compensation assignments for additional earnings, benefits, and taxes and calculate compensation based on the rates in the data load file.</td>
<td>OWP_Incremental Process Data with Synchronize Definition</td>
</tr>
<tr>
<td>• Copy changed data (employee/job properties or any change in salary or compensation assignments) to future periods in the Year Range.</td>
<td></td>
</tr>
</tbody>
</table>

Note:
If you want to apply the rates from the Benefits and Taxes wizard, then load only component assignments. Don't provide rates in the data load file.

For more information, see Adding Business Rules in Administering Data Management for Oracle Enterprise Performance Management Cloud.

Executing an Incremental Workforce Data Load

After you've prepared the source data file and configured the Incremental File Adapter in Data Management, you're ready to import incremental Workforce data.

See:
• Loading and Calculating Incremental Workforce Data
• Preparing the Source Data File
• Configuring the Incremental File Adapter in Data Management

To execute the data load:
1. From the Home page, click the Navigator, and then under Integration, click Data Management.
2. On the Workflow tab, click Data Load Rule.
3. Select the data load rule you created, and then click Execute.
4. On the Execute Rule dialog, select Import from Source and Export to Target.
5. For the Start and End Period, select the Period (it may already default from the POV).
6. Click Run.

For more information, see Step 1: Importing Source Data in Administering Data Management for Oracle Enterprise Performance Management Cloud.
Accessibility

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website.

All videos for this cloud service have HTML equivalent topics.

Enabling Accessibility Settings

To enable accessibility settings, click the button at the top right of the Home page to open a dialog box with options for Screen Reader Mode and High Contrast mode.

Recommendations

If you use screen reading software, Oracle recommends that you use Internet Explorer. Some service component screens may not display properly if you use Google Chrome.

General Considerations and Notes

Note these general considerations for using keyboard equivalents and for online help.

Using Keyboard Equivalents

When you use keyboard equivalents, note that:

- The underlined letter that typically appears in a menu title, menu item, or button text is called a mnemonic. Because Oracle considers mnemonics to be self-documenting, additional documentation for mnemonics is not necessarily provided. You can use mnemonics where they are implemented.

- Some mnemonics are repeated. For example, on the File menu, the underlined mnemonic D is used for both the Delete and the Deactivate menu items. When mnemonics are repeated, the first time you press D, the item to be deleted is highlighted. Press Enter to delete or press D again to highlight the Deactivate button, and then press Enter to deactivate.

- Keystrokes listed are standard for PCs. iOS standard keys may be different.

For additional information, see Keyboard Equivalents.

Online Help

For information about working with online Help, see Help Menu.
Accessibility Features

These features are provided:

- Support for screen readers and magnifiers
- Keyboard navigation equivalents for all objects
- **Alt** and **Title** attributes for all objects, images, and page titles
- Support for expanding and collapsing trees using the **Enter** key and keyboard equivalents
- Data form access using keyboard equivalents
- Tab indexing, implemented from left to right on all pages
- A button at the top right corner of the page opens a dialog box with options for screen reader mode and high contrast

**Note:**
To read elements that are read only and do not get focus using keyboard navigation, use the arrow keys to read text. This applies, for example, to task list status.

**Note:**
When moving to the Approvals subcomponent from another subcomponent, such as Revenue, a Filter popup may display.
This feature allows an end user to submit, review, approve, or reject a planning unit. When users come to this feature, planning units are listed for the scenario and version that were most recently used by them while entering data into forms. If no scenario and version were most recently used, a **Filter** popup displays that allows users to select the scenario and the version. The user can select the scenario and version member for which they want to see planning units.

Using Screen Reader Mode

For information about using screen reader mode, see Using Screen Reader Mode.
Updating Workforce Artifacts to Use New Features

Overview

Enhancements available in certain releases, described here, require updates to some provided artifacts.

- If you haven't modified these artifacts (described below), the artifacts and features are available to you automatically with the release.
- Because customized artifacts aren't updated during a new release, if you've customized these artifacts and want to take advantage of the new features, perform these steps:

  1. Perform a full backup after the update and download it locally.
  2. Review the list of modified artifacts and consider whether the enhancements in the monthly update address the modifications you've made to artifacts. Evaluate whether you want to restore the modified artifacts to take advantage of the new features, and whether you will need to re-apply some or all of your modifications.

  **Tip:**

  For any artifacts listed below that you have modified, consider creating a copy of your modified artifact and using that as a reference for the changes you made to it.

  **Note:**

  Obsolete artifacts remain available for your use but will no longer be enhanced and could be removed from active forms, menus, dashboards, and so on.

  3. After the update, reverse the customizations to the artifacts you've identified to restore the artifacts to the provided format. See Reversing Customizations.
  4. Re-implement your customizations to the artifacts, if necessary.
  5. For any restored Calculation Manager rules or templates, after they are final, be sure to deploy the updated rules or templates to the application for any impacted artifacts. See Showing the Usages of a Custom Template and Deploying Business Rules and Business Rulesets.

June 2019 Update
